NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, and the Institute for Computer Sciences and Technology.

THE NATIONAL MEASUREMENT LABORATORY provides the national system of physical and chemical and materials measurement; coordinates the system with measurement systems of other nations and furnishes essential services leading to accurate and uniform physical and chemical measurement throughout the Nation's scientific community, industry, and commerce; conducts materials research leading to improved methods of measurement, standards, and data on the properties of materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government Agencies; develops, produces, and distributes Standard Reference Materials; and provides calibration services. The Laboratory consists of the following centers:

Absolute Physical Quantities[2] — Radiation Research — Thermodynamics and Molecular Science — Analytical Chemistry — Materials Science.

THE NATIONAL ENGINEERING LABORATORY provides technology and technical services to users in the public and private sectors to address national needs and to solve national problems in the public interest; conducts research in engineering and applied science in support of objectives in these efforts; builds and maintains competence in the necessary disciplines required to carry out this research and technical service; develops engineering data and measurement capabilities; provides engineering measurement traceability services; develops test methods and proposes engineering standards and code changes; develops and proposes new engineering practices; and develops and improves mechanisms to transfer results of its research to the ultimate user. The Laboratory consists of the following centers:

Applied Mathematics — Electronics and Electrical Engineering[2] — Mechanical Engineering and Process Technology[2] — Building Technology — Fire Research — Consumer Product Technology — Field Methods

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides scientific and technical services to aid Federal Agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal Agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following divisions:

Systems and Software — Computer Systems Engineering — Information Technology

[1]Headquarters and Laboratories at Gaithersburg, Maryland, unless otherwise noted; mailing address Washington, D.C. 20234.
[2]Some divisions within the center are located at Boulder, Colorado, 80303.

The National Bureau of Standards was reorganized, effective April 9, 1978.

PREFACE

Throughout the history of the National Bureau of Standards, publications have served as the single most effective means for conveying results of Bureau research to the Bureau's diverse audiences. Much of this research has lasting value, and publications reporting Bureau work of many years ago are still consulted by current researchers. Because of these facts, NBS is issuing this catalog of Bureau publications from 1966 through 1976. Each of the two volumes may be used separately, or they may be used to complement each other. Volume 1 consists of abstracts and a full bibliographic citation for each paper. It is an accumulation of the complete citations originally appearing in the NBS annual publications catalogs: NBS SP305 and its Supplements 1 through 8. It also contains availability information not only for currently in-print papers but also for NBS publications series which are no longer in print. Volume 2 consists of a permuted key word index for all papers. See the "Guide to Users of This Publication" for more details on how to most effectively use each volume.

The NBS publications series (presently consisting of 11 non-periodicals and 3 periodicals) provides a matrix which makes it possible to issue each NBS paper in a medium best calculated to reach its most interested specific audience. Throughout the years, this matrix has evolved to reflect changing emphases in Bureau work. Some former publications series have been eliminated; some have been modified; new ones have been created. The "Miscellaneous Publications" series, for example, was superseded by "Special Publications" in 1970. The NBS Journal of Research evolved into three publications, each reporting work in a different discipline, and now has further evolved to the present single volume which reports work in all NBS technical areas. NBS publications series, past and present, are listed and described. (Currently active NBS publications series are described more briefly on the inside back cover of this catalog's two volumes.)

One final note, as the years pass we have constantly attempted to expand the usefulness and comprehensiveness of our *annual* publications catalog. To this end, we have utilized new computer technology as it became available—for composition as well as for cataloging purposes. In earlier years we were only able to include the overall abstract for a conference or symposium Proceedings. For the past several years we have been able to include, in addition, abstracts for the individual papers presented. Also, for the past several years we have been able to include information on Patents, Grant/Contract Reports, and other items which we had not been able to cover previously —all this toward the end of increasing the catalog's usefulness in communicating NBS work to the public.

We hope this summary of former NBS effort will facilitate the work of those who use it. This two-volume catalog of NBS publications covering calendar years 1966 through 1976 will be updated by the annual catalog supplements. The 1977 supplement is currently available as NBS SP305, Supplement 9. (See Section 2.2.)

W. R. Tilley, Chief
Technical Information and
Publications Division

FOR VOL. 2 ONLY

A GUIDE TO USERS OF THIS PUBLICATION

This 11-year record of NBS publications is available in two volumes, each of which may be used independently.

Volume 1, issued in two parts because of its length, consists of abstracts for publications issued by NBS from 1966 through 1976. It also contains general availability information for current and out-of-print NBS publications and a general overview of the NBS publications program. Frequently, the full abstract will satisfy the user's need for information and preclude the need for further research or for acquiring the full paper. Volume 1 reports papers by NBS publications series, as shown in its Table of Contents. If the user does know the NBS publications series involved but does not know the year of publication, this format will be especially useful.

Volume 2, also issued in two parts, consists of a permuted key word index. The key words for each publication or paper are arranged by shifting each group of key words so that each key word, in turn, appears alphabetically followed by the other key words in that group. Volume 2, which also contains the availability and overview information for current and out-of-print NBS publications, may be used in three ways:

(a) as a reference to the abstract given in Volume 1 of this catalog (for papers reported in the annual catalogs, SP305 and Supplements 1 through 8);

(b) as a reference to the abstract in the appropriate annual NBS publications catalog (if available to the reader; see list in Section 2.3);

(c) as a reference to the paper itself, available in a regional depository library, from the National Technical Information Service, or from the original publisher or publication medium, if the paper is still in print. (See availability information in Section 2.).

If the reader does not know the NBS publications series or title of the paper, or is interested in a specific subject matter area, the key word format of Volume 2 will prove useful.

Tables of the abbreviations used to identify various NBS publications series are given below. The tables include the Volume 1 page numbers on which the series listings begin.

SYMBOLS FOR NBS PUBLICATIONS

A. Symbols for the Periodicals

NBS Journal of Research	Index Symbol			Issue Date	Volume 1 Page
	Vol.	Sec.	No.		
Section A	J. Res. 70 through 80	A	1 through 6	July 1966 through December 1976	1
Section B	J. Res. 70 through 80	B	1 through 4	July 1966 through December 1976	88

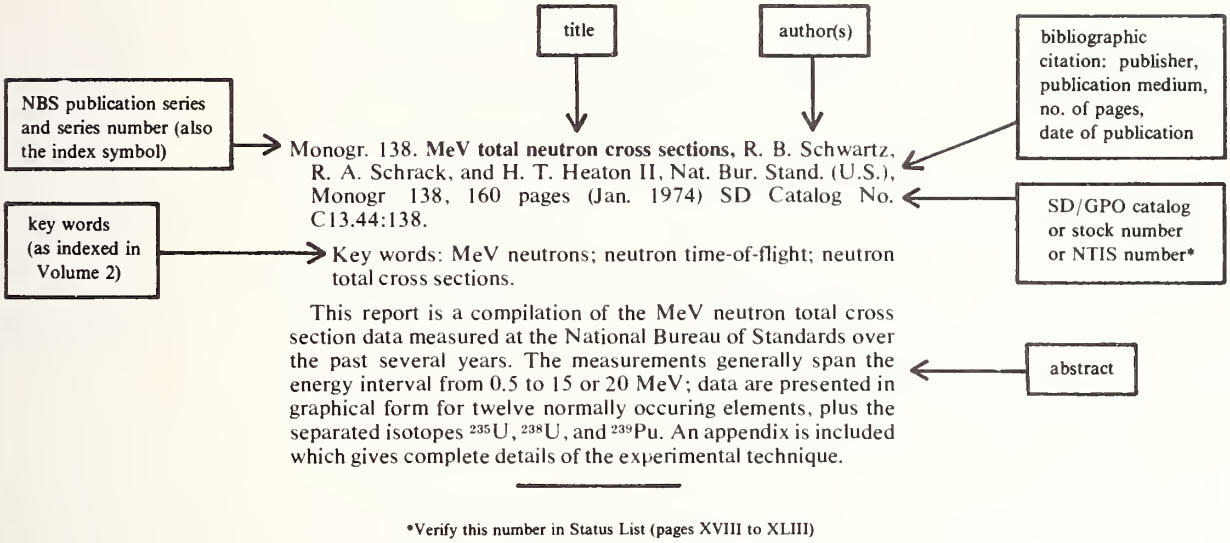
SAMPLE
ENTRIES
FROM
VOLUMES
1 AND 2
FOLLOW

CATALOG ENTRIES: HOW TO READ THEM

A. Sample Entries from Volume 1



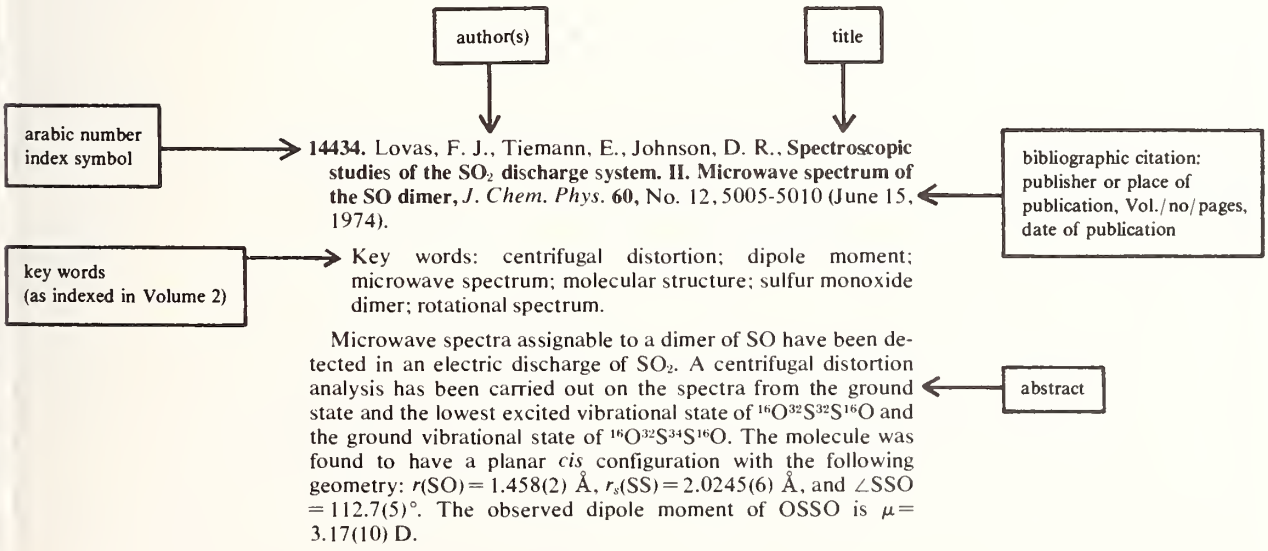
Monogr. 138. **MeV total neutron cross sections,** R. B. Schwartz, R. A. Schrack, and H. T. Heaton II, Nat. Bur. Stand. (U.S.), Monogr 138, 160 pages (Jan. 1974) SD Catalog No. C13.44:138.

Key words: MeV neutrons; neutron time-of-flight; neutron total cross sections.

This report is a compilation of the MeV neutron total cross section data measured at the National Bureau of Standards over the past several years. The measurements generally span the energy interval from 0.5 to 15 or 20 MeV; data are presented in graphical form for twelve normally occuring elements, plus the separated isotopes ^{235}U, ^{238}U, and ^{239}Pu. An appendix is included which gives complete details of the experimental technique.

*Verify this number in Status List (pages XVIII to XLIII)

Example of NBS published paper. (See Section 2 for status and availability.)



14434. Lovas, F. J., Tiemann, E., Johnson, D. R., **Spectroscopic studies of the SO_2 discharge system. II. Microwave spectrum of the SO dimer,** *J. Chem. Phys.* **60,** No. 12, 5005-5010 (June 15, 1974).

Key words: centrifugal distortion; dipole moment; microwave spectrum; molecular structure; sulfur monoxide dimer; rotational spectrum.

Microwave spectra assignable to a dimer of SO have been detected in an electric discharge of SO_2. A centrifugal distortion analysis has been carried out on the spectra from the ground state and the lowest excited vibrational state of $^{16}O^{32}S^{32}S^{16}O$ and the ground vibrational state of $^{16}O^{32}S^{34}S^{16}O$. The molecule was found to have a planar *cis* configuration with the following geometry: $r(SO) = 1.458(2)$ Å, $r_s(SS) = 2.0245(6)$ Å, and $\angle SSO = 112.7(5)°$. The observed dipole moment of OSSO is $\mu = 3.17(10)$ D.

1. NBS PUBLICATION PROGRAM

1.1. INTRODUCTION

The formal publications of the National Bureau of Standards provide the primary means of communicating the results of NBS programs to its varied technical audiences as well as to the general public. Publications thus constitute a major end product of the Bureau's efforts. These take the form of the Bureau's periodicals, its nonperiodical series, interagency reports, and articles in the journals of professional organizations and technological associations.

The various media in which the results of NBS programs appear are as follows:

1.2. PERIODICALS

1.2.1. JOURNAL OF RESEARCH

Since July 1977, the Journal of Research has been published on a single-volume, bi-monthly basis. See the inside back cover for a description of the present Journal which reports NBS research and development in those disciplines of the physical and engineering sciences in which the Bureau is active.

Annual subscription: domestic $17.00; foreign, $21.25. Single copy, $3.00 domestic; $3.75 foreign.

The Journal was formerly published in three sections: Section A "Physics and Chemistry," Section B "Mathematical Sciences," and Section C "Engineering and Instrumentation." Papers published in these former versions of the Journal are reported in this catalog. Each section's coverage is briefly described below:

A. Physics and Chemistry (July 1966 through December 1976)

Contained papers of interest primarily to scientists working in these fields.

B. Mathematical Sciences (July 1966 through December 1976)

Presented studies and compilations designed mainly for the mathematician and the theoretical physicist.

C. Engineering and Instrumentation (July 1966 through June 1972)

Reported research and development results of interest chiefly to the engineer and to the applied scientist.

1.2.2. DIMENSIONS/NBS

This magazine is published to inform both the technical expert and the interested layman of the latest advances in science and technology, with primary emphasis on the work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing. Formerly issued monthly. The tables of contents for each issue of DIMENSIONS/NBS (formerly Technical News Bulletin) for the years 1973 through 1976 are listed in Section 3.5.

1.2.3. JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA (JPCRD)

This Journal is published quarterly by the American Chemical Society and the American Institute of Physics for the National Bureau of Standards. The objective of the Journal is to provide critically evaluated physical and chemical property data, fully documented as to the original sources and the criteria used for evaluation. Critical reviews of measurement techniques, whose aim is to assess the accuracy of available data in a given technical area, are also included. The principal source for the Journal is the National Standard Reference Data System (NSRDS). The Journal is not intended as a publication outlet for original experimental measurements such as are normally reported in the primary research literature, nor for review articles of a descriptive or primarily theoretical nature. (See also Section 1.3. National Standard Reference Data Series.)

1.3. NONPERIODICALS

Several categories of nonperiodical publica-

tions, described as follows, are listed in this catalog:

MONOGRAPHS—major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

HANDBOOKS—recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

MISCELLANEOUS PUBLICATIONS. The name of this series was changed to Special Publications in 1970.

SPECIAL PUBLICATIONS—include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Special subject-matter subseries include Semiconductor Measurement Technology (SP400–), Standard Reference Materials (SP260–), and Precision Measurement and Calibration (SP300–).

APPLIED MATHEMATICS SERIES—mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

NATIONAL STANDARD REFERENCE DATA SERIES—provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS, under authority of National Standard Data Act (Public Law 90-396). This series supplements the JPCRD, see also Section 3.4.

BUILDING SCIENCE SERIES—disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

TECHNICAL NOTES—studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Special subject-matter subseries include Optical Radiation Measurements (TN594–) and Self Calibrations Manual for Optical Radiation (TN910–).

COMMERCIAL STANDARDS AND SIMPLIFIED PRACTICE RECOMMENDATIONS. See Voluntary Product Standards below.

VOLUNTARY PRODUCT STANDARDS—developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. The National Bureau of Standards administers the Voluntary Product Standards program as a supplement to the activities of the private sector standardizing organizations.

FEDERAL INFORMATION PROCESSING STANDARDS PUBLICATIONS (FIPS PUBS)—publications in this series collectively constitute the Federal Information Processing Standards Register. Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

Public distribution of FIPS PUBS is by purchase from the National Technical Information Service, Springfield, VA 22161.

CONSUMER INFORMATION SERIES—practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowl-

edge for shopping in today's technological marketplace.

1.4. NBS INTERAGENCY REPORTS

A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service (Springfield, VA 22161) in paper copy or microfiche form. (See pages XVIII to XLIII.)

1.5. GRANTEE/CONTRACTOR REPORTS AND PATENTS

Grantee/contractor reports are prepared by non-NBS persons or organizations working under grant or contract from the National Bureau of Standards. Those contract reports not incorporated into the formal NBS publication series are available directly from the National Technical Information Service (NTIS), Springfield, VA 22161, in paper copy or microfiche form unless otherwise stated. When ordering a report from NTIS you must order it by the "COM, PB, AD, or N" number as indicated.

Patents are obtained on NBS inventions of high commercial potential, in order to establish Government ownership of the patent rights. The patents are then made available for the grant of nonexclusive licenses to all qualified applicants. A limited exclusive license may be granted under a particular patent, however, if it appears that some period of exclusivity is necessary as an incentive for the investment of risk capital. For information on licensing any of the NBS held patents, write to the Office of the Legal Adviser, National Bureau of Standards, Washington, DC 20234. Copies of patents may be obtained from the U.S. Patent and Trademark Office, Washington, DC 20231 for 50 cents each.

1.6. NBS BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The Cryogenic Data Center of the National Bureau of Standards, Boulder, CO has developed specialized bibliographic issuances designed to provide interested audiences with information on latest developments in certain specialized fields. These issuances, together with subscription information, are listed below:

CRYOGENIC DATA CENTER CURRENT AWARENESS SERVICE (Publications and Reports of Interest in Cryogenics). A literature survey issued weekly. Annual subscription: Domestic, $25.00; Foreign, $30.00.

LIQUEFIED NATURAL GAS. A literature survey issued quarterly. Annual subscription: $20.00.

SUPERCONDUCTING DEVICES AND MATERIALS. A literature survey issued quarterly. Annual subscription: $30.00.

Send subscription orders and remittances for the preceding bibliographic services to the National Bureau of Standards, Cryogenic Data Center (736.00), Boulder, CO 80303.

1.7. PAPERS PUBLISHED BY OTHERS

Many significant contributions by NBS authors are published in other journals. Up-to-date listings of these articles are carried regularly in the Journal of Research and the annual publications catalog (NBS SP305), along with abstracts, key words, and author/subject indexes. Except for the author index, the complete citations for years 1966–1976 have been reprinted in this two-volume catalog.

2. PURCHASE PROCEDURES AND DOCUMENT AVAILABILITY

2.1. PURCHASE PROCEDURES

Many recent publications of the Bureau are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, at the prices listed in this publication. However prices are subject to change without notice. You may also order through the U.S. Department of Commerce Field Office nearest you. Microfiche copies of all recent NBS publications, and paper copies of many non-periodicals, may be ordered through the National Technical Information Service, U.S. Department of Commerce, Springfield, VA 22161. Note that three of the non-periodical

series are available only from NTIS; these are FIPS PUBS., NBS Interagency Reports (NBSIR's), and Grantee/Contractor Reports (GCR's). This section includes current price lists of available publications, plus instructions on how to acquire reprints of articles by NBS authors, and how to get out-of-print material.

How To Make Remittances. Remittances for publications for which individual sales or subscription prices are shown should be mailed to Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, by postal money order, express money order, or check. Postage stamps will not be accepted. Publications cannot be mailed before remittances are received. *Foreign remittances should be made either by international money order, draft on an American bank or UNESCO coupons.*

The letter symbol, publication number, full title of the publication, SD catalog or SD stock number MUST be given when ordering. The Superintendent of Documents allows a discount of 25 percent on orders of 100 or more copies of one publication.

Persons who make frequent purchases from the Superintendent of Documents may find a deposit account convenient. Deposits of $50 or more are accepted against which orders may be placed without making individual remittances or first obtaining quotations. Order blanks are furnished for this purpose. After the order has been processed, the order itself is returned, showing the publications supplied, explanations regarding those not sent, the amount of charge, and the balance on deposit.

No charge is made for postage on documents sent to points in the United States and its possessions. In computing foreign postage, the charge is approximately one-fourth of the current selling price of the publication. The charge is to cover the special handling required to comply with the customs and international mailing regulations.

How To Make Remittances to NTIS. Orders for publications purchased from the National Technical Information Service (NTIS) must be accompanied by postal money order, express money order, or check made out to the NTIS and covering total cost of the publications order. All inquiries or orders should be addressed to: National Technical Information Service, Springfield, VA 22161.

2.2. ANNOUNCEMENT OF NBS PUBLICATIONS

The National Bureau of Standards and the agencies mentioned below regularly issue the following official announcements dealing with NBS publications.

DIMENSIONS/NBS. Issued monthly by the National Bureau of Standards. In addition to publishing technical news of the Bureau, this periodical announces selected new publications in an NBS series. Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Annual subscription, $11.00; $13.75 foreign. Single copies, $1.10 domestic; $1.40 foreign each.

NBS JOURNAL OF RESEARCH. The Journal carries a listing of all NBS publications as issued. See Section 2.6 for subscription information.

Monthly Catalog of United States Government Publications. Issued monthly by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Annual subscription, with consolidated annual index, $45.00; $56.00 foreign.

Selected List of U.S. Government Publications. Issued monthly by the Superintendent of Documents. Each list is arranged by subject, with annotations, prices, and order form. May be obtained free from the U.S. Government Printing Office, Superintendent of Documents, Mail List Section, Stop SSOM, Washington, DC 20402.

Business Service Check List. Bi-weekly announcement of publications of the Department of Commerce. Lists titles and prices of National Bureau of Standards publications, as well as those of other offices of the Department of Commerce. Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Annual subscription, $9.00; $11.25 foreign.

NBS Publications Newsletter. This newsletter is issued approximately six times a year.

It presents full citations, including abstracts and availability information, for NBS papers announced during the report period. Its primary audience includes librarians, documentalists and science information specialists. However, other NBS audiences also find it useful as a guide to new NBS publications.

Contact: Editor, NBS Publications Newsletter, Technical Information and Publications Division, National Bureau of Standards, Washington, DC 20234.

2.3. CATALOGS OF NBS PUBLICATIONS

The following constitute a complete list of the titles of the Bureau's publications through December 31, 1977. The catalogs are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, unless otherwise stated, or may be consulted in a library which maintains sets of National Bureau of Standards publications. Note that all citations in NBS SP305 and its Supplements 1 through 8 are accumulated into this two-volume catalog.

Circular 460: Publications of the National Bureau of Standards 1901 to June 30, 1947. 375 pages including subject and author indexes. Brief abstracts are included for the period January 1, 1941 to June 30, 1947 ..... *

Supplement to Circular 460: Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957. 373 pages, including subject and author indexes ..... *

Miscellaneous Publication 240: Publications of the National Bureau of Standards, July 1, 1957 to June 30, 1960. First NBS Catalog to include Titles of Papers Published in Outside Journals 1950 to 1959. 391 pages, including subject and author indexes ..... *

Supplement to Miscellaneous Publication 240: Publications of the National Bureau of Standards published by NBS, July 1960 through June 1966; published by others, 1960 through 1965. 740 pages, including subject and author indexes *

Special Publication 305: Publications of the National Bureau of Standards, published by NBS, July 1966 through December 1967; published by others, 1966–1967. 223 pages, a citation of titles and abstracts, with key words and author indexes ..... *

Supplement 1 to Special Publication 305: Publications of the National Bureau of Standards, 1968 through 1969. 497 pages, a citation of titles and abstracts, with key words and author indexes ..... *

Supplement 2 to Special Publication 305: Publications of the National Bureau of Standards, 1970. 378 pages, a citation of titles and abstracts, with key words and author indexes ..... *

Supplement 3 to Special Publication 305: Publications of the National Bureau of Standards, 1971. 342 pages, a citation of titles and abstracts, with key words and author indexes ..... *

Supplement 4 to Special Publication 305: Publications of the National Bureau of Standards, 1972. 449 pages, a citation of titles and abstracts, with key words and author indexes $4.20

Supplement 5 to Special Publication 305: Publications of the National Bureau of Standards, 1973. 349 pages, a citation of titles and abstracts, with key words and author indexes $4.15

Supplement 6 to Special Publication 305: Publications of the National Bureau of Standards, 1974. 523 pages, a citation of titles and abstracts, with key words and author indexes $6.80

Supplement 7 to Special Publication 305: Publications of the National Bureau of Standards, 1975. 595 pages, a citation of titles and abstracts, with key words and author indexes $7.55

Supplement 8 to Special Publication 305: Publications of the National Bureau of Standards, 1976. 728 pages, a citation of titles and abstracts, with key words and author indexes $8.25

Supplement 9 to Special Publication 305: Publications of the National Bureau of Standards, 1977. 601 pages, a citation of titles and abstracts, with key words and author indexes $8.00

* Available by purchase from the National Technical Information Service, Springfield, VA 22161.

2.4. FUNCTIONS OF DEPOSITORY LIBRARIES IN THE UNITED STATES

The Superintendent of Documents, United States Government Printing Office, is authorized by law to furnish Government publications to designated depository libraries.

Under provisions of Title 44 of the United States Code, certain libraries are designated depositories for Government publications. Through them, Federal Government documents are made available to residents of every State, District of Columbia, Guam, Puerto Rico, and the Virgin Islands. Distribution to the libraries is made by the Office of the Superintendent of Documents.

It is sometimes impossible to obtain desired publications by purchase from the Superintendent of Documents. Stocks may have been exhausted or the document may be permanently out of print. In these instances the depositories render an invaluable service by keeping such publications permanently available. Every Government publication cannot be consulted at all depository libraries. Designated Regional Depositories are required to receive

and retain one copy of all Government publications made available to depository libraries either in printed or microfacsimile form. All other libraries are allowed to select the classes of publications best suited to the interest of their particular clientele.

These libraries are now receiving selected publication series of the National Bureau of Standards for general reference use. Whether a given library has a copy of a particular publication can be determined by inquiring at the library.

2.5. FUNCTIONS OF U.S. DEPARTMENT OF COMMERCE DISTRICT OFFICES

Department of Commerce District Offices provide ready access, at the local level, to the services of the Department of Commerce as well as to its reports, publications, statistical statements, and surveys. Each District Office serves as an official sales agent of the Superintendent of Documents, U.S. Government Printing Office, making available for purchase locally a wide range of Government publications. The reference library maintained by each District Office contains many Government and private publications, periodicals, directories, reports, and other reference materials.

2.6. AVAILABILITY OF NBS PUBLICATIONS

A. PERIODICAL SUBSCRIPTION RATES

Periodical	Domestic [1]	Foreign [2]
Journal of Research of the National Bureau of Standards: Effective July 1977 issued bimonthly as single section. Separate Sections A and B discontinued with the June 1977 issues. Paper covers....	$17.00	$21.25
Bound volume (1 volume per year), blue buckram	[3]	[3]
DIMENSIONS/NBS, issued 10 times per year	$11.00	$13.75

NOTE—Send order, with remittance, to Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

[1] United States and its possssions.

[2] Foreign price incudes the cost of the publication and postage.

[3] Prices of the bound volumes vary. The Superintendent of Documents will furnish prices on request.

B. SUPERSEDED NBS REFERENCE PUBLICATIONS

Those NBS publications not listed in the Price Lists are out of print and are not available from the Superintendent of Documents. Many can be consulted at libraries. Also, in many cases, photoduplicated copies can be purchased from the Library of Congress. For full information concerning this service, write to the Photoduplication Service, Library of Congress, Washington, DC 20540.

Certain NBS publications are out of print because they have been replaced, or partially replaced, by material issued by other organizations. In this connection NBS is able to offer the following information:

Circular 410, National Standard Petroleum Oil Tables. Information in this Circular has been incorporated in the ASTM–IP Petroleum Measurement Tables issued as D1250 by the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103. Available at $12.75, 20% off to ASTM members. Tables 5 and 7 of the ASTM–IP Tables may also be purchased from the ASTM in separate reprint form at $2.25 and $2.00 per copy respectively. *Circular 438, Static Electricity.* The National Fire Protection Association, 60 Batterymarch Street, Boston, MA 02110, has issued a publication by the same title, available from them as NFPA Publication 77, at $3.00.

Circular 499, Nuclear Data. Replaced by Atomic and Nuclear Data Tables, published by Academic Press, 111 Fifth Avenue, New York, NY 10003. Available by subscription for $108.00 per year.

Circular 564, Tables of Thermal Properties of Gases. A reprinted edition is available from University Microfilms, Inc., Ann Arbor, MI 48106. Order as OP 12,192 for $56.80. Microfiche of this Circular is available from Cryogenic Data Center, National Bureau of Standards, Boulder, CO 80302.

Circular 576, Automotive Antifreezes. For information on this subject consult American National Standards Institute, 1430 Broadway, New York, NY 10018.

Circular 577 and Supplement, Energy Loss and Range of Electrons and Positrons. These have been superseded by NASA Special Publication

3012, available from the National Technical Information Service, Springfield, VA 22161, at $6.75 hardcopy and $3.00 microfiche number N65–12506.

Miscellaneous Publication 179, American Standard Building Code Requirements for Minimum Design Loads in Buildings and Other Structures. The American National Standards Institute, 1430 Broadway, New York, NY 10018, has issued a publication on this subject. Available from them as A58.1–1969–1972, at $7.50.

Miscellaneous Publication 187, Directory of Commercial and College Laboratories. A new Directory of Testing Laboratories issued as 333D is published by the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103, at $3.75.

Miscellaneous Publication 211, American Standards Building Code Requirements for Masonry. The American National Standards Institute, 1430 Broadway, New York, NY 10018, has issued a publication on this subject. Available from them as A41.1–1953–R1970, at $4.50.

NBS Handbook 28, Part 1, 2, and 3, Screw Thread Standards. Responsibility for screw thread standards for Federal Government has been transferred to General Services Administration (GSA). Standards will be promulgated as Federal Standard 28 by GSA. Technical Questions should be addressed to Mr. John McGlone, Directorate of Engineering and Standardization, Defense Logistics Agency (DISC), 700 Robbins Ave., Philadelphia, PA 19111, telephone (215) 697–4349. Questions regarding administration of the program should be addressed to Mr. Grant Beattie, Standards Control and Support Division, General Services Administration (Federal Supply Service), attn: FMHS, Washington, DC 20406, telephone (703) 557–0506.

Handbook 30, National Electrical Safety Code (also H81 and its Supplements and H110–1). All NBS publications on this subject have been superseded by National Electrical Safety Code, 1977 Edition, issued by the American National Standards Institute, 1430 Broadway, New York, NY 10018. Available from them as ANSI C2, at $6.50.

Handbook 46, Code for Protection Against Lightning. A United States of America Standards Institute Code for Protection Against Lightning (NFPA–78–1969) is available from the American National Standards Institute, 1430 Broadway, New York, NY 10018, at $4.25, as C5.1–1969–1975.

Handbook 48, Control and Removal of Radioactive Contamination in Laboratories. Reprints of this Handbook can be purchased as NCRP Report at $3.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 49, Recommendations for Waste Disposal of Phosphorus–32 and Iodine–131 for Medical Users. Reprints of this Handbook can be purchased as NCRP Report 9 at $3.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 53, Recommendations for the Disposal of Carbon–14 Wastes. Reprints of this Handbook can be purchased as NCRP Report 12 at $3.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 55, Protection Against Betatron-Synchrotron Radiations up to 100 Million Electron Volts. February 26, 1954 has been combined with NBS Handbook 97. Available as NCRP Report 51, Radiation Protection Design Guidelines for 0.1–100 MeV Particle Accelerator Facilities from NCRP Publications, Post Office Box 30175, Washington, DC 20014 at $6.00.

Handbook 58, Radioactive Waste Disposal in the Ocean. Reprints of this Handbook can be purchased as NCRP Report 16 at $3.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 59, Permissible Dose from External Sources of Ionizing Radiations. Reprints of this Handbook can be purchased as NCRP Report 39 at $5.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 63, Protection Against Neutron Radiation up to 30 MeV. Reprints of this Hand-

book can be purchased as NCRP Report 38 at $6.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 65, Safe Handling of Bodies Containing Radioactive Isotopes. Reprints of this Handbook can be purchased as NCRP Report 37 at $4.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 69, Maximum Permissible Body Burdens and Maximum Permissible Concentrations of Radionuclides in Air and in Water for Occupational Exposure. Reprints of this Handbook can be purchased at $3.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 71, Specifications for Dry Cells and Batteries. Available as C18.1–1972 from the American National Standards Institute, 1430 Broadway, New York, NY 10018, at $6.25.

Handbook 73, Protection Against Radiations from Sealed Gamma Sources (Supersedes H54). Reprints of this Handbook can be purchased as NCRP Report 40 at $5.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 74, Building Code Requirements for Reinforced Masonry. The American National Standards Institute, 1430 Broadway, New York, NY 10018 has issued a publication on this subject. Available from them as A41.2–1960 (R1970), at $3.25.

Handbook 75, Measurement of Absorbed Dose of Neutrons and of Mixtures of Neutrons and Gamma Rays. Reprints of this Handbook can be purchased as NCRP Report 25 at $3.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 76, Medical X-ray Protection Up to Three Million Volts. Now available as NCRP 33. Purchase from NCRP Publications, Post Office Box 30175, Washington, DC 20014 at $4.00.

Handbook 80, A Manual of Radioactivity Procedures. Reprints of this Handbook will be available as NCRP Report 58 (in press). For more information write to NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 81 and Its Supplements, Safety Rules for the Installation and Maintenance of Electric Supply and Communication Lines (also H30 and H110–1). All NBS publications on this subject have been superseded by National Electrical Safety Code, 1977 Edition, issued by the American National Standards Institute, 1430 Broadway, New York, NY 10018. Available from them as ANSI C2, at $6.50.

Handbook 84, Radiation Quantities and Units. Reprints of this Handbook can be purchased as ICRU Report 19 at $5.00 per copy from ICRU Publications, Post Office Box 30165, Washington, DC 20014.

Handbook 89, Methods of Evaluating Radiological Equipment and Materials. Reprints of this Handbook can be purchased as ICRU Report 10F at $2.50 per copy from ICRU Publications, Post Office Box 30165, Washington, DC 20014.

Handbook 96, Inspection of Processed Photographic Record Films for Aging Blemishes. Reprints of this Handbook can be purchased as PH 1.28–1973 at $4.00 per copy from the American National Standards Institute, 1430 Broadway, New York, NY 10018.

Handbook 97, Shielding for High-Energy Electron Accelerator Installations. July 1, 1964 has been combined with NBS Handbook 55. Available as NCRP Report 51, Radiation Protection Design Guidelines for 0.1–100 MeV Particle Accelerator Facilities from NCRP Publications, Post Office Box 30175, Washington, DC 20014 at $6.00.

Handbook 102, ASTM Metric Practice Guide. Available as Z 210.1–1976 from the American National Standards Institute, 1430 Broadway, New York, NY 10018 at $4.00.

Handbook 110–1, National Electrical Safety Code. Part 1. Rules for Installation and Maintenance of Electric Supply and Communication Lines (also H30 and H81 and its Supplements). All NBS publications on this subject have been

superseded by National Electrical Safety Code, 1977 Edition, issued by the American National Standards Institute, 1430 Broadway, New York, NY 10018. Available from them as ANSI C2, at $6.50.

Technical Note 938, Recommended Practice for the Use of Metric (SI) Units in Building Design and Construction, has been superseded by ASTM E 621–78, Standard Practice of the Use of Metric (SI) Units in Building Design and Construction. It is available from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103. Price $5.00.

C. STATUS OF PUBLICATIONS CITED IN THIS DOCUMENT

The following list provides the current status of NBS-issued publications cited in this 11-year compilation, including those that have been superseded and those that are still in print at the Government Printing Office (GPO) or the National Technical Information Service (NTIS). NBS publications still available from the Superintendent of Documents, GPO, carry prices effective as of the date of this publication; but these prices are subject to change without notice. Publications shown as available from NTIS are represented by the NTIS price schedule in effect at the time of purchase. NTIS prices as of this date are given below. Again, prices are subject to change.

Publications not listed are out of print; the abstracts have been included in this catalog for information purposes. Your nearest regional depository library may still have copies of these items. (See Section 2.4.)

NTIS PRICE SCHEDULE

Customers in Canada, U.S., and Mexico please use this price schedule; other addressees write for Folder PR-360-4.

3. TITLES AND ABSTRACTS OF NBS PUBLICATIONS

3.1. PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 70A, JULY–DECEMBER 1966

July-August 1966

Elastic constants of synthetic single crystal corundum, W. E. Tefft, *J. Res. NBS* **70A**4-403, pp. 277-280 (July-Aug. 1966).

Key words: Aluminum oxide; corundum; elastic constants; shear modulus; Young's modulus.

The elastic constants of synthetic single crystal corundum (aluminum oxide) were calculated from 0 to 900 °K from data obtained by a resonance technique from 80 to 900 °K.

Phase equilibria as related to crystal structure in the system niobium pentoxide-tungsten trioxide, R. S. Roth and J. L. Waring, *J. Res. NBS* **70A**4-404, pp. 281-303 (July-Aug. 1966).

Key words: Crystal structure; niobium pentoxide; phase equilibria; system; tungsten trioxide.

The phase equilibrium diagram for the binary system niobium pentoxide-tungsten trioxide has been constructed from results of x-ray diffraction studies on both single crystals and powders and from fusion characteristics. Twelve stable compounds have been found in the system. The exact composition of eight of these compounds has been established by single crystal analyses at the Nb_2O_5:WO_3 ratios of 6:1, 13:4, 7:3, 8:5, 9:8, 1:1, 4:9, and 2:7. The approximate compositions of the remaining four other phases are 30:1, 6:11, 1:11, and 1:15. The 6:1, "6:11", 4:9, and 2:7 phases melt congruently at 1476, 1378, 1380, and 1357 °C, respectively. The "30:1", 7:3, 8:5, 9:8, "1:11", and "1:15" phases melt incongruently at 1470, 1440, 1385, 1375, 1356, and 1358 °C, respectively; and the 13:4 and 1:1 phases decompose before melting at 1435 and 1115 °C, respectively. The 8:5, 9:8, "6:11", 2:7, "1:11", and "1:15" compounds are shown on the phase diagram as having minimum temperatures of stability. One metastable phase having a narrow range of composition near the 3:8 ratio was also encountered. Although Nb_2O_5 apparently exhibits no solid solution, WO_3 was found to accept a maximum of three mole percent niobia in solid solution enabling all the reported polymorphs of WO_3 to be obtained at room temperature.

Properties of aqueous mixtures of pure salts. Thermodynamics of the ternary system: Water-calcium chloride-magnesium chloride at 25 °C, R. A. Robinson and V. E. Bower, *J. Res. NBS* **70A**4-405, pp. 305-311 (July-Aug. 1966).

Key words: Isopiestic measurements; vapor pressure; calcium chloride; mixed solutions; activity coefficients.

Isopiestic vapor pressure measurements have been made on the system water-calcium chloride-magnesium chloride at 25 °C. Activity coefficients have been evaluated for each salt in the presence of the other in systems of constant total ionic strength. The excess free energy of mixing has been calculated and compared with the values for analogous systems.

Properties of aqueous mixtures of pure salts. Thermodynamics of the ternary system: Water-sodium chloride-calcium chloride at 25 °C, R. A. Robinson and V. E. Bower, *J. Res. NBS* **70A**4-406, pp. 313-318 (July-Aug. 1966).

Key words: Calcium chloride; isopiestic measurements; mixed salt solutions; sodium chloride; vapor pressure of aqueous solutions.

Isopiestic vapor pressure measurements have been made to determine some thermodynamic properties of the system: water-sodium chloride-calcium chloride at 25 °C. Equations are derived for the activity coefficient of each salt in the presence of the other when the total ionic strength is kept constant. The limiting conditions in very dilute solutions are considered and "trace" activity coefficients calculated. A comparison with previous work is made. The excess free energy of mixing is calculated.

Use of the consistency check in the vector verification method, A. D. Mighell and R. A. Jacobson, *J. Res. NBS* **70A**4-407, pp. 319-321 (July-Aug. 1966).

Key words: Crystal; structure; Patterson; vector; symmetry; consistency; frequency; superposition.

The consistency check is a type of frequency check in which full use is made of the space group symmetry. It is designed for application to a symmetry map, to a tentative atom map, to the results of superpositions, or to any pseudoelectron-density map. Like the frequency check, its purpose is to aid in the analysis of one of the above maps by assigning a relative weight (relative weight equals the number of other peaks that the given peak is consistent with) to the peaks in these maps. To determine the relative weight, each peak in the map is compared with each of the others to see if it is consistent. Two peaks are considered consistent with each other, if and only if, the set of unique vectors between the two is present in the Patterson map. The method is equivalent to doing a full set of symmetry superpositions at each peak in a symmetry map or a tentative atom map; counting the number of points in the resulting map; and outputting this number at the initial peak position. No assumptions other than that for space group symmetry are required to apply the consistency check to a symmetry map. The resulting map, which has been calculated in a routine fashion directly from the Patterson map, may then be conveniently used as the starting point for the structure analysis of an unknown compound.

Self-reversal in the spectral lines of uranium, D. D. Laun, *J. Res. NBS* **70A**4-408, pp. 323-324 (July-Aug. 1966).

Key words: Uranium, spectrum; spectrum, uranium; self-reversal; uranium spectrum.

In 1946, spectrum analysis indicated that the outer-electron configuration of normal uranium atoms was $5f^36d^17s^2$, with an energy level designated $^5L^\circ_6$ representing the normal state. Now that conclusion is experimentally verified by the observation of self-reversed lines in uranium spectra emitted by a high-current pulsed arc between metallic electrodes. Fifty-four reversed lines were observed; thirty-eight involve the normal state and sixteen are distributed among four low metastable states of the same configuration.

Oscillator strengths for ultraviolet lines of Fe I, C. H. Corliss and B. Warner, *J. Res. NBS* **70A**4-409, pp. 325-371 (July-Aug. 1966).

Key words: Atomic spectra; iron; oscillator strengths; transition probability; ultraviolet lines of Fe I.

Relative intensities and oscillator strengths for 2000 ultraviolet lines of Fe I from several investigations between 2080 and 4150 Å have been critically discussed and adjusted to a uniform absolute scale. New values for many lines not measured heretofore are reported.

September-October 1966

Orientation of calcium molybdate ($CaMoO_4$) and other single crystals having the scheelite structure, E. N. Farabaugh, H. S. Peiser, and J. B. Wachtman, Jr., *J. Res. NBS* **70A**5-410, pp. 379-384 (Sept.-Oct. 1966).

Key words: Calcium molybdate; crystal orientation; crystallographic groups; interplanar angles; physical properties; scheelite structure; single crystal; x-ray back-reflection.

Values of interplanar angles useful in distinguishing the [100] from the [110] direction in $CaMoO_4$ are given to facilitate orientation by analysis of back-reflection Laue patterns. The distinction between the [001] and [001] directions in the scheelite structure is discussed and examples of physical properties dependent upon this distinction are given. The [001] direction is defined in terms of the crystal structure and a procedure for identifying (001) using Laue patterns is described. The same distinction applies to certain nonpolar directions of all crystals belonging to the following nonenantiomorphous point groups: $\bar{1}$, m, 2/m, mmm, $\bar{3}$, 3m, $\bar{3}$m, $\bar{4}$, 4/m, 4/mmm, $\bar{6}$, 6/m, 6/mmm, m3, and m3m.

Crystal structure of $BaGe[Ge_3O_9]$ and its relation to benitoite, C. Robbins, A. Perloff, and S. Block, *J. Res. NBS* **70A**5-411, pp. 385-391 (Sept.-Oct. 1966).

Key words: Barium tetragermanate; structure; benitoite; crystal; x-ray.

$BaGe[Ge_3O_9]$ is trigonal space group P3 with lattice constants $a=11.61$, $c=4.74$ Å, and $Z=3$. The structure was established by three-dimensional Patterson and electron density syntheses. Three-dimensional least-squares refinement resulted in a final R value of 6.8 percent (observed data only).

The previously proposed structural relationship of this compound with benitoite, $BaTiSi_3O_9$, has been confirmed. The structure can be considered as composed of Ge_3O_9 rings, in which the Ge is tetrahedrally coordinated, linked through octahedrally coordinated Ge atoms to form a three-dimensional Ge-O network. All Ge polyhedra are linked by corner sharing. The Ba ions occupy positions in channels of the network.

A rotating cylinder method for measuring normal spectral emittance of ceramic oxide specimens from 1200 to 1600 °K, H. E. Clark and D. G. Moore, *J. Res. NBS* **70A**5-412, pp. 393-415 (Sept.-Oct. 1966).

Key words: Alumina; ceramic oxides; emittance; error sources; magnesia; measurement uncertainties; spectral emittance; thermal radiation; thoria; zirconia.

Equipment was designed and constructed for measuring the spectral emittance of polycrystalline ceramic oxide specimens in the wavelength region 1 to 15 μ and at temperatures of 1200, 1400, and 1600 °K. Specimens consisted of small hollow cylinders that were rotated at 100 rpm in a furnace cavity equipped with a water-cooled viewing port. Emittances were determined by comparing the radiance of the specimen to that of a blackbody at the same temperature.

A series of six measurements (two measurements each on three specimens) was made on commercially pure specimens of alumina, thoria, magnesia, and zirconia. All four materials showed similar behavior in that the emittances were low in the shorter wavelength regions and high at the longer wavelengths. The temperature coefficients of spectral emittance were positive for all four materials, but varied with the material; those for thoria were appreciably higher than the other three. In all cases coefficients were greater at short wavelengths than at long.

Error sources were investigated, and the measurement uncertainties associated with each source were evaluated. It was concluded that at 1200 °K the true values of emittance at 2 μ for the particular specimens measured might be as much as 0.032 lower or 0.012 higher than the reported values. The data were in good agreement with reflectance measurements of the same material and with recently reported absorption coefficients.

Electron absorption spectrum of cobalt(II)-doped trisphenanthrolinezinc nitrate dihydrate, C.W. Reimann, *J. Res. NBS* **70A**5-413, pp. 417-419 (Sept.-Oct. 1966).

Key words: Trisphenanthroline cobalt(II) nitrate dihydrate; trisphenanthrolinezinc nitrate dihydrate; electron absorption spectrum.

The electron absorption spectrum of cobalt(II)-doped trisphenanthrolinezinc nitrate dihydrate has been observed at room temperature and at 77 °K. Broad bands appear at 10,750 and 22,000 cm^{-1} which are assigned to the $^4T_{1g}(F) \leftarrow\rightarrow {}^4T_{2g}(F)$ and the $^4T_{1g}(F) \leftarrow\rightarrow {}^4T_{1g}(P)$ transitions respectively. A broad weak band occurs near 19,000 cm^{-1} but at 77 °K this band is resolved into a series of narrower bands. These bands are assigned to ^2G transitions. The relationship between the spectrum of cobalt(II) trisphenanthrolinezinc nitrate dihydrate and the solution spectra of cobalt(II) in ammonia and ethylenediamine is discussed.

Procedures for homogeneous anionic polymerization, L. J. Fetters, *J. Res. NBS* **70A**5-414, pp. 421-433 (Sept.-Oct. 1966).

Key words: Homogeneous anionic polymerization; monodisperse, polystyrene, poly-α-methylstyrene; polyisoprene; and polybutadiene.

This report is a review of the procedures and equipment used in the preparation of polymers of predictable molecular weights and narrow molecular weight distributions. The monomers considered in detail are sytrene, α-methylstyrene, isoprene, and butadiene.

The configurations $4d^n+4d^{n-1}$ 5*s* in doubly-ionized atoms of the palladium group, Y. Shadmi, *J. Res. NBS* **70A**5-415, pp. 435-445 (Sept.-Oct. 1966).

Key words: Configurations $4d^n+4d^{n-1}$ 5*s*, energy levels interaction parameters; palladium group; theoretical; third spectra.

Four hundred and eighty-three energy levels belonging to the low even configurations of the third spectra of the palladium group are predicted by the use of interpolation formulas for the interaction parameters.

November-December 1966

Absolute isotopic abundance ratios and atomic weight of magnesium, E. J. Catanzaro, T. J. Murphy, E. L. Garner, and W. R. Shields, *J. Res. NBS* **70A**6-416, pp. 453-458 (Nov.-Dec. 1966).

Key words: Absolute ratios; atomic weight; isotopic abundances; magnesium.

Absolute values have been obtained for the isotopic abundance ratios of magnesium, using surface emission mass spectrometry. Samples of known isotopic composition, prepared from nearly pure separated magnesium isotopes, were used to calibrate the mass spectrometers. The resulting absolute values

are $^{25}Mg/^{24}Mg = 0.12663 \pm 0.00013$ and $^{26}Mg/^{24}Mg = 0.13932 \pm 0.00026$, yielding an atomic weight ($^{12}C = 12$) of 24.30497 ±0.00044. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the mean and allowances for effects of known sources of possible systematic error.

Mass spectrometric study of photoionization, V. Water and ammonia, V. H. Dibeler, J. A. Walker, and H. M. Rosenstock, *J. Res. NBS* **70A**6-417, pp. 459-463 (Nov.-Dec. 1966).

Key words: Autoionization; electronic; excited states; H_2O^+; NH_3^+; NH_2^+; OH^+ ions; heats of formation; ionization thresholds; mass spectrometer; photoionization; radicals; Rydberg levels; vacuum monochromators.

Photoionization efficiency curves are obtained for the molecule and fragment ions of H_2O and NH_3 in the wavelength region extending from onset of ionization to 600 A. Threshold values of 12.593eV and 10.162eV are observed for the H_2O^+ and NH_3^+ ions, respectively. Vibrationally excited states of the molecule ions and autoionization of Rydberg levels are observed. A determination of the bond angle of the H_2O^+ ion from the Franck-Condon factors of the bending overtones results in a value of 112 degrees. Threshold values of the fragment ions permit calculations of heats of formation of the OH^+ and NH_2^+ ions and result in the ionization energies, I(OH)=12.94eV and I(NH_2)=11.22eV.

Interpretation of the third spectrum of gold (Au III), L. Iglesias, *J. Res. NBS* **70A**6-418, pp. 465-466 (Nov.-Dec. 1966).

Key words: Corrections to analysis of Au III; gold; spectrum of Au III; third spectrum.

A revision of the analysis of the Au III spectrum is presented. Of 9 energy levels considered doubtful on the basis of a recent theoretical treatment, 6 are found to be real and 3 have been rejected as incorrect. Three new energy levels have also been found in agreement with theoretical predictions.

A formal solution for slit corrections in small-angle x-ray scattering, J. Mazur and A. M. Wims, *J. Res. NBS* **70A**6-419, pp. 467-471 (Nov.-Dec. 1966).

Key words: Distribution of intensity; integral equation; scattering cross section; slit correction; small-angle x-ray scattering.

Slit shaped apertures are usually used in small-angle x-ray scattering measurements in order to obtain easily measured intensities of scattered radiation. As a result, the scattering intensity at a given angle determined by the camera, the center of the sample, and the central incident x-ray beam is not simply related to the scattering from the sample only at that angle. The experimentally determined intensities $\mathbf{I}(x)$ are related to the true scattering intensities by the following integral equation:

$$\tilde{I}(x) = \int_{-\infty}^{\infty} I[(x^2 + t^2)^{1/2}] W(t) dt.$$

This integral equation has been previously solved only for certain simplified functional forms for $W(t)$ and $\mathbf{I}(x)$. In this paper, a formal procedure is developed for calculating $I(x)$ from the observed angular measurements, which does not necessitate making any a priori assumption about the form of $W(t)$ and $\mathbf{I}(x)$.

High-temperature reactions of hexafluorobenzene, J. M. Antonucci and L. A. Wall, *J. Res. NBS* **70A**6-420, pp. 473-480 (Nov.-Dec. 1966).

Key words: Direct replacement; high temperature; mechanisms; nonionic or ionic coreactants; nuclear fluorine; pentafluorohalobenzenes.

The direct replacement of aromatic fluorine in hexafluorobenzene has hitherto been possible only by the use of nucleophilic reagents. In this investigation, the replacement of nuclear fluorine by nonnucleophilic, or weakly nucleophilic, reagents was achieved by reaction at relatively high temperatures, 300 to 850 °C. For example, the reaction of hexafluorobenzene with such reagents as bromine, chlorine, and tetrafluoroethylene gave as major products bromopentafluorobenezene, chloropentafluorobenzene, and octafluorotoluene. In addition, pentafluorohalobenzenes can also be produced by passage of hexafluorobenzene over the appropriate alkali or alkaline earth-metal halides at elevated temperatures.

The mechanism of the pyrolytic reactions of hexafluorobenzene and the nonionic coreactants are considered to involve free-radical intermediates. The reaction of hexafluorobenzene with the ionic coreactants may proceed by an ionic mechanism similar to that advanced for the usual, relatively low temperature, nucleophilic substitution reactions of aromatic systems. However, a more complicated free radical-ionic process cannot be ruled out for these reactions.

The melting temperatures of the *n*-paraffins and the convergence temperature for polyethylene, M. G. Broadhurst, *J. Res. NBS* **70A**6-421, pp. 481-486 (Nov.-Dec. 1966).

Key words: Convergence temperature; melting temperatures; methyl surfaces; *n*-paraffins; polyethylene; thermodynamic properties.

The extrapolation of the melting points, T_m, of the *n*-paraffins to large chain lengths ($n \rightarrow \infty$) is reexamined in order to resolve the differences in the proposed values of the convergence temperature $T_0 = \lim_{n \rightarrow \infty} T_m$. Experimental liquid entropies can be made consistent with a term, $R \ln n$, proposed by Flory and Vrij. This term effectively replaces the well-known expression $T_m = T_0(n+a)/(n+b)$ with an expression $T_m = T_0(n+a)/(n+\ln n+b)$; thus, slowing the convergence rate and increasing T_0 from 141.1 °C to 144.7 °C. Independent estimates of the parameters in the melting relationship were obtained from thermodynamic data and the least squares estimate of T_0=144.7 °C (calculated from 33 melting points with a standard deviation of T_m=0.3 °C) could not be altered by more than ±0.5 °C by any reasonable variation of the parameters. A simplified melting expression is obtained for polyethylene which includes both the chain end and fold surface energies, and it is shown that chain end effects partly account for the discrepancy between the 144.7 °C convergence temperature and experimental melting temperatures (~139 °C) of extended chain polyethylene crystals.

General treatment of the thermogravimetry of polymers, J. H. Flynn and L. A. Wall, *J. Res. NBS* **70A**6-422, pp. 487-523 (Nov.-Dec. 1966).

Key words: Degradation; nonisothermal kinetics; polymers; pyrolysis; thermal decomposition; thermogravimetry; thermolysis; stability of polymers.

Theoretical equations are developed for typical decompositions of polymers including those in which the volatilization does not follow a simple "reaction order" and those made up of a composite of several reactions of differing energies of activation. The effects of order, activation energy, heating rate and temperature dependence upon the calculated thermograms is illustrated. The literature on thermogravimetric kinetics is critically reviewed and coalesced into a logical and coherent development stressing the interrelation of methods and employing a consistent system of notation. As a result, a number of improved methods and new methods for the analysis of kinetic data applicable to the complex systems mentioned above are developed. It is concluded that methods involving a variable rate of heating or involving several thermogravimetric traces at

different rates of heating are capable of establishing the uniqueness of kinetic parameters. A new method of determining initial parameters from rate-conversion data is developed. A novel concept is employed of programming reaction variables (in this case, the heating rate) in a manner which greatly simplifies the mathematics of the kinetic system and which shows promise of a wide range of applicability in the area of rate processes.

Viscoelastic behavior under large deformations, L. J. Zapas, *J. Res. NBS* **70A**6-423, pp. 525-532 (Nov.-Dec. 1966).

Key words: BKZ theory; constant rate of strain; creep; elastic fluid; nonlinear behavior; polyisobutylene; recovery; stress; relaxation.

The BKZ elastic fluid theory is used to correlate experimental results obtained in biaxial strain and steady simple shear. With a heuristic potential function involving three material properties, excellent agreement is obtained between theory and experiment. In the special case where one of the material properties is dominant, the behavior in steady simple shear is calculated from dynamic measurements in the infinitesimal range and is compared with actual data.

Statistical aspects of second and third law heats, W. S. Horton, *J. Res. NBS* **70A**6-424, pp. 533-539, (Nov.-Dec. 1966).

Key words: Bias of least squares estimators; coefficient of variation; correlated estimators; enthalpy adjustments; heat of vaporization; high temperature chemistry; overestimation of standard deviation; second law heat; slope estimators; third law heat; vapor pressure.

The effects of random errors and of nonconstant heat of vaporization upon the estimation of the second and third law heats of vaporization are examined. The most important conclusion is that the often noticed marked improvement in precision of the third law heat over that for the second law heat is real and is a natural consequence of the difference between the two estimators. The effects of systematic errors upon the two heats are not investigated here. Other results of interest, but of less importance because of the small magnitude of the effects, include: (1) the two heats are negatively correlated, (2) the second law heat is generally biased, (3) the third law heat is not the minimum variance unbiased estimator of the heat of vaporization, and (4) the standard deviation obtained from least squares fitting consistently overestimates the true standard deviation, but by a negligible amount. Any reversible process for which the equilibrium constant is treated by a similar procedure is governed by the same considerations. The results apply approximately at any temperature although the stimulus for these considerations comes from high temperature chemistry.

Density-temperature formulae for coexisting liquid and vapor and for freezing liquid parahydrogen, R. D. Goodwin, *J. Res. NBS* **70A**6-425, pp. 541-544 (Nov.-Dec. 1966).

Key words: Coexistence densities; freezing liquid densities; hydrogen; melting-line liquid densities; orthobaric densities; parahydrogen; vapor-liquid equilibrium.

A single formula is given for coexistence temperature as a continuous function of the vapor-liquid densities. With six coefficients and seven adjusted exponents, it may conveniently replace the several formulae formerly used in separate regions of the data. Freezing liquid densities are described by a simple power law in temperature, replacing more complicated formulae. Computed results are tabulated and compared with the derived data.

Solubility of $CaHPO_4 \cdot 2H_2O$ and formation of ion pairs in the system $Ca(OH)_2$-H_3PO_4-H_2O at 37.5 °C, E. C. Moreno, T. M. Gregory and W. E. Brown, *J. Res. NBS* **70A**6-426, pp. 545-552 (Nov.-Dec. 1966).

Key words: Solubility of calcium monohydrogen phosphate dihydrate at 37.5 °C; calcium-phosphate ion-pairs; solubility of dicalcium phosphate dihydrate; solubility of dibasic calcium phosphate dihydrate.

The solubility isotherm for $CaHPO_4 \cdot 2H_2O$ (DCPD) in the three-component system $Ca(OH)_2$-H_3PO_4-H_2O was determined in the *p*H range 3.5 to 6.8 by leaching a thermostated column of DCPD with dilute phosphoric acid solutions. In confirmatory experiments, equilibrium was approached both from super- and under-saturation by shaking DCPD with appropriate solutions. The calculated ionic activity product $(Ca^{++}) \times (HPO_4^{=})$, appeared to be a parabolic function of *p*H with a minimum near *p*H 5.0. The *p*H dependence of the ionic product could be accounted for by considering the ion pairs $[CaHPO_4]^\circ$ and $[CaH_2PO_4]^+$ as semi-empirical parameters. Under the condition of saturation with respect to DCPD, the activity of the pair $[CaHPO_4]^\circ$ must be a constant. The activity of the species $[CaH_2PO_4]^+$ was shown to vary directly with hydrogen ion activity. The activities of the two ion pairs were adjusted to give a set of *p*H-independent ionic activity products with a mean of $2.19 \pm 0.11 \times 10^{-7}$. The stability constants for $[CaHPO_4]^\circ$ and $[CaH_2PO_4]^+$ are $5.88 \pm 0.031 \times 10^2$ and 7.49 ± 0.039, respectively. Experiments were conducted to study the hydrolysis of DCPD to more basic calcium phosphates and the kinetics of these transformations is discussed. The significance of the ion pairs in human serum is considered.

Dissociation of some substituted phenols in 50-percent aqueous methanol as solvent, R. A. Robinson and R. G. Bates, *J. Res. NBS* **70A**6-427, pp. 553-556 (Nov.-Dec. 1966).

Key words: Dissociation constant; methanol-water mixtures; solvent effects; substituted phenols.

The dissociation constants of the following substituted phenols in 50 wt percent methanol have been measured at 25 °C: *o*-nitrophenol, *p*-nitrophenol, 4-methyl-2-nitrophenol, 2, 6-dichlorophenol, pentachlorophenol. The respective values found, expressed as *pK* values, are 7.91_7, 7.69_2, 8.28_4, 7.68_0, and 5.27_8. The dissociation constants of 4-methyl-2-nitrophenol and pentachlorophenol, again expressed as *pK* values, have been measured in water as solvent at 25 °C and found to be 7.59_7 and 4.82_0, respectively.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 71A, JANUARY-DECEMBER 1967

January-February 1967

Electric fields produced in cubic crystals by point defects, A. D. Franklin and D. J. Sparks, *J. Res. NBS* **71A**1-428, pp. 1-2 (Jan.-Feb. 1967).

Key words: Electric fields; ionic crystals; lattice sums; point defects; polarization; NaCl; CsCl; CaF_2; ZnS.

Charged point defects in crystals polarize the surrounding ions. These induced dipoles contribute to the electric field in the crystal. In this paper, lattice sums for the calculation of this contribution are given for the NaCl, CsCl, CaF_2, and ZnS structures. Various positions for the defect are chosen, and the field evaluated near lattice sites in the vicinity of the defect, with radial (with respect to the defect) displacements of ±20 percent of the cation-anion distance allowed away from each lattice site. The lattice sums are expressed in power series, including terms up to cubic in the displacements, and the coefficients tabulated.

Heat capacity and thermodynamic properties of beryllium 1:3-aluminate, $BeO \cdot 3Al_2O_3$, from 15 to 390 °K, G. T. Furukawa and W. G. Saba, *J. Res. NBS* **71A**1-429, pp.3-8 (Jan.-Feb. 1967).

Key words: Beryllium 1:3-aluminate; enthalpy; entropy; Gibbs energy; heat capacity; low temperature calorimetry; thermodynamic properties.

The heat capacity of beryllium 1:3-aluminate, $BeO \cdot 3Al_2O_3$, was determined from 15 to 380 °K and the thermodynamic properties calculated from 0 to 390 °K. The entropy at 298.15 °K was found to be 175.55 J deg^{-1} mol^{-1} (41.96 cal deg^{-1} mol^{-1}).

Dissociation constant of *m*-nitrophenol in 50 wt percent methanol-water solvent from 25 to 40 °C and related medium effects, B. J. Steel, R. A. Robinson, and R. G. Bates, *J. Res. NBS* **71A**1-430, pp. 9-12 (Jan.-Feb. 1967).

Key words: Dissociation; electrolytes; methanol; *m*-nitrophenol; nonaqueous solvents; phenols; thermodynamics.

The dissociation constant of *m*-nitrophenol in 50 wt percent methanol-water as solvent has been determined at 25, 30, 35, and 40 °C. A spectrophotometric method was used, together with acidity functions for buffer solutions in 50 percent methanol derived from previous emf measurements. Values of the enthalpy and entropy changes on dissociation of the phenol have been calculated. A comparison with corresponding values for the dissociation of *m*-nitrophenol in aqueous solution affords a measure of the medium effects. The medium effect for *m*-nitrophenol lies intermediate between that for *o*-nitrophenol and that for *p*-nitrophenol.

On the calculation of moments of molecular weight distribution from sedimentation equilibrium data, I. H. Billick, M. Schultz, and G. H. Weiss, *J. Res. NBS* **71A**1-431, pp. 13-17 (Jan.-Feb. 1967).

Key words: Molecular weight average; molecular weight distributions; moments; polydispersity; polynomial representation; sedimentation equilibrium.

In this paper we discuss a technique for calculating moments of polydisperse materials in terms of concentration readings along the cell. The proposed method minimizes dependence on data from the end points where they may be unreliable. An analysis is given of the errors involved in the use of the proposed method when the underlying molecular weight distribution is the Schulz distribution or the lognormal.

The far infrared spectrum of vulcanized natural rubber, J. E. Stewart and F. J. Linnig, *J. Res. NBS* **71A**1-432, pp. 19-23 (Jan.-Feb. 1967).

Key words: Accelerators; far infrared; natural rubber; sulfur; tetramethylthiuram disulfide; vulcanization; zinc dibutyldithiocarbamate; zinc dimethyldithiocarbamate.

Earlier studies of the infrared spectra of rubber and some vulcanizates of rubber have been extended into the 650 to 33 cm^{-1} far infrared region. Some of the absorption bands originating in the crystalline portion of unvulcanized rubber have been studied by using polarized radiation and samples oriented by stretching. Vulcanization of rubber with sulfur alone produces a general weakening of all absorption bands and no new absorptions. Vulcanization with sulfur and an accelerator also results in a reduction in intensity of the rubber absorptions, but is accompanied by the appearance of new bands. When the accelerator is tetramethylthiuram disulfide (TMTD) the new bands are probably indicative of a thiocarbamate structure. When zinc dibutyldithiocarbamate is used as an accelerator a band probably due to zinc sulfide occurs. Vulcanization with TMTD alone produces only slight changes in the far infrared spectrum. However, when TMTD is used in the presence of zinc oxide a reaction occurs in which zinc dimethyldithiocarbamate (ZnDMDC) is formed. After vulcanization for a short period of time strong TMTD bands remain, but after long vulcanization the TMTD bands are replaced by ZnDMDC bands.

Irradiation of dextran and its aqueous solutions with cobalt-60 gamma rays, J. H. Flynn, L. A. Wall, and W. L. Morrow, *J. Res. NBS* **71A**1-433, pp. 25-31 (Jan.-Feb. 1967).

Key words: Aqueous solution; cross-linking; dextran; dextran triacetate; gamma irradiation; polymer degradation; postirradiative decay.

Cross-linking predominates over chain scission during the irradiation of concentrated aqueous dextran solutions by cobalt-60 gamma rays in the absence of oxygen. An extensive and long-lived postirradiative viscosity decay, which has not been previously reported, is attributed to the agency of hydrogen peroxide formed during the radiolysis of water. Solid dextran primarily degrades upon γ-irradiation while dextran triacetate is borderline between dominant scission and cross-linking. Both exhibit a postirradiative viscosity decrease when irradiated in the presence of water vapor. Electron spin resonance spectra of dextran in the solid state and in aqueous solution are presented and compared. Spin resonance spectral and chemical evidence concerning the mechanism of cross-linking and postirradiative decay reactions is presented. There is conflicting evidence for the presence of oxyradicals. Speculations are made concerning possible mechanisms of oxyradical formation and their role in the production of ether and peroxy linkages.

Synthesis of poly-*p*-oxyperfluorobenzylene and related polymers. A novel synthesis of the monomer 2,3,5,6-tetrafluoro-4-trifluoromethylphenol, J. M. Antonucci and L. A. Wall, *J. Res. NBS* 71A1-434, pp. 33-41 (Jan.-Feb. 1967).

Key words: 1-*t*-butoxy-2,3,5,6-tetrafluoro-4-trifluoromethylbenzene; perfluoro-*p*-quinonemethide; polymerization; poly-*p*-oxyperfluorobenzylene; pyrolysis; 2,3,5,6-tetrafluoro-4-trifluoromethylphenol.

The synthesis and polymerization of 2,3,5,6-tetrafluoro-4-trifluoromethylphenol (heptafluoro-*p*-cresol) is described. The polymer, poly-*p*-oxyperfluorobenzylene (polyperfluoro-*p*-benzylene oxide), is probably formed through the perfluoro-*p*-quinonemethide intermediate obtained by the intramolecular loss of either hydrogen fluoride or a metal fluoride. The polymer has a structure analogous to that reported for the polymer derived from *p*-trifluoromethylphenol under similar conditions.

In the course of the synthesis of the monomer, heptafluoro-*p*-cresol, a novel synthetic method was discovered. The synthesis consists in the prior preparation of 1-*t*-butoxy-2,3,5,6-tetrafluoro-4-trifluoromethylbenzene and its subsequent thermal decomposition into the isobutylene and the desired cresol. Similarly, *N*-*t*-butyl-2,3,5,6-tetrafluoro-4-trifluoromethylaniline undergoes a similar liquid phase pyrolysis into isobutylene and 2,3,5,6,-tetrafluoro-4-trifluoromethylaniline. However, during the course of this pyrolysis, practically all of the aniline undergoes polymerization with concomitant loss of hydrogen fluoride. The polymer is formed by the same mechanism operative in the thermal polymerization of *p*-heptafluorocresol except that additional quantities of hydrogen fluoride can be eliminated from the $-NHCF_2-$ segments of the polymer chain thereby introducing -N=CF- units into the polymer backbone.

Other *t*-butyl derivatives were synthesized and their thermal decomposition studied. Several possible mechanisms for the decomposition of these *t*-butyl compounds are considered.

Preparation, purity, and homogeneity of NBS standard samples 705 and 706, polystyrene, D. McIntyre, *J. Res. NBS* 71A1-435, pp. 43-47 (Jan.-Feb. 1967).

Key words: Ash content; elemental analysis; homogeneity; lithium content; molecular weights; polymer; preparation; purity; sampling; standard sample; volatile content.

The state-of-art in the measurement of the molecular weights of macromolecules is discussed. The preparation of polystyrene standard samples 705 and 706 is described. The results and the description of the carbon-hydrogen microanalysis, the ash determination, the lithium analysis, and the volatiles determination are given. The sampling methods for determining the homogeneity of 705 and 706 are presented. Some evidence of heterogeneity appeared to be present, particularly for lot 705, but the experiment did not provide conclusive evidence of heterogeneity of the material.

Large-scale, preparative paper chromatography, H. L. Frush, *J. Res. NBS* 71A1-436, pp. 49-52 (Jan.-Feb. 1967).

Key words: Chromatography on seed-test paper; large-scale paper chromatography; radioactive carbohydrates; use of heavy papers in preparative chromatography.

Simplified techniques are described for the use of heavy papers in large-scale, preparative chromatography. A new technique is illustrated for nondestructively locating bands of compounds on wet chromatograms. Capacities and behavior characteristics of Whatman seed-test paper and Whatman No. 17 paper are illustrated.

Infrared absorption spectra of some aldofuranoid, aldopyranoid, and acyclic 1-acylamido derivatives of sugars, R. S. Tipson, A. S. Cerezo, V. Deulofeu, and A. Cohen, *J. Res. NBS* 71A1-437, pp. 53-79 (Jan.-Feb. 1967).

Key words: Absorption spectra; acyclic sugars; 1-acylamido sugars; aldofuranoid sugars; aldopyranoid sugars; infrared spectra.

The infrared absorption spectra of two glycofuranosylacetamides and their perbenzoates, and of eleven glycopyranosylacylamides and eight esters thereof, are presented and discussed. For comparison, the spectra of thirteen 1,1-bis(acylamido)-1-deoxyalditols and eight esters thereof are also given and discussed.

The useful correlations between structure and infrared absorption made by Barker and co-workers for certain carbohydrates, and by Nanasi and co-workers for some *N*-arylglycosylamines, cannot be extended to the 1-acylamido compounds we have studied. Certain of Verstraeten's correlations may have some diagnostic value.

March-April 1967

Relative enthalpy of beryllium 1:1-aluminate, $BeO{\cdot}Al_2O_3$, from 273 to 1173 °K. Thermodynamic properties from 273 to 2150 °K, D. A. Ditmars and T. B. Douglas, *J. Res. NBS* 71A2-438, pp. 89-95 (Mar.-Apr. 1967).

Key words: Beryllium aluminate; chrysoberyl; drop calorimetry; enthalpy measurements; high-temperature calorimetry; mixed oxides; specific heat; thermodynamic properties.

The relative enthalpy of the beryllium aluminate $BeO{\cdot}Al_2O_3$ was measured by "drop" calorimetry from 273 to 1173 °K. The thermodynamic properties were calculated up to 2150 °K (approximately the melting point). For this calculation, the data were extrapolated above 1173 °K and the entropy at 273 °K, previously determined at the NBS, was used.

Relative enthalpy of beryllium 1:3-aluminate, $BeO \cdot 3Al_2O_3$, from 273 to 1173 °K. Thermodynamic properties from 273 to 2150 °K, D. A. Ditmars and T. B. Douglas, *J. Res. NBS* 71A2-439, pp. 97-103 (Mar.-Apr. 1967).

Key words: Beryllium aluminate (1:3); drop calorimetry; enthalpy measurements; high-temperature calorimetry; mixed oxides; specific heat; thermodynamic properties.

The relative enthalpy of beryllium 1:3-aluminate, $BeO \cdot 3Al_2O_3$, was measured from 273 to 1173 °K. Thermodynamic properties were calculated up to 2150 °K (near the melting point) by extrapolating the present measurements and making them consistent with existing low-temperature data.

The heats of combustion of polytetrafluoroethylene (Teflon) and graphite in elemental fluorine, E. S. Domalski and G. T. Armstrong, *J. Res. NBS* 71A2-440, pp. 105-118 (Mar.-Apr. 1967).

Key words: Aluminum fluoride; carbon tetrafluoride; fluorine; fluorine bomb calorimetry; graphite; heat of combustion; heat of formation; hydrogen fluoride aqueous; Teflon.

Bomb calorimetric measurements are reported for the combustion in fluorine of polytetrafluoroethylene (Teflon) and graphite-polytetrafluoroethylene mixtures. Mass spectrometric examination of the product gases showed CF_4 to be the only major product with $C_2F_6(g)$ present in only very small amounts. The completeness of combustion of the graphite was determined by chemical analysis of combustion residues and found to range from 97 to better than 99 percent. From the combustion data, the heats of formation $\Delta H\,°_{f298}[CF_4(g)]$ and $\Delta H\,°_{f298}[C_2F_4$ (solid

polymer)] were determined to be -222.87 ± 0.38 kcal mol^{-1} and -197.82 ± 0.39 kcal (gfw $C_2F_4)^{-1}$, respectively. The uncertainties are estimates of the overall experimental errors.

A previously reported value for the heat of formation of AlF_3(c) is adjusted to be consistent with the present work. An evaluation of other data on CF_4 is presented. The heat of formation of CF_4(g) is combined with other work to derive the heats of formation of HF solutions at three specific concentrations.

Phase relations in the systems TiO_2-IrO_2 and SnO_2-IrO_2 in air, C. L. McDaniel and S. J. Schneider, *J. Res. NBS* 71A2-441, pp. 119-123 (Mar.-Apr. 1967).

Key words: Dissociation; phase relations; SnO_2-IrO_2 system; solid solution; TiO_2-IrO_2 system.

The pseudobinary systems TiO_2-IrO_2 and SnO_2-IrO_2 were studied by x-ray diffraction after treatment at various temperatures in air. Their equilibrium phase diagrams were similar, with no intermediate phases detected in either system. Maximum solid solution of TiO_2 occurs with the addition of about 5 mole percent IrO_2 at 1040 °C. Solid solution of TiO_2 in IrO_2 extends to a maximum of about 12 mole percent TiO_2 at 1040 °C, the dissociation temperature. Limited solid solubility of SnO_2 in IrO_2 exists up to 3 mole percent SnO_2 at the dissociation temperature, 1025 °C. Solid solution in SnO_2 was not detected at temperatures up to 1400 °C.

Sample purity and the N.Q.R. of Cl^{35} in $KClO_3$ at 0 °C, D. B. Utton, *J. Res. NBS* 71A2-442, pp. 125-126 (Mar.-Apr. 1967).

Key words: Measurements at 0 °C; nuclear quadrupole resonance thermometry; potassium chlorate.

It is shown that careful preparation is necessary to achieve a consistent value for the Cl^{35} nuclear quadrupole resonance frequency in $KClO_3$ samples at 273.16 °K (the triple point of water). This is illustrated by measurements on a number of samples. It is suggested that the N. Q. R. frequency of Cl^{35} in $KClO_3$ at 273.16 °K and atmospheric pressure is 28,213,372±2Hz. This value is compared with measurements made by previous workers which show a considerable spread.

Techniques for the growth of large single crystals of potassium of high purity, H. J. Foster and P. H. E. Meijer, *J. Res. NBS* 71A2-443, pp. 127-132 (Mar.-Apr. 1967).

Key words: Crystal growth; fermi surface; orientation; potassium; spark cutting; zone refining.

The preparation of large, high purity, single crystals of potassium is described. First, high initial purity is obtained by careful zone refining. Then, a modification of the Bridgman technique is applied which leads to crystals with resistivity ratios up to 6800 at 4.2 °K. The modification consisted of a heat shield as described in the test. We concluded from the magnetoacoustic experiments that were subsequently done with these samples, that the samples had mean free paths of the order of 10^{-2} cm. Typical crystals were 7/8 in diam and about 8 in long, with growth direction along [110]. A description is given of an easy method of orientation as well as the use of a spark erosion technique to cut and polish the surfaces.

Synthesis of α-L-fucose-1-^{14} *C* (6-deoxy-L-galactose-1-^{14}*C*), H. S. Isbell, H. L. Frush, and N. B. Holt, *J. Res. NBS* 71A2-444, pp. 133-136 (Mar.-Apr. 1967).

Key words: Carbon-14-labeled L-fucose; L-fuconic acid-*1*-^{14}*C*; L-fucose-*1*-^{14}*C*; radioactive carbohydrates; synthesis of radioactive sugars.

α-L-Fucose-*1*-^{14}*C* was synthesized in a radiochemical yield of 30 percent. The synthesis involved degradation of nonradioactive L-fuconic acid to 5-deoxy-L-lyxose and synthesis from this of α-L-fucose-*1*-^{14}*C* by use of ^{14}C-labeled cyanide in the cyanohydrin reaction. The resulting epimeric, ^{14}C-labeled aldonic acids were separated as either the barium or the sodium salts. Both salts of L-fuconic acid crystallize more readily than corresponding salts of the epimeric 6-deoxy-L-talonic acid.

The preparation of barium L-fuconate by the electrolytic oxidation of L-fucose in the presence of barium carbonate and barium bromide is described.

Deuterium isotope effects in α-β pyranose and in pyranose-furanose interconversions, H. S. Isbell and C. W. R. Wade, *J. Res. NBS* 71A2-445, pp. 137-148 (Mar.-Apr. 1967).

Key words: Acid-base catalysis in D_2O; deuterium isotope effects; D-fructose; D-glucose; isotope effects; mechanism of mutarotation; mutarotation; pyranose-furanose interconversions; sugars in solution.

Rates of mutarotation, catalytic coefficients, and isotope effects are reported for the mutarotations of α-D-xylose, α-D-glucose, and β-D-fructose in H_2O and in D_2O at 20 °C. The isotope effects (k_h/k_d) for the mutarotation of β-D-fructose (a pyranose-furanose interconversion) parallel in striking manner the isotope effects for the mutarotation of α-D-glucose (an α-β pyranose anomerization). For each sugar, the isotope effect is lowest for the acid-catalyzed reaction and highest for the water-catalyzed reaction. The parallelism of the values obtained for the isotope effects under various conditions shows that the rate-determining steps in the two reactions are similar. Presumably, in both instances, the overall mutarotation arises from concurrent reactions operating on different species of the sugar and showing substantially different isotope effects. The gradual change in the isotope effect indicates that, under the conditions studied, three reactions take place concurrently.

The following isotope effects were found for the mutarotations at 20 °C: For α-D-glucose, k_{H3O+}/k_{D3O+}=1.39: k_{H2O}/k_{D2O}=3.87; and k_B/k^*_B=1.83. For β-D-fructose, k_{H3O+}/k_{D2O+}=1.39; k_{H2O}/k_{D2O}=3.87; and k_B/k^*_B=1.92. Mechanisms are presented for the several concurrent acid- and base-catalyzed mutarotation reactions.

Calculated transition strengths between the configurations $5d^86s$ and $5d^86p$ in Au III, H. Mendlowitz, *J. Res. NBS*, 71A2-446, pp. 149-156 (Mar.-Apr. 1967).

Key words: Au III; calculated transition strengths; configurations $5d^86s$ and $5d^86p$.

The transition strengths have been calculated for transitions between configurations $5d^86s$ and $5d^86p$ of Au III based upon the wavefunctions given by Shadmi. These strengths have been compared with the estimated intensities given by Iglesias and are found to be in substantial agreement.

Hartree-Fock multiplet strengths for K I, Ca II, and Sc III, A. W. Weiss, *J. Res. NBS*, 71A2-447, pp. 157-162 (Mar.-Apr. 1967).

Key words: Multiplet strength; self-consistent field; term values; wavefunctions.

Analytical approximations to Hartree-Fock wavefunctions have been computed for the 4*s*, 4*p*, and 3*d* states of K I, Ca II, and Sc III. Multiplet strengths for the 4*s*-4*p* and 4*p*-3*d* transitions in these ions are also computed. Examination of the results indicate that relaxation of the core in the field of the series electron accounts for a large portion of the core polarization effect, at least for the 3*d* level. Serious cancellation is found to invalidate the dipole velocity results of the 4*p*-3*d* transition in Ca II.

Oscillator strengths for the helium isoelectronic sequence, A. W. Weiss, *J. Res. NBS*, 71A2-448, pp. 163-168 (Mar.-Apr. 1967).

Key words: Atomic term value; oscillator strengths; wavefunctions.

Variational wavefunctions have been computed for the 1^1S, $2^{1,3}S$, $2^{1,3}P$, $3^{1,3}P$, and $3^{1,3}D$ terms of ions in the helium isoelectronic sequence from He through Ne^{+8}. The trial functions are Hylleraas type expansions, explicitly involving r_{12}, and with expansion lengths of around 50 terms, differing slightly for the different states. Oscillator strengths have been computed for all the allowed transitions by both the dipole length and velocity formulas. Agreement between these forms, comparisons with very accurate data for neutral helium, and the accuracy of the computed energies all point to considerable reliability of the results for the entire sequence, probably around 5 percent, if not better.

Solvent effects on the ultraviolet absorption of polystyrene, V. M. Story, D. McIntyre, and J. H. O'Mara, *J. Res. NBS*, 71A2-449, pp. 169-175 (Mar.-Apr. 1967).

Key words: Carbon tetrachloride; cyclohexane; ethylbenzene; extinction coefficient; polymer; polystyrene; solvent effects; ultraviolet absorption.

NBS Standard Sample Polystyrene 705 is shown to exhibit a small, but significant, hypochromism in the 38,300 cm^{-1} region in several solvents compared to the model compound, ethylbenzene. Beer's law is not obeyed for solutions of the polymer in all solvents. The concentration dependence of the extinction coefficient is related to the scattered light and its dependence on the activity coefficient of the solvent. The specific extinction coefficients for polystyrene 705 in cyclohexane and in carbon tetrachloride are 20.89 and 27.38, respectively.

May-June 1967

Measured relative enthalpy of anhydrous crystalline aluminum trifluoride, AlF_3, from 273 to 1173 °K and derived thermodynamic properties from 273 to 1600 °K, T. B. Douglas and D. A. Ditmars, *J. Res. NBS*, 71A3-450, pp. 185-193 (May-June 1967).

Key words: Aluminum trifluoride; drop calorimetry, enthalpy measurements; high-temperature calorimetry; phase transition; pretransition phenomena; specific heat; thermodynamic properties.

The enthalpy of a high-purity sample of anhydrous crystalline aluminum trifluoride, AlF_3, relative to that at 0 °C (273.15 °K), was precisely measured with an ice calorimeter and a "drop" method at 18 temperatures starting at 50 °C and proceeding in 50-deg steps to 900 °C (1173.15 °K). Thirty additional enthalpy measurements between 450 and 453 °C revealed a gradual transition. A simple general relation for the progress of transition when impurity is in solid solution is derived. The relation fits the observed transition data and indicates a first-order transition temperature of 455 °C (728 °K). X-ray powder patterns on the sample, measured in the Crystallography Section of the NBS, established the existence of a phase transition by showing not only the known hexagonal structure at room temperature (even after violent quenching from above the transition temperature region) but a new, simple-cubic structure at 570 °C (843 °K). The smooth heat-capacity curve formulated from the data merges very smoothly with that representing published precise low-temperature data. The common thermodynamic properties were derived, and are tabulated at and above 273.15 °K, with extrapolation up to 1600 °K.

The heat of formation of boron trifluoride by direct combination of the elements, E. S. Domalski and G. T. Armstrong, *J. Res. NBS*, 71A3-451, pp. 195-202 (May-June 1967).

Key words: Bomb calorimeter; boron; boron trifluoride; fluorine; heat of formation; Teflon.

The energy of combination of crystalline boron in gaseous fluorine was measured in a bomb calorimeter. The experimental data combined with reasonable estimates of all known errors may be expressed by the equation:

$$B(c) + 3/2F_2(g) = BF_3(g), \Delta H°_{f298} = -271.03 \pm 0.51 \text{ kcal mol}^{-1}.$$

This result is compared with other recent work on and related to the heat of formation of boron trifluoride.

An equation of state for fluid parahydrogen from the triple-point to 100 °K at pressures to 350 atmospheres, R. D. Goodwin, *J. Res. NBS* 71A3-452, pp. 203-212 (May-June 1967).

Key words: Equation of state; hydrogen; parahydrogen; *PVT*-relations; thermodynamic properties.

This equation of state may be useful for interpolation and for computations which include thermodynamic properties of parahydrogen. A principal advantage is that it employs only one set of 24 coefficients for all fluid states. The basic form is relatively simple. And adjustment term for the critical region leads to good agreement with published PVT data and specific heats in this especially difficult area. The forms of fitting functions were developed by systematic trial methods using least squares to find the coefficients.

The dissociation constants of some disubstituted anilines and phenols in aqueous solution at 25 °C, R. A. Robinson, *J. Res. NBS*, 71A3-453, pp. 213-218 (May-June 1967).

Key words: Dissociation constant; substituted anilines; substituted phenols.

The dissociation constants of six disubstituted anilines and of five disubstituted phenols in aqueous solution at 25 °C have been measured using the spectrophotometric method. Consideration is given to the extent to which these dissociation constants can be predicted from corresponding values for monosubstituted anilines and phenols. In addition, the question as to whether the *pK* value of a substituted aniline can be predicted from the *pK* value of a phenol with substituents in the same positions is also investigated.

Third virial coefficient for air-water vapor mixtures, R. W. Hyland and E. A. Mason, *J. Res. NBS*, 71A3-454, pp. 219-224 (May-June 1967).

Key words: Chemical association; Lennard-Jones potential parameters; virial coefficients; water vapor-air mixtures.

The third interaction virial coefficient C_{aww} for air-water vapor mixtures is estimated in the temperature range 0 to 100 °C, by means of an approximate method based on molecular association. The results are believed accurate to within a factor of two. The value of C_{aww} can be combined with previous estimates of the other interaction coefficient C_{aaw} and the values of the third virial coefficients of pure air and pure water vapor, to give a quantitative description of the equation of state of air-water vapor mixtures through the complete third virial coefficient. It is shown that the maximum total contribution from both C_{aww} and C_{aaw} to the compressibility factor is only of the order of parts in 10^4 up to 100 °C and 100 atmospheres total pressure. At -50 °C, it can be shown by extrapolation of C_{aww} that the contribution of the C_{aww} term to the compressibility factor is only on the order of parts in 10^{11}.

Recrystallization and melting of partially melted stark rubber, D. E. Roberts, *J. Res. NBS* 71A3-455, pp. 225-229 (May-June 1967).

Key words: Crystal size; crystallized rubber; heating rate; melting range; melting temperature; oriented; partial melting; recrystallization; rubber; slow melting; stark rubber.

Two specimens from a piece of stark rubber which had a melting temperature originally at 41 °C were partially melted at 38 °C and allowed to stand for 11 years, one at about 25 °C, the other at 38 °C. The first showed a continuous slow decrease in specific volume, while the second increased slowly in volume for 5 months and remained constant for about 5 months more before showing the continuous slow decrease. The melting temperature of the first increased to 45 °C and the melting range was broadened. The melting temperature of the second became 52 °C and the range was narrowed. Perfecting or enlarging of crystals and the effect of higher recrystallization temperatures have influenced the melting temperatures. The effect of heating rate is discussed in connection with slow increases in volume, attributed to relaxation of oriented regions, during melting.

Effects of a distribution of volume relaxation times in the annealing of BSC glass, P. B. Macedo and A. Napolitano, *J. Res. NBS*, 71A3-456, pp. 231-238 (May-June 1967).

Key words: Annealing; borosilicate crown glass; glass; index of refraction; relaxation times; two-relaxation time model; volume relaxation.

The influence of a distribution of relaxation times is studied in annealing experiments. A two-relaxation time model is proposed, which permits the calculation of the distribution of relaxation times from the crossover data of Spinner and Napolitano as well as that of Ritland. This model also characterizes the structure of any glass in terms of two parameters. Thus, quenched equilibrium as well as nonequilibrium glass were compared with rate cooled glasses with respect to their behavior upon further annealing as well as their conductivity at low temperatures with excellent agreement.

Borosilicate crown glass was found to have a narrow distribution of relaxation times which is particular to associated liquid monomers rather than polymers. The results can be explained in terms of a topological model for the distribution of relaxation times. The temperature dependence of the viscosity is due to a true activation energy rather than a free volume effect.

July-August 1967

Kinetics of crystallization in multicomponent systems: I. Binary mixtures of *n*-paraffins, J. I. Lauritzen, Jr., E. Passaglia, and E. A. DiMarzio, *J. Res. NBS* 71A4-457, pp. 245-259 (July-Aug. 1967).

Key words: Crystal growth; kinetics; multicomponent systems; *n*-paraffins; pair distributions; phase diagrams.

The kinetics of crystallization of a binary mixture of *n*-paraffins is treated using a theory for the rate of growth of chains in multicomponent systems. The kinetic chain is considered to be a strip of crystalline material composed of molecules of both components that is growing on a substrate of uniform thickness. This substrate is considered to be a close-packed surface step. Using the binary mixture of $C_{24}H_{50}$ and $C_{26}H_{54}$ as an example, the calculations are carried out by an iterative procedure so that the mean thickness of the strip equals that of the substrate. This procedure necessitates modification of the rate constants that would be used without this requirement. The rate of growth of the strips (total flux) is calculated as well as their composition over an appropriate range of temperature and a complete range of liquid compositions. The pair distribution in the strips is also determined. The substrate is assumed to be unkinked in the calculations, whereas the substrate is probably highly kinked in the actual system. For this reason the calculated total flux is probably not representative of the actual crystal growth rate in a binary mixture of $C_{24}H_{50}$ and $C_{26}H_{54}$. It is believed that the calculated compositions are reasonably accurate. For a binary mixture of longer *n*-paraffins (e.g., $C_{50}H_{102}$ $C_{52}H_{106}$) the substrate should have many fewer kinks, and the total flux calculated by this theory will be more closely related to actual crystal growth rate studies. However, no data exist for such systems.

Kinetics of crystallization in multicomponent systems: II. Chain-folded polymer crystals, J. I. Lauritzen, Jr. and E. Passaglia, *J. Res. NBS* 71A4-458, pp. 261-275 (July-Aug. 1967).

Key words: Chain-folded crystals; crystal growth; kinetics; multicomponent systems; surface free-energy.

Using polyethylene as an example, the kinetics of growth of chain-folded polymer crystals is treated using a theory for the kinetics of growth of chains in multicomponent systems. The kinetic chain is considered to be a chain-folded strip growing on the lateral face of a chain-folded lamella, and the various components are the possible lengths l_j the polymer chain may form on folding at the end of the growing strip. Thus, the number of components is in principle infinite, but it is sufficient to take a number of the order of 20-50 for the calculations. By an iteration procedure, the calculations are carried out so that the average thickness of the strip is the same as that of the chain-folded lamella on which it grows. This necessitates modification of the rate constants that would be used without this requirement. The rate of growth, average thickness and its standard deviation, and the pair distribution are calculated as a function of undercooling and other relevant parameters of the system. The results for the rate of growth and thickness are similar to those of simpler theories, provided that the constant end-surface free-energy of those theories is replaced by a temperature dependent "effective" surface free-energy. The standard-deviation of the thickness is larger than commonly believed, values of 8 to 14 Å being typical. Consequently, the crystals as grown may have quite rough fold surfaces, although the equilibrium roughness will be less.

Infrared absorption spectra of 2-oxo-1,3-bis(phenylhydrazono) derivatives and related bis- and tris-phenylhydrazones, A. J. Fatiadi, *J. Res. NBS* 71A4-459, pp. 277-285 (July-Aug. 1967).

Key words: Absorption spectra; infrared spectra; mono-, bis-, and tris-(phenylhydrazones); phenylazo compounds.

The infrared absorption spectra of six 2-oxo-1,3-bis(phenylhydrazones), four tris(phenylhydrazones), and six related mono- and bis-(phenylhydrazono) derivatives are presented. For comparison, partial spectra of ten selected aromatic azo compounds are also given and discussed.

The important features of the absorption bands arising from the N=N (1579 to 1558 cm^{-1} and 1447 to 1408 cm^{-1}), N–H (bending) (1557 to 1515 cm^{-1}), and Ph–N (1163 to 1123 cm^{-1}) groups are presented and discussed.

Dielectric constant of *n*-hexane as a function of temperature, pressure, and density, F. I. Mopsik, *J. Res. NBS* 71A4-460, pp. 287-292 (July-Aug. 1967).

Key words: Clausius-Mossotti; density; dielectric constant; dilatometer; function; high pressure; *n*-hexane; pressure; three-terminal electrode set.

A description is given of apparatus employing a cell that is both a bellows dilatometer and a three-terminal electrode set for measuring simultaneously the density and dielectric properties of

liquids as functions of temperature and pressure. Measurements are possible at temperatures from 120 °K to over 300 °K and pressures from 1 to 2000 atm with an uncertainty of 0.03 percent. The density, dielectric constant, and Clausius-Mossotti function of *n*-hexane have been measured for temperatures from 223 to 298 °K (−50 to 25 °C) and at pressures from 1 to 2000 atm. There is a linear decrease in the Clausius-Mossotti function with density and a decrease with temperature corresponding to an effective dipole moment of 0.085 debye.

Heat capacities and related thermal data for diethyl phthalate crystal, glass, and liquid to 360 °K, S. S. Chang, J. A. Horman, and A. B. Bestul, *J. Res. NBS* 71A4-461, pp. 293-305 (July-Aug. 1967).

Key words: Annealed glass; crystal; diethyl phthalate; glass transformation; heat capacity calorimetry; molecular configurational state, normal and supercooled liquid; quenched glass, residual (configurational) entropy; thermodynamic properties.

Experimentally determined heat capacity values, precise to within 0.1 percent, and related thermal data are reported for quenched and annealed diethyl phthalate glasses from 10 °K to the glass transformation temperature, T_g (around 180 °K), for the liquid from T_g to 360 °K, and for the crystal from 10 °K to the melting temperature (269.9 °K). The mole fraction of liquid-soluble, solid-insoluble impurity in the sample as determined by fractional melting was 0.0012. Common thermodynamic properties calculable from the experimental data are reported. The heat capacities of the two glasses differ by more than the uncertainty of the measurements, and both lie below that of the crystal in the range from 30 to 75 °K. At low temperatures, just above 10 °K, the heat capacities of the glasses rise as much as 8 percent above that of the crystal.

Heats of formation of aluminum diboride and α-aluminum dodecaboride, E. S. Domalski and G. T. Armstrong, *J. Res. NBS* 71A4-462, pp. 307-315 (July-Aug. 1967).

Key words: Aluminum diboride; α-aluminum dodecaboride; aluminum fluoride; bomb calorimeter; boron trifluoride; fluorine; heat of combustion; heat of formation; Teflon.

The energies of combustion of AlB_2 and α-AlB_{12} were measured in a bomb calorimeter using fluorine as the oxidant. Major problems of this investigation were the assessment of the state and distribution of impurities in the samples and the establishment of the stoichiometry of the aluminum boride phase. We obtain -16 ± 3 kcal mol^{-1} and -48 ± 10 kcal mol^{-1} for the heats of formation of AlB_2 and α-AlB_{12}, respectively. The uncertainties cited are the overall experimental errors. Their magnitudes are chiefly due to uncertainties in the impurity correction applied and the uncertainties in the heats of formation of the combustion products.

Effect of environment upon the melting point of Al_2O_3. S. J. Schneider and C. L. McDaniel, *J. Res. NBS* 71A4-463, pp. 317-333 (July-Aug. 1967).

Key words: Al_2O_3; dissociation; environmental effects; melting point; premelting.

The melting point of Al_2O_3 has been determined in vacuum, air, argon, and helium utilizing iridium or tungsten containers. All melting point experiments were conducted in induction furnaces capable of heating small samples under blackbody conditions to 3000 °C in vacuum, 2600 °C in inert atmospheres, and 2400 °C in air. Temperatures were continuously monitored with a recording photoelectric pyrometer which has a sensitivity of ±0.2° at 1063 °C and ±1° at 2000 °C. Melting points were determined on specimens having a purity in excess of 99.9 percent. The data indicated that the melting point of Al_2O_3 determined in vacuum ($\sim 6.5 \times 10^{-5}$ torr) is 2051 °C (IPTS). The overall maximum uncertainty was estimated to be ±6 °C. The measurements themselves were precise within ±1.5 °C. Vacuum treatment had least detrimental effect upon the Al_2O_3 specimens. Each of the gaseous atmospheres including air yielded lower melting points for Al_2O_3, presumably due to a premelting phenomenon.

September-October 1967

Zeeman effect in positronium annihilation at low temperatures, W. C. Sauder and R. D. Deslattes, *J. Res. NBS* 71A5-464, pp. 347-353 (Sept.-Oct. 1967).

Key words: Annihilation radiation; Compton wavelength of the electron; positronium; quenching.

The annihilation of positronium is discussed as a means of obtaining a precise measurement of the Compton wavelength of the electron. In particular the spectral line shape of the annihilation radiation is calculated for positronium thermalized in helium gas cooled to the region of its critical point with an applied magnetic field sufficient to yield a three photon to two photon branching ratio of unity for the $^3S_0$ component. Under such conditions the rapid thermalization of the positronium and the long half-life of two photon decay out of the predominantly triplet state make possible the production of rather narrow spectral distributions. An exact solution of the Zeeman effect in positronium is included. This study suggests that a wavelength determination beyond the one part per million level is attainable within the range of present technology.

Surface-layer relaxation in the dielectric spectrum of CaF_2 doped with GdF_3. A. D. Franklin, S. Marzullo, and J. B. Wachtman, Jr., *J. Res. NBS* 71A5-465, pp. 355-362 (Sept.-Oct. 1967).

Key words: CaF_2; conductivity; crystals; defect pairs; dielectric relaxation; electrode capacitance; surface layers.

CaF_2 crystals doped with 0.1 percent GdF_3 were observed to develop surface layers when annealed above 700 °C in air, during application of Pt paste electrodes. The conductivity in these surface layers was much higher than in the bulk, due presumably to the large numbers of anion vacancies produced by dissolved oxygen. The presence of these high conductivity surface layers produced a relaxation in the dielectric spectrum with (1) an approximately temperature-independent magnitude, $\Delta\kappa$, (2) a relaxation time controlled by the conductivity of the surface layers, and influenced therefore by heat treatment of the specimen, and (3) an activation energy equal to that for conductivity of the surface layers, about 0.9 eV. This relaxation is sufficiently similar to dielectric relaxations observed previously in ionic crystals and ascribed to defect pairs to suggest that great care must be taken in interpreting dielectric measurements in these materials. What is thought to be dipole relaxation may in fact be due to the presence of thin layers accidentally present on the crystal. There is a marked electrode polarization effect in these crystals. The electrode capacitance at not-too-low frequencies depended upon the frequency and both the number and mobility of the charge carriers with 3/2 power laws.

Thermal expansion of rutile from 100 to 700 °K, R. K. Kirby, *J. Res. NBS* 71A5-466, pp. 363-369 (Sept.-Oct. 1967).

Key words: Anisotropic crystal; Gruneisen's constant; interferometer; rutile; thermal expansion.

The thermal expansion of a single crystal of rutile (TiO_2) was determined in directions parallel to its crystallographic axes. A unique macroscopic technique was used wherein a cube-shaped specimen was cut from the anisotropic crystal, each of its six faces polished flat and nearly parallel to the face opposite it, and

the expansion measured along each of its three body axes with an Abbe-Pulfrich interferometer. The relationship between the expansion along the body axes of the specimen and that in the crystallographic directions was determined from a Laue x-ray pattern. The unusual behavior of the thermal expansion that was observed can be explained by assuming an acoustical and optical contribution where the corresponding Gruneisen constants are 2.80 and 0.75 respectively.

Mass spectrometric study of photoionization. VII. Nitrogen dioxide and nitrous oxide, V. H. Dibeler, J. A. Walker, and S. K. Liston, *J. Res. NBS* **71A**5-467, pp. 371-378 (Sept.-Oct. 1967).

Key words: Dissociation; fragment ions; ionization; mass spectrometer; molecule; NO_2; NO_2^+ N_2O^+; photoionization; threshold; ultraviolet; vacuum.

Photoionization efficiency curves are obtained for the molecule and fragment ions of NO_2 and N_2O from ionization threshold to 600 Å. Features of the molecule ion curves are ascribed to autoionization and the Rydberg levels are correlated with reported spectroscopic observations. The minimum onset of ionization for NO_2 occurs at 1272 Å (9.75 eV). The threshold value of 12.34 eV for the NO^+ fragment results in $D(NO-O)$ of 3.09 eV in good agreement with that calculated from thermochemical heats of formation. The O^+ ion is apparently formed with 0.1 eV excess energy. The minimum threshold energy for the N_2O^+ ion is 962 Å (12.89 eV). The N_2^+ fragment ion curve has a threshold at 17.29 eV corresponding to the thermochemical bond energy, $D(N_2-0)=1.67$ eV. However a lower-energy threshold at 15.57 eV is ascribed to ionization of molecular nitrogen from an unknown source. There is no evidence for an ion-pair process. The ground state transition for NO^+ is forbidden by spin conservation rules. The observed threshold is 0.8 eV in excess of the calculated value and suggests a vibrationally excited state of the ion. The N^+ ion is also formed with excess energy.

Ionization constants of substituted benzoic acids in ethanol-water, G. M. Brauer, G. Durany, and H. Argentar, *J. Res. NBS* **71A**5-468, pp. 379-384 (Sept.-Oct. 1967).

Key words: Allyl- and propenylbenzoic acids; change of pK with dielectric constant; Hammett sigma constants; ionization constants; pK values in ethanol-water; sigma constants in ethanol-water; substituted benzoic acids.

The thermodynamic ionization constants of meta and para substituted allyl- and propenylbenzoic acids were determined potentiometrically in aqueous ethanol of varying ethanol concentration. The pK values increase with increasing ethanol content. The relative acid strength does not vary with change in solvent concentration. The $\Delta pK/\Delta$ percent ETOH increases with ethanol content of the medium until a maximum is reached around 40 weight-percent ethanol. A plot of $pK+\log [H_2O]$ versus the reciprocal of the dielectric constant of the solvent gives a nearly linear relationship to about 44 weight-percent ethanol. From pK values found in the literature a similar linear relationship exists for other benzoic acids. With the exception of the p-propenylbenzoic acid the σ-substituent constants of the Hammett equation do not change greatly with ethanol concentration. This behavior may be indicative that the solvation shell surrounding the p-propenyl-acid differs from that of other benzoic acids.

Dissociation constants of some substituted nitrophenols in aqueous solution at 25 °C, R. A. Robinson, *J. Res. NBS* **71A**5-469, pp. 385-389 (Sept.-Oct. 1967).

Key words: Dissociation constant; nitrophenols; substituted phenols.

The dissociation constants of twelve substituted phenols with a nitro group in the o- or p-position have been determined by spectrophotometric measurements in aqueous solution at 25 °C.

November-December 1967
(A Memorial Issue to William Frederick Meggers, July 13, 1888 to November 19, 1966)

The second spectrum of ytterbium (Yb II), W. F. Meggers, (Edited by C. E. Moore), *J. Res. NBS* **71A**6-470, pp. 396-545 (Nov.-Dec. 1967).

Key words: Analysis of Yb II; atomic energy levels of Yb II; classified line of Yb II; spectrum, Yb II; ytterbium, second spectrum; Zeeman effect in Yb II.

The analysis of Yb II provides the most complete interpretation of a complex rare-earth spectrum known to date. The total number of energy levels is 315; 141 even levels and 174 odd levels. Three coupling schemes are represented: LS-coupling for the terms $4f^{14}ns^2S(n=6, 7, 8)$; $4f^{14}nd^2D(n=5,6,7)$ and $4f^{13}6s^2\ ^2F°$: J_lJ_{ll}-coupling for the levels from the configurations $4f^{13}6s6p$ and $4f^{13}5d6p$; and J_lL_{ll}-coupling for those from the $4f^{13}5d6s$ and $4f^{13}5d^2$ configurations.

More than 5000 Yb II lines are listed, of which about 80 percent have been classified, and 95 percent of the total intensity is accounted for. Observed Zeeman patterns for over 1000 lines have yielded g-values for 258 levels. The agreement between observation and theory is excellent as regards both the positions of the energy levels and the g-values. The theoretical work was done in collaboration with Racah and his associates over more than a decade.

A limit, 98150 K, giving an ionization potential of 12.17 eV, has been derived from the three-member ^2S series.

An improved description of technetium spectra (Tc I and Tc II), 2000 to 9000 Å, W. R. Bozman, W. F. Meggers, and C. H. Corliss, *J. Res. NBS* **71A**6-471, pp. 547-565 (Nov.-Dec. 1967).

Key words: Spectra of technetium; technetium, spectra of; wavelengths of technetium.

A new description of technetium spectra has been made that is more complete and provides more accurate data on wavelengths than those reported heretofore. The observations were made in the region 2000 to 9000 Å with arc and spark sources. Larger samples of technetium and spectrographs of higher resolution were used and the number of lines reported (4500) is more than doubled. The intensities are estimated over a range from 1 to 20,000 and the relative strengths in arc and spark permit assignment of the origin of the lines to neutral atoms (3300 lines) or ions (1200 lines).

Lifetimes of energy levels in neutral iron, C. H. Corliss and J. L. Tech, *J. Res. NBS* **71A**6-472, pp. 567-573 (Nov.-Dec. 1967).

Key words: Atomic spectra; energy levels; iron; iron, lifetimes in; lifetimes in Fe I; radiative lifetimes; spectroscopy.

Mean radiative lifetimes for 408 energy levels of neutral iron are calculated from the known transition probabilities of 3288 lines of Fe I.

Transition probabilities in argon I, C. H. Corliss and J. B. Shumaker, Jr., *J. Res. NBS* **71A**6-473, pp. 575-583 (Nov.-Dec. 1967).

Key words: Argon; atomic spectra; transition probabilities.

In order to derive transition probabilities from intensity measurements of Ar I lines made by Dieke and Crosswhite, new

transition probabilities for 26 lines from high levels in Ar I have been measured in a high current constricted arc. With these data, relative level populations of Ar I in Dieke and Crosswhite's microwave discharge are determined and transition probabilities for 240 lines of Ar I in the wavelength range 4100 to 9800 Å are derived. The new values are compared with other published values.

The fifth spectrum of praseodymium, V. Kaufman and J. Sugar, *J. Res. NBS* 71A6-474, pp. 583-585 (Nov.-Dec. 1967).

Key words: Atomic energy levels; isoelectronic sequence; praseodymium; rare earth; sliding spark discharge lamp; spectrum.

Twelve spectral lines of quadruply-ionized praseodymium in the region 840 to 2250 Å are reported. Five terms ($4f^2$F, $5d^2$D, $6s$ ^{2}S, $6p$ ^{2}P, and $7s$ ^{2}S) and the hyperfine splitting of the $6s$ ^{2}S term are given. A calculation of the principal ionization energy ($Pr^{4+} \rightarrow Pr^{5+}$) leads to a value of 57.44 eV with an estimated uncertainty of ±0.05 eV.

Fundamental energy levels of neutral promethium (Pm I), J. Reader and S. P. Davis, *J. Res. NBS* 71A6-475, pp. 587-599 (Nov.-Dec. 1967).

Key words: Atomic spectroscopy; electronic energy levels; neutral atom; promethium; rare earth.

The spectrum of atomic promethium has been observed with a variety of light sources and spectrographs. The Zeeman effect has also been recorded. Analysis of the spectrum shows that the ground configuration of the neutral promethium atom is $4f^5 6s^2$. The relative positions (in cm^{-1}) of the low levels of this configuration are:

$^6H^\circ_{5/2}$	0.00	$^6H^\circ_{13/2}$	3919.03	$^6F^\circ_{5/2}$	5872.84
$^6H^\circ_{7/2}$	803.82	$^6H^\circ_{15/2}$	5089.79	$^6F^\circ_{7/2}$	6562.86
$^6H^\circ_{9/2}$	1748.78	$^6F^\circ_{1/2}$	5249.48	$^6F^\circ_{9/2}$	7497.99
$^6H^\circ_{11/2}$	2797.10	$^6F^\circ_{3/2}$	5460.50	$^6F^\circ_{11/2}$	8609.21

This group represents all levels of $4f^5 6s^2$ expected below 14,000 cm^{-1}. From these results the following values of interaction parameters and their estimated uncertainties have been inferred:

ζ_{4f}=925±20 cm^{-1} $\quad\quad$ E^3=510±20 cm^{-1}

Data on 209 upper levels of even parity and 714 classified lines are given.

PAPERS FROM THE NBS JOURNAL OF RESEARCH, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 72A, JANUARY–DECEMBER 1968

January-February 1968

Reactions of uranium with the platinide elements. I. The uranium-ruthenium system, J. J. Park, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 1-10 (Jan.-Feb. 1968).

Key words: Intermetallic compounds; phase diagram; ruthenium; solubility; uranium.

The phase diagram of the uranium-ruthenium system was constructed from data obtained by thermal analysis, metallographic examination, and x-ray diffraction. The system is characterized by five intermetallic compounds: U_2Ru, formed peritectically near 937 °C; "URu," melting congruently near 1158 °C; U_3Ru_4, formed peritectically near 1163 °C; U_3Ru_5, formed peritectically near 1182 °C; and URu_3, formed peritectically at about 1850 °C. "URu" has a solid-state transition at about 795 °C. One eutectic occurs near 886 °C and 18.5 atomic percent (a/o) ruthenium; and a second at about 1148 °C and 49 a/o ruthenium. The maximum solid solubilities are about 7.5 a/o ruthenium in uranium and near 1.3 a/o uranium in ruthenium. Ruthenium lowers the gamma-uranium transformation to near 691 °C and the beta-transformation to near 625 °C.

Reactions of uranium and the platininde elements. II. The uranium-rhodium system, J. J. Park, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 11-17 (Jan.-Feb. 1968).

Key words: Intermetallic compounds; phase diagram; rhodium; solubility; uranium.

The phase diagram of the uranium-rhodium system was constructed from data obtained by thermal analysis, metallographic examination, and x-ray diffraction. The system is characterized by four intermetallic compounds: U_4Rh_3, formed peritectically near 1155 °C and having a solid state transformation at about 720 °C; U_3Rh_4, formed peritectically near 1450 °C; U_3Rh_5, formed peritectically near 1550 °C; and URh_3, melting congruently at about 1700 °C. One eutectic occurs near 865 °C and 24.5 atomic percent (a/o) rhodium, and a second near 1393 °C and 87 a/o rhodium. The maximum solid solubility of rhodium in uranium is approximately 8 a/o, and of uranium in rhodium is approximately 3 a/o.

Reactions of uranium and the platinide elements. III. The uranium-iridium system, J. J. Park and L. R. Mullen, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 19-25 (Jan.-Feb. 1968).

Key words: Intermetallic compounds; iridium; phase diagram; solubility; uranium.

The phase diagram of the uranium-iridium system was constructed from data obtained by thermal analysis, metallographic examination, and x-ray diffraction. The system is characterized by five intermetallic compounds: U_3Ir, formed peritectically near 945 °C and decomposing eutectoidally near 758 °C; U_3Ir_2, formed peritectically near 1121 °C; UIr, melting congruently at about 1470 °C; UIr_2, formed peritectically above 1850 °C; and UIr_3, having a congruent melting point above 1950 °C. U_3Ir_2 has a solid state transition near 898 °C. One eutectic occurs at 914 °C at about 15 atom percent (a/o) iridium between uranium and U_3Ir; a second occurs between UIr and UIr_2 near 1450 °C; and a third occurs between UIr_3 and iridium at about 1950 °C. The solid solubility of iridium in gamma-uranium is about 5.5 a/o and of uranium in iridium is under 3 a/o. Iridium lowers the gamma-beta uranium transformation to about 681 °C and the beta-alpha transformation to about 565 °C.

Phase relations between palladium oxide and the rare earth sesquioxides in air, C. L. McDaniel and S. J. Schneider, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 27-37 (Jan.-Feb. 1968).

Key words: Dissociation; equilibrium; Ln_2O_3:PdO compounds; Ln_2O_3-PdO systems; phase relations.

The equilibrium phase relations were determined in an air environment between PdO and each of the following: La_2O_3, Nd_2O_3, Sm_2O_3, Eu_2O_3, Gd_2O_3, Dy_2O_3, Ho_2O_3, Y_2O_3, Er_2O_3, Tm_2O_3, Yb_2O_3, and Lu_2O_3. In air PdO dissociates to Pd metal at 800 °C. The dissociation of PdO is apparently a reversible process. The Nd_2O_3-PdO and Sm_2O_3-PdO systems were studied in detail inasmuch as they typified several of the Ln_2O_3-PdO systems. Three compounds, $2Nd_2O_3 \cdot PdO$, metastable $Nd_2O_3 \cdot PdO$, $Nd_2O_3 \cdot 2PdO$ occur in the Nd_2O_3-PdO system. The 2:1, 1:1, and 1:2 compounds, of unknown symmetry, dissociate or decompose at 1135, 860, and 1085 °C, respectively. The 2:1 compound dissociates to the solid phases, Nd_2O_3 and Pd. No further reactions occur between Nd_2O_3 and Pd up to 1300 °C. Three compounds, 2:1, metastable 1:1, and 1:2 occur in the Sm_2O_3-PdO and Eu_2O_3-PdO systems. Two compounds, 2:1 and 1:2 occur in the La_2O_3-PdO system. Other compounds detected were the 1:1 and 1:2 in the Gd_2O_3-PdO system and the metastable 1:1 in the Dy_2O_3-PdO system. Each of these compounds subsequently dissociated upon heating. No apparent reaction occurred between PdO and either Ho_2O_3, Y_2O_3, Er_2O_3, Tm_2O_3, Yb_2O_3, or Lu_2O_3.

Preparation and purification of some oxidation products of perylene, A. J. Fatiadi, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 39-47 (Jan.-Feb. 1968).

Key words: Absorption spectra; air pollutants; anthraquinone-1,5-dicarboxylic acid; dihydroxyperylenequinones; infrared; perylene; perylenequinones; photo-oxidation products of perylene; polycyclic aromatic hydrocarbons; thin-layer chromatograms; ultraviolet; visible absorption spectra; 4-oxo-4*H*-benz[*de*]anthracene-7,8-dicarboxylic anhydride.

Reliable procedures are given for the purification of perylene, and for the preparation and purification of 3,10-perylenequinone, 1,12-perylenequinone, 2,11-dihydroxy-3,10-perylenequinone, 4,9-dihydroxy-3,10-perylenequinone, 4-oxo-4*H*-benz[*de*]-anthracene-7,8-dicarboxylic anhydride, phenanthrene 1,8,-9,10-tetracarboxylic dianhydride, and anthraquinone-1,5-dicarboxylic acid. Data on the physical properties of 3,9-perylenequinone are also reported.

Electron spin resonance spectra of polymer radicals in aqueous solution, R. E. Florin, F. Sicilio, and L. A. Wall, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 1, 49-73 (Jan.-Feb. 1968).

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

Key words: Abstraction; dextran; dextrin; free radicals; hydroxyl; polyacrylic; polyethylene imine; polyethylene oxide; polymer degradation; polymethacrylic acid; polypropylene oxide; polyvinyl alcohol; starch.

Mixing of aqueous polymer solutions containing Ti^{3+} and H_2O_2 in a rapid flow mixer produced radicals by abstraction, OH + RH → R · + H_2O, which were observed by electron spin resonance. Oscillation of segments was sufficient to narrow the lines to 0.5 — 2.0 g. Polymers and radicals identified with more or less certainty were polyacrylic acid, ~~$CH(CO_2H)\dot{C}HCH(CO_2H)$~~, polymethacrylic acid, ~~$C(CH_3)(CO_2H)\dot{C}HC(CH_3)(CO_2H)$~~, polyvinyl alcohol, ~~$CHOH\dot{C}HCHOH$~~, and one indefinite, polyethylene imine, ~~$CH_2\dot{N}CH_2$~~ or ~~$CH_2\dot{N}OCH_2$~~, polyethylene oxide, ~~$CH_2O\dot{C}HCH_2O$~~. Radicals from polypropylene oxide, dextran, dextrin, soluble starch, and the disaccharide maltose were unidentified; the last three were strikingly similar.

Products of secondary C—C scission were not observed with certainty. It is presumed that such reactions are slow compared to the time-scale of the experiment, 10 msec. However, some evidence exists for a very rapid β—OH loss in carbohydrate radicals and a slow C—O scission in polyethylene oxide radicals. A large number of related small molecule radicals were investigated, and hyperfine splittings and g-values are reported.

A mass spectrometric study of the BeO-BeF_2 system of high temperatures, J. Efimenko, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 1, 75-80 (Jan.-Feb. 1968).

Key words: Beryllium difluoride; beryllium oxide; high temperatures; mass spectrometry; reaction enthalpy; sublimation enthalpy.

Mass spectrometric studies were made at high temperatures of the vapors over BeF_2(s) and BeO(s) individually and of their mixture. The sublimation enthalpy, ΔH_0° = 55.56 ± 0.43 kcal/mol, where 1 kcal equals 4184 J, was obtained for BeF_2 by the use of a log I^+T versus $1/T$ plot. A complex molecule appeared in the BeF_2-BeO system at high temperatures which, on the basis of its m/e position, corresponded to Be_2OF_2. For the reaction, BeO(s)+BeF_2(g)=Be_2OF_2(g), a second law treatment of the data gave an enthalpy value, ΔH_0°=41.56±1.8 kcal/mol. The data, combined with free energy functions, resulted in a mean reaction enthalpy, ΔH_0°=42.6 kcal/mol. The heat of formation for Be_2OF_2(g), ΔH_0°=−288.3 kcal/mol, was computed using the reaction enthalpy based on the second law.

Laser induced Raman spectra of some tungstates and molybdates, R. K. Khanna, W. S. Brower, B. R. Guscott, and E. R. Lippincott, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 1, 81-84 (Jan.-Feb. 1968).

Key words: Molybdates; Raman spectra; tungstates.

The Raman spectra of single crystals of $CaWO_4$, $CaMoO_4$, $PbWO_4$, and $PbMoO_4$ have been recorded using a He-Ne laser (λ = 6328 Å) and an Argon ion laser (λ = 4880 Å) as the exciting radiation sources. The polarization data have enabled us to classify unambiguously the observed fundamentals into the Raman active species of the point group C_{4h} to which these crystals belong. The comparison of the spectra of these crystals in the low frequency region has also enabled us to make a rough classification of the bands into the rotational and the translational lattice vibrations.

Valence-only correlation in LiH and BeH^+, W. A. Sanders and M. Krauss, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 1, 85-90 (Jan.-Feb. 1968).

Key words: BeH^+; correlation energy; dissociation energy; LiH; molecular orbital; potential energy curve.

The pseudonatural orbital procedure has been applied to the calculation of the potential energy curve of LiH and the dissociation energy of BeH^+. Only the two-electron bonding pair is correlated and estimates of σ and π type correlation are obtained. The results for LiH are in good agreement with the most accurate previously published calculations. Comparison with experimental results for LiH indicates that the calculated dissociation energies are accurate to about 0.15 to 0.2 eV.

Thermalization by elastic collisions: positronium in a rare gas moderator, W. C. Sauder, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 1, 91-93 (Jan.-Feb. 1968).

Key words: Elastic collisions; positronium; thermalization.

The energy decay of particles moving through a moderating medium is discussed for the case in which only elastic collisions occur between these incoming particles and the moderator atoms; the random thermal motion of the moderator atoms is taken into account. It is shown that if the cross section is independent of particle velocity the equation for the energy decay emerges in a rather simple form involving the hyperbolic cotangent. Finally, the theoretical development is applied to estimating the thermalization time of positronium in rare gas moderators, and is shown to agree with the limited experimental results presently available.

Density fluctuations in fluids having an internal degree of freedom, R. D. Mountain, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 1, 95-100 (Jan.-Feb. 1968).

Key words: Brillouin scattering; density fluctuations in liquids; Rayleigh scattering; spectral distribution of scattered light; structural relaxation; thermal relaxation; volume viscosity.

The frequency spectrum of density fluctuations is calculated for a fluid whose molecules possess an internal degree of freedom which is weakly coupled to the translational degree of freedom of the fluid. Irreversible thermodynamics is used to obtain an equation of motion for the internal degree of freedom. This equation plus the linearized hydrodynamic equations are solved for the frequency spectrum of density fluctuations. The results are compared with a similar calculation involving a frequency dependent volume viscosity. The results are identical for structural relaxation but there is a difference for thermal relaxation. The origin of the difference is discussed and the magnitude of the difference is examined for CCl_4 and for CS_2.

March-April 1968

Constant pressure flame calorimetry with fluorine. II. The heat of formation of oxygen difluoride, R. C. King and G. T. Armstrong, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 2, 113-131 (Mar.-Apr. 1968).

Key words: Bond energy (O—F); flame calorimetry; flow calorimetry; fluorine; heat of formation; heat of reaction; hydrogen fluoride (aqueous); oxygen; oxygen difluoride; reaction calorimetry; water.

The heats of the following reactions were measured directly in an electrically calibrated flame calorimeter operated at one atm pressure and 303 °K.

$$OF_2(g) + 2H_2(g) + 99H_2O(l) \rightarrow 2[HF \cdot 50H_2O](l)$$

$$F_2(g) + H_2(g) + 100H_2O(l) \rightarrow 2[HF \cdot 50H_2O](l)$$

$$\tfrac{1}{2}O_2(g) + H_2(g) \rightarrow H_2O(l)$$

The reactants and products were analyzed for each of the reactions. From these heats we calculated the corresponding heats of formation, as follows:

$OF_2(g)\Delta H^\circ_{f298.15} = +24.52 \pm 1.59$ kJ mol^{-1} ($+5.86 \pm 0.38$ kcal mol^{-1})

$HF \cdot 50H_2O(l)\Delta H^\circ_{f298.15} = -320.83 \pm 0.38$ kJ mol^{-1} (-76.68 ± 0.09 kcal mol^{-1})

$H_2O(l)\Delta H^\circ_{f298.15} = -285.85 \pm 0.33$ kJ mol^{-1} (-68.32 ± 0.08 kcal mol^{-1})

The uncertainties indicated are the estimates of the overall experimental errors. The value of the average O—F bond energy in OF_2 was calculated to be 191.29 kJ mol^{-1} (45.72 kcal mol^{-1}).

The heat of formation of boron carbide, E. S. Domalski and G. T. Armstrong, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 133-139 (Mar.-Apr. 1968).

Key words: Bomb calorimeter; boron carbide; boron trifluoride; carbon tetrafluoride; heat of combustion; heat of formation; polytetrafluoroethylene.

The standard heat of combustion in fluorine of a boron carbide sample having the composition $B_{4.222}C$ was determined from the heats of combustion of polytetrafluoroethylene and of boron carbide-polytetrafluoroethylene mixtures. The energy of the combustion reaction was measured in an isothermal-jacket bomb calorimeter. From the experimental data, we calculate -17.1 kcal mol^{-1} for the heat of formation of boron carbide. By combining all probable errors, we estimate our overall experimental uncertainty to be 2.7 kcal mol^{-1}. The value for the heat of formation of boron carbide is for the phase represented by the formula $B_{4.222}C$.

Solubility of tris(hydroxymethyl)aminomethane in water-methanol solvent mixtures and medium effects in the dissociation of the protonated base, P. Schindler, R. A. Robinson, and R. G. Bates, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 141-148 (Mar.-Apr. 1968).

Key words: Dissociation constant; medium effect; methanol-water solvents; solubility; tris(hydroxymethyl)aminomethane.

The dissociation constant of the protonated form of tris(hydroxymethyl)aminomethane has been measured at 25 °C in water-methanol solvents containing 30, 50, 70, and 90 wt percent methanol by means of potentiometric titrations. The solubility of tris(hydroxymethyl)aminomethane at 15, 25, and 35 °C in water-methanol solvents containing from 0 to 100 percent methanol has been determined. The results are discussed in terms of free energies of transfer and "medium effects" for hydrochloric acid, tris(hydroxymethyl)aminomethane, and tris(hydroxymethyl)aminomethane hydrochloride.

Calibration of the nickel dimethylglyoxime spectral shift at pressures to 20 kilobars for use in spectroscopic pressure measurement, H. W. Davies, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 149-153 (Mar.-Apr. 1968).

Key words: Absorption spectra; diamond-anvil cell; high pressure measurement; nickel dimethylglyoxime.

A method for incorporating solid nickel dimethylglyoxime in a liquid enclosed by a gasket in the diamond-anvil high pressure cell is described. A calibration curve relating the spectral shift of the nickel dimethylglyoxime visible absorption band to the known freezing pressures of 14 liquids has been obtained. The equation for the calibration line is $\Delta\bar{\nu} = -158.9\ P + 1.82\ P^2$ where P is expressed in kilobars. The 90 percent confidence band about the calibration curve has been computed, and the curve has been used to determine the room-temperature freezing pressures of acetone and methylcyclohexane.

Second virial coefficient of He^4 in the temperature range from 2 to 20 °K, M. E. Boyd, S. Y. Larsen, and H. Plumb, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 155-156 (Mar.-Apr. 1968).

Key words: He^4; low temperature; second virial.

We present preliminary values for the second virial coefficient of He^4 in the temperature range from 2 to 20 °K. They were derived from recent sound velocity measurements in the gas made by Plumb and Cataland using an ultrasonic interferometer.

Diffusion rates in inorganic nuclear materials, A. L. Dragoo, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 157-173 (Mar.-Apr. 1968).

Key words: Chemical interdiffusion; grain-boundary diffusion; intrinsic diffusion; lattice diffusion; self-diffusion; tracer diffusion.

The tracer diffusion coefficient, the self-diffusion coefficient, the intrinsic diffusion coefficient and the interdiffusion coefficient are briefly described. Grain boundary and lattice (volume) diffusion are contrasted. The frequency factors (D_0) and activation energies (Q) are tabulated for diffusion in the borides, carbides, and oxides of Be, Hf, Mo, Nb, Ta, Th, Ti, and Zr and for diffusion of C, N, and O in these metals. The purity of the solvent media, the preparation and properties of the samples, the method, the type of diffusion coefficient measured and the temperature range are also specified.

Effect of oxide additions on the polymorphism of tantalum pentoxide (system Ta_2O_5-TiO_2), J. L. Waring and R. S. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 175-186 (Mar.-Apr. 1968).

Key words: Phase equilibria; polymorphism; tantalum pentoxide; titanium dioxide.

The phase equilibrium relationships of the TiO_2-Ta_2O_5 system were determined in air. An equimolar compound, $TiTa_2O_7$, was found to melt congruently at about 1662 °C and have a monoclinic unit cell $a = 20.297$ Å, $b = 3.804$ Å, $c = 11.831$ Å, $\beta = 120°14'$, apparently isostructural with $TiNb_2O_7$. In addition, two other compounds are postulated to occur at about TiO_2:49Ta_2O_5 and TiO_2:7Ta_2O_5 and to dissociate at about 1230 and 1190 °C, respectively. TiO_2 apparently accepts a maximum of 9 mole percent Ta_2O_5 in solid solution at 1630 °C. Two eutectics occur in the system at 54 mole percent Ta_2O_5 and 1650 °C and 31 mole percent Ta_2O_5 and 1630 °C.

The high temperature form of Ta_2O_5 is apparently triclinic at room temperature with $a = 3.801$ Å, $b = 3.785$ Å, $c = 35.74$ Å, $\alpha = 90°54.4'$, $\beta = 90°11.5'$, and $\gamma = 89°59.9'$. A metastable transition occurs at 320 °C to a monoclinic form which inverts to tetragonal at 920 °C with $a = 3.81$ Å, $c = 36.09$ Å. Several intermediate morphotropic phases are found with up to 9 mole percent TiO_2 in solid solution.

Effect of statistical counting errors on wavelength criteria for x-ray spectra, J. S. Thomsen and F. Y. Yap, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 187-205 (Mar.-Apr. 1968).

Key words: Lattice constants; peak intensity; physical constants; spectral line profiles; statistical error analysis; x-ray line shapes; x-ray spectra; x-ray wavelength criteria.

Various features of the spectral profile of an x-ray line can be measured with an uncertainty which is only a small fraction of the observed line width. With recent improvements in measurement techniques, statistical errors due to the random fluctuations of the intensities in counter recordings may become significant. The present study considers the effect of such errors on several features of the line profile which could be used for definition of

its wavelength. These may be broadly classified into three groups, viz, the peak, the centroid, and the median. In the present analysis the statistical errors associated with these features are compared theoretically, with the assumption of negligible error in angular measurement. Certain systematic errors are also briefly examined. The effects of truncation range, asymmetry, and background intensity are considered, as well as possible optimization of the data-taking procedure.

In general, σ, the standard deviation of the wavelength, is given by $\sigma/W = F/(I_p T)^{1/2}$, where W is the full width at half-maximum intensity, I_p the peak intensity, T the total counting time, and F a dimensionless factor of the order of unity. Thus F may be regarded as a factor of merit for comparing the various cases, a low value of F being desirable. When the form of the line profile is known a priori, it is usually best to make use of this knowledge; e.g., a Lorentzian can be thus fitted with $F \approx 0.8$ for any of the three wavelength features. Using optimized truncation ranges and including the error in locating end points, one obtains approximately this same F for the centroid or median even without prior knowledge of the profile. In the latter case the value of F for the peak usually ranges from about 1.6 to 2.1. However, the peak is less subject to certain systematic errors and is preferable from the viewpoint of simplicity and historical precedent. It is recommended that use of the peak be continued at present; further study of the problem from the viewpoint of atomic energy level interpretation would be desirable.

Thermodynamic properties of ammonia as an ideal gas, L. Haar, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 2, 207-216 (Mar.-Apr. 1968).

Key words: Ammonia; ideal gas; thermodynamic functions.

Thermodynamic functions for ammonia as an ideal gas at one atmosphere pressure have been evaluated. The contribution of the highly anharmonic out-of-plane vibrational mode, including its large coupling with rotation and its coupling with the other vibrational modes, is considered in detail. Tables of $C_P°/R$, $(H° - E_0^c)/RT$, $(E_0° - G°)/RT$, and $S°/R$ have been calculated at closely spaced intervals from 50 to 5000 °K within an overall uncertainty of less than 0.1 percent at 1000 °K.

May-June 1968

Jump rates for point defects in special positions held by a trapping center of noncubic symmetry, H. S. Peiser and J. B. Wachtman, Jr., *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 3, 231-237 (May-June 1968).

Key words: Crystal symmetry; equivalent sites; jump rates; point defects; relaxation; trapping center.

In a previous paper [J. Phys. Chem. Solids **27**, 975 (1966)] the authors have discussed symmetry conditions for equivalence of jump rates operative in point-defect motion between crystallographically equivalent general sites neighboring a trapping center. The treatment is here extended to equivalent special sites to show that the total number of inequivalent jump rates can be expressed as $(N_t/N_d) - q_e - 1$ where N_t and N_d are the orders of the symmetry groups of the trap and defect respectively and where q_e is the number of independently effective pairs of nonself-inverse symmetry operators (paired with their inverses) all in the symmetry group of the trap. The number q_e can be obtained by counting any nonself-inverse operator pair, an element of which, when multiplied by an element of the defect symmetry, equals neither its own inverse nor an element of a pair previously counted.

For thermally activated relaxation processes expressions apply for maximum and minimum numbers of jump frequencies involved in complete and partial relaxation processes. For complete relaxation the maximum number is the number of prime factors in the ratio of the order of the symmetry group of the trap to that of the defect group. The minimum number is the minimum number of generators that will raise the defect position symmetry to that of the trap.

The thermodynamics of the ternary system; water-potassium chloride-calcium chloride at 25 °C, R. A. Robinson and A. K. Covington, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 3, 239-245 (May-June 1968).

Key words: Activity coefficient; calcium chloride; isopiestic measurements; mixed salt solutions; osmotic coefficients; potassium chloride; vapor pressure.

Isopiestic vapor pressure measurements have been made on the system: water-potassium chloride-calcium chloride at 25 °C. The osmotic coefficients of the mixed salt solutions and the activity coefficients of each salt in the presence of the other have been evaluated.

Force field for SiF_4, I. W. Levin and S. Abramowitz, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 3, 247-249 (May-June 1968).

Key words: Band contour; Coriolis constant; force field; infrared; isotopic shift; low temperature; SiF_4.

The force field of SiF_4 has been determined using both Coriolis coupling constants obtained from an investigation of the band contour of ν_3 at 195 °K and isotopic shifts. The force fields are equally well determined using both methods and are in agreement.

Blemish formation in processed microfilm, C. I. Pope, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 3, 251-259 (May-June 1968).

Key words: Archival record film; blemishes due to aging; colloidal silver; microfilm; microfilm storage cartons; permanent record film; peroxides.

Oxidizing and reducing agents generated by paper cartons during storage may react with the image silver to form blemishes. The type of fixing bath, concentration of chlorine in the wash water, washing time and composition of the storage cartons can be factors that accelerate or retard the attack of the peroxide on the image silver. Microfilm washed after fixation in distilled water or chlorine-free tap water formed blemishes when exposed to peroxide paper. A trace of silver chloride in the image silver of processed microfilm augmented the formation of the natural type blemishes when exposed to peroxide paper, but high concentrations of residual silver chloride inhibited blemish formation. During storage, some storage cartons evolved formaldehyde, formic acid, and ammonia which created a chemical environment favorable for blemish formation in microfilm in the presence of peroxide. A correlation was found between the incidence of blemishes and the brand of paper storage cartons. A procedure was developed for testing processed microfilm to determine its susceptibility to blemish formation. According to the present theory, peroxide reacts with the silver in the image, forming colloidal silver which imparts a yellowish or reddish color to the blemishes.

Absolute isotopic abundance ratios of common, equal-atom and radiogenic lead isotopic standards, E. J. Catanzaro, T. J. Murphy, W. R. Shields, and E. L. Garner, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 3, 261-267 (May-June 1968).

Key words: Absolute ratios; abundance; isotopic standards; lead.

Absolute values have been obtained for the isotopic abundance ratios of common, equal-atom, and radiogenic lead

isotopic standards using solid-sample mass spectrometry. Samples of known $^{208}Pb/^{206}Pb$ ratio, prepared from nearly pure separated ^{206}Pb and ^{208}Pb solutions, were used to calibrate the mass spectrometers.

Rate of nickel in Al-10 percent Si composites containing nickel-coated sapphire whiskers, H. Yakowitz, W. D. Jenkins, and H. Hahn, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 3, 269-272 (May-June 1968).

Key words: Al-10 percent Si alloy; electron probe microanalyzer; fiber composites; matrix-whisker bonding; Ni coated sapphire whiskers; optical metallography; sapphire whiskers.

The role of nickel in regard to whisker-matrix bonding in a composite of nickel-coated sapphire whiskers inserted into a matrix of aluminum-10 percent silicon alloy by means of liquid phase hot-pressing was investigated. The study was carried out with the aid of optical and electron microscopy, electron probe microanalysis, and microhardness measurements. Results show that most of the nickel is distributed within the matrix alloy.

Some of the nickel apparently interacts with the matrix and forms $NiAl_3$. The presence of $NiAl_3$ in this form increases the average hardness of the composite but apparently does not contribute significantly to strengthening of the alloy. Occasionally, clusters or clumps of nickel-rich material which also contains aluminum are found at or very near whisker-matrix interfaces. It is concluded that if any bonding of the nickel to the sapphire occurred, it was in these regions. Finally, a heat treatment to improve nickel to sapphire bonding and hence bonding of the entire composite is suggested.

July-August 1968

Mass spectrometric study of photoionization. X. Hydrogen chloride and methyl halides, M. Krauss, J. A. Walker, and V. H. Dibeler, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 4, 281-293 (July-Aug. 1968).

Key words: Dissociation energies; HCl; ionization; mass spectrometry; methyl halides; vacuum ultraviolet spectroscopy.

Photoionization efficiency curves are obtained for hydrogen chloride and several methyl halides, both ordinary and deuterated, from ionization threshold to 600 Å. Discussion is given on electronic structure of ions, autoionizing Rydberg states, and line-shape behavior. Ionization energies, heats of formation of ions, and bond dissociation energies are tabulated without regard to distribution of energy in internal modes, in relative kinetic energy, or other possible modes.

The fourth and fifth spectra of vanadium (V IV and V V), L. Iglesias, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 4, 295-308 (July-Aug. 1968).

Key words: Atomic spectra, V IV and V V; classified lines, V IV and V V spectra; spectra V IV and V V; terms, V IV and V V spectra; vanadium, the fourth and fifth spectra of.

The V IV spectrum has been extended by using as light sources a condensed spark and a hollow cathode discharge. With the new data, the experimental interpretation of levels of the $3d^2$, $3d\,4d$, $3d\,5s$, $3d\,5p$, $3d\,4f$, $3d\,5d$ and $3d\,6s$ configurations has been completed with the exception of three levels of the $3d\,4f$ and $3d\,5d$ configurations. Four levels of the $3d\,5g$ electron configuration have also been found. These levels account for 340 of the 360 lines assigned to V IV in the region 675 Å – 5940 Å.

Three members of the $3d\,ns$ series give an ionization potential of $376730 \pm 40\ cm^{-1} = 46.70$ volts.

The $4d\ ^2D$ term of V V has also been located in the course of this work. With the aid of the new observations between 675 Å and 2200 Å the value of some levels already known has been improved.

Variation of absorptance-curve shape with changes in pigment concentration, G. L. Howett, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 4, 309-340 (July-Aug. 1968).

Key words: Absorption; adaptation; Beer's law; chromatic adaptation; color vision; concentration; cones; curve shape; high luminance; metameric matches; pigment; photopigment; vision.

A complete quantitative analysis is presented of changes in the shape of the spectral absorptance curve of any Beer's-law pigment solution (or other Bouguer's-law material) as concentration of the pigment, or thickness of the solution layer, is varied. The relative absorptance curve, normalized to unit maximum, is taken as defining the shape of the absolute absorptance curve, and the index of shape change is taken to be the difference between the normalized curves. All concentration changes from infinite decrease to infinite increase are covered, with some extreme cases requiring limit methods. Formulas and graphs are given for determining, as a function of concentration change and peak absolute absorptance of the original curve, where along the curve the shape change is greatest, and how large the maximum change is. Implications for color vision theory are discussed and it is shown that the assumption of low peak absorptances (<10%) for the visual photopigments accounts for the constancy of the color-matching functions for moderate luminances, but not, in itself, for the breakdown of matches at high luminances; while the assumption of high peak absorptances (≈ 80%), although it contradicts recent microspectrophotometric measurements, seems to account for both phenomena.

Periodic acid, a novel oxidant of polycyclic, aromatic hydrocarbons, A. J. Fatiadi, *J. Res. Nat. Bur. Stand. (U.S.)*), **72A** (Phys. and Chem.), No. 4, 341-350 (July-Aug. 1968).

Key words: Aprotic solvents; aromatic hydrocarbons; malonic acid; periodic acid; pyrene radical; quinones; reaction mechanism; sodium metaperiodate.

Certain polycyclic, aromatic hydrocarbons can be oxidized with periodic acid in aprotic solvents containing a small proportion of water. A unique, two-fold character of response to periodic acid by these hydrocarbons has been found: (1) production of a coupling reaction through a radical intermediate [conversion of pyrene into 1,1′-bipyrene, and fluorene into 1,2-bis(2,2′-biphenylylene)ethylene] or (2) conversion into quinones by a two-equivalent oxidation mechanism that does not involve a radical intermediate [acenaphthene, anthracene, anthrone, benz[*a*]anthracene, naphthacene, naphthalene, and phenanthrene]. Little or no reaction was observed when oxidation was attempted with sodium metaperiodate instead of periodic acid.

Electron-spin resonance revealed no radical intermediate in the oxidation of malonic acid with either periodic acid or sodium periodate.

A galvanic cell with a low emf-temperature coefficient, G. N. Roberts and W. J. Hamer, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 4, 351-354 (July-Aug. 1968).

Key words: Cell with low temperature coefficient; double salt; galvanic cells; standard cells.

This paper presents data on a modified cadmium sulfate saturated standard cell of the Vosburgh type in which a tertiary amalgam containing 11.2 percent bismuth and 8.4 percent cadmium is used as anode and the double salt, $CdSO_4 \cdot Na_2SO_4 \cdot 2H_2O$ is added to the usual $CdSO_4$ electrolyte in an amount more than

sufficient to saturate the solution with the double salt. Crystals of $CdSO_4 \cdot Na_2SO_4 \cdot 2H_2O$ are placed over the surface of both electrodes. The emf of the cell, as a function of temperature, is given by

$$E \text{ (in volts)} = 1.018243 + 3.0956 \times 10^{-5} t - 8.559 \times 10^{-7} t^2 + 1.3534 \times 10^{-8} t^3.$$

At 25 °C the cell has an emf-temperature coefficient of +13.5 μV/°C while the conventional saturated cadmium sulfate cell has a dE/dT of −49.4 μV/°C. Data on the emf-temperature hysteresis of the cell on cooling and on heating are also given in graphical form. Data on the changes in Gibbs energy, enthalpy, entropy, and heat capacity for the cell reaction are given for the temperature range of 5 to 40 °C.

Synthesis of cerite, J. Ito, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 4, 355-358 (July-Aug. 1968).

Key words: Ca, Mg phosphate; hydrothermal synthesis; inorganic synthesis; mineral chemistry; rare-earth silicate; x-ray powder analysis.

Some compounds isostructural with cerite have been synthesized hydrothermally at temperatures from 500 to 720 °C. The compositional range for cerite, and its phase relation to the silicate apatites are established in terms of ionic radii of rare-earth and divalent ions. The proposed formula for cerite on the basis of isomorphism with whitlockite, $Ca_3(PO_4)_2$, is discussed. A solid-solution series between $Ca_9P_6O_{24} - Ca_7Mg_2P_6O_{24}$ (whitlockite − Mg-whitlockite) has been established.

Tables of collision integrals for the (m,6) potential function for 10 values of m, M. Klein and F. J. Smith, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 4, 359-424 (July-Aug. 1968).

Key words: Collision integrals; diffusion; potential; thermal conductivity; thermal diffusion; transport properties; viscosity.

Tables of collision integrals are presented for the (m,6) potential function for 87 reduced temperatures for each of 10 values of m. The exponents m used were $m = 9$, 12, 15, 18, 21, 24, 30, 40, 50, and 75. Comparisons are made with five other calculations for the case $m = 12$. The accuracy of the calculation appears to be at least several parts in 10,000.

Spectrum of relaxation times in GeO_2 glass, A. Napolitano and P. B. Macedo, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 4, 425-433 (July-Aug. 1968).

Key words: Activation energy; annealing; germania glass; index of refraction; relaxation times; thermal expansion; two relaxation model; viscosity.

Index-of-refraction versus time isotherms have been established for germania glass. Using the crossover technique with air-quenched samples and applying the two relaxation time model previously reported for borosilicate glass, it was found that the width of the spectrum of relaxation times for germania glass was temperature dependent. Upon analyzing this in terms of a distribution of activation energies, the results showed that, similarly to B_2O_3, activation energies smaller than the activation energy present in the Arrhenius region appear at low temperatures.

Extensive viscosity measurements by the fiber elongation method were made from 10^{11} to 6×10^{14} poises. From this data a lower and more precise value of the activation energy ($E\eta$ = 72.3 kcal/mol) was obtained in the annealing range.

Resumé of values of the Faraday, W. J. Hamer, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 4, 435-439 (July-Aug. 1968).

Key words: Coulometers; Faraday; inclusions in silver coulometers; values of Faraday.

A resumé is given of the determinations of the value of the Faraday. Values obtained by silver deposition, iodide oxidation, oxalate oxidation, the omegatron, and silver dissolution are reviewed. All values are converted to the unified ^{12}C international scale of atomic weights using the international atomic weights of 1967. Values of the Faraday are given in terms of both the NBS (legal) and absolute units of electrical measure. In the latter the new value for the acceleration due to gravity is used in computing the absolute value of electric current. On this basis and using the atomic weight of silver determined by Shields, Craig, and Dibeler, and converting to the ^{12}C scale, the value of the Faraday is 96,486.9 ± 1.6 absolute coulombs per gram-equivalent which differs by only 1 part per million from the value recommended by the National Academy of Sciences–National Research Council. If the atomic weight of silver recommended in 1967 by the International Atomic Weight Commission is used, the Faraday on the new gravity value is 96,486.5 ± 1.6 absolute coulombs per gram-equivalent which differs by 5 parts per million from that recommended by the National Academy of Sciences–National Research Council. No change in the value of the Faraday adopted by the NAS–NRC Committee is recommended.

September-October 1968

Studies in bomb calorimetry. A new determination of the energy of combustion of benzoic acid in terms of electrical units, K. L. Churney and G. Armstrong, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 5, 453-465 (Sept.-Oct. 1968).

Key words: Benzoic acid, heat of combustion; bomb calorimetry, procedures and errors; bomb-calorimeter, electrical calibration; Dickinson calorimeter; heat of combustion.

The heat of combustion of NBS Standard Sample 39i of benzoic acid under standard bomb conditions has been determined in terms of electrical units. A value of −26,434.0 J g^{-1} was obtained. The total uncertainty in our determination is estimated to be ±3.3 J g^{-1}. The uncertainty due to random errors was 1.7 J g^{-1} and is based on the appropriate factors for the Student t distribution at the 95 percent confidence limits for eleven determinations of the energy equivalent of the calorimeter and six determinations of the heat of combustion of benzoic acid. The principal systematic error, neglect of surface temperature correction for our calorimeter, has been assigned a value of ±2.6 J g^{-1} until more reliable estimates of the correction can be made. Particular emphasis was placed on improving the precision of a calorimetric measurement over those previously obtained in this laboratory by the use of more sensitive auxiliary measuring equipment and more accurate procedures to evaluate the corrected temperature rise.

Effect of low pressures on the room temperature transitions of polytetrafluoroethylene, G. M. Martin and R. K. Eby, *J. Res. Nat. Bur. Stand. (U.S.)*, **72A** (Phys. and Chem.), No. 5, 467-470 (Sept.-Oct. 1968).

Key words: Dilatometry; enthalpy; entropy; helical molecule; low pressure; phase diagram; polytetrafluoroethylene; transitions; triple point.

Between approximately 20 and 30 °C at atmospheric pressure, polytetrafluoroethylene exhibits a phase (denoted as IV), which has not been observed in P-V-T measurements at pressures above 10^8 Nm^{-2} (1 Kilobar). Data are presented to resolve this phase in the temperature range 0 to 50 °C and the pressure range 0 to 0.686×10^8 Nm^{-2}. The II-IV (20 °C) transition pressure increases with temperature according to the equation $P = (-820$

$+ 26.9t + 0.68t^2) \times 10^5$ and the IV-I (30 °C) transition according to the equation $P = (-91 - 57.8t + 1.99t^2) \times 10^5$ suggesting a possible triple point near 2.6×10^8 Nm^{-2} and 54 °C. However, the IV-I transition probably cannot be resolved by volume measurements at pressures above 2×10^8 Nm^{-2} because its volume of transition is small and the two transitions overlap. The enthalpies of the transitions are calculated for different pressures and some thermodynamic properties of phase IV are determined indirectly. It is shown that, if the effect of volume change is subtracted, random reversals of the hand of the helical conformation of the molecule can account for appreciable fractions of the enthalpy and corresponding entropy change for the combined transitions at atmospheric pressure.

Electrostatic potentials and their spatial derivatives about point defects in ionic crystals, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 471-475 (Sept.-Oct. 1968).

Key words: CaF_2; classical ionic lattice theory; electrostatic potential; lattice distortion; NaCl; point defect.

The electrostatic potential which arises from a lattice array of point ions is computed in terms of a Taylor's series expansion for small distances from a lattice site. This expansion gives the change in electrostatic energy when an ion moves in the background of a perfect point ion lattice potential. The Taylor's series coefficients for terms up to fourth order in the ion displacement are evaluated for the NaCl and CaF_2 lattice structures.

Electric fields produced by a charge density in ionic crystals, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 475-478 (Sept.-Oct. 1968).

Key words: CaF_2; dipole shell coefficient; electric fields; NaCl; polarization; spatially extended defects.

Spatially extended defects such as the *F* center give rise to an effective defect charge density which may produce important polarizations in the crystal. The electric field in the crystal depends upon these induced dipoles. Lattice summations for the contribution to the electric field which arises from ionic shells centered about the defect are evaluated for the NaCl and CaF_2 lattice structures.

Mass spectrometric study of the photoionization of some fluorocarbons and trifluoromethyl halides, C. J. Noutary, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 479-485 (Sept.-Oct. 1968).

Key words: CF_4; C_2F_6; C_3F_8; C_4F_{10}; CF_3H; CF_3Cl; CF_3Br; CF_3I; heats of formation; ionization energies; mass spectrometric; photoionization; vacuum ultraviolet.

The photoionization curves and the threshold energies for the molecule and several abundant fragment ions of CF_4, C_2F_6, C_3F_8, C_4F_{10}, CF_3H, CF_3Cl, CF_3Br, and CF_3I have been measured. The threshold energies are correlated and the ionic heats of formation and some bond dissociation energies are calculated. It is apparent that the values obtained for the CF_3^+ ions are not the adiabatic ones, but include large amounts of excess energy. This excess is the lowest for the CF_3^+ from CF_3I for which an explanation is suggested. Assuming that the excess is not zero for the last compound we obtain the following upper limits: $\Delta Hf_0°(CF_3)^+ \leq +365.3$ kJ $mol^{-1} = +87.3$ kcal mol^{-1}; $I(CF_3)^+ \leq 8.62$ eV; $I(C_2F_5)^+ \leq 8.72$ eV; $I(C_3F_7)^+ \leq 8.70$ eV; $I(C_4F_9)^+ \leq 8.68$ eV. From the mean value $D(C_p - C_p) = 402 \pm 2$ kJ $mol^{-1} = 96.0 \pm 0.5$ kcal mol^{-1} the bond dissociation energies $D(C_p - C_s) = 363 \pm 3$ kJ $mol^{-1} = 86.8 \pm 0.8$ kcal mol^{-1} and $D(C_s - C_s) = 337 \pm 4$ kJ $mol^{-1} = 80.6 \pm 1.0$ kcal mol^{-1} and $D(C_p - F) = 525$ kJ $mol^{-1} = 125.7$ kcal mol^{-1} are calculated.

Infrared matrix spectra of lithium fluoride, S. Abramowitz and N. Acquista, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 487-493 (Sept.-Oct. 1968).

Key words: Force field; infrared; lithium fluoride dimer; low temperature; matrix; vibrational assignment.

Evidence for a linear dimer Li_2F_2 has been obtained by extending the spectral measurements for matrix isolated lithium fluoride into the far infrared region. The vapors from solid ^6LiF, ^7LiF, and $^6LiF/^7LiF$ mixtures were deposited in argon matrices at liquid hydrogen temperatures. Vibrational assignments were made on the basis of the following linear species: $^6Li_2F_2$, $^7Li_2F_2$, $^{6,7}Li_2F_2$ and $^{7,6}Li_2F_2$. Although the specific geometry of the dimer could not be determined, a normal coordinate analysis supported the spectral interpretation of a linear structure ($C_{\infty v}$).

Electronic transition moment integrals for first ionization of CO and the A – X transition in CO^+. Some limitations on the use of the *r*-centroid approximation, P. H. Krupenie and W. Benesch, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 495-503 (Sept.-Oct. 1968).

Key words: CO; CO^+; electronic transition moment integrals; Franck-Condon factors; Franck-Condon principle; transition probabilities.

Integrals necessary for the determination of transition moment matrix elements from experimental data have been evaluated numerically by use of vibrational wave functions derived from RKR potentials. A power series expansion for the electronic transition moment has been assumed. The significant quantities which can be related to an arbitrary center of expansion are vibrational overlap integrals and quantities of the form $\int \psi_v r'' \psi_{v''} dr$. Experimental band intensities and relative populations for vibrational levels of the initial electronic state are needed to determine the expansion coefficients. Transition moment integrals have been calculated for first ionization from the ground electronic state of CO and for the $A^2\Pi_i - X^2\Sigma^+$ transition of CO^+. Comparison of these integrals with previous calculations based on Morse functions has shown them to be rather sensitive to the wave-functions [potentials] used. Characteristics generally attributed to the *r*-centroid and related integrals are examined, and some limitations on the use of the *r*-centroid approximation are discussed, following a review of assumptions made in the use of that approximation.

The configurations $3d^n4p$ in doubly ionized atoms of the iron group, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 505-520 (Sept.-Oct. 1968).

Key words: βQ and T corrections; configurations $3d^n4p$; energy levels; interaction parameters; iron group; third spectra.

Experimental levels of the configurations $3d^n4p$ in the third spectra of the iron group were compared with corresponding calculated values. Besides the electrostatic and spin-orbit interactions the $\alpha L(L+1)$, βQ and T corrections were considered in the individual and general treatments. The insertion of the parameters β and T improved the results by about 25 percent. The root-mean-square (rms) error on fitting 581 experimental levels by means of 21 free interaction parameters was 138 cm^{-1}. Altogether 912 energy levels were predicted.

Electron impact excitation of hydrogen Lyman-α radiation, R. L. Long, Jr., D. M. Cox, and S. J. Smith, *J. Res. Nat. Bur. Stand. (U.S.),* **72A** (Phys. and Chem.), No. 5, 521-535 (Sept.-Oct. 1968).

Key words: Atomic hydrogen; beams; electron impact excitation; experimental; high vacuum; Lyman-α.

An experimental investigation of electron impact excitation of the $2p$ state of atomic hydrogen is described. A beam of elec-

trons was passed through a chopped beam of hydrogen atoms in a high vacuum apparatus. The modulated flux of Lyman-α photons emitted in the radiative decay of the $2p$ state was taken as a measurement of the excitation probability resulting from direct excitation plus indirect excitation resulting from cascading. The region surrounding the intersection of the two beams was electrically and magnetically shielded to prevent quenching of metastable $2s$ atoms and thereby to ensure that the observed Lyman-α flux resulted from decay of the short-lived $2p$ state. The experimental results are consistent with those obtained by Fite, Stebbings, and Brackmann [1959], and confirm the existence of a large discrepancy between theoretical and experimental results in the electron energy range below 50 eV.

November-December 1968

Interaction energy surfaces for Li(2^2S) and Li(2^2P) with H_2, M. Krauss, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 553-557 (Nov.-Dec. 1968).

Key words: Charge-transfer; energy surface; energy transfer; Hartree-Fock; $H_2(X^1\Sigma_g^+)$; Li(2^2P); Li(2^2S); resonance state.

Interaction energy surfaces for the interaction of Li(2^2S) and Li(2^2P) with H_2 are calculated using approximate Hartree-Fock trial functions. The crossing of energy curves is observed for C_{2v} conformations if the H_2 internuclear distance is sufficiently large. No crossing is observed for colinear collisions for any H_2 distance.

The wave function of the strongly attractive state involved in the crossing is related to the metastable negative-ion states that are postulated to account for resonant electron-molecule scattering. Such a charge-transfer state can only be bound for C_{2v} conformations for the H_2 molecule. The likelihood and geometry of the crossing complexes for other molecules interacting with alkalis is discussed in terms of the formation of these resonance charge-transfer states.

Energy levels and classified lines in the first spectrum of technetium (Tc I), W. R. Bozman, C. H. Corliss, and J. L. Tech. *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 559-608 (Nov.-Dec. 1968).

Key words: Atomic spectra; energy levels, Tc I; spectrum of technetium; technetium.

Progress in the classification of Tc I lines is reported. About 2200 of the known Tc I lines between 2154 and 8918 Å are now classified as transitions between 108 even and 147 odd energy levels. Tables of levels and classified lines are given.

The first spectrum of tungsten (W I), D. D. Laun and C. H. Corliss, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 609-755 (Nov.-Dec. 1968).

Key words: Atomic spectra; energy levels; spectroscopy; spectrum of tungsten; tungsten; wavelengths.

The first spectrum of tungsten (W I) has been observed in the region between 2000 Å and 10500 Å. Of the 6800 spectral lines reported here, about 5500 have been classified as transitions between 91 even and 365 odd levels.

Theoretical interpretation of the even levels in the first spectrum of tungsten, Y. Shadmi and E. Caspi, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 757-760 (Nov.-Dec. 1968).

Key words: Atomic spectrum, W I; energy levels, W I; spectrum of tungsten; tungsten; W I.

The calculated even levels of W I up to the height of about 40,000 cm^{-1}, which is the height of the ground level of the d^6 configuration, are reported. Fifty-seven observed levels are fitted to them, with a mean error of 100 cm^{-1}. *L-S* coupling and configuration assignments are usually meaningless because of a between 108 even and 147 odd energy levels. very strong spin-orbit interaction and configuration interaction. For every level, the largest squared *L-S* coupling components of its eigenvector are reported, as well as observed and calculated *g*-values.

Stable carbon isotope ratio measurements with a gas density meter, S. P. Wasik and W. Tsang, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 761-764 (Nov.-Dec. 1968).

Key words: Carbon-13; carbon dioxide; ethyl acetate; gas chromatography; gas density meter; isotope ratios.

A method is presented for measuring C^{13}/C^{12} isotope ratio of organic compounds by burning the material in a stream of normal CO_2, separating the combustion products by gas chromatography and sequentially measuring the density of the enriched CO_2 peak with a gas density meter. Data are presented for the analysis of enriched ethyl acetate from 15 to 1 percent enrichment. The method is applicable for other stable isotope analysis.

The single crystal spectrum of hexakis(imidazole)nickel(II)nitrate, C. W. Reimann, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 765-768 (Nov.-Dec. 1968).

Key words: Crystal spectrum; hexakis(imidazole)nickel(II)nitrate; octahedral nickel(II); spin-forbidden bands.

The crystal spectrum of hexakis(imidazole)nickel(II)nitrate from 7000 cm^{-1} to 30,000 cm^{-1} at liquid nitrogen temperature has been measured. Three spin-allowed and three spin-forbidden bands in this spectrum were assigned on the basis of octahedral ligand field symmetry. These assignments are compared with those made in several related materials. Important differences and similarities in spectral detail and their bearing on assignments in other strong field nickel(II) complexes, are discussed.

Crystalline alpha and beta forms of 3-*O*-α-D-glucopyranosyl-D-arabinopyranose, H. S. Isbell, H. L. Frush, and J. D. Moyer, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 769-771 (Nov.-Dec. 1968).

Key words: Anomeric sugars; calcium maltobionate; maltose-*1*-^{14}C; mutarotation of 3-*O*-α-D-glucopyranosyl-D-arabinopyranose; Ruff degradation of; sugars; 3-*O*-α-D-glucopyranosyl-D-arabinopyranose.

Crystalline 3-*O*-α-D-glucopyranosyl-α-D-arabinopyranose monohydrate, mp 120 to 121 °C, and 3-*C*-α-D-glucopyranosyl-β-D-arabinopyranose, mp 155 to 157 °C, were prepared from a sirup obtained by the Ruff degradation of calcium maltobionate. For the *alpha* monohydrate, $[\alpha]_D^{20} = +16.7 \times 10^{-0.024t} - 9.6 \times 10^{-0.098t} + 46.6$, and for the anhydrous *beta* form, $[\alpha]_D^{20} = -25.6 \times 10^{-0.025t} - 9.4 \times 10^{-0.097t} + 49.2$. The structure of the sugar was established by converting it into maltose.

Treatment of the *alpha* form with pyridine-acetic anhydride gave a heptaacetate, mp 127 to 128 °C, $[\alpha]_D^{20}$ + 62.4° (*c* 2.5, chloroform). The *beta* form gave a heptaacetate, mp 194.5 – 195.5 °C, $[\alpha]_D^{20}$ + 13.4° (*c* 2.5, chloroform).

Preparation and solubility of hydroxyapatite, E. C. Moreno, T. M. Gregory, and W. E. Brown, *J. Res. Nat. Bur. Stand.* (*U.S.*), **72A** (Phys. and Chem.), No. 6, 773-782 (Nov.-Dec. 1968).

Key words: Apatite; hydroxyapatite; calcium phosphates; solubility; solubility isotherms; solubility product.

Two portions of a synthetic hydroxyapatite (HA), $Ca_5OH(PO_4)_3$, fully characterized by x-ray, infrared, petrographic, and chemical analyses, were heated at 1,000 °C in air

and steam atmospheres, respectively. Solubility isotherms for these two samples in the system $Ca(OH)_2$-H_3PO_4-H_2O were determined in the *p*H range 5 to 7 by equilibrating the solids with dilute H_3PO_4 solutions. Both samples of HA dissolved stoichiometrically. The activity products $(Ca^{++})^5(OH^-)(PO_4^{\equiv})^3$ and their standard errors—obtained by a least squares adjustment of the measurements (Ca and P concentrations and *p*H of the saturated solutions) subject to the conditions of electroneutrality, constancy of the activity product, and stoichiometric dissolution—were $3.7_3 \pm 0.5 \times 10^{-58}$ for the steam-heated HA and $2.5_1 \pm 0.4 \times 10^{-55}$ for the air-heated HA. Allowance was made in the calculations for the presence of the ion pairs $[CaHPO_4]^0$ and $[CaH_2PO_4]^+$. The higher solubility product for the air-heated HA is ascribed either to a change in the heat of formation brought about by partial dehydration or to a state of fine subdivision resulting from a disproportionation reaction. The solubility product constants were used to calculate the points of intersection (i.e., singular points) of the two HA solubility isotherms with the isotherms of $CaHPO_4 \cdot 2H_2O$ and $CaHPO_4$; it was found that the *p*H's of the singular points for the air-heated HA were a full unit higher than those of the steam-heated preparation. Conditions are described for the precipitation of HA crystals suitable for solubility measurements.

High temperature dehydroxylation of apatitic phosphates, T. Negas and R. S. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, 72A (Phys. and Chem.), No. 6, 783-787 (Nov.-Dec. 1968).

Key words: Apatite; dehydroxylation; high temperature; phosphates; x-ray diffraction.

$Sr_{10}P_6O_{24}(OH)_2$, (Hex. $a = 9.765$ Å, $c = 7.280$ Å), and $Ba_{10}P_6O_{24}(OH)_2$, (Hex. $a = 10.177$ Å, $c = 7.731$ Å), undergo cell parameter contractions at elevated temperatures in air. These can be correlated with progressive dehydroxylation, although neither can be completely dehydrated. $Pb_{10}P_6O_{24}(OH)_2$, (Hex. $a = 9.878$ Å, $c = 7.432$ Å), also does not completely dehydrate in air.

A new apatite-like strontium phosphate, (Hex. $a = 9.872$ Å, $c = 7.199$ Å), was prepared at elevated temperatures in vacuum.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 73A, JANUARY-DECEMBER 1969

January-February 1969

Specific heats of oxygen at coexistence, R. D. Goodwin and L. A. Weber, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 1-13 (Jan.-Feb. 1969).

Key words: Coexistence; experimental; heat capacity; liquid phase; oxygen; saturated liquid; specific heat.

Specific heats of saturated liquid, along the coexistence path, are useful for computing thermodynamic properties throughout the compressed liquid phase. We report 86 experimental heat capacities of oxygen for the two-phase system, liquid plus vapor, from the triple-point to near the critical-point and corresponding derived values for the liquid phase. These results are represented by a formula which can be integrated for heat absorbed and for entropy. The changes in value of internal energy, enthalpy, and entropy of the saturated liquid are tabulated from the triple-point to the critical-point.

Specific heats C_v of fluid oxygen from the triple point to 300 K at pressures to 350 atmospheres, R. D. Goodwin and L. A. Weber, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 15-24 (Jan.-Feb. 1969).

Key words: Compressed liquid; heat capacities; liquid; oxygen; specific heats; thermodynamic properties.

Experimental specific heats at constant volume for oxygen in single phase domains are reported from the triple point to 300 K at pressures to 350 atmospheres. An empirical equation with seven constants describes these specific heats over the entire domain of ρ-T coordinates to within the experimental accuracy of 1 to 2 percent. Values for the terminal slopes of PVT isochores at the coexistence boundary, $(\partial P/\partial T)_v$, are derived for the liquid.

Thermodynamic properties of fluid oxygen at temperatures to 250 K and pressures to 350 atmospheres on isochores at 1.3 to 3.0 times critical density, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 25-36 (Jan.-Feb. 1969).

Key words: Compressed liquid; enthalpy; entropy; internal energy; oxygen; saturated liquid; thermodynamic properties.

The starting point for these calculations is liquid oxygen at the triple point. An analytical formula is used for specific heats of saturated liquid along the coexistence path to obtain internal energies and entropies of the saturated liquid. With these initial values, the calculations next are made as a function of temperature along isochores, using an "equation of state" for the specific heats $C_v(\rho, T)$ in the single-phase domain. Enthalpies are obtained by adding Pv to the internal energies. Results are tabulated at uniform densities and temperatures. Based on uncertainties of one percent in the specific heat data, the uncertainty of thermal properties also is taken to be 1 percent.

Two new standards for the pH scale, B. R. Staples and R. G. Bates, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 37-41 (Jan.-Feb. 1969).

Key words: Acidity; carbonate; citrate; emf; hydrogen electrode; pH; standards for pH.

Two new primary standards for the NBS pH scale, supplementing the five already available, are proposed. The new reference solutions are the 0.05 molal solution of potassium dihydrogen citrate and a mixture of sodium bicarbonate and sodium carbonate, each 0.025 molal. The citrate solution has a pH of 3.776 at 25 °C and is more stable under certain conditions than either the tartrate or phthalate standards. The carbonate solution has a pH of 10.012 at 25 °C. It therefore extends the NBS pH scale above its present upper limit of 9.180 at this temperature. Reference values pH(S), based on emf measurements of cells with hydrogen electrodes and silver-silver chloride electrodes, have been assigned to these two standard solutions at 11 temperatures from 0 to 50 °C.

Calculation of diffusion coefficients in ternary systems from diaphragm cell experiments, P. R. Patel, E. C. Moreno, and T. M. Gregory, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 43-49 (Jan.-Feb. 1969).

Key words: Diaphragm cell; diffusion coefficients; least squares calculation; ternary system.

Using a generalized least square procedure, a method is developed to estimate diffusion coefficients, D_{ij}, from concentration measurements made in a set of experiments of varying duration but with the same initial conditions. The method requires neither approximations nor restrictions in the flow equations. The D_{ij} and their errors are calculated simultaneously with the adjustment of the weighted observables—concentrations of the two solute components and time. A procedure is described to insure convergence in a given experimental set. The effect of the duration of the longest experiment, and errors in the observables on the estimated values of D_{ij} and their errors, are investigated. Application of the method to available data yielded values for D_{ij} in agreement with those previously calculated by more involved procedures.

Calculated line strengths for the transition array $(3d^3 + 3d^24s) = 3d^24p$ in Ti II, H. Mendlowitz, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 51-64 (Jan.-Feb. 1969).

Key words: Calculated line strengths; configuration interaction; intermediate coupling; Ti II; $3d^3$, $3d^24s$, $3d^24p$ configurations; transition array.

The transition array for the transitions between the configurations $(3d^3+3d^24s)$ and $3d^24p$ in Ti II are presented here. The relative line strengths have been calculated in the intermediate coupling scheme, taking into account interaction between configurations. The relative phase and magnitude of the radial transition integrals $(s-p)$ and $(d-p)$ for the jumping electron in the LS coupling have been determined empirically.

Morphological stability of a cylinder, S. R. Coriell and S. C. Hardy, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 65-68 (Jan.-Feb. 1969).

Key words: Cylinder; ice; interface kinetics; morphological stability; solute diffusion; surface tension.

The stability of the shape of a solid cylinder crystallizing in a supercooled liquid is treated. The effects of solute diffusion, slightly anisotropic surface tension and interface kinetics are included. The resulting stability equations are applied to the specific case of ice cylinders.

Distorted tetrahedra in strontium copper åkermanite, J. Ito and H. S. Peiser, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 69-74 (Jan.-Feb. 1969).

Key words: Åkermanite; crystal chemistry; crystal growth; cupric silicate; flux growth; ion polyhedron distortion; melilite; Mössbauer spectroscopy; silicate gels; silicate synthesis; x-ray powder data.

New analogs of åkermanite: $Sr_2CuSi_2O_7$ and $Sr_2CdSi_2O_7$ as well as many previously synthesized analogs were obtained by a simple technique consisting of heating in air of precipitated gels of the right composition. X-ray data revealed an anomaly of the Cu^{2+} and (to a lesser extent) Fe^{2+} åkermanites which is explained by a simple geometric argument in terms of a small (~3°) angular distortion of the oxygen tetrahedron surrounding the smaller divalent cation. This interpretation is consistent with previous theoretical discussions and Mössbauer data on the iron analog prepared for this study. Single crystals of cobalt åkermanites can be grown from a sodium tungstate flux.

Tritium-labeled compounds XII. Note on the synthesis of D-glucose-2-*t* and D-mannose-2-6, H. S. Isbell, H. L. Frush, C. W. R. Wade, and A. J. Fatiadi, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 75-77 (Jan.-Feb. 1969).

Key words: D-Gluconic-*2-t* acid, synthesis of; D-Glucose-*2-t,* synthesis and radioanalysis of; D-Mannonic-*2-t* acid, synthesis of; D-Mannose-*2-t,* synthesis and analysis of; Sodium 2-*keto*-D-gluconate, reduction with lithium borohydride-*t*; sugars, tritium-labeled; tritium-labeled compounds, D-mannose-2-*t* and D-glucose-2-*t*.

D-Glucose-*2-t* and D-mannose-*2-t* have been synthesized from sodium 2-*keto*-D-gluconate (sodium D-*arabino*-hexulosonate). Reduction of the salt with lithium borohydride-*t* produced the epimeric, 2-labeled aldonic acids in almost equal proportions. The acids, separated by carrier techniques, were lactonized, and the lactones were reduced with sodium amalgam to the corresponding sugars. The specificity of the labeling was established by converting each sugar into D-*arabino*-hexulose phenylosazone and determining that the osazone was substantially tritium-free.

A survey of blemishes on processed microfilm, C. S. McCamy, S. R. Wiley, and J. A. Speckman, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 1, 79-97 (Jan.-Feb. 1969).

Key words: Aging blemishes; archival records; blemishes; microfilm blemishes; microscopic spots; redox blemishes.

As part of an investigation of the formation of six types of redox blemishes on microfilm, 7411 rolls of microfilmed records in 36 Federal Government agencies were microscopically inspected by 34 inspectors trained by the National Archives and the National Bureau of Standards. About 350,000 observations were statistically analyzed. Careful photographic processing, adequate washing, careful handling, cool and dry storage in inert containers, and adequate ventilation, are among the conditions that have been found beneficial in preventing blemish formation. Data are compiled in an appendix.

March-April 1969

Color representation of electron microprobe area-scan images by a color separation process, H. Yakowitz and K. F. J. Heinrich, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 2, 113-123 (Mar.-Apr. 1969).

Key words: Color photography; metallography; petrography; photomicrography; scanning electron microprobe; x-ray microscopy.

Composite color photographs were prepared using x-ray area scanned images from the electron probe microanalyzer. Three-color composites are completely interpretable in terms of the primary color (red, green or blue) chosen to represent each element. The color pictures were obtained by preparing conventional black-and-white scanning images which were then used as color-separation-positives, with appropriate filters, to make color prints. Methods for preparing and interpreting color composites are considered. Specifically, color mixing, proper choice of filters to match film characteristics, exposure criteria, and choice for each partial image are discussed in detail. Finally, typical applications drawn from the fields of metallurgy, mineralogy, and biology are shown to illustrate the principles described. With the use of Polaroid film this procedure is quite convenient.

Configurations $3d^n4p$ in singly ionized atoms of the iron group, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 2, 125-157 (Mar.-Apr. 1969).

Key words: Configurations $3d^n4p$; β and T corrections; energy levels; interaction parameters; iron group; second spectra.

Experimental levels of the configuration $3d^n4p$ in the second spectra of the iron group were compared with corresponding calculated values. Besides the electrostatic and spin-orbit interactions the α, β and T corrections were considered in the individual and general treatments. The insertion of the parameters β and T improved the results by about 21 percent. The rms error on fitting 703 levels by means of 21 free interaction parameters was 231 cm^{-1}. Altogether 912 energy levels were predicted.

Configurations $3d^n4p + 3d^{n-1}4s4p$ in Sc II, Ti II, and V II, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 2, 159-171 (Mar.-Apr. 1969).

Key words: Configurations $3d^n4p + 3d^{n-1}4s4p$; energy levels; interaction between configurations; iron group; second spectra.

Experimental levels of the configurations $3d^n4p + 3d^{n-1}4s4p$ for Sc II, Ti II, and V II were compared with corresponding calculated values. Electrostatic, spin-orbit interactions, as well as the α, β and T corrections, whenever possible, were considered for $3d^n4p$ and $3d^{n-1}4s4p$. The electrostatic interaction between the configurations $3d^n4p$ and $3d^{n-1}4s4p$ was included explicitly. The rms errors for Sc II, Ti II and V II were 4.6, 75 and 66 cm^{-1}, respectively.

Effective interactions in the even configurations of the third spectra of the iron group, Y. Shadmi, E. Caspi, and J. Oreg, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 2, 173-189 (Mar.-Apr. 1969).

Key words: Atomic theory; iron group; third spectra.

Four hundred eighty-three levels belonging to the configurations $3d^n + 3d^{n-1}4s$ of all third spectra of the iron group were calculated, and 334 observed levels were fitted to them. In addition to the usually used approximation, we first introduced a complete set of two-body and three-body effective-interaction parameters between $3d$ electrons. Using only two-body effective interactions, we obtained a rms error of 175 cm^{-1}; while the addition of three-body effective interactions reduced the rms error to 46 cm^{-1}. When a parameter representing three-body effective interaction between $3d$ and $4s$ electrons was also introduced, the rms error was reduced to 38 cm^{-1}.

Test of a kinetics scheme: emission in $H(^2S)+NO(^2\Pi)$, M. Krauss, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 2, 191-193 (Mar.-Apr. 1969).

Key words: Hartree-Fock; $HNO(^1A', ^3A'', ^1A')$; interaction energy; ionic state; radiative recombination; reaction barrier.

The mechanism to explain the afterglow in the collision of $H(^2S)$ and $NO(^2\Pi)$ is critically examined by calculating part of

the energy surface of the $^3A''$ state. It is found that the long range interaction energies are consistently repulsive even though at shorter distances attractive ionic interactions dominate. It is concluded that the essential feature of the Clyne and Thrush mechanism is missing; intimate interaction of $H(^2S)$ and $NO(^2\Pi)$ is not possible at room temperature along the $^3A''$ surface. This study was undertaken to provide an example where a theoretical calculation is required to critically test a kinetics mechanism.

A nuclear magnetic resonance and relaxation study of dimethoxyborane, T. C. Farrar and T. Tsang, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 195-199 (Mar.-Apr. 1969).

Key words: Boron-10; boron-11; dimethoxyborane; proton: pulsed nuclear magnetic resonance; scalar and quadrupolar coupling constants and relaxation effects.

Proton and boron-11 c.w. nuclear magnetic resonances have been studied in solid $H^{11}B(OCD_3)_2$ and $H^{10}B(OCD_3)_2$. For $^{11}3$, only the $-1/2 \rightarrow 1/2$ transition, broadened by second order quadrupolar effects and by proton dipolar interaction can be seen; from the spectrum at several rf frequencies, the quadrupolar coupling constant $|e^2qQ/h|$ was found to be 3.0 ± 0.2 MHz ($\pm$ always refers to rms errors). In $H^{10}B(OCD_3)_2$, the proton line shapes at 53 and 10 MHz are considerably different; this may be interpreted as due to changes in the directions of ^{10}B nuclear quantization. Nuclear magnetic relaxation studies have been made in the liquid phase. From the ^{10}B and ^{11}B relaxation times, the activation energy for molecular reorientation was found to be 8.7 ± 0.4 kJ/mol (2.1 ± 0.1 kcal/mol). Consistent values for $|e^2qQ/h|$ were obtained from relaxation measurements in liquid phase and from c.w. spectra in solid phase. The temperature dependence of proton relaxation times deviates significantly from the activation energy model at higher temperatures, where spin-rotation interactions may be important. Proton transverse relaxation times (T_2) have also been measured and are consistent with the Allerhand-Thiele theory.

The effects of low energy irradiation on organometallics. Organometal halides of group IVA, F. E. Brinckman, G. F. Kokoszka, and N. K. Adams, Jr., *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 201-206 (Mar.-Apr. 1969).

Key words: EPR; free radicals; germanium; irradiation; low-temperature reaction; organometallic compounds; silicon; tin.

A group of selected group IVA halides of the type $(CH_3)_nMCl_{4-n}$, where $n = 0$, 1, 3 and M = Si, Ge, Sn have been subjected to low-energy irradiation (254 and 370 nm) in the condensed phase at -196 °C. This survey also examined related compounds including $HSiCl_3$, $CH_2ClSiCl_3$, CH_3SiF_3, CH_3SiHCl_2 as well as cocondensed mixtures. It is demonstrated by EPR spectroscopy that these conditions suffice to cleave M–C bonds. By following spectral changes during or following irradiation, as a function of time, it is demonstrated that both primary and secondary reactions occur. Some general features of the spectra are discussed and certain conclusions are projected to additional studies on low temperature reactions in 1:1 cocondensed mixtures of organometal halides. Some preliminary supporting evidence from mass spectrometric observations is discussed.

Measurements of gaseous diffusion coefficients by a gas chromatographic technique, S. P. Wasik and K. E. McCulloh, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 207-211 (Mar.-Apr. 1969).

Key words: Argon; diffusion coefficient; gas chromatography; helium; krypton; nitrogen; oxygen.

A method is presented for measuring gaseous diffusion coefficients using a gas chromatographic technique. Diffusion coefficients were measured for the systems: argon, krypton, oxygen, and nitrogen diffusing into helium at temperatures from 77 to 400 K.

Phase relations in the Ru-Ir-O_2 system in air, C. L. McDaniel and S. J. Schneider, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 213-219 (Mar.-Apr. 1969).

Key words: Dissociation; oxidation; phase relations; Ru-Ir-O_2 system; RuO_2-IrO_2 system; solid solution.

The equilibrium phase relations were determined in an air environment for the system Ru-Ir-O_2. In air Ru oxidizes at moderate temperatures, to form RuO_2, which in turn dissociates at 1405 °C. Similarly Ir oxidizes to form IrO_2 and dissociates at 1020 °C. The dissociation of RuO_2 and IrO_2 are reversible processes. A ternary equilibrium phase diagram was constructed indicating selected oxygen reaction lines and isotherms. A binary representation of the Ru-Ir-O_2 system in air is given. Up to 1020 °C, RuO_2 reacts with IrO_2 to form a complete solid solution series having the rutile-type structure. At 1345 °C three solid phases, $rutile_{ss}$, Ru_{ss}, and Ir_{ss}, exist in equilibrium for compositions between approximately 2 and 45 mole percent IrO_2. Above 1405 °C dissociation is complete for all compositions and the phase relations are represented by the Ru-Ir system. At 1500 °C solid solution of Ru and Ir occurs with the addition of up to 45 mole percent Ir and up to 44 mole percent Ru, respectively.

Heats of reaction of natural rubber with sulfur, N. Bekkedahl and J. J. Weeks, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 221-231 (Mar.-Apr. 1969).

Key words: Aneroid calorimeter; calorimeter; heat measurements; heat of vulcanization; rubber; rubber-sulfur reaction; volume change on vulcanization; vulcanization.

An adiabatic copper calorimeter was used to determine the heats of vulcanization of pale crepe natural rubber with sulfur for mixtures varying in composition from 0 to 32 percent added sulfur. The side reaction that produces hydrogen sulfide was avoided by using reaction temperatures near 155 °C. Heats of reaction at 25 °C and at 155 °C are reported. The enthalpy change at 25 °C for compounds containing up to about 18 percent sulfur is given in joules per gram of vulcanizate by the equation, $\Delta H_{25} = -21.1 \cdot S$ with a standard deviation of 11 J/g. Here S is the percentage of combined sulfur. Above 18 percent sulfur the heat of reaction at 25 °C remains approximately constant at 380 ± 8 J/g. A comparison is made between the heat of vulcanization and the volume change on vulcanization, both as functions of combined sulfur, by making use of data in the literature.

A table of rotational constants of symmetric top molecules giving rise to microwave spectra, M. S. Lojko and Y. Beers, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 233-239 (Mar.-Apr. 1969).

Key words: Asymmetric, linear, and symmetric top molecules; "B" rotational constants; formaldehyde; microwave spectra; spectral lines; water.

This paper lists, in order of increasing value, the "B" rotational constants of most of the linear and symmetric top molecules which have been observed by microwave spectroscopy. Also are listed the microwave spectral lines which have been observed for the asymmetric tops water and formaldehyde. These data are useful for making a quick selection of a molecule which has a spectral line close to some previously selected frequency.

Energy levels, wave functions, dipole and quadrupole transition of Fe^{+++} ions in sapphire, J. Lewiner and P. H. E. Meijer, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73A** (Phys. and Chem.), No. 2, 241-268 (Mar.-Apr. 1969).

Key words: Energy levels of Fe^{+++} in Al_2O_3; iron doped Al_2O_3; magneto elastic tensor; paramagnetic resonance; quadrupole transitions; spin hamiltonian; transition probabilities; ultrasonic (paramagnetic) resonance; ultrasonic transition probabilities; wave functions of Fe^{+++}.

A computation is made of energy levels, wave functions and transition probabilities of the Fe^{3+} ion in Al_2O_3. The crystal field parameters used were those determined by Symmons and Bogle at 4 K. The magnetic field direction is described by the angles θ and φ indicating the directions with respect to and around the c axis of the crystal. The values of θ go from 0 to $\pi/2$ with $\pi/12$ intervals, the angles φ are 0 and $2\pi/3$ corresponding to the two nonequivalent sites of the crystal. The transition probabilities are given for dipole radiation in three polarization directions and for ultrasonic work the six components of the quadrupole transitions were computed.

May–June 1969

New even levels and classified lines in the first spectrum of tungsten (W I), C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 277-279 (May-June 1969).

Key words: Atomic energy levels in W I; classified lines of W I; spectrum, W I; tungsten, first spectrum; W I.

Ten new even levels, which classify 161 previously unclassified lines, have been found in the first spectrum of tungsten. Nine of these fit levels in the $(5d+6s)^6$ mixture of configurations calculated theoretically by Shadmi and Caspi.

The heat of combustion of beryllium in fluorine, K. L. Churney and G. T. Armstrong, *J. Res. Nat. Bur. Stand. (U. S.)*, **73A** (Phys. and Chem.), No. 3, 281-297 (May-June 1969).

Key words: Analysis of methane-hydrogen mixtures; beryllium fluoride; beryllium metal; combustion calorimetry; fluorine; heat of formation; molecular-sieve gas analysis; polytetrafluoroethylene.

An experimental determination of the energies of combustion in fluorine of polytetrafluoroethylene film and powder and of mixtures of beryllium with polytetrafluoroethylene gives for reaction (1) $\Delta H^\circ_{25°C} = -1022.22$ kJ mol^{-1} (-244.32 kcal mol^{-1}) with an overall precision of 0.96 kJ mol^{-1} (0.23 kcal mol^{-1}) at the 95 percent confidence limits. The total uncertainty is estimated not to exceed ± 3.2 kJ mol^{-1} (± 0.8 kcal mol^{-1}). The measurements on polytetrafluoroethylene give for reaction (2a) and reaction (2b) $\Delta H^\circ_{25°C} = -10369.7$ and -10392.4 Jg^{-1}, respectively. Overall precisions expressed at the 95 percent confidence limits are 3.3 and 6.0 Jg^{-1}, respectively.

$$\mathrm{Be(c) + F_2(g) = BeF_2(amorphous)} \qquad (1)$$

$$\mathrm{C_2F_4(polymer\ powder) + 2F_2(g) = 2CF_4(g)} \qquad (2a)$$

$$\mathrm{C_2F_4(polymer\ film) + 2F_2(g) = 2CF_4(g)} \qquad (2b)$$

Be_2C and Be metal were observed in a small carbonaceous residue from the combustion of the beryllium-polytetrafluoroethylene mixtures. Methods of analysis for these substances were developed. Gases resulting from the solution of the solid residues in aqueous KOH were analyzed for H_2 and CH_4 by differential absorption in molecular sieves at low temperatures.

Deuterium isotope effect on the dissociation of weak acids in water and deuterium oxide, R. A. Robinson, M. Paabo, and R. G. Bates, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 299-308 (May-June 1969).

Key words: Acidic dissociation; acidity; deuterium isotope effect; dissociation constants; heavy water; isotope effect pK values.

The dissociation constants of *o*-nitroanilinium ion, *m*-nitroanilinium ion, and 4-chloro-2,6-dinitrophenol in deuterium oxide at 25 °C have been determined by a spectrophotometric method, and an emf method has been used to obtain $(pK_1 + pK_2)/2$ for citric acid in deuterium oxide. In addition, data for the dissociation constants of other weak acids in ordinary and heavy water have been critically examined with a view to clarifying the relationship between the deuterium isotope effect and the intrinsic strength of the acid. The difference ΔpK between the pK value in deuterium oxide and that in water varies linearly with pK above $pK = 7$. Two stronger inorganic acids (sulfuric and phosphoric) also appear to lie on an extension of this same line. On the contrary, a considerable group of organic acids with pK less than 7 have values of Δpk that are more or less constant near $\Delta pK = 0.55$. It appears, therefore, that the isotope effect is more complex than has heretofore been assumed.

Vortex motions in ideal Bose superfluid, M. J. Cooper, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 309-312 (May-June 1969).

Key words: Coherent Bose gas; superfluid; vortices.

A general nonlinear field equation is derived for the macroscopic order parameter of an ideal coherent Bose gas. It is shown that this noninteracting system can support stable quantized vortex-like motions within the superfluid phase. It is suggested that this coherent phase of the ideal Bose gas describes the dominant physical features of real superfluid liquid helium.

Franck-Condon factors for the ionization of H_2O and D_2O, R. Botter and H. M. Rosenstock, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 313-319 (May-June 1969).

Key words: D_2O; Franck-Condon principle; geometry; H_2O; ion; photoionization; photoelectron spectroscopy.

Franck-Condon factors have been calculated for vertical transitions of H_2O and D_2O involving both bond length and angle changes. It is shown that even in the harmonic oscillator approximation different Franck-Condon factors are obtained for positive and negative angle changes. The results are used to obtain the geometry of the ion ground state. Satisfactory agreement is obtained for the isotope effect on the vibrational transition probabilities. The effects of anharmonicity are discussed semiquantitatively.

Topological features of hot carrier induced anisotropic breakdown on silicon diode surfaces, G. G. Harman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 321-331 (May-June 1969).

Key words: Anisotropy; crystallographic orientation; hot carriers; semiconductor breakdown; silicon diodes.

Both Gunn and Morozov have reported breakdown paths (tracking) on the surface of germanium under hot carrier conditions. Many silicon and gallium arsenide device failures appear to have been caused by similar breakdown tracks extending between contacts or across junctions. In the present work on silicon, extremely anisotropic tracking has been observed on the surface of long, thin, forward biased, $n^+ - p - p^+$, silicon diodes. The tracks propagate only in ⟨100⟩ crystallographic directions, independent of the applied field orientation, the temperature, or the crystal growth direction. For example, on a sample with a {100} surface plane, having the field oriented along a ⟨110⟩ direction, the tracks propagate along ⟨100⟩ directions which are 45° away from the applied field. Tracks on {100}-plane, disk shaped diodes, propagate radially from the center (positive biased) ohmic contact region and mark off the ⟨100⟩ directions

within 2°. Tracking requires both high current densities (~ 5 × 10^3 A/cm²) and high fields (~ 15 kV/cm), and occurs most readily on the *p*-region of 10 Ω cm, $n^+ - p - p^+$, ⟨100⟩ oriented diodes. Diodes with $n^+ - n - p^+$ structures having *n*-regions ~1 Ω cm, and $n^+ - n - n^+$, structures of ~ 1 Ω cm will also track, but require much higher fields and the ⟨100⟩ tracking orientation is not clearly defined. Tracking does not occur on diodes having the field oriented along a ⟨111⟩ direction.

Two basic types of tracks are observed. The first resembles a series of tiny explosion craters (~ 10μ m diam). The second appears to be continuous in nature, even though it is extended by each applied pulse. These tracks may be several micrometers wide and deep.

It is also shown that hot-minority-carrier sample explosions are anisotropic and not, as generally assumed, caused by thermal breakdown. Typically a {110} ⟨111⟩ oriented $n^+ - p - p^+$ sample requires 4 to 6 times more impulse energy to explode than a {100} ⟨100⟩ oriented sample.

The third spectrum of praseodymium (Pr III) in the vacuum ultraviolet, J. Sugar, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 3, 333-381 (May-June 1969).

Key words: Energy levels; interaction parameters; praseodymium; third spectrum; vacuum ultraviolet; wavelengths.

Measurements of the spectrum of doubly ionized praseodymium from 821 to 2103 Å are given. One hundred fifty-three energy levels deduced from these wavelengths and an earlier line-list of longer wavelengths are presented. These levels are identified with the configurations $4f^26s$. $4f^27s$. $4f^28s$. $4f^26p$. $4f^26d$. $4f^25f$. $5d^24f$. and $4f5d6s$ and are given term designations. Radial energy integrals belonging to these configurations are parametrically deduced from the known levels.

A value of 21.625 eV (174420 cm^{-1}) for the ionization energy of Pr III, with an estimated uncertainty of 0.016 eV (130 cm^{-1}), is derived from the $4f^2ns$ series ($n = 6, 7, 8$).

July-August 1969

Classical path methods in line broadening. I. The classical path approximation, E. W. Smith, C. R. Vidal, and J. Cooper, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 4, 389-404 (July-Aug. 1969).

Key words: Classical path methods; line broadening theory.

The classical path approximation is reviewed in a manner which permits definitive statements concerning its region of validity.

Classical path methods in line broadening. II. Application to the Lyman series of hydrogen, E. W. Smith, C. R. Vidal, and J. Cooper, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 4, 405-420 (July-Aug. 1969).

Key words: Classical path; impact theory; line broadening theory; one-electron theory.

The use of the classical path approximation in line broadening theory is illustrated in a development of the familiar impact and one-electron theories. The one-electron theory which is presented is an improved version of the usual one-electron theory; this improved version of the theory provides a consistent description of a line profile from the halfwidth to the quasi-static wings. The validity criteria for the impact and one-electron theories are discussed in detail and a comparison of the theories is made with a view toward the development of a more general theory containing elements of both. To avoid unnecessary mathematical complications and to provide a more transparent comparison of the theories, the Stark broadening of the Lyman series in hydrogen is used as a specific example.

The second virial coefficient for the realistic pair potential, H. W. Woolley, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 4, 421-423 (July-Aug. 1969).

Key words: Hypergeometric series; London interaction; pair potential function; realistic potential; second virial coefficient; spherical potential.

An analytical formulation for the second virial coefficient is given for a spherically symmetric potential function of a simple form which has been called a realistic pair potential. This potential, given as an inverse relationship with r as a function of U, is capable of being much softer than a Lennard-Jones in the extreme of close approach. Differing forms of the result are given, including an expression by means of the generalized hypergeometric series. The result is also expressed in terms of the second virial coefficient for the (12, 6) potential.

Synthesis of barium ferrates in oxygen, T. Negas and R. S. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 4, 425-430 (July-Aug. 1969).

Key words: Ferrates; hexagonal barium ferrate; perovskite; phase equilibria; tetravalent iron.

Phase relations in the system $BaO - Fe_2O_3 -$ "FeO_2" at 1 atm (1 atm = 1.013 × 10^5 N/m²) oxygen and between 800 to 1050 °C are shown in the vicinity (high Ba portion) of the 1:1 cation-cation ratio composition. A hexagonal $BaTiO_3$-like phase, $BaFeO_{3-x}$ (a = 5.676 Å, c = 13.934 Å), exists below 960 °C. A perovskite-like phase $BaFeO_{3-x'}$ occurs between 960 and 1050 °C. Single-phase tetragonal perovskite can be obtained at room temperature by quenching compositions with Ba-Fe ratios of 67:66 (a = 3.985 Å, c = 4.005 Å, 1000 °C) and 27:26 (a = 3.988 Å, c = 4.003 Å, 1000 °C) from above 960 °C. At the 17:16 ratio, single phase cubic perovskite (a = 3.994 Å, 1000 °C), can be synthesized. Influence of temperature, additions of barium, and use of Pt-containers on phase relations are discussed.

The system SrO – "chromium oxide" in air and oxygen, T. Negas and R. S. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **73A** (Phys. and Chem.), No. 4, 431-442 (July-Aug. 1969).

Key words: Chromium oxide; phase equilibria; strontium chromates; strontium-"chromium oxide" system, $SrCrO_4$, $Sr_3Cr_2O_8$.

Phase relations in the system SrO – "chromium oxide" were determined in air and 1 atm O_2 (1 atm = 1.013 × 10^5 N/m²) and are shown as isobaric projections on the $SrO - Cr_2O_3$ pseudobinary. At both oxygen pressures, the system consists of three joins in the $SrO - Cr_2O_3$-oxygen ternary, (1) $SrO - Sr_3Cr_2O_8$, (2) $Sr_3Cr_2O_8 - SrCrO_4$, and (3) $SrCrO_4 - Cr_2O_3$. The former is binary from 1065 °C to liquidus temperatures in air and includes a eutectic near 79 mol percent SrO (in terms of $SrO - Cr_2O_3$ starting materials). $Sr_3Cr_2O_8$ melts congruently at 1453 °C. Below 1065 °C in air, phase relations are complicated by reactions with atmospheric water vapor resulting in the formation of $Sr_{10}Cr_6O_{24}$ $(OH)_2$ which decomposes to SrO and $Sr_3Cr_2O_8$ above 1065 °C. In air, below 775 °C, $Sr_3Cr_2O_8$ reacts with water vapor and oxygen to form $Sr_{10}Cr_6O_{24}$ $(OH)_2$ and $SrCrO_4$. Water vapor reactions are restricted in 1 atm O_2. The $Sr_3Cr_2O_8 - SrCrO_4$ join contains a binary eutectic between 69-70 mol percent SrO but liquidus relations are ternary below 69 (air) and 68 (oxygen) mol percent SrO, as reduction of Cr^{6+} occurs. Likewise, the $SrCrO_4 - Cr_2O_3$ join is not binary at solidus and liquidus temperatures. In air, $SrCrO_4$ melts at 1251 °C to Cr_2O_3 plus liquid with release of oxygen. In oxygen, the compound melts at 1283 °C with evolution of oxygen.

September-October 1969

Conversion of existing calorimetrically determined thermodynamic properties to the basis of the International Practical Temperature Scale of 1968, T. B. Douglas. *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 451-470 (Sept.-Oct. 1969).

Key words: Existing property tables; IPTS–48; IPTS–68; practical-scale differences; temperature-scale conversion; thermodynamic properties.

Formulas are derived for converting the relative enthalpy, heat capacity, entropy, and Gibbs energy from the basis of one practical temperature scale to the basis of another, when these properties on either scale have been derived from calorimetric measurements of enthalpy as though that scale were the thermodynamic one. These formulas are directly applicable for converting certain other properties as well. The conversion relates the values of the property at the same numerical temperature on both scales. The formulas, given as exact infinite series, are applicable to widely differing scales, one of which may vary linearly with a temperature-measuring quantity such as electrical resistance. However, great simplification is well within most calorimetric accuracy when the conversion is from the International Practical Temperature Scale of 1948 to the corresponding scale of 1968, which has recently replaced it, provided the heat capacity is not changing abnormally rapidly, as in a transition region. For convenient application to conversion between these two scales, relatively simple numerical equations are derived giving the differences between the two scales at temperatures from 90 K to 10,000 K. The problem of avoiding the introduction of discontinuities with temperature in converted tables, arising from the existing discontinuities in the temperature derivative of the differences between the two scales, is discussed.

Measured enthalpy and derived thermodynamic properties of alpha beryllium nitride, Be_3N_2, from 273 to 1200 K, T. B. Douglas and W. H. Payne, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem). No. 5, 471-477 (Sept.-Oct. 1969).

Key words: Beryllium nitride; drop calorimetry; enthalpy data; light-element compounds; refractory crystals; thermodynamic properties.

The relative enthalpy of a sample of alpha beryllium nitride, Be_3N_2, of 95 percent purity was precisely measured over the temperature range 273 to 1173 K using a drop calorimetric method. Corrections were applied for the impurities, and the resulting heat capacity–temperature function was required to join smoothly that from recent precise NBS adiabatic calorimetry which covered the range 20 to 315 K. The enthalpy, heat capacity, entropy, and Gibbs free-energy function were computed from empirical functions of temperature and tabulated from 273 to 1200 K.

Measured enthalpy and derived thermodynamic properties of solid and liquid lithium tetrafluoroberyllate, Li_2BeF_4, from 273 to 900 K, T. B. Douglas and W. H. Payne. *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 479-485 (Sept.-Oct. 1969).

Key words: Drop calorimetry; enthalpy data; lithium beryllium fluoride; lithium tetrafluoroberyllate; premelting; thermodynamic properties.

The enthalpy of a sample of lithium tetrafluoroberyllate, Li_2BeF_4, of 98.6 percent purity was measured relative to 273 K at eleven temperatures from 323 to 873 K. Corrections were applied for the impurities and for extensive premelting below the melting point (745 K). The enthalpy and heat capacity, and the entropy and Gibbs free-energy function relative to the undetermined value of $S°_{298.15}$, were computed from empirical functions of temperature derived from the data, and are tabulated from 273 to 900 K.

Nonanalytic vapor pressure equation with data for nitrogen and oxygen, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 487-491 (Sept.-Oct. 1969).

Key words: Critical point; equation; formula; liquid; nitrogen; nonanalytic; oxygen; vapor pressure.

The specific heat of a two phase liquid-vapor system at constant volume apparently increases without limit at temperatures approaching the critical point, suggesting (via a thermodynamic relation) that the vapor pressure derivative d^2P/dT^2 may behave similarly. This nonanalytic behavior at the critical point is used in the present vapor pressure formula to gain simplicity and accuracy, as seen by use of data for nitrogen and oxygen.

Some precise measurements of the vapor pressure of water in the range from 25 to 100 °C, H. F. Stimson. *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 493-496 (Sept.-Oct. 1969).

Key words: Manometer; precision manometer; pressure; *p-t* relation; *p-t* relation of water; standard resistance thermometers; temperature; vapor pressure; vapor pressure of water; water.

The vapor pressure of water was measured at seven temperatures in the range from 25 to 100 °C using the boiler and precision manometer with which standard resistance thermometers were calibrated at the NBS in the 1940's. A table gives measured values of pressure, adjusted to even degrees, and indicates estimates of the standard deviations of pressure and of the corresponding temperatures. Except for the measurement at 25 °C, the values of pressure were consistent within one part in 50 000. The temperature measurements had an estimated standard deviation of 0.000 40 degree.

The configurations $(3d + 4s)^n 4p$ in neutral atoms of calcium, scandium, and titanium, C. Roth. *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 497-510 (Sept.-Oct. 1969).

Key words: Configurations $(3d + 4s)^n 4p$; energy levels; first spectra; *g*-factors; interactions between configurations; iron group.

Experimental levels of the configurations $(3d + 4s)^n 4p$ for neutral atoms of calcium, scandium, and titanium were compared with corresponding calculated values. The rms errors in the calculated values for Ca I, Sc I, and Ti I were 23, 126, 126 cm^{-1}, respectively.

Absolute isotopic abundance ratio and atomic weight of terrestrial rubidium, E. J. Catanzaro, T. J. Murphy, E. L. Garner, and W. R. Shields, *J. Res. Nat. Bur. Stand. (U.S.),* **73A** (Phys. and Chem.), No. 5, 511-516 (Sept.-Oct. 1969).

Key words: Absolute ratio; atomic weight; isotopic abundances; rubidium.

An absolute value has been obtained for the isotopic abundance ratio of terrestrial rubidium, using solid-sample thermal ionization mass spectrometry. Samples of known isotopic composition, prepared from nearly isotopically pure separated rubidium isotopes, were used to calibrate the mass spectrometers. The resulting absolute $^{85}Rb/^{87}Rb$ ratio is 2.59265 ± 0.00170 which yields atom percents of: $^{85}Rb = 72.1654 \pm 0.0132$ and $^{87}Rb = 27.8346 \pm 0.0132$. The atomic weight calculated from this isotopic composition is 85.46776 ± 0.00026. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the mean and allowances for the effects of known sources of possible systematic error.

Fundamental aspects of dislocation theory: A conference report with abstracts, J. A. Simmons, R. deWit, and R. Bullough,

J. Res. Nat. Bur. Stand. (U.S.), 73A (Phys. and Chem.), No. 5, 517-552 (Sept.-Oct. 1969).

Key words: Abstracts; conference; dislocations; fundamental aspects; theory.

A brief description of the Conference "Fundamental Aspects of Dislocation Theory" held at NBS, April 21-25, 1969, is given. This is followed by the abstracts of the papers, which will be published in 1970 in the hardbound Proceedings.

November-December 1969

Scaling analysis of thermodynamic properties in the critical region of fluids, M. Vicentini-Missoni, J. M. H. Levelt Sengers, and M. S. Green, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 563-583 (Nov.-Dec. 1969).

Key words: CO_2; chemical potential; critical point parameters; critical region; fluids; He^4; scaling laws; specific heat; thermodynamic properties; vapor pressure; xenon.

A review of the scaled equation of state proposed for the critical region of fluids and magnets is given using the language appropriate for fluids. The experimental evidence for the validity of the basic hypothesis underlying this equation of state is discussed in detail. Experimental data in the critical regions of CO_2, Xe, and He^4 are then analyzed using a closed-form expression for the chemical potential as a function of density and temperature, based on scaling ideas. Agreement between the proposed equation and the experimental data is found for the three substances. The results of the scaling of $\Delta\mu$, $\Delta\rho$, t data are shown not to be in contradiction with the analysis, also based on scaling ideas, of independent experimental measurements of both specific heat and vapor pressure.

Formulation of a nonanalytic equation of state for parahydrogen, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 585-591 (Nov.-Dec. 1969).

Key words: Critical point; equation of state; hydrogen; parahydrogen; specific heats; thermodynamic properties.

A method is described for building an equation of state which gives an infinite specific heat C_v at the critical point approached from the one-phase domain. Interpolated PVT data are used on isochores up to 100 K at densities to the liquid triple point. In addition to an accurate representation of these data, the equation gives specific heats which agree well with experimental data along near-critical isochores.

Dynamical model for Brillouin scattering near the critical point of a fluid, R. D. Mountain, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 593-598 (Nov.-Dec. 1969).

Key words: Brillouin scattering; critical opalescence; critical phenomena; density fluctuations in fluids; light scattering; volume viscosity.

A dynamical model for density fluctuations in a one-component fluid near the critical point is proposed and compared with existing measurements in carbon dioxide. The model is described by a set of linearized hydrodynamic equations modified to include a nonlocal pressure density relationship and to include relaxation in the volume viscosity. Parameters for the model are found which are consistent with bulk measurements. With these parameters the model reproduces, within experimental uncertainty, the observed Brillouin spectrum of critical opalescence in CO_2. The low frequency volume viscosity is found to diverge as the $-1/3$ power of $T - T_c$. An additional modification of the hydrodynamic equations, a frequency dependent thermal conductivity, is considered, but no definite conclusions can be reached as the Brillouin line-width data lack sufficient precision.

Odd configurations in singly-ionized copper, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 599-609 (Nov.-Dec. 1969).

Key words: Copper; energy levels; interaction between configurations; odd configurations; parameters; second spectra.

Experimental levels of the configurations $3d^94p$, $3d^95p$, $3d^96p$, $3d^84s4p$, $3d^94f$, and $3d^95f$ of Cu II were compared with corresponding calculated values. The electrostatic interactions between the configuration $3d^84s4p$ and the configurations $3d^94p$, $3d^95p$, and $3d^96p$ were considered explicitly. It was shown that the configurations $3d^94f$ and $3d^95f$ of Cu II do not interact strongly with other configurations.

Capillary depressions for nearly planar menisci, M. C. I. Siu, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 611-613 (Nov.-Dec. 1969).

Key words: Bessel functions; calculus of variations; capillary depression; Laplace's equation; meniscus; meniscus height; nearly planar meniscus.

It is demonstrated analytically that the capillary depression C of a nearly planar meniscus is linearly related to its meniscus height h by the relationship $C = h/[1 - I_0(r/a)]$. Here $a^2 = \gamma/\rho g$, ρ and γ are the density and surface tension of the liquid respectively, g, the acceleration due to gravity, r is the radius of the capillary tube at the liquid-solid-gas interface, and $I_0(z)$ is the modified Bessel function of the first kind and zero order.

Phase transformation in barium tetraborate, C. R. Robbins and E. M. Levin, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 615-620 (Nov.-Dec. 1969).

Key words: BaB_8O_{13}; heats of transformation; orthorhombic form; polymorphism; tetragonal form.

Orthorhombic BaB_8O_{13} ($a = 8.550$, $b = 17.352$, $c = 13.211$ Å. $D = 2.927$ g/cm³ at 25 °C) transforms reversibly at 700 °C to a high-temperature tetragonal form ($a = 8.629$, $c = 13.252$ Å, $D = 2.906$ g/cm³) stable from 700 °C to the congruent melting point (889 °C) of the compound. The transition is rapid and probably displacive in character. At the transformation point cell constants change discontinuously, doubling of the b axis is lost and cell contents are reduced from $Z = 8$ to $Z = 4$. Doubling of the b axis reappears with cooling to the transformation temperature and volume strain is relieved by formation of multiple twins or domains. The latent heat of transformation is 2100 J/mol (0.50 kcal/mol) and $dT/dP = -0.0363$ K/bar.

Crystallography and preparation of some $ABCl_3$ compounds, H. F. McMurdie, J. de Groot, M. Morris, and H. E. Swanson, *J. Res. Nat. Bur. Stand. (U.S.)*, 73A (Phys. and Chem.), No. 6, 621-626 (Nov.-Dec. 1969).

Key words: Chlorides, crystal structures; double chlorides; lattice constants; melting point; perovskites; polymorphism; x-ray diffraction.

Compounds of the composition $ABCl_3$, in which A is K, Rb, NH_4, or Cs and where B is a divalent element, have been reviewed. Ten new compounds were prepared on which there was little or no previous crystallographic information. Refined unit cell parameters were obtained on these and on fifteen other compounds in this group. A general review of the structural information on this group is presented in tables, and a comprehensive list of references is included.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 74A, JANUARY- DECEMBER 1970

January-February 1970

Standardization of cesium-137 gamma-ray sources in terms of exposure units (roentgens), T. P. Loftus, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 1-6 (Jan.-Feb. 1970).

Key words: Calibration; cavity ionization chamber; cesium-137; exposure rate; scattered radiation; standardization.

^{137}Cs γ-ray sources, which have been proposed by the Public Health Service as a substitute for radium in the treatment of malignant diseases, require suitable calibration if consistency is to be achieved in radiation treatment.

Several ^{137}Cs sources were calibrated using a graphite cavity ionization chamber in an open-air geometry. The contribution of scatter from the room surfaces was calculated and the source measurements corrected for this effect.

A large-volume aluminum-walled ionization chamber was designed and fabricated for use in routine calibrations. This chamber will be used as a means for intercomparison of the source to be calibrated with one of the standards.

Calculations of Zn II $3d^9 4s5s$ and Ag I $4d^9 5s6s$, and some new levels in these spectra, W. C. Martin and J. Sugar, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 7-10 (Jan.-Feb. 1970).

Key words: Atomic spectra; energy levels; silver; zinc.

Results of intermediate-coupling calculations are given for Zn II $3d^9 4s5s$ and Ag I $4d^9 5s6s$. A $[(4d^9)J_I, (5s6s)J_{II}]J$ coupling scheme is appropriate for the latter. New $3d^9 4s(^3\mathrm{D})5s\ ^2\mathrm{D}_{2\,1/2}$ and $3d^9 4s(^1\mathrm{D})5s\ ^2\mathrm{D}_{2\,1/2}$ levels were found in Zn II, and a few other additions and revisions are given for the analysis. The combinations of the new levels $3d^9(^2\mathrm{D})4s4p(^3\mathrm{P}^\circ)\ ^4\mathrm{F}^\circ_{4\,1/2}$ in Zn II and $4d^9(^2\mathrm{D})5s5p(^3\mathrm{P}^\circ)\ ^2\mathrm{F}^\circ_{2\,1/2}$ in Ag I are also listed.

New vacuum ultraviolet wavelengths and revised energy levels in the second spectrum of zinc (Zn II), W. C. Martin and V. Kaufman, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 11-22 (Jan.-Feb. 1970).

Key words: Atomic energy levels of Zn II; ionized zinc; spectral wavelengths of Zn II.

Spectra from sliding spark discharges between zinc electrodes and from a hollow-cathode source were photographed in the range 2105-1400 Å with the NBS 10.7 m vacuum spectrograph. New measurements of 130 Zn II lines in this region, combined in some cases with previous measurements in the air region, were used to derive revised positions for the known levels. Wavelengths calculated from these levels are given for 267 lines in the region 2570-730 Å. The line list also includes unclassified Zn II lines below 2570 Å, based on the most complete description of this spectrum [A. M. Crooker and K. A. Dick, Can. J. Phys. **46,** 1241 (1968)]. A few additions to the line list of Crooker and Dick above 2700 Å are given. The line and level lists take into account recent work at the National Bureau of Standards on the Zn II analysis.

CIE 1960 UCS diagram and the Müller theory of color vision, D. B. Judd and G. T. Yonemura, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 23-30 (Jan.-Feb. 1970).

Key words: Chromaticity; color; perception; protanopia; tritanopia; vision.

A close relationship has been shown to exist between the second stage of the Müller theory and the MacAdam 1937 (u, ϵ)-diagram recommended in 1960 by the CIE for interim use as a chromaticity diagram having approximately uniform scales. By considering normal vision as a combination of protanopia and tritanopia as suggested by the Müller second stage, a more general measure of the perceived size of a chromaticity difference is developed than the length of the line connecting the two chromaticity points. The general measure is the square root of the sum of the squares of the angles subtended by the line at the convergence points of the chromaticity confusion lines for protanopia and tritanopia, respectively. By this measure the chromatic sensibility to wavelength change in the spectrum is accounted for quantitatively not only for protanopic and tritanopic vision, but also for normal vision including the secondary maximum of sensibility in the neighborhood of 420 nm.

Blemish formation in processed microfilm II, C. I. Pope, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 31-36 (Jan.-Feb. 1970).

Key words: Archival record film; microfilm; microfilm storage cartons; permanent record film; peroxides; redox blemishes; zinc powder.

Gaseous peroxides form blemishes on some processed microfilms. Two procedures are given for testing the blemish susceptibility of processed microfilm, one using peroxide paper and the other zinc powder as a source of peroxide. The susceptibility of microfilm to blemish formation decreased when conditioned at 86 percent relative humidity and 26 °C. Coarse-grain microfilms are less susceptible to blemish formation than fine-grain microfilm. Fine-grain microfilms fixed in ammonium thiosulfate were less susceptible to blemish formation than those fixed in sodium thiosulfate. Oven-aged microfilm storage cartons were found to generate peroxide when wetted. The microfilm base readily absorbed hydrogen peroxide.

Positive and negative ion sublimation from transition metal surfaces: A review of some recent results, M. D. Scheer, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 1, 37-43 (Jan.-Feb. 1970).

Key words: Mass spectrometry; positive and negative ions; sublimation; transition metals.

Singly charged, positive and negative, atomic ions have been observed to sublime freely from 4*d* and 5*d* transition metal surfaces in the 1800 to 2600 K temperature range. The rates of

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

sublimation were found to be about equal to those which would be observed under conditions of thermal equilibrium. Ion sublimation energies were obtained from the temperature dependence of these sublimation rates. The energies were found to be consistent with currently accepted values for the atom sublimation energy, electron work function, and first ionization potentials of the elements investigated.

The electron affinities of these metal atoms were determined from an isothermal measurement of the ratio of positive to negative ion sublimation rates. The results were compared with some recent theoretical estimates of this quantity for those $3d$ transition metals whose valence electron configurations are analogous to the $4d$ and $5d$ elements considered here.

Generation of controlled low pressures of nitrogen by means of dissociation equilibria, R. H. Orcutt, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 1, 45-49 (Jan.-Feb. 1970).

Key words: Barium nitride; dissociation equilibria; nitrides; nitrogen; thermodynamic properties; vacuum; vacuum measurement.

It is shown that fixed low pressures of nitrogen in the vacuum region can be generated by chemical dissociation in a system at equilibrium at constant temperature. Dissociation pressures ranging from 2×10^{-5} to 0.7 torr (3×10^{-3} to 90 $N \cdot m^{-2}$), corresponding to temperatures of 740 to 1150 K, for the reaction

$$Ba_3N_2 \rightleftarrows 3/2\ Ba_2N + 1/4\ N_2$$

have been measured. The pressures, p, in $N \cdot m^{-2}$ are represented by the equation

$$\ln p = (22.02 \pm 0.14) - (20{,}080 \pm 140)/T,$$

where T is the absolute temperature, and the uncertainties are least squares estimates of the standard deviations of the parameters.

Temperature coefficient of the bismuth I-II transition pressure, J. C. Houck, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 1, 51-63 (Jan.-Feb. 1970).

Key words: Bismuth transition; calibration point; high pressure; pressure measurement; temperature coefficient.

A rotatable piston in a supported cylinder was used to determine the temperature coefficient of the bismuth I-II transition pressure for the temperature range of 20 to 50 °C. The temperature coefficient of the transition pressure is −40.6 bar/°C.

Isothermal diffusion in the dilute range of the system $Ca(OH)_2 - H_3PO_4 - H_2O$: Theory, E. C. Moreno, P. R. Patel, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 1, 55-63 (Jan.-Feb. 1970).

Key words: Diffusion; phenomenological coefficients; polycomponent systems; reciprocal relations.

The equations describing isothermal diffusion in the dilute range of the ternary system $Ca(OH)_2 - H_3PO_4 - H_2O$ are derived in two ways, first, assuming that the components are electroneutral species and, second, considering the actual ionic species present in solution. It is shown that the two models are thermodynamically equivalent. The theory permits the calculation of the four fundamental diffusion coefficients (phenomenological coefficients) in the concentration range where the Debye-Hückel theory suffices for the calculation of ionic activity coefficients. The equations can be used to test the Onsager reciprocal relations for the diffusion process in the above system. The ionic model was used to calculate practical diffusion coefficients for the electroneutral components from the limiting equivalent conductances of the ions in solutions saturated with respect to hydroxyapatite, $Ca_{10}(OH)_2(PO_4)_6$. Large diffusion interferences, as revealed by relatively large values for the cross-terms in D_{ij}, are predicted even for solutions with total molarity in the order of 10^{-5}. Therefore, diffusion models based on independent fluxes of the components appear to be invalid.

High-speed (subsecond) measurement of heat capacity, electrical resistivity, and thermal radiation properties of molybdenum in the range 1900 to 2800 K, A. Cezairliyan, M. S. Morse, H. A. Berman, and C. W. Beckett, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 1, 65-92 (Jan.-Feb. 1970).

Key words: Electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; molybdenum; thermal radiation properties; thermodynamics.

A technique is described for the high-speed measurement of heat capacity, electrical resistivity, hemispherical total and normal spectral emittances of electrical conductors at high temperatures (above 1900 K) with millisecond resolution. Duration of an individual experiment, in which the specimen is heated from room temperature to close to its melting point, is less than one second. Temperature measurements are made with a high-speed photoelectric pyrometer. Quantities are recorded by a high-speed digital data acquisition system which has a resolution of approximately one part in 8000. Time resolution of the entire system is 0.4 ms. Results on the above properties of molybdenum in the temperature range 1900 to 2800 K are reported and are compared with those in the literature. Estimated inaccuracy of measured properties in the above temperature range is: 2 to 3 percent for heat capacity, 0.5 percent for electrical resistivity, 3 percent for hemispherical total emittance and 2 percent for normal spectral emittance.

P−V−T, thermodynamic and related properties of oxygen from the triple point to 300 K at pressures to 33 MN/m², L. A. Weber, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 1, 93-129 (Jan.-Feb. 1970).

Key words: Density; enthalpy; entropy; equation of state; fixed points (PVT); Joule-Thomson; latent heat; melting curve; oxygen; properties of fluids; saturated liquid and vapor; specific heat; vapor pressure; velocity of sound.

The results of new experimental pressure-volume-temperature measurements on oxygen are presented. The data range in temperature from 54 to 300 K and in pressure from 0.1 to about 33 MN/m². The following properties are tabulated for selected isobars: molar volume, $(\partial P/\partial \rho)_T$, $(\partial P/\partial T)_\rho$, internal energy, enthalpy, entropy, specific heats at constant volume and at constant pressure, and the velocity of sound. Additional tables present the above properties for saturated liquid and vapor, the freezing liquid P−V−T relationship, and the derived Joule-Thomson inversion curve. New values for the critical density and triple point density are presented, and the second and third virial coefficients are tabulated.

March-April 1970

A theoretical investigation of the configurations $(3d+4s)^4 4p$ in neutral vanadium (V I), C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 2, 141-156 (Mar.-Apr. 1970).

Key words: Configurations in V I; configurations $(3d + 4s)^4 4p$ in V I; configuration interaction; energy levels of V I; first spectrum; g-values V I; parameters; theory; vanadium; V I; Zeeman effect.

Experimental levels of the configurations $(3d + 4s)^4 4p$ in V I were compared with corresponding calculated values. On fitting 228 experimental levels by means of 20 free parameters an rms error in the calculated values of 216 cm^{-1} was obtained. All the 438 theoretically predicted levels and g-factors were calculated.

A theoretical investigation of the configurations $(3d+4s)^5 4p$ in neutral chromium (Cr I), C. Roth, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 157-179 (Mar.-Apr. 1970).

Key words: Chromium; configurations in Cr I; configurations $(3d + 4s)^5 4p$ in Cr I; configuration interaction; Cr I; energy levels of Cr I; first spectrum; g-values Cr I; parameters; theory; Zeeman effect.

Experimental levels of the configurations $(3d + 4s)^5 4p$ in Cr I were compared with corresponding calculated values. On fitting 296 experimental levels by means of 20 free parameters an rms error of 183 cm^{-1} was obtained. All the 684 theoretically predicted levels and g-factors are calculated.

It is shown that the correction parameters β and T are not significant here.

A theoretical investigation of the configurations $(3d+4s)^7 4p$ in neutral iron, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 181-202 (Mar.-Apr. 1970).

Key words: Arc spectrum; configurations $(3d + 4s)^7 4p$; configuration interactions; energy levels; g-factors; iron.

Experimental levels of the configurations $(3d + 4s)^7 4p$ were compared with corresponding calculated values. On fitting 248 experimental levels by means of 20 free parameters an rms error of 213 cm^{-1} was obtained.

It was shown that the correction parameters β and T were not significant.

The intensity as a function of temperature of the low-angle x-ray diffraction maxima of the *n*-paraffins: Hexatriacontane, tetratetracontane, and tetranonacontane, P. K. Sullivan and J. J. Weeks, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 203-214 (Mar.-Apr. 1970).

Key words: Defects; *n*-paraffins; phase transition; temperature dependence; x-ray diffraction.

The diffraction of x-rays by the crystalline *n*-paraffins, $C_{36}H_{74}$, $C_{44}H_{90}$, and $C_{94}H_{190}$, was examined at small angles—below seven degrees 2θ—as a function of temperature. The Bragg maxima (00*l*) that occur at these angles result from a lamellar repeat distance which depends on the molecular length. In general the intensity of these maxima was found to increase with increasing temperature in an approximately reversible manner. All the samples experienced solid-solid phase transitions in the temperature range of observation. Several possible mechanisms consistent with the temperature dependence of the intensity are considered.

Photoelastic constants of ruby, R. M. Waxler and E. N. Farabaugh, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 215-220 (Mar.-Apr. 1970).

Key words: Birefringence; crystals, lasers; photoelasticity; ruby.

The eight piezo-optic and eight elasto-optic constants of synthetic, single crystal ruby have been determined using the cadmium red radiation of 643.8 nanometers (nm). All the constants are found to be negative in value, or to have very small positive values. The data indicate that changes in the polarizability of the oxygen ion and changes in the local field are primarily responsible for the observed changes in refractive index. Hydrostatic pressure has been used for the first time as part of a complete photoelastic investigation, and a new, screw-clamp device for easily attaining high, uniaxial stress is described.

Estimation of critical constants T_c, ρ_c from the $\rho(T)$ and $T(\rho)$ relations at coexistence, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 221-227 (Mar.-Apr. 1970).

Key words: Coexistence; coexistence temperatures; critical constants; critical density; critical temperatures; fluorine; neon; oxygen; orthobaric densities; parahydrogen; saturated liquid and vapor densities.

The critical temperature T_c and the critical density ρ_c are estimated from new equations (1) for the double-valued $\rho(T)$ relation, and (2) for the single-valued $T(\rho)$ relation. For method (1) this report gives concise descriptions of the rectilinear diameter and of the densities of liquid oxygen. Calculated vapor densities agree well with experimental oxygen data over the wide range from triple- to critical-point. Method (2) is applied to hydrogen, oxygen, fluorine, and neon, giving the $T(\rho)$ relation and estimates for T_c and ρ_c all in one step from the complete set of liquid and vapor data.

Synthesis and growth of fresnoite ($Ba_2TiSi_2O_8$) from a TiO_2 flux and its relation to the system $BaTiO_3$-SiO_2, C. R. Robbins, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 229-232 (Mar.-Apr. 1970).

Key words: $Ba_2TiSi_2O_8$; $BaTiSiO_5$; crystal growth; fresnoite; phosphor; piezoelectric; system $BaTiO_3$-SiO_2; TiO_2 solvent.

Crystals of $Ba_2TiSi_2O_8$ (synthetic fresnoite) up to 5 mm in longest dimension have been grown by slow cooling of a TiO_2-rich liquid of initial composition $1BaO{:}1TiO_2{:}1SiO_2$. The synthetic crystals are essentially identical to their mineral equivalent in morphology, cleavage, optical properties and unit cell dimensions. X-ray powder diffraction data previously reported for the compound $BaTiSiO_5$ ("barium sphene") is that of $Ba_2TiSi_2O_8$. Apparently the compound $BaTiSiO_5$ has never been synthesized and the system $BaTiO_3$-SiO_2 is not binary.

Photoionization study of $Fe(CO)_5$ and $Ni(CO)_4$, G. Distefano, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 233-238 (Mar.-Apr. 1970).

Key words: Dissociation energies; $Fe(CO)_5$; heats of formation; ionization; mass spectrometry; $Ni(CO)_4$; vacuum ultraviolet spectroscopy.

Photoionization yield curves from onset to 600 Å, and ionization threshold values have been obtained for the ions $Fe(CO)_5^+$, $Fe(CO)_4^+$, $Fe(CO)_3^+$, $Fe(CO)_2^+$, $Fe(CO)^+$, Fe^+ and CO^+ from iron pentacarbonyl, and for $Ni(CO)_4^+$, $Ni(CO)_3^+$, $Ni(CO)_2^+$, $Ni(CO)^+$, Ni^+, and CO^+ from nickel tetracarbonyl. From these curves, information on the ionization-fragmentation processes of $Fe(CO)_5$ and $Ni(CO)_4$ under photon impact, have been obtained. Differences in the threshold energies as determined by photon and by electron impact methods increase with the fragmentation. The appearance potentials and the heats of formation of the metal-ions, agree within 0.1 eV, with those calculated from thermochemical data. The average bond dissociation energy of the neutral molecule agrees within 0.02 eV, with the thermochemical values. The kinetic shift for the formation of Fe^+ and Ni^+ ions is very small. The Ni^+ ion is most likely formed directly from the molecule ion rather than by a cascade fragmentation process.

The band structure problem, J. M. Ziman, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 241-252 (Mar.-Apr. 1970).

Key words: APW; band structure; density of states; disordered systems; KKR; pseudopotential; t-matrix; molecular crystals.

The numerical solution of the Schrödinger equation for an electron in a dense assembly of atoms (i.e., a solid or liquid metal or semiconductor) has made great progress in the past ten years. This is not merely a consequence of greater computer power; we now have a much better grasp of the mathematical theory of such solutions.

By 1960 a number of practical methods had been devised for the computation of the electronic structure of ordered crystals, but these lacked intuitive interpretation. The first advance was to rewrite the OPW method in terms of pseudopotentials, thus making sense of the free-electron theory of metals. This development has proved particularly valuable in semiquantitative and empirical investigations of Fermi surfaces, transport properties, lattice dynamics, cohesion, etc., but we have had to wait until recently for a rigorous analysis of the criteria for convergence of the various types of model potential or pseudopotential that have been postulated.

The next step was to show that the KKR (Green function) method could also be expressed as a pseudopotential, and then to demonstrate that this was also a form of APW expansion. The relative computational power of these two methods can thus be analyzed, and questions answered concerning the fulfillment of the empty lattice test, the apparent lack of uniqueness of the expansions, the advantages of "folding" matrix elements from distant points of the reciprocal lattice, and the introduction of contributions from the interstitial potential.

At this stage, the connections between the band structure problem and the t-matrix theory of scattering were uncovered, and d-bands were seen to arise as resonances of the muffin-tin wells. The KKR matrix could now be rewritten as a mixture of pseudopotential and tight-binding elements, in harmony with the empirical model Hamiltonian representations of hybridized s-p and d-bands. This method not only permits more rapid computations, but shows clearly how the width and position of such bands should depend on the atomic potential.

Some problems still remain. For example, present techniques do not seem adequate for first-principles calculations on molecular crystals, where the anisotropy of the interstitial potential (i.e., easy channels along bonds, but high hills between layers or chains) is probably the dominant feature.

As for disordered systems—we know little for certain and nothing quantitatively. The linear chain model has been fully studied but is quite irrelevant to the three-dimensional case. The present theoretical confusion is exemplified by the equiconcentration substitutional alloy in the tight-binding limit; some formulae give only one band, others allow two. Again, the very possibility of producing band gaps by diffraction of free electrons in a topologically disordered system (e.g., amorphous Ge) has not been demonstrated mathematically with any rigor.

Optical properties and electronic density of states, M. Cardona, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 253-265 (Mar.-Apr. 1970).

Key words: Critical points; density of states; dielectric constant; modulated reflectance; optical absorption.

The fundamental absorption spectrum of a solid yields information about critical points in the optical density of states. This information can be used to adjust parameters of the band structure. Once the adjusted band structure is known, the optical properties and the density of states can be generated by numerical integration. We review in this paper the parametrization techniques used for obtaining band structures suitable for density of states calculations. The calculated optical constants are compared with experimental results. The energy derivative of these optical constants is discussed in connection with results of modulated reflectance measurements. It is also shown that information about density of empty states can be obtained from optical experiments involving excitation from deep core levels to the conduction band.

A detailed comparison of the calculated one-electron optical line shapes with experiment reveals deviations which can be interpreted as exciton effects. The accumulating experimental evidence pointing in this direction is reviewed together with the existing theory of these effects.

A number of simple models for the complicated interband density of states of an insulator have been proposed. We review in particular the Penn model, which can be used to account for response functions at zero frequency, and the parabolic model, which can be used to account for the dispersion of response functions in the immediate vicinity of the fundamental absorption edge.

Excitonic effects in x-ray transitions in metals, G. D. Mahan, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 267-272 (Mar.-Apr. 1970).

Key words: Density of states; exciton; many body effects; phase shifts; soft x ray; transition probability.

In the study of soft x-ray transitions in solids, there has always been some hope that the results provide a direct measure of the density of states. This assumes that (a) matrix element variations over the band and (b) final state interactions are small. Both of these assumptions are now known to be incorrect. To illustrate the possible strength of these effects, two approximate calculations are presented: the one electron oscillator strength of a simple bcc metal as a function of energy; and the strength of the Nozieres—DeDominicis singularity at threshold, with phase shifts estimated from an assumed Yukawa interaction between conduction electrons and core hole.

Soft x-ray band spectra and their relationship to the density of states, G. A. Rooke, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 273-279 (Mar.-Apr. 1970).

Key words: Alloys; auger transitions; density of states; many-body interactions; plasmons; singularities; soft x rays.

The paper concentrates on the similarities and differences between the one-electron spectrum and the density of states; many-body effects, although important, are listed but they are not considered in detail. It is shown that the only reliable information about the density of states that can be obtained from soft x-ray spectroscopy are the energies of the Fermi surface and the van-Hove singularities, although the shape of the density of states can be derived indirectly from the energies of the van-Hove singularities.

It is the differences between the density of states and the one-electron spectra that may prove to be most important. These differences can give information about the symmetry and the local nature of the screening electrons. This is particularly interesting when studying alloys.

The Li K, the Al L_{23} and the Zn L_3 spectra are given as examples which illustrate the above arguments. Finally, a brief discussion on the soft x-ray spectra from the Al-Mg system show how the results may be used to study alloys.

The electronic structure of disordered alloys, J. L. Beeby, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 281-291 (Mar.-Apr. 1970).

Key words: Density of states; disordered alloys; one-electron propagator; perturbation expansion; sum rule.

The problem of calculating the electronic density of states in an alloy is considered from first principles. Choosing a suitably simplified model potential a diagrammatic expansion is discussed within which the various existing theories can be compared. Some comments are made on the comparison with experiment.

Summary of the conference on electronic density of states, H. Ehrenreich, *J. Res. Nat. Bur. Stand. (U.S.),* **74A** (Phys. and Chem.), No. 2, 293-299 (Mar.-Apr. 1970).

May-June 1970

The crystal structure of hydrazinium trinitromethide, $(N_2H_5^+[C(NO_2)_3]^-$ at ~ — 160 °C), D. Dickens, *J. Res. Nat.*

Bur. Stand. (U.S.), **74A** (Phys. and Chem.), No. 3, 309-318 (May-June 1970).

Key words: Crystal structure; hydrazinium; hydrazinium trinitromethide; hydrogen bonding; trinitromethide; x-ray diffraction.

The crystal structure of hydrazinium trinitromethide ($N_2H_5^+[C(NO_2)_3]^-$) has been determined using 1914 x-ray data collected photographically from a single crystal held at ~ -160 °C. The unit cell at ~ -160 °C is $a=7.91(2)$, $b=11.77(2)$, $c=13.98(2)$ Å, $\beta=104.9(3)°$, and contains eight formula weights in space group $P2_1/n$. The calculated density is 1.93 g·cm^{-3}. The structure has been refined isotropically to $R=0.10$ by full-matrix least-squares procedures. The two crystallographically independent trinitromethide anions are propeller shaped, with angles of 41°, 7°, 8°, and 74°, 5°, 4°, respectively, between the NO_2 and CN_3 plane normals. The central CN_3 part of each anion is almost planar. In one anion, the C atom is 0.008 Å out of the N_3 plane; in the other, the C atom is 0.033 Å out of the N_3 plane. Hydrogen atoms have been located approximately in an electron density difference synthesis. Their positions agree with those obtained from independent calculations involving the minimization of a function which is a first approximation to the electrostatic hydrogen bonding energy. These analyses provide evidence that one hydrazinium ion is eclipsed and the other is staggered.

A refinement of the crystal structure of $Na_2CO_3 \cdot H_2O$, B. Dickens, F. A. Mauer, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 319-324 (May-June 1970).

Key words: Crystal structure; hydrated carbonates; hydrogen bonding; sodium carbonate; thermonatrite; x-ray diffraction.

The crystal structure of synthetic $Na_2CO_3 \cdot H_2O$ has been refined using 1231 unique x-ray diffraction data collected by the peak height method on a diffractometer. $R=0.034$. The unit cell is $a=6.474(2)$, $b=10.724(3)$ and $c=5.259(2)$ Å with $z=4$ and space group $P2_1ab$. The calculated density is the same as the observed density, 2.26 g·cm^{-3}. The structure contains sheets of CO_3^{2-} ions bonded to Na^+ ions and water molecules roughly halfway between the sheets. Each CO_3^{2-} bonds edgewise to both Na^+ ions. The Na^+ ions have irregular but similar coordinations of seven neighbors. Each water molecule is bonded to both Na^+ ions and forms hydrogen bonds to both neighboring CO_3^{2-} layers.

Anisotropic reaction kinetics of oxygen with pyrolytic graphite, W. S. Horton, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 325-330 (May-June 1970).

Key words: Chemical anisotropy; chemisorption; oxidation; pyrolytic graphite.

Because of the possible use of pyrolytic graphite in aerospace vehicles its reaction with oxygen-containing gases is of interest, particularly with respect to chemical anisotropy. Although several authors have found different degrees of reactivity of graphite in different directions they disagree regarding the existence of a temperature coefficient. This disagreement, however, is probably due to investigators studying single crystals in some cases and pyrolytic graphite in others and in some cases different oxidizers. New data for pyrolytic graphite are presented which were obtained by oxidizing in each run several pieces of differing geometry. These together with earlier data show that the rate ratio for the two major directions is temperature dependent with an activation energy difference of about 19 kilojoules (4500 thermochemical calories) per gram atom of carbon reacted. It is shown that this difference in rates probably arises because the relative number of sites available in these directions is sufficiently different to cause a shift in which reaction step is rate-controlling. On the "faces" chemisorption is the rate controlling step followed by rapid decomposition of surface oxides. On the "edges" decomposition is the rate controlling step. This interpretation applied to the data yield 131 kJ/mol for the activation energy of chemisorption and 150 kJ/mol for decomposition (31 and 36 kcal/mol, respectively).

The viscosity and thermal conductivity of dilute gaseous hydrogen from 15 to 5000 K, H. J. M. Hanley, R. D. McCarty, and H. Intemann, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 331-353 (May-June 1970).

Key words: Dissociation; hydrogen; intermolecular potential functions; kinetic theory; quantum gas; thermal conductivity; viscosity.

Measurements of the viscosity and thermal conductivity of dilute gaseous para and normal hydrogen are critically evaluated and correlated by means of dilute gas kinetic theory. Numerical results are presented from 15 to 5000 K including the dissociation region.

Temperature classification of the spectra of dysprosium (Dy I, Dy II), A. S. King, J. G. Conway, E. F. Worden, and C. E. Moore, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 355-394 (May-June 1970).

Key words: Intensity estimates, Dy spectra; dysprosium spectra, temperature classification; temperature classification, Dy I and Dy II; spectra, Dy I and Dy II.

The Temperature Classifications are listed for 4584 lines of Dy I and Dy II, as taken from an unpublished manuscript of the late A. S. King. In recording his observations, King used a wavelength list compiled mostly from the early literature. A homogeneous and extensive line list based on new observations has been prepared at the Lawrence Radiation Laboratory (LRL). King's data have been edited and adjusted by the present authors to fit the new wavelength list.

In the Table, King's estimated intensities of Dy lines in the spectra of the Arc, Spark, and Furnace are given along with the Temperature Classification. Some of his earlier published work has been used to fill the gaps in this manuscript, which was forwarded to the late W. F. Meggers in 1956.

Optical density of states ultraviolet photoelectric spectroscopy, W. E. Spicer, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 397-415 (May-June 1970).

Key words: Copper; copper nickel alloys; density of states; GaAs; Ge; nondirect transitions; optical density of states; PbTe; ultraviolet photoemission.

The use of ultraviolet photoemission to determine the density of valence and conduction states is reviewed. Two approaches are recognized. In one, the photoemission as well as other studies are used to locate experimentally a limited number of features of the band structure. Once these are fixed, band structure calculations could be carried out throughout the zone and checked against other features of the photoemission data. If the agreement is sufficiently good, the density of states is then calculated from the band structure. The second method depends only on experimental data. Using this approach, features of the density of states are determined directly by the photoemission experiment without recourse to band calculations. In cases where bands are wide and k clearly provides an empirically important optical selection rule, this is possible only for portions of the bands which are relatively flat. Successful determinations of this type are cited for PbTe, and GaAs. In metals with narrow *d* bands such as Cu, it has been found empirically that one may explain fairly well the experimental energy distribution curves in terms of transitions between a density of initial and final states

(the optical density of states, ODS) requiring only conservation of energy.

The ODS determined by such ultraviolet photoemission studies have more strong detailed structure than the density of states determined by any other experimental method. Studies on a large number of materials indicate that the position in energy of this structure correlates rather well with the position in energy of structure in the calculated density of states. It is suggested, following the very recent theoretical work of Doniach, that k conservation becomes less important (and nondirect transitions more important) as the mass of the hole becomes larger. This is due to the change in k of electrons in states near the Fermi level as they attempt to screen the hole left in the optical excitation process. These electrons take up the excess momentum. One would expect the k conservation selection rule to play an increasingly important role as the mass of the hole decreases. This is in agreement with experiment.

Beyond the one-electron approximation: Density of states for interacting electrons, L. Hedin, B. I. Lundqvist, and S. Lundqvist, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 417-431 (May-June 1970).

Key words: Density of states; interacting electrons; one-particle Green function; oscillator strengths; quasi particle density of states; x-ray emission and absorption.

The concept "density of states" can be given many different meanings when we go beyond the one-electron approximation. In this survey we concentrate on the definition tied to excitation processes, where one electron is added or removed from the solid. We discuss the one-particle spectral function for conduction and core electrons in metals, how it can be approximately calculated, and how it can be related to different types of experiments like x-ray photoemission, x-ray emission and absorption, photoemission and optical absorption in the ultraviolet, and the Compton effect. We also discuss the form of the exchange-correlation potential for use in band structure calculations.

Ion-neutralization spectroscopy, H. D. Hagstrum, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 433-441 (May-June 1970).

Key words: Auger processes; autoionization; density of states; ion-neutralization; transition probability.

The ion-neutralization spectroscopy (INS) is discussed in comparison with other spectroscopies of solids. It is shown that INS probes the local density of states of the solid at or just outside the solid surface. It is believed that this accounts for the clear-cut differences between INS results and those of other spectroscopies. Because of its unique specificity to the surface region INS is particularly useful in studying the surface electronic structures of atomically clean surfaces and of surfaces having ordered arrays of known atoms adsorbed upon them. In the latter case INS determines a portion of the molecular orbital spectrum of surface molecules formed from the adsorbed foreign atom and surface atoms of the bulk crystal. Such spectra provide information on local bonding symmetry and structure and electrical charging within the surface molecule which is as yet unavailable by any other method. INS is the first attempt to base a spectroscopy of electronic states on a two-electron process. More recent work on experimental and mathematical problems which such a spectroscopy entails are also briefly mentioned in this paper.

Local theory of disordered systems, W. H. Butler and W. Kohn, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 443-447 (May-June 1970).

Key words: Binary alloys; density of states; disordered systems; periodically continued neighborhood.

The most striking characteristic of crystalline solids is their periodicity. As a result of this feature, theoretical descriptions of physical phenomena in such systems are usually given in wave number or *momentum* space. The reciprocal lattice of a crystal and the Fermi surface of a metal are examples. In a disordered system, on the other hand, there is no such periodicity and momentum space descriptions are much less natural. However, in such systems, physical conditions near a point **r**, in *coordinate* space, become independent of the conditions at a distant point **r'**, provided that $|\mathbf{r'}-\mathbf{r}|$ is large compared to either a characteristic mean free path or some other appropriate length. This suggests that one can analyze a macroscopic disordered system by averaging over the properties of microscopic neighborhoods.

In the present paper we report some details of such a program. Although the point of view is of quite general applicability we have, for the sake of definiteness, studied so far only one type of system: Noninteracting electrons moving in the field of interacting, disordered scattering centers. We have focused especially on the electronic density of states. The macroscopic system is represented by an average over small neighborhoods. If one did not take special precautions, one would encounter one class of errors of the order of d/L where L is a characteristic dimension of the neighborhood, and d is a characteristic atomic dimension; and another class of errors of the order of $1/N$ where N is the number of ions. Both are too large to be tolerable for practical purposes. However, by an appropriate treatment of the statistical mechanics of the scatterers and by periodic repetition of the small neighborhoods, these errors can be avoided. The remaining errors are exponentially small in the ratio $\gamma(L/R)$ where γ is of order unity and R is the smaller of the electronic mean free path of the deBroglie wavelength of the electrons. This exponential convergence of the small neighborhood theory promises to make it a useful practical method for the study of disordered systems, especially very highly disordered ones.

Numerical examples are presented and discussed.

Density of states information from low temperature specific heat measurements, P. A. Beck and H. Claus, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 3, 449-454 (May-June 1970).

Key words: Alloys; density of states; low temperature specific heat; magnetic specific heat; many-body effects; superconductivity.

The calculation of one-electron density of state values from the coefficient γ of the term of the low temperature specific heat linear in temperature is complicated by many-body effects. In particular, the electron-phonon interaction may enhance the measured γ as much as twofold. The enhancement factor can be evaluated in the case of superconducting metals and alloys. In the presence of magnetic moments, additional complications arise. A magnetic contribution to the measured γ was identified in the case of dilute alloys and also of concentrated alloys where parasitic antiferromagnetism is superimposed on an over-all ferromagnetic order. No method has as yet been devised to evaluate this magnetic part of γ. The separation of the temperature-linear term of the specific heat may itself be complicated by the appearance of a specific heat anomaly due to magnetic clusters in superparamagnetic or weakly ferromagnetic alloys.

July-August 1970

Solubility of $CaHPO_4 \cdot 2H_2O$ in the system $Ca(OH)_2 - H_3PO_4 - H_2O$ at 5, 15, 25, and 37.5 °C, T. M. Gregory, E. C. Moreno, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 461-475 (July-Aug. 1970).

Key words: Calcium phosphate; dicalcium phosphate dihydrate; ion pairs; solubility; solubility isotherms; solubility product.

Solubility isotherms for $CaHPO_4 \cdot 2H_2O$, dicalcium phosphate dihydrate, DCPD, in the ternary system $Ca(OH)_2-H_3PO_4-H_2O$ were determined at 5, 15, 25, and 37.5 °C in the pH range 3.5 – 7; the relative positions of the isotherms indicate that DCPD has a negative thermal coefficient of solubility. The solubility product, K_s, of DCPD and the stability constants K_x and K_y for the ion pairs $[CaHPO_4^0]$ and $[CaH_2PO_4^+]$, respectively, were obtained as functions of temperature by the use of a generalized least squares procedure subject to three condition functions – constancy of the solubility product, electrical neutrality in the solution, and congruent dissolution of the solid. The equations obtained are

$$\ln K_s = -8403.5/T + 41.863 - 0.09678T$$

$$\ln K_x = 51090/T - 341.14 + 0.5880T$$

$$\ln K_y = 19373/T - 122.81 + .0.1994T.$$

The existence of a maximum in K_s in the neighborhood of 25 °C is plausible on the basis of available thermodynamic data for DCPD. Thermodynamic functions are reported for the solution of DCPD and for the association of the ion pairs.

Effect of oxide additions on the polymorphism of tantalum pentoxide. II. "Stabilization" of the high temperature structure type, R. S. Roth, J. L. Waring, and W. S. Brower, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 477-484 (July-Aug. 1970).

Key words: High temperature polymorph; single crystals; stabilization; tantalum oxide.

The high temperature, apparently tetragonal, polymorph of tantalum pentoxide can be obtained at room temperature by quenching a specimen containing 2-5 mole percent of the following oxides: SnO_2, Ga_2O_3, Cr_2O_3, Fe_2O_3, Sc_2O_3, or MgO. All the x-ray patterns can be indexed on a body centered tetragonal cell with $a \approx 3.830$ Å, $c \approx 35.68$ Å. However, P_2O_5, V_2O_5, Nb_2O_5, ZrO_2, Lu_2O_3, NiO, or ZnO do not stabilize the tetragonal form at room temperature. Single crystals of scandium "stabilized" Ta_2O_5 have been grown by the Czochralski technique.

Effect of oxide additions on the polymorphism of tantalum pentoxide. III. "Stabilization" of the low temperature structure type, R. S. Roth and J. L. Waring, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 485-493 (July-Aug. 1970).

Key words: Low temperature polymorph; single crystals; stabilization; tantalum oxide.

The "low temperature structure type" of Ta_2O_5 has been found to occur in two distinct forms with the lowest temperature form having a unit cell 14 times the subcell and an intermediate temperature form with a unit cell 11 times the subcell. The two types form intermediate partially ordered mixtures which are apparently in thermal equilibrium at various temperatures between ~1000 and 1350 °C. The addition of MoO_3, WO_3, SiO_2, GeO_2, ZrO_2, TiO_2, B_2O_3 and Al_2O_3 each affect the multiplicity of the true unit cell in different ways. WO_3, SiO_2, GeO_2, B_2O_3, and Al_2O_3 form phases structurally similar to "low-Ta_2O_5" which are stable up to the solidus temperatures of the corresponding systems.

The dissociation constant of *m*-nitroanilinium ion in water-tetrahydrofuran solvents at 25 °C, R. A. Robinson, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 495-497 (July-Aug. 1970).

Key words: Dissociation constant; ionization constant; mixed solvents; *m*-nitroaniline; tetrahydrofuran.

The dissociation constant of *m*-nitroanilinium ion has been determined in water and in six water-tetrahydrofuran mixtures. The results are compared with those for water-methanol mixtures.

Specific heats of fluorine at coexistence, R. D. Goodwin and R. Prydz, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 499-505 (July-Aug. 1970).

Key words: Fluorine; liquid-vapor coexistence; saturated liquid; saturation; specific heats; thermodynamic properties; two-phase.

Experimental specific heats of fluorine at constant total volume are reported for the two-phase liquid-vapor system from triple- to the critical point. Specific heats of liquid along the coexistence path are derived by use of PVT data for the two-phase system, and are represented by a formula to facilitate computations of thermodynamic properties.

A theoretical investigation of the configurations $(3d+4s)^6 4p$ in neutral manganese (Mn I), C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 507-520 (July-Aug. 1970).

Key words: Energy levels Mn I; *g*-factors Mn I; interactions between configurations Mn I; manganese spectrum; Mn I configurations $(3d + 4s)^6 4p$.

Experimental levels of the configurations $(3d + 4s)^6 4p$ in Mn I were compared with corresponding calculated values. On fitting 228 experimental levels by means of 20 free parameters an rms error of only 170 cm^{-1} was obtained.

It was shown that the correction parameters β and T were not significant.

A literature survey of the chemistry of flame inhibition, E. C. Creitz, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 521-530 (July-Aug. 1970).

Key words: Flame chemistry; flame extinction; flame inhibition.

Evidence is beginning to accumulate indicating that catalytic recombination of oxygen atoms may be the mechanism of extinction of flames by halogenated extinguishing agents. The literature of flame inhibition and of oxygen atom chemistry has been examined to ascertain whether the available data would support such a mechanism. Considerable sustentative evidence was found.

Kinetic rate-constant data are not available covering all reactions of interest, but those that are reported indicate that catalytic recombination of oxygen atoms can probably compete successfully with normal flame processes which require them.

The NBS Alloy Data Center: Description of index to the literature, G. C. Carter, D. J. Kahan, L. H. Bennett, J. R. Cuthill, and R. C. Dobbyn, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 531-533 (July-Aug. 1970).

Key words: Alloy data; bibliography; index; information; Knight shifts; NMR; soft x ray.

Computerized listings of 10,000 research papers, indexed at the Alloy Data Center, are now being made available in two forms. In the first, the Permuted Materials Index, all records are arranged alphabetically by chemical symbol. Records referring to alloys or compounds are listed under each of the constituent elements. In the second, the Author Index, all papers are listed alphabetically by first author in three groupings: the first, the NMR papers; the second, the soft x-ray papers; and the third, a broad group of papers that have been of general interest to the Alloy Physics Section. The magnetic tape on which the indexed file is stored will be made available at a future date.

What is a quasi-particle?, J. R. Schrieffer, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 537-541 (July-Aug. 1970).

Key words: Density of states; Green's function; mass enhancement; quasi-particle; superconductors.

The concept of a quasi-particle excitation in an interacting many-body system will be discussed from both the physical and the mathematical points of view. The physical origin of mass enhancement, wave function renormalization, interactions between quasi-particles, etc. will be presented. Landau's Fermi liquid theory, including the quasi-particle kinetic equation, will be reviewed. Finally, the domain of validity of the quasi-particle approximation will be discussed.

Electronic densities of states from x-ray photoelectron spectroscopy, C. S. Fadley and D. A. Shirley, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 543-558 (July-Aug. 1970).

Key words: $CdCl_2$; density of states; HgO; noble metals; rigid band model; transition metals; x-ray photoemission; ZnS.

In x-ray photoelectron spectroscopy (XPS), a sample is exposed to low energy x rays (approximately 1 keV), and the resultant photoelectrons are analyzed with high precision for kinetic energy. After correction for inelastic scattering, the measured photoelectron spectrum should reflect the valence band density of states, as well as the binding energies of several core electronic levels. All features in this spectrum will be modulated by appropriate photoelectric cross sections, and there are several types of final-state effects which could complicate the interpretation further.

In comparison with ultraviolet photoelectron spectroscopy (UPS), XPS has the following advantages: (1) the effects of inelastic scattering are less pronounced and can be corrected for by using a core reference level, (2) core levels can also be used to monitor the chemical state of the sample, (3) the free electron states in the photoemission process do not introduce significant distortion of the photoelectron spectrum, and (4) the surface condition of the sample does not appear to be as critical as in UPS. XPS seems to be capable of giving a very good description of the general shape of the density-of-states function. A decided advantage of UPS at the present time, however, is approximately a fourfold higher resolution.

We have used XPS to study the densities of states of the metals Fe, Co, Ni, Cu, Ru, Rh, Pd, Ag, Os, Ir, Pt, and Au, and also the compounds ZnS, $CdCl_2$, and HgO. The *d* bands of these solids are observed to have systematic behavior with changes in atomic number, and to agree qualitatively with the results of theory and other experiments. A rigid band model is found to work reasonably well for Ir, Pt and Au. The *d* bands of Ag, Ir, Pt, Au and HgO are found to have a similar two-component shape.

Tunneling measurements of superconducting quasi-particle density of states and calculation of phonon spectra, J. M. Rowell, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 559-565 (July-Aug. 1970).

Key words: Density of states; phonons; semiconductors; superconductivity; tunneling.

It is an unfortunate fact that the tunneling technique, which has proved incredibly successful in the study of superconductivity, has given little information about the normal state properties of metals and semiconductors. It will be shown that, in the determination of the superconducting quasi-particle density of states, it is the change in density induced by the onset of superconductivity which is measured rather than the total density.

Returning to the problem of normal materials, a review of the limited achievements and failures of tunneling will be presented. This will include the influence of band edges on tunneling in *p-n* diodes and metal-semiconductor contacts, the structures observed in tunneling into bismuth and the negative results obtained in nickel and palladium. The dominant effect of the change in barrier shape in most of these tunneling characteristics will be illustrated.

Pauli paramagnetism in metals with high densities of states, S. Foner, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 567 (July-Aug. 1970).

Relevance of Knight shift measurements to the electronic density of states, L. H. Bennett, R. E. Watson, G. C. Carter, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 4, 569-610 (July-Aug. 1970).

Key words: Electronic density of states; hyperfine fields; Knight shift; nuclear magnetic resonance; susceptibility; wave functions.

The Knight shift, $\mathscr{K}$, measures the magnetic hyperfine field at the nucleus produced by the conduction electrons which are polarized in a magnetic field. Knight shifts are often dominated by the Pauli term and, in its most simple form, can be written as $\mathscr{K} = \langle a \rangle \chi_p$. Here χ_p is the conduction electron Pauli spin susceptibility which depends on the density of states at the Fermi level, $N(E_F)$, and $\langle a \rangle$ is an average magnetic hyperfine coupling constant associated with the wave function character at the nucleus, $|\psi_F(0)|^2$, for conduction electrons at the Fermi surface.

The Knight shift therefore provides, through $\langle a \rangle$, insight into the wave function character associated with $N(E_F)$. Calculations of $\langle a \rangle$ involving an averaging over *k*-space have been attempted for a few simple metals up to the present time. For alloys and intermetallic compounds, rather different $\langle a \rangle$'s are experimentally observed for different local environments, indicating that $\mathscr{K}$ samples the variation in *local* wave function character, or a variation in *local* density of states. There is no unique way of separating the local variation of $N(E_F)$ from $|\psi_F|(0)|^2$.

In this article the methods developed for relating $\mathscr{K}$ to the electronic properties for most of the types of cases encountered in the literature are reviewed. We discuss "simple" metals including problems of orbital magnetism and changes in $\mathscr{K}$ caused by electronic transitions such as melting. Knight shifts and their temperature dependence in metals and intermetallic compounds involving unfilled *d* shells, are discussed. We give estimates of atomic hyperfine fields due to single electrons, appropriate to those cases where problems due to electronic configurations do not make deductions from experiment too ambiguous. A density of states curve calculated for Cu is given, showing the relative importance of *s-p*, and *d* character for that metal. In a qualitative sense this Cu curve implies such information for other transition metals. We discuss alloy solid solutions for the cases where a "rigid" band model might be used to explain the results, and for cases where local effects have to be taken into account. The charge oscillation and RKKY approaches and their limitations are reviewed for cases of dilute nonmagnetic and *d*- or *f*-type impurities.

September-October 1970

Heat capacity and thermodynamic properties of α-beryllium nitride, Be_3N_2, from 20 to 315 K, G. T. Furukawa and M. L. Reilly, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 617-629 (Sept.-Oct. 1970).

Key words: Calorimeter; entropy; heat capacity; specific heat; thermodynamic properties; α-beryllium nitride.

The heat capacity of α-beryllium nitride, Be_3N_2, was determined from 20 to 315 K and the thermodynamic properties calculated from 0 to 315 K. The entropy at 298.15 K was found to be 34.4 ± 0.3 *J/K*·mol (8.23 ± 0.08 cal/K·mol). The precision using a calorimeter of a new design is shown to be ±0.01 percent over most of the temperature range of the measurements.

Heat capacity and thermodynamic properties of β-lithium hexafluoroaluminate, Li_3AlF_6, from 15 to 380 K, G. T. Furukawa,

W. G. Saba, and J. C. Ford, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 631-639 (Sept.-Oct. 1970).

Key words: Calorimetry; entropy; heat capacity; thermodynamic properties; β-lithium hexafluoroaluminate.

The heat capacity of β-lithium hexafluoroaluminate, Li_3AlF_6, was determined from 15 to 380 K and the thermodynamic properties calculated from the results. The entropy at 298.15 K was found to be 187.88 ± 0.38 J/K·mol (44.904 ± 0.090 cal/K·mol).

Thermodynamics of hydrochloric acid in 80 weight percent 2-methoxyethanol and 20 weight percent water from 10 to 50 °C, H. P. Thun, B. R. Staples, and R. G. Bates, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 641-645 (Sept.-Oct. 1970).

Key words: Activity coefficients; non-aqueous emf; standard emf; thermodynamic constants for HCl transfer.

Electromotive-force measurements of cells of the type Pt, $H_2|HCl(m)$ in 2-methoxyethanol $+H_2O|AgCl$, Ag at nine temperatures ranging from 10 to 50 °C were used to derive (a) the standard emf of the cell in 80 weight percent 2-methoxyethanol (methylcellosolve), (b) the activity coefficient of HCl, (c) the relative partial molal enthalpy and heat capacity of HCl, and (d) the thermodynamic constants for the transfer of HCl from water to 80 weight percent methylcellosolve. The molality of the acid ranged from 0.006 to 0.106 mol kg^{-1}. To obtain the standard emf it was necessary to correct for ion-pair formation and to use the extended terms of the Debye-Hückel theory. The standard emf varied with temperature (t, °C) according to the equation $E_t^\circ = 0.14382 - 1.517 \times 10^{-3}t - 3.8317 \times 10^{-6}t^2 - 2.3838 \times 10^{-9}t^3$. Vapor pressures and dielectric constants for this mixture were measured over the temperature range. At 25 °C the solvent has a vapor pressure of 2506.5 Nm^{-2} (18.8 mm Hg) and a dielectric constant of 31.5.

Vapor pressure and heat of sublimation of platinum, E. R. Plante, A. B. Sessoms, and K. R. Fitch, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 647-653 (Sept.-Oct. 1970).

Key words: Heat of sublimation; Langmuir vaporization; platinum; rate of vaporiztion; vapor pressure.

The vapor pressure of platinum was measured by the Langmuir method in the temperature range 1700-2000 K using a vacuum microbalance. Eight series of data gave concordant results and an average third-law heat of sublimation of 564.49 kJ mol^{-1} with an estimated overall uncertainty of 2.1 kJ mol^{-1} (134.92 ± 0.5 kcal mol^{-1}). Three out of eight second-law heats agreed with the third-law heats within one standard error but there was a tendency for second-law heats to be low. This was attributed to small systematic errors in the measurements. A vapor-pressure equation representing the data is $\log P(\text{atm}) = -29020/T + 7.502$, based on our third-law heat and tabulated entropies evaluated at 1800 K. Our data agree well with several previous Langmuir determinations but significantly decrease the error in the heat previously accepted.

Inability to obtain saturation pressures at lower temperatures, previously reported in the literature, was confirmed. It was shown that microgram quantities of carbon are capable of blocking the sublimation reaction.

Thermophysical properties of methane: Virial coefficients, vapor and melting pressures, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 655-660 (Sept.-Oct. 1970).

Key words: Melting pressures; methane; thermophysical properties; vapor pressures; virial coefficients.

For use in the computation of thermodynamic properties in gaseous and liquid states at $T < 300$ K there are given concise descriptions of the properties named in the title. Numerous published data on methane are combined with some new analytical expressions which give more acceptable behavior than previously could have been achieved.

Specific heats, C_v, of compressed liquid and gaseous fluorine, R. Prydz and R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 661-665 (Sept.-Oct. 1970).

Key words: Compressed gas; compressed liquid; fluorine; heat capacities; specific heats.

Experimental specific heats at constant volume for compressed gaseous and liquid fluorine are reported from 80 K to 300 K at pressures to about 23 MN/m^2.

Acidic dissociation of diprotonated piperazine in methanol-water solvents from 10 to 40 °C, M. Paabo and R. G. Bates, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 667-671 (Sept.-Oct. 1970).

Key words: Dissociation constant; ionization constant; methanol; mixed solvents; piperazine; pK; thermodynamics.

The first dissociation constant of piperazinium ion has been determined by the emf method in five methanol-water solvents (10 to 70 wt % MeOH) at 25 °C and in three solvents (10, 20, and 50 wt % MeOH) from 10 to 40 °C. From the variation of the dissociation constant with temperature, the changes of enthalpy, entropy, and heat capacity were derived and compared with similar data for piperazinium ion in water. The variation of pK, ΔS°, and ΔC_p° have been used to interpret the effect of the double positive charge on the solute-solvent interactions as compared to the effect exhibited by a single positive or a negative charge.

Thermal conductivity standard reference materials from 4 to 300 K. I. Armco iron: Including apparatus description and error analysis, J. G. Hust, R. L. Powell, and D. H. Weitzel, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 673-690 (Sept.-Oct. 1970).

Key words: Cryogenics; electrical resistivity; equipment; error analysis; iron; Lorenz ratio; Seebeck effect; thermal conductivity; transport properties.

An apparatus for the measurement of thermal conductivity, electrical resistivity, and thermopower of solids from 4 to 300 K is described. This apparatus, a modified version of the one used earlier in this laboratory, utilizes the steady-state, axial heat flow method. Included is a detailed discussion of the limitations of the apparatus, probable errors, and data analysis methods.

Thermal conductivity, electrical resistivity, Lorenz ratio, and thermopower data are reported for several specimens of Armco iron for temperatures from 4 to 300 K. At low temperatures the electrical resistivity and thermal conductivity vary from specimen to specimen by more than 10 percent. However, the Lorenz ratios of these specimens differ by less than 2.5 percent; and the intrinsic resistivities calculated by using Matthiessen's rule differ by less than 0.5 percent of the total resistivities. Thus, Armco iron specimens can be used as standards by measuring the residual resistivities and utilizing the Lorenz ratio reported here.

Mössbauer spectrometer calibration using TiFe, L. J. Swartzendruber and L. H. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 691-697 (Sept.-Oct. 1970).

Key words: Calibration; chemical shift; iron; Knight shift; Mössbauer effect; sodium nitroprusside; TiFe.

The splitting of the ^{57}Fe Mössbauer spectrum in TiFe has been carefully measured in a magnetic field and compared with the zero-field quadrupolar splitting of sodium nitroprusside. The

comparison gives a value of 1.699 mm/s at 295 K for the sodium nitroprusside splitting. This determination makes use of the known Knight shift of Fe in TiFe and is independent of any velocity measurement. Comparison is made with the splitting of the inner two lines of a pure Fe spectrum.

Energies of $1snl$ ($1 \geq 3$) configurations in He^4 I as calculated from polarization theory, W. C. Martin, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 699-702 (Sept.-Oct. 1970).

Key words: Atomic energy levels; atomic theory; helium; polarizability.

The calculated singlet-triplet mean energies are given for all He^4 I configurations having $3 \leq l \leq n - 1$ from $4f$ to $8k$. Since only Stark-shifted transitions have been observed for such configurations with $l \geq 4$, the calculated positions are the most accurate available. The polarization energy (to the quadrupole approximation) for two-electron ions may be evaluated for higher nl or Z from the simple formulas. The calculated and observed positions of the $1snf$ configurations in He^4 I and Li^7 II agree within the experimental uncertainties.

A theoretical investigation of the configurations $(3d+4s)^8 4p$ in neutral cobalt (Co I), C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 703-713 (Sept.-Oct. 1970).

Key words: Cobalt; configurations $(3d + 4s)^8 4p$; energy levels; g-factors; interactions between configurations.

Experimental levels of the configurations $(3d + 4s)^8 4p$ were compared with corresponding calculated values. On fitting 154 levels by means of 19 free parameters an rms error of only 164 cm^{-1} was obtained.

Odd configurations in neutral nickel (Ni I), C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 715-722 (Sept.-Oct. 1970).

Key words: Energy levels; g-factors; interactions between configurations; nickel; $(3d + 4s)^9 4p$; $3d^9 4p + 3d^8 4s 4p + 3d^9 5p$.

Experimental levels of the configurations $3d^9 4p$, $3d^8 4s 4p$ and $3d^9 5p$ of Ni I were compared with corresponding calculated values. The electrostatic interactions between the configurations $(3d + 4s)^9 4p$ as well as between $3d^8 4s 4p$ and $3d^9 5p$ were considered explicitly.

For the configuration $(3d + 4s)^9 4p$, 71 experimental levels were fitted by means of 17 free parameters to yield an rms error of 131 cm^{-1}. On fitting 83 levels of the configurations $3d^9 4p + 3d^8 4s 4p + 3d^9 5p$ by means of 25 free parameters an rms error of 147 cm^{-1} was obtained.

Electron-spin resonance study of an alkaline solution of copper(II) oxalate-*meso*-tartrate complex (the Somogyi reagent) and related complexes, A. J. Fatiadi, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 5, 723-731 (Sept.-Oct. 1970).

Key words: Alkaline; complex; copper, e.s.r.; ligand; paramagnetic; reagent; spectra; structure; superoxide.

Electron-spin resonance (e.s.r.) studies of the structure of four reagents commonly used in the carbohydrate field, namely, the Somogyi reagent, the Fehling reagent, the Benedict reagent, and the Reeves reagent, in frozen aqueous solution at 77 K, gave definite indications of dimer in the Fehling reagent only; the Benedict reagent contains a relatively low concentration of dimer as compared to monomer. The presence of an "extra" peak at 3.245 kgauss in the e.s.r. spectrum of the Somogyi reagent at 25 °C may be associated with a paramagnetic, superoxide, ion-ligand O_2^-; at 77 K, extra peaks were observed for the Somogyi, Fehling, and Benedict reagents.

November-December 1970

***PVT* measurements, virial coefficients, and Joule-Thomson inversion curve of fluorine,** R. Prydz and G. C. Straty, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 747-760 (Nov.-Dec. 1970).

Key words: Isochores; isotherms; Joule-Thomson inversion curve; liquid densities along melting line; PVT data; second virial coefficient; third virial coefficient.

Experimental *PVT* measurements on gaseous and liquid fluorine from the triple point (53.5 K) to 300 K at pressures to about 21 MN/m^2 are presented. The data are represented by a truncated virial equation in the low-density region. Comparisons of the second virial coefficient from this equation are made with published data. The *PVT* relationship along the Joule-Thomson inversion curve was obtained from the isotherm-isochore representation of the high density region.

The activity coefficients of hydrofluoric acid in water from 0 to 35 °C, W. J. Hamer and Y.-C. Wu, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 761-768 (Nov.-Dec. 1970).

Key words: Activities of HF; equilibrium constant of HF dissociation; ionic concentrations in HF; pH values of HF.

The mean stoichiometric activity coefficients of hydrofluoric acid in aqueous solutions have been calculated from measurements of electrolytic conductivity, the electromotive forces of galvanic cells without liquid junction, and the freezing-point depression. Values obtained from freezing-point depressions were converted to values for 25 °C using known values of the heats of dilution and apparent molal heat capacities of aqueous solutions of hydrofluoric acid of various concentrations. It is also shown that values for the concentrations of the various ionic species in hydrofluoric acid, namely, H^+, F^-, HF_2^-, and HF depend on the functions used to represent the ionic activity coefficients whereas values of the mean activity, $a_{H^+}a_{F^-}$, are independent of such functions. Values of the pH of various concentrations of hydrofluoric acid are given for temperatures of 0 to 35 °C; these, likewise, are nearly independent of activity-coefficient function used to obtain values for the ionic concentrations.

Fluorine flame calorimetry III. The heat of formation of chlorine trifluoride at 298.15 K, R. C. King and G. T. Armstrong, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 769-779 (Nov.-Dec. 1970).

Key words: Bond energy (Cl — F); chlorine reaction with hydrogen; chlorine trifluoride, heat of formation; flame calorimetry; flow calorimetry; fluorine compounds; heat of formation; heat of reaction; hydrogen chloride (aqueous), heat of formation; mixed acids; $(HCl + 3HF)_{aq}$, heat of formation; reaction calorimetry; reaction with hydrogen.

The standard heat of formation of chlorine trifluoride (gas) at 298.15 K has been determined to be — 164.65 kJ mol^{-1} (— 39.35 kcal mol^{-1}) with an overall experimental uncertainty of 5.14 kJ mol^{-1} (1.23 kcal mol^{-1}). This value is derived from the enthalpies of the following reactions which were measured directly in a flame calorimeter operated at 1 atm pressure and 303.5 K, together with data from previous investigations.

$$ClF_3(g) + 2H_2(g) + 100H_2O(l) \rightarrow [HCl \cdot 3HF \cdot 100H_2O](l)$$

$$(1/2)Cl_2(g) + 1/2H_2(g) + [3HF \cdot 100H_2O](l) \rightarrow [HCl \cdot 3HF \cdot 100H_2O](l)$$

The enthalpy of formation of $[HCl \cdot 100H_2O](l)$ was also measured. The average Cl — F bond energy in chlorine trifluoride is calculated to be 160.1 kJ mol^{-1} (38.26 kcal mol^{-1}).

A review of oscillator strengths for lines of Cu I, C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 781-790 (Nov.-Dec. 1970).

Key words: Atomic spectra; copper; Cu I; oscillator strengths; spectral lines of Cu I.

New determinations of oscillator strengths made by Kock and Richter provide for the first time reference standards which permit the adjustment of five previous sets of measurements to an improved scale of absolute oscillator strengths for lines of Cu I. Critical discussions of the several sets of measurements and a consistent list of values for 272 lines in the region 2024 to 8092 Å are presented.

Stark effect and hyperfine structure of HCN measured with an electric resonance maser spectrometer, H. E. Radford and C. V. Kurtz, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 791-799 (Nov.-Dec. 1970).

Key words: Dipole moment; HCN resonance spectrum; maser spectrometer; Stark effect; voltage standard.

The 449 MHz *l*-type doubling spectrum of HCN has been measured to high precision with a molecular beam maser spectrometer. Hyperfine structure due to both the nitrogen nucleus and the proton was resolved, and the coupling constant of the proton $\mathbf{I} \cdot \mathbf{J}$ interaction was found to be -27.3 ± 1.6 kHz. The spectrometer is also suited to precise measurements of Stark effects in molecules of the linear and symmetric top variety, and Stark shifts of up to 10^4 times the zero-field line width have been measured in the HCN spectrum. Analysis of these measurements yields the value $\mu = 2.940 \pm 0.001$ D for the dipole moment of the $\epsilon_2 = 1$ state of HCN.

The second spectrum of nickel (Ni II), A. G. Shenstone, *J. Res. Nat. Bur. Stand. (U.S.)*, **74A** (Phys. and Chem.), No. 6, 801-855 (Nov.-Dec. 1970).

Key words: Energy levels; ionization potential; nickel; spectral series; spectroscopy; wavelength.

An analysis of Ni II based on 4300 observed lines is presented. The low structures are $3d^9$, $3d^8 4s$ and $3d^7 4s^2$ which are now complete except for $3d^8(^1S)4s^2S$ and $3d^7 4s^2\ ^2P_{1/2}$ and the higher of the two ^2D terms of $3d^7 4s^2$. Long series occur such as $3d^8 4s$ to $9s$, $4d$ to $8d$, $4f$ to $7f$, $5g$ to $7g$. The analysis also includes many terms of the complex structure $3d^7 4s 4p$ but only 55 percent of the levels within reach of the hollow cathode source have been found. The identification of the levels of $3d^8 4d$ and $5d$ was assisted by the calculations of N. Spector. The $4d^7 4s^2$ levels were calculated by Y. Shadmi, who also provided calculated positions for all the levels of $3d^7 4s 4p$ without which much of the analysis would have been impossible. The $3d^8 ns$ and $3d^8 nd$ series give a limit of 146532.0 but the $3d^8 ng$ series give 146541.56. The latter has been adopted though no explanation of the discrepancy has been found.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 75A, JANUARY-DECEMBER 1971

January-February 1971

High-speed (subsecond) measurement of heat capacity, electrical resistivity, and thermal radiation properties of tantalum in the range 1900 to 3200 K, A. Cezairliyan, J. L. McClure, and C. W. Beckett, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 1-13 (Jan.-Feb. 1971).

Key words: Electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; tantalum; thermal radiation properties; thermodynamics.

Measurements of heat capacity, electrical resistivity, hemispherical total and normal spectral emittances of tantalum above 1900 K by a pulse heating technique are described. Duration of an individual experiment, in which the specimen is heated from room temperature to near its melting point, is less than one second. Temperature measurements are made with a photoelectric pyrometer. Experimental quantities are recorded with a digital data acquisition system. Time resolution of the entire system is 0.4 ms. Results on the above properties of tantalum in the range 1900 to 3200 K are reported and are compared with those in the literature. Estimated inaccuracy of measured properties in the above temperature range is 2 to 3 percent for heat capacity, 0.5 percent for electrical resistivity, 3 percent for hemispherical total emittance, and 2 percent for normal spectral emittance.

Thermophysical properties of methane: orthobaric densities and some thermal properties, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 15-21 (Jan.-Feb. 1971).

Key words: Heats of vaporization; methane; orthobaric densities; specific heats of the saturated liquid; thermofunctions for ideal gas states; thermophysical properties.

For use in the computation of thermodynamic functions, analytical descriptions are given for the following properties: the orthobaric densities and saturation temperatures; the heats of vaporization; the specific heats of saturated liquid; and the thermodynamic functions for ideal gas states.

The infrared spectrum of matrix isolated BaO_2, S. Abramowitz and N. Acquista, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 23-25 (Jan.-Feb. 1971).

Key words: Barium; barium oxides; high temperature; infrared; matrix isolations.

The infrared spectra of matrix isolated BaO_2 have been observed and assigned. Ba atoms were allowed to react with an argon oxygen mixture and condensed on a liquid hydrogen cooled surface. Spectra observed using $^{18}O_2$ and $^{16}O^{18}O$ confirm this assignment.

Refinement of the crystal structure of the aragonite phase of $CaCO_3$, B. Dickens and J. S. Bowen, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 27-32 (Jan.-Feb. 1971).

Key words: Calcium carbonates; carbonates; crystal structure; single crystal x-ray diffraction.

Aragonite ($CaCO_3$) crystallizes in the unit cell $a = 4.9598(5)$ Å, $b = 7.9641(9)$ Å, and $c = 5.7379(6)$ Å at 25 °C with four formula weights in space-group *Pmcn*. The structure has been refined to $R_w = 0.024$, $R = 0.040$ using 765 x-ray reflections from a single crystal. The Ca ion is coordinated to nine oxygens with Ca . . . O distances in the range 2.414(2) Å to 2.653(1) Å. The two unique C – O distances in the CO_3 group are 1.288(2) Å (on the mirror plane) and 1.283(1) Å. The two unique O – C – O angles are 119.6(2)° (across the mirror plane) and 120.13(8)°. The distances and angles in the CO_3 group are not significantly different at the 95 percent confidence level.

Simple shearing flows in polyisobutylene solutions, L. J. Zapas and J. C. Phillips, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 33-40 (Jan.-Feb. 1971).

Key words: BKZ fluid; nonlinear behavior; polyisobutylene; stress relaxation; viscosity.

Measurements of shear stress for various shearing flow histories at 25 °C are correlated through the BKZ elastic fluid theory. The data are on 10 percent P1B solution in cetane. The histories include single step stress relaxation, suddenly applied steady shear, steady shearing flow, stress relaxation after steady shear.

Synthesis of fluorodienes, J. E. Fearn, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 41-56 (Jan.-Feb. 1971).

Key words: Cyclic inter-intramolecular mechanism; diene polymerization; fluorodienes; intermediates; polymerization; purity; synthesis; telomerization.

In a comprehensive study of the cyclic, inter-intramolecular mechanism in diene polymerization, all of the completely fluorinated dienes from C_5 to C_8 have been prepared with a high degree of purity. Also prepared were 4-chloroperfluoro-1,6-heptadiene and perfluoro-1,11-dodecadiene, the latter inadvertently. The successful syntheses involved, in most cases, a telomerization which utilized, as the starting material, I_2, ICl, CF_2CFCl, or CF_2CF_2. From these telomers, not only the dienes but many new intermediate compounds were prepared; they were then purified and characterized. The chemistry of these compounds, especially that relating to their polymerization, is briefly discussed.

Quantum corrections to the second virial coefficient for the Lennard-Jones (*m*-6) potential, M. E. Boyd, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 1, 57-89 (Jan.-Feb. 1971).

Key words: Lennard-Jones gas; (*m*-6) intermolecular potential; quantum corrections; second virial coefficient; statistical mechanics; thermodynamics.

Tables are presented for the second virial coefficient of a Lennard-Jones (*m*-6) gas in reduced variables for seven values of *m*.

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

A wide range of reduced temperatures, in a mesh chosen for ease of interpolation, is covered. Values are given for the classical term and three quantum corrections as well as the first two temperature derivatives of each of these terms. A discussion of the variation of behavior with m, especially at the limits $m=6$ and $m=\infty$, is included.

March-April 1971

Tentative set of key values for thermodynamics—Part 1. Report of the ICSU-CODATA Task Group on key values for thermodynamics, October, 1970, S. Sunner, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 97-101 (Mar.-Apr. 1971).

Key words: CODATA; key values; thermodynamics.

This paper is a preliminary report from the Task Group on Key Values for Thermodynamics of the Committee on Data for Science and Technology (CODATA) of the International Council of Scientific Unions (ICSU). It gives values agreed upon by the Committee for enthalpies of formation and entropies of 32 atoms, molecules, and ionic species. Sources of the data are also tabulated.

Expanded formulation of thermodynamic scaling in the critical region, M. J. Cooper, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 103-107 (Mar.-Apr. 1971).

Key words: Critical region; equation of state; liquid-gas transition; phase boundary; phase transition; thermodynamic scaling.

A description of the thermodynamic properties in the critical region of a physical system is obtained from a scaled expression for the free-energy $F(\rho, T)$. In general, a nonsymmetric coexistence curve is predicted, with the symmetric case (e.g., magnets) included as a special example. For fluids, deviations from symmetry give rise to an expression for the average density below the critical point nonlinear in the temperature near T_c (in contrast to the usual "law of rectilinear diameter"); these asymmetries also contribute to the discontinuity in the specific heat along the critical isochore. To lowest order, the formulation reduces to Widom's homogeneous scaling; the classical equations of state of the van der Waals type are incorporated as a special case.

Table of spin-orbit energies for *p*-electrons in neutral atomic (core) *np* configurations, W. C. Martin, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 109-111 (Mar.-Apr. 1971).

Key words: Atomic spectra; atomic theory; spin-orbit interaction.

Data are given in support of the recently proposed formula $\zeta_{np}n^{*3}=0.450Z^{2.33}$ cm^{-1} ($Z \geq 5$). The table includes evaluations of this formula, which are probably accurate to ~ 15 percent for all atoms $Z=10$ to 90. For many (core) *np* configurations, the accuracy of ζ_{np} rom the formula is greater than that to be expected from fitting the observed levels to intermediate coupling theory.

Heat capacities of *cis*-1,4-polyisoprene from 2 to 360 K, S. S. Chang and A. B. Bestul, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 113-120 (Mar.-Apr. 1971).

Key words: Annealed and quenched glass; calorimetry; *cis*-1,4-polyisoprene; glass transformation; heat capacity; natural rubber; normal and supercooled liquid; rubber, natural; thermal diffusivity; thermodynamic properties.

Heat capacities of amorphous synthetic *cis*-1,4-polyisoprene have been determined for the quenched and annealed glasses from 2 to T_g (around 200 K) and for the liquid from T_g to 360 K, with a precision of better than 0.05 percent above 15 K. T_g, as determined from H versus T plots, is 203 K for the quenched glass and 198 K for the annealed glass. For the glasses the heat capacity values from this research are about 1 percent higher than that reported in 1935 for natural rubber hydrocarbon. For the liquid the result from this research agrees better (within 1 percent) with recently (1967) proposed values than those from the earlier experiment cited. Effects of crystallization and melting, stark rubber crystals, and additives (antioxidants and stabilizers) were also studied.

Combined low-pressure and high-pressure measurements of density and bulk modulus of aviation instrument oil and 2-methylbutane and their mixtures, J. C. Houck and P. L. M. Heydemann, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 121-127 (Mar.-Apr. 1971).

Key words: Bulk modulus; compressibility; density; dilatometric measurements; high pressure; liquids; ultrasonics; 2-methylbutane.

Dilatometric measurements were made on mixtures of aviation instrument oil and 2-methylbutane at low pressures. These results are combined with previous dilatometric and ultrasonic measurements at high pressures to give density, relative volume, and isothermal bulk modulus of the mixtures to pressures of 20 kilobars. The ratio of the adiabatic bulk modulus to isothermal bulk modulus for 2-methylbutane is also given.

Crystal structure of $Ca_2Na_2(CO_3)_3$ (shortite), B. Dickens, A. Hyman, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 2, 129-135 (Mar.-Apr. 1971).

Key words: Calcium sodium carbonate; crystal structure; shortite; single-crystal x-ray diffraction.

$Ca_2Na_2(CO_3)_3$ crystallizes in the orthorhombic unit cell $a=4.947(1)$ Å, $b=11.032(2)$ Å, and $c=7.108(1)$ Å at 25 °C with two formula weights in space-group Amm2. The structure has been redetermined, corrected, and refined to $R_w=0.025$, $R=0.020$ using 684 "observed" x-ray reflections from a single crystal. Corrections were made for absorption and isotropic extinction. In the extinction refinements, r refined to 0.00017(1) cm. The structure consists of Ca_2NaCO_3 layers interleaved with $Na(CO_3)_2$ layers. The Ca ion is coordinated strongly to nine oxygens, including three CO_3 edges, with Ca . . . O distances varying from 2.401(2) Å to 2.576(2) Å. One Na ion is coordinated strongly to eight oxygens, including two CO_3 edges, with Na . . . O distances from 2.429(2) Å to 2.605(1) Å. The other Na ion is coordinated strongly to six oxygens, including one CO_3 edge, at 2.296(1) Å to 2.414 Å, and weakly to a seventh at 3.050(3) Å. One CO_3 group is coordinated to seven cations, the other is coordinated to eight. The CO_3 groups have seemingly maximized their edge sharing with Ca ions rather than Na ions.

May-June 1971

The solid phase photolysis and radiolysis of ethylene at 20 to 77 K, R. Gorden, Jr., and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 3, 141-146 (May-June 1971).

Key words: Ethylene; free radical reactions; ion-molecule reactions; photolysis; polymerization; radiolysis.

Films of ethylene condensed onto a cold finger maintained at 20 K were irradiated with photons whose energy ranged from 8.4 to 21.2 eV. At the higher photon energies the relative yields of products compare well with those seen in the radiolysis of solid ethylene. Experiments on CH_2CD_2 demonstrate that in the photolysis hydrogen is mainly formed by the elimination processes $CH_2CD_2^* \rightarrow H_2(D_2) + C_2D_2(C_2H_2)$ and $CH_2CD_2^* \rightarrow HD + C_2HD$. The relative probabilities of these three processes

are independent of the energy of the incident photons from 8.4 to 11.6 eV and are within experimental error identical to those observed in earlier gas phase photolysis experiments. Relative to acetylene, cyclobutane is a minor product at 8.4 eV but increases by an order of magnitude at higher energies where ions play a role. Cyclobutane, 1-butene and methylcyclopropane formed upon irradiation of frozen $C_2H_4-C_2D_4$ mixtures consisted mainly of C_4D_8, $C_4D_4H_4$, and C_4H_8. Plausible mechanisms which may account for the formation of the latter products are examined. In the solid phase as in the gas phase the relative importance of H-atom production is seen to increase with increasing photon energy. Cyclopropane, apparently formed by insertion of CH_2 into C_2H_4, is observed as a product at all wavelengths in the photolysis, and in the radiolysis.

Kinetic mass spectrometric investigation of the ion-molecule reactions occurring in C_4 and C_5 alkanes following photoionization at 106.7 and 104.8 nm, L. W. Sieck, S. K. Searles, and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 147-153 (May-June 1971).

Key words: Gas phase; hydrocarbons; ion-molecule reactions; mass spectrometry; photoionization; rate constants.

The photoionization of C_4 and C_5 alkanes has been investigated at 106.7 and 104.8 nm in a mass spectrometer specifically designed for the investigation of ion-molecule reactions occurring at thermal kinetic energies. Absolute rate constants are reported for the reactions of various fragment ions with the corresponding parent molecule.

The rate constants found for reactions of *sec*-$C_3H_7^+$ ions with *i*-C_4H_{10}, *n*-C_4H_{10}, *i*-C_5H_{12}, and *n*-C_5H_{12} were found to be 3.3, 4.4, 4.7, and 5.2×10^{-10} cm³/molecule-second respectively. The $C_4H_9^+$ ions were also found to be highly reactive, exhibiting rate constants of 3.6 and 3.8×10^{-10} cm³/molecule-second in reactions with *i*-C_5H_{12} and *n*-C_5H_{12}. The rate constants for reaction of $C_3H_6^+$ with *i*-C_4H_{10}, *n*-C_4H_{10}, *i*-C_5H_{12}, and *n*-C_5H_{12} were found to be 4.9, 4.9, 7.6, and 7.9×10^{-10} cm³/molecule-second, respectively. Butene ions are less reactive by an order of magnitude. The results are compared with complementary data derived from electron impact experiments, and the relationship between the structure and reactivity of the various ions is discussed.

An alumina standard reference material for resonance frequency and dynamic elastic moduli measurement. I. For use at 25 °C, R. W. Dickson and J. B. Wachtman, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 155-162 (May-June 1971).

Key words: Alumina; elastic modulus; resonance frequency; shear modulus; standard reference material; Young's modulus.

Bars of sintered polycrystalline alumina were machined to nominal dimensions of 12.7 by 1.27 by 0.32 cm. Surfaces were machined flat and parallel. The mass, dimensions, and resonance frequencies (flexural and torsional) were measured at 25 °C. The exact frequency is specified for each bar and is typically about 2030 Hz for flexural resonance and 11250 Hz for torsional resonance. The effect of suspension loading on resonance frequency was determined and a correction made. Each bar can be used as a frequency standard with an uncertainty for values measured in air of about ± 0.03 Hz for flexure and ± 0.08 Hz for torsion. The effect of atmosphere on resonance frequency was determined and a correction was made for this effect. The uncertainty for resonance frequencies in vacuum is about ± 0.06 Hz for flexure and ± 0.18 Hz for torsion. Each bar can also be used as a dynamic elasticity standard with an uncertainty estimated to be about 0.2 percent for the shear modulus and 0.4 percent for Young's modulus.

Optical and mechanical properties of some neodymium-doped laser glasses, R. M. Waxler, G. W. Cleek, I. H. Malitson, M. J. Dodge, and T. A. Hahn, *J. Res. Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 163-174 (May-June 1971).

Key words: Chemical composition; density; glasses; hardness; laser; optical homogeneity; photoelasticity; refractive index; thermal conductivity; thermo-optic properties; transmittance.

Studies have been made to evaluate thermo-optic and piezo-optic properties of five laser glasses. Measurements were made at the Cd red line, $\lambda = 0.6438$ μm, over a wide range of temperatures and pressures using interferometric and polarimetric techniques. The refractive index-temperature data show both positive and negative values and small changes with temperature. The changes in index with applied compressive stress are positive in value. Other optical properties evaluated were homogeneity, transmittance, and refractive index as a function of wavelength. An ultrasonic pulse-echo technique was used to determine the elastic constants, Young's modulus, shear modulus, bulk modulus, and Poisson's ratio. Data for thermal expansion, thermal conductivity, density, hardness and chemical composition are also given. Calculations were made of the thermal change of refractive index at constant volume. These data can be used to calculate corrections for the distortions of the wavefront of light generated in lasers.

Effect of environment on viscous flow in inorganic oxide glasses, J. H. Simmons and P. B. Macedo, *J. Res Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 175-184 (May-June 1971).

Key words: Critical point theories; immiscibility; phase transitions; structural relaxation; transport phenomena; viscous flow.

Results from viscosity and shear structural relaxation measurements conducted above the liquid-liquid phase transition of a series of immiscible inorganic oxide glasses are analyzed. A model is proposed which relates the temperature dependence of the complex modulus and viscosity to the behavior of microstructure in the glass resulting from supercritical fluctuations in composition. It is suggested that the critical microstructure induces differences in local environment in the glass which in turn cause the appearance of distributions of relaxation times. The model is formulated using elementary fluctuation theory and the resulting equations are successfully compared to the data.

Phase relations in the SrO-IrO_2-Ir system in air, C. L. McDaniel and S. J. Schneider, *J. Res. Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 185-196 (May-June 1971).

Key words: Dissociation; equilibrium; phase relations; SrO:IrO_2 compounds; SrO-IrO_2-Ir system.

The equilibrium phase relations for the SrO-IrO_2-Ir system were determined in an air environment at atmospheric pressure. A ternary equilibrium phase diagram was constructed indicating selected oxygen reaction lines and tie lines. A binary representation is given for the ternary system in air. Of the nine phases detected in this study, three are stable and six are probably metastable under atmospheric conditions. The stable compounds, $4SrO\cdot IrO_2$, $2SrO\cdot IrO_2$, and $SrO\cdot IrO_2$ dissociate at 1540, 1445, and 1205 °C, respectively. The metastable phases include low-$4SrO\cdot IrO_2$, $2SrO\cdot 3IrO_2$, $xSrO\cdot IrO_2 (x > 2)$, $ySrO\cdot IrO_2 (4 > y > 2)$, $zSrO\cdot IrO_2 (2 > z > 1)$, and $3SrO\cdot 2IrO_2$. The specific composition of the metastable phases could not be ascertained with certainty. The x-ray patterns of all phases detected in this study were indexed with the exception of that of the $zSrO\cdot IrO_2 (2 > z > 1)$ compound. A summary of x-ray data is given for all known phases occurring in the system.

The crystal structure of $BaCa(CO_3)_2$ (barytocalcite), B. Dickens and J. S. Bowen, *J. Res. Nat. Bur. Stand. (U.S.),* **75A** (Phys. and Chem.), No. 3, 197-203 (May-June 1971).

Key words: Aragonite; barium calcium carbonate; calcium carbonate; crystal structure; single crystal x-ray diffraction.

The barytocalcite phase of $BaCa(CO_3)_2$ crystallizes in the monoclinic unit cell $a=8.092(1)$ Å, $b=5.2344(6)$ Å, $c=6.544(1)$ Å, $\beta=106.05(1)°$ at 25 °C with cell contents of $2[BaCa(CO_3)_2]$. The structure previously reported by Alm is correct in its coarse details but has been redetermined here and refined to $R_w=0.028$, $R=0.023$ in space-group $P2_1/m$ using 1652 observed reflections. Corrections were made for absorption, isotropic extinction, and anomalous dispersion.

The structure of barytocalcite has an ... ABCABC ... stacking of cation layers and repeat every 3 layers. The calcite phase of $CaCO_3$ has an ABC cation layer sequence and repeats every 6 layers. The orientations of the CO_3 groups in barytocalcite are like the CO_3 group orientation in the aragonite phase of $CaCO_3$, and are rotated about 30° from the CO_3 group orientation in calcite. The cation layer sequence in aragonite is ... ABAB ... and the structure repeats every 2 layers.

The Ca ion in barytocalcite is coordinated to seven oxygens, including an edge of a CO_3 group, with Ca ... O distances in the range 2.305(2) Å to 2.518(2) Å. The Ba ion is coordinated to five edges and one apex of the CO_3 groups with Ba ... O distances ranging from 2.729(3) Å to 3.140(2) Å. The distances of the C atoms in the CO_3 groups from the planes of the O atoms are 0.025(5) Å and 0.022(4) Å for C(1) and C(2), respectively.

Ionization of hydrofluoric acid at 25 °C, P. R. Patel, E. C. Moreno, and J. M. Patel, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 3, 205-211 (May-June 1971).

Key words: Hydrofluoric acid; ionization constant; lanthanum fluoride electrode; least squares procedure; potentiometric measurements.

The ionization constant, K_1, for the reaction $HF \rightleftarrows H^+ + F^-$ was calculated on the basis of potentiometric measurements in the cell Ag; AgCl, Cl^-, $F^-||LaF_3||NaF$, HCl, $H_2O|KCl$(Satd.), Hg_2Cl_2; Hg at 25 °C. A least squares procedure was applied to the experimental data yielding a best estimate for K_1 of 5.85×10^{-4} with a standard error of 0.03×10^{-4}.

Vapor pressure equation for water in the range 0 to 100 °C, A. Wexler and L. Greenspan, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 3, 213-230 (May-June 1971).

Key words: Clausius-Clapeyron equation; saturation vapor pressure over water; steam; vapor pressure; vapor pressure of water; virial coefficients; water vapor.

Some precise measurements of the vapor pressure of liquid water at seven temperatures in the range 25 to 100 °C were reported recently by H. F. Stimson of NBS. These measurements have an estimated standard deviation of 20 ppm or less, except at 25 °C where the estimated standard deviation is 44 ppm. We have derived a formula which yields computed values of vapor pressure agreeing with Stimson's measurements to within 7 ppm.

We integrated the Clausius-Clapeyron equation using the accurate calorimetric data of Osborne, Stimson, and Ginnings and the Goff and Gratch formulations for the virial coefficients of water vapor to obtain an equation that has a rational basis. This equation was then adjusted to bring it into closer accord with Stimson's pressure measurements. Two tables are given of the vapor pressure, expressed in pascals, as a function of temperature at 0.1-deg intervals over the range 0 to 100 °C, one on the International Practical Temperature Scale of 1948 and the other on the International Practical Temperature Scale of 1968.

July-August 1971

Inclusions in laser materials, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 247-260 (July-Aug. 1971).

Key words: Antimony; heat conduction; laser materials; Nd-doped glass; platinum; stress components; thermoelastic theory.

One of the severe problems encountered in high-power-solid-state laser systems is the thermal damage to laser rods and optical elements. One such type of damage is thought to arise from metallic or dielectric inclusions; i.e., impurities with physical and optical properties which differ substantially from those of the host material. Such inclusions may absorb an appreciable amount of the incident radiation and thereby may undergo thermal expansion. This produces major stresses within the host material. Estimating such thermal properties requires the consideration of solutions to the heat diffusion equation and to the thermal stress equations with appropriate boundary conditions. The optical path length change for a probing light ray passing near the inclusion, the radial and tangential stress components, and the changes of the refractive index for radially polarized and tangentially polarized light due to the thermal stress field are computed. The dependence of the maximum value of the tensile stress upon the size of the inclusion and upon the physical properties of the host is examined. The feasibility of using optical techniques to detect metallic and dielectric inclusions in laser materials before they cause damage also is studied. The computations suggest that the use of laser pulse widths of the order of microseconds or longer may be more promising for the detection of small incipient absorbing centers than the use of nanosecond pulse widths.

Heat diffusion near absorbing centers in laser materials, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 261-268 (July-Aug. 1971).

Key words: Absorbing center; complementary error function; heat diffusion; laser host.

The solutions to the heat diffusion equation for spherical absorbing centers in laser materials are presented. The ratio of the volume specific heats for the absorbing center and the laser host is found to determine three regions of behavior. Series expansions for small times and for very large times also are given in each of the three regions. Rapidly converging representations for the complementary error function of complex arguments are developed in order to evaluate numerically the region for which the volume specific heat ratio is greater than three fourths.

Thermal conductivity, electrical resistivity, and thermopower of aerospace alloys from 4 to 300 K, J. G. Hust, D. H. Weitzel, and R. L. Powell, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 269-277 (July-Aug. 1971).

Key words: Aluminum alloy; cryogenics; electrical resistivity; Lorenz ratio; nickel alloys; Seebeck effect; thermal conductivity; titanium alloy; transport properties.

Thermal conductivity, electrical resistivity, and thermopower have been measured for several aerospace alloys: titanium alloy A110—AT, aluminum alloy 7039, Inconel 718, and Hastelloy X. Tables and graphs of the measured properties and Lorenz ratio are presented over the range 4 to 300 K. Comparisons to other measurements and theoretical analysis of the data are included. The uncertainties of the property data are estimated as (1) 0.7 to 2.5 percent for thermal conductivity, (2) 0.25 percent in electrical resistivity, and (3) about 0.1 μV/K in thermopower.

Refractive indices of fused silica at low temperatures, R. M. Waxler and G. W. Cleek, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 279-281 (July-Aug. 1971).

Key words: Fused silica; glasses; interferometry; optics; refractive index.

The refractive indices of a commercial fused silica specimen were determined at ten wavelengths from 404.7 to 667.8 nm over the temperature range from − 200 to +20 °C. The data are needed for the design of optical systems for space applications where the extremes of temperature are encountered. Values of the thermal coefficient of refractive index were found to be positive and varied from about 9×10^{-6}/°C at room temperature to 3×10^{-6}/°C at liquid nitrogen temperature. The data also showed that there is an increase in dispersion with increasing temperature. These results bear out the predictions of the theory for the thermo-optic behavior of solids.

High-speed (subsecond) measurement of heat capacity, electrical resistivity, and thermal radiation properties of tungsten in the range 2000 to 3600 K, A. Cezairliyan and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 283-290 (July-Aug. 1971).

Key words: Electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; thermal radiation properties; thermodynamics; tungsten.

Measurements of heat capacity, electrical resistivity, hemispherical total emittance, and normal spectral emittance of tungsten above 2000 K by a pulse heating technique are described. Duration of an individual experiment, in which the specimen is heated from room temperature to near its melting point, is less than one second. Temperature measurements are made with a photoelectric pyrometer. Experimental quantities are recorded with a digital data acquisition system, which has a full-scale signal resolution of one part in 8000. Time resolution of the entire system is 0.4 ms. Results on the above properties of tungsten in the range 2000 to 3600 K are reported and are compared with those in the literature. Estimated inaccuracy of measured properties in the above temperature range is: 2 to 3 percent for heat capacity, 1 percent for electrical resistivity, 3 percent for hemispherical total and normal spectral emittances.

The calculated continuous emission of a LTE hydrogen plasma, J. R. Roberts and P. A. Voigt, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 291-333 (July-Aug. 1971).

Key words: Emission coefficient; hydrogen; hydrogen continuum; LTE; spectral radiance standard; Stark-broadening.

The total continuous emission coefficient for a LTE hydrogen plasma at one atmosphere is calculated for a temperature range from 8000 to 16000 K and a wavelength range from 400 to 15000 Å. Contributions involving the species H, H_2^+, H^-, and H_2, as well as the wings of Stark-broadened hydrogen lines are included. This calculation will permit the radiation emitted from a laboratory hydrogen plasma to be used as a high intensity spectral radiance calibration standard.

The second spectrum of nickel (Ni II) (addenda and errata), A. G. Shenstone, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 335-336 (July-Aug. 1971).

Key words: Energy levels; ionization potential; nickel; spectral series; spectroscopy; wavelength.

This paper provides additional information which came to light too late for the original publication [J. Res. Nat. Bur. Stand. (U.S.) **74A**, 801 (1970)].

Tables of second virial coefficients and their first and second derivatives for the Stockmayer (m, 6, 3) potential function, J. S. Gallagher and M. Klein, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 4, 337-385 (July-Aug. 1971).

Key words: Dipole; gas; intermolecular potential function; polar; second virial coefficient; Stockmayer.

Expressions are developed for the second virial coefficient and its first two temperature derivatives for polar molecules on the Stockmayer model of a dipole imbedded in a spherical core. In the case considered, the core molecules interact according to an (m, 6) intermolecular potential function. Terms describing the dependence of these quantities on the polarizability of the dipole are also included. Tables are given for the cases $m = 9$, 12, 18, 24, 36, and 60. These tables can be used to calculate the first density corrections to all of the thermodynamic properties of a fluid of polar molecules. The adequacy and accuracy of the tables are discussed in some detail.

September-October 1971

Measurement of the relative enthalpy of pure α-Al_2O_3 (NBS heat capacity and enthalpy standard reference material No. 720) from 273 to 1173 K, D. A. Ditmars and T. B. Douglas, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 401-420 (Sept.-Oct. 1971).

Key words: Alumina; aluminum oxide; corundum; drop calorimetry; enthalpy; heat capacity standard; specific heat; standard reference material; synthetic sapphire; thermodynamic functions.

The relative enthalpy of NBS Standard Reference Material No. 720 (99.98 percent pure, single-crystal α-Al_2O_3, a calorimetric heat-capacity standard) was measured over the range 273 to 1173 K by the drop method using a highly precise Bunsen ice calorimeter. Enthalpy data over the same temperature interval were obtained also on the Calorimetry Conference Sample of this substance. These results are believed to be more accurate than similar NBS results on the latter sample published in 1956, and show no significant discontinuity with the NBS data on the same substance that covered the ranges 13 to 380 K and 1173 to 2257 K. The average deviation from the mean for all enthalpy measurements on the SRM 720 sample was 0.017 percent, and the smooth enthalpy values derived from the data were estimated to be accurate to 0.1 percent. The precautions observed in order to minimize measuring errors are described in detail. The data are compared with many sets of the most reliable published data available and new recommended values for the thermodynamic functions of α-Al_2O_3 are presented for the interval 0 to 1200 K.

High-precision coulometric titrations of boric acid, G. Marinenko and C. E. Champion, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 421-428 (Sept.-Oct. 1971).

Key words: Accurate analysis; boric acid; coulometric titration; high-precision acidimetry; high-precision coulometry.

An absolute method was developed for the determination of boric acid by coulometric titrimetry. The precision of the method, expressed as the standard deviation of a single determination is 0.0033 percent. Changes in the investigated titration parameters produced no significant effects on the titration results. Indications are that within the uncertainty of measurements the method is bias free.

Determination of trace elements in ruby laser crystals by neutron activation analysis, B. A. Thompson and E. C. Miller, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 429-433 (Sept.-Oct. 1971).

Key words: Activation analysis; Al_2O_3; interfering reactions; laser; nondestructive analysis; ruby; trace elements.

Methods are described by which concentration levels have been determined for up to ten different trace elements and upper limits established for over 40 additional elements at the parts per million level or below in ruby crystals using neutron activation analysis. This information is required to determine the effect of trace element levels on laser performance. With conventional

analytical methods difficulties arise because of both the refractory and insulating properties of the material. Because the crystals cannot be readily dissolved, the activation analysis was carried out nondestructively, irradiating the samples with highly thermalized neutrons to minimize formation of ^{24}Na and ^{27}Mg from (n, α) and (n, p) reactions on the Al_2O_3 matrix, and using a 47-cm^3 Ge(Li) detector.

Crystallography of some double sulfates and chromates, H. F. McMurdie, M. C. Morris, J. deGroot, and H. E. Swanson, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 435-439 (Sept.-Oct. 1971).

Key words: Chromates; langbeinites; lattice constants; sulfates; Tutton salts.

New information is given on cell parameters, density and methods of preparation of 50 compounds of the langbeinite and Tutton salt groups. The langbeinites have the general formula $(A^+)_2(B^{2+})_2(XO_4)_3$ and the Tutton salts the general formula $(A^+)_2(B^{2+})(XO_4)_2 \cdot 6H_2O$, where A is K, Rb, (NH_4), Tl or Cs; B is Mg, Ni, Cu, Co, or Zn; and X is S or Cr. A comprehensive list of references on the crystallography of the compounds is included.

Discrimination between equations of state, J. R. Macdonald and D. R. Powell, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 441-453 (Sept.-Oct. 1971).

Key words: Curve fitting; data analysis; equations of state; model discrimination; surface fitting.

Eight isothermal equations of state are analyzed to yield quantitative measures of the degrees to which equation pairs can be discriminated for real data, data of limited span and precision. Calculated curves allow one to assess the span and precision necessary in *P-V* data to allow unambiguous discrimination of various pairs. Some discussion is presented of bias and systematic error which may arise in least squares fitting. Using exact synthetic data, we also illustrate for seven equation pairs the very large relative systematic errors in parameter and standard deviation estimates which arise from such fitting of data of limited span with an incorrect but "close" equation model. General conclusions following from these results are discussed. Although the present work is principally concerned with discrimination between equations of state, its results are pertinent to the more general problem of choosing a "best" analytical model (linear or nonlinear) to represent experimental results.

New absorption bands and isotopic studies of known transitions in CO, J. D. Simmons and S. G. Tilford, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 455-467 (Sept.-Oct. 1971).

Key words: Absorption spectrum; CO; electronic transitions; rotational analysis; vibrational analysis; vibrational and rotational constants.

Several new absorption bands of the $a'\,^3\Sigma^+ - X^1\Sigma^+$ and $e\,^3\Sigma^- - X^1\Sigma^+$ transitions in CO have been observed and analyzed. Vibrational levels of both the $a'\,^3\Sigma^+$ and $e\,^3\Sigma^-$ states are now known to within 0.4 eV of their dissociation limits. Isotopic bands of $^{13}C^{16}O$ in natural abundance have been analyzed for both transitions. The vibrational numbering of the $e\,^3\Sigma^-$ state must be increased by one unit. New bands of the $I^1\Sigma^- - X^1\Sigma^+$ and $D^1\Delta - X^1\Sigma^+$ transitions are also reported.

A study of line shape of CO infrared emission lines, J. A. Dowling, S. Silverman, W. S. Benedict, and J. W. Quinn, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 469-479 (Sept.-Oct. 1971).

Key words: Carbon monoxide; collision parameters; equivalent width; flame spectra; line shapes.

The shape of several vibration-rotation lines of CO emitted by a C_2H_2-O_2 flame was investigated. An equivalent width measurement was made using an absorption cell of room temperature CO as an analyzer. Analysis of the data showed that line shapes could be fitted to a Voigt function with shape parameters a between 1.0 and 1.5.

The collision widths of the flame lines, as determined by the shape parameters, are in essential agreement with earlier room temperature measurements. The extrapolation of the widths measured at room temperature to high temperature has been shown to be reliable within the uncertainty of this experiment (± 15%).

Ionization quantum yields and absorption coefficients of selected compounds at 58.4 and 73.6-74.4 nm, R. E. Rebbert and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 481-485 (Sept.-Oct. 1971).

Key words: Absorption coefficient; helium resonance radiation; hydrocarbons; inorganic molecules; ionization efficiency; ionization quantum yield; neon resonance radiation.

The ionization quantum yields and the extinction coefficients of a number of compounds have been determined at the wavelengths of the helium (58.4 nm) and neon (73.6-74.4 nm) resonance lamps. These are lamps with thin aluminum windows (100-200 nm) which we inserted in a glass cell backed by a second cell. Both cells are provided with parallel plate electrodes and separated from each other by an aluminum window. The ionization quantum yields are based on ionization efficiency of argon which is unity. Hydrogen, which has an ionization quantum yield of 0.94 and 1.00 at 73.6-74.4 and 58.4 nm respectively, was used as a secondary standard because it yielded better defined saturation ion current plateaus. The extinction coefficients were determined in both a double cell and a single cell arrangement. The agreement between the two measurements was excellent. In general an inert diluent was added to the gas of interest in order to improve the plateau of the saturation ion current. These results are compared with the literature values, which were mainly determined in windowless systems with monochromators.

Kinetic mass spectrometric investigation of the reactions of t-$C_4H_9^+$ ions with some simple polar molecules at thermal energies, L. Hellner and L. W. Sieck, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 487-493 (Sept.-Oct. 1971).

Key words: Ion molecule reactions; mass spectrometry; neopentane; photoionization; proton affinity; rate constants.

The interactions of t-$C_4H_9^+$ ions from neopentane with some simple polar molecules have been investigated in a high pressure photoionization mass spectrometer at thermal kinetic energies. Proton transfer was found to occur from t-$C_4H_9^+$ to acetone, ammonia, and the various methylamines, but not to molecules having estimated proton affinities < 195 kcal/mol (815 kJ/mol). Macroscopic thermal rate coefficients are reported for the various proton transfer reactions, all of which are on the order of 10^{-9} cm^3/molecule · second. The reaction

$$t\text{-}C_4H_9^+ + 2CH_3OH \rightarrow (CH_3OH)_2H^+ + C_4H_8$$

was found to occur, but not the analogous reaction with H_2O. On the basis of supplementary experiments, new limits are reported for the proton affinity of acetone. These are 203 ± 2 kcal/mol $<$ proton affinity of acetone < 207 kcal/mol.

Energy levels, wave functions, dipole and quadrupole transitions of trivalent gadolinium ions in sapphire, P. H. E. Meijer, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 5, 493-523 (Sept.-Oct. 1971).

Key words: Corundum; energy levels of Gd^{+++} in Al_2O_3; quadrupole transitions; spin Hamiltonian; transition probabilities; ultrasonic (paramagnetic) resonance; ultrasonic transition probabilities; wave functions of Gd^{+++}.

A computation is made of energy levels, wave functions and transition matrix elements of the Gd^{3+} ion in Al_2O_3. The crystal field parameters are taken from Geschwind and Remeika's paramagnetic resonance experiments. The transition probabilities are given for dipole radiation in three polarization directions. For ultrasonic work we give the real and imaginary parts of the five matrix elements of the quadrupole transition. From these one can easily deduce the transition probabilities in any given direction.

The magnetic field directions are described by the angles θ and ϕ, the polar and azimuthal angles with respect to the crystalline c axis. The values of θ go from 0 to $\pi/2$ in six steps and two values of π are chosen, 0 and 2 $\pi/3$ for which the variation is largest. The magnetic field strengths are from 0 to 0.6 tesla (6000 gauss); beyond this value the spin can be considered as "free." Some consideration is given to the analytical behavior of the energy versus field diagram for the direction $\theta = \phi = 0$.

November-December 1971

The accuracy of measurements of viscosity of liquids, R. S. Marvin, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 535-540 (Nov.-Dec. 1971).

Key words: Absolute measurement of viscosity; accuracy of viscosity measurement; calibration of viscometers; viscosity; uncertainty of viscosity measurements.

Most absolute measurements of viscosity have utilized capillary flow, and required semiempirical corrections amounting to several times their precision and estimated accuracy. The range of values found from these measurements and the possibility of unrecognized systematic errors make it impossible to base a realistic estimate of accuracy on the results of only one type of measurement. The results of two independent absolute measurements involving different types of flow, reported in the two accompanying papers, are summarized here. The estimated accuracy in each case is about 0.1 percent. The two results differ by 0.5 percent. It is suggested that we continue to base the calibration of relative viscometers on the value of 1.002 centipoise (cP) for the viscosity of water at 20 °C and one atmosphere. This provides a generally accepted base which limits comparability only by the precision of the measurements. However, whenever the true values of viscosity are required the limits of uncertainty including an estimate of systematic error should be taken as no better than ± 0.25 percent.

An absolute determination of viscosity using a torsional pendulum, H. S. White and E. A. Kearsley, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 541-551 (Nov.-Dec. 1971).

Key words: Absolute measurement; calibration; standard; torsional pendulum; viscosity.

An absolute measurement of the viscosity of di(2-ethylhexyl) sebacate with a torsional pendulum viscometer. The apparatus and calibration procedures are discussed and a detailed study of errors is made. The systematic error was estimated to be less than ± 0.07 percent and the variability was shown to be less than ± 0.07 percent. There is an unexplained difference of 0.3 to 0.4 percent between these measurements and measurements with a capillary instrument.

An absolute determination of viscosity using channel flow, R. W. Penn and E. A. Kearsley, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 553-560 (Nov.-Dec. 1971).

Key words: Absolute measurement; calculation of bounds; calibration; Poiseuille flow; standard; viscosity; viscous flow.

The viscosity of a sample of di(2-ethylhexyl) sebacate has been determined by measuring the pressure at taps along a closed channel containing the flowing liquid. By means of relative viscosity measurements in conventional capillary viscometers, we are able to express our results in terms of the viscosity of water at 20 °C. We find a value of 0.010008 poise. An appendix outlines the calculation of upper and lower bounds for the geometrical flow constant.

A new determination of the atomic weight of zinc, G. Marinenko, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 561-564 (Nov.-Dec. 1971).

Key words: Atomic weight; coulometry; zinc, atomic weight.

The atomic weight of zinc determined coulometrically for 5 metallic reference samples is 65.377 ± 0.003 where the uncertainty figure is the 95 percent confidence interval for the mean plus an allowance for the mean plus an allowance for known possible sources of systematic error.

High-speed (subsecond) measurement of heat capacity, electrical resistivity, and thermal radiation properties of niobium in the range 1500 to 2700 K, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 565-571 (Nov.-Dec. 1971).

Key words: Electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; niobium; thermal radiation properties; thermodynamics.

Measurements of heat capacity, electrical resistivity, hemispherical total emittance, and normal spectral emittance of niobium in the temperature range 1500 to 2700 K by a subsecond duration pulse heating technique are described. Results obtained on the above properties are reported and are compared with those in the literature. A sharp increase in heat capacity above 2000 K was observed. Electrical resistivity showed a negative departure from linearity in the curve of electrical resistivity against temperature. Estimated inaccuracy of measured properties is: 2 percent for heat capacity, 0.5 percent for electrical resistivity, and 3 percent for hemispherical total and normal spectral emittances.

Stable radical-anions derived from glyoxal *bis*(phenylhydrazones), A. J. Fatiadi, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 573-577 (Nov.-Dec. 1971).

Key words: Bis(phenylhydrazone); e.s.r.; glyoxal; methyl sulfoxide; oxygen; radical-anion.

A series of resonance-stabilized, hydrazyl radical-anions has been observed for the first time; they were prepared by an electron-transfer reaction involving treatment of glyoxal bis(phenylhydrazones) in methyl sulfoxide with a base and a trace of oxygen. The stability of these radical-anions appears to be dependent on the nature of the *para* substituents on the phenylhydrazine moiety.

Temperature dependence of photocurrents produced by x and gamma rays in silicon radiation detectors, K. Scharf and R. K. Mohr, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 579-589 (Nov.-Dec. 1971).

Key words: Gamma rays; photocurrents; radiation; radiation detector; radiation dosimetry; silicon radiation detector; temperature dependence; x rays.

The temperature dependence of dc photocurrents produced by x and gamma rays in silicon radiation detectors of the *n-p*, *p-i-n*, and surface-barrier type was investigated in a temperature range

between 20 and 50 °C. Photodiode photocurrents, assumed as being equal to the *generated* currents I_g, showed a positive temperature dependence in all detectors investigated. Their temperature coefficient at 25 °C varied between +0.004 per °C and +0.002 per °C. The temperature dependence of short-circuit currents I_{sc} measured by a compensation method, was positive and nearly linear for *n-p* type detectors but nonlinear and negative for *p-i-n* and surface-barrier type detectors. It is shown, that this different behavior of individual detectors is due to the influence of the strongly temperature-dependent junction current I_j which under the short-circuit mode is drained off the generated current I_g. The junction current is a function of the internal series resistance R_s and the junction resistance R_j of the irradiated detector ($I_j = I_{sc}\, R_s/R_j$). With increasing resistance ratio R_s/R_j, the current ratio I_j/I_g increases and the temperature coefficient α_{sc} of the short-circuit current decreases. Temperature coefficients $(\alpha_{sc})_{25}$ measured in the different detectors at 25 °C and a current density 6×10^{-7} A/cm² decreased with increasing resistance ratio from +0.004 per °C to −0.005 per °C. Resistance ratios R_s/R_j of the detectors investigated ranged between 0.01 and 0.24 approximately. Thus, $(\alpha_{sc})_{25}$ measured in an individual detector can be changed by changing its *effective* series resistance. A decrease of $(\alpha_{sc})_{25}$ with increasing I_{sc} was observed in detectors with larger resistance ratios. This was apparently due to the voltage dependence of R_j at higher junction voltages produced by larger short-circuit currents.

Isomerization processes in ions of the empirical formula $C_4H_8^+$, S. G. Lias, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 591-605 (Nov.-Dec. 1971).

Key words: Butene; cyclobutane; ion structure; isomerization; methylcyclopropane; photoionization; photolysis; radiolysis.

Ions of the formula $C_4H_8^+$ have been generated with different initial energies by ionizing ethylene ($C_2H_4^+ + C_2H_4 \rightarrow C_4H_8^+$, where the $C_4H_8^+$ ion is formed with an initial energy of > 11.51 eV), cyclobutane (initial energy of $C_4H_8^+$, > 10.84 eV), methylcyclopropane (> 10.15 eV), 1-C_4H_8 (> 9.58 eV), and *i*-C_4H_8 (> 9.06 eV) with 11.6-11.8 eV photons, and in some cases also with 10 eV photons and with gamma radiation. The structures of the ions have been determined from the structures of the C_4H_8 products formed in charge transfer reaction between the ions and charge acceptors such as dimethylamine and nitric oxide, as well as from the structures of the butanes formed in D_2^- transfer reactions with methylcyclopentane-d_{12} ($C_4H_8^+ + C_6D_{12} \rightarrow C_4H_8D_2 + C_6D_{10}^+$).

At low pressures the $C_4H_8^+$ ions initially formed in ethylene, cyclobutane, and methylcyclopropane isomerize to the thermodynamically most stable configurations, *i*-$C_4H_8^+$ and 2-$C_4H_8^+$. The 2-$C_4H_8^+$ structure predominates in all the experiments. As the pressure is raised, the *i*-$C_4H_8^+$ ion yield diminishes as that of 2-$C_4H_8^+$ increases, indicating that when the precursor of the *i*-$C_4H_8^+$ ion is collisionally deactivated, it ends up as 2-$C_4H_8^+$. At high pressures, 1-$C_4H_8^+$ ions are intercepted; their yield increases with increasing pressure, indicating that 1-$C_4H_8^+$ is an intermediate which isomerizes further unless it is collisionally deactivated. The 1-$C_4H_8^+$ ion formed in methylcyclopropane (initial energy > 10.15 eV) is more easily deactivated than that formed in cyclobutane (initial energy > 10.84 eV). That the isomerization of the 1-$C_4H_8^+$ ion to lower energy structures such as *i*-$C_4H_8^+$ and 2-$C_4H_8^+$ requires excess internal energy is demonstrated by the fact that in the photolysis with 10 eV photons, a negligible amount of isomerization is observed, but with 11.6-11.8 eV photons, more than half of the 1-$C_4H_8^+$ ions isomerize to the 2-$C_4H_8^+$ structure at a pressure of 2 torr. Isomerization of the low energy *i*-$C_4H_8^+$ ions formed in the photolysis of *i*-C_4H_8 to other structures is relatively unimportant at 11.6-11.8 eV.

Taking the ratio *i*-$C_4H_8^+$/2-$C_4H_8^+$ as an indicator of the amount of energy removed by collisions from the intermediate $C_4H_8^+$ species under conditions where only *i*- and 2-$C_4H_8^+$ ions are intercepted, it is shown that the efficiency of energy transfer from the ions to helium, hydrogen, neon, krypton, xenon, nitrogen, and carbon dioxide is related to the polarizability of the added deactivator.

The photochemistry of propane at high photon energies (8.4-21.2 eV), R. E. Rebbert, S. G. Lias, and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **75A** (Phys. and Chem.), No. 6, 607-612 (Nov.-Dec. 1971).

Key words: Ion-molecule reaction; photoionization; propane; quantum yields; rare-gas resonance radiation; unimolecular dissociation.

Neon and helium resonance lamps, which deliver photons of 16.7-16.8 eV and 21.2 eV energy, respectively, have been used to photolyze C_3H_8, C_3D_8, C_3H_8-C_3D_8 (1:1) mixtures, and $CD_3CH_2CD_3$ and the results obtained at the two energies are compared. In particular, it is noted that although the quantum yield of ionization in propane is unity at 16.7-16.8 eV, when the energy is raised still further to 21.2 eV, the probability of ionization apparently diminishes to 0.93, an observation which suggests that at 21.2 eV, superexcited states may be reached whose dissociation into neutral fragments competes with ionization.

The quantum yields of the lower hydrocarbon products formed in the presence of a radical scavenger in C_3H_8 and C_3D_8 are reported, and are compared with quantum yields of products formed in the vacuum ultraviolet photolysis at lower energies. (Quantum yields of products formed at 8.4 eV and 10.0 eV are reported here for the first time.) Acetylene is formed as a product in the decomposition of the neutral excited propane molecule, and its yield increases in importance with increasing energy; at 16.7-16.8 eV, where all product formation can be traced to ionic processes, acetylene is formed in negligible yields. It is concluded that ionic processes in propane do not lead to the formation of acetylene, and the observation of this product in radiolytic systems may be a reliable indicator of the relative importance of neutral excited molecule decomposition processes.

From the results obtained with the C_3H_8-C_3D_8 (1:1) mixture, and with $CD_3CH_2CD_3$, details of the ion-molecule reaction mechanisms and the unimolecular decomposition of the propane ion are derived.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 76A, JANUARY-DECEMBER 1972

January-February 1972

The absorption spectra of krypton and xenon in the wavelength range 330-600 Å, K. Codling and R. P. Madden, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 1-12 (Jan.-Feb. 1972).

Key words: Autoionization; far ultraviolet; krypton; photoionization; resonances; xenon.

A total of 153 krypton resonances in the spectral region 330-500 Å and 253 xenon resonances in the spectral region 375-600 Å are reported. A detailed listing of the resonances is given, with wavelength and line shape information. The analysis of the spectra is very incomplete and will require detailed theoretical calculation to significantly improve it. In Kr, 45 resonances and in Xe, 56 resonances have been grouped into probable Rydberg series, for which classifications are suggested. The resonances are due, in the main, to either the excitation of the inner subshell "*s*" electron ($s^2p^6 \rightarrow sp^6np$) or to the excitation of two of the outer "*p*" electrons simultaneously ($s^2p^6 \rightarrow s^2p^4nln'l'$). These high-lying excited states autoionize, resulting in resonances with window-, asymmetric-, or absorption-type profiles. Where possible, comparisons are made with previous work.

A reference calorimeter for laser energy measurements, E. D. West, W. E. Case, A. L. Rasmussen, and L. B. Schmidt, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 13-26 (Jan.-Feb. 1972).

Key words: Calorimetry; laser; laser calorimetry; laser energy measurement; laser power measurement.

Principles and detailed procedures are described for measuring laser energy and power in terms of electrical energy based on votage, resistance, and frequency standards. The construction of a small isoperibol calorimeter used for the measurements is described. The calorimeter will accommodate 0.01 to 20 J and 4×10^{-5} to 1 W cw and is limited to a maximum pulse intensity of 0.1 J/cm². The standard deviation of comparison measurements using two calorimeters and a beam splitter is 0.08 percent when the smaller energy input is not less than 0.3 J. The estimated limits of systematic error for one calorimeter are ±1.0 percent of the laser energy measured by the calorimeter.

Accurate calculations of properties of the two-tube electrostatic lens. I. Improved digital methods for the precise calculation of electric fields and trajectories, S. Natali, D. Di Chio, and C. E. Kuyatt, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 27-35 (Jan.-Feb. 1972).

Key words: Calculation of electric fields; calculation of electron trajectories; electron lens; nine-point relaxation formulas; predictor-corrector method; two-tube electrostatic lens.

Digital methods of high precision have been developed for the calculation of electric fields and trajectories in electrostatic lenses and a computer program was written to apply these methods to the two-tube lens. The increased precision results from the use of nine-point formulas in the relaxation calculation of potentials in place of previously used five-point formulas and from the use of an improved predictor-corrector method for the calculation of trajectories. Trajectories obtained with these methods are sufficiently precise to determine third-order aberration coefficients.

Dielectric constant of compressed gaseous and liquid oxygen, B. A. Younglove, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 37-40 (Jan.-Feb. 1972).

Key words: Clausius-Mossotti function; dielectric constant; oxygen.

The dielectric constants of compressed gaseous and liquid oxygen were measured on ten isotherms at temperatures between 100 and 300 K and on the saturated liquid boundary at temperatures between 55 and 154 K. Densities ranged from 0.06 to 1.30 g/cm³ at pressures up to 33 MN/m². The dielectric constant measurements were combined with accurate density data to compute the Clausius-Mossotti (CM) function, $(\epsilon-1)/(\epsilon+2)\rho$. The CM function for oxygen decreases with density from a value of 0.1236 cm³/g at the low density limit to 0.1219 cm³/g near the triple point.

Thermal analysis of calcium sulfate dihydrate and supposed α and β forms of calcium sulfate hemihydrate from 25 to 500 °C, J. R. Clifton, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 41-49 (Jan.-Feb. 1972).

Key words: α- and β-$CaSO_4 \cdot 1/2H_2O$; $CaSO_4 \cdot 2H_2O$; differential scanning calorimetry; differential thermal analysis; thermogravimetry.

Thermal studies were carried out on $CaSO_4 \cdot 2H_2O$ and the supposed α and β forms of $CaSO_4 \cdot 1/2H_2O$ in the region of 25 to 500 °C using differential thermal analysis, thermogravimetry, and differential scanning calorimetry methods.

Two large endothermic effects and a smaller exothermic effect were found in the differential thermogram of $CaSO_4 \cdot 2H_2O$ while a single endothermic as well as an exothermic effect were found in the thermograms of the supposed α and β forms of $CaSO_4 \cdot 1/2H_2O$. However, the exotherm of α-$CaSO_4 \cdot 1/2H_2O$ had lower peak and first-break temperatures than that of the β-form. The peak and first-break temperatures of the endothermic effects of $CaSO_4 \cdot 2H_2O$ and α and B-$CaSO_4 \cdot 1/2H_2O$ and the exothermic effect of α-$CaSO_4 \cdot 1/2H_2O$ were pressure dependent, shifting to lower temperatures as the gaseous pressure within the DTA cell was decreased. The noted differences in the thermograms possibly are due to kinetic factors because of the differences in crystallinity of the supposed α- and β-$CaSO_4 \cdot 1/2H_2O$.

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

No differences in the supposed α and β forms of $CaSO_4 \cdot 1/2H_2O$ were detected by thermogravimetry and differential scanning calorimetry studies. The formulation of a two-step dissociative process in the complete dehydration of $CaSO_4 \cdot 2H_2O$ was supported by the results of the thermogravimetry study.

Modulus of natural rubber cross-linked by dicumyl peroxide. I. Experimental observations, L. A. Wood, G. W. Bullman, and G. E. Decker, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 1, 51-59 (Jan.-Feb. 1972).

Key words: Creep; cross-linking; dicumyl peroxide; glass transition; indentation measurements; rubber, natural.

Natural rubber mixed with varying amounts of dicumyl peroxide was cross-linked by heating 120 min at 149 °C. The quantitative measure of cross-linking was taken as the amount *fp* of decomposed dicumyl peroxide, the product of *p*, the number of parts added per hundred of rubber and *f* the fraction decomposed during the time of cure. The shear creep modulus *G* was calculated from measurements of the indentation of a flat rubber sheet by a rigid sphere. The glass transition temperature T_g, was raised about 1.2 °C for each part of decomposed dicumyl peroxide. Above $(T_g + 12)$ the modulus-temperature relations were linear with a slope that increased with increasing cross-linking. The creep rate was negligible except near the glass transition and at low values of *fp*. Values of *G*, read from these plots at seven temperatures, were plotted as a function of *fp*. The linearity of the two plots permits the derivation of the general relation: $G = S(fp + B)T + H(fp + B) + A$ where *A*, *B*, *H*, and *S* are constants. The lines representing *G* as a function of *fp* at each temperature all intersected near the point, $fp = 0.45$ phr, $G = 2.70$ Mdyn cm^{-2} (0.270 MN m^{-2}). The constants were evaluated as $A = 2.70$ Mdyn cm^{-2}, $B = -0.45$ phr, $S = 5.925 \times 10^{-3}$ Mdyn cm^{-2} (phr)$^{-1}$K^{-1} and $H = 0.0684$ (Mdyn cm^{-2}) (phr)$^{-1}$. This equation represented satisfactorily all the data obtained at temperatures from − 50 to + 100 °C for values of *fp* from about 1 to 24 phr.

March-April 1972

Guidelines for the reporting of numerical data and experimental procedures, D. Garvin, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 67-70 (Mar.-Apr. 1972).

Key words: Chemistry; experimental procedures; numerical data; physics.

General recommendations are made about the reporting of data and experimental procedures. These are intended as instructions to authors of papers in which quantitative physical and chemical data are reported. There is included a bibliography of standards documents and more detailed guidelines.

A study of equilibrium in argon arcs, J. B. Shumaker and C. H. Popenoe, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 71-76 (Mar.-Apr. 1972).

Key words: Argon arcs; argon transition probabilities; equilibrium; LTE.

The intensities of the 7147 Å Ar I and 4806 Å Ar II lines obtained from wall-stabilized arcs at pressures of 0.2 to 5 atm are presented in an Olsen-Richter diagram. Departures from equilibrium are evident at electron densities below 5×10^{16} cm^{-3}. The assumption of equilibrium at higher electron densities leads to transition probabilities in fair agreement with lifetime measurements.

Rates of reaction of atomic oxygen III. Spiropentane, cyclopentane, cyclohexane, and cycloheptane, R. E. Huie and J. T. Herron, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 77-80 (Mar.-Apr. 1972).

Key words: Cycloheptane; cyclohexane; cyclopentane; oxygen; rate constants; spiropentane.

Rate constants have been measured from 307 to 652 K for the reactions of atomic oxygen (O^3P) with spiropentane, cyclopentane, cyclohexane, and cycloheptane. The derived Arrhenius parameters are $k(sp - C_5H_8) = 10^{13.60 \pm 0.10} \exp[(-2890 \pm 100)/T]$, $k(cy - C_5H_{10}) = 10^{14.10 \pm 0.09} \exp[(-2210 \pm 100)/T]$, $k(cy - C_6H_{12}) = 10^{14.35 \pm 0.09} \exp[(-2350 \pm 100)/T]$, and $(cy - C_7H_{14}) = 10^{14.46 \pm 0.13} \exp[(-2230 \pm 100)/T]$ all in units of cm^3 mol^{-1} s^{-1}.

Densities of compressed liquid methane, and the equation of state, R. D. Goodwin and R. Prydz, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 81-101 (Mar.-Apr. 1972).

Key words: Compressed liquid; densities; equation of state; methane; orthobaric densities.

Experimental *PVT* data for liquid methane are reported at densities from 1.8 times critical up to the freezing liquid, at temperatures from 91 to 245 K and pressures to 350 bar. A nonanalytic equation of state is adjusted to these and other *PVT* data from ideal gas states to the freezing liquid, at temperatures from the triple point to 400 K.

Spin-relaxation effects on the EPR spectrum of gaseous hydrogen atoms, R. L. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 103-113 (Mar.-Apr. 1972).

Key words: Electron spin resonance; hydrogen atoms; spin-exchange; spin-relaxation.

A theoretical analysis is presented of the relaxation processes which lead to the magnetization of gaseous hydrogen atoms in a strong magnetic field. Experiments are described which demonstrate that the spin-lattice relaxation time in a pure H_2 carrier can be of the order of 10 ms. From the effects of traces of O_2 on the hydrogen atom EPR spectrum, a H-O_2 spin-exchange collision cross section of $(8.0 \pm 2.5) \times 10^{-16}$ cm^2 was derived.

Photoionization of $C_4H_8^+$ isomers. Unimolecular and bimolecular reactions of the $C_4H_8^+$ ions, L. W. Sieck, S. G. Lias, L. Hellner, and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 115-124 (Mar.-Apr. 1972).

Key words: C_4H_8 isomers; collisional stabilization; isomerization; photoionization; rate constants; vapor phase.

1-Butene, *cis*-2-butene, isobutene and methylcyclopropane have been photoionized with the resonance lines of krypton (10.0 − 10.6 eV) and argon (11.6 − 11.8 eV). We have determined that the internally excited 1-$C_4H_8^+$ ion and, to a much lesser extent, the *i*-$C_4H_8^+$ ion isomerizes to the 2-$C_4H_8^+$ structure. In both cases the extent of isomerization increases, approximately by a factor of ten when the photon energy is increased from 10 to 11.7 eV. An inert gas, neon, quenches the isomerization of the *i*-$C_4H_8^+$ ion and, to a much lesser extent, that of the 1-$C_4H_8^+$ ion.

The unimolecular fragmentation of the $C_4H_8^+$ isomeric ions has been examined at 11.6 − 11.8 eV. In this energy range the dissociative lifetime of *i*-$C_4H_8^+$ was found to be at least 5×10^{-6} s, and collisional quenching of the dissociative process is already noticeable at pressures in the 10^{-3} torr range.

The rate coefficients for the reaction $C_4H_8^+$ (thermal) + C_4H_8 → $(C_8H_{18}^+)^*$ occurring in the isomeric C_4H_8 systems have been determined under conditions where the structure of the reacting $C_4H_8^+$ ion is established. The values in cm^3/molecule · second are 1-C_4H_8 − $6.0 \pm 0.5 \times 10^{-10}$, *cis*-2-$C_4H_8$ − $0.37 \pm 0.1 \times 10^{-10}$, *i*-$C_4H_8$ − $5.4 \pm 0.4 \times 10^{-10}$. At pressure below 10^{-3} torr, the internally excited $(C_8H_{16}^+)^*$ produced in the reaction dissociates along various channels with relative probabilities de-

pending upon the structure of both the ionic and neutral reactant. Above 10^{-3} torr collisional quenching of $(C_8H_{16}^+)^*$ is noted.

Theoretical investigation of the odd configurations of Ni II, Y. Shadmi and E. Caspi, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 125-136 (Mar.-Apr. 1972).

Key words: Energy levels; *g*-factors; nickel; parameters, theory.

Two groups of odd levels in Ni II were investigated: those belonging to the complex $3d^84p + 3d^74s4p + 3d^85p$ and those belonging to the configuration of $3d^84f$. In the first group the calculated positions of the levels were fit to the positions of the 174 observed levels with an rms error of 133 cm^{-1}. The fit for the second group was based on 60 observed levels and had an rms error of 25 cm^{-1}. The predictions of this investigation helped in the discovery of many of the observed levels.

The characterization of linear polyethylene SRM 1475. I. Introduction, C. A. J. Hoeve, H. L. Wagner, and P. H. Verdier, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 137-138 (Mar.-Apr. 1972).

Key words: Fractionation; linear polyethylene; molecular weight; molecular weight distribution; National Bureau of Standards; pellet variability; standard reference material.

The National Bureau of Standards has issued a linear polyethylene standard reference material, SRM 1475. In this report a general description of the sample is given, and the characterization work described in the subsequent reports is outlined. Some pellet-to-pellet variability was found and estimated.

The characterization of linear polyethylene SRM 1475. II. Determination of total methyl content by infrared spectrophotometry, J. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 141-142 (Mar.-Apr. 1972).

Key words: Infrared; linear polyethylene; methyl; methylene; number average molecular weight; spectra; spectrophotometry.

An ASTM method was used to determine the methyl content of linear polyethylene SRM 1475 by measuring the absorbance at 1378 cm^{-1} (7.25 nm) of methyl groups on compensated infrared spectra. The methyl content of this polymer was found to be 0.15 methyls per 100 carbon atoms. Considering the methyls to be polymer end groups, the number average molecular weight computed approximates that determined by gel permeation chromatography within the experimental error. These values indicate that the polymer is essentially free of branching.

The characterization of linear polyethylene SRM 1475. III. Density determination, J. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 143-144 (Mar.-Apr. 1972).

Key words: Crystallization; degree of crystallinity; density; linear polyethylene; polymer; recrystallization.

The density of SRM 1475 at 23 °C was determined by ASTM method D 1505-67 on samples prepared by Procedure A of ASTM method D 1928-68, with the result 0.9784 g/cm^3.

The characterization of linear polyethylene SRM 1475. IV. Melt flow rate, J. R. Maurey, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 145-146 (Mar.-Apr. 1972).

Key words: Extrusion plastometer; load; melt flow rate; orifice; orifice die; preliminary extrudate; test extrudate.

The melt flow rate of SRM 1475 was determined to be 2.07 g/10 min at 190 °C under a load of 325 g by a method similar to procedure A of ASTM method D 1238-65T. This value is the average of determinations on 42 samples with a standard deviation of a single measurement of 0.040 g/10 min, and a range of 1.991 g/10 min to 2.132 g/10 min.

The characterization of linear polyethylene SRM 1475. V. Solution viscosity measurements, R. G. Christensen, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 147-149 (Mar.-Apr. 1972).

Key words: Decalin; limiting viscosity number; linear polyethylene; solution viscosity; viscometer; 1-chloronaphthalene; 1,2,4-trichlorobenzene.

The limiting viscosity numbers of linear polyethylene SRM 1475 were determined at 130 °C in 1,2,4-trichlorobenzene, 1-chloronaphthalene, and decalin. Technique, including use of a novel solution transfer method, is described.

The characterization of linear polyethylene SRM 1475. VI. Preparation of calibrating fractions, R. G. Christensen, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 149-150 (Mar.-Apr. 1972).

Key words: Column extraction fractionation; fractionation; linear polyethylene.

Fractions for use in calibrating a gel permeation chromatograph were prepared by a Desreux column extraction method. The construction and operation of the fractionating system are described.

The characterization of linear polyethylene SRM 1475. VII. Differential refractive index of polyethylene solutions, H. L. Wagner, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 151-155 (Mar.-Apr. 1972).

Key words: Differential refractive index; *dn/dc*; refractive index; refractometer; 1-chloronaphthalene; 1,2,4-trichlorobenzene.

The value of *dn/dc* for polyethylene in 1-chloronaphthalene at 135 °C, required for the determination of molecular weight by light scattering, was found to vary with molecular weight. Similar changes were found in 1,2,4-trichlorobenzene, the gel permeation chromatograph solvent. The absolute value of *dn/dc* decreases by about 2 percent as the polymer molecular weight increases from 12,000 to 110,000.

The characterization of linear polyethylene SRM 1475. VIII. Light-scattering studies on polyethylenes in 1-chloronaphthalene, L. J. Frolen, G. S. Ross, A. M. Wims, and P. H. Verdier, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 156-160 (Mar.-Apr. 1972).

Key words: End-to-end distance; light scattering; linear polyethylene; M_w; polyethylene fractions; second virial coefficient; solution properties.

Light-scattering measurements have been made on a series of linear polyethylene fractions and a linear polyethylene standard reference material (SRM 1475). All measurements were made in 1-chloronaphthalene at 135 °C, and over an angular range from 45 to 135°. The data were analyzed to obtain the weight average molecular weights, second virial coefficients and root-mean square end-to-end distances.

The characterization of linear polyethylene SRM 1475. IX. Number average molecular weight of fractions by membrane osmometry, J. E. Brown and P. H. Verdier, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 2, 161-163 (Mar.-Apr. 1972).

Key words: Concentration dependence; linear polyethylene; membrane; number average molecular weight; osmometer; osmotic pressure; virial coefficient.

The number average molecular weights of a series of fractions of linear polyethylene have been determined using a high speed membrane osmometer. The M_n values of the fractions, which were prepared by an elution technique, were used in GPC calibration and subsequent characterization of linear polyethylene SRM 1475. The molecular weights, measurement techniques, and the precision of the measurements are presented.

The characterization of linear polyethylene SRM 1475. X. Gel permeation chromatography, G. Ross and L. Frolen, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 2, 163-170 (Mar.-Apr. 1972).

Key words: Gel permeation chromatography (GPC); linear polyethylene; molecular weight distribution (MWD); number average; weight average.

The determination of the integral molecular weight distribution *(MWD)* of the linear polyethylene sample (SRM 1475) by means of gel permeation chromatography (GPC) is described. Both the experimental and mathematical details of column calibration and sample analysis are included.

May-June 1972

Thermodynamics of standard cells of the saturated cadmium sulfate type, W. J. Hamer, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 3, 185-205 (May-June 1972).

Key words: Emfs of standard cells; emf-temperature coefficients of standard cells; standard potential of standard cells; thermodynamics of standard cells.

This paper gives data on the thermodynamic functions of standard cells of the saturated cadmium sulfate type, as obtained from calorimetric and equilibrium data at 25 °C or from the electromotive forces (emfs) and emf-temperature coefficients of the cell for the temperature range of 0 to 43.6 °C. The functions considered are the changes in Gibbs energy, enthalpy, entropy and heat capacity for the cell reaction. The electromotive forces are expressed on the V_{69} volt and the t_{68} temperature scale. Results are expressed on the SI and for comparisons with literature data in terms of the defined thermochemical calorie. The effect of expressing the emf-temperature coefficient as a function of temperature in different ways on the values for the changes in entropy and heat capacity for the cell reaction is discussed. Finally, the observed emf of the standard cell at 25 °C is compared with emfs calculated from various values reported for the standard potentials of the cadmium-amalgam and mercury-mercurous sulfate electrodes and the activity coefficient of cadmium sulfate in saturated aqueous solution.

An improved state equation in the vicinity of the critical point, O. B. Verbeke, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 3, 207-211 (May-June 1972).

Key words: Compressibility; critical point; equation of state; fluid; helium; low temperature; methane; scaling law; specific heat; xenon.

An improved state equation for the vicinity of the critical point is proposed. An analysis of the experimental data on helium and xenon has been carried out in order to investigate the influence of the number of constants in the equation and the $P\rho T$ range on the critical constants T_c and ρ_c and on the critical exponents α, β, γ, and δ. No such influence has been detected. The model for the critical point, recently proposed by Widom, has been checked regarding its consequences for the rectilinear diameter. No definite confirmation but indications for its correctness have been found.

Dilute solution theory of polymer crystal growth: fractionation effects, I. C. Sanchez and E. A. DiMarzio, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 3, 213-223 (May-June 1972).

Key words: Cilia; dissolution temperature; fractionation; rate constant; undercooling.

A nonequilibrium (kinetic) theory of polymer molecular weight (MW) fractionation is formulated and applied to binary and multicomponent polyethylenes crystallized from unstirred xylene solutions. High MW components crystallize more readily than do low MW components. This fractionation effect is enhanced as the crystallization temperature is raised. At low crystallization temperatures (high undercoolings) the polymer tends to fractionate according to the volume fraction distribution of its MW components and thus, the number average MW of the crystal that is formed is approximately equal to the weight average MW of the polymer in solution. It is shown that MW fractionation does not depend on the details of nucleation, but rather on the rates for post-nucleation crystal growth. The effects of MW polydispersity on crystalline properties is considered and in particular it is shown that polydispersity tends to mask the intrinsic dependence of crystal thickness on MW. The variables which govern and influence fractionation are also discussed.

The formation of curved polymer crystals: poly(4-methylpentene-1), F. Khoury and J. D. Barnes, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 3, 225-252 (May-June 1972).

Key words: Chain-folded; crystal, curved; electron microscopy; lamellar; optical microscopy; poly(4-methylpentene-1); polymer; solution-grown.

An optical and electron microscopical study is described of the habits exhibited by poly(4-methylpentene-1) crystals (Modification 1 tetragonal unit cell) grown at temperatures between 50 and 90 °C from 0.1 percent solutions of the polymer in equivolume mixtures of xylene and amyl acetate. A distinct trend in the effect of crystallization temperature (supercooling) on the habits of the crystals is illustrated and discussed. The lamellar crystals formed in that temperature range are all the more pronouncedly curved the lower the crystallization temperature. To indicate but the extremes in this trend, the crystals varied from essentially planar ones whose constitutent square shaped chain-folded lamellae (bounded laterally by {100} faces and up to 20 μm on a side) are four-sectored and only very slightly buckled as previously indicated by Bassett et al., to distinctly curved four-fold symmetrical hollow bowl shaped ones having a radius of curvature of about 2.5 μm and in which the surface of the curved multilayered wall of which they are constituted changes in orientation through 180° from the base (pole) to the periphery. In contrast with the four-sectored character of the lamellae in the aforementioned essentially planar crystals, the constituent lamellae in all the distinctly dished and bowl-like crystals formed in the temperature range 50 to 90 °C are multisectored, their lateral development being characterized by the formation at their periphery during growth of successive arrays of {100} microfaceted sectored outgrowths. The reasons why the lamellar crystals of poly(4-methylpentene-1) are all the more pronouncedly curved the lower the crystallization temperature are explored and discussed. Conjectures concerning the origins of this phenomena are advanced in the form of a working "model."

Photoionization of propylene, cyclopropane, and ethylene. The effect of internal energy on the bimolecular reactions of $C_2H_4^+$ and $C_3H_6^+$, L. W. Sieck and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 3, 253-262 (May-June 1972).

Key words: Collisional stabilization; hydrocarbons; ion-molecule reactions; photoionization; rate constants; structures of ions.

The ion-molecule chemistry occurring in photoionized ethylene, propylene and cyclopropane has been investigated in the NBS high pressure mass spectrometer. Emphasis has been placed on determining the overall effect of internal excitation on the absolute rate coefficients for the various reactions. This was accomplished by comparing the behavior found when ionization was induced by photon absorption at the ionization threshold with that found at higher photon energies. The values for the absolute rate coefficients for the formation of excited compound ions at various photon energies were as follows (units of 10^{-10} cm^3/molecule · s); $C_2H_4^+$, 9.6 (10.6 eV photons); 8.5 (11.7 eV photons); $C_3H_6^+$, 8.4 (10.0 eV photons); 6.8 (11.7 eV photons); $C_3D_6^+$, 7.8 (10.0 eV photons), 6.1 (11.7 eV photons); *c*-$C_3H_6^+$ and *c*-$C_3D_6^+$, 2.2 (10.0 eV photons); 2.2 (11.7 eV photons). The distributions of product ions obtained from the unimolecular decomposition of the compound ion in each system have also been determined at various photon energies, and considerable variation has been observed. In general, the variations are similar to those found elsewhere when the kinetic energy of the reactant ion is increased. The bimolecular reactions of the $C_6D_{12}^+$ compound ion obtained from $C_3D_6^+$ have been investigated at higher pressures, and separate experiments involving isotopically labeled ethylenes have provided new information concerning the nature of the compound ion in that system. Results obtained from other laboratories are discussed in some detail, and in most cases the differences found for the same system are explicable in terms of the energy content (internal and/or kinetic) of the reactant ion.

Low temperature thermocouples: KP, "normal" silver, and copper versus *Au*-0.02 at% Fe and *Au*-0.07 at% Fe, L. L. Sparks and R. L. Powell, *J. Res. Nat. Bur. Stand.* (*U.S.*), **76A** (Phys. and Chem.), No. 3, 263-283 (May-June 1972).

Key words: Cryogenics; gold alloy; liquid helium; liquid hydrogen; liquid nitrogen; thermocouples.

The Seebeck thermoelectric voltages of two dilute alloys of iron in gold, *Au* 0.02 at% Fe and *Au*-0.07 at% Fe, have been determined with respect to KP (a particular Ni-Cr alloy), "normal" silver, and copper in the temperature range from 4 to 280 K. The power series representation of these data, along with the calculated Seebeck coefficients and derivatives of the Seebeck coefficients, have been extrapolated to 0 K and are presented as a function of temperature. In addition to these reference data, seven different *Au*-0.07 at % Fe alloys were thermoelectrically intercompared in order to determine the variability in wires from different melts and from different manufacturers. The largest deviation found amounted to about 9 percent of the output of a KP versus *Au*-0.07 at% Fe thermocouple pair between 4 and 20 K. A more typical variation for this temperature range was 2 to 4 percent. Initial indications are that the reference data can be adjusted satisfactorily with data from spot calibrations on particular wires. The effect of heat treatment is illustrated by comparing our results to Rosenbaum's data for annealed and unannealed specimens of both *Au*-Fe alloys.

Infrared spectra of cerium (Ce I and Ce II) between 0.8 and 2.4 μm, J. Verges, C. H. Corliss, and W. C. Martin, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 3, 285-304 (May-June 1972).

Key words: Ce I and II; cerium spectra; infrared spectra; spectra; wavelengths.

The cerium spectrum emitted by an electrodeless lamp has been observed with a SISAM spectrometer in the region from 0.82 to 2.42 μm. Of the 2076 lines observed, about 1100 lines have been classified as transitions in the energy level system of Ce I and 400 lines in Ce II. The average deviation between the observed wave numbers and those calculated from the two energy levels is ± 0.023 cm^{-1}.

July-August 1972

The EMF-temperature coefficient of "acid" standard cells of the saturated cadmium sulfate type from 15 to 40 °C, W. J. Hamer, A. Skapars, and B. F. Field, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 4, 321-328 (July-Aug. 1972).

Key words: Effect of acid on standard cells; EMF-temperature coefficients of standard cells; entropy changes in standard cells; heat-capacity changes in standard cells; standard cells.

This paper gives the results of new measurements of the effect of temperature on the electromotive force of standard cells of the saturated cadmium sulfate type. Measurements were made over the temperature range of 15 to 40 °C. Twelve cells of NBS manufacture and 24 cells supplied by two different commercial manufacturers were used in the studies. Final results were analyzed by the method of least squares using computer programs. The relation between EMF and temperature for NBS, company 1, and company 2 cells was found to be given, respectively, by:

$$E_t = E_{20°C} - [40.44(t-20) + 0.921(t-20)^2 - 0.00866(t-20)^3] \times 10^{-6} \text{V},$$

$$E_t = E_{20°C} - [40.14(t-20) + 0.888(t-20)^2 - 0.00668(t-20)^3] \times 10^{-6} \text{V},$$

$$E_t = E_{20°C} - [39.28(t-20) + 0.986(t-20)^2 - 0.00943(t-20)^3] \times 10^{-6} \text{V}.$$

Values for the entropy and heat-capacity changes for the cell reaction in "acid" standard cells are also given.

Pulse radiolysis of neopentane in the gas phase, R. E. Rebbert and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 4, 329-336 (July-Aug. 1972).

Key words: Electron scavengers; gas phase; ion-molecule reactions; neopentane; neutralization; pulse radiolysis.

The pulse radiolysis of gaseous neopentane has been investigated in the absence and presence of electron scavengers (SF_6, CD_3I, CCl_4). Deuterium labeling experiments show that the stable product molecules can be accounted for by (a) radical combination reactions involving mainly CH_3 and H; (b) hydride ion transfer reactions involving $C_2H_3^+$, $C_2H_5^+$, and $C_3H_5^+$; (c) neutralization reactions of $C_4H_9^+$ and $C_5H_{11}^+$; and (d) unimolecular dissociation of the parent ion ($C_5H_{12}^+$) and of electronically excited neopentane. Neutralization of the *t*-$C_4H_9^+$ ion, which is the major positive ion in the system, occurs as follows: (a) *t*-$C_4H_9^+ + e \rightarrow$ *i*-$C_4H_8 + H$ and (b) *t*-$C_4H_9^+ + e \rightarrow 2CH_3 + C_3H_6$. It is shown that $C_5H_{11}^+$ produced in hydride ion transfer reaction $C_nH_m^+ +$ neo-$C_5H_{12} \rightarrow C_nH_{m+1} + C_5H_{11}^+$ (where $C_nH_m^+ = C_2H_3^+$, $C_2H_5^+$, and $C_3H_5^+$) rearranges to the $CH_3C^+(CH_3)CH_2CH_3$ structure prior to neutralization. A detailed accounting of all products produced in the unimolecular and bimolecular reactions led to the conclusion that the ratio of neutral electronically excited molecules to parent ions (N_{ex}/N_+) is 0.28.

Anatomy and thermal history of laser self-focusing damage tracks in glass, W. Haller and J. H. Simmons, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 4, 337-345 (July-Aug. 1972).

Key words: Glass; laser damage; self-focusing.

Laser induced self-focusing damage tracks in glass are analyzed. The damaged regions consist of long cylinders of altered refractive index, containing occasional bubbles and partly surrounded by arrays of small cracks. An analysis of the refractive index change in the subfracture damage tracks and the presence of bubbles leads to estimates of a minimum temperature reached by heating of the glass in the tracks. A calculation of minimum stresses developed during laser-beam heating gives a good account of the orientation of the observed cracks.

Normal emissivity of an isothermal, diffusely reflecting cylindrical cavity (with top) as a function of inside radius, W. B. Fussell, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 4, 347-349 (July-Aug. 1972).

Key words: Cavity; cylindrical cavity; diffusely reflecting; emissivity; normal emissivity; radiation; reflectance.

The normal emissivity of an isothermal cylindrical cavity (with top), with a diffusely reflecting interior of reflectivity much less than 1, is calculated approximately as a function of the inside radius of the cylinder by the DeVos method. The calculation is analytical, and considers the singly and doubly reflected radiation escaping from the cavity aperture. The results of the analysis indicate that, for cylinders whose length-to-lid aperture ratio is much larger than 1: (a), for a given cylinder length and lid aperture, the configuration with the inside diameter approximately 0.64 the length has the *smallest* normal emissivity; (b), as the inside diameter increases or decreases from the configuration of smallest normal emissivity, the normal emissivity *increases* monotonically.

Lattice vibrations of antiparallel chain sheet structures, B. M. Fanconi, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 4, 351-359 (July-Aug. 1972).

Key words: Antiparallel chain sheet structures; honeycomb lattice; lattice vibrations.

Methods are developed for calculating the normal coordinate vibrations of isolated helical homopolymers and of the antiparallel sheet structures formed by some helical polymers in the solid state. The dynamical equations are expressed in Cartesian displacement coordinates starting from an internal coordinate harmonic force field. As an example of the method, the dynamical equations of the honeycomb lattice are derived.

September-October 1972

High accuracy spectrophotometry at the National Physical Laboratory, F. J. J. Clarke, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 5, 375-403 (Sept.-Oct. 1972).

Key words: High accuracy spectrophotometry; photoelectronic linearity; reflectance; transmittance.

The techniques and equipment used at the National Physical Laboratory (NPL) to achieve high accuracy spectrophotometric measurements are described and discussed. The emphasis at NPL has always been on the determination of systematic components of error and their elimination or correction rather than on the attainment of mere precision, which is largely a matter of variance and resolution. The scales of regular transmittance, diffuse transmittance, total transmittance of scattering samples, regular reflectance, diffuse reflectance, total reflectance and radiance factor are determined, maintained, and made available in practical form to industry by combined use of a reference NPL manual spectrophotometer and commercial recording spectrophotometers.

The presentation will concentrate on transmittance measurements made with the reference instrument, which is designed specifically to allow separate investigation of the various possible sources of systematic error, processes that are not practicable with commercial spectrophotometers. The investigation of the linearity of the complete photoelectronic system has always been a key factor, and double-aperture devices have been used consistently at NPL for over 40 years to monitor the performance of this instrument and its predecessors. Besides instrumentation, the procurement of material standards of suitable quality is a major limitation of the art, and the types in use at NPL are described, including the recently developed Ceramic Colour Standards.

An accurate spectrophotometer for measuring the transmittance of solid and liquid materials, R. Mavrodineanu, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 5, 405-425 (Sept.-Oct. 1972).

Key words: Absorbance; automation of accurate spectrophotometer; instrumentation, spectrophotometric; spectrophotometry, high accuracy; standard reference material in spectrophotometry; transmittance.

The optical transmittance of solids and liquids as well as the molar absorptivity of various chemical species are parameters of fundamental significance in characterizing these materials. Meaningful transmittance data can be obtained only when the measurements are performed with well-known accuracy and precision. To perform such measurements, a high accuracy spectrophotometer was designed and assembled at NBS, Analytical Chemistry Division, and will be described in this paper. This single-beam instrument is composed of a constant radiation source, a monochromator, a sample carriage, an integrating sphere-photomultiplier assembly followed by appropriate electronics, and a read out system consisting of a digital voltmeter and a computer data acquisition and handling provision. The accuracy of transmittance measurements is determined by the light-addition principle used in conjunction with a two-aperture arrangement. The spectrophotometer can be used in manual or automatic modes of operation. A detailed discussion of the data obtained with this instrument, used in both modes, will be presented together with its application to the certification of solid and liquid Standard Reference Materials for checking the photometric scales of conventional spectrophotometers.

Absolute spectroradiometric measurements, G. A. W. Rutgers, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 5, 427-436 (Sept.-Oct. 1972).

Key words: Absolute spectroradiometry; absolute standard source of radiation; calibrated photodetector.

There are two general methods for measuring a quantity of radiation emitted by a source. One can compare it with the radiation emitted by a standard source or one can measure the radiation with a detector calibrated in absolute units. When using the latter method, one must know the spectral transmittance factor of the optical components between source and detector.

In the present paper, a survey will be given of the standard sources available for spectroradiometry: cavity radiator, tungsten strip lamp, anode of the carbon arc, xenon arc and cascade arc. Several types of detectors such as the absolute bolometer and thermopile, with their properties, will be discussed.

Accurate measurements of and corrections for nonlinearities in radiometers, C. L. Sanders, *J. Res. Nat. Bur. Stand. (U.S.)*, **76A** (Phys. and Chem.), No. 5, 437-453 (Sept.-Oct. 1972).

Key words: Nonlinearity; photocell linearity; photometric accuracy; radiation addition method.

The methods described in the literature for accurately measuring photocell linearity are surveyed and assessed. The effects of not measuring photocell linearity under the conditions used in the final apparatus are considered. Some of the conditions necessary for accurate assessment of the nonlinearity under working conditions are specified. The use of the NRC "Photocell Linearity Tester" to measure and correct for the nonlinearity of various receivers is described.

Physical parameters in high-accuracy spectrophotometry, K. D. Mielenz, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 455-467 (Sept.-Oct. 1972).

Key words: High accuracy spectrophotometry, physical parameters; linearity test of photodetector; spectrophotometry, high accuracy.

The measured apparent transmittance T_A of a filter or liquid sample depends on the beam geometry in the spectrophotometer. For focused light incident upon the sample, T_A is different for systems having different f-numbers, and also depends on the state of polarization of the light. These effects are eliminated when the incident light is collimated; in this case T_A approaches the "true" transmittance T of the sample. Both modes of operation suffer from stray light and interference effects. The former may be reduced significantly by using mirror rather than lens optics, and the latter by suitable choice of the monochromator slit width. A new spectrophotometer based upon the above-mentioned design principles is described. The photometric precision of this instrument is shot-noise limited, permitting measurements to better than 10^{-4} transmittance units.

The double-aperture method of testing detector linearity to this level of precision is discussed. The conventional method of finding the nonlinearity correction can be replaced by a curve-fitting procedure giving better precision. Data on detector nonlinearity, and its dependence on wavelength, are presented.

Liquid absorbance standards, R. W. Burke, E. R. Deardorff, and O. Menis, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 469-482 (Sept.-Oct. 1972).

Key words: Absorptivity data; liquid absorbance standards; Standard Reference Materials.

Errors in the measurement of the absorbances of liquid filters result from instrumental and chemical uncertainties. This paper presents a systematic study of these variables on the absorbances of selected filters. Three types of liquid filters are discussed. These are (1) individual solutions of high purity compounds, (2) composite mixtures, and (3) aqueous solutions of organic dyes. The accuracy of the absorptivity data is established using NBS-calibrated glass filters. The magnitude of the errors arising from spectral bandpass, beam geometry, stray light, internal multiple reflections, and refractive index are delineated. Finally, as a practical outgrowth of this study, the development and issuance of NBS Standard Reference Material 931, Liquid Absorbance Standards for Ultraviolet and Visible Spectrophotometry, is described.

Accurate measurement of molar absorptivities, R. W. Burnett, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 483-489 (Sept.-Oct. 1972).

Key words: Molar absorptivity in clinical chemistry; random errors in molar absorptivity; systematic errors in molar absorptivity.

The key to accurate measurement of molar absorptivities is a thorough understanding of the sources of error which appear throughout the measurement procedure. Sources of determinant error will be listed with comments on estimating their magnitude and eliminating them where possible. Sources of random error will be discussed as well as the propagation of both random and determinant errors. There is discussion of the need for accurate values of molar absorptivities using examples from clinical chemistry. Finally, the proper use of accurate absorptivity values in the clinical chemistry laboratory will be considered. Here, emphasis is on the need for a quality assurance system which includes routine checks on such things as wavelength calibration and photometric accuracy of spectrophotometers, calibration of analytical balances, and quality of incoming reagents.

Problems associated with the need for standardization in clinical spectrophotometric and fluorometric measurements, J. R. Penton, G. M. Widdowson, and G. Z. Williams, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 491-498 (Sept.-Oct. 1972).

Key words: Clinical standards; standardization, spectrofluorometric; standardization, spectrophotometric; standard reference materials.

There is a growing demand in clinical chemistry for analyses to be performed in a manner allowing comparisons of results among laboratories and, from time to time, in the same laboratory. Reliable comparability requires adequate procedures of standardization for spectrophotometric and fluorometric instruments and methods. Problems with chemical and instrumental standardization are discussed.

For assays where the substance to be measured is available in suitable form, primary chemical standardization is justifiably popular. Relatively unsophisticated instrumentation can be used to compare measurements of unknown samples with such standards. Because primary standards meeting all necessary criteria are not available for many assays of clinical significance, standardization must depend on precision and accuracy of the instrumentation used, and on accurately compiled values of chemical-optical properties for the materials of interest. The task of compilation is outside the capability of the routine laboratory and should be provided by a reliable central agency. If an individual laboratory is to use the agency's compiled values, that laboratory must have available precise, accurate and reasonably inexpensive instrumentation along with reliable absorbance, fluorescence, and wavelength calibration standards.

The role of spectrophotometric standards in the clinical chemistry laboratory, R. N. Rand, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 499-508 (Sept.-Oct. 1972).

Key words: Clinical spectrophotometry, accuracy, precision; optical cuvettes; spectrophotometric standards, clinical.

It is obvious that erroneous data reported to a physician may adversely affect patient welfare. Currently, acceptable limits of accuracy and precision are poorly defined. It should be recognized, however, that the spectrophotometric measurement step in an appropriate analytical procedure is critical and inapparent error may occur. Spectrophotometric measurements, both manual and automated, are extensively used in the clinical chemistry laboratory. At least 1,000,000 such measurements per day on rather diverse equipment are made in this country; yet, few standards exist. Results of intra-lab surveys suggest that performance could be improved. The various ways in which spectrophotometry is used will be illustrated and a discussion of possible errors resulting from nonstandardized instrumentation will follow. There is pressing need for well defined and easily usable standards for wavelength, photometric accuracy, photometric linearity, stray light, as well as NBS specifications for optical cuvettes.

Spectrophotometric standards, W. H. Venable, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 509-510 (Sept.-Oct. 1972).

Key words: Photometric accuracy; standards, spectrophotometric.

To be useful, spectrophotometric measurements must be believable and practical. The basic standard for any believable spectrophotometric measurements is the ability to accurately compare fluxes of radiation within the framework of a well-defined geometry. The emphasis in the program proposed for the Institute for Basic Standards is to develop such ability over the broadest range of spectrophotometric measurements. Establishing such a basis will enable the National Bureau of Standards to render real assistance to those who deal with the problem of making practical measurements.

An alternative to accurate pyrometry in distinguishing concurrent vaporization reactions. Postulated results using the vaporization of gold in analyzing the vaporization of beryllium oxide in water vapor, T. B. Douglas, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 511-515 (Sept.-Oct. 1972).

Key words: Beryllia hydrates (gases); contaminants; gold; pyrometry; reference vaporization; temperature consistency; thermodynamic parameters (estimated).

For the transpiration determination of vaporization properties whose interconsistency is critical, the simultaneous vaporization of a reference substance such as uncontaminated gold is suggested as an alternative to accurate pyrometry. Calculations suggest that gold would be superior to all but the most accurate pyrometry in the temperature range 1700 to 2300 K. An application to seeking unreported gaseous hydrates of beryllia is illustrated by calculations based on estimated thermodynamic parameters.

The determination of iron, titanium, and nickel in Apollo 14 samples by cathode ray polarography, E. J. Maienthal, *J Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 517-520 (Sept.-Oct. 1972).

Key words: Analyses of iron, titanium, nickel; Apollo 14 lunar samples; differential cathode ray polarography.

Methods have been developed and applied to the determination of iron, titanium, and nickel in Apollo 14 fine soil and rock by differential cathode ray polarography on the same sample. A 5 mg sample was sufficient for the determination of all 3 elements. Iron and titanium were determined either directly or after cupferron separation. Nickel was determined after dimethylglyoxime separation.

The Stark splitting of millimeter wave transitions of water, Y. Beers and G. P. Klein, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 5, 521-528 (Sept.-Oct. 1972).

Key words: Millimeter waves; Stark effect; water.

This paper first discusses the technique of making Stark measurements at millimeter wavelengths. The details of correcting for residual overlap between the lines, the effects of modulation, and of the field inhomogeneity are discussed. Finally the measured frequencies and the empirical Stark coefficients for one H_2O and one D_2O and five HDO lines between 85 and 250 GHz are given. The final analysis of the data to give values of the dipole moment will be given in another paper.

November-December 1972

Absolute spectrofluorometry, W. H. Melhuish, *J. Res. Nat. Bur. Stand. (U.S.),* **76A,** (Phys. and Chem.), No. 6, 547-560 (Nov.-Dec. 1972).

Key words: Actinometers; calibration of spectrofluorometers; detectors, absolute; fluorescence spectra, corrected; quantum counters; spectrofluorometers, design; spectrofluorometry, absolute; standard lamps; standards, fluorescence; thermopiles.

The last 10 years has seen the increasing publication of the emission spectra of organic, inorganic and metal-chelate compounds, but there is no agreed method of presentation of such spectra. In the few cases where corrected emission spectra have been published, there is often no mention of the units used for the intensity coordinate or the method used for correcting spectra. A method of reporting absolute fluorescence spectra originally put forward in 1962 will be reexamined and improved. The two best known methods for calibrating spectrometers for absolute spectrofluorometry: (a) standard tungsten lamp, (b) quantum counter method, will be critically examined, and the limitations and possible improvements in accuracy will be proposed. The criteria for an emission standard will be examined and the use of emission standards for calibrating spectrofluorometers discussed. It is suggested that the distribution of emission standards to laboratories measuring corrected fluorescence spectra and the analysis and publication of the results should be done in the near future.

Absolute quantum efficiencies, G. A. Crosby, J. N. Demas, and J. B. Callis, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 561–577 (Nov.-Dec. 1972).

Key words: Calorimetry in quantum yields; laser, use in quantum yields; photodetectors in quantum yields; quantum efficiencies.

Recent developments in several areas of chemistry, laser technology, photodetector instrumentation, and calorimetry are surveyed, and their probable impact on the measurement of quantum yields is assessed. Chemical developments include: (a) synthesis and design of new luminescent molecules that could possibly serve as standards, (b) application of improved separation techniques to provide samples of extreme purity, and (c) advances in photochemistry that portend the development of wide-range chemical actinometers. The potential use of lasers in quantum yield measurements and their advantages over conventional sources for application in both optical and calorimetric techniques are pointed out. New methods of quantum yield measurements, based on the novel characteristics of laser pump sources, are suggested, including the feasibility of measuring yields under time-resolved conditions and of employing internal standards. The possible lifting of wavelength restrictions on both laser sources and detector devices and the implications of these developments for extending the spectral range of quantum yield measurements are discussed. The current status of calorimetry for determining yields is surveyed, and the impact of recent technology on the feasibility of developing calorimetric methods competitive with optical methods is assessed.

Phosphorimetry, J. D. Winefordner, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 579-592 (Nov.-Dec. 1972).

Key words: Aqueous solvents in phosphorimetry; phosphorimetry; rotating capillary cell; solvents for phosphorimetry.

Phosphorimetry in the past has received limited use because the precision of reproducibility was inadequate, there were solvent limitations, and preparation of test specimens was difficult and time consuming. Detection limits have now been lowered by more than two orders of magnitude by using a rotating capillary

sample cell, a more stable excitation-source power supply, and aqueous solvents. These steps have also increased precision by more than an order of magnitude. Considerable reduction in time and effort of sampling and measurements has been effected compared to phosphorimetric measurements made with standard procedures and commercial equipment. Twenty microliters of aqueous solution is all that is required to fill a quartz capillary cell by capillary action. Capillary cells filled with aqueous solutions do not crack when cooled to 77 K or when returned to room temperature. Rotation of the sample cell minimizes effects due to cell orientation and thus improves precision. Reduction of background phosphorescence results in improved accuracy of analysis. A study was made of the influence of methanol-water mixtures and of sodium-halide aqueous solutions on the magnitude of phosphorescence signals from several substances and of the effect on signal-to-noise ratios. The optimum solvent system for many phosphorimetric measurements is discussed. Analytical results are given for several organic substances measured by phosphorimetry at 77 K. These results are compared with those from previous studies by older methods.

Measurements of absolute values in biochemical fluorescence spectroscopy, R. F. Chen, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 593-606 (Nov.-Dec. 1972).

Key words: Absolute fluorometry; absolute fluorometry in biochemistry; standard reference materials in fluorometry.

Fluorescence spectroscopy is an important tool of the biochemist studying the structure and interactions of proteins and nucleic acids. The four basic quantities to measure accurately are: (1) spectra (corrected excitation and emission), (2) quantum yields (Q), (3) fluorescence decay characteristics, and (4) polarization. Commercially available instruments, with little modification, can be used to obtain these measurements, but the biochemist in this field is very dependent on the accuracy of measurements of substances he uses as standards. Confusion arises from disagreement between reported values for standards which may be used to calibrate a detector system to obtain quantum yields, or to set up lifetime and polarization photometers. For instance, the protein chemist is fond of using tryptophan and quinine as quantum yield standards, but Q for tryptophan has been variously reported as 0.13 and 0.20, and Q values for quinine bisulfate range from 0.4 to 0.7. The biochemist should also be aware of the problems inherent in the use of commercially available instruments in absolute measurements, as well as the special complications arising in complex biochemical systems where the fluorescence is heterogeneous.

Newer fluorometric methods for the analysis of biologically important compounds, G. G. Guilbault, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 607-612 (Nov.-Dec. 1972).

Key words: Enzymes, fluorometric analysis; fluorometry of enzymes; fluorometry of substrates; silicone pad; solid surface fluorometry.

Newer fluorometric methods for the analysis of biologically important compounds will be discussed: enzymes such as LDH, alkaline phosphatase, lipase and cholinesterase, and substrates such as glucose, urea and uric acid. These methods are based on the production of fluorescence initiated by an enzymic reaction.

New reagentless fluorescence methods will be described for enzymes and substrates. These methods are highly precise (1%), fast (less than 1 minute) and involve no preparation of reagents. These methods, as adapted to clinical laboratory procedures, will be discussed.

Inorganic ions in glasses and polycrystalline pellets as fluorescence standard reference materials, R. Reisfeld, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 613-635 (Nov.-Dec. 1972).

Key words: Fluorescence standards, inorganic ions; glass standards in fluorescence; rare-earth-doped glasses.

The absorption and fluorescence of inorganic glasses and polycrystalline disks doped by heavy metal ions is discussed, and their use as fluorescence standards is evaluated. The advantages of the glass standards over other media are summarized.

The glass standards are divided into two groups: (1) glasses doped by trivalent rare earths such as Gd^{3+}, Tb^{3+}, Eu^{3+}, Sm^{3+}, and Tm^{3+} which have narrow band optical spectra as a result of intraconfigurational transitions, and (2) glasses and polycrystalline disks doped by ions such as Tl^{+}, Pb^{2+}, Ce^{3+}, and Cu^{+} which have broad spectral bands since the optical spectra originate from interconfigurationally allowed transitions. Optical and physical parameters, including matrix effects, quantum efficiencies, decay characteristics, Stokes' shifts and spin-orbit versus orbit-lattice interactions due to the different transitions will be discussed.

Group (1) glasses are suitable for use as standards where a narrow well-defined fluorescence range is required, and group (2) glasses are suitable for use as standards whenever a substance with a wide range of fluorescence is measured. Special emphasis will be placed on energy transfer between donor and acceptor ions.

Development of a new fluorescent reagent and its application to the automated assay of amino acids and peptides at the picomole level, S. Udenfriend, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 637-640 (Nov.-Dec. 1972).

Key words: Fluorometry, amino acids; fluorometry, peptides; picomole fluorometry.

Methods for the assay of amino acids and peptides are most important in elucidating the structure of proteins and peptides. In many important areas of research such as in endocrinology, neurobiology, and genetics, methods are needed with sensitivity higher than is available with the widely used colorimetric ninhydrin procedure. A short while ago, we noted that all primary amines react with ninhydrin and phenylacetaldehyde to give a ternary product which is highly fluorescent. The chemistry of that reaction has now been elucidated and the conditions have been modified and improved so that essentially quantitative yields of fluorescent products are formed with all primary amines. The reaction has been automated and is being used as the detecting system for chromatography of amino acids, peptides and amines in the 10 to 100 picomole range. Problems concerning the fluorescence instrumentation and the isolation and chromatography of these compounds in the picomole range will be discussed.

Considerations on organic compounds in solution and inorganic ions in glasses as fluorescent standard reference materials, R. A. Velapoldi, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 641-654 (Nov.-Dec. 1972).

Key words: Emission spectra; excitation spectra; fluorescence; fluorescence standards; glass standards; quinine derivatives; rare earths; relative quantum efficiencies; solution standards.

The use of various organic compounds in solution and inorganic ions in glasses has been investigated as possible fluorescence Standard Reference Materials. Emphasis was placed on measuring physical and chemical parameters such as stability, reproducibilities of absorbance and fluorescence measurements, relative quantum efficiencies as a function of excitation wavelength, etc., for quinine derivatives and selected or-

ganic compounds. A brief discussion is included on the use of rare earth and non-rare earth inorganic ions in glasses as standards.

Ion-molecule reactions in isopropanol: Implications for its radiolysis, R. Gorden, Jr., and L. W. Sieck, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 655-659 (Nov.-Dec. 1972).

Key words: Gas-phase kinetics; ion-molecule reactions; mass spectrometry; photoionization; proton affinity; radiolysis.

The photoionization of isopropanol (*i*-PrOH) at 11.7 eV has been investigated in the NBS high pressure photoionization mass spectrometer over the pressure range 0.1 to approximately 200 millitorr. The major primary ion, CH_3CHOH^+, reacts with a total rate coefficient of $1.1 \pm 0.1 \times 10^{-9}$ cm^3/molecule · s to yield mainly (*i*-PrOH)H^+ and $CH_3(i\text{-}C_3H_7)COH^+$. At pressures in excess of a few millitorr consecutive reactions of (*i*-PrOH)H^+ and $CH_3(i\text{-}C_3H_7)COH^+$ were also detected, including the overall dehydration process

$$(i\text{-PrOH})H^+ + i\text{-PrOH} \rightarrow H_2O + (i\text{-}C_3H_7)_2OH^+$$

These data are interpreted in light of a recent radiolysis study, and a thermal cationic chain mechanism for production of $(i\text{-}C_3H_7)_2O$ consistent with those results is proposed. The value for the proton affinity of SF_6 is also discussed in some detail.

Excitation of $O_2{}^1\Delta_g$ by electron impact, P. S. Julienne and M. Krauss, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 661-663 (Nov.-Dec. 1972).

Key words: Ab initio Gaussian wave functions; electron impact excitation; exchange amplitude; $O_2{}^1\Delta_g$ state; Ochkur-Rudge approximation.

The total and differential cross sections as a function of energy were calculated for electron impact excitation of the $O_2{}^1\Delta_g$ state for the ground $^3\Sigma_g^-$ state. The Ochkur-Rudge approximation was used for the exchange amplitude, which was calculated using Hartree-Fock wave functions with a Gaussian basis; there is good agreement with the experimental total cross section except near threshold.

Vibrational and electronic oscillator strengths of LiO, M. Marchetti, P. S. Julienne, and M. Krauss, *J. Res. Nat. Bur. Stand. (U.S.),* **76A** (Phys. and Chem.), No. 6, 665-668 (Nov.-Dec. 1972)

Key words: $A^2\Sigma$; electronic transition probabilities; Hartree-Fock; LiO; vibrational transition probabilities; $X^2\Pi$.

Electronic energies and wave functions of ground and excited states of LiO are calculated in the Hartree-Fock approximation. The vibrational oscillator strengths of the $X^2\Pi$ and $A^2\Sigma^+$ valence states are calculated for v=0 to 1 and 1 to 2 transitions. Electronic oscillator strengths are also presented for transitions to the quantum number of two Li Rydbergs. Reasons are presented to support the use of the Hartree-Fock approximation.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 77A, JANUARY-DECEMBER 1973

January-February 1973

Spectrum and energy levels of neutral thulium, J. Sugar and W. F. Meggers, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 1, 1-43 (Jan.-Feb. 1973).

Key words: Energy levels; spectrum; thulium; wavelengths.

A new set of measurements of the spectrum of neutral thulium covering the range of 2513 Å to 11750 Å is given. The light source utilized for the observations was a microwave-excited thulium-iodide lamp. Second spectrum lines were recognized by comparing the output of this lamp with that of a 6A sliding spark. The results of Zeeman effect studies of these lines are included. Analysis of these new data led to the discovery of 348 new energy levels and provided revised values for the 142 already published. Measured Landé g factors are given for most of the levels.

Simultaneous measurement of specific heat, electrical resistivity, and hemispherical total emittance of niobium-1 (wt.%) zirconium alloy in the range 1500 to 2700 K by a transient (subsecond) technique, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 1, 45-48 (Jan.-Feb. 1973).

Key words: Electrical resistivity; emittance; high-speed measurements; high temperature; niobium-zirconium alloy; specific heat; thermodynamics.

Simultaneous measurements of specific heat, electrical resistivity, and hemispherical total emittance of niobium-1 (wt.%) zirconium alloy in the temperature range 1500 to 2700 K by a subsecond duration pulse heating technique are described. Estimated inaccuracy of measured properties are: 3 percent for specific heat and hemispherical total emittance, and 0.5 percent for electrical resistivity. Properties of the alloy are compared with the properties of pure niobium. It was found that specific heat and emittance of the alloy were approximately 0.5 percent and 1.5 percent, respectively, higher than those of pure niobium. Electrical resistivity of the alloy was 0.5 percent lower than that of pure niobium. Like niobium, the alloy showed a negative departure from linearity in the curve of electrical resistivity versus temperature.

Theory of disclinations: II. Continuous and discrete disclinations in anisotropic elasticity, R. deWit, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 1, 49-100 (Jan.-Feb. 1973).

Key words: Burgers vector; continuum mechanics; defect; dipole; disclination; dislocation; distortion; Green's tensor; incompatibility; loop; plasticity; strain; Volterra.

A general theory of stationary disclinations for a linearly elastic, infinitely extended, homogeneous body is developed. Dislocation theory is extended in three different ways to include disclinations, i.e., from continuous distributions, discrete lines, and continuous distributions of infinitesimal loops. This leads to three independent definitions of the disclinations, which can be uniquely related to each other. These interrelationships clarify Anthony and Mura's approaches to disclination theory, which at first appear to diverge from the present theory. Mura's "plastic distortion" and "plastic rotation" are identified as the dislocation and disclination loop densities. The elastic strain and bend-twist are derived as closed integrals in terms of the defect densities, and shown to be state quantities. The theory reduces to classical dislocation theory when the disclinations vanish. For every discrete disclination line, it is always possible to find a "dislocation model," which is a dislocation wall terminating on the line that gives exactly the same elastic strain and stress.

Photochemistry of methane in the photoionization region, R. E. Rebbert and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 1, 101-107 (Jan.-Feb. 1973).

Key words: Ion-molecule reaction; ion pair yield; methane; photochemistry; photoionization; quantum yields.

Methane was irradiated with microwave operated helium (21.2 eV) and neon (16.7–16.8 eV) resonance lamps which were separated from the reaction vessel by an aluminum window. The quantum yields of the stable end products have been determined at methane pressures ranging from 1 to 20 torr. Over this pressure range the abundances of the primary ions, determined through various diagnostic experiments, are within experimental error the same at 21.2 eV as at 16.7–16.8 eV [$(CH_4^+ \simeq CH_3^+ \simeq 0.5$, $CH_2^+ \leq 0.02)$, and are in good agreement with the primary mass spectra obtained in a photoionization mass spectrometer under collision free conditions ($P < 10^{-5}$ torr). The $C_2H_5^+$ which is formed by the reaction: $CH_3^+ + CH_4 \rightarrow C_2H_5^+ H_2$ loses a proton by an undetermined mechanism to give C_2H_4 as a product.

There is no evidence for the formation of neutral fragments such as H_2, C, CH or CH_2 at 16.7–16.8 eV. The fact that the ionization quantum is equal to unity in this energy range accounts for the absence of these intermediates. At 21.2 eV where ($\Phi_{ionization} = 0.95$) there is concrete evidence for the formation of carbon atoms ($\Phi(C) \geq 0.002$).

In an attempt to demonstrate the usefulness of enclosed neon and helium resonance light sources in the ion-molecule kinetic studies, the relative probabilities of transfer of H^- over D^- from various partially deuterium labeled hydrocarbons in $C_2H_5^+$ (or $C_2D_5^+$) has been determined.

The results presented in this article resolve the existing disagreements between previous helium resonance photolysis studies on CH_4.

Radiolysis of methane. Formation of acetylene, R. E. Rebbert and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 1, 109-114 (Jan.-Feb. 1973).

Key words: Acetylene formation; electron scavenger; ion

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

pair yields; methane; pulse radiolysis; vacuum ultraviolet photolysis.

The ^{60}Co-gamma radiolysis (at 200 to 2000 torr) and the pulse radiolysis (100 to 760 torr) of methane has been investigated with the specific purpose of elucidating the mode of formation of acetylene. The following two reactions account for the formation of acetylene in the pulse radiolysis:

$$C_2H_5^+ + e \rightarrow C_2H_2 + H_2 + H \qquad \text{I}$$

$$C(^1S \text{ or } ^1D) + CH_4 \rightarrow C_2H_2 + H_2. \qquad \text{II}$$

Addition of SF_6 as an electron scavenger eliminates reaction I as a source of acetylene, but increases the yield of ethylene through the occurrence of a reaction such as:

$$C_2H_5^+ + SF_6^- \rightarrow C_2H_4 + HF + SF_5.$$

In the low dose rate ^{60}Co-gamma radiolysis of $CH_4 - NO$ mixtures, reaction II is the only mode for formation of acetylene. The $C(^1S$ or $^1D)$ atoms which undergo reaction II are formed in the gamma radiolysis and pulse radiolysis, as well as in the 10 and 11.6 – 11.8 eV photolyses, through the dissociation process:

$$CH_4^* \rightarrow C + 2H_2.$$

In the gamma radiolysis, the $C_2H_5^+$ ion apparently is intercepted by accumulated products before undergoing homogeneous neutralization process 1. In the 16.7 – 16.8 and 21.2 eV photolyses, evidence is presented that the ions do not undergo homogeneous neutralization.

The enhancement of water vapor in carbon dioxide-free air at 30, 40, and 50 °C, R. W. Hyland and A. Wexler, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 1, 115-131 (Jan.-Feb. 1973).

Key words: Concentration of saturated water vapor in air; enhancement factor; moist air; moisture content of saturated air; saturated air; solubility of water vapor in air; water vapor.

The enhancement of water vapor in compressed atmospheric air was measured at 30, 40, and 50 °C over respective pressure ranges of 10 to 35 bars, 15 to 60 bars, and 10 to 100 bars. The data for each isotherm were fitted by the method of least squares to an empirical smoothing equation of the form $\ln f = a + bP$ where f is the enhancement factor, P is the total (absolute) pressure and a and b are constants. A detailed error analysis, necessary for the eventual use of the data in humidity standards work, shows that the calculated (predicted) values of f have an estimated limit of systematic bias of ± 0.07 percent and a maximum observed standard deviation of a predicted value of ± 0.2 percent.

The second interaction (cross) virial coefficient for moist air, R. W. Hyland and A. Wexler, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 1, 133-147 (Jan.-Feb. 1973).

Key words: Interaction virial coefficients; moist air; second virial coefficient; virial coefficients; water vapor.

The results of calculations of the second interaction (cross) virial coefficient B_{aw} for water vapor and air, based on enhancement data obtained at NBS at 30, 40, and 50 °C, are presented. Comparisons are made with the results of calculations based on the enhancement data of Politzer and Strebel, Webster, and Goff et al. and with the results of the theoretical calculations of Mason and Monchick and of Chaddock. An empirical equation is given for interpolation and extrapolation.

The random (one standard deviation) uncertainty in the mean values of B_{aw}, arising from the scatter of previously obtained NBS values of the enhancement factor is estimated to range from 0.7 percent at 30 °C to 1.4 percent at 50 °C. The estimated systematic uncertainties range from 4 percent at 30 °C to 6 percent at 50 °C, respectively.

Solubility and surface properties of finely divided hydroxyapatite, Y. Avnimelech, E. C. Moreno, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 1, 149-155 (Jan.-Feb. 1973).

Key words: Bone mineral; calcium phosphate; hydroxyapatite; solubility product; surface.

Synthetic hydroxyapatite (OHAp), $Ca_5(PO_4)_3OH$, was prepared by slow addition of phosphoric acid to a boiling $Ca(OH)_2$ suspension. The solid, precipitated at a pH of about 12, was stabilized by prolonged boiling. The Ca/P ratio of the product was 1.69 ± 0.04 and it had a specific surface area of 26 m^2/g.

Samples of OHAp were equilibrated with phosphoric acid solutions. Within the pH range studied, 5 to 7, the solubility product, $(Ca)^5(PO_4)^3(OH)$, was found to be $6.3 \pm 2.1 \times 10^{-59}$ at 25 °C.

Substantial deviations of the overall dissolution reaction from OHAp stoichiometry were observed and are attributed to non-stoichiometric reactions occurring at the surface. A linear dependence of excessive phosphorus on the surface with decrease in pH was found. Estimated on the extent of deviation from stoichiometry caused by the surface reaction are given.

Pyrolysis of anionic and thermally prepared polystyrenes, L. A. Wall, S. Straus, R. E. Florin, and L. J. Fetters, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 1, 157-170 (Jan.-Feb. 1973).

Key words: Anionic polystyrene; molecular weight distributions; molecular weights; thermal polystyrene; polymers; polystyrene degradation; pyrolysis; thermolysis.

The changes in molecular weights, their distributions, and initial rates have been measured, for a series of polystyrenes prepared by thermal and anionic procedures. The information obtained and previous results can be explained to a very large extent by a kinetic chain decomposition comprised of competing end and random initiation, depropagation, intra- and intermolecular transfer and termination by combination.

Modulus of natural rubber cross-linked by dicumyl peroxide. II. Comparison with theory, L. A. Wood, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 1, 171-177 (Jan.-Feb. 1973).

Key words: Cross-linking of rubber; dicumyl peroxide; elasticity theory of rubber; entropy component; gel point; modulus of rubber; rubber elasticity; statistical theory of rubber elasticity; thermodynamics of rubber elasticity.

Thermodynamics and molecular considerations are applied to an examination of the equation $G = S(fp + B)T + H(fp + B) + A = 5.925 \times 10^{-3}(fp - 0.45)T + 0.0684(fp - 0.45) + 2.70$, found experimentally in Part I. G is the shear modulus in Mdyn cm^{-2} at a temperature T for natural rubber cross-linked by adding p parts of dicumyl peroxide per hundred of rubber (phr) and heating until a fraction f of the peroxide is decomposed. G^*, the energy component of the modulus, is $H(fp + B) + A$. The ratio G^*/G decreases from 1.00 at the gel point ($fp = 0.45$ phr) to 0.5 near 2 phr and to 0.09 at 23.8 phr. The modulus G is related to ν_e, the number of moles of effective sub-chains per cm^3, by the equation $G - G^* = \nu_e RT$ where R is the gas constant. If each molecule of decomposed dicumyl peroxide of molecular weight M_d produces one cross-link in the rubber of specific volume $\bar{v}_r$, then

it is predicted that $S = 2R(100M_d\bar{v}_r)^{-1} = 5.5535 \times 10^{-3}$ Mdyn cm^{-2} phr^{-1} K^{-1}, as compared with the experimental value 5.925×10^{-3}. Theory gives no prediction of the values of A, or of H. The gel point may be located experimentally as the point where the slope of the modulus-temperature relation is zero. The value of G at the gel point is the energy component G^*. The experimental value of fp at the gel point permits a calculation of the molecular weight of the rubber before cross-linking as 193,000. The results afford a very satisfactory confirmation of the essential validity of the statistical theory of rubber elasticity in its simplest form, if due regard is paid to G^*, the energy component of the modulus.

March-April 1973

An adiabatic solution calorimeter and measurements of a standard reaction for solution calorimetry, E. J. Prosen and M. V. Kilday, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 2, 179-203 (Mar.-Apr. 1973).

Key words: Adiabatic solution calorimeter; enthalpy of reaction of H_2SO_4 in aqueous NaOH; H_2SO_4, enthalpy of reaction in NaOH(aq); heat of reaction of H_2SO_4 in aqueous NaOH; heat of solution of H_2SO_4 in aqueous NaOH; solution calorimetry; thermochemistry.

This paper discusses in detail the design, construction, and performance of the vacuum jacketed, adiabatic solution calorimeter which was used for the work in the certification of two NBS Standard Reference Materials for solution calorimetry. As a test for the calorimetric precision the following enthalpies of reaction were measured (referred to the mass or moles of $H_2SO_4 \cdot 8H_2O$):

$$H_2SO_4 \cdot 8H_2O + 2.36\,(NaOH \cdot 2620\,H_2O) = (Na_2SO_4 \cdot 0.36\,NaOH \cdot 6193\,H_2O)_{soln}$$

$$\Delta H_r(298.15\text{ K}) = -590.692 \pm 0.101\ J \cdot g^{-1}$$

$$= -34{,}194 \pm 5.9\ \text{cal} \cdot \text{mol}^{-1}$$

$$H_2SO_4 \cdot 8H_2O + 2.6\,(NaOH \cdot 714\,H_2O) = (Na_2SO_4 \cdot 0.6\,NaOH \cdot 1866\,H_2O)_{soln}$$

$$\Delta H_r(298.15\text{ K}) = -590.828 \pm 0.193\ J \cdot g^{-1}$$

$$= -34{,}203.4 \pm 11.1\ \text{cal} \cdot \text{mol}^{-1}$$

The enthalpy of solution of low quartz (α-quartz) in aqueous hydrofluoric acid, M. V. Kilday and E. J. Prosen, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 2, 205-215 (Mar.-Apr. 1973).

Key words: Enthalpy of soln, SiO_2; heat of soln, SiO_2(c); quartz, soln in HF(aq); reference material, soln calorimetry; SiO_2(c), soln in HF(aq); thermochemistry.

An adiabatic solution calorimeter was used to measure the enthalpy of solution of the NBS Standard Reference Material No. 1654 (α-quartz or low quartz) for use as a reference standard for HF solution calorimetry. The enthalpy of solution of this material at a concentration of 5 grams in 1000 cm^3 of 24.4 weight percent HF(aq) is

$$-\Delta H_{soln}(353.15\text{ K}) = 2362.2 \pm 1.1\ J \cdot g^{-1}.$$

This value also applies to the enthalpy of solution of pure low quartz within the uncertainty limits given. The enthalpy of solution of quartz (in $J \cdot g^{-1}$) as a function of the temperature, T, of reaction in 24.4 weight percent HF in the range 298 to 358 K, is

$$-\Delta H_{soln}(T) = 2275.0 + 1.586\,(T - 298.15).$$

Thus, the average ΔCp for the reaction over the range, 298 to 358 K, is $-1.586 \pm 0.025\ J \cdot g^{-1} \cdot K^{-1}$. As a function of the concentration of HF solution in the range, 18 to 30 weight percent.

$$-\Delta H_{soln}(353.15\text{ K}) = 2362.10 + 1.429\,(\text{wt\%HF} - 24.40) + 0.069\,(\text{wt\%HF} - 24.40)^2.$$

From measurements of the enthalpies of solution of several samples of quartz and fused silica, the enthalpy difference between low quartz and silica glass at 298.15 K was determined to be $162.2 \pm 4.9\ J \cdot g^{-1}$ (2.330 ± 0.070 kcal $\cdot$ mol^{-1}).

Enthalpies of solution of BeO(c) in HF(aq) and in HCl(aq), M. V. Kilday, E. J. Prosen, and D. D. Wagman, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 2, 217-225 (Mar.-Apr. 1973).

Key words: BeO(c), enthalpy of soln in HF(aq); BeO(c), enthalpy of soln in HCl(aq); BeO(c), enthalpy of reaction in HF(aq); beryllium oxide; enthalpy of solution; heat of solution; thermochemistry.

An adiabatic solution calorimeter was used to measure the enthalpies of the following reactions:

$$BeO(c) + [96\ HF + 338\ H_2O]\ (l) \rightarrow [BeF_2 + 94\ HF + 339\ H_2O](l)$$

$$\Delta H \text{ at } 298.15\text{ K} = -101.30 \pm 0.20\ \text{kJ} \cdot \text{mol}^{-1}$$

$$BeO(c) + [48\ HCl + 333\ H_2O]\ (l) \rightarrow [BeCl_2 + 46\ HCl + 334\ H_2O](l)$$

$$\Delta H \text{ at } 352.58\text{ K} = -54.19 \pm 0.22\ \text{kJ} \cdot \text{mol}^{-1}$$

$$\Delta H \text{ at } 298.15\text{ K} = -53.0 \pm 2.0\ \text{kJ} \cdot \text{mol}^{-1}$$

ΔCp is $12.5 \pm 2.8\ J \cdot \text{mol}^{-1} \cdot K^{-1}$ for the first reaction in the range 298 to 325 K.

The enthalpies of formation of BeO(c) and BeF_2(c), V. B. Parker, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 2, 227-235 (Mar.-Apr. 1973).

Key words: BeF_2(c); BeO(c); beryllium fluoride; beryllium oxide; enthalpies of formation; $\Delta H f°_{298.15K}$ [BeF_2(c)]; $\Delta H f°_{298.15K}$ [BeO(c)]; thermochemistry.

Two of the key compounds in the evaluation and synthesis of a consistent set of thermodynamic values for the Be compounds are BeO(c) and BeF_2(c). The available measurements on the enthalpies of formation of these two compounds are presented with a detailed outline of the approach used to select the "best" values. $\Delta H f°_{298.15K}$ [BeO(c)] $= -145.7 \pm 0.6$ kcal $\cdot$ mol^{-1} (-609.6 ± 2.5 kJ $\cdot$ mol^{-1}) and $\Delta H f°_{298.15K}$ [BeF_2(c, quartz)] $= -245.4 \pm 0.8$ kcal $\cdot$ mol^{+1} (-1026.8 ± 3.3 kJ $\cdot$ mol^{-1}).

Vapor pressure and heat of sublimation of tungsten, E. R. Plante and A. B. Sessoms, *J. Res. Nat. Bur. Stand. (U.S.),* **77A** (Phys. and Chem.), No. 2, 237-242 (Mar.-Apr. 1973).

Key words: Heat of sublimation; Langmuir vaporization; rate of vaporization; tungsten; vapor pressure.

The vapor pressure of tungsten was measured by the Langmuir method in the temperature range 2600 to 3100 K using a vacuum microbalance. Four series of data gave concordant results and three of the four series gave second and third law heats of sublimation in excellent agreement. A vapor pressure equation representing the data is $\log P(\text{atm}) = -45385/T + 7.871$, based on our mean third law heat and tabulated entropies at 2800 K. The mean third law heat of sublimation at 298.15 K is 205.52 ± 1.1 kcal mol^{-1} (859.90 ± 4.6 kJ mol^{-1}) where the uncertainty is an overall estimated error. Rates of vaporization are about 1/2 those previously accepted for tungsten.

Gas phase far ultraviolet photolysis and radiolysis of vinyl

chloride, P. Ausloos, R. E. Rebbert, and M. H. J. Wijnen, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 2, 243-248 (Mar.-Apr. 1973).

Key words: Gas phase; photolysis; quantum yield; radiolysis; vinyl chloride; vinyl radical.

Quantum yields of the major products formed in the far ultraviolet photolysis of CH_2CDCl (C_2H_2, C_2HD, C_2H_3D, $C_2H_2D_2$, and 1,3-$C_4H_4D_2$) have been determined at 147 nm (8.4 eV), 123.6 nm (10.0 eV), and 104.8-106.7 nm (11.6-11.8 eV). The quantum yield of the stable vinyl radicals which can be unambiguously ascribed to the primary process ($CH_2CDCl + h\nu \rightarrow CH_2CD + Cl$) is 0.3 and 0.05 at 147 and 123.6 nm, respectively. The sharp decrease in the yield of vinyl radicals with the increase in energy of the incident photon beam is in part attributed to the decomposition of internally excited vinyl radicals to give acetylene as a product. At 147 nm, the combined yield of acetylene plus vinyl radicals is 0.95 ± 0.05. At the shorter wavelengths, approximately one acetylene molecule is formed per electronically excited vinyl chloride molecule. It is concluded that the dissociative process: $C_2H_3Cl^* \rightarrow C_2H_2 + H + Cl$, occurring via a C_2H_3 or C_2H_2Cl intermediate adequately accounts for the reactive neutral species formed at higher photon energies. Isotopic labeling experiments show that the hydrogen atoms are detached from both positions of the parent molecule. Ethylene which is a product over the entire wavelength range is in part formed via the reaction: $H^* + C_2H_3Cl \rightarrow C_2H_4 + Cl$, where H^* represents a translationally excited hydrogen atom. The $C_2H_2DCl^+$ ions formed at 104.8-106.7 nm with a quantum yield of 0.47 do not contribute to the formation of acetylene or vinyl radicals. In the gas phase radiolysis of vinyl chloride, acetylene ($G \sim 1.5$) is mainly formed in the dissociation of neutral electronically excited vinyl chloride molecules. From this value, we may estimate that the ratio of neutral excited molecules formation to ionization in the radiolysis of vinyl chloride is 0.39. Vinyl ions, which are also produced ($G \sim 0.28$-0.35) react mainly by addition to vinyl chloride.

Pulse radiolysis of methane, R. E. Rebbert, S. G. Lias, and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 2, 249-257 (Mar.-Apr. 1973).

Key words: Electron scavengers; gas phase; ion-molecule reactions; methane; neutralization; pulse radiolysis.

The pulse radiolysis of methane has been studied in the absence and presence of electron scavengers such as SF_6 and CD_3I and positive ion scavengers such as i-C_4D_{10} in order to define the role of the intermediates H, C, CH, CH_2, CH_3,CH_5^+, and $C_2H_5^+$ in product formation. The dose rate was varied from 0.68 to 15.2×10^{19} eV/g-s, the dose (number of pulses) was varied, and the duration of the pulse was changed from 3 ns to 100 ns. The variation of the yields of the ethylene and ethane products with dose is explained by the reaction of H-atoms with accumulated ethylene product. The fast reacting C, CH, and $^1CH_2$ species insert into methane to form acetylene, ethylene, and ethane products, but all of the reactions of these species cannot be completely specified since they may originate in upper electronic states, whose reactions with methane are unknown. Product formation by the slow reacting $^3CH_2$ and CH_3 radicals is also examined; for instance, evidence is presented for the occurrence of the reaction: $^3CH_2 + CH_3 \rightarrow C_2H_4 + H$. Results indicate that the ions CH_5^+ and $C_2H_5^+$ undergo neutralization mainly through the processes

$$CH_5^+ + e \rightarrow CH_4 + H$$

$$C_2H_5^+ + e \rightarrow (C_2H_4)^* + H \rightarrow C_2H_2 + H + H_2(2H).$$

When i-C_4D_{10} is added, a fraction of the CH_5^+ and $C_2H_5^+$ react with the additive rather than undergo neutralization. A calculation demonstrates that the fraction of ions undergoing reaction with a given concentration of i-C_4D_{10} can be correctly predicted by assuming that the rate constant for neutralization of CH_5^+ and $C_2H_2^+$ is the same as that determined recently for the t-butyl ion.

Relation of vitron theory to 2-layer-liquid immiscibility in binary silicate and borate glass melts, L. W. Tilton, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 2, 259-272 (Mar.-Apr. 1973).

Key words: Binary borates; binary silicates; boron glass; glass; homogenization of glass melts; immiscible glass melts; immiscibility gaps; silica glass; structure of glass; vitron theory.

Silica-rich and boron-rich binary glasses resemble clathrates in having host cavities in which modifier oxides may be inclosed without stress as inactive guests until the cavities are approximately filled. Additional modification results in stress both in the holes of the matrix and the cavities of vitrons. Then the structure begins to disintegrate and mixing takes place. The required mole-percent modification is expressed by an equation of the form

$$100_{r_h} = \frac{100(A-\alpha)\cdot q/5}{(L-\delta-\alpha)+(A-\alpha)\cdot q/5}$$

where A and α are the diameters of vitron cavity and matrix hole, respectively, L is the linear extent of a modifier, and q the proportion of glass-maker that forms vitrons. Computations for 66 glasses have been made to constitute a unified system covering approximately the gamut of typical modifiers.

The identity of parameters A and α for silicates and borates leads to the suggestion that the vitron structure in boric-oxide glass is the regular icosahedron of 20 triangular faces to accommodate a neutral molecule of $(B_4O_6)_5$. Regular octahedra of $(B_4O_6)_2$, if present in the matrix, would provide matrix holes of approximately α in diameter.

May-June 1973

The International Practical Temperature Scale of 1968 in the region 13.81 K to 90.188 K as maintained at the National Bureau of Standards, G. T. Furukawa, J. L. Riddle, and W. R. Bigge, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 309-332 (May-June 1973).

Key words: International Practical Temperature Scale; NBS-IPTS-68; NBS-1955 provisional scale; platinum resistance thermometer.

The reproducibility of the International Practical Temperature Scale of 1968 (IPTS-68) in the region of 13.81 K to 90.188 K using standard platinum resistance thermometers is discussed. The effect of errors above 0 °C on the calibration between 13 and 90 K is analyzed. Calibrations resulting from least squares and "fixed point" treatment of the data are compared. The results show that in general the NBS-IPTS-68 temperature scale maintained at the National Bureau of Standards (NBS) by reference standard platinum resistance thermometers is transferred to thermometers calibrated at the NBS within a few tenths of a mK between about 20 and 90.188 K and within about ± 1 mK between 13.81 and 20 K. Agreements within a few mK are shown between the observed values of temperatures, employing platinum resistance thermometers calibrated in terms of the NBS-IPTS-68 scale, and the values of temperatures of the fixed points in the region 13.81 to 90.188 K given in the text of the IPTS-68.

Radiance temperature of niobium at its melting point, A. Cezair-

liyan, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 333-339 (May-June 1973).

Key words: High-speed measurements; high temperature; melting; niobium; radiance temperature; surface roughness.

A subsecond duration pulse heating method is used to investigate variations in the radiance temperature (at 650 nm) of niobium near and at its melting point. Measurements were made on several specimens with different surface conditions. The results do not indicate any dependence of radiance temperature (at the melting point) on initial surface conditions. The average radiance temperature (at 650 nm) at the melting point for twelve different niobium specimens is 2425 K on the International Practical Temperature Scale of 1968, with an average absolute deviation of 0.6 K and a maximum deviation of 1.2 K.

An experimental search for gaseous reactivity between AlF_3 and HF near 1200 K, T. B. Douglas and R. F. Krause, Jr., *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 341-342 (May-June 1973).

Key words: Aluminum fluoride; aluminum hydrofluorides; equilibrium constant; hydrogen fluoride; stability limits; transpiration measurements.

Using an accurate transpiration method, AlF_3 was sublimed near 1200 K into argon containing 0, 0.02, and 0.76 atm of HF, but no reaction between AlF_3 and the HF was detected within the precision (about 1%). Two alternative structures of $HAlF_4$ are postulated. An upper bound for extent of reaction corresponds to $\Delta H°_{298} > -33$ kcal (-138 kJ) for AlF_3 (g) + HF (g) = $HAlF_4$ (g); this indicates a far lower stability of $HAlF_4$ (g) than that of $LiAlF_4$ (g) or $NaAlF_4$ (g) when formed similarly.

A numerical solution of the integral equation describing a photometric integrating sphere, R. L. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 343-351 (May-June 1973).

Key words: Integrating sphere; photometry.

A photometric integrating sphere containing a single disk-shaped baffle and a point source with an arbitrary angular intensity distribution is described by an integral equation. Numerical solutions of this equation are presented for several different source distributions. The errors involved in comparing the various sources are evaluated as a function of baffle size and position.

Crystallization of random copolymers, I. C. Sanchez and R. K. Eby, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 353-358 (May-June 1973).

Key words: Copolymers; crystallization; growth rate; lamella thickness; melting temperature.

A theory of crystallization is formulated for random copolymers which crystallize with the noncrystallizable co-units incorporated into the crystalline lattice as defects. The appropriate melting point equation and other associated thermodynamic properties are derived for this model as a function of crystal thickness and comonomer concentration. The formation of lamellar type morphology is assumed to be a kinetically determined phenomena and nucleation theory is utilized accordingly. The isothermal lamella thickness is predicted to increase in a definitive manner as the noncrystallizable comonomer concentration X increases, while the associated isothermal growth rate is predicted to decrease. The variation of lamella thickness with X when the copolymer is quenched or cooled at a uniform rate is also qualitatively predicted. Under these conditions lamella thickness decreases with increasing X, which is in accord with previous experimental observations on random copolymers of tetrafluorethylene and hexafluoropropylene as well as other random copolymers. Theory also suggests how the surface free energy parameters σ_e and σ can be determined from isothermal crystallization experiments for a series of random copolymers of varying composition.

Theory of disclinations: III. Continuous and discrete disclinations in isotropic elasticity, R. deWit, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 359-368 (May-June 1973).

Key words: Burgers vector; continuum mechanics; defect; disclination; dislocation; distortion; Green's tensor; incompatibility; plasticity; strain.

A general theory of stationary disclinations is developed for a linearly elastic, infinitely extended, homogeneous, isotropic body. It is shown to be a special case of the anisotropic theory. Integral expressions are derived for the total displacement, elastic strain and bend-twist, and stress. Both continuous distributions and discrete lines are treated.

Compressive fatigue coaxing in composites, C. A. Berg and M. Salama, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 3, 369-373 (May-June 1973).

Key words: Coaxing; composites; compressive fatigue; fatigue.

Compressive fatigue experiments on unidirectional fiber reinforced composites, of both fiberglass and graphite fiber, reveal that compressive fatigue damage takes place by crack extension directly transverse to the fibers. It is also found that specimens which are first subjected to a few hundred thousand cycles of compressive fatigue at low stress levels, and then subjected to compressive fatigue at high stress levels, will survive longer at high stress levels than specimens which are placed under high compressive fatigue stresses from the outset. The increase of fatigue life at high compressive stress levels can be quite large; increases of fatigue life by as much as a factor of five were observed. The phenomenon of prolonging fatigue life at high stress levels by first "running in" a specimen at low stress levels is called coaxing, and is directly opposite to the often reported cumulative damage phenomena observed in tensile fatigue of composites. A possible mechanism for coaxing in compressive fatigue of composites is offered, and practical applications of the effect are suggested.

July-August 1973

The thermodynamic kelvin temperature scale from 273.15 K to 415 K, L. A. Guildner and R. E. Edsinger, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 383-389 (July-Aug. 1973).

Key words: Gas thermometry; International Practical Temperature Scale of 1968; sorption; steam point; temperature standards; Thermodynamic Kelvin Temperature Scale.

The investigation of the effects of sorption in a gas thermometer used to realize the Thermodynamic Kelvin Temperature Scale has been continued. By eliminating sorbable material more completely from the gas thermometer, we attained higher gas purity. So little contaminant remained that further cleanup produced no significant effect on the values of thermodynamic temperatures measured between 0 °C and 142 °C. The results are presented by giving the differences between the values on the thermodynamic scale and the International Practical Temperature Scale of 1968. The value of the steam point was determined to be 99.970 °C(therm) with an uncertainty of ± 3.5 mK at the 99 percent confidence level (based on 3 times the estimate of the standard deviation).

An alumina standard reference material for resonance frequency and dynamic elastic moduli measurement. II. Characteristic values for use from 25 °C to 1000 °C, R. W. Dickson and E. Schreiber, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 391-394 (July-Aug. 1973).

Key words: Alumina; elastic modulus; resonance frequency; shear modulus; standard reference material; Young's modulus.

The temperature dependence of Young's modulus and the shear modulus of polycrystalline alumina is given over the range of 25 to 1000 °C. Results are expressed in terms of the dimensionless ratio: modulus value at temperature divided by modulus value at 25 °C. The results are intended for use with Standard Reference Material No. 718 which is intended for calibration of apparatus used to determine elastic moduli of solids by a resonance technique. The worst agreement is 9.5×10^{-4} for the flexure and 19.1×10^{-4} for the torsion, between any two individual measurements, and we recommend these as the minimum acceptable limits in using the standards.

Heat capacities of polyethylene from 2 to 360 K. I. Standard samples of linear and branched polyethylene whole polymer, S. S. Chang and A. B. Bestul, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 395-405 (July-Aug. 1973).

Key words: Branched polyethylene; calorimetry; glass transition; heat capacity; linear polyethylene; polyethylene; thermal analysis; thermodynamic properties.

Heat capacities of two well characterized polyethylene samples have been measured from 2 to 360 K in a precision vacuum adiabatic calorimeter. The two samples are derived from the same stocks from which NBS standard reference materials (SRM) 1475 and 1476 for linear and branched polyethylene whole polymers, respectively, were established. Both samples have been studied in the conditions as received. The branched polyethylene sample has also been studied following various thermal treatments in the calorimeter. The effect of thermal history on the behavior of branched polyethylene has also been studied by differential scanning calorimetry.

The quasi-harmonic approximation and a generalized Grüneisen equation of state, F. I. Mopsik, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 406-409 (July-Aug. 1973).

Key words: Crystal equation of state; frequency distribution; Grüneisen constant; Grüneisen equation of state; quasi-harmonic approximation; thermal expansion.

The validity of the Grüneisen equation of state for a solid having a continuous distribution of frequencies is investigated. It is shown that one cannot generally replace $\partial S/\partial V$ with the heat capacity multiplied by appropriate Grüneisen constants. A model frequency distribution is used to show the difference that can arise.

Valence resonance states of N_2^-, M. Krauss and D. Neumann, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 411-412 (July-Aug. 1973).

Key words: Electron scattering resonance; excited states N_2; excited states N^-; inelastic scatter; N_2^-; valence excited states.

Resonance valence excited states of N_2^- are calculated and used to interpret resonant excitation of the A and B states of N_2 by electron impact.

Internal electric fields near isolated defects in ionic crystals, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 413-417 (July-Aug. 1973).

Key words: Electric fields; *F* centers; Gaussian function; Holtsmark function; isolated defects.

Integral representations for three distributions of internal electric fields near isolated defects in ionic crystals are given. These three distributions are the Gaussian distribution for electric fields associated with phonons, and two Holtsmark type distributions for electric fields associated with charged impurities when the Jahn-Teller effect is small and when it is large. Numerical values for the distributions and for the averages of squared-dipole matrix elements over them are tabulated in the conclusion.

Wavelengths and energy levels of the second spectrum of cerium (Ce II), C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 4, 419-546 (July-Aug. 1973).

Key words: Cerium; Ce II; energy levels; spectrum; wavelengths.

The second spectrum of cerium (Ce II) has been compiled in the wavelength region between 2500 Å and 24 000 Å. Of the 11 000 lines in the list, about 7500 are now classified as transitions between 192 odd levels and 288 even levels. The odd levels arise from 5 configurations ($4f5d^2$, $4f5d6s$, $4f6s^2$, $4f^26p$, and $4f^3$) and the even levels from 7 configurations ($4f^26s$, $4f^25d$, $4f5d6p$, $4f6s6p$, $5d^3$, $5d^26s$, and $5d6s^2$). The known levels extend up to only 52 000 cm^{-1} although the ionization potential is known to be 35 000 cm^{-1} higher.

September-October 1973

Enthalpies of precipitation of silver halides; entropy of the aqueous silver ion, D. D. Wagman and M. V. Kilday, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 569-579 (Sept.-Oct. 1973).

Key words: AgBr; AgCl; AgI; $AgNO_3$; enthalpy of dilution; enthalpy of precipitation; enthalpy of solution; entropy; heat of reaction; KBr; KCl; solution calorimetry; thermochemistry.

The enthalpies of precipitation of silver halides and the enthalpies of solution of $AgNO_3$, KCl, and KBr in H_2O were measured in an adiabatic solution calorimeter.

From the enthalpy measurements of KCl(c) and KBr(c) in $AgNO_3$(aq), and of $AgNO_3$(c) in KCl(aq), in KBr(aq), and in KI(aq), we calculated (in kJ · mol^{-1}) − 65,724, − 84,826, and − 111,124 for $\Delta H°$pptn(298.15 K) for the averages of the chloride, bromide, and iodide reactions, respectively.

A reevaluation of the data for the enthalpy of solution of $AgNO_3$(c) has resulted in our selected best value,

$$\Delta H°(\infty)(298.15\ \text{K}) = 22.730 + 0.084\ \text{kJ} \cdot \text{mol}^{-1}$$

$$= 5.433 \pm 0.020\ \text{kcal} \cdot \text{mol}^{-1}$$

A table of enthalpies of dilution of $AgNO_3$(aq) is also given.

The average standard entropy for the aqueous silver ion at 298.15 K is found to be

$$S°[Ag^+(aq)] = 73.42 \pm 0.20\ \text{J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$$

$$= 17.55 \pm 0.05\ \text{cal} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}.$$

Enthalpies of reaction of tris(hydroxymethyl)aminomethane in HCl(aq) and in NaOH(aq), E. J. Prosen and M. V. Kilday, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 581-597 (Sept.-Oct. 1973).

Key words: Enthalpy of reaction; heat of solution; solution

Key words: calorimetry; standard reference material; THAM; TRIS; tris(hydroxymethyl)aminomethane; thermochemistry.

The enthalpy of reaction of tris(hydroxymethyl)-aminomethane, NBS Standard Reference Material 724a, measured in an adiabatic solution calorimeter at 298.15 K in 0.1 *N* HCl solution is -245.76 ± 0.26 J · g^{-1}, and in 0.0500 *N* NaOH solution is 141.80 ± 0.19 J · g^{-1}. The conditions applicable and the factors included in the overall uncertainties are discussed in detail. For the reaction in 0.1 *N* HCl in the range, 293 to 303 K, $\Delta Cp = 1.435 \pm 0.023$ J · g^{-1} · K^{-1}, and in 0.0500 *N* NaOH in the range, 295 to 303 K, $\Delta Cp = 1.025 \pm 0.025$ J · g^{-1} · K^{-1}.

Possible sources of error in measurements of the reactions are discussed. A summary of other enthalpy measurements of the reaction in 0.1 *N* HCl is given.

The enthalpy of reaction of tris(hydroxymethyl)aminomethane with hydrochloric acid, A. P. Brunetti, E. J. Prosen, and R. N. Goldberg, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 599-606 (Sept.-Oct. 1973).

Key words: Enthalpy of reaction; solution calorimetry; standard reference material; tris(hydroxymethyl)-aminomethane; thermochemistry.

The enthalpy of reaction of tris(hydroxymethyl)aminomethane with 0.1 *N* HCl has been measured using an isoperibol solution calorimeter, employing a modified quartz thermometer and an automatic digital data acquisition system. The enthalpy value obtained at 298.15 K is 245.93 ± 0.26 J · g^{-1}. Particular attention was given to possible sources of systematic error in the electrical calibrations.

Theory of disclinations: IV. Straight disclinations, R. deWit, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 607-658 (Sept.-Oct. 1973).

Key words: Burgers vector; continuum mechanics; defect; dipole; disclination; dislocation; distortion; Green's tensor; incompatibility; loop; plasticity; strain; Volterra.

The general theory of disclinations developed earlier is applied to the special case of a straight disclination line. First the geometrical fields are found, such as the defect loop densities which correspond to Mura's new concepts of "plastic distortion" and "plastic rotation," the basic plastic fields (strain and bend-twist), the defect densities (dislocation and disclination), the characteristic vectors (Burgers and Frank), and the incompatibility. Then the static fields are found for the isotropic case, such as the displacement, total distortion, basic elastic fields, and the stress. It is shown that the disclination axis is moved by adding a dislocation to the disclination line. All these special results for the straight disclination line are shown to satisfy the general equations of the theory. As corollaries the following topics are also treated:

1. The finite and infinitesimal straight disclination dipole, which can be biaxial or uniaxial. It resembles the straight dislocation line.

2. The dislocation models of the straight disclination line and of the finite disclination dipole. They are terminating dislocation walls (tilt and twist).

3. The compensated disclination line and the bent dislocation wall.

4. Finally we show analytically a special case of a dislocation ending on a disclination.

Optical properties of *U* centers in alkali halides and alkaline earth fluorides, H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 659-665 (Sept.-Oct. 1973).

Key words: BaF_2; CaF_2; ionic polarization; KCl; Mollwo-Ivey relations; NaCl; point-ion potential; SrF_2; *U* centers.

The two-electron orbitals for the *U* center have been computed numerically from the Hartree-Fock-Slater (HFS) equations in the point-ion lattice potential. The lattice relaxation of the nearest-neighbor ions is included in the model. The five lowest-lying *U*-center states for NaCl, KCl, CdF_2, CaF_2, SrF_2, and BaF_2 are given. The low-lying singlet states have the following order for increasing values of the energy; $^1S(1s,1s)$, $^1P(1s,2p)$, and $^1S(1s,2p)$. The energy levels for the triplet states $^3S(1s,2s)$, and $^3P(1s,2p)$ lie between the energy levels for the $^1S(1s,1s)$ and $^1P(1s,2p)$ states. The ordering of the triplet states depends upon the host crystal and the lattice relaxation. The predictions based upon the numerical HFS wave functions are compared with the predictions based upon past variational wave functions and with experiment.

Air flow rate as a test for gage block wringing, L. A. Guildner, R. L. Anderson, and R. E. Edsinger, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 667-670 (Sept.-Oct. 1973).

Key words: End length standards; gage blocks; joining; wringing; wring test.

Gage blocks can be joined by "wringing" to produce a vacuum-tight joint. Hoke gage blocks have square gaging surfaces with a central hole connecting them. The quality of the joints between blocks can be tested by measuring the vacuum leak rates through the joints into the central hole. When two Hoke blocks are in contact at one edge but tilted at an angle ϕ, the vacuum leak rate into a chamber of 22 cm^3 produces a rate of pressure increase which can be represented by the following polynomial:

$$dp/dt = 0.42\,\phi^2 + 0.022\,\phi^3 \ \mu\text{m Hg/min},$$

where ϕ is in μrad. Hoke blocks in suitable condition to be joined by wringing can also be joined by alining them and evacuating the joint through the center hole.

Low frost-point humidity generator, L. Greenspan, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 5, 671-677 (Sept.-Oct. 1973).

Key words: Calibration; frost-point; generator; humidity; water vapor.

A low frost-point humidity generator has been developed at NBS to provide a capability for calibration, testing and research at very low levels of water vapor content in such gases as atmospheric air, carbon dioxide and nitrogen. The generator produces frost points from − 30 to − 100 °C at ambient pressures from 500 to 200,000 pascals (0.005 to 2 atm.). This is equivalent to mixing ratios of 4×10^{-6} to 51 grams of water vapor per kilogram of dry air and to vapor pressures of 1.4×10^{-3} to 38 pascals. The generated test gas can be fed to a test chamber with independent temperature control between + 25 and − 100 °C. The uncertainty of the frost point in the test chamber is estimated not to exceed 0.05 deg C. Intercomparisons with a frost-point hygrometer as well as two gravimetric checks gave results which in all cases agreed to within 0.2 deg C in frost-point temperature.

November-December 1973

Absolute isotopic abundance ratio and atomic weight of a reference sample of rhenium, J. W. Gramlich, T. J. Murphy, E. L. Garner, and W. R. Shields, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 691-698 (Nov.-Dec. 1973).

Key words: Absolute ratio; atomic weight; isotopic abundance; rhenium.

An absolute value has been obtained for the isotopic abundance ratio of a reference sample of rhenium, using surface emission mass spectrometry. Samples of known isotopic composition, prepared from nearly isotopically pure separated rhenium isotopes, were used to calibrate the mass spectrometers. The resulting absolute $^{185}Re/^{187}Re$ ratio is 0.59738 ± 0.00039, which yields atom percents of $^{185}Re = 37.398 \pm 0.016$ and $^{187}Re = 62.602 \pm 0.016$. The atomic weight calculated from this isotopic composition is 186.20679 ± 0.00031. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the mean and allowances for the effects of known sources of possible systematic error.

Reflection correction for high-accuracy transmittance measurements on filter glasses, K. D. Mielenz and R. Mavrodineanu, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 699-703 (Nov.-Dec. 1973).

Key words: Correction for reflections; reflections, multiple; spectrophotometry, high accuracy; systematic bias in spectrophotometry; transmittance, correction.

Multiple reflections in the sample compartment of a spectrophotometer constitute a source of systematic bias in transmittance measurements on filter glasses. This bias may be removed by applying a numerical correction obtained from measurements on tilted samples in polarized light. For a high-accuracy spectrophotometer, this correction was found to be of the order of several 10^{-4} transmittance units, independent of polarization, but slightly wavelength-dependent.

Temperature-pressure phase relationships in niobium pentoxide, J. L. Waring, R. S. Roth, and H. S. Parker, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 705-711 (Nov.-Dec. 1973).

Key words: Niobium pentoxide; phase relationships; pressure; temperature.

A pressure-temperature (P-T) section of the phase equilibrium diagram for Nb_2O_5 has been determined. Four single phase regions, H-Nb_2O_5, B-Nb_2O_5, and two L-Nb_2O_5 areas, were characterized by x-ray powder diffraction data. The superstructure of L-Nb_2O_5 was indexed on the basis of similarities to the known superstructures of L-Ta_2O_5 and confirmed with single crystal electron diffraction data. The correct unit cell is orthorhombic with $a = 6.168$, $b = 29.312$, $c = 3.938$ Å, with the b axis 8 times the subcell (8×3.664 Å).

Nuclear magnetic resonance of ^{113}Cd and ^{199}Hg in Cd-Mg and Cd-Hg solid solutions, V. V. Zhukov, I. D. Weisman, and L. H. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 713-723 (Nov.-Dec. 1973).

Key words: Anisotropic; Cd; Cd-Hg; internal Mg oxidation; isotropic; Knight shift.

The current theoretical and experimental situation with respect to Knight shifts and bulk susceptibility of Cd in pure Cd and in Cd-Mg and Cd-Hg alloys is reviewed. New experimental isotropic and anisotropic Knight shift data on ^{113}Cd in Cd-Mg and Cd-Hg alloys and on ^{199}Hg in Cd-Hg alloys are presented. The behavior of the ^{199}Hg sites is found to be remarkably similar to that of the ^{113}Cd site in the Cd-Hg alloys. However the ratio of isotropic Knight shift of ^{199}Hg to ^{113}Cd is somewhat greater than the ratio of ^{199}Hg to ^{113}Cd atomic hyperfine fields suggesting that there is more local electronic "s" character at the Fermi surface in the alloy than in the pure metals. This is consistent with the theoretical picture of Cd in which phonon scattering induced by increasing temperature or alloying smears and weakens the lattice potential which in turn leads to a more "s" like Fermi surface.

Further, the ^{113}Cd Knight shift is found to be a useful tool for monitoring the phase segregation that occurs in Cd-Mg due to internal oxidation and for determining the concentrations of solutes such as Hg and Mg in Cd-Hg and Cd-Mg alloys.

The pair correlation function in liquid ^4He, R. D. Mountain and H. J. Raveché, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 725-731 (Nov.–Dec. 1973).

Key words: Ground state wave function; liquid ^4He; neutron diffraction data; pair correlation function; short range behavior; structure factor; superfluid transition.

The pair correlation function obtained from the neutron diffraction data of Mozer, De Graaf, and Le Neindre, is given for liquid ^4He at several thermodynamic states above and below the superfluid transition. A method for smoothly and accurately extrapolating the pair function into the limit of zero internuclear separation is considered. The pair function is computed from an approximation integral equation for the ground state wave function and compared to the experimental results.

Molecular basis of flame inhibition, J. W. Hastie, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 733-754 (Nov.-Dec. 1973).

Key words: Fire retardants; flame inhibition; flames.

The role played by inorganic chemical additives in fire retardancy and flame inhibition is considered. Particular attention is given to the molecular level aspects of commercially important systems containing compounds of antimony, halogens, and phosphorus. The flame inhibiting function of metal containing additives is also discussed.

The effect of temperature and pressure on the refractive index of some oxide glasses, R. M. Waxler and G. W. Cleek, *J. Res. Nat. Bur. Stand. (U.S.)*, **77A** (Phys. and Chem.), No. 6, 755-763 (Nov.-Dec. 1973).

Key words: Interferometry; light scattering; oxide glasses; polarizability; pressure; refractive index; temperature coefficient of refractive index; thermal expansion.

The change in refractive index with temperature has been determined for some oxide glasses from about – 200 to 700 °C. The change in refractive index with applied hydrostatic pressure has been determined at room temperature from a pressure of 10^5 to 10^8 Pa. All measurements were made using the yellow spectral line of helium. A calcium aluminate glass, an aluminum magnesium phosphate glass, a binary barium borate glass and a multicomponent germanate glass were studied, as were four commercial specimens of fused silica. From the data at room temperature, it has been possible to calculate the change in electronic polarizability with temperature at constant volume. This parameter has been found to be very high for the glasses as compared to crystals, and this agrees with the results of earlier research on silica-based optical glasses. Furthermore, over the entire temperature range, the change of refractive index with temperature is shown to be due predominantly to the temperature dependence at constant volume of the electronic polarizability. The relevance of the data to the molecular scattering of light in glasses is discussed.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 78A, JANUARY–DECEMBER 1974

January-February 1974

Thermophysical measurements on iron above 1500 K using a transient (subsecond) technique, A. Cezairliyan and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 1-4 (Jan.-Feb. 1974).

Key words: electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; iron; melting point; phase transformation; thermodynamics; thermophysical properties.

Simultaneous measurements of heat capacity, electrical resistivity and hemispherical total emittance of iron (99.9% pure) in the temperature range 1500 to 1800 K, and the melting point of iron by a subsecond duration, transient technique are described. The measurements indicate increases in heat capacity and electrical resistivity as the result of the solid-solid phase transformation ($\gamma \rightarrow \delta$) in iron. The measured value of the hemispherical total emittance at 1720 K is 0.33. The average of the results of two experiments yield a value of 1808 K for the melting point of iron. Estimated inaccuracies of measured properties are: 3 percent for heat capacity and emittance, 1 percent for electrical resistivity, and 5 K for the melting point.

Measurement of melting point, normal spectral emittance (at melting point) and electrical resistivity (near melting point) of some refractory alloys, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 5–8 (Jan.–Feb. 1974).

Key words: alloys; electrical resistivity; high temperature; melting point; normal spectral emittance; refractory materials; thermophysics.

A subsecond duration pulse heating method is used to measure the melting point, normal spectral emittance (at the melting point, corresponding to 650 nm), and electrical resistivity (near the melting point) of the following refractory alloys: 90 Ta-10W, 99 Nb-1 Zr, and 80 Nb-10 Ta-10 W (numbers indicate nominal composition in percentage by weight). The melting point and the normal spectral emittance are: 3286 ± 15 K and 0.396 for 90 Ta-10 W, 2737 ± 10 K and 0.351 for 99 Nb-1 Zr, and 2814 ± 10 K and 0.333 for 80 Nb-10 Ta-10 W. The inaccuracy of the normal spectral emittance and electrical resistivity results is estimated to be 3 percent and 0.5 percent, respectively.

Comparative density measurements for solid specimens weighing a few milligrams, A. D. Franklin and J. R. Donaldson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 9-13 (Jan.-Feb. 1974).

Key words: CaF_2; density; measurement technique; Si; tungsten wires.

A density comparison technique previously described has been used to compare the densities of tungsten wires weighing about 1.3 mg to within a few percent error. For larger, less dense specimens the expected random error of a few parts in 10^4 was confirmed by comparing the known densities of Si and CaF_2.

A density scale based on solid objects, H. A. Bowman, R. M. Schoonover, and C. L. Carroll, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 13-40 (Jan.-Feb. 1974).

Key words: density standard; hydrostatic weighing; perfect sphere; silicon; spherical interferometer; spherical volume; volume standard.

We have determined the density of four pieces of single crystal silicon in terms of universally accepted standards of mass and length. These four objects will be used as a working density standard to which all future density work in the United States will be referred. Using these crystals as standards, NBS can calibrate other objects as density standards for associated laboratories.

The work was accomplished with the assistance of an interferometer, developed especially for the task, which measures the diameter of commercially available steel balls. From measured diameters ball volumes are calculated. The volumetric information contained in the balls is transferred to the silicon crystals in a newly designed hydrostatic weighing experiment.

We have made three independent density determinations on each of the four crystals, and the presently accepted values of the density of each crystal is the average of the three determinations. The random component of uncertainty (3 standard deviations) of these four averages is 0.7 ppm. The systematic error is estimated to be about 0.7 ppm.

Geometrical considerations in the measurement of the volume of an approximate sphere, D. P. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 41-48 (Jan.-Feb. 1974).

Key words: asphericity correction; density; spherical harmonics; volume of ball.

Expressions are derived for the volume of an approximate sphere in terms of measured breadth, the distance between parallel planes tangent to opposite sides. The difference in volume of a ball and a true sphere of the same average breadth is shown to be of second order, and much smaller than the random and systematic errors in the measurements of the dimension. Thus, a ball commercially available at moderate cost can be used for absolute density measurements of high accuracy. Similar expressions are given for the area of an approximate circle.

Note on diffusion of vapor into flowing gas, D. P. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 49-51 (Jan.-Feb. 1974).

Key words: diffusion; equilibrium; evaporation; humidity; humidity generator; laminar flow; saturation; water vapor.

The theory of diffusion of vapor between the walls of a tube and a stream of gas is applied to a generator of known humidities. The rate of approach to equilibrium is evaluated for gas velocities in the laminar flow range. The effect of pressure drop is examined.

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

Theoretical analysis of miscibility gaps in the alkali-borates, P. B. Macedo, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 1, 53-59 (Jan.-Feb. 1974).

Key words: glass; immiscibility; phase separation; thermodynamics of solutions.

A thermodynamic approach based on the regular solution concept is applied to the description of miscibility gap boundaries in the alkali-borate systems. It is suggested that in each system the structural units which control the entropy of mixing are the stoichiometric compounds at the apparent limit of the alkali-rich edge of the gap, and a complex boron trioxide structure. (The former is inferred by the shape of the gap, and the latter is chosen to fit the regular mixing equation.) The same boron trioxide complex is used for all the systems analyzed. The physical implications of this analysis are discussed.

March-April 1974

The formation of curved polymer crystals: Polyoxymethylene, F. Khoury and J. D. Barnes, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 95-127 (Mar.-Apr. 1974).

Key words: chain-folded; crystal; curved; electron microscopy; optical microscopy; polymer; polyoxymethylene; solution grown.

An optical and electron microscopical study is presented of the habits exhibited by chain-folded polyoxymethylene crystals grown from hot 0.02 percent solutions of the polymer in orthodichlorobenzene when these solutions are cooled to temperatures (T_c) between 140 and 80 °C inclusive. In contrast with the lamellar crystals formed in the $T_c = 140$ and 120 °C preparations, which crystals were six-sectored and nearly planar, the crystals formed below $T_c = 120$ °C exhibited multisectored dendritic habits and were all the more pronouncedly curved the lower the temperature at which they grew. The most pronouncedly curved crystals which were observed were hollow bowl shaped dentrites having a radius of curvature of $\sim 2\mu$m which were formed in the 80 °C preparations. The possible origins of why the lamellar crystals of polyoxymethylene were all the more pronouncedly curved the lower the crystallization temperature are considered in the light of conjectures which have been previously advanced concerning the formation of curved crystals of poly(4-methylpentene-1). Among the features which are discussed is the role played by the bulkiness of the chain folds.

Solid-phase behavior of several long-chain *n*-paraffins, esters, and a ketone, P. K. Sullivan, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 131-141 (Mar.-Apr. 1974).

Key words: dielectric loss; *n*-paraffins; phase transitions; x-ray scattering.

The long-spacings of the compounds methyl stearate, ethyl stearate, *n*-butyl stearate, 2-nonadecanone, *n*-eicosane, *n*-hexatriacontane and *n*-tetratetracontane have been examined as a function of temperature by means of low-angle x-ray diffraction. The intensity of the long-spacing was also determined versus temperature. The effect of annealing temperature and time was examined by means of the DSC. Dielectric loss was studied in two crystalline phases of *n*-butyl stearate.

Simultaneous measurements of heat capacity, electrical resistivity, and hemispherical total emittance by a pulse heating technique: Vanadium, 1500 to 2100 K, A. Cezairliyan, F. Righini, and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 143-147 (Mar.-Apr. 1974).

Key words: electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; thermodynamics; thermophysics; vanadium.

Simultaneous measurements of heat capacity, electrical resistivity, and hemispherical total emittance of vanadium in the temperature range 1500 to 2100 K by a subsecond duration, pulse heating technique are described. The results are expressed by the relations:

$$c_p = 56.34 - 3.839 \times 10^{-2}\, T + 1.563 \times 10^{-5}\, T^2$$

$$\rho = 8.794 + 6.282 \times 10^{-2}\, T - 6.804 \times 10^{-6}\, T^2$$

where c_p is in J · mol^{-1} · K^{-1}, ρ is in $10^{-8}\,\Omega \cdot$ m, and T is in K. The values for the hemispherical total emittance are: 0.313 at 1900 K and 0.332 at 2000 K. Estimated inaccuracies of the measured properties are: 3 percent for heat capacity, 0.5 percent for electrical resistivity and 5 percent for hemispherical total emittance.

The shape of idealized grain boundaries, S. R. Coriell, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 149-150 (Mar.-Apr. 1974).

Key words: boundary shape; curvature; grain boundary.

Mullins has treated a two-dimensional model of grain boundary motion in which each point on the boundary moves toward its center of curvature with a speed proportional to its curvature. For boundaries which preserve shape under uniform magnification, an integral representation of the boundary shape is found. We then obtain several analytic results from approximate evaluations of the integral.

Reactions of fluorocarbon ions in C_2F_6. Implications for the radiolysis, L. W. Sieck, R. Gorden, Jr., and P. Ausloos, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 151-156 (Mar.-Apr. 1974).

Key words: fluorocarbons; heats of formation; ion-molecule reactions; mass spectrometry; photoionization; rate constants.

Reactions of the fragment ions formed in the photoionization of C_2F_6, Xe-C_2F_6, and Kr-C_2F_6 mixtures have been investigated in the NBS photoionization mass spectrometer using both helium (21.2 eV) and neon (16.66-16.84 eV) resonance radiation. Contrary to previously held views, it is shown that CF_3^+ ions having no internal excitation energy undergo the F^- transfer reaction:

$$CF_3^+ + C_2F_6 \rightarrow CF_4 + C_2F_5^+. \qquad (a)$$

A rate constant of $4 \pm 1 \times 10^{-11}$ cm^3/molecule − s is determined for reaction (a) at pressures below 10^{-2} torr. On the basis of the collision rate for these reactants, it can be estimated that, on the average, each CF_3^+ ion undergoes 16 unreactive collisions before undergoing reaction (a). Therefore, from the facts that (1) in pure C_2F_6, all CF_3^+ ions undergo reaction (a) at high pressures, and (2) CF_3^+ ions formed by charge transfer from Xe^+ ions with a maximum of 8.4 kJ/Mol (2kcal/mol) excess energy undergo reaction (a), one must conclude that reaction (a) is either thermoneutral or exothermic for ground state CF_3^+ ions. Therefore, the earlier estimate for $\Delta H_f(C_2F_5^+)$ of ~ 33 kJ/mol (8 kcal/mol) must be revised downward: $\Delta H_f(C_2F_5^+) \leq 3.8$ kJ/mol (0.9 kcal/mol).

The $C_2F_5^+$ ion is unreactive towards C_2F_6, but does react with alkanes through the H^- transfer reaction:

$$C_2F_5^+ + RH \rightarrow C_2F_5H + R^+. \qquad (b)$$

It is suggested that the CF_4 observed in previous gas and liquid phase radiolysis studies of C_2F_6-O_2 mixtures can be entirely ascribed to reaction (a). Small concentrations of impurities or accumulated products will react with the $C_2F_5^+$ ions under normal low dose rate radiolysis conditions.

A simple technique for the generation of dilute mixtures of pollutant gases, W. Tsang, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 2, 157-162 (Mar.-Apr. 1974).

Key words: acetaldehyde; acrolein; air pollution; calibration; decomposition; formaldehyde; reactive gases.

The pyrolysis of compounds whose decomposition produces equal numbers of reactive and stable molecules provides a simple quantitative means of generating dilute mixtures of formaldehyde, acetaldehyde and acrolein. The requirements with respect to the thermal stability of such "parent" compounds are discussed and the possible extentions to other reactive gas systems are considered.

Energy levels and classified lines in the second spectrum of thorium (Th II), R. Zalubas and C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 2, 163-246 (Mar.-Apr. 1974).

Key words: energy levels of Th II; g-values of Th II; spectrum of Th II; Th II spectrum; thorium; wavelengths of Th II.

The analysis of Th II has been extended with improved observations of the spectrum between 2000 and 25 000 Å. About 6500 lines are classified as transitions between 199 odd levels and 271 even levels. Of the 192 levels expected from the six odd configurations $5f(6d+7s)^2$ and $(6d+7s)^2 7p$, 188 are now known. In the even level system, all but one of the 37 levels of the three $(6d+7s)^3$ configurations are known. Of the 268 levels predicted for the configurations $5f^2 7s + 5f7s7p + 5f6d7p + 5f^2 6d$, 235 are now known. The identifications are based on the theoretical calculations by N. Minsky. New Zeeman effect observations have increased the number of levels with known g-values to 406 out of 470 known levels. The classifications will be useful in establishing secondary standards of wavelength.

Proposed secondary wavelength standards and line classifications in thorium spectra between 0.9 and 3 μm, A. Giacchetti, J. Blaise, C. H. Corliss, and R. Zalubas, *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 2, 247-281 (Mar.-Apr. 1974).

Key words: classified lines of Th I and Th II; Fourier transform spectra of Th; infrared spectra of Th; spectra of Th; Th I and Th II; thorium spectra; wavelengths of Th.

The spectrum of thorium as emitted by an electrodeless lamp has been recorded by Connes and collaborators by means of Fourier Transform Spectroscopy in the region 0.9 to 3 μm. Of the 3100 lines observed, about 1900 are classified as transitions in the energy level system of Th I and 412 in Th II. Since the average deviation between the observed and calculated wave numbers is less than 0.002 cm^{-1}, the observed wavelengths are suitable for use as standard wavelengths.

May-June 1974

Photoionization of CO_2-CO-O_2 mixtures. Formation and reactions of ion clusters, L. W. Sieck and R. Gorden, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 3, 315-322 (May-June 1974).

Key words: CO; CO_2; ion-molecule reactions; O_2; photoionization; radiolysis; rate constants.

Various mixtures containing combinations of CO_2, O_2, or CO have been photoionized at 16.7 and 21.2 eV at pressures up to 1.5 torr in the NBS high pressure photoionization mass spectrometer. In CO_2-CO mixtures the interactions of CO_2^+ ions eventually lead to the formation of $(CO)_2^+$ and $[(CO)_2 \cdot CO_2]^+$ cluster ions, while photoionization of CO_2-CO-O_2 mixtures yields mainly oxygen-containing clusters at higher pressures. The investigation of O_2-CO mixtures also revealed reactions between O_4^+ and CO. The role of impurity reactions involving H_2O is considered in some detail, and the implications of all of these data to the vapor phase radiolysis of CO_2 is discussed.

Analysis of low temperature viscosity data for three NBS standard glasses, A. Napolitano, J. H. Simmons, D. H. Blackburn, and R. E. Chidester, *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 3, 323-329 (May-June 1974).

Key words: beam-bending; fiber-elongation; Fulcher equation; glass viscosity; standard reference material; viscosity; viscosity standard.

The low temperature viscosities of three glasses established as viscosity standards at the National Bureau of Standards are reported. The data overlap results which appear on the published certificates between 10^9 and 10^{12} poise and present extensive measurements up to 10^{16} poise. The measurements were made using both the fiber-elongation and beam-bending methods. No evidence of an Arrhenius behavior was found for any of the three glasses, even though the measurements covered a narrow range of temperatures. An analysis of the inherent measurement uncertainty associated with each method indicates that the fiber-elongation measurements are more precise than the beam-bending measurements. Analysis of the data and its uncertainty by the Fulcher Equation supports the conclusions of the error analysis.

***PVT* relationships for liquid and glassy poly(vinyl acetate),** J. E. McKinney, *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 3, 331-353 (May-June 1974).

Key words: density; dilatometer; entropy; glass transition; glass; liquid; polymer; poly(vinyl acetate); *PVT*; relaxation.

PVT measurements were made on liquid and glassy poly(vinyl acetate) over ranges of − 30 to 100 °C and 0 to 800 bar (gage pressure). The data were obtained by three different thermodynamic histories: (a) variable formation pressure, (b) constant formation pressure at one atmosphere, and (c) constant formation pressure at 800 bar. In all of these the glass was formed by isobaric cooling at 5 °C/h. The salient characteristics resulting from the different histories are the following. History (a) produces a glass of structure varying with formation pressure and, hence, does not necessarily give the proper thermodynamic properties of a "single physical substance." However, the liquid-glass intersection temperature, $T_g(P)$, is an important kinetic, or relaxational, property which approximates an isoviscous state. Accordingly, the values of dT_g/dP are in close agreement with those obtained from dynamic mechanical and dielectric time-temperature-pressure superposition. Constant formation histories (b) and (c) give proper thermodynamic properties of the glasses, but very little information with respect to kinetics. Increasing the pressure at which the glass is formed increases the density of the glass (at the given cooling rate) considerably in contrast to the entropy (from other work), which appears to be essentially independent of formation pressure.

A considerable part of the paper is definitional. The results are related to other *PVT*, dynamic mechanical, dielectric, and thermodynamic measurements. Interpretations are given in terms of both phenomenological and molecular models.

Correction and extension of van der Poel's method for calculating the shear modulus of a particulate composite, J. C. Smith, *J. Res. Nat. Bur. Stand. (U.S.),* **78A** (Phys. and Chem.), No. 3, 355-361 (May-June 1974).

Key words: bulk modulus; composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; shear modulus; theory of elasticity.

Van der Poel's method (Rheol. Acta **1**, 198 (1958) for calculating the shear modulus of a particulate composite agrees well with experimental data, but its validity has been questioned, and it was applicable only to composites in which the matrix material is incompressible. These limitations are removed in this paper in which an error in the original derivation is corrected and the method generalized to apply to any matrix material. Calculations

using the corrected theory show that despite the error, a table of shear modulus values published with the original theory is sufficiently correct for most practical purposes. Applicability of the generalized method to the large class of composites having compressible matrices is discussed. Shear moduli calculated by the corrected and extended method are compared with corresponding values calculated by other methods currently used.

The formation of curved polymer crystals: Polychlorotrifluoroethylene, J. D. Barnes and F. Khoury, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 363-373 (May-June 1974).

Key words: crystal morphology; crystallization; electron microscopy; optical microscopy; polychlorotrifluoroethylene; solution crystallization.

The habits and fine structure of crystals of polychlorotrifluoroethylene (PCTFE) grown from dilute solution were studied as functions of crystallization temperature. The solvent used was a low molecular weight PCTFE oil. The simplest crystals found were monolayered chain folded lamellae formed at 110 °C. These lamellae are planar and possess an unusual texture characterized by the presence of fine channel-like voids in the interior of the crystals. These lamellae do not exhibit well-formed crystal faces but are disc-like in overall shape. At lower crystallization temperatures the crystals take the form of complex arrays of curved lamellae which are aggregated into, among others, watchglass-shaped or hollow spherical objects. The variation of the curvature of the crystals with crystallization temperature is discussed in the light of previous studies of the formation of curved crystals of poly(4-methylpenetene-1) and polyoxymethylene.

Enthalpy of formation of phosphorus pentachloride; derivation of the enthalpy of formation of aqueous orthophosphoric acid, R. H. Schumm, E. J. Prosen, and D. D. Wagman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 375-386 (May-June 1974).

Key words: enthalpy of formation; phosphoric acid; phosphorus pentachloride.

When chlorine (real gas, 980 mmHg) combines with white (α) phosphorus to form phosphorus pentachloride at 24.89 °C, 3986 $\pm$ 2.7 J of heat are liberated per gram of stoichiometrically equivalent $Mg_2P_2O_7$. This value was determined by a dead-ended flow system in an electrically calibrated isoperibol calorimeter. Correction was made for the formation of up to one mol percent PCl_3 in the products; no other impurities were found. From this value, the standard (25 °C, ideal gas) enthalpy of formation of PCl_5(c) is calculated to be $-$ 443.85 $\pm$ 0.30 kJ/mol, $-$ 106.08 $\pm$ 0.07 kcal/mol. When this figure is combined with a recent determination of the enthalpy of hydrolysis of PCl_5(c), the standard enthalpy of formation of H_3PO_4 (aq, 100 H_2O) is calculated to be $-$ 1296.5 $\pm$ 1.5 kJ/mol, in good agreement with two other values which involve the formation and hydrolysis of P_4O_{10} (hex). A "best value" is suggested: $\Delta Hf°$ (H_3PO_4, 100 H_2O) = $-$ 1295.8 $\pm$ 1.3 kJ/mol, $-$ 309.7 $\pm$ 0.3 kcal/mol.

Heat capacities of polyethylene from 2 to 360 K. II. Two high density linear polyethylene samples and thermodynamic properties of crystalline linear polyethylene, S. S. Chang, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 387-400 (May-June 1974).

Key words: amorphous polyethylene; calorimetry; crystalline polyethylene; extended chain crystals; glass transition temperature; heat capacity; linear polyethylene; polyethylene; thermodynamic properties.

Heat capacities of two high density linear polyethylene samples were measured from 2 to 360 K. By incorporating the results from the previous work of this series, thermodynamic properties of completely crystalline linear polyethylene may be estimated. C_p, $H - H_0$, S and $-(G - H_0)$ at 298.15 K for crystalline linear polyethylene are estimated to be 22.60 J K^{-1} mol^{-1}, 3544 J mol^{-1}, 23.02 J K^{-1} mol^{-1} and 3319 J mol^{-1}, respectively. Spontaneous adiabatic temperature drifts were observed in both samples near 240 K. These drifts may be attributed to the enthalpy relaxation phenomena occurring in the glass transformation region.

The specific heats, C_σ, and C_V, of compressed and liquefied methane, B. A. Younglove, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 401-410 (May-June 1974).

Key words: constant volume; heat capacity; liquid; saturated liquid; specific heat; methane.

The specific heats, C_σ, of saturated liquid methane have been measured at 66 temperatures in the temperature range 95-187 K. The specific heats at constant volume, C_V have been measured at 20 densities ranging from 0.8 to 2.8 times the critical density, at temperatures between 91 and 300 K, and at pressures to 330 bar (at 280 *PVT* states in all). The uncertainty of most of the measurements is estimated to be less than 0.5 percent, except near the critical point. These measurements were performed primarily to provide input data for accurate thermodynamic properties data calculations for liquid methane. They are believed to be the most comprehensive specific heat measurements available for pure compressed gaseous and liquid methane.

An improved procedure for synthesis of DL-4-hydroxy-3-methoxymandelic acid (DL-"vanillyl"-mandelic acid, VMA), A. J. Fatiadi and R. Schaffer, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 411-412 (May-June 1974).

Key words: alkaline condensation; glyoxylic acid; guaiacol; synthesis; vanillyl-mandelic acid; VMA.

An improved procedure for synthesis of DL-4-hydroxy-3-methoxymandelic acid (DL-vanillyl-mandelic acid, VMA) entails slow addition of an ice-cold, aqueous solution of glyoxylic acid to an ice-cold alkaline solution of guaiacol, with efficient mechanical stirring. This one-step condensation procedure provides VMA in 68-75 percent yield.

Single particle motions in liquids: Qualitative features of memory functions, R. D. Mountain, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 413-420 (May-June 1974).

Key words: depolarized Rayleigh scattering; ideal gas; incoherent neutron scattering; infrared absorption; liquid state; memory function; projection operator; Raman scattering; time correlation function.

Memory functions, which enter into the equations of motion for time correlation functions, are constructed from neutron scattering, infrared absorption and light scattering data involving single particle motions in liquids. The qualitative features of these memory functions are related to the shape of the corresponding time correlation functions. It is found that a negative portion to the memory function is indicative of a rapid loss of correlation in time while strong temporal correlations imply a memory function which does not go negative. The mathematical structure of a memory function is examined for the case of the ideal gas by expanding and evaluating the projection operator representation of the function. The resulting expression has a rich mathematical structure and can be expressed in a closed form only for its Laplace transform.

The infrared spectra of matrix isolated uranium oxide species, S. Abramowitz and N. Acquista, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 3, 421-424 (May-June 1974).

Key words: infrared spectra; mass spectrophotometry; matrix isolated; oxides of uranium.

The infrared spectra of matrix isolated products of the interaction of uranium and oxygen have been investigated at high temperatures. By use of collateral available data on the various uranium oxide species, plus employment of oxygen 16 and 18 isotopes, peak assignments were verified for many of the neutral metal oxide species.

July-August 1974

The glass transition temperature of monodispersed polystyrenes and their binary mixtures, L. A. Wall, Roestamsjah, and M. H. Aldridge, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 447-451 (July-Aug. 1974).

Key words: binary mixtures; glass transition temperature; monodispersed polystyrene.

Glass transition measurements on monodispersed polystyrenes of different molecular weight and their binary mixtures result in the following conclusions: (a) the effect of molecular weight on the glass transitions of monodispersed samples satisfies the Fox and Flory equation written as $T_g = T_{g\infty} - A/M_n$, with constant $A = 0.84 \times 10^{-5}$; (b) polymers of the same number average molecular weight with a broad distribution show lower glass transitions than the monodisperse; (c) the binary mixtures follow the Gordon-Taylor equation derived for copolymers, with constant k (experimental) 0.5.

A method of measuring the solubilities of hydrocarbons in aqueous solutions, R. L. Brown and S. P. Wasik, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 453-460 (July-Aug. 1974).

Key words: aqueous solutions; benzene solubility; hydrocarbons; partition coefficients; seawater.

An apparatus is described which measures the equilibrium distribution of a hydrocarbon between a gas phase and a liquid water phase. The method involves a multiple equilibration procedure which requires the analysis of only the gas phase. Gas-liquid chromatography was used for the hydrocarbon analysis because of its high sensitivity and selectivity. Supplemented by vapor pressure data, the observed distribution can be used to calculate the solubility of the hydrocarbon in the liquid phase. This was done for benzene, toluene, and ethylbenzene in distilled water over the temperature range 5 to 20 °C and in an artificial seawater over the temperature range 0 to 20 °C. The various factors affecting the accuracy of the results are discussed in detail.

Theoretical and experimental Compton scattering cross sections at 1.12 MeV in the case of strongly bound K-shell electrons, P. N. Baba Prasad and P. P. Kane, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 461-463 (July-Aug. 1974).

Key words: Compton scattering; differential cross section; electron binding; gamma rays; K-shell; photons.

Measurements are reported for the differential cross sections for Compton scattering of 1.12 MeV gamma rays by the K-shell electrons of tin, tantalum, gold, and thorium. A few discrepancies between approximate theoretical calculations and the experimental results for different energies are pointed out. The need for an exact relativistic calculation is indicated.

Standardization of ^{60}Co and ^{137}Cs gamma-ray beams in terms of exposure, T. P. Loftus and J. T. Weaver, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 465-476 (July-Aug. 1974).

Key words: cavity ionization chamber; exposure; gamma rays; ^{60}Co; ^{137}Cs; standards.

At the National Bureau of Standards (NBS), the exposure-rate standards for ^{60}Co and ^{137}Cs gamma rays were based for a number of years on a weighted average of measurements using a cylindrical ionization chamber and a group of small spherical chambers. Complex setup conditions for the cylindrical chamber, differences between the cylindrical and spherical chamber data, and recognition that the institution of this weighted average exposure-rate standard increased the difference between free-air-chamber and cavity-chamber measurements, led to the development of new spherical chambers. All correction factors for exposure-rate measurements were investigated and updated. Excellent agreement was achieved between independent exposure-rate measurements for six spherical chambers and, as of May 1, 1972, the exposure standards were reduced 0.7 percent for ^{60}Co and 0.6 percent for ^{137}Cs gamma rays. Recalculation of correction factors since that time indicates that the standard ^{137}Cs should be further reduced by 0.2 percent, and this adjustment was made on July 1, 1974.

The uncertainties associated with each of the quantities entering into the determination of exposure rate were tabulated and the overall uncertainty of the exposure rates used for instrument calibrations at NBS was found to be about 0.7 percent for addition in quadrature.

Investigation of freezing temperatures of National Bureau of Standards aluminum standards, G. T. Furukawa, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 477-495 (July-Aug. 1974).

Key words: A-C bridge; aluminum; aluminum point; fixed point; freezing point; IPTS-68; platinum resistance thermometer.

The design of a high-precision furnace for investigating the freezing points of metals up to 700 °C or higher is described. The freezing points of aluminum samples of nominally 99.999 percent purity from two batches were compared in terms of the ratio $R(\mathrm{Al})/R\mathrm{TP})$, the ratio of the resistance of the platinum resistance thermometer at the aluminum freezing point to that at the triple point of water. The average standard deviation of measurements of the ratio $R(\mathrm{Al})/R\mathrm{TP})$ obtained on six specimens corresponds to ± 0.40 mK, while the average standard deviations of $R(\mathrm{Al})$ and $R(\mathrm{TP})$ correspond to ± 0.17 mK and ± 0.14 mK, respectively. (The variations in the measurements of $R(\mathrm{TP})$ are amplified by 3.4 in the ratio $R(\mathrm{Al})/R(\mathrm{TP})$.) The spread of the mean $R(\mathrm{Al})/R(\mathrm{TP})$ obtained for five out of the six specimens corresponds to 0.51 mK; the deviation of the mean $R(\mathrm{Al})/R(\mathrm{TP})$ of the sixth specimen from the mean $R(\mathrm{Al})/R(\mathrm{TP})$ of the five specimens corresponds to -1.31 mK. (The sixth specimen may have been contaminated during the assembly of the freezing-point cell or the original sample bar was inhomogeneous.) The results show that aluminum can provide a freezing point (near 660 °C) that is at least as reproducible as the freezing point of antimony (near 631 °C).

Prediction of the viscosities of "soda-lime" silica glasses, K. C. Lyon, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 497-504 (July-Aug. 1974).

Key words: composition; Fulcher equation; glasses; soda-lime glasses; viscosity.

Published data are used to develop factors for predicting the viscosity-temperature relationship from the compositions of "soda-lime" type silicate glasses at specific temperatures in the range of 600 to 1300 °C. The effects of Na_2O, K_2O, CaO, MgO, Al_2O_3 and their interactions are evaluated. The influence of minor amounts of BaO, B_2O_3, Li_2O, and F_2, in the temperature range of 700 to 1300 °C, is estimated.

The system NaCl-$AlCl_3$, E. M. Levin, J. F. Kinney, R. D. Wells, and J. T. Benedict, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 505-507 (July-Aug. 1974).

Key words: immiscibility; $NaAlCl_4$; phase equilibrium; system $AlCl_3$-NaCl; system NaCl-$AlCl_3$.

The system NaCl-$AlCl_3$ has been restudied by DTA, visual observation, and x-ray diffraction powder techniques for identification of crystalline phases. It was confirmed that the system contains one intermediate compound $NaAlCl_4$ with an incongruent mp of 153 ± 0.5 °C and a region of liquid immiscibility extending from 80.25 to 99.6 mol percent $AlCl_3$ at 191.3 °C, the monotectic temperature.

Simultaneous measurements of heat capacity, electrical resistivity and hemispherical total emittance by a pulse heating technique: zirconium, 1500 to 2100 K, A. Cezairliyan and F. Righini, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 509-514 (July-Aug. 1974).

Key words: electrical resistivity; emittance; heat capacity; high-speed measurements; high temperature; thermodynamics; thermophysical properties; zirconium.

Simultaneous measurements of heat capacity, electrical resistivity and hemispherical total emittance of zirconium in the temperature range 1500 to 2100 K by a subsecond duration, pulse heating technique are described. The results are expressed by the relations:

$$C_p = 36.65 - 1.435 \times 10^{-2} T + 6.624 \times 10^{-6} T^2$$

$$\rho = 87.95 + 1.946 \times 10^{-2} T$$

$$\epsilon = 0.2031 + 6.362 \times 10^{-5} T$$

where C_p is in $J \cdot mol^{-1} \cdot K^{-1}$, ρ is in 1^{-8} $\Omega \cdot m$, and T is in K. Estimated inaccuracies of the measured properties are: 3 percent for heat capacity, 2 percent for electrical resistivity and 5 percent for hemispherical total emittance.

Measured enthalpy and derived thermodynamic properties of crystalline and liquid potassium chloride, KCl, from 273 to 1174 K, T. B. Douglas and A. W. Harman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 4, 515-529 (July-Aug. 1974).

Key words: heat of fusion; high-temperature drop calorimetry; lattice vacancies; muriate of potash; potassium chloride; sylvite; thermodynamic properties.

The enthalpy of KCl relative to that at 273.15 K was precisely measured by drop calorimetry from 273 to 1174 K, and smooth thermodynamic functions were derived for this temperature range. The heat capacities found for the crystalline phase join smoothly the most precise published data for lower temperatures; those for the liquid phase are temperature-independent within the precision of measurement over the 120° range covered. It is concluded that the broad exponential upturn of the heat-capacity curve below the melting point, if attributed to lattice vacancies, indicates a predominance of large vacancy clusters.

September-October 1974

Spectrum of doubly ionized praseodymium from 2107 Å to 10716 Å, J. Sugar, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 555-593 (Sept.-Oct. 1974).

Key words: line classifications; praseodymium; Pr III; spectrum.

Wavelengths, relative intensity estimates, and classifications of the spectral lines of doubly ionized praseodymium (Pr III) in the range of 2107 to 10716 Å are given. About 4400 lines are included of which some 2500 are classified.

A heat-loss-compensated calorimeter: Theory, design, and performance, S. R. Domen and P. J. Lamperti, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 595-610 (Sept.-Oct. 1974).

Key words: absorbed dose; calorimeter; heat-loss-compensation; thermal gradients.

A new type of 3-body calorimeter for measuring absorbed dose produced by ionizing radiation is described in detail. All three bodies rise in temperature during irradiation, and the heat absorbed by the central core is measured by standard means. Only the central core is heated during electrical calibration, but the increased heat losses are compensated by measuring most of the heat lost to the surrounding jacket and automatically adding it to the heat retained by the core. The third body is a massive, thermally-floating shield, whose presence reduces the heat losses during irradiation, with a consequent increase in sensitivity and stability. A mathematical description of the calorimeter behavior is presented, along with a discussion of control and operation technique. In particular it is shown how this 3-body calorimeter can be calibrated as a 1-body calorimeter, with large heat losses, or as a 2-body calorimeter, in the quasi-adiabatic mode. This calorimeter design decreases the effects of thermal gradients and at the same time provides the means to test for these effects. The results of these tests show that for this particular model, systematic errors caused by thermal gradients, during electrical measurements, are no larger than 0.1 percent. Errors in comparing an electrical run with an irradiation may be somewhat larger because of different temperature gradient within the system. It is also pointed out that the general design of this calorimeter is not restricted to measuring absorbed dose but can be applied to calorimetry in general.

The enthalpies of combustion and formation of linear polyethylene, P. L. Splitstone and W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 611-616 (Sept.-Oct. 1974).

Key words: enthalpy; heat of combustion; heat of crystallization; heat of formation; polymer; standard reference polymer.

The enthalpies of combustion and formation of two samples of linear polyethylene which differ only in the degree of crystallinity have been determined in an oxygen bomb calorimeter. For the two samples the degree of crystallinity, the enthalpy of combustion at 298.15 K, and the enthalpy of formation at 298.15 K, were respectively: 72 percent, -651.16 ± 0.12 $kJ \cdot mol^{-1}$, -28.18 ± 0.13 $kJ \cdot mol^{-1}$ for the less crystalline sample; and 96 percent, -650.27 ± 0.12 $kJ \cdot mol^{-1}$ and -29.08 ± 0.12 $kJ \cdot mol^{-1}$ for the more crystalline sample. The values are per mole of CH_2. Uncertainties listed are estimates of accuracy of approximate 95 percent confidence limits. The results of previous determinations by other investigators are discussed briefly.

High pressure measurements of density, velocity of sound, and bulk moduli of pentane and 2-methylbutane and their mixtures, J. C. Houck, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 617-622 (Sept.-Oct. 1974).

Key words: bulk modulus; compressibility; density; dilatometric measurements; high pressure; liquids; 2-methylbutane; pentane; ultrasonics.

Dilatometric and ultrasonic measurements were made on mixtures of pentane and 2-methylbutane to give density, relative volume, isothermal bulk modulus, velocity of sound, and adiabatic bulk modulus to pressure of 24 kilobars (2.4×10^9 N/m^2).

Long-time creep in a pure-gum rubber vulcanizate: Influence of humidity and atmospheric oxygen, L. A. Wood, G. W. Bullman, and F. L. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 623-629 (Sept.-Oct. 1974).

Key words: compliance of rubber; creep, long-time, in rubber; humidity, effect of, on creep of rubber; modulus of rubber, effect of humidity; oxygen, influence of, on creep of rubber; rubber, natural, creep; time, effect of, on compliance of rubber.

Long-time creep of natural rubber cured with a sulfur-accelerator recipe containing no filler can be conveniently represented by a plot of $(E - E_1)/E_1 = \Delta E/E_1$ with a double-abscissa scale showing log t and t. E is the elongation at any time t, after application of the load, and E_1 its value at unit time. Experimental data conform to the equation

$$\Delta E/E_1 = A \log t + B(t - 1)$$

except for a more rapid rise preceding rupture. The constants A and B can be evaluated from only three observations—at the longest time (about 70 days), at one minute, and at an intermediate time. $\Delta E/E_1$ is approximately linear with log t when t is less than $0.1(A/B)$ and approximately linear with t when t is greater than $4.343(A/B)$. The observed modulus was about 1.4 MPa and A was about 2.4 percent/(unit log t) when the atmosphere was a vacuum, dry N_2, or dry air. The modulus was lowered very slightly and A became about 4 percent/(unit log t) when the air was saturated with water. B was raised from about 2×10^{-5} percent/min to about 20×10^{-5} percent/min when the vacuum or dry N_2 was replaced by dry air and to about 50×10^{-5} percent/min when the air was saturated with moisture. A is considered to be related to physical relaxation, while B corresponds to a chemical reaction, probably oxidative degradation.

Adaptation of a high-accuracy spectrophotometer for ultraviolet work, K. D. Mielenz, R. Mavrodineanu, and E. D. Cehelnik, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 5, 631-636 (Sept.-Oct. 1974).

Key words: averaging sphere; deuterium arc lamp; fluorescent wavelength converter; grating; spectrophotometry; standard reference materials; ultraviolet; UV achromats; visible.

A high-accuracy spectrophotometer, originally designed for work at visible wavelengths, was modified to permit measurements in the ultraviolet without degradation of its original performance. This was accomplished by equipping the spectrophotometer with a stable deuterium arc source, a highly efficient averaging sphere with fluorescent wavelength converter, a new grating, and achromatic sample-compartment optics. The modified spectrophotometer will be used for the development of new Standard Reference Materials, as well as for materials research, in the region between 200 and 300 nm.

November-December 1974

Solubility of β-$Ca_3(PO_4)_2$ in the system $Ca(OH)_2$-H_3PO_4-H_2O at 5, 15, 25, and 37 °C, T. M. Gregory, E. C. Moreno, J. M. Patel, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 6, 667-674 (Nov.-Dec. 1974).

Key words: beta-tricalcium phosphate, preparation; solubility, solubility product, stoichiometry of; dissolution, thermodynamics of; ion pairs; singular points; solubility isotherms; thermal coefficient of solubility.

Solubility isotherms of beta-tricalcium phosphate, β-$Ca_3(PO_4)_2$, prepared by heating mixtures of $CaCO_3$ and $CaHPO_4$ above 800 °C, were determined in the ternary system $Ca(OH)_2$-H_3PO_4-H_2O at 5, 15, 25, and 37 °C in the pH range 6.0-7.5 by equilibration with dilute H_3PO_4 solutions. The results indicate that β-$Ca_3(PO_4)_2$ has a negative thermal coefficient of solubility. The solubility product, K_s, was determined as a function of temperature by a generalized least-squares procedure; the resulting equation is

$$\log K_S = -45723.26/T + 287.4536 - 0.546763T;$$

the values of K_S and its dispersion at 25 and 37 °C are 1.20(0.056), and $0.283(0.011) \times 10^{-29}$. Thermodynamic functions for the dissolution of the salt at the four experimental temperatures are reported.

When treated as an adjustable constant, the Ca/P ratio in these β-$Ca_3(PO_4)_2$ solutions was found to have the value 1.514(0.010), confirming that the stoichiometry of the high temperature form of this salt is correctly indicated by the above formula.

Solubility of $CaHPO_4 \cdot 2H_2O$ in the quaternary system $Ca(OH)_2$ – H_3PO_4 – NaCl – H_2O at 25 °C, P. R. Patel, T. M. Gregory, and W. E. Brown, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 6, 675-681 (Nov.-Dec. 1974).

Key words: brushite; $CaHPO_4 \cdot 2H_2O$; $NaHPO_4^-$ ion pair; solubility product; system $Ca(OH)_2$ – H_3PO_4 – H_2O – NaCl.

Solubility of $CaHPO_4 \cdot 2H_2O$ was determined in the quaternary system $Ca(OH)_2$ – H_3PO_4 – NaCl – H_2O at 25 °C in the pH range 4.39-6.38; ionic strengths of the saturated solutions varied from 0.00485 to 0.545. Satisfactory constancy in the solubility product, $(K_{sp} = [Ca^{2+}] \cdot [HPO_4^{2-}] \cdot \gamma_{Ca^{2+}} \cdot \gamma_{HPO_4^{2-}} = 2.49 \pm 0.05 \times 10^{-7}$ mol^2 l^{-2}) was obtained when (i) the ion activity coefficients, γ_i, were calculated with the Debye-Hückel equation, $\log \gamma_i = -AZ_i^2 \sqrt{I}/(1 + B\alpha_i \sqrt{I}) + 0.0626I$ + the value 0.0626 for the coefficient in the linear term was derived from the solubility data by utilizing a statistical procedure, and (ii) formation of an ion pair $NaHPO_4^-$ was taken into account; a statistically derived value for the stability constant of this ion pair is 7.0 ± 2.41 — mol^{-1}. The ion pair $NaHPO_4^-$ appears to have significant concentrations in physiological fluids.

The enthalpies of combustion and formation of the monochlorobenzoic acids, W. H. Johnson and E. J. Prosen, *J. Res. Nat. Bur. Stand. (U.S.)*, **78A** (Phys. and Chem.), No. 6, 683-689 (Nov.-Dec. 1974).

Key words: combustion; enthalpy; formation; heat; isomerization; secondary standard.

The enthalpies of combustion of *o*-, *m*-, and *p*-chlorobenzoic acid have been determined in an adiabatic rotating-bomb calorimeter. The enthalpies of formation have been obtained by combination of the experimental data with the accepted values for the enthalpies of formation of water and for the formation and solution of hydrochloric acid. The results of other investigators are discussed briefly. The resulting values and their estimated 95 percent confidence limits are as follows:

	$\Delta Hc°$ (25 °C) kJ/mol	$\Delta Hf°$ (25 °C) kJ/mol
o-Chlorobenzoic Acid	−3087.67 ± 0.69	−404.83 ± 0.74
m-Chlorobenzoic Acid	−3067.91 ± 1.53	−424.59 ± 1.55
p-Chlorobenzoic Acid	−3064.34 ± 0.66	−428.16 ± 0.72

Where $\Delta Hc°$ corresponds to the process:

$$C_7H_5O_2Cl(c) + 7\ O_2(g) + 198\ H_2O(liq) \rightarrow 7\ CO_2(g) + [HCl + 200\ H_2O](liq).$$

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 79A, JANUARY-DECEMBER 1975

January-February 1975

Polarization effects on fluorescence measurements, E. D. Cehelnik, K. D. Mielenz, and R. A. Velapoldi, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 1, 1-15 (Jan.-Feb. 1975).

Key words: emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; fluorimetry; polarization; spectrofluorimetry; viewing angle.

Polarization effects on fluorescence measurements are a function of four independent variables. The first is F, the polarization ratio of the exciting light which reaches the sample. The second is r, the emission anisotropy of the sample, which is the polarization "response" of the sample to plane polarized exciting light. The third is G, the polarization ratio of the emission detection system, which is the ratio of the sensitivities of the detection system to vertically and horizontally polarized light. The fourth is α, the viewing angle, which is the angle between the direction of the propagation of the exciting light and the direction from which the emission is being detected.

The intensity and the degree of polarization of the fluorescence emission that the sample exhibits are functions of F, r, and α, while the actual readings obtained with a typical spectrofluorimeter are functions of all four variables, F, r, α, and G. A theoretical analysis is made taking all these factors into account, and proper mathematical models are developed for the different modes of operation in which a fluorimeter can be used. These are verified experimentally with data obtained for a sample which has a high degree of emission anisotropy (Nile Blue A Perchlorate in glycerol). A recently designed goniospectrofluorimeter was used. Calibration procedures are developed and recommendations are made for modes of operation and fluorescence standards.

The iron-neon hollow-cathode spectrum, H. M. Crosswhite, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 1, 17-69 (Jan.-Feb. 1975).

Key words: hollow cathode; iron; neon; wavelength standards.

Over 4000 wavelengths are listed between 1900 and 9000 Å for Fe I, Fe II, Ne I and Ne II lines measured in a hollow cathode discharge tube with iron electrodes and a neon gas filling. Photoelectric traces between 2400 and 5700 Å on a semiquantitative intensity scale are also included. For Fe I, energy values for 124 even and 240 odd levels have been computed. These have been used to calculate Ritz standards for most of the Fe I lines.

Equation of state for thermodynamic properties of fluids, R. D. Goodwin, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 1, 71-79 (Jan.-Feb. 1975).

Key words: coexistence boundary; critical point; ethane; equation of state; fluids; methane; orthobaric densities; specific heats; vapor pressures.

This equation of state was developed from PVT compressibility data on methane and ethane. The highly-constrained form originates on a given liquid-vapor coexistence boundary (described by equations for the vapor pressures and the orthobaric densities). It then requires only five least-squares coefficients, and ensures a qualitatively correct behavior of the $P(\rho, T)$ surface and of its derivatives, especially about the critical point. This nonanalytic equation yields a maximum in the specific heats $C_v(\rho, T)$ at the critical point.

Thermodynamic studies of the $\alpha \rightarrow \beta$ phase transformation in zirconium using a subsecond pulse heating technique, A. Cezairliyan and F. Righini, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 1, 81-84 (Jan.-Feb. 1975).

Key words: electrical resistivity; high-speed measurements; high temperature; solid-solid phase transformation; thermodynamics; zirconium.

Measurements of the temperature and energy of the $\alpha \rightarrow \beta$ phase transformation, and the electrical resistivity near and at the transformation point of zirconium using a subsecond duration pulse heating technique are described. The results yield 1147 K for the transformation temperature and 3980 J · mol^{-1} for the transformation energy. Electrical resistivity is found to decrease by 17 percent during the transformation. Estimated inaccuracies of the measured properties are: 10 K for the transformation temperature, 5 percent for the transformation energy, and 2 percent for the electrical resistivity.

March-April 1975

Thermal conductivity of gases. III. Some values of the thermal conductivities of argon, helium, and nitrogen from 0 °C to 75 °C at pressures of 1×10^5 to 2.5×10^7 pascals, L. A. Guildner, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 407-413 (Mar.-Apr. 1975).

Key words: excess thermal conductivity of N_2; thermal conductivity of Ar; thermal conductivity of He; thermal conductivity of N_2.

Accurate measurements of the thermal conductivities of Ar and He agree with the theoretical value of 2.5 $\phi \eta c_v$ (η = viscosity, c_v = specific heat capacity at constant volume, ϕ is a number slightly greater than 1 depending upon the intermolecular potential). Measurements of the thermal conductivities of N_2 at 9.6 and 75 °C as a function of pressure up to 2.53×10^7 Pa help to appraise the validity of other measurements of the thermal conductivities of dense gases. The excess conductivity of

[1] The various NBS publications series are grouped under subjeadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

nitrogen (the additional conductivity resulting from pressure) is shown to be a function of only the density of the nitrogen from 0 to 700 °C and pressures up to 1.3×10^8 Pa.

On the differential cross section for x-ray inelastic scattering, M. Kuriyama, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 415-417 (Mar.-Apr. 1975).

Key words: differential cross section; real metals; theory; x-ray inelastic scattering.

A formal formulation of the differential cross section for x-ray inelastic scattering is given for a real solid, in particular, in terms of the polarization propagator and the inverse dielectric function. The differential cross section is related to the causal functions of electron properties rather than those retarded functions.

Simplification of van der Poel's formula for the shear modulus of a particulate composite, J. C. Smith, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 419-423 (Mar.-Apr. 1975).

Key words: composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; shear modulus; theory of elasticity.

The coefficients in van der Poel's equation for calculating the shear modulus of a particulate composite have been greatly simplified, making the calculation much less unwieldy. Approximate solutions of van der Poel's equation are also derived, and it is shown that one of the low order approximations is Kerner's equation, or Hashin and Shtrikman's equation for the highest lower bound. The Kerner approximation is often too low in value when the volume fraction of filler exceeds 0.2, but it can be used to provide further simplification in van der Poel's equation, or it can be used as a first approximation in a Newton's method of solution.

The enthalpies of combustion and formation of nicotinic acid and creatinine, W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 425-430 (Mar.-Apr. 1975).

Key words: calorimetry; combustion; creatinine; enthalpy; formation; heat; nicotinic acid.

The enthalpies of combustion of nicotinic acid and creatinine have been determined in an adiabatic rotating-bomb calorimeter. The enthalpies of formation have been obtained by combination of the experimental data with the accepted values for the enthalpies of formation of carbon dioxide and water. The results of other investigations on creatinine are discussed briefly. The resulting values and their estimated uncertainties are as follows:

	Nicotinic acid	*Creatinine*
$\Delta Hc°$(25 °C)	−2730.67±0.57 kJ/mol	−2334.53±0.86 kJ/mol
$\Delta Hf°$(25 °C)	−344.97±0.62 kJ/mol	−239.93±0.88 kJ/mol

Simultaneous measurements of specific heat, electrical resistivity, and hemispherical total emittance by a pulse heating technique: Hafnium-3 (wt. %) zirconium, 1500 to 2400 K, A. Cezairliyan and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 431-436 (Mar.-Apr. 1975).

Key words: electrical resistivity; emittance; hafnium; high-speed measurements; high temperatures; specific heat; thermodynamics.

Simultaneous measurements of specific heat, electrical resistivity and hemispherical total emittance of hafnium containing 3.12 weight percent zirconium in the temperature range 1500 to 2400 K by a subsecond duration, pulse heating technique are described. The measurements indicate decreases in specific heat (by about 13%) and in electrical resistivity (by about 8%) as the result of the $\alpha \rightarrow \beta$ transformation. Estimated inaccuracies of the measured properties are: 3 percent for specific heat, 1 percent for electrical resistivity and 5 percent for hemispherical total emittance.

Heat capacities of polyethylene III. One linear and one branched sample from 5 to 350 K, S-S. Chang, E. F. Westrum, Jr., and H. G. Carlson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 2, 437-441 (Mar.-Apr. 1975).

Key words: adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; heat capacity; linear polyethylene; polyethylene; thermodynamic properties.

Heat capacities of two polyethylene samples, one linear with a density of 0.973 g cm^{-3} and one branched with a density of 0.91 g cm^{-3}, have been determined by adiabatic calorimetry from 5 to 360 K in a different experimental arrangement than employed for studies of other polyethylene samples in this series. The heat capacity behavior of these two samples confirms expectations for samples with corresponding densities.

May-June 1975

The enthalpies of combustion and formation of ortho- and parafluorobenzoic acid, W. H. Johnson and E. J. Prosen, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 3, 481-486 (May-June 1975).

Key words: combustion; enthalpy; formation; heat; isomerization; secondary standard.

The enthalpies of combustion and formation of one sample of ortho- and two samples of parafluorobenzoic acids have been determined by combustion in an oxygen-bomb calorimeter. The data obtained by other investigators are discussed briefly. The values obtained and their estimated uncertainties are as follows:

	o-Fluorobenzoic acid
$\Delta Hc°$ (25°C)	−3080.00±1.02 kJ/mol
$\Delta Hf°$ (25°C)	−568.52±1.10 kJ/mol
	p-Fluorobenzoic acid I
$\Delta Hc°$ (25°C)	−3062.97±0.70 kJ/mol
$\Delta Hf°$ (25°C)	−585.56±0.81 kJ/mol
	p-Fluorobenzoic acid II
$\Delta Hc°$ (25° C)	−3063.78±0.80 kJ/mol
$\Delta Hf°$ (25° C)	−584.74±0.90 kJ/mol

where $\Delta Hc°$ corresponds to the reaction:

$$C_7H_5O_2F(c) + 7\ O_2(g) + 48\ H_2O(liq) \rightarrow 7\ CO_2(g) + [HF + 50\ H_2O](liq).$$

The enthalpies of combustion and formation of acetanilide and urea, W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 3, 487-491 (May-June 1975).

Key words: combustion; enthalpy; formation; heat; secondary standard; thermochemical standard.

The enthalpies of combustion of acetanilide and urea have been determined in an oxygen-bomb calorimeter. The following values and their estimated uncertainties were obtained.

	Acetanilide	Urea
$\Delta Hc°$(25°C)	−4224.88±0.93kJ/mol	−631.78±0.16 kJ/mol
$\Delta Hf°$(25°C)	−209.40±1.00 kJ/mol	−333.39±0.17 kJ/mol

A comparison with previously reported data is given.

The enthalpies of combustion and formation of cholesterol [cholest-5-en-ol (3β)], W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 3, 493-496 (May-June 1975).

Key words: cholesterol; clinical standard; combustion, heat of; enthalpy; formation, heat of; reference material.

The enthalpy of combustion of cholesterol was measured in an adiabatic, rotating-bomb calorimeter capable of high precision with relatively small samples. The random error for the experimental measurements was 0.006 percent which may be compared with approximately 0.3 percent for prior investigations on this substance. The results obtained for the enthalpy of combustion and the derived enthalpy of formation together with the estimated overall uncertainties are:

$$\Delta Hc°(25\ °C) = -16524.0 \pm 3.9\ \text{kJ/mol}$$

$$\Delta Hf°(25\ °C) = -674.8 \pm 4.1\ \text{kJ/mol}$$

The results of prior investigations are discussed briefly.

The third spectrum of copper (Cu III), A. G. Shenstone, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 3, 497-521 (May-June 1975).

Key words: atomic energy levels; atomic spectrum; copper; doubly ionized copper; electron configuration; ionization potential; wavelengths.

An analysis of Cu III based on observations from 500 to 6900 Å is presented. The low structures $3d^9$ and $3d^84s$ are complete, including the rarely, if ever before, found $3d^8(^1S)4s\ ^2S$. The $3d^74s^2$ includes ^4F, ^2F, ^2G, and ^2H but the ^4P, ^2P, $a\ ^2D$, $b\ ^2D$ have eluded all attempts to find them. The ionization potential calculated from $4s$, $5s$, $6s\ ^4F_4 1/2$ is 296 980 cm^{-1} but by a comparison with Ni II which has a longer series an approximate value of 297 140 can be estimated. The $3d^84d$ group is complete, except for one level, as is $5d$ based on ^3F and ^1G, the other $5d$ groups being incomplete. $3d^8(^3F)4f$ is complete and 26 levels based on ^1D, ^3P, ^1G are known. $3d^8(^3F)5g$ is incomplete and a few levels based on ^1D and ^1G have been found. A discussion of the validity of the analysis of Cu IV by J. F. Schröder and Th. A. M. Van Kleef is given.

July-August 1975

Radiance temperature (at 653 nm) of iron at its melting point, A. Cezairliyan and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 4, 541-544 (July-Aug. 1975).

Key words: high-speed measurements; high temperature; iron; melting; normal spectral emittance; radiance temperature.

Radiance temperature (at 653 nm) of iron at its melting point was measured using a subsecond-duration pulse heating technique. Specimens in the form of strips with initially different surface roughnesses were used. The results do not indicate any dependence of radiance temperature (at the melting point) on initial surface or system operational conditions. The average radiance temperature (at 653 nm) at the melting point for 13 specimens is 1670 K on IPTS-68, with a standard deviation of 0.8 K and a maximum absolute deviation of 1.7 K. The total error in the radiance temperature is estimated to be not more than ± 6 K.

Precision measurements of the dimensional stability of four mirror materials, B. Justice, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 4, 545-550 (July-Aug. 1975).

Key words: dimensional stability; glass; glass-ceramic; interferometry.

There are several glasses and glass-ceramics available today which have low coefficients of thermal expansion—some near zero. For this reason they often serve as substrates for massive mirrors in orbit. In order for such a mirror to enjoy a lifetime of 5 years or more of diffraction-limited service, the substrate must be dimensionally stable and thereby preserve the original figure.

Early in 1967, it was decided that the National Bureau of Standards and Corning Glass Works would undertake a joint effort to measure the lengths of small samples of such materials over a period of years. These measurements were completed in 1971.

The average length changes in parts per million of the four materials selected are as follows:

Corning Code 9623 a glass ceramic − 0.30

Corning Code 7971 a titanium silicate − 0.37

Corning Code 7940 a vitreous silica − 0.47

Corning Code 9622 a glass-ceramic − 1.03.

A correlation for the second interaction virial coefficients and enhancement factors for moist air, R. W. Hyland, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 4, 551-560 (July-Aug. 1975).

Key words: enhancement factor; equation of state; interaction virial coefficients; moist air; saturated air; second virial coefficients; virial coefficients.

Experimental measurements of the enhancement factors for mixtures of water vapor and CO_2-free air have been made at − 20, − 10, and + 70 °C. The results, coupled with previous experimental enhancement data, have been used to calculate the second interaction virial coefficients, B_{aw}, for water vapor air mixtures from − 50 to + 90 °C. Within this temperature range, an error analysis shows that the uncertainties in B_{aw} are between 6 and 10 percent. The calculated B_{aw} values are used in deriving enhancement factors at 10 °C intervals for $-50 < t < 90$ °C, at varying pressure intervals from 0.25 to 100 bar. The associated uncertainties are shown as a function of pressure and temperature. The enhancement factors are extrapolated to − 80 °C.

The enthalpies of combustion and formation of thianthrene, W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 4, 561-564 (July-Aug. 1975).

Key words: combustion; enthalpy; formation; heat; secondary standard; sulfur compound; thianthrene.

The enthalpy of combustion of thianthrene (diphenylene disulfide) has been determined in an oxygen-bomb calorimeter. The enthalpy of formation has been derived using data from the available literature. The results obtained are as follows:

$$C_{12}H_8S_2(c) + 17\ O_2(g) + 228\ H_2O(liq) =$$

$$12\ CO_{2(g)} + 2[H_2SO_4 + 115\ H_2O]\ (liq).$$

$$\Delta H_c°(25\ °C) = -7253.27 \pm 1.40\ \text{kJ/mol}$$

$$(-1733.65 \pm 0.33\ \text{kcal/mol}).$$

$$\Delta Hf°(25\ °C) = 184.23 \pm 1.50\ \text{kJ/mol}\ (44.03 \pm 0.36\ \text{kcal/mol}).$$

A comparison is given of the results of this investigation with those of previous investigators.

Unbound water content from application of adsorption theory, W. V. Loebenstein, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 4, 565-576 (July-Aug. 1975).

Key words: adsorption; computer application; desorption;

dry weight determination; moisture content; surface area; water content; water vapor adsorption.

It is standard procedure to fit an applicable isotherm equation to water vapor adsorption data using the method of least squares in arriving at a value for the surface area accessible to the water molecule. The least squares technique has been extended in the present investigation to determine, in addition and simultaneously, a "best value" for the zero-humidity sample weight of the material. The application is equally valid for desorption insofar as the zero-humidity weight is concerned, although the derived value for "surface area" from desorption data will be over-estimated in the general case because of hysteresis. There is no limitation on the range of humidities since the method is not restricted to the BET equation (i.e., between 0.1 and 0.3 r.h.). In fact, good agreement with the zero-humidity points measured experimentally has been obtained even from drying curves in which the relative humidity has been confined to the region above 50 percent. An iterative method is employed in the calculations for which computer assistance is especially adaptable. Fortran IV programs are included in the appendix whose use requires no extensive computer experience. A fraction of a second in computer processing time is all that is required for each determination.

September-October 1975

Surface films on polyoxymethylene single crystals. J. E. Breedon and P. H. Geil, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 609-611 (Sept.-Oct. 1975).

Key words: adsorbed polymer; deformation; fold surface; gold decoration; polymer crystals; poly(oxymethylene); surface layer.

The deformation of single crystals of poly(oxymethylene) grown from 0.01 percent bromobenzene solution has been studied by deposition on a deformable substrate. Slight decoration of the crystal surfaces with gold prior to mechanical deformation of the composite reveals breaks in the gold which are displaced with respect to cracks in the underlying polymer crystals. These observations are interpreted to imply the existence of a very thin discrete film on the surface of the polymer crystals which can slip during deformation. Such a film might arise from polymer molecules adsorbed on the crystal surface.

On the origin of the amorphous component in polymer single crystals and the nature of the fold surface. J. D. Hoffman and G. T. Davis, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 613-617 (Sept.-Oct. 1975).

Key words: adsorbed layer; amorphous component; fold surface; polymer crystals; regular folds.

A model for the surface of folded-chain polymer single crystals is presented in which the "amorphous" phase is composed of polymer molecules physically adsorbed on surface sites of a fairly regularly folded surface. The evidence for the presence of an amorphous phase in polymer single crystals is reviewed briefly as well as the evidence for regular folding and adjacent reentry. The proposed model would allow simultaneous acceptance of the evidence for both an amorphous layer and a surface composed of regularly folded molecules; such evidence was heretofore contradictory. Experimental evidence for such a model is discussed and some predictions are made concerning the properties of such an adsorbed layer.

Some thermodynamic properties of bromobenzene from 0 to 1500 K. J. F. Masi and R. B. Scott, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 619-628 (Sept.-Oct. 1975).

Key words: bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; heat capacity; heat of fusion; heat of vaporization; thermodynamic properties, triple point.

Measurements were made of the heat capacity of crystalline and liquid bromobenzene from 11 to 300 K, of the triple point and heat of fusion at the triple point and of the heat of vaporization at one temperature. The adiabatic calorimeter used was precise over most of its range to ±0.1 percent; the purity of the sample was 99.998 mol percent. The triple point of pure bromobenzene is 242.401 K (−30.749 °C) ± 0.010°; the enthalpy and entropy of fusion are, respectively, 10702 ± 5 J mol^{-1} and 44.150 ± 0.022 J K^{-1} mol^{-1}. The heat and entropy of vaporization at 293.00 K are, respectively, 43 963 ± 60 J mol^{-1} and 150.0 ± 0.2 J K^{-1} mol^{-1}. Tables are given for the thermodynamic functions of the condensed phases from 0 to 300 K; the functions for the ideal gas from 100 to 1500 K, calculated from spectroscopic and molecular data using statistical mechanical methods, are also tabulated. The entropy of the ideal gas at 293.00 K and one atmosphere, from statistical mechanics, is 323.63 J K^{-1} mol^{-1}; the same quantity from the experimental measurements (third law) is 323.73 J K^{-1} mol^{-1}. No anomalies or additional transitions were observed.

Relativistic effects on line strengths for transitions in the hydrogenic isoelectronic sequence. S. M. Younger and A. W. Weiss, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 629-633 (Sept.-Oct. 1975).

Key words: Dirac theory; hydrogen; line strength; oscillator strength; relativistic corrections; spectroscopy.

Relativistic line strengths have been computed for a large number of transitions using Dirac wave functions for the one-electron, hydrogen-like ions. As expected, the results indicate that relativistic effects are quite small for low stages of ionization. However, in general, they also remain small throughout a large portion of the isoelectronic sequence, becoming typically of the order of 10 percent in the vicinity of $Z = 50$, after which they grow quite rapidly. This suggests that for multielectron ions a basically nonrelativistic theory might well be adequate for light atom isoelectronic ions through as much as 30 or 40 stages of ionization.

The enthalpies of combustion and formation of 2,2′-dichloroethyl sulfide. W. H. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 634-638 (Sept.-Oct. 1975).

Key words: combustion; dichloroethyl sulfide; enthalpy; formation; heat; mustard gas.

The enthalpies of combustion and formation of 2,2′-dichloroethyl sulfide (mustard gas) have been determined by combustion in an adiabatic rotating-bomb calorimeter. The bomb process has been corrected to:

$$C_4H_8Cl_2S(liq) + 7O_2(g) + 98\ H_2O(liq) \rightarrow$$

$$4\ CO_2(g) + [2\ HCl + H_2SO_4 + 100\ H_2O](liq)$$

for which the following values were obtained:

$$\Delta Hc°(25\ °C) = -3163.49 \pm 1.26\ kJ/mol\ and$$

$$\Delta Hf°(25\ °C) = -200.57 \pm 1.58\ kJ/mol.$$

Barothermal theory of two devices for measuring absorption coefficients. H. S. Bennett, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 5, 639-648 (Sept.-Oct. 1975).

Key words: absorption coefficients; barothermal behavior; Green's function; heat diffusion; weakly absorbing materials.

Two devices are proposed for measuring absorption coefficients in weakly absorbing materials. The first device measures cylindrical samples and the second device measures flat plate or disk samples. This paper reports on the derivations for the

steady-state and transient solutions to the heat diffusion equations which describe the barothermal behavior of the two proposed devices. In addition, Green's function techniques are used to describe the cyclic heating and cooling of the cylinders and plates.

November-December 1975

On the growth rate of spherulites and axialites from the melt in polyethylene fractions: regime I and regime II crystallization, J. D. Hoffman, L. J. Frolen, G. S. Ross, and J. I. Lauritzen, Jr., *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 671-699 (Nov.-Dec. 1975).

Key words: axialite; chain folds; crystallization rate; molecular weight; nucleation theory; polyethylene; regime I; regime II; spherulite.

The growth rate G of the crystalline bodies appearing in each of a set of 35 characterized polyethylene fractions ranging from 3600 to 807,000 in molecular weight has been measured as a function of the undercooling ΔT. In isothermal crystallization, only axialites were found from $M_w = 3600$ to 18,000. (For these runs, $\Delta T < 17.5$ °C.) From $M_w = 18{,}000$ to $M_w \cong 115{,}000$ coarse-grained nonbanded spherulites were found for $\Delta T > 17.5$ °C, and axialites for $\Delta T < 17.5$ °C; a rather sharp break occurred in the $\log_{10}G$ versus T data at $\Delta T \cong 17.5$ °C. Above $M_w \cong 115{,}000$, only nearly structureless "irregular" spherulites were found at all undercoolings corresponding to isothermal growth. Typical ringed spherulites were obtained only on quenching. Wide-angle x-ray data showed that the usual orthorhombic subcell predominated in all the morphologies encountered. Low-angle x-ray data showed that the specimens exhibited lamellar crystallization irrespective of the particular gross morphology involved. The growth rate data on each fraction were analyzed using $G = G_o \exp[-U^*/R(T - T_\infty)] \exp[-K_g/T(\Delta T)f]$ where $f \cong 1$ to obtain values of K_g and G_o. The value of Y in $K_g = Yb\sigma\sigma_e/(\Delta h_f)k$ was obtained for each morphology by applying the "Z" test of Lauritzen. $Y = 4$ for regime I crystallization (single surface nucleus leads to completion of substrate) and $Y = 2$ for regime II crystallization (numerous surface nuclei involved in substrate completion). It was found that the axialites obeyed regime I kinetics ($Y = 4$), the coarse-grained spherulites regime II kinetics ($Y = 2$), and the irregular spherulites "mixed" kinetics ($Y \sim 3$). The assumption that the substrate length L in Lauritzen's regime theory was ~ 5 μm led to the prediction of a rather sharp regime I → regime II transition (corresponding to a break in the $\log_{10}G$ versus T data) at $\Delta T \cong 17.5$ °C, in accord with experiment. The $\sigma\sigma_e$ value calculated from K_g and Y for $M_w \geq 20{,}000$ was approximately constant with molecular weight and independent of morphology; the limiting value of $\sigma\sigma_e$ from kinetic measurements was about 1285 erg^2/cm^4, corresponding to $\sigma_{e(\infty)} = 90.5$ erg/cm^2 and $\sigma = 14.2$ erg/cm^2. (This value of $\sigma_{e(\infty)}$ compares favorably with $\sigma_{e(eq)} = 93 \pm 8$ erg/cm^2 from melting point experiments.) The increase of $\sigma\sigma_e$ and σ_e that took place at low molecular weights on up to $\sim 20{,}000$ was treated using an expression given by Hoffman, *viz* $\sigma_e = \sigma_{e(\infty)}[(\nu + \beta_i)/(\nu + 1)]$ where ν = number of folds per molecule, $\beta_i = \sigma_{e(cilium)}/\sigma_{e(\infty)}$. Intermittent high and low values of σ_e were found experimentally in this region, showing that β_i varied intermittently with increasing molecular weight between 0.15 and ~ 0.7. Theoretical estimates of these upper and lower bounds for β_i are given. The variation of σ_e between its upper and lower bounds was tentatively explained in terms of the alternate appearance of short and long terminal cilia, few if any of the latter exceeding l_g^* in length, as the molecular weight increased. Estimates of the initial lamellar thickness l_g^* were made from σ_e, and compared with the appropriate low-angle x-ray spacings. A theoretical estimate of the ratio of the preexponential factors $G_{o(I)}$ and $G_{o(II)}$ for regimes I and II was compared with experiment with satisfactory results. The value of G_o is not strongly dependent upon the viscosity of the melt. The work of chain folding deduced from the growth rate data is close to 4.1 kcal/mol, which is in good agreement with other estimates.

Homogeneous nucleation in polyethylene; molecular weight dependence, G. S. Ross and L. J. Frolen, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 701-711 (Nov.-Dec. 1975).

Key words: chain folds; fractions; homogeneous nucleation; molecular weight; nucleation theory; polyethylene; surface free energies.

The droplet technique was used to obtain estimates of the isothermal rate of homogeneous crystal nucleation in highly supercooled melts of 8 characterized fractions of linear polyethylene (weight average molecular weights from 3,100 to 249,000). The data obtained from these experiments were analyzed in accord with current theories of homogeneous nucleation of chain folded crystals. Values for the quantity $\sigma^2\sigma_e$, where σ and σ_e are the lateral and end-surface free energies of the crystal, were estimated as a function of molecular weight.

Sample 3.2 K was found to be anomalous in its nucleation behavior. When we assume that this sample crystallizes in the extended chain form and calculate σ^3 instead of $\sigma^2\sigma_e$ the value for σ is found to be 10.57 ergs/cm^2 which is in reasonable agreement with the value 9.6 ergs/cm^2 found by other investigators for linear hydrocarbons. However, there remains the question as to whether sample 3.2 K ever underwent homogeneous nucleation.

For samples 9.70 K, 11.74 K and 23.0 K, $\sigma^2\sigma_e$ was found to increase rapidly due to a decrease in the number of cilia per chain fold as the molecular weight increases. For higher molecular weights the value for $\sigma^2\sigma_e$ levels off and the average value of $\sigma^2\sigma_e$ for samples 23.0 K to 249 K was found to be 19,000 ergs^3/cm^6.

The experimental value of the absolute nucleation frequency I_0, was found to differ from the theoretical value by approximately 1×10^{12}. If one assumes that the surface free energies are temperature dependent [i.e., $\sigma = \sigma_1(1 + \bar{x}\Delta T)$ and $\sigma_e = \sigma_{e1}(1 + \bar{y}\Delta T)$ where $\bar{x} = -0.0073$ and $\bar{y} = 0.014$] the average value of $\sigma^2\sigma_e$ changes only slightly (to 19,800 ergs^3/cm^6) due to the compensating effects in the signs of the temperature corrections and I_0 is close to the theoretical value, 1×10^{34} nuclei/cm^3/s.

Absolute isotopic abundance ratios and the atomic weight of a reference sample of potassium, E. L. Garner, T. J. Murphy, J. W. Gramlich, P. J. Paulsen, and I. L. Barnes, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 713-725 (Nov.-Dec. 1975).

Key words: absolute ratios; atomic weight; isotopic abundance; potassium; reference standard.

Solid sample, thermal ionization, mass spectrometry has been used to obtain absolute values for the isotopic abundance ratios of a reference sample of potassium. Standards of known isotopic composition, prepared by gravimetrically mixing nearly isotopically and chemically pure separated isotopes of ^{39}K and ^{41}K, were used for calibration. The absolute isotopic abundance ratios are $^{39}K/^{41}K = 13.8566 \pm 0.0063$ and $^{40}K/^{41}K = 0.0017343 \pm 0.0000061$ which yield atom percent compositions of $^{39}K = 93.2581 \pm 0.0029$, $^{40}K = 0.01167 \pm 0.00004$, and $^{41}K = 6.7302 \pm 0.0029$. The calculated atomic weight for potassium is 39.098304 ± 0.000058. The indicated uncertainties are overall limits of error which are the sum of the uncertainty components for ratio determinations and the components covering the effects of known sources of possible systematic error.

Absolute isotopic abundance ratios and the atomic weight of a reference sample of silicon, I. L. Barnes, L. J. Moore, L. A. Machlan, T. J. Murphy, and W. R. Shields, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 727-735 (Nov.-Dec. 1975).

Key words: absolute ratios; atomic weight; isotopic abundance; silicon.

Absolute values have been obtained for the isotopic abundance ratios of a reference sample of silicon using electron impact mass spectrometry. Samples of known isotopic composition prepared from nearly isotopically pure separated silicon isotopes were used to calibrate the mass spectrometers. The resulting absolute $^{28}Si/^{30}Si$ ratio $= 29.74320 \pm 0.00747$ and the $^{29}Si/^{30}Si$ ratio $= 1.50598 \pm 0.00086$ which yield atom percents of $^{28}Si = 92.22933 \pm 0.00155$, $^{29}Si = 4.66982 \pm 0.00124$ and $^{30}Si = 3.10085 \pm 0.00074$. The atomic weight calculated from this isotopic composition is 28.085526 ± 0.000056. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the means and allowances for the effects of known sources of possible systematic error. A study of natural $^{28}Si/^{30}Si$ ratio variations reported in the literature extends the estimated uncertainty in the atomic weight of natural silicon to $\pm$ 0.00039.

Absolute determination of electrochemical equivalent and the atomic weight of zinc I. Method, apparatus, and preliminary experiments, G. Marinenko and R. T. Foley, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 737-745 (Nov.-Dec. 1975).

Key words: atomic weight; coulometry; electrochemical equivalent; zinc atomic weight.

The use of a specially designed coulometer and a high accuracy coulometric circuit resulted in the accurate measurement of the electrochemical equivalent and atomic weight of zinc. The experimental conditions to make possible the final precise and accurate measurements were established. These include a study of mechanical losses from the anode during the electrolysis and the corrosion of zinc in various media used in the determination. The effects of both of these sources of error may be controlled. Mechanical losses are minimized when an amalgamated electrode is used; corrosion when an amalgamated electrode is used in an air free system. An electrolyte, 25 wt. percent NH_4Cl and 3 molal $ZnCl_2$, was used in these determinations. This report presents the account of research which was prerequisite for subsequent accurate determination of the electrochemical equivalent and the atomic weight of zinc.

Absolute determination of the electrochemical equivalent and the atomic weight of zinc. II. Final determination, G. Marinenko and R. T. Foley, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 747-759 (Nov.-Dec. 1975).

Key words: atomic weight; coulometry; electrochemical equivalent; zinc atomic weight.

A new, successful approach to the determination of atomic weights of suitable elements has been demonstrated in this research. An absolute constant-current coulometric method was employed for the determination of the electrochemical equivalent and the atomic weight of zinc. The effects of possible sources of systematic error were investigated and appropriate corrections applied. The newly determined values of the two constants are 0.3387958 mg C^{-1} and 65.3771 respectively. The uncertainty in the atomic weight of zinc was reduced by more than an order of magnitude. The publication of partial data resulted in the revision of the value of the atomic weight of zinc by the International Union of Pure and Applied Chemistry.

The use of synchrotron radiation as an absolute source of vuv radiation, D. L. Ederer, E. B. Saloman, S. C. Ebner, and R. P. Madden, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 761-774 (Nov.-Dec. 1975).

Key words: irradiances; radiometry; spectrometer calibration; standard source; synchrotron radiation; vacuum ultraviolet.

Synchrotron radiation has been used as a standard source to calibrate spectrographic instruments at the National Bureau of Standards (NBS). Conceptually it is straightforward to apply the calculable continuum distribution of synchrotron radiation to problems requiring a source of known irradiance if the electron energy, the radius of the electron orbit, and the beam current are known. In practice many factors affect the accuracy of such a calibration, such as temporal and spatial variations in electron beam, uncertainties in the orbital radius and maximum energy of the orbiting electron beam. These sources of error are discussed and the method of calibration on SURF-I is specified. A storage ring synchrotron radiation facility (SURF-II) is now operational at NBS. The calibration techniques developed for SURF-I are applied to SURF-II with anticipated improvements in calibration accuracy. For SURF-I the incident flux was determined with an accuracy of 15 percent while for SURF-II we anticipate accuracies of about 7 percent.

Corrections to paper entitled "Third Virial Coefficient for Air-Water Vapor Mixtures," R. W. Hyland and E. A. Mason, *J. Res. Nat. Bur. Stand. (U.S.)*, **79A** (Phys. and Chem.), No. 6, 775-776 (Nov.-Dec. 1975).

Key words: chemical association; Lennard-Jones potential parameters; third interaction virial coefficients; virial coefficients; water vapor-air mixtures.

This note points out errors in the values of the third virial coefficients for pure water vapor which appeared in a 1967 paper by Hyland and Mason. The errors arose while converting from the units of Goff and of Keyes to the desired units of $(l/mol)^2$. The consequences of the errors are outlined, and it is shown that there is no effect on the primary results of the paper, namely, in the preferred values of the third interaction virial coefficient for air-water vapor mixtures, C_{aww}.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION A. PHYSICS AND CHEMISTRY, VOLUME 80A, JANUARY-DECEMBER 1976

January-February 1976

Line strengths and lifetimes of levels in neutral uranium, C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 1-7 (Jan.-Feb. 1976).

Key words: lifetimes in U I; oscillator strengths for U I; transition probabilities for U I; uranium spectrum.

Relative intensities of 549 U I lines observed in a dc copper arc are used to derive transition probabilities and oscillator strengths. Upper limits to lifetimes for 65 levels in neutral uranium atoms are determined.

Optical properties of nuclear matter, J. S. O'Connell, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 9-13 (Jan.-Feb. 1976).

Key words: absorption cross section; index of refraction; nuclear matter; optical properties; photon; plasma frequency.

The index of refraction and absorptive properties are estimated in nuclear matter consisting of protons and neutrons and in nuclear matter charge neutralized by electrons.

A study of the polarization of fluorescence of ordered systems with application to ordered liquid crystals, E. D. Cehelnik, K. D. Mielenz, and R. B. Cundall, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 15-33 (Jan.-Feb. 1976).

Key words: fluorescence; linear dichroism; liquid crystals; polarization; spectrofluorimetry; 1,6-diphenyl-1,3,5-hexatriene.

The fluorescence polarization of uniaxial molecules dissolved in an ordered medium is studied. A theoretical model is developed which relates the polarization of the fluorescence emission to molecular structure, orientation of absorption and emission dipole oscillators and the degree of ordering. This theory was tested experimentally using all trans 1,6-diphenyl-1,3,5-hexatriene dissolved in an ordered liquid crystal.

PVT and vapor pressure measurements on ethane, G. C. Straty and R. Tsumura, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 35-39 (Jan.-Feb. 1976).

Key words: density; ethane; vapor pressure; *PVT*.

New measurements of the vapor pressures and *PVT* properties of ethane are reported. *PVT* determinations have been made from near the triple point to 320 K at pressures to 33 MPa. The density range investigated extends to more than three times the critical density. The new measurements of the vapor pressures of ethane extend from 160 K to near the critical point.

Functional equations for the enhancement factors for CO_2-free moist air, L. Greenspan, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 41-44 (Jan.-Feb. 1976).

Key words: enhancement factor; moist air; saturated air.

Equations are presented which explicitly express the enhancement of water vapor in CO_2-free air from 0.1 to 2 MPa. The equations are approximations to the formulation of Hyland and provide the means of obtaining enhancement with very modest computational facilities. The agreement with Hyland's enhancement values is well within his estimated uncertainty.

Experimental values for the elastic constants of a particulate-filled glassy polymer. J. C. Smith, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 45-49 (Jan.-Feb. 1976).

Key words: composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; Poisson's ratio; Young's modulus.

Young's modulus and Poisson's ratio have been measured simultaneously on a series of particulate composites containing volume fractions of filler up to 0.50. The composites consisted of small glass spheres imbedded in rigid epoxy polymer matrix. The measured values were compared with theoretical values calculated from current theories. A recently generalized and simplified version of van der Poel's theory provided the best agreement. It predicted values of Young's modulus for composites with filler volume fractions up to 0.35. Measured values of Poisson's ratio exhibited scattering, but were consistent with values calculated from van der Poel's theory.

Heat capacities of polyethylene IV. High molecular weight linear polyethylene, S. S. Chang, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 51-57 (Jan.-Feb. 1976).

Key words: glass transition; heat capacity; high molecular weight linear polyethylene; polyethylene; temperature drift; thermodynamic properties.

A high molecular weight linear polyethylene sample has been studied by adiabatic calorimetry from 10 to 380 K. Two broad temperature regions of unusual spontaneous temperature drift have been observed. The phenomena occurring around 240 K are similar to that observed in other polyethylene samples studied in this series, and are presumed to be caused by the relaxational processes in the amorphous phase. The weak exothermic behavior occurring around 160 K is presumed to be caused by the stabilization of the quenched sample.

Computer simulation of metastable fluid states in the Lennard-Jones system, H. J. Raveché and W. B. Streett, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 1, 59-64 (Jan.-Feb. 1976).

Key words: glassy state; Lennard-Jones system; Monte Carlo simulation; nucleation; overcompression; supercooling.

[1] The various NBS publications series are grouped under subheadings within this section. The several volumes of the Journal of Research are presented consecutively within their appropriate subheadings. If a particular publications series is sought, consult the table of contents or the edge index on the back cover.

Using the Monte Carlo method in statistical mechanics, we have simulated high density metastable states. We find that nucleation from a three dimensional fluid array to a crystalline solid is possible, but that periodic boundary conditions and the small size of the system inhibit the formation of perfect crystals. Evidence for the existence of an amorphous solid state has also been observed, and the pair correlation function of this state exhibits some of the features associated with random close-packed aarays of hard spheres. The possible relation between these simulations and the formation of glassy states in real systems is briefly discussed.

Relative enthalpy of solid beryllium aluminate (chrysoberyl), $BeO \cdot Al_2O_3$, from 1175 to 2025 K, and of liquid beryllium aluminate from 2170 to 2350 K, S. Ishihara and E. D. West, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 1, 65-73 (Jan.-Feb. 1976).

Key words: beryllium aluminate; chrysoberyl; drop calorimetry; enthalpy measurements; high temperature calorimetry; specific heat; thermodynamic properties.

The relative enthalpy of solid beryllium aluminate $BeO \cdot Al_2O_3$ from 1180 to 2025 K and liquid beryllium aluminate from 2170 to 2350 K was measured by "drop" calorimetry using an adiabatic "receiving type" calorimeter. The thermodynamic functions from 1175 to 2025 K and the enthalpy of melting at 2146 K are reported.

March-April 1976

Extinction coefficients of NO_2 and N_2O_4, A. M. Bass, A. E. Ledford, Jr., and A. H. Laufer, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 143-166 (Mar.-Apr. 1976).

Key words: absorption: extinction coefficients; N_2O_4; NO_2; spectra; temperature effects.

The extinction coefficient of NO_2 has been measured in the spectral range 185 to 410 nm as a function of temperature between 235 and 298 K. In order to correct for the effect of the dimer absorption, the extinction coefficient of N_2O_4 has also been measured. The effect of a decrease in temperature upon the NO_2 absorption is a reduction in the extinction coefficient of approximately 10 percent in the range 320 to 380 nm.

A study of the chemiluminescence of the $Pb + O_3$ reactions, M. J. Kurylo, W. Braun, S. Abramowitz, and M. Krauss, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 167-171 (Mar.-Apr. 1976).

Key words: chemiluminescence; electronic states; gas kinetics; laser enhanced reactions; O_3; PbO.

The chemiluminescent reaction of $Pb + O_3$ has been studied using both "cold" an dvibrationally excited O_3. Emission from new states *a* and *b* has been observed in addition to the A and B states. The reaction of vibrationally excited O_3 with Pb to yield PbO(A) appears to be faster than that using "cold" O_3.

Structure- and solvent-property relationships for the electronic energies of charge-transfer complexes between certain benzene derivatives, H. Argentar, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 173-187 (Mar.-Apr. 1976).

Key words: aromatic amine; benzene derivative; charge-transfer complex; dental materials; electron affinity; electron spin resonance spectroscopy; extrathermodynamic relationships; ionization potential; linear free-energy relationship; polarography; solvatochromic relationship; ultraviolet and visible spectroscopy.

A chemical model is proposed for describing charge-transfer complexes between aromatic amines and electron-accepting benzene derivatives containing a group having a double- or triple-bond conjugated with the benzene ring. According to this model, an electron migrates from the nitrogen atom of the amine to one of the atoms of the multiple-bonded group during charge-transfer interaction.

Structure-property relationships were derived for correlating: (1), the transition energies of the complexes; (2), the ionization, or oxidation, potentials of the amines, and (3), the electron affinities or reduction potentials of the electron acceptors, with the electron-donating abilities of the substituents of the various compounds. Transition energies calculated from reported spectroscopic data for these complexes were correlated using equations derived in this study. Similarly correlated were reported data for the above properties of the amine and electron acceptor.

Equations were derived for correlating the effect of variation in solvent on the transition energies of the complexes. Correlation of reported spectroscopic data indicated that the greatest effect is caused by variation in the refractive index; of secondary importance was the change in dielectric constant.

Bidirectional reflectometry. Part I. A high resolution laser bidirectional reflectometer with results on several optical coatings, J. J. Hsia and J. C. Richmond, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 189-205 (Mar.-Apr. 1976).

Key words: barium sulphate; bidirectional reflectance; bidirectional reflectometer; black coating; gonioreflectometer; magnesium oxide; mu sulphur; reflectance; reflectometer; sodium chloride.

A laser-source bidirectional reflectometer that is fully automated and has angular resolution on the order of one degree has been designed and built. The direction of incidence and viewing can be independently varied over an entire hemisphere except for directions more than 77.5° from the normal, and the two directions must be at least 2.5° apart. Bidirectional reflectances for 15 samples of black and white coatings are presented.

Bidirectional reflectometry. Part II. Bibliography on scattering by reflection from surfaces, J. C. Richmond and J. J. Hsia, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 207-220 (Mar.-Apr. 1976).

Key words: bibliography; emittance; heat transfer; measurement techniques; periodic surfaces; polarization; random surfaces; reflectance; reflectance of coherent radiation; scattering; scattering theory; surface roughness; transmittance.

In connection with the work on development of a high resolution laser source bidirectional reflectometer, a large number of papers were collected dealing with various aspects of the geometrical distribution of the radiant energy reflected from surfaces of different types.

Each paper has been classified into one or more classes on the basis of its technical content. There are eight general classes, with several subclasses in some of the general classes.

Because of the interest in this field, the bibliography is being published as a service to the public.

Energy levels, classified lines, and Zeeman effect of neutral thorium, R. Zalubas, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 2, 221-358 (Mar.-Apr. 1976).

Key words: energy levels; thorium; Th I; wavelengths; Zeeman-effect of Th I.

A list of about 9500 classified lines of Th I in the range 2345-29 662 Å is given. Lines in the range 2345-9239 A were observed and measured at NBS. Zeeman effect data for 2281 lines are listed. Lists of 254 even and 322 odd levels including their g values are presented. Among them there are 72 new levels, which were not contained in earlier publications.

May-June 1976

Fluorescence quantum yield measurements, J. B. Birks, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 3, 389-399 (May-June 1976).

Key words: fluorescence lifetime; fluorescence quantum efficiency; fluorescence quantum yields; fluorescence spectrum; fluorescence standards; molecular fluorescence parameters; observed (technical) fluorescence parameters; polarization; radiative and nonradiative transition probabilities; real fluorescence parameters.

Four *molecular fluorescence parameters* describe the behavior of a fluorescent molecule in very dilute ($\sim 10^{-6}$ M) solution: (i) the fluorescence spectrum $F_M(\bar{\nu})$; (ii) the fluorescence polarization P_M; (iii) the radiative transition probability k_{FM}; and (iv) the radiationless transition probability k_{IM}. These parameters and their temperature and solvent dependence are those of primary interest to the photophysicist and photochemist. $F_M(\bar{\nu})$ and P_M can be determined directly, but k_{FM} and k_{IM} can only be found indirectly from measurements of the secondary parameters, (v) the fluorescence lifetime τ_M, and (vi) the fluorescence quantum efficiency q_{FM}, where $k_{FM} = q_{FM}/\tau_M$ and $k_{IM} = (1 - q_{FM})\tau_M$.

The *real fluorescence parameters* $F(\bar{\nu})$, τ and ϕ_F of more concentrated ($c > 10^{-5}$ M) solutions usually differ from the molecular parameters $F_M(\bar{\nu})$, τ_M and q_{FM} due to concentration (self) quenching, so that $\tau > \tau_M$ and $\phi_F < q_{FM}$. The concentration quenching is due to excimer formation and dissociation (rates $k_{DM}c$ and k_{MD}, respectively) and it is often accompanied by the appearance of an excimer fluorescence spectrum $F_D(\nu)$ in addition to $F_M(\bar{\nu})$, so that $F(\bar{\nu})$ has two components. The *excimer fluorescence parameters* $F_D(\bar{\nu})$, P_D, k_{FD} and k_{ID}, together with k_{DM} and k_{MD}, and their solvent and temperature dependence, are also of primary scientific interest.

The *observed* (technical) *fluorescence parameters* $F^T(\bar{\nu})$, τ^T and $\phi_F{}^T$ in more concentrated solutions usually differ from the real parameters $F(\bar{\nu})$, τ and ϕ_F, due to the effects of self-absorption and secondary fluorescence. The technical parameters also depend on the optical geometry and the excitation wavelength. The problems of determining the real parameters from the observed, and the molecular parameters from the real, will be discussed.

Methods are available for the accurate determination of $F^T(\bar{\nu})$ and τ^T. The usual method of determining $\phi_F{}^T$ involves comparison with a reference solution R, although a few calorimetric and other absolute determinations have been made. For two solutions excited under identical conditions and observed at normal incidence

$$\phi_F{}^T/\phi_{FR}{}^T = n^2 \int F^T(\bar{\nu})d\bar{\nu}/n_R{}^2 \int F_R{}^T(\bar{\nu})d\bar{\nu}$$

where n is the solvent refractive index.

Two reference solution standards have been proposed, quinine sulphate in N H_2SO_4 which has no self-absorption, and 9,10-diphenylanthracene in cyclohexane which has no self-quenching. The relative merits of these solutions will be discussed, and possible candidates for an "ideal" fluorescence standard with no self-absorption and no self-quenching will be considered.

Some methods of luminescence efficiency measurements, A. Bril and A. W. de Jager-Veenis, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 3, 401-407 (May-June 1976).

Key words: cathode-ray excitation; luminescence; luminescence standards; phosphors; quantum efficiencies; radiant efficiencies; UV excitation; x-ray excitation.

Methods of absolute and relative radiant and quantum efficiency measurements are described for ultraviolet, visible, cathode-ray and x-ray excitations. Data on some standard luminescent materials are given.

On the actinometric measurement of absolute luminescence quantum yields, J. N. Demas and B. H. Blumenthal, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 3, 409-412 (May-June 1976).

Key words: absolute yield; chemical actinometry; correction factors; luminescence; quantum-flat actinometer; quantum yield.

The theory of the measurement of luminescent quantum yields using chemical actinometry is described. The sample's emission intensity is measured by nearly completely surrounding the sample with an actinometer solution, and the excitation intensity is directly measured with the same type of actinometer. The ratio of the measured sample emission intensity corrected for the fraction escaping through the excitation ports to the measured excitation intensity is the absolute luminescence yield. Equations, a suitable cell design, and computer calculated correction factors for different cell dimensions and optical densities are given. The absolute yield of the actinometer is not needed, only its relative response with wavelength. New quantum-flat actinometers which should greatly simplify the measurements are described.

The calorimetric detection of excited states, J. B. Callis, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 3, 413-419 (May-June 1976).

Key words: absolute quantum efficiency; absolute quantum yield; calorimetry; luminescence; photoacoustic spectrometer; piezocalorimeter; transducers; triplet formation.

Calorimetric techniques offer the photophysicist and photochemist the opportunity to measure a number of parameters of excited states which may be difficult to obtain by other techniques. The calorimetric strategy seeks to measure the heating of a sample resulting from radiationless decays or chemical reactions of excited states. Heating is best measured through volume and pressure transducers, and four calorimeters based on these are described. With calorimetric instrumentation one can perform measurements on samples in the gas, liquid and solid phases over a wide temperature range. Moreover time dependent processes with time constants ranging from microseconds to seconds are amenable to study. Examples of the application of calorimetric techniques to the determination of quantum yields of fluorescence, triplet formation and photochemistry are given.

Fluorescence efficiency of laser dyes, K. H. Drexhage, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 3, 421-428 (May-June 1976).

Key words: aminocoumarins; carbazine dyes; deuterium effect; fluorescence quantum yield; laser dyes; molecular structure; oxazine dyes; quenching; xanthene dyes.

The fluorescence efficiency of xanthene dyes, oxazine dyes, and 7-aminocoumarins is discussed. Relations with the molecular structure are pointed out and dependence on solvent and temperature is explained. Several new fluorescence standards are suggested.

Oscillator strengths for lines of ionized uranium (U II), C. H. Corliss, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 429-438 (May-June 1976).

Key words: oscillator strengths for U II; transition probabilities for U II; uranium spectrum.

Oscillator strengths for 49 lines of U II recently measured by Voight can be used to calibrate the intensity scale of the U II lines in the NBS Tables of Spectral-Line Intensities and derive a larger set of oscillator strengths of lower precision but consistent with the new measurements. The standard deviation of the differences between the two sets of *gf*-values for the 49 lines is 29 percent. Oscillator strengths of that precision are given for 776 additional lines from the NBS Intensity Tables. The uncertainty in absolute value is 67 percent.

Cancer detection by NMR in the living animal, I. D. Weisman, L. H. Bennett, L. R. Maxwell, Sr., and D. E. Henson, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 439-450 (May-June 1976).

Key words: cancer; mice; NMR; spin-lattice relaxation; spin-spin relaxation.

The purpose of this paper is to review *in vivo* NMR experiments on a transplantable tumor in mice and to discuss the feasibility of using noninvasive NMR for cancer detection in humans.

Modulus of natural rubber cross-linked by dicumyl peroxide. III. Some molecular interpretations, possible refinements of theory, and conclusions, L. A. Wood, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 451-463 (May-June 1976).

Key words: cross-linking of rubber; dicumyl peroxide; elasticity theory of rubber; entanglements in rubber; gel point; modulus of rubber; molecular interpretation of rubber elasticity; rubber elasticity; statistical theory of rubber elasticity; swelling of rubber network.

The shear modulus $G = 5.925 \times 10^{-3}(fp - 0.45)T + G^*$ (Part I), its energy component $G^* = 0.0684\ (fp - 0.45) + 2.70$ (Part II), and the number of effective sub-chains per unit volume $\nu_e = (G - G^*)/RT$ are given detailed molecular consideration. G is given in Mdyn cm^{-2} for rubber cross-linked by adding p parts of dicumyl peroxide per hundred of rubber, and heating until a fraction f of the peroxide is decomposed. ν_e is found to be approximately twice the density of cross-links, after a correction for impurities and chain ends is made. It cannot be computed as G/RT since only the entropy component of modulus is related to ν_e. The sub-chains for the most highly cross-linked rubbers studied had a molecular weight of about 575 g mol^{-1}, corresponding to about 8 isoprene units. The modulus corresponding to no added cross-links is not zero. It is determined chiefly by the energy component of the modulus; it does not arise from entanglements. The "front factor" is found to be unity.

An extensive literature survey yields values of the quantity $RT\Psi(\nu_2)$, where $\Psi(\nu_2)$ is the Flory-Rehner equation function of ν_2, the equilibrium volume fraction obtained by swelling the cross-linked rubber. $RT\Psi(\nu_2)$ is found to be greater than $G - G^*$, but not as large as G itself.

Calculations of configurations of doubly ionized copper (Cu III), J. Sugar and W. C. Martin, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 465-476 (May-June 1976).

Key words: atomic energy levels; atomic spectra; atomic theory; copper; doubly ionized copper; electron configuration.

The energy levels belonging to the configurations $3d^74s^2$ and $3d^8nl$ ($nl = 4s, 5s, 4p, 5p, 4d, 5d, 4f$, and $5g$) have been calculated. The radial energy integrals were treated as parameters and adjusted to give a least-squares fit to the observed levels. Two- and three-body effective electrostatic interactions for equivalent electrons were included, as well as two-body effective interactions for inequivalent electrons. Strong configuration interaction between $3d^74s^2$ and $3d^84d$ was taken into account. Values of the parameters are given for all the above configurations, and the calculated levels are given for all except $3d^84s$ and $3d^84p$ (for which essentially equivalent results have been published). Leading eigenvector percentages are given in appropriate coupling schemes.

The International Practical Temperature Scale of 1968 in the region 90.188 K to 903.89 K as maintained at the National Bureau of Standards, G. T. Furukawa, J. L. Riddle, and W. R. Bigge, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 477-504 (May-June 1976).

Key words: comparator; International Practical Temperature Scale of 1968; IPTS-68; oxygen point; platinum resistance thermometer; temperature standard; tin point; triple point of water; zinc point.

The reproducibility of the International Practical Temperature Scale of 1968 (IPTS-68) in the region 90.188 K to 903.89 K as maintained at the National Bureau of Standards is discussed. The realizations of the triple point of water, the freezing points of zinc and tin, and the boiling point of oxygen are described. The average of the standard deviations of the resistance measurements at the triple point of water of 213 platinum resistance thermometers received for calibration over a two-year period corresponds to ± 0.15 mK. The standard deviations of the resistance ratio $R(T)/R(0\ ^\circ C)$ obtained with check thermometers employed for monitoring the zinc, tin, and oxygen point measurements correspond to ± 0.28 mK, ± 0.30 mK, and ± 0.16 mK, respectively; the results of repeated calibrations with five thermometers show comparable reproducibility at the tin and oxygen points but the reproducibility is worse by a factor of two at the zinc point. When suitably packed for protection from possible mechanical shock platinum resistance thermometers can be shipped by common carrier and retain their calibrations.

Vapor pressure of water at its triple point, L. A. Guildner, D. P. Johnson, and F. E. Jones, *J. Res. Nat. Bur. Stand. (U.S.),* **80A** (Phys. and Chem.), No. 3, 505-521 (May-June 1976).

Key words: precision mercury manometer; triple point of water; vapor pressure of water.

The vapor pressure of water at its triple point was measured with exceptionally high accuracy by realizing it with a special apparatus and measuring the pressure with the NBS precision mercury manometer. The vapor pressure apparatus had a system for circulating the liquid water. Actual triple point conditions were established with a thin sheet of freshly distilled liquid flowing down over an exposed mantle of ice frozen on a vertical well. This technique reduced nonvolatile contaminants and the vapor was repeatedly pumped to remove accumulated volatile contaminants. A diaphragm pressure transducer was used to separate the water vapor from the helium used to transmit the pressure to the manometer. The value found for the vapor pressure of water at its triple point was 611.657 Pa with an uncertainty of ± 0.010 Pa from random errors, computed at 99 percent confidence limits. The systematic errors are estimated to be insignificant relative to the random errors.

July-August 1976

Diffuse reflectance spectroscopy; applications, standards, and calibration (with special reference to chromatography), R. W.

Frei, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 551-565 (July-Aug. 1976).

Key words: chromatography; color matching; color measurement; diffuse reflectance; Kubelka-Munk function; reflectance; reflectance standards; thin layer chromatography.

The multitude of areas in which diffuse reflectance spectroscopy can be applied has been described in several books and reviews and ranges from color measurements of textiles, pharmaceuticals, building materials, paper and pulp materials, etc., to adsorption studies and other basic investigations in physical, inorganic and organic chemistry.

The major area of application is still the measurement of color which has become indispensible in the quality control of colored products, dyes and pigments. Color matching practices and techniques with sophisticated instrumentation which can be fully computerized as well as the use of simpler filter instruments for quality control are mentioned.

Transferability of reflectance data i.e., color coordinates, depends on the quality of standards particularly when absolute measurements are desired. The difficulty of finding suitable "white standards" with good reflection properties at low UV and with a good long term stability is discussed. Similar arguments hold for sphere coating materials. For the measurement of fluorescing surfaces suitable standards are lacking which renders transfer of such data almost impossible.

The usefulness of diffuse reflectance techniques to study adsorption phenomena on small particle adsorbents is demonstrated with a malachite green-*o*-carboxylic acid lactone system studied by Kortüm. This or similar systems could be adopted to the measurement of relative surface areas on certain chromatographic adsorbents yielding more realistic values than the BET-method.

The most recent area of application has been in the field of chromatography for the in situ evaluation of chromatographic zones in flat-bed chromatography, electrophoresis and isoelectric focusing.

In chromatography, standardization is less problematic since usually relative measurements are sufficient. On the other hand one has to find suitable calibration procedures. The use of the Kubelka-Munk function is often questionable since we are usually not dealing with layers of infinite thickness and below 300 nm the conventional adsorbents such as silica gel, alumina or cellulose are strongly absorbing. Experiences with a new function combining the laws of Kubelka-Munk and Lambert-Beer are therefore presented.

The problem is also to find calibration techniques which account for chromatographic parameters. Until recently it was believed that a quantitative evaluation of chromatograms required a number of reference zones to be developed on the same chromatogram. In our experience this is no longer true. A novel calibration technique which utilizes the concept of transferable calibration factors is discussed. With this approach a quantitative evaluation of a chromatogram with only one reference spot is possible. Here again scanning and data acquisition can be fully automated. The application of proper calibration procedures to differential reflectance techniques and the measurement of multicomponent systems is briefly mentioned.

Finally it is demonstrated that it is possible to carry out in situ quantitative measurements on low UV absorbing compounds (down to 190 nm) separated on silica gel surfaces, provided suitable techniques and instrumentation are used.

The interpretation of diffuse reflectance spectra, H. G. Hecht, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 567-583 (July-Aug. 1976).

Key words: absolute absorptivities; continuum models; diffuse reflectance; radiative transfer; reflectance spectra; scattering coefficients; statistical models.

Numerous treatments of the diffuse reflecting properties of scattering media have been described. Many theories give an adequate account of the reflectance for a specific set of conditions for which the model was constructed and the solution tested experimentally. Only those models which are considered to be fairly general are considered here.

It is convenient to divide the theories into those based upon continuum models and those based upon statistical models. The continuum models typically describe the scattering and absorbing properties of a given medium in terms of two phenomenological constants. These models may all be regarded as varying levels of approximate solution to the general equation of radiative transfer. This provides a convenient basis for comparison of the various theories.

The statistical models are based upon a summation of transmittances and reflectances from individual layers or particles. Thus, some assumptions must be made about the nature of the fundamental units, and the validity of the ultimate result will depend upon how closely these assumptions correspond with reality. Only the statistical models lead to expressions from which absolute absorptivities and scattering coefficients can be calculated and related to the actual particle characteristics.

The relationship between the various models will be discussed and the features which typify the absorptivity and scattering coefficient according to each will be compared and related to the available experimental data. This leads to a consideration of the characteristics of appropriate model sytems and standards.

Calibration of reflectance standards, W. Budde, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 585-595 (July-Aug. 1976).

Key words: barium sulfate; diffuse reflectance spectra; magnesium oxide; opal glass; radiant flux; reflectance standards; standards calibration.

Measurements of the diffuse spectral reflectance are usually not made as direct measurement of the incident and the reflected radiant flux but rather as measurements relative to a standard of known reflectance value.

For the calibration of such standards, different methods have been described in the literature: 1. Goniophotometric methods also called Indicatrix methods or point-by-point methods; 2. Methods based on the Kubelka-Munk theory; 3. Integrating sphere methods according to Taylor, Benford, Sharp-Little, van den Akker, Korte.

Various materials such as magnesium oxide, barium sulfate or opal glass are being used as standards. Their suitability as transfer or as working standards will be discussed.

The results of comparative measurements between some of these methods will be given.

Understanding bidirectional reflectance and transmission for spac applications, J. B. Schutt, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 597-603 (July-Aug. 1976).

Key words: bidirectional radiometry; canopies; diffus reflectance; diffuse transmission; reflectance standards scattering surfaces.

Applications for optical diffusers in space projects are presented which include the functions of reflection, transmittance, and collection. These modes encompass such diverse uses as temperature regulation and ozone concentration monitors. Discussed is the cooperative aspect of diffuse reflectance and environmental stability. Magnesium oxide, sodium chloride and barium sulphate are evaluated in some detail. The importance of scene scattering behavior to modeling the earth's radiation budget and in determining thermal inertias of the earth's surface are discussed, because solar albedo serves as the weighting function in the solar input irradiance. Finally, work in the area of canopy reflectance modeling is reviewed with verification data included whenever available. Some knowledge of the bidirectional reflectance properties of vegetation is necessary for identification, acreage computations, and scene transferrance.

Standardization of light scattering measurement in conjunction with immunochemical analysis, G. J. Buffone, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 605-608 (July-Aug. 1976).

Key words: antibodies; antigens; biological polymers; immunochemical analysis; light scattering; polymers; proteins; solid standards.

Light scattering methods for the physical analysis of synthetic and biological polymers necessitates the use of scattering standards and absolute light scattering measurements. Standardization has not been employed when light scattering has been used to monitor immunochemical reactions using a kinetic or thermodynamic mode.

The concentration of a specific protein present in a complex matrix such as urine, serum or cerebrospinal fluid, is measured by reacting the protein of interest with its specific antibody and then measuring the excess light scattering of the solution produced by the formation of antigen antibody complexes. The lack of established light scattering standards in the area of immunochemical measurements make instrumental quality control difficult and has hindered direct comparison of data among investigators. Both solid and liquid light scattering standards would be necessary to encompass the wide range of instrumentation currently in use. Several solid standards which have been used in the past include reflecting diffusers such as vitrolite, magnesium carbonate crystal, casein paint on vitrolite, and solid opal glass transmitting diffusers such as flashed opal glass and solid opal glass. These standards, while applicable to manual light scattering photometers, are not suitable for recently developed automated instrumentation. Liquid standards in the form of Ludox®, solutions of polystyrene, suspensions of small diameter latex spheres and even pure organic solvents could be used more easily with the continuous flow and discrete automated analyzers. The introduction of instrumental standards at this level of analysis would result in improved overall quality control and facilitate data and method comparison between laboratories.

Errors in spectrophotometry and calibration procedures to avoid them, A. G. Reule, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 609-624 (July-Aug. 1976).

Key words: bandwidth; calibration; errors in spectrophotometry; interferences; multiple reflections; photometric linearity; polarization; sample characteristics; straylight; wavelength accuracy.

Based on simple principles, spectrophotometry nevertheless demands a lot of precautions to avoid errors. The following properties of spectrophotometers will be discussed together with methods to test them: spectral properties – wavelength accuracy, bandwidth, stray light; photometric linearity; interactions between sample and instrument – multiple reflections, polarization, divergence, sample wedge, sample tilt, optical path length (refractive index), interferences.

Calibration of master instruments is feasible only by complicated procedures. With such a master instrument standards may be calibrated which greatly simplify performance checks of instruments used for practical work. For testing high quality spectrophotometers the use of emission lines and nearly neutral absorbing solid filters as standards seems to be superior, for some kinds of routine instruments the use of absorption bands and liquid filters may be necessary.

Standardization in transmission spectrophotometry in the visible and ultraviolet spectral regions, A. R. Robertson, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 625-630 (July-Aug. 1976).

Key words: errors in spectrophotometry; photometric scale; slit width; spectral transmission; spectrophotometer standards; stray light; wavelength scale.

In an instrument as complex as a spectrophotometer there are many potential sources of error. Because of this it is useful to have available standard materials whose spectral transmittances are known accurately. Periodic measurement of such standards provides a useful indication of whether a spectrophotometer is producing accurate results.

If the spectral transmittance functions of these standards are chosen suitably, the measurements can provide diagnostic information to indicate what type of error is occurring. Among the factors that most often lead to errors in spectrophotometry are the slit-width, the wavelength scale, the photometric scale, and stray radiation. Suitable material standards can provide indications of the occurrence of these errors. However it is sometimes difficult to identify a particular error since often several errors will occur at the same time.

Several sets of standards for testing spectrophotometers are available or can be constructed easily. Most of these are glass filters, but interference filters, perforated screens, and rotating sectors are also used. Liquid filters have some advantages, especially in the ultraviolet where glass filters absorb too strongly to be useful. However difficulties in preparing and handling liquid filters can introduce uncertainties.

It is important that standard materials are insensitive to environmental conditions (such as temperature) and that they are stable over a long period of time. Unfortunately, many of the materials with the most suitable spectral characteristics are least suitable in these respects, and it would be very useful if new and better materials could be developed.

Acidic potassium dichromate solutions as ultraviolet absorbance standards, R. W. Burke and R. Mavrodineanu, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 631-636 (July-Aug. 1976).

Key words: absorbance linearity; accuracy; acidic potassium dichromate solutions; calibration of ultraviolet spectrophotometers; liquid filters; transfer standards; ultraviolet absorbance standards.

The absorbances of five concentrations of potassium dichromate in 0.001 *M* perchloric acid have been determined at eight wavelengths in the ultraviolet on the National Bureau of Standards Institute for Materials Research high-accuracy spectrophotometer. Four of the wavelengths – 235, 257, 313, and 350 nm – correspond to absorbance maxima or minima in the $HCrO_4^-$ spectrum and are useful wavelengths for checking the accuracy of the absorbance scale of narrow bandpass spectrophotometers. Although partial dimerization of $HCrO_4^-$ to

$Cr_2O_7^=$ produces small positive deviations from Beer's law at these wavelengths, the apparent absorptivities calculated for each concentration are reproducible to one part in a thousand. The estimated uncertainties in the absorptivity values are ±0.7 percent at 0.1 absorbance (A) and ±0.2 percent near $A = 1$. These uncertainties include all known sources of possible systematic error and the 95 percent confidence level for the mean. The remaining four wavelengths used for measurement are near two predicted isosbestic points in the $HCrO_4^-/Cr_2O_7^=$ spectra. The absorptivities at 345 nm are sufficiently independent of concentration that this wavelength can be used for checking absorbance linearity to one part in a thousand over the range $A = 0.2 - 1$.

Considerations for the use of semitransparent metallic thin films as potential transmittance standards in spectrophotometry, R. Mavrodineanu, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 637-641 (July-Aug. 1976).

Key words: evaporated metal-on-quartz; filters, transmittance; neutral filters; standard reference materials; transmittance characteristics; ultraviolet-visible filters.

Various characteristics of evaporated metal-on-fused silica filters are discussed in relation to their optical transmission properties. Special metal holders provided with shutters were designed to be used with these filters, and are described in detail. Transmittance measurements, performed in various conditions, are reported and indicate that the evaporated metal-on-fused silica filters might present an acceptable material as transfer standards in spectrophotometry.

Structure-related optical characteristics of thin metallic films in the visible and ultraviolet, H. E. Bennett and J. L. Stanford, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 643-658 (July-Aug. 1976).

Key words: absorption; dielectric layers; irregularities; metallic thin films; microirregularities; overcoating; plasmons; scatter.

Surface irregularities and crystalline order strongly influence both the scattered light and absorption of metallic films. These effects extend through all spectral regions but are particularly important in the visible and ultraviolet. Scattered light arises from several scattering mechanisms. Macroscopic irregularities such as dust, scratches and particulates are typically much less important than are microirregularities only a few tens of angstroms in height but covering the entire surface. For metals such as silver and aluminum, which have plasma edges in the ultraviolet, the excitation of surface plasmons resulting from these microirregularities causes additional incoherently reemitted or "scattered" light. Surface plasmon excitation also causes increased absorption in some wavelength regions. These effects are enhanced by dielectric overcoating layers, which both increase the absorption and scattering and shift the wavelength at which the peak occurs. Surface plasmon excitation is particularly important in the ultraviolet region, where the dielectric overcoating applied to prevent formation of an oxide film on aluminized mirrors, for example, can significantly change the mirror reflectance. Plasmon excitation is made possible by a momentum conserving process associated with material inhomogeneities and hence can presumably be caused by crystalline disorder in the metal surface as well as surface irregularities. If the disorder is present on a sufficiently fine scale, it also affects the band structure of the metal and hence its optical absorption. Examples of the effect of film structure on the optical properties of evaporated and sputtered metal films will be given.

Measurement of melting point and radiance temperature (at melting point and at 653 nm) of hafnium-3(wt.%) zirconium by a pulse heating method, A. Cezairliyan and J. L. McClure, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 659-662 (July-Aug. 1976).

Key words: hafnium; high-speed measurement; high temperature; melting point; pyrometry; radiance temperature.

A subsecond duration pulse heating method is used to measure the melting point and radiance temperature (at 653 nm) at the melting point of hafnium containing 3.12 weight percent zirconium. The results yield a value of 2471 K for the melting point on the International Practical Temperature Scale of 1968. The radiance temperature (at 653 nm) of this material at its melting point is 2236 K, and the corresponding normal spectral emittance is 0.39. Estimated inaccuracies are: 10 K in the melting point and in the radiance temperature, and 5 percent in the normal spectral emittance.

Nationwide survey of ^{60}Co teletherapy dosimetry, M. Ehrlich and G. L. Welter, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 663-668 (July-Aug. 1976).

Key words: absorbed dose; cobalt-60 gamma radiation; computation check; dose interpretation; mailings; results; therapy departments; thermoluminescence dosimeters; uncertainty; water phantom.

The National Bureau of Standards is performing a study of the ability of radiation-therapy departments to deliver prescribed absorbed doses of ^{60}Co gamma radiation to a water phantom. Batches of thermoluminescence dosimeters are mailed to participating therapy departments for irradiation under prescribed conditions. Upon return of the dosimeters, the participants' computations are checked and the absorbed dose is evaluated from dosimeter response. The rugged dosimetry system was assembled mainly from commercial components adapted to the present requirements of relatively high flexibility of readout parameters and data-handling techniques, and of relatively high accuracy. The uncertainty in the dose interpretation inherent in the system is estimated to be about 4 percent.

In order to illustrate the type of information that can be obtained from such a study, results of the first four mailings involving tests on 114 ^{60}Co gamma-ray beams are discussed. They show about 75 percent of the dose interpretations to be within 5 percent of the prescribed absorbed dose, and about 20 percent to be within 5 to 10 percent of this dose. Four dose interpretations showed discrepancies larger than 20 percent. Differences in the computations larger than 1 percent were observed in over one-half of the cases.

A self-balancing nanovolt potentiometric system for thermometry and calorimetry, S. S. Chang, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), No. 4, 669-675 (July-Aug. 1976).

Key words: automatic potentiometry; automation calorimetry; Diesselhorst ring; potentiometer; programmable potentiometer; self-balancing potentiometers; thermometry.

The principle of a self-balancing potentiometric system is described. The principle is applied to the modification of an existing manually operated thermo-free, low voltage potentiometer consisting of Diesselhorst ring elements. The modification involves the addition of reed relays which enable the potentiometer voltage to be set by digital signals. By incorporating a digital voltmeter, or an analog-to-digital converter, and a nanovolt amplifier with the modified potentiometer, self-balancing of the potentiometer may be achieved through either hardware logic implementation or direct digital control from a minicomputer. The resolution of this self-balancing potentiometric system for full scale input of 100 mV is about one to 10 parts in 10^8. With

real-time digital processing of the data, resolution of about 1 nV or better has been achieved for slowly changing input signals. The overall accuracy of the system is better than 10 ppm for voltage measurements and about 1 ppm for voltage ratio or resistance measurements.

September-December 1976

Deviation of international practical temperatures from thermodynamic temperatures in the temperature range from 273.16 K to 730 K, L. A. Guildner and R. E. Edsinger, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), Nos. 5 and 6, 703-738 (Sept.-Dec. 1976).

Key words: gas thermometry; International Practical Temperature Scale of 1968; temperature scale differences; thermodynamic temperatures.

The range over which thermodynamic temperatures have been realized by gas thermometry at the NBS has been extended to 730 K. The results are preserved by measuring the corresponding international practical temperatures. The difference between them is expressed as the following polynomial:

$$T/\mathrm{K} - T_{68}/\mathrm{K}_{68} = -120{,}887.784/T_{68}^2 + 1213.53295/T_{68} - 4.3159552 + 6.44075647 \times 10^{-3} T_{68} - 3.56638846 \times 10^{-5} T_{68}^2$$

which is valid in the range 273 to 730 K.

The difference found and the estimated uncertainties at the three defining fixed points in the range covered are

		Uncertainty	
t(°C)	$T/\mathrm{K} - T_{68}/K_{68}$	Random (99% confidence limits)	Systematic
100	−0.0252	±0.0018	±0.00054
231.9681	−0.0439	±0.0022	±0.0015
419.58	−0.0658	±0.0028	±0.0028

Measurements of the specific heats, C_σ, and C_v, of dense gaseous and liquid ethane, H. M. Roder, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), Nos. 5 and 6, 739-759 (Sept.-Dec. 1976).

Key words: constant volume; ethane; heat capacity; liquid; saturated liquid; specific heat; vapor.

The specific heats of saturated liquid ethane, C_σ, have been measured at 106 temperatures in the temperature range 93 to 301 K. The specific heats at constant volume, C_v, have been measured at 19 densities ranging from 0.2 to 3.1 times the critical density, at temperatures between 91 and 330 K, with pressures to 33 MPa, at 200 PVT states in all. The uncertainty of most of the measurements is estimated to be less than 2.0 percent. As the critical point is approached the uncertainty rises to about 5.0 percent. The measurements were performed to provide input data for accurate calculations of the thermodynamic properties for ethane. They are believed to be the most comprehensive specific heat measurements available for the liquid and vapor states of ethane.

Phase equilibria and crystal growth in the alkali antimonate systems Sb_2O_4-$NaSbO_3$, Sb_2O_4-$KSbO_3$, and Sb_2O_4-$NaSbO_3$-NaF, J. L. Waring, R. S. Roth, H. S. Parker, and W. S. Brower, Jr., *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), Nos. 5 and 6, 761-774 (Sept.-Dec. 1976).

Key words: alkali antimonates; crystal growth; ionic conductors; potassium antimonate; sodium antimonate; sodium antimony oxyfluoride.

Phase equilibrium diagrams have been constructed from experimental data for the systems Sb_2O_4-$NaSbO_3$, Sb_2O_4-$KSbO_3$, and Sb_2O_4-$NaSbO_3$-NaF. The system Sb_2O_4-$NaSbO_3$ contains only an intermediate pyrochlore type solid solution with a maximum melting point of 1490 °C at a Na:Sb atom ratio of 3:5. The Sb_2O_4-$KSbO_3$ system contains in addition to the pyrochlore phase a compound $3K_2O{\cdot}5Sb_2O_5$ which melts congruently at about 1450 °C and two polymorphs of $K_2O{\cdot}2Sb_2O_5$. The low temperature form of $K_2O{\cdot}2Sb_2O_5$ was found to be monoclinic $P2_1/c$ with $a = 7.178$, $b = 13.378$, $c = 11.985$ A, $\beta = 124°10'$. The melting point of Sb_2O_4 was found to be 1350 ± 5 °C and $NaSbO_3$ and $KSbO_3$ both melt congruently at 1555 ± 5 °C and 1410 ± 5 °C respectively. The previously reported cubic form of $KSbO_3$ was found to be a K^+ deficient phase stabilized by reaction with atmospheric moisture. A similar cubic phase which appears to be a good Na^+ ion conductor can be synthesized in the ternary system $NaSbO_3$-Sb_2O_4-NaF.

Vapor pressure formulation for water in range 0 to 100 °C. A revision, A. Wexler, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), Nos. 5 and 6, 775-785 (Sept.-Dec. 1976).

Key words: Clapeyron equation; saturation vapor pressure over water; steam; vapor pressure; vapor pressure of water; virial coefficients.

In 1971 Wexler and Greenspan published a formulation for the vapor pressure of water encompassing the temperature range 0 to 100 °C. In this paper a revision is made of that earlier formulation to make it consistent with the definitive experimental value of the vapor pressure of water at its triple point recently obtained by Guildner, Johnson, and Jones. The two formulations are essentially identical at temperatures from 25 to 100 °C.

For temperatures below 25 °C the new formulation predicts values that are higher than the 1971 formulation. At the triple point, the vapor pressure given by the new formulation is 611.657 Pa whereas the value given by the 1971 formulation is 611.196 Pa. A table is given of the vapor pressure as a function of temperature at 0.1-deg intervals over the range 0 to 100 °C on the International Practical Temperature Scale of 1968, together with values of the temperature derivative at 1-deg intervals.

Revised lifetimes of energy levels in neutral iron, C. H. Corliss and J. L. Tech, *J. Res. Nat. Bur. Stand. (U.S.)*, **80A** (Phys. and Chem.), Nos. 5 and 6, 787-797 (Sept.-Dec. 1976).

Key words: atomic spectra; energy levels; Fe I; iron; iron lifetimes; lifetimes in Fe I.

Mean radiative lifetimes for 408 energy levels of neutral iron are revised from our 1967 paper on the basis of comparison with 81 subsequently measured lifetimes. The standard deviation of the ratio of the revised values to the reference lifetimes is 30 percent.

3.2. PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICS AND MATHEMATICAL PHYSICS, VOLUME 70B, JULY-DECEMBER 1966

July-September 1966

Error bounds for asymptotic solutions of differential equations. I. The distinct eigenvalue case, F. Stenger, *J. Res. NBS.* **70B**3-180, pp. 167-186 (July-Sept. 1966).

Key words: Asymptotic solutions; eigenvalues; error term; matrices; norm bounds; vector bounds; Volterra vector integral equations.

The method of Olver for bounding the error term in the asymptotic solutions of a second-order equation having an irregular singularity at infinity is extended to the general system of n first-order equations in the case when the eigenvalues of the lead coefficient matrix are distinct. Vector and norm bounds are given for the difference between an actual solution vector and a partial sum of a formal solution vector. Two cases are distinguished geometrically: In one it is possible to express the error vector by a single Volterra vector integral equation; in the other it is necessary to use a simultaneous pair of Volterra vector integral equations. Some new inequalities for integral equations are given in an appendix.

Error bounds for asymptotic solutions of differential equations. II. The general case, F. Stenger, *J. Res. NBS* **70B**3-181, pp. 187-210 (July-Sept. 1966).

Key words: Asymptotic solutions; error bounds; integral equations; matrices.

The results of the preceding paper are extended to the general system of n first-order differential equations having an irregular singularity of arbitrary rank at infinity. Formal solutions are explicitly constructed for the system in canonical form. Proofs of existence and uniqueness of solutions of integral equations defining the error are given. As an example, the case $n=2$ is solved completely, and a flow chart of the transformations of this case to canonical form is included.

On the approximation of functions of several variables, B. Mond and O. Shisha, *J. Res. NBS*, **70B**3-182, pp. 211-218 (July-Sept. 1966).

Key words: Approximations; convergence; multidimensional; polynomials; functions; variables; Hermite-Fejer; Bernstein; Chebyshev.

The purpose of this note is to point out how a certain type of approximation to functions of one real variable gives rise to similar approximations to functions of several variables. Information on the rapidity of convergence in the one dimensional case, yields at once corresponding information for the multidimensional case.

Finding a rank-maximizing matrix block, A. J. Goldman and M. Newman, *J. Res. NBS* **70B**3-183, pp. 219-220 (July-Sept. 1966).

Key words: Matrix; block; rank; algorithm.

An algorithm is developed for the following problem: Given three matrices of respective dimensions $s\times s$, $s\times t$, and $t\times s$, to find a $t\times t$ matrix such that the $(s+t)\times(s+t)$ matrix formed from the four blocks has maximum rank.

On certain discrete inequalities and their continuous analogs, A. M. Pfeffer, *J. Res. NBS*, **70B**3-184, pp. 221-231 (July-Sept. 1966).

Key words: Inequalities; norms; Wirtinger.

The purpose of this paper is to find inequalities between the L^2-norms of a function and its kth and mth derivatives.

October-December 1966

A random walk model of chain polymer adsorption at a surface. III. Mean square end-to-end distance, R. J. Rubin, *J. Res. NBS*, **70B**4-185, pp. 237-247 (Oct.-Dec. 1966).

Key words: Adsorption; chain polymer; critical energy; generating function; lattice model; partition function; random walk.

A 6-choice simple cubic lattice model of adsorption of an isolated polymer chain at a solution surface is investigated. The mean square components $\langle x^2(N)\rangle$ and $\langle z^2(N)\rangle$ of the end-to-end distance are computed as a function of the adsorption energy per monomer unit in the limit of a very long polymer chain. In the calculation, one end of the polymer chain consisting of N monomer units is constrained to lie in the surface; and $\langle x^2(N)\rangle$ and $\langle z^2(N)\rangle$ are, respectively, the mean square displacement of the free end of the chain parallel to the solution surface in one of the lattice directions and normal to the solution surface. The limiting value of $\langle x^2(N)\rangle/N$ as $N\to\infty$ is a continuous function of θ, the dimensionless adsorption energy per monomer unit, and is equal to 1/3 for $\theta\leqslant \ln(6/5)$ and $(1/2)[1+(1/4)(e^{\theta}-1)^{-1}]^{-1/2}$ for $\theta^{\theta}\ln(6/5)$. The limiting value of $\langle z^2(N)\rangle/N$ as $N\to\infty$ is a discontinuous function of θ and is equal to 2/3 for $\theta<\ln(6/5)$, 1/3 for $\theta=\ln(6/5)$, and 0 for $\theta>\ln(6/5)$. The relation of these results to earlier investigations and the generalization of these results to other cubic lattice models is discussed.

Abscissas and weights for Gaussian Quadrature for N=2 to 100, and N=125, 150, 175, and 200, C. H. Love, *J. Res. NBS*, **70B**4-186, pp. 249-256 (Oct.-Dec. 1966).

Key words: Gaussian quadrature; integral equations; numerical integration; zeros of Legendre polynomials.

The abscissas and weights for Gaussian Quadrature of order N=2 to 100, and N=125, 150, 175, and 200 are given. The abscissas are given to twenty-four places and the error is estimated to be no more than one unit in the last place. The weights are given to twenty-three places and the error is estimated to be no more than 1 unit in the last place.

Transverse impact of a linear three-element spring and dashpot model filament: Theory, J. C. Smith, *J. Res. NBS*, **70B**4-187, pp. 257-264 (Oct.-Dec. 1966).

Key words: Characteristics; impact; linear viscoelasticity; partial differential equations; stress waves; wave propagation.

The mathematics of wave propagation in a viscoelastic filament subjected to constant velocity transverse impact is discussed. The equations governing the stress-strain-tim

behavior are assumed to be those for a linear model consisting of a spring coupled in parallel with a spring and dashpot in series. The nature of the solution is discussed, and a method is described for calculating the configuration, and the stress, strain, and particle velocity distributions along the impacted filament. The method used consists of an integration along the characteristics of the system of differential equations describing the problem.

Functions for thermal stress calculation near a transient heat source on a flat surface, S. Jarvis, Jr., and G. Hardy, *J. Res. NBS* **70B**4-188, pp. 265-272 (Oct.- Dec. 1966).

Key words: Elastic stress; heat transfer; plane strain; thermal stress; yield stress.

When an initially unstressed elastic solid at uniform temperature is subject to a transient, locally two-dimensional heat flux on a flat surface, the two-dimensional total stress field near the wall is locally determined for short times and may be constructed from the functions described in this report; Fortran programs are available for their computation. In particular, maximum total stress and total stress fields for initially large heat fluxes are readily obtained for estimations of yield probability.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICS AND MATHEMATICAL PHYSICS, VOLUME 71B, JANUARY-DECEMBER 1967

January-March 1967

Algorithms for frames and lineality spaces of cones, R. J.-B. Wets and C. Witzgall, *J. Res. NBS*, **71B**1-189, pp. 1-7 (Jan.- Mar. 1967).

Key words: Algorithm; cone; convex hull; face; frame; lineality space; linear programming.

A frame of a cone C is a minimal set of generators, and the lineality space L of C is the greatest linear subspace contained in C. Algorithms are described for determining a frame and the lineality space of a cone $C(S)$ spanned by a finite set S. These algorithms can be used for determining the vertices, edges, and other faces of low dimension of the convex hull of a finite set $H(S)$. All algorithms are based on the simplex method of linear programming. The problem of finding the lineality space can be successively reduced to problems in spaces of lower dimensions.

The coefficients of the powers of a polynomial, M. Newman, *J. Res. NBS*, **71B**1-190, pp. 9-10 (Jan.-Mar. 1967).

Key words: Binomial coefficients; bounds; polynomials.

It is shown that if $f(z)$ is a polynomial with no zeroes inside the unit circle and if r is any positive number, then the coefficients of $f^r(z)$ tend to zero like n^{1-r}, and this is best possible.

Stable evaluation of polynomials, C. Mesztenyi and C. Witzgall, *J. Res. NBS*, **71B**1-191, pp. 11-17 (Jan.-Mar. 1967).

Key words: Evaluation; Newton form; polynomial; relative error; round-off.

A class of Newton forms

$$P(x)=a_0+a_1(x-x_0)+\ .\ .\ .+a_n(x-x_0)\ .\ .\ .\ (x-x_{n-1})$$

are discussed which admit a stable evaluation algorithm in an interval $[A,B]$. Stability is defined in the paper. The estimate

$$\frac{\Delta P}{|P|}\leq 2+6\frac{M'(L)L}{M(L)},$$

where $L:=B-A$ and $M(x):=|a_0+|a_1|x+\ .\ .\ .+|a_n|x^n$, is shown to hold for the relative error of evaluation of $P(x)$ in $[A,B]$.

On involutions, O. Shisha and C. B. Mehr, *J. Res. NBS*, **71B**1-192, pp. 19-20 (Jan.-Mar. 1967).

Key words: Inverses; involutions; real functions.

Two methods are described of constructing real functions over the reals which are one-to-one, assume every real value and are their own inverses, and several examples are given. It is also shown that such a function, if everywhere continuous, is either the function $f(x)\equiv x$ or else is strictly decreasing.

Minimum number of subsets to distinguish individual elements, P. R. Meyers, *J. Res. NBS*, **71B**1-193, pp. 21-22 (Jan.-Mar. 1967).

Key words: Classification design; combinatorics; set theory.

Given a set S of cardinality m, we determine the minimum cardinality $f(m)$ for a family F of subsets of S such that each $s\epsilon S$ can be expressed as the intersection of some subfamily of F. The problem is solved in the following inverse form. For a given number n of subsets of S, find $g(n)$: the maximum number of elements of S which can be written as the intersection of some of these subsets. We show that $g(n)$ is the largest binomial coefficient for combinations of n things.

***E*-Transforms,** F. M. Ragab, *J. Res. NBS*, **71B**1-194, pp. 23-37 (Jan.-Mar. 1967).

Key words: Fourier-transform; functional transforms; generalized MacRobert's function; Hankel transform, *K*-transform; Laplace transform, MacRobert's function; *Y*-transform.

The following transform pair is established:

$$g(x)=\int_0^\infty (xy)^k[Ep;\alpha_r:q;\rho_t:(xy)^{\pm n}]f(y)dy;$$

$$f(x)=n^2\int_0^\infty (xy)^{-k}E\left[\begin{matrix}0 & q;1-\rho_t\mp\frac{1}{n}:(xy)^{\pm n}\\ 1;\mp\frac{1}{n} & p+1;1-\alpha_r\mp\frac{1}{n},1\end{matrix}\right]g(y)dy,$$

where n is any positive integer, and E is MacRobert's function and the generalized MacRobert's function, respectively.

Special choices of the parameters in the last transform lead in turn to the derivation of Hankel transform, *Y*-transform, *K*-transform, Fourier transform, Laplace transform and other integral transforms with tables to illustrate these new transforms.

Three observations on nonnegative matrices, A. J. Hoffman, *J. Res. NBS*, **71B**1-195, pp. 39-41 (Jan.- Mar. 1967).

Key words: Bounds; eigenvalues; nonnegative matrices.

Some results on nonnegative matrices are proved, of which the following is representative: Let $A=(a_{ij})$ be a nonnegative row stochastic matrix. If $\lambda\neq 1$ is an eigenvalue of A, then

$$|\lambda|\leq \min\left(1-\sum_j \min_i a_{ij},\sum_j \max_i a_{ij}-1\right).$$

Additional remarks on a theorem of M. Riesz, J. M. Smith, *J. Res. NBS*, **71B**1-196, pp. 43-46 (Jan.-Mar. 1967).

Key words: Commutator; matrix; orthogonal; quaternions; skew-symmetric; regular representation.

Let V be a real four-dimensional vector space, whose underlying geometry is the metric defined by the matrix

$$K=\begin{bmatrix}1&0&0&0\\0&1&0&0\\0&0&-1&0\\0&0&0&-1\end{bmatrix}$$

The following theorem is proved.

THEOREM: *If A and B are real, skew-symmetric, orthogonal (with respect to K) linear transformations on V, then $[A,B]=AB-BA$ is a multiple of a real, skew-symmetric orthogonal (with respect to K), linear transformation on V.*

The theorem is proved by use of the first and second regular representations of the real quaternions.

Methods are given for constructing all 4×4 matrices which are skew-symmetric and orthogonal with respect to K, and all 4×4 matrices which are skew-symmetric (in the Euclidean sense) and orthogonal with respect to K.

April-September 1967

Poincare's conjecture is implied by a conjecture on free groups, R. D. Traub, *J. Res. NBS* **71B**2&3-197, pp. 53-56 (Apr.-Sept. 1967).

Key words: Free group; handlebody; homeomorphism; simply connected; topology; 3-manifold; 3-sphere.

Poincare's conjecture is implied by a single group-theoretic conjecture. The converse is also valid modulo a hypothesis on the uniqueness of decomposition of the 3-sphere as the union of two handlebodies intersecting in a torus.

Construction of *EPr* generalized inverses by inversion of nonsingular matrices, J. Z. Hearon, *J. Res. NBS* **71B**2&3-198, pp. 57-60 (Apr.-Sept. 1967).

Key words: *EPr* matrices; generalized inverse; matrix.

Any matrix B such that $ABA=A$ is called a C_1-inverse of A and a C_1-inverse of A such that $BAB=B$ is called a C_2-inverse of A. Some properties of such inverses are established. It is shown that if A is p-square of rank $q<p$ and P is any positive semidefinite matrix, whose rank is the nullity of A, such that $U=A+P$ is nonsingular, then $B=U^{-1}AU^{-1}$ is a C_2-inverse of A with the property that null space B=null space B^*. That such a P exists for arbitrary square A is shown. The relation between this result and the work of Goldman and Zelen is discussed.

A generalized matrix version of Rennie's inequality, J. Z. Hearon, *J. Res. NBS* **71B**2&3-199, pp. 61-64 (Apr.-Sept. 1967).

Key words: Generalized inverse; inequality; matrix.

The matrix version of Rennie's inequality and the finite-dimensional version of Kantorovich's inequality are obtained by considering a positive definite matrix and its inverse. Generalizations of these inequalities are obtained in which the inverse matrix is replaced by a generalized inverse with certain prescribed properties. From the generalization of the Kantorovich inequality follows a (finite-dimensional) generalization of an inequality due to Strang.

Polar factorization of a matrix, J. Z. Hearon, *J. Res. NBS* **71B**2&3-200, pp. 65-67 (Apr.-Sept. 1967).

Key words: Generalized inverse; matrix; partial isometry.

It is known that if A is a bounded linear operator with closed range on a Hilbert space then A can be factored as $A=UH$, with U a partial isometry and H nonnegative and self adjoint. For the finite-dimensional case a strictly matrix-theoretic derivation is given based on the concept of a generalized inverse. Certain properties of the factors are given as well as conditions under which H or both U and H are uniquely determined by A. A pivotal item in the derivation is the representation of a square partial isometry as the product of a unitary matrix and an orthogonal projection. This representation is new, of some interest in itself and greatly simplifies the derivations.

Two classical theorems on commuting matrices, M. Newman, *J. Res. NBS* **71B**2&3-201, pp. 69-71 (Apr.-Sept. 1967).

Key words: Commuting matrices; group representations; normal matrices; Schur's lemma; simultaneous triangularization and diagonalization.

Simple proofs are given of the following classical theorems: (1) An arbitrary set of commuting matrices may be simultaneously brought to triangular form by a unitary similarity. (2) An arbitrary set of commuting normal matrices may be simultaneously brought to diagonal form by a unitary similarity.

A converse to Banach's contraction theorem, P. R. Meyers, *J. Res. NBS* **71B**2&3-202, pp. 73-76 (Apr.-Sept. 1967).

Key words: Contractions; functional analysis; metric spaces; topology.

The class of all continuous self-mappings of a metrizable space which can become contractions (in the sense of Banach) under metrics compatible with the topology on the space is characterized. The characterization amounts to a converse to the Contraction Mapping Principle.

***E*-transforms (II),** F. M. Ragab, *J. Res. NBS* **71B**2&3-203, pp. 77-89 (Apr.-Sept. 1967).

Key words: *E*-functions; integral transforms; inversion formulas; kernels.

The following class of integral transform pairs is established

$$g(x)=\int_0^\infty E\left(\begin{matrix}\nu-ix,\ \nu+ix,\ \alpha_1,\ \ldots,\ \alpha_p;\\ \beta_1,\ \ldots,\ \beta_q\end{matrix}\ \frac{1}{y}\right)f(y)dy, \tag{1}$$

$$f(x)=\frac{x^{\nu-1}}{i\pi^2}\int_0^\infty yg(y)\left[\frac{1}{i}\sum_{i,-i} ix^{iy}\sin(iy+\nu)\pi E\right. \tag{2}$$

$$\left.\left(\begin{matrix}1-\nu-iy,\ \beta_1-\nu-iy,\ \ldots,\ \beta_q-\nu-iy;x\\ 1-2iy,\ \alpha_1-\nu-iy,\ \ldots,\ \alpha_p-\nu-iy\end{matrix}\right)\right]dy.$$

The kernel in the transform (1) is MacRobert's E-function and integration is performed with respect to the argument of this function. In the inversion formula (2), the kernel is likewise an E-function, but the integration is performed with respect to its parameters.

Known special cases of this general transform pair is the Kantorovich-Lebedev transforms pair:

$$g(x)=\frac{2}{\pi^2}x\sinh(\pi x)\int_0^\infty y^{-1}K_{ix}(y)f(y)dy,$$

$$f(x)=\int_0^\infty K_{iy}(x)g(y)dy,$$

and the generalized Mehler transform pair

$$g(x)=\frac{x}{\pi}\sinh(\pi x)\Gamma\left(\frac{1}{2}-k+ix\right)\Gamma\left(\frac{1}{2}-k-ix\right)\int_0^\infty P^k_{ix-1/2}(y)f(y)dy,$$

$$f(x)=\int_0^\infty P^k_{iy-1/2}(x)g(y)dy.$$

Criterion for the stability of numerical integration methods for the solution of systems of differential equations, A. I. A. Karim, *J. Res. NBS* **71B**2&3-204, pp. 91-103 (Apr.-Sept. 1967).

Key words: Numerical integration; propagation of error; stability; systems of differential equations.

The problem of studying the growth of the error is most important for the numerical solution of differential equations. In this paper the Wilf's criterion is generalized to be applied for systems of differential equations. A general theorem is investigated and regions of stability have to be determined. The

use of an electronic computer is more essential for such regions to be characterized. These regions of stability have the property that, the error introduced at any stage tends to decay. The regions of stability for particular numerical methods are explicitly determined.

Discrete complex functions with prescribed boundary values and residues, E. L. Peterson, *J. Res. NBS* **71B**2&3-205, pp. 105-110 (Apr.-Sept. 1967).

Key words: Analytic functions; complex analysis; Dirichlet problem; discrete analytic functions.

R. Isaacs, J. Ferrand, R. J. Duffin, and several others have developed a function theory for "discrete analytic functions" defined on "discrete regions" in the "discrete complex plane." In this paper we bring to light some combinatorial-topological properties of "simple discrete regions," and we study some basic properties of discrete analytic functions that are defined on simple discrete regions. These combinatorial-topological properties and basic properties are then used to establish an existence and uniqueness theorem for discrete complex functions with prescribed "boundary values" and "residues" on an arbitrary simple discrete region.

Numerical solution of second-order linear difference equations, F. W. J. Olver, *J. Res. NBS* **71B**2&3-206, pp. 111-129 (Apr.-Sept. 1967).

Key words: Chebyshev series; difference equations; error analysis; Miller algorithm; recurrence methods; special functions.

A new algorithm is given for computing the solution of any second-order linear difference equation which is applicable when simple recurrence procedures cannot be used because of instability. Compared with the well-known Miller algorithm the new method has the advantages of (i) automatically determining the correct number of recurrence steps, (ii) applying to inhomogeneous difference equations, (iii) enabling more powerful error analyses to be constructed.

The method is illustrated by numerical computations, including error analyses, of Anger-Weber, Struve, and Bessel functions, and the solution of a differential equation in Chebyshev series.

Indefinite integrals involving Bessel functions, B. A. Peavy, *J. Res. NBS* **71B**2&3-207, pp. 131-141 (Apr.-Sept. 1967).

Key words: Bessel functions; indefinite integrals.

Expressions are derived for the indefinite integrals,

$$\int rf(r)\, C_0(\alpha r)dr$$

$$\int rf(r)\, C_0^2(\alpha r)dr$$

$$\int rf(r)C_0(\alpha r)\, C_0(\beta r)dr \qquad \alpha \neq \beta$$

$$\int rf(r)C_0(\alpha r)\, Z_0(\lambda r)dr$$

where $C_0(\alpha r)$ are zero order Bessel functions, $Z_0(\lambda r)$ are zero order modified Bessel functions and $f(r)$ is a polynomial in r. In general, the expressions given for the integrals are given in terms of prescribed functions of the Bessel functions, and the coefficients of these functions are determined from a finite series, the terms of which are found from recurrence relationships that involve only the polynomial $f(r)$. Coefficients of the terms of the finite series are given in tabular form for up to an eleventh degree polynomial.

October-December 1967

Calibration designs based on solutions to the tournament problem, R. C. Bose and J. M. Cameron, *J. Res. NBS* **71B**4-237, pp. 149-160 (Oct.-Dec. 1967).

Key words: Calibration; calibration designs; combinatorial analysis; difference sets; incomplete block designs; statistical experiment designs; tournaments; weighing designs.

In high precision calibrations one measures differences between nominally equal objects or group of objects and establishes a value for the individuals with reference to one or more standards. The solutions to the classical tournament problem, which calls for arranging v individuals into teams of p players so that a player is teamed the same number of times with each of the other players and also that each player is pitted equally often against each of the other players, provide balanced designs for scheduling the measurements. These designs are useful in weighing and other measurements when the objects to be measured can be combined into groups without loss of precision or accuracy in the comparisons.

This paper presents solutions to the tournament problem for all $v \leq 13$ and for $p \leq v/2$. The statistical analysis, a worked example, and computational procedures are given.

Bounds for the solutions of second-order linear difference equations, F. W. J. Olver, *J. Res. NBS* **71B**4-238, pp. 161-166 (Oct.-Dec. 1967).

Key words: Chebyshev series; difference equations; error bounds; Miller algorithm; recurrence relations; special functions.

Simple bounds are established for the solutions of second-order homogeneous linear difference equations in ranges in which the solutions are exponential in character. The results are applied to a recent algorithm for the computation of subdominant solutions of second-order linear difference equations, homogeneous or otherwise. Strict and extremely realistic bounds are obtained for the truncation error associated with the algorithm in a number of examples, including Anger-Weber functions, Struve functions, and the solution of a differential equation in Chebyshev series.

Notes on automorphic functions: An entire automorphic form of positive dimension is zero, M. I. Knopp, *J. Res. NBS* **71B**4-239, pp. 167-169 (Oct.-Dec. 1967).

Key words: Automorphic forms; discontinuous groups; Fourier expansion; H-groups.

Several new proofs are given of the fact that an entire automorphic form of positive dimension is zero. The first proof is modeled on the method used by Hecke to estimate the Fourier coefficients of cusp forms of negative dimension. The other proofs involve well-known theorems of complete function theory.

Solving equations exactly, M. Newman, *J. Res. NBS* **71B**4-240, pp. 171-179 (Oct.-Dec. 1967).

Key words: Exact solutions; Hilbert matrices; linear equations; modular arithmetic.

A congruential method for finding the exact solution of a system of linear equations with integral coefficients is described, and complete details of the program are given. Typical numerical results obtained with an existing program are given as well.

A system of equations having no nontrivial solutions, H. Gupta, *J. Res. NBS* **71B**4-241, pp. 181-182 (Oct.-Dec. 1967).

Key words: Diophantine equations; Prouhet-Terry-Escott problem; symmetric functions.

The object of this note is to prove the THEOREM: *The system of equations*

$$a_1^r + a_2^r + \ldots + a_{n-1}^r = b_1^r + b_2^r + \ldots + b_{n-1}^r \quad r = 2, 3, \ldots, n;$$

has no nontrivial solutions in positive integers.

Remarks on cut-sets, J. W. Grossman, *J. Res. NBS* **71B**4-242, pp. 183-186 (Oct.-Dec. 1967).

Key words: Basic cut-sets; cut-sets; graph theory; network flows; mathematics; segs.

This paper gives a theorem on combinations of segs in a finite, connected, undirected graph. Then the theorem is specialized to combinations of cut sets, giving a theorem first proven by Mayeda. The paper contains an example showing that modifiers added to Mayeda's theorem by Yau, in the Journal of the Franklin Institute, January 1962, yield a false theorem. Finally, the paper discusses the practicability of algorithms developed by Mayeda and Yau and based on Mayeda's theorem.

A pseudo primal-dual integer programming algorithm, F. Glover. *J. Res. NBS* **71B**4-243, pp. 187-195 (Oct.-Dec. 1967).

Key words: Gomory algorithm; integer programming; linear inequalities; maximization.

The Pseudo Primal-Dual Algorithm dolves the pure integer programming problem in two stages, systematically violating and restoring dual feasibility while maintaining an all-integer matrix. The algorithm is related to Gomory All-Integer Algorithm and the Young Primal Integer Programming Algorithm, differing from the former in the dual feasible stage by the choice of cuts and pivot variable, and from the latter in the dual infeasible stage by the use of a more rigid (and faster) rule for restoring dual feasibility.

The net advance in the objective function value produced by the algorithm between two consecutive stages of dual infeasibility is shown to be at least as great as that produced by pivoting with the dual simplex method. Example problems are given that illustrate basic features and variations of the method.

Properties of a useful biorthogonal system, L. V. Spencer and P. Flusser, *J. Res. NBS* **71B**4-244, pp. 197-211 (Oct.-Dec. 1967).

Key words: Biorthogonal functions; gamma-ray penetration theory; neutron penetration theory; polynomial approximations.

In radiation penetration theory, infinite medium flux distributions have for some years been calculated using biorthogonal functions called $U_n^k(z)$. In this paper the spaces spanned by these functions, transformation kernels, generating functions, recursion relations, asymptotic trends for large n, many expansions, and relations with well-known orthogonal polynomials are worked out.

On even matroids, W. T. Tutte, *J. Res. NBS* **71B**4-245, pp. 213-214 (Oct.-Dec. 1967).

Key words: Binary; bridge-separable; even; graphic; matroid.

This article is intended as a supplement to an earlier paper entitled "Lectures on Matroids."

The author takes this opportunity to correct some errors in "Lectures on Matroids." Theorems 4.31 and 4.372 are valid only for binary matroids, the plane of 4.281 must be connected, and the word "reductions" is used in 3.48 instead of "contractions."

Matrices of class J_2, J. S. Maybee, *J. Res. NBS* **71B**4-246, pp. 215-224 (Oct.-Dec. 1967).

Key words: Chains; cycles; Jacobi matrices; triple diagonal matrices.

Let J_2 be the set of $n \times n$ complex matrices $A = (a_{ij})$ such that $a_{j_1 j_2} a_{j_2 j_3} \ldots a_{j_r j_1} = 0$ for all r such that $3 \leq r \leq n$ and all distinct $j_1, j_2, \ldots, j_r$. Then many properties of this set are given, which may be regarded as generalizations of the properties of the set of triple diagonal matrices.

Partially isometric matrices, J. Z. Hearon, *J. Res. NBS* **71B**4-247, pp. 225-228 (Oct.-Dec. 1967).

Key words: Generalized inverse; matrix; partial; isometry.

The complex, not necessarily square matrix A is called a partial isometry if the vectors x and Ax have the same Euclidean norm whenever x is in the orthogonal complement of the null space of A. The main results of the paper give necessary and sufficient conditions for a matrix to be a partial isometry, for a partial isometry to be normal and for the product of two partial isometries to be a partial isometry. A factorization for an arbitrary matrix involving partial isometries is given. The concept of a generalized inverse is used in establishing the primary results.

Symmetrizable generalized inverses of symmetrizable matrices, J. Z. Hearon, *J. Res. NBS* **71B**4-248, pp. 229-231 (Oct.-Dec. 1967).

Key words: Generalized inverse; symmetrizable matrix.

The matrix A is said to be symmetrizable by V when V is positive definite and AV is hermitian. Several lemmas regarding symmetrizability are given. For three classes of generalized inverses it is shown that if A is symmetrizable by V there exists a generalized inverse in each class which is symmetrizable by V. The Moore-Penrose inverse (or pseudo-inverse) of a matrix symmetrizable by V is also symmetrizable by V if and only if the matrix and the pseudo-inverse commute.

Optimum branchings, J. Edmonds, *J. Res. NBS* **71B**4-249, pp. 233-240 (Oct.-Dec. 1967).

Key words: Algorithms; arborescences; branchings; combinatorics; graphs; linear programming; traveling salesman; trees.

An arborescence T is a tree whose edges are directed so that each is directed toward a different node. Exactly one node of T, called the root, has no edge of T directed toward it. Let G be any directed graph with a real numerical weight on each edge. A good algorithm is described for finding in G (if there is one) a spanning arborescence, with prescribed root, whose edges have maximum (or minimum) total weight.

Systems of distinct representatives and linear algebra, J. Edmonds, *J. Res. NBS* **71B**4-250, pp. 241-245 (Oct.-Dec. 1967).

Key words: Algorithms; combinatorics; indeterminates; linear algebra; matroids; systems of distinct representatives; term rank.

Some purposes of this paper are: (1) To take seriously the term, "term rank." (2) To make an issue of not "rearranging rows and columns" by not "arranging" them in the first place. (3) To promote the numerical use of Cramer's rule. (4) To illustrate that the relevance of "number of steps" to "amount of work" depends on the amount of work in a step. (5) To call attention to the computational aspect of SDR's, an aspect where the subject differs from being an instance of familiar linear algebra. (6) To describe an SDR instance of a theory on extremal combinatorics

that uses linear algebra in very different ways than does totally unimodular theory. (The preceding paper, Optimum Branchings, describes another instance of that theory.)

Bounds for the number of generators of a finite group, M. Newman, *J. Res. NBS* 71B4-251, pp. 247-248 (Oct.-Dec. 1967).

Key words: Bounds; elementary abelian groups; generator rank; Sylow subgroups.

It is proved that if G is a finite group of order n, then the generator rank of G does not exceed the total number of primes dividing n and is equal to this number for infinitely many groups G.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 72B, JANUARY-DECEMBER 1968

January-March 1968

Means and the minimization of errors, M. Aissen, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 1-4 (Jan.-Mar. 1968).

Key words: Arithmetic mean; geometric mean; harmonic mean; means; relative error.

Let $0 < a < b$. How should a number p be chosen so that the maximum 'relative error' obtained, by replacing a number x varying in the closed interval $[a, b]$, by p. is a minimum? For a large number of 'relative errors,' p must be chosen as the geometric mean of a and b.

On Taylor's theorem, O. Shisha, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 5 (Jan.-Mar. 1968).

Key words: Iterated integrals; remainders; Taylor series.

A simple way of looking at and proving Taylor's theorem.

Principal submatrices III: linear inequalities, R. C. Thompson, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 7-22 (Jan.-Mar. 1968).

Key words: Cauchy inequalities; Hermitian matrices; interlacing theorems; matrices; matrix inequalities; matrix theory; principal submatrices.

Let H be an $n \times n$ Hermitian matrix with eigenvalues $\lambda_1 \leqslant \lambda_2 \leqslant \ldots \leqslant \lambda_n$. Let $H(i|i)$ denote the principle submatrix of H obtained by deleting row i from H. Let $\xi_{i1} \leqslant \xi_{i2} \leqslant \ldots \leqslant \xi_{i,n-1}$ be the eigenvalues of $H(i|i)$. The famous Cauchy inequalities assert that $\xi_{i1}, \ldots, \xi_{i,n-1}$ interlace $\lambda_1, \ldots, \lambda_n$. It was recently proved by the present author that, for each fixed j, the arithmetic mean $n^{-1} \sum_{i=1}^{n} \xi_{ij}$ of the ξ_{ij} lies between $(1-\theta)\lambda_j + \theta\lambda_{j+1}$ and $\theta\lambda_j + (1-\theta)\lambda_{j+1}$, where $\theta = 1/n$. In the present paper the cases of equality in these inequalities for the arithmetic mean of the ξ_{ij} are discussed.

The diophantine equation $P(x, y) = (xy + d)z$, C. F. Osgood, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 23-28 (Jan.-Mar. 1968).

Key words: Algebraic equations; diophantine equations; integers; three variables.

Under certain conditions the algebraic equation $P(x, y) = (xy + d)z$, where $P(x, y)$ is a polynomial in x and y with integral coefficients and d is an integer, is shown to have an infinite number of distinct solutions with x, y, and z each an integer.

A note on the *G*-transformation, H. L. Gray and T. A. Atchison, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 29-31 (Jan.-Mar. 1968).

Key words: Improper integrals; nonlinear transformation.

Recent literature concerning the use of nonlinear transformations to evaluate numerically certain improper integrals of the first kind has shown that difficulties are encountered if the integrand f is such that

$$\lim_{t \to \infty} \frac{f(t+k)}{f(t)} = 1.$$

This note introduces a new nonlinear transformation which is in some cases quite useful when the above limit is one. A simple example is given to illustrate the use of this transformation.

The distribution of the sample correlation coefficient with one variable fixed, D. Hogben, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 33-35 (Jan.-Mar. 1968).

Key words: Analysis of variance; calibration; correlation coefficient; degrees of freedom; distribution; fixed variable; noncentral beta variable; noncentrality; Q variate.

For the usual straight-line model, in which the independent variable takes on a fixed, known set of values, it is shown that the sample correlation coefficient is distributed as Q with $(n-2)$ degrees of freedom and noncentrality $\theta = (\beta/\sigma) \sqrt{\Sigma(x_i - \bar{x})^2}$. The Q variate has been defined and studied elsewhere by Hogben et al. It is noted that the square of the correlation coefficient is distributed as a noncentral beta variable.

Solutions of the time-dependent Klein-Gordon and Dirac equations for a uniform electric field, V. W. Myers, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 37-42 (Jan.-Mar. 1968).

Key words: Dirac and Klein-Gordon equations; time-dependent solutions; uniform electric field.

The time-dependent Klein-Gordon and Dirac equations are solved for the motion of a charged particle in a classical uniform electrostatic field of infinite extent. The elementary solutions have a position dependence of the form $e^{ik \cdot r}$ with the component of k in the field direction varying linearly with time.

Analysis of a market split model, J. M. McLynn, A. J. Goldman, P. R. Meyers, and R. H. Watkins, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 43-60 (Jan.-Mar. 1968).

Key words: Demand; elasticity; mathematical economics; partial differential equations.

A mathematical analysis is given for a class of models describing how a "market" (i.e., some subset of the consuming public) might divide its patronage among p competing products ($p > 1$). The analysis is confined to the question of how the respective shares of market change with respect to changes in the variables describing the competing products. The split fractions which define the share of market are assumed to be functions of the choice-influencing attributes of *all* the competing products. The elasticities of the split fractions with respect to these attributes are assumed to be functions only of the split fractions themselves. Some functional forms (including the linear case) leading to self-consistent models are analyzed and their solutions derived.

Citation searching and bibliographic coupling with remote on-line computer access, F. L. Alt and R. A. Kirsch, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 61-78 (Jan.-Mar. 1968).

Key words: Bibliographies; citations; computer; information retrieval; remote consoles; timesharing.

Experiments were performed on a remote, multiple access computer to retrieve bibliographic items based on citation data. The citations were from some 25,000 physics papers. Estimates were made of the relevance of bibliographies derived from such

citations. Some extrapolations are made to future systems with remote multiple access capability.

Simple analytic expressions for the total Born approximation cross section for pair production in a coulomb field, L. C. Maximon, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 1, 79-88 (Jan.-Mar. 1968).

Key words: Born approximation; coulomb field; moderate energy cross section; pair production; Racah cross section; total photon cross section.

The total Born approximation cross section for pair production in a coulomb field given originally by Racah is used to derive two simple and rapidly convergent analytic expansions for this cross section, one valid for high energies, k, of the incident photon, the other for energies near the threshold. For $k > 4mc^2$ the fractional error involved in using the first four terms in the high energy expansion is $< 4.4 \times 10^{-5}$. For $k < 4mc^2$ the fractional error committed in using the first five terms of the low energy expansion is $< 1.1 \times 10^{-4}$. The leading terms in these expansions are the well known high energy and low energy limits of this cross section, respectively.

April-June 1968

The probability of an equilibrium point, K. Goldberg, A. J. Goldman, and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 93-101 (Apr.-June 1968).

Key words: Equilibrium; probability; theory of games.

A formula is derived for the probability that a "random" m-by-n two-person noncooperative game has an equilibrium-point solution in pure strategies. The limit of this probability as $m, n \to \infty$ is shown to be $1\text{-}1/e$. The probability is tabulated for $m, n \leq 10$.

On spaces and maps of generalized inverses, J. Z. Hearon and J. W. Evans, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 103-107 (Apr.-June 1968).

Key words: Generalized inverse; linear algebra; matrix.

Several classes of generalized inverses of a given $m \times n$ matrix are considered. A collection of continuous maps is given, each of which maps a class of generalized inverses onto a stronger class and the elements of the stronger class are the fixed points of the map. For the case of EPr matrices one of these maps is studied in more detail. The various classes of generalized inverses are characterized as subspaces of the space of all $n \times m$ matrices.

Differentiable generalized inverses, J. Z. Hearon and J. W. Evans, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 109-113 (Apr.-June 1968).

Key words: Differentiable generalized inverse; generalized inverse; matrix.

Necessary and sufficient conditions are given for a differentiable matrix to have a differentiable generalized inverse. It is shown that when these conditions are met there exist, for several classes of generalized inverses, a differentiable generalized inverse which coincides with a prescribed generalized inverse on a particular subset. The relations betweeen the derivative of a matrix and that of a differentiable generalized inverse are given.

Principal submatrices V: some results concerning principal submatrices of arbitrary matrices, R. C. Thompson, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 115-125 (Apr.-June 1968).

Key words: Eigenvalues; matrix; principal submatrices; rank; symmetric matrix.

This paper studies: (i) interlacing properties for the real eigenvalues of matrices; (ii) symmetric matrices with many equal principal minors; (iii) the determinantal characterization of the rank of a matrix.

Mathematical basis for the plasma kinetic equations (BBGKY), J. J. Sopka, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 127-133 (Apr.-June 1968).

Key words: BBGKY hierarchy equations; probabilistic basis for kinetic equations.

The general family of kinetic equations, which in plasma kinetics are called the BBGKY equations, are obtained rigorously from basic probabilistic considerations in order to exhibit explicity the conditions or assumptions under which they obtain.

On the diffusion of an ion sheet in Poiseuille flow, S. Jarvis, Jr., *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 135-143 (Apr.-June 1968).

Key words: Diffusion; ion flow tubes.

A nonuniform sheet of ions generated at time $t = 0$ diffuses in a cylindrical ion diffusion tube containing a nonreacting neutral species flowing with parabolic velocity distribution. Calculation of the on-axis ion density at a point z downstream as a function of time t is reduced to a single numerical integration for each (z, t) involving some functions which have been computed once for all. An example is given showing the effect of the velocity distribution compared with a uniform flow with the same flow rate. The results appear to be corroborated by experiment.

A class of thickness-minimal graphs, A. M. Hobbs and J. W. Grossman, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 2, 145-153 (Apr.-June 1968).

Key words: Bipartite graphs; graph theory; mathematics; planar graphs; thickness of graphs; t-minimal graphs.

The thickness of a graph G is the minimum number of planar subgraphs whose union is G. A t-minimal graph is a graph of thickness t which contains no proper subgraph of thickness t. In this paper, we show that the complete bipartite graph on two sets each containing $4t-5$ vertices is t-minimal for all $t \geq 2$. We also show that if the complete graph on 16 vertices has thickness 4, it is 4-minimal.

July-September 1968

Interaction in multidimensional contingency tables: an information theoretic approach, H. H. Ku and S. Kullback, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 3, 159-199 (July-Sept. 1968).

Key words: Contingency tables; estimation of cell frequencies from marginals; generalized independence; hypothesis testing; information theory; interaction; second-order interaction.

The problem of interaction in multidimensional contingency tables is investigated from the viewpoint of information theory as developed by Kullback. The hypothesis of no rth-order interaction is defined in the sense of an hypothesis of "generalized" independence of classifications with fixed rth order marginal restraints. For a three-way table, with given cell probabilities π_{ijk}, the minimum discrimination information for a contingency table with marginals $p_{ij\cdot}$, $p_{\cdot jk}$, and $p_{i\cdot k}$ is given by the set of cell probabilities $p^*_{ijk} = a_{ij}b_{jk}c_{ik}\pi_{ijk}$ where a_{ij}, b_{jk}, and c_{ik} are functions of the given marginal probabilities, that is, $\ln (p^*_{ijk}/\pi_{ijk}) = \ln a_{ij} + \ln b_{jk} + \ln c_{ik}$, representing no second-order interaction. The minimum discrimination information statistic, asymptotically distributed as χ^2 with appropriate degrees of freedom is

$$2\Sigma_{ijk}x_{ijk} \ln x_{ijk} - 2\Sigma_{ijk}x_{ijk} \ln x^*_{ijk} \geq 0$$

where x_{ijk} are the observed cell frequencies and x^*_{ijk} are the "no interaction" cell frequencies uniquely determined by a simple

convergent iteration process of the marginals on π_{ijk}. For lower order marginal restraints the usual independence hypotheses are generated when π_{ijk} are taken to be the cell probabilities under uniform distribution. It is shown that the set p^*_{ijk} satisfies definitions of no second order interaction in a $2 \times 2 \times 2$ table given by Bartlett and no interaction in a $r \times s \times t$ table by Roy and Kastenbaum, and is also related to that given by Good. Results of application to the analysis of some "classical" three-dimensional contingency tables are given, together with full details for two four-dimensional examples.

On the coupling of longitudinal and transverse waves in a linear three-element viscoelastic string subjected to transverse impact, J. C. Smith and J. T. Fong, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 3, 201-214 (July-Sept. 1968).

Key words: Characteristics; finite-difference equations; linear viscoelasticity; partial differential equations; transverse impact; wave propagation; waves in strings.

The problem of wave propagation in a simple viscoelastic string subjected to constant velocity transverse impact is reexamined. An error in an earlier solution by Smith (*J. Res. NBS* **70B**, 257 (1966)) is corrected and an alternate numerical scheme based on the method of characteristics but using an implicit formulation of finite-difference equations is presented. The constitutive equation used is that of a linear viscoelastic model consisting of a spring and Maxwell element in parallel. Results of an illustrative calculation are discussed.

Allocating service periods to minimize delay time, W. A. Horn, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 3, 215-227 (July-Sept. 1968).

Key words: Allocation; queueing theory; scheduling; switching theory; traffic flow; transportation theory.

Consider a facility which must divide its services, during the time interval $[0, T]$, among N streams of arrivals. The problem treated is that of finding a pattern of service which minimizes total delay to the members of the streams, taking into account the "dead time" which begins each service period. For each stream, it is required that final queue size equal initial size, and that the queue be empty sometime in $[0, T]$. Conditions for feasibility of solutions are given in the case where the instantaneous service rates are bounded above by known constants. In the event that all streams have constant arrival rates and are to be served the same number of times, an optimal service pattern is derived using a recent result of R. Rangarajan and R. M. Oliver.

The second orthogonality conditions in the theory of proper and improper rotations. I. Derivation of the conditions and their main consequences, H. Gelman, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 3, 229-237 (July-Sept. 1968).

Key words: Matrices; orthogonal transformations; rotation.

A new set of orthogonality conditions is derived for real three-by-three orthogonal matrices which describe transformations in Euclidean three-dimensional space. The principal consequences of these conditions are obtained. These are: (1) the existence and construction of the intrinsic vector of the transformation, (2) an equation connecting the trace of a transformation matrix with that of its square, which, for rotations, can be solved to give the well-known trace formula analytically, (3) a simple formula for the determinant of a transformation matrix directly in terms of the relative handedness of the two coordinate systems connected by the transformation, (4) the secular equation for a transformation matrix.

Thickness and connectivity in graphs, A. M. Hobbs and J. W. Grossman, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 3, 239-244 (July-Sept. 1968).

Key words: Conjectures; connectivity; cut-set; graph theory; mathematics; minimality; thickness of graphs.

A graph G has *thickness* t if and only if t is the smallest number of planar subgraphs of G whose union is G. A *thickness-minimal*, or *t-minimal*, graph is a graph of thickness t with no proper subgraph of thickness t. In this paper we show that, for every t, a cut set in a t-minimal graph can have no fewer than t edges. This theorem suggests that the connectivity of a t-minimal graph is bounded from below by t. We disprove this suggestion for every $t > 2$ by constructing a graph which contains a 2-connected t-minimal graph. Two theorems extend this result and develop additional properties of the construction method. In addition, we show that the connectivity of a graph of thickness t is at most $6t - 1$ and that the thickness of K_{22} is 4. Finally, we make four conjectures about graphs of thickness t.

October-December 1968

Principal submatrices VII: further results concerning matrices with equal principal minors, R. C. Thompson, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 249-252 (Oct.-Dec. 1968).

Key words: Matrix; principal submatrices; rank; symmetric matrix.

This paper characterizes real symmetric matrices A such that all $t \times t$ principal minors are equal and all $t \times t$ nonprincipal minors are of fixed sign, for two consecutive values of t less than rank A. It also characterizes matrices A (over an arbitrary field) in which all $t \times t$ principal minors are equal and all nonprincipal $t \times t$ minors are equal, for one fixed value of t less than rank A.

On the multipliers of the Dedekind modular function, J. Lehner, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 253-261 (Oct.-Dec. 1968).

Key words: Cancellation; commutator subgroup; modular group; multiplier; word.

The Dedekind modular function is defined by $\eta(\tau) = e^{\pi i \tau/12} \prod_1^\infty (1 - e^{2\pi i m\tau})$, Im $\tau > 0$, and satisfies the transformation equation $(c\tau + d)^{-1/2}\eta(A\tau) = v(A)\eta(\tau)$ for every $A \epsilon \Gamma$, the modular group, where $v(A)$ is a complicated 24th root of unity depending on A. Let G be the set of all $A \epsilon \Gamma$ for which $v(A) = 1$. *Then G is not a group,* but there are groups that are subsets of G, e.g., $\{S^{24}\}$, where $S = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$. *Main Theorem.* Every subgroup of Γ that is a subset of G is cyclic. Moreover $G \subset \Gamma'$, the commutator subgroup of Γ.

Minimax error selection of a discrete univariate distribution with prescribed componentwise bounds, A. J. Goldman and P. R. Meyers, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 263-271 (Oct.-Dec. 1968).

Key words: Linear programs; mathematical models; operations research.

The topic treated is that of finding a reproducible, plausible and computationally simple method of selecting a discrete frequency distribution with prescribed upper and lower bounds on its components. The problem is shown to be tractable when a minimax error selection criterion is employed, and "error" is measured by maximum absolute deviation between components. In this case one obtains a linear program of a special form admitting explicit solution. The vertices of the polyhedron of optimal solutions can also be found explicitly, and so their centroid can be calculated if unique specification is required.

Minimax error selection of a discrete univariate distribution with prescribed componentwise ranking, A. J. Goldman, *J. Res.*

Nat. Bur. Stand. (U.S.), **72B** (Math. Sci.), No. 4, 273-277 (Oct.-Dec. 1968).

Key words: Mathematical models; minimax estimation; probability distribution.

The topic treated is that of finding a reproducible, plausible and computationally simple method of selecting a discrete frequency distribution with a prescribed ranking of its components. The problem is shown to be tractable when a minimax error selection criterion is employed, and "error" is measured by maximum absolute deviation between components. The vertices of the polyhedron of optimal solutions can also be found explicitly, and so their centroid can be calculated if unique specification is required.

On the signs of the ν-derivatives of the modified Bessel functions $I_\nu(x)$ and $K_\nu(x)$, D. O. Reudink, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 279-280 (Oct.-Dec. 1968).

Key words: Bessel functions; ν-derivatives.

It is proved that $\partial I_\nu(x)/\partial\nu$ is negative and $\partial K_\nu(x)/\partial\nu$ is positive when $x > 0$ and $\nu > 0$.

Comparison of finite-difference computations of natural convection, K. E. Torrance, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 281-301 (Oct.-Dec. 1968).

Key words: Enclosures; finite-difference; fluid flow; natural convection; numerical.

Five numerical methods were compared for calculating two-dimensional, transient natural convection in an enclosure. Both implicit and explicit procedures were considered. Requirements for numerical stability were derived from analysis and experience, and when satisfied, the calculated flows for all methods were found to be similar. Consideration was also given to the accuracy and (energy and vorticity) conservation of the methods. One method was found to be conservative and stable without a restriction on the spatial mesh increment. This method can be successfully applied to nonlinear flows, but care must be exercised due to the presence of truncation errors which introduce false transport mechanisms.

Generalized inverses and solutions of linear systems, J. Z. Hearon, *J. Res. Nat. Bur. Stand. (U.S.)*, **72B** (Math. Sci.), No. 4, 303-308 (Oct.-Dec. 1968).

Key words: Generalized inverse; linear systems; matrix.

For an arbitrary complex matrix A we consider (1) the set of all matrices B such that $ABA = A$ and AB is Hermitian and (2) the set of all matrices B such $ABA = A$ and BA is Hermitian. It is shown that if B is in (1) then $x = By$ is a least-squares solution of $Ax = y$ and that if B is in (2) then $x = By$ is the solution of minimum Euclidian norm of the consistent systems $Ax = y$. The connection is exposed between the properties of the generalized inverses in (a) and (b) and the fact that among all matrices X satisfying $AXA = A$, that with minimum Euclidian norm is the Moore-Penrose inverse of A.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 73B, JANUARY-DECEMBER 1969

January-March 1969

A table of integrals of the error functions, E. W. Ng and M. Geller, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 1-20 (Jan.-Mar. 1969).

Key words: Astrophysics; atomic physics; Error functions; indefinite integrals; special functions; statistical analysis.

This is a compendium of indefinite and definite integrals of products of the Error function with elementary or transcendental functions. A substantial portion of the results are new.

Fourier coefficients of Mathieu functions in stable regions, H. Fruchting, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci), No. 1, 21-24 (Jan.-Mar. 1969).

Key words: Bisection method; eigenvalues; Fourier coefficients; Mathieu functions.

A method for calculating the Fourier coefficients of Mathieu functions in stable regions based on the method of bisection and Miller's recurrence algorithm is introduced. Some Fourier coefficients are calculated and compared with those given earlier by Tamir and Wang. It is shown that the method of Tamir and Wang fails for indices in the neighborhood of integers.

A note on the *T*-transformation of Lubkin, W. D. Clark, H. L. Gray, and J. E. Adams, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 25-29 (Jan.-Mar. 1969).

Key words: Convergence acceleration techniques; epsilon-transformation; nonlinear series transformation; numerical methods; series summability methods.

This paper is concerned with a sequence-to-sequence transformation studied extensively by Samuel Lubkin [*J. Res. NBS* **48**, 228-254 (1952)]. Lubkin has studied the rate of convergence of the transformed sequence, $\{T_n\}$, versus the original sequence, $\{S_n\}$. In this respect, the authors have shown that a more accurate evaluation of the transformation is achieved by the comparison of $\{T_n\}$ with $\{S_{n+1}\}$ instead of $\{S_n\}$. The main theorems proved are rate-of-convergence comparisons between $\{T_n\}$ and $\{S_{n+1}\}$ where $\{S_n\}$ is the sequence of partial sums of a convergent series whose terms are of constant sign or else are alternating.

The cylinder problem in thermoviscoelasticity, W. S. Edelstein, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 31-40 (Jan.-Mar. 1969).

Key words: Cylinder; Neumann series; thermoviscoelasticity.

Solutions are obtained for several axially symmetric plane strain problems involving a hollow circular viscoelastic cylinder. The cylinder is assumed to be subject to planar, axially symmetric body force and temperature fields. Displacement, traction, and mixed boundary conditions are considered.

Relations within sequences of congruential pseudo-random numbers, P. H. Verdier, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 41-44 (Jan.-Mar. 1969).

Key words: Congruential generators; multidimensional distributions; random number generators.

Conditions are exhibited under which simple, approximate linear relations may be found between sets of successive choices made by congruential pseudo-random number generators. These relations imply that the distributions in n-dimensional space produced by such generators can be very highly nonuniform. The results are illustrated with several examples. Restrictions on the parameters of the generator to minimize difficulties of this sort are discussed.

On the mean dimensions of restricted random walks, P. H. Verdier and E. A. DiMarzio, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 45-46 (Jan.-Mar. 1969).

Key words: Lattice; nonreversing walk; polymer dimension; random walk.

A simple method is presented for obtaining mean dimensions of certain restricted random walks on lattices.

The cube of every connected graph is 1-hamiltonian, G. Chartrand and S. F. Kapoor, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 47-48 (Jan.-Mar. 1969).

Key words: Cube of a graph; graph; hamiltonian.

Let G be any connected graph on 4 or more points. The graph G^3 has as its point set that of G, and two distinct points u and v are adjacent in G^3 if and only if the distance between u and v in G is at most three. It is shown that not only is G^3 hamiltonian, but the removal of any point from G^3 still yields a hamiltonian graph.

Minimum-length covering by intersecting intervals, W. A. Horn, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 1, 49-51 (Jan.-Mar. 1969).

Key words: Covering problems; Manhattan metric.

This paper considers the problem: Given a sequence $\{I_i\}_1^n$ of intervals on the real axis, find a sequence $\{J_i\}_1^n$ of closed intervals which minimizes the sum-of-lengths $S = \Sigma_1^n |J_i|$ subject to $I_i \subseteq J_i$ and $J_i \cap J_{i+1} \neq \phi$ for all i. The paper gives a simple algorithm for determining the J_i and notes that linear programming can be applied to the more complicated problem where S is changed to $\Sigma_1^n \alpha_i |J_i|$, $\alpha_i > 0$.

April–June 1969

An evaluation of linear least squares computer programs, R. H. Wampler, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 59-90 (Apr.-June 1969).

Key words: Computer programs; Gram-Schmidt orthogonalization; Householder transformations; least squares; linear equations; orthogonalization; orthogonal polynomials; regression; rounding error; stepwise regression.

Two linear least squares test problems, both fifth degree polynomials, have been run on more than twenty different computer programs in order to assess their numerical accuracy. Among the programs tested were representatives from various statistical packages as well as some from the SHARE library. Essentially five different algorithms were used in the various programs to obtain the coefficients of the least squares fits. The

tests were run on several different computers, in double precision as well as single precision. By comparing the coefficients reported, it was found that those programs using orthogonal Householder transformations or Gram-Schmidt orthonormalization were much more accurate than those using elimination algorithms. Programs using orthogonal polynomials (suitable only for polynomial fits) also proved to be superior to those using elimination algorithms. One program, using congruential methods and integer arithmetic, obtained exact solutions. In a number of programs, the coefficients reported in one test problem were sometimes completely erroneous, containing not even one correct significant digit.

The traffic assignment problem for a general network, S. C. Dafermos and F. T. Sparrow, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 91-118 (Apr.-June 1969).

Key words: Algorithm; least cost; traffic allocation; transportation.

A transportation network is considered. The traffic demands associated with pairs of nodes and the (convex) traveling cost functions associated with the links are assumed given. The two problems of finding the traffic patterns which either minimize the total cost or equilibrate the users' costs are formulated, and algorithms are constructed for the solution of these problems.

Sufficient conditions for the instability of numerical integration methods, A. I. Abdel Karim, *J. Res. Nat. Bur. Stand. (U.S.)*, 73B (Math. Sci.), No. 2, 119-123 (Apr.-June 1969).

Key words: Numerical integration; stability.

In a previous paper, a general theorem was investigated for the stability of numerical integration methods for the solution of systems of differential equations. In this paper, further theorems are developed as sufficient conditions for the instability of numerical integration methods. Applying these theorems, the instability of known formulas are checked easily at a glance.

The second orthogonality conditions in the theory of proper and improper rotations. II. The intrinsic vector, H. Gelman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 125-138 (Apr.-June 1969).

Key words: Axis and angle of rotation; coordinate inversion; coordinate reflection; improper rotations; matrices; orthogonal transformations; proper rotations; rigid rotations; rotation.

The properties of the intrinsic vector associated with a real three-by-three orthogonal transformation, are derived. For proper rotations the problem of extracting the axis and angle or a rotation from its matrix representation, is considered. It is shown that the intrinsic vector allows the determination of the axis and angle as unambiguously as possible, thus remedying the ambiguous treatment of this problem in the literature. Several examples of this use of the intrinsic vector are given. Its properties for improper rotations are also discussed.

The second orthogonality conditions in the theory of proper and improper rotations. III. The conjugacy theorem, H. Gelman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 139-141 (Apr.-June 1969).

Key words: Conjugacy; conjugacy theorem; conjugate rotations; matrices; orthogonal group; orthogonal transformations; rotation; rotation group; rotation-inversions.

The second orthogonality conditions are used to provide a concise proof of the theorem that two rotation matrices connected by an orthogonal similarity transformation have the same angles of rotations. This theorem is discussed in the context of its applicability to the problem of decomposing the real orthogonal group 0(3) into its classes of conjugate elements.

Subgroups of $SL(t,Z)$, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 143-144 (Apr.-June 1969).

Key words: Congruence subgroup property; free groups; free products; higher modular groups.

It is shown that if $t \geq 3$, then no subgroup of $SL(t,Z)$ of finite index is free (in fact is not even the free product of cyclic groups). Here $SL(t,Z)$ is the multiplicative group of $t \times t$ matrices over the integers of determinant 1.

Cuttable and cut-reducible matrices, R. B. Marimont, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 145-151 (Apr.-June 1969).

Key words: Compartmental systems; connectivity; graph; matrix.

An n square matrix having an $(n-1)$ principal minor which is block diagonal (or reducible) is called cuttable (or cut-reducible). The connectivity matrix of a graph having a cutpoint is cuttable. While neither block diagonal nor reducible, cuttable and cut-reducible matrices share with these matrices some of the theoretical and computational simplicity derived from a natural division into principal submatrices which are relatively independent of each other. Solution of linear compartmental systems are shown to be simplified by the presence of a cutpoint in the system.

Automorphic integrals with preassigned periods, J. Lehner, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 153-161 (Apr.-June 1969).

Key words: Automorphic form; automorphic integral; fundamental region; group; Poincaré series.

Let Γ be a discrete group of real 2×2 matrices of determinant 1. Generalizing the usual notion of abelian integral, Eichler has defined $\Phi(\tau)$ to be an automorphic integral of degree $2n-2$ on Γ if (1) $\Phi|A = \Phi + \omega_A$ for all $A \epsilon \Gamma$. Here n is a positive integer, ω_A is a polynomial in τ of degree $2n-2$ or less, and $\Phi|A = (c\tau + d)^{2n-2}\Phi(A\tau)$, where τ is confined to the upper half-plane. A consequence of (1) is that (2) $\omega_{AB} = \omega_A|B + \omega_B$. If Φ has at most poles but no logarithmic singularities, Φ is said to be of the second kind and this requires (3) $\omega_A = Q|(A-1)$ for all elements A that fix a real cusp of a fundamental region of Γ, where Q is a polynomial of degree $\leq 2n-2$. Eichler proved that the necessary conditions (2) and (3′) are also sufficient for the existence of a Φ on Γ with the preassigned "periods" ω_A, but only when Γ is a subgroup of finite index in the modular group. Here (3′) is a stronger version of (3). In the present paper this is generalized to all groups Γ that are finitely-generated and have translations, and we use the correct conditions (2), (3) rather than (2), (3′).

A digital computer technique for calculating the step response of lumped or distributed networks, J. R. Andrews and N. S. Nahman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73B** (Math. Sci.), No. 2, 163-176 (Apr.-June 1969).

Key words: Digital computer program; distributed networks; inverse Laplace Transformation; lumped networks; Rosenbrock cursor; step response; transmission line.

This paper discusses a technique to solve step response problems for lumped or distributed networks with the aid of a digital computer. The Rosenbrock graphical cursor technique for obtaining the step response from the frequency response through the inverse Laplace Transformation was adapted for computer use. In addition, it was modified to increase its accuracy when used with a digital computer.

The response of a series RLC lumped network is computed and the numerical solution is compared to the analytical solution. Also, a numerical solution is given for the step response of a transmission line processing skin-effect metal loss and Debye dielectric loss.

Symmetry and the crossing number for complete graphs, T. L. Saaty, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 2, 177-186 (Apr.-June 1969).

Key words: Complete graphs; intersections, symmetry.

This paper studies the minimum number of intersections of edges in a complete graph on n vertices drawn in the plane. The proofs are first given for $n \leq 10$. A theorem on the maximum number of intersections is also given. Geometric representations of these cases are included. Symmetry of the representations is then discussed as it applies to extensions from small values of n to larger values maintaining the minimality of the number of intersections. Based on a symmetry conjecture given in the paper, a proof is given for the general case of the minimum intersection problem.

July–September 1969

A table of integrals of the exponential integral, M. Geller and E. W. Ng, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 191-210 (July-Sept. 1969).

Key words: Diffusion theory; exponential integral; indefinite integrals; quantum mechanics; radiative equilibrium; special functions; transport problems.

This is a compendium of indefinite and definite integrals of products of the Exponential Integral with elementary or transcendental functions. A substantial portion of the results are new.

Principal ideals in matrix rings, M. Newman and S. Pierce, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 211-213 (July-Sept. 1969).

Key words: Dedekind ring; matrix ring; non-Noetherian ring; principal ideal ring.

It is shown that every left ideal of the complete matrix ring of a given order over a principal ideal ring is principal, and a partial converse is proven.

The second orthogonality conditions in the theory of proper and improper rotations. IV. Solution of the trace and secular equations, H. Gelman, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 215-223 (July-Sept. 1969).

Key words: Closed form of rotation matrix; orthogonal transformation; rotation; rotation matrix; secular equation; trace equation; trace formula.

The equation which connects the trace of a rotation matrix and that of its square, and the secular equation for a rotation matrix, both of which are direct results of the second orthogonality conditions, are solved by purely analytic methods based on the group property and the periodicity property of rotation matrices. The point is thus made that the well known formulas for the trace of a rotation matrix in terms of the angle of rotation and for the rotation matrix itself in terms of the axis and angle of rotation, are closely related to the algebraic properties of rotation matrices.

Minimax error selection of a univariate distribution with prescribed componentwise bounds and ranking, A. J. Goldman, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 225-230 (July-Sept. 1969).

Key words: Linear programs; mathematical models; minimax estimation; operations research; probability distribution.

The topic treated is that of finding a reproducible, plausible and computationally simple method of selecting a discrete frequency distribution with a prescribed ranking of its components and prescribed upper and lower bounds on these components. The problem is shown to be tractable when a minimax error selection criterion is employed, and "error" is measured by maximum absolute deviation among components. In this case one obtains a linear program of a special form admitting explicit solution.

Minimax adjustment of a univariate distribution to satisfy componentwise bounds and/or ranking, A. J. Goldman, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 231-239 (July-Sept. 1969).

Key words: Linear programs; mathematical models; minimax estimation; operations research; probability distribution.

Consider a discrete probability distribution, represented by an n-vector **a**. This paper treats the problem of adjusting **a** as little as possible, in the sense of minimizing $\max_i |x_i - a_i|$, to obtain a distribution **x** which satisfies given componentwise bounds $\mathbf{L} \leq \mathbf{x} \leq \mathbf{U}$, or a given componentwise ranking, or both. The resulting linear programs are shown to admit special explicit solution algorithms.

On the application of some interpolating functions in physics, A. J. Jerri, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 241-245 (July-Sept. 1969).

Key words: Cardinal series; interpolation; Regge poles; special functions.

J. M. Whittaker considered interpolating equidistant samples by using the cardinal series. In this paper we consider the extension provided by the generalized sampling theorem of Kramer for nonequidistant samples. We calculate some sampling functions for cases of interest in mathematical physics. In particular, this includes the S-matrix contribution due to Regge poles, especially when a series expansion other than that of Fourier-Legendre type is needed.

Commutator groups and algebras, L. Greenberg, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 247-249 (July-Sept. 1969).

Key words: Adjoint representation; commutator; Lie algebra; Lie group.

Let H and K be connected, Lie subgroups of a Lie group G. The group $[H,K]$, generated by all commutators $hkh^{-1}k^{-1}(h \epsilon H, k \epsilon K)$ is arcwise connected. Therefore, by a theorem of Yamabe, $[H,K]$ is a Lie subgroup. If $\mathfrak{H},\mathfrak{K}$ denote the Lie algebras of H and K, respectively, then the Lie algebra of $[H,K]$ is the smallest algebra containing $[\mathfrak{H},\mathfrak{K}]$, which is invariant under $ad\mathfrak{H}$ and $ad\mathfrak{K}$. An immediate consequence is that if H and K are complex Lie subgroups, then $[H,K]$ is also complex.

On a class of nonlinear transformations and their applications to the evaluation of infinite series, H. L. Gray and W. D. Clark, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 3, 251-274 (July-Sept. 1969).

Key words: Aitken transformations; G-transformations; nonlinear transformations; rapidity of convergence.

In this paper the problem of increasing the rate of convergence of infinite sequences and series is considered by means of a class of nonlinear transformations. The transformations employed are the discrete analogue of the so called G-transformations and the theory surrounding them is investigated in some detail. The theoretical results are demonstrated by numerous examples.

October-December 1969

Temperature renormalization in the non-linear Vlasov problem, W. L. Sadowski and Z. G. Ruthberg, *J. Res. Nat. Bur. Stand. (U.S.),* **73B** (Math. Sci.), No. 4, 281-291 (Oct.-Dec. 1969).

Key words: Expansion coefficients; Hermite polynomials; non-linear; numerical; plasma; truncation error; Vlasov equation.

Ways of improving the representation of the velocity distribution function in the solution of the non-linear Vlasov equation are discussed. Hermite polynomial coefficients for temperature renormalization are derived. Transformation properties of Hermite polynomials necessary to do this are discussed. Analytic expressions for the truncation error of the temperature renormalized functions are compared with the computer results.

Selective excitation of harmonics in a collisionless plasma by two counterstreaming electron beams, W. L. Sadowski and Z. G. Ruthberg, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73B** (Math. Sci.), No. 4, 293-300 (Oct.-Dec. 1969).

Key words: Electron trapping; non-linear; numerical; selective harmonic excitation; two-stream; velocity distribution; Vlasov equation.

The possibility of selective harmonic excitation in a one-dimensional plasma that obeys the Vlasov equation is discussed. Electron beams, collimated in velocity space, are used for this purpose. Conditions on the velocity distribution function to achieve selective excitation are given. The velocity distribution function is expanded in Gram-Charlier series and the expansion coefficients are given. Bounds on truncation errors of the expansion are derived and compared with computer results.

Simultaneous contractification, A. J. Goldman and P. R. Meyers, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73B** (Math. Sci.), No. 4, 301-305 (Oct.-Dec. 1969).

Key words: Contractions; functional analysis; metric spaces; topology.

Consider a finite family of continuous self-mappings of a topological space X, with a common fixed point. Suppose that for each member of the family, X has a metric for which that member is a contraction. It is shown that if the family is commutative, then X has a metric under which all members are (simultaneously) contractions. Additional hypotheses are given which ensure the same conclusion in the noncommutative case.

A theorem on convex hulls, W. A. Horn, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73B** (Math. Sci.), No. 4, 307-308 (Oct.-Dec. 1969).

Key words: Convex geometry; convex sets.

Let p be a point in the interior K° of the convex hull $K = K(S)$ of a bounded point-set S in a real Hilbert space. A quantity $R(p)$ is determined such that every closed ball of radius $>R(p)$, if it contains p, must also meet S.

The partitioning of interaction in analysis of variance, J. Mandel, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73B** (Math. Sci.), No. 4, 309-328 (Oct.-Dec. 1969).

Key words: Factorial experiments; interaction; nonadditivity; principal components; surface fitting.

A method is presented for the analysis of data representing functions of two variables, when the response can be tabulated in a rectangular array. The procedure is based on a partitioning of the row by column interaction effects into a sum of terms, each of which is the product of a row factor by a column factor. The factors in each term are estimated by a method involving the extraction of characteristic roots.

The method contains as special cases a number of procedures used for the handling of non-additivity in two way arrays. It is very useful for the fitting of empirical surfaces, but it is also applicable to cases in which the data depend on qualitative rather than quantitative factors.

Comparisons with other techniques are made and an illustrative example is given.

Highly restricted partitions, H. Gupta, *J. Res. Nat. Bur. Stand.* (*U.S.*), **73B** (Math. Sci.), No. 4, 329-350 (Oct.-Dec. 1969).

Key words: Generating functions; graph of a partition; partitions.

The function $g(n, m, h, k)$, which enumerates the number of partitions of n into exactly k summands each less than or equal to m and in which the number of different summands is exactly h, is here tabulated and studied.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 74B, JANUARY-DECEMBER 1970

January-March 1970

Partitions—a survey, H. Gupta, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 1-29 (Jan.-Mar. 1970).

Key words: Congruences; generating functions; identities; partitions; recurrence formulas.

A historical survey of some aspects of the theory of partitions is given here.

A relation between the coefficients and roots of two equations and its application to diophantine problems, T. N. Sinha, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 31-36 (Jan.-Mar. 1970).

Key words: Diophantine equations; Prouhet-Tarry-Escott problem; symmetric functions.

The object of this paper is to prove:

THEOREM 1: *The system of equations*

$$a_1^r + a_2^r + \ldots + a_n^r = b_1^r + b_2^r + \ldots + b_n^r (r = 1, 2, \ldots, j-1, j+1, \ldots, n+1)$$

where j *is odd, has no nontrivial solutions in positive integers.*

THEOREM 2: *No two equations* $a_1^r + a_2^r = b_1^r + b_2^r (r = s,t)$ *where the pairs of values of* r *range between* 1 *and* 4 *can have a nontrivial solution in integers.*

An enumeration problem for a congruence equation, R. A. Brualdi and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 37-40 (Jan.-Mar. 1970).

Key words: Circulants; congruences; permanents.

It is shown that the number of n-tuples $(x_0, x_1, \ldots, x_{n-1})$ of nonnegative integers such that

$$\sum_{i=0}^{n-1} x_i = n,$$

$$\sum_{i=0}^{n-1} i x_i \equiv 0 \bmod n,$$

is given by

$$\frac{1}{n} \sum_{d \mid n} \binom{2d-1}{d} \varphi\left(\frac{n}{d}\right).$$

Orthogonal decompositions of tensor spaces, S. Pierce, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 41-44 (Jan.-Mar. 1970).

Key words: Irreducible character; symmetry class of tensors; symmetry operator; tensor product.

Let V be an n-dimensional vector space over the complex numbers. Let H be a subgroup of S_m, the symmetric group on $\{1, \ldots, m\}$, and let $W = \overset{m}{\otimes} V$ be the tensor product of V with itself m times. In this note we give an orthogonal direct sum decomposition of W in terms of the system of inequivalent irreducible characters of H.

AMS Subject Classifications: Primary, 1580; Secondary, 2080.

Partitioned hermitian matrices, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 45-46 (Jan.-Mar. 1970).

Key words: Generalized matrix function; positive semidefinite hermitian matrix.

A class of Cauchy-Schwarz type inequalities for partitioned hermitian matrices is presented.

Bounds on a polynomial, T. J. Rivlin, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 47-54 (Jan.-Mar. 1970).

Key words: Bernstein polynomials; bounds; polynomials.

Methods for computing the maximum and minimum of a polynomial with real coefficients in the interval [0,1] are described, and certain bounds are given.

Entire functions of exponential type, F. Gross, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 1, 55-59 (Jan.-Mar. 1970).

Key words: Bounded index; convexity; entire function; exponential type; maximum modulus.

Let f be an entire function satisfying for some integer p and some constant C

$$\sum_{j=0}^{N} \left(\int_0^{2\pi} \left| f^{(j)}(re^{i\theta}) \right|^r d\theta \right)^{1/p} \geq C \sum_{j=N+1}^{\infty} \left(\int_0^{2\pi} \left| f^{(j)}(re^{i\theta}) \right|^p \right)^{1/p}$$

for sufficiently large r. Then f is of exponential type. Conversely, the above is satisfied whenever f is periodic of exponential type. Similar conditions on the maximum moduli $M_f(j)(r)$ yield the same result. The analogous condition on $|f^{(j)}|$ is also discussed.

April-June 1970

Acoustic propagation and stability within an inviscid, heat-conducting fluid, J. E. McKinney and H. J. Oser, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 2, 67-84 (Apr.-June 1970).

Key words: Absorption; acoustic; adiabatic; fluid; heat-conducting; inviscid; isothermal; Kirchoff-Langevin equation; stability; steady-state; thermal; transient.

Propagation of acoustic waves within a continuum of inviscid, compressible, heat-conducting fluid is evaluated in detail in terms of both frequency (steady-state) and time dependent (transient) functions. The analysis reveals that when the value of the ratio of specific heats, γ, lies between one and two, the apparent steady-state solutions are conjugate to unstable, or regenerative, "transient" solutions, and, thus, are unacceptable. Propagation is stable for other values ($\gamma = 1, \gamma \geq 2$). The common assumption that the steady-state phase velocity varies continuously with increasing frequency from adiabatic to isothermal values is shown to be invalid, except when $\gamma = 2$.

On some indefinite integrals of confluent hypergeometric functions, E. W. Ng and M. Geller, *J. Res. Nat. Bur. Stand. (U.S.),* **74B** (Math. Sci.), No. 2, 85-98 (Apr.-June 1970).

Key words: Bessel functions; confluent hypergeometric functions; electronic energies; indefinite integrals.

Analytical expressions and reduction formulas are developed for various indefinite integrals of the confluent hypergeometric

functions. These integrals are of the type $\int f(a,b,z)z^p e^{\alpha z}dz$, where f is one of the two Kummer functions $M(a,b,z) \equiv {}_1F_1(a;b;z)$ or $U(a,b,z)$, with real or complex a, b, z and α, and real p.

On complementary polar conical sets, C. Witzgall, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 2, 99-113 (Apr.-June 1970).

Key words: Conjugate functions; convex cones; duality; linear programming; orthogonality; polarity.

Tucker has formulated the Duality Theorem of Linear Programming in terms of orthogonality properties of a pair of complementary orthogonal linear manifolds with respect to the positive orthant. This theorem is generalized by substituting complementary polar conical sets for complementary orthogonal linear manifolds, and the generalization is proved under simple stability assumptions. Equivalence to Fenchel's Duality Theorem for conjugate convex functions is established. There are strong parallelisms to work by Kretschmer.

On contractive semigroups and uniform asymptotic stability, P. R. Meyers, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 2, 115-120 (Apr.-June 1970).

Key words: Contractions; control theory; functional analysis; semigroup; stability theory; topology.

This paper calls attention to the equivalence between two well-known mathematical ideas: contraction mappings (in the sense of Banach) and asymptotic stability. The equivalence is formalized by defining a flow (representing the possible movements over time of some system through its state space) as a continuous one-parameter semigroup of operators on a metric space, and then showing that these operators are all contractions (in suitably revised metrics) if and only if there is a uniformly asymptotically stable equilibrium point. Generalizations to other operator semigroups are also given.

Normal subgroups of the modular group, L. Greenberg and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 2, 121-123 (Apr.-June 1970).

Key words: Genus; index; modular group; normal subgroups.

A number of results on the normal subgroup structure of the classical modular group is announced. A typical result is that a normal subgroup of square-free index is necessarily of genus 1, apart from 4 exceptions.

July-September 1970

Hecke basis theorems for groups of genus 0, M. I. Knopp and J. R. Smart, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 131-148 (July-Sept. 1970).

Key words: Eisenstein series; Hecke group; H-group; modular form; parametrization of cusp forms.

A Hecke-type basis theorem is established for the cusp forms of negative even integral degree (multiplier system 1) on the class of Hecke groups. Hecke established the result for the classical modular group, which is the first of the Hecke groups. A second result is a parametrization theorem for entire automorphic forms of negative real degree (with arbitrary multiplier systems) on certain discrete groups of real linear fractional transformations of genus zero.

The distribution of eigenvalues of covariance matrices of residuals in analysis of variance, J. Mandel, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 149-154 (July-Sept. 1970).

Key words: Analysis of variance; covariance matrix; eigenvalues; interaction; matrix; residuals; two-way table; vacuum cleaner.

A rigorous definition is given for the concept of an "interaction matrix" (Z_{ij}) where $i=1$ to m and $j=1$ to n, in terms of two idempotent matrices A_r and B_s of rank r and s, respectively. It is then shown that the frequency distribution of the eigenvalues of $(Z)(Z)'$ depends only on r and s. Applications are given to matrices of residuals arising from two-way data, either by removing row and/or column-means, or by applying any number of sweeps of the "vacuum cleaner." The theorems are important in the theory of the analysis of two-way tables of nonadditive data.

Expansions with coefficient algorithms for time domain responses of skin effect lossy coaxial cables, D. R. Holt, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 155-173 (July-Sept. 1970).

Key words: Coefficient algorithms; expansions; inverse Laplace transform; reflectometry; skin effect; step response; system function; transmission.

Time domain step response expansions with coefficient algorithms are developed from the system function of a doubly terminated skin effect lossy coaxial transmission line. Three models of series impedance valid for (a) high frequency, (b) high and intermediate frequency, (c) high and low frequency, are incorporated into the system function. The system function is expanded via the method of polynomial expansions of analytic functions through generating relations and inverted term by term into the time domain through the inverse Laplace transform. Step responses for time domain reflectometry and transmission are developed, computed, and compared with experimental results.

Derivatives of the Grüneisen and Einstein functions, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 175-182 (July-Sept. 1970).

Key words: Einstein function; electrical resistivity; Grüneisen function; solid state physics; transport properties.

Expressions (in closed form) are derived for the first five derivatives of the Grüneisen and Einstein functions. Recursion formulas for the successive derivatives of both functions are also given. Computations are made and tabular results are given for the first five derivatives of the Grüneisen and Einstein functions.

Selecting nonlinear transformation for the evaluation of improper integrals, T. A. Atchison, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 183-185 (July-Sept. 1970).

Key words: Improper integral; nonlinear transformation.

Recent literature concerning the use of nonlinear transformations to evaluate numerically certain improper integrals of the first kind involves the determination of a transformation function g to improve the approximation. By approximating a given integrand f by an integrable function f_1 and then determining an associated g function for f_1, a nonlinear transformation may be constructed which will yield an improved approximation of the improper integral of f.

On the spheroidal functions, D. R. Rhodes, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 187-209 (July-Sept. 1970).

Key words: Mathieu functions; spheroidal functions.

A number of new properties of the spheroidal functions of arbitrary real order $\alpha > -1$ are established, including double orthogonality over two separate intervals simultaneously and the existence of a new kind of characteristic numbers $\gamma_{\alpha n}(c)$ that arise from it. Some computational formulas are derived and a few numerical results are shown.

Automatic computing methods for special functions, I. A. Stegun and R. Zucker, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 3, 211-224 (July-Sept. 1970).

Key words: Approximations; computer programs; computing pitfalls; continued fractions; error function; recurrence relations; series.

Some of the pitfalls of automatic computation are described as well as their possible avoidance. A detailed description is given of the methods for computing the error and complementary error function. The implementation of the method is given in a double precision ASA FORTRAN program. The test ("driver") program and test results are also given.

October-December 1970

A property of the triangle groups, J. Lehner, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 231-233 (Oct.-Dec. 1970).

Key words: Element of finite order; F-group; normal subgroup; triangle group.

The F-groups are the groups possessing faithful representations by Fuchsian groups of the first kind; their presentations are known explicitly. Among the F-groups are the well-known triangle groups $G=\{x, y|x^p=y^q=(xy)^r=1\}$. If p, q, r are distinct prime integers, every proper normal subgroup of finite index in G has no elements of finite order. In this paper it is proved that among the F-groups only the triangle groups with distinct prime p, q, r have this property.

Some theorems on tensor composite graphs, M. F. Capobianco, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 235-237 (Oct.-Dec. 1970).

Key words: Digraphs; graphs; products; tensor; trees.

If a graph (digraph) is isomorphic to the tensor product of two graphs (digraphs) it is said to be a tensor composite graph (digraph). If not, it is said to be tensor prime. Several theorems giving various properties of tensor composite graphs and digraphs are presented. Among those dealing with (undirected) graphs is the result that any tree is tensor prime. This does not hold for digraphs. An example is given of a tensor composite digraph which is an unoriented tree. It is proved that a tensor composite digraph which is an oriented tree (an arborescence) does not exist. Some applications are presented.

The diophantine approximation of roots of positive integers, C. F. Osgood, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 239-242 (Oct.-Dec.).

Key words: Diophantine approximation; diophantine equation; effective computability.

The following result is established:

THEOREM: *Suppose that* $k \geq 150$ *and* m *are fixed positive integers. Then*

$$|\sqrt[k]{m}-pq^{-1}|<q^{-\frac{7}{8}k}$$

can hold for at most one pair of relatively prime positive integers p *and* q *with* $q \geq 2^9(\sqrt[k]{m}+1)^6$.

The new feature of this result is that the lower bound on q is given explicitly and is "small."

The minimum number of problems to cover all subproblems, H. J. Greenberg, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 243-247 (Oct.-Dec. 1970).

Key words: Combinatorics; dynamic programming; optimization; systems of distinct representatives; theory of computation.

The following problem is motivated and then solved, using the theory of systems of distinct representatives. Let $M=\{1, 2, \ldots, m\}$, and for each sequence σ of distinct members of M, let $\langle\sigma\rangle$ be the associated subset. Suppose given a mathematical problem $P(S)$ for each subset S of M, and an algorithm A which when applied to σ solves not only $P(\langle\sigma\rangle)$ but also all $P(\langle\tau\rangle)$ where τ is an initial segment of σ. What is the smallest number of applications of A needed to solve the entire ensemble of problems $\{P(S):S \subset M\}$?

Error estimates for the solution of linear algebraic systems, Brother K. E. Fitzgerald, F.S.C., *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 249-306 (Oct.-Dec. 1970).

Key words: Error estimates; evaluation of computer programs; inverse of a matrix; linear systems and matrices.

In this paper bounds for the error of a computed inverse of a matrix are developed. These are then applied to the solution of a single system. Methods for improving the approximate inverse are then discussed with some observations on the dangers involved in their practical use on a computer and some safeguards are indicated. Some computer programs for matrix inversion are then evaluated by means of the bounds developed.

On the singular values of a product matrices, W. Watkins, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 307-309 (Oct.-Dec. 1970).

Key words: Matrices; singular values.

The purpose of this note is to give necessary and sufficient conditions for the singular values of a product of matrices to be equal to certain products of their singular values. We then analyze the case of equality in a matrix inequality of Ostrowski.

Contractifiable semigroups, P. R. Meyers, *J. Res. Nat. Bur. Stand. (U.S.)*, **74B** (Math. Sci.), No. 4, 311-319 (Oct.-Dec. 1970).

Key words: Contractions; functional analysis; operators; semigroups; stability theory.

Consider a continuous semigroup of operators on a metric space, indexed $\{T_t\}$ by the nonnegative real numbers. It is shown that if any one of the operators can be made into a contraction by some topology-preserving remetrization, then for each $\lambda\epsilon(0, 1)$ there is a metric under which each operator $T_t(t>0)$ becomes a contraction constant λ^t. With the operators regarded as describing the evolution of an autonomous dynamical system, this metric can be used to define a Lyapanov function.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 75B, JANUARY-DECEMBER 1971

January-June 1971

Bounds to truncation errors in biorthogonal polynomial approximations, with illustrative applications to gamma-ray transport distributions, L. V. Spencer, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 1-16 (Jan.-June 1971).

Key words: Biorthogonal polynomials; gamma-ray transport; moment method; neutron transport; polynomial truncation errors; Sievert function.

Problems of gamma-ray and neutron penetration in infinite, homogeneous media can be solved in terms of infinite sums of a certain type of biorthogonal polynomial system. Many calculations have used a few terms, perhaps 4 to 8, successfully due to good apparent convergence. This paper develops expressions for bounds to the truncation error of these finite sums. Examples and applications are given of the functions used to obtain the error bounds.

A theorem on matrix commutators, J. M. Smith, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 17-21 (Jan.-June 1971).

Key words: Commutator; matrix; orthogonal; skew-symmetric.

Let $P = I_p + (-I_q)$, the direct sum of the $p \times p$ identity matrix and the negative of the $q \times q$ identity matrix. The following theorem is proved.

THEOREM: *If the matrices* A *and* B *are* P*-orthogonal (orthogonal with respect to* P*) and* P*-skew-symmetric (skew-symmetric with respect to* P*) then* [A,B] = AB − BA *may be expressed as the difference,* C − D, *of matrices which are* P*-orthogonal,* P*-skew-symmetric.*

Explicit expressions for the matrices C and D are given.

A special permutation matrix decomposition for combinatorial design incidence matrices, E. C. Johnsen and T. F. Storer, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 23-30 (Jan.-June 1971).

Key words: Block design; combinatorial analysis; configurations; König's theorem; matrices; matrix equations; permutation matrix decompositions; 0, 1 matrices.

By a well-known theorem of König, every 0,1 matrix A of order v with all row and column sums equal to $k > 0$ can be decomposed into a sum of k permutation matrices of order v. Here we consider whether A, trace $A = 0$ or v, can have a special permutation matrix decomposition called a *special König decomposition*. The question is answered more or less satisfactorily using certain graph factorization theorems of Petersen and Tutte. Symmetric counterexamples are given to show that not all such matrices have special König decompositions; however, it is shown that symmetric incidence matrices *for* $\langle v, k, \lambda \rangle$ designs always have special König decompositions.

The Casimir check for the algebraic matrices of the configuration $(d+s)^n p$, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 31-47 (Jan.-June 1971).

Key words: Casimir operator; checking parameters; $(d+s)^n p$, SU_3.

By using the eigenvalues of the Casimir operator for the group SU_3, checking parameters were obtained for 12 electrostatic interaction matrices of the configuration $(d+s)^n p$.

Convex homotopy, W. A. Horn, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 49-61 (Jan.-June 1971).

Key words: Convex functions; convex sets; homotopy.

Given any two continuous, convex functions f and g on a compact, convex set with certain properties ("regular" convexity), it is shown that an infinite number of homotopies of f and g exist which are also convex. One such homotopy in particular (the "basic" homotopy) is shown to have nice monotonicity properties and can be used as a basis for constructing other homotopies. A method of constructing the basic homotopy is given for the case where the domain of f and g is a line segment. (Theorems are for normed linear spaces only.)

The powers of a connected graph are highly hamiltonian, V. N. Bhat and S. F. Kapoor, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 63-66 (Jan.-June 1971).

Key words: Graph; hamiltonian; power of a graph.

Let G be a connected graph on p points. It is proved that if any k points are deleted from the graph G^{m+2}, $1 \leq m \leq p-3$ and $0 \leq k \leq m$, then the resulting graph is hamiltonian.

Exact solutions of linear equations with rational coefficients, A. S. Fraenkel and D. Loewenthal, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 69-75 (Jan.-June 1971).

Key words: Congruences; exact solutions; linear equations; modular arithmetic.

Improvements of a congruential method for finding the exact solutions of systems of linear equations with rational coefficients are described. Typical execution times on the CDC 1604-A are given, as well as the Fortran program.

An improvement of the Fischer inequality, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 77-80 (Jan.-June 1971).

Key words: Fischer inequality; Hadamard determinant theorem; permanent; positive definite hermitian matrix.

An improvement of the classical Fischer inequality for the determinant of a positive definite hermitian matrix is proved. It is used to analyze the Hadamard determinant theorem.

On the Smith normal form, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 81-84 (Jan.-June 1971).

Key words: Invariant factors; principal ideal rings; Smith normal form.

An elementary proof is given of the fact that if A, B are nonsingular $n \times n$ matrices over a principal ideal ring R, then the kth invariant factor of AB is divisible by the kth invariant factor of A and by the kth invariant factor of B, $1 \leq k \leq n$. Some consequences are drawn.

On certain optimal quadrature formulas, S. Haber, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 1 and 2, 85-88 (Jan.-June 1971).

Key words: Analytical functions; approximation; Gaussian quadrature; integration; optimal quadrature; quadrature.

A class of optimal quadrature formulas defined by V. L. N. Sarma in a probabilistic context is shown to be identical with a class of formulas defined previously, in a different manner, by P. J. Davis. As a result a contrast is drawn between the maximum of the error of a quadrature formula over the unit sphere in a certain function space, and its average—in Sarma's sense—over that sphere.

July-December 1971

Some elementary formulas in "matrix calculus" and their applications, J. T. Fong, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 97-107 (July-Dec. 1971).

Key words: Chain rule; continuum mechanics; gradient; matrices; matrix calculus; partial differentiation; product rule; tensor function; trace.

A collection of elementary formulas for calculating the gradients of scalar- and matrix-valued functions of one matrix argument is presented. Using some of the well-known properties of the operator "trace" on square matrices, alternative definitions of gradients and simple examples of calculating them using the product rule and the chain rule for differentiation are treated in an expository fashion in both component and matrix notations with emphasis on the latter. Two examples in continuum mechanics are presented to illustrate the application of the so-called "matrix calculus" of differentiable functions.

Linear transformations on matrices, M. Marcus, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 109-115 (July-Dec. 1971).

Key words: Determinant; generalized matrix function; invariants; matrices; rank.

Let K be a field and let $M_n(K)$ denote the vector space of all $n \times n$ matrices over K. Suppose $I(X)$ is an invariant defined on a subset $\mathcal{U}$ of $M_n(K)$. This paper surveys certain results concerning the following problem. Describe the set $\mathcal{L}(I, \mathcal{U})$ of all linear transformations $T: \mathcal{U} \to \mathcal{U}$ that hold the invariant I fixed:

$$I(T(X)) = I(X), \qquad X \in \mathcal{U}$$

Eigenvalues of sums of Hermitian matrices. III., R. C. Thompson and L. F. Garbanati, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 117-124 (July-Dec. 1971).

Key words: Eigenvalues; linear inequalities; singular values.

Two classes of nonlinear inequalities for the eigenvalues of sums of Hermitian matrices are obtained. These nonlinear inequalities are shown to follow from linear inequalities established in parts I and II of this series. A new inequality for the singular values of matrix products is also obtained.

A new type of boundary value coupling for second order Sturm-Liouville systems, J. Geist, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 125-138 (July-Dec. 1971).

Key words: Boundary value problems; coupled equations; differential equations; self-adjoint equations; Sturm-Liouville systems.

A natural generalization of the familiar second order Sturm-Liouville system is presented. This generalization consists of considering a number of differential equations defined on different intervals, instead of just one equation on one interval. The self-adjoint character of the differential equations is retained in the generalization, but the boundary conditions are relaxed considerably. The most general boundary conditions which can be accommodated by this sort of generalization of Sturm-Liouville theory are discussed. The existence of eigenvalues is proved, and a generalized orthogonality and a weak eigenfunction expansion theorem are derived.

An ergodic source which is not a function of any finite Markov process, R. D. Traub, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 139-148 (July-Dec. 1971).

Key words: Information theory; Markov process; probability theory; ring theory; stochastic process.

The problem of deciding when a stationary stochastic process is a function of a finite Markov process has been considered by several authors, leading to an elegant necessary and sufficient condition. Taking a different approach, this note uses elementary ring theory to prove that a certain explicitly constructed stationary ergodic process is not a function of any finite Markov process.

On entire functions of exponential type, S. M. Shah and W. C. Sisarcick, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 149-156 (July-Dec. 1971).

Key words: Bounded index; entire function; exponential type; maximum modulus.

Let f be an entire function and let $p \geq 1$ and

$$I(l, r) = \left\{ \int_0^{2\pi} |f^{(l)}(re^{i\theta})|^p d\theta \right\}^{1/p}.$$

Let $C > 0$. If there exists a positive integer N such that for $k = 0, 1, \ldots, N$,

$$\sum_{j=0}^{N} \frac{I(k+j, r)}{j!} \geq C \sum_{j=N+1}^{\infty} \frac{I(k+j, r)}{j!},$$

for all sufficiently large r, then f is of exponential type not exceeding $\{2 \log (1(1/c)) + 1 + \log (2N)!\}$. If this condition is replaced by related conditions, then also is of exponential type.

A table of integrals of the error function. II. Additions and corrections, M. Geller and E. W. Ng, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math Sci.), Nos. 3 and 4, 157-178 (July-Dec. 1971).

Key words: Error functions; indefinite integrals; special functions.

This is an extension of a compendium of indefinite and definite integrals of products of the error function with elementary or transcendental functions recently published by the authors.

A note on the time dependence of the effective axis and angle of a rotation, H. Gelman, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 179-186 (July-Dec. 1971).

Key words: Angular velocity; effective axis and angle of rotation; intrinsic vector; kinematics of a rigid body; rotation group; spatial rotation.

The time dependent rotation of one orthogonal coordinate system with respect to a fixed one is considered in the parametrization based on the effective axis and angle of the rotation, a parametrization which has recently been used to discuss the irreducible representations of the rotation group. The method of the intrinsic vector is used to derive the equations of motion for the instantaneous effective axis and angle. A new representation of the angular velocity is obtained in a rotating orthogonal coordinate system generated by a unit vector along the effective axis, and a new geometrical interpretation of the effective angle is given.

A numerical solution of integral equation of the first kind applied to slit correction in small-angle x-ray scattering, J. Mazur, *J. Res. Nat. Bur. Stand. (U.S.)*, **75B** (Math. Sci.), Nos. 3 and 4, 187-207 (July-Dec. 1971).

Key words: Conditions for convergence of solutions; integral equation of first kind; shifting operators; slit correction; slit weighting-function; small-angle x-ray scattering; strong numerical instability.

A novel approach to the problem of the slit correction in small-angle x-ray scattering is presented, based on a matrix inversion method. The integral equation for the slit correction is written as a Volterra equation of the first kind. This equation is reduced to a system of simultaneous equations, expressed in matrix form. The order of the matrix is equal to the number of experimentally determined points. To obtain these equations, one has to expand the unknown functions in Taylor series around each point to be subsequently determined. There is, however, a difficulty inherent in this method due to the fact that most of the series expansions of the function to be determined lead to a strong numerical instability. However, a general method is developed, which enables us to find shifting operators leading to numerically stable systems of equations. The "unsmearing" of the experimental data is then performed by standard matrix inversion procedures

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 76B, JANUARY-DECEMBER 1972

January-June 1972

Minimax-based selection, adjustment and disaggregation for incompletely specified univariate distributions, A. J. Goldman, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 1-38 (Jan.-June 1972).

Key words: Linear programs; mathematical models; minimax estimation; operations research; probability distribution.

This paper deals with making a nominal choice from a class of discrete univariate probability distributions about which one has "incomplete information" such as component-wise bounds, a component-wise ranking, or both. In some cases, an initial distribution is provided, to be "adjusted" so as to be compatible with the incomplete information. The first part of the analysis systematizes and unifies the contents of four earlier papers treating such problems using a minimax-error or minimax-adjustment approach. The second part applies the same approach to situations in which an "aggregate" of the desired distribution is stipulated, either exactly, or approximately by component-wise bounds. All problems discussed in the paper can be formulated as linear programs, but relatively explicit solution methods are sought; unresolved difficulties arising in this attempt are identified.

Three results for trees, using mathematical induction, W. A. Horn, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 39-43 (Jan.-June 1972).

Key words: Helly's theorem; mathematical induction; minimum-length coverings; node-covering; trees.

The paper illustrates the use of mathematical induction to extend results which are true for a line segment to trees. Three separate theorems are stated and proved, each of which has some importance in its own right.

Abstract groups as doubly transitive permutation groups, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 45-50 (Jan.-June 1972).

Key words: Character; cosets; matrix representation; nilpotent group; normalizer; solvable group.

The question considered is this: Which abstract groups have representations as doubly transitive permutation groups? Moreover, given an abstract group, can all doubly transitive representations be found? The paper is expository. Various results which bear on the question are presented in an elementary way.

Covariances of two sample rank sum statistics, P. V. Tryon, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 51-52 (Jan.-June 1972).

Key words: c Sample problem; covariances; Mann-Whitney-Wilcoxon statistics; rank sum statistics; statistics.

This note presents an elementary derivation of the covariances of the $c(c-1)/2$ two-sample rank sum statistics computed among all pairs of samples from c populations.

Efficient techniques for unbiasing a Bernoulli generator, J. A. Lechner, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 53-60 (Jan.-June 1972).

Key words: Bernoulli; binomial; coin-tossing; computer; efficiency; generator; random numbers; statistics.

Consider the problem of operating on a sequence of i.i.d. Bernoulli variables with unknown mean p to produce a sequence of symmetric Bernoulli variables. Define the efficiency of any proposed method to be the average number of binary output digits per input digit. The following results are proved: (A) No method exists having efficiency greater than $-p\log_2 p - q\log_2 q$, where $q=1-p$. (B) Methods do exist with efficiency arbitrarily close to the bound just given. Examples are given, and compared with other methods in the literature. A technique for finding the methods of (B) above is given.

Checks of the algebraic matrices for the configurations $(d+s)^n p$, C. Roth, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 1 and 2, 61-80 (Jan.-June 1972).

Key words: Checking parameters; $(d+s)^n p$; electrostatic interaction; relative phases; spin-orbit interation.

By constructing suitable combinations of algebraic matrices enabling the resulting eigenvalues to be predicted theoretically, checking parameters were obtained for 32 interaction parameters of the configuration $(d+s)^n p$.

July-December 1972

"Plural-series" approximations of functions, L. V. Spencer, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 91-108 (July-Dec. 1972).

Key words: Biorthogonal function; gamma-ray transport; moment methods; neutron transport; polynomial representations; radiation penetration.

A method is given for developing approximations to neutron and gamma-ray transport distributions in the form of a superposition of U_n^k polynomial series multiplied by exponentials and characterized by different scale factors. Convergence conditions and error bound expressions are given. Biorthogonality properties are worked out. Examples are given in which these approximations are compared with polynomial approximations.

Scheduling a time-shared server to minimize aggregate delay, A. J. Goldman, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 109-117 (July-Dec. 1972).

Key words: Computer systems; optimization; scheduling; time-sharing.

A simplified analysis is given of a problem situation, previously treated in the literature, which pertains to the delay-minimizing allocation of servicing times among N incoming streams requiring "processing" of some kind by a single "server" (e.g., a time-shared computer). The original problem is generalized to permit different "weights" for the delays suffered by different streams.

Normal matrices with entries from an arbitrary field of character $\neq 2$, M. H. Pearl and A. I. Penn, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 119-143 (July-Dec. 1972).

Key words: Field; matrices; normality.

Let F be an arbitrary field of characteristic $\neq 2$ and let conjugation in F be defined by an arbitrary involutory automorphism (possibly the identity mapping). A matrix with entries from F is normal if it commutes with its conjugate transpose. Several conditions which are equivalent to normality when F is the complex field are properly nested when F is an arbitrary field. Of these conditions, normality is the weakest and unitary diagonalizability is the strongest.

When the underlying field is closed the unitarily diagonalizable matrices are those which possess a spectral representation with Hermitian idempotents. These matrices may be characterized in terms of their EP properties.

A matrix is indecomposable if it has a single elementary divisor of the form $(x-s)^i$. For $i>1$, normal indecomposable matrices do not exist when F is the complex field. However there exists field for which normal indecomposable matrices of all finite orders exist. A matrix is a normal indecomposable matrix if and only if it can be expressed as $r(B)$ where $r(x)$ is a polynomial such that $r(0)\neq 0$ and B is a matrix having the single elementary divisor x^i and satisfying the equation $B^*=sB$ for some scalar s.

When the involutory automorphism of F is the identity mapping indecomposable normal matrices of even order exist if and only if the vector space F^n is hyperbolic, and in this case the matrices are symmetric. Moreover, indecomposable normal matrices of odd order exist if and only if F^n is the orthogonal sum of a hyperbolic space and a one dimensional space, and in this case both symmetric and nonsymmetric indecomposable normal matrices exist.

Distance coordinates with respect to a triangle of reference, K. Goldberg, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 145-152 (July-Dec. 1972).

Key words: Area coordinates; distance coordinates; Plane Geometry; radical center; triangle of reference.

With respect to a triangle of reference $A_1A_2A_3$, each point P in the plane of the triangle, has unique *area* coordinates: $P=(b_1, b_2, b_3)$ with $b_1+b_2+b_3=1$. *Distance* coordinates are introduced such that $P=[d_1, d_2, d_3]$, with d_k the distance from P to A_k. It is shown that there is an explicit function $f(x_1, x_2, x_3)$ such that $f(d_1^2, d_2^2, d_3^2)=0$ is necessary and sufficient for $P=[d_1, d_2, d_3]$, each d_k nonnegative. The partial derivatives $f_k(x_1, x_2, x_3)=\partial f(x_1, x_2, x_3)/\partial x_k$ are such that $b_k=f_k(d_1^2, d^2, d^2)$ for each k. Other results relating the b_k and the d_k are given. The use of $f(x_1, x_2, x_3)$ in solving geometric problems is shown.

On regular sets of polynomials whose zeros lie in prescribed domains, M. A. Farag and M. Nassif, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 153-159 (July-Dec. 1972).

Key words: Basic sets; Cannon sum of basic sets; lower semiblock matrices; order of basic sets; zeros of polynomials in regular sets.

The relation between the mode of increase of regular basic sets of finite span and the order of magnitude of the zeros of polynomials $\{p_n(z)\}$ belonging to them is investigated. Upper bounds are obtained for the order of the basic sets when the zeros of $p_n(z)$ lie either in the unit circle or in a circle whose radius increases in a certain manner with the index n of the polynomial.

The Stieltjes Constants, J. J. Y. Liang and J. Todd, *J. Res. Nat Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 161-17 (July-Dec. 1972).

Key words: Bernoulli numbers; Euler-Maclaurin method Euler transform; Euler's constant; multiple precisio package; Riemann zeta function.

The Stieltjes Constants are the coefficients in the Lauren expansion of the Riemann Zeta function $\xi(z)$ about its simpl pole at $z=1$. They can be represented as the limit of the differ ence between the sum of the first n terms of a series and th integral of its n-th term.

The first 20 coefficients have been computed to 15 D usin the Euler-Maclaurin method. As a by-product the sums of th series

$$\tau_n=\sum_{2}^{\infty}(-1)^k(\log k)^n/k$$

have been obtained to 15 D for $n=1(1)20$.

Confidence limits for the abscissa of intersection of two linea regressions, J. J. Filliben and J. E. McKinney, *J. Res. Na Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 179-19 (July-Dec. 1972).

Key words: Abscissa; confidence limits; glass transition intercept; intersection; linear; regression; second orde transition; statistics; variance.

A method to determine the confidence limits for the absciss of the intersection of two linear regressions has been developec This method does not require the assumption of equal varianc for the two regressions, as was necessary with previous method A numerical example is included on thermodynamic, glas transition data for which this method is applicable. Comparison are made between the results using equal and unequal varianc assumptions. A FORTRAN subroutine is included for comput tions using both assumptions.

Weighting methods for Monte Carlo calculation of polym configurations, F. L. McCrackin, *J. Res. Nat. Bur. Stan (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 193-200 (July-De 1972).

Key words: Boltzmann factors; importance samplin Monte Carlo; non-self-intersecting walks; polymer co figurations; random walks.

In the Rosenbluth and Rosenbluth method of computing pol mer configurations, the configurations are weighted in order remove bias of the estimated parameters of the configuration This weighting method is investigated and generalized f importance sampling and Boltzmann factors. The estimat are found to be unbiased in the limit for an infinite sample configurations, but to have a bias for a finite sample. The stan ard deviations of the estimates are also derived.

Product solutions and separation of variables, A. J. Goldma *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. and 4, 201-204 (July-Dec. 1972).

Key words: Difference equations; functional equatior separation of variables.

This paper consists of two independent notes, whose comm features are (a) their concern with "product-form" functions a (b) their use of an abstract-algebra setting to isolate the esse tial features of the problems treated. The first note furth generalizes the generalizations given by Chu and Diaz (19 of their observation that Euler's difference equation $y(x+1)$ $y(x)=f(x)$, when f is of period 1, has the product-form soluti

$v(x) = xf(x)$. The second note formalizes and rigorously proves the fact that a function is separable jointly in its variables if it is separable in each individual variable.

A note of the multiplicative property of the Smith normal form, M. Marcus and E. E. Underwood, *J. Res. Nat. Bur. Stand. (U.S.)*, **76B** (Math. Sci.), Nos. 3 and 4, 205-206 (July-Dec. 1972).

Key words: Compound; divisors; matrix.

This paper contains an elementary proof of the fact that if A and B are n-square matrices over a principal ideal domain R with relatively prime determinants then $S(AB) = S(A)S(B)$ where $S(A)$ is the Smith normal form of A.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 77B, JANUARY-DECEMBER 1973

January-June 1973

Some Hamiltonian results in powers of graphs, A. M. Hobbs, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 1-10 (Jan.-June 1973).

Key words: Combinatorics; connectivity; Euler graphs; 2-factors; graph theory; Hamiltonian circuits; Hamiltonian connected; powers of graphs.

In this paper we show that the connectivity of the kth power of a graph of connectivity m is at least km if the kth power of the graph is not a complete graph. Also, we prove that removing as many as $k-2$ vertices from the kth power of a graph ($k \geq 3$) leaves a Hamiltonian graph, and that removing as many as $k-3$ vertices from the kth power of a graph ($k \geq 3$) leaves a Hamiltonian connected graph. Further, if every vertex of a graph has degree two or more, then the square of the graph contains a 2-factor. Finally, we show that the squares of certain Euler graphs are Hamiltonian.

On a functional equation, A. O. L. Atkin, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 11-13 (Jan.-June 1973).

Key words: Analysis; continuous; equation; function; real.

Subject to suitable conditions of continuity and normalization, it is shown that the equation $f(x,y)+f(x+y,z)=f(y,z)+f(x,y+z)$ implies $f(x,y)=g(x)+g(y)-\epsilon(x+y)$. The result has application in physics to the motion of an electron in a crystal lattice.

Matroid designs, P. Young and J. Edmonds, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 15-44 (Jan.-June 1973).

Key words: Balanced incomplete block designs; matroid designs; matroids.

Matroids are investigated in which equicardinality conditions are imposed on the flats. Such matroids are shown to be closely related to certain types of BIBD's. Existence and uniqueness theorems for these structures are derived, together with a boundedness criterion on their rank. Several classes are exhibited, including finite projective and affine geometries, certain t-designs (Steiner systems) and so-called trivioids. By viewing certain t-designs as matroids, new ways of constructing BIBD's are derived. Three new series of 3-designs and two new 4-designs are obtained by these methods. A matroid analysis of the 5-(24,8,1) design of Witt is presented, and examples are obtained from it of matroids having equicardinal hyperplanes but not equicardinal flats in lower ranks. Several general conjectures and existence problems for these types of matroids are suggested.

Extrapolation techniques related to transcendence proofs, K. B. Stolarsky, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 45-51 (Jan.-June 1973).

Key words: Baker's extrapolation method; extrapolation; Hermite interpolation formula; transcendental numbers; transcendence proofs.

An extrapolation method used by A. Baker to study linear forms in the logarithms of algebraic numbers is further refined, and used to study a general extrapolation problem involving a function holomorphic in a large disk.

A catalog of minimal blocks, A. M. Hobbs, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 53-60 (Jan.-June 1973).

Key words: Blocks; combinatorics; examples of graphs; graph theory; minimal blocks; planar graphs; thickness of graphs; two-connected graphs.

In this paper we provide a catalog of the minimal blocks with 10 and fewer vertices, together with a discussion of the methods and theorems used to produce the catalog. In addition, we prove a theorem which is a strengthening of a similar theorem of Fleischner [2] on the structure of minimal blocks.

On the eigenvalues of A+B and AB, H. Wielandt, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 1 and 2, 61-63 (Jan.-June 1973).

Key words: Angular field of values; eigenvalues; field of values; hermitian; inertia; positive semidefinite.

Using the usual field of values and the angular field of values inclusion sets are found for the eigenvalues of sums and products of $n \times n$ complex matrices. For instance if the field of values of B does not contain 0 it is found that the quotient of the field of values of A by that of B contains the eigenvalues of AB^{-1}. Applications are made to the polar form (AB where A is unitary and B positive semidefinite) and to products AB with A hermitian and $B+B^*$ positive definite.

July-December 1973

An application of Schur's lemma on irreducible sets of matrices in continuum mechanics, J. T. Fong, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 73-79 (July-Dec. 1973).

Key words: Continuum mechanics; elasticity; integration; matrix calculus; matrix identity; matrix theory; reducibility; Schur's lemma; strain energy.

In a recent study of the thermodynamic restrictions of a theory of compressible, viscoelastic fluids, Fong and Simmons (ZAMP **23**, No. 5 (1972)) encountered a problem of integrating the following matrix identity:

$$\underline{\underline{M}}[\underline{\underline{H}}\hat{U}_{,C}(\underline{\underline{H}}^T\underline{\underline{M}}\underline{\underline{H}})\underline{\underline{H}}^T - \hat{U}_{,C}(\underline{\underline{M}})] - \underline{\underline{H}}\hat{U}_{,C}(\underline{\underline{H}}^T\underline{\underline{H}})\underline{\underline{H}}^T \equiv \underline{\underline{O}},$$

where $\hat{U}_{,C}$ denotes the gradient of the scalar-valued function $U = \hat{U}(\boldsymbol{C})$ with respect to its matrix argument $\boldsymbol{C}$ which is symmetric and positive-definite. The identity is valid for every symmetric positive-definite $\boldsymbol{M}$ and every unimodular $\boldsymbol{H}$. The symbol $\boldsymbol{H}^T$ denotes the transpose of the matrix $\boldsymbol{H}$. The solution of the problem is presented here in detail as an example of applying, probably for the first time, Schur's lemma on irreducible sets of matrices in theoretical continuum mechanics.

Remarks on a problem of Rademacher in the theory of modular forms, M. I. Knopp, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 81-83 (July-Dec. 1973).

Key words: Dedekind function; modular form; partition function; Poincaré series.

Rademacher quite some time ago posed the question of deriving the classical functional equation of $1/\eta(z)$ ($\eta(z)$ is the Dedekind modular form) directly from the exact expression he had found for the partition function, $p(n)$, which arises as the Fourier coefficient of $1/\eta(z)$. Although he had been able to solve a similar problem for the absolute invariant $J(z)$, Rademacher was unable to solve the problem for $1/\eta(z)$. We here relate this question to some more recent results of Douglas Niebur, which reduce the problem to one of identically zero Poincaré series of degree $-5/2$.

The characterizations of $(A_q(U))$, M. E. Sheingorn, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 85-92 (July-Dec. 1973).

Key words: Automorphic functions; Hardy spaces.

For $q > 1$ Bers defines a Banach space $A_q(U) = \left\{ f \epsilon H(U) \mid \int_U |f(u)|(1-|u|^2)^{q-2} dxdy < \infty \right\}$ and shows that any bounded linear functional Λ on $A_q(U)$ may be represented as $\Lambda(f) = \int_U f(u)\bar{G}(u)(1-|u|^2)^{2q-2} dxdy$ where $G \epsilon B_q(U) = \{ h \epsilon H(U) \mid \sup_{u \epsilon U} |h(u)|(1-|u|^2)^q < \infty \}$ and is unique. This work is done in [1]. Duren, Romberg, and Shields, pursuant to their work on H^p for $p < 1$, define a Banach space $B^p(p<1) = \left\{ f \epsilon H(U) \mid \int_0^{2\pi} \int_0^1 |f(re^{i\theta})|(1-r)^{1/p-2} dr d\theta < \infty \right\}$. They show that a bounded linear functional Λ on B^p may be uniquely represented as $\Lambda(f) = \lim_{r \to 1} \int_0^{2\pi} f_r(e^{i\theta}) \bar{g}(e^{i\theta}) d\theta$ where

(i) $f_r(e^{i\theta}) = f_r(re^{i\theta})$

(ii) $g \epsilon A = \{ h \epsilon H(U) \mid g$ is continuous on $\bar{U}\}$ and $g^{(n-1)}$, and $n-1$ *st* derivative of g, is in $\Lambda_\alpha = \{ h \epsilon H(U) \mid h'(re^{i\theta}) = 0((1-r)^{\alpha-1}) \}$. (Here $\alpha = 1/p - n$ where $n < 1/p < n+1$, so $\alpha \neq 0$. If $1/p = n+1$, the conditions on g are: $g \epsilon A$, $g^{(n-1)} \epsilon \Lambda_* = \{ h \epsilon H(U) \mid h''(re^{i\theta}) = 0((1-r)^{-1}) \}$.) This work appears in [2].

In this paper, after showing that $B^p \cong A_q(U)$ with $1/p = q$, we derive the relationship between G and g, namely:

$$G(z) = \sum_{k=0}^{2n+1} A_k \cdot g^{(2k+1)}(z) \cdot z^{2k+1},$$

($|z| < 1$) where A_i are constants, $A_{2n+1} \neq 0$. (in this case $q = 1/p$ is an integer. The Theorem is slightly different if q is not an integer.)

Character induced subgroups, R. Merris and W. Watkins, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 93-99 (July-Dec. 1973).

Key words: Character of central type; central idempotent; Frobenius Reciprocity; group algebra; orthogonality relations; tensor product.

Given a finite group G with an irreducible character χ, define $G_\chi = \{ g \epsilon G : |\chi(g)| = \chi(1) \}$. Then $\chi(1)^2 \leq [G : G_\chi]$. We investigate the case of equality. There are applications to symmetry classes of tensors and generalized matrix functions.

Performance testing of a FORTRAN library of mathematical function routines—A case study in the application of testing techniques, D. W. Lozier, L. C. Maximon, and W. L. Sadowski, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 101-110 (July-Dec. 1973).

Key words: Automated testing; bit comparison; FORTRAN library; function validation; mathematical functions; performance tests.

This paper describes an application of testing methodology and techniques developed by the authors to aid in improving the quality of mathematical software. These techniques differ radically in several aspects from techniques previously used, the most important difference being that the testing is not based exclusively on random arguments. Instead, throughout the range of each function use is made of special arguments that are designed to detect programming errors and to test the performance of an algorithm in different regions. The function values are tested against reference values which are stored on reference tapes generated by a highly authenticated system of subroutines.

Since the effectiveness of such a testing system in discovering errors and performance limitations can be fully ascertained only through actual use, we report the results of employing our system to test an existing FORTRAN library of mathematical function routines. Specific aspects of the numerical accuracy of the library used in this test case are discussed in order to illustrate the effectiveness of a well-designed testing system as an analytic tool for the evaluation of mathematical software.

Since documentation provides information necessary to perform testing and contains specifications that reflect the results of testing, our study includes comments on the documentation.

No information on timing or storage requirements is presented in this case study.

Bessel functions *I* and *J* of complex argument and integer order, D. J. Sookne, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 111-114 (July-Dec. 1973).

Key words: Bessel functions; backward recursion; error bound; Miller algorithm; difference equation.

A computer program is described for calculating Bessel functions $J_n(z)$ and $I_n(z)$, for z complex, and n a nonnegative integer. The method used is that of backward recursion, with strict control of error, and optimum determination of the point at which to begin the recursion.

Certification of an algorithm for Bessel functions of real argument, D. J. Sookne, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 115-124 (July-Dec. 1973).

Key words: Bessel functions; bit comparison; error bounds.

The accuracy of routine BESLRI is certified.

Bessel functions of real argument and integer order, D. J. Sookne, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 125-132 (July-Dec. 1973).

Key words: Backward recursion; Bessel functions; difference equation; error bounds; Miller algorithms.

A computer program is described for calculating Bessel functions $J_n(x)$ and $I_n(x)$, for x real, and n a nonnegative integer. The method used is that of backward recursion, with strict control of error.

Certification of an algorithm for Bessel functions of complex argument, D. J. Sookne, *J. Res. Nat. Bur. Stand. (U.S.)*, **77B** (Math. Sci.), Nos. 3 and 4, 133-136 (July-Dec. 1973).

Key words: Backward recursion; Bessel function; bit comparison; error bounds; relative error.

Computer tests of algorithm BESLCI are described, and the results of the test are given.

Triangles generated by powers of triplets on the unit circle, C. R. Johnson and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.),* **77B** (Math. Sci.), Nos. 3 and 4, 137-141 (July-Dec. 1973).

Key words: Convex hull; unit circle; Weyl's Theorem.

Let α, β, γ be three distinct complex numbers of modulus 1. It is shown that there is essentially one exception to the following statement: For some positive integer m, 0 is in the closed convex hull of $\alpha^m, \beta^m, \gamma^m$. The exception occurs for the normalized triple

$$1, e^{2\pi i/7}, e^{2k\pi i/7},$$

where $k=3$ or 5. This question was motivated by the problem of determining when a positive integer m and a nonzero $n \times 1$ vector χ exist such that

$$\chi \approx A^m \chi = 0,$$

where A is a given matrix of $M_n(C)$.

Tables and graphs of the stable probability density functions, D. R. Holt, *J. Res. Nat. Bur. Stand. (U.S.),* **77B** (Math. Sci.), Nos. 3 and 4, 143-198 (July-Dec. 1973).

Key words: Accuracy; approximations; asymptotic expansion; Cauchy distribution; characteristic function; closed forms; contour; convergence; curves; distribution function; error; Fourier transform; infinite series; interpolation; limit distribution; normal distribution; polynomials; probability density function; quadrature; stable distribution; sums of independent random variables; tables; truncation.

Four-decimal-place tables are presented of the probability density function $p(\chi; \alpha, \beta)$ of the stable distribution for $\alpha = 0.25(.25)2.00$, $\beta = -1.00(.25)1.00$, and nonnegative χ in steps varying by factors of 10 from 0.001 to 100 such that interpolation is possible, the tabulation being terminated where $p(\chi;\alpha,\beta)$ falls to 0.0001. The largest such value of χ is 338, for $\alpha = 0.25, \beta = -1.00$. Graphs of $p(\chi; \alpha, \beta)$ are also provided for essentially the above values of α and β. The methods of calculation (from the characteristic function), checking, and interpolation with respect to χ, β, and (to some extent) α are described. The most important properties of stable distributions are summarized. Some applications are cited. A selected bibliography with 91 items is included.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 78B, JANUARY–DECEMBER 1974

January-March 1974

A class of positive stable matrices, D. Carlson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 1-2 (Jan.-Mar. 1974).

Key words: positive stable matrix; sign-symmetry; spectrum.

A square complex matrix is positive sign-symmetric if all its principal minors are positive, and all products of symmetrically-placed minors are nonnegative. It is proved that every positive sign-symmetric matrix is positive stable.

The Smith normal form of a partitioned matrix, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 3-6 (Jan.-Mar. 1974).

Key words: elementary divisors; invariant factors; partitioned matrices; Smith normal form.

It is shown that if

$$M=\begin{bmatrix} M_{11} & M_{12} & \cdots & M_{1t} \\ 0 & M_{22} & \cdots & M_{2t} \\ & \cdots & & \\ 0 & 0 & \cdots & M_{tt} \end{bmatrix}$$

is a matrix over a principal ideal ring R such that the matrices M_{ii} are square and have pairwise relatively prime determinants, then the Smith normal form of M is the same as the Smith normal form of

$$M_{11}+M_{22}\dot{+}\cdots\dot{+}M_{tt}.$$

A Lyapunov theorem for angular cones, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 7-10 (Jan.-Mar. 1974).

Key words: cramped; field of values; open positive convex cone; polar decomposition; positive definite; spectrum; square matrix.

The well known theorem of Lyapunov is generalized to characterize matrices whose spectra lie in a given open convex angular sector. Related facts about positive definite matrices, the polar decomposition and matrices with cramped spectra are also given.

Second, third, and fourth order D-stability, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 11-13 (Jan.-Mar. 1974).

Key words: D-stable; positive stable matrix; spectrum.

For $n=2$, 3, and 4, conditions are given for the real n by n D-stable matrices. The 3 by 3 sufficient condition is easily checkable and reveals to be D-stable a class of matrices which is not included in any known, general sufficient condition.

Comparison of some FORTRAN programs for matrix inversion, K. E. Fitzgerald, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 15-33 (Jan.-Mar. 1974).

Key words: error estimates; evaluation of computer programs; execution time; inverse of a matrix; iterative refinement; linear systems.

In this paper several programs for computing the inverse of a matrix are compared primarily on the basis of execution time. Accuracy estimates and two programs that use iterative refinement are included. It is shown that for small matrices, improvement procedures are worthwhile but for large matrices, one must be more careful in their use. Two other points are also brought out: the value of multiplying matrices before taking the norm of a product and the need for some kind of an error estimate to be included in the output of every program.

On characters of subgroups, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 35-38 (Jan.-Mar. 1974).

Key words: Frobenius Reciprocity Theorem.

Let H be a subgroup of G. Let χ be an irreducible character of H. Let χ^G be the character of G induced by χ. The irreducibility of χ^G is discussed. In particular, if H is normal in G, then χ^G is irreducible if and only if χ cannot be extended to any subgroup of G which properly contains H.

These results have application to the determination of irreducibility of a class of representations of the full linear groups.

Integer arithmetic determination of polynomial real roots, G. W. Reitwiesner, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 1, 39-43 (Jan.-Mar. 1974).

Key words: Budan theorem; exact computation; integer arithmetic; modular arithmetic; polynomial; polynomial real roots; roots; Sturm theorem.

The real roots of a polynomial with rational coefficients may be evaluated to absolute precision by integer arithmetic. Based upon the theorems of Sturm and Budan, two algorithms for this evaluation are described, and some comparative observations are offered.

April-June 1974

Rational equivalence of unimodular circulants, S. Pierce, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 63 (Apr.-June 1974).

Key words: circulant, totally positive unit.

We answer a question of M. Newman by providing all unimodular positive circulants are rationally equivalent to the identity.

How to determine the accuracy of the output of a matrix inversion program, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 65-68 (Apr.-June 1974).

Key words: approximate inverses; approximate solutions; error bounds; high speed digital computation; matrix norms.

If A is a given nonsingular matrix and X an approximate inverse of A such that $N(R)<1$, where $R=I-AX$ and N is any matrix norm, then it is shown that

$$\frac{N(XR)}{1+N(R)}\leq N(A^{-1}-X)\leq\frac{N(XR)}{1-N(R)}.$$

This inequality provides the means for checking the output of a matrix inversion program. Methods for checking the solution of a single linear system are also discussed.

A conjecture on a matrix group with two generators, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 69-70 (Apr.-June 1974).

Key words: free groups; matrix groups; roots of unity.

Let ζ be a primitive qth root of unity. It is conjectured that the group generated by

$$A=\begin{pmatrix} 1 & \zeta \\ 0 & 1 \end{pmatrix} \quad \text{and} \quad B=\begin{pmatrix} 1 & 0 \\ \zeta & 1 \end{pmatrix}$$

is never free. The conjecture is proved when q is an even prime power, or an odd prime power having 2 as a primitive root.

A property of equivalence, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 71-72 (Apr.-June 1974).

Key words: elementary divisors; equivalence; Kronecker products.

It is shown that if K, A, B are nonsingular matrices over a principal ideal ring R such that $K \otimes A$ is equivalent to $K \otimes B$, then A is equivalent to B.

Comments on the discrete matrix model of population dynamics, R. Freese and C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 73-78 (Apr.-June 1974).

Key words: eigenvalue; net reproduction rate; oscillations; Perron-Frobenius theory; rate of natural increase; stable population.

This paper examines several aspects of the discrete matrix model of population transition. Certain appropriate applications of matrix theory and exploitation of the specific form of the model should serve to enhance its already well-developed status. The aspects dealt with include (1) a simplification of the Perron-Frobenius theory; (2) row and column sum bounds on maximal eigenvalues; (3) relations between oscillations in a population and the remaining eigenvalues; (4) implications of stability for the transition matrix; and (5) relations between characteristic quantities of a stable population.

Fixed-point solution of plant input/location problems, A. J. Goldman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 2, 79-94 (Apr.-June 1974).

Key words: *CES*; economics; Leontief; location theory; plant location; production functions; transportation; Weber problem, mathematical programming.

This paper considers the following generalization of the Weber plant location problem: the plant's output level is fixed, and its levels of input from its supply points, as well as its location, are among the decision variables. Hurter and Wendell (J. Reg. Sci., 1972) showed that this problem admits a kind of separability when the plant's production function lies in a certain class including the Cobb-Douglas forms. The present paper (a) determines the extent of that function-class, (b) carries out the explicit separation for the *CES* generalization of the Cobb-Douglas functions, and (c) discusses simple fixed-point-type iterative solution algorithms, similar to that well-known for the ordinary Weber problem, for several production functions (Cobb-Douglas, *CES*, and various two-stage technologies). Local convergence of these algorithms is established; computational experience will be reported in a separate Part II.

A new proof of Pick's theorem, S. Minsker, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci), No. 2, 95-96 (Apr.-June 1974).

Key words: Bieberbach's theorem; coefficient estimate; univalent analytic function.

Pick's theorem states that, if f is a univalent analytic function on the open unit disk with $f(0)=0$ and $f'(0)=1$, and $|f| \leq M$ then $\left| \frac{f''(0)}{2} \right| \leq 2\left(1-\frac{1}{M}\right)$. A new proof of this result is given, and a comparison with the usual proof is made.

July-September 1974

A sufficient condition for matrix stability, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 103-104 (July-Sept. 1974).

Key words: M-matrix; principal minors; stable matrix.

An n by n complex matrix A is said to be positive stable if Re $(\lambda) > 0$ for each eigenvalue λ of A. If A satisfies both of the following two conditions, then A is positive stable: (1) for each $k=1,\ldots,n$, the real part of the sum of the k by k principal minors of A is positive; and (2) the minimum of the real parts of the eigenvalues of A is itself an eigenvalue of A. Special cases include hermitian positive definite matrices and M-matrices.

Computation of the field of values of a 2 × 2 matrix, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 105-107 (July-Sept. 1974).

Key words: eigenvalues; ellipse; field of values; square matrix.

It is known that the field of values, $F(A) \equiv \{x^*Ax : x^*x=1, x \in C^2\}$, of a 2×2 matrix A is a convex set whose boundary is an ellipse. This is used to compute $F(A)$ explicitly from the entries of A when A is 2×2 and real. Employing known properties of the field of values, this may then be used to estimate $F(A)$ when A is $n \times n$ and real.

The factorization of a matrix as the commutator of two matrices, J. M. Smith, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 109-112 (July-Sept. 1974).

Key words: anticommuting; commutator; factorization matrix; orthogonal; skew-symmetric.

Let $P=I_p+(-I_q)$, the direct sum of the $p \times p$ identity matrix and the negative of the $q \times q$ identity matrix. The following theorem is proved.

THEOREM: *If* $X=cZ$ *where* Z *is a* 4×4 P-*orthogonal*, P-*skew symmetric matrix and* $|c| \leq 2$, *there exist matrices* A *and* B, *both of which are* P-*orthogonal and* P-*skew-symmetric, such that* $X=AB-BA$. Methods for obtaining certain matrices which satisfy $X=AB-BA$ are given. Methods are also given for determining pairs of anticommuting P-orthogonal, P-skew-symmetric matrices.

Complete elliptic integrals resulting from infinite integrals of Bessel functions, S. Okui, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 113-135 (July-Sept. 1974).

Key words: applied mathematics; Bessel functions; complete elliptic integrals; engineering; infinite integrals; modified Bessel functions; physics; signal statistics.

Infinite integrals of Bessel and modified Bessel functions reducible to complete elliptic integrals are compiled. These formulas are of great use in solving problems of applied mathematics, physics and engineering.

The convex hull of the transposition matrices, L. S. Joel, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 137-13 (July-Sept. 1974).

Key words: combinatorial analysis; convex set; linear inequalities; permutations.

The convex hull of the n by n transposition matrices is characterized as the set of symmetric doubly stochastic matrices with trace $n-2$. A similar characterization (with trace $\geq n-2$) is given for the convex hull of the union of transposition matrices and the identity matrix.

Computational experience with an algorithm for finding the k shortest paths in a network, D. R. Shier, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 139-165 (July-Sept. 1974).

Key words: double-sweep method; graph; k shortest paths; network; network algorithms; shortest path.

A particular computer implementation of the Double-Sweep method for calculating the k shortest paths in a network is described. Results are presented for a series of computational experiments performed on rectangular grid networks.

How bad is the Hadamard determinantal bound?, C. R. Johnson and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 3, 167-169 (July-Sept. 1974).

Key words: determinant; expected value; Hadamard determinantal bound; uniform distribution.

The Hadamard bound for the determinant of an n by n matrix is a good one in that equality may be attained in a rich class of cases. However, the bound generally gives up a good deal, and we answer the title question "on the average." Assuming the entries of $A=(a_{ij})$ are uniformly distributed over some interval symmetric about the origin, the expected value of the ratio of $(\det A)^2$ to the square of the Hadamard bound is found to be $(n!)/(n^n)$. The expectations of the square of the Hadamard bound and of $(\det A)^2$ are also computed individually, and their ratio turns out also to be $(n!)/(n/n^n)$.

October-December

Saddlepoints in P-pivot classes of skew matrices, M. L. Stein, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 4, 181–191 (Oct.–Dec. 1974).

Key words: combinatorial equivalence; linear inequalities; linear programs; pivot operations; skew-symmetry.

A finite class of skew matrices can be associated via "principal pivots" with a self-dual linear system. Given a row index h, it is known that there is a skew matrix in the class with nonnegative hth row. Using this "saddlepoint theorem," we prove a similar result for nonpositive rows. An open question is whether such a class of skew matrices contains one with both a nonnegative row and a nonpositive row. We show that this "double saddlepoint property" holds for arbitrarily large degenerate cases and for all skew matrices of small order.

Maximizing the number of spanning trees in a graph with n nodes and m edges, D. R. Shier, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 4, 193–196 (Oct.–Dec. 1974).

Key words: combinatorial analysis; enumeration; graphs; maximigation; spanning trees; trees.

The problem considered is that of determining, among all graphs on n nodes and m edges, those having the maximum number of spanning trees. The possible candidate graphs can be obtained by deleting some number k of edges from a complete n-node graph. For $k \leq n/2$, it is shown that the maximum occurs when the k edges are mutually nonadjacent.

The field of values and spectra of positive definite multiples, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 4, 197–198 (Oct.–Dec. 1974).

Key words: eigenvalues; field of values; H-stable; positive definite matrix; spectrum.

Suppose $0 \neq \lambda \epsilon C$ and $A \epsilon M_n(C)$. We show constructively that λ is an eigenvalue of HA for some $H^* = H >$ if and only if $\lambda = x^*Ax$ for some $x \epsilon C^n$. The characterization of H-stable matrices is then an easy corollary.

Automatic computing methods for special functions. Part II. The exponential integral $E_n(x)$, I. A. Stegun and R. Zucker, *J. Res. Nat. Bur. Stand. (U.S.)*, **78B** (Math. Sci.), No. 4, 199–215 (Oct.–Dec. 1974).

Key words: computer programs; continued fraction; exponential integral; key values; recurrence relation.

Accurate, automatic, efficient methods for computing the exponential integral $E_n(x)$ are detailed and implemented in an American National Standard FORTRAN program. The driver program and test results are also included.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 79B, JANUARY-DECEMBER 1975

January-June 1975

Ideal elements for perturbed Keplerian motions, A. Deprit, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 1-15 (Jan.-June 1975).

Key words: celestial mechanics; orbit perturbation; satellite ephemeris; variation of parameters.

A new set of elements is proposed to describe Keplerian motions subject to perturbing forces. The resulting equations do not break down for small eccentricities, small inclinations and rotations of the ideal frame reference that are half turns. The parameters are selected with a view of simplifying the programming of the right-hand members.

Generalized or adjoint reciprocity relations for electroacoustic transducers, A. D. Yaghjian, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B**(Math. Sci.), Nos. 1 and 2, 17-39 (Jan.-June 1975).

Key words: linear differential operators; reciprocity relations; scattering matrix; transducers.

The "equations of motion" of a linear electroacoustic transducer are written in the alternative forms $L^{-}X=\bar{0}$, $\bar{L}^{-}\bar{X}=0$, where the matrices $L^{=}$ are linear differential expressions. $X=(\bar{E},\bar{H},\bar{u})$ represents electroacoustic fields, and the superscripts distinguish selected normalizations of the equations of motion. To each operator $L^{=}$ corresponds a mathematically defined adjoint operator $(L^{=})^{a}$ and an associated adjoint transducer, whose material tensor parameters are given by certain transpositions and interchanges of the parameters of the given transducer. Dissipative characteristics (lossiness, losslessness, or "gaininess") of the material of the given transducer are preserved pointwise in the adjoint transducers. A generalized reciprocity lemma leads to relations of reciprocal type between external properties of the given and the adjoint transducers. In the self-adjoint cases, the conventional electroacoustic reciprocity and antireciprocity relations are obtained and the derivation of those relations is critically confirmed. The generalized or adjoint reciprocity relations have been applied in the plane-wave scattering-matrix formalism developed for electroacoustic transducers by D. M. Kerns.

Corollaries of the adjoint reciprocity relations, analogous to conventional reciprocity theorems, but involving properties of adjoint pairs of transducers, are derived. Examples are discussed of transducers for which it is feasible to form the adjoint tranducers.

The diophantine equation $p^2x^4+3px^2y^2+y^4=z^2$, p an odd prime, T. N. Sinha, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 41-44 (Jan.-June 1975).

Key words: diophantine equation; infinite descent; quadratic residues.

The object of this paper is to prove:

THEOREM 1. *The equation*

$$p^2x^4+3px^2y^2+y^4=z^2$$

where p *is an odd prime, has no solutions in integers with* $xy\neq 0$ *if* $p=5$ *or* $p\equiv 3,7 \pmod{20}$ *or* $p\equiv 13 \pmod{40}$.

A condition for the diagonalizability of a partitioned matrix, C. R. Johnson and M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 45-48 (Jan.-June 1975).

Key words: diagonalizable matrix; partitioned matrix.

When U and V are diagonalizable matrices the diagonalizability of

$$\begin{bmatrix} U & N \\ 0 & V \end{bmatrix}$$

is equivalent to the solvability in X of

$$UX-XV=N.$$

A corollary and simple generalization are given.

Linearly independent sets of isotropic Cartesian tensors of ranks up to eight, E. A. Kearsley and J. T. Fong, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 49-58 (Jan.-June 1975).

Key words: algebra; alternating tensor; Capelli's identity; Cartesian tensor; group representation; invariant; isotropic tensor; Kronecker delta; orthogonal group; tensor.

This paper contains a complete listing of isotropic Cartesian tensors of ranks up to eight with their associated reduction equations for obtaining linearly independent sets whenever the reduction is called for. In particular, the listing is compiled only for isotropic tensors associated with the rotation group $O^{+}(3)$ of the three-dimensional underlying vector space. Based on an identity originally due to Capelli (1887), reduction equations for tensors of odd ranks beginning at rank five and even ranks beginning at rank eight are shown to be nontrivial. Significance of the computational result in both pure and applied mathematics is discussed.

Maximal network flows, matroids and matchings, E. Minieka, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 59-62 (Jan.-June 1975).

Key words: independence properties; matroids; maximal flows; network flows.

This paper represents new proofs for some known network flow results. First, maximal network flows are expressed as matroids, and then Gale's characterization of matroids is used to prove the existence of various lexicographic network flows. Second, an independence property of maximum flows is proved and this property is related to an independence property of Brualdi and Scrimger.

A note on the metrizability of spaces with countably based closed sets, R. R. Sabella, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nov. 1 and 2, 63-64 (Jan.-June 1975).

Key words: co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences.

The main result of this note is a generalization of an earlier theorem on the metrizability of spaces with countably based

closed sets. Use is made of some results related to co-convergent spaces which are spaces having countably based compact sets.

Charge profiles in parallel-plate ionization chambers, G. F. L. Ferreira, L. Nunes de Oliveira, and B. Gross, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 1 and 2, 65-75 (Jan.-June 1975).

Key words: charge profiles; ionization chambers; numerical integration.

Numerical integration of the differential equations describing charge transport in plane-parallel ionization chambers allows to obtain charge profiles in addition to current-voltage curves. It is found that charge densities may exhibit maxima within a certain range of saturation. The effect is interpreted in terms of field modulation of carrier velocities.

July-December 1975

Two submatrix properties of certain induced norms, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 97-102 (July-Dec. 1975).

Key words: consistency; matrix norm; monotonicity; principal submatrix; spectral radius; vector norm.

Induced matrix norms N, defined consistently for all orders up to a given order, which have the property:

$$N(\hat{A}) \leq N(A)$$

for all principal submatrices $\hat{A}$ of an arbitrary m x m complex matrix A are characterized. Conditions are also given which insure that

$$N(A \oplus B) = \max \{N(A), N(B)\}$$

Properties of neighboring sequences in stratifiable spaces, R. R. Sabella, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 103-105 (July-Dec. 1975).

Key words: co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences.

In T_0-spaces metrizability can be characterized in terms of mutual convergence of "neighboring sequences." In this paper Nagata spaces are characterized in terms of a convergence property of neighboring sequences and more generally it is shown that in all stratifiable spaces, neighboring sequences satisfy a similar convergence property.

Maximin facility location, P. J. Slater, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 107-115 (July-Dec. 1975).

Key words: center; centroid; facility location; graph; tree.

Using the criterion that vertex u of a graph G is "more central" than vertex v if there are more vertices closer to u than to v, the security center and security centroid of a graph are defined. Several results, including the fact that the security center of a tree is the centroid, are presented. A simple algorithm to find the security center (centroid) of a tree is presented. The problem of finding the security center of G is shown reducible to a search over a single block of G.

Similarity of partitioned matrices, R. B. Feinberg, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 117-125 (July-Dec. 1975).

Key words: matric equation; partitioned matrix; rational canonical form; similarity.

Suppose that A, B, and T are matrices of order $r \times r$, $s \times s$, and $r \times s$ respectively over a field F. We prove that

$$\begin{bmatrix} A & T \\ 0 & B \end{bmatrix}$$

is similar to

$$\begin{bmatrix} A & 0 \\ 0 & B \end{bmatrix}$$

if $AX - XB = T$, for some matrix X. We also give some corollaries and a simple generalization.

On the dimension group of classical physics, C. H. Page, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 127-135 (July-Dec. 1975).

Key words: angle; dimension; logarithm; neper; radian.

The basic principles of the group properties of physical quantities are reviewed. The problems associated with the dimensions of *angle* and *logarithm* are solved by using functional equations, instead of analytic expressions, for defining functions of non-numerical quantities. It is concluded that the neper and radian are related by $Np = -j$ rad, so that when the radian is considered as a base unit, the neper becomes a derived unit, and is the SI unit for logarithmic quantities.

Complete elliptic integrals resulting from infinite integrals of Bessel functions. II., S. Okui, *J. Res. Nat. Bur. Stand. (U.S.)*, **79B** (Math. Sci.), Nos. 3 and 4, 137-170 (July-Dec. 1975).

Key words: Bessel functions; complete elliptic integrals; hyperbolic function; infinite integrals; modified Bessel functions; noise theory; signal statistics; trigonometric functions.

Infinite integrals involving products of Bessel and trigonometric or hyperbolic functions reducible to complete elliptic integrals are compiled. The table also contains certain types of infinite double integrals of modified Bessel functions. All results are expressed in conveniently compact form suited for practical applications.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 80B, JANUARY-DECEMBER 1976

January-March 1976

Nonnegative sums of roots of unity, M. Newman, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 1-4 (Jan.-Mar. 1976).

Key words: algebraic numbers; conjugates; roots of unity.

Let q, n be integers > 1, and let $\rho_1, \rho_2, \ldots, \rho_n$ be distinct qth roots of unity. It is shown that $\rho_1{}^k + \rho_2{}^k + \ldots + \rho_n{}^k \geq 0$ for all integral k if and only if n is a divisor of q and the set $\{\rho_1, \rho_2, \ldots, \rho_n\}$ coincides with the set $\{1, \zeta_n, \zeta_n{}^2, \ldots, \zeta_n{}^{n-1}\}$, where $\zeta_n = \exp(2\pi i/n)$.

Plane-wave scattering-matrix theory of antennas and antenna-antenna interactions: Formulation and applications, D. M. Kerns, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 5-51 (Jan.-Mar. 1976).

Key words: antenna-antenna interactions; antenna measurements; antenna theory; scattering-matrix theory of antennas.

In recent years a considerable amount of theoretical, experimental, and computational work in the development and application of techniques for accurate measurement of microwave antennas has been successfully completed at the National Bureau of Standards (and work is continuing). This paper presents and extends the basic plane-wave scattering-matrix formalism and presents new generalized or adjoint reciprocity relations for antennas. The PWSM formalism is eminently suitable for the formulation and solution of problems involving interactions at arbitrary distances and for the expression of conventional asymptotic quantities, such as gain, effective area, and polarization. It has in particular enabled derivation of two new techniques that permit accurate, "probe-corrected" antenna measurements at greatly reduced distances: (1) by deconvolution of transverse scanning data, taken with $d \ll d_R$ (where $d_R \equiv a^2/2\lambda$) and (2) by extrapolation of received signal observed as a function of distance d, with $d \sim d_R$. These techniques basically determine the scalar product, C, of two vectors characteristic respectively of the transmitting and the receiving antennas. Formulas for utilization of C-data, taking full account of polarization characteristics and not requiring reciprocal antennas, are given for (a) one-unknown-antenna, (b) generalized two-identical-antenna, and (c) generalized three-antenna measurement techniques.

Optimal facility location for normally and exponentially distributed points, I. N. Katz and L. Cooper, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 53-73 (Jan.-Mar. 1976).

Key words: always convergent algorithms; exponentially distributed points; facility location; location theory; normally distributed points; numerical analysis; optimization; stochastic Weber problem.

N destinations in the plane $\{P_j : j = 1, \ldots, N\}$ are given as independent random variables with specified probability densities, and the problem is to find the location of the point P which minimizes the expected sum of the Euclidean distances PP_j.

In this paper, upper bounds for the minimizing sum of distances are found in terms of solutions to corresponding deterministic problems and the first and second moments of the probability densities. Three commonly occurring classes of bivariate probability densities: (A) normal, (B) exponential, and (C) symmetric exponential, are then considered. Numerical tests are presented which show that in all cases, Steffensen's iteration is effective in accelerating convergence. Finally it is shown that in contrast to the deterministic case, P need not be in the convex hull of the means of P_j and a sufficient condition is given for P to be in this convex hull.

Real, 3×3, D-stable matrices, B. E. Cain, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 75-77 (Jan.-Mar. 1976).

Key words: arc-connectedness; Carlson-Johnson conjecture; D-stable; positive stable matrix.

We characterize the 3×3 real D-stable matrices.

Transient solutions for stratified fluid flows, D. W. Fox, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 79-88 (Jan.-Mar. 1976).

Key words: fluid dynamics; fundamental solution, intitial value problem; partial differential equations; stratified flow, internal waves, buoyant flows.

The solution to an initial value problem for the flow of a buoyant inviscid incompressible fluid in three-space is given in terms of a fundamental solution. The initial values and the distribution of source strength can be quite general subject only to mild restrictions on smoothness. The fundamental solution and its associated velocity and displacement fields are given explicitly and in some detail.

Equivalence of partitioned matrices, R. B. Feinberg, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 89-98 (Jan.-Mar. 1976).

Key words: determinantal divisors; equivalence; matric equation; partitioned matrix; Smith normal form.

It is shown that if $M = \begin{bmatrix} A & T \\ 0 & B \end{bmatrix}$ is a partitioned matrix over a principal ideal domain R such that the matrices A and B are both square, then M is equivalent to $A+B$ $\langle = \rangle$ the matric equation $T = AY + XB$ is solvable. The result is generalized to treat the case when

$$M = \begin{bmatrix} M_{11} & M_{12} & \cdots & M_{1t} \\ 0 & M_{22} & \cdots & \cdot \\ \cdot & & & \cdot \\ \cdot & & & \cdot \\ 0 & \cdots & 0 & M_{tt} \end{bmatrix}$$

where each M_{ii} is square.

Tables of binomial coefficients and Stirling numbers, K. Goldberg, F. T. Leighton, M. Newman, and S. L. Zuckerman, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 1, 99-171 (Jan.-Mar. 1976).

Key words: binomial coefficients; modular computation; Stirling numbers.

Tables of binomial coefficients and of Stirling numbers are given, along with the most important formulas and relationships satisfied by them. The tables were computed using modular arithmetic.

April-June 1976

The dependence of inspection-system performance on levels of penalties and inspection resources, A. J. Goldman and M. H. Pearl, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 189-236 (Apr.-June 1976).

Key words: inspection; mathematical model; regulation; strategy; theory of games.

This paper presents three simple mathematical models, all of game-theoretic type, dealing with an inspector-inspectee relationship. The inspectee always tries to maximize his net gain, which is the amount he obtains by "cheating" less the amount he is penalized when caught. The first model assumes a zero-sum payoff and so the inspector tries to minimize the inspectee's net gain. In the second model, the inspector tries to deter cheating without concern for the extraction of penalties. In the third model we assume that the probabilistic pattern of the inspector's strategy is known to the inspectee and that the inspector constructs his strategy with this in mind. Each of these models is analyzed and optimal solutions are obtained. Several simple examples are presented to show the relation between the level of cheating and the levels of inspection resources and penalty.

A minimax-measure intersection problem, P. R. Meyers, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 237-243 (Apr.-June 1976).

Key words: combinatorial analysis; combinatorial probability; measure theory; minimax.

The problem solved is that of selecting n subsets of the unit interval, each of measure α, so as to minimize the maximum of the measures of their p-fold intersections. This is achieved by minimizing the sum of the measures of these p-fold intersections.

Inverting sparse matrices by tree partitioning, D. R. Shier, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 245-257 (Apr.-June 1976).

Key words: block Gaussian elimination; graph; inversion; partitioning; sparse matrix; tree.

This paper studies the tree partitioning of a graph whose definition is based on the pattern of zero elements present in a given matrix. This partitioning then indicates a particularly advantageous strategy for employing block Gaussian elimination over a certain class of matrices. The strategy is exploited for matrix inversion, where it is especially appropriate for problems which require finding only selected submatrices of the inverse. A graph-theoretic algorithm is given for automatically generating tree partitioning for any matrix. Combinatorial properties of this procedure are also discussed.

The structure of higher degree symmetry classes of tensors, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 259-264 (Apr.-June 1976).

Key words: decomposable (or pure) tensor products; irreducible complex character; orthogonality relations; permutation group.

The paper is concerned with symmetry classes of tensors which arise from a permutation group G and irreducible character χ of G. In case χ is of degree 1, a well-known algorithm is available for inducing a basis of the symmetry class from the underlying vector space. When the degree of χ is greater than 1, no comparable construction has been discovered. The difficulties are discussed and results obtained in some special cases.

The Kronecker power of a permutation, R. Merris, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 265-268 (Apr.-June 1976).

Key words: bell numbers; branching theorem; Clebsch-Gordon series; irreducible character; matrix functions; multiple transitivity; permutation group; Stirling numbers.

Let G be a permutation group of degree n. Think of the elements, σ, of G as n-square permutation matrices. The paper concerns a reduction of the representation $\sigma \rightarrow$ the rth Kronecker power of σ. In case G is the full symmetric permutation group, a formula is given which involves the Stirling numbers of the second kind.

On Iohvidov's proofs of the Fischer-Frobenius theorem, R. C. Thompson, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 269-272 (Apr.-June 1976).

Key words: Hankel matrix; Toeplitz matrix.

A short proof is given of theorem of Fischer and Frobenius exhibiting a conjunctive transformation mapping Toeplitz matrices onto Hankel matrices.

Matrix algebra and eigenvalues for the bead/spring model of polymer solutions, J. T. Fong and A. Peterlin, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 273-284 (Apr.-June 1976).

Key words: bead/spring model; dilute polymer solutions; eigenvalue; hydrodynamic interaction; matrix algebra; necklace model; polymer physics.

Based on purely matrix-algebraic arguments, we prove three new results on the eigenvalue problem [Zimm, 1956] arising from modeling the bulk hydrodynamic and dielectric properties of very dilute polymer solutions:

1. Let N be the number of identical segments joining $N+1$ beads of a bead/spring model for any polymer molecule. Then for any N, the well-known hydrodynamic interaction matrix $\underline{\underline{H}}$ is positive definite if the so-called interaction parameter h^* is less than $(2\sqrt{2}+1)/7$ or 0.547. 2. Let $\underline{\underline{A}}$ be the tridiagonal matrix governing the elastic link force on each bead. Then if $\underline{\underline{H}}$ is positive definite, there exists a matrix $\underline{\underline{Q}}$ such that $\underline{\underline{Q}}^{-1}\underline{\underline{H}}\,\underline{\underline{A}}\,\underline{\underline{Q}}=\underline{\underline{Q}}^{T}\,\underline{\underline{A}}\,\underline{\underline{Q}}=\underline{\underline{\Lambda}}$, where $\underline{\underline{\Lambda}}$ is a diagonal matrix. 3. (Equivalence Statement due to Lodge and Wu [1971]). The nonzero eigenvalues of the matrix product $\underline{\underline{H}}\,\underline{\underline{A}}$ are completely determined by solving the eigenvalue problem associated with a symmetric matrix $\underline{\underline{S}}$, where $S_{ij}=H_{ij}+H_{i-1,j-1}-H_{i-1,j}-H_{i,j-1}, i,j=1,2,\ldots,N$.

To illustrate the significance of these results, numerical output for N as large as 300 based on a Fortran program for several values of h^* is given.

Predictable regular continued cotangent expansions, J. Shallit, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 285-290 (Apr.-June 1976).

Key words: continued cotangent; continued fraction; quadratic irrational.

Expansions of the form $x=\cot(\text{arc cot } n_0 - \text{arc cot } n_1 + \text{arc cot } n_2 - \ldots)$ are discussed. It is shown that if x is of the form $(1/2)(c+\sqrt{c^2+4})$, then the n's are predictable by a simple recurrence.

Continued fractions derived from the expansion of x are also given.

Automatic computing methods for special functions. Part III. The sine, cosine, exponential integrals, and related functions, I. A. Stegun and R. Zucker, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 291-313 (Apr.-June 1976).

Key words: continued fraction; cosine integral; exponential integral; FORTRAN program; hyperbolic sine and cosine integrals; key values; recurrence relations.

Accurate, efficient, automatic methods for computing the sine, cosine, exponential integrals and hyperbolic sine and cosine integrals are detailed and implemented in an American National Standard FORTRAN program. The functions are also tabulated to 35 significant figures for arguments $0, 10^j (10^j) 10^{j+1}$ with $J = -2(1)2$.

Definite integrals of the complete elliptic integral K, M. L. Glasser, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 2, 313-323 (Apr.-June 1976).

Key words: complete elliptic integral; cubic lattice; definite integral; special functions.

Definite integrals whose integrands contain the complete elliptic integral of the first kind are compiled.

July-September 1976

A note on pairs of matrices with product zero, C. R. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 333-335 (July-Sept. 1976).

Key words: eigenvalues; independence; quadratic form; random variable; singular value decomposition.

Pairs of not necessarily hermitian matrices for which $AB = BA = 0$ are characterized in terms of the singular values of $A + B$. This provides a generalization and a simpler proof of a classical result on the independence of quadratic forms in normal random variables.

Finding the circuits of a matroid, E. Minieka, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 337-342 (July-Sept. 1976).

Key words: algorithm; graph; matroid; network; operations research.

Given the bases of a matroid, this paper presents a primal algorithm and a dual algorithm for finding the circuits of the matroid.

One-sided tolerance limits for the normal distribution, $P = 0.80$, $\gamma = 0.80$, R. H. Wampler, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 343-346 (July-Sept. 1976).

Key words: noncentral t-distribution; normal distribution; statistics; tolerance limits.

A table is given of factors k used in constructing one-sided tolerance limits for a normal distribution. This table was obtained by interpolation in an existing table of percentage points of the noncentral t-distribution. The accuracy of the table is estimated, and a comparison is made of the presently computed factors with a previously published approximation.

Spectral measures and separation of variables, D. W. Fox, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 347-351 (July-Sept. 1976).

Key words: convolution; Hilbert space; separation of variables; spectral measure; tensor products.

This article gives an expression for the spectral measure corresponding to a self-adjoint operator for which separation of variables is possible. The construction makes use of the amalgamation theorem for normal operators in a natural way to obtain the required measure as a tensor convolution of the spectral measures of the part operators.

A survey of selected aspects of stratified and rotating fluids, R. G. Rehm, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 353-402 (July-Sept. 1976).

Key words: buoyant flows; geophysical fluid flows; inertial waves; internal waves; rotating fluids; stratified fluids; waves in fluids.

A survey is presented of phenomena in stratified and rotating fluids. Care is taken to define important quantities, to discuss basic concepts, to derive the fundamental equations and to present the basic nondimensional parameters associated with these flows. After a rather extensive section on waves, the analogy between stratified and rotating flows is discussed. Then nonlinear processes and transport and diffusion processes are reviewed. Although this report is rather brief in parts, it displays the rich variety of phenomena in stratified and rotating fluids. It also tabulates many of the important references.

This report also contains a discussion of some applications. Physical oceanography, physical limnology and meteorology are all areas of application in the earth sciences. The variety of application is stressed at the expense of depth and completeness. The more technological application of plumes in bodies of water or in the atmosphere is also discussed.

Finally, some important problem areas are briefly surveyed. These areas are turbulence, nonlinear processes, numerical computation of flows, and further applications.

A more tractable solution to a singular integral equation obtained by solving a related Hilbert problem for two unknowns, J. A. Pennline, *J. Res. Nat. Bur. Stand. (U.S.)*, **80B** (Math. Sci.), No. 3, 403-414 (July-Sept. 1976).

Key words: analytic function; Cauchy principle value; Hilbert problem for two unknowns; singular integral equation; wave-guide boundary problem.

The singular integral equation

$$\int_0^1 \left(\frac{1}{x-\sigma} + \frac{\frac{1}{2}}{x+\sigma} \right) \psi(x)\, dx = h, \quad 0 < \sigma < 1,$$

is converted into another singular integral equation

$$\frac{1}{2} \int_1^\infty \frac{\phi(t)}{t-x}\, dt + \frac{3}{2} \sqrt{x} \int_1^\infty \frac{\phi(t)}{\sqrt{t}(t-x)}\, dt = \frac{-2h}{\sqrt{x}}, \quad 1 < x < \infty$$

where

$$\phi(x) = \frac{\psi\left(\frac{1}{\sqrt{x}}\right)}{\sqrt{x}}.$$

The former was derived from a boundary value problem in wave guide theory, and the solution is known. By solving a related Hilbert problem for two unknown functions, the solution of the latter integral equation is obtained. Then, the expression

$$\psi(x) = \frac{1}{x}\, \phi\left(\frac{1}{x^2}\right)$$

is compared to the former known expression obtained for $\psi(\chi)$, and the new expression is found to be more tractable.

Sampling expansion for a Laguerre-L_ν^α transform, A. J. Jerri, *J. Res. Nat. Bur. Stand. (U.S.),* **80B** (Math. Sci.), No. 3, 415-418 (July-Sept. 1976).

Key words: Laguerre transform; sampling function; Whittaker's cardinal function.

The Whittaker cardinal (or sampling) series expansion, which is associated with a finite limit Fourier transform, has been extended to include other kernels that are solutions of the Sturm-Liouville problem. To date all illustrations on this generalized sampling expansion have been associated with orthogonal functions on finite intervals. In this note, we present a sampling expansion for a Laguerre-L_ν^α transform where we shall use the Laguerre polynomials $L_n^\alpha(x)$ which are orthogonal on the semi-infinite interval $(0, \infty)$ with respect to the weight function $e^{-x}x^\alpha$.

October-December 1976

An inequality for doubly stochastic matrices, C. R. Johnson and R. Bruce Kellogg, *J. Res. Nat. Bur. Stand. (U.S.),* **80B** (Math. Sci.), No. 4, 433-436 (Oct.-Dec. 1976).

Key words: diagonal scaling; doubly stochastic matrix; Perron-Frobenius eigenvalue.

Interrelated inequalities involving doubly stochastic matrices are presented. For example, if B is an n by n doubly stochastic matrix, x any nonnegative vector and $y = Bx$, then $x_1x_2....x_n \leq y_1y_2....y_n$. Also, if A is an n by n nonnegative matrix and D and E are positive diagonal matrices such that $B = DAE$ is doubly stochastic, then $\det DE \geq \rho(A)^{-n}$, where $\rho(A)$ is the Perron-Frobenius eigenvalue of A. These two mentioned inequalities are actually equivalent.

Improved error bounds for second-order differential equations with two turning points, F. W. J. Olver, *J. Res. Nat. Bur. Stand. (U.S.),* **80B** (Math. Sci.), No. 4, 437-440 (Oct.-Dec. 1976).

Key words: error bounds; parabolic cylinder functions; turning points; uniform asymptotic approximations; Weber's equation.

New error bounds are given for approximate solutions of differential equations of the form

$$d^2w/d\zeta^2 = \{u^2(\pm\alpha^2 - \zeta^2) + \psi(u,\alpha,\zeta)\}w$$

in terms of parabolic cylinder functions. Here ζ is a real variable, α is a bounded real parameter, u is a large positive parameter, and $\psi(u,\alpha,\zeta)$ is a continuous function of α and ζ. Zero values of α are admitted.

Pseudointersection graphs, P. J. Slater, *J. Res. Nat. Bur. Stand. (U.S.),* **80B** (Math. Sci.), No. 4, 441-445 (Oct.-Dec. 1976).

Key words: clique; clique graph; intersection graph; pseudointersection graph; set covering.

Pseudointersection graphs are defined and a parameter called the pseudointersection number of a graph, denoted $\omega^*(G)$ and closely related to the intersection number of G, denoted $\omega(G)$, is introduced. Relations between these parameters and conditions for them to be equal are examined. The problem of computing $\omega^*(G)$ is examined.

An efficient linear algebraic algorithm for the determination of isomorphism in pairs of undirected graphs, C. R. Johnson and F. T. Leighton, *J. Res. Nat. Bur. Stand. (U.S.),* **80B** (Math. Sci.), No. 4, 447-483 (Oct.-Dec. 1976).

Key words: graph isomorphism; labels; modified adjacency matrix; spectrum.

An algorithm, complete with a specific FORTRAN implementation, is presented for the problem of determining whether or not two undirected graphs are isomorphic. The algorithm, centered upon the eigenvalues and eigenvectors of a modified adjacency matrix and techniques for decreasing the size of the automorphism group, is quite different from others (most of which are combinatorially based) and tends to work relatively very quickly on difficult test cases as well as on typical examples. Complexity estimates are given for many eventualities.

3.3. PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 70C, JULY-DECEMBER 1966

July-September 1966

Some harmonic properties of an oscillating Fabry-Perot interferometer, M. Gadsden and H. M. Williams, *J. Res. NBS*, **70C**3-226, pp. 159-163 (July-Sept. 1966).

Key words: Fabry-Perot interferometer; airglow photometry.

The transmission of a spectral line through an air spaced Fabry-Perot interferometer is considered. The harmonic components of the transmission when the spacing of the interferometer is oscillated are discussed and it is found that the components can be used in a servocontrol system to offset drifts in the optical thickness of the interferometer. A possible use of such a controlled system in observations of the night airglow is discussed.

Precise reflection coefficient measurements with an untuned reflectometer, W. E. Little and D. A. Ellerbruch, *J. Res. NBS*, **70C**3-227, pp. 165-168 (July-Sept. 1966).

Key words: Microwave; impedance; measurements; reflectometer.

The precision tuned reflectometer technique of reflection coefficient measurement is, at present, the most accurate technique available. Utilization of the technique requires the use of tuners and sliding terminations to eliminate or reduce the inherent errors of a directional coupler.

This paper describes a reflection coefficient measurement technique that approaches the accuracy of the tuned reflectometer. Instead of tuners, the technique uses an ideal one-quarter wavelength waveguide section to eliminate the measurement error introduced by finite directional coupler directivity and to reduce to second order the error introduced by an equivalent generator mismatch.

A comparison of the quarter-wave technique with the tuned reflectometer technique through the measurement of the reflection coefficient of three 9/16 inch coaxial waveguide terminations is also included.

A versatile ratio instrument for the high ratio comparison of voltage or resistance, A. E. Hess, *J. Res. NBS*, **70C**3-228, pp. 169-172 (July-Sept. 1966).

Key words: DRRS (direct reading ratio set); junction; precision measurements; ratio; resistor; four-terminal; resistance decade; transresistance; URS (universal ratio set); VERI (versatile ratio instrument).

A 9-dial resistance ratio instrument capable of precise high ratio comparison of voltage or resistance (from 1/1 to 10^7/1) is described. Also described is the modification of a 6-dial universal ratio set to permit its additional use as a versatile ratio instrument. Paramount to the accuracy of these high ratio instruments is the carefully adjusted "common point" junction which is briefly discussed.

Console for the rapid and precise comparison of volt boxes, P. H. Lowrie, Jr., *J. Res. NBS*, **70C**3-229, pp. 173-185 (July-Sept. 1966).

Key words: Calibration; console; electrical; measurement; ratio; standards; voltage; volt box.

The comparison of volt boxes within uncertainties of ±0.01 percent or less has, in the past, been a long and difficult task at the NBS Boulder Laboratories. A console for this purpose recently put in use has reduced the time and labor to a great extent and, at the same time, has reduced the uncertainties associated with the measurement circuitry to less than 0.001 percent, thus allowing realizable calibration uncertainties of less than 0.005 percent. The console was designed as part of a system in which the operator was considered to be the decision-making link in the measurement chain. The circuitry, through the use of a contained computer and associated circuits, provides the operator with the data he requires in the form he chooses. The operator is thus freed from the need to consider minutiae, and thereby is able to concentrate on those factors requiring judgment.

Corrosion rates of binary alloys of nickel and iron measured by polarization methods, W. J. Schwerdtfeger, *J. Res. NBS*, **70C**3-230, pp. 187-194 (July-Sept. 1966).

Key words: Corrosion rates; Ni-Fe alloys; polarization techniques; polarization rate; polarization resistance; polarization circuits; Ni-Fe pitting.

Specimens of ten binary alloys of nickel and iron containing 3, 5, 10, 16, 20, 30, 36, 50, 57, and 81 percent Ni and of the metals nickel and iron were immersed for 7 months in 265 gallons of city water to which had been added 3 percent by weight of sodium chloride.

Cathodic and anodic polarization curves of the specimens were obtained at about 22 periodic intervals throughout the exposure period. Corrosion currents, calculated from currents at breaks in the curves, were converted to corrosion rates expressed as weight losses by applying Faraday's law. The calculated weight losses were in reasonable agreement with the actual weight losses.

The polarization rates, $\Delta V/\Delta I$, of the specimens calculated from cathodic polarization curves (cathodic control prevailed) at several intervals throughout the exposure period were plotted on logarithmic coordinates with respect to the corrosion current densities calculated from breaks in the same curves. Similarly, the averages of these $\Delta V/\Delta I$ values were also plotted on logarithmic coordinates versus the actual corrosion rates expressed as weight losses. Both plots conformed to the theoretical slope of -1.

The effect of cold-drawing on the creep behavior of a nickel-4.2 percent aluminum alloy, W. D. Jenkins and W. A. Willard, *J. Res. NBS*, **70C**3-231, pp. 195-205 (July-Sept. 1966).

Key words: Cold-drawing; creep; nickel alloys; Duranickel; nickel-aluminum precipitates; high temperatures; deformation.

Creep tests were made at 700, 900 and 1200 °F (644, 755 and 921 °K) on a nickel-4.2 percent aluminum alloy (Duranickel) initially as cold-drawn and as cold-drawn and age-hardened. Microstructural changes occurring during creep are correlated

with the flow, fracture, and ductility of the specimens. Light and electron microscope observations indicate that increases in creep strength were associated with the formation of rather straight discontinuous slip bands, a well defined subgrain structure, small precipitates of Ni_3Al and a general distribution of these precipitates throughout the grains. Creep strength at 1200 °F was relatively unaffected by prior cold-drawing or aging. Intercrystalline cracking, accompanied by low ductility, was evident at 900 and 1200 °F and slow creep rates; whereas transcrystalline cracking and high ductility values were observed at 700 °F.

Magnetic transformation and the influence of plastic strain on the shear modulus of Fe-Cr-Ni alloys, R. P. Mikesell and R. P. Reed, *J. Res. NBS*, **70C**3-232, pp. 207-210 (July-Sept. 1966).

Key words: Antiferromagnetic; cold-work; Fe-Ni-Cr alloys; Neel temperature; shear modulus; stainless steel.

The Fe-18Cr-9Ni and Fe-19Cr-9Ni alloys exhibit a decrease in shear modulus between 76 and 20 °K. Susceptibility measurements confirm that a paramagnetic to antiferromagnetic transition occurs at about 40 °K in these alloys. The shear modulus for the Fe-25Cr-21Ni alloy did not decrease between 76 and 20 °K which was consistent with the fact that the alloy remained paramagnetic to 4 °K. The effect of cold-work on the shear modulus above and below the Neel temperature is discussed.

October-December 1966

Some techniques for measuring small mutual inductances, D.N. Homan, *J. Res. NBS*, **70C**4-233, pp. 221-226 (Oct.-Dec. 1966).

Key words: Auxiliary generator; bridge; coaxial choke; mutual inductor; stray magnetic field; transformer.

A method of measuring small mutual inductances is presented. The smallest inductor measured was 0.1 μH. The circuit is a transformer-ratio-arm bridge with multiple balances and is described in detail. Uncertainties are of the order of one part in 10^7.

Several ideas for the design and construction of suitable mutual inductance standards are presented.

Deflection of centrally loaded thin circular elastic plates on equally spaced point supports, A. F. Kirstein, W. H. Pell, R. M. Woolley, and L. J. Davis, *J. Res. NBS*, **70C**4-234, pp. 227-244 (Oct.-Dec. 1966).

Key words: Bassali's theory; concentric loading; circular plates; deflection; elasticity; experimental; flexure; point supports; simplified approximate solutions; thin plates.

Bassali's general theory for the flexure of the thin circular elastic plate supported at an arbitrary number of points and subjected to transverse load over an eccentric circle is specialized to the case of a centrally loaded plate supported at points equally spaced on a circle concentric with the center. Simplified methods for approximating the results predicted by the more complicated theoretical expressions for deflection are presented along with the experimental results from 138 tests. Both the experimental results and the simplified equations are compared with the theory and agreement is found to be good.

Reproducibility of germanium resistance thermometers at 4.2 °K, M. H. Edlow and H. H. Plumb, *J. Res. NBS*, **70C**4-235, pp. 245-254 (Oct.-Dec. 1966).

Key words: Germanium resistors; germanium resistor reproducibility; low temperature thermometry; reproducibility of germanium resistors; thermal cycling at low temperature; thermometry.

NBS has needed a set of very reproducible germanium resistors that would be capable of maintaining temperature scales. This paper describes our procedure for selecting such a set.

A group of germanium resistors from three commercial sources have been thermally cycled between 4.2 °K and room temperature. The resistance-temperature calibrations at 4.2 °K were made with reference to a liquid helium bath so that reproducible temperatures could be determined from liquid helium vapor pressure measurements. Seven resistors out of 25 demonstrated reproducibilities (of the 4.2 °K calibration) of about 0.001 °K after undergoing the multiple cyclings. Guided by these results, we procured twelve, new, similar resistors which were cycled in a comparable procedure. After 85 cycles, in which 14 resistance-temperature calibrations were performed at 4.2 °K for each resistor, 10 of the 12 resistors demonstrated reproducibilities of approximately 0.001 °K.

The resulting set of secondary thermometers have undergone calibrations in the temperature ranges, 2 to 5 °K and 2 to 20 °K; reports of this work will be published in the near future.

Calibration of vibrating-sample magnetometers, W. E. Case and R. D. Harrington, *J. Res. NBS*, **70C**4-236, pp. 255-262 (Oct.-Dec. 1966).

Key words: Ferro- and ferrimagnetism; magnetization; magnetometer calibration; measurement of magnetization; saturation magnetization; vibrating-sample magnetometer.

An evaluation of two of the most widely accepted methods for calibrating vibrating-sample magnetometers is given. The comparison method uses a material of known magnetization such as pure nickel. In the slope method, the magnetometer is calibrated from the low field linear slope of the magnetization curve of a sample of high permeability.

The primary source of error in the comparison method arises from an uncertainty in the absolute magnetization of nickel and its dependence on environmental conditions. The study indicated that better accuracy can be expected from the slope method. The use of pure iron in this method was found preferable to high permeability ferrites.

Notes on the use of propagation of error formulas, H. H. Ku, *J. Res. NBS*, **70C**4-237, pp. 263-273 (Oct.-Dec. 1966).

Key words: Approximation; error; formula; imprecision; law of error; products; propagation of error; random; ratio; systematic; sum.

The "law of propagation of error" is a tool that physical scientists have conveniently and frequently used in their work for many years, yet an adequate reference is difficult to find. In this paper an expository review of this topic is presented, particularly in the light of current practices and interpretations. Examples on the accuracy of the approximations are given. The reporting of the uncertainties of final results is discussed.

The apparent thermal radiation properties of an isothermal V-groove with specularly reflecting walls, R. B. Zipin, *J. Res. NBS*, **70C**4-238, pp. 275-280 (Oct.-Dec. 1966).

Key words: Reflectance; specular walls; thermal radiation; V-grooves.

The reflection of a parallel beam of light incident in a V-groove is treated for the case when the walls are specularly reflecting. Methods of calculating apparent reflectances and absorptances are given. Experiments have been performed to test the theoretical calculations, and the agreement has been found to be satisfactory.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 71C, JANUARY-DECEMBER 1967

January-March 1967

Symmetrical bending of thin circular elastic plates on equally spaced point supports, A. F. Kirstein and R. M. Woolley, *J. Res. NBS*, 71C1-438, pp. 1-10 (Jan.-Mar. 1967).

Key words: Circular plates; concentric loading; design; elasticity; experiment; maximum stresses; symmetrical bending; symmetrically distributed load; theory.

A special application of Bassali's solution for transverse flexure of thin elastic plates supported at several points is presented for the case of symmetrical bending. Equations for moments, shearing forces, and stresses are developed which may be useful for design purposes. The experimental results although limited in quantity are in good agreement with the theoretical predictions.

Ultrasonic measurement of cylinder expansion at pressures to 40 kilobars, P. L. M. Heydemann and J. C. Houck, *J. Res. NBS*, 71C1-439, pp. 11-17 (Jan.-Mar. 1967).

Key words: Compressibility; cylinder distortion; high pressure; nickel; tellurium; ultrasonics.

For the accurate determination of internal pressures in solid-filled piston and cylinder devices the effective area and its change with pressure are very significant factors. The computation of the change of area with pressure from elastic theory leads however to considerable uncertainties.

The present paper describes how ultrasonic measurements made in solid-filled piston and cylinder devices to 45 kilobars are combined with measurements of the lengths of the samples as function of pressure and with ultrasonic measurements under hydrostatic pressure to yield values for cylinder expansion. The results are compared with values obtained from modified elastic theory.

A comparison of absorbed dose determinations in graphite by cavity ionization measurements and by calorimetry, B. Petree and P. Lamperti, *J. Res. NBS*, 71C1-440, pp. 19-27 (Jan.-Mar. 1967).

Key words: Absorbed dose; calorimeter; cavity ionization chamber; cobalt-60 gamma rays; comparison; graphite; $W \cdot \bar{s}_m$.

The absorbed dose in graphite from a cobalt-60 gamma-ray source was measured with a spherical air-filled cavity ionization chamber and with two spherical calorimeters. The instruments were constructed from high-purity graphite. The current per unit mass of air and the absorbed power per unit mass of graphite were determined with uncertainties of 0.40 and 0.17 percent respectively. When the two results are combined the value of $W_{air} \cdot \bar{s}_m$ is found to be 33.72 electron volts in graphite per ion pair in air, with an uncertainty of ±0.14 electron volts.

Germanium resistance thermometry in the range 2.1 to 5.0 °K, M. H. Edlow and H. H. Plumb, *J. Res. NBS*, 71C1-441, pp. 29-41 (Jan.-Mar 1967).

Key words: Calibration of germanium resistors; germanium resistors; thermometry.

The resistances of three encapsulated, hermetically sealed, arsenic-doped germanium resistors from a commercial source have been measured at every 0.1 °K from 2.1 to 5.0 °K in highly stabilized liquid helium baths; values of temperature were derived from vapor pressure measurements associated with the liquid bath.

Ten similar germanium resistors of common origin have been calibrated from 2.1 to 5.0 °K in a calibration comparator apparatus that is similar to a calorimeter in design. Calibrations were performed against a resistor that had been previously referenced to temperature through a helium-4 vapor pressure calibration.

Next, three of the resistors that were calibrated in the comparator apparatus were recalibrated in a liquid helium bath (at 2.2, 3.0 and 4.2 °K) and results from the two methods agree within ±1 milli-degree. The resistance-temperature data from both methods have been fitted to the polynomial equation

$$\log_{10} R = \sum_{n=0}^{m} A_n \cdot (\log_{10} T)^n$$

and the results of a computer program, which evaluates the coefficients, are presented.

Least squares technique for the analysis of periodic temperatures of the earth's surface region, T. Kusuda, *J. Res. NBS*, 71C1-442, pp. 43-50 (Jan.-Mar. 1967).

Key words: Earth temperature; least squares technique; thermal diffusivity of earth.

A least squares technique has been applied to periodic earth temperature data for the purpose of determining basic characteristics of earth temperature cycles, such as thermal diffusivity, average temperature, amplitude, and phase angle of the temperature cycle. A new procedure was developed for obtaining a single thermal diffusivity which represents an average over time and depth at a particular temperature site. This thermal diffusivity was obtained as a nonlinear part of least squares constants which yielded a best-fit harmonic curve to a given set of observed earth temperatures. The thermal diffusivity thus calculated and the calculation method developed are preferred to those obtained by current practice, which yields two thermal diffusivities, one based on amplitude decay and another on phase angle shift.

A new near-zone electric-field-strength meter, F. M. Greene, *J. Res. NBS*, 71C1-443, pp. 51-57 (Jan.-Mar. 1967).

Key words: Device, electroexplosive ordnance; field, near zone electromagnetic; hazards, electromagnetic radiation line, nonmetallic electrical transmission; line, semiconducting plastic transmission; meter, electric field-strength telemetry, novel form of.

The National Bureau of Standards has recently completed the development of prototype instrumentation for measuring the electric-field components of complex, high-level, near-zone electromagnetic fields. The instrumentation is intended for use in evaluating hazards of high-level electromagnetic radiation to electroexplosive ordnance devices at military installations. The

measuring range is from 0.1 to 1000 V per meter, at frequencies from 150 kHz to 30 MHz, with a present uncertainty of less than ±2 dB.

The design of the NBS meters is based on the use of a novel form of telemetry, which apparently has not been fully exploited heretofore. This involves the use of a completely nonmetallic electrical transmission line over which the field information is transmitted from the measuring antenna to a remote readout unit. The line is essentially "transparent" to the field being measured, and reduces the perturbation of the field two orders of magnitude below that normally experienced when using a metallic line. The high r-f line loss involved necessitates miniaturizing the r-f portions of the receiving and calibrating instrumentation and placing them and their associated battery supplies *inside* the measuring antenna. The design and performance of the meters are discussed in some detail.

Inductance and characteristic impedance of a strip-transmission line, R. L. Brooke, C. A. Hoer, and C. H. Love, *J. Res. NBS*, 71C1-444, pp. 59-67 (Jan.-Mar. 1967).

Key words: Characteristic impedance; inductance; and strip-transmission lines.

A general method is developed for determining the inductance and characteristic impedance of uniform transmission lines. A non-uniform current distribution is allowed in the transverse plane. The system is represented by a matrix equation which can be programmed for computer solution. The correct inductance and impedance are obtained as the result of a simple limiting process. The method is applied to one particular geometry, a four-tape stripline system. Results are given for the inductance, resistance, and current distribution as functions of frequency and resistivity for a particular geometry. A method for extending the results to strip lines with proportional dimensions is developed. An accuracy of one part in 10^5 was found to be feasible for the determination of the inductance per unit length.

Tensor permeability measurements at L-band frequencies using a degenerate mode cavity, L. B. Schmidt, R. D. Harrington, and W. E. Case, *J. Res. NBS*, 71C1-445, pp. 69-75 (Jan.-Mar. 1967).

Key words: Degenerate mode cavity; L-band cavity; polycrystalline garnets; tensor permeability.

The exact solution for the field equations of a cylindrical TM_{110} mode cavity has previously allowed accurate measurements of tensor permeability to be obtained at X-band frequencies. It is demonstrated that this method is also applicable at frequencies down to 1 GHz. A brief description of the cavity and measurement system for obtaining data at these lower frequencies is given. Both intrinsic and external permeability results on three commercially available polycrystalline garnets are shown. The larger size rods required for measurements at these frequencies result in some sample size effects in the data. In addition, a previously unreported absorption in the external tensor permeability of the materials was observed.

April-June 1967

An apparatus for measuring thermal expansion at elevated temperatures, B. D. Rothrock and R. K. Kirby, *J. Res. NBS*, 71C2-247, pp. 85-91 (Apr.-June 1967).

Key words: Controlled-gradient vacuum furnace; elevated temperatures; optical comparator; thermal expansion.

An apparatus has been developed for making precise measurements of the absolute thermal expansion of refractory materials at temperatures up to 1600 °C. This apparatus consists of an optical comparator and a controlled gradient vacuum furnace. Special care was taken on the techniques of measuring length and temperature and on the calibration of the microscopes and thermometers. The expansion data obtained with this apparatus on specimens of platinum and sapphire have a standard deviation of less than 30 ppm and are estimated to be accurate to within 50 ppm.

Determination and smoothing of Fourier coefficients representing piecewise continuous functions, B. A. Peavy, *J. Res. NBS*, 71C2-248, pp. 93-100 (Apr.-June 1967).

Key words: Continuous function; Fourier series; piecewise; smoothing.

This paper presents a method of solving for Fourier coefficients where the dependent variable can be expressed as a piecewise continuous function, when various conditions of continuity and smoothing are assumed. An example is included to show the effect of smoothing in the region of a discontinuity for a system composed of two materials that exhibit a discontinuity at their interface and surrounded by a third material which does not have a discontinuity. An advantage to be gained from smoothing is an increase in the convergence of a finite Fourier series representation of a piecewise continuous function in the region of the discontinuities.

A 2:1 ratio inductive voltage divider with less than 0.1 ppm error to 1 MHz, C. A. Hoer and W. L. Smith, *J. Res. NBS*, 71C2-249, pp. 101-109 (Apr.-June 1967).

Key words: Attenuator; bridge; high frequency; inductive voltage divider; ratio transformer.

A simple ratio transformer having a 2:1 ratio of input voltage to output voltage can be made with a ratio error less than 0.1 ppm from 1 kHz to above 1 MHz. Applications and sources of error are discussed. Experimental results leading to an optimum transformer design are given. A bridge to measure the ratio error to 0.025 ppm from 1 kHz to 1 MHz is also described.

A dual-load flow calorimeter for rf power measurement to 4 GHz, M. L. Crawford and P. A. Hudson, *J. Res. NBS*, 71C2-250, pp. 111-117 (Apr.-June 1967).

Key words: Coaxial; flow calorimeter; radio frequency power.

A new dual-load flow coaxial calorimeter power meter has been constructed at the National Bureau of Standards, Boulder Laboratories. Designed for use as a reference standard, the frequency range of the calorimeter extends up to 4 GHz and beyond. The power range extends from 2W to 100W with an error limit of 0.38 percent.

Design details, error analysis, and results of intercomparison with other standards are given.

Polymeric materials for dielectric reference specimens, A. H. Scott and J. R. Kinard, Jr., *J. Res. NBS*, 71C2-251, pp. 119-125 (Apr.- June 1967).

Key words: Dielectric constant; dissipation factor; frequency; fluorinated ethylene-propylene; humidity; polycarbonate; polyethylene; poly(1,4-cyclohexylenedimethylene terephthalate); polystyrene; poly(tetrafluoroethylene); time; reference specimens.

The results from a study of the effects of aging and humidity change on certain polymer specimens indicate it is possible to establish stable dielectric reference specimens. Specimens of polyethylene, polystyrene, polycarbonate, poly(tetrafluoroethylene) (PTFE), fluorinated ethylene-propylene polymer (FEP), and poly(1,4-cyclohexylenedimethylene terephthalate) were used in the investigation. Slow changes in the dielectric proper-

ties were observed on some specimens over a period as long as three years. Very long timed humidity runs indicate PTFE, and FEP to only a slightly less degree, are best suited for dielectric reference specimen preparation.

The sensitivity of the Dicke radiometer, D. F. Wait, *J. Res. NBS*, 71C2-252, pp. 127-152 (Apr.-June 1967).

Key words: Dicke; microwave; radiometer; sensitivity; switching.

The literature is reviewed concerning the sensitivity of the Dicke radiometer, excluding gain fluctuations. Discrepancies are pointed out and a new derivation of sensitivity using a Fourier transform method is used to resolve these discrepancies and to extend the results to radiometers with lossy switches.

Experimentally it is shown that radiometers using a half-wave square-law, linear-law, intermediate-law, or envelope detectors all have a sensitivity equal to the theoretical full-wave square-law detector (within the ±20 percent uncertainty of the experiment).

Sensitivity of a correlation radiometer, J. J. Faris, *J. Res. NBS*, 71C2-253, pp. 153-170 (Apr.-June 1967).

Key words: Correlation radiometer; differential time delay; gain fluctuations; imperfect multiplier; noise comparison; nonidentical amplifiers; sine-wave comparison signal.

The correlation radiometer is analyzed to determine the sensitivity that can be obtained under various operating conditions.

The radiometer using a sine wave comparison signal is analyzed and compared with the usual radiometer that employs a random noise for the comparison signal. It is found that the radiometer employing the sine wave comparison signal is the more sensitive of the two circuits, particularly in the case that the effective temperature of the input noise signal is greater than the effective input temperature of the amplifiers.

It is shown that if nonidentical amplifiers are used in the correlation circuit, the properties of the radiometer are determined by the portion of the amplifier response functions in the frequency interval that the two response functions overlap. The effect of amplifier gain fluctuations are considered, and although the correlation scheme reduces the effect of gain fluctuations, it is shown that they still do contribute to the output fluctuations of the radiometer.

Calculations are included showing that the effect of a differential phase shift between the two channels is a reduction in radiometer sensitivity. The same conclusion is reached concerning the effect of a differential time delay.

Finally, it is shown that if the comparison signal and the input signal have the same statistical properties, the requirements on the multiplier are less stringent than if the two signals have different statistical properties.

July-September 1967

Procedure for high precision density determinations by hydrostatic weighing, H. A. Bowman and R. M. Schoonover with Appendix by M. W. Jones, *J. Res. NBS* 71C3-254, pp. 179-198 (July-Aug. 1967).

Key words: Air density; balance; balance calibration; balance equilibrium; balance sensitivity; density; double substitution weighing; hydrostatic balance; hydrostatic weighing; silicon density; substitution balance; volumetric measurement; water density; water weighing.

There are several simplifications which can be made in the performance of the hydrostatic experiment which lead to more reproducible results. The operation of single-pan two-knife balances is discussed, and simple modifications suggested to adapt it to hydrostatic work. A data philosophy is presented which will be particularly applicable to a generation of now-developing force measuring instruments when used in hydrostatic work. A simplified formula for air density is presented and a formula for estimating day-to-day variability in the density of water. A simple balance calibration procedure is presented in an appendix, and simplified methods of fabricating suspension wires and degassing sample surfaces are described. The use of these techniques is illustrated by measurements on silicon crystals which indicate process reproducibility of a standard deviation to about one part per million.

Study of the storage stability of the barium fluoride film electric hygrometer element, F. E. Jones, *J. Res. NBS* 71C3-255, pp. 199-207 (July-Sept. 1967).

Key words: Adsorption; barium fluoride; electric hygrometer; humidity; thin films; vacuum.

A study of the aging properties of the barium fluoride film electric hygrometer element and of possible causes of the drift of calibration with time in storage has been made. It was found that exposure of aged elements to glow discharge bombardment resulted in near recovery of the prestorage calibration, indicating that the calibration drift was not irreversible and providing insight into the mechanism of aging. Based on the likelihood that aging was due, at least in part, to contamination of the barium fluoride film, production procedures were formulated which resulted in elements with significantly reduced drift. If an adjustment is made similar to the "lock-in" procedure in the operational use of radiosonde humidity elements, then the poststorage resistance values can be adjusted to correspond closely to the prestorage calibration curves. Experimental evidence supports the hypothesis that contamination of the elements by diffusion pumping fluid in the production process was a source of the calibration drift. Applications of the element as a research tool in cloud physics, atmospheric turbulence and radio refractive index structure studies, evaporation and evaporation reduction studies, water vapor flux determinations and tropospheric humidity distribution studies are mentioned.

Torsion creep of circular and noncircular tubes, L. Mordfin, *J. Res. NBS* 71C3-256, pp. 209-225 (July-Sept. 1967).

Key words: Creep; primary creep; shear; shell; stress analysis; thin wall; torsion; tube.

A torsion creep theory for noncircular tubes was developed by applying a multiaxial creep theory to a derived generalization of Bredt's equations.

A review of the literature revealed no torsion creep data on noncircular tubes. Hence, to evaluate the theory, a test program was carried out on twelve specimens of aluminum alloy structural tubing, of four configurations, at 400 °F.

Observed discrepancies between the torsion creep theory and experiment are smaller than variations in the measured creep properties of the specimen material from one tube configuration to another and are not appreciably greater than discrepancies between elastic torsion theory and experiment. Most of the observed discrepancies are consistent with measured anisotropy in the tubes, while other discrepancies are ascribed to nonhomogeneity in creep properties and a hydrostatic stress effect in multiaxial creep.

For the calculation of torsion stresses in circular tubes the thin-wall approximation is adequate for thickness-to-radius ratios up to one-tenth. For straight-sided tubes equivalent accuracy is obtained for effective ratios up to only one-twentieth. These criteria apply to creep conditions as well as to elastic conditions.

Digitized low-frequency phasemeter assembled from logic modules, J. E. McKinney, *J. Res. NBS* 71C3-257, pp. 227-238 (July-Sept. 1967).

Key words: Digital; phasemeter; logic circuit; low frequency; measurements; phase.

A digital phasemeter is described which is capable of operating from arbitrarily low frequencies to 10 kHz, for which the lower limit depends essentially upon the time available to the operator to make the measurement. The phasemeter involves a logic circuit which can be assembled easily from commercially available logic modules without the necessity of a proficiency in electronics. The output of the logic circuit is read into a conventional digital preset frequency-ratio meter. The determination is absolute and utilizes a time base. Accordingly, no calibration against a phase standard is necessary. The agreement between this phasemeter and a quality phase shifter was found to be within ±0.01° at 400 Hz, which is the accuracy specified by the manufacturer of the phase shifter. Considerable ability to ignore signal imperfections is inherent in this device.

October-December 1967

Measurements of the thermal conductivity and electrical resistivity of platinum from 100 to 900 °C, D. R. Flynn and M. E. O'Hagan, *J. Res. NBS* 71C4-258, pp. 255-284 (Oct.-Dec. 1967).

Key words: Conductivity; electrical conductivity; electrical resistivity; heat conductivity; Lorenz function; platinum; reference material; resistivity; standard; thermal conductivity.

Measurements have been made of the thermal conductivity and the electrical resistivity of commercial grade platinum (99.98% pure) in the temperature range 100 to 900 °C. The measurements have been made with a view to providing accurate data on the thermal conductivity of platinum to serve as a basis for establishing platinum as a thermal conductivity standard reference material. Two methods of measuring the thermal conductivity have been employed, one an electrical method and the other a nonelectrical method. In the electrical method, a direct current passed through a necked-down portion of the specimen and the thermal conductivity was determined in terms of the temperature and electrical potential distributions in the necked-down region. The second method was of the absolute guarded longitudinal heat flow type. The experiment was designed to permit measurements by both methods in the same apparatus and on the same specimen thereby providing as direct a comparison as possible between the methods. The data given by the two methods agree within experimental error and show the thermal conductivity of platinum to be a smoothly increasing function of temperature in the measured range. Additional measurements on samples of differing purities are necessary before platinum could be adopted as a thermal conductivity reference material.

Thermal conductivity and electrical resistivity of Armco iron, T. W. Watson, D. R. Flynn, and H. E. Robinson, *J. Res. NBS* 71C4-259, pp. 285-291 (Oct.-Dec. 1967).

Key words: Armco iron; conductivity; electrical conductivity; electrical resistivity; heat conductivity; heat transfer; iron; Lorenz function; resistivity; thermal conductivity.

New data are presented for the thermal conductivity and electrical resistivity of two samples of Armco iron. On a sample of material used in a round robin comparison between several laboratories, thermal conductivity was measured from −160 to +640 °C and electrical resistivity was measured from −195 to +1380 °C. On a sample of cold-worked Armco iron from a different lot, data are reported from −150 to +200 °C.

Heat flow in a right circular cylinder with internal heat generation: Applications to the determination of thermal conductivity, D. R. Flynn, *J. Res. NBS* 71C4-260, pp. 293-298 (Oct.-Dec. 1967).

Key words: Heat conduction; heat generation; heat transfer; neutron absorption; radioactive decay; thermal conductivity.

Expressions are developed which permit calculation of the temperature-dependent thermal conductivity of a cylindrical specimen in which heat is generated internally, e.g., by radioactive decay. The information needed consists of the experimentally determined temperature distributions on the surfaces of the cylinder, the heat flow through a central circular area at one end of the cylinder, and the rate of internal heat generation (which in general may be position-dependent). Numerical coefficients are tabulated for the case of uniform internal heat generation. The application of this calculation procedure to published methods of thermal conductivity determination is shown and an example is given.

Radiation-induced acoustic cavitation: Apparatus and some results, M. Greenspan and C. E. Tschiegg, *J. Res. NBS* 71C4-261, pp. 299-312 (Oct.-Dec. 1967).

Key words: Acoustic cavitation; alpha-particle-induced cavitation; cavitation; cavitation nucleus; cavitation threshold; fission-induced cavitation; neutron-induced cavitation; radiation-induced cavitation; threshold.

Equipment and techniques for acoustic cavitation work are described. The test liquid and its container form part of a self-sustaining programmable oscillator. Emphasis is laid on the treatment of the liquid necessary to yield reproducible results after artificial nucleation, especially by neutrons, α-recoils, and fission. With neutrons, for instance, the cavitation rate rises rapidly with acoustic (negative) pressure, and at fixed pressure is proportional to neutron flux. The cavitation events are random, and no appreciable induction or decay times are observed. Each cavitation arises from the action of a single neutron (or α-recoil, or fission). The cavitation "threshold" (roughly negative pressure below which cavitation is rare) is highly variable from liquid to liquid. Thresholds at about room temperature for liquids irradiated with 10 MeV neutrons ranged from 1 to 2 bars for *n*-pentane, ether, and freon 113 to over 50 bars for water.

Design of a new Kossel pattern generator, D. L. Vieth and H. Yakowitz, *J. Res. NBS* 71C4-262, pp. 313-318 (Oct.-Dec. 1967).

Key words: Divergent x-ray beam; instrument design; Kossel camera; Kossel method; x-ray instrumentation.

A Kossel pattern generator, designed and built at the National Bureau of Standards, is described in detail. The unit is modular and consists of an electron beam column, vacuum system, light microscope, film cassette, and Kossel camera. The camera component includes microgoniometric capabilities. The Kossel x-ray technique enables the investigator to obtain lattice spacing data precise to two or three parts per million, and orientation of crystals to 0.1° of arc. The Kossel pattern generator described permits data for such determinations to be obtained quickly and precisely.

The near-zone magnetic field of a small circular-loop antenna, F. M. Greene, *J. Res. NBS* 71C4-263, pp. 319-326 (Oct.-Dec. 1967).

Key words: Loop-antenna field strength; magnetic field-strength standard; mutual inductance of coaxial circular filaments; near-zone magnetic field; transmitting loop antenna.

An improved formula is derived for accurately computing the *near-zone* magnetic field of a small circular transmitting loop antenna. Such a field can serve as a reference standard for calibrating field-strength meters employing small receiving loop antennas in the frequency range 30 Hz to 30 MHz.

This formula includes correction terms for frequency (due to the finite time of propagation), as well as corrections for the finite radii of both the transmitting and receiving loops. Other formulas appearing in the literature often fail to include such corrections which can result in errors of up to 20 percent and more in computing standard-field values.

The NBS formula is derived by expanding the integrand of the retarded vector potential into an infinite series of spherical Hankel functions of increasing order. The resulting series expression is in error by less than 0.2 percent, is rapidly converging and simple to use without recourse to a table of functions or a computer.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 72C, JANUARY-DECEMBER 1968

January-March 1968

Acceleration due to gravity at the National Bureau of Standards, D. R. Tate, *J. Res. Nat. Bur. Stand. (U.S.)*, 72C (Eng. and Instr.), No. 1, 1-20 (Jan.-Mar. 1968).

Key words: Absolute gravity; acceleration; free-fall; gravity; Potsdam.

A determination of the absolute value of the acceleration due to gravity was completed in June 1965 at the National Bureau of Standards near Gaithersburg, Maryland. The determination resulted in a value of 980.1018 centimeters per second squared for a reference point on the first floor of the Engineering Mechanics Building. The result was published in *The Journal of Research of the National Bureau of Standards*, Vol. **70C**, No. 2, Engineering and Instrumentation, page 149, April-June 1966. The present paper describes in detail the apparatus and the techniques employed and presents the summarized data from which the value was derived.

Deflection of thin circular elastic plates under symmetrically distributed loading, A. F. Kirstein and R. M. Woolley, *J. Res. Nat. Bur. Stand. (U.S.)*, 72C (Engr. and Instr.), No. 1, 21-26 (Jan.-Mar. 1968).

Key words: Bassali's theory; deflection; elasticity; flexure; point supports; symmetrically distributed load; thin plates.

A special application of Bassali's solution for transverse flexure of thin elastic plates supported at several points is presented for the case of concentric symmetrically distributed load. Equations for deflection are presented for the case where the point supports lie within the loaded area. Under special conditions the numerical results from these equations coincide with those of Nadai's.

A dynamic method for determining the vapor pressure of carbon dioxide at 0 °C, J. L. Edwards and D. P. Johnson, *J. Res. Nat. Bur. Stand. (U.S.)* **72C** (Eng. and Instr.), No. 1, 27-32 (Jan.-Mar. 1968).

Key words: Carbon dioxide; fixed point; hypsometer; pressure standard; purification; vapor pressure.

The vapor pressure of carbon dioxide at 0 °C, or at 0.01 °C, has been used as a fixed point on the pressure scale. Comparisons between laboratories may be affected equally by pressure measurements, temperature measurements, and the purity (and possibly isotope composition) of the sample. A dynamic method for establishing this pressure is described, utilizing a device similar to those used to realize the sulfur and steam points on the International Practical Temperature Scale. Advantages of the method include rapid establishment of equilibrium conditions, and the automatic purification of the carbon dioxide. Results obtained indicate a sample-to-sample reproducibility better than one part in 25,000. The method is suggested as being suitable for general use in realizing the CO_2 point of the pressure scale. This experiment yielded a value for the vapor pressure at 0 °C of 3.48516 MN m^{-2} or 26,140.8 mm Hg; at the triple point of water, 0.01 °C, it was 3.48608 MN m^{-2} or 26,147.7 mm Hg.

An adiabatic saturation psychrometer, L. Greenspan and A. Wexler, *J. Res. Nat. Bur. Stand. (U.S.)*, 72C (Eng. and Instr.), No. 1, 33-47 (Jan.-Mar. 1968).

Key words: Adiabatic saturation; gas mixtures; humidity; hygrometer; mixing ratio; moist gas; psychrometer; psychrometric factor; saturation; thermodynamic wet-bulb temperature; vapor content; wet-bulb.

An adiabatic saturation psychrometer for measuring the humidity of gases, as well as the vapor content of vapor-gas mixtures, is described. The instrument behaves in accordance with predictions deduced solely from thermodynamic considerations. With water-air, water-hydrogen, carbon tetrachloride-hydrogen, carbon tetrachloride-oxygen and toluene-air systems, at room temperature, atmospheric pressure, and gas flow rates of 1.3 to 5.2 liters per minute, measured wet-bulb temperatures agree with calculated "thermodynamic wet-bulb temperatures" to within the accuracy of the measurements and the uncertainties in the published thermodynamic data used in the computations. For the water-air system, the systematic and random errors due to these sources are estimated at 0.027 deg C and 0.019 deg C respectively. The agreement between the calculated and measured wet-bulb temperature is 0.029 deg C, which at a dry-bulb temperature of 25 °C and an ambient pressure of 1 bar is equivalent to an uncertainty in relative humidity which varies from 1/8 to 1/4 percent. The time constant is a function of the gas flow rate; at flow rates of 3.75 to 5.2 liters per minute, the time constant is of the order of 3/4 minute.

An injection method for self-calibration of inductive voltage dividers, W. C. Sze, *J. Res. Nat. Bur. Stand. (U.S.)*, 72C (Eng. and Instr.), No. 1, 49-59 (Jan.-Mar. 1968).

Key words: Calibration; in-phase deviation; inductive voltage divider; measurements; quadrature deviation; ratio calibration; transformer; two-stage voltage transformer; voltage divider; voltage ratio.

A self-calibration or "boot-strapping" injection method for determining the voltage ratio and phase angle deviations of inductive voltage dividers utilizes specially constructed transformers for step and differential voltage injections without reference to the fundamental electrical units or standards. Construction details of transformers, derivation of equations, and systematic evaluation of uncertainties are presented. Calibration of certain ratios involving a combination of dial settings on several decades can be obtained as readily as that of a single decade. The accuracy of the results obtainable at 10 kHz is within 2×10^{-7} of input for deviations less than 10 ppm of input and within 1×10^{-6} for deviations up to 100 ppm of input. This same calibration technique can readily be used to cover a frequency range from 1 to 20 kHz.

Bolometric voltage and current (Bolovac) standard for high and microwave frequencies, M. C. Selby, *J. Res. Nat. Bur. Stand. (U.S.)*, **72C** (Eng. and Instr.), No. 1, 61-79 (Jan.-Mar. 1968).

Key words: Current measurement; measurement voltages; microwave current; microwave voltages; transmission-line voltages; voltage measurements.

A standard of voltages and currents for lumped-constant, coaxial, and other circuits operating in the TEM mode has been

developed. Its approximate potential ranges are 1 MHz to 20 GHz in frequency, 0.05 to 10 volts, and 5 microamperes to 10 amperes. The principle may be used with bolometric, thermoelectric, photoelectric or other sensing elements consisting of thin film conducting or semiconducting disks located in the transverse plane of the TEM mode. Application and advantages are described and a comprehensive error analysis is presented. Figures illustrating construction details of one of the models of the Bolovac are included.

An admittance meter technique to measure the complex permeability at VHF, A. L. Rasmussen and C. M. Allred, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 1, 81-89 (Jan.-Mar. 1968).

Key words: Admittance meter; attenuation calibration; lossy magnetic materials; magnetic measurement methods; permeability; rf magnetic materials; VHF bridge; VHF magnetic materials.

An admittance meter technique may be used in evaluating and comparing accurately and conveniently the complex permeability of magnetic materials from 30 MHz to ~ 100 MHz. The admittance meter has three coaxial lines fed from a common source at a common junction point, two lines being terminated by shorts and the third by 50Ω. The currents in the lines are detected by three electrically connected parallel loops each located close to the common junction point of the lines. The loops are adjustable to one minute of rotation and follow closely a sine law. The complex permeability of a sample is derived from measurements with a sample in and out of one of the shorted coaxial lines. The estimated error from 30 MHz to 100 MHz is from ~ 1 to ~ 10 percent for sample inductance from $3 \cdot 10^{-9}$ to 10^{-7} H and sample resistance $5 \cdot 10^{-1}$ to $10^{2}\Omega$. Error of inductance is ~ 1 percent from 30 MHz to 200 MHz for low-loss samples using calibrated sample data. Using precision 50Ω, low-contact resistance lines, the sample impedance error attainable is estimated as ~ 1 percent for the above limits of impedance and measurements can be extended to above 100 MHz. The equations for the inductance and the resistance of the sample are expressed in terms of calibrated values for the settings of two loops, the calibrated resistance value of the 50Ω termination, the calibrated or calculated impedance components of the sample line, and the inductance of an equivalent air core.

April-June 1968

Analysis and design of an oscilloscope deflection system with a calculable transfer function, D. M. Stonebraker, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 2, 117-125 (Apr.-June 1968).

Key words: Deflector; drift space; oscilloscope; standard; strip-line; transfer function.

An oscilloscope deflector is described, which has a calculable transfer function. The deflector is analyzed, leading to its transfer function, in terms of the complex frequency variables. A practical strip line deflector, usable as a pulse standard, is designed; and its frequency response, sensitivity, bandwidth, rise time, step function, and impulse response are calculated. The predicted deflection is down to 70 percent of its d-c value at 2.82 GHz, while the step-response 10 to 90 percent rise time is 148 picoseconds. The effects of a drift space on the oscilloscopic display is also discussed. Results are compared with a well-known expression for the parallel plate deflector structure.

Calculation of substitution error in barretters, S. Jarvis, Jr., and J. W. Adams, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 2, 127-237 (Apr.-June 1968).

Key words: Barretter; bolometer; microwave power measurements; substitution error.

This paper describes a mathematical analysis for determining the value of the substitution error of a bolometer with a Wollaston-wire element (barretter). The analysis reflects all significant nonlinearities in the heat flow, including some not covered before, and includes all appreciable heat transport mechanisms simultaneously.

The values of substitution error thus obtained, in conjunction with efficiency data obtained by microwave techniques, will be very useful in extending power meter calibrations to frequency ranges where extremely accurate microcalorimeters are not available.

Analysis of *n*-degree elliptical elastic rings of nonuniform cross section, R. A. Mitchell, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 2, 139-160 (Apr.-June 1968).

Key words: Curved bar analysis; elasticity; force transducer; *n*-degree elliptical ring; nonlinear programming; optimization; proving ring; structural design; theory.

A curved bar structural analysis is developed for an *n*-degree elliptical elastic ring with sinusoidally varying cross-section dimensions, where the *n*-degree ellipse is defined by $(x/a)^n + (y/b)^n = 1$, $n \geq 2.0$. A sequential grid constrained optimization method is used to search for a minimum weight design in six dimensional shape parameter space. Numerical results indicate that rings of this shape can be designed to have considerably less weight and greater flexibility than comparable circular rings with uniform cross-section dimensions.

Applications of coaxial chokes to a-c bridge circuits, D. N. Homan, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 2, 161-165 (Apr.-June 1968).

Key words: Bridge; capacitance; coaxial cable; ground loop; inductance; magnetic core; stray magnetic field.

One or more turns of coaxial cable on a magnetic core form a coaxial choke which may be used to suppress unwanted loop currents in a-c bridge circuits. A review of several applications of coaxial chokes to a-c bridge circuits is presented. These applications include suppressing ground loop currents, assuring unique definition in the measurement of small 3-terminal capacitors, reducing stray magnetic field and reducing voltage drops in leads caused by large ground capacitance current. There is also a discussion of techniques for greatly increasing the effectiveness of the coaxial choke.

Creep rupture properties of Ti-8Al-1Mo-1V alloy, W. D. Jenkins and W. A. Willard, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 2, 167-174 (Apr.-June 1968).

Key words: Creep; engineering design; high temperatures; phase changes; rupture; titanium alloy.

Creep tests were made at 600, 800, 1000, and 1200 °F (588, 699, 811, and 921 °K) on duplex-annealed Ti-8Al-1Mo-1V alloy specimens. Creep-test conditions were selected to produce creep rates ranging from 0.1 to 50,000 percent per 1,000 hours and rupture times ranging from 0.1 to about 10,000 hours. Conformance of the test data to creep theories was obtained over a limited range of stress, strain, creep rate and temperature. Creep behavior was influenced by microstructural changes during creep and by prior thermal-mechanical treatment. Engineering-design curves are included in this paper.

July-September 1968

Gas density balance design considerations, E. C. Creitz, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 3, 187-195 (July-Sept. 1968).

Key words: Chromatographic detector; density detector; gas density; gas detector.

The Nerheim gas density balance operates by measuring the flow produced by differences in density between a sample and a reference gas in the earth's gravitational field. It has been

considered theoretically in order to outline the characteristics of the gas flow system, those of the flow measuring anemometers, and the effects of detector volume on peak separation and sensitivity. It is shown that both design parameters and operating conditions affect the performance of the device, and that properly considered compromises can improve its characteristics.

Standard mismatch—the production of controlled small reflections in waveguides, L. Lewin, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 3, 197-201 (July-Sept. 1968).

Key words: Controlled small reflections; mismatch; reflector posts; waveguide.

The reflection properties of possible suitable structures, for producing small accurately controlled reflections in rectangular waveguide, are examined and a choice made of cylindrical posts for a more detailed study.

A number of sources of error due to ohmic loss, positioning and shape are investigated, and it is shown that both the inductive and capacitive post can meet reasonable specifications, but that the latter is the more suitable on almost all counts. Attention to post size and tilt is necessary, but the accuracies needed lie well within the range achievable by good engineering practice.

Viscoelastic behavior of dental amalgam, P. L. Oglesby, G. Dickson, M. L. Rodriguez, R. M. Davenport, and W. T. Sweeney, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 3, 203-213 (July-Sept. 1968).

Key words: Amalgam; creep; dental; steady-state creep; stress-strain; transient creep; viscoelastic.

Measurements made on dental amalgam in tension indicate that amalgam exhibits three types of viscoelastic phenomena: (1) instantaneous elastic strain, (2) retarded elastic strain (transient creep), and (3) viscous strain (steady-state creep). The combination of elastic plus retarded strain can be represented by an equation of the form $\epsilon = A\sigma + B^2\sigma^2$ where A and B are functions of time but not of the stress, σ. The viscous strain rate can be represented by an equation of the form $\epsilon_v = K\sigma^m$ where K and m are constants of the material. By applying a nonlinear generalization of the Boltzmann superposition principle to a general equation describing the creep behavior of amalgam, the results of creep tests can be directly related to the results of stress-strain tests.

The steady-state creep behavior of dental amalgam, G. Dickson, P. Oglesby, and R. Davenport, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 3, 215-218 (July-Sept. 1968).

Key words: Amalgam; creep; creep activation energy; dental amalgam; silver amalgam.

The steady-state creep behavior of a dental amalgam subjected to tensile stresses of 500 to 4000 psi (3.4×10^6 to 2.8×10^7 N/m^2) was investigated over the temperature range of 23 to 52 °C (296 to 325 K). It was found that the creep behavior can be represented by the equation:

$$\epsilon_v = K\sigma^m e^{-E/RT}$$

where ϵ_v is the creep rate, K and m are constants of the material, σ is the stress, E is the activation energy for the process, R is the gas constant and T is the temperature. Values of the constants determined for the dental amalgam were $K = 2.31 \times 10^9$, $m = 3.45$ and $E = 35{,}300$ cal/mol (148,000 joule/mole).

October-December 1968

Theoretical and experimental study on longitudinal impact of tapered rods, L. R. Hettche, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 4, 231-241 (Oct.-Dec. 1968).

Key words: Aluminum; experiments; longitudinal impact; numerical solution; one-dimensional; plastic-wave propagation; rate-independent theory; tapered rods.

To examine the adequacy of the one-dimensional, rate-independent theory of plastic-wave propagation for annealed, commercially pure aluminum, experimental results from the longitudinal impact of uniform and tapered rods are compared to a theoretical analysis. The theoretical description is a numerical solution which utilizes the characteristic properties of the governing equations to construct difference relations for a constant mesh spacing. Numerical evidence of convergence and stability of the solution is presented. A constant-velocity boundary condition is defined by the axial collision of identical specimens, 6 inches (152 mm) in length and tapered slope varying between ±0.03, using a 3/4-inch (19mm) bore gas gun. Strain-time profiles are measured at cross-section distances of 1, 2, and 4 inches (25, 51, and 102 mm) from the impact face with resistance gages. Quantitative agreement between theoretical prediction and experimental data, e.g., dispersive features and unloading patterns of the strain wave, show the theory and method of solution to be a reasonably accurate model of the deformation. The selection of the specimen geometry as the experimentally controllable parameter in the longitudinal impact experiment is found to be a useful testing method in investigating the dynamic response of materials.

Analytical studies of probe conduction errors in ground temperature measurements, B. A. Peavy, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 4, 243-247 (Oct.-Dec. 1968).

Key words: Earth temperature; probe conduction errors; steady periodic heat flow.

Vertical probes with temperature sensing elements placed at fixed positions along their length are commonly used for measuring earth temperature variations with time. Mainly for structural reasons, the probes are comprised of materials whose thermal properties are not the same as those of the surrounding earth, so that the temperatures as measured at a given time by the probe are not the same as that for the undisturbed earth. A mathematical analysis for steady periodic, two-dimensional heat flow in a two body composite has been made to determine the probe conduction errors in ground temperature measurements. Several examples are given to show the relative magnitude of probe conduction errors.

Nonlinear constrained optimization by a nonrandom complex method, R. A. Mitchell and J. L. Kaplan, *J. Res. Nat. Bur. Stand. (U.S.),* **72C** (Eng. and Instr.), No. 4, 249-258 (Oct.-Dec. 1968).

Key words: Curved bar analysis; discrete variables; elastic; force transducer; minimum weight; n-degree elliptical ring; nonlinear programming; nonrandom complex method; optimization; rib-stiffened plate; structural analysis.

A nonrandom complex method is described for application to optimization problems characterized by nonlinear objective and constraint functions involving continuous and/or discrete optimization variables. The method is a mutation of the "complex" method (involving a pseudo-random process) developed by M. J. Box. Application of the method is demonstrated by two minimum weight structural analysis problems: (1) an n-degree elliptical elastic ring with sinsusoidally varying cross section dimensions; and (2) a rib-stiffened, simply supported elastic plate. The ring problem has six continuous independent variables, and the plate problem has four independent variables, two of which are discrete.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 73C, JANUARY-DECEMBER 1969

January-June 1969

An interferometer for measuring gradients in both refractive index and thickness of large or small optics, J. B. Saunders, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Engr. and Instr.), Nos. 1 and 2, 1-4 (Jan.-June 1969).

Key words: Interferometer; optical homogeneity; refractive index.

A small aperture prism interferometer is described for measuring refractive index and thickness gradients between pairs of adjacent points in both small and large optics. It is relatively free from vibration problems and thermal gradients are reduced to a minimum by confining the two component beams of light to a relatively small space. Large specimens are tested by scanning them with the light beam.

A Kerr electro-optical technique for observation and analysis of high-intensity electric fields, E. C. Cassidy and H. N. Cones, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Engr. and Instr.), Nos. 1 and 2, 5-13 (Jan.-June 1969).

Key words: Dielectric liquids; electro-optical measurements; electrostatic field measurements; high voltage measurements; Kerr cell; laser applications; potential measurements; pulse measurements.

A Kerr electro-optical technique, which permits observation and analysis of high intensity electric fields in nitrobenzene-filled Kerr cells, is described. Two-dimensional visual images, similar to those achieved in photoelastic-mechanical stress analysis, of the field distribution are afforded by the fringe pattern produced by the Kerr effect when high direct voltages are applied to the cell. Analysis of the field profile, by measurement of the fringe positions, permits calibration of the system for measurement of high voltage pulses. The Kerr constant of the liquid and space-resolved determinations of relative field strength, actual field strength (in volts per centimeter), and potential are also derived.

Student-*t* deviate corresponding to a given normal deviate, B. L. Joiner, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 1 and 2, 15-16 (Jan.-June 1969).

Key words: Standard deviation; statistics; Student-*t*; table of Student-*t*; uncertainties.

A table is given of the t deviate that corresponds to a given normal deviate z in the sense that the probabilities outside the t value and outside the z value are identical. This table enables those who are accustomed to expressing uncertainties in terms of 1σ, 2σ, 3σ, or 4σ limits to give statistically equivalent limits when the standard deviation σ is not known and consequently must be estimated from small samples.

A heat loss compensated calorimeter and related theorems, S. R. Domen, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 1 and 2, 17-20 (Jan.-June 1969).

Key words: Absorbed dose; calorimeter; heat flow theorems; heat loss compensation.

A new calorimetric design and measuring technique are proposed for reducing uncertainties caused by temperature gradients. A theoretical analysis reveals a mathematical theorem concerning heat transfer and its electrical analog.

Laboratory measurements of air cavity temperature in a passenger car tire, B. G. Simson and J. Mandel, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 1 and 2, 21-24 (Jan.-June 1969).

Key words: Temperature sensitivity; tires.

The air cavity temperature of a passenger car tire, running on a test wheel, was measured for different combinations of load, speed, and pressure. An empirical function was developed to illustrate the way in which the air cavity temperature of tires can be related adequately to given values of speed, load, and inflation pressure within the range covered by this laboratory experiment. The standard deviation computed from the residuals of the fit was 5 °F ($\simeq$ 2.8 °C).

July-December 1969

Design features of a precision ac-dc converter, L. A. Marzetta and D. R. Flach, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 3 and 4, 47-55 (July-Dec. 1969).

Key words: AC; DC; operation; precision; rectifier; transfer.

With the availability today of high performance operational amplifiers and related components, it is possible to construct an instrument for ac-dc transfer work that meets the requirements of a standards laboratory. Transformation of measured average a-c values into d-c voltage is possible with a predictable accuracy of 20 parts per million up to 1 kHz. Precision of operation is assured from dc to 100 kHz.

An improved high-precision calibration procedure for reference standard hydrometers, H. A. Bowman and W. H. Gallagher, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 3 and 4, 57-65 (July-Dec. 1969).

Key words: Calibration; density; hydrometer; hydrometer calibration; reference hydrometer; specific gravity; standard hydrometer.

This paper describes a method of calibrating hydrometers which, although no more accurate than the technique used heretofore at the National Bureau of Standards, reduces calibration time from several days to a few hours. The procedure is based upon easily measured hydrometer weight, stem scale geometry, and flotation level measurements at only one liquid density. The reliability of this single level is improved by observing the hydrometer flotation under various weight loads. The calibration experiment is oriented toward automatic data reduction so the finished calibration report is of much wider applicability than the simple correction table derived from the older experiment.

The nuclear quadrupole resonance magnetometer: A new method for the precision measurement of the magnitude and direction of magnetic fields, M. Linzer, *J. Res. Nat. Bur. Stand. (U.S.),* 73C (Eng. and Instr.), Nos. 3 and 4, 67-73 (July-Dec. 1969).

Key words: Magnetometer; nuclear quadrupole resonance.

A theoretical investigation of the feasibility of a magnetometer based on the observation of the Zeeman splitting of a nuclear quadrupole resonance line is presented. With a single crystal of potassium chlorate as the sensor, an nqr magnetometer with center frequency of 28 MHz and bandwidth of 10 MHz could cover a range of 10 nT to greater than 1 T. Precision at specific crystal orientations should approach 10 nT in the magnitude of the field, at flux densities exceeding 100 μT, and (65/B) microradians in the direction of the field where B is the flux density in mT. If circularly polarized rf excitation is employed, a precision of 10 nT could be achieved at flux densities less than 100 μT. Accuracy of the flux density measurements is limited by the uncertainty in the gyromagnetic ratio of ^{35}Cl, which at the present time is approximately 1×10^{-4}. The effect of the small asymmetry parameter which characterizes the ^{35}Cl resonance in $KClO_3$ is analyzed. Various experimental arrangements are proposed to record the magnitude and direction of the field, to obtain high resolution at low fields and good linearity at high fields, to overcome the difficulties due to the presence of a small asymmetry parameter, and to make an instantaneous measurement of the Zeeman splitting frequency.

Optical FM system for measuring mechanical shock, L. D. Ballard, W. S. Epstein, E. R. Smith, and S. Edelman, *J. Res. Nat. Bur. Stand. (U.S.)*, **73C** (Eng. and Instr.), Nos. 3 and 4, 75-78 (July-Dec. 1969).

Key words: Accelerometer; calibration; Doppler; interferometer; laser; shock measuring; single-sideband.

A technique is described for calibrating shock accelerometers by measuring the Doppler shift in light frequency produced by the change in velocity of a target. The system employs a quadrature laser interferometer and a single-sideband carrier insertion circuit to distinguish between positive and negative velocities.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 74C, JANUARY-DECEMBER 1970

January-June 1970

Production of near-perfect interferograms of variable visibility, J. B. Saunders, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 1-2 (Jan.-June 1970).

Key words: Interference fringes; interferograms.

A method is given for producing interferograms of fringes that are straight and equally spaced. The intensity distribution obeys the cosine law. The visibility can be controlled over the entire range from zero to unity. The interferometer is rugged and practically free from vibration effects.

Locked nuclear quadrupole resonance spectrometer for pressure measurements, R. C. Frisch and D. L. VanderHart, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 3-8 (Jan.-June 1970).

Key words: $KClO_3$ nuclear quadrupole resonance; pressure transducer; spectrometer.

The Nuclear Quadrupole Resonance frequency of a nucleus in a solid is dependent on its local environment and can be quite sensitive to changes in temperature and pressure. A spectrometer capable of locking accurately to the center of a resonance signal is described. The feasibility of using the quadrupole resonance frequency as a transfer gage for precise pressure measurements is discussed using ^{35}Cl resonance in a $KClO_3$ polycrystalline sample. The performance of the instrument implies a limiting accuracy for pressure measurements of 0.7 bar; preliminary results are presented showing frequency versus pressure near room temperature. Uncertainties of these measurements are primarily due to inadequate temperature control and the uncertainty of the pressure measurement.

Precise continuous optical attenuator, G. Ruffino, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 9-13 (Jan.-June 1970).

Key words: Dichroic polarizers; optics; pyrometry; radiometry; relative transmittance factor.

The construction of a precision photometric attenuator is described, which uses linear birefringent polarizers. If properly calibrated, the instrument has relative error not exceeding 2.4×10^{-4} within a relative transmittance range down to 8×10^{-3}. The calibration takes into account stray light, provided the ratio of stray light intensity to total intensity remains constant and low in the whole range. The construction and calibrating procedure apply equally well to the near infrared region.

An a-c resistance thermometer bridge, R. D. Cutkosky, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 14-17 (Jan.-June 1970).

Key words: Automatic phase balance; bridge; multistage transformers; operational amplifiers; resistance bridge; resistance thermometry; temperature measurement.

A 400 Hz bridge designed specifically for measuring the resistances of platinum thermometers is described. When used in conjunction with a conventional 25 ohm thermometer, the instrument can resolve a resistance change of 2 micro-ohms or less, or about 20 microdegrees. It is believed to be in error by no more than 3 micro-ohms throughout the useful temperature range of a conventional thermometer. The instrument features an automatic phase angle balance, and extensive use is made of multistage transformers and operational amplifiers.

On the flow induced by a Maxwell-Chartoff rheometer, E. A. Kearsley, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 18-19 (Jan.-June 1970).

Key words: Normal stresses; rheology; rheometer; viscoelasticity.

The Maxwell-Chartoff rheometer does not supply the surface tractions necessary to maintain the flow customarily assumed. This can be seen from considerations of the energy balance.

Mechanical compliance measurements of single-edge-notch tension specimens, M. J. Orloski, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 20-26 (Jan.-June 1970).

Key words: Compliance; crack-toughness; fracture; single-edge-notch specimen.

This paper describes the mechanical compliance measurement of a 15×3-in single-edge-notch (SEN) specimen, effective gage length greater than twice specimen width, and a 7×3-in SEN specimen, effective gage length less than twice specimen width, both of 1/4-in-thick 7075 – T6 aluminum. The 15×3-in specimen was chosen to provide experimental values of EWG/P^2 for comparison with the theoretical stress function solutions of Srawley and Gross. Results obtained are in good agreement with the theoretical values. The 7×3-in specimen was chosen as proportional to a practical size SEN specimen that has been widely used. Comparisons of experimental values of EWG/P^2 for this specimen were made with these theoretical stress function solutions.

Effect of notch geometry and temperature on the creep-rupture behavior of titanium alloy, W. D. Jenkins and W. A. Willard, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 1 and 2, 27-37 (Jan.-June 1970).

Key words: Creep; elevated temperature; engineering design; notch geometry; stress concentration; stress-rupture; titanium alloy.

Creep-rupture tests were made on circumferentially notched Ti-8Al-1Mo-1V specimens at temperatures of 600, 800, 1000, and 1200 °F (588, 699, 811, and 921 K) with stresses to produce rupture times ranging from 1 min to several thousand hours. A comprehensive study was made to determine the effects of notch geometry (angle, depth, root radius) on creep, rupture, and ductility characteristics of the alloy. Although a limited first stage and well-defined second and third stages of creep were observed, neither rupture times nor reduction of area values were predictable from extension-time behavior. Rupture time and ductility appeared to be affected more by the initial root radius at the base of the notch than by notch depth. Differences in mechanical behavior between specimens of different notch geometries were less as the temperature was increased or the stress decreased. A limited number of tests indicated that prior strain history had a marked effect on subsequent creep-rupture behavior at 1000 °F.

Relative amounts of alpha and beta constituents, the number of observed internal cracks, and the mode of fracture were affected by notch geometry and test temperatures.

July-December 1970

Techniques for comparing four-terminal-pair admittance standards, R. D. Cutkosky, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 63-78 (July-Dec. 1970).

Key words: AC direct-reading ratio set; ac measurements; bridge; coaxial chokes; defining transformers; equal power bridge; four-pair standards; frequency-dependent bridge; quadrature bridge.

Some of the advantages of four-pair admittance standards and some of the special problems encountered in their measurement are pointed out. Detailed descriptions of three distinct types of four-pair bridges and some of their limitations are presented. These three bridges form a vital part of a very precise absolute measurement of resistance based on a calculable capacitor being undertaken at the National Bureau of Standards, but are believed to be of more general usefulness.

Some applications for series impedance elements in radio frequency immittance measurements, L. E. Huntley, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 79-85 (July-Dec. 1970).

Key words: Immittance measurement; radio frequency; series elements; two-port standards.

A series impedance element equipped with coaxial connectors may be evaluated as a two-port network. Precision connectors greatly reduce the uncertainties associated with the series connection, making practical several measurement techniques which involve series impedances. This paper discusses techniques for extending the range of immittance bridges to high values of admittance or impedance, for measuring very small admittances with incremental standards of ordinary range, and for using a bridge to measure its own reference open-circuit admittance or short-circuit impedance.

A pulse heating method for the measurement of melting point of electrical conductors (thin wires) above 2000 K, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 87-88 (July-Dec. 1970).

Key words: High-speed measurements; high temperatures; melting point; platinum.

A pulse heating method is described for the measurement of melting point of electrical conductors at high temperatures (above 2000 K) which are in the form of thin wires. The technique is checked by measuring the melting point of platinum. The results give 2044 ± 5 K on IPTS-1968.

A time-shared computer system for diffractometer control, H. A. Alperin and E. Prince, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 89-95 (July-Dec. 1970).

Key words: Automatic control; computer control; diffractometer; FORTRAN; neutron diffractometer; real-time data processing; time sharing; x-ray diffractometer.

A system is described for controlling data acquisition, and for online data reduction, on up to eight neutron and x-ray diffractometers. The system uses a medium-sized computer, with the individual instruments sharing time. Storage of programs, data, and the intermediate results of computations on a rapid-access disk makes roughly 12K of the 16K core memory available to each user in turn for computations. All users' programs are written in FORTRAN. Each user has independent access to the computer, through his own separate typewriter, for input of control parameters and output of sample results. Final output data may be recorded on magnetic tape for permanent filing or for processing offline by a large computer.

Tensile deformation of vapor-deposited copper reinforced with tungsten wires, W. D. Jenkins, W. A. Willard, and D. E. Harne, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 97-110 (July-Dec. 1970).

Key words: Composites; copper; electrical conductivity; fracture; law of mixtures; metallic bonding; tensile properties; tungsten; vapor-deposition; wires.

Short-time tensile tests were made at room temperature on sheet specimens of vapor-deposited copper containing zero to 26 volume percent continuous tungsten wires having diameters of 0.0005, 0.001, and 0.005-inch. Specimens were annealed at 25, 300, and 600 °C (298, 573, and 873 K) prior to testing. Strength, ductility, shape of the stress-strain curves, and types of fractures were influenced by volume fraction and number of layers of wires as well as by wire diameter and alinement. Strength values for the composites with 2 to 3 percent volume fractions of wires exceeded those predicted by the law of mixtures whereas at higher volume fractions, either conformance to the law was observed or lower values than those predicted were obtained. Increase in strength was accompanied by a decrease in electrical conductivity. All the properties investigated were markedly affected by increasing the annealing temperature. Tungsten wires failed in a ductile manner after considerable localized deformation ("necking") in various sections of the wires.

"Connector-pair" techniques for the accurate measurement of two-terminal low-value capacitances, A. Millea, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 111-116 (July-Dec. 1970).

Key words: Capacitance measurement; coaxial adaptor; coaxial connector; fringe capacitance; standard capacitor; two-terminal capacitor.

A method is described that allows two-terminal capacitance measurements to be performed with uncertainties of $\pm 0.0001 - 0.0002$ pF, the ultimate accuracy limit being imposed only by the repeatability performance of the connectors. This technique has been used for the calibration of coaxial capacitance standards and the measurement of the fringe capacitance of coaxial open-circuit terminations; other applications are also possible in the field of high-frequency coaxial measurements.

The use of dew-point temperature in humidity calculations, L. A. Wood, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 117-122 (July-Dec. 1970).

Key words: Antoine Equation; dew point; humidity; hygrometry; psychrometric chart; relative humidity; vapor pressure of water; wet-bulb temperature.

The dew-point temperature has a number of desirable features as a means of expressing humidity. The Antoine Equation, $\log e_w = A - B(T+C)^{-1}$, where e_w is the partial pressure and T is the temperature of saturated aqueous vapor, represents the Goff-Gratch formulation quite well over the range of temperature from 0 to 140 °F. The pressure e_w, in inches of mercury, is obtained by taking the constants $A = 6.70282$, $B = 3150.515$ (°F)$^{-1}$ and $C = 391.0$ °F, calculated from values given by Dreisbach. It is shown that the dew-point DP is related to the relative humidity RH by the relation:

$$(DP+C)^{-1} = (T+C)^{-1} + B^{-1} \log (RH)^{-1}.$$

Lines of nearly constant positive slope represent constant relative humidity values on graphs of dew-point against temperature. The value of the slope decreases from unity for $RH = 100$ percent to about 0.76 for $RH = 10$ percent, corresponding to the linear equation

$$DP = [1 + 0.1471 \log (RH)^{-1}]^{-2}(T-70) + DP_{70} \text{ where } DP_{70} = [2169 + 319 \log (RH)^{-1}]^{-1} \times 10^6 - 391.$$

Psychrometric charts showing dew-point and dry-bulb temperature as coordinates with lines representing constant relative humidity and constant wet-bulb temperature (obtained from the Ferrell Equation) are extremely useful, since given values for any two of these four variables serve to locate a point, from which the values of the other two variables can be read directly.

Bolovac application for hf and microwave power measurement and standardization, M. C. Selby, *J. Res. Nat. Bur. Stand. (U.S.)*, **74C** (Eng. and Instr.), Nos. 3 and 4, 123-133 (July-Dec. 1970).

Key words: Bolometric power standards; Bolovac power measurements; calibration of power meters; rf and microwave power measurements; standard of power through 18 GHz.

The bolometric voltage and current (BOLOVAC) standard for frequencies to 18 GHz and higher, recently developed at the National Bureau of Standards (NBS), can also be used to measure power, offering the following advantages over a number of other methods in use today: (1) It eliminates: (a) the uncertainty resulting from neglecting termination mismatch, (b) measurement of reflection coefficients and computations using complex equations, (c) "Limits-of-error" charts, thus rendering definitive results, (d) use of impedance charts, (e) dc or af calibrations of power meters, (f) need of corrections such as "effective efficiency" and "calibration factor." (2) It covers a wide frequency range (0.5 MHz to 18 GHz or wider); (3) It should result in substantial reduction of calibration time in many instances; (4) It can be applied to calibrate feed-through power measurement methods for power levels ranging into kilowatts.

In measuring power, the Bolovac (1) measures the voltage across a known resistance component of a given load, or (2) measures the voltage in any plane of a coaxial line of known characteristic impedance and known voltage distribution along the line, or (3) absorbs the rf power as any other absorption-type power mount does. In the first two cases resistance and voltage distribution measurements may be made separately or these measurements may be combined with the power measurement procedure. In the third case the rf power is absorbed in a special disk-type bolometric detector of the Bolovac and is equal to the dc- (or af) bias-power substituted in that detector; this bias power is measured with conventional power substitution bridges. Any appreciable unaccounted for power losses occur outside the Bolovac and can be determined employing conventional techniques as well as the Bolovac itself. The Bolovac needs no rf calibration. A Bolovac may have a power range of 20 dB or higher, depending on accuracy desired, and a maximum power approaching its safe power dissipation, e.g., 0.5 W or higher. This paper is limited to the application of the Bolovac to power measurements only and presents analytical and practical aspects of this application.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 75C, JANUARY-DECEMBER 1971

January-March 1971

Rotary-vane attenuator with an optical readout, W. E. Little, W. Larson, and B. J. Kinder, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 1-5 (Jan.-Mar. 1971).

Key words: Attenuator; microwave; precision; rotary vane.

A precision x-band rotary-vane attenuator has been developed that follows its theoretical cosine squared law of attenuation to within 0.002 dB to a value of 20 dB. The best available attenuation measurement techniques verify this relationship to within the accuracy of the measurements. From 20 to 50 dB, the deviation from the theoretical value slowly increases and is frequency dependent. At present, three attenuators of this type have been constructed by NBS. Two of these attenuators have excellent attenuation versus frequency characteristics in the 20 to 50 dB range (0.08 dB deviation at 50 dB) while the third has a marked degree of frequency sensitivity (0.21 dB at 50 dB).

Design and operational characteristics of a high-speed (millisecond) system for the measurement of thermophysical properties at high temperatures, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 7-18 (Jan.-Mar. 1971).

Key words: High-speed measurements; high temperatures; thermodynamics; thermophysical properties.

Design and constructional details of a high-speed system for the measurement of selected thermophysical properties of electrical conductors at temperatures above 2000 K in experiments of subsecond duration are described. Operational characteristics of such a system are given. Various phenomena that affect the design and successful operation of the system are discussed and, whenever possible, quantitative results are given. Certain experimental checks to assess the operation of the system are also described.

A new method of determining residual thiosulfate in processed photographic film, C. I. Pope, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 19-22 (Jan.-Mar. 1971).

Key words: Archival film; hypo; microfilm; permanent record film.

Chromatographic paper, saturated with ammonia, is used to extract the residual thiosulfate from the gelatin layer of processed film. The paper is treated in a silver nitrate solution and fixed in an ammonia-sodium chloride solution. Thiosulfate, if present, forms silver sulfide and the thiosulfate is determined by measuring the transmission density of the paper darkened by silver sulfide. The paper extraction method is simple, rapid, requires only a densitometer as special equipment, and is very sensitive especially when the transmission density is measured for two layers of the paper. No filters are required. The test readily reveals the uneven distribution of residual thiosulfate on the film. By selective removal of thiosulfate from the image silver by ammonia and potassium bromide solutions, it was shown that small amount of thiosulfate was absorbed on the image silver immediately after processing.

Scanning densitometer for continuous recording of spectral transmission density at low spatial contrast, W. L. McLaughlin, M. Rosenstein, E. K. Hussmann, and J. J. Lantz, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 23-27 (Jan.-Mar. 1971).

Key words: Densitometer; microdensitometer; radiochromic dye films; spectral transmission density.

A simple photoelectric transmission densitometer can be converted in the laboratory into an instrument for measuring spatial variations in spectral density of small areas of thin, nonturbid films. This is accomplished by adding relatively inexpensive components that are readily available and easily assembled. The basic instrument can be one of a number of commercial densitometers, consisting of stabilized electronics, an adjustable light source, and a photosensitive probe which has a wide range and measures spectral transmission density. For continuous scanning of relatively small sample areas, the following additions are needed: (1) narrow-bandpass filters; (2) interchangeable field illuminating slits; (3) a short-focal-length illuminating-condenser lens which compromises between a relatively large numerical aperture and a reasonable depth of focus; (4) a motor-driven stage with adjustable speeds; (5) a light diffuser and light guide; and (6) a continuous, relatively fast-response data-recording system (such as a fast-response strip-chart recorder). This instrument has been assembled and tested especially for measuring spatial variations of spectral density produced in irradiated photochromic films; and also for calibrating a train of irradiated film samples, in terms of transmission density at a given wavelength as a function of irradiance, radiation absorbed dose, or photochemical reactivity.

Rotating optical attenuator for the generation of subsecond duration sawtooth shape radiance pulses, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 29-32 (Jan.-Mar. 1971).

Key words: High-speed methods; light attenuator; photometry; radiance modulation; radiation.

A rotating attenuator for the generation of subsecond duration sawtooth shape radiance pulses is described. The attenuator disk is in the form of a cam. The geometry of the opening of a diaphragm used as the aperture stop determines the shape of the radiance pulses. Radiance is determined from the measurements with a high-speed photoelectric pyrometer. Recording of signals is made with a high-speed digital data acquisition system. The combined measuring and recording systems have a full-scale signal resolution of approximately one part in 8000 and a time resolution of 0.4 ms. Two different diaphragms are used in this study yielding radiance pulses (20 to 150 ms long) with linear and quadratic rise. The standard deviation of the experimental points from the pertinent functions describing the radiance variation is less than 0.5 percent.

Sound speed measurements in solids: absolute accuracy of an improved transient pulse method, T. M. Proctor, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 33-40 (Jan.-Mar. 1971).

Key words: Acoustical pulse; longitudinal and shear sound waves; solids sound speed accuracy; speed of sound; transient pulse-acoustical.

A modified transient pulse technique for measuring shear and longitudinal sound speeds in solids has been devised. The

technique is described and evaluated for both precision and accuracy on a variety of solids. This evaluation has been done by experiments in which the constancy of sound speed with path length is used as the prime test for accuracy. A number of variables such as transducer frequency, transducer size, choice of different coincidence points, etc., have been examined. The transducer bond problem is examined and overcome by the use of a time delay bond. Indicated accuracy of the method is found to be better than one part in 10^4. Advantageous sample geometries for accuracy testing are discussed.

Seismic response of infrasonic microphones, A. J. Bedard, Jr., *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 1, 41-45 (Jan-Mar. 1971).

Key words: Compensation; ground motion; infrasonic microphones; seismic response.

Factors affecting the (unwanted) seismic response of infrasonic microphones are indicated. Past measurements of ground motion deduced from the radiated atmospheric sound measured with infrasonic microphones are reviewed, and such measurements are compared with seismometer measurements of ground motion. Seismic motions caused by the Japanese earthquake of May 1968 are used in this example. The seismic response of the infrasonic microphone used for this measurement was experimentally determined and the results are presented. A simple method of compensating for interfering seismic effects on microphones is described.

April-June 1971

Heated air adiabatic saturation psychrometer, L. Greenspan, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 2, 69-78 (Apr.-June 1971).

Key words: Adiabatic saturation; dew point temperature; humidity; hygrometer; mixing ratio; moist gas; psychrometer; vapor pressure.

A portable self-contained heated-air adiabatic saturation psychrometer intended as a field and laboratory instrument has been developed and constructed. The instrument measures the humidity of air in the range from 0 to 50 grams of water vapor per kilogram of dry air over an ambient temperature range of − 5 to 40 °C. It samples a test gas at the rate of 4 liters per minute.

The psychrometer was compared with the NBS pressure humidity generator over the mixing ratio range of 2.5 to 19 grams of water per kilogram of dry air (equivalent to a dew-point range of − 5.4 to 24 °C at atmospheric pressure). The mixing ratio indicated by the psychrometer was higher than that produced by the generator by 0.025 g/kg + 0.24 percent of the reading with a standard deviation of 0.024 g/kg; that is, it was higher by 1.24 percent to 0.37 percent of the reading as the measured mixing ratio increased from 2.5 to 19 g/kg. In equivalent terms of dew point, the psychrometer reading was higher by 0.16 deg C to 0.06 deg C as the measured dew point increased from − 5.4 to 24.0 °C. The results are approximately those which would be expected based on an analysis of estimated errors in individual measurements.

Computation of the temperature distribution in cylindrical high-pressure furnaces, M. Waxman and J. R. Hastings, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 2, 79-83 (Apr.-June 1971).

Key words: Analytic solutions; boundary conditions; computation, temperature distribution; furnaces, high-pressure; high-pressure furnaces; high-temperature, high-pressure research; power dissipation; temperature distribution, steady-state; temperature gradients; temperature irregularities; temperature variation; thermal conductivity.

The steady-state temperature distribution in typical cylindrical high-pressure furnaces has been computed from analytic solutions for various boundary conditions. Either the temperature variation along the cylindrical heater or the power dissipation per unit length is prescribed. The results are tabulated and discussed as an aid in the design of high-pressure furnaces and in the estimation of temperature gradients. Topics considered include: (1) the reduction of temperature gradients around the center of the furnace, (2) the effect of temperature irregularities along the heater, and (3) the effect of the relative thermal conductivity of neighboring components.

Rotating adjustable transmission optical step attenuator, A. Cezairliyan, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 2, 85-88 (Apr.-June 1971).

Key words: High-speed measurements; optical attenuator; photometry; radiance.

A rotating wavelength-independent optical attenuator is described that generates four radiance steps. Radiance ratios between the steps can be continuously varied. Experiments are performed to assess the operational characteristics of the attenuator. Radiance is determined from measurements with a high-speed photoelectric pyrometer. Recording of signals is made with a high-speed digital data acquisition system. The combined measuring and recording systems have a full-scale signal resolution of approximately one part in 8000 and a time resolution of 0.4 ms. The results of several experiments on radiance ratio measurements are found to be in agreement within one part in 1000.

An improved method for microwave power calibration, with application to the evaluation of connectors, G. E. Engen, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 2, 89-93 (Apr.-June 1971).

Key words: Calibration; connectors; mismatch; power equation; power measurement.

In the procedures for microwave power calibration, which are well documented, the subject of mismatch errors (or corrections) plays a major role. In particular, the evaluation of mismatch corrections requires the measurement of complex reflection coefficients; and the accuracy of this measurement is limited, in part, by connector imperfections.

The application of recently developed "power equation" methods to this problem provides both a simplified determination of the mismatch correction (M_{gm}) and improved accuracy. In particular, the intermediate step of measuring the reflection coefficients is eliminated, and the precision connector requirement is greatly relaxed. If this new method were adopted at each level of the usual calibration hierarchy, the accuracy of disseminating measurements referenced to the primary standards at NBS would be greatly improved.

The accuracy potential was demonstrated in a series of experiments involving the Type N, GPC-7, and waveguide flange connectors. The outcome of this experimental evaluation, in which the "ordinary" Type N performed on a par with GPC-7, raises some rather serious questions relative to current trends in connector development.

Apparatus for impact-fatigue testing, R. E. Schramm, R. J. Durcholz, and R. P. Reed, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), No. 2, 95-98 (Apr.-June 1971).

Key words: Cryostat; fatigue; impact; low temperature; mechanical property equipment; stainless steel.

A standard impact machine was extensively modified to allow the measurement of the response of specimens to repeated, controlled impact pulses. This equipment enables one to vary the

mperature (76-297 K), specimen geometry (uniaxial, biaxial, iaxial stress systems), and load levels. At stress levels in the eighborhood of the yield stress, on the order of 10,000 impact ycles are needed to fatigue specimens to fracture. Strain rates chieved are moderately high, of the order of 1000 min^{-1}, which onveniently form intermediate data between tensile (max. of bout 100 min^{-1}) and explosive straining data (about 6000 in^{-1}). Contrasted to standard fatigue tests, no constraint is aced on specimen elongation and only unidirectional stresses e imposed. Typical impact-fatigue results for AISI 310 stainss steel are presented.

program in refractory metal thermocouple research, G. W. Burns and W. S. Hurst, *J. Res. Nat. Bur. Stand. (U.S.)*, **75C** (Eng. and Instr.), No. 2, 99-106 (Apr.-June 1971).

Key words: EMF-temperature relationship; furnace; high temperature; refractory metals; thermocouple; thermoelements; sensor; ultra high vacuum; W-Re alloys.

A refractory metal thermocouple research program, directed wards establishing the parameters that are necessary to hieve reliable, long term, high temperature thermocouple perrmance, is outlined. A description of special apparatus for exsing bare-wire thermoelements to high temperatures in cuum and in high purity gaseous environments is given, and e design and performance of an ultra-high-vacuum, high-temrature furnace system are described. Bare-wire W-3 percent e and W-25 percent Re thermoelements were exposed at 2400 in argon, hydrogen or vacuum, and experienced a shift in their nf-temperature relationship upon initial exposure. After the inil shift, the thermoelements exposed in the gaseous environents experienced no significant further change in their emf-mperature relationship for periods up to 1000 hours. The therbelements exposed in vacuum continually drifted in their emf-mperature relationship as a result of the preferential loss of Re evaporation.

larization measurements as related to corrosion of underground steel piling, W. J. Schwerdtfeger, *J. Res. Nat. Bur. Stand. (U.S.)*, **75C** (Eng. and Instr.), No. 2, 107-121 (Apr.-June 1971).

Key words: Corrosion; corrosion rate; disturbed soil; instantaneous rate; pit depth; pitting factor; polarization; steel piling; undisturbed soil; weight loss.

Most of this paper is devoted to the author's evaluation of larization measurements made by the Corps of Engineers ower Mississippi Valley Division) on steel pipe specimens exsed to the soil at four dam sites as related to the corrosion of el piling (underground) observed at the sites. As the polarizan measurements were made periodically on weighed ecimens for periods as long as seven years, the Corps' data ofed an excellent opportunity for evaluating the accuracy and acticability of a polarization technique for measuring corrosion es. Reasonable agreement between calculated and actual corsion on the specimens made it possible to estimate maximum icipated corrosion on the piling after 50 years of exposure.

Confidence gained in the value of polarization measurements de on short length pipe specimens led the author to make meaements on actual piling. Instantaneous corrosion rates were asured on two driven pipe piles, 72 ft (22 m) and 19 ft (5.8 m) length, both of which had been exposed for 12 years. One nth later, the short pile was extracted and examined. Relativelow corrosion rates calculated from the polarization data were ified by the appearance of the pile and by the limited extent of pitting.

July-December 1971

ermal voltage converters and comparator for very accurate AC oltage measurements, E. S. Williams, *J. Res. Nat. Bur. Stand. (U.S.)*, **75C** (Eng. and Instr.), Nos. 3 and 4, 145-153 (July-Dec. 1971).

Key words: AC-DC difference; comparator; thermoelement; transfer voltmeter, voltage measurements.

A new fourteen-range set of thermal voltage converters and a thermoelement comparator are used to measure ac-dc difference, and a-c voltages relative to external d-c standards, with 20 ppm (parts-per-million) accuracy at audio frequencies. The imprecision is less than 2 ppm. Corrections relative to the very stable middle ranges can be redetermined for every range by a seven-step intercomparison of certain adjacent ranges.

Formulation and experimental verification of an axisymmetric finite-element structural analysis, R. A. Mitchell, R. M. Woolley, and C. R. Fisher, *J. Res. Nat. Bur. Stand. (U.S.)*, **75C** (Eng. and Instr.), Nos. 3 and 4, 155-161 (July-Dec. 1971).

Key words: Axisymmetric; elastic; experiment; finite-element analysis; force transducer; stiffness matrix; structural analysis.

A finite-element structural analysis is described for application to problems in which geometry and loading are axisymmetric and material properties are isotropic elastic. An attempt to minimize restrictions imposed on the shape and orientation of the triangular finite-elements has been largely successful. This facilitates use of the analysis, with automatic finite-element mesh generation, in parameter or optimization studies. A series of laboratory tests to verify the analysis are described in which the magnitude and distribution of boundary loading was known within narrow limits.

A Burnett apparatus for the accurate determination of gas compressibility factors and second virial coefficients, and an evaluation of its capability based on some results for argon and carbon dioxide, M. Waxman and J. R. Hastings, *J. Res. Nat. Bur. Stand. (U.S.)*, **75C** (Eng. and Instr.), Nos. 3 and 4, 163-172 (July-Dec. 1971).

Key words: Adsorption, gas on metal; argon, compressibility factor of; Burnett data reduction; carbon dioxide, second virial coefficient of; compressibility factor; gas; gas, compressibility factor of; gas, *PVT* properties of; measurements; second virial coefficient.

A Burnett apparatus has been developed for the determination of the compressibility factor of gases, including corrosive halogenic gases, to an accuracy of 0.1 percent to 0.01 percent at temperatures from 0 to 225 °C and for pressures up to 250 bars. The apparatus has been used throughout this temperature and pressure range and at temperatures within 15 °C of the critical temperature of the sample gas. The apparatus features a rugged yet highly sensitive and reproducible null-type pressure transducer to isolate the sample gas without introducing a pressure uncertainty greater than the precision of the pressure measurements, which is better than 1 part in 50,000. The pressure measurements are accurate to at least 1 part in 20,000. The reduction of the data is discussed extensively. The capability of the apparatus has been evaluated in terms of the compressibility factor represented by a finite pressure or density virial expansion and derived from argon data at 25 °C and pressures up to 250 bars and in terms of the second virial coefficient of carbon dioxide based on data at 50 °C and pressures below 35 bars. The value obtained for this second virial coefficient, -102.2 ± 0.5 cm^3/mol, compares favorably with the value of -102.5 cm^3/mol obtained from a recent correlation and is in substantial disagreement with the value of -100.7 ± 0.4 cm^3/mol determined by Dadson and co-workers from the Burnett method and the piezometer method.

An extension to the sliding short method of connector and adaptor

evaluation, G. F. Engen, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), Nos. 3 and 4, 173-180 (July-Dec. 1971).

Key words: Adaptor; connector; efficiency; sliding short.

Sliding short methods represent a measurement tool of substantial potential for the measurement of small losses such as are associated with waveguide connectors or adaptors. Until recently, however, the use of these methods has been inhibited by the uncertainty of the error contribution due to non-ideal short behavior.

A recent analysis by Almassy has shown that by the use of proper techniques, the error contribution from this source is usually negligible, provided that the adaptor (or connector) is "well matched."

It is the purpose of this paper to eliminate this latter restriction, develop additional measurement methods, and describe further applications.

Accurate microwave high power measurements using a cascaded coupler method, K. E. Bramall, *J. Res. Nat. Bur. Stand. (U.S.),* **75C** (Eng. and Instr.), Nos. 3 and 4, 181-186 (July-Dec. 1971).

Key words: Accurate; calibration; directional coupler; high power; measurement; microwave.

The use of directional couplers to extend the range of low-level power meters is a well established technique. Calibration of bolometer-coupler units up to 20 dB is routine at NBS and other laboratories and allows power measurement to the 1 W level. For higher coupling ratios, however, the problems in calibration using conventional techniques becomes more difficult. This paper describes a cascade method which allows calibration of low power meter-coupler combinations for measurement up to the megawatt range.

The technique is based upon system linearity and the uncertainty limits are shown to be 1 percent to 1.5 percent using NBS low power standards. By using the NBS calibration services and commercially available equipment, the above power levels can be measured with uncertainty limits less than 2.7 percent. The method can also be adapted to measurement of large coupling ratios (20-80 dB).

Results are given for power (200 watts in WR-90 waveguide) and coupling ratio (40 dB coaxial coupler) measurements.

PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION C. ENGINEERING AND INSTRUMENTATION, VOLUME 76C, JANUARY-DECEMBER 1972

Effective with this issue, this Section was discontinued.

January-June 1972

ational Bureau of Standards one kilogram balance (NBS No. 2), H. E. Almer, *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 1-10 (Jan.-June 1972).

Key words: Arrestment; balance; beam; buoyant; case; constant-load; equilibrium; knife; one-pan; short arm; two-knife.

The balance described is a one-pan, two-knife, short arm, 1 kg lance. The fulcrum flat and the suspension support elements mounted on a bed plate supported by three posts attached to base. The weight handling mechanism is mounted on a center lumn attached to the base. The balance has two modes of ar-tment, the constant load mode and the full arrest mode. A uble case encloses the structure.

There are positions for six weights inside the balance. These ights can be compared with each other, according to an ap-ppriate weighing design, without opening the balance case. e operation of the balance and the weight changing are ough control elements outside the balance case. The indicat-, elements for the instruments measuring the pressure, tem-rature, and relative humidity within the balance are located in-e the balance.

The standard deviation of the balance developed by a series of asurements in the National Bureau of Standards Experimen-Mass Laboratory was approximately 4μg.

ll and cylinder interferometer, J. B. Saunders, Sr., *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 11-20 (Jan.-June 1972).

Key words: Density standards; interferometer; volume of spheres.

An interferometer is described that permits the comparison of meters of balls and cylinders with an etalon. The specimen is ated in the cavity of the etalon. Interference is produced by t reflected from each surface of the etalon and the adjacent face of the specimen. The two pairs of interfering beams of t (one pair from each side of the etalon) are received by the e eyepiece or camera. A shutter permits alternate viewing of two interferograms. Magnification and contrast of the fringes obtained by a suitable choice of power and separations of nponents of the system. After the prime dimension of the lon is determined, it can be subsequently rechecked with the gle mode (stabilized) laser, used with this interferometer, hout removing the etalon from the assembly. A method is pro-ed for analyzing the results of this interferometer.

cision reference specimens of surface roughness: Some characteristics of the Cali-Block, R. D. Young and F. E. Scire, *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 1-23 (Jan.-June 1972).

Key words: Arithmetic Average roughness; Cali-Block; calibration; roughness.

The distribution of Arithmetic Average values of surface ghness across the 120 and 20 micro-inch patches of NBS Cali-Block "B" have been measured. It is shown that each distribution can be described in terms of its mean value and standard deviation. The observed systematic distribution of *AA* values strongly suggests that the user select several widely spaced regions at random on the patch when calibrating a roughness measuring instrument.

Absorption of sound in liquids by the resonator-decay technique: A critique, M. Greenspan, *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 25-32 (Jan.-June 1972).

Key words: Acoustic impedance; acoustic materials; acoustic parameters; acoustics.

(1) The resonator-decay and the reverberation methods for measurement of the absorption of sound in liquids are in wide use, but their theoretical foundation has not hitherto been investigated. The basic assumptions are in fact invalid, but under most practical conditions the errors are tolerable, at least for three common geometries. (2) The very large excess losses always observed at the lower-order modes are identified with anelastic effects in the envelope, for the most part, and with viscous boundary-layer effects to a lesser, but very substantial extent. For modes of sufficiently high order these become negligible.

Ductile fracture by development of surfaces of unstable cavity expansion, C. A. Berg, *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 33-39 (Jan.-June 1972).

Key words: Ductile fracture; plasticity; void growth.

A model of fracture of a ductile metal in which surfaces of unstable microcavity expansion occur is proposed. It is shown that such surfaces can occur only in locally plane incremental strain. The hardening conditions required for the development of these surfaces are considered. It is shown that in a material possessing an equivalent yield stress (Y) which depends upon the total plastic dilatation (Δ) and equivalent distortional strain (ϵ), the minimum ratio of dilatational softening ($\partial\gamma/\partial\Delta < 0$) to distortional hardening ($\partial\gamma/\partial\epsilon > 0$) under which an unstable surface of a dilatation may form is $-2/3$. A possible explanation, based upon the model, for the lack of correlation between plane strain ductility and ductility as measured in a tensile test is offered. Also, the pertinence of the model to fracture of glassy polymers and environmental stress cracking of crystalline polymers is discussed.

Friction and wear of graphite fiber composites, C. A. Berg, S. Batra, and J. Tirosh, *J. Res. Nat. Bur. Stand. (U.S.)*, 76C (Eng. and Instr.), Nos. 1 and 2, 41-52 (Jan.-June 1972).

Key words: Composites; friction; graphite fiber; wear.

Friction and wear of two different types of graphite fiber composites were studied in a pin-disk sliding contact wear machine. Composites reinforced (62% by volume) with low modulus, high strength circular fiber (Modmor 11) exhibited very high resistance to wear [a threshold wear load of ~ 20 N, a maximum bearing load of ~ 50 N, and a wear coefficient of ~ 10^{-6}] when worn by hardened steel pins. However, the composite produced extreme abrasion on the steel counterface. Composites rein-

forced (62% by volume) with high modulus, lower strength, non-circular fiber (GY70) also exhibited high resistance to wear (a threshold wear load of ~ 25 N, a maximum bearing capacity of ~ 20 N, and a wear coefficient of ~ 10^{-6}) when worn by hardened steel, but these composites developed a surface film which prevented abrasional damage to the steel counterface.

Potential applications of the two different types of composites in bearings are discussed. The advantages of these composites in bearings subject to corrosion, vibration, loss of lubrication, or impact damage are noted.

A note on construction of the equivalent plastic strain increment, C. A. Berg, *J. Res. Nat. Bur. Stand. (U.S.)*, **76C** (Eng. and Instr.), Nos. 1 and 2, 53-54 (Jan.-June 1972).

Key words: Equivalent strain; hardening; plasticity; strain hardening; work hardening.

Strain hardening plastic deformation of a material possessing a yield locus which may be written as a homogeneous function of the stress components, and which obeys the classical associated flow rule for metals is considered. The material may be anisotropic and may display plastic dilatation. A method is given for constructing the equivalent plastic strain increment in such a way that the increment of plastic work is always equal to the product of the equivalent plastic strain increment and the equivalent yield stress. The method is implied in classical treatments of hardening but seems not to have been given explicitly heretofore.

.4. PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 1, JANUARY-DECEMBER 1972

This journal is published quarterly by the American Chemical ociety and the American Institute of Physics for the National ureau of Standards. The objective of the Journal is to provide ritically evaluated physical and chemical property data, fully ocumented as to the original sources and the criteria used for valuation. Critical reviews of measurement techniques, whose im is to assess the accuracy of available data in a given technical tea, are also included. The principal source for the Journal is the lational Standard Reference Data System (NSRDS). The Jour- al is not intended as a publication outlet for original experimen- al measurements such as are normally reported in the primary esearch literature, nor for review articles of a descriptive or rimarily theoretical nature.

Volume 1, No. 1

aseous diffusion coefficients, T. R. Marrero and E. A. Mason, *J. Phys. Chem. Ref. Data* **1,** No. 1, 3-118 (1972).

Key words: binary gas mixtures; critically evaluated data; diffusion; diffusion coefficients; gases; transport properties.

Diffusion coefficients of binary mixtures of dilute gases are omprehensively compiled, critically evaluated, and correlated y new semi-empirical expressions. There are seventy-four ystems for which the data are sufficiently extensive, consistent nd accurate to allow diffusion coefficients to be recommended ith confidence. Deviation plots are given for most of these ystems. Almost every gaseous diffusion coefficient which was xperimentally determined and reported prior to 1970 can be ob- ained from the annotated bibliography and table of gas pairs.

A detailed analysis of experimental methods is given, and in- ercomparison of their results helps establish reliability limits for ne data, which depend strongly on temperature. Direct mea- urements are supplemented by calculations based on knowledge f intermolecular forces derived from independent ources – molecular beam scattering for high temperatures, and ondon dispersion constants for low temperatures. In addition, iffusion coefficients for several mixtures are obtained from ex- erimental data on mixture viscosities and thermal diffusion fac- ors. Combination of all these results gives diffusion coefficients ver a very extensive temperature range, from very low tempera- ures to 10 000 K.

All data are corrected for composition dependence and for uantum effects. New semi-empirical equations are derived for aking such corrections easily.

elected values of critical supersaturation for nucleation of liquids from the vapor, G. M. Pound, *J. Phys. Chem. Ref. Data* **1,** No. 1, 119-133 (1972).

Key words: critical supersaturation; data evaluation; homogeneous nucleation; phase change.

Selected values of critical supersaturation for homogeneous ucleation of droplets from the vapor and for heterogeneous ucleation of droplets on the natural stationary concentration of aseous ions are tabulated and plotted, and a rationale is given r selection of these data.

elected values of evaporation and condensation coefficients for simple substances, G. M. Pound, *J. Phys. Chem. Ref. Data* **1,** No. 1, 135-146 (1972).

Key words: condensation coefficients; data evaluation; evaporation coefficients; phase change.

Tables of selected data on the coefficients of evaporation and condensation far from equilibrium for simple substances are presented, together with a rationale for the exclusion or choice of data and an estimate of the precision measure.

Atlas of the observed absorption spectrum of carbon monoxide between 1060 and 1900 Å, S. G. Tilford and J. D. Simmons, *J. Phys. Chem. Ref. Data* **1,** No. 1, 147-188 (1972).

Key words: absorption spectra; carbon monoxide; electronic transitions; identification atlas; potential energy curves; rotational and vibrational constants.

This atlas summarizes the results of a recent investigation of the carbon monoxide absorption spectrum between 1060 and 1900 Å. Twelve electronic transitions are observed in this region; four electric dipole allowed electric transitions from the ground state X $^1\Sigma^+$ to the A $^1\Pi$, B $^1\Sigma^+$, C $^1\Sigma^+$, and E $^1\Pi$ states, and eight forbidden transitions to the a' $^3\Sigma^+$, e $^3\Sigma^-$, a $^3\Pi$, D $^1\Delta$, d $^3\Delta_i$, I $^1\Sigma^-$, j $^3\Sigma^+$, and c $^3\Pi$ states. The following items are presented in the atlas: (1) A photograph of the spectrum with band assignments; (2) a table of band head measurements and assignments arranged by wavelength; (3) a summary of the spectroscopic constants and potential curve for each electronic state; (4) a line list, arranged by wavelength, of the observed rotational lines of the allowed transitions.

Tables of molecular vibrational frequencies. Part 5, T. Shimanouchi, *J. Phys. Chem. Ref. Data* **1,** No. 1, 189-216 (1972).

Key words: fundamental frequencies; infrared spectra; polyatomic molecules; Raman spectra; vibrational frequencies.

The compilations of fundamental vibrational frequencies of molecules previously published as NSRDS-NBS-6, NRSD-NBS-11, NSRDS-NBS-17, and NSRDS-NBS-39, are extended to 58 additional molecules. Selected values of the fundamental vibrational frequencies are given for each molecule, together with observed infrared and Raman spectral data and citations to the original literature. The selection of vibrational fundamentals has been based on careful studies of the spectral data and comprehensive normal-coordinate analyses. An estimate of the accuracy of the selected values is included. The tables provide a convenient source of information for those who require vibrational energy levels and related properties in molecular spectroscopy, thermodynamics, analytical chemistry, and other fields of physics and chemistry.

Volume 1, No. 2

Selected values of heats of combustion and heats of formation of organic compounds containing the elements C, H, N, O, P, and S, E. S. Domalski, *J. Phys. Chem. Ref. Data* **1,** No. 2, 221-277 (1972).

Key words: CHNOPS compounds; heat of combustion; heat of formation; selected values.

Selected values of the heats of combustion and heats of forma-

tion of 719 organic compounds are reported here. The data tabulated pertain to compounds containing the elements carbon, hydrogen, nitrogen, oxygen, phosphorus, and sulfur (CHNOPS). The information is arranged according to classes of compounds and within each class, compounds are arranged by empirical formula. The general classes covered are: hydrocarbons, alcohols, phenols, polyols, ethers, aldehydes, ketones, acids, acid anhydrides, esters, steroids, lactones, carbohydrates, heterocyclic oxygen compounds, amines, amides, urea derivatives, guanidine derivatives, amino acids, peptides, alkaloids, heterocyclic nitrogen compounds, porphyrins, organic sulfur compounds, and organic phosphorus compounds. When a selection was made from among several investigators, commentary is provided to indicate the choice, and usually some relevant data. The number of references cited is 596. An alphabetical compound index is provided which gives the name, page number, empirical formula, and the Wiswesser Line Notation (WLN), for each compound.

Thermal conductivity of the elements, C. Y. Ho, R. W. Powell, and P. E. Liley, *J. Phys. Chem. Ref. Data* **1**, No. 2, 279-421 (1972).

Key words: conductivity; critically evaluated data; data compilation; elements; reference data; thermal conductivity; transport properties.

This is the abridged version of a comprehensive volume on the thermal conductivity of the elements. It contains recommended reference values resulting from critical evaluation, analysis, and synthesis of all the available data. It also gives estimated values for those elements for which no thermal conductivity data are available. Thus, the work provides recommended or estimated thermal conductivity values for all the elements over the full temperature ranges where experimental data are available or reliable extrapolations or estimations can be made. The results on each element are presented in both graphical and tabular forms. Summary graphs arranged by group in the periodic table are also given.

The spectrum of molecular oxygen, P. H. Krupenie, *J. Phys. Chem. Ref. Data* **1**, No. 2, 423-534 (1972).

Key words: critical review; electronic spectrum; molecular oxygen; potential energy curves; rotational spectrum; spectroscopic constants.

This is a critical review and compilation of the observed and predicted spectroscopic data on O_2 and its ions O_2^-, O_2^+, and O_2^{2+}. The ultraviolet, visible, infrared, Raman, microwave, and electron paramagnetic resonance spectra are included. Each electronic band system is discussed in detail, and tables of band origins and heads are given. The microwave and EPR data are also tabulated. Special subjects such as the dissociation energy of O_2, perturbations, and predissociations are discussed. Potential energy curves are given, as well as *f*-values, Franck-Condon integrals, and other intensity factors. A summary table lists the molecular constants for all known electronic states of O_2 and O_2^+. Electronic structure and theoretical calculations are also discussed.

A critical review of the gas-phase reaction kinetics of the hydroxyl radical, W. E. Wilson, Jr., *J. Phys. Chem. Ref. Data* **1**, No. 2, 535-573 (1972).

Key words: activation energy; chemical kinetics; combustion; rate constant; review.

The literature pertinent to reactions of the hydroxyl radical has been reviewed. An extensive discussion is given for reactions of the hydroxyl radical with itself and with CO, H_2, and CH_4. These four reactions are: (1) $OH + OH \rightarrow H_2O + O$; (2) $CO + OH \rightarrow CO_2 + H$; (3) $H_2 + OH \rightarrow H_2O + H$; (4) $CH_4 + OH \rightarrow CH_3 + H_2O$.

Values are recommended for k_1 and k_2 and for the ratio k_3/k_2 and k_4/k_2. These rate ratios are used with the previously established value of k_2 to obtain recommended values for k_3 and k_4.

The recommended values in $cm^3\ mol^{-1} \cdot s^{-1}$, the temperature range, and the uncertainty are:

$$k_1 = 1.55 \times 10^{12}, 300\ \text{K}, \log k \pm .5^1$$

$$k_2 = 3.1 \times 10^{11} \exp(-300/T), 300\text{-}2000\ \text{K}, \log k \pm .3$$

$$k_3/k_2 = 73 \exp(2300/T), 300\text{-}2000\ \text{K}, \log k_3/k_2 \pm .3$$

$$k_3 = 3.8 \times 10^{13} \exp(-2600/T), 300\text{-}2000\ \text{K}, \log k \pm .3$$

$$k_4/k_2 = 92 \exp(2200/T), 300\text{-}2000\ \text{K}, \log k_3/k_2 \pm .3$$

$$k_4 = 2.85 \times 10^{13} \exp(-2500/T), 300\text{-}2000\ \text{K}, \log k \pm .7.$$

Rate expressions are also recommended for a number of other hydroxyl reactions whose rates are less well established.

Volume 1, No. 3

Molten salts: Volume 3, nitrates, nitrites, and mixtures. Electrical conductance, density, viscosity, and surface tension data, G. J. Janz, U. Krebs, H. F. Siegenthaler, and R. P. T. Tomkins, *J. Phys. Chem. Ref. Data* **1**, No. 3, 581-746 (1972).

Key words: data compilation; density; electrical conductance; molten salt mixtures; nitrates; nitrites; standard reference data; surface tension; viscosity.

Data on the electrical conductance, density, viscosity, and surface tension of nitrate-nitrate, nitrite-nitrite, and nitrite-nitrate mixtures have been systematically collected and evaluated. Results are given for some 71 binary mixtures over a range of compositions and temperatures. Values of the above properties for the single salts have been updated in accord with previously advanced recommendations.

High temperature properties and decomposition of inorganic salts. Part 3. Nitrates and nitrites, K. H. Stern, *J. Phys. Chem. Ref. Data* **1**, No. 3, 747-772 (1972).

Key words: nitrates; nitrites; thermal decomposition; thermodynamic functions.

The literature dealing with the high-temperature behavior of inorganic nitrates and nitrites has been critically reviewed. Values of $(G_T^\circ - H_{298}^\circ)/T$ of the reactants and products of the decomposition reactions were calculated and have been tabulated from 298 K up to as high a temperature as possible. Equilibrium constants and partial pressures were tabulated. Auxiliary data on phase transitions and densities have also been included. Qualitative information about the thermal decomposition of the salts is reviewed.

High-pressure calibration. A critical review, D. L. Decker, W. A. Bassett, L. Merrill, H. T. Hall, and J. D. Barnett, *J. Phys. Chem. Ref. Data* **1**, No. 3, 773-836 (1972).

Key words: calibration of pressure scales; critically evaluated data; high pressure; high pressure phase changes; pressure measurement.

A critical review of experimental technique for measuring high pressures has been made. The broad coverage includes discussions relating to (a) the establishment of a primary pressure scale using the free-piston gage, (b) the selection and precise measurement of identifiable phase changes as fixed pressure points, and (c) the use of interpolation and extrapolation techniques such as resistance gages, equations of state, and optical changes. The emphasis is on static pressure measurements above 10 kbar, but shock measurements are also considered for completeness. The pressure values to be associated with the fixed points have been analyzed in detail. Temperature measurement in the high pres

ure environment is also reviewed. The accuracy with which ressures can be measured has been carefully considered; the aximum accuracies now obtainable are considered to be of the rder of 0.02 percent at 8 kbar, 0.25 percent at 25 kbar, 2 percent 50 kbar, and 4 percent at 100 kbar.

Volume 1, No. 4

he surface tension of pure liquid compounds, J. J. Jasper, *J. Phys. Chem. Ref. Data* **1**, No. 4, 841-1010 (1972).

Key words: evaluated data; liquids; surface tension; thermodynamics of liquids.

The surface tension tables presented herein are the result of a erature survey, evaluation, and compilation of data of some 200 pure liquid compounds, 226 of which were reported for a ngle temperature. These are arranged with related compounds the increasing order of their molecular weights. As far as ssible the method of measurement, nature of atmosphere to hich the liquid was exposed during measurements, and the esti- ated accuracy are given for each liquid. The tabulated values ere calculated from the derived results of directly measured uantities reported in the literature of many countries from about 374 to 1969. Preliminary plots of the experimentally measured uantities indicated that the surface tensions of the liquid com- ounds are linear functions of the temperature over the reported erational range. The principle of least squares was applied to perimental surface tension values to establish the regression urves and their equations. The constants of the equations (slope nd intercept), together with the standard deviations are given r each compound. The selection factors establishing criteria of uality of surface tension data are discussed. These include (a) ethod of measurement, (b) purity of compound, (c) quality of pparatus and assembly, (d) experimental procedure (experimen- tion), (e) reliability of measurements (most probable values), (f) perience of investigator, and (g) availability of data. There are 74 references listed alphabetically.

icrowave spectra of molecules of astrophysical interest. I. Formaldehyde, formamide, and thioformaldehyde, D. R. Johnson, F. J. Lovas, and W. H. Kirchhoff, *J. Phys. Chem. Ref. Data* **1**, No. 4, 1011-1046 (1972).

Key words: formaldehyde; formamide; interstellar molecules; microwave spectra; molecular parameters; radio astronomy; rotational transitions; thioformaldehyde.

The available data on the microwave spectra of formaldehyde, rmamide, and thioformaldehyde are critically reviewed for in- rmation applicable to radio astronomy. Molecular data such as tational constants, centrifugal distortion parameters, dipole oments, hyperfine coupling constants, and structural parame- rs are tabulated. Observed rotational transitions are presented r the astronomically interesting isotopic forms of these olecules when available. Detailed centrifugal distortion calcu- tions have been carried out for the most abundant isotopic forms of these molecules, namely, $H_2{}^{12}C^{16}O$, $H_2{}^{13}C^{16}O$, $^{14}NH_2{}^{12}CH^{16}O$, and $H_2{}^{12}C^{32}S$. Transitions have been predicted and tabulated for the frequency ranges

1 MHz to 300 GHz for $H_2{}^{12}C^{16}O$,

100 MHz to 300 GHz for $H_2{}^{13}C^{16}O$,

500 MHz to 180 GHz for $^{14}NH_2{}^{12}CH^{16}O$,

and

100 MHz to 300 GHz for $H_2{}^{12}C^{32}S$.

All predicted transitions include 95 percent confidence limits; measured transition error limits have been reproduced from the original literature. References are given for all data included.

Osmotic coefficients and mean activity coefficients of uni-univalent electrolytes in water at 25 °C, W. J. Hamer and Y.-C. Wu, *J. Phys. Chem. Ref. Data* **1**, No. 4, 1047-1100 (1972).

Key words: activity coefficients; critically evaluated data; excess Gibbs energy for electrolytes; osmotic coefficients.

This paper gives values for the osmotic coefficients and mean activity coefficients of uni-univalent electrolytes in aqueous solutions at 25 °C. The values are expressed on the molality or weight basis. The data available in the literature have been corrected to the presently accepted scales of atomic weights (1969) and temperature (IPST 1968) and, where necessary, to the absolute electrical units of 1969 and the fundamental constants of 1963. The selected values of osmotic coefficients and mean activity coefficients for individual electrolytes have been made internally consistent thermodynamically. In some cases estimated values are given; in other cases, references only are given when the data are sparse or unsuited to critical evaluation. Values of the osmotic coefficients and mean activity coefficients of 79 compounds are given together with the standard deviation, variance, and normalized standard deviation of their fit to equations which express these quantities as functions of electrolyte concentration. Finally, literature references are given to data on 51 additional uni-univalent electrolytes.

The viscosity and thermal conductivity coefficients of gaseous and liquid fluorine, H. J. M. Hanley and R. Prydz, *J. Phys. Chem. Ref. Data* **1**, No. 4, 1101-1114 (1972).

Key words: critically evaluated data; fluorine; kinetic theory; modified Enskog theory; thermal conductivity; viscosity.

Tables of values for the viscosity and thermal conductivity of fluorine are presented in the range 70-300 K for pressures up to 200 atmospheres. Experimental results were reviewed but were judged to be unreliable. Accordingly, dilute gas values were determined from kinetic theory using the m-6-8 potential, and dense gas and liquid values were obtained from the modified Enskog theory. The critical point anomaly in the thermal conductivity coefficient is also discussed.

PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 2, JANUARY-DECEMBER 1973

Volume 2, No. 1

Microwave spectra of molecules of astrophysical interest. II. Methylenimine, W. H. Kirchhoff, D. R. Johnson, and F. J. Lovas, *J. Phys. Chem. Ref. Data* 2, No. 1, 1-10 (1973).

Key words: hyperfine structure; interstellar molecules; methylenimine; microwave spectra; molecular parameters; radio astronomy; rotational transitions.

The available data on the microwave spectrum of methylenimine are critically reviewed for information applicable to radio astronomy. Molecular data such as rotational constants, centrifugal distortion parameters, hyperfine coupling constants, and dipole moments are tabulated. A detailed centrifugal distortion calculation has been carried out for the most abundant isotopic form of this molecule, H_2 ^{12}C ^{14}NH. Transitions have been predicted and tabulated for the frequency range 100 MHz to 300 GHz. All predicted transitions include 95 percent confidence limits; error limits have been reported for all measured transitions.

Analysis of specific heat data in the critical region of magnetic solids, F. J. Cook, *J. Phys. Chem. Ref. Data* 2, No. 1, 11-24 (1973).

Key words: critical exponents; critical phenomena; data analysis; magnetic solids; nonlinear least-squares; phase transitions; specific heat; static scaling.

A detailed analysis of specific heat data in the critical region of magnetic solids is presented. An inverse power law, whose strength is measured by the exponent α, is used to describe the temperature dependence of the magnetic specific heat. Other parameters used include the power law coefficient A, the critical temperature T_c, and a constant background term B. Advanced techniques of data analysis suitable for estimation of nonlinear parameters and their errors under conditions of realistically weighted experimental data were used to obtain the dependence of α, T_c, A, and B on the range of data points included in the fit. Those exponents and parameters that provide the best overall fit to the data have been found. Literature references to 49 experiments from 1935 to 1971 are given. We present in tabular form the values of α, A, and B for 24 different magnetic crystals. With some exceptions, the best fits to the data suggest that in the temperature range studied the magnetic specific heat is not symmetric; the exponent α depends on the range of data included in the fit, varies widely from material to material, and in many cases is definitely negative below the critical temperature; and that there is little evidence that the asymptotic region is being adequately sampled by experiment. These results have the implication that until such time as we can adequately account for departures from the expected sharp peak in the data at T_c (data rounding) and corrections to asymptotic scaling, then comparisons between magnetic specific heat experiments and lowest order scaling predictions are to this date still tenuous.

Evaluated chemical kinetic rate constants for various gas phase reactions, K. Schofield, *J. Phys. Chem. Ref. Data* 2, No. 1, 25-84 (1973).

Key words: activation energies; evaluation; gaseous reactions; radical reactions; rate constants; review; sulfur chemistry; tables.

The available information, up to mid-1972, for the rate constants of a series of gas phase chemical reactions has been evaluated critically. For each reaction, relevant thermodynamic data are presented and values for the equilibrium constant expressed in mathematical form. Kinetic data are presented in tabular and graphical form together with a discussion of the pertinent details. Recommended rate constant values are presented wherever possible with suggested error limits. The reactions considered involve the species H, O, C, N, S, OH, HS, S_2, CS, SO, HSO_2, NH_2, NH_3, NO, N_2O, NO_2, N_2O_4, N_2, O_2, O_3, H_2, H_2O, SO_2, SO_3, CS_2, OCS, H_2S, and CO. Particular emphasis is given to reactions involving sulfur chemistry. The best available data for these reactions have been summarized in a table at the end of the paper. An appendix discussing the available evaluations and review articles published since 1960 also has been included to publicize these sources of either evaluated data or of extensive reference bibliographies.

Atomic transition probabilities for forbidden lines of the iron group elements. (A critical data compilation for selected lines) M. W. Smith and W. L. Wiese, *J. Phys. Chem. Ref. Data* 2, No. 1, 85-120 (1973).

Key words: chromium; cobalt; forbidden transitions; iron; manganese; nickel; transition probabilities; vanadium.

Atomic transition probabilities for about 750 forbidden spectral lines for elements of the iron group, specifically V, Cr, Mn, Fe, Co, and Ni, have been critically evaluated and compiled using all available literature sources. The selection of the spectra and elements has been made primarily according to their astrophysical importance. The data are presented in separate tables for each element and stage of ionization, and for each ion the data are arranged according to multiplets. For each line within a multiplet the transition probability for spontaneous emission is listed along with the standard spectroscopic designation, the wavelength, the statistical weights, and the energy levels of the upper and lower states. In addition, the estimated accuracy and the source are indicated. In short introductions which precede the individual tables for the ions the main justifications for the choice of the adopted data and for the accuracy rating are discussed. A general introduction contains a detailed discussion of the critical factors entering into the calculations. It also includes detailed comparisons of calculated data with astrophysical observations and a few laboratory results, which serve as a valuable indication for the validity of the estimated accuracies.

Tables of molecular vibrational frequencies. Part 6, T. Shimanouchi, *J. Phys. Chem. Ref. Data* 2, No. 1, 121-161 (1973).

Key words: fundamental frequencies; infrared spectra; polyatomic molecules; Raman spectra; vibrational frequencies.

The compilations of fundamental vibrational frequencies of molecules previously published in the NSRDS-NBS publication series and in this journal are here extended to 55 additional molecules. Selected values of the fundamental vibrational frequencies are given for each molecule, together with observed infrared and Raman spectral data and citations to the original literature. The selection of vibrational fundamentals has been based on careful studies of the spectral data and comprehensive normal-coordinate analyses. An estimate of the accuracy of the selected values is included. The tables provide a convenient source of information for those who require vibrational energy levels and related properties in molecular spectroscopy, ther

nodynamics, analytical chemistry, and other fields of physics nd chemistry.

ompilation of energy band gaps in elemental and binary compound semiconductors and insulators, W. H. Strehlow and E. L. Cook, *J. Phys. Chem. Ref. Data* **2**, No. 1, 163-199 (1973).

Key words: band gaps; binary compounds; electronic properties; insulators; semiconductors.

Energy band gaps are tabulated for elemental and binary compound semiconductors and insulators reported in 723 references. he method of measurement, transition, type of sample, and ther pertinent information are included for each entry. The eterminations believed to be the most reliable are indicated.

Volume 2, No. 2

licrowave spectra of molecules of astrophysical interest. III. Methanol, R. M. Lees, F. J. Lovas, W. H. Kirchhoff, and D. R. Johnson, *J. Phys. Chem. Ref. Data* **2**, No. 2, 205-214 (1973).

Key words: internal rotation; interstellar molecules; methanol; microwave spectra; molecular parameters; radio astronomy; rotational transitions; torsion.

The available data on the microwave spectrum of methanol are itically reviewed for information applicable to radio astrono- ay. Molecular data such as moments and product of inertia, tor- ional potential constants, centrifugal distortion and torsion-rota- ion interaction constants, dipole moment, and structural arameters are tabulated. Observed rotational transitions are resented for the astronomically interesting isotopic forms of ethanol when available. Detailed centrifugal distortion and tor- ion-rotation interaction calculations have been carried out for he most abundant isotopic form of methanol. Transitions are abulated for the frequency range from 500 MHz to 200 GHz. leasured transition error limits have been reproduced from the riginal literature. References are given for all data included.

licrowave spectra of molecules of astrophysical interest. IV. Hydrogen sulfide, P. Helminger, F. C. De Lucia, and W. H. Kirchhoff, *J. Phys. Chem. Ref. Data* **2**, No. 2, 215-223 (1973).

Key words: hydrogen sulfide; hyperfine structure; interstellar molecules; microwave spectra; molecular parameters; radio astonomy; rotational transitions.

The available data on the microwave spectrum of hydrogen ulfide are critically reviewed for information applicable to radio stronomy. Molecular data such as rotational constants, cen- ifugal distortion constants, hyperfine coupling parameters, and pole moments are tabulated. A detailed centrifugal distortion alculation has been carried out for the most abundant isotopic rm of this molecule, $H_2{}^{32}S$, as well as for $HD^{32}S$. Transitions ave been predicted and tabulated for the frequency range 1 Hz to 1000 GHz for $H_2{}^{32}S$ and 1 MHz to 700 GHz for $HD^{32}S$. ll predicted transitions include 95 percent confidence limits; stimated error limits have been reported for all measured transi- ons. Observed transitions of $H_2{}^{32}S$ and $H_2{}^{34}S$ are also listed.

ables of molecular vibrational frequencies. Part 7, T. Shimanouchi, *J. Phys. Chem. Ref. Data* **2**, No. 2, 225-256 (1973).

Key words: fundamental frequencies; infrared spectra; polyatomic molecules; Raman spectra; vibrational frequencies.

The compilations of fundamental vibrational frequencies of olecules previously published in the NSRDS-NBS publication ries and in this journal are here extended to 50 additional olecules. Selected values of the fundamental vibrational equencies are given for each molecule, together with observed frared and Raman spectral data and citations to the original literature. The selection of vibrational fundamentals has been based on careful studies of the spectral data and comprehensive normal-coordinate analyses. An estimate of the accuracy of the selected values is included. The tables provide a convenient source of information for those who require vibrational energy levels and related properties in molecular spectroscopy, thermodynamics, analytical chemistry, and other fields of physics and chemistry.

Energy levels of neutral helium (^{4}He I), W. C. Martin, *J. Phys. Chem. Ref. Data* **2**, No. 2, 257-265 (1973).

Key words: atomic energy levels; atomic spectra; autoionization; electron scattering; fine structure; helium; photoionization resonances; photon absorption.

This compilation of all identified levels is based on the most accurate available observations. It includes 48 levels above the He II 1^2S limit (two-electron excitation).

Survey of photochemical and rate data for twenty-eight reactions of interest in atmospheric chemistry, R. F. Hampson, Ed., W. Braun, R. L. Brown, D. Garvin, J. T. Herron, R. E. Huie, M. J. Kurylo, A. H. Laufer, J. D. McKinley, H. Okabe, M. D. Scheer, W. Tsang, and D. H. Stedman, *J. Phys. Chem. Ref. Data* **2**, No. 2, 267-311 (1973).

Key words: atmospheric chemistry; chemical kinetics; data evaluation; gas phase reactions; optical absorption coefficients; photochemistry; quantum yields; rate constants.

Photochemical and rate data have been evaluated for 28 gas phase reactions of interest for the chemistry of the stratosphere. The results are presented on data sheets, one per reaction. For each reaction, the available data are summarized. Where possible there is given a preferred value for the rate constant or, for the photochemical reactions, preferred values for primary quantum yields and optical absorption coefficients.

Compilation of the static dielectric constant of inorganic solids, K. F. Young and H. P. R. Frederikse, *J. Phys. Chem. Ref. Data* **2**, No. 2, 313-409 (1973).

Key words: dielectric constant; dielectric loss; permittivity; static dielectric constant.

This compilation contains values of the static dielectric constant of more than 300 inorganic solids. The temperature and frequency of the measurements are listed and the magnitude of the loss tangent is indicated if known. For ninety materials – including most ferroelectrics and antiferroelectrics and several oxides and halides – additional information is presented in the form of graphs depicting the temperature dependence of the dielectric constant. In a few cases the frequency and pressure dependences are also shown. The basic principles and formulas pertinent to the field of dielectrics are reviewed in a short introduction. This part also mentions several measuring techniques and indicates the criteria used for data selection.

Soft x-ray emission spectra of metallic solids: Critical review of selected systems, A. J. McAlister, R. C. Dobbyn, J. R. Cuthill, and M. L. Williams, *J. Phys. Chem. Ref. Data* **2**, No. 2, 411-426 (1973).

Key words: alloys; critical review; emission spectra; intermetallic compounds; metals; soft x-ray; spectra.

Theory and experimental practice in the field of soft x-ray emission from metallic solids are briefly reviewed, and measurements on a number of systems (Al, Al in $AuAl_2$, Al and Mg in Al-Mg, Cu, Cu and Ni in Cu-Ni, Li, Mg, Na, and Ni) are critically evaluated and compared with the results of other techniques and theory, with a view to establishing the pertinence of the soft x-ray measurements and indicating specific guidelines for enhancing their value.

Ideal gas thermodynamic properties of ethane and propane, J. Chao, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **2,** No. 2, 427-437 (1973).

Key words: critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; equilibrium constant of formation; ethane; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation barrier height; internal rotation energy levels; propane; torsional frequencies.

The thermodynamic properties ($C_p°$, $S°$, $H°-H_0°$, $(H°-H_0°)/T$, $-(G°-H_0°)/T$, $\Delta Hf°$, $\Delta Gf°$ and log Kf) for ethane and propane in the ideal gaseous state in the temperature range from 0 to 1500 K and at 1 atm were calculated by statistical thermodynamic methods based on a rigid-rotor harmonic-oscillator model. The internal rotation contributions to thermodynamic functions were evaluated by using a partition function formed by summation of internal rotation energy levels. The calculated heat capacities and entropies compare favorably with available experimental data.

Volume 2, No. 3

An analysis of coexistence curve data for several binary liquid mixtures near their critical points, A. Stein and G. F. Allen, *J. Phys. Chem. Ref. Data* **2,** No. 3, 443-466 (1973).

Key words: binary liquid mixtures; coexistence curve; consolute point; critically evaluated data; critical point; critical point exponent; diameter; power law; statistical analysis.

Experimental data on the coexistence curves for nine binary liquid systems, which meet strict criteria of precision, purity of components, and experimental method, are analyzed in the neighborhood of the critical point. The data are examined in terms of a general equation of state which is nonanalytic at the critical point. The results of the computer analysis using weighted non-linear least squares procedures present evidence that some symmetry features of classical equations of state remain; and within the experimental errors in the data all systems are consistent with the critical exponent $\beta = 0.34$. The asymptotic behavior of the diameter is examined and evidence is provided for a curved diameter in some cases; however, it is concluded that the available data are not extensive enough to make a firm conclusion concerning the shape of the diameter. Experimental methods are briefly criticized and mention is made of the experimental direction that future work should take. Special attention is given to estimating the reliability of the conclusions that may be drawn from a given set of data.

Rate constants for the reactions of atomic oxygen (O ^3P) with organic compounds in the gas phase, J. T. Herron and R. E. Huie, *J. Phys. Chem. Ref. Data* **2,** No. 3, 467-518 (1973).

Key words: atomic oxygen; chemical kinetics; compilation; critical evaluation; gases; organic compounds; rate constants.

Rate constants for the reactions of atomic oxygen (O ^3P) with organic compounds in the gas phase are compiled and critically evaluated. Data are given here as originally reported in the literature for a total of 107 organic reactants. From a critical evaluation of the data, recommended values for rate constants are given over specified temperature intervals, and where possible at 298 K and 1000 K. Estimated error limits are assigned to all recommended values.

First spectra of neon, argon, and xenon 136 in the 1.2-4.0 μm region, C. J. Humphreys, *J. Phys. Chem. Ref. Data* **2,** No. 3, 519-530 (1973).

Key words: argon; extraphotographic region; infrared emission spectra; intensities; neon; wavelengths; wavelength standards; wave numbers; xenon.

Descriptions of the first spectra of neon, argon, and xenon 136, comprising calculated wavelengths, calculated wave numbers, relative intensities, and classifications, are presented. The calculated values are derived from currently best established energy levels, obtained mostly from interferometric observations and adopted as standards by the International Astronomical Union. All listed lines have actually been observed. This paper makes available a compilation of all results previously presented in fragmentary or relatively inaccessible reports with intensities normalized to as nearly a uniform scale as the various observations permit.

Elastic properties of metals and alloys. I. Iron, nickel, and iron-nickel alloys, H. M. Ledbetter and R. P. Reed, *J. Phys. Chem. Ref. Data* **2,** No. 3, 531-618 (1973).

Key words: bulk modulus; compressibility; elastic constant; Debye temperatures; iron; iron alloys; Lamé constants; nickel; nickel alloys; Poisson's ratio; shear modulus; single-crystal elastic coefficients; Young's modulus.

A comprehensive compilation is given of elastic properties of iron-nickel alloys. When sufficient data exist, preferred values are recommended. This compilation covers, besides pure iron and pure nickel, the entire binary composition range, both b.c.c. and f.c.c. phases. Elastic constants included are: Young's modulus, shear modulus, bulk modulus (reciprocal compressibility), Poisson's ratio, and single-crystal elastic stiffnesses, both second-order and higher-order. Data are compiled for variation of elastic constants with composition, temperature, pressure, magnetic field, mechanical deformation, annealing, and crystallographic transitions. An overview is given from the vantage points of the electron theory of metals, elasticity theory, and crystallographic theory. Also included are discussions of isothermal and adiabatic elastic constants, interrelationships among engineering elastic constants, computation of the latter from single-crystal elastic stiffnesses, and similar topics. Where key data have not been measured, they were generated if possible from existing data using standard formulae. Other gaps, both theoretical and experimental, in the elastic properties of iron-nickel alloys are indicated. A few theoretical results are included where experimental data are nonexistent or scarce. A semantic scheme is proposed for distinguishing elastic constants of solids.

The viscosity and thermal conductivity coefficients of dilute argon, krypton, and xenon, H. J. M. Hanley, *J. Phys. Chem. Ref. Data* **2,** No. 3, 619-642 (1973).

Key words: dilute gas; kinetic theory; m-6-8 potential function; rare gases; thermal conductivity coefficient; viscosity coefficient.

The viscosity and thermal conductivity coefficients of dilute argon, krypton, and xenon are reviewed and tables of recommended values presented. The tables were generated using the appropriate kinetic theory expressions with the m-6-8 potential. The temperature range covers from about one-half critical temperature to 2000 K for each gas. A general estimate of the accuracy is one percent increasing to one and three-quarters percent for temperatures above 1000 K.

Diffusion in copper and copper alloys. Part I. Volume and surface self-diffusion in copper, D. B. Butrymowicz, J. R. Manning and M. E. Read, *J. Phys. Chem. Ref. Data* **2,** No. 3, 643-65(1973).

Key words: copper; diffusion; electromigration; liquid copper diffusion; nuclear magnetic resonance and diffusion; pressure effects on diffusion; self-diffusion; sintering; surface diffusion; thermo-migration.

A survey, comparison, and critical analysis is presented of data compiled from the scientific literature concerning copper self-diffusion. Topics include volume diffusion, dislocation pipe diffusion, surface diffusion, sintering, electromigration, the

momigration, pressure effect on diffusion, strain-enhanced diffusion, nuclear magnetic resonance measurements of solid state diffusion and diffusion in molten copper. An extensive bibliography is presented along with figures, tabular presentation of data, and discussion of results.

Volume 2, No. 4

The 1973 least-squares adjustment of the fundamental constants, E. R. Cohen and B. N. Taylor, *J. Phys. Chem. Ref. Data* **2**, No. 4, 663-734 (1973).

Key words: data analysis; fundamental constants; least-squares adjustments; quantum electrodynamics.

This paper is a summary of the 1973 least-squares adjustment of the fundamental physical constants carried out by the authors under the auspices of the CODATA Task Group on Fundamental Constants. The salient features of both the input data used and its detailed analysis by least-squares are given. Also included is the resulting set of best values of the constants which is to be recommended for international adoption by CODATA, a comparison of several of these values with those resulting from recent past adjustments, and a discussion of current problem areas in the fundamental constants field requiring additional research.

The viscosity and thermal conductivity coefficients of dilute nitrogen and oxygen, H. J. M. Hanley and J. F. Ely, *J. Phys. Chem. Ref. Data* **2**, No. 4, 735-756 (1973).

Key words: critically evaluated data; dilute polyatomic gas; kinetic theory of polyatomic molecules; *m*-6-8 potential; nitrogen; nonspherical interactions; oxygen; second virial coefficient; thermal conductivity coefficient; thermal diffusion factor; viscosity coefficient.

The viscosity and thermal conductivity coefficients of dilute oxygen and nitrogen are discussed and tables of values are presented for temperatures between 80 and 2000 K. The oxygen viscosity tables are estimated to be accurate to two percent for temperatures up to 400 K and four percent above that temperature; the nitrogen viscosity tables are estimated to be reliable to one percent in the range 100-1000 K, increasing to two percent above 1000 K and below 100 K. The error assigned to the thermal conductivity is three percent below 400 K and five percent above 400 K for both gases. The tables were calculated from the appropriate kinetic theory equations using the *m*-6-8 model potential with nonspherical contributions. The approximations to the equations are discussed. It is emphasized that the available data for oxygen viscosity are generally poor and that the thermal conductivity data for both oxygen and nitrogen cannot be considered reliable at high temperatures. No oxygen data exist for temperatures above 1500 K.

Thermodynamic properties of nitrogen including liquid and vapor phases from 63 K to 2000 K with pressures to 10,000 bar, R. T. Jacobsen and R. B. Stewart, *J. Phys. Chem. Ref. Data* **2**, No. 4, 757-922 (1973).

Key words: critically evaluated data; critical point; density; enthalpy; entropy; equation of state; heat capacity; ideal gas properties; latent heat; nitrogen; second virial coefficient; vapor pressure; velocity of sound.

Tables of thermodynamic properties of nitrogen are presented for the liquid and vapor phases for temperatures from the freezing line to 2000 K and pressures to 10,000 bar. The tables include values of density, internal energy, enthalpy, entropy, isochoric heat capacity (C_v), isobaric heat capacity (C_p), velocity of sound, the isotherm derivative $(\partial P/\partial \rho)_T$, and the isochor derivative $(\partial P/\partial T)_\rho$. The thermodynamic property tables are based on an equation of state, $P = P(\rho, T)$, which accurately represents liquid and gaseous nitrogen for the range of pressures and temperatures covered by the tables. Comparisons of property values calculated from the equation of state with measured values for P-ρ-T, heat capacity, enthalpy, latent heat, and velocity of sound are included to illustrate the agreement between the experimental data and the tables of properties presented here. The coefficients of the equation of state were determined by a weighted least squares fit to selected P-ρ-T data and, simultaneously, to C_v data determined by corresponding states analysis from oxygen data, and to data which define the phase equilibrium criteria for the saturated liquid and the saturated vapor. The vapor pressure equation, melting curve equation, and an equation to represent the ideal gas heat capacity are also presented. Estimates of the accuracy of the equation of state, the vapor pressure equation, and the ideal gas heat capacity equation are given. The equation of state, derivatives of the equation, and the integral functions for calculating derived thermodynamic properties are included.

Thermodynamic properties of helium 4 from 2 to 1500 K at pressures to 10^8 Pa, R. D. McCarty, *J. Phys. Chem. Ref. Data* **2**, No. 4, 923-1042 (1973).

Key words: critically evaluated data; critical point; enthalpy; entropy; equation of state; helium; internal energy; Joule-Thomson coefficient; lambda line; melting line; P-V-T; specific heat; speed of sound; vapor pressure; virial coefficient.

Tabular values of density, internal energy, enthalpy, entropy, heat capacity, and speed of sound for liquid and gaseous helium are presented for temperatures from 2 to 1500 kelvin at pressures from 1.0×10^4 to 1.0×10^8 pascals. Diagrams of temperature vs. entropy are also given. The properties presented are calculated from an equation of state which was fitted to experimental P-V-T and other thermodynamic data from the world's literature. The equation of state was fitted to these data in three separate regions of pressure and temperature. The regional equations are forced to join smoothly at the preconceived boundaries. Extensive comparisons between the equation of state and experimental data have been made, and deviation plots are presented. A particularly careful determination of the second virial coefficient over the full temperature range 2-1500 kelvin is presented. The Joule-Thomson inversion curve has been calculated and comparisons made with other sources. Equations for the density of the saturated liquid and vapor are included as well as an equation which represents the 1958 helium vapor pressure temperature scale.

PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 3, JANUARY-DECEMBER 1974

Volume 3, No. 1

Molten salts: Volume 4. Part I. Fluorides and mixtures. Electrical conductance, density, viscosity, and surface tension data, G. J. Janz, G. L. Gardner, U. Krebs, and R. P. T. Tomkins, *J. Phys. Chem. Ref. Data* **3**, No. 1, 1-115 (1974).

Key words: data compilation; density; electrical conductance; fluorides; molten salt mixtures; standard reference data; surface tension; viscosity.

Data on the electrical conductance, density, viscosity, and surface tension of fluoride mixtures have been systematically collected and evaluated. Results are given for 44 binary mixtures over a range of compositions and temperatures. Values of the above properties for the single salts have been updated in accord with previously advanced recommendations.

Ideal gas thermodynamic properties of eight chloro- and fluoromethanes, A. S. Rodgers, J. Chao, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **3**, No. 1, 117-140 (1973).

Key words: chloromethane; critical evaluation of thermodynamic properties; fluoromethane; ideal gas thermodynamic properties.

The structural data, vibrational assignments, enthalpies of vaporization and formation for chloromethane, dichloromethane, trichloromethane, tetrachloromethane, fluoromethane, difluoromethane, trifluoromethane, and tetrafluoromethane were critically reviewed. Based on the selected best values, the thermodynamic properties for each of these eight chloro- and fluoromethanes were calculated by statistical thermodynamic methods using the rigid-rotor harmonic-oscillator approximations. The derived entropies and heat capacities are compared with the available third law entropies and vapor heat capacities. The calculated values of $C_p°$, $S°$, and $\Delta Hf°$ at 298.15 and 700 K are compared with those reported in the other major compilations.

Ideal gas thermodynamic properties of six chloroethanes, J. Chao, A. S. Rodgers, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **3**, No. 1, 141-162 (1973).

Key words: chloroethane with a symmetry top; ideal gas thermodynamic properties; internal rotation; internal rotation barrier heights; torsional fundamental.

The thermodynamic properties: $C_p°$, $S°$, $H° - H_0°$, $-(G° - H_0°)/T$, $\Delta Hf°$, $\Delta Gf°$, and log K_f for chloroethane, 1,1-dichloroethane, 1,1,1-trichloroethane, 1,1,2,2-tetrachloroethane, pentachloroethane, and hexachloroethane in the ideal gaseous state in the temperature range from 0 to 1500 K and at 1 atm were evaluated by statistical thermodynamic methods based on a rigid-rotor harmonic-oscillator model. The internal rotation contributions to thermodynamic functions were calculated by using a partition function formed by summation of internal rotation energy levels. The internal rotation barrier heights (in kcal mol^{-1}) employed for generation of the energy levels for each of the above six chloroethanes are: 3.69, 3.54, 5.08, 10.38, 14.43, and 14.7, respectively. The calculated heat capacities and entropies are compared with available experimental data. The derived values of $C_p°$, $S°$, and $\Delta Hf°$ at 298.15 and 700 K are compared with those reported in the other major compilations.

Critical analysis of heat-capacity data and evaluation of thermodynamic properties of ruthenium, rhodium, palladium, iridium, and platinum from 0 to 300 K. A survey of the literature data on osmium, G. T. Furukawa, M. L. Reilly, and J. S. Gallagher, *J. Phys. Chem. Ref. Data* **3**, No. 1, 163-209 (1974).

Key words: calorimetry; critically evaluated data; Debye temperature (θ); electronic coefficient of heat capacity (γ); enthalpy; entropy; Gibbs energy; heat capacity; iridium; osmium, palladium; platinum; rhodium; ruthenium; thermodynamic properties.

The literature sources of heat-capacity data on ruthenium, rhodium, palladium, osmium, iridium, and platinum have been compiled and the data critically analyzed. Except for osmium where data are lacking, best values of themodynamic properties have been evaluated between 0 and 300 K from the analyses. The literature values of heat capacity, the electronic coefficient of heat capacity (γ), and the zero K limiting Debye characterstic temperature ($\theta_D(0)$) are compared. The sources of data are tabulated chronologically along with the temperature range of measurements, purity of sample, and the pertinent experimental procedures used. A bibliography of the references is listed.

Microwave spectra of molecules of astrophysical interest. V. Water vapor, F. C. De Lucia, P. Helminger, and W. H. Kirchhoff, *J. Phys. Chem. Ref. Data* **3**, No. 1, 211-219 (1974).

Key words: hyperfine structure; interstellar molecules; microwave spectra; molecular parameters; radio astronomy; rotational transitions; water.

The available data on the microwave spectrum of water vapor are critically reviewed for information applicable to radio astronomy. Molecular data such as rotational constants, centrifugal distortion constants, hyperfine coupling parameters, and dipole moments are tabulated. A detailed centrifugal distortion calculation has been carried out for the most abundant isotopic form of this molecule $H_2\,{}^{16}O$, as well as for $H_2\,{}^{18}O$ and HD ^{16}O. Transitions have been predicted and tabulated for the frequency range 1 MHz to 800 GHz. All predicted transitions include 95 percent confidence limits; estimated error limits have been reported for all measured transitions. Observed transitions of $H_2\,{}^{17}O$ are also listed.

Microwave spectra of molecules of astrophysical interest. VI. Carbonyl sulfide and hydrogen cyanide, A. G. Maki, *J. Phys. Chem. Ref. Data* **3**, No. 1, 221-244 (1974).

Key words: carbonyl sulfide; hydrogen cyanide; interstellar molecules; microwave spectra; molecular parameters; radio astronomy; rotational transitions; spectra.

All available data on the microwave spectra of carbonyl sulfide and hydrogen cyanide are critically reviewed and tabulated. Molecular data such as rotational constants, centrifugal distortion constants, dipole moments, hyperfine coupling constants, and structural parameters are also tabulated. All rotational transitions from 100 MHz to 300 GHz that are deemed likely to be of interest to radio astronomers are calculated and tabulated along with their estimated 95 percent confidence limits. Microwave measurements are tabulated for most isotopic species and for many of the lower vibrational states. For both carbonyl sulfide and hydrogen cyanide a bibliography is given which includes nearly all the spectroscopic work reported in the literature. For each molecule a bibliography of related astrophysical papers is also given.

Microwave spectra of molecules of astrophysical interest. VII. Carbon monoxide, carbon monosulfide, and silicon monoxide, F. J. Lovas and P. H. Krupenie, *J. Phys. Chem. Ref. Data* **3**, No. 1, 245-257 (1974).

Key words: carbon monosulfide; carbon monoxide; interstellar molecules; microwave spectra; molecular parameters; radio astronomy; rotational transitions; silicon monoxide.

The available data on the microwave spectra of carbon monoxide, carbon monosulfide, and silicon monoxide are critically reviewed for information applicable to radio astronomy. Molecular data such as rotational constants, centrifugal distortion parameters, dipole moments, hyperfine coupling constants, and structure are tabulated. Observed rotational transitions are presented for all measured isotopic forms of these molecules. All of the available data has been analyzed in order to predict all rotational transitions of these molecules up to 300 GHz. Error limits have been taken from the original literature for each measured transition frequency. All predicted transition frequencies are given with estimated uncertainties which represent the 90 percent confidence limit.

Microwave spectra of molecules of astrophysical interest. VIII. Sulfur monoxide, E. Tiemann, *J. Phys. Chem. Ref. Data* **3**, No. 1, 259-268 (1974).

Key words: interstellar molecules; microwave spectra; molecular parameters; radio astronomy; rotational transitions; spectra; sulfur monoxide.

The available data on the microwave spectrum of sulfur monoxide (SO) is critically reviewed and tabulated. Molecular data such as rotational constants, hyperfine coupling constants, electric dipole moment, and magnetic g-factors are given. All rotational transitions up to 350 GHz for the isotopic species $^{32}S^{16}O$, $^{34}S^{16}O$, and $^{32}S^{18}O$ in the ground vibrational state are calculated and tabulated along with their estimated 95 percent confidence levels. The line strengths of all tabulated transitions have been determined. A bibliography of SO is given which includes results from microwave spectroscopy as well as from electron paramagnetic resonance.

Tables of molecular vibrational frequencies. Part 8, T. Shimanouchi, *J. Phys. Chem. Ref. Data* **3**, No. 1, 269-308 (1974).

Key words: fundamental frequencies; infrared spectra; polyatomic molecules; Raman spectra; vibrational frequencies.

The compilations to fundamental vibrational frequencies of molecules previously published in the NSRDS-NBS publication series and in this journal are here extended to 49 additional molecules. Selected values of the fundamental vibrational frequencies are given for each molecule, together with observed infrared and Raman spectral data and citations to the original literature. The selection of vibrational fundamentals has been based on careful studies of the spectral data and comprehensive normal-coordinate analyses. An estimate of the accuracy of the selected values is included. The tables provide a convenient source of information for those who require vibrational energy levels and related properties in molecular spectroscopy, thermodynamics, analytical chemistry, and other fields of physics and chemistry.

Volume 3, No. 2

JANAF Thermochemical Tables, 1974 supplement, M. W. Chase, J. L. Curnutt, A. T. Hu, H. Prophet, A. N. Syverud, and L. C. Walker, *J. Phys. Chem. Ref. Data* **3**, No. 2, 311-480 (1974).

Key words: critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables.

The thermodynamic tabulations previously published as NSRDS-NBS-37 are extended by 154 new and revised tables. The JANAF Thermochemical Tables cover the thermodynamic properties over a wide temperature range with single phase tables for the crystal, liquid, and ideal gas state. The properties given are heat capacity, entropy, Gibbs energy function, enthalpy, enthalpy of formation, Gibbs energy of formation, and the logarithm of the equilibrium constant for formation of each compound from the elements in their standard reference states. Each tabulation lists all pertinent input data and contains a critical evaluation of the literature upon which these values are based. Literature references are given.

High temperature properties and decomposition of inorganic salts. Part 4. Oxy-salts of the halogens, K. H. Stern, *J. Phys. Chem. Ref. Data* **3**, No. 2, 481-526 (1974).

Key words: bromates; bromites; chlorates; chlorites; critically evaluated data; iodates; iodites; perbromates; perchlorates; periodates; thermal decomposition; thermodynamic functions.

The literature dealing with the high-temperature behavior of inorganic oxygen-containing salts of chlorine, bromine and iodine has been critically reviewed. Values of $(G°_T - H°_{298})/T$ of the reactants and products of the decomposition reactions were calculated and have been tabulated from 298 K up to as high a temperature as possible. Equilibrium constants and partial pressures were tabulated. Auxiliary data on phase transitions and densities have also been included. Qualitative information about the thermal decomposition of the salts is reviewed.

Diffusion in copper and copper alloys. Part II. Copper-silver and copper-gold systems, D. B. Butrymowicz, J. R. Manning, and M. E. Read, *J. Phys. Chem. Ref. Data* **3**, No. 2, 527-602 (1974).

Key words: alloy diffusion; copper; diffusion; electromigration; gold; grain boundary diffusion; impurity diffusion; liquid metal diffusion; silver; surface diffusion; thermomigration.

A survey, comparison, and critical analysis is presented of data compiled from the scientific literature concerning diffusion in copper-silver and copper-gold systems. Here the term "copper alloy system" is interpreted in the broadest sense. For example, the review of diffusion in the Cu-M system reports all diffusion situations which involve both copper and element M, including diffusions of Cu in M or in any binary, ternary or multicomponent alloy containing M: diffusion of M in Cu or in any alloy containing Cu; and diffusion of any element in any alloy containing both Cu and M. Topics include volume diffusion, surface diffusion, grain boundary diffusion, tracer diffusion, alloy interdiffusion, electromigration, thermomigration, strain enhanced diffusion, and diffusion in molten metals. An extensive bibliography is presented along with figures, tabular presentation of data and discussion of results.

Volume 3, No. 3

Microwave spectral tables. I. Diatomic molecules, F. J. Lovas and E. Tiemann, *J. Phys. Chem. Ref. Data* **3**, No. 3, 609-770 (1974).

Key words: diatomic molecules; dipole moments; hyperfine structure; internuclear distance; molecular spectra; rotational constants; rotational spectral lines.

All of the rotational spectral lines observed and reported in the open literature for 83 diatomic molecules have been tabulated. The isotopic molecular species, assigned quantum numbers, observed frequency, estimated measurement uncertainty, and

reference are given for each transition reported. In addition to rectifying a number of misprints and errors in the literature cited, the spectral lines for approximately 20 molecules have been reanalyzed to produce a comprehensive and consistent analysis of all the data extracted from various literature sources. The derived molecular properties, such as rotational constants, hyperfine structure constants, electric dipole moments, rotational g-factors and internuclear distances are listed with one standard deviation uncertainties for all species.

Ground levels and ionization potentials for lanthanide and actinide atoms and ions, W. C. Martin, L. Hagan, J. Reader, and J. Sugar, *J. Phys. Chem. Ref. Data* **3**, No. 3, 771-780 (1974).

Key words: actinide elements; atomic data; atomic ground levels; ionization energies; ionization potentials; lanthanide elements.

Values of the first four ionization potentials of the lanthanides ($Z = 57 - 71$) and of Hf have been compiled. All except the value for neutral Hf are based on spectroscopic data. The spectroscopic designations of the ground levels of the neutral through triply ionized atoms ($Z = 57 - 72$) are also tabulated. A similar compilation for the actinides ($Z = 89 - 103$) lists Sugar's recent values for the first ionization potentials through No ($Z = 102$). Accurate spectroscopic ionization potentials have been determined for only two of the actinide ions (Ac^{+} and Th^{3+}). The ground-level designations for the neutral through triply ionized actinides are given where they are known or can be predicted with near certainty. A selection of references to the most complete and most recent work on the analyses of the optical spectra of the neutral through triply ionized lanthanide and actinide elements is included.

Behavior of the elements at high pressures, J. F. Cannon, *J. Phys. Chem. Ref. Data* **3**, No. 3, 781-824 (1974).

Key words: critically evaluated data; crystal structures; elements; high pressure; melting curves; phase diagrams; polymorphism.

Data on polymorphic phase changes and variation of melting temperature of the elements with pressure have been compiled and critically evaluated. Emphasis has been placed on work done at pressures exceeding 1 kbar. Pressure-temperature phase diagrams showing first-order solid-solid phase boundaries and/or melting curves derived from the best available data are given for 58 elements. Information on the crystal structures of high-pressure polymorphs is also reviewed. Those elements that exist in the gaseous state at room temperature and pressure are not included.

Volume 3, No. 4

Reference wavelengths from atomic spectra in the range 15 Å to 25000 Å, V. Kaufman and B. Edlén, *J. Phys. Chem. Ref. Data* **3**, No. 4, 825-896 (1974).

Key words: optical spectra, atomic; reference wavelengths; standard wavelengths; vacuum ultraviolet.

This is a compilation of atomic lines with accurately known wavelengths covering the range from 15 Å to 25000 Å. The tables are a fairly complete record of available spectrum lines that meet the requirements for useful references with regard to wavelength accuracy and intensity. In general, wavelength uncertainties range from 0.0001 Å to 0.0002 Å. Section 1, $\lambda >$ 2000 Å, gives λ_{air} and λ_{vac} for 3341 lines belonging to thirteen different spectra of ten elements. Section 2, $\lambda <$ 2000 Å, contains 2091 lines belonging to 59 different spectra of 28 elements. The lines of section 2 are listed both by spectrum (i.e., element and ionization stage) and in a finding list arranged in order of decreasing wavelength. Detailed explanations of the data and the sources used for the compilation are included.

Elastic properties of metals and alloys. II. Copper, H. M. Ledbetter and E. R. Naimon, *J. Phys. Chem. Ref. Data* **3**, No. 4, 897-936 (1974).

Key words: bulk modulus; compressibility; copper; elastic constants; Poisson's ratio; shear modulus; single-crystal elastic coefficients; Young's modulus.

The elastic properties of copper have been compiled and reviewed. Polycrystalline elastic constants included are: Young's modulus, the shear modulus, the bulk modulus, and Poisson's ratio. Single-crystal constants of second-, third-, and fourth-order are included. Over 200 references to the experimental literature are given. A few theoretical numbers are included. When sufficient data exist, best values are recommended together with their standard errors. Effects on the elastic constants of temperature, pressure, and mechanical (plastic) deformation are included. The Cauchy (central-force) relationships and the single-crystal–polycrystal relationship are also discussed.

A critical review of H-atom transfer in the liquid phase: Chlorine atom, alkyl, trichloromethyl, alkoxy, and alkylperoxy radicals, D. G. Hendry, T. Mill, L. Piszkiewicz, and J. A. Howard, *J. Phys. Chem. Ref. Data* **3**, No. 4, 937-978 (1974).

Key words: chlorine atom reactions; hydrogen transfer reactions; liquid phase; organic molecules; organic radical reactions; rate constants; reference data.

This review covers hydrogen-atom transfer from carbon-hydrogen bonds in organic compounds to chlorine atom, methyl, ethyl, trichloromethyl, t-butoxy and alkylperoxy radicals in the liquid phase. Rate constant data are presented in 38 tables. Literature is covered through most of 1972. The review is divided into six sections; an introduction plus five sections each dealing with specific radicals. Hydrogen-atom transfer to chlorine atom are presented as relative rate constants. For hydrogen-atom transfer to methyl, ethyl, trichloromethyl, and t-butoxy radicals, both relative and absolute rate constants are tabulated. For alkylperoxy radicals only absolute rate constants are listed. Each absolute rate constant has a tabulated set of rate parameters where A has been assigned and E derived from the Arrhenius equation.

The viscosity and thermal conductivity coefficients for dense gaseous and liquid argon, krypton, xenon, nitrogen, and oxygen, H. J. M. Hanley, R. D. McCarty, and W. M. Haynes, *J. Phys. Chem. Ref. Data* **3**, No. 4, 979-1018 (1974).

Key words: argon; correlation; critical data evaluation; critical point; dense gas and liquid; excess transport property functions; krypton; nitrogen; oxygen; tables; thermal conductivity coefficient; transport property; viscosity coefficient; xenon.

Data for the viscosity and thermal conductivity coefficients of argon, nitrogen, and oxygen have been critically evaluated. A functional form to represent the data has been proposed. The function is basically the same for both coefficients if the contribution of the viscosity coefficient at high densities is considered as a separate effect. The critical point enhancement in the thermal conductivity coefficient is also treated separately. Transport properties of krypton and xenon are calculated by means of the principle of corresponding states. Tables of values are presented in the range from about the triple point temperature to 500 K for pressures up to 100 MPa. Care has been taken to ensure that the calculated values are consistent with reliable equation-of-state data and also with dilute gas transport coefficients previously determined. The uncertainties of the tabulated coefficients are assessed as follows: Viscosity: argon, nitrogen and oxygen, ±2 percent; krypton and xenon, ±5 percent. Thermal conductivity: argon, nitrogen, and oxygen, ±4 percent increasing to ±15 percent in the critical region and to 8 percent

above 200 K; krypton and xenon, ± 8 percent again increasing to ± 15 percent in the critical region. The correlation further serves to clarify the state of the art concerning transport data and experiment and to emphasize gaps in data coverage.

PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 4, JANUARY-DECEMBER 1975

This journal is published quarterly by the American Chemical Society and the American Institute of Physics for the National Bureau of Standards. The objective of the Journal is to provide critically evaluated physical and chemical property data, fully documented as to the original sources and the criteria used for evaluation. Critical reviews of measurement techniques, whose aim is to assess the accuracy of available data in a given technical area, are also included. The principal source for the Journal is the National Standard Reference Data System (NSRDS). The Journal is not intended as a publication outlet for original experimental measurements such as are normally reported in the primary research literature, nor for review articles of a descriptive or primarily theoretical nature.

Volume 4, No. 1

JANAF Thermochemical Tables, 1975 supplement, M. W. Chase, J. L. Curnutt, H. Prophet, R. A. McDonald, and A. N. Syverud, *J. Phys. Chem. Ref. Data* **4**, No. 1, 1-176 (1975).

Key words: critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables.

The thermodynamic tabulations previously published in NSRDS-NBS-37 and the 1974 Supplement (J. Phys. Chem. Ref. Data 3, 311 [1974]) are extended by 158 new and revised tables. The JANAF Thermochemical Tables cover the thermodynamic properties over a wide temperature range with single phase tables for the crystal, liquid, and ideal gas state. The properties given are heat capacity, entropy, Gibbs energy function, enthalpy, enthalpy of formation, Gibbs energy of formation, and the logarithm of the equilibrium constant for formation of each compound from the elements in their standard reference states. Each tabulation lists all pertinent input data and contains a critical evaluation of the literature upon which these values are based. Literature references are given.

Diffusion in copper and copper alloys. Part III. Diffusion in systems involving elements of the groups IA, IIA, IIIB, IVB, VB, VIB, and VIIB, D. B. Butrymowicz, J. R. Manning, and M. E. Read, *J. Phys. Chem. Ref. Data* **4**, No. 1, 177-250 (1975).

Key words: alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium.

A survey, comparison, and critical analysis is presented of data compiled from the scientific literature concerning diffusion in copper alloy systems involving elements in Groups IA, IIA, IIIB, IVB, VB, VIB, and VIIB. Here the term "copper alloy system" is interpreted in the broadest sense. For example, the review of diffusion in the Cu-M system reports all diffusion situations which involve both copper and element M, including diffusion of Cu in M or in any binary, ternary or multicomponent alloy containing M; diffusion of M in Cu or in any alloy containing Cu; and diffusion of any element in any alloy containing both Cu and M. Topics include volume diffusion, surface diffusion, grain boundary diffusion, tracer diffusion, alloy interdiffusion, electromigration, thermomigration, dislocation-pipe diffusion, and diffusion in molten metals. An extensive bibliography is presented along with figures, tabular presentation of data and discussion of results.

Ideal gas thermodynamic properties of ethylene and propylene, J. Chao and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **4**, No. 1, 251-261 (1975).

Key words: critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; equilibrium constant of formation; ethylene; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; torsional frequency.

The ideal gas thermodynamic properties [$H° - H_0°$, $(G° - H_0°)/T$, $(H° - H_0°)/T$, $S°$, $C_p°$, $\Delta Hf°$, $\Delta Gf°$, and log K_f] for ethylene and propylene in the temperature range 0 to 1500 K and at 1 atm have been calculated by the statistical thermodynamic method employing the most recent fundamental and molecular spectroscopic constants. The internal rotational contributions to thermodynamic properties for propylene were generated based on an internal rotation partition function formed by summation of internal rotation energy levels. The energy levels were derived from the potential function $V(cm^{-1}) = 349.2\ (1 - \cos 3\theta) - 6.5\ (1 - \cos 6\theta)$. The calculated heat capacities and entropies were compared with the available experimental values.

Volume 4, No. 2

Atomic transition probabilities for scandium and titanium. (A critical data compilation of allowed lines), W. L. Wiese and J. R. Fuhr, *J. Phys. Chem. Ref. Data* **4**, No. 2, 263-352 (1975).

Key words: allowed transitions; line strengths; oscillator strengths; scandium; titanium; transition probabilities.

Atomic transition probabilities for about 1500 allowed spectral lines of the elements scandium and titanium through all stages of ionization have been critically evaluated and compiled. All available literature sources have been utilized. The data are presented in separate tables for each element and stage of ionization and are arranged according to multiplets and, when appropriate, also to transition arrays and increasing quantum numbers. For each line the transition probability for spontaneous emission, the absorption oscillator strength, and the line strength are given along with the spectroscopic designation, the wavelength, the statistical weights, and the energy levels (when available) of the upper and lower atomic states. In addition the estimated accuracy and the literature reference is indicated. In short introductions, which precede the tables for each spectrum, the main justifications for the choice of the adopted data and for the accuracy rating are discussed. A general introduction contains some more details on our evaluation procedure.

Energy levels of iron, Fe I through Fe XXVI, J. Reader and J. Sugar, *J. Phys. Chem. Ref. Data* **4**, No. 2, 353-440 (1975).

Key words: atomic energy levels; atomic spectra; iron.

The energy levels of the iron atom in all of its stages of ionization, as derived from the analyses of atomic spectra, have been compiled. In cases where only line classifications are given in the literature, level values have been derived. The percentages for the two leading components of the calculated eigenvectors of the levels are given where available. Ionization energies are also given.

Ideal gas thermodynamic properties of six fluoroethanes. S. S. Chen, A. S. Rodgers, J. Chao, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **4**, No. 2, 441-456 (1975).

Key words: barrier height to internal rotation; fluoroethanes with a symmetric top; ideal gas thermodynamic functions; reduced and principal moments of inertia; standard heat of formation; structural parameters; torsional mode; vibrational fundamentals.

The molecular structural parameters, the vibrational fundamentals, the potential barrier height to internal rotation, and the standard enthalpy of formation for each of the six fluoroethanes in which at least one of the internally rotating groups is a symmetric top have been extensively studied and recommended values selected. Chemical thermodynamic properties of molecules in the ideal gas state at temperatures from 0 to 1500 K have been calculated with the rigid-rotor harmonic-oscillator approximation. The calculated values are in a very good agreement with the existing third-law entropies.

Ideal gas thermodynamic properties of the eight bromo- and iodomethanes. S. A. Kudchadker and A. P. Kudchadker, *J. Phys. Chem. Ref. Data* **4**, No. 2, 457-470 (1975).

Key words: bromomethanes; critically evaluated data; ideal gas thermodynamic properties; iodomethanes.

The available molecular parameters, fundamental frequencies, and enthalpy of formation for eight bromo- and iodomethanes have been critically evaluated and recommended values selected. This information has been utilized to calculate the ideal gas thermodynamic properties, $C_p°$, $S°$, $H° - H_0°$, $(G° - H_0°)/T$, $\Delta Hf°$, $\Delta Gf°$, and log Kf from 0 to 1500 K using the rigid rotor-harmonic oscillator approximation.

Volume 4, No. 3

Atomic form factors, incoherent scattering functions, and photon scattering cross sections. J. H. Hubbell, W. J. Veigele, E. A. Briggs, R. T. Brown, D. T. Cromer, and R. J. Howerton, *J. Phys. Chem. Ref. Data* **4**, No. 3, 471-538 (1975).

Key words: atomic form factor; Compton scattering; cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; x rays.

Tabulations are presented of the atomic form factor, $F(x,Z)$, and the incoherent scattering function, $S(x,Z)$, for values of x (= $\sin(\theta/2)/\lambda$) from 0.005 Å^{-1} to 10^9 Å^{-1}, for all elements $A = 1$ to 100. These tables are constructed from available state-of-the-art theoretical data, including the Pirenne formulas for $Z = 1$, configuration-interaction results by Brown using Brown-Fontana and Weiss correlated wavefunctions for $Z = 2$ to 6 nonrelativistic Hartree-Fock results by Cromer for $Z = 7$ to 100, and a relativistic K-shell analytic expression for $F(x,Z)$ by Bethe and Levinger for $x > 10$ Å^{-1} for all elements $Z = 2$ to 100. These tabulated values are graphically compared with available photon scattering angular distribution measurements. Tables of coherent (Rayleigh) and incoherent (Compton) total scattering cross sections, obtained by numerical integration over combinations of $F^2(x,Z)$ with the Thomson formula and $S(x,Z)$ with the Klein-Nishina formula, respectively, are presented for all elements $Z = 1$ to 100, for photon energies 100 eV ($\lambda = 124$ Å) to 100 MeV (0.000124 Å). The incoherent scattering cross sections also include the radiative and double-Compton corrections as given by Mork. Similar tables are presented for the special cases of terminally-bonded hydrogen and for the H_2 molecule, interpolated and extrapolated from values calculated by Stewart et al. and by Bentley and Stewart using Kolos-Roothaan wavefunctions.

Binding energies in atomic negative ions. H. Hotop and W. C. Lineberger, *J. Phys. Chem. Ref. Data* **4**, No. 3, 539-576 (1975).

Key words: ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; recommended values; semiempirical calculations.

A survey of the electron affinity determinations for the elements up to $Z = 85$ is presented, and based upon these data, a set of recommended electron affinities is established. Recent calculations of atomic electron affinities and the major semiempirical methods are discussed and compared with experiment. The experimental methods which yield quantitative electron binding energy data are described and intercompared. Based primarily upon extrapolation techniques, fine structure splittings for these ions and excited state term energies are given.

A survey of electron swarm data. J. Dutton, *J. Phys. Chem. Ref. Data* **4**, No. 3, 577-856 (1975).

Key words: electrical breakdown of gases; electrical discharges; electron attachment coefficient; electron detachment coefficient; electron diffusion coefficient; electron drift velocity; electron excitation coefficient; electron ionization coefficient; electron-ion recombination coefficient; electron swarm; electron transport coefficients; ionized gases.

An electron swarm consists of a small number density n of electrons in a gas of much higher number density N. The mean energy and energy distribution of such a swarm are determined by the value of E/N, where E is the electric field. At any given value of E/N the swarm may be characterized by the values of eight parameters, viz: drift velocity, diffusion coefficient, (diffusion coefficient)/mobility, excitation coefficient, electron attachment coefficient, electron detachment coefficient, ionization coefficient, recombination coefficient. In this survey, data on these parameters obtained by a variety of experimental techniques are collected, discussed, and compared graphically. Also included on the graphs are computed values of the parameters obtained in many cases from cross sections and energy distributions chosen to give the best fit with the swarm data. Selected tabulations of the data are also given except in cases for which the accuracy of the data is not sufficient to warrant numerical presentation. The mean energy of the electron swarms ranges from thermal to several electron volts and the gases for which data are given are the rare gases, the common molecular gases (H_2, N_2, O_2, CO, NO, CO_2, NO_2) and air. The survey also contains an extensive bibliography which includes references (i) to publications on electron swarms in a much wider range of gases than those for which data are given and (ii) to papers concerned with energy distributions, conductivity, and ionization coefficients in crossed electric and magnetic fields in addition to those relating to the eight parameters listed above.

Volume 4, No. 4

Ideal gas thermodynamic properties and isomerization of *n*-butane and isobutane. S. S. Chen, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **4**, No. 4, 859-870 (1975).

Key words: equilibrium compositions; heat of isomerization; ideal gas thermodynamic properties; isobutane; *n*-butane; potential barrier to internal rotation.

Reported values of structural parameters, vibrational fundamentals, and potential energy functions for internal rotation of *n*-butane and isobutane are reviewed. The selected values were used to calculate the thermodynamic properties ($C_p°$, $S°$, $(H° - H_0°)/T$, $(G° - H_0°)/T$) in the temperature range of 0 to 1500 K by the usual statistical thermodynamic methods using the rigid-rotor and harmonic-oscillator model. Contributions of internal rotation were evaluated by the direct sum of terms containing energy levels which were calculated with a one-dimensional potential model. For internal rotation about the central C–C bond in *n*-butane, energy levels were approximated by two procedures. A unique potential function was assumed for each methyl rotor of *n*-butane or of isobutane. Top-top interactions in isobutane were approximated by the potential parameter V_6 which was determined empirically by comparison with thermodynamic data. The calculated and observed values of heat capacities and entropies agree well within experimental uncertainties. Standard enthalpies of formation at 298.15 K for the ideal gaseous state were selected from measured values of heats of combustion and third-law enthalpies for isomerization. Corresponding values of $\Delta Hf°$, $\Delta Gf°$ and log Kf are tabulated over the same temperature range.

Molten salts: Volume 4, part 2, chlorides and mixtures. Electrical conductance, density, viscosity, and surface tension data, G. J. Janz, R. P. T. Tomkins, C. B. Allen, J. R. Downey, Jr., G. L. Gardner, U. Krebs, and S. K. Singer, *J. Phys. Chem. Ref. Data* **4**, No. 4, 871-1178 (1975).

Key words: chlorides; data compilation; density; electrical conductance; molten salt mixtures; standard reference data; surface tension; viscosity.

Data on the electrical conductance, density, viscosity, and surface tension of chloride mixtures have been systematically collected and evaluated. Results are given for 124 binary mixtures over a range of compositions and temperatures. Values of the above properties for the single salts have been updated in accord with previously advanced recommendations.

PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 5, JANUARY-DECEMBER 1976

This journal is published quarterly by the American Chemical Society and the American Institute of Physics for the National Bureau of Standards. The objective of the Journal is to provide critically evaluated physical and chemical property data, fully documented as to the original sources and the criteria used for evaluation. Critical reviews of measurement techniques, whose aim is to assess the accuracy of available data in a given technical area, are also included. The principal source for the Journal is the National Standard Reference Data System (NSRDS). The Journal is not intended as a publication outlet for original experimental measurements such as are normally reported in the primary research literature, nor for review articles of a descriptive or primarily theoretical nature.

Scaled equation of state parameters for gases in the critical region, J. M. H. L. Sengers, W. L. Greer, and J. V. Sengers, *J. Phys. Chem. Ref. Data* 5, No. 1, 1-52 (1976).

Key words: air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality.

The anomalous thermodynamic behavior of fluids near the critical point can be described in terms of scaling laws. In this paper we consider two critical region equations of state, to be referred to as the NBS equation and the Linear Model parametric equation, that satisfy the scaling laws. A complete formulation of the thermodynamic properties in terms of the two equations is given. The statistical methods used for fitting these equations to experimental data are described. Each of the equations is fitted to experimental equation of state data for six fluids, namely He^3, He^4, Xe, CO_2, O_2, and H_2O. An evaluation of the recorded experimental material is included. We find that the two equations represent the experimental data in the range $|T-T_c|/T_c<0.03$ and $|\rho-\rho_c|\sqrt{\rho_c}<0.25$ equally well and that the exponents and amplitudes of the power laws deduced from the two equations agree closely. The optimum critical exponents appear to vary little from substance to substance. Moreover, a restricted version of the Linear Model with only two freely adjustable constants, in addition to the critical point parameters and the critical exponents, fits the data well in most cases, in agreement with expectations based on universality of critical behavior. The principle of universality is discussed and applied to predict critical region parameters for nine additional fluids, including several for which only limited experimental information is available. These additional fluids are Ar, Kr, N_2, H_2, CH_4, C_2H_4, SF_6, NH_3, and D_2O. We thus conclude with a single universal equation for the critical region of all fifteen fluids considered in this paper.

Microwave spectra of molecules of astrophysical interest. IX. Acetaldehyde, A. Bauder, F. J. Lovas, and D. R. Johnson, *J. Phys. Chem. Ref. Data* 5, No. 1, 53-78 (1976).

Key words: acetaldehyde; internal rotation; interstellar molecules; microwave spectrum; radio astronomy; rotational transitions.

The microwave spectrum of acetaldehyde is critically reviewed and augmented through calculations which include the effects of internal rotation and centrifugal distortion. Since the primary objective of this review is to provide microwave spectral transitions applicable to radio astronomy studies, the review encompasses only the ground state rotational spectrum of the most abundant isotopic form of acetaldehyde, $^{12}CH_3{}^{12}CH^{16}O$. While all measured transitions are included, the predicted transition frequencies were limited to $J\leqq 12$ in the range of 900 MHz to 250 GHz. In addition to this spectral information, the review includes the rotational constants, centrifugal distortion constants, inertial rotation parameters, electric dipole moment, structural data, moments of inertia, and constants relating to the barrier to internal rotation.

Microwave spectra of molecules of astrophysical interest. X. Isocyanic acid, G. Winnewisser, W. H. Hocking, and M. C. L. Gerry, *J. Phys. Chem. Ref. Data* 5, No. 1, 79-102 (1976).

Key words: isocyanic acid; interstellar molecules; microwave spectra; molecular parameters; rotational transitions; radio astronomy.

The available data on the microwave spectrum of isocyanic acid are critically reviewed for information applicable to radio astronomy. Molecular data such as rotational constants, centrifugal distortion parameters, dipole moments, hyperfine coupling constants, and structural parameters are tabulated. Detailed centrifugal distortion calculations have been carried out for all isotopic forms of this molecule, including DNCO. Transitions have been predicted for the parent molecule for the frequency range 160 MHz-300 GHz. All predicted transitions include error limits. The quoted uncertainties represent one standard deviation. A 95 percent confidence limit is obtained by using approximately twice the calculated standard deviation. Estimated error limits for the measured transitions are discussed. References are given for all data included.

Diffusion in copper and copper alloys. Part IV. Diffusion in systems involving elements of group VIII, D. B. Butrymowicz, J. R. Manning, and M. E. Read, *J. Phys. Chem. Ref. Data* 5, No. 1, 103-200 (1976).

Key words: alloys; cobalt; copper; diffusion; electromigration; iron; nickel; palladium; platinum; rhodium; ruthenium; thermomigration.

A survey, comparison, and critical analysis is presented of data compiled from the scientific literature concerning diffusion in copper alloy systems involving elements in Group VIII (Co, Fe, Ni, Pd, Pt, Rh, Ru). Here the term "copper alloy system" is interpreted in the broadest sense. For example, the review of diffusion in the Cu-M system reports all diffusion situations which involve both copper and element M, including diffusion of Cu in M or in any binary, ternary or multicomponent alloy containing M; diffusion of M in Cu or in any alloy containing Cu; and diffusion of any element in any alloy containing both Cu and M. Topics include volume diffusion, surface diffusion, grain boundary diffusion, tracer diffusion, alloy interdiffusion, electromigration, thermomigration, dislocation-pipe diffusion, and diffusion in molten metals. An extensive bibliography is presented along with figures, tabular presentation of data and discussion of results.

Volume 5, No. 2

A critical review of the Stark widths and shifts of spectral lines from non-hydrogenic atoms, N. Konjevic and J. R. Roberts, *J. Phys. Chem. Ref. Data* **5**, No. 2, 209-258 (1976).

Key words: experimental; neutral atom; review; shift; Stark broadening; width.

A critical review of all available data on the Stark broadening and shifts of spectral lines of neutral elements has been undertaken. Over 200 papers compiled by the NBS Data Center on Atomic Line Shapes and Shifts have been evaluated, and of these, 68 were chosen as having reviewable data. Only those papers with properly determined critical factors, such as electron density, temperature, spatial homogeneity, optical depth, and instrument function deconvolution, were selected.

Experimental Stark widths and shifts for non-hydrogenic spectral lines of ionized atoms. (A critical review and tabulation of selected data), N. Konjevic and W. L. Wiese, *J. Phys. Chem. Ref. Data* **5**, No. 2, 259-308 (1976).

Key words: critically evaluated data; experimental; ionized spectra; Stark broadening parameters; Stark shifts; Stark widths.

A critical review of all available data on the Stark widths and shifts for lines of non-hydrogenic ionized spectra has been carried out. The relevant literature compiled by the NBS Data Center on Atomic Line Shapes and Shifts was critically evaluated, and from this evaluation 54 papers were found to satisfy all requirements and thus selected for this review. The most important factors determining the quality of plasma sources, diagnostic techniques, and line profile and shift determinations are discussed in detail in the first part of this review. In the second part the data tables containing the selected experimental Stark broadening parameters are presented. The data are arranged according to spectra and elements, and these are presented in alphabetical order. The accuracy of the experimental data is estimated on the basis of guidelines developed during the review, and comparisons with theoretical results are made whenever possible.

Atlas of the absorption spectrum of nitric oxide (NO) between 1420 and 1250 Å, E. Miescher and F. Alberti, *J. Phys. Chem. Ref. Data* **5**, No. 2, 309-318 (1976).

Key words: absorption spectrum; identification atlas; nitric oxide; Rydberg series.

This atlas presents the absorption spectrum between 1420 and 1250 Å of cold (−180 °C) nitric oxide gas, both $^{14}N^{16}O$ and $^{15}N^{16}O$, photographed in first order of a 10.5 m vacuum spectrograph. The spectral region comprises the Rydberg series (*s*-, *p*-, *d*-, and *f*-) of the molecule, including their limits of v=0, 1, and 2 of the ground state of the ion NO^+. In addition it shows some valence bands. To each band are assigned quantum numbers. The assignment is based on the detailed study of the fine structure of the bands, measured on spectral plates obtained in high order of the same instrument. Accurate numerical results of these measurements are tabulated for 140 molecular levels. A short survey on the NO absorption spectrum is given.

Ideal gas thermodynamic properties of propanone and 2-butanone, J. Chao and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **5**, No. 2, 319-328 (1976).

Key words: enthalpy; entropy; equilibrium constant of formation; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotational barrier height; propanone (acetone); torsional frequencies; 2-butanone (methyl ethyl ketone).

The ideal gas thermodynamic properties ($C_p°$, $S°$, $H°-H_0°$, $(H°-H_0°)/T$, $-(G'-H_0°)/T$, $\Delta Hf°$, $\Delta Gf°$, and log Kf) for propanone and 2-butanone in the temperature range from 0 to 1500 K and at 1 atm were calculated by statistical mechanical procedures, using rigid-rotor and harmonic-oscillator approximations. The internal rotation contributions to thermodynamic properties were evaluated by use of a partition function formed by summation of internal rotation energy levels. The calculated heat capacities and entropies are in agreement with the available experimental values.

Refractive index of alkali halides and its wavelength and temperature derivatives, H. H. Li, *J. Phys. Chem. Data* **5**, No. 2, 329-528 (1976).

Key words: alkali halides; optical constants; refractive index; temperature coefficient of refractive index.

Refractive index data for 20 alkali halides are exhaustively surveyed, compiled, and analyzed. The most probable values at 293 K for the transparent region are generated for the materials for which experimental data are sufficiently abundant and reliable. Provisional values are also provided for the wavelength regions where available data are insufficient or missing. Reasonable estimations of refractive index for the very scantily measured materials were made by incorporating the dielectric constants and wavelengths of absorption peaks into a simplified dispersion equation. Temperature derivatives of refractive index for most of the alkali halides were unavailable. However, using the existing data for the five most commonly used alkali halides, novel empirical facts were discovered and dn/dT formulas were constructed for all of the alkali halides. The calculated dn/dT values agree remarkably well with the existing experimental data.

Volume 5, No. 3

Tables of critically evaluated oscillator strengths for the lithium isoelectronic sequence, G. A. Martin and W. L. Wiese, *J. Phys. Chem. Ref. Data* **5**, No. 3, 537-570 (1976).

Key words: *f*-values; isoelectronic sequence; lithium sequence; oscillator strengths; relativistic effects; spectral series; systematic trends.

Oscillator strengths for the lithium isoelectronic sequence have been critically evaluated and compiled by means of a new generalized analysis which makes use of several types of systematic trends and fundamental spectroscopic constraints. Relativistic effects have also been considered. The data are presented in separate tables for each ion of the sequence from Li I through Ni XXVI, and are arranged within each table according to spectral series. Separate tables are presented for the 2*s*-2*p* and 2*s*-3*p* transitions, with both relativistic and nonrelativistic *f*-values listed for all ions of the sequence through Ni XXVI, as well as for a few selected ions of higher nuclear charge. The general tables contain transitions of the type *ms-np*, *mp-ns*, and *mp-nd*, with $2 \leq m \leq 4$ (m is the lower principal quantum number) and $3 \leq n \leq 7$. Since most recommended data were determined from a nonrelativistic analysis, hydrogenic relativistic considerations were applied to estimate when the data would be significantly altered by the inclusion of relativistic effects, and such *f*-values were excluded from the tabulation.

Ideal gas thermodynamic properties of six chlorofluoromethanes, S. S. Chen, R. C. Wilhoit, and B. J. Zwolinski, *J. Phys. Chem. Ref. Data* **5**, No. 3, 571-580 (1976).

Key words: chlorofluoromethanes; ideal gas thermodynamic functions; principal moments of inertia; standard enthalpy of formation; vibrational fundamentals.

Spectroscopic and thermal data were reviewed. The selected values for the principal moments of inertia, the vibrational fundamentals, and the standard enthalpy of formation at 298.15 K for each of the six chlorofluoromethanes were used to derive the chemical thermodynamic properties of molecules from 0 to 1500 K, based on the rigid-rotor harmonic-oscillator approximation. The calculated values are in accord with experimental heat capacities and entropies.

Survey of superconductive materials and critical evaluation of selected properties, B. W. Roberts, *J. Phys. Chem. Ref. Data* **5,** No. 3, 581-822 (1976).

Key words: bibliography; composition; critical fields; critical temperature; crystallographic data; low temperature; superconductive materials; superconductivity.

This publication includes all data on superconductive materials intercepted through March 1975. Data on the bulk elements have been critically evaluated, and values on alloys, compounds, and other forms have been selected and condensed to indicate the probable value and spread of values observed. Proven nonsuperconductors have been noted. Conflict in data values has been noted. All data have been keyed to the literature in one or more of the tables. Special subdivisions are presented for superconductive materials with organic constituents and for those based on semiconductive materials. The properties presented are superconductive critical temperature, critical magnetic fields, material state and composition including crystal-structure type where noted, a key to thin-film forms, and the presence of thermodynamic data (generally the electronic specific heat, γ, and Debye θ). High-magnetic-field superconductors are noted with listing of H_{c1}, H_c, H_{c2}, and H_{c3} plus the temperature of observation T_{obs}.

Volume 5, No. 4

Nuclear spins and moments, G. H. Fuller, *J. Phys. Chem. Ref. Data* **5,** No. 4, 835-1092 (1976).

Key words: evaluated data; nuclear electric hexadecapole moments; nuclear electric quadrupole moments; nuclear magnetic dipole moments; nuclear magnetic octupole moments; nuclear spins.

A summary of nuclear-moment values and an index, arranged by Z and A, is presented. The summary value is based on the experimentally determined values of the nuclear moments which have been listed in tables according to the techniques used. Each table is preceded by a short introduction describing the experimental technique involved and the method of calculating the moment from the measured quantities. References are given for all data quoted. The date for the last systematic literature search is included with each table. This tabulation supplements and revises the earlier tables which appeared in Nuclear Data Tables, Volume A5, 433-612 (1969).

Nuclear moments and moment ratios as determined by Mössbauer spectroscopy, J. G. Stevens and B. D. Dunlap, *J. Phys. Chem. Ref. Data* **5,** No. 4, 1093-1122 (1976).

Key words: Mössbauer; nuclear electric quadrupole moments; nuclear magnetic dipole moments.

Values are given for Mössbauer effect measurements of nuclear magnetic moments, spectroscopic quadrupole moments, ratios of moments between low lying excited states and the ground state of the same isotope, and ratios of moments between states of different isotopes. Adopted values for moments, obtained by direct selection of specific results or by an averaging process, are presented. The literature has been covered through December 1974.

Rate coefficients for ion-molecule reactions I. Ions containing C and H, L. W. Sieck and S. G. Lias, *J. Phys. Chem. Ref. Data* **5,** No. 4, 1123-1146 (1976).

Key words: chemical kinetics; data evaluation; gas phase; hydrocarbons; ion-molecule reactions; mass spectrometry; rate coefficients.

A compilation is presented of experimentally determined bimolecular and third order rate coefficients for the reactions of hydrocarbon ions with neutral molecules in the vapor phase. The literature covered is from 1960 to the present, and both positive and negative ions are considered. Four hundred and fifty-eight separate reaction-pairs are tabulated, and the ionic reaction products and experimental conditions are specified wherever possible. Preferred values are suggested for a number of these processes.

Microwave spectra of molecules of astrophysical interest. XI. Silicon Sulfide, E. Tiemann, *J. Phys. Chem. Ref. Data* **5,** No. 4, 1147-1156 (1976).

Key words: interstellar molecules; microwave spectra; radio astronomy; rotational transitions; silicon sulfide; spectra.

The available data on the microwave spectrum of silicon sulfide are critically reviewed for information applicable to radio astronomy. Molecular data such as rotational constants, electric dipole moment and hyperfine coupling constant are tabulated. Observed rotational transitions are presented for all measured isotopic forms of SiS. These data have been analyzed in order to predict rotational transition of the ground vibrational state up to 300 GHz. From the given rotational constants transition frequencies in excited vibrational states can be calculated with little loss in accuracy.

Error limits have been taken from the original literature for each measured frequency. The predicted transition frequencies are given with uncertainties which represent the 90 percent confidence limit.

3.5. DIMENSIONS/NBS (Formerly Technical News Bulletin), ARTICLE TITLES ONLY

This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS.

DIMENSIONS/NBS highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, DIMENSIONS/NBS reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing. Issued monthly.

3.6. MONOGRAPHS

Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities. Until July 1959 most of this type of material was published in the Circular series. The abbreviation for the Monograph Series was changed from Mono. to Monogr. in 1968.

Mono. 25, Section 5. **Standard x-ray diffraction powder patterns. Section 5.-Data for 80 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, and E. H. Evans, NBS Mono. 25, Section 5 (Aug. 31, 1967).

Key words: Constants; crystal; lattice; measurements; powder-patterns; reference-intensities; standard; structure; x-ray diffraction.

Standard x-ray diffraction powder patterns are presented for 80 substances. Thirty-nine of these patterns represent experimental data and 41 are calculated. The experimental x-ray powder diffraction patterns are made with a Geiger counter x-ray diffractometer, using samples of high purity. All d-values were assigned Miller indices determined by comparison with theoretical interplanar spacings and from consideration of space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were obtained from published crystal structure data. The reported peak height intensities for calculated patterns were converted from integrated intensities.

Reference intensity values based upon the strongest line of corundum (113) in a 50 percent weight mixture are given for 73 materials.

Monogr. 25, Section 6. **Standard x-ray diffraction powder patterns, Section 6.-Data for 60 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, and E. H. Evans, Nat. Bur. Stand. (U.S.), Monogr. 25, Sec. 6, 101 pages (June 1968).

Key words: Constants; crystal; lattice; measurements; powder-patterns; reference-intensities; standard; structure; x-ray diffraction.

Standard x-ray diffraction powder patterns are presented for 60 substances. Fifty-four of these patterns represent experimental data and 6 are calculated. The experimental x-ray powder diffraction patterns are made with a Geiger counter x-ray diffractometer, using samples of high purity. All d-values were assigned Miller indices determined by comparison with theoretical interplanar spacings and from consideration of space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were obtained from published crystal structure data. The reported peak height intensities for calculated patterns were converted from integrated intensities.

Reference intensity values based upon the strongest line of corundum (113) in a 50 weight percent mixture are given for 98 materials.

Monogr. 25, Section 7. **Standard x-ray diffraction powder patterns, Section 7.-Data for 81 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, and E. H. Evans, Nat. Bur. Stand. (U.S.), Monogr. 25, Sec. 7 (Sept. 1969).

Key words: Crystal structure; integrated intensities; latttice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction powder patterns are presented for 81 substances. Forty-five of these patterns represent experimental data and 36 are calculated. The experimental x-ray powder diffraction patterns were obtained with a Geiger or proportional counter x-ray diffractometer, using samples of high purity. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings and consideration of space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr. 25, Section 8. **Standard x-ray diffraction powder patterns, Section 8. – Data for 81 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, and E. H. Evans, Nat. Bur. Stand. (U.S.), Monogr. 25, Sec. 8, 171 pages (Sept. 1970).

Key words: Crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 81 substances. Fifty-three of these patterns represent experimental data and 28 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer, using samples of high purity. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities were reported for the calculated patterns.

Monogr. 25, Section 9. **Standard x-ray diffraction powder patterns. Section 9. – Data for 63 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, E. H. Evans, and B. Paretzkin, Nat. Bur. Stand. (U.S.), Monogr. 25 – Sec. 9, 128 pages (Dec. 1971).

Key words: Crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 63 substances. Forty of these patterns represent experimental data and 23 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All *d*-values were assigned Miller indices determined by comparison with computer interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr. 25, Section 10. **Standard x-ray diffraction powder patterns. Section 10 – Data for 84 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, E. H. Evans, B. Paretzkin, J. H. deGroot, and S. J. Carmel, Nat. Bur. Stand. (U.S.), Monogr. 25, Sec. 10, 161 pages (Nov. 1972).

Key words: Crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 84 substances. Forty-seven of these patterns represent experimental data and 37 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indexes determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indexes were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr. 25, Section 11. **Standard x-ray diffraction powder patterns. Section 11-data for 70 substances,** H. E. Swanson, H. F. McMurdie, M. C. Morris, E. H. Evans, B. Paretzkin, J. H. de Groot, and S. J. Carmel, Nat. Bur. Stand. (U.S.), Monogr. 25-Sec. 11, 134 pages (Feb. 1974) SD Catalog No. C13.44:25/Sec. 11.

Key words: crystal structure; integrated intensities; lattice constants; peak intensities, powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 70 substances. Fifty-two of these patterns represent experimental data and 18 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computer interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr. 25, Section 12. **Standard x-ray diffraction powder patterns. Section 12-data for 57 substances,** H. F. McMurdie, M. C. Morris, E. H. Evans, B. Paretzkin, J. H. de Groot, C. R. Hubbard, and S. J. Carmel, Nat. Bur. Stand. (U.S.), Monogr. 25-Sec. 12, 90 pages (Feb. 1975) SD Catalog No. C13.44:25/Sec. 12.

Key words: crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 57 substances. Twenty-five of these patterns represent experimental data and 32 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr. 25, Section 13. **Standard x-ray diffraction powder patterns. Section 13—Data for 58 substances,** M. C. Morris, H. F. McMurdie, E. H. Evans, B. Paretzkin, J. H. de Groot, C. R. Hubbard, and S. J. Carmel, *Nat. Bur. Stand. (U.S.), Monogr. 25, Sec. 13,* 114 pages (June 1976) SD Catalog No. C13.44:25/Sec. 13.

Key words: crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 58 substances. Thirty-one of these patterns represent experimental data and 27 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computed inter-planar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Monogr.27 & all Supplements superseded by Special Publication 373.

Monogr.32. Pts. 1 & 2 superseded by Monograph 145.

Mono. 61. **The solar spectrum 2935 Å to 8770 Å. Second revision of Rowland's preliminary table of solar spectrum wavelengths,** C. E. Moore, M. G. J. Minnaert, and J. Houtgast. NBS Mono. 61 (Dec. 1966).

Key words: Elements in sun; equivalent widths of solar lines; identification of solar lines; molecules in sun; solar spectrum; wavelengths of solar lines.

The present compendium of solar spectrum wavelengths and intensities is essentially a second revision of Rowland's Table, corrected and supplemented by material from the Utrecht Photometric Atlas. Approximately 24,000 lines are listed. In a number of cases new wavelengths were determined. Measured equivalent widths from the Atlas records replace the Rowland estimated line intensities recorded in the 1928 revision. From these directly measured equivalent widths have been derived reduced widths, which, if necessary, were corrected for disturbing influences. The intensity behavior of atomic lines in the spot spectrum as compared with the spectrum of the solar disk is indicated by letters denoting strengthening, weakening, and the like. Atomic lines present only in the spot spectrum are, also, included, 223 in all.

Revised identifications of the lines, as to chemical origin, are given for both atomic and molecular lines. For classified atomic lines the lower excitation potential and multiplet number are listed. For molecular lines the rotation branch and quantum number, and the vibration band are indicated. Note numbers refer to notes in which the complete designation of the band is given.

An introductory text gives a detailed description of each column of the solar ledger. Figures are included to illustrate the procedure used to derive the observed equivalent widths $\Delta\lambda$(mÅ) and the reduced widths $\Delta\lambda/\lambda$(F).

Tables include counts of lines of each spectrum recorded in the identification column, leading lines in the first and second spectra, and summaries of molecules and elements present in the sun. About 73 percent of the lines are wholly or partially identified. Sixty-three elements are recorded as present. A number need further study. The number of molecules identified in the sun totals 11.

Monogr. 70, Volumes I and II. See Nat. Bur. Stand. (U.S.), Misc. Publ. Suppl. to 240, 757 pages (Apr. 1967).

Monogr. 70, Volume III. **Microwave spectral tables. Volume III. Polyatomic molecules with internal rotation,** P. F. Wacker, M. S. Cord, D. G. Burkhard, J. D. Petersen, and R. F. Kukol, Nat. Bur. Stand. (U.S.), Monogr. 70, Vol. III, 275 pages (June 1969).

Key words: Barrier height; centrifugal distortion constant; coherent radiation technique; dipole moment; hindered rotation; internal rotation; microwave spectra; molecular spectra; polyatomic molecules; quadrupole coupling constants; rotational constant; spectral lines.

Measured frequencies, assigned molecular species, and assigned quantum numbers are given for about 9,000 spectral lines of polyatomic molecules with internal rotation observed by coherent radiation techniques. Molecular data, such as rotational constants, dipole moments, and various coupling constants, determined by such techniques, are also tabulated. References are given for all included data.

Monogr. 70, Volume IV. **Microwave spectral tables. Volume IV. Polyatomic molecules without internal rotation,** M. S. Cord, J. D. Petersen, M. S. Lojko, and R. H. Haas, Nat. Bur. Stand. (U.S.), Monogr. 70, Vol. IV, 429 pages (Oct. 1968).

Key words: Centrifugal distortion constant; coherent radiation technique; dipole moment; l-doubling; microwave spectra; molecular spectra; polyatomic molecules; quadrupole coupling constants; rotational constant; spectral lines.

Measured frequencies, assigned molecular species, and assigned quantum numbers are given for about 14,000 spectral lines of polyatomic molecules without internal rotation observed by coherent radiation techniques. Molecular data, such as rotational constants, dipole moments, and various coupling constants, determined by such techniques, are also tabulated. References are given for all included data.

Monogr. 70, Volume V. **Microwave spectral tables. Volume V. Spectral line listing,** M. S. Cord, M. S. Lojko, and J. D. Petersen, Nat. Bur. Stand. (U.S.), Monogr. 70, Vol. V, 538 pages (June 1968).

Key words: Diatomic molecules; hyperfine; microwave spectra; molecular spectra; polyatomic molecules; rotational quantum numbers; spectral lines.

This volume is a listing of the spectral lines reported in Volumes I, III, and IV of the Microwave Spectral Tables. These lines are listed according to ascending magnitude of frequency and should provide a ready reference.

Mono. 75. **Colors of signal lights: Their selection, definition, measurement, production, and use,** F. C. Breckenridge, NBS Mono. 75 (Apr. 3, 1967).

Key words: Colors; lights; signal lights.

This Monograph is intended to serve as a reference work for all those concerned with the selection, specifications, and use of signal-light colors. It discusses the nature of the problem, and the mathematical representation, recognition, production, control, and use of such colors. The characteristics of different types of chromaticity boundaries and the purpose and effect of the requirement for similarity of chromaticity characteristics are given special consideration. The treatment is varied according to the intended use. The discussion of the control of colors and the section on the use of colors are nontechnical, whereas the section on the production of signal colors is designed for the colorimetrist who is faced with the problem of selecting limit filters or drafting a specification.

Mono. 88. **Heat treatment and properties of iron and steel,** T. G. Digges, S. J. Rosenberg, and G. W. Geil, NBS Mono. 88 (Nov. 1, 1966).

Key words: Annealing; case hardening; chemical composition; hardening; heat treatment; Ni-maraging steels; normalizing; stainless steels; structural steels; surface hardening; tempering; tool steels.

This Monograph is a revision of the previous NBS Monograph 18. Its purpose is to provide an understanding of the heat treatment of iron and steels, principally to those unacquainted with this subject. The basic principles involved in the heat treatment of these materials are presented in simplified form. General heat treatment procedures are given for annealing, normalizing, hardening, tempering, case hardening, surface hardening, and special treatments such as austempering, ausforming, martempering and cold treatment. Chemical compositions, heat treatments, and some properties and uses are presented for structural steels, tool steels, stainless and heat-resisting steels, precipitation-hardenable stainless steels and nickel-maraging steels. (Supersedes NBS Circ. 495 and NBS Mono. 18).

Mono. 97. **Microwave attenuation measurements and standards,** R. W. Beatty, NBS Mono. 97 (Apr. 3, 1967).

Key words: Microwave; attenuation; measurements; standards; tutorial.

A comprehensive and commentarial review of microwave attenuation measurement methods and standards is presented. In addition, a relatively new and more precise way of representing and analyzing an attenuation measurement is presented. This in turn permits more rigorous definitions and error analyses than were previously possible. Expressions for both mismatch and connector errors are presented.

The referral of microwave attenuation measurements to standards operating at lower frequencies is discussed with particular attention to the errors in the referral processes as well as the errors in the standards themselves. Standards operating at d-c, audio frequencies, and higher frequencies are included in this discussion which covers waveguide-below-cutoff attenuators and rotary vane attenuators.

Desirable characteristics are listed for attenuators which are suitable for calibration, and examples of these are given.

Measurement methods are classified and described, giving greatest emphasis to the intermediate-frequency substitution method using a waveguide-below-cutoff standard attenuator, and to d-c substitution techniques. Methods for measurement of small attenuations as well as methods not requiring reference to any standard attenuators are covered.

Comments are made on the accuracy and convenience of various methods, and references are given which cover most of the basic and important research in this field.

Mono. 98. **Abscissas and weights for Gaussian Quadrature for N=2 to 100, and N=125, 150, 175, and 200,** C. H. Love, NBS Mono. 98 (Dec. 28, 1966).

Key words: Integration; Gaussian; Quadrature.

The abscissas and weights for Gaussian Quadrature of order N=2 to 100 and N=125, 150, 175 and 200 are given. The abscissas are given to twenty-four places and the error is estimated to be no more than one unit in the last place. The weights are given to twenty-three places and the error is estimated to be no more than one unit in the last place.

Mono. 99. **Automatic typographic-quality typesetting techniques: A state-of-the-art review,** M. E. Stevens and J. L. Little, NBS Mono. 99 (Apr. 7, 1967).

Key words: Automated type composition; computerized typesetting; graphic arts; photocomposition; printing and publication.

This report describes the current state-of-the-art in automation of graphic arts composition, starting from either of two sources: (1) keyboard entry of manuscript material, or (2) mechanized input in the form of available perforated tapes or magnetic tapes. The gamut is covered from one extreme in which a skilled keyboard operator performs all of the compositor functions required to operate a typesetting machine, to the other extreme in which the input merely provides text whether or not including designation of desired font changes, followed by a high degree of automation through all operations leading to type set for printing. Intermediate automation aids for the compositor functions, including characteristics of special-purpose digital computers and functions performed by typography programs for general-purpose digital computers, are reviewed.

Characteristics of automatically operated typesetting mechanisms, including hot metal casting machines and photocomposers, slow, medium and high speed, are outlined. Applications of new techniques for typographic-quality automated composition that are of interest in scientific and technical information centers, libraries and other documentation operations include sequential card camera listings, computer-generated KWIC indexes, photocomposition of technical journals, automatic composition of books containing both computer-produced tabular data and natural language texts, and the incorporation of mechanized processes throughout the publication cycle from the author's original manuscript preparation to the final printing. A bibliography of 363 references is included.

Mono. 100. **Trace characterization. Chemical and physical,** Editors, W. W. Meinke and B. F. Scribner, NBS Mono. 100 (April 28, 1967).

Key words: Electrochemical methods; electron and optical microscopy; nuclear methods; optical spectroscopy; symposium on trace characterization; trace characterization; x-ray spectroscopy.

A symposium on Trace Characterization, Chemical and Physical was held at the National Bureau of Standards October 3-7, 1966. This volume contains the texts of invited lectures, and summaries by the rapporteurs of the contributed papers and discussion sessions. Topics covered include trace characterization and the properties of materials; electrical measurements; electrochemical methods; optical and x-ray spectroscopy; x-ray diffraction; optical methods; chemical spectrophotometry; nuclear methods; mass spectroscopy; preconcentration; sampling and reagents; and electron and optical microscopy.

Mono. 101. **Low-temperature mechanical properties of copper and selected copper alloys. A compilation from the literature,** R. P. Reed and R. P. Mikesell, NBS Mono. 101 (Dec. 1, 1967).

Key words: Compilation; copper; copper alloys; low temperature; mechanical properties.

In the past 60 years considerable data has accumulated concerning the mechanical properties of copper and its alloys. It was felt that there was a great need to adequately document these results in one publication. Therefore a unique type of compilation is presented. The compilation is divided into four parts. The first section is intended for quick reference use for those who are interested in average values. The second section includes data from most of the investigators who have published results on the mechanical properties of copper and its alloys. The third section is composed of tables classifying the investigations which were not included in section two. These usually involve investigations in which data were obtained only at one temperature, such as room temperature. The fourth section lists, in alphabetical order, all references used.

Mono. 102. **Effects of finite lattice heat capacity on spin-lattice relaxation. Theory and numerical analysis,** R. L. Peterson, NBS Mono. 102 (Aug. 1, 1967).

Key words: Spin-lattice relaxation; phonon bottleneck; phonon-boundary scattering; spin-phonon interactions.

The transient magnetic behavior of a paramagnetic substance, after an initial disturbance, is considered theoretically for a variety of situations in which the lattice temperature rises as a result of energy flow from the magnetic (electron spin) system. The relaxation mechanisms considered are the direct process, involving interaction between spins and the resonant-phonon modes, and a T^9 Raman process, involving the remaining phonon modes. It is first assumed that the resonant and remaining modes are strongly coupled to each other, and that the helium bath has been removed (helium temperatures are assumed). The resulting transient behavior typically does not differ much from exponential relaxation (the rate increases somewhat during the relaxation), but the difference should be experimentally observable, particularly if the resonance line is inverted initially.

Next, the opposite extreme is considered--that in which the resonant and remaining modes are totally uncoupled; the helium bath is again assumed to have been removed. Two dramatic effects can then occur, depending upon initial conditions. One is the rapid decay to saturation from initial inversion, due to an avalanching creation of resonant phonons by the spins. The second is the pronounced inhibition of the subsequent decay, with the spins remaining near saturation. This decay rate is typically very much slower than the Raman rate, and is due to the flow of the resonant-phonon energy back into the spin system as the spin energy flows into the remaining lattice. Eventually the rate increases to the Raman rate characteristic of the final lattice temperature. Because of inelastic phonon scattering at crystal boundaries, which couples the phonon modes together, this effect of inhibited decay may be difficult to observe.

Finally, we consider the case of spins coupled only to the resonant phonons, which in turn are coupled to a constant temperature bath, whether this be the helium or the remaining modes. Recent phonon avalanche experiments are discussed in this context. It is pointed out that such experiments, performed in the absence of a bath, may provide a reliable measurement of inelastic phonon-boundary scattering.

Mono. 103. **Realistic uncertainties and the mass measurement process. An illustrated review,** P. E. Pontius and J. M. Cameron, NBS Mono. 103 (Aug. 15, 1967).

Key words: Accuracy; mass measurement; measurement; measurement process; precision; statistical control; uncertainty.

This paper gives a review of the concepts and operations involved in measuring the mass of an object. The importance of viewing measurement as a production process is emphasized and methods of evaluating process parameters are presented. The use of one of the laboratory's standards as an additional unknown in routine calibration provides an accuracy check and, as time goes on, the basis for precision and accuracy statements.

Monogr. 104. **Colorimetry,** I. Nimeroff, Nat. Bur. Stand. (U.S.), Monogr. 104, 50 pages (Jan. 1968).

Key words: Color dictionaries; color vision; colorimeters; photoelectric tristimulus; spectrophotometric colorimetry; visual colorimetry.

The definition of color, as a characteristic of light, and the basic principles of its measurement are given. The reduction of spectrophotometric data to three chromaticity coordinates by means of the three-function CIE standard observer system for colorimetry is described. Various methods of direct colorimetry, and visual and photoelectric methods of colorimetry by differences from material standards are treated. The most useful collections of material color standards are described and the most widely used one-dimensional color scales are explained. The limitations of several colorimetric methods: spectrophotometric, photoelectric, and visual, are discussed. (Supersedes NBS Circ. 478).

Monogr. 105. **Acid-base behavior in aprotic organic solvents,** M. M. Davis, Nat. Bur. Stand. (U.S.), Monogr. 105, 156 pages (Aug. 1968).

Key words: Acid-base behavior; acidity and basicity scales; aprotic organic solvents; hydrogen bonding; titrations.

A unified picture of acid-base behavior in aprotic organic solvents is presented, based on an extensive survey of the literature and experimental results of the author and associates. Evidence given to support this picture includes data pertaining to colligative properties of acids, bases, and salts and also conductance, dielectric constants, distribution between immiscible solvents, and spectral absorption in the infrared, visible, and ultraviolet. The acids upon which attention is centered are proton-donor compounds that are measurably ionized in water, such as aliphatic and aromatic carboxylic acids, substituted phenols, and mineral acids. The bases of principal interest are likewise compounds capable of forming ions in water, for example, aliphatic and aromatic amines and derivatives of guanidine or pyridine. The solvents emphasized are hydrocarbons and halohydrocarbons, but data for dipolar aprotic solvents (for example, acetone, acetonitrile, and nitrobenzene) are included. Contrasts in acid-base behavior and in acidity and basicity scales in aprotic and water-like solvents are discussed.

The role of hydrogen bonding in aprotic solvents is discussed at length. Important types of hydrogen-bonded structures include chelate rings; self-associated acids, bases, and salts; hydrogen-bonded ion pairs; and homo- and heteroconjugate cations and anions. Examples are given in which hydrogen bonding of these types affects such properties as the absorption spectrum of a salt, the catalytic effect of an acid, and the accurate location of a titration endpoint.

Monogr. 106. **Nickel and its alloys,** S. J. Rosenberg, Nat. Bur. Stand. (U.S.), Monogr. 106, 160 pages (May 1968).

Key words: Alloys; corrosion-resisting alloys; copper-nickel alloys; electroplating; electrical resistance alloys; heat resisting alloys; magnetic alloys; maraging steels; nickel; stainless steels; steels.

This monograph reviews available information on the production, properties, and uses of high-purity and commercial forms of nickel, and on the properties and applications of its important alloys, both ferrous and nonferrous. It is a revision of National Bureau of Standards Circular 592, issued in 1958. (Supersedes NBS Circ. 592.)

Monogr. 107. **Acceleration due to gravity at the National Bureau of Standards,** D. R. Tate, Nat. Bur. Stand. (U.S.), Monogr. 107, 24 pages (June 1968).

Key words: Absolute gravity; acceleration; free-fall; *g*; gravity; Potsdam.

A determination of the absolute value of the acceleration due to gravity was completed in June 1965 at the National Bureau of Standards near Gaithersburg, Maryland. The determination resulted in a value of 980.1018 centimeters per second squared for a reference point on the first floor of the Engineering Mechanics Building. The result was published in the Journal of Research of the National Bureau of Standards, Vol. **70C,** No. 2, Engineering and Instrumentation, page 149, April-June 1966. The present paper describes in detail the apparatus and the techniques employed and presents the summarized data from which the value was derived.

Monogr. 108. **Oscillator strengths and transition probabilities for 3288 lines of Fe I (2100-9900 Å),** C. H. Corliss and J. L. Tech, Nat. Bur. Stand. (U.S.), Monogr. 108, 68 pages (Mar. 1968).

Key words: Fe I; iron; oscillator strengths; spectrum; spectrum of neutral iron; transition probabilities in Fe I.

A homogeneous set of intensity-related data has been calculated for 3288 spectral lines of Fe I in the region from 2100 to 9900 angstroms. The quantities tabulated in the present monograph include log ($gf\lambda$), log (gf), gf, f, gA, and A. The data are presented on the absolute scale established in a previous work by Corliss and Bozman. In that work and the later extensions of it by Corliss and Warner, the calculation of gf-values included the application of an empirically determined normalization correction to the level populations, the normalization being given as a function of upper energy level for the transition. Since recent investigations do not support these excitations corrections in the case of Fe I and certain other spectra, the present tabulation incorporates a removal of that normalization function. This recalculation affects the values for all lines whose upper energy levels lie above 46000 cm^{-1} and should significantly improve the internal consistency of the present data.

Monogr. 109. **Investigation of the exploding wire process as a source of high temperature studies,** E. C. Cassidy, S. Abramowitz, and C. W. Beckett, Nat. Bur. Stand. (U.S.), Monogr. 109, 53 pages (Nov. 1968).

Key words: Electrical discharges; exploding wire; high current; high speed; high speed photography; high temperature; high voltage; light sources; time-resolved electrical measurements; time-resolved spectroscopy.

Numerous experiments with electrically exploded wires are described. The results include time-resolved measurements of electrical energy, power, voltage, and current during the discharge; periodic still and high-speed photographs of the entire explosion process; integrated and time-resolved measurements of the intensity and spectral distribution of the radiation emitted; and time-resolved absorption spectra from the products of the discharge, with emphasis on observations of the spectrum of the AlO molecule. The apparatus, instrumentation, and fast-measurement techniques developed in order to permit these direct experimental observations and measurements, under the extreme and transient conditions of the explosive discharge, are also described. Results from calculations of the composition, entropy, enthalpy, and density of the explosion mixture are given.

Monogr. 110. **Infrared spectroscopy of carbohydrates. A review of the literature,** R. S. Tipson, Nat. Bur. Stand. (U.S.), Monogr. 110, 24 pages (June 1968).

Key words: Analysis; carbohydrates; conformations; infrared spectra; spectrometry; structure.

A survey has been made of the literature on the infrared spectroscopy of carbohydrates, in order to assemble and systematize information in this field. The Monograph discusses principles and instrumentation, sampling techniques, comparison of samples, and the interpretation of the spectra, particularly as regards functional groups of carbohydrates and their derivatives, correlations for the fingerprint region and beyond, and conformational studies. In addition, examples are discussed of the use of infrared spectra for qualitative and quantitative purposes and in the determination of structure. Special techniques are briefly described, including use of plane-polarized radiation, the technique of attenuated total reflection, and Raman spectra.

Monogr. 111. **Technology of liquid helium,** R. H. Kropschot, B. W. Birmingham, and D. B. Mann, Editors, Nat. Bur. Stand. (U.S.), Monogr. 111, 380 pages (Oct. 1968).

Key words: Conservation; cryoelectronics; cryogenics; cryopumping; helium; liquefaction; magnets; purification; refrigeration; safety; storage; thermodynamic properties; transportation.

The discovery of the element helium was made just 100 years ago in 1868. Today helium is produced in large quantities and used in many technological applications. This treatise is a source document containing information on helium resources, production, conservation, themodynamic properties, liquefaction and refrigeration techniques, transportation and storage of liquid and safety requirements. It also contains a discussion of uses for liquid and cold gas in cryoelectronics, superconductivity, bubble chambers, cryopumping and missile and space systems. The book brings together articles by noted authorities in cryogenic technology in which they discuss their specialized field in great depth.

Monogr. 112. **An introduction to the description and evaluation of microwave systems using terminal invariant parameters,** G. F. Engen, Nat. Bur. Stand. (U.S.), Monogr. 112, 27 pages (Oct. 1969).

Key words: Attenuation; impedance; microwave power; precision connector; terminal invariant.

The description and evaluation of microwave systems is usually by means of microwave circuit analysis, which may be regarded as an extension of the practice at lower frequencies. In order to insure its validity, it is necessary to postulate that the different components, which comprise the microwave system, are interconnected via uniform and lossless waveguide, and which is usually (but not necessarily) restricted to single mode operation. As a consequence, precision (uniform) waveguide and connectors are usually considered necessary elements for an accurate experimental evaluation of a microwave system.

It is possible to avoid this requirement in an alternative formulation where the description is based upon net power, instead of the complex traveling wave amplitudes. In this reformulation the basic parameters include available power, maximum efficiency (or intrinsic attenuation), and several different "mismatch factors." The important feature of these parameters is their "terminal invariant" property, i.e., their invariance to an arbitrary shift in the terminal reference surface (in an assumed lossless region).

In this way the precision waveguide and connector requirement is avoided for an important class of measurement problems. In addition the physical model, upon which the description is based, is a simple one which provides improved insight into mismatch errors and corrections.

Monogr. 113, Volume 1. **Research and development in the computer sciences. 1. Information acquisition, sensing, and input: A selective literature review,** M. E. Stevens, Nat. Bur. Stand. (U.S.), Monogr. 113, Vol. 1, 170 pages (Mar. 1970).

Key words: Audio inputs; automatic pattern recognition; character recognition; communication systems; data transmission; graphic inputs; image enhancement; remote sensing; source data automation; speech recognition.

This report, the first of a projected series on research and development efforts and requirements in the computer and information sciences, is concerned with a selective literature review involving the operations of information acquisition, sensing, and input to information processing systems considered in generalized terms. Specific topics include but are not limited to: source data automation and remote sensing techniques, communication systems and data transmission links, audio and graphic inputs, preprocessing operations upon input items such as image enhancement and property filtering, character recognition, speech recognition, and various other aspects of automatic pattern recognition. Supplemental notes and a bibliography of over 640 cited references are included.

Monogr. 113, Volume 2. **Research and development in the computer and information sciences. 2. Processing, storage, and output requirements in information processing systems: A selective literature review,** M. E. Stevens, Nat. Bur. Stand. (U.S.), Monogr. 113, Vol. 2, 125 pages (May 1970).

Key words: Computer-assisted-instruction; information display; information recording; machine-aided design; memory allocation; microforms; multiple-access systems; on-line systems; output modes; photocomposition and typesetting; storage hierarchies; time sharing.

Areas of concern with respect to processing, storage, and output requirements of a generalized information processing system are considered. Special emphasis is placed on multiple-access systems. Problems of system management and control are discussed, including hierarchies of storage levels. Facsimile, digital, and mass random access storage media and techniques are considered. A variety of output mode requirements are also considered, including direct recording to microforms; on-line display systems; printing, photocomposition, and automatic character generation; and three-dimensional, color, and other special-purpose display systems. Problems of system use and evaluation are also briefly noted. A bibliography of approximately 480 cited references is included, together with supplemental notes and quotations from the literature.

Monogr. 113, Volume 3. **Research and development in the computer and information sciences. 3. Overall system design considerations: A selective literature review,** M. E. Stevens, Nat. Bur. Stand. (U.S.), Monogr. 113, Vol. 3, 147 pages (June 1970).

Key words: Data recording; debugging; holography; information control; input-output; integrated circuits; lasers; memory systems; multiprocessing; networks; on-line systems; programming; simulation; storage.

This report, the third in a series on research and development efforts and requirements in the computer and information sciences, is concerned with a selective literature review involving overall system design considerations in the planning of information processing systems and networks. Specific topics include but are not limited to: requirements and resources analysis, problems of system networking, input/output and remote terminal design, character sets, programming problems and languages, processor design considerations, advanced hardware developments, debugging and on-line diagnosis or instrumentation, and problems of simulation. Supplemental notes and a bibliography of over 570 cited references are included.

Monogr. 114. **Survey of micromanometers,** W. G. Brombacher, Nat. Bur. Stand. (U.S.), Monogr. 114, 62 pages (June 1970).

Key words: Calibration techniques; capacitance pressure gages; gas column manometers; manometers; meteorographs: micromanometers; piston gages; pressure measurement; vane gages; vapor pressure measurement.

This survey is concerned with instrumentation for measuring pressures from about 0.001 to 50 mm of mercury (0.13 to 6650 Nm^{-2}), described in publications during the years 1900-1968. U-tube micromanometers and diaphragm-capacitance gages are treated in considerable detail. Other instrumentation described includes gas column manometers; elastic element micromanometers with optical, inductance, resistance wire, strain gage, and vacuum tube transducers; piston gages; vane gages; and centrifugal micromanometers. The measurement of dynamic pressure, atmospheric pressure oscillations, low vapor pressure, and calibration techniques are discussed. Only technical periodicals, books, and government or university laboratory serials were used as sources of information. Details of electrical measurement circuits, amplifiers, and recorders have been omitted. Schematic diagrams of approximately 70 instruments are included. References to the sources of information and available performance data are given.

Monogr. 115. **The calculation of rotational energy levels and rotational line intensities in diatomic molecules,** J. T. Hougen, Nat. Bur. Stand. (U.S.), Monogr. 115, 52 pages (June 1970).

Key words: Diatomic molecules; Hund's coupling cases; rotational levels; rotational line intensities; theoretical calculations.

Procedures are described, in this pedagogical monograph, for making quantum mechanical calculations of rotational energy levels and rotational line intensities in diatomic molecules. The procedures are illustrated by sample calculations. A familiarity with the material of this report should enable a practicing electronic spectroscopist to carry out, though in a rather mechanical way, his own theoretical calculations for molecules under experimental investigation. The material of this report is aimed at electronic spectroscopists who have had the equivalent of one semester of graduate-level quantum mechanics.

Monogr. 116. **Hydrogen Stark broadening calculations with the unified classical path theory,** C. R. Vidal, J. Cooper, and E. W. Smith, Nat. Bur. Stand. (U.S.), Monogr. 116, 143 pages (May 1970).

Key words: Classical path; hydrogen lines; line wings; one-electron theory; Stark broadening; unified theory.

The unified theory has been generalized for the case of upper and lower state interaction by introducing a more compact tetradic notation. The general result is then applied to the Stark broadening of hydrogen. The thermal average of the time development operator for upper and lower state interaction is presented. Except for the time ordering it contains the effect of finite interaction time between the radiator and perturbers to all orders, thus avoiding a Lewis type cutoff. A simple technique for evaluating the Fourier transform of the thermal average has been developed. The final calculations based on the unified theory and on the one-electron theory are compared with measurements in the high and low electron density regime. The unified theory calculations cover the entire line profile from the line center to the static wing and the simpler one-electron theory calculations provide the line intensities only in the line wings.

Monogr. 117. **Hearing aids,** E. L. R. Corliss, Nat. Bur. Stand. (U.S.), Monogr. 117, 26 pages (Oct. 1970).

Key words: Audition; communications; hearing; hearing aids; selection of hearing aids; speech communication.

This publication contains information, useful to the hard of hearing, on several topics relating to hearing and hearing aids. It is assumed that the individual has already consulted a physician on the diagnosis of his hearing loss, for this is the necessary first step in correcting any faulty hearing condition. The publication may also be of interest to teachers and others wishing to explore this field.

This publication represents an extensive revision of NBS Circular 534, Hearing Aids. It includes new material based upon research conducted at the National Bureau of Standards during the intervening years. (Supersedes Circular 534.)

Monogr. 118. **Photonuclear reactions,** E. Hayward, Nat. Bur. Stand. (U.S.), Monogr. 118, 46 pages (Aug. 1970).

Key words: Nuclear hydrodynamics; particle-hole calculations; photon scattering; photonuclear; sum rules.

This paper reviews photonuclear reactions in the approximate energy range 10 to 30 MeV. Various sum rules are discussed and applied to experimental data. Several different theories are described and their predictions compared with experiment, and as often as possible open questions and discrepancies are pointed out.

Monogr. 119. **A high-dispersion spectral analysis of the Ba II star HD 204075 (ζ Capricorni),** J. L. Tech, Nat. Bur. Stand. (U.S.), Monogr. 119, 174 pages (Mar. 1971).

Key words: Abundances of elements in stars; Ba II stars (ζ Capricorni); curve of growth; equivalent widths; identification of spectral lines; ionization in stars; oscillator strengths; temperature in stars; turbulence in stars.

A double differential curve of growth analysis, using both the sun and ϵ Virginis (G9 II-III) as comparison stars, has been performed for the Ba II star ζ Capricorni. The observational material consists of equivalent widths, central depths, and half-widths for 1100 spectral lines measured on direct-intensity tracings of plates obtained by J. L. Greenstein at the coudé focus of the 200-in telescope. The plates cover the spectral regions 3880-4825 Å and 5100-6720 Å at reciprocal dispersions of 2.3 and 3.4 Å/mm, respectively. Line identifications given in earlier lists for barium stars have been critically re-examined. Three lines have been attributed with reasonable certainty to dysprosium, which has not previously been observed in barium stars.

The atmospheric parameters derived for ζ Cap are:

θ_{exc} :	1.13	$[P_e]_{\zeta-\odot}$:	−1.28
θ_{ion} :	0.99	$[P_e]_{\zeta-\epsilon}$:	+0.13
$\log 2\alpha$:	−2.5	$[k]_{\zeta-\odot}$:	−1.10
v_{micro} :	3.5 km/s	$[k]_{\zeta-\epsilon}$:	−0.03
v_{macro} :	5.5 km/s		

Atmospheric abundances have been derived for 37 elements. The results obtained with respect to the two comparison stars are in good agreement. The barium star exhibits essentially solar abundances for most elements lighter than germanium, but overabundances by factors of about two are indicated for carbon and lithium. With the exception of europium, all observed elements heavier than germanium are found to be overabundant in ζ Cap. Improved NBS *gf*-values, converted to the system of line strengths in ϵ Vir, have yielded exceptionally well-defined curves of growth for several rare earths. Overabundances by factors of about eight or nine have been found for the *s*-processed rare earths, as well as for dysprosium, which is generally considered to be *r*-processed. The abundances derived for the rare earths are greater by about a factor of three than those derived for the same star by Warner (Mon. Not. Roy. Astron. Soc. **129**, 263 (1965)).

Monogr. 120. **Unified theory calculations of Stark broadened hydrogen lines including lower state interactions,** C. R. Vidal, J. Cooper, and E. W. Smith, Nat. Bur. Stand. (U.S.), Monogr. 120, 45 pages (Jan. 1971).

Key words: Classical path; hydrogen lines; line wings; Stark broadening; unified theory.

Recently published calculations of hydrogen Stark broadening on the basis of the unified classical path theory have been extended to include lower state interactions in the final line profile. A detailed comparison with experiments in the density range 10^{13}-10^{17} cm^{-3} is given

Monogr. 121. **The effect of time ordering on the Lyman α profile,** J. T. Godfrey, C. R. Vidal, E. W. Smith, and J. Cooper, Nat. Bur. Stand. (U.S.), Monogr. 121, 14 pages (June 1971).

Key words: Lyman-α; Stark-broadening; time-ordering; unified theory.

Using a unified theory of spectral line broadening previously developed, the effects of time-ordering over the complete line profile are investigated. The behavior of the time-ordered thermal average and un-time-ordered thermal average are compared. The Fourier transform of the thermal average is obtained analytically. Calculations for the line profile of the Lyman-α line of hydrogen are presented and are representative in that the full thermal average is replaced by the thermal average with the electron velocity distribution approximated by $f(v)=\delta v-v_{av})$ where v_{av} is the thermal velocity for the plasma in question.

Monogr. 122. **Mechanics of pneumatic tires,** S. K. Clark, Editor, Nat. Bur. Stand. (U.S.), Monogr. 122, 853 pages (Nov. 1971).

Key words: Friction; rubber; skid; tire contact; tire cord; tires; tire stress; tire structure; vehicles.

The pneumatic tire has been an integral part of automotive transportation almost since its inception, yet it remains a product whose characteristics are not easily predictable or comprehensible by conventional engineering techniques. This treatise is an attempt to provide a rational descriptive and analytical basis for tire mechanics. Chapters of this book are contributed by active research workers in the fields of rubber and textile properties, friction, material properties, tire stress problems, tire design and construction, vehicle skid and handling, and tire mechanical properties.

Monogr. 123. **BOLOVAC systems for measuring electrical quantities from 0.5 MHz through microwaves,** M. C. Selby, Nat. Bur. Stand. (U.S.), Monogr. 123, 24 pages (Jan. 1972).

Key words: BOLOVAC; calibration of current meters through microwaves; calibration of power meters through microwaves; calibration of voltmeters through microwaves; current measurement; disk-type bolometer evaluation; frequency-domain pulse evaluation; measurement of microwave current; measurement of microwave power; measurement of microwave voltage; mismatch error; picosecond rise-time pulse evaluation; power measurement; pulse-rise-time standardization; sampling oscilloscope standardization; spectrum analyzer standardization; termination mismatch error elimination; thin-film bolometers; voltage measurement.

A novel device—the BOLOVAC—is employed in measurement systems that furnish known voltages and currents up to 18 GHz, remove serious difficulties in power measurements, and are applicable in impedance, attenuation and other measurements. Typical of such measurements are the evaluation of rf power sources; calibration of power meters; measurement of net and incident power flow in a system; calibration of signal generators, voltmeters, current meters, picosecond-rise-time pulse-display oscilloscopes, spectrum analyzers; determination of insertion loss of components; and calibration of directional couplers. The Bolovac also serves as an accurately known resistive termination for match or mismatch applications from LF through microwaves.

Monogr. 124. **Reference tables for low-temperature thermocouples,** L. L. Sparks, R. L. Powell, and W. J. Hall, Nat. Bur. Stand. (U.S.), Monogr. 124, 61 pages (June 1972).

Key words: Cryogenics; homogeneity tests; liquid helium; liquid hydrogen; liquid nitrogen; thermocouples.

The experimental program to establish low-temperature reference tables for the commonly used thermocouples has been completed. Details of the experimental system, instrumentation, data analysis, error analysis, and materials tested are given in order to allow the user to better evaluate and apply the results. The results presented here include: (1) Reference tables for thermocouple types E, K, and T, both as $E=f(T)$ and $T=f(E)$. The shorter $f(E)$ tables have a 0 °C (273.15 K) reference temperature while all other tables have a 0 K reference temperature; (2) Reference tables for Pt and *Ag*-28 at% Au vs the materials used in thermocouple types E, K, and T. These data are presented as $E=f(T)$ only; (3) Orthogonal polynomials and the associated coefficients necessary to generate the data with reduced order approximations; and (4) Power series coefficients for full precision reproduction of the reference data.

The data presented in the $E=f(T)$ tables cover the temperature range from 0 to 280 K. The $T=f(E)$ tables cover temperature ranges from 273.15 K down to the lowest temperatures allowed by table resolution.

Monogr. 125. **Thermocouple reference tables based on the IPTS-68,** R. L. Powell, W. J. Hall, C. H. Hyink, Jr., L. L. Sparks, G. W. Burns, M. G. Scroger, and H. H. Plumb, Nat. Bur. Stand. (U.S.), Monogr. 125, 410 pages (Mar. 1974) SD Catalog No. C13.44:125.

Key words: base metal alloys; noble metal alloys; temperature scale; temperature standards; thermocouples; thermometry.

Revision of the International Practical Temperature Scale requires that there be changes for all accurately tabulated thermophysical values. Revised reference data for thermocouples have been generated in a cooperative program between groups of the National Bureau of Standards in Boulder and Gaithersburg. This Monograph contains tables, analytic expressions, various approximations, and explanatory text. Only the standard letter-designated thermocouples are described: noble metal Types S, R, and B and base metal Types E, J, K, and T. Their appropriate "single-leg" or thermoelement versus Pt-67 values are also included. The new reference data reflect not only revisions in the temperature scale, but also slight changes in the materials themselves and improvements in data fitting methods. The temperature ranges vary for different types, from a low of −270 °C for Type E to a high of 1820 °C for Type B. The main functions and tables are given in terms of Celsius degrees and microvolts. Tables in the appendices represent the data with less precision, in millivolts, and in degrees Fahrenheit as well as Celsius. Approximate quadratic, cubic, and quartic analytic expressions are also given for each thermocouple type in various temperature ranges. Supersedes NBS Circular 561.

Monogr. 125, Suppl. 1. **Thermocouple reference tables based on the IPTS-68: Reference tables in degrees Fahrenheit for thermoelements versus platinum (Pt-67),** R. L. Powell and G. W. Burns, Nat. Bur. Stand. (U.S.), Monogr. 125, Suppl. 1, 46 pages (Jan. 1975) SD Catalog No. C13.44:125/Suppl. 1.

Key words: base metals alloys; noble metal alloys; temperature scale; temperature standards; thermoelements; thermometry.

Reference tables for several thermoelements versus platinum (Pt-67) are given with values of the thermoelectric voltage as a function of temperature in degrees Fahrenheit. Only tables for standard letter-designated thermoelements are included: Types BP, BN, JP, JN, KP (same as EP), KN, TP, and TN (same as EN). These tables supplement those given in NBS Monograph 125 and were calculated from the power series expansions presented in that Monograph. They are based upon the absolute electrical units and the International Practical Temperature Scale of 1968 (IPTS-68).

Monogr. 126. **Platinum resistance thermometry,** J. L. Riddle, G. T. Furukawa, and H. H. Plumb, Nat. Bur. Stand. (U.S.), Monogr. 126, 129 pages (Apr. 1973) $2.10, SD Catalog No. C13.44:126.

Key words: Calibration; calibration errors; cryostat; fixed points; freezing point; International Practical Temperature Scale; platinum resistance thermometer; Thermodynamic Temperature Scale; thermometry; triple point.

The monograph describes the methods and equipment employed at the National Bureau of Standards for calibrating standard platinum resistance thermometers (SPRT) on the International Practical Temperature Scale (IPTS-68). The official text of the scale is clarified and characteristics of the scale are described. Several designs of SPRT's are shown and discussed in the light of the requirements and recommendations on the text of the IPTS-68. Possible sources of error such as those due to the internal and external self-heating effects and the immersion characteristics of SPRT's are described in detail. Precautions and limitations for the mechanical and thermal treatment and for the shipment of SPRT's are indicated, and a guide is given for those desiring the thermometer calibration services of NBS. The description of equipment employed at the National Bureau of Standards for maintaining the IPTS-68 includes the triple point of water cell, tin point cell, zinc point cell, oxygen normal boiling point comparison cryostat, the 13 to 90 K comparison cryostat, and the reference SPRT's upon which the NBS- IPTS-68 in the region 13 to 90 K is based. Methods are given for calculating temperatures from the calibration data and observed resistances; the propagation of calibration errors is discussed. Supplemental information given in the Appendixes includes the authorized English version of the text of the IPTS-68, tabular values of the "reference function" used below 0 °C, tabular values of the differences between IPTS-68 and IPTS-48, analysis of the first derivatives at 0 °C of the IPTS-68 formulations, methods for calibrating potentiometers and Mueller bridges, and the derivation of the coefficients used in the analysis of error propagation.

Monogr. 127. **NBS papers on underground corrosion of steel piling 1962-1971. Corrosion of steel pilings in soils, corrosion evaluation of steel test piles exposed to permafrost soils, performance of steel pilings in soils, and polarization measurements as related to corrosion of underground steel piling,** W. J. Schwerdtfeger and M. Romanoff, Nat. Bur. Stand. (U.S.), Monogr. 127, 63 pages (Mar. 1972).

Key words: Active region; aerated soil; corrosion; disturbed soil; excavated; extracted; H-piling; instantaneous corrosion rate; mill scale; permafrost region; pipe piling; pit depth; polarization; sheet piling; undisturbed soil; weight loss.

This monograph is a collection of published papers on underground corrosion of steel piling. The papers are as follows: (1) Romanoff, Melvin, Corrosion of Steel Pilings in Soils, Nat. Bur. Stand. (U.S.), Monogr. 58, (Oct. 1962); (2) Romanoff, Melvin, Corrosion Evaluation of Steel Test Piles Exposed to Permafrost Soils, Proceedings 25th Conference, National Association of Corrosion Engineers, page 6 (Mar. 1969); (3) Romanoff, Melvin, Performance of Steel Pilings in Soils, Proceedings 25th Conference, National Association of Corrosion Engineers, page 14 (Mar. 1969); (4) Schwerdtfeger, W. J., Polarization Measurements as Related to Corrosion of Underground Steel Piling, J. Res. Nat. Bur. Stand. (U.S.), 75C (Eng. and Instr.) No. 2, 107-121 (Apr.-June 1971).

The papers describe corrosion of various types of steel piling exposed underground in the United States under climatic conditions ranging from semi-tropical to frigid. Corrosion is described on driven piling above and below the water table after many years of exposure in soils having resistivities between 78 and 50,000 ohm-cm and ranging in pH from 2.3 to 8.8.

One of the papers demonstrates the value of a polarization technique in measuring corrosion. Polarization data were obtained on weighed steel pipe specimens exposed underground for seven years in backfilled soil trenches in the vicinity of driven sheet piling. The technique was evaluated by comparing calculated cumulative weight losses of specimens with their actual weight losses. The technique was also shown to be applicable to underground pipe piling. Supersedes NBS Monograph 58.

Monogr. 128. **Corrosion rates on underground steel test piles at Turcot Yard, Montreal, Canada—Part 1,** W. J. Schwerdtfeger and M. Romanoff, Nat. Bur. Stand. (U.S.), Monogr. 128, 17 pages (July 1972).

Key words: Average penetration rate; H-piles; instantaneous corrosion rate; linear polarization; pit depth; polarization curve.

In 1966, isolated steel H-piles allocated for underground corrosion tests were installed in three locations at the Turcot Yard Interchange of the Transcanadian Highway at Montreal. The reason for the installation was to furnish answers to some questions concerning the corrosion characteristics of piles, 12 in-74 lb/ft(30.5 cm-110 kg/m), which are identical with the piles supporting the concrete piers under the highway. Polarization measurements have been made once every year since installation.

This paper describes the determination of corrosion rates based on the polarization measurements made up to the time of removal of the first group of piles in 1969. The piles, placed underground at the three locations, differ mainly in that at one site all the piles are bare, at the second site the upper ends of the piles are coated with an epoxy paint and at the third site the upper ends are encased in concrete. Physical measurements made on the cleaned piles after removal are correlated with corrosion rates calculated from the polarization measurements. Also penetration rates on the piling based on the polarization data are compared with average penetration rates (based on actual weight losses) on relatively small pipe specimens. The pipe specimens were removed from 28 underground sites having a range of soil resistivities comparable to those of the three piling sites.

Using one of the polarization techniques applied to the individual test piles, polarization measurements were also carried out on 32 interconnected piles supporting one of the concrete piers. The calculated average corrosion rate of the 32 piles was found to compare favorably with that of the separate test piles in the same area.

Monogr. 129. **The development of Loran-C navigation and timing,** G. Hefley, Nat. Bur. Stand. (U.S.), Monogr. 129, 144 pages (Oct. 1972).

Key words: Cyclan; cytac; Loran; Loran-C; low frequency; navigation; pulse propagation; radio positioning; time dissemination; time transfer system.

The Loran-C timing and navigation concept and its implementation in the form of the Loran-C system has taken on considerable importance in a variety of military and civilian applications such as microsecond clock synchronization, precision tactical or civil navigation, etc. Future applications like tying together continental surveys, aircraft collision avoidance, etc., have yet to be explored in detail. This work traces the development of the Loran-C concept from its inception as a 100 kHz pulse hyperbolic navigation system to more recent times when it found a variety of applications to both timing and navigation. This work is intended to present the story of Loran-C in a readable and understandable way without resorting to the complicated mathematical formulation of the theory or detailed instrumentation aspects. Thus, the history, experimental and theoretical developments, political decisions, and field testing of the early equipment are described and the lessons learned can certainly be a guide for modern development of the system in all its detailed applications.

Monogr. 130. **The divergent beam (Kossel) x-ray method and its uses in measuring strain contours in an individual grain of Fe-3 weight percent Si transformer sheet,** H. Yakowitz, Nat. Bur. Stand. (U.S.), Monogr. 130, 80 pages (Aug. 1973) 95 cents, SD Catalog No. C13.44:130.

Key words: Divergent beam x-ray diffraction; electron probe microanalysis; iron-silicon alloy; Kossel; strain; stress; transformer sheet.

Residual and impressed stresses and strains in Fe-3 wt. pct. Si alloy transformer sheet were studied. Results were obtained by the divergent beam (Kossel) x-ray microdiffraction techniques. The optically opaque Fe-3 wt. pct. Si alloy was mapped for residual and impressed stresses and strains. These maps are roughly analogous to polarized light stress analysis of transparent materials. The results showed that a variable strain distribution existed in the alloy sheet at the time it was ready for insertion into a transformer core. Small applied compressive and tensile loads tended to rearrange this variable strain distribution but not to appreciably alter the total stored elastic energy.

Monogr. 131. **Thermal conductivity of solids at room temperature and below. A review and compilation of the literature,** G. E. Childs, L. J. Ericks, and R. L. Powell, Nat. Bur. Stand. (U.S.), Monogr. 131, 624 pages (Sept. 1973) $7.80, SD Catalog No. C13.44:131.

Key words: Cryogenic thermal conductivity; elements, alloys, commercial metals, semiconductors, semimetals, ionic and valence crystals, minerals, molecular crystals, polymers, glasses, disordered dielectrics, thermal conductivity of; review; thermal conductivity.

An extensive compilation is given of the measured values of thermal conductivity for nearly all solid materials from room temperature down to 0.01 kelvin. The reviewed materials include elements, alloys and commercial metals, semiconductors, semimetals, ionic and valence crystals, minerals, molecular crystals, polymers, glasses, and disordered dielectrics. Excluded are foams, powders, earths, fibers, layers of composites, and similar other heterogeneous solids. Data for temperatures below 1 kelvin are presented separately. The tables and graphs are complete for literature references from 1900 to mid-1971. Experimental methods and physical phenomena are discussed in the text and coded in the tables for references for which curves are shown. Supersedes NBS Circular 556.

Monogr. 132. **A compilation and evaluation of mechanical, thermal, and electrical properties of selected polymers,** R. E. Schramm, A. F. Clark, and R. P. Reed, Nat. Bur. Stand. (U.S.), Monogr. 132, 848 pages (Sept. 1973) $10.25, SD Catalog No. C13.44:132.

Key words: Compilation; electrical properties; mechanical properties; plastics; polymers; thermal properties.

This compilation abstracts original experimental data on the mechanical, thermal, and electrical properties of six commercially available polymers. After an extensive review of the open literature, all available data were collected together in graphical and tabular form along with material characterization, experimental method, and reference to the original publication. The data are also summarized and a brief description of each polymer is included.

Monogr. 133. **Mass and mass values,** P. E. Pontius, Nat. Bur. Stand. (U.S.), Monogr. 133, 39 pages (Jan. 1974) SD Catalog No. C13.44:133.

Key words: apparent mass; buoyancy corrections; mass comparison; mass value; true mass; weighing.

There are several bases for assigning mass values to weights to be used as mass standards. As a consequence a given weight may have several assigned mass values depending on the basis used. In many cases, the differences between these assigned values, although easily detectable with precise weighing equipment, are of no practical concern. However, in some instances these differences may be crucial. The first part of this paper is a historical summary of weighing, standards, and the assignment of value; and the interfacing of mass measurements with civilization. The second part of this paper discusses in detail the methods of assigning mass values. Ways to convert from values on one basis to values on another basis are discussed. Sample problems relating to the buoyant effect of the air are presented in the appendices.

Monogr. 134. **Space groups and lattice complexes,** W. Fisher, H. Burzlaff, E. Hellner, and J. D. H. Donnay, Nat. Bur. Stand. (U.S.), Monogr. 134, 184 pages (May 1973) $4.10, SD Catalog No. C13.44:134.

Key words: Crystallography; crystal point groups; crystal structure; lattice complexes; site sets; space groups.

The lattice complex is to the space group what the site set is to the point group—an assemblage of symmetry-related equivalent points. The symbolism introduced by Carl Hermann has been revised and extended. A total of 402 lattice complexes are derived from 67 Weissenberg complexes. The Tables list site sets and lattice complexes in standard and alternate representations. They answer the following questions: What are the coordinates of the points in a given lattice complex? In which space groups can a given lattice complex occur? What are the lattice complexes that can occur in a given space group? The higher the symmetry of the crystal structures is, the more useful the lattice-complex approach should be on the road to the ultimate goal of their classification.

Monogr. 135. **Properties of glasses in some ternary systems containing BaO and SiO_2,** G. W. Cleek and C. L. Babcock, Nat. Bur. Stand. (U.S.), Monogr. 135, 42 pages (Sept. 1973) 70 cents, SD Catalog No. C13.44:135.

Key words: Barium glasses; barium silicates; glass properties; glass property factors; oxide glasses; silicate substructures; ternary glasses.

The glass forming regions in six ternary oxide systems containing BaO, SiO_2 and a third oxide have been determined. The

properties of the resulting glasses were measured and the results are reported. The data on refractive indices, dispersions and specific volumes were evaluated by computer methods in an attempt to identify "substructures" containing the cations present in the glasses.

Monogr. 136. **Graphical recoupling of angular momenta,** D. R. Lehman and J. S. O'Connell, Nat. Bur. Stand. (U.S.), Monogr. 136, 18 pages (Oct. 1973) 50 cents, SD Catalog No. C13.44:136.

Key words: Angular momentum; diagrams; graphs; quantum theory; recouping; transformation theory.

A diagrammatic method for solving angular momentum recoupling problems is presented. It is shown that a few graphical elements with a set of rules for their use lead to the solution of many types of recoupling problems in an intuitive and systematic way. Several examples are given together with exercise to develop the reader's facility with the method.

Monogr. 137. **Applications of waveguide and circuit theory to the development of accurate microwave measurement methods and standards,** R. W. Beatty, Nat. Bur. Stand. (U.S.), Monogr. 137, 322 pages (Aug. 1973) $5.20, SD Catalog No. C13.44:137.

Key words: Attenuation definitions; attenuation measurement; barretter mount efficiency; coaxial connectors; impedance measurement; microwave network theory; mismatch errors; phase shift-measurement; power measurement; reflectometers; waveguide joints; waveguide theory.

The basic theory and analytical methods used in the development of accurate microwave measurement methods and standards are presented.

Developments at the U.S. National Bureau of Standards during 1948-1968 are described in which the above theory and analytical methods were applied.

These developments were in the fields of power, impedance, attenuation and phase shift, and led to the establishment of National Standards and calibration methods at frequencies from about 300 MHz to 30 GHz.

Monogr. 138. **MeV total neutron cross sections,** R. B. Schwartz, R. A. Schrack, and H. T. Heaton II, Nat. Bur. Stand. (U.S.), Monogr. 138, 160 pages (Jan. 1974) SD Catalog No. C13.44:138.

Key words: MeV neutrons; neutron time-of-flight; neutron total cross sections.

This report is a compilation of the MeV neutron total cross section data measured at the National Bureau of Standards over the past several years. The measurements generally span the energy interval from 0.5 to 15 or 20 MeV; data are presented in graphical form for twelve normally occuring elements, plus the separated isotopes ^{235}U, ^{238}U, and ^{239}Pu. An appendix is included which gives complete details of the experimental technique.

Monogr. 139. **Interactions of high energy particles with nuclei,** W. Czyż, Nat. Bur. Stand. (U.S.), Monogr. 139, 73 pages (Sept. 1975) SD Catalog No. C13.44:139.

Key words: diffractive production; diffractive scattering; Glauber model; hadronic components of photons; high energy scattering; multiple scattering; neutrino-nucleus interactions; shadowing effects.

Elastic scattering and diffractive production processes induced in nuclear targets by high energy projectiles are discussed in this article. Special attention is paid to the interaction of high energy hadrons and photons. Interactions of high energy electrons and neutrinos are briefly mentioned. The common features of all these processes are emphasized throughout the article: The multiple scattering and shadowing processes inside of the target nuclei. An effort is made to develop a unified way of treating nuclear interactions of particles which are either hadrons or exhibit some hadronic components in such interactions.

This article is divided into five sections: 1) Introduction, 2) Description of multiple scattering, 3) Elastic scattering of hadrons from nuclei, 4) Diffractive dissociation and diffractive excitation, 5) Diffractive production of hadrons in hadron-nucleon collisions.

Monogr. 140. **Time and frequency: Theory and fundamentals,** B. E. Blair, Ed., Nat. Bur. Stand. (U.S.), Monogr. 140, 470 pages (May 1974) SD Catalog No. C13.44:140.

Key words: accuracy; Allan variance; atomic frequency standards; atomic time scales; AT(NBS); BIH; buffer gases; CCIR; clock ensembles; clocks; crystal aging; Cs frequency standard; dissemination techniques; figure of merit; flicker noise; frequency stability; frequency standards; frequency/time metrology; hydrogen maser; leap seconds; Loran-C; magnetic resonance; masers; NBS-III; NBS-5; NBS/USNO time coordination; Omega; optical pumping; precision; quartz crystal oscillators; radio T/F dissemination; Rb frequency standards; satellite T/F dissemination; short-term stability; SI Units; TAI; television T/F dissemination; thallium beam standards; time; time dispersion; time domain; time/frequency statistics; time scale algorithm; time scales; "unified standard"; URSI; USA standard time zones; UTC (NBS); UTC (USNO).

This is a tutorial Monograph describing various aspects of time and frequency (T/F). Included are chapters relating to elemental concepts of precise time and frequency; basic principles of quartz oscillators and atomic frequency standards; historical review, recent progress, and current status of atomic frequency standards; promising areas of developing future primary frequency standards; relevance of frequency standards to other areas of metrology including a unified standard concept; statistics of T/F data analysis coupled with the theory and construction of the NBS atomic time scale; an overview of T/F dissemination techniques; and the standards of T/F in the USA. This Monograph addresses both the specialist in the field as well as those desiring basic information about time and frequency. The authors trace the development and scope of T/F technology, its improvement over periods of decades, its status today, and its possible use, applications, and development in days to come.

Monogr. 141. **The measurement of lumped parameter impedance: A metrology guide,** R. N. Jones, Nat. Bur. Stand. (U.S.), Monogr. 141, 211 pages (June 1974) SD Catalog No. C13.44:141.

Key words: adapters; capacitance; capacitors; detectors; generators; impedance instruments; impedance standards; inductance; inductors; measurement methods; reactance; resistance; resistor; standards.

The measurement of two-terminal impedance in the 30 kHz to 300 MHz range involves a variety of different methods including null, resonance, active and comparison. Each method is represented by a number of instruments having specific capabilities, strengths, and weaknesses. This metrology guide is intended to assist the scientist who is not intimately familiar with impedance measurement, in the selection and use of the best instrument for a particular requirement. Information is included on range and accuracy capabilities as well as availability and ease of operation. In addition to providing help in the selection of the appropriate instrument, there are operating tips which enhance accuracy, criteria for choosing standards, means for extending normal measurement range of an instrument, a discussion on generators and detectors, and a section on the evaluation and use

adapters. Finally, an extensive bibliography is included to assist in pursuing a particular problem beyond the depth of the guide.

Monogr. 142. **The measurement of noise performance factors: A metrology guide,** M. G. Arthur, Nat. Bur. Stand. (U.S.), Monogr. 142, 202 pages (June 1974) SD Catalog No. C13.44:142.

Key words: effective input noise temperature; measurement errors; noise factor; noise measurements; noise performance factors; noise temperature; Y-factor measurements.

This metrology guide provides the basis for critical comparisons among seven measurement techniques for average noise factor and effective input noise temperature. The techniques that are described, discussed, and analyzed include the (1) Y-Factor, (2) 3-dB, (3) Automatic, (4) Gain Control, (5) CW, (6) Tangential, and (7) Comparison Techniques. The analyses yield working equations and error equations by which accuracy capabilities are compared. Each technique is also analyzed for (a) frequency range for best measurement results, (b) special instrumentation requirements, (c) speed and convenience, (d) operator skill required, and (e) special measurement problems. General instrumentation requirements and practical measurement problems are discussed for the benefit of the nonexpert metrologist. Worked examples illustrate the principles involved in applying the working and error equations. An extensive bibliography and suggested reading list aid the metrologist to locate additional material on these measurements. Taken altogether, this guide will be helpful in selecting the best measurement technique for any of a wide range of operational requirements and, once the technique is selected, it will be of further benefit in helping the metrologist identify where his efforts should be placed to derive the greatest efficiency and accuracy from his measurement system.

Monogr. 143. **Analysis of optically excited mercury molecules,** R. E. Drullinger, M. M. Hessel, and E. W. Smith, Nat. Bur. Stand. (U.S.), Monogr. 143, 51 pages (Jan. 1975) SD Catalog No. C13.44:143.

Key words: dissociation laser; excimers; excited state kinetics; *f*-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves.

The Hg_2 molecule is representative of a class of molecules which have dissociative ground states and bound excited states. It can therefore be used as a prototype of this class of molecules which are of interest as potential new laser candidates. Because of the non-bound ground state, standard absorption spectroscopic techniques cannot be used to obtain the necessary information about the excited states. We have therefore developed new measurement techniques to obtain potential curves, *f*-values, and kinetic behavior for Hg_2. These techniques are applicable to this whole class of dissociation molecular systems.

Monogr. 144. **The rotary-vane attenuator as an interlaboratory standard,** W. Larson, Nat. Bur. Stand. (U.S.), Monogr. 144, 70 pages (Nov. 1975) SD Catalog No. C13.44:144.

Key words: attenuation; interlaboratory standard; measurement; rotary-vane attenuator.

This paper presents a comprehensive report on the measurement and the use of the rotary-vane attenuator as an interlaboratory standard.

Methods of attenuation measurement developed at NBS are used to supply data for the evaluation of the deviations from theoretical $\cos^2$ law due to rotor misalignment, gear eccentricity, resettability, resolution, and insufficient maximum attenuation.

A precision rotary-vane attenuator with an optical readout capable of 1 second of arc angular resolution has an effective attenuation resolution of 0.00005 dB at a 3 dB dial setting, and 0.0005 dB at a 30 dB dial setting. This type of precision attenuator is an effective standard for use in the dual detection microwave bridge measurement system.

Monogr. 145, Part I. **Tables of spectral-line intensities. Part I—Arranged by elements,** W. F. Meggers, C. H. Corliss, and B. F. Scribner, Nat. Bur. Stand. (U.S.), Monogr. 145, Part 1, 403 pages (May 1975) SD Catalog No. C13.44:145/I.

Key words: classification of spectral lines; intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines.

The relative intensities, or radiant powers, of 39 000 spectral lines with wavelengths between 2000 and 9000 Ångstroms have been determined on a uniform energy scale for seventy chemical elements. This was done by mixing 0.1 atomic percent of each element in powdered copper, pressing the powder-mixture to form solid electrodes which were burned in a 10 ampere, 220 volt direct-current arc, and photographing the spectra with a stigmatic concave grating while a step sector was rotating in front of the slit. The sectored spectrograms facilitated the estimation of intensities of all element lines relative to copper lines which were then calibrated on an energy scale provided by standardized lamps, and all estimated line intensities were finally adjusted to fit this calibration. Comparisons with other intensity measurements in individual spectra indicate that the National Bureau of Standards spectral-line intensities may have average errors of 20 percent, but first of all they provide uniform quantitative values for the seventy chemical elements commonly determined by spectrochemists. These data are presented by element in part I, and all 39 000 observed lines are given in order of wavelength in part II. Supersedes Monograph 32, Parts I and II and its supplement.

Monogr. 145, Part II. **Tables of spectral-line intensities. Part II—Arranged by wavelengths,** W. F. Meggers, C. H. Corliss, and B. F. Scribner, Nat. Bur. Stand. (U.S.), Monogr. 145, Part II, 228 pages (May 1975) SD Catalog No. C13.44:145/II.

Key words: classification of spectral lines; intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines.

The relative intensities, or radiant powers, of 39 000 spectral lines with wavelengths between 2000 and 9000 Ångstroms have been determined on a uniform energy scale for seventy chemical elements. This was done by mixing 0.1 atomic percent of each element in powdered copper, pressing the powder-mixture to form solid electrodes which were burned in a 10 ampere, 220 volt direct-current arc, and photographing the spectra with a stigmatic concave grating while a step sector was rotating in front of the slit. The sectored spectrograms facilitated the estimation of intensities of all element lines relative to copper lines which were then calibrated on an energy scale provided by standardized lamps, and all estimated line intensities were finally adjusted to fit this calibration. Comparisons with other intensity measurements in individual spectra indicate that the National Bureau of Standards spectral-line intensities may have average errors of 20 percent, but first of all they provide uniform quantitative values for the seventy chemical elements commonly determined by spectrochemists. These data are presented by element in part I, and all 39 000 observed lines are given in order of wavelength in part II. Supersedes NBS Monograph 32, Parts I and II.

Monogr. 146. **The theory of the optical wedge beam splitter,** Y. Beers, Nat. Bur. Stand. (U.S.), Monogr. 146, 31 pages (Oct. 1974) SD Catalog No. C13.44:146.

Key words: optical attenuation; optical beam splitter.

An optical wedge beam splitter consists of a prism of transparent material with a very small apex angle, usually about one degree. If a pencil beam of radiation is incident upon it, a portion enters the material and undergoes a series of reflections at the surfaces. At each reflection a refracted beam emerges from the material. This paper gives the basic theory for computing the ratio of the intensity of the incident beam to the intensity of any selected emerging beam and also for computing the direction of the emerging beam, assuming that the wedge angle, index of refraction, angle of incidence, and number of reflections are known.

The paper also gives the results of numerical calculations based upon this theory for sample situations which are of interest. It is shown that polarization effects can be minimized by the use of a small wedge angle and be the proper selection of the angle of incidence. In particular, it is shown that it is possible by the use of four reflections and a wedge angle of one degree to obtain attenuation factors of about 400,000 (56 db), and that the effect of changes in polarization on the attenuation factor can be held down to about one percent.

Monogr. 147. **Relativistic many-body bound systems,** M. Danos and V. Gillet, Nat. Bur. Stand. (U.S.), Monogr. 147, 149 pages (Apr. 1975) SD Catalog No. C13.44:147.

Key words: composite particles; interacting quantum fields; nuclear structure; particle structure; relativistic bound systems; relativistic nuclear physics.

The principles and the mathematical details of a fully relativistic nuclear theory are given. Since the concept of nuclear forces is a strictly non-relativistic construct, it must be abandoned and the forces must be replaced explicitly by their physical origin, i.e., by the interaction between nucleons and mesons. Thus, in this monograph the description of a nucleus has been formulated as a problem of relativistic quantum field theory which is solved by nuclear physics methods. To wit: The physics is described by specifying a Lagrangian which is a functional of the constituent fields (=of the parton fields). The solutions for the physical systems then are obtained in a time-independent treatment as expansions in the parton fields: both particles and nuclei are composite systems, made up of parton configurations, which define a representation of the Hamiltonian (associated with the specified Lagrangian). The Hamiltonian is truncated by omitting all configurations having a diagonal element exceeding that of the lowest configuration by a pre-determined value, E_{max}, and is diagonalized. All formulae needed to carry out this program are derived and given in full detail for spin 0, 1/2, and 1 parton fields for PS, PV, and φ^4 interactions. Particular attention is devoted to the center-of-mass position coordinate which in relativistic kinematics is a non-separable many-body operator. Finally, the configurations up to $E_{max}=1$ GeV are listed for the nucleon, the deuteron, and the pion.

Monogr. 148. **The role of standard reference materials in measurement systems,** J. P. Cali, T. W. Mears, R. E. Michaelis, W. P. Reed, R. W. Seward, C. L. Stanley, H. T. Yolken, and H. H. Ku, Nat. Bur. Stand. (U.S.), Monogr. 148, 56 pages (Jan. 1975) SD Catalog No. C13.44:148.

Key words: certification; meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error.

This publication is a guide to the use of Standard Reference Materials (SRM's) and should be useful to all users of SRM's, particularly those in countries developing national measurement systems. It is not intended to be an exhaustive description of the NBS-SRM program, but rather a review of the role SRM's play in the measurement system, how SRM's are certified, and what the certification means. To illustrate the use of SRM's several selected industries are described in which SRM's have made significant contributions.

Monogr. 149. **Measurement assurance program—A case study: Length measurements. Part 1. Long gage blocks (5 in to 20 in),** P. E. Pontius, Nat. Bur. Stand. (U.S.), Monogr. 149, 75 pages (Nov. 1975) SD Catalog No. C13.44:149.

Key words: measurement algorithm; measurement assurance; measurement process; measurement unit; process variability; uncertainty.

The differences between the methods of traditional metrology and the measurement assurance programs are briefly discussed. The historical data relative to long gage blocks (5 in to 20 in) are analyzed to provide a basis for comparison with results from new measurement processes formulated in accordance with the philosophies of the measurement assurance programs. The results from the new processes are in agreement with the work of the past. The current length values assigned and associated uncertainties are shown for selected long gage blocks used in the dissemination of length by the National Bureau of Standards. These long gage blocks are a part of a growing collection of similar well characterized artifact standards for use in comparative measurement processes. The methods and techniques used in developing the new measurement process are discussed in some detail. It is the author's intent that, in addition to the technical content, this paper be largely tutorial in the area of measurement process analysis. This paper is, in essence, a report on the extension of the techniques first suggested in NBS Monograph 103 "Realistic Uncertainties and the Mass Measurement Process" to the area of length measurement.

Monogr. 150. **Liquid-in-glass thermometry,** J. A. Wise, *Nat. Bur. Stand. (U.S.), Monogr. 150,* 30 pages (Jan. 1976) SD Catalog No. C13.44:150.

Key words: calibration; emergent stem; liquid-in-glass thermometer; reference point; stirred liquid comparison bath; temperature scale.

This Monograph, which supersedes NBS Monograph 90, contains information of general interest to manufacturers and users of liquid-in-glass thermometers. Instructions explaining how to submit a thermometer to the National Bureau of Standards for calibration are provided, and the techniques and equipment, such as stirred liquid comparison baths, used in the calibration procedures are described. A discussion of important principles of acceptable thermometer design and factors affecting their use is included. Listed are tables of tolerances reflecting good manufacturing practices and reasonably attainable accuracies expected with liquid-in-glass thermometers. The calculation of corrections for the temperature of the emergent stem is given in detail for various types of thermometers and conditions of use.

Monogr. 151. **Automatic measurement of network parameters—A survey,** R. W. Beatty, *Nat. Bur. Stand. (U.S.), Monogr. 151,* 113 pages (June 1976) SD Catalog No. C13.44:151.

Key words: automatic network analyzers; computer-controlled measurement; magic tee; microwave measurement methods; multiple probe devices; reflectometers; rotating probe devices; slotted lines; survey of automatic techniques; swept frequency measurements; Wheatstone Bridge.

A survey is made of principles, methods, and systems developed for semiautomatic and automatic measurement of network parameters, such as the complex scattering coefficients, impedance, VSWR, return loss, attenuation, and group delay time. The period covered is from 1922 to 1975 and develop-

ments range from simple ideas such as a motor driven probe for a slotted line, to computer-controlled transmission and reflection measurement systems.

The essential ideas and features of each development are briefly described and both similarities and differences between various schemes are pointed out. Trends in modern developments are noted and some of the options open for future work are mentioned. A bibliography of 151 references is included.

Monogr. 152. **A gage block measurement process using single wavelength interferometry,** J. S. Beers, Nat. Bur. Stand. (U.S.), Monogr. 152, 34 pages (Dec. 1975) SD Catalog No. C13:44:152.

Key words: calibration; gage blocks; interferometery; laser; length; measurement process; uncertainty.

The interferometric transfer of the length unit from its defined wavelength to NBS reference standard gage blocks is basic to the gage block calibration program at NBS. The interferometric measurement process using a laser light source and a Kosters type gage block interferometer is described here. Continuous evaluation and refinement of the process is aided by statistical treatment and control chart techniques. All error sources, both random and systematic, are evaluated and the process is maintained in a state of statistical control.

Monogr. 153. **The first spectrum of hafnium (Hf I),** W. F. Meggers and C. E. Moore, *Nat. Bur. Stand. (U.S.), Monogr. 153,* 117 pages (July 1976) SD Catalog No. C13.44:153.

Key words: analysis, Hf I spectrum; hafnium, analysis of first spectrum; spectrum, Hf I; Zeeman effect, Hf I.

The present publication terminates the work on the analysis of Hf I which was started by the late W. F. Meggers in 1928 and left unfinished in 1966. His final line list contains some 4700 lines of which about 67 percent have been classified. Observed g-values are known for 198 levels. The reliability of the Zeeman observations is indicated in tables containing sums of Observed and Landé g-values for selected groups of "even" and "odd" terms.

An attempt has been made to continue Meggers' analysis in LS-coupling as far as possible. This coupling is not rigorous in Hf I, and many intervals are irregular. Consequently, the levels are given also in numerical order with the even and odd levels presented in separate tables.

An ionization limit of 54700 ± 600 cm^{-1}, giving an ionization potential of 6.78 ± 0.07 eV has been derived from a two-member series.

The long line lists are given in two Appendices: Appendix A contains the observed Zeeman data for the individual lines, 531 in all; Appendix B consists of the complete line list of observed and classified lines.

By far the greater part of the analysis is that of Meggers. Detailed notes explain changes that have been introduced and additions to this work.

Monogr. 154. **The dynamics of fields of higher spin,** R. W. Hayward, *Nat. Bur. Stand. (U.S.), Monogr. 154,* 99 pages (Aug. 1976) SD Catalog No. C13.44:154.

Key words: causality; high spin fields; inhomogeneous Lorentz group; relativistic fields; wave equations.

There are several difficulties that plague all existing relativistic equations of motion describing elementary fields having an intrinsic spin greater than one. While the free field equations can be shown to be explicitly covariant, the introduction of interactions gives rise to a phenomenon of noncausality. In the presence of interactions, the retarded solutions spread beyond the light cone and the influence travels faster than light. Furthermore, the solutions in certain simple potentials do not have a finite norm, violating the probabilistic requirements of quantum mechanics.

This paper develops a relativistic theory that is free of the aforementioned difficulties. This Lagrangian theory describes fields and particles with arbitrary mass and charge and having any discrete spin, integer or half integer. Apart from gauge conditions there are no subsidiary conditions.

A matrix formulation is used. The generators of the inhomogeneous Lorentz group for a field of any intrinsic spin and mass are defined in terms of Wigner operators of the group SU(2) and a metric operator. A maximal Abelian set of invariants is formed which defines two completely reducible representation bases of the inhomogeneous Lorentz group having distinct structures. A set of γ matrices, obeying a Clifford algebra, is also defined in terms of the Wigner operators and the metric operator. State vectors having different structures and Lorentz transformation properties can be related to one another by operators involving the γ matrices.

The equations of motion can be obtained from the Lagrangian by variational methods, and certain aspects of the canonical formalism can be used to quantize the fields. Invariance of the Lagrangian under infinitesimal displacements and rotations yield conservation laws and constants of the motion for pertinent physical observables. The metric of the Hilbert space of the states is uniquely defined for any spin field, assuring positive definite four momenta and charge.

The Dirac formulation for the spin one-half field and the Maxwell-Lorentz formulation for the electromagnetic field are special cases of this theory.

Monogr. 157. **Computers, health records, and citizen rights,** A. F. Westin, *Nat. Bur. Stand. (U.S.), Monogr. 157,* 401 pages (Dec. 1976) SD Catalog No. C13.44:157.

Key words: citizen rights; computers; confidentiality; data systems; health records; information policy; management principles; medical records; privacy; recordkeeping practices; security.

This report investigates the impact of computers on citizen rights in the health recordkeeping area. Under Dr. Alan F. Westin's direction, from July of 1974 to April of 1976, a small interdisciplinary team did the following: (1) examined published literature from medicine and health, law, computing, and social science; (2) conducted interviews with major computer manufacturers, systems developers, health professionals and civil liberties, public interest, consumer, and minority-rights groups; (3) made on-site visits to six representative health-care organizations using computers to handle personal records; (4) corresponded with 70 organizations in the health field; and (5) subjected an initial draft report to review by a conference of experts in September 1975 and subsequently by about 50 outside reviewers. The findings of this investigation were then combined into this four-part report. Part One describes the world of medical data and citizen rights within the framework of three zones—primary health care (by health professionals), service payers and health care reviewers, and social uses of health data (such as in employment, life insurance, and welfare); Part Two treats patterns of computerization in health-care organizations that were studied in depth; and Part Four analyzes the impact of computerization on personal health records, presents comparisons with six other democratic nations, and states 12 recommended management principles for health care data systems. The report also contains a 28 page bibliography and twelve appendices with support documents and information.

Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

H44. **Specifications, tolerances, and other technical requirements for commercial weighing and measuring devices,** H. F. Wollin, Compiler and Editor, Nat. Bur. Stand. (U.S.), Handb. 44, Fourth Edition, 222 pages (Dec. 1971).

Key words: Commercial weighing and measuring devices; specifications; technical requirements; tolerances.

NBS Handbook 44, Fourth Edition, "Specifications, Tolerances, and Other Technical Requirements for Commercial Weighing and Measuring Devices," is a revision of the Third Edition of Handbook 44. This Fourth Edition adopted by the National Conference on Weights and Measures is given legal status in practically every state in the United States. (Supersedes NBS Handbook 44—3rd Edition.)

H102. **ASTM metric practice guide,** NBS Handb. 102 (March 10, 1967).

Key words: Metric system; international system (SI); conversion factors.

This Handbook, prepared by the ASTM Ad Hoc Committee on Metric Practice, is intended to assist persons confronted with the task of conversion between U. S. customary units and SI (metric) units.

Rules for conversion and rounding are explained in detail, and an extensive list of factors for conversion is included. A brief history of the development of SI is presented.

H103. **Tabulation of data on receiving tubes,** J. K. Moffitt, NBS Handb. 103 (Sept. 29, 1967).

Key words: Basing connections; characteristics; electron tubes; similar types; tabulation.

A tabulation of Receiving-Type Electron Tubes with some characteristics of each type has been prepared in the form of two major listings, a Numerical Listing in which the tubes are arranged by type number, and a Characteristic Listing in which the tubes are arranged by tube type and further ordered on the basis of one or two important parameters. The tabulation is accompanied by a listing of similar tube types and basing connections for the listed tubes. (Supersedes Handbook 83).

H104. **Tabulation of data on microwave tubes,** J. K. Moffitt, NBS Handb. 104 (Sept. 29, 1967).

Key words: Characteristics tabulation; electron tubes; microwave electron tubes; tabulation.

A tabulation of microwave electron tubes with characteristics of each type has been arranged in the form of two major listings, a Numerical Listing in which the tubes are arranged by type number, and a Characteristic Listing in which the tubes are arranged by the kind of tube, and further ordered on the basis of minimum frequency and power output. (Supersedes NBS Handbook 70).

H105-1. (Apr.1969) Superseded by H105-1, Revised 1972.

H105-1 (Revised 1972). **Specifications and tolerances for reference standards and field standard weights and measures. 1. Specifications and tolerances for field standard weights (NBS class F),** T. M. Stabler, Nat. Bur. Stand. (U.S.), Handb. 105-1, 12 pages (July 1972).

Key words: Field standard weights; specifications; test weights; tolerances; weights and measures inspection; weights used by servicemen.

These specifications and tolerances are recommended as minimum requirements for standards used in the field by State and local weights and measures officials in examination of weighing devices. Revision of NBS Handbook 105-1, April 1969.

H105-2. **Specifications and tolerances for reference standards and field standard weights and measures. 2. Specifications and tolerances for field standard measuring flasks,** B. C. Keysar, Nat. Bur. Stand. (U.S.), Handb. 105-2, 6 pages (Jan. 1971).

Key words: Accurate measurements of volume of liquids; field standard measuring flasks; specification; tolerances; weights and measures inspection.

These specifications and tolerances are recommended as ninimum requirements for standards used in the field by State

H105-3. **Specifications and tolerances for reference standards and field standard weights and measures. 3. Specifications and tolerances for metal volumetric field standards,** B. C. Keysar, Nat. Bur. Stand. (U.S.), Handb. 105-3, 8 pages (May 1971).

Key words: Accurate measurements of volumes; field standard; metal volumetric field standards; provers; specifications; test measures; tolerances; weights and measures inspection.

These specifications and tolerances are recommended as minimum requirements for standards used in the field by State and local weights and measures officials in quantity determinations of liquid commodities.

H106. **CODASYL COBOL journal of development 1968,** Nat. Bur. Stand. (U.S.), Handb. 106, 344 pages (July 1969).

Key words: COBOL; CODASYL; journal.

This document is a report to the COBOL community from the Conference on Data Systems Languages (CODASYL) Common Business Oriented Language (COBOL) Programming Language Committee. It is an official report documenting the development activities of CODASYL through July 1968.

H107. **American National Standard. Radiological safety in the design and operation of particle accelerators,** Nat. Bur. Stand. (U.S.), Handb. 107, 22 pages (June 1970).

Key words: Accelerator design; accelerator operation; health physics; particle accelerators; radiation measurements; radiation protection; standard.

This American National Standard provides the basic considerations essential to the safe operation of a particle accelerator. It applies principally to particle accelerators with primary energies less than 100 MeV. It considers the characteristics of and controls for radiations as they affect accelerator design, operating procedures, and exposure evaluation. The section on radiation protection design criteria includes radiation shielding considerations and the use of safety systems. Operational health physics requirements are treated extensively, and radiation measurements are discussed in terms of the types of radiation that may be produced and proper techniques for monitoring. The final section, on dose assessment, includes basic exposure considerations such as maximum permissible dose and dose equivalent.

H108. **Weights and measures labeling handbook,** D. E. Edgerly, Nat. Bur. Stand. (U.S.), Handb. 108, 406 pages (May 1971)

Key words: Consumer package; exemption; fluid measure; labeling; net quantity; principal display panel; regulations; weights and measures.

The Weights and Measures Labeling Handbook has been prepared for use by State weights and measures officials in the enforcement of State laws and regulations pertaining to the packaging and labeling of commodities. The Handbook provides a cross indexed compilation of the requirements of the Model State Packaging and Labeling Regulation, U. S. Department of Agriculture regulations, and regulations of the Food and Drug Administration and Federal Trade Commission issued pursuant to the Fair Packaging and Labeling Act.

H109. **Aluminum wire tables,** C. Peterson, J. L. Thomas, and H. Cook, Editors, Nat. Bur. Stand. (U.S.), Handb. 109, 66 pages (Feb. 1972).

Key words: Aluminum conductor; aluminum wire cables; conversion factors; electrical conductivity; electrical conductor; electrical resistivity; standard values; temperature coefficient.

This handbook of aluminum wire tables is a companion publication to NBS Handbook 100, Copper Wire Tables, a review of which is contained in Part I, Sections 1 and 2. Data are presented on the conductivities and resistivities of both solid and stranded wires of various sizes and composition, together with a variety of other data of interest to the designer of electrical equipment and installations. Values are expressed in both U.S. Customary and International System (SI) Units. Wire sizes involved are based on and restricted to those manufactured and typically used in the United States. American Wire Gage sizes are used for the smaller range of conductors from 56 gage through 4/0. Larger conductors are sized on the basis of circular mil area. The alloy compositions included in these tables are EC-0 (annealed), EC-H19, 5005-H19, and 6201-T81; values are given over a temperature range of 0 to 100 °C.

H110-1. **National Electrical Safety Code. Part 1. Rules for the installation and maintenance of electrical supply stations and equipment,** Nat. Bur. Stand. (U.S.), Handb. 110-1, 43 pages (June 1972).

Key words: Electrical safety; electrical supply station; electrical utility station; high voltage safety; power station equipment; power station safety.

This Handbook contains Part 1 of the National Electrical Safety Code and supersedes NBS Handbook H31 and pages 31 through 75 of the NBS Handbook H30. Part 1 of this Code covers the electric conductors and equipment in electrical supply stations along with the associated structural arrangements employed, for example, by an electrical or railway utility in the exercise of its function as a utility and accessible only to properly qualified personnel. It also covers similar electric conductors and equipment in electrical supply stations when owned by and installed in an industrial establishment, where the electrical supply stations are under the control of and accessible only to properly qualified persons. Examples of such industrial establishments are the paper and steel industries.

H111. **American National Standard. Radiation safety for x-ray diffraction and fluorescence analysis equipment,** Nat. Bur. Stand. (U.S.), Handb. 111, 20 pages (June 1972).

Key words: Radiation safety; x-ray equipment.

This standard reviews the types of injuries resulting from accidental exposure to ionizing radiation resulting from the operation of x-ray diffraction and fluorescence analysis equipment, establishes equipment design criteria, sets up requirements for approved operating procedures and recommends the establishment of health surveillance, and personnel monitoring programs. The circumstances under which operation of equipment must be limited to specially designated areas equipped with radiation barriers and warning signs are set forth. Maximum permissible dose limits established by the National Council on Radiation Protection and Measurement are stated. A list of references to selected articles on various aspects of radiation safety is given and notes on the detection and measurement of radiation from x-ray diffraction and fluorescence analysis equipment are included in an appendix.

H112. **Examination procedure outlines for commercial weighing and measuring devices. A manual for weights and measures officials,** O. K. Warnlof, Nat. Bur. Stand. (U.S.), Handb. 112, 89 pages (June 1973) $1.10, SD Catalog No. C13.11:112.

Key words: Codes; examination procedure; inspection; meters; outlines; scales; tests.

This handbook presents an operational guide for the field examination of commercial weighing and measuring devices. It includes inspection and test procedures, with code references to National Bureau of Standards Handbook 44, Fourth Edition, "Specifications, Tolerances, and Technical Requirements for Commercial Weighing and Measuring Devices."

H113. **CODASYL data description language. Journal of Development, June 1973,** Nat. Bur. Stand. (U.S.), Handb. 113, 155 pages (Jan. 1974) SD Catalog No. C13.6/2:113.

Key words: COBOL; CODASYL; data base administration; data base management; data base task group; data description language.

This Journal of Development reports the work of the CODASYL Data Description Language Committee. The Committee was assigned the tasks of establishing "ways to aid the functions of data administration and systems administration." The Committee's charter included, "the provision of specifications for the declarations required to establish and maintain data base structures." As a step towards this purpose, the Journal contains three sections which treat the Background and History of the Data Description Language Committee, Major Concepts, and the specifications of the Data Description Language. The Committee based its work, in part, on the 1971 report of the Data Base Task Group Report.

The approved Data Description Language specifications contain the syntax and semantic rules that permit the description of the structure and contents of a data base in a language independent of, but common to, many other high level programming languages. The language specifications will have a significant impact on the development of functionally compatible data base management systems and will increase the portability of programs between different computer systems.

Though not part of the approved language specifications, the presentation of the major concepts will help in the understanding of the specifications. Similarly, the background and history information will help explain the evolutionary growth of the Data Description Language.

H114. **General safety standard for installations using non-medical x-ray and sealed gamma-ray sources, energies up to 10 MeV.** *(ANS N543-1974),* E. H. Eisenhower, Nat. Bur. Stand. (U.S.), Handb. 114, 69 pages (Feb. 1975) SD Catalog No. C13.11:114.

Key words: gamma-ray equipment; radiation installations; radiation safety; x-ray equipment.

This standard establishes requirements for the design and operation of common types of installations which use gamma and x radiation for non-medical purposes. Its objective is to protect persons who work with or are near such installations, as well as the general public, against excessive exposure to radiation. Maximum permissible dose limits established by the National Council on Radiation Protection and Measurements are cited. Methods for achieving adequate radiation protection are described, including structural details, surveys and inspections, and operating procedures. Appendixes contain technical information useful for design of radiation shielding barriers. (Revision of ANS Z54.1-1963, published as NBS Handbook 93).

H115. **Energy Conservation Program Guide for Industry and Commerce (EPIC),** R. R. Gatts, R. G. Massey, and J. C. Robertson, Nat. Bur. Stand. (U.S.), Handb. 115, 212 pages (Sept. 1974) SD Catalog No. C13.11:115.

Key words: energy conservation; energy conservation guide; energy conservation opportunities; energy conservation program; industrial energy conservation.

The Energy Conservation Program Guide for Industry and Commerce (EPIC) is a guide to assist business and industry to establish an on-going conservation program. EPIC outlines the steps in an energy conservation program and suggests specific ways to reduce energy use in manufacturing and commercial businesses. EPIC focuses on two aspects of energy conservation: (1) The key steps in an implementation plan for an energy conservation plan; (2) Energy Conservation opportunities which have been identified by industry.

H115. Supplement 1. **Energy conservation program guide for industry and commerce (EPIC),** R. G. Massey, Ed., Nat. Bur. Stand. (U.S.), Handb. 115, Suppl. 1, 212 pages (Dec. 1975) SD Catalog No. C13.11:115/Suppl. 1.

Key words: energy conservation; energy conservation guide; energy conservation opportunities; energy conservation program; industrial energy conservation.

The Energy Conservation Program Guide for Industry and Commerce (EPIC) is a handbook to assist business firms to establish an on-going conservation program. Supplement contains simplified management program, additional conservation opportunities, case studies, and sources of information.

H116. **American National Standard N540; classification of radioactive self-luminous light sources,** *Nat. Bur. Stand. (U.S.), Handb. 116,* 15 pages (Jan. 1976) SD Catalog No. C13.11:116.

Key words: classification; containment; designation; light sources; national standard; radiation source; radioactive; radioluminous products; self-luminous sources; test procedures.

This standard establishes the classification of certain radioactive self-luminous sources according to radionuclide, type of source, activity, and performance requirements. The objectives are to establish minimum prototype testing requirements for radioactive self-luminous light sources, to promote uniformity of marking such sources, and to establish minimum physical performance for such sources. This standard is primarily directed toward assuring adequate containment of the radioactive material. Testing procedures and classification designations are specified for discoloration, temperature, thermal shock, reduced pressure, impact, vibration, and immersion. A range of test requirements is presented according to intended usage and source activity.

H117. **Examination of vapor-measuring devices for liquefied petroleum gas. A manual for weights and measures officials,** S. Hasko, Nat. Bur. Stand. (U.S.), Handb. 117, 25 pages (Dec. 1975) SD Catalog No. C13.11:117.

Key words: bell prover; calibration; inspection; liquefied petroleum gas; pressure; report form; temperature; temperature compensator; test; vapor meter; volume.

A manual for State and local weights and measures officials for the examination and test of liquefied petroleum gas vapor measuring devices. Definitions, test methods, and testing apparatus (including description and calibration procedures) are given. Inspection and test procedures are reviewed. A proposed test report form along with suggestions on reporting the results of a test are included. Provision is made for accommodating a changeover to metric units of registration in the definitions, correction tables, procedures, and in reporting a test. Supersedes NBS Handbook 45.

H118. **MUMPS Language Standard,** J. T. O'Neill, Ed., Nat. Bur. Stand. (U.S.), Handb. 118, 144 pages (Dec. 1975) SD Catalog No. C13.11.118.

Key words: data handling language; interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard.

This NBS Handbook contains a three-part description of various aspects of the MUMPS computer programming language. Part I, the MUMPS Language Specification, consists of a stylized English narrative definition of the MUMPS language which was adopted and approved for publication as a Type A release of the MUMPS Development Committee on March 12, 1975. Part II, the MUMPS Transition Diagrams, represents a formal definition of the language described in Part 1, employing a form of line drawings to illustrate syntactic and semantic rules governing each of the language elements; it was adopted and approved for publication as a Type A release of the MUMPS Development Committee on September 17, 1975. Part III, the MUMPS Portability Requirements, identifies constraints on the implementation and use of the language for the benefit of parties interested in achieving MUMPS application code portability; it was adopted and approved for publication as a Type A release of the MUMPS Development Committee on September 17, 1975.

A bibliography of other MUMPS Development Committee documents is included.

H119. **Quieting: A practical guide to noise control,** R. D. Berendt, E. L. R. Corliss, and M. S. Ojalvo, *Nat. Bur. Stand. (U.S.), Handb. 119,* 163 pages (July 1976) SD Catalog No. C13.11:119.

Key words: airborne and structure-borne sounds; aircraft noise intrusion; annoyance; appliance noise; health and hearing hazards; household noise; legal and community action; loudness; noise control and abatement; traffic noise.

This guide offers practical solutions for ordinary noise problems that a person is likely to meet. The discussion describes the ways in which sounds are generated, travel to the listener, and affect his hearing and well-being. Recommendations are given for controlling noise at the source and along its path of travel, and for protecting the listener. The guide instructs the reader by way of "Warning Signs" on how to determine whether he is being subjected in his environment to prolonged noise exposures that may prove hazardous to his hearing. Remedies are given for noise problems that a person is likely to find in his home, at work and at school, while traveling, and in the growth

and development of his community. The remedies include noise prevention techniques and selection of quiet alternatives to existing noise sources. General principles for selecting quiet appliances are given. Ways of searching for the sources of noise and for determining the paths over which they travel to the listener are described. A detailed index is given for individual noise sources describing specific solutions to the problems they present. General ways of looking for inherently quiet homes and travel accomodations are described. In a final chapter, there are suggestions for enlisting community help where large external sources of noise must be quieted, such as those arising from public utilities and public transportation.

H120. **Energy management guide for light industry and commerce,** W. J. Kelnhofer and L. A. Wood, *Nat. Bur. Stand. (U.S.), Handb. 120,* 28 pages (Dec. 1976) SD Catalog No. C13.11:120.

Key words: energy conservation; energy conservation guide; energy conservation opportunities; energy conservation program; industrial energy conservation.

The Energy Management Guide for Light Industry and Commerce is a training tool to assist small industrial and commercial organizations in an energy conservation program. It is part of a planned series, starting with NBS HB-115 (EPIC), of guides and training aids to assist industry in making the most efficient use of the energy supply.

While much of the information in the Light Industry Guide has been published in EPIC, the material has been edited and rewritten in shortened form for use by the large number of small organizations with a limited supply of technical manpower. The energy conservation case studies (Cost Saving Opportunities) have been written with this target audience in mind.

3.8. MISCELLANEOUS PUBLICATIONS

As the name implies, this series includes material which, because of its character or because of its size, does not fit into any of the other regular publication series. Some of these are charts, administrative pamphlets, Annual Reports, Weights and Measures Conference Reports, and other subjects appropriate to the Miscellaneous series.

The name of this series was changed to Special Publications in 1970.

M236, Superseded by Special Publication 432.

M260, All editions superseded by Special Publication 260, 1975-76 Ed.

M260-11. **Standard reference materials: Viscosity of a standard lead-silica glass,** A. Napolitano and E. G. Hawkins, NBS Misc. Publ. 260-11 (Nov. 7, 1966).

Key words: Beam bending; fiber elongation; glass; glass standard; glass viscosity; lead-silica glass; restrained sphere; rotating cylinders; standard; standard reference material; viscosity; viscosity standard.

The viscosity of a lead-silica glass has been measured at the National Bureau of Standards and seven other laboratories. Determinations were made in the range of 10^2 to 10^{15} poises (1350-400 °C). Measurements were made by the rotating cylinder, restrained sphere, fiber-elongation, and beam-bending methods. The results have been critically evaluated and the glass has been issued as Standard Reference Material No. 711.

M260-12. **Standard reference materials: Homogeneity characterization of NBS spectrometric standards III: White cast iron and stainless steel powder compact,** H. Yakowitz, D. L. Vieth, R. E. Michaelis, NBS Misc. Publ. 260-12 (Sept. 19, 1966).

Key words: Microanalytical techniques; solids mass spectrometer; electron probe microanalyzer; NBS white cast iron sample (SRM 1175); stainless steel powder metallurgy compact; optical metallography; macroanalytical techniques; optical emission; x-ray spectrochemical analysis.

This paper describes a continuation of the NBS effort to characterize metal materials as to their suitability for use in calibrating microanalytical techniques such as the solids mass spectrometer and, especially, the electron probe microanalyzer. An NBS white cast iron sample (SRM 1175) and a specially prepared stainless steel powder metallurgy compact have been investigated by means of electron probe microanalysis and optical metallography. Results for six elements in the cast iron and three in the stainless steel are given. It is concluded that neither of these materials is suitable for use for calibration in microanalytical techniques. It is emphasized, however, that this in no way affects the usefulness of the white cast iron material for macroanalytical techniques such as optical emission and x-ray spectrochemical analysis.

M260-13. **Standard reference materials: Mossbauer spectroscopy standard for the chemical shift of iron compounds,** J. J. Spijkerman, D. K. Snediker, F. C. Ruegg, and J. R. DeVoe, NBS Misc. Publ. 260-13 (July 28, 1967).

Key words: Mossbauer; spectroscopy; standard; differential chemical shift; quadrupole splitting; random error; systematic error; sodium nitroprusside; iron compounds; optical Mossbauer spectrometer; tandem Mossbauer spectrometer; velocity calibration.

The preparation, calibration, and use of the Standard Reference Material for chemical shift of iron compounds in Mossbauer Spectroscopy is described. This standard is a properly oriented single crystal of sodium pentacyanonitrosylferrate (II) dihydrate (sodium nitroprusside). Primary standards were calibrated with a high accuracy optical Mossbauer spectrometer and secondary calibrations were made with a tandem Mossbauer spectrometer. The midpoint between the two absorption peaks in the spectrum at 25.0 °C provide a useful velocity scale calibration of the spectrometer. Descriptions of the spectrometers used and the error analysis associated with the data are given. Suggested format for reporting Mossbauer spectra and their parameters is also presented.

M260-14. **Standard reference materials: Determination of oxygen in ferrous materials, SRM 1090, 1091 and 1092,** O. Menis and J. T. Sterling, NBS Misc. Publ. 260-14 (Sept. 23, 1966).

Key words: Vacuum fusion; inert gas fusion; oxygen; ferrous standard reference materials; CO by infrared absorbancy; homogeneity; certified value; eighteen cooperating laboratories.

A description is presented of methods used for the determination of homogeneity and the establishment of the oxygen values certified by NBS for three ferrous standard reference materials. These standards are represented by two low alloy materials, ingot and vacuum melted iron containing 484 and 28 ppm of oxygen respectively, and a high alloy steel containing 131 ppm of oxygen. The analyses of these materials are based on two vacuum fusion procedures. The poor results for the high alloy steel obtained by the first of these methods are explained. The first method is based on manometric measurements and depends on the conversion of CO to CO_2 by copper oxide and on a differential freezing of gases. In the second method a system is used which provides a highly efficient degassing of sample and a direct measurement of CO by infrared absorbancy. Additional data from an analysis by inert gas fusion method also indicate that the homogeneity of a single rod of ingot iron, over a wide range of sample size, has a relative standard deviation of less than two per cent. From control data and homogeneity studies it was ascertained that the uncertainty limits stated in the NBS certificate include the error due to the relative inhomogeneity between rods. Finally, data from eighteen laboratories cooperating in this program are presented.

M260-15, Superseded by Special Publication 260-41.

M262-2. **Legibility of alphanumeric characters and other symbols: II. A reference handbook,** D. Y. Cornog and F. C. Rose, NBS Misc. Publ. 262-2 (Feb. 10, 1967).

Key words: Alphanumeric characters; displays; handbook; human factors; legibility; psychology; readability; standards; symbols; type faces; typography; visibility.

The major psychological findings and data in the field of the legibility of alphanumeric characters and other symbols are provided in this detailed Reference Handbook. Summaries and extracts of information for 203 experimental, developmental, review, and other legibility reports are presented and are multiply indexed in depth by (1) a matrix, cross-reference index (article versus functional variables - environmental typographical), (2) author indexes (alphabetical and chronological), and (3) a character-face-name index. These Handbook entries are further indexed by the permuted title index in NBS Miscellaneous Publication No. 262-1, "Legibility of Alphanumeric Characters and Other Symbols: I. A Permuted Title Index and Bibliography." Selected samples of several important experimental and other faces are presented in an appendix.

M273. **Critical phenomena. Proceedings of a conference, Washington, D.C., April 1965,** Editors, M. S. Green and J. V. Sengers, NBS Misc. Publ. 273 (Dec. 1, 1966).

Key words: Critical phenomena; critical point; second order phase transition; singularities; Pade approximate fluctuations; opalescence; X-transitions.

A conference on Critical Phenomena was held at the National Bureau of Standards, April 5-8, 1965. This volume contains 30 of the papers included in the program, together with the discussions which followed oral presentation. Topics covered include equilibrium critical phenomena in fluids, critical phenomena in ferro- and antiferromagnets, logarithmic singularities in specific heats, elastic, and inelastic scattering, and transport and relaxation phenomena in the critical region.

M277, Superseded by Special Publication 380.

M278 Supplement. **Bibliography on atomic transition probabilities, May 1966 through December 1967,** B. M. Glennon and W. L. Wiese, Nat. Bur. Stand. (U.S.), Misc. Publ. 278, 46 pages (Apr. 1968). Superseded by SP320 & suppls.

Key words: Allowed; atomic; discrete; forbidden; transition probability.

A supplement to NBS Miscellaneous Publication 278, Bibliography on Atomic Transition Probabilities is presented, which covers the most recent literature on this subject from May 1966 through December 1967. The papers are arranged according to elements and stages of ionization, and the method employed and class of transitions are indicated behind each reference. Only articles on discrete transitions, both allowed and forbidden, are listed. Papers containing data for more than 20 individual elements or stages of ionization are collected separately in front of the list in order to keep this bibliography at a reasonable size. Also included is a selected list of papers dealing with the subject of transition probabilities from a general point of view.

M280. **Hydraulic research in the United States, 1966,** Editors, H. K. Middleton and G. Kulin, NBS Misc. Publ. 280 (Sept. 8, 1966).

Key words: Hydraulic; hydrology; naval hydrodynamics.

Research and development projects being conducted in 1966 in hydraulic and hydrologic laboratories of universities and Federal agencies throughout the United States and Canada are briefly described. A list of the contributing laboratories is given. The status of continuing projects covered by previous issues of the publication is reported upon, as well as on new projects in progress, the results of completed work are given. References to publications relating to the projects and an extensive subject index are included.

M281. **Bibliography on flame spectroscopy. Analytical applications, 1800-1966,** R. Mavrodineanu, NBS Misc. Publ. 281 (Feb. 23, 1967).

Key words: Flame; spectroscopy; analytical emission; atomic absorption; electrical discharge; bibliography; indexed.

Flame spectroscopy, especially in its analytical applications, continues to be an active field of study. Its literature is growing steadily, and the use of flame photometry in many specialized applications calls for a comprehensive indexed bibliography. This collection consists of 5,113 references to works on flame spectroscopy, selected with emphasis toward analytical measurements. It covers the period from 1800 to 1966. Subject indexes, keyed by number to the references cited, precede most of the sections.

M282, Superseded by Special Publication 387.

M283. **Technical highlights of the National Bureau of Standards, Annual Report Fiscal Year 1966,** NBS Misc. Publ. 283 (Apr. 1967).

Key words: Annual report; technical highlights.

This is an illustrated digest of NBS technical and scientific activities during the fiscal year ending June 30, 1966. It lists major programs as they were carried out by the three NBS institutes: Institute for Basic Standards, Institute for Materials Research, and Institute for Applied Technology. Summaries are given of typical institute projects in applied mathematics, electricity, metrology, mechanics, heat, atomic physics, physical chemistry, laboratory astrophysics, radiation physics, radio standards, analytical chemistry, polymers, metallurgy, inorganic materials, reactor radiations, cryogenics, building research, information technology, instrumentation, radio propagation, engineering standards, and weights and measures. Also included are discussions of the Clearinghouse for Federal Scientific and Technical Information, the National Standard Reference Data System, Standard Reference Materials program, measurement services program, and national and international cooperative activities. This report also includes the description of the new laboratory facilities at Gaithersburg, Md., and the history of their construction.

M284. **Technology and world trade. Proceedings of a symposium held at the National Bureau of Standards, Gaithersburg, Md., November 16-17, 1966,** Editor, R. L. Stern, NBS Misc. Publ. 284 (1967).

Key words: Developing countries; international standards; role of government; role of private enterprise; technology; world trade.

The publication embodies the proceedings of the Symposium on Technology and World Trade, held on the occasion of the dedication of the new laboratories of the National Bureau of Standards at Gaithersburg, Maryland. Subjects considered by the 29 speakers and discussants from the United States, nine other nations, and the United Nations, include: Technology's Impact on the Character of World Trade and Investment; International Competition and Co-operation in Technology; The Role of International Standards; The Respective Roles of Government, Public and Private Enterprises in Creating, Using and Transferring Technology; and Technology in Relation to the Developing Countries.

M285. **Nuclear science and technology for ceramists. Proceedings of the American Ceramic Society Symposium, Washington, D.C., April 7-12, 1966,** NBS Misc. Publ. 285 (May 26, 1967).

Key words: Ceramics; lattice defects; nuclear fuels; nuclear science and technology; radiation damage; reactor materials.

An introductory survey is given on the subject of Nuclear Ceramics, consisting of six invited papers presented at an American Ceramic Society Symposium held in April, 1966. Authors and their titles are: C. O. Muehlhause (National Bureau of Standards) "Material Radiation Environment"; A. B. Lidiard (UK Atomic Energy Research Establishment, Harwell, England) "Radiation Damage in Ceramics"; P. W. Levy (Brookhaven National Laboratory) "Physical Properties of Irradiated Ceramic Materials"; R. J. Thorn and G. H. Winslow (Argonne National Laboratory) "Chemical Problems Associated with Lattice Defects"; D. W. Readey and J. H. Handwerk (Argonne National Laboratory) "Nuclear Fuel Materials"; and D. R. deHalas, W. D. Freshley, and W. C. Morgan (Pacific Northwest Laboratories, Batelle Memorial

Institute) "Reactor Materials Design." The volume is intended to provide a survey of those properties involved in the choice and use of ceramics for nuclear technology, and as a reference useful in the teaching of ceramic science.

M286, Superseded by Letter Circular 1071.

M287. **Calculation of the properties of vacancies and interstitials. Proceedings of a conference, Shenandoah National Park, Va., May 1-5, 1966,** NBS Misc. Publ. 287 (Nov. 17, 1966).

Key words: Calculations; electronic states, energies of formation; energies of motion; interstitials; point defects; theory; vacancies; vibrational states.

This is the Proceedings of a Conference on the Calculation of the Properties of Vacancies and Interstitials. The Conference dealt with the theory and techniques of calculation of the properties of point defects in metallic and nonmetallic crystals. The contributed and invited papers divided about evenly among three major topics: (1) static-lattice calculations of the energies and configurations of simple vacancies and interstitials in, mainly, metals and ionic crystals; (2) electronic states at and near point defects in metals, rare gas solids, and insulators (*f*-centers, electron traps); and (3) vibrational states at point defects. The report of a panel discussion on each topic is also included. The emphasis is on the theory of the properties of isolated, simple defects rather than on the statistical properties of defect assemblies. The Conference attempted to examine the point defect theory and calculations critically, from the standpoint of general theory, rather than simply compare results with experiment.

M288, Superseded by Special Publication 417.

M289. **Bibliography of low energy electron collision cross section data,** L. J. Kieffer, NBS Misc. Publ. 289 (Mar. 10, 1967).

Key words: Atom; molecule; electron; collision cross section.

A bibliography of low energy electron collision cross section data is presented. Only references which report original measurements or calculations of electron collision cross sections are included. The cross section data for each process are listed by atomic species in order of their atomic number. The data for molecules are listed in arbitrary order.

M290. **Report of the 51st National Conference on Weights and Measures, 1966,** Report Editor, L. J. Chisholm, NBS Misc. Publ. 290 (May 15, 1967).

Key words: Conference, National; weights and measures.

A report of the proceeding of the fifty-first National Conference on Weights and Measures, held in Denver, Colorado, July 11, 12, 13, 14, and 15, 1966, and attended by state, county, and city weights and measures officials.

M291. **Proceedings of the 1966 Standards Laboratory Conference,** held at the National Bureau of Standards, Gaithersburg, Md., May 9-12, 1966, NBS Misc. Publ. 291 (July 13, 1967).

Key words: Accuracy; calibrations; conferences, 1966 Standards Laboratory; foreign standards laboratories; laboratory management; measurements and standards; measurement system; National Conference of Standards Laboratories; proceedings, 1966 Standards Laboratory Conference; traceability; United States measurement system.

The annual report of the NCSL chairman, and the text of 50 presentations on standards laboratory problems are given in this volume. The subjects treated at the third biennial congress of delegates of the National Conference of Standards Laboratories, held at the NBS Gaithersburg facility, May 9-12, 1966, included committee reports and panel discussions on the 1965-66 measurement agreement comparison, statistical control of the measurement process, information needs and sources, calibration procedures, the measurement system of USA, calibration needs of USA, personnel development, traceability and accuracy ratio, world-wide physical standards, equipment performance, organization and management, workload, and recommended practices.

M292. **Bibliography of Liesegang rings (Second Edition),** K. H. Stern, NBS Misc. Publ. 292 (Sept. 1, 1967).

Key words: Diffusion; Liesegang rings; periodic precipitation.

A bibliography of Liesegang rings (periodic precipitation figures produced by diffusion) and other periodic structures for the period 1855-1965 is compiled in chronological and alphabetical order. An author index and an index to applications of Liesegang rings to extra-chemical fields are also given.

M293. **Technical highlights of the National Bureau of Standards, Annual Report 1967,** NBS Misc. Publ. 293 (Nov. 1967).

Key words: Annual report; technical highlights.

This is an illustrated digest of NBS technical and scientific activities during the fiscal year ending June 30, 1967. It lists major programs as they were carried out by the three NBS institutes: Institute for Basic Standards, Institute for Materials Research, and Institute for Applied Technology. Summaries are given of typical institute projects in applied mathematics, electricity, metrology, mechanics, heat, atomic physics, physical chemistry, laboratory astrophysics, radiation physics, radio standards, analytical chemistry, polymers, metallurgy, inorganic materials, reactor radiations, cryogenics, building research, information technology, instrumentation, radio propagation, engineering standards, and weights and measures. Also included are discussions of the Clearinghouse for Federal Scientific and Technical Information, the National Standard Reference Data System, Standard Reference Materials program, measurement services program, and national and international cooperative activities.

M294. **Operations research. Proceedings of a conference for Washington area government agencies, April 20, 1966,** Editor, J. A. Joseph, NBS Misc. Publ. 294 (Dec. 1967).

Key words: Conference proceedings; government; operations research; systems analysis.

The proceedings of a one-day conference of practitioners and users of Operations Research in Federal Government in the Washington, D.C. area, sponsored by the National Bureau of Standards. The purpose of the conference was to initiate a series of periodic meetings where information on topics of actual concerns might be exchanged. Invited papers were presented by Prof. Merill M. Flood on "Operations Research in the Civilian Sector of the Government," Dr. John Haldi on "The Planning-Programming-Budgeting System," and Dr. Alan J. Hoffman on "Operations Research and Government O.R." Reports of two panel meetings on "Special Problems of Operations Research in Civil Agencies of Government" and "Broadening the O.R. Competence of Mid-Careerist" are included on the proceedings.

3.9 SPECIAL PUBLICATIONS

Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

SP-236, All previous editions superseded by Special Publication 432

SP-250, All previous editions superseded by Special Publication 250, 1978 Edition.

SP-260, All previous editions superseded by Special Publication 260, 1975-76 Edition.

SP260, 1975-76 Edition. **Catalog of NBS Standard Reference Materials 1975-76 Edition,** R. W. Seward, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-1975-76 catalog, 92 pages (June 1975) SD Catalog No. C13.10:260-1975-76 cat.

Key words: analysis; characterization; composition; General Materials; properties; Research Materials; Standard Reference Materials.

This Catalog lists and describes the Standard Reference Materials (SRM's), Research Materials (RM's), and General Materials (GM's) currently distributed by the National Bureau of Standards, as well as many of the materials currently in preparation. SRM's are used to calibrate measurement systems and to provide a central basis for uniformity and accuracy of measurement. The unit and quantity, the type, and the certified characterization are listed for each SRM, as well as directions for ordering. The RM's are not certified, but are issued to meet the needs of scientists engaged in materials research. RM's are issued with a "Report of Investigation," the sole authority of which is the author of the report. The GM's are standardized by some agency other than NBS. NBS acts only as a distribution point and does not participate in the standardization of these materials. Announcements of new and renewal SRM's, RM's, and GM's are made in the semi-annual supplements of this Catalog, SRM Price List, and in scientific and trade journals.

SP260-16. **Standard reference materials: homogeneity characterization of NBS spectrometric standards IV: preparation and microprobe characterization of W-20% Mo alloy fabricated by powder metallurgical methods,** H. Yakowitz, R. E. Michaelis, and D. L. Vieth, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-16, 30 pages (Jan. 1969).

Key words: Electron probe analysis; metallography; powder metallurgy; spectrometric standards; Standard Reference Materials; W-Mo alloys.

A significant problem of the National Bureau of Standards Standard Reference Materials program is the provision of standards suitable in homogeneity for use with microanalytical techniques such as the spark source mass spectrograph and the electron probe microanalyzer. An interim approach to the problem has been the extended homogeneity characterization of selected existing standards. This paper describes the preparation and evaluation of the first NBS standard tested specifically from the beginning for application to electron probe microanalyzers. The standard designated SRM 480 is a tungsten-20 weight percent molybdenum alloy prepared by a powder metallurgy process. Based on the results of about 1500 determinations for both tungsten and molybdenum electron probe microanalysis, the material was found to be of high homogeneity at about the micrometer level of spatial resolution. The coefficient of variation for molybdenum was 2.5% and that for tungsten 1.5%. Correction of relative intensity ratios to obtain concentrations is discussed in terms of input parameter uncertainties such as mass absorption coefficients, and electron backscatter factors. The result of studies for atomic number correction and effects on operating voltage on the microprobe absorption correction, will be given. It is concluded that SRM 480 should be a valuable addition to any microprobe laboratory doing quantitative analyses.

SP260-17. **Standard reference materials: Boric acid; isotopic and assay; standard reference materials,** E. J. Catanzaro, C. E. Champion, E. L. Garner, G. Marinenko, K. M. Sappenfield, and W. R. Shields, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-17, 70 pages (Feb. 1970).

Key words: Absolute ratios; assay standards; boron; coulometry; isotopic standards; mass spectrometry.

A precise coulometric titration method has been developed for the assay of boric acid. The method is capable of providing boric acid assays precise to within 0.0025 percent (1 sigma) which is an order of magnitude better than existing techniques. Using this method, a lot of high purity boric acid has been assayed and found to be virtually stoichiometric H_3BO_3. Its acidimetric assay value of 100.00 ± 0.01 percent characterizes this material as a primary chemical standard for boron determinations.

Multiple samples of boric acid were studied and characterized with respect to homogeneity and the effect of relative humidity on stoichiometry. Procedures for precise preparation, aliquoting and storage of boric acid solutions were devised.

A mass spectrometric technique for the precise measurement of boron isotope ratios was developed. Single-filament tantalum-ribbon sources are used, and $^{11}B/^{10}B$ ratios are determined by measuring the relative abundances of $Na_2{}^{11}BO_2{}^+$ and $Na_2{}^{10}BO_2{}^+$ ions, at masses 89 and 88, respectively. The effects of various parameters such as sample mounting procedure, filament material, sample size, total sample composition and sodium concentration were studied and alternative procedures were evaluated.

Absolute values were obtained for the isotopic abundance ratios of two boron isotopic standards, using surface emission mass spectrometry. Samples of known isotopic composition, prepared from nearly pure separated boron isotopes, were used to calibrate the mass spectrometers. The resulting absolute values are: SRM 951, Boric Acid, $^{11}B/^{10}B = 4.04362 \pm 0.00137$; and SRM 952, Boric Acid, $^{11}B/^{10}B = 0.053199 \pm 0.000032$. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the means and allowances for effects of known sources of possible systematic error.

SP260-18. **Calibration of NBS secondary standard magnetic tape (computer amplitude reference) reference tape amplitude measurement "process A,"** S. B. Geller, P. A. Mantek, and N. G. Cleveland, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-18, 41 pages (Nov. 1969).

Key words: Average peak signal level, computer amplitude reference; magnetic tape; master standard; saturation curves; secondary standard; signal level calibration; standard reference materials; unrecorded reference.

This publication describes the design and operation of the NBS signal amplitude measuring system (Process A) that is used for calibrating unrecorded Secondary Standard Magnetic Tapes (Computer Amplitude Reference). The signal level calibration is made with respect to a reference signal level derived from the NBS Master Standard Magnetic Tape (Computer Amplitude Reference) that is kept in repository at NBS. The techniques for measuring and recording the data that accompany each Secondary Standard Magnetic Tape in the form of strip chart recordings and saturated curves are described.

SP260-19. **Analysis of interlaboratory measurements on the vapor pressure of gold (Certification of Standard Reference Material 745),** R. C. Paule and J. Mandel, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-19, 21 pages (Jan. 1970).

Key words: Components of error (within- and between-laboratories); gold; heats of sublimation (second and third law); interlaboratory measurements; standard errors; standard reference materials; vapor pressure.

A detailed statistical analysis has been made of results obtained from a series of interlaboratory measurements on the vapor pressure of gold. The gold Standard Reference Material 745 which was used for the measurements has been certified over the pressure range 10^{-8} to 10^{-3} atm. The temperature range corresponding to these pressures is 1300-2100 K. The gold heat of sublimation at 298 K and the associated standard error were found to be 87,720 ± 210 cal/mol (367,040 ± 900 J/mol). Estimates of uncertainty have been calculated for the certified temperature-pressure values as well as for the uncertainties expected from a typical single laboratory's measurements. The statistical analysis has also been made for both the second and third law methods, and for the within- and between-laboratory components of error. Several notable differences in second and third law errors are observed.

SP260-21. **Analysis of interlaboratory measurements on the vapor pressures of cadmium and silver. (Certification of Standard Reference Materials 746 and 748),** R. C. Paule and J. Mandel, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-21, 30 pages (Jan. 1971).

Key words: Cadmium; components of error (within- and between-laboratory); heats of sublimation (second and third law); interlaboratory measurements; silver; standard errors; standard reference materials; vapor pressure.

Detailed statistical analyses have been made of results obtained from a series of interlaboratory measurements on the vapor pressures of cadmium and silver. Standard Reference Materials 746 (cadmium) and 748 (silver) which were used for the measurements have been certified over the respective pressure ranges $10^{-11}-10^{-4}$ atm and $10^{-12}-10^{-3}$ atm. The temperature ranges corresponding to these pressures are 350-594 K for cadmium and 800-1600 K for silver. The heats of sublimation at 298 K and the associated two standard error limits for cadmium and silver are 26660 ± 150 cal/mol and 68010 ± 300 cal/mol, respectively. Estimates of uncertainty have been calculated for the certified temperature-pressure values as well as for the uncertainties expected from a typical single laboratory's measurements. The statistical analysis has also been made for both the second and third law methods, and for the within- and between-laboratory components of error. The uncertainty limits are observed as functions of both the heat of sublimation and the temperature.

SP260-22. **Homogeneity characterization of Fe-3Si Alloy,** H. Yakowitz, C. E. Fiori, and R. E. Michaelis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-22, 30 pages (Feb. 1971).

Key words: Fe-3Si alloy; homogeneity testing; metallography; microprobe analysis; spectrometric analysis; Standard Reference Materials.

An alloy of iron-3.22 wt. pct. silicon (Fe-3Si) was characterized with regard to chemical homogeneity of iron and silicon at the micrometer level of spatial resolution. This alloy is satisfactory for use as a homogeneous standard for electron probe microanalysis. The samples were cut from coarse-grained sheet stock to a final size of about 3 mm × 3 mm × 0.28 mm thick. Homogeneity was checked by means of quantitative raster scanning in which a square matrix (1.1 mm × 1.1 mm) of individual points is analyzed by the microprobe. Each matrix represents 400 separate analyses. Usually, the same matrix was rerun so that each point was sampled twice. The coefficient of variation for both the iron and silicon is less than one percent. Quantitative microprobe analysis was also carried out on this alloy giving a silicon content of 3.14% and an iron content of 96.9%.

SP260-23. **Viscosity of a standard borosilicate glass,** A. Napolitano and E. G. Hawkins, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-23, 10 pages (Dec. 1970).

Key words: Beam-bending; borosilicate glass; glass viscosity; parallel-plate; rotating cylinder; standard reference material; viscosity; viscosity standard.

The viscosity of a borosilicate glass has been measured at the National Bureau of Standards and four other laboratories. Determinations were made in the range 10^2 to 10^{15} poises (1525 to 470 °C). Measurements were made by the rotating cylinder, fiber elongation, beam bending, and parallel-plate methods. The results have been evaluated and the glass has been issued as Standard Reference Material No. 717.

SP260-24. **Standard reference materials: comparison of redox standards,** K. M. Sappenfield, G. Marinenko, J. L. Hague, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-24, 97 pages (Jan. 1972).

Key words: Analytical procedures; arsenic-iodine method; comparison; effective purity; oxidimetric standards.

The methods described in this publication are those that have been used at the National Bureau of Standards for the comparison of the current oxidimetric standard reference materials with each other and for the determination of the effective purity of these standard reference materials. The methods, which are modifications of well-established and previously published methods, were selected or designed for their accuracy and dependability. An accurate method was devised for the determination of the effective purity of the arsenic trioxide standard SRM 83c by adding solid iodine and determining the excess iodine photometrically.

SP260-25. **A standard reference material containing nominally four percent austenite,** G. E. Hicho, H. Yakowitz, S. D. Rasberry, and R. E. Michaelis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-25, 22 pages (Feb. 1971).

Key words: Austenite in ferrite; electron microprobe; powder metallurgy; quantitative microscopy; SRM; x-ray fluorescence analysis.

This standard was produced by powder metallurgical techniques using known amounts of austenite. Using these techniques, 134 specimens were prepared. Because these standards are expected to be used primarily for the calibration of x-ray diffraction equipment, only one surface of each standard is certified, and these surfaces range from 3.1 percent to 5.2 per

cent in austenite content. To make the specimens, 310 stainless steel powder (austenitic) was blended with 430 stainless steel powder (ferritic) to make a mixture of 5 percent austenite in ferrite. The material was compacted, sintered, polished and etched so the austenite appears white and the ferrite, a deep brown. Then quantitative microscopy methods were used to determine the percentage of austenite near the surface. Furthermore, the 310 powder contains 20 percent of nickel while the 430 powder contains virtually no nickel. Therefore, after establishing a meaningful calibration curve, x-ray fluorescence analysis for the nickel content was also used as a direct measurement of the amount of austenite on the surface of the compact. Both procedures were carried out on fifteen specimens statistically selected from the total number of compacts produced. Agreement, within experimental error limits, was obtained between the x-ray fluorescence results and quantitative microscopy results. The x-ray fluorescence method was used to characterize all additional compacts. X-ray diffraction determinations of austenite content are in good agreement with the x-ray fluorescence and quantitative microscopy results. The compacts may be used as x-ray diffraction standards for austenite or in special cases as x-ray fluorescence standards for nickel content.

SP260-26. **Standard reference materials: National Bureau of Standards—U.S. Steel Corporation joint program for determining oxygen and nitrogen in steel,** J. F. Martin, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-26, 40 pages (Feb. 1971).

Key words: Inert gas fusion; one ppm of oxygen and nitrogen in steel; Research Associate Program; simultaneous determination of oxygen and nitrogen; Standard Reference Material for oxygen.

Because of a need for a method for the rapid, simultaneous determination of small concentrations of oxygen and nitrogen in steel, a joint project under the Industrial Fellowship Program of U.S. Steel and the Research Associate Program of the National Bureau of Standards (NBS) was established. After investigation of various techniques, an analytical apparatus was constructed with excellent sensitivity for both elements. This apparatus consists of an inert gas fusion system coupled to a gas chromatograph. Recommended modifications have been completed on this equipment, and simultaneous determinations of oxygen and nitrogen in steel are presently being made. The detection limit is < 1 ppm for both oxygen and nitrogen, and the analysis time is about 5 minutes.

A direct result of this program has been the issuance by NBS of a new Standard Reference Material (SRM), a maraging steel, for oxygen. This SRM has the lowest oxygen concentration (4.5 ppm) of any steel standard yet issued by NBS.

SP260-27. **Uranium isotopic standard reference materials,** E. L. Garner, L. A. Machlan, and W. R. Shields, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-27, 162 pages (Apr. 1971).

Key words: Absolute isotopic abundance; ignition procedure; isotopic standards, mass spectrometry; stoichiometry; uranium.

An ignition procedure has been developed that will yield reproducible stoichiometry for U_3O_8. The effects of temperature, length of ignition, rate of cooling, pressure and type of atmosphere were investigated. This ignition procedure has been used for the blending of high purity ^{235}U and ^{238}U separated isotopes to prepare calibration standards for the determination of bias effects in the thermal emission mass spectrometry of uranium. Weight aliquoting was used to prepare calibration mixes with $^{235}U/^{238}U$ ratios of more than 10 and less than 0.1 and to add a ^{233}U spike for the determination of minor isotope abundances in the uranium isotopic standards by the isotope dilution technique.

A description of the unique features of the mass spectrometer instrumentation including the source, NBS collector and expanded scale recorder are given. Two specific analytical procedures were used for the isotopic analysis of uranium and are adaptable, within a general framework, to fit the particular ion current intensity requirements of a wide range of isotopic distributions. Mass discrimination due to evaporation and ionization on the filaments, and other parameters such as temperature, time, sample size, sample mounting, total sample composition, acidity, filament material, pressure, non-ohmic response, R-C response and source memory were studied as part of the development effort to establish sound analytical procedures.

The absolute isotopic abundances of 18 uranium SRMs were determined by thermal emission mass spectrometry. The general approach was to determine absolute $^{235}U/^{238}U$ ratios by using calibration mixes to correct for filament bias. Then the absolute ^{234}U and ^{236}U were determined by ^{233}U isotope dilution. For SRM U-0002, isotope dilution was the only practical means of determining the low abundance of ^{235}U as well as the ^{234}U. The limits given for the isotopic composition of the uranium SRMs are at least as large as the 95 percent confidence limits for a single determination and include terms for inhomogeneities of the material as well as analytical error.

SP260-28. **Standard reference materials: Preparation and evaluation of SRM's 481 and 482 gold-silver and gold-copper alloys for microanalysis,** K. F. J. Heinrich, R. L. Myklebust, S. D. Rasberry, and R. E. Michaelis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-28, 100 pages (Aug. 1971).

Key words: Alloys; corrections; electron probe; homogeneity; matrix scanner; microanalysis; quantitative analysis; standard reference materials; x-ray emission.

The reasoning behind the choice of the systems Au-Ag and Au-Cu for SRM's, and their suggested uses are described. We also report on the preparations of the materials, their chemical analysis, the tests performed to ascertain macroscopic and microscopic homogeneity, and on relative x-ray intensity measurements at various x-ray lines and voltages. A description of the instrumentation (matrix scanner), techniques, and programs employed in the homogeneity studies, as well as tables and graphs of the x-ray intensity measurements, are appended.

SP260-29. **Calibration of NBS secondary standard magnetic tape (computer amplitude reference) SRM 3200 using the reference tape amplitude measurement "Process A" Model II,** S. B. Geller, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-29, 57 pages (June 1971).

Key words: Average signal peak level; computer amplitude reference; magnetic tape; master standard; saturation curves; secondary standard; signal level calibration; standard reference materials; unrecorded reference.

This publication describes the design, operation and calibration of the NBS signal amplitude measuring system (Process A—Model II) that is used for calibrating unrecorded Secondary Standard Magnetic Tapes (Computer Amplitude Reference) SRM 3200. This system supersedes the measurement system that was described in the NBS Special Publication 260-18 (November 1969). The signal level calibration is made with respect to a reference signal level derived from the NBS Master Standard Magnetic Tape (Computer Amplitude Reference) that is kept in repository at NBS. The techniques for measuring and recording the data that accompany each Secondary Standard Magnetic Tape in the form of strip chart recordings and saturation curves are described.

SP260-30. **Standard reference materials: standard samples issued in the USSR,** R. S. Gorozhanina, A. Y. Freedman, and A. B. Shaievitch, All-Union Scientific Research Institute of Metrology Sverdlovsk Branch, All-Union Scientific Research

Center of the State Service for Standard Samples, translated from the Russian by M. C. Selby, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-30, 86 pages (June 1971).

Key words: Standard reference materials; standard samples; standards in Russia; USSR standards.

This reference handbook contains information on standard samples of properties and composition of substances and materials including areas of their application, nomenclature, certified characteristics, and values of the certified quantities.

The handbook was prepared for personnel of metrological establishments, for laboratories of ferrous and non-ferrous metallurgy, for all branches of industry employing metals and alloys, for the mining industry, geological research service, oil refining industry, scientific research organizations, and institutes of higher education.

SP260-31. **Thermal conductivity of electrolytic iron, SRM 734, from 4 to 300 K,** J. G. Hust and L. L. Sparks, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-31, 19 pages (Nov. 1971).

Key words: Cryogenics; electrical resistivity; electrolytic iron; Lorenz ratio; Seebeck effect; thermal conductivity; transport properties.

Thermal conductivity data are reported for a specimen of electrolytic iron, SRM 734, for temperatures from 4 to 300 K. Variability of this iron was studied by means of electrical residual resistivity ratio measurements on 63 specimens. This study showed that with a two-hour anneal at 1000 °C one can obtain a thermal conductivity Standard Reference Material that has variability of less than 1 percent in thermal conductivity.

SP260-32. **Standard reference materials: Standard quartz cuvettes for high accuracy spectrophotometry,** R. Mavrodineanu and J. W. Lazar, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-32, 27 pages (Dec. 1973) 55 cents, SD Catalog No. C13.10:260-32.

Key words: Cuvette, spectrophotometry; lightpath; pathlength; quartz, cuvette; radiation pathlength.

Accurate knowledge of lightpath and parallelism of cuvettes used in spectrophotometry is one of the indispensable parameters which must be determined when accurate transmittance measurements of liquid materials is considered. A description is given of the design and techniques developed at NBS for the production of quartz cuvettes having a nominal radiation pathlength of 10 mm $\pm$ 0.03 mm and a parallelism certified both with an uncertainty of $\pm$ 0.0005 mm. The method and instrumentation used to determine these parameters is also described in the paper.

SP260-33. **Standard reference materials: comparison of original and supplemental SRM 705, narrow molecular weight distribution polystyrene,** H. L. Wagner, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-33, 30 pages (May 1972).

Key words: Characterized polymers; narrow molecular weight polystyrene; polystyrene standard; Standard Reference Material 705.

Because the supply of the original batch of narrow molecular weight distribution polystyrene, SRM 705, is almost exhausted, another supply of polystyrene, reported to be from the same batch as the original has been characterized to determine whether it is the same as the original as far as the properties listed on the certificate are concerned. No difference in molecular weight as measured by light scattering, osmometry, or gel-permeation chromatography could be found. The limiting viscosity numbers were also the same. It was also shown from solution viscosity measurements that pellet to pellet variation in molecular weight is negligible.

SP260-34. **Standard reference materials: thermoelectric voltage of silver-28 atomic percent gold thermocouple wire, SRM 733, versus common thermocouple materials (between liquid helium and ice fixed points),** L. L. Sparks and J. G. Hust, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-34, 34 pages (Apr. 1972).

Key words: Cryogenics; Seebeck voltage; silver-gold alloy; Standard Reference Material; thermocouple.

Industry wide standardization of thermocouple wire depends, in part, on the ability to thermoelectrically compare commercial wires with a Standard Reference Material (SRM). The alloy *Ag*-28 at% Au, SRM 733, meets the requirements of a thermoelectric reference material, particularly in the temperature range of liquid helium and liquid hydrogen where Pt-67 is not adequate. Thermoelectric voltage comparisons are reported for SRM 733 versus common thermocouple materials between liquid helium and ice fixed points. Detailed standard reference data based on these common materials are given in NBS Monograph 124. The comparisons were made in a thermocouple comparator which was designed to be a permanent holder of three SRM 733 wires; the comparator allows tests to be made without handling the standard wires. Details of the construction, testing, and analysis of the comparators are given.

SP260-35. **Standard reference materials: thermal conductivity of austenitic stainless steel, SRM 735, from 5 to 280 K,** J. G. Hust and L. L. Sparks, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-35, 22 pages (Apr. 1972).

Key words: Cryogenics; electrical resistivity; stainless steel; Standard Reference Material; thermal conductivity.

Thermal conductivity data are presented for a well-characterized austenitic stainless steel. Thermal conductivity and electrical resistivity measurements were conducted on two lots of this steel. Electrical resistivity measurements were performed on the second lot both before and after the material was hot-swaged and reannealed to a size 1/10 the original diameter. These measurements indicate that this steel can be swaged and reannealed without an appreciable change in thermal conductivity. Electrical resistivity measurements as well as direct thermal conductivity measurements on several specimens from both lots indicate a material variability in these lots of less than 1% in thermal conductivity.

SP260-36. **Standard reference materials: a referee method for the determination of calcium in serum,** J. P. Cali, J. Mandel, and L. Moore, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-36, 136 pages (May 1972).

Key words: Accuracy; atomic absorption spectrometry; calcium in serum; clinical chemistry; referee method for calcium.

The first referee method of analysis (a method of known accuracy) in clinical chemistry has been developed by a team of experts from clinical chemistry, 8 cooperating clinical chemistry laboratories, and scientists from the National Bureau of Standards. Subject to the limitations and provisos stated, calcium in serum can be determined by the referee method to within $\pm$ 2% of the "true or absolute" value. Also discussed are: (1) What Constitutes a Meaningful Measurement System; (2) Theory of Operation and Practice Required to Develop a Referee Method; (3) History of the Actual Work; the Referee Method Protocol; (4) Results; (5) The Isotope-Dilution Mass Spectrometry Work; (6) Discussion, Conclusions, and Recommendations for Future Referee Method Developments.

SP260-37. **Standard reference materials: methods of analysis of NBS clay standards,** J. I. Shultz, R. K. Bell, T. C. Rains, and O. Menis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-37, 86 pages (June 1972).

Key words: Atomic absorption; ceramics; classical procedures; clay materials; flame emission; refractories; Standard Reference Materials.

This publication brings together a compilation of methods used at NBS for the analysis of two complex standard reference clay materials. The methods were selected to give the best obtainable results for those elements normally found in clays. In some instances, more than one procedure was employed for an element as a cross-check on the precision and accuracy of the results. The procedures are presented in two parts. Part I is concerned with the determination of the major constituents by the classical analytical procedures. Part II covers the minor elements which are determined instrumentally by flame emission and atomic absorption spectrometry. These clay materials serve as analytical composition standards to provide quality control of the basic raw materials which are used in the ceramics and refractories industries.

SP260-38. **Standard reference materials: preparation and calibration of standards of spectral specular reflectance,** J. C. Richmond and J. J. Hsia, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-38, 57 pages (May 1972).

Key words: Aluminum; gold; infrared reflectance; interferometer; mirrors; reflectance; reflectance standards; spectral reflectance; spectral specular reflectance; specular reflectance; standards; ultraviolet reflectance.

This report describes in detail the preparation and calibration of Standard Reference Materials 2001 through 2008. These standards of spectral specular reflectance were prepared commercially by vacuum depositing opaque coatings of gold and aluminum, respectively, onto polished substrates of fine-annealed borosilicate glass. The near-normal (9° from normal) spectral specular reflectance was measured by the multiple-reflection technique. Four different combinations of source, spectrometer, and detector were used to cover the wavelength range from about 0.25 μm to 30 μm and beyond.

SP260-39. **Standard reference materials: the eddy current decay method for resistivity characterization of high purity metals,** A. F. Clark, V. A. Deason, J. G. Hust, and R. L. Powell, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-39, 53 pages (May 1972).

Key words: Apparatus; characterization; eddy current decay; electrical resistivity; high purity metals; homogeneity; low temperature.

Characterization of high purity metals by resistivity measurements at low temperatures is discussed. In particular, the eddy current decay method of resistivity measurement is described in detail. The advantages and limitations are presented along with the theoretical basis of the method. Detailed instructions are given for constructing and operating the apparatus.

SP260-40. **Standard reference materials: selection of differential thermal analysis temperature standards through a cooperative study (SRM 758, 759, 760),** H. G. McAdie, P. D. Garn, and O. Menis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-40, 71 pages (Aug. 1972).

Key words: DTA; International Confederation on Thermal Analysis; international cooperative testing; Standard Reference Materials NBS 758, 759, 760; temperature scale; thermal analysis.

The testing and evaluation program leading to the certification of 10 materials as Standard Reference Materials NBS 758, 759 and 760, for calibrating the temperature scale for thermal analysis is described. The international cooperative testing program was set up on the basis of a preliminary program initiated in 1966. Thirty-four laboratories reported to the Standards Committee of the International Confederation on Thermal Analysis. The results were obtained on a variety of apparatus under their conditions of experimentation, except that the heating rate was prescribed in the range of 4 to 10 °C per minute. The data were processed to obtain means and measures of scatter, not only in total, but separated in terms of a number of sample number of sample holder parameters. The sample holder geometry was the only parameter having a clear effect on the extrapolated onset and peak temperatures. The effects of the thermocouple position and calibration were tested, but no significant effect was found. The heating rate has only a small effect, tending to increase the spread of onset and peak temperature values from the DTA are somewhat higher than the thermodynamic equilibrium values reported in the literature. Based on the mean values from all the laboratories the standard deviation was 5 to 8 °C, which includes the bias between laboratories as well as measurement errors.

SP260-41. **Standard reference materials: use of standard light-sensitive paper for calibrating carbon arcs used in testing textiles for colorfastness to light,** L. A. Wood and P. J. Shouse, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-41, 24 pages (Aug. 1972).

Key words: Carbon-arcs, standardization of; color-fastness, testing of; fading tests, standardization; light-sensitive paper; paper, light-sensitive; textiles, fading of.

The use of NBS Light-Sensitive Paper and NBS Booklets of Standard Faded Strips in the standardization of carbon arcs is described. These lamps are used to determine the fading characteristics and degradation of textiles and other materials when subjected to visible and ultraviolet radiation. The light-sensitive paper is useful in calibrating the arcs in terms of NBS Standard Fading Hours (SFH) or equivalent exposure in the NBS Master Carbon-Arc Lamp.

SP260-42. **Standard reference materials: the characterization of linear polyethylene SRM 1475,** H. L. Wagner and P. H. Verdier, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-42, 39 pages (Sept. 1972).

Key words: Density; differential refractive index; gel permeation chromatography (GPC); light scattering; linear polyethylene; melt flow rate; molecular weight distribution; number average molecular weight; osmometry; refractive index; standard reference material; viscosity; weight average molecular weight; Z average molecular weight.

The National Bureau of Standards has issued a linear polyethylene standard reference material, SRM 1475. This material is certified for weight average molecular weight (M_w), number average molecular weight (M_n), Z average molecular weight (M_z), molecular weight distribution, limiting viscosity numbers in several solvents, melt flow rate, and density. The experimental details of the determination and certification of these properties are given in these collected papers previously published in the Journal of Research of the National Bureau of Standards.

SP260-43. **Standard reference materials: preparation and homogeneity characterization of an austenitic iron-chromium-nickel alloy,** H. Yakowitz, A. W. Ruff, and R. E. Michaelis, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-43, 19 pages (Nov. 1972).

Key words: Austenitic stainless steel; electron probe microanalysis; Fe-Cr-Ni alloy; homogeneity testing; metallography; stacking fault energy; Standard Reference Material.

An alloy of weight fraction 0.710 iron, 0.183 chromium and 0.107 nickel was characterized at the micrometer level of spatial resolution by means of electron probe microanalysis. This alloy,

designated SRM 479, is of suitable homogeneity for use as a standard in microanalytical techniques. The coefficient of variation for each of the three elements is not more than 1.5% based on about 800 analyses involving five different specimens. There is no statistically significant variation in composition within specimens or from specimen to specimen. Electron probe microanalysis was carried out using different instrumental conditions and operators. SRM 479 is supplied as a disc about 4.6mm diameter by 1mm thick.

SP260-44. **Standard reference materials: preparation and use of superconductive fixed point devices, SRM 767,** J. F. Schooley, R. J. Soulen, Jr., and G. A. Evans, Jr., Nat. Bur. Stand. (U.S.), Spec. Publ. 260-44, 35 pages (Dec. 1972).

Key words: Aluminum; cadmium; cryogenics; indium; lead; magnetic susceptibility; superconductive transition temperature; superconductivity; thermometric fixed points; zinc.

The preparation, testing, and use of SRM 767 devices are described. These devices incorporate samples of lead, indium, aluminum, zinc, and cadmium within a mutual inductance coil pair. These elements become superconductive at temperatures near 7.2, 3.4, 1.2, 0.85 and 0.5 K, respectively, and the transition midpoints, when attained by observing the sample magnetic susceptibilities in negligible small magnetic fields, provide thermometric reference points which are reproducible to ± 1 mK.

SP260-45. **Standard reference materials: Development of NBS Standard Reference Material No. 1579 Powdered Lead-Based Paint,** B. Greifer, E. J. Maienthal, T. C. Rains, and S. D. Rasberry, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-45, 31 pages (Mar. 1973) 50 cents, SD Catalog No. C13.10:260-45.

Key words: Analytical standard; atomic absorption spectrometry; differential cathode ray polarography; electrodeposition; lead-based paint; neutron activation analysis; x-ray fluorescence spectrometry; Standard Reference Material.

The development of NBS Standard Reference Material No. 1579, Powdered Lead-Based Paint is described. This SRM is intended for use in the calibration of apparatus and methods used in determining lead in paint removed from old housing.

Paints scraped from the interior surfaces of old housing were collected, blended, homogenized, and characterized for lead content. The average lead content was found to be 11.87 ± 0.04 percent lead by weight determined by atomic absorption spectrometry and by differential cathode ray polarography.

The analytical procedures involved sample dissolution by dry ashing in a furnace at 450-550 °C followed by exhaustive extractions of the insoluble residue with acids and with ammonium acetate solution.

SP260-46. **Standard reference materials: Thermal conductivity and electrical resistivity. Standard reference materials: Austenitic stainless steel, SRM's 735 and 798, from 4 to 1200 K,** J. G. Hust and P. J. Giarratano, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-46, 42 pages (Mar. 1975) SD Catalog No. C13.10:260-46.

Key words: austenitic stainless steel; electrical resistivity; high temperature; low temperature; standard reference materials; thermal conductivity.

A historical review of the development of selected thermophysical standard reference materials, SRM's, is given and selection criteria for those SRM's are listed. Thermal conductivity and electrical resistivity data for austenitic stainless steel, SRM's 735 and 798, are critically evaluated. Recommended values are presented for the temperature range 4 to 1200 K. Material variability studies, including the effects of heat treatment, have been performed at low temperatures. No irreversible transformations are observed up to temperatures of 1200 K. Based on the results of several types of characterization measurements, effects of material variability are believed to be less than 1 percent in electrical resistivity and not significantly more in thermal conductivity. The uncertainty of the recommended electrical resistivity data is estimated at 1 percent at low temperatures and 2 percent at higher temperatures. The corresponding uncertainty for thermal conductivity is 2 percent below 100 K, increasing to 3 percent at 300 K, and 5 percent at higher temperatures.

SP260-47. **Standard reference materials: Electrical resistivity of electrolytic iron, SRM 797, and austenitic stainless steel, SRM 798, from 5 to 280 K,** J. G. Hust, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-47, 20 pages (Feb. 1974) SD Catalog No. C13.10:260-47.

Key words: austenitic stainless steel; cryogenics; electrical resistivity; electrolytic iron; Lorenz ratio; standard reference material.

Electrical resistivity data are presented for characterized electrolytic iron, SRM 797, and austenitic stainless steel, SRM 798, at temperatures from 5 to 280 K. Resistivities at ice and liquid helium temperatures were determined for 22 randomly selected iron specimens and the same number of steel specimens. These data indicate that the effect of material variability is about 1 percent for each of these SRM's.

SP260-48. **Standard Reference Materials: Description and use of precision thermometers for the clinical laboratory, SRM 933 and SRM 934,** B. W. Mangum and J. A. Wise, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-48, 23 pages (May 1974) SD Catalog No. C13.10:260-48.

Key words: clinical laboratory; enzymology; health care; liquid-in-glass thermometers; standard reference material; SRM 933; SRM 934; thermometers.

Because of the high sensitivity to temperature of many facets of the clinical laboratory, e.g., in enzyme reactions and in pH and blood gas analysis, there is a need for accurate temperature measurements and its control. In order to help satisfy these needs and to aid in getting a usable and accurate temperature scale into the clinical laboratory, the National Bureau of Standards has developed SRM 933 and SRM 934. These are precision thermometers, which are calibrated at 0, 25, 30, and 37 °C and their description, their calibration, and the procedures for their proper usage are discussed.

SP260-49. **Standard reference materials: Calibrated glass standards for fission track use,** B. S. Carpenter and G. M. Reimer. Nat. Bur. Stand. (U.S.), Spec. Publ. 260-49, 25 pages (Nov. 1974) SD Catalog No. C13.10:260-49.

Key words: fission tracks; flux monitors; glass standards; standard reference material; thermal neutron irradiation; uranium.

Four glasses of different uranium concentrations were prepared and certified by the National Bureau of Standards as standards for use as neutron monitors to aid fission track studies. These Standard Reference Materials (SRM) and their uranium concentrations are: SRM 941 (461 ppm), SRM 962 (37.4 ppm), SRM 963 (0.823 ppm), and SRM 964 (0.0721 ppm). These glass wafers were irradiated in the National Bureau of Standards Reactor and the neutron flux was monitored using copper and gold foils.

SP260-50. **Standard reference materials: Thermal conductivity and electrical resistivity standard reference materials: Electrolytic iron SRM's 734 and 797 from 4 to 1000 K,** J. G. Hust

and P. J. Giarratano, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-50, 41 pages (June 1975) SD Catalog No. C13.10:260-50.

Key words: electrical resistivity; electrolytic iron; high temperature; iron; Lorenz ratio; low temperature; standard reference material; thermal conductivity; thermopower.

A historical review of the development of Standard Reference Materials, SRM's, is given and selection criteria of SRM's are listed. Thermal conductivity and electrical resistivity data for electrolytic iron and similar irons are compiled, analyzed, and correlated. Recommended values of thermal conductivity and electrical resistivity for electrolytic iron, SRM's 734 and 797, are presented for the range 4 to 1000 K. These values are based on NBS measurements up to 280 K and on measurements by Oak Ridge National Laboratory on a similar iron above 280 K. The average uncertainty of the thermal conductivity values below ambient is 1.5 percent and 3 percent above ambient. The corresponding uncertainties in electrical resistivity are 1 percent and 2 percent.

SP260-51. **Standard reference materials: Glass filters as a Standard Reference Material for spectrophotometry—selection, preparation, certification, use, SRM 930,** R. Mavrodineanu and J. R. Baldwin, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-51, 118 pages (Nov. 1975) SD Catalog No. C13.10:260-51.

Key words: accuracy in spectrophotometry; glass filters; spectral bandpass; spectrophotometry; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy.

This publication describes various factors which can affect the proper functioning of a spectrophotometer and suggests means and procedures to assess and control these factors. Particular consideration is given to the long and short term stability of a spectrophotometer, to the wavelength accuracy, the spectral bandpass, the stray radiation, and the accuracy of the transmittance or absorbance scale. A description is given of the means and Standard Reference Materials (SRM's) which can be used to control these factors, together with the methods for the preparation, certification, and use of such materials (SRM 930). The results obtained in actual use of SRM 930 are examined in some detail. An appendix contains the reproduction of several publications relevant to the subject discussed in this work.

SP260-52. **Standard reference materials: Thermal conductivity and electrical resistivity standard reference materials: Tungsten SRM's 730 and 799, from 4 to 3000 K,** J. G. Hust and P. J. Giarratano, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-52, 47 pages (Sept. 1975) SD Catalog No. C13.10:260-52.

Key words: electrical resistivity; high temperature; Lorenz ratio; low temperature; standard reference materials; thermal conductivity; thermopower; tungsten.

A historical review of the development of thermophysical Standard Reference Materials, SRM's, is given and selection criteria of SRM's are listed. Thermal conductivity and electrical resistivity data for arc cast and sintered tungsten are compiled, analyzed, and correlated. Recommended values of thermal conductivity (SRM 730) and electrical resistivity (SRM 799) for these lots of tungsten are presented for the range 4 to 3000 K. These values are based on low temperature NBS measurements and higher temperature measurements by participants of the AFML-AGARD project. The uncertainty of the thermal conductivity values below ambient is 2 percent and rises to 5 percent between ambient and 2000 K. Above 2000 K the uncertainty rises to a maximum of about 8 percent. The uncertainty of the electrical resistivity values is 2 percent over the entire temperature range.

SP260-53. **Standard Reference Materials: Standardization of pH measurements,** R. A. Durst, Nat. Bur. Stand. (U.S.), Spec. Publ. 260-53, 48 pages (Dec. 1975) SD Catalog No. C13.10:260-53.

Key words: buffers; buffer solutions; glass electrode; pH; pH buffers; pH electrode; pH measurement; pH standards.

One of the most widely performed analytical measurements in chemical laboratories is that of pH using the glass electrode. In order to insure the consistency of these measurements, the National Bureau of Standards has adopted an operational scale of pH defined in terms of the pH(S) of a series of standard buffer solutions. Certified samples of buffer materials, from which the standard reference solutions of reproducible pH can be prepared, are issued by the NBS. At present, the operational scale is defined by the pH of seven primary and three secondary standard solutions.

This report is concerned primarily with a discussion of the method used at the NBS for the assignment of pH values to the standard buffer solutions, a description of the NBS measurement facilities, and a summary of the characteristics of these standards. A brief discussion of the types of electrodes used and the calibration of pH instrumentation is also presented.

SP295. **Electronic composition in printing.** Proceedings of a symposium held at the National Bureau of Standards, Gaithersburg, Md., June 15-16, 1967, R. W. Lee and R. W. Worral, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 295, 133 pages (Feb. 1968).*

Key words: Character generation; composition language; computer technology; computerized text processing; electronic composition; electronic computer; electronic printing; GRACE; Linotron; MACRO coding; MEDLARS; microfilm; photocomposition; Photon; programming; text editing.

A Symposium on Electronic Composition in Printing was held at the Gaithersburg, Md. Laboratories of the National Bureau of Standards June 15 and 16, 1967. Sponsored by the NBS Center for Computer Sciences and Technology, the symposium was a state-of-the-art review of a rapidly advancing field of computer application with great potentialities for increased efficiency and savings in the Federal Government.

Twenty-nine papers were presented and are published in this Proceedings. They include a diverse group by industry representatives reporting recent technological advancements in the field. Several papers define government policy and describe the new Linotron system of photocomposition at the Government Printing Office; another series is devoted to nongovernment applications and research; and a final group details specific applications within several Government agencies.

SP296. **Mass transport in oxides.** Proceedings of a symposium held at the National Bureau of Standards, Gaithersburg, Md., October 22-25, 1967, J. B. Wachtman, Jr. and A. D. Franklin, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 296, 224 pages (Aug. 1968).*

Key words: Crystal defects; diffusion; ionic conductivity; mass transport; oxides; stoichiometry.

This Special Publication presents the Proceedings of the Conference on Mass Transport in Oxides, held at the National Bureau of Standards in Gaithersburg, Md., from October 22 to October 25, 1967, under the joint sponsorship of the Bureau and the Advanced Research Projects Agency. Invited papers reviewed mass transport in alkali and silver halides as background, and topics relating to oxides including point defects, (both experiment and theory), lattice dynamics and ionic interactions, atomistic mechanisms of diffusion and ionic conduction, chemical diffusion, defect complexes, assessments of the experimental situation for diffusion and ionic conduction, and the availability of good research materials. In contributed papers, attention was focused on color centers in alkaline earth oxides, cation diffusion in MgO, transport of both cations and anions in transition metal oxides, and coulometric and emf techniques for obtaining transport data. A panel discussion summarized the work of the conference.

SP298. **Quantitative electron probe microanalysis.** Proceedings of a Seminar held at the National Bureau of Standards, Gaithersburg, Md., June 12-13, 1967, K. F. J. Heinrich, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 298, 305 pages (Oct. 1968).

Key words: Atomic number effect; biological specimens; electron probe microanalysis; electron scattering; fluorescence by the continuum; quantitative analysis; stereometric analysis; x-ray absorption; x-ray emission.

A seminar was held at the National Bureau of Standards in June 1967 to examine critically the factors involved in quantitative electron probe microanalysis. Major consideration was given to proposed methods for data evaluation, and to requirements for further work in theory, in measurement, and in the preparation of standards. This volume contains a series of invited papers which formed the basis of discussion at the seminar. Topics covered include corrections for the atomic number effect, for x-ray absorption, and for fluorescence by characteristic lines and the continuum. The various ways to derive a simplified model of the complex electron-target interaction are critically analyzed by several authors, and the accuracy of several proposed methods is compared by error histograms constructed on the basis of hundreds of analyses of materials of known composition. Applications to the analysis of biological specimens and to problems of stereometric analysis are also discussed.

The Choice of Models for Electron Scattering and Deceleration for Electron Probe Microanalysis, T. Mulvey.

Progress in the Correction for the Atomic Number Effect, D. M. Poole.

The Calculation of Stopping Power and Backscatter Effects in Electron Probe Microanalysis, P. Duncumb and S. J. B. Reed.

Scattering of Electrons in Metallic Targets, K. Murata, R. Shimizu, and G. Shinoda.

Absorption Edge Effects in Electron Probe Analysis, D. Nagel and J. Criss.

Fluorescence Excited by the Continuum, J. Hénoc.

Quantitative Evaluation Methods for Alloy Microstructures by Microprobe Analysis, G. Dörfler.

Some Aspects of the Microprobe Analysis of Biological Specimens, T. Hall.

SP299, Volumes 1 and 2. **Neutron cross sections and technology.** Proceedings of a conference held in Washington, D.C., March 4-7, 1968, D. T. Goldman, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 299, Vol. 1, 660 pages and Spec. Publ. 299, Vol. 2, 718 pages (Sept. 1968).*

Key words: Cross sections; neutrons; nuclear data; nuclear technology; reactors.

* The Second Conference on Neutron Cross Sections and Technology was held in Washington, D.C. on March 4-7, 1968.

Papers from this Conference have been published in two volumes as follows: Volume I, Sessions A-D, pages 1-640; Volume II, Sessions E-H, pages 641-1337. These volumes contain the texts of the invited and contributed papers of the Conference. Topics covered include: The need for neutron data in fields of science and technology; standard data and flux measurements; the determination of neutron cross sections by theoretical and experimental techniques; a presentation of recently measured data and their utilization in a variety of applications. These two volumes are sold as a set.

Volume 1:

The Role of Neutrons in Astrophysical Phenomena, W. A. Fowler.

Cosmic Abundances and the Extrapolation of Nuclear Systematics, P. A. Seeger.

The Field of Shielding Technology, H. Goldstein.

Sensitivity of Gamma-Ray Dose Calculations to the Energy Dependence of Gamma-Ray Production Cross Sections, K. J. Yost and M. Solomito.

Temperature Dependence of the Average Transmission of Tungsten Between 2 keV and 2 MeV Neutron Energy, F. H. Fröhner, J. L. Russell, Jr., and J. C. Young.

Neutron Cross Sections: The Field of Radiation Damage, M. S. Wechsler.

Production of s-Nuclei from e- and r-Seed Nuclei by a Fixed Neutron Flux, J. P. Amiet and H. D. Zeh.

Neutron Flux Measurements, R. Batchelor.

Developments in Standard Neutron Cross Sections, J. H. Gibbons.

Helium Production Cross Section Measurements, J. Weitman and N. Dåverhög.

Measurement of Gamma-Ray Production Cross Sections Using a LINAC, V. J. Orphan, A. D. Carlson, and C. G. Hoot.

Neutron Cross Sections of ^{6}Li in the Kilovolt Region, J. A. Farrell and W. F. E. Pineo.

Total Neutron Cross Sections of ^{6}Li, ^{7}Li, and Lithium from 10 to 1236 keV, C. T. Hibdon and F. P. Mooring.

The Non-Elastic Cross-Section of Beryllium for Neutrons from 2.3 to 5.2 MeV, J. R. P. Eaton and J. Walker.

Fast Neutron Energy Measurements, J. C. Davis and F. T. Noda.

Experimental Techniques in Absolute Measurements of the Fission Neutron Yield, A. De Volpi.

Review of Some Fast Neutron Cross Section Data, Y. Kanda and R. Nakasima.

Characteristics of Various Isotopes for Sandwich Foil Measurements of Neutron Spectra, T. J. Connolly and F. De Kruijf.

Advances in Accurate Fast Neutron Detection, A. De Volpi and K. G. Porges.

Nonelastic and Some Inelastic Cross Sections in C^{12} and N^{14} at 15.3 MeV, L. F. Hansen, J. D. Anderson, M. L. Stelts, and C. Wong.

Neutron Differential Cross Section Evaluation by a Multiple Foil Activation Iterative Method, W. N. McElroy, J. A. Ulseth, S. Berg, G. Gigas, and T. B. Crockett.

Spatially Continuous Neutron Flux Plotting with Spark Chambers, K. G. Porges, W. W. Managan, and W. C. Kaiser.

The Manganese-55 Resonance Activation Integral, R. Sher.

Use of Neutron Data in Thermal Reactor Power Plant Design, R. J. French.

Sensitivity of Reactivity Characteristics to Cross Section Uncertainties for Plutonium-Fueled Thermal Systems, U. P. Jenquin, V. O. Uotinen, and C. B. Heeb.

Significance of Neutron Data to Fast Reactor Power Plant Design, P. Greebler, B. A. Hutchins, and B. Wolfe.

Fission Product Cross-Section and Poisoning in Fast Reactors, V. Benzi.

The (n,γn') and Fission Reactions as Possible Sources of Low Energy Neutrons in Fast Critical Assemblies, K. Parker, E. D. Pendlebury, J. P. Shepherd, and P. Stanley.

Fissile Doppler Effect Measurement Data and Techniques, C. E. Till and R. A. Lewis.

An Examination of Methods for Calculating the Doppler Coefficient in Fast Breeder Reactors, M. W. Dyos, C. R. Adkins, and T. E. Murley.

Influence of Neutron Data in the Design of Other Types of Power Reactors, A. M. Perry.

Effects of Cross-Section Uncertainties in Compact Space Power Reactors, P. S. Brown, J. L. Watts, and R. J. Doyas.

New Cross Section Needs for Zirconium Hydride SNAP Reactors, E. H. Ottewitte.

FISSPROD, A Fission Product Program for Thermal Reactor Calculations, F. E. Lane and W. H. Walker.

Effects of Uncertainties in Nuclear Data on Experimental and Calculated Reactor Burnup, D. E. Christensen, R. C. Liikala, R. P. Matsen, and D. L. Prezbindowski.

Ratio of Photon to Neutron Fission Rates in Fast Reactors, E. J. Dowdy, W. H. Kohler, R. T. Perry, and N. B. Poulsen.

Criticality and Central Reactivity Calculations Using ENDF/B Data, R. J. LaBauve and M. E. Battat.

Transuranium Cross Sections Which Influence FBR Economics, E. H. Ottewitte.

Measurements on Fissile Nuclei: Experimental Results and Interpretation, A. Michaudon.

Normalization of Relative ^{235}U Fission Cross-Section in the Resonance Region, A. J. Deruytter and C. Wagemans.

Fission Cross-Section Measurement on U^{235}, M. G. Cao, E. Migneco, J. P. Theobald, J. A. Wartena, and J. Winter.

Precise 2200 m/s Fission Cross-Section of U^{235}, A. J. Deruytter, J. Spaepen, and P. Pelfer.

Measurement of the U^{235} Fission Cross-Section in the keV Energy Range, W. P. Poenitz.

Scattering Cross-Section of Pu^{240}, M. G. Cao, E. Migneco, J. P. Theobald, and J. A. Wartena.

Final Results on the Neutron Total Cross Section of Pu^{240}, W. Kolar and K. H. Böckhoff.

Resonance Grouping Structure in the Neutron Induced Subthreshold Fission of Pu^{240}, E. Migneco and J. P. Theobald.

Neutron Capture Measurements in the Resonance Region: Cu and Pu^{240}, H. Weigmann, J. Winter, and H. Schmid.

Neutron Scattering Cross-Section of U^{233}, U^{235}, and Pu^{241} from 1 to 30 eV, G. D. Sauter and C. D. Bowman.

Fission Cross Section Measurements: Present and Potential Capabilities, J. A. Farrell.

Neutron Induced Fission Cross-Section Measurements in ^{244}Cm, R. R. Fullwood, J. H. McNally, and E. R. Shunk.

U^{238} Neutron Capture Results from Bomb Source Neutrons, N. W. Glass, A. D. Schelberg, L. D. Tatro, and J. H. Warren.

Measurement of the Absolute Value of Eta for Pu^{241} by the Manganese Bath Method, J. R. Smith and S. D. Reeder.

Techniques for Fission Cross-Section Measurements for Elements with High α and Spontaneous Fission Activity, P. G. Koontz and D. M. Barton.

Fragment Angular Distributions for Monoenergetic Neutron-Induced Fission of Pu^{239}, J. R. Huizenga, A. N. Behkami, J. W. Meadows, Jr., and E. D. Klema.

Fission Cross-Section of ^{232}Th for Thermal Neutrons, M. N. De Mevergnies and P. Del Marmol.

A Single Level Analysis of U^{233} Cross Sections, M. J. Schneider.

Relative Fission Cross Sections of U^{236}, U^{238}, Np^{237}, and U^{235}, W. E. Stein, R. K. Smith, and H. L. Smith.

Low Energy U-235 ν Measurements, S. Weinstein and R. C. Block.

Volume 2:

Neutron Cross Section Measurements in the Resonance Region, M. C. Moxon.

A Study of Partial Radiative Widths at and Between Neutron Resonances, C. Samour, R. Alves, H. E. Jackson, J. Julien, and J. Morgenstern.

Gamma Rays Following Neutron Capture in Iron, Sodium, and Thorium, O. A. Wasson, J. B. Garg, R. E. Chrien, and M. R. Bhat.

Total Neutron Cross Section and Resonance Parameters for Pm^{147}, G. J. Kirouac, H. M. Eiland, R. E. Slovacek, C. A. Conrad, and K. W. Seemann.

Radiation Width of the 2.85-keV Resonance in Na^{23}, S. J. Friesenhahn, W. M. Lopez, F. H. Fröhner, A. D. Carlson, and D. G. Costello.

Fast Neutron Cross Sections: keV to MeV, S. A. Cox.

Neutron Radiative Capture in the keV Region, R. W. Hockenbury, Z. M. Bartolome, W. R. Moyer, J. R. Tatarczuk, and R. C. Block.

Neutron Scattering Measurements in Low Energy Cd and Rh Resonances, T. J. King and R. C. Block.

High Resolution Total Fast Neutron Cross Sections on Some Non-Fissible Nuclei in the Energy Range $0.5 \leq E_n \leq 30$ MeV, S. Cierjacks, P. Forti, D. Kopsch, L. Kropp, and J. Nebe.

Elastic Scattering of Fast Neutrons by Praseodymium and Lanthanum, D. L. Bernard, G. H. Lenz, and J. D. Reber.

Gamma Rays from Inelastic Neutron Scattering in Nitrogen, H. Condé, I. Bergqvist, and G. Nystrom.

Total Neutron Cross-Sections of Carbon, Iron, and Lead in the MeV Region, R. B. Schwartz, R. A. Schrack, and H. T. Heaton, II.

Nuclear Level Schemes from Resonance Neutron Capture (^{196}Pt, ^{184}W, ^{200}Hg, ^{64}Cu, ^{68}Cu, ^{36}Cl, ^{198}Au, ^{60}Co), R. N. Alves, C. Samour, J. M. Kuchly, J. Julien, and J. Morgenstern.

Neutron-Resonance Parameters of Cadmium and Antimony, A. Asami, M. Okubo, Y. Nakajima, and T. Fuketa.

Neutron Capture Resonances of Tungsten in the Range 150 eV to 100 keV, Z. M. Bartolome, W. R. Moyer, R. W. Hockenbury, J. R. Tatarczuk, and R. C. Block.

The Neutron Inelastic Cross-Section for the Production of ^{103m}Rh, J. P. Butler and D. C. Santry.

The ^{14}N (n,n'γ) Reaction for $5.8 \leq E_n \leq 8.6$ MeV, J. K. Dickens, E. Eichler, F. G. Perey, P. H. Stelson, J. Ashe, and D. O. Nellis.

Measurements of Absorption Resonance Integrals for ^{176}Hf, ^{177}Hf, ^{178}Hf, ^{179}Hf, and ^{180}Hf, R. H. Fulmer, L. J. Esch, F. Feiner, and T. F. Ruane.

Measurements of Neutron Scattering from ^{7}Li, H. H. Knitter and M. Coppola.

Capture Cross-Section Measurements for Lu, ^{151}Eu, and ^{153}Eu and the Total Cross-Section of Eu, M. V. Harlow, A. D. Schelberg, L. D. Tatro, J. H. Warren, and N. W. Glass.

A Systematic Investigation of Fast Neutron Elastic Scattering, B. Holmqvist and T. Wielding.

Total Neutron Cross-Sections of ^{9}Be, ^{14}N, and ^{16}O, C. H. Johnson, F. X. Haas, J. L. Fowler, F. D. Martin, R. L. Kernell, and H. O. Cohn.

Cross-Section Measurements of Zirconium, W. M. Lopez, F. H. Fröhner, S. J. Friesenhahn, and A. D. Carlson.

The Strength Functions S_0 and S_1, The Total Radiative Width Γ_γ and the Mean Level Spacing D as a Function of Mass Number and Spin Value, J. Morgenstern, R. Alves, S. de Barros, J. Julien, and C. Samour.

The Thermal Cross-Sections and Paramagnetic Scattering Cross-Sections of the Yb Isotopes, S. F. Mughabghab and R. E. Chrien.

Cross-Section Measurements for the Reaction ^{152}Eu (n,γ) ^{152m}Eu Between 0.02 eV and 0.5 eV, F. Poortmans, A. Fabry, and I. Girlea.

Precision Measurements of Excitation Functions of (n,p), (n,α), and (n,2n) Reactions Induced by 13.5-14.7 MeV Neutrons, H. K. Vonach, W. G. Vonach, H. Munzer, and P. Schramel.

Total Neutron Cross-Section of ^{204}Tl from 0.2 eV to 1000 eV, T. Watanabe, G. E. Stokes, and R. P. Schuman.

Detection of a Spin Dependent Effect in the Gamma Spectrum Following Neutron Capture, C. Coceva, F. Corvi, D. Giacobbe, and G. Carraro.

Nuclear Theory and Neutron Cross-Sections, E. W. Vogt.

Correlations in Positions of Single-Particle Levels on Complex Nuclei, S. I. Sukchoruchkin.

Calculations of Elastic Scattering and Inelastic Direct Processes of Fast Neutrons by U-238, F. Bühler.

Determination of the Optical Potential Depth from a Many Body Approach, N. Azziz.

Thermal Neutron Cross-Sections and Resonance Integrals for Transuranium Isotopes, A. Prince.

Interpretation of the Correlated Analysis of Fission, Total and Capture Cross-Section Data, F. T. Adler and D. B. Adler.

Gerade-Ungerade Symmetry and the Nuclear Mass Division in Fission, J. J. Griffin.

Calculation of Photon Production Cross-Sections and Spectra from 4 to 15 MeV Neutron Induced Reactions, R. J. Howerton.

Theory of Doppler Broadening of Neutron Resonances, S. N. Purohit, T. Shea, and S. Kang.

The Neutron Cross-Section and Resonance Integrals of Holmium, T. E. Stephenson.

Recent Developments in the Automated Compilation and Publication of Neutron Data, S. Pearlstein.

Automated Evaluation of Experimental Data, H. A. Alter.

Principles of Cross-Section Evaluation, J. J. Schmidt.

Neutron Data Compilation at the International Atomic Energy Agency, H. D. Lemmel, P. M. Attree, T. A. Byer, W. M. Good, L. Hjaerne, V. A. Konshin, and A. Lorenz.

The ENEA Neutron Data Compilation Centre, V. I. Bell.

An Integrated System for Producing Calculational Constants for Neutronics and Photonics Codes, R. J. Howerton.

A Computer File of Resonance Data, T. Fuketa, Y. Nakajima, and K. Okamoto.

Storage and Retrieval of Photon Production and Interaction Data in the ENDF/B System, D. J. Dudziak and R. J. LaBauve.

A Mathematical Scheme for Evaluating Cross-Section Data on the Fissile Isotopes U^{233}, U^{235}, and Pu^{239} in the Energy Range 10 keV-10 MeV, P. C. Young and K. B. Cady.

On Line Computer System for Cross-Section Evaluation, L. E. Beghian and J. Tardelli.

Data Reduction with a Small Remote Computer Linked to a CDC-6600, W. R. Moyer, R. P. Bianchini, and E. Franceschini.

Evaluation of Uranium 238 Neutron Data in the Energy Range .0001 eV to 15 MeV, M. Vaste and J. Ravier.

Neutronic Measurements in Non-Critical Media, C. A. Stevens.

The Use of Integral Spectrum Measurements to Improve Neutron Cross-Section Data, E. D. Pendlebury.

Fast Neutron Spectra in Multiplying and Non-Multiplying Media, J. M. Neill, J. L. Russell, Jr., R. A. Moore, and C. A. Preskitt.

Studies of the Angular Distribution of Fast Neutrons in Depleted Uranium, E. Greenspan, B. K. Malaviya, N. N. Kaushal, E. R. Gaerttner, and A. Mallen.

Adequacy of Fast and Intermediate Cross-Section Data From Neutron Spectrum Measurements in Bulk Media, B. K. Malaviya, E. Greenspan, E. R. Gaerttner, and A. Mallen.

Differential Data and the Interpretation of Large, Fast Reactor, Critical Experiments, W. G. Davey.

Calculations of Fast Critical Experiments Using ENDF/B Data and a Modified ENDF/B Data File, T. A. Pitterle, E. M. Page, and M. Yamamoto.

A Comparison of Pu-240 Cross-Section Evaluations by Calculations of ZPR-III Assemblies 48 and 48B, T. A. Pitterle and M. Yamamoto.

Integral Test of Capture Cross-Sections in the Energy Range 0.1-2 MeV, A. Fabry and M. De Coster.

^{238}Pu Production Predictions from Available Neutron Cross-Sections, E. J. Hennelly, W. R. Cornman, N. P. Baumann.

Foil Measurements of Integral Cross-Sections of Higher Mass Actinides, R. L. Folger, J. A. Smith, L. C. Brown, R. F. Overman, and H. P. Holcomb.

Reactor Cross-Sections for ^{242}Pu-^{252}Cf, J. A. Smith, C. J. Banick, R. L. Folger, H. P. Holcomb, and I. B. Richter.

Thermal Reactor Absorption Cross-Sections of Radioactive Nuclides, R. S. Mowatt and W. H. Walker.

The Decay of a Neutron Pulse in a Fast Nonmultiplying System as an Integral Check on the High Energy Inelastic Scattering, T. Gozani and P. d'Oultremont.

SP300, Volume 1. **Precision measurement and calibration. Selected papers on statistical concepts and procedures,** H. H. Ku, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 1, 436 pages (Feb. 1969).

Key words: Accuracy; analysis of measurement data; design of experiments; functional relationships; interlaboratory tests; measurement process; precision; statistical concepts in measurements; systematic error.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 1 deals with methodology in the generation, analysis, and interpretation of precision measurement data. It contains 40 reprints assembled in 6 sections: (1) The Measurement Process; (2) Design of Experiments in Calibration; (3) Interlaboratory Tests; (4) Functional Relationships; (5) Statistical Treatment of Measurement Data; (6) Miscellaneous. Each section is introduced by an interpretive foreword, and the whole is supplemented by abstracts and selected references.

SP300, Volume 2. **Precision measurement and calibration temperature. Selected NBS papers on temperature,** J. F. Swindells, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 2, 520 pages (Aug. 1968).

Key words: Acoustical thermometry; cerous magnesium nitrate thermometer; error analysis; liquid-in-glass thermometry; reprints; resistance thermometry; spectroscopic thermometry; standards; temperature scales; thermoelectric thermometry.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 2 contains reprints through June 1967 covering the general topics: Uncertainties, Temperature Scales, Resistance Thermometry, Thermoelectic Thermometry, Liquid-in-Glass

Thermometry, Optical Pyrometry, and Spectroscopic Thermometry. A selected bibliography covering the period from January 1953 through December 1965 is included. (Supersedes in part NBS Handb. 77, Vol. II.)

SP300, Volume 3. **Precision measurement and calibration. Selected NBS papers on electricity—low frequency,** F. L. Hermach and R. F. Dziuba, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 3, 498 pages (Dec. 1968).

Key words: Ac-dc transfer standards; capacitors; current transformers; dielectric measurements; electrical calibrations; electrical measurements; electrical standards; electrical units; high voltage measurements; inductive voltage dividers; inductors; magnetic measurements; resistance apparatus; resistors; standard cells; voltage transformers; zener diodes.

This volume is one of an extended series which brings together some of the previously published papers, monographs, abstracts and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 3 contains reprints through 1967 on d-c and low-frequency electrical measurements covering the following topics: Electrical Units, Electrical Standards, Standard Cells, Zener Diodes, Resistors, Resistance Apparatus, Capacitors, Inductors, Instruments, AC-DC Transfer Standards, Transformers, Inductive Voltage Dividers, High Voltage Measurements, Dielectric Measurements, and Magnetic Measurements. A selected list of NBS publications on electrical measurements is also included.

SP300. Volume 4. **Precision measurement and calibration. Electricity—radio frequency,** A. J. Estin, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 4, 456 pages (June 1970).

Key words: Admittance; antenna; attenuator; bolometer; calorimetry; horn; impedance; interferometry; measuring system; phase; power; radiometry; resonant cavity; voltage; waveform; waveguide junction.

This volume is one of an extended series which brings together some of the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 4 contains reprints through June 1967 on radio-frequency electrical measurements covering the following topics: Power, Sinusoidal Voltage and Current, Electromagnetic Fields and Antennas, Radar and Baseband Pulses, Noise, Attenuation and Phase, Impedance, Radio Frequency Materials, Quasi-optics and Millimeter Waves, and Applications to Measurement Systems.

SP300. Volume 5. **Precision measurement and calibration. Selected NBS papers on frequency and time,** B. E. Blair and A. H. Morgan, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 5, 565 pages (June 1972).

Key words: Atomic beams; atomic clocks; atomic standards; atomic time; clock synchronization; coordinated U.T. dissemination of frequency and time; flicker noise; frequency and time standards; frequency measurement; frequency stability; international comparison of atomic standards; lasers; masers; radio frequency measurements; satellite timing; spectral density; standard frequency and time broadcasts; statistics of frequency and time measurements; time scales; time synchronizations; TV timing; VLF timing.

This is one of a series of volumes consisting of a group of selected papers and monographs by NBS authors, and abstracts of papers by non-NBS and NBS authors, dealing with the precision measurement of specific physical quantities and related topics. The contents should be useful to those in the scientific community who are engaged in frequency and time measurements or are otherwise interested in these physical quantities.

This volume contains selected reprints, and abstracts of very general papers, printed in chronological order in most cases from January 1960 through June 1969, covering the following general topics: Frequency and Time Standards, Time Scales, Distribution of Frequency and Time Signals, Statistics of Frequency and Time Standards, and Selected Frequency and Time References.

SP300. Volume 6. **Precision measurement and calibration. Selected NBS papers on heat,** D. C. Ginnings, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 6, 387 pages (Feb. 1970).

Key words: Bomb calorimetry; calorimetric design principles; calorimetric methods; calorimetric theory; cryoscopic studies; differential thermal analysis; heat measurements; heat transfer; high temperature calorimetry; low temperature calorimetry; reaction calorimetry.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 6 contains reprints through 1968 covering the following topics: General Calorimetry and Techniques, Low Temperature Calorimetry, High Temperature Calorimetry, Reaction Calorimetry, and Heat Transfer.

SP300. Volume 7. **Precision measurement and calibration. Radiometry and photometry,** H. K. Hammond, III, and H. L. Mason, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 7, 685 pages (Nov. 1971).

Key words: Emissivity; flashing light; flux measurement; irradiance; material properties; photometry; projectors; radiance; radiometry; reflectometry.

This volume is one of an extended series which brings together some of the previously published papers, monographs, abstracts and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 7 contains reprints of more than 60 items on radiometry and photometry published between 1957 and 1970. The material has been placed in groups according to the following subjects: general radiometry, emissivity standards, emissivity measurements and techniques, material properties, irradiance standards, radiometric measurement techniques, radiance standards, flux measurement, reflectometry, general photometry, projectors, flashing lights, and chronological bibliography of publications by NBS staff.

SP300. Volume 8. **Precision measurement and calibration. Selected NBS papers on mechanics,** R. L. Bloss and M. J. Orloski, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 8, 590 pages (Jan. 1972).

Key words: Acoustics; fluid mechanics; force; gravity; humidity; pressure; strain; vacuum; vibration; viscosity.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 8 consists primarily of published works of the staff of the Mechanics Division of NBS. It includes papers in the fields of acoustics, fluid mechanics, force, gravity, humidity, pressure, strain, vacuum, vibration, and viscosity. Although most of the papers had been previously published, original papers in the fields of "gravity" and "viscosity" are included.

SP300. Volume 9. **Precision measurement and calibration. Selected NBS papers on colorimetry,** I. Nimeroff, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 9, 460 pages (June 1972).

Key words: Appearance evaluation; colorimetry; color spacing; color vision; gloss; metamerism; spectrophotometry; standards; uncertainty; variability.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with the precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to the NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 9 treats the field of Colorimetry. It contains 37 reprints on Colorimetry and Spectrophotometry assembled in 8 sections: (1) Spectrophotometry, (2) Color Vision, (3) Color Specification, (4) Sources and Instrumentation, (5) Color Spacing and Metamerism, (6) Variabilities and Uncertainties, (7) Appearance and Gloss, (8) List of Publications, LP39 (in part), Colorimetry and Spectrophotometry Publications by the Staff of the National Bureau of Standards, January 1957 through August 1969.

SP300. Volume 10. **Precision measurement and calibration. Selected NBS papers on image optics,** C. S. McCamy, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 300, Vol. 10, 953 pages (Nov. 1972) $11.10, SD Catalog No. C13.10:300, Vol. 10.

Key words: Camera calibration; image evaluation; image optics; image stability; interferometry; lens testing; light filters; light sources; photography.

This volume is one of an extended series which brings together the previously published papers, monographs, abstracts, and bibliographies by NBS authors dealing with precision measurement of specific physical quantities and the calibration of the related metrology equipment. The contents have been selected as being useful to the standards laboratories of the United States in tracing to NBS standards the accuracies of measurement needed for research work, factory production, or field evaluation.

Volume 10 deals with image optics, including photography. It contains 57 reprints assembled in 4 sections: (1) Refractometry and Optical Homogeneity: (2) Interferometry in Image Optics; (3) Optical Image Evaluation; (4) Photography. Each section is introduced by an interpretive foreword, including in some instances, pertinent references.

SP301. **Molecular dynamics and structure of solids.** Proceedings of the Second Materials Research Symposium held at the National Bureau of Standards, Gaithersburg, Md., October 16-19, 1967, R. S. Carter and J. J. Rush, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 301, 580 pages (June 1969).*

Key words: Crystal; crystal structure; diffraction; lattice dynamics; molecular dynamics; molecular solid; rotation; spectroscopy; vibration.

This volume is based on material presented at the Second Materials Research Symposium of the National Bureau of Standards, held October 16-19, 1967. It provides a review of the application of spectroscopic and diffraction techniques to the study of the structure and dynamics of molecular solids. Invited papers on the theory and practice of the major experimental methods, including neutron and x-ray diffraction, neutron inelastic scattering, infrared and Raman spectroscopy and nuclear magnetic resonance, serve as a background for the more detailed presentation and discussion of results which follows. The topics covered in a series of invited and contributed papers include the lattice dynamics of molecular crystals, the spectroscopy and crystal structure of organic and inorganic solids and the dynamics of polymers.

Theoretical Basis of Techniques for the Investigation of Molecular Dynamics and Structure of Solids, Elliott Montroll.
The Contributions of Neutron and X-Ray Diffraction Techniques, G. E. Bacon.
Infrared and Raman Studies on Molecular Structure and Motion in Condensed Phases, G. R. Wilkinson.
Neutron Inelastic Scattering Studies of Molecular Solids and Liquids, P. A. Egelstaff.
The Principles Involved in the Study of Molecular Motion in Solids by Nuclear Magnetic Resonance, R. E. Richards.
Spectroscopic and Diffraction Studies of Simple Hydrogen Bonds in Solids, James A. Ibers.

SP302. **Thermal conductivity.** Proceedings of the seventh conference held at the National Bureau of Standards, Gaithersburg, Md., November 13-16, 1967, D. R. Flynn and B. A. Peavy, Jr., Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 302, 820 pages (Sept. 1968).*

Key words: Conductance; conductivity; contact conductance; contact resistance; electrical conductivity; electrical resistivity; heat transfer; Lorenz function; resistivity; temperature; thermal conductivity; thermal diffusivity; thermal resistivity; thermophysical properties.

The Seventh Conference on Thermal Conductivity was held at the National Bureau of Standards on November 13-16, 1967. This volume contains the texts of the papers presented. Topics covered include surveys of the present state of knowledge regarding the thermal conductivity of different materials, descriptions of different apparatuses for measuring thermal conductivity, new experimental data on the thermal conductivity or diffusivity of a variety of materials, and correlations between experimental results and theoretical predictions.

The State of Knowledge Regarding the Thermal Conductivity of the Metallic Elements, R. W. Powell and C. Y. Ho.
The State of Knowledge Regarding the Thermal Conductivity of the Non-Metallic Elements—Those Solid at Normal Temperature, C. Y. Ho and R. W. Powell.
Some Aspects Concerning Thermal Conductivity Data of Liquids and Proposals for New Standard Reference Materials, H. Poltz.
The Thermal Conductivity of Non-Metallic Elements (in Liquid or Gaseous State at NTP) in Solid, Saturated and Atmospheric Pressure States, P. E. Liley.
Thermal Conductivity of Vitreous Silica: Selected Values, Lois C. K. Carwile and Harold J. Hoge.

SP303. **Mechanical and thermal properties of ceramics.** Proceedings of a symposium held at the National Bureau of Standards, Gaithersburg, Md., April 1-2, 1968, J. B. Wachtman, Jr., Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 303, 275 pages (May 1969).*

Key words: Ceramics; elasticity; fracture; inelastic deformation; melting point; standards; thermal conductivity; thermal expansion; thermal radiation; viscoelasticity.

The proceedings of the Symposium on Mechanical and Thermal Properties of Ceramics, held at the National Bureau of Standards in Gaithersburg, Md., on April 1-2, 1968 are presented. The symposium was cosponsored by the American Ceramic Society, the American Society for Testing and Materials, and the National Bureau of Standards. Attention was concentrated upon properties primarily of structural and/or high temperature use including melting points, thermal expansion, thermal conductivity, thermal radiation properties, elasticity, viscoelasticity, inelastic deformation, and fracture. The dependence of these properties upon composition and microstructure was surveyed and the importance of controlling these features of character to insure reliability of ceramics was emphasized. The procedures by which American ceramists formulate standards and specifications to assist in insuring reliability were summarized.

SP-304, All previous editions superseded by Special Publication 304, Revised October 1972.

SP-304A, All previous editions superseded by Special Publication 304A, Revised August 1976.

SP305. **Publications of the National Bureau of Standards 1966-1967,** B. L. Oberholtzer, Nat. Bur. Stand. (U.S.), Spec. Publ. 305, 221 pages (Apr. 1969).

Key words: Articles; publications.

All published work by National Bureau of Standards authors from the middle of 1966 to the end of 1967, both in the extensive publications issued by NBS itself and in outside publications, is covered in this latest supplement to the NBS catalog. Each title is accompanied by complete bibliographic information, plus a list of key words and an abstract, both prepared by the authors. In addition, there is information on the NBS publishing program, purchase procedures, publication announcement services, and price lists.

Information in the catalog is accessible through two indexes: an author index and a key word index. In the latter, the group of key words for each catalog entry is permuted so that each key word appears once as the first in the group, and therefore determines the alphabetical order in which the group appears in the index. The user can thus locate papers of interest to him through the subject-related key words.

SP305. Supplement 1. **Publications of the National Bureau of Standards 1968-1969. A compilation of abstracts and key word and author indexes,** B. L. Oberholtzer, Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 1, 497 pages (Dec. 1970).

Key words: Articles; publications.

This Supplement lists the publications of the NBS from January 1968 to December 1969. A brief abstract for each publication is given. It also includes abstracts of those papers by Bureau authors that have appeared in non-NBS media. Subject and author indexes are included and general publication information is furnished. This catalog and previous lists give reference to the publications printed by the Bureau during the period 1901 to December 1969. To accompany NBS Circular 460, its Supplement, Miscellaneous Publication 240, its Supplement, and Special Publication 305.

SP305. Supplement 2. **Publications of the National Bureau of Standards 1970. A compilation of abstracts and key word and author indexes,** B. L. Oberholtzer, Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 2, 378 pages (July 1971).

Key words: Abstracts, NBS publications; key words; publications.

This Supplement to Special Publication 305 Supplement 1 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1970 and December 31, 1970. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 1), key word and author indexes, and general information and instructions about NBS publications. Previous catalogs of NBS publications referenced in Special Publication 305, Supplement 1 remain in effect. To accompany National Bureau of Standards Circular 460, its Supplement, Miscellaneous Publication 240, its Supplement, Special Publication 305 and its Supplement 1.

SP305. Supplement 3. **Publications of the National Bureau of Standards 1971 catalog. A compilation of abstracts and key word and author indexes,** B. L. Oberholtzer, Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 3, 342 pages (July 1972).

Key words: Abstracts, NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1 and 2 the National Bureau of Standards lists the publications of the Bureau issued between 1 January 1971 and 31 December 1971. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 2), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967) and Special Publication 305 Supplement 1 (covering the period 1968-1969), and Special Publication 305 Supplement 2 (covering the period 1970), remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect. To accompany National Bureau of Standards Circular 460; its Supplement, Miscellaneous Publication 240; its Supplement, Special Publication 305; and its Supplements 1 and 2.

SP305. Supplement 4. **Publications of the National Bureau of Standards 1972 catalog. A compilation of abstracts and key word and author indexes,** B. L. Oberholtzer, Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 4, 449 pages (July 1973) $3.75, SD Catalog No. C13.10:305 Suppl. 4.

Key words: Abstracts, NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1, 2, and 3 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1972 and December 31, 1972. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 3), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967) and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), and Special Publication 305 Supplement 3 (covering the period 1971) remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect.

SP305. Supplement 5. **Publications of the National Bureau of Standards 1973 catalog. A compilation of abstracts and key word and author indexes,** B. L. Oberholtzer, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 5, 349 pages (July 1974) SD Catalog No. C13.10:305.

Key words: abstracts, NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1, 2, 3, and 4 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1973 and December 31, 1973. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 3), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967) and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), Special Publication 305 Supplement 3 (covering the period 1971), and Special Publication 305 Supplement 4 (covering the period 1972) remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect. To accompany National Bureau of Standards Special Publication 305; and its Supplements 1, 2, 3, and 4.

SP305. Supplement 6. **Publications of the National Bureau of Standards 1974 catalog. A compilation of abstracts and key word and author indexes,** B. L. Hurdle, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 6, 523 pages (June 1975) SD Catalog No. C13.10:305 Suppl. 6.

Key words: abstracts, NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1 through 5 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1974 and December 31, 1974. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 4), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967) and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), Special Publication 305 Supplement 3 (covering the period 1971), Special Publication 305 Supplement 4 (covering the period 1972), Special Publication 305 Supplement 5 (covering the period 1973) remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect.

SP305. Supplement 7. Publications of the National Bureau of Standards 1975 catalog. **A compilation of abstracts and key word and author indexes,** B. L. Hurdle, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 305 Suppl. 7,* 595 pages (June 1976) SD Catalog No. C13.10:305 Suppl. 7.

Key words: abstracts; NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1 through 6 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1975 and December 31, 1975. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 6), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967), and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), Special Publication 305 Supplement 3 (covering the period 1971), Special Publication 305 Supplement 4 (covering the period 1972), Special Publication 305 Supplement 5 (covering the period 1973), Special Publication 305 Supplement 6 (covering the period 1974), remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect.

SP306-1. **Bibliography on the analyses of optical atomic spectra. Section 1. ^{1}H-^{23}V,** C. E. Moore, Nat. Bur. Stand. (U.S.), Spec. Publ. 306-1, Sec. 1, 89 pages (Sept. 1968).

Key words: Analyses of atomic spectra; atomic spectra, H thru V; bibliography, atomic spectra; elements, spectra of H thru V; references to atomic spectra; spectra, atomic.

The three published volumes on "Atomic Energy Levels," NBS Circ. 467, contain for each spectrum the bibliography that was used in compiling the data. The present work is a continuation of these bibliographies arranged in the same form. The time interval is the span from the respective dates of the earlier publications to the present. The selection of references is restricted to those needed for the preparation of revised tables of atomic energy levels and multiplets.

The bibliography is being published in three sections each of which covers the same elements as the respective volumes of AEL. The present section contains reference lists for the elements 1 H through 23 V, corresponding to Volume I. The spectra of a given element are listed in order of increasing stage of ionization. Listings are included for spectra of the 23 elements.

The original papers have been examined for nearly all of the quoted references. A selected list of general literature references is also included.

SP306-2. **Bibliography on the analyses of optical atomic spectra. Section 2. ^{24}Cr-^{41}Nb,** C. E. Moore, Nat. Bur. Stand. (U.S.), Spec. Publ. 306-2, Sec. 2, 63 pages (Feb. 1969).

Key words: Analyses of atomic spectra; atomic spectra, Cr through Nb; bibliography, atomic spectra; elements, spectra of Cr through Nb; references to atomic spectra; spectra, atomic.

The three published volumes on "Atomic Energy Levels," NBS Circ. 467, contain for each spectrum the bibliography that was used in compiling the data. The present work is a continuation of these bibliographies arranged in the same form. The time interval is the span from the respective dates of the earlier publications to the present. The selection of references is restricted to those needed for the preparation of revised tables of atomic energy levels and multiplets.

The bibliography is being published by sections, each of which covers the same elements as the respective volumes of AEL. Section 1 was issued in September 1968; it contains references for the elements ^{1}H through ^{23}V, corresponding to AEL Volume I.

The present section is similarly arranged, giving references to the spectra of the elements ^{24}Cr through ^{41}Nb, corresponding to AEL Volume II. For a given element the spectra are listed in order of increasing stage of ionization.

The original papers have been examined for nearly all of the quoted references.

SP306-3. **Bibliography on the analyses of optical atomic spectra. Section 3. ^{42}Mo-^{57}La and ^{72}Hf-^{89}Ac,** C. E. Moore, Nat. Bur. Stand. (U.S.), Spec. Publ. 306-3, Sec. 3, 37 pages (May 1969).

Key words: Analyses of atomic spectra; atomic spectra; bibliography, atomic spectra, Mo through La, Hf through Ac; elements, spectra of Mo through La, Hf through Ac; references to atomic spectra; spectra, atomic.

The three published volumes on "Atomic Energy Levels," NBS Circ. 467, contain for each spectrum the bibliography that was used in compiling the data. The present work is a continuation of these bibliographies arranged in the same form. The time interval is the span from the respective dates of the earlier publications to the present. The selection of references is restricted to those needed for the preparation of revised tables of atomic energy levels and multiplets.

The bibliography is being published by sections, each of which covers the same elements as the respective volumes of AEL. Section 1 was issued in September 1968; it contains references for the elements ^{1}H through ^{23}V, corresponding to AEL Volume I. Section 2 appeared in February 1969; as in AEL Volume II, the references cover the elements ^{24}Cr through ^{41}Nb.

The present section is similarly arranged, giving references to the spectra of the elements, ^{42}Mo through ^{57}La and ^{72}Hf through ^{89}Ac, similar to AEL Volume III. For a given element the spectra are listed in order of increasing stage of ionization.

The original papers have been examined for nearly all of the quoted references.

SP306-4. **Bibliography on the analyses of optical atomic spectra. Section 4. ^{57}La-^{71}Lu and ^{89}Ac-^{99}Es,** C. E. Moore, Nat. Bur. Stand. (U.S.), Spec. Publ. 306-4, Sec. 4, 55 pages (Aug. 1969).

Key words: Analyses of rare-earth spectra; atomic spectra; La through Lu, Ac through Es; rare-earth spectra; references to atomic spectra; spectra, atomic: elements, spectra of rare-earths.

There is a steady demand for information on rare-earth spectra. In an attempt to satisfy this need the present bibliography has been prepared. It comprises Section 4, concludes this publication, and completes the coverage of the Periodic Table. The references listed have been selected on a general basis as those needed for the preparation of Volume 4 of "Atomic Energy Levels."

Since rare-earth structure is revealed in the neighboring spectra, ^{57}La and ^{89}Ac, the references for these elements are repeated in the present Section, which contains the two groups of ele-

ments: ^{57}La to ^{71}Lu and ^{89}Ac to ^{99}Es. A selected list of general literature references is also included.

Nearly all of the quoted references have been checked from the original papers.

SP307. **Wolf-Rayet stars.** Proceedings of a symposium held at the Joint Institute for Laboratory Astrophysics, National Bureau of Standards, Boulder, Colo., June 10-14, 1968, K. M. Grebbe and R. N. Thomas, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 307, 286 pages (Dec. 1968).*

Key words: Atomic cross sections; atmospheric aerodynamics; diagnostic spectroscopy; non-equilibrium gases; stellar instability; Wolf-Rayet stars.

A symposium on Wolf-Rayet stars was held at the Joint Institute for Laboratory Astrophysics on the campus of the University of Colorado, Boulder, Colorado, June 10-14, 1968. The Wolf-Rayet stars represent the most extreme example studied on an interaction between aerodynamic motions and a radiation field to produce a high temperature, large-scale plasma in a steady but non-equilibrium state. As such these stars provide a perfect example of the kind of gaseous ensemble that JILA was created to study. In order to understand them, we require a knowledge of gases with temperatures between 10^4 and 10^7 °K and differential velocities between 0 and 10^3 km/sec. In particular we need information on radiative and collisional atomic cross sections for a wide range of ions, on collective interactions of ions and photons, on methods of diagnostic spectroscopy, and on velocity fields generated by convective, gravitational, nuclear, radiative, rotational, thermal, and other instabilities. The material of the symposium was divided into four broad topics: the distribution, physical properties and evolutionary status of Wolf-Rayet stars; the detailed features of their spectra; the interpretations of these features and the models on which they are based; and finally a survey of the material and ideas arising out of the symposium itself. This volume contains the introductory summaries of each of these broad topics, together with an edited version of the discussions which followed.

Part A.—The Features of the System of Wolf-Rayet Stars.
Part B.—A Survey of Spectroscopic Features of Wolf-Rayet Stars.
Part C.—Spectroscopic Diagnostics, Interpretation, and Atmospheric Models.
Part D.—Summary of Problems, Ideas, and Conclusions on the Physical Structure of the Wolf-Rayet Stars.

SP308. **Technical highlights of the National Bureau of Standards, Annual Report Fiscal Year 1968,** Nat. Bur. Stand. (U.S.), Spec. Publ. 308, 216 pages (Nov. 1968).

Key words: Annual report; technical highlights.

This is an illustrated digest of NBS technical and scientific activities during the fiscal year ending June 30, 1968. It lists major programs as they were carried out by the three NBS institutes: Institute for Basic Standards, Institute for Materials Research, Institute for Applied Technology and by the Bureau's Center for Radiation Research. Summaries are given of typical projects in measurement engineering, applied mathematics, electricity, metrology, mechanics, heat, atomic physics, radio standards, laboratory astrophysics, cryogenics, analytical chemistry, polymers, metallurgy, inorganic materials, physical chemistry, engineering standards, weights and measures, invention and innovation, vehicle systems research, product evaluation, building research, electonic technology, technical analysis, computer sciences, and radiation research. Also included are discussions of the Clearinghouse for Federal Scientific and Technical Information, the National Standard Reference Data System, Standard Reference Materials program, and national and international cooperative activities.

SP309, Volume 2. **Computer literature bibliography 1964-1967,** W. W. Youden, Nat. Bur. Stand. (U.S.), Spec. Publ. 309, Vol. 2, 385 pages (Dec. 1968).

Key words: Author index; coden; computer bibliography; information retrieval; permuted index; title word index.

This bibliography is a continuation of NBS Miscellaneous Publication 266, *Computer Literature Bibliography, 1946 to 1963,* and is intended as a further service to the computer community. It contains approximately 5,200 references to computer literature published during the years 1964 through 1967. The Bibliography Section includes the full title and the names of all of the authors of each item published in 17 journals, 20 books composed of chapters by individual authors, and 43 conference proceedings. In addition, references to all items that were reviewed in the IEEE Transactions on Electronic Computers have been included.

The Title Word Index Section provides the means for locating an item if any part of its title is known. Likewise, it can be used to identify all items whose titles include a particular word or phrase. The Author Index Section lists all authors of each item, but does not indicate whether an individual is its sole author.

SP310. **Nuclear standards for chemistry and technology.** Proceedings of a Symposium on Standards in Nuclear Chemistry and Technology held at the 156th National Meeting of the American Chemical Society, Atlantic City, N.J., September 8-9, 1968, H. F. Beeghly, J. P. Cali, and W. W. Meinke, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 310, 261 pages (Dec. 1968).*

Key words: Activation analysis standards; isotope reference standards; nuclear fuel burn-up standards; radiation effect standards; radioactivity standards; standards for nuclear chemistry; standards for nuclear technology.

Many diverse organizations are engaged in developing the nuclear standards needed by science, industry, and government for the rapidly growing field of nuclear technology. Often there has been inadequate communication between these groups and insufficient opportunity to get an overall picture of the needs of the country for the many different kinds of standards necessary for this new industry. The Symposium sponsored by the American Chemical Society Division of Nuclear Chemistry and Technology in cooperation with the Committee on Standardization Relations brought together most of the groups with interests in standards for nuclear chemistry and technology to identify the problems, to discuss present programs, and to outline future needs for standards in this broad field. Standards for purposes of the symposium were defined very broadly to include standard materials, standard procedures, standard specifications, standard data, and engineering standards. The mechanisms available for standardization, the "state of the art" in standardization in many areas of the nuclear field, some indications of unmet needs, and estimates of future needs were discussed in a series of papers and panel discussions which are presented here in either complete or summary form.

SP312, Volumes I and II. **Modern trends in activation analysis.** Proceedings of the 1968 International Conference held at the National Bureau of Standards, Gaithersburg, Md., October 7-11, 1968, J. R. DeVoe, Editor and P. D. LaFleur, Assistant Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 312, Vol. I, 691 pages and Vol. II, 676 pages (June 1969).*

Key words: Activation analysis; applications; archaeology; biology; charged particles; computation; conference; criminology; data handling; geochemistry; industry; neutron; nuclear reactions; photons; radiation detectors; radiochemical separation.

A conference on Modern Trends in Activation Analysis was held at the National Bureau of Standards, October 7-11, 1968. Volume I contains texts of two invited plenary lectures, one on the applications of activation analysis and one on radiochemical separations, contributed papers, remarks by honored guests, and synopses of discussion sessions by each chairman. Topics covered include applications of activation analysis in the environmental sciences, biology, medicine, archaeology, criminology, geochemistry, geology, and industry. Also included are studies on radiochemical separations. Volume II contains texts of three plenary lectures, one on nuclear reactions, one on radiation detectors and data processing, and one on computation methods in activation analysis. Contributed papers, remarks by honored guests, and synopses of discussion sessions by chairmen are included. Topics covered include nuclear reactions in activation analysis, radiation detectors, data handling and processing, computation methods, error analysis, and information retrieval. These two volumes are sold as a set.

Volume I:

The Halogen Composition of Aerosol Particles Over Lake Michigan, R. H. Loucks, J. W. Winchester, W. R. Matson, and M. A. Tiffany.

Thermal Neutron Activation Analysis of Airborne Particulate Matter in Chicago Metropolitan Area, S. S. Brar, D. M. Nelson, E. L. Kanabrocki, C. E. Moore, C. D. Burnham, and D. M. Hattori.

Application of Activation Analysis and Ge(Li) Detection Techniques for the Determination of Stable Elements in Marine Aerosols, N. D. Dudey, L. E. Ross, and V. E. Noshkin.

Activation Analysis Applied to Sediments From Various River Deltas, A. J. de Groot, K. H. Zschuppe, M. de Bruin, J. P. W. Houtman, and P. A. Singgih.

Measurements of Movements of Solid Substances in Water by Means of Stable Tracers and Activation Analysis, C. Cappadona.

Specific Activation Analysis Techniques and Methods for the Assay of Trace Substances in Aquatic and Terrestrial Environments, G. W. Leddicotte.

Post-Sampling Activation Analysis of Stable Nuclides for Estuary Water Tracing, J. K. Channell and P. Kruger.

Neutron Activation Analysis of Vanadium in Natural Waters, K. D. Linstedt and P. Kruger.

Neutron Activation Analysis Identification of the Source of Oil Pollution of Waterways, V. P. Guinn and S. C. Bellanca.

The Multielement Analysis of Biological Material by Neutron Activation and Direct Instrumental Techniques, L. A. Rancitelli, J. A. Cooper, and R. W. Perkins.

Multielement Analysis of Pathological Tissue, D. M. Linekin, J. F. Balcius, R. D. Cooper, and G. L. Brownell.

The Use of Neutron Capture Gamma Radiations for the Analysis of Biological Samples, D. Comar, C. Crouzel, M. Chastel and, R. Riviere, and C. Kellershohn.

Element Imbalances of Atherosclerotic Aortas, W. H. Strain, G. G. Rob, W. J. Pories, R. C. Childers, M. F. Thompson, Jr., A. A. Hennessen, and F. M. Graber.

A Useful Neutron Activation Analysis Method for the Determination of Tellurium in Human Tissues, A. Abu-Samra and G. W. Leddicotte.

Neutron Activation Analysis of Brain for Copper and Manganese, E. D. Bird, J. F. Emery, S. B. Lupica, and W. S. Lyon.

Neutron Activation Analysis of Barnacle Shells, C. M. Gordon and R. E. Larson.

Sampling Methodology Development in a Large Scale Cystic Fibrosis Screening Program Based on Automated Neutron Activation Analysis, L. E. Fite, R. E. Wainerdi, H. P. Yule, G. M. Harrison, G. Bickers, and R. Doggett.

Clinical Experience With the Use of Neutron Activation Analysis in the Diagnosis of Cystic Fibrosis, G. L. Woodruff, W. E. Wilson, Jr., Y. Yamamoto, A. L. Babb, and S. J. Stamm.

Activation Analysis in Plant Biology. Radioecological Applications Using Simple or Automated Radiochemical Separation Techniques, A. Fourcy, M. Neuburger, C. Garrec, A. Fer, and J. P. Garrec.

Determination of Vanadium by Neutron Activation Analysis at Nanogram Levels in Diets for Experimental Animals, J. P. F. Lambert and R. E. Simpson.

The Instrumental Determination of Fifteen Elements in Plant Tissue by Neutron Activation Analysis, W. A. Haller, R. Filby, L. A. Rancitelli, and J. A. Cooper.

Simultaneous Determination of Arsenic, Antimony and Mercury in Biological Materials by Neutron Activation Analysis, I. Hadzistelios and A. P. Grimanis.

Instrumental Neutron Activation Analysis of Tobacco Products, R. A. Nadkarni and W. D. Ehmann.

Simultaneous Determination of Arsenic and Copper in Wines and Biological Materials by Neutron Activation Analysis, A. P. Grimanis

Aspects of Low Temperature Irradiation in Neutron Activation Analysis, D. Brune.

Determination of the Specific Activity of Commercial Iodine-125 Preparations by Neutron Activation Analysis, K. Heydorn.

Investigations on the Age and Place of Origin of Paintings by Neutron Activation Analysis, F. Lux, L. Braunstein, and R. Strauss.

An Investigation of the Silver Content of Roman Coinage by Neutron Activation Analysis, D. Gibbons and D. Lawson.

Nondestructive Activation Analysis of Ancient Coins Using Charged Particles and Fast Neutrons, P. Meijers.

The Analysis of English and American Pottery of the American Colonial Period, J. S. Olin and E. V. Sayre.

Comparison of Forensic Soil Specimens by Neutron Activation Analysis, C. M. Hoffman, R. L. Brunelle, K. B. Snow, and M. J. Pro.

Recent Forensic Applications of Instrumental Activation Analysis, A. K. Perkons and R. E. Jervis.

The Examination of Actual Case Evidence Samples by Neutron Activation Analysis, H. L. Schlesinger, H. R. Lukens, and D. M. Settle.

Arsenic Content of Human Hair After Washing as Determined by Activation Analysis, A. J. van den Berg, J. J. M. de Goeij, J. P. W. Houtman, and C. Zegers.

Comparison of Activation Analysis and Spark Source Mass Spectrometry for Forensic Applications, T. G. Williamson and W. W. Harrison.

Routine Determinations of Al, K, Cr, and Sn in Geochemistry by Neutron Activation Analysis, H. A. Das, J. G. van Raaphorst, and H. J. L. M. Umans.

Determination of Trace Elements in Meteorites by Neutron Activation Analysis, W. Kiesl.

The Nondestructive Determination of Iridium in Meteorites Using Gamma-Gamma Coincidence Spectrometry, W. D. Ehmann and D. M. McKown.

Determination of Some Rare Earths in Rocks and Minerals by Neutron Activation and Gamma-Gamma Coincidence Spectrometry, O. B. Michelsen and E. Steinnes.

Neutron Activation Method for the Isotopic Analysis of Lead, P. P. Parekh, M. S. Das, and V. T. Athavale.

Determination of Protactinium by Neutron Activation and Alpha Spectrometry, J. N. Rosholt and B. J. Szabo.

Use of a Ge(Li) Detector After Simple Chemical Group Separation in the Activation Analysis of Rock Samples. IV. Simultaneous Determination of Strontium and Barium, H. Higuchi, K. Tomura, H. Takahashi, N. Onuma, and H. Hamaguchi.

Activation Analysis of Geochemical Materials Using Ge(Li) Detectors, R. H. Filby and W. A. Haller.

Ge(Li) Detectors in the Activation Analysis of Geological Samples, K. Randle and G. G. Goles.

An Investigation of Trace Elements in Marine and Lacustrine Deposits by Means of a Neutron Activation Method, O. Landstrom, K. Samsahl, and C. G. Wenner.

Geochemical Surveying by Means of Neutron Activation Analysis with Possible Application to Continental Drift Studies, E. A. Uken, G. G. Santos, and R. E. Wainerdi.

Volcanological Studies Using Activation Analysis Techniques, G. Santos and R. E. Wainerdi.

Aluminum and Silicon Abundances of Some Italian Meteorites as Determined by Instrumental Activation Analysis, S. Meloni, V. Maxia, and S. Buzzi.

Neutron Activation Analysis of Individual Cosmic Spherules, H. T. Millard, Jr.

Extensions of the Use of Ge(Li) Detectors in Instrumental Neutron Activation Analysis of Geological Samples, G. E. Gordon, J. C. Dran, P. A. Baedecker, and C. F. L. Anderson.

Neutron Techniques for *In Situ* Elemental Analysis, J. W. Mandler and J. H. Reed.

Simultaneous Measurement of Seventeen Trace Elements in Eight Geochemical Standards: A Novel Adaptation of Neutron Activation Analysis, D. R. Case, J. C. Laul, M. A. Wechter, F. Schmidt-Bleek, and M. E. Lipschutz.

On the Feasibility of the Determination of Water, Salt and Sulphur in Crude Oil by Means of Neutron Activation Analysis, L. Gorski, J. Janczyszyn, and L. Loska.

Investigation of Material Transfer by Neutron Activation Analysis, D. Gibbons, D. Lawson, B. Metcalfe, and H. Simpson.

Applications of Activation Analysis to Determination of Cement in Concrete, F. A. Iddings and A. Arman.

Determination of Sodium and Potassium in Solid Propellants, W. H. Barber, O. H. Dengel, R. H. Vogt, and C. V. Strain.

Routine Determination of Major Components by Activation Analysis, J. F. Cosgrove.

Instrumental Neutron Activation Analysis Using Reactor, Ge(Li) Detector and Computer, O. U. Anders.

Substoichiometric Determination of Molybdenum and Palladium by Neutron Activation Analysis, Z. K. Doctor, R. A. Nadkarni, and B. C. Haldar.

Activation Analysis by Standard Addition and Solvent Extraction. Determination of Certain Trace Elements in Antimony, A. Alian.

Nondestructive Determination of Elements in Specific Freshwater Microplankton by Activation Analysis, M. Merlini, O. Ravera, and C. Bigliocca.

Isotopic Analysis of Uranium by Neutron Activation and High Resolution Gamma-Ray Spectrometry, M. Mantel, J. Gilat, and S. Amiel.

Pulsed Neutron Activation Analysis System for Short-Lived Radioisotopes, W. F. Naughton and W. A. Jester.

The Detection and Determination of Fissionable Species by Neutron Activation—Delayed Neutron Counting, J. L. Brownlee, Jr.

A High-Intensity ^{241}Am-Be-^{242}Cm Neutron Source, M. Wahlgren, J. Wing, and D. C. Stewart.

New Facilities for Activation Analysis at the Grenoble Center for Nuclear Studies, J. Laverlochere.

The Nuclear Analysis Program of the NRL Cyclotron Facility, J. A. Eisele and R. E. Larson.

The Localization of Impurities in Activation Analysis Demonstrated by Analyses of Semiconductor Silicon, J. Martin.

The Determination of Copper and Gold Trace Impurities in High Purity Gallium by Activation Analysis with Pretreatment, L. G. Nagy, G. Torok, L. Szokolyi, and J. Giber.

Neutron Activation Analysis of Laser Crystals, R. F. Ortega.

Determination of Traces of Selenium and Tellurium in Sulphur by Neutron Activation, A. Arroyo A. and J. Toro G.

Nondestructive Activation Analysis for Arsenic and Antimony in Soft Soldering Alloys, M. D. Rudelli, H. C. Rocca, and G. B. Baro.

The Application of the Activation Analysis to the Investigation of Sorption and Sublimation Properties of High-Temperature Materials, I. A. Maslov, V. A. Lucknitsky, N. M. Karnauckova, and G. I. Karajanova.

Diversified Instrumental Nuclear Analysis Methods Using a Reactor, H. W. Nass.

Major Constituents Determination in Substances by Activation Analysis, C. Cappadona.

Gas Chromatographic Separations in Neutron Activation Analysis, S. P. Cram and F. T. Varcoe.

Rapid Group Separation Method for Neutron Activation Analysis of Geological Materials, S. F. Peterson, A. Travesi, and G. H. Morrison.

Group Radiochemical Separations: A Practical Approach to Activation Analysis, B. A. Thompson.

Radiochemical Separations by Retention on Inorganic Precipitates, F. Girardi, R. Pietra, and E. Sabbioni.

Chromium Separation by Inorganic Exchangers in Activation Analysis of Biological Materials, S. Meloni, A. Brandone, and V. Maxia.

Determination of the Distribution Coefficients of the Elements of the IB, VB, VIA, and VIB Groups in Anionic Ion Exchange Resin in the Water-Hydrochloric Acid-Acetone Mixture, C. Cleyrergue, N. Deschamps, and P. Albert.

Quantitative Determination of Impurities in Nuclear Graphites by Radioactivation Methods, S. May and G. Pinte.

Radiochemical Separations for Activation Analysis Using Bis(2-Ethyl-Hexyl) Orthophosphoric Acid, I. H. Qureshi, L. T. McClendon, and P. D. LaFleur.

Volume II:

Study of a Beam of Charged Particles: Their Slowing Down, and Their Energy Distribution in a Thick, Complex Target for Activation Analysis, M. D. Tran and J. Tousset.

Range Transformation of Activation Curves and Their Application to Quantitative Charged Particle Activation Analysis, H. L. Rook, E. A. Schweikert, and R. E. Wainerdi.

Contribution to Activation Analysis by Charged Particles: Determination of Carbon and Oxygen in Pure Metals, Possibilities of Sulphur Determination, J. L. Debrun, J. N. Barrandon, and P. Albert.

Influence of Channeling in Customary ^{3}He Activation Analysis, E. Ricci.

Surface Analysis of Gold and Platinum Disks by Activation Methods and by Prompt Radiation from Nuclear Reactions, J. W. Butler and E. A. Wolicki.

Determination of Oxygen Present at the Surface of Metals by Irradiation with 2 MeV Tritons, J. N. Barrandon and P. Albert.

The Determination of Stable Calcium Isotopes by Charged Particle Irradiation, M. Peisach and R. Pretorius.

Cross Sections of ^{18}F Formation by Deuteron Bombardment of Oxygen and Fluorine. Applications to Oxygen Analysis, M. D. Tran, A. Chenaud, H. Giron, and J. Tousset.

Examples of Determination of Light Elements in Various High Purity Materials, by Gamma Photon and Charged Particle Activation, C. Engelmann, J. Gosset, M. Loeuillet, A. Marschal, P. Ossart, and M. Boissier.

Self-Shielding Corrections in Photon Activation Analysis, G. J. Lutz.

Photon Activation Analysis of Oxygen and Carbon in a Eutectic Mixture of Lead and Bismuth Using a Linac, W. D. Mackintosh and R. E. Jervis.

Determination of Carbon in High Purity Iron by Irradiation in Photons, G. Revel, T. Chaudron, J. L. DeBrun, and P. Albert.

Charged Particle Activation Analysis for Carbon, Nitrogen, and Oxygen in Semiconductor Silicon, T. Nozaki, Y. Yatsurugi, N. Akiyama, and I. Imai.

^{7}Be as a Dosimeter During Photon Activation of Iodine, J. A. Cardarelli, E. S. Dell, and B. A. Burrows.

Some Recently Determined Photonuclear Reaction Yields and Cross Sections for Formation of Several Isomers, H. R. Lukens.

Spectrum, Yield and Use of Fast Neutrons Produced by 20 MeV Helium-3 Ions, 14 MeV Protons and 7.5 MeV Deuterons on a Thick Beryllium Target, E. Bruninx.

The Production of Fast Neutrons by Small Cyclotrons, A. A. Fleischer.

Use of a 60 MeV Linac for Fast and Variable Energy Neutron Activation Analysis, P. E. Wilkniss.

Blank Considerations in 14 MeV Neutron Activation Analysis for Trace Oxygen, S. S. Nargolwalla, E. P. Przybylowicz, J. E. Suddueth, and S. L. Birkhead.

SP313. **Making valuable measurements.** Proceedings of the 1968 Standards Laboratory Conference, H. L. Mason, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 313, 177 pages (May 1969).*

Key words: Metrology management; National Conference of Standards Laboratories; physical measurement.

The National Conference of Standards Laboratories is a nonprofit, laboratory-oriented organization whose purpose is to promote cooperative efforts toward solving the common problems faced by standards laboratories in their organization and operation. Established in 1961 under the sponsorship of the National Bureau of Standards, NCSL has a membership of more than 200 organizations. Three biennial national meetings have been held previously as well as a number of specialized regional workshops.

The theme of the 1968 Standards Laboratory Conference is "Making Valuable Measurements." The papers presented will attempt to answer the Who? When? Where? How? and Why? of making valuable measurements. The conference provides an opportunity for discussion of problems confronting laboratory managers and calibration personnel.

Representatives of member organizations of the National Conference of Standards Laboratories met at the Boulder facility of the National Bureau of Standards August 25-29, 1968. Major addresses were given by A. V. Astin and J. L. Sloop. Reports and discussions at eight sessions covered the management of valuable measurements: the management of equipment and data, measurement agreement comparisons, international practices, Defense Department activities, NBS activities, NCSL liaison, and NCSL committee work.

SP314. **Ion-Selective Electrodes.** Proceedings of a symposium held at the National Bureau of Standards, Gaithersburg, Md., January 30-31, 1969, R. A. Durst, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 314, 474 pages (Nov. 1969).*

Key words: Ion-selective electrodes; specific-ion electrodes; review of ion-selective electrodes; symposium proceedings.

This volume contains a review of ion-selective electrodes, emphasizing the non-glass types, and provides a thorough and critical evaluation of the subject. It consists of eleven invited review papers and selected discussions from the Symposium on Ion-Selective Electrodes held at NBS on January 30-31, 1969. This publication provides a comprehensive survey of the field and should prove very valuable in advancing the state of the art. The chapters include discussions on the theory, characteristics, and methodology of all types of ion-selective electrodes; their use in thermodynamic, kinetic, and complex-ion studies; standards; pure and applied research in various biomedical areas of interest; industrial analysis and control systems; and applications to diverse analytical problems. Both the present status and future potential of these sensors are discussed in a wide range of scientific disciplines, from the physical sciences to biomedicine. Extensive bibliographies provide an excellent survey of the literature for anyone using or anticipating the use of these electrodes.

SP315. **Bibliography on the high temperature chemistry and physics of materials, October, November, December 1968,** J. J. Diamond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315, 72 pages (Jan. 1969).

Key words: Bibliography, high-temperature chemistry; chemistry at high temperatures, bibliography; high temperature; high-temperature chemistry, bibliography.

A classified collection of references to scientific research performed at temperatures above 1000 °C and published in the world literature during the fourth quarter of 1968.

SP315-1. **Bibliography on the high temperature chemistry and physics of materials, January, February, March 1969,** J. J. Diamond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315-1, 81 pages (April 1969).

Key words: Bibliography, high temperature; chemistry, high temperature; high temperature chemistry; materials properties; research at high temperatures; thermophysical properties.

The bibliography consists of references to research involving temperatures above 1000 °C, which were noted by the contributors during the above three-month period. Since this is intended primarily as a current-awareness bibliography, there is no cross-referencing or indexing. This issue contains about 700 references roughly grouped under fifteen subject headings.

SP315-2. **Bibliography on the high temperature chemistry and physics of materials, April, May, June 1969,** J. J. Diamond, Edi-

tor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315-2, 74 pages (July 1969).

Key words: Bibliography, high temperature; chemistry, high temperature; high temperature chemistry; materials properties; research at high temperatures; thermophysical properties.

The bibliography consists of references to research involving temperatures above 1000 °C, which were noted by the contributors during the above three-month period. Since this is intended primarily as a current-awareness bibliography, there is no cross-referencing or indexing. This issue contains about 700 references roughly grouped under fifteen subject heading.

SP315-3. **Bibliography on the high temperature chemistry and physics of materials, July, August, September 1969,** J. J. Diamond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315-3, 90 pages (Oct. 1969).

Key words: Bibliography, high temperature; chemistry, high temperature; high temperature chemistry; materials properties; research at high temperatures; thermophysical properties.

The bibliography consists of references to research involving temperatures above 1000 °C, which were noted by the contributors during the above three-month period. Since this is intended primarily as a current-awareness bibliography, there is no cross-referencing or indexing. This issue contains about 825 references roughly grouped under fifteen subject headings.

SP315-4. **Bibliography on the high temperature chemistry and physics of materials, October, November, December 1969,** J. J. Diamond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315-4, 85 pages (Jan. 1970).

Key words: Bibliography, high temperature; chemistry, high temperature; high temperature chemistry; materials properties; research at high temperatures; thermophysical properties.

The bibliography consists of references to research involving temperatures above 1000 °C, which were noted by the Contributors during the above three-month period. Since this is intended primarily as a current-awareness bibliography, there is no cross-referencing or indexing. This issue contains about 775 references roughly grouped under fifteen subject headings.

SP315-5. **Bibliography on the high temperature chemistry and physics of materials, January, February, March 1970,** J. J. Diamond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 315-5, 82 pages (Apr. 1970).

Key words: Bibliography, high temperature; chemistry, high temperature; high temperature chemistry; materials properties; research at high temperatures; thermophysical properties.

The bibliography consists of references to research involving temperatures above 1000 °C, which were noted by the Contributors during the above three-month period. Since this is intended primarily as a current-awareness bibliography, there is no cross-referencing or indexing. This issue contains about 750 references roughly grouped under fifteen subject headings.

SP316. **Hydraulic research in the United States 1968,** G. Kulin, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 316, 331 pages (June 1969).

Key words: Hydraulic engineering; hydraulic research; hydraulics; hydrodynamics; project summaries.

Current and recently concluded research projects in hydraulics and hydrodynamics for the years 1967-1968 are summarized. Projects from more than 200 university, industrial, state and federal government laboratories in the United States and Canada are reported.

SP317. Volumes I and II. **Fundamental aspects of dislocation theory.** Proceedings of a conference held at the National Bureau of Standards, Gaithersburg, Md., April 21-25, 1969. J. A. Simmons, R. deWit, and R. Bullough, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 317, Vol. I, 752 pages, Vol. II, 624 pages (Dec. 1970).

Key words: Conference; continuum mechanics; crystal physics, disclinations; dislocations; elasticity; electron-dislocation interactions; lattice defects; phonon-dislocation interactions; solid-state; theoretical physics; thermally activated processes; twinning.

These Proceedings contain research papers, discussions thereon, and panel discussions for the conference on "Fundamental Aspects of Dislocation Theory," held under the auspices of the Institute for Materials Research, April 21-25, 1969, at the laboratories of the National Bureau of Standards, Gaithersburg, Maryland. Approximately 75 contributed papers and two panel discussions are included. Topics covered are Discrete Dislocations in Continuum Elasticity, Lattice Theories, Dislocation-Phonon Interactions, Applications of the Geometry of Dislocations, Intrinsic Properties of Dislocations, Dislocation Field Theories, Thermally Activated Processes and Statistical Theories, Dislocation-Electron Interactions, and Future Directions for Dislocation Theory. *These proceedings include the following papers (indented):*

Discrete dislocations in continuum elasticity, A. K. Head, *SP317,* pp. 5-9 (Dec. 1970).

Key words: Dislocation observations; dislocation theory; status and problems.

As a framework in which to survey some of the current questions in this long-established part of dislocation theory, the problem of the experimental determination of stacking fault energy is considered. Attention is restricted to those methods which observe and measure in the electron microscope a simple dislocation-stacking fault configuration. It is assumed that the configuration is in equilibrium with the forces between the dislocation balancing the surface tension of the stacking fault. The stacking fault energy then follows if these dislocation forces are known from theory for the observed dimensions of the configuration.

Experimental techniques have improved to the point where a reproducibility of 1 to 5 percent standard deviation is claimed. This calls for theory which has at least a similar standard of accuracy. It is doubtful if the theory which is in current use has this accuracy and this is surveyed under the following headings: (a) The treatment of the core; (b) Elastic anisotropy; (c) Zig-zag instabilities; (d) The effect of the stacking fault; (e) The observation of dislocations by electron microscopy.

The image force on dislocations at free surfaces—comments on the concept of line tension, J. Lothe, *SP317,* pp. 11-22 (Dec. 1970).

Key words: Dislocation nodes; dislocations-image series; dislocation-surface interactions; line tension of dislocations.

It is shown that a straight dislocation emerging at a planar free surface is acted upon by a force distributed according to the law $dF=\lambda^{-1}(-E \cot\theta+\partial E/\partial\theta)d\lambda$. Here θ is angle of inclination to surface. E is dislocation energy factor, and λ is distance from surface along the dislocation. The proof involves use of a slightly generalized version of the energy flow theorem for straight dislocations (Lothe, Phil. Mag. **15,** 9 (1967)). The above formula is the exact linear elasticity law corresponding to the usual approximate line tension

result. According to this law there are certain angles of incidence for which the forces vanish so that the dislocation can be straight. Similarly, when only elastic terms are considered, there are certain node orientations for which the forces on the branches vanish so that the branches can be truly straight (Indenbom and Dubnova, Sovj. Phys. (Solid State) 9, 915 (1967)). In this paper a discussion is given of how core energy terms may modify the results. It is concluded that also for nodes in the characteristic orientation for no elastic forces on the branches, some branch curvature will be present near the node.

Stability and some characteristics of uniformly moving dislocations, K. Malén, *SP317*, pp. 23-33 (Dec. 1970).

Key words: Anisotropic elasticity; Cerenkov waves; dislocation dynamics; dislocation stability.

The stability of uniformly moving dislocations has been studied in the case of elastic anisotropy using computer. The velocity for instability to occur for a screw dislocation in an isotropic medium is so high, 0.98 C_t, with C_t the transverse sound velocity, that it may well be unattainable. Inclusion of anisotropy gives the possibility of more reasonable instability velocities. Some data showing this for Fe, Li and Cr are given.

The stress field around a uniformly moving dislocation has been studied. Increasing the velocity of a dislocation corresponds to some extent to a change in the anisotropy of the crystal.

In uniform motion above the lowest velocity of sound in the direction of motion one can have associated with the moving dislocation 2, 4 or 6 Çerenkov waves, above the next sound velocity 4 or 6 and above the highest sound velocity 6 waves.

The formula developed earlier for the stress field around a uniformly moving planar dislocation loop can be generalized directly to three dimensions using the theorems of Indenbom and Orlov for the fields from three-dimensional sources using data for two-dimensional sources.

The generalization can also be made using the fact that the choice of cut surface is arbitrary.

The dislocation in a semi-infinite isotropic medium, D. J. Bacon and P. P. Groves, *SP317*, pp. 35-45 (Dec. 1970).

Key words: Dislocation loops; elasticity; finite bodies.

The displacement associated with an infinitesimal dislocation loop (displacement dipole) of arbitrary orientation in an isotropic, semi-infinite elastic medium has been obtained, and on integration this yields the displacement associated with a finite dislocation loop. The solution for the infinitesimal loop has been obtained by finding the relationship between point forces and displacement dipoles in an infinite medium, and using the same relations with Mindlin's solution for the point force in an elastic half-space. This approach leads to a rather simpler analysis than that of Steketee, and the expressions for the displacements of all the infinitesimal loops near a free surface are presented here for the first time. The solution is being used to study the stability of a prismatic dislocation loop on a glide prism of square cross-section near a free surface. Preliminary results are presented for the forces on the loop sides and changes in loop energy on rotation for the situation in which the Burgers vector is normal to the surface.

Theoretical considerations on the extension of 1/2⟨110⟩, {111} dislocations in isotropic fcc metals into Shockley partials, Doris Kuhlmann-Wilsdorf and T. R. Duncan, *SP317*, pp. 47-55 (Dec. 1970).

Key words: Dislocation geometry; Shockley partials; stacking faults.

The energy changes and equilibrium separations associated with the extension of 1/2 ⟨110⟩, {111} dislocations in fcc metals into Shockley partials have been calculated and were found considerably smaller than the previous corresponding values due to Seeger and Schöck. The new results may be shown to be credible on the basis of the following simple estimates:

The theoretical shear fracture strength of a crystal may be written as $\tau_{crit} = G/q$, with G the appropriate shear modulus, and the numerical parameter q near 30 for {111} planes in fcc metals. The resolved shear stress required to force the Shockley partials into coincidence at vanishing stacking fault energy, $(\tau_{eq})_{Max}$, must approach but cannot exceed τ_{crit} so that $(\tau_{eq})_{Max} \leqslant G/30$, i.e. much smaller than the value of $\sqrt{6}G/8\pi \simeq G/9$ previously assumed. Similarly, the stacking fault energy cannot exceed the value of $\gamma_{crit} = Ga/\sqrt{6}q$ with a the lattice constant, and the dislocation core energy must be in the order of $E_c \simeq 2r_0\,\gamma_{crit} \simeq 1/4E_D$ where E_D is the total dislocation energy, and the core radius, r_0, is taken to be that distance from the dislocation axis at which the resolved shear stress on the slip plane would become equal to τ_{crit} in linear elastic behavior. Lastly, D_0, the actual equilibrium separation between the partials must be considerably smaller than D_0^*, the separation calculated from linear elastic theory, as long as $D_0^* < 2r_0$. One finds easily that $D_0^* \leqslant 2r_0$ for $\gamma \geqslant \gamma_{crit}/6$ and $\gamma \geqslant \gamma_{crit}/10$ for edge and screw dislocations, respectively, depending somewhat on Poisson's ratio, so that only in silver will edge dislocations have an equilibrium separation a little larger than $2r_0$, but much less than $2r_0$ in the other common pure fcc metals. For $D_0 = 2r_0$, when the core energy is reduced by about 1/3 according to the rule of the square of the Burgers vectors but the elastic energy is virtually unaffected, and remembering that work $2r_0\gamma$ with $\gamma \simeq \gamma_{crit}/6$ must be done to spread out the stacking fault, the relative energy gain due to the extension of edge dislocations is simply estimated as $(\Delta E/E_D)\perp \simeq [1/3E_c/4E_c - 1/6\gamma_{crit}/4\gamma_{crit}] \simeq 4\%$ which may be compared to the calculated value of 4.6% in silver.

Screw dislocations in inhomogeneous solids, G. P. Sendeckyj, *SP317*, pp. 57-69 (Dec. 1970).

Key words: Dislocations-elasticity; dislocation surface interactions; finite elasticity; inhomogeneities.

The problem of screw dislocations interacting with free surfaces and inhomogeneities is reconsidered and a general method is presented for solving a large class of screw dislocation problems. The method is based on knowledge of certain general solutions in the theory of antiplane deformation of elastic solids. It can be shown that all the known screw dislocation solutions for solids undergoing antiplane deformation can be found by using this approach.

As an illustration of the method, three new solutions for screw dislocations near inhomogeneities are given. These are the screw dislocation near (1) an elastic elliptic cylindrical inclusion, (2) two circular cylindrical inclusions, and (3) a *curvilinear* cavity or rigid inclusion. The interaction energy between the dislocation and the inhomogeneities is also computed.

Subsonic, supersonic, and transonic dislocations moving on an interface separating two media of differing elastic properties, H. M. Berg, J. E. Bloom, H. Ishii, R. H. Marion, D. E. Pease, D.

T. Spreng, J. B. Vander Sande, and J. Weertman, *SP317*, pp. 71-82 (Dec. 1970).

Key words: Dislocation dynamics; interface dislocations; supersonic dislocation.

This paper examines the problem of a dislocation moving on an interface separating two isotropic elastic media that have differing elastic constants and densities. This problem has application to the phenomenon of diffusionless transformations. Solutions are found for moving screw dislocations, gliding edge dislocations, and climbing edge dislocations. It is assumed that the dislocation velocity lies in either the subsonic, the transonic, or the supersonic velocity region. We have generalized the analysis that was used in a study of the elastic displacements and stress field of subsonic, transonic, and supersonic dislocations moving in an ordinary elastic medium. The results given in the present paper are formally identical to those obtained in that simpler analysis.

Internal stress and the incompatibility problem in infinite anisotropic elasticity, J. A. Simmons and R. Bullough, *SP317*, pp. 89-124 (Dec. 1970).

Key words: Anisotropic elasticity; dislocations; Green's tensor; incompatibility; internal stress; source kernels; stress functions.

Using the language of integral projection operators, the linear elastic distortion field of an infinite anisotropic body is decomposed into its internal and external components. The kernel of the external projection operator is identified as the elastic field due to force dipoles while that of the internal field corresponds to internal distortion fields due to displacement dipoles.

By integration of the projection operator for the internal distortion field, an alternative description for internal distortion fields in terms of dislocations is given. The Mura-Willis formula as well as the distortion field due to a rational dislocation element (in the sense of Eshelby and Laub) for an anisotropic body are then obtained as integrals of the basic displacement dipole kernel for internal distortions.

Further integration of the displacement dipole kernel provides a description of the internal distortion field due to a rational incompatibility element. The general formula for the stress function due to an incompatibility distribution in a general infinite anisotropic body is then given and shown to reduce to the formulation of Kröner for isotropic bodies.

Finally, explicit methods to compute kernels for internal distortions due to incompatibilities are given and discussed.

Series representations of the elastic Green's tensor for cubic media, D. M. Barnett, *SP317*, pp. 125-134 (Dec. 1970).

Key words: Anisotropy; cubic materials; elasticity; Green's tensor.

Two representations for the cubic Green's tensor components as power series in the anisotropy factor $\omega = 1 - (c_{11} - c_{12})2c_{44}$ are developed, and first order corrections of anisotropy to the Green's tensor and to the interaction energy between two "mechanical" point defects are calculated. It is shown that the best successive approximation scheme is that which constructs the zeroth order (isotropic) approximation to the Green's tensor by identifying the Lamé constants λ and μ as $\lambda = c_{12}, \mu = c_{44}$.

Some problems involving linear dislocation arrays, N. Louat, *SP317*, pp. 135-146 (Dec. 1970).

Key words: Dislocation pileups; dislocations-elasticity; phase boundaries.

Muskhelishvili's inversion formulae for singular integral equations are shown to be special cases of a more general result which is then employed to deal with two types of problems. In the first we consider the distribution of dislocations in a double periodic array of screw pile-ups in an arbitrary stress field. The second type is concerned with screw pile-ups terminating at phase boundaries, again for arbitrary stress fields.

Some recent results on dislocation pileups, J. C. M. Li, *SP317*, pp. 147-150 (Dec. 1970).

Key words: Dislocation pileups; Moutier cycle; stress concentrations.

A few results intended to illustrate the usefulness of orthogonal polynomials and singular integral equations for the problem of dislocation pileups are described. A simple method of solving a few special integral equations is suggested. The usefulness of a Moutier cycle for the calculation of stress concentration is shown.

The behavior of an elastic solid containing distributions of free and fixed dislocations, E. Smith, *SP317*, pp. 151-162 (Dec. 1970).

Key words: Crack nucleation; dislocations-elasticity; internal stresses.

There are many situations in metal physics where the stresses acting on fixed dislocations have an important bearing on a physical phenomenon, and the paper derives a general expression relating these stresses when fixed edge dislocations are contained within an infinite elastic solid in which there are also free edge dislocations that occupy equilibrium positions.

Special cases are considered in detail, particular attention being given to the situation where all the dislocations are of the same type, the free ones having identical Burgers vectors b while there are two fixed dislocations with Burgers vectors pb and qb; all the dislocations lie in the same plane within an infinite solid. This is the most general model for which the stresses on each dislocation and also the equilibrium positions of the free dislocations may be determined analytically. It is indicated how the model degenerates into all the others that have been discussed analytically in terms of classic polynomial functions.

The results are briefly discussed in relation to the problem of cleavage crack nucleation in crystalline solids.

The elastic interaction between grain boundaries and screw dislocation pile-ups, M. O. Tucker, *SP317*, pp. 163-171 (Dec. 1970).

Key words: Anisotropic elasticity; dislocation pileups; dislocations-elasticity; grain boundaries.

The configuration of an array of parallel infinitive straight screw dislocations, in equilibrium under a constant applied stress, and piled-up on a plane inclined to a grain boundary at an arbitrary angle is considered. The model used for the grain boundary is the plane interface between two elastically anisotropic half-spaces welded together. Using this approximation of a continuous distribution of infintesimal dislocations the integral equation expressing the equilibrium conditions is solved using a Wiener-Hopf technique and approximate expressions are presented for the stresses near to the tip of the array when the dislocations are parallel to orthotropic symmetry axes in each half-crystal.

One-electron theories of cohesion on ion-pair potentials in metals, N. W. Ashcroft, *SP317*, pp. 179-200 (Dec. 1970).

Key words: Band structure; cohesion; core-core interactions; electron density; inter-atomie; one-electron potentials; pseudopotentials.

The single particle picture of cohesion in metals is briefly reviewed in the light of modern knowledge of their band structures. Periodic components in the electron density distributions (intimately connected with the same band structures) are important in the determination of the effective potential between ions.

In simple metals, defined to be those with tightly bound core states, the net binding of the metallic state is basically a remnant of a competition between kinetic (Pauli principle) and Madelung energies of ostensibly free conduction electrons. Various corrections (for correlation, for exchange, etc.) must be included, and the Madelung energy (which is normally appropriate to a uniform electron gas in a Coulomb lattice of point ions) can be modified as necessary for departures from Coulomb's law. Terms in the total energy also arise from periodic variations in conduction electron density; for perfect lattices these are naturally dependent on the ionic arrangement and will vary in importance from crystal structure to crystal structure. Electronic density variations arising from disorder (e.g. distributions of defects) also introduce corrections into total energy.

The structurally dependent terms in the total energy can be evaluated to second order in the pseudopotential: to this same order the *total* energy may be written as a sum over pair potentials between ions whose form is quite straight forward to evaluate. As with many inter-atomic potentials, the ion-ion potentials demonstrate "hard-core" effects at small separation, and are rather weak at large distances.

Extending the simple theory to transition metals or metals exhibiting additional band structure more akin to itinerant narrow-band behavior, can be carried through by incorporating Born-Mayer interactions between tight binding atomic states. This procedure is, of course, only valid in situations where the Block method itself is applicable. While the core-core exchange term approximated by the Born-Mayer interaction is quite small in the simple metals it is appreciable for metals like Cu, Ag and Au, and in fact is basically responsible for fixing the equilibrium density. Its addition to the otherwise "simple-metal" like ion pair potentials modifies the behavior at short range.

Localized vibration modes associated with screw dislocations, A. A. Maradudin, *SP317*, pp. 205-217 (Dec. 1970).

Key words: Dislocation-phonon interactions; dispersion relations; lattice of dynamics; localized modes.

The dispersion relation for the one-dimensional continuum of localized modes associated with a screw dislocation is obtained in the long wavelength limit, as a function of the wave vector parallel to the dislocation line. The result has the form $\omega^2(q)=s^2q^2-\omega_0^2\exp(-\text{const.}/q)$ where s is the speed of sound for transverse acoustic waves, and ω_0 is a typical Brillouin zone boundary frequency.

The method of lattice statics, J. W. Flocken and J. R. Hardy, *SP317*, pp. 219-245 (Dec. 1970).

Key words: Computer simulation; Kansaki method; lattice statics; point defects; Schottky pairs.

The formalism of the method of lattice statics for treating the lattice distortions and the formation and interaction energies associated with a defect in a crystal is presented in detail. This approach is based on the Fourier transformation of the set of direct space equilibrium equations to reciprocal space. This results in a set of decoupled equations which can be explicitly solved for the Fourier amplitudes of the displacement field which can then be found by Fourier inversion. A similar approach is used to obtain Fourier transformed expressions for the relaxation and interaction energies associated with the defect.

The solution of the equations of lattice statics for the Fourier amplitudes in the limit of small wave vectors gives expressions for the displacement field identical to those obtained from the theory of continuum elasticity.

Results are presented of recent applications of the method of lattice statics to find the formation energies of Schottky pairs in certain alkali halides. Strain field displacements, relaxation energies and interaction energies associated with vacancies in Na and K are given.

Lattice statics in its asymptotic form has been used to find the displacement field far from cubic point defects and double force defects in a number of metals. Displacement profiles about vacancies in Na and K and about a double force defect in Cu are shown. A comparison of the exact lattice statics results to asymptotic results along a ⟨111⟩ direction in K shows that the elastic limit is only attained at about the 19th or 20th neighbor position from the defect.

Effect of zero-point motion on Peierls stress, H. Suzuki, *SP317*, pp. 253-272 (Dec. 1970).

Key words: Anharmonicity; dislocations in lattices; Peierls stress; zero point motion.

Calculations of the Peierls stress hitherto made are criticized and the following conclusions are obtained. The significant difference in Peierls stress between different materials arises mainly from the difference in crystal structures. The Peierls stress is necessarily high in a rectangular lattice where atoms just above and below the slip plane face each other, while in the lattices where the atoms face alternately along the slip plane it is of the order of one percent of that in the rectangular lattice. The Peierls stress in the body-centered cubic crystal is, however, rather high for a screw dislocation owing to the screw structure of this crystal with the axes parallel to [111] direction. The calculated Peierls stresses are several times of those expected from experiments. The zero-point motion decreases the calculated Peierls stress through two mechanisms. The one is the difference in frequency spectrum of a dislocation line at the bottom of the potential valley and at the top of the potential hill. The other is due to the change in spring constants of atom pairs around the dislocation through anharmonicity.

Point defects and dislocations in copper, A. Englert, H. Tompa, and R. Bullough, *SP317*, pp. 273-283 (Dec. 1970).

Key words: Computer simulation; copper; dislocation structure; pair-potential; point defects.

A new pair potential for copper has been constructed from a set of ten interpolated cubic polynomials. The form of the potential is such that at short range it agrees with the usual Born-Mayer repulsive potential and is in satisfactory agreement with the available phonon dispersion data and the observed stacking fault energy and vacancy formation energy for copper. The potential has been used to study the atomic configuration associated with various point and line defects in copper. In particular, because of its fit to the stacking fault energy, it provides a consistent result for the degree and nature of the dissociation to be expected for an edge dislocation in copper.

Atomistic calculations of dislocations in solid krypton, M. Doyama and R. M. J. Cotterill, *SP317*, pp. 285-289 (Dec. 1970).

Key words: Atomic calculation; interatomic potential; krypton.

The elastic continuum theory treatment usually fails near the core of dislocations. Atomic calculations of edge and screw dislocations in solid krypton were carried out using a pairwise potential. In rare gases, the electron redistribution of the electron density is small, thus, this method is useful in studying the properties of dislocation cores.

A lattice theory model for Peierls-energy calculations, A. Hölzler and R. Siems, *SP317,* pp. 291-298 (Dec. 1970).

Key words: Computer simulation; Green's tensors; interatomic potential; lattice studies; Peierl's energy; screw dislocation.

A lattice theory model for a screw dislocation is discussed which is similar to that of Maradudin. For the forces between neighbouring rows of atoms, however, a sinusoidal, not a linear, dependence of their relative displacements is assumed throughout the whole lattice. The displacements are expanded about the elastic theory values. The conditions of equilibrium then yield a system of linear equations for the deviations of the displacements from the elastic theory values, which is solved by an iteration procedure making use of Green's Function for a plane square lattice. For a number of points in the vicinity of the source point and for points in certain symmetry directions simple exact analytical expressions for the latter are derived, for points at larger distances an asymptotic expansion is given. The displacements thus obtained are then used to calculate the energies of the dislocation at the position of minimum energy and at the saddle point and their difference, the Peierls energy, by direct summation of the interaction energies of neighbouring pairs of atoms.

The interaction between a screw dislocation and carbon in body-centered cubic iron according to an atomic model, R. Chang, *SP317,* pp. 299-303 (Dec. 1970).

Key words: Carbon in iron; computer simulation; dislocation-interstitial interaction; interatomic potentials; lattice defects.

The interaction energy between carbon and a screw dislocation in body-centered cubic iron near the core regions of the dislocation was calculated atomistically using a pairwise interatomic potential matching the elastic properties of the material. In order to avoid the use of the iron-carbon potential, it was assumed that the iron-carbon octahedron of the Johnson configuration (2 iron atoms separated by 1.225 a_0 in the [100] direction and 4 iron atoms separated by 0.958 a_0 in the (100) plane, a_0 being the lattice parameter) remains undistorted whether it is present in a perfect or a defective lattice. Our first calculations yield, depending on site location, binding energies varying from 0.04 to 0.55 eV.

The structure of the ⟨111⟩ screw dislocation in iron, P. C. Gehlen, G. T. Hahn, and A. R. Rosenfield, *SP317,* pp. 305–308 (Dec. 1970).

Key words: Computer simulation; dislocation core structure; interatomic potentials; iron.

The concept of a dissociated $a/2\langle 111\rangle$ screw dislocation has been invoked to explain the slip behavior in b.c.c. materials and particularly the asymmetry of the critical resolved shear stress. No direct experimental evidence of dissociation has been obtained, but the idea has received some albeit conflicting support from discrete lattice calculations of the atomic positions in the core. Chang, using isotropic elasticity for α-iron, found that the dislocation core has three very narrow intrinsic faults. These three faults are symmetric with respect to the screw axis. Bullough and Perrin, on the other hand, found that the screw is split with faults on two {112} planes belonging to the zone of the screw axis. The misfit is spread over a distance of about $3b$. On the third {112} plane no splitting was found to occur.

In view of these discrepancies, the calculations were repeated for anisotropic and isotropic elastic boundary conditions and with different interatomic potentials. Excellent agreement was found with Chang's configuration even though a volume expansion term was added to the displacements associated with the dislocation.

It was shown that the final configuration is strongly dependent on the position of the dislocation line with respect to the lattice and at least two metastable positions were found. Even though the atomic arrangement is quite different, their energy is not more than 0.1 eV larger than the energy of the stable one.

Using the Johnson potential unmodified for long-range electronic effects, the dislocation was found to have the following characteristics: core radius, 4-5.5 A; core energy, 0.20-0.25 eV per atomic plane; and an effective hole radius of 1.35 Å.

It was shown that the final configurations are rather insensitive to the model size and to the boundary conditions used.

Eigenfrequencies in a dislocated crystal, T. Ninomiya, *SP317,* pp. 315-357 (Dec. 1970).

Key words: Dislocation-phonon interactions; dislocation vibration; internal friction; localized modes.

Dynamical theories of dislocation vibration and interactions with phonons are surveyed. Eigenfrequencies of lattice vibrations in a crystal containing a straight dislocation are calculated by using Lagrangian formalism. It is found that there is one eigenfrequency of dislocation vibration (wave number κ) in each of the intervals of the normal mode frequencies of $k_z = \kappa$ in a perfect lattice. It is also found that there is a band of localized dislocation vibration below the phonon band. The mean squared amplitude of the dislocation vibration is determined by the localized mode for an edge dislocation and by the resonance modes for a screw dislocation. Phonon scattering by the fluttering mechanism is next treated by using the above results and the conditions of resonance scattering is given. Finally, the effect of the Peierls potential and the vibration of a dislocation dipole are discussed. In the Appendices the problem of quantization of dislocation vibration and the extension of the above theories to a case of translational motion are briefly described.

Phonon scattering by dislocations and its influence on the lattice thermal conductivity and on the dislocation mobility at low temperatures, P. P. Gruner, *SP317,* pp. 363-389 (Dec. 1970).

Key words: Dislocation mobility; dislocation-phonon interactions; nonlinear elasticity; phonons; thermal conductivity.

On account of the large strains associated with dislocations, the superposition principle is violated. The resulting scattering of phonons limits the lattice thermal conductivity and leads to a friction force which acts on moving dislocations. The phonon-dislocation interaction is treated with nonlinear continuum theory. Terms up to the third order in the strains are retained in the Taylor expansion of the elastic energy density. These third order terms contain the phonon-dislocation interaction and the normal three-phonon interactions. In the case of thermal conductivity, the transport problem is solved with the variational method which leads to a system of linear equations for the phonon occupation numbers. The coefficients of this system of equations contain all the information on the scattering mechanisms. The

influence on the thermal conductivity of special dislocation configurations such as piled-up dislocations and dislocation dipoles will be discussed.

It will be shown that the friction force which acts on moving dislocations on account of the anharmonicity can be obtained from quantities that are known from the calculations of the phonon conductivity. A one to one correspondence between friction force and thermal resistance exists, however, only if the dislocation velocity is small compared with the sound velocity and if all parts of the dislocation move with the same velocity.

Phonon scattering by Cottrell atmospheres, P. G. Klemens, *SP317*, pp. 391-394 (Dec. 1970).

Key words: Cottrell atmospheres; mechanical properties; phonon scattering; thermal resistivity.

The formation of Cottrell atmospheres can change the scattering of phonons by dislocations and in some cases substantially enhance the lattice thermal resistivity due to dislocations. The strength of the atmospheres can be changed by annealing. This changes thermal conductivity values at high temperatures first, since diffusion through shorter distances is involved. The diffusion coefficient can be determined by means of such annealing studies.

Dragging forces on moving defects by strain-field phonon scattering, A. Seeger and H. Engelke, *SP317*, pp. 397-401 (Dec. 1970).

Key words: Dislocation drag; dislocation-phonon interactions; electroresistivity; kink motion; phonon scattering.

An expression for the dragging force on a uniformly moving defect by scattering of phonons at its strain-field has been derived using nonlinear elasticity theory. The quantization procedures and the formulation of the master equation for the phonon distribution follow the techniques developed in the theory of heat conductivity. Numerical calculations have been performed for kinks in screw dislocations in copper. A comparison with numerical results obtained in the theory of heat conductivity shows quite good agreement. The formalism developed should prove useful also for calculations of the electron drag on dislocations in metals.

Thermal energy trapping by moving dislocations, J. H. Weiner, *SP317*, pp. 403-414 (Dec. 1970).

Key words: Computer simulation; dislocation-phonon interaction; Frenkel-Kontorowa model.

The steady motion of a dislocation along a piece-wise harmonic Frenkel-Kontorowa model is considered For suitable model parameters there is one localized mode associated with either the stable or unstable dislocation configuration and the remaining modes are nonlocalized or extended. Because of the piece-wise harmonic character of the model, the set of normal modes of the system changes at discrete instants of time, referred to as transition times, as the dislocation moves along the chain. In particular, the localized modes must move along with the dislocation position and we refer to the localized mode momentum and energy as the dislocation momentum and energy respectively. The particle momentum and energy due to the sum of the extended modes is termed thermal.

At the transition times, it is necessary to expand atomic velocities in terms of the new set of modes appropriate to the forthcoming state of the crystal. It is found that a coordination effect exists between the transition times and the thermal motion such that on the average over many transitions, thermal momentum in the direction of the dislocation motion is transferred to the dislocation momentum.

Dislocation resonance, J. A. Garber and A. V. Granato, *SP317*, pp. 419-421 (Dec. 1970).

Key words: Dislocation damping; dislocation resonance; internal friction.

At low temperatures in insulators and superconductors, only reradiation of elastic waves should limit dislocation resonance. This effect has been calculated using Eshelby's expression for the reradiation. It is found that the resonance is very sharp, and still persists even when a random distribution of dislocation segment lengths is assumed.

Dislocation radiation, R. O. Schwenker and A. V. Granato, *SP317*, pp. 423-426 (Dec. 1970).

Key words: Dislocation radiation; dispersion relations; internal friction.

Thin walls of mobile dislocations have been produced. These can be excited to emit macroscopic plane sound waves. Calculations have been made to predict the properties of the reradiated waves on the basis of a vibrating string model which neglects dislocation interactions. Measurements of the relative modulus change $\Delta G/G$ and the decrement Δ (real and imaginary part of the response) as a function of frequency permit a check of the Kramers-Kronig dispersion relations. In addition, measurements of the amplitude of the reradiated wave provide another check since the amplitude is proportional to $[(\Delta G/G)^2 + (\Delta/\pi)^2]^{1/2}$.

The anharmonic properties of vibrating dislocations, C. Elbaum and A. Hikata, *SP317*, pp. 427-445 (Dec. 1970).

Key words: Anharmonic properties; dislocation dynamics; ultrasonics.

The anharmonic properties of vibrating dislocations are discussed in terms of the nonlinear stress-strain relation and of the higher harmonics of an ultrasonic wave generated when an initially sinusoidal wave propagates in a solid containing (mobile) dislocations. The treatment takes account of both lattice and dislocation contributions to the anharmonic behavior of the solid.

Estimates of the amplitude of the harmonics (these estimates have been confirmed experimentally) indicate that the lattice and dislocation components are comparable for the second harmonic and that the dislocation component is much larger than the lattice component for the third harmonic. Therefore, by investigating the third harmonic, it is possible to obtain detailed information on dislocation dynamics, without the complications of the lattice contribution.

A source of dissipation that produces an internal friction independent of the frequency, W. P. Mason, *SP317*, pp. 447-458 (Dec. 1970).

Key words: Internal friction; kink motion; Peierl's stress.

Many measurements of the internal friction of metals and other materials such as the earth's crust show that there is a component at low frequencies which produces a value independent of the frequency. It has been shown that this component is associated with dislocation motion.

Using a model for which dislocation motion results from the motion of kinks, it is shown that such a loss can be associated with the energy dissipated when kinks cross Peierls barriers. Theoretical calculations have shown that the energy dissipated in mechanical vibrations requires a dissipative force equal to from 0.01 to 0.1 of the Peierls stress to replace the energy lost. At the low stresses used in interna

friction measurements, it requires a thermal activation to cause motions of the kinks. The lag of the motion behind the applied stress produces a drag coefficient B proportional to the temperature. The energy due to kink dissipation produces an internal friction to modulus change ratio β, equal to the ratio of the dynamic to the static kink stress. Measurements in copper and in the alloy Ti-6Al-4V indicate that this ratio is about 0.03, in agreement with calculations.

The meaning of dislocations in crystalline interfaces, W. Bollmann, *SP317*, pp. 465-477 (Dec. 1970).

Key words: Dislocations; grain boundaries; interfaces; twinning.

The extension of the dislocation concept to arbitrary crystalline interfaces is discussed. It is shown that invariance and continuity of the Burgers vector can be conserved and that in high angle boundaries the function of the standard or primary dislocation is the delimitation of ranges of coordination between the two crystals. In certain relative orientations where the superposition of the two crystals forms a highly periodic pattern (which is energetically favorable such that the crystal tends to conserve it) a slight deviation from that optimum pattern is corrected by a network of secondary dislocations. There is complete balance between the Burgers vectors of primary as well as secondary dislocations.

Structural and elastic properties of zonal twin dislocations in anisotropic crystals, M. H. Yoo and B. T. M. Loh, *SP317*, pp. 479-493 (Dec. 1970).

Key words: Dislocation geometry; twinning; zonal dislocations.

A descriptive definition of zonal twin dislocations for compound twin systems is given based on the well established rational crystallographic elements. Geometric characteristics of zonal twin dislocations in double lattice structures are thoroughly discussed. Equilibrium shapes of an incoherent twin boundary have been analyzed by using the anisotropic elastic properties of edge dislocations. Short-ranged structural properties of zonal twin dislocations are discussed based on a Peierls-Nabarro model. It is found that the "anisotropic parameter," $K_e S_{66}$, correctly predicts the active mode of crystallographically nonequivalent conjugate twin systems.

Non-planar dissociations of dislocations, S. Mendelson, *SP317*, pp. 495-529 (Dec. 1970).

Key words: Dislocation dissociation; lattice shuffling; partial dislocations; twinning; zonal dislocations.

Non-planar dissociations of dislocations are studied in hcp, fcc, bcc, diamond lattice, tetragonal and orthorhombic crystal structures. The geometric and energetic conditions are shown to be favorable for various dissociations in each crystal structure. A general equation is formulated for dissociations into partials which are glissile on various twin planes of a common zone. The Burgers vector of the twinning dislocations are expressed in terms of orthogonal unit vectors which lie in the "plane of shear" of the twin mode. The twinning dislocations are generally of the "zonal" type, chosen to be consistent with minimum shear-strain and simple atomic shuffling criteria for twinning, and applied in derivations of the twinning elements and shear-strains for various twin modes. The sign of the shear-strain determines the "stress sense" characteristics for dislocation resistance and twinning and are shown to be consistent with behavior in various hcp and bcc metals. The maximum repulsive force on the twinning partials γ_m is computed using anisotropic elasticity, and compared with evaluations of twin lamella energies γ. In many cases it is found that $\gamma_m/\gamma > 1$, leading to an increase in dislocation resistance, locking, or twinning at lower temperatures. In the cases where $0 < \gamma_m/\gamma < 1$ the partialized dislocation model reduces to the "modified pseudo-Peierls-Nabarro model" for dislocation resistance.

Among various effects, the dissociations account for all twin modes in hcp metals and for the extreme difference in the flow behavior of Cd and Zn on one hand and Ti and Zr on the other. The stress dependent activation energies for motion of dissociated 60° dislocations in germanium are computed and compare favorably with the data of Kabler. A "lock" for kinks on 60° dislocations is described which can account for dragging points in the model of Celli et al.

Propagation of glide through internal boundaries, M. J. Marcinkowski, *SP317*, pp. 531-545 (Dec. 1970).

Key words: Boundary dislocations; glide propagation; grain boundaries; virtual dislocations.

It has been shown that when an internal boundary such as a grain boundary is cut by a crystal glide dislocation, a disturbance is left at the boundary. This disturbance closely resembles that about a crystal dislocation with the exception that (a) there is no extra half plane associated with the dislocation and (b) the Burgers vector associated with this disturbance is a variable which depends on the nature of the internal boundary. These boundary dislocations have been termed virtual dislocations.

The nature of the virtual boundary dislocations has been treated in detail for the symmetrical tilt boundary. Both homogeneous and heterogeneous type glide across these boundaries have in turn been applied to grain boundary crack formation and propagation, grain boundary rotation, preferred orientation, etc.

Kinks, vacancies, and screw dislocations, R. M. Thomson, *SP317*, pp. 563-576 (Dec. 1970).

Key words: Dislocation geometry; dislocations; kinks; pipe diffusion; vacancies in dislocations.

A vacancy on a nonsplit pure screw dislocation can dissociate into a set of kinks. This dissociation is demonstrated geometrically for the NaCl lattice, showing that no geometrical constraints are violated by the dissociation. The kinks thus generated also splinter and spread the charge of the vacancy along the line. The effective vacancy association energy on the line is thus much higher than has been supposed hitherto, and is partly due to the delocalization of the charge singularity of the point defect and partly due to the delocalization of elastic singularity. When the Peierls energy is low, the vacancy will always dissociate, while if it is high, the dissociation will occur only when the total kink energy is less than the vacancy energy. Vacancy contributions to both climb and pipe diffusion are discussed in terms of the kink dissociation process. Results are that interstitial pipe diffusion is entirely symmetric to vacancy pipe diffusion, no motion energy is needed, and the formation energy for diffusion is related to the Peierls energy.

Topological restriction on the distribution of defects in surface crystals and possible biophysical application, W. F. Harris, *SP317*, pp. 579-592 (Dec. 1970).

Key words: Dislocations in biophysics; protein structure; surface crystals; surface dislocations.

Many thin biological structures such as some plasma membranes and virus capsids appear to be made up of units packed in two-dimensional lattices. Such structures are termed *surface crystals*. Dislocations and disclinations are observable in some of these crystals. The perfect surface crystal is described by a *pair* of basis vectors and the conventional crystal by a *triplet* of basis vectors; both are re-

garded as embedded in three-dimensional space. This difference allows the existence of defects which have no counterpart in conventional crystals. The various defects are classified as local or global, intrinsic or extrinsic. Surface crystals that form closed surfaces are considered and it is shown that the sum of the rotations of intrinsic (screw) disclinations in them must equal $2\pi X$ where X is the Euler-Poincaré characteristic of the surface. The biophysical consequences are discussed briefly.

Disclinations in surfaces, F. R. N. Nabarro, *SP317*, pp. 593-606 (Dec. 1970).

Key words: Crystal surface imperfections; disclinations; screw disclinations.

The screw disclination is essentially a 2-dimensional object. Screw disclinations provide a convenient classification of star polygons. By considering the disclinations in vector fields lying on surfaces, it is possible to relate Euler's theorem for polyhedra inscribed on a sphere (faces − edges + corners = 2) to the fixed-point theorem for continuously-varying small displacements of points on a sphere. The changes in the Euler characteristic produced by the addition of holes, handles and cross caps are related to the disclinations which these singularities introduce into vector fields lying on the surface. These disclinations may be localized into the neighbourhood of their corresponding singularities.

Application of dislocation theory to liquid crystals, J. Friedel and M. Kléman, *SP317*, pp. 607-636 (Dec. 1970).

Key words: Cholesteric crystals; faulted ribbon; liquid crystals; nematic crystals; smectic crystals.

After an introduction which recalls some of the properties of liquid crystals, a general theory of dislocations in a mesomorphic medium is outlined. On the basis of their symmetry properties, and of viscosity relaxation, it is first shown that perfect disclinations in nematic crystals may take any shape, are restricted to straight lines in smectic crystals, and that both types exist in cholesteric crystals, where there are two possible axes of rotation. The second part is specialized to the case of cholesteric crystals for which a mechanism of pairing of dislocations is proposed which allows a multiple disclination to take any shape, at the expense of a small increase of energy in the faulted ribbon.

Nonmetric connexions, quasidislocations and quasidisclinations. A contribution to the theory of nonmechanical stresses in crystals, K. H. Anthony, *SP317*, pp. 637-649 (Dec. 1970).

Key words: Affine connexions; continuum mechanics; curvature tensor; disclination; internal stresses; quasidisclination.

Nonmechanical stresses produced, for instance, by a temperature gradient or by an internal magnetic field are related to an affine lattice connexion, which is nonmetric with respect to the elastic metric. The covariant derivative of the elastic metric with respect to the lattice connexion is regarded as source-function for this kind of internal stresses. It may easily be determined from experimental data. The calculation of mechanical stresses is based on this quantity.

Instead of describing nonmechanical stresses by a nonmetric lattice connexion we alternatively may use an elastic connexion which is metric with respect to the elastic metric. In the elastic connexion are involved the tensors of quasiplastic torsion and of quasidisclination-density, which are regarded as source functions of nonmechanical stresses. Both tensors are intimately connected. They are a natural generalization of the quasidislocation tensor of the linear theory of nonmechanical stresses.

From the theory of quasidisclinations we obtain the following statement: In general, nonmechanical stresses cannot be eliminated solely by a dislocation movement. An additional distribution of crystal disclinations is necessary.

Linear theory of static disclinations, R. deWit, *SP317*, pp. 651-673 (Dec. 1970).

Key words: Burgers vector; compatibility; continuum; contortion; Cosserat; couple-stress; defect; deformation; disclination; dislocation; dualism; elasticity; incompatibility; motor calculus; plasticity.

A brief review of compatible and incompatible elasticity theory is given. It is shown how dislocation theory was developed from classical compatible elasticity. Then disclination theory is developed from dislocation theory in an analogous way. The disclination and dislocation density tensors are defined from the plastic deformation. The total deformation satisfies the classical condition of compatibility. By combining these two concepts the geometric basic laws or field equations are found, which relate the elastic deformation to the defect content. The contortion or Nye curvature tensor is found to be a useful equivalent for the dislocation density. Weingarten's theorem motivates the generalization of the Burgers vector and the definition of the analogous rotation vector of disclinations. Finally the dualism between the geometry of disclination theory and the statics of couple-stress theory, as well as the relation of disclination theory to "motor calculus" are pointed out.

Introduction to the panel discussion "intrinsic properties of dislocations," J. P. Hirth, *SP317*, pp. 683-685 (Dec. 1970).

The problem of non-locality in the mechanics of solids: review on present status, E. Kröner, *SP317*, pp. 729-736 (Dec. 1970).

Key words: Dilatation centers; lattice statics; non-local theories; solid mechanics; wave propagation.

The concept of non-locality, in particular with reference to the mechanics of solids, is discussed. A brief report is given on the derivation of the non-local theory of elasticity from atomic lattice theory. In addition some simple solutions of this theory, concerning the interaction of dilatation centers and wave propagation, are quoted. A generalization of the theory which would include dislocations is indicated.

Non-local theory of elasticity for a finite inhomogeneous medium—a derivation from lattice theory, E. Kröner and B. K. Datta, *SP317*, pp. 737-746 (Dec. 1970).

Key words: Green's tensor; Hooke's elasticity; non-local elasticity; solid mechanics.

In the linear theory of non-local elasticity the strain energy can be written as a double volume integral summing up the interactions of pairs of mass elements. The properties of the material, in this case, are described by a two-point-tensor function $c_{ijkl}(\mathbf{r},\mathbf{r}')$. It is found that for finite bodies $c_{ijkl}(\mathbf{r},\mathbf{r}')$ does not have the symmetries of the (Hooke's) elasticity tensor C_{ijkl} of the local theory. However, the symmetries of this tensor function are sufficient to exclude the rotations from the strain energy expression. It is shown that with the help of the elastic Green's function one can express $c_{ijkl}(\mathbf{r},\mathbf{r}')$ in terms of force constants of the lattice. It is also shown that an infinite homogeneous body is not a suitable model either for the non-local or for the local theory, because in this case $c_{ijkl}(\mathbf{r},\mathbf{r}')$ as well as C_{ijkl} obey the Cauchy relations.

On problems of the non-local theory of elasticity, I. A. Kunin and A. M. Waisman, *SP317*, pp. 747-759 (Dec. 1970).

Key words: Green's tensor; non-local elasticity; solid mechanics; surface waves.

The paper contains new results concerning the linear theory of an elastic medium with non-local interactions:

I. *The structure of the general solution of the equations of motion.* The dependence of the general solution on the distribution of energy operator zeroes. Specific effects of the non-locality: new types of damped and undamped waves, the existence of a maximum frequency for the latter ones. the space dispersion. The Green's function.

II. *Approximate models.* Two types of approximate models: the long-wave approximations and the first zeroes approximations. Domains of their applicability.

III. *Boundary value problems.* The replacing of the boundary by a boundary layer of width of the interaction radius. Generalized Green's formula. Fundamental boundary value problems, their correct formulation for first zeroes approximations. The comparison with couple-stress theories. Examples of exact and approximate solutions. The existence of new types of surface waves different from Rayleigh waves.

A non-Riemannian construction of variational criteria for plastic manifolds with special reference to the theory of yielding, K. Kondo, *SP317*, pp. 761-784 (Dec. 1970).

Key words: Continuum mechanics; non-Riemannian theories; plasticity; yielding.

The variational formalism is viewed not as an independent assumption but as a natural consequence following from a more fundamental penetration into the recognition of nature and this is shown in regard to the static aspects of plasticity. The energy is defined as the necessary quantity for the geometrical construction. With the Riemannian and non-Riemannian picture, a bridge is sought between the theory of yielding and the theory of dislocations, as also between the theory of dual yielding and theory of couple stresses. The standpoint of the theory of yielding and dual yielding is explained constitutively with a statistical construction to reconfirm the formulae which have been proposed. The meaning of the plastic constants involved in the theory is clarified by the construction.

Derivation of a continuum theory of dislocations on the basis of an estimative analysis of crystal lattices, M. Mişicu, *SP317*, pp. 785-816 (Dec. 1970).

Key words: Continuum mechanics; dislocation field theory; statistical methods.

Starting from the non-primitive crystal lattice model, a continuum theory is derived by means of an interpolation procedure which takes into account the variability of kinematic and dynamic fields. The non-holonomy of the fields of displacements, energy and entropy is considered in order to elaborate the analysis of dislocation and irreversible effects.

The elastic generalized Cosserat continuum with incompatible strains, R. Stojanović, *SP317*, pp. 817-829 (Dec. 1970).

Key words: Continuum mechanics; Cosserat continua; dislocation field theory; oriented media.

Considered is a continuum with deformable directors. Dislocations are regarded as sources of incompatibilities and internal strains. Established are the relations between the dislocation density tensor and the gradients of directors. The conservation law for dislocations (i.e. the law that the dislocation lines cannot end inside a body) appears as the integrability condition for the dislocation density – gradients of directors relation. In a linearly connected space L_3 in which the directors of a dislocated medium represent fields of absolutely parallel vectors the equality of the dislocation density tensor with the torsion tensor of the space L_3 follows as an immediate consequence. It is also proved that the geometry of L_3 is equivalent to the geometry of the linearly connected space L_3 which is defined in terms of the distorsions, introduced in the theories based on the non-oriented continuum models. From the principle of virtual work are derived the general (non-linear) relations for stress and hyperstress. The stress tensor is not symmetric. In the appendix are presented the modified divergence theorem and the expressions for the variations of the gradients of directors in the absence of a displacement field, i.e., in the case when the compatibility conditions for the strain tensor are not satisfied.

A dynamic theory of dislocations and its applications to the theory of the elastic-plastic continuum, C. Teodosiu, *SP317*, pp. 837-876 (Dec. 1970).

Key words: Anisotropic elasticity; anisotropic plasticity dislocations; constitutive relations; dislocation dynamics; non-linear elasticity.

The starting point of this study is a paper by Kröner (J. Math. Phys. **42**, p. 27, 1963), who proposed the replacement of the loading history variables in the yield criterion and in the work-hardening equation by state variables, such as the dislocation density and the density of dislocation loops.

The first part of the work summarizes the formulation recently given by the author for the dynamic non-linear theory of dislocations in anisotropic media. The relations connecting the continuum kinematic quantities to the discrete dislocation arrangement and to the dislocation velocities are emphasized.

To construct a theory of the elasto-plasticity, the system of kinematic equations is completed by postulating a yield condition and a work-hardening equation, which contain as independent variables the stress, the dislocation density, the density of dislocation loops, and the temperature.

Making constitutive assumptions for the free energy, the specific entropy, and the heat conduction vector, and using the principle of material indifference and the thermodynamical restrictions, a definite theory of the elastic-plastic continuum is obtained.

Non-linear dynamic problems for anisotropic elastic bodies in the continuum theory of dislocations, C. Teodosiu and A. Seeger, *SP317*, pp. 877-905 (Dec. 1970).

Key words: Anisotropic elasticity; dislocation dynamics; dislocation; elasticity; non-linear elasticity.

The non-linear continuum theory of dislocations has been used to solve a number of problems for isotropic materials, including the determination of stresses produced by dislocations, the scattering of elastic waves by straight dislocations and kinks, and the small-angle scattering of x-rays by dislocation lines and rings. For the application of these results it is necessary to know the elastic constants of third or higher order entering the constitutive equations. Third-order elastic constants have recently become available for a large class of single crystals with an accuracy that exceeds considerably the earlier polycrystalline data. It appears therefore desirable to develop a formulation of the theory that may be applied to anisotropic materials.

The present work aims at developing approximate methods for solving non-linear problems such as the determination of the strains produced by stationary or uniformly moving dislocations in anisotropic media and of their effects on a superimposed infinitesimal motion.

The non-linear problems are solved by reduction to a series of linear problems using expansions in terms of small parameters. Three such parameters appear naturally: the magnitude of the distortion produced by dislocations, the magnitude of the deformation gradient of the superimposed motion, and the ratio between the dislocation and sound velocities. To obtain definite approximation algorithms, hypotheses concerning the relative order of magnitude of these three parameters are introduced.

On the thermodynamics of inhomogeneous bodies, C. C. Wang, *SP317*, pp. 907-924 (Dec. 1970).

Key words: Constitutive relations; continuum mechanics; dislocations; inhomogeneous elastic bodies.

This paper concerns the thermodynamics of inhomogeneous elastic bodies. I adopt the constitutive equations for thermoelastic materials given by Coleman & Noll (1963) and develop a theory for bodies made up of such materials. The general scheme of this theory is based on my paper on Generalized Simple Bodies (1969). The main result is the explicit field equations for the deformation and the temperature on a thermoelastic body.

Elastic-plastic plane bending of a single crystal, C. S. Hartley and M. A. Eisenberg, *SP317*, pp. 925-941 (Dec. 1970).

Key words: Dislocation distributions; mechanical properties; plane blending.

The elastic-plastic bending of a single crystal beam which deforms by single slip on a plane containing the axis of bending and in a direction normal to the axis of bending is analyzed. Both continuum plasticity and dislocation approaches are used to obtain stresses and/or displacements in the elastic and plastic regions. The relation between the applied bending moment and the curvature of the neutral axis is also obtained. The approaches are compared and correspondences between the two theories are discussed.

Generalized stress and non-Riemannian geometry, S. I. Ben-Abraham, *SP317*, pp. 943-962 (Dec. 1970).

Key words: Affine connection; continuum mechanics; non-Riemannian geometry; stress.

The general non-Riemannian approach to the geometry of a solid with lattice defects is briefly discussed. Non-Riemannian geometry is applied to the treatment of statics. The "stress" curvature tensor has the meaning of a generalized stress tensor with 27 components, while the associated Einstein tensor represents the classical stress tensor. The "stress" connexion expresses the generalized moment stress having 27 components. Its torsion tensor is the classical couple stress tensor.

The identities of the curvature tensors are identified with the static equilibrium conditions. Using a stress function density instead of a metric tensor, it is shown that the equilibrium conditions can always be identically fulfilled. A consistent theory involving lattice defects must necessarily involve also generalized moment stresses and generalized stresses.

The elastic field of moving dislocations and disclinations, T. Mura, *SP317*, pp. 977-996 (Dec. 1970).

Key words: Anisotropic elasticity; dislocation dynamics; dislocations; Green's tensors.

The previous work and the present state of study on the elastic field of moving dislocations and disclinations are reviewed. Emphasis will be placed upon the general method and approach using Green's tensor functions and Fourier integrals. The previous solutions for individual problems are reviewed as examples of this unified approach.

Kinematics of continuously distributed dislocations, S. I. Ben-Abraham, *SP317*, pp. 999-1020 (Dec. 1970).

Key words: Affine connection; continuum mechanics; kinematics; non-Riemannian geometry.

The general non-Riemannian approach to the geometry of a solid with lattice defects is extended to include the kinematics. The treatment is valid for both the motion of old defects and the creation of new ones. The change in a geometric quantity is described by a corresponding rate. The main quantities dealt with are distortion rates, stretching tensors and connexion rates, and new quantities called fluxions are introduced. In terms of these a fundamental kinematic law and continuity equations for the defect currents are set up and are found to be consistent with earlier results valid in special cases.

A micromorphic approach to dislocation theory and its relation to several existing theories, A. C. Eringen and W. D. Claus, Jr., *SP317*, pp. 1023-1040 (Dec. 1970).

Key words: Continuum mechanics; dislocation distributions; micromorphic dislocations; micropolar dislocations.

Two separate continuum dislocation theories are presented; one dealing with static, incompatible, micropolar dislocations and disclinations, as encountered in initial stress problems, and the other with a dynamical theory of micromorphic solids, containing continuous distributions of dislocations.

Relationships between several continuum dislocation theories and micromorphic mechanics are established by providing extensions and new interpretations of the micromorphic theory. First both micromorphic and micropolar theories of elastic solids are summarized, and then the theories of Kröner, Fox, and Berdichevskii and Sedov are discussed in some detail within this framework. In the last section, by use of micromorphic kinematics, dislocation density, strain, and microstrain tensors are introduced and constitutive equations are constructed. Together with the balance laws this constitutes a complete dynamical theory. The theory is intended for predictions of motions and micromotions of a solid containing dislocations undergoing elastic deformations. From the micromotion, the dislocation density and first stress moments can be calculated.

On the continuum theory of dislocations, N. Fox, *SP317*, pp. 1041-1052 (Dec. 1970).

Key words: Constitutive relations; continuum mechanics; dislocation kinematics; dislocations; oriented media; thermodynamics and dislocation motion.

The kinematics of an oriented medium are discussed with reference to the continuum theory of dislocations. The concepts of dislocation density dislocation flux and slip velocity are introduced and a corresponding constitutive theory is developed.

Dislocation dynamics in the presence of a multiple spectrum of thermally surmountable barriers, W. Frank, *SP317*, pp. 1065-1076 (Dec. 1970).

Key words: Arrhenius rate theory; dislocation dynamics; statistical theory of dislocation; thermal acceleration.

A theoretical treatment is given of the thermally activated motion of dislocations in the presence of dislocation barriers with different heights. The height of a barrier is allowed to depend on an arbitrary number of characteristic parameters (multiple obstacle spectrum). Under the assumptions which are usually made for the derivation of an Arrhenius equation for the slip rate $\dot{a}$ in the case of a uniform array of dislocation barriers, $\dot{a}$ is calculated for a multiple spectrum of barriers.

It is found that even under these conditions the validity of an Arrhenius equation $\dot{a} = \dot{a}_0 \exp(-\Delta\overline{G}/kT)$ (a_0 = const., $\Delta\overline{G}$ = mean free enthalpy of activation) is preserved. An application of the "spectrum theory" is discussed.

Flow and the Arrhenius equation in the statistical framework, U. F. Kocks, *SP317*, pp. 1077-1082 (Dec. 1970).

Key words: Arrhenius law; mechanical properties; precipitation hardening; thermal activation.

The rate equation of plastic flow and a general work-hardening law are combined into a single equation of flow. It degenerates into the Arrhenius law only under certain specified conditions. A single Arrhenius term with temperature insensitive pre-exponential (and entropy) terms adequately describes the rate dependence of dislocation motion through a slip plane studded with obstacles of any spectrum of strengths and spacings. In this case, the mobile dislocation density in the slip plane generally does not enter the flow equation; only the density of slip plane does.

Movement of a dislocation through random arrays of point and parallel line obstacles, A. J. E. Foreman, P. B. Hirsch, and F. J. Humphreys, *SP317*, pp. 1083-1098 (Dec. 1970).

Key words: Computer simulation; dislocation motion; mechanical properties; precipitation hardening.

The motion of a dislocation through random arrays of impenetrable point and parallel line obstacles is considered. For impenetrable point obstacles the difference in line tension for edges and screws, and the elliptical equilibrium shape of the bowing-out loop are taken into account, and the yield stress for screws and edges is found to be the same. The results of a calculation of the effect of interaction between neighboring segments of the dislocation on the critical breaking angle and on the yield stress are presented. Computer calculations on the motion of dislocations through random arrays of parallel line obstacles show that the dislocations move by the generation and motion of large "kinks." The yield stress is found to increase approximately linearly with the obstacle length. These calculations are relevant to and are compared with the hardening in the early stages of the work hardening curve of dispersion hardened alloys containing small particles, in which rows of prismatic loops are formed at the particles, which act as linear obstacles to the gliding dislocations.

Strain rates in dislocation dynamics, W. de Rosset and A. V. Granato, *SP317*, pp. 1099-1106 (Dec. 1970).

Key words: Dislocation kinetics; mobile dislocations, stress rates.

Since the success by Johnston and Gilman in relating yield phenomena in LiF to direct measurements of dislocation velocities and densities, the Λbv expression for the strain rate has been used almost exclusively, where Λ is the mobile dislocation density, b the Burgers vector, and v is the average dislocation velocity. We note that there are cases for which the strain rate is independent of dislocation velocity. When the velocity is large enough the strain rate is given in a simplified model by $\Lambda b\bar{x}$, where $\bar{x}$ is the average distance traveled by a dislocation. The strain rate is eventually determined, then, by the rate at which new dislocations are created and not necessarily by the rate at which old dislocations expand or by the dislocation velocity.

On the mechanism of cross-slip of dislocations at particles, M. S. Duesbery and P. B. Hirsch, *SP317*, pp. 1115-1134 (Dec. 1970).

Key words: Activation energy; cross slip; mechanical properties; misfit strain; precipitation hardening.

The effect of the misfit strain field upon the mechanism of cross-slip of dislocations at impenetrable particles in two-phase alloys is considered. The strain field is found to have a profound effect of the activation energy for cross-slip.

Theories of thermally activated processes and their application to dislocation motions in crystals, H. Engelke, *SP317*, pp. 1137-1156 (Dec. 1970).

Key words: Bordoni-peaks; dislocation motion; kink relaxation; mechanical properties; thermal activation.

Thermally activated processes involving dislocations are usually treated by applying the theory of absolute reaction rates and the string approximation of dislocations. In the first part of this paper the limits of validity of these treatments are discussed. A paper of T. Geszti is briefly reviewed in which it is shown that in processes involving *point defects* deviations from the rate theory must be expected if the energy exchange between defect and lattice waves is slow compared with the average time between jumps, e.g. if localized or quasi-local vibrations contribute essentially to the defect motion. It is pointed out that the localized modes of dislocations may also lead to deviations from the rate theory.

In the second part a treatment of the double kink relaxation (Bordoni relaxation) based on the Kramers-Brinkman diffusion theory of chemical reactions is given. After showing that in f.c.c. metals the influence of the Peierls potential is so small that on dislocation loops only one kink pair must be considered explicitly whereas the remaining parts of the loops may be described by the string approximations, diffusion equations for the loop motion are derived. Under certain conditions these equations are equivalent to a system of reaction rate equations. Exact solutions of this system are not yet available. However, the behaviour of dislocation loops in the amplitude independent region of internal friction measurements may be extrapolated combining results of two limiting cases: a double well model and a simplified multi-well model.

The relaxation strength and the preexponential factor of the relaxation time calculated have the same orders of magnitude as in measurements of the Bordoni peak. The loop length dependence of the damping peak is in good agreement with neutron-irradiation measurements. The characteristic half-width of the Bordoni peak may partly be explained using loop length and stress distributions.

Slightly dissociated dislocations, R. Hobart, *SP317*, pp. 1157-1161 (Dec. 1970).

Key words: Dislocation stacking faults; Peierls-Nabarro model.

A modified Peierls-Nabarro model is used to calculate the relation between the separation of partials and stacking fault energy for an idealized dislocation dissociated into two equal pure screw partials. The resulting expression agrees with the inverse dependence obtained by equating the elastic repulsion of the partials to the attraction of the stacking fault, but unlike that result does not break down at zero separation. Also an argument is given that the width of such a dissociated dislocation should be considered as a complex quantity, with the imaginary part corresponding to the separation of the partials.

The broadening of resonance lines by dislocations, A. M. Stoneham, *SP317*, pp. 1169-1173 (Dec. 1970).

Key words: Line broadening; optical zero phonon line; spin resonance; statistical methods for dislocations.

Dislocations and other defects in solids broaden sharp resonance lines in solids, such as spin resonance and optical

zero phonon lines. The broadening is a result of the random strain fields produced, and the shape of the resonance line is a measure of the distribution of internal strains. Measurement of line shapes can give information which is different from that given by the more usual mechanical and transport studies of dislocations. We calculate the shapes of the resonance lines in terms of the properties of the individual defects which cause broadening, their density and their statistical distribution. The theory is applied to straight dislocations, infinitesimal loops, dislocation dipoles and to point defects.

Dislocation pair interaction in a finite body, R. O. Scattergood and U. F. Kocks, *SP317,* pp. 1179-1189 (Dec. 1970).

Key words: Dislocation surface; dislocations; elastic interactions; finite elasticity; interactions.

The elastic interaction between dislocations in a finite body shows important features not found in an infinite body. For example, two like dislocations parallel to the axis of a cylinder repel each other only when they are close, but attract each other when their distance is comparable to the cylinder radius. Contours of the pair interaction energy are given for both screw and edge dislocations in a circular cylinder.

These new features appear not only when free surface conditions are demanded on the entire body, but even when approximate stress fields are used that demand some surface tractions, so long as no torques are transmitted through the body.

The relevant torques (bending moments) associated with an edge dislocation in a circular cylinder, which vanish when the mantle is traction free, may be made to vanish in general by a simple modification of the stress field of the edge dislocation.

The mean square stresses $\langle \sigma^2 \rangle$ for a completely random and a restrictedly random distribution of dislocations in a cylindrical body, M. Wilkens, *SP317,* pp. 1191-1193 (Dec. 1970).

Key words: Dislocations; elasticity; statistical methods.

The paper gives a full proof of the author's earlier statement according to which the elastic interaction energy of completely randomly distributed dislocations vanishes. As a consequence the outer cut-off radius in the logarithmic factor of the elastic energy coincides with the external cylinder radius rather than with the mean dislocation spacing. The proof takes into account the elastomechanical boundary conditions which were neglected in the earlier paper. Further it is shown that for a restrictedly random distribution the outer cut-off radius is equivalent to the radius of the areas small compared with the cylinder cross-section, each of which contains the same number of dislocations randomly distributed over the corresponding area. In the special case that each area contains only one dislocation with arbitrary inside the area the outer cut-off radius degenerates to the mean dislocation spacing.

Theoretical aspects of kinematical x-ray diffraction profiles from crystals containing dislocation distributions, M. Wilkens, *SP317,* pp. 1195-1221 (Dec. 1970).

Key words: Diffraction profiles; dislocation diffraction; kinematic x-ray diffraction; statistical methods for dislocations.

The paper deals with a theoretical study of the Fourier transform of the x-ray diffraction line profiles from crystals containing dislocation distributions. The theory is based mainly on a calculation of spatial averages of powers of the strains ϵ_n, where ϵ_n means the differential strain perpendicular to the reflecting planes averaged over a certain length $n(n$ = variable of the Fourier transform). The second power average $\langle \epsilon_n^2 \rangle$ is calculated in a closed form for a restrictedly random dislocation distribution. However, the result is approximately valid also for other distributions. The contributions of the averages of higher powers of ϵ_n are taken into account in an approximate manner. The expression derived for the Fourier transform depends on the two parameters ρ and R_e, where ρ is the dislocation density. R_e is equivalent to the effective outer cut-off radius which appears for instance in the logarithmic factor of the elastically stored energy. The result which is applicable for $R_e \geq \rho^{-1/2}$ is discussed in comparison with the theory of Krivoglaz and Ryaboshapka, in which a completely random dislocation distribution is assumed, and with the theory of diffraction from distorted crystals mainly developed by Warren and Averbach.

Thermodynamic properties of solids containing dislocations, J. Holder and A. V. Granato, *SP317,* pp. 1223-1225 (Dec. 1970).

Key words: Bulk modulus; dislocations and thermodynamics; entropy; specific heat; thermal expansion; thermodynamics and expansions.

Using thermodynamics and elasticity theory, a unified treatment of the changes in the thermodynamic properties of solids containing dislocations is given. The results are expressed in terms of temperature and pressure derivatives of the formation energy of the dislocations. The required pressure and temperature dependence of the energy is given by the measured pressure and temperature dependence of the elastic constants appearing in the energy expression found at zero pressure and temperature. The method is not restricted to calculations of volume changes, or to isotropic, static or even elastic systems at zero pressure. Changes in entropy, specific heat, thermal expansion and bulk modulus due to dislocations are easily calculated.

Charged dislocations in the diamond structure, P. Haasen and W. Schröter, *SP317,* pp. 1231-1253 (Dec. 1970).

Key words: Band structures; charged dislocations; diamond lattice; dislocation-electron interactions; semiconductors.

The electronic states at dislocations in elemental semiconductors are reviewed in the light of new experimental and theoretical work. Evidence is produced for the existence of a one-dimensional energy band along edge as well as screw dislocations. This explains quantitatively their ability to act as donors as well as acceptors depending on temperature, doping, and dislocation density. The degree of charging has been recalculated from the free energy of a system of charged dislocations screened by free carriers. The dislocation charge limits the Hall mobility in addition to the strain field of the dislocation. Measurements of photoconductivity of deformed semiconductors support the above model of the charged dislocation. The dislocation charge influences the Peierls force and thus the mobility of dislocations in the diamond structure. The occupation limit of the neutral dislocation, measured from the valence band edge, lies at 0.09 eV in germanium, and at 0.3 eV in silicon.

Electronic effects associated with stacking faults in normal metals, C. Nourtier and G. Saada, *SP317,* pp. 1259-1277 (Dec. 1970).

Key words: Dislocation-electron interactions; interatomic potentials; stacking faults.

The authors use a simple pair interaction model to make the following calculations. (1) Stacking fault energy of simple metals. (2) Interaction energy between a stacking fault and an impurity atom or a vacancy, and application to the study of segregation effects. (3) Interaction energy of parallel stacking faults.

Numerical results are given. Consequences of the long range interaction between defects are discussed.

Theory of surface states on stacking faults, R. M. Thomson, *SP317*, pp. 1279-1288 (Dec. 1970).

Key words: Dislocation-electron interactions; Slater-Koster method; stacking fault.

The Slater-Koster method in the Bloch representation is applied to a model for a stacking fault in an idealized crystal leading to a type of Shockley surface state. A series expansion is obtained for the energy which is worked out for the simplified case of a constant matrix element, with the result that for a tight binding nonoverlapping band, there are surface waves which split off from both the top and bottom of the band. Contrary to Shockley's results for external surfaces, and to the Slater-Koster theory of the localized impurity, localized states occur on the stacking fault for a single nonoverlapping band and for arbitrary potential values. A constant matrix approximation is worked out for the case of the simple metals.

Interactions of dislocations with electrons in metals, C. Elbaum and A. Hikata, *SP317*, pp. 1291-1292 (Dec. 1970).

Key words: Dislocation dynamics; dislocation-electron interactions; phonons.

Physical arguments are given to show that the interaction of moving (vibrating) dislocations with conduction electrons in metals is independent of temperature. Calculations based on the assumption that the Fourier components of the displacement field of a moving dislocation can be treated as pseudo-phonons give the same result. These conclusions were confirmed by the results of recent experiments.

Electronic energy states of dislocations; the case of covalent-ionic solids, C. Elbaum and R. R. Holmes, *SP317*, pp. 1293-1302 (Dec. 1970).

Key words: Band structure; covalent-ionic solids; dislocation-electron interactions; Fermi energy; semiconductors.

It is shown that electronic energy bands are associated with dislocations in wide-band-gap, compound semiconductors. The eigenvalue problem for the dislocation band edge is solved for CdS-type crystals, and the occupation of the band is calculated. The Fermi energy is then determined for crystals containing many deep-lying discrete levels as well as dislocation bands. It is predicted that when a crystal is illuminated with light of appropriate wavelength and increasing intensity, the thermal activation energy governing the electrical conductivity passes through a series of energy plateaus which are equal to the energy of the discrete levels. In a dislocation-free crystal, these plateaus are connected by step changes, while in a crystal with dislocations they are connected by broad transition regions. The above predictions have been verified experimentally.

Interactions between electrons and moving dislocations, G. P. Huffman and N. Louat, *SP317*, pp. 1303-1322 (Dec. 1970).

Key words: Dislocation damping; dislocation-electron interactions; electroresistivity.

A moving dislocation in a metal induces an electric field which causes currents in the conduction electron gas. The energy dissipation associated with these fields and currents is calculated from the Boltzmann equation in a manner analogous to theories of acoustical attenuation. It is found that the applied stress required for steady motion is proportional to the dislocation velocity divided by the electrical resistivity, in good agreement with low temperature yield and flow stress measurements on bcc metals. The concept of a large electronic component of drag which increases with decreasing temperature is used to give a qualitative explanation of the observed mechanical properties of b.c.c. metals. When one considers electronically damped dislocations impeded by pinning points, it is found that: (1) the dislocation velocity depends only on the mean strength of the pinning obstacles; (2) the stress required to overcome an obstacle dynamically is less than that required statically and is, in fact, the electronic drag stress; and (3) the apparent dislocation velocity should vary rapidly with applied stress. The displacement field of a dislocation is significantly wider and more gradual in a f.c.c. than in a b.c.c. lattice, and this feature can be incorporated into the calculation by assuming that the electronic screening of the positive charge shift of the dislocation is essentially perfect in a f.c.c. lattice. The Boltzmann formation then gives a temperature independent stress or drag coefficient in agreement with experiment and with Holstein's scattering calculation. The problem of a dislocation moving in an applied magnetic field directed along its length and perpendicular to its direction of motion is also treated. Under suitable conditions it is found that the stress or drag coefficients exhibit oscillations of the cyclotron resonance type which could be as large as 10 to 30% of the zero field values.

SP318. **Report of the 54th National Conference on Weights and Measures 1969,** R. L. Koeser, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 318, 270 pages (Nov. 1969).*

Key words: Conference, weights and measures—laws; weights and measures—regulations; weights and measures—technical requirements; weights and measures—history; weights and measures.

This is a report of the proceedings (edited) of the Fifty-fourth National Conference on Weights and Measures, sponsored by the National Bureau of Standards, held in Washington, D.C., June 9-13, 1969 and attended by State, county, and city weights and measures officials and representatives of the Federal Government, business, industry, railroads, and associations.

SP319. **Man, his job, and the environment: A review and annotated bibliography of selected recent research on human performance,** W. G. Mather, III, B. V. Kit, G. A. Bloch, and M. F. Herman. Nat. Bur. Stand. (U.S.), Spec. Publ. 319, 107 pages (Oct. 1970).

Key words: Bibliography; effort; environment; fatigue; human performance; human physiology; psychology; psychophysics; stress (physiological); stress (psychological) work.

Recent scientific literature was searched to review procedures currently being used to study human reactions to work and environmental stress. An ecological context is followed, considering task variables, environmental conditions, individual variations in subjects, and physiological, psychophysical, psychological, and sociological responses. The different types of research reviewed included analyses of on-the-job performance, simulations of real-life situations, laboratory experiments with human and nonhuman subjects, and clinical studies. A methodological program is suggested for measuring the expenditure of effort in work situations. In addition to an extensive bibliography, detailed abstracts of 190 research reports are presented.

SP320. **Bibliography on atomic transition probabilities, January 1916 through June 1969,** B. M. Miles and W. L. Wiese, Nat. Bur. Stand. (U.S.), Spec. Publ. 320, 111 pages (Feb. 1970).

Key words: Atomic; discrete; forbidden; permitted; transition probability.

A revised and updated bibliography on atomic transition probabilities including all new references up to July 1, 1969 is presented. The papers, except for a number of comprehensive articles, are arranged according to elements and stages of ionization. In addition to the literature reference the employed experimental or theoretical method is indicated. For the 20 lightest elements and Ba I and II the literature is presented on a critically selected basis. To keep the bibliography to a compact size, a number of comprehensive papers which contain numerical results throughout extended isoelectronic sequences are listed in a separate section. Also included in this bibliography is a supplementary list of selected important papers dealing with the subject of transition probabilities from a general point of view.

SP320. Supplement 1. **Bibliography on atomic transition probabilities, July 1969 through June 1971,** J. R. Fuhr and W. L. Wiese, Nat. Bur. Stand. (U.S.), Spec. Publ. 320, Suppl. 1, 67 pages (Sept. 1971).

Key words: Allowed; atomic; discrete; forbidden; transition probability.

This is the first supplement to the NBS Special Publication 320, "Bibliography on Atomic Transition Probabilities," and it covers the most recent literature on the subject from July 1969 through June 1971. The papers are arranged according to elements and stages of ionization, and the method employed and classification of transitions are indicated for each reference. Only articles on discrete transitions, both allowed and forbidden, are listed. Papers containing data for many elements within isoelectronic sequences are collected separately in front of the list in order to keep this bibliography to a reasonable size. Also included is a selected list of new papers dealing with the subject of atomic transition probabilities from a general point of view.

SP320. Supplement 2. **Bibliography on atomic transition probabilities July 1971 through June 1973,** J. R. Fuhr and W. L. Wiese, Nat. Bur. Stand. (U.S.), Spec. Publ. 320 Suppl. 2, 63 pages (Nov. 1973) 95 cents, SD Catalog No. C13.10:320.

Key words: Allowed; atomic; discrete; forbidden; transition probability.

This is the second supplement to the NBS Special Publication 320, "Bibliography on Atomic Transition Probabilities," and it covers the most recent literature on the subject from July 1971 through June 1973. The papers are arranged according to elements and stages of ionization, and the method employed and classification of transitions are indicated for each reference. Only articles on discrete transitions, both allowed and forbidden, are listed. Papers containing data for many elements within isoelectronic sequences are collected separately in front of the list in order to keep this bibliography to a reasonable size. Also included is a selected list of new papers dealing with the subject of atomic transition probabilities from a general point of view.

SP321. **An author and permuted title index to selected statistical journals,** B. L. Joiner, N. F. Laubscher, E. S. Brown, and B. Levy, Nat. Bur. Stand. (U.S.), Spec. Publ. 321, 510 pages (Sept. 1970).

Key words: Bibliography; computer indexing; index; key word in context; KWIC; permuted title index; statistics.

Over 5,000 articles appearing in the indicated issues of the following journals are indexed: *Annals of Mathematical Statistics* (1961-1969), *Biometrics* (1965-1969 #3), *Biometrike* (1951-1969), *Journal of the American Statistical Association* (1956-1969), *Journal of the Royal Statistical Society, Series B* (1954-1969 #2). *South African Statistical Journal* (1967-1969 #2), *Technometrics* (1959-1969). The articles indexed correspond to those appearing since the most recent cumulative subject index was published for the first six named journals, while for *Technometrics* all articles have been included even though a subject index exists for the first seven volumes. The index consists of three sections, an author index, a permuted title index and a bibliographic listing. In the permuted title index each article is listed under every important word appearing in its title. This index should consequently serve many of the functions of a conventional subject index. The author index is similar to a conventional author index.

SP322, Superseded by Special Publication 380.

SP323. **Electronic density of states.** Based on invited and contributed papers and discussion, 3d Materials Research Symposium held at Gaithersburg, Md., Nov. 3-6, 1969, L. H. Bennett, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 323, 834 pages (Dec. 1971).

Key words: Band structure: disordered systems; electronic density of states; ion neutralization; Knight shift; magnetic susceptibility; many-body effects; optical properties; photoemission; soft x-ray; specific heat; superconductivity; transport properties; tunneling.

This volume is based on materials presented at the Third Materials Research Symposium of the National Bureau of Standards, held November 3-6, 1969. It provides a review of various experimental and theoretical techniques applied to the study of the electronic density of states in solids and liquids. The topics covered in a series of invited and contributed papers include theory of and experiments to obtain the one-electron density-of-states; many-body effects; optical properties; spectroscopic methods such as photoemission (x-ray and UV), ion neutralization, and soft x-ray; obtaining the density-of-states at the Fermi level by specific heat, magnetic susceptibility, and the Knight shift; the disordered systems of alloys, liquids, dirty semiconductors, and amorphous systems; and superconducting tunneling and the application of density of states to properties such as phase stability.

An edited discussion follows many of the papers. *These proceedings include the following papers (indented):*

The band structure problem, J. M. Ziman, *SP323,* pp. 1-12 (Dec. 1971).

Key words: APW; band structure; density of states; disordered systems; KKR; *t*-matrix; molecular crystals; pseudopotential.

The numerical solution of the Schrödinger equation for an electron in a dense assembly of atoms (*i.e.* a solid or liquid metal or semiconductor) has made great progress in the past ten years. This is not merely a consequence of greater computing power; we now have a much better grasp of the mathematical theory of such solutions.

By 1960 a number of practical methods had been devised for the computation of the electronic structure of ordered crystals, but these lacked intuitive interpretation. The first advance was to rewrite the OPW method in terms of pseudopotentials, thus making sense of the free-electron theory of metals. This development has proved particularly valuable in semiquantitative and empirical investigations of Fermi surfaces, transport properties, lattice dynamics, cohesion, *etc.*, but we have had to wait until recently for a rigorous analysis of the criteria for convergence of the various types of model potential or pseudopotential that have been postulated.

The next step was to show that the KKR (Green function) method could also be expressed as a pseudopotential, and then to demonstrate that this was also a form of APW expansion. The relative computational power of these two methods can thus be analyzed, and questions answered concerning the fulfillment of the empty lattice test, the apparent lack of uniqueness of the expansions, the advantages of "folding" matrix elements from distant points of the reciprocal lattice, and the introduction of contributions from the interstitial potential.

At this stage, the connections between the band structure problem and the *t*-matrix theory of scattering were uncovered, and *d*-bands were seen to arise as resonances of the muffin-tin wells. The KKR matrix could now be rewritten as a mixture of pseudopotential and tight-binding elements, in harmony with the empirical model Hamiltonian representations of hybridised *s-p* and *d*-bands. This method not only permits more rapid computations, but shows clearly how the width and position of such bands should depend on the atomic potential.

Some problems still remain. For example, present techniques do not seem adequate for first-principles calculations on molecular crystals, where the anisotropy of the interstitial potential (*i.e.* easy channels along bonds, but high hills between layers or chains) is probably the dominant feature.

As for disordered systems – we know little for certain and nothing quantitatively. The linear chain model has been fully studied but is quite irrelevant to the three-dimensional case. The present theoretical confusion is exemplified by the equiconcentration substitutional alloy in the tight-binding limit; some formulae give only one band, others allow two. Again, the very possibility of producing band gaps by diffraction of free electrons in a topologically disordered system (*e.g.* amorphous Ge) has not been demonstrated mathematically with any rigor.

Electronic density of states of transition, noble, and actinide metals, F. M. Mueller, *SP323*, p. 17 (Dec. 1971).

Key words: Electronic density of states; histogram representations; QUAD scheme.

Electronic densities of states and optical properties of CsCl type intermetallic compounds, J. W. D. Connolly and K. H. Johnson, *SP323*, pp. 19-25 (Dec. 1971).

Key words: AuZn; CsCl-type intermetallic compounds; direct interband transitions; electronic density of states; NiAl; optical properties.

The electronic band structures and densities of states have been calculated from first principles for two intermetallic compounds having the CsCl structure. The nonrelativistic augmented plane wave method has been used in conjunction with an LCAO interpolation technique to determine the band structure and density of states of β'NiAl to a high degree of accuracy. These theoretical results are in excellent agreement with the measured optical properties if k-conserving (direct) interband transitions are assumed to be dominant. A similar study has been carried out for β'AuZn, using as a basis the energy bands determined by the relativistic Korringa-Kohn-Rostoker method. The band profiles and density of states of β'AuZn are qualitatively similar to those of β'NiAl, except for the appearance of relativistic effects in the former alloy and differences in the relative positions and widths of the respective Au and Ni *d*-bands. The β'AuZn results have also been compared with the measured optical properties and are again consistent with these measurements if direct interband transitions are assumed.

The calculation of densities of states by LCAO interpolation of energy bands with application to iron and chromium, J. W. D. Connolly, *SP323*, pp. 27-32 (Dec. 1971).

Key words: Chromium; electronic density of states; interpolation method; iron; photoemission.

The LCAO (linear combination of atomic orbitals) interpolation method is described as a means of calculating the density of states curves of a crystalline solid. This method is shown to be more straightforward and convenient to use than the composite (LCAO-OPW) techniques that have recently been proposed for transition metals. A computer program is described which determines the LCAO interaction integrals from an *ab initio* energy band calculation by a nonlinear least squares procedure, and then uses these parameters to sample the Brillouin zone at a large number of points in order to calculate the density of states curve to a high degree of accuracy. As examples of the application of this program, the results of calculations on chromium (in both the nonmagnetic and antiferromagnetic states) and iron (nonmagnetic and ferromagnetic) are presented and compared with the recent photoemission data.

Optical properties of aluminum, G. Dresselhaus, M. S. Dresselhaus, and D. Beaglehole, *SP323*, pp. 33-36 (Dec. 1971).

Key words: Aluminum (Al); dielectric constant; electronic density of states; interband transition; optical properties; pseudopotential.

The Ashcroft energy band model which provides a good representation of the measured Fermi surface of aluminum is used here to calculate the optical properties. New reflectivity measurements in aluminum have also been carried out between 2μ and 3000 Å using a sensitive continuous frequency scanning technique. A Kramers-Kronig analysis of the reflectivity data yields a frequency dependent dielectric constant which is essentially in agreement with the results of the calculation. This comparison suggests that the optical properties of aluminum can be described in terms of a one-electron energy band model.

On the optical properties and the density of states in arsenic, R. W. Brodersen and M. S. Dresselhaus, *SP323*, pp. 39-44 (Dec. 1971).

Key words: Arsenic (As); electronic density of states; Fermi surface; interband transition; Landau levels; magneto-reflection.

The infrared reflectivity of arsenic is calculated and correlated with Fermi surface, magnetoreflection and optical reflectivity measurements. These infrared properties are

strongly affected by interband transitions across a small spin-orbit induced bandgap. The unusually large intensity of this interband transition for light incident along the trigonal direction is due to the simultaneous occurrence of a strong interband momentum matrix element and a large density of states. By considering this interband transition explicitly, good agreement is obtained with the experimental data of Riccius.

Density of states and ferromagnetism in iron, K. J. Duff and T. P. Das, *SP323*, pp. 47-52 (Dec. 1971).

Key words: Electronic density of states; ferromagnetism; iron; optical reflection; photoemission; x-ray emission.

The band structure of ferromagnetic iron has been calculated by a variational method using a basis of tight-binding functions and orthogonalized plane waves. Exchange matrix elements are evaluated without approximation by a local potential. Correlation effects are explicitly included. Histograms for the density of states are constructed and compared with photoemission and optical reflection and x-ray emission data. The calculation leads self-consistently to the observed magnetic moment. The relative importance of intra-atomic exchange and itinerancy to the origin of iron's ferromagnetism is discussed.

Calculation of density of states in W, Ta, and Mo, I. Petroff and C. R. Viswanathan, *SP323*, pp. 53-56 (Dec. 1971).

Key words: Electronic density of states; Fermi energy; molybdenum; photoemission; tantalum; tungsten.

Density of states curves were calculated for tungsten, tantalum and molybdenum from corresponding energy band structures obtained by a nonrelativistic APW calculation. The Fermi energy and the density of states at the Fermi energy were obtained for each material. The calculations were part of a study intended to calculate theoretical photoemission yield curves which could be compared with experimental results.

Adjustment of calculated band structures for calcium by use of low-temperature specific heat data, R. W. Williams and H. L. Davis, *SP323*, pp. 57-61 (Dec. 1971).

Key words: Calcium; de Haas-van Alphen; electronic density of states; low-temperature specific heat; pseudopotential; transition-metal behavior.

The electronic band structure of calcium has been studied theoretically by employing the Korringa-Kohn-Rostoker method. The crystal potentials used in our calculation were obtained by means of a standard superposition of free-atom charge densities. E_k vs **k** curves and the density of states at the Fermi energy were calculated for various potentials, with the measured low-temperature electronic specific heat coefficient, γ, being used as an empirical aid to adjust the exchange portion of the crystal potential. The important feature of the potentials used is that they all give band structures which have definite *d*-band character in the vicinity of the Fermi surface. These *d* bands or their corresponding *d* scattering resonances vary rapidly in energy for small changes in the exchange, resulting in values of γ which are extremely sensitive to exchange.

Fermi surface properties of the noble metals at normal volume and as a function of pressure, W. J. O'Sullivan, A. C. Switendick, and J. E. Schirber, *SP323*, pp. 63-65 (Dec. 1971).

Key words: Crystal potential; effective masses; electronic density of states; electronic specific heat; noble metals; pressure effects.

We present the results of nonrelativistic KKR calculations of the Fermi surface properties of Cu, Ag, and Au at normal volume and as a function of pressure. In particular we compare electronic specific heats, effective masses and the associated pressure shifts with the corresponding experimental results for the noble metals. In contrast to the results of previous calculations we find that the Herman-Skillman-Mattheiss crystal potential is an excellent effective potential for both Cu and Ag.

Calculated effects of compression upon the band structure and density of states of several metals, E. A. Kmetko, *SP323*, pp. 67-73 (Dec. 1971).

Key words: Alkali and alkaline earth metals; augmented plane wave method (APW); cerium; compressibility; electronic density of states; lanthanides.

Energy bands were obtained self-consistently by the augmented plane wave method for the following metals: Li, Cs, Ca, Sr, Ba, La, Ce, U, Pu, W and Fe. The density of states and the electronic charge were resolved into *s*-, *p*-, *d*-, and *f*-like components. Under compression the charges associated with the higher values of ℓ increase, mainly at the expense of the *s*-like component, and a more compact overall distribution is thereby achieved. The present results indicate that such "electronic transitions" are of general occurrence and probably play a significant role in determining the compressibility of metals.

Optical properties and electronic density of states, M. Cardona, *SP323*, pp. 77-89 (Dec. 1971).

Key words: Critical points; density of states; dielectric constant; modulated reflectance; optical absorption.

The fundamental absorption spectrum of a solid yields information about critical points in the optical density of states. This information can be used to adjust parameters of the band structure. Once the adjusted band structure is known, the optical properties and the density of states can be generated by numerical integration. We review in this paper the parametrization techniques used for obtaining band structures suitable for density of states calculations. The calculated optical constants are compared with experimental results. The energy derivative of these optical constants is discussed in connection with results of modulated reflectance measurements. It is also shown that information about density of empty states can be obtained from optical experiments involving excitation from deep core levels to the conduction band.

A detailed comparison of the calculated one-electron optical line shapes with experiment reveals deviations which can be interpreted as exciton effects. The accumulating experimental evidence pointing in this direction is reviewed together with the existing theory of these effects.

A number of simple models for the complicated interband density of states of an insulator have been proposed. We review in particular the Penn model, which can be used to account for response functions at zero frequency, and the parabolic model, which can be used to account for the dispersion of response functions in the immediate vicinity of the fundamental absorption edge.

Theoretical electron density of states study of tetrahedrally bonded semiconductors, D. J. Stukel, T. C. Collins, and R. N. Euwema, *SP323*, pp. 93-102 (Dec. 1971).

Key words: Aluminum phosphide (AlP); electronic density of states; exchange potential; gallium arsenide (GaAs); germanium; self-consistent orthogonalized plane wave model (SCOPW); semiconductors, tetrahedrally bonded; silicon; zincblende; ZnSe.

The electron density of states has been calculated using a self-consistent orthogonalized plane wave (SCOPW) model for compounds in the isoelectronic sequences Si-AlP and Ge-GaAs-ZnSe. The valence and conduction band density of states are presented. The location of the core states is also given. The effect upon the density of states of using the exchange approximations of Slater, Kohn-Sham, and Liberman is displayed.

Electronic density of states in Eu-chalcogenides, S. J. Cho, *SP323*, pp. 105-108 (Dec. 1971).

Key words: Augmented plane wave method (APW); electronic density of states; europium-chalcogenides; exchange potential; *f* bands; photoemission.

The spin-polarized energy bands and the electronic density of states in the Eu-chalcogenides have been obtained by the augmented-plane-wave (APW) method. The results show that the *f* bands are extremely sensitive to the exchange potential used, and the $f(\uparrow)$ bands become the highest valence bands with a band width of the order of 0.5 eV. Our results have been compared with the recent photoemission spectroscopy data. The UPS data show too large *f* band width and too small relative peak intensities of the *f* bands, which disagree with our results. The 4*f* bands in the Eu and Gd could be located within 3.0 eV below their Fermi energies.

Energy band structure and density of states in tetragonal GeO_2, F. J. Arlinghaus and W. A. Albers, Jr., *SP323*, pp. 111-113 (Dec. 1971).

Key words: Augmented plane wave method (APW); electron densities of states; GeO_2; indirect transition; optical properties; Slater exchange; vacuum ultraviolet reflectance spectra.

The electronic energy bands of tetragonal GeO_2 have been calculated and correlated with optical properties of single crystals of this material. The agreement between theory and experiment is sufficiently good to warrant calculations of densities of states and conduction band effective masses preparatory to the determination of the dielectric constant as a function of energy. The calculated energy bands, density of states, and the experimental optical absorption edge data are presented and discussed.

Calculation of the density of states and optical properties of PbTe from APW-LCAO energy bands, D. D. Buss and V. E. Schirf, *SP323*, pp. 115-123 (Dec. 1971).

Key words: Augmented plane wave method (APW); electronic density of states; k·p method; LCAO; lead telluride (PbTe); optical properties; pseudopotential; random phase approximation; tight-binding.

The overlap integrals in the tight-binding secular equation for the relativistic *p*-bands in PbTe have been adjusted to give the best representation of the APW results at high symmetry points. The resulting LCAO bands have been used to calculate the density of states in energy and the optical constants of PbTe. The calculated density of states is found to have peaks which correspond closely to the four peaks measured by Spicer and Lapeyre. However, the assignment of peaks to bands is found to be different from that proposed previously. The method of Dresselhaus and Dresselhaus has been used to obtain the oscillator strengths for optical transitions, and these are found to agree with previous calculations. The interband electronic contribution to the optical constants has been calculated for photon energy less than 5 eV.

Plasmon-induced structure in the optical interband absorption of free-electron like metals, B. I. Lundqvist and C. Lydén, *SP323*, pp. 125-127 (Dec. 1971).

Key words: Electronic density of states; free-electron like metals; interband absorption; optical properties; plasmon; pseudopotential; quasi-particle; satellite structure.

We have extended Butcher's method to include the spectrum of interacting electrons, which contains satellite structure. The calculated optical conductivity shows a weak additional absorption, starting at about the frequency $\omega_t + \omega_p$, where ω_t is the interband threshold frequency and ω_p the plasma frequency.

Theory of the photoelectric effect and its relation to the band structure of metals, N. W. Ashcroft and W. L. Schaich, *SP323*, pp. 129-134 (Dec. 1971).

Key words: Electronic density of states; electron-electron scattering; electrons in a box; joint density of states; Kronig-Penney model; photoelectric effect.

We develop the theory of the external photoelectric effect in terms of quadratic response to the incident electromagnetic field. Electrons in the solid are in states determined by their interactions with themselves, the ions and the surface. We denote by H_0 the Hamiltonian for this part. In the presence of the electromagnetic field we have a coupling term:

$$H_1 = -\frac{1}{c}\int d\mathbf{r}\mathbf{A}(r,t)\cdot\mathbf{J}(\mathbf{r})e^{\eta t}, \qquad (\eta = 0^+)$$

where $\mathbf{A}(\mathbf{r}, t)$ is the vector potential, and $\mathbf{J}(\mathbf{r})$ is the current density operator for the electrons. Let $\mathbf{R}$ be a point exterior to the solid. Then the expectation value of the operator measuring the external current density at $\mathbf{R}$ in the states of $(H_0 + H_1)$ is, to second order:

$$\langle J_\alpha(\mathbf{R},t)\rangle = \left(\frac{1}{\hbar c}\right)^2 \int_{-\infty}^{\infty} d\tau_1\theta(t-\tau_1)\int_{-\infty}^{\infty} d\tau_2\theta(t-\tau_2)\cdot$$

$$\sum_{\mu,\nu}\int d^3x_1\int d^3x_2 A_\mu(\mathbf{x}_1,\tau_1)A_\nu(\mathbf{x}_2,\tau_2)\cdot$$

$$\langle\langle J_\mu(\mathbf{x}_1,\tau_1)J_\alpha(\mathbf{R},t)J_\nu(\mathbf{x}_2,\tau_2)\rangle\rangle.$$

There is no linear response and no other terms to order A^2 giving a measurable result. We show that $\langle J_\alpha(\mathbf{R}, t)\rangle$ may be related to the expectation value of the time ordered product of three current operators. This alternative description can be evaluated in the independent particle model (no scattering) and leads to a compact formulation of photoemission. There need not be a simple dependence of $\langle J_\alpha(\mathbf{R}, t)\rangle$ or of its spectral reduction $\langle J_\alpha(\mathbf{R}, t, e)\rangle$ (corresponding to measured electron distribution curves) on the joint density of states. Rather $\langle J_\alpha(\mathbf{R}, t, E)\rangle$ depends on the density of bound states but is not at all simply related to the density of states above the vacuum level. This emerges quite clearly from an analysis carried out in the well known constant matrix element approximation. A careful examination of the terms appearing in the photoelectric current shows that it is not always correct to interpret photoemission in terms of a "volume effect" or a "surface effect." The contributions from these two interfere. The usual explanations of the processes involved (i.e., the sequential operations of excitation, transport, and transmission) are also somewhat blurred.

The effect of electron-electron scattering is well known to be important and will be discussed both in terms of its manifestation in the observed electron distribution curves and its ability to limit the contribution of the conventional volume effect.

Optical density of states ultraviolet photoelectric spectroscopy, W. E. Spicer, *SP323*, pp. 139-157 (Dec. 1971).

Key words: Copper; copper nickel alloys; density of states; GaAs; Ge; nondirect transitions; optical density of states; PbTe; ultraviolet photoemission.

The use of ultraviolet photoemission to determine the density of valence and conduction states is reviewed. Two approaches are recognized. In one, the photoemission as well as other studies are used to locate experimentally a limited number of features of the band structure. Once these are fixed, band structure calculations could be carried out throughout the zone and checked against other features of the photoemission data. If the agreement is sufficiently good, the density of states is then calculated from the band structure. The second method depends only on experimental data. Using this approach, features of the density of states are determined directly by the photoemission experiment without recourse to band calculations. In cases where bands are wide and **k** clearly provides an empirically important optical selection rule, this is possible only for portions of the bands which are relatively flat. Successful determinations of this type are cited for PbTe, and GaAs. In metals with narrow *d* bands such as Cu, it has been found empirically that one may explain fairly well the experimental energy distribution curves in terms of transitions between a density of initial and final states (the optical density of states, ODS) requiring only conservation of energy.

The ODS determined by such ultraviolet photoemission studies have more strong detailed structure than the density of states determined by any other experimental method. Studies on a large number of materials indicate that the position in energy of this structure correlates rather well with the position in energy of structure in the calculated density of states. It is suggested, following the very recent theoretical work of Doniach, that **k** conservation becomes less important (and nondirect transitions more important) as the mass of the hole becomes larger. This is due to the change in **k** of electrons in states near the Fermi level as they attempt to screen the hole left in the optical excitation process. These electrons take up the excess momentum. One would expect the **k** conservation selection rule to play an increasingly important role as the mass of the hole decreases. This is in agreement with experiment.

The density of states and photoemission from indium and aluminum, R. Y. Koyama and W. E. Spicer, *SP323*, pp. 159-161 (Dec. 1971).

Key words: Aluminum (Al); direct and nondirect transitions; electronic density of states; indium (In); nondirect transitions; optical density-of-states; photoemission.

Experimental photoemission data from indium and aluminum are briefly described and can be understood in terms of a density of states model. In contrast to this, a direct transition model based on calculated band structures is found to yield photoelectron spectra which are fair reproductions of the density of states. This suggests that for these two metals, conclusions drawn concerning the density of states are independent of the model used to explain the photoemission data.

Electronic densities of states from x-ray photoelectron spectroscopy, C. S. Fadley and D. A. Shirley, *SP323*, pp. 163-178 (Dec. 1971).

Key words: $CdCl_2$; density of states; HgO; noble metals; rigid band model; transition metals; x-ray photoemission; ZnS.

In x-ray photoelectron spectroscopy (XPS), a sample is exposed to low energy x rays (approximately 1 keV), and the resultant photoelectrons are analyzed with high precision for kinetic energy. After correction for inelastic scattering, the measured photoelectron spectrum should reflect the valence band density of states, as well as the binding energies of several core electronic levels. All features in this spectrum will be modulated by appropriate photoelectric cross sections, and there are several types of final-state effects which could complicate the interpretation further.

In comparison with ultraviolet photoelectron spectroscopy (UPS), XPS has the following advantages: (1) the effects of inelastic scattering are less pronounced and can be corrected for by using a core reference level, (2) core levels can also be used to monitor the chemical state of the sample, (3) the free electron states in the photoemission process do not introduce significant distortion of the photoelectron spectrum, and (4) the surface condition of the sample does not appear to be as critical as in UPS. XPS seems to be capable of giving a very good description of the general shape of the density-of-states function. A decided advantage of UPS at the present time, however, is approximately a fourfold higher resolution.

We have used XPS to study the densities of states of the metals Fe, Co, Ni, Cu, Ru, Rh, Pd, Ag, Os, Ir, Pt, and Au, and also the compounds ZnS, $CdCl_2$, and HgO. The *d* bands of these solids are observed to have systematic behavior with changes in atomic number, and to agree qualitatively with the results of theory and other experiments. A rigid band model is found to work reasonably well for Ir, Pt and Au. The *d* bands of Ag, Ir, Pt, Au and HgO are found to have a similar two-component shape.

Direct-transition analysis of photoemission from palladium, J. F. Janak, D. E. Eastman, and A. R. Williams, *SP323*, pp. 181-189 (Dec. 1971).

Key words: Copper; dielectric constant; direct interband transitions; electronic density of states; interband transition; Korringa-Kohn-Rostoker (KKR); "muffin-tin" potential; palladium (Pd); photoemission; plasmon; secondary emission; silver (Ag).

The energy distribution of optically excited electrons in Pd arising from direct interband transitions has been calculated assuming constant momentum matrix elements. Principal features of new photoemission data (*d*-band structure with four peaks at 0.15, 1.2, 2.2, and 3.5 eV below the Fermi level and a *d*-band width of ~ 3.8 eV) are successfully explained by these calculations. The data can be analyzed with comparable success using the nondirect-transition model, but only by assuming a free-electron density of unoccupied states, which is shown to be unjustified for Pd. In addition to the photoemission spectra and the density of states, the imaginary part of the dielectric constant is computed and compared with experiment.

Photoemission determination of the energy distribution of the joint density of states in copper, N. V. Smith, *SP323*, pp. 191-197 (Dec. 1971).

Key words: Aluminum-insulator-palladium (Al-Pd); augmented plane wave method (APW); cesium; copper; direct transitions; electronic density of states; joint density of states; nondirect transitions; optical density of states; optical properties; photoemission.

Measurements have been made of the photoemission properties of cesiated copper, with improved sample preparation over the previous work by Berglund and Spicer. The

energy distribution curves (EDCs) of photoemitted electrons show structure in the region associated with the copper *d* bands which was not seen in the previous data. The behavior in the photon energy range 6 to 8 eV is particularly interesting in that some of these new peaks in the EDCs are observed to move, appear and disappear in a manner characteristic of direct transitions.

Parallel calculations have been performed of the energy distribution of the joint density of states (EDJDOS) similar to those reported recently by Smith and Spicer. The band structure used was the interpolation scheme of Hodges, Ehrenreich, and Lang fitted to the APW calculation of Burdick. In a constant matrix element approximation, the EDJDOS represents the energy distribution of photo*excited* electrons. This was converted to an energy distribution of photo*emitted* electrons by introducing appropriate threshold and escape factors. The overall agreement with experiment is good. In particular, some of the peaks in the theoretical EDCs are predicted to disappear and reappear on varying the photon energy, and there are strong similarities with the change observed experimentally.

It is found, therefore, that the optical transitions from parts of the copper *d* bands can be identified as direct. Theoretical calculations based on the EDJDOS work quite well for these and other transitions. Photoemission provides a very sensitive tool for verifying and even determining the EDJDOS. Burdick's bands for copper appear to be essentially correct over a wide range of energies including the whole of the *d*-band region, although minor modifications of a few tenths of an eV would improve agreement. It is found that the most persistent peaks in the calculated EDJDOS tend to coincide with the peaks in the calculated true density of states. This indicates that when a phenomenological "optical density of states" can be obtained, it may well be a good approximation to the true density of states even if transitions are direct.

The band structure of tungsten as determined by ultraviolet photoelectric spectroscopy, C. R. Zeisse, *SP323,* pp. 199-203 (Dec. 1971).

Key words: Carbon contamination; electronic density of states; photoemission; tungsten (W); UV photoemission; work function.

The technique of photoelectron spectroscopy has been used to probe the band structure of tungsten in the energy region where the *5d* bands are most prominent. The work function of the clean sample, a 25 micron thick polycrystalline foil, was found to be 4.36 ± 0.02 eV, and the yield rose by three orders of magnitude from 5.0 to 11.3 eV without showing prominent structure of any other sort. The electron energy spectra, on the other hand, contain two pieces of reliable structure which are found to increase in energy at the same rate as the exciting photon energy. A simple analysis of the data gives evidence that the density of *d* states in tungsten consists of a shoulder just below the Fermi level, a peak located about 1.5 eV below the shoulder, and a broad peak which extends at least 7 eV below the Fermi level.

Photoemission studies of scandium, titanium, and zirconium, D. E. Eastman, *SP323,* pp. 205-208 (Dec. 1971).

Key words: Copper; direct versus nondirect transitions; electronic density of states; gold (Au); nondirect transitions; optical density-of-states; photoemission; scandium (Sc); silver (Ag); titanium (Ti); zirconium (Zr).

Photoemission spectroscopy studies of the hexagonal metals Sc, Ti and Zr in the 4 to 11.6 eV range have resolved *d*-band structure and have determined occupied *d*-band widths (at 1/2 maximum) of 1.6, 2.0 and 2.3 eV respectively. Resolved structure for all three metals correlates with structure in energy band density of states; however, the observed band widths for Ti and Zr are much narrower than previously calculated band widths. The relation of the data to the controversy concerning the nature of optical excitations in transition and noble metals (direct *vs* nondirect transitions) is discussed.

Photoemission and reflectance studies of the electronic structure of molybdenum, K. A. Kress and G. J. Lapeyre, *SP323,* pp. 209-215 (Dec. 1971).

Key words: Dielectric constant; electronic density of states; molybdenum (Mo); optical density of states; optical properties; photoemission; reflectivity; tungsten (W); zinc (Zn).

Normalized energy distributions of photoemitted electrons for $4.3 < h\nu < 11.8$ eV (threshold is 4.3 eV) and near normal reflectance for $0.5 < h\nu < 11.8$ eV are measured for molybdenum films prepared with ultra high vacuum. The nondirect transition model with constant matrix elements is found to be consistent with the photoemission data. The above model, in conjunction with calculations for the emission of scattered electrons, is used to obtain the optical density of states (ODS) for the occupied states. Three peaks due to *d*-electrons are observed at $E - E_F = -0.5$, -1.6, and -3.9 eV where E_F is the Fermi energy. No structure is observed for $E - E_F > 4.3$ eV. The imaginary part of the dielectric constant, ϵ_2, is obtained by Kramers-Kronig analysis, and the occupied ODS are used to obtain the ODS for $0 < E - E_F < 4.3$ eV. The latter analysis is done by writing the finite difference approximation for the integral expression of ϵ_2 and solving for the empty ODS. The ODS is compared to the band calculations of Mattheiss where a molybdenum density of states is obtained by scaling his tungsten (W) results. Both the measured and calculated occupied densities of states have three peaks and both empty states have one dominant peak. The calculations predict a low density of states for $-1 < E - E_F < 0$ eV which is not observed in the data. The absorption coefficient has a minimum at 11.3 eV which correlates with a dip in the quantum yield. The energy distributions of the photoemitted electrons show small structural changes above the spectral range of the peak in the energy loss function at 10.8 eV. The relation of these data to the explanations based on the electron density of states for the anomalous isotopic mass dependence of the superconducting transition temperature is discussed.

Ultraviolet and x-ray photoemission from europium and barium, G. Brodén, S. B. M. Hagström, P. O. Hedén, and C. Norris, *SP323,* pp. 217-220 (Dec. 1971).

Key words: Barium (Ba); β-tungsten compounds; effects of oxidation; electronic density of states; europium (Eu); lanthanides; matrix elements; photoemission; rare-earth metals; UV and x-ray photoemission; x-ray photoemission.

Europium and barium are predicted to have very similar outer electronic structures with the exception that europium has a partially filled *4f* shell. Measurements are reported on photoemission from thin films excited with both vacuum ultraviolet and soft x-ray radiation. The results obtained using the low energy excitation indicate the similarity of the materials. Both show structure close to the leading edge in agreement with band structure calculations which indicate an increase in the density of states immediately below the Fermi level. Only a very small feature is observed with europium films which can be associated with the *4f* electrons. On the other hand using soft x-ray excitation a large peak corresponding to *4f* states lying 2.5 eV below the Fermi level is observed. The difference in the magnitudes is attributed to the size of the matrix elements involved.

What is a quasi-particle?, J. R. Schrieffer, *SP323*, pp. 227-231 (Dec. 1971).

Key words: Density of states; Green's function; mass enhancement; quasi-particle; superconductors.

The concept of a quasi-particle excitation in an interacting many-body system will be discussed from both the physical and the mathematical points of view. The physical origin of mass enhancement, wave function renormalization, interactions between quasi-particles, etc. will be presented. Landau's Fermi liquid theory, including the quasi-particle kinetic equation, will be reviewed. Finally, the domain of validity of the quasi-particle approximation will be discussed.

Beyond the one-electron approximation: Density of states for interacting electrons, L. Hedin, B. I. Lundqvist, and S. Lundqvist, *SP323*, pp. 233-247 (Dec. 1971).

Key words: Density of states; interacting electrons; one-particle Green function; oscillator strengths; quasi particle density of states; x-ray emission and absorption.

The concept "density of states" can be given many different meanings when we go beyond the one-electron approximation. In this survey we concentrate on the definition tied to excitation processes, where one electron is added or removed from the solid. We discuss the one-particle spectral function for conduction and core electrons in metals, how it can be approximately calculated, and how it can be related to different types of experiments like x-ray photoemission, x-ray emission and absorption, photoemission and optical absorption in the ultraviolet, and the Compton effect. We also discuss the form of the exchange-correlation potential for use in band structure calculations.

Excitonic effects in x-ray transitions in metals, G. D. Mahan, *SP323*, pp. 253-258 (Dec. 1971).

Key words: Density of states; exciton; many body effects; phase shifts; soft x-ray; transition probability.

In the study of soft x-ray transitions in solids, there has always been some hope that the results provide a direct measure of the density of states. This assumes that (a) matrix element variations over the band and (b) final state interactions are small. Both of these assumptions are known to be incorrect. To illustrate the possible strength of these effects, two approximate calculations are presented: the one electron oscillator strength of a simple bcc metal as a function of energy; and the strength of the Nozieres – DeDominicis singularity at threshold, with phase shifts estimated from an assumed Yukawa interaction between conduction electrons and core hole.

Vibronic exciton density of states in some molecular crystals, R. Kopelman and J. C. Laufer, *SP323*, pp. 261-267 (Dec. 1971).

Key words: Anthracene; aromatic crystals; benzene; excitonic density of states; molecular crystals; naphthalene.

Excited states of molecular crystals, which happen to be the majority of known crystals, are almost always classified as excitonic. The largest class of well studied systems are very closely described by the Frenkel model, and a majority of these systems can actually be described by a special case of the Frenkel model, one with steeply falling-off intersite (intermolecular) interactions. In this specific model the expression for the band structure depends only on the interchange symmetry of the crystal, with a small number of intersite parameters. Examples are given for some aromatic crystals, comparing band structures derived from theoretically calculated parameters, experimentally derived parameters, and completely experimentally derived band structure.

Effect of the core hole on soft x-ray emission in metals, L. Hedin and R. Sjöström, *SP323*, pp. 269-270 (Dec. 1971).

Key words: Aluminum; core hole; electronic density of states; Fermi edge singularity; pseudopotential; sodium (Na); soft x-ray emission.

We report a simple type of calculation to estimate the enhancement on the intensity of soft x-ray emission in free-electron like metals due to the effect of the core hole. We consider an electron gas in the presence of a perturbing potential and calculate the x-ray intensity assuming the dipole matrix elements to be constant. The calculation is based on a simple type of trial function for the initial state of the valence electron system and the coefficients are determined from the variation principle. The calculation does not give the Fermi edge singularity, which has recently aroused such a large interest, but instead aims at giving the gross effects for the whole spectrum. The results indicate an increase in the intensity by 25 to 50% at metallic densities. The enhancement factor is found to vary roughly linearly over the main band, increasing about 50% in going from the bottom of the band to the Fermi edge.

Cancellation effects in the emission and absorption spectra of light metals, B. Bergersen and F. Brouers, *SP323*, pp. 273-274 (Dec. 1971).

Key words: Electronic density of states; light metals; many-body effects; plasmon satellite; soft x-ray.

Photoabsorption measurement of Li, Be, Na, Mg, and Al in the vicinity of K and $L_{II,III}$ edges, C. Kunz, R. Haensel, G. Keitel, P. Schreiber, and B. Sonntag, *SP323*, pp. 275-277 (Dec. 1971).

Key words: Aluminum (Al); beryllium (Be); electronic density of states; electron synchrotron light; K spectra; light metals; lithium (Li); L spectra; magnesium (Mg); photoabsorption; sodium (Na); transmission measurements.

The absorption structure of five light metals has been measured in the vicinity of the onset of K shell respectively $L_{II,III}$ shell absorption. In accord with recent theoretical investigations a peaking of the cross section at the edge is observed for the $L_{II,III}$ edges of Na, Mg, and less pronounced for Al. There is structure of a different type at the K edges of Li and Be.

Optical absorption of solid krypton and xenon in the far ultraviolet, C. Kunz, R. Haensel, G. Keitel, and P. Schreiber, *SP323*, p. 279 (Dec. 1971).

Key words: Electronic density of states; electron synchrotron light; krypton; optical absorption; xenon.

The piezo soft x-ray effect, R. H. Willens, *SP323*, pp. 281-285 (Dec. 1971).

Key words: Copper; electronic density of states; mechanical strain; modulation technique; nickel; soft x-ray.

In principle the soft x-ray emission spectrum should reveal the electronic structure of a material below the Fermi surface. In general, but for a few exceptions, the beginning and termination of the band structure are masked by low and high energy tails. The Van Hove singularities and critical points are unresolved due to effects such as Auger, lifetime and instrumental broadening.

The modulation of the L_{III} emission band of polycrystalline copper by an alternating elastic strain has recently been measured. Two effects are observed. First, there is an overall band shift which gives a measure of the deformation potentials. The band shift is not uniform as different subbands can shift varying degrees. For an applied load of 12,000 psi in uniaxial tension, the shift of the high energy side of the band is 0.015 eV and the low energy side is 0.010 eV. Because of the preferred orientation and polycrystalline nature of the sample, the exact microscopic sample is isotropic with a Young's modulus of 20×10^6 psi, the average deformation potential is 25 eV at the top of the band and 17 eV at the bottom of the band. Secondly, superimposed on this band shift is structure which is unresolved in the normal emission spectrum. The origin of this structure is presumed to be from positions in the electronic structure which are extra sensitive to strain as far as altering the x-ray emission. This would be at Van Hove singularities or critical points where a high degree of degeneracy and wave function mixing is prevalent which can be changed by the symmetry alteration of the lattice due to strain. Comparison between the theoretical band structure calculations of copper and the emission structure due to strain modulation show several similarities.

The application of this technique to alloys should be useful for studying their electronic structure.

Soft x-ray band spectra and their relationship to the density of states, G. A. Rooke, *SP323*, pp. 287-293 (Dec. 1971).

Key words: Alloys; auger transitions; density of states; many-body interactions; plasmons; singularities; soft x rays.

The paper concentrates on the similarities and differences between the one-electron spectrum and the density of states; many-body effects, although important, are listed but they are not considered in detail. It is shown that the only reliable information about the density of states that can be obtained from soft x-ray spectroscopy are the energies of the Fermi surface and the van-Hove singularities, although the shape of the density of states can be derived indirectly from the energies of the van-Hove singularities.

It is the differences between the density of states and the one-electron spectra that may prove to be most important. These differences can give information about the symmetry and the local nature of the screening electrons. This is particularly interesting when studying alloys.

The Li K, the Al L_{23} and the Zn L_3 spectra are given as examples which illustrate the above arguments. Finally, a brief discussion on the soft x-ray spectra from the Al-Mg system show how the results may be used to study alloys.

Orbital symmetry contributions to electronic density of states of AuAl, A. C. Switendick, *SP323*, pp. 297-301 (Dec. 1971).

Key words: Augmented plane wave method (APW); electronic density of states; electronic specific heat; gold aluminide ($AuAl_2$); "muffin-tin" potential; orbital density of states; soft x-ray emission.

From an augmented plane wave calculation of the valence and conduction bands of $AuAl_2$ we have constructed density of states histograms. From further calculations of the wave functions, one can attribute atomic-like character of the band states, e.g., Au 5*d*-bands, Al 3*s*-band, Al 3*p*-band. One can then partition the total density of states into atomic-like components according to the fractional atomic-like character of each state.

From the total density of states an electronic specific heat coefficient of 2.81 mJ/mole K^2 was calculated compared with the experimental value 3.03. The aluminum 3*s* density of states is compared with the aluminum $L_{2,3}$ soft x-ray emission spectra. Excellent agreement with experiment is obtained for the absolute location, and location relative to the Fermi energy, of the low energy peak. About half the calculated peak is attributable to tails of wave functions associated with the gold *d*-bands. Additional structure in the experimental curve is quite well reproduced in the calculation. This we take to be confirmation of the overall correctness of our bands.

Soft x-ray emission spectrum of Al in $AuAl_2$, M. L. Williams, R. C. Dobbyn, J. R. Cuthill, and A. J. McAlister, *SP323*, pp. 303-305 (Dec. 1971).

Key words: Electron density of states; gold aluminide ($AuAl_2$); gold-gallium ($AuGa_2$); gold-indium ($AuIn_2$); intermetallic compounds CsCl structure; L spectra; silver-aluminum alloys (AgAl); soft x-ray emission; *s*-orbital density of states.

Recently, Switendick and Narath have reported results of a systematic calculation of the electronic band structure of the compound series AuX_2(X = Al,Ga,In). We have measured the $L_{2,3}$ soft x-ray emission spectrum of Al in $AuAl_2$ and from it, estimated the Al L_3 emission profile. We compare the latter to the distribution in energy of *s*-like charge at Al sites, estimated by Switendick from his band calculation. This *s* density is the dominant factor in a one-electron estimate of the soft x-ray emission rate. Quite good agreement is found, lending strong support to the calculations for $AuAl_2$. This result also supports interpretation of a recently observed low energy peak in the $L_{2,3}$ emission spectrum of Al in Ag-Al alloys in terms of Ag *d* and Al *s-p* hybridization.

Soft x-ray emission from alloys of aluminum with silver, copper, and zinc, D. J. Fabian, G. Mc D. Lindsay, and L. M. Watson, *SP323*, pp. 307-312 (Dec. 1971).

Key words: Aluminum-copper alloys (AlCu); aluminum-zinc alloys (Al-Zn); electron density of states; silver aluminum alloys (Ag-Al); soft x-ray emission.

Measurements of the soft x-ray emission from the alloys Al-Ag, Al-Cu and Al-Zn are reported, and the effect of the *d*-bands of the metals Ag, Cu and Zn on the Al $L_{2,3}$-emission for these alloys is examined. For Al-Ag and Al-Cu alloys, sharp resonance peaks are observed in the Al $L_{2,3}$-spectra and are attributed to transitions from states in the hybridized silver and copper *d*-bands to core states of the aluminums atoms. The observations agree with the general theoretical considerations discussed by Harrison for a simple metal alloyed with a noble metal. For the Al-Zn alloys the *d*-bands of Zn do not contribute to the Al $L_{2,3}$-emission.

Soft x-ray emission spectra of Al-Mg alloys, H. Neddermeyer, *SP323*, pp. 313-317 (Dec. 1971).

Key words: Aluminum (Al); aluminum-magnesium alloys (Al-Mg); charging effect; electronic density of states; emission spectra; magnesium (Mg); rigid-band approximation; soft x-ray emission.

In recent years the interpretation of soft x-ray emission band spectra has made good progress. With a detailed knowledge of the electronic band structure, of transition probabilities, and of lifetime broadening effects, it has been possible to calculate the shape of emission band spectra of a few pure elements. However, the situation is much more complicated in the case of alloys where the problems are far from being solved. The different shapes of emission band spectra of the components of an alloy make the applicability of the usual model to alloy spectra doubtful.

As a contribution to these problems we have remeasured the soft x-ray emission band spectra of Al-Mg alloys using improved experimental techniques. The Al $L_{2,3}$- and Mg $L_{2,3}$-emission spectra lying in the same wavelength region can be studied in the same spectrometer. Since the spectra of the pure metals have characteristic details and the energy resolution in this wavelength region is good, shapes and changes of shape can be registered very precisely.

An L-series x-ray spectroscopic study of the valence bands in iron, cobalt, nickel, copper, and zinc, S. Hanzely and R. J. Liefeld, *SP323*, pp. 319-326 (Dec. 1971).

Key words: Cobalt; copper; electronic density of states; iron; nickel; satellite emissions; self absorption; soft x-ray emission; x-ray spectroscopy; zinc (Zn).

This paper presents the results of an attempt to evaluate the merits of the soft x-ray spectroscopic method by examining a group of neighboring elements possessing a variety of valence band properties. The emission lines studied were the threshold level L_α (valence $\rightarrow L_{III}$ shell) lines obtained from high purity, polycrystalline bulk samples under bombardment by a nearly monoenergetic ($\Delta E \sim 1$ eV) electron beam. The associated L_{III} absorption spectra were obtained in this work as self-absorption curves from the same anode samples. Experimental and instrumental distortions were either eliminated, minimized or explicitly corrected for. The results indicate the presence of some anomalous emissions on the high energy side of the L_α line in elements possessing a large density of unfilled valence levels just above the Fermi energy. The valence band emission line shape for these elements (iron, cobalt, and nickel) is found to be strongly dependent on the incident electron beam energy even for near-threshold-level excitations. Analysis of the emission and self-absorption curves demonstrates that the x-ray spectroscopic method is capable of exposing meaningful differences among the valence band energy structures of the solids examined here.

The electronic properties of titanium interstitial and intermetallic compounds from soft x-ray spectroscopy, J. E. Holliday, *SP323*, pp. 329-333 (Dec. 1971).

Key words: Electron concentration; electronic density of states; localized states; soft x ray; titanium compounds.

The $TiL_{II,III}$ emission bands ($3d+4s \rightarrow 2p$ transition) have been obtained from $TiC_{0.95}$ and TiN_x ($x = 0.2$ to 0.8) interstitial compounds and $TiCr_2$, TiCo, TiNi and intermetallic compounds. Additional peaks on the low energy side of the TiL_{III} band from TiC and TiN_x appear to be cross transitions from the $2s$ and $2p$ bands of the nonmetal to the $2p$ level of titanium. Agreement was found between the soft x-ray band spectra and the band calculations of Ern and Switendick on TiC and TiN. The soft x-ray emission spectra from TiC indicated strong admixture of the titanium $3d$ and carbon $2p$ bands which is in disagreement with LCAO band calculations of Lye and Logothetis. However, the $2p$ band of nitrogen was shown to be below the Ti $3d$ band indicating a localized state and a possible transfer of electrons from titanium to nitrogen.

The $TiL_{II,III}$ bands from $TiCr_2$, TiCo and TiNi show a progressive change with increasing electronegativity difference between titanium and the combining element indicating possible ionic character to the bond. No peaks were observed in the low energy side of the TiL_{III} bands, but a distinct splitting was observed in the peak of the TiL_{III} band from TiNi.

Soft x-ray emission spectrum and valence-band structure of silicon, and emission-band studies of germanium, G. Wiech and E. Zöpf, *SP323*, pp. 335-337 (Dec. 1971).

Key words: Carbon; diamond; electronic density of states; germanium; kp method; orthogonalized plane wave (OPW) method; silicon; soft x-ray emission.

With a photon-counting concave grating spectrometer the $L_{2,3}$-emission band of silicon and the energy range of the $M_{2,3}$-emission band of germanium were investigated. The Si L spectrum shows new structural details. The measured intensity distribution for both the K- and L-emission bands of silicon are compared with recent calculations of the K- and L-emission spectra and with the density-of-states curve.

Density of states in α and β brass by positron annihilation, W. Triftshäuser and A. T. Stewart, *SP323*, pp. 339-342 (Dec. 1971).

Key words: Angular correlation; brass; electronic density of states; positron annihilation.

Positron annihilation experiments using a long slit angular correlation apparatus have been performed to investigate the momentum distribution of photons resulting from positron annihilating with electrons in brass. Single crystals of α and β brass which had been oriented along the 100, 110 and 111 directions respectively, were used for the measurements. The counter slits subtended an angle of 0.32 mrad at the sample. Thus, keeping the samples at liquid nitrogen temperature to reduce the positron motion, a total resolution of 0.42 mrad was achieved. The results show clearly deviations from a spherical Fermi surface. The observed anisotropies are found to agree very well with the theoretical predictions based on cross-sectional areas of the Fermi surface.

Compton scattering from lithium and sodium, P. Eisenberger and P. H. Schmidt, *SP323*, p. 345 (Dec. 1971).

Key words: Compton scattering; electronic linear momentum distribution function; lithium; potassium; sodium.

Ion-neutralization spectroscopy, H. D. Hagstrum, *SP323*, pp. 349-357 (Dec. 1971).

Key words: Auger processes; autoionization; density of states; ion-neutralization; transition probability.

The ion-neutralization spectroscopy (INS) is discussed in comparison with other spectroscopies of solids. It is shown that INS probes the local density of the solid at or just outside the solid surface. It is believed that this accounts for the clear-cut differences between INS results and those of other spectroscopies. Because of its unique specificity to the surface region INS is particularly useful in studying the surface electronic structure of atomically clean surfaces and of surfaces having ordered arrays of known atoms adsorbed upon them. In the latter case INS determines a portion of the molecular orbital spectrum of surface molecules formed from the adsorbed foreign atom and surface atoms of the bulk crystal. Such spectra provide information on local bonding symmetry and structure and electrical charging within the surface molecule which is as yet unavailable by any other method. INS is the first attempt to base a spectroscopy of electronic states on a two-electron process. More recent work on experimental and mathematical problems which such a spectroscopy entails are also briefly mentioned in this paper.

Potential and charge density near the interface of a transition metal, E. Kennard and J. T. Waber, *SP323*, pp. 359-373 (Dec. 1971).

Key words: Absorption potential; charge density; metal-vacuum interface; platinum; surface energy.

The early literature on methods of calculating surface energy and charge density and of dealing with potential barriers at an interface are reviewed.

The three dimensional potentials and charge densities were obtained by superimposing the relevant atomic information which had been obtained from Dirac-Slater self-consistent field calculations on free atoms.

The total charge density at each point P was found by summing the contributions from atoms located within a sphere of radius R centered at P. The local exchange was estimated at P by means of Slater's $\rho^{1/3}$ method. This was included with the overlapped atomic Coulomb potentials to obtain the crystal potential near the surface.

Virtual impurity level density of states as investigated by resonance tunneling, J. W. Gadzuk, E. W. Plummer, H. E. Clark, and R. D. Young, *SP323*, pp. 375-379 (Dec. 1971).

Key words: Anderson Hamiltonian; barium (Ba); calcium; chemisorption; electron density of states; field-emission resonance tunneling; germanium; tungsten (W); tunneling; zirconium.

The analogy between a virtual electronic state of an atom adsorbed on a metal surface and an Anderson type magnetic impurity state is pointed out. The density of states of the impurity can be characterized through a knowledge of the host induced shift and broadening of the atomic state. This density of states can be related to the current-voltage characteristics in a field-emission resonance tunneling experiment in the same manner as Appelbaum has done for describing spin flip Kondo type resonance tunneling in junctions.

Experimental current-voltage (field-emission total energy distribution) characteristics for single zirconium, barium, and calcium atoms on atomically perfect tungsten surfaces are analyzed in terms of the resonance tunneling theory described here and the virtual impurity level density of states is thus determined. Preliminary results for a metal-thin semiconductor-vacuum junction are also discussed.

What properties should the density of states have in order that the system undergoes a phase transition?, P. H. E. Meijer, *SP323*, pp. 381-384 (Dec. 1971).

Key words: Density of states; Ising model; Onsager model; partition function; phase transition; Weiss model.

We have solved nothing that needs to be solved regarding the density of states problem in a system that undergoes a phase transition. We, however, raise the question of what conditions the density of state function of the total system (*not* the temperature dependent quasiparticle spectrum) should have in order that we are observing a phase transition. In general, one needs an extremely strong increase in the density—how strong can only be illustrated by using models. From these models we tried to obtain the density of states using the inverse Laplace transform. The results reveal that a vertical slope seems to be a necessary condition. There are reasons to believe that the condition is not sufficient.

On deriving density of states information from chemical bond considerations, F. L. Carter, *SP323*, pp. 385-405 (Dec. 1971).

Key words: Aromatic compounds; chemical bond; electronic density of states; Fermi surface; Pauling radii; transition metals; rare earth intermetallic compounds.

The chemical picture of bond formation between neighboring atoms in crystalline solids can give valuable electronic density of states information including the rough shape and relative filling of bands. In addition, from the representation of the chemical bond in momentum space one can readily predict the distortion of the Fermi surface from sphericity. This latter approach appears to provide an alternate explanation of the apparent attraction of the Fermi surface to the Brillouin zone faces.

The first relationship is best demonstrated in cases where relatively unique schemes of bond formation can be devised. This is possible in many intermetallic compounds having high coordination by the use of orthogonal sets of bidirectional orbitals; their use leads to multicenter bonds or cycles which are approximately orthogonal. Via the Fourier transform, the series of Slater determinants (representing the multicenter bond) can be transformed into momentum p space and then related to the usual band picture. The occupation or filling of bands can be estimated from bond orders of the associated bonds and obtained from known interatomic distances by using Pauling's metallic radii. Bond hybridization is obtained from orthogonality requirements and bond angle considerations characteristic of valence bond theory. These ideas can be applied to FCC and HCP transition metals. For copper one would expect a sharp peak in the density of states corresponding to two unshared filled local d orbitals. In addition there would be a broad bonding band filled with electrons (6 per atom) containing large amounts of p character; and a half-filled s band. As one moves downward through the periodic table to iron while maintaining either FCC or HCP structures the high melting points of the elements involved indicate that the broad bonding band remains relatively unchanged (filled) while the number of electrons in the narrow d band is steadily decreased.

In the rare earth cubic Laves phases of composition AB_2, this relatively simple chemical approach suggests the presence of four bands. The two more important bands are: (1) a large narrow-width density of states band associated with two unshared local d orbitals per B atoms, and (2) a band which is generally more than half-filled associated with all the transition metal B—B as well as the A—B bonds. The other bands include an s band associated with the B atoms which is less than half-filled due to the transfer of electrons from the hyper-electronic B atom, and a band of unusually high d character associated with the A—A bonds and probably not occupied for the lighter rare earth compounds.

From the study of simple σ bonds, Coulson has shown that the momentum distribution function is compressed in the direction of the internuclear axis. By using this idea in conjunction with the Fourier transform of hydrogenic atomic orbitals it is comparatively easy to show that for a CCP transition metal like copper the momentum distribution function has its principal projections in the ⟨111⟩ directions while the BCC transition metals should have projections in the ⟨110⟩ directions. Projections in more complicated structures can be obtained from considerations of bond hybridization and bond order. In summary, we see that the valence bond concepts of bond hybridization and bond order coupled with known structures and bond distances can be used to suggest band shapes, filling, and hybridization. It is apparent that the increased use of chemical concepts in the interpretation of information concerning the electronic density of states is an area of promise.

Electroreflectance observation of band population effects in InSb, R. Glosser, B. O. Seraphin, and J. E. Fischer, *SP323*, pp. 407-410 (Dec. 1971).

Key words: Band population effects; electroreflectance; Fermi level shifts; indium antimonide (InSb); optical transitions; surface potential.

It is found that bias changes applied to *n*-InSb produce shifts in portions of the electroreflectance spectra. We attribute this to changes in the conduction band population produced as the separation between the Fermi level and the bottom of the conduction band is varied. Spectra which displays red, blue, or no shift correlates to electronic transitions starting from, ending at, or bridging the Fermi level. These observations permit a band structure identification of the shifting spectra and optical monitoring of the surface potential.

Spin-orbit effects in the electroreflectance spectra of semiconductors, B. J. Parsons and H. Piller, *SP323*, pp. 411-415 (Dec. 1971).

Key words: Critical points; diamond semiconductors; electroreflectance; gallium antimonide (GaSb); gallium arsenide (GaAs); germanium; semiconductors, diamond; semiconductors, zinc blende; spin-orbit splittings.

Measurements have been made of the electroreflectance spectra of germanium, gallium arsenide and gallium antimonide in the range of photon energies from 0.6 to 6.7 eV. Special attention has been paid to the resolution of multiplicity within the E_0' and E_1' structures. The identification of these structures in terms of critical point interband transitions involving the second conduction band has an important bearing on the band structure of these materials. The data is discussed in terms of the possible identification, within these higher energy multiplets, of spin-orbit splittings associated with the valence band states at Γ and L.

Experimental verification of the predictions of the Franz-Keldysh theory as shown by the interference of light and heavy hole contributions to the electroreflectance spectrum of germanium, P. Handler, S. Jasperson, and S. Koeppen, *SP323*, pp. 417-421 (Dec. 1971).

Key words: Electro-absorption techniques; electroreflectance; Franz-Keldysh theory; germanium; oscillatory dielectric function.

By the use of improved experimental techniques and samples of particular impurity concentration, we have been able to observe as many as eleven half oscillations in electroreflectance spectra of germanium at the direct edge ($\Gamma_8^+ \rightarrow \Gamma_7^-$) at room temperature. In addition, near the experimental sixth half oscillation where the light and heavy hole contributions are of opposite signs, we observe destructive interference which greatly modifies the signal lineshape in that region. The unique characteristics of the resultant lineshape allow the determination of the relative magnitudes of the dipole matrix elements and reduced masses for the two bands in a region of k-space somewhat removed from the Γ-point. The experimental results also demonstrate that neither thermal broadening nor field inhomogeneity need be a problem in electroreflectance measurements.

Variations of infrared cyclotron resonance and the density of states near the conduction band edge of InSb, E. J. Johnson and D. H. Dickey, *SP323*, pp. 423-430 (Dec. 1971).

Key words: Cyclotron resonance; electronic density of states; electron-phonon interaction; InSb; interband transitions; Landau levels.

The electronic density of states near the conduction band edge of InSb with and without a magnetic field is obtained from dispersion relations based upon $k \cdot p$ interactions with nearby bands and parameters determined and confirmed by several intraband experiments including fundamental cyclotron resonance, spin resonance, spin-flip cyclotron resonance, phonon assisted cyclotron resonance and harmonics of cyclotron resonance. The density of states displays effects due to nearby band interactions and due to electron-phonon interaction.

Cyclotron resonances of holes in Ge at noncentral magnetic critical points, J. C. Hensel and K. Suzuki, *SP323*, pp. 431-435 (Dec. 1971).

Key words: Cyclotron resonances; germanium; joint density of states; Landau levels; magnetic; magnetic critical points.

The anomalous, "quantum" cyclotron resonance spectrum of holes in the degenerate valence bands of Ge is analyzed utilizing the concept of a critical point in the magnetic joint density of states. Contrary to previous work done for $k_H = 0$ (where k_H is the hole wave vector along the magnetic field) our results indicate that cyclotron resonance lines originating at critical points away from $k_H = 0$ are responsible for most of the prominent features of the observed quantum spectrum in Ge.

Landau level broadening in the magneto-optical density o states, B. H. Sacks and B. Lax, *SP323*, pp. 437-450 (Dec 1971).

Key words: Delta-function formulation of density of states Green effect; k-conserving transitions; Landau levels; laser semiconductor; magneto-optical density of states; optica density of states; semiconductor laser.

In this paper we derive a convolution integral expressio of the optical density of states for k-conserving transition between broadened Landau levels in crystalline solids. Th convolution is between single Landau level densities o states expressed in a form derived by Kubo. The expressio includes as parameters the reduced mass, magnetic fiel strength, and the strength of the broadening mechanism. W present the results of numerical evaluation of this expres sion for various values of the parameters.

Our consideration is directed to dipolar transition between the $n = 0$ Landau levels of the valence and conduc tion bands, and we assume that the dominant broadening ef fects are intraband scattering processes. This assumption i reasonable in view of the comparative intraband and inter band lifetimes.

The resulting optical density of states function has an ap pearance identical to that of the single band function, bu with the frequency measured from the gap energy replacin the energy measured from the band edge, the reduced mas replacing the single band mass, and a reduced broadenin parameter replacing the single band parameter. Our expres sion for this last parameter is shown to be a consequence o a mutual consistency requirement between the single ban and optical densities of states, and this same requiremen also leads to the reduced lifetime expression encountered i the more conventional Lorentzian formulation.

The electronic structure of disordered alloys, J. L. Beeby *SP323*, pp. 453-463 (Dec. 1971).

Key words: Density of states; disordered alloys; one-elec tron propagator; perturbation expansion; sum rule.

The problem of calculating the electronic density of state in an alloy is considered from first principles. Choosing

suitably simplified model potential a diagrammatic expansion is discussed within which the various existing theories can be compared. Some comments are made on the comparison with experiment.

Local theory of disordered systems, W. H. Butler and W. ohn, *SP323*, pp. 465-469 (Dec. 1971).

Key words: Binary alloys; density of states; disordered systems; periodically continued neighborhood.

The most striking characteristic of crystalline solids is their periodicity. As a result of this feature, theoretical descriptions of physical phenomena in such systems are usually given in wave number or *momentum* space. The reciprocal lattice of a crystal and the Fermi surface of a metal are examples. In a disordered system, on the other hand, there is no such periodicity and momentum space descriptions are much less natural. However, in such systems, physical conditions near a point **r**, in *coordinate* space, become independent of the conditions at a distant point **r'**, provided that $|\mathbf{r}'-\mathbf{r}|$ is large compared to either a characteristic mean free path or some other appropriate length. This suggests that one can analyze a macroscopic disordered system by averaging over the properties of microscopic neighborhoods.

In the present paper we report some details of such a program. Although the point of view is of quite general applicability we have, for the sake of definiteness, studied so far only one type of system: Noninteracting electrons moving in the field of interacting, disordered scattering centers. We have focused especially on the electronic density of states. The macroscopic system is represented by an average over small neighborhoods. If one did not take special precautions, one would encounter one class of errors of the order of d/L where L is a characteristic dimension of the neighborhood, and d is a characteristic atomic dimension; and another class of errors of the order of $1/N$ where N is the number of ions. Both are too large to be tolerable for practical purposes. However, by an appropriate treatment of the statistical mechanics of the scatterers and by periodic repetition of the small neighborhoods, these errors can be avoided. The remaining errors are exponentially small in the ratio $\gamma(L/R)$ where γ is of order unity and R is the smaller of the electronic mean free path or the deBroglie wavelength of the electrons. This exponential convergence of the small neighborhood theory promises to make it a useful practical method for the study of disordered systems, especially very highly disordered ones.

Numerical examples are presented and discussed.

Density of electron levels for small particles, L. N. Cooper nd S. Hu, *SP323*, pp. 473-475 (Dec. 1971).

Key words: Diffusion equation; electronic density of states; "muffin-tin" potential; small particles; two dimensional classical membrane.

The density of electronic levels for small particles is calculated. This differs from the usual expression which is valid as the volume of the sample becomes very large. The leading term of the correction is proportional to the surface/volume of the sample. Depending on the environment the density of electronic levels may be increased or decreased.

One-dimensional relativistic theory of impurity states, M. tęślicka, S. G. Davison, and A. G. Brown, *SP323*, pp. 477-80 (Dec. 1971).

Key words: Impurity states; Kronig-Penney model; one-dimensional Dirac equation.

The one-dimensional Dirac equation is solved for the Kronig-Penney model containing a δ-potential impurity. Depending on certain existence conditions, the impurity states can be classified into two types called relativistic and Dirac impurity states. In the nonrelativistic limit, the Dirac states disappear and the relativistic ones become the ordinary impurity states. A detailed discussion is given of the complete energy spectrum.

The influence of generalized order-disorder on the electron states in five classes of compound-forming binary alloy systems, E. W. Collings, J. E. Enderby, and J. C. Ho, *SP323*, pp. 483-492 (Dec. 1971).

Key words: Binary alloys; Bi_2Te_3; CdSb; copper-gold (Cu-Au); Cu_3Au; CuPt; Cu_3Pt; ductility; electrical resistivity; Hall effect; magnesium bismide (Mg_3Bi_2); mechanical behavior; melting; model potential of Heine and Abarenkov; nickel aluminide; order-disorder; Peierls barriers; Pt-Cu; silver$_2$ tellurium (Ag_2Te); Ti-Al; TiCo; TiFe; TiNi; Tl_2Te.

The influence of generalized order-disorder (including solid-state order-disorder, and melting) on electronic structures will be discussed for various types of binary intermetallic compounds which, for the purpose of discussion, will be arbitrarily subdivided into five classes. Classes A and B exhibit solid-state order-disorder (O-D) reactions. In the first of these the atomic potentials are sufficiently similar that the use of low-order perturbation theory at all concentrations is valid. The effect of O-D on such alloys will be described in relationship to the density-of-states, as measured by low-temperature specific heat and magnetic susceptibility, and to the electrical transport properties, particularly the conductivity and Hall coefficient. We then consider from the same standpoint a second type of system in which the potentials are sufficiently different as to produce bound states which appear in the *ordered* form. The disappearance of these bound states when the alloy disorders gives rise to characteristic electronic behavior.

The effect of O-D on the experimental parameters referred to above will be compared for the two types of systems. In particular, published data for Cu-Au, as a representative example of the first type of system, will be contrasted with new electronic property data for Ti-Al, and compared with recent experimental results for Pt-Cu, which occupies an intermediate position. In class C, which is metallic in the solid, and in classes D and E which are semiconducting in the solid, structural order persists up to the melting point. For D the liquid is metallic, and data are presented for Bi_2Te_3, a typical system of this class. The conditions for the existence of intermetallics of class E are extreme, and give rise to nonmetallic behavior in the liquid.

These various systems will be discussed in terms of differences in atomic potentials. The major problems involved in giving precise estimates of the required differences will be outlined and a critical account of the use of concepts like the electronegativity parameter will be presented.

Localized states in narrow band and amorphous semiconductors, D. Adler and J. Feinleib, *SP323*, pp. 493-503 (Dec. 1971).

Key words: Amorphous semiconductors; Anderson transition; augmented plane wave method (APW); chalcogenide glasses; electronic density of states; Franck-Condon principle; localized states; Mott insulator; NiO; optical density-of-states; photoconductivity; photoemission; polaron.

The electronic density-of-states is discussed in situations where some of the states near the Fermi energy are local-

ized, due to either intraionic Coulomb repulsion or disorder. When localized states are present, the Franck-Condon principle necessitates separate electrical and optical densities-of-states. In the case of ionic Mott insulators, it is shown that doping or nonstoichiometry drastically affects the energy-band structure. For the particular example of NiO, introduction of Li^+ impurities or excess oxygen leads to a large upward displacement of the $2p$ band associated with the oxygen ions, moving it sufficiently near the Fermi level that hole conduction in the $2p$ band predominates above 200 K, in agreement with the available experimental data. In the case of amorphous semiconductors, it is shown that introduction of electron-electron and electron-phonon interactions results in a shift of the relative position of the localized parts of the valence and conduction bands, as well as shifts of the localized states relative to the itinerant states. However, the qualitative features of the model of Cohen et al. are preserved.

A cluster theory of the electronic structure of disordered systems, K. F. Freed and M. H. Cohen, *SP323*, pp. 505-507 (Dec. 1971).

Key words: Amorphous semiconductors; band tail of localized states; cluster theory; coherent potential approximation; disorder systems; electronic structure; Neel temperature.

The equation of motion for the averaged Green's function in an alloy couples the latter to the Green's function for which the average is restricted so that the composition of one atom is held fixed. The average Green's function may be regarded as the Green's function for a zero-atom cluster, and it is coupled to the Green's function for a one-atom cluster. There is thus an infinite hierarchy of equations of motion in which the n-atom functions are coupled to the $(n+1)$-atom functions. The coherent potential approximation of Soven corresponds to truncation in the equation of motion of the one-atom function. We have generalized the coherent potential theory to a theory the n-atom functions with truncation in the equation of motion of the $(n+1)$-atom function. The formalism is developed and a few of the results obtained thus far are presented in this paper.

***T* matrix theory of density of states in disordered alloys—application to beta brass,** M. M. Pant and S. K. Joshi, *SP323*, pp. 509-514 (Dec. 1971).

Key words: Alloys; brass; delta-function potential; disordered systems; Green's functions; Korringa-Kohn Rostoker (KKR); "muffin-tin" potential; short-range-order parameters; spectral density of states; t-matrices.

The T matrix theory of electronic states in disordered systems, has been used to determine the spectral density for states of various symmetries, for binary alloys. Soven's averaged t matrix procedure is improved by retaining the distinction between the t matrices of the constituents, and introducing partial Greenians of the Pant-Joshi theory. Information about the pair-correlation function obtained by critical neutron scattering method is used to evaluate the partial Greenians, as well as the crystalline potentials for the constituents. In order to facilitate computation of the t matrices, these potentials have been replaced by energy-dependent model potentials. The parameters of the model potentials are determined by the requirement that they yield logarithmic derivatives (of the radial wave function at the muffin-tin spheres) identical with those generated by the real potentials. The scheme has been applied to disordered beta-brass. The separation in energy of the peaks of the spectral density of states at the high symmetry points of the Brillouin zone, are compared with experimental results, and with the results obtained by the virtual crystal approximation.

On the terms excluded in the multiple-scattering series, R. M. More, *SP323*, pp. 515-518 (Dec. 1971).

Key words: Delta-function potential; excluded terms; Green's functions; multiple-scattering series; rigid-band approximation; scattering phase-shifts; t-matrices.

We have evaluated certain of the excluded terms in the multiple-scattering series for a simple soluble potential. We discuss three aspects of the result: first, the reduction to "on-shell" quantities; second, the numerical contribution of the excluded terms; and third, the analytic properties of these terms.

On non-localization at the centre of a disordered bound band, F. Brouers, *SP323*, pp. 521-526 (Dec. 1971).

Key words: Cellular disorder; disordered systems; electronic density of states; localization life-time; quasi-localized state; tight-binding.

It is shown for a three dimensional model of tightly bound electrons with cellular disorder that the electronic states at the middle of a continuous band cannot be strictly localized. This conclusion is just the opposite of what has often been suggested.

Nevertheless, an approximate calculation of the electron localization "life-time" suggests that with increasing disorder the localized character of the electron states become more pronounced.

It is argued that in such a system there is no sharp transition between localized and non-localized regions of the energy spectrum.

The half-filled narrow energy band, L. G. Caron and G. Kemeny, *SP323*, pp. 527-541 (Dec. 1971).

Key words: Antiferromagnetic insulator; first order phase transition; half-filled narrow energy band; Mott state paramagnetic metal; t-matrix.

The antiferromagnetic and paramagnetic states of a half-filled narrow energy band are investigated using a t-matrix approach. This method is justified despite the high particle density in the system. A phase diagram including the Mott state is given. Employing the gap of the antiferromagnetic insulator as a variational parameter, it is shown that the increase of the band width potential energy ratio leads to a first order phase transition into the paramagnetic metal state, nearly where Mott has estimated it to occur.

Electronic structure of gold and its changes on alloying, E. Erlbach and D. Beaglehole, *SP323*, pp. 545-549 (Dec. 1971).

Key words: Electronic constant; electronic density of states; gold (Au); gold-copper alloys (Au-Cu); gold-iron alloys (Au-Fe); gold-silver alloys (Au-Ag); optical constants; reflectivity.

We have measured the changes in reflectivity upon alloying small amounts of Ag, Cu and Fe into Au. By means of Kramers-Kronig analysis, we have deduced the changes in ϵ_2 produced by this alloying. We relate these changes to shifts in the position and character of the electron energy bands in gold.

Density of states of AgAu, AgPd, and AgIn alloys studied by means of the photoemission technique, P. O. Nilsson, *SP323*, pp. 551-554 (Dec. 1971).

Key words: Coherent potential approximation; electronic density of states; Friedel screening theory; photoemission; silver-gold alloys (AgAu); silver-indium alloys (AgIn); silver-palladium alloys (AgPd); virtual crystal approximation.

The density of states of AgAu, AgPd, and AgIn alloys have been studied by means of the photoemission technique. General trends of the results are compared with the predictions from simple models of alloys. The rigid-band or virtual-crystal approximation cannot explain the results, while model calculations in the coherent potential approximation reproduces the observed density of states. The Friedel screening theory explains the shift of the Fermi level on alloying.

Density of states information from low temperature specific heat measurements, P. A. Beck and H. Claus, *SP323*, pp. 557-562 (Dec. 1971).

Key words: Alloys; density of states; low temperature specific heat; magnetic specific heat; many-body effects; superconductivity.

The calculation of one-electron density of state values from the coefficient γ of the term of the low temperature specific heat linear in temperature is complicated by many-body effects. In particular, the electron-phonon interaction may enhance the measured γ as much as twofold. The enhancement factor can be evaluated in the case of superconducting metals and alloys. In the presence of magnetic moments, additional complications arise. A magnetic contribution to the measured γ was identified in the case of dilute alloys and also of concentrated alloys where parasitic antiferromagnetism is superimposed on an over-all ferromagnetic order. No method has as yet been devised to evaluate this magnetic part of γ. The separation of the temperature-linear term of the specific heat may itself be complicated by the appearance of a specific heat anomaly due to magnetic clusters in superparamagnetic or weakly ferromagnetic alloys.

Electronic density of states determined by electronic specific heat measurements, T. Mamiya and Y. Masuda, *SP323*, pp. 565-568 (Dec. 1971).

Key words: Augmented plane wave method (APW); Debye temperatures; electronic density of states; electron-phonon coupling constant; electronic specific heat; superconducting transition temperatures; tantalum (Ta); tantalum-rhenium (Ta-Re) alloys; Ta-Re alloys.

The superconducting transition temperatures, electronic specific heats, and Debye temperatures have been recently measured by us for 5*d* transition-metal alloy series Ta-Re. By making use of these data and the theoretical predictions by McMillan, we have deduced the electron-phonon coupling constant and bare electronic density of states. The density of states is compared with the theoretical one derived from band-structure calculations of Ta using the augmented-plane-wave (APW) method by Mattheiss.

Low-temperature specific heats of hexagonal close-packed erbium-thulium alloys, A. V. S. Satya and C. T. Wei, *SP323*, pp. 571-577 (Dec. 1971).

Key words: Anti-ferromagnet; anti-phase domain; augmented plane wave method (APW); Curie temperature; electronic density of states; enhancement factors; erbium; erbium-thulium alloys; ferro-magnetic spiral structure; gadolinium; itinerant 4*f*-band model; lanthanides; low-temperature specific heat; rare-earth lanthanides; specific heats; spin-wave theory; thulium.

The specific heats of hexagonal close-packed erbium and thulium metals, and three of their isostructural alloys were measured in the liquid-helium temperature range between 1.3 and 4.2 K for examining the validity of the localized 4*f*-band model, on which the current theories of the rare-earth metals are based. Barring possible uncertainties in the magnetic properties of the samples and their impurity contents, the coefficients of the specific-heat component linear in temperature calculated from the present data range in values approximately two to twenty times the constant electronic specific-heat coefficient predicted by the above model for all the hexagonal close-packed rare-earth lanthanides. Possible explanations for such discrepancies are discussed. An itinerant 4*f*-band model based on the one-electron-band model suggested by Mott is proposed for the lanthanides as an alternative to the localized 4*f*-band model.

Low-temperature specific heats of face-centered cubic Ru-Rh and Rh-Pd alloys, P. J. M. Tsang and C. T. Wei, *SP323*, pp. 579-585 (Dec. 1971).

Key words: Electronic density of states; electronic specific heat; palladium (Pd); Rh; Rh-Pd alloys; Ru-Rh alloys; specific heat; tight-binding approximation.

The specific heats of Rh, Pd, and a number of face-centered cubic Ru-Rh and Rh-Pd alloys were determined between approximately 1.4 and 4.2 K. Whereas the C/T vs. T^2 plots for the Ru-Rh alloys show a straight-line behavior, a low temperature anomaly is observed in similar plots for Pd and the Rh-Pd alloys below 2.2 K. This low temperature anomaly appears to be most pronounced in the alloy $Rh_{0.78}Pd_{0.22}$, and diminishes with increasing Rh or Pd. The electronic specific heats of these alloys are generally high with a minimum occurring at $Ru_{0.30}Rh_{0.70}$. A portion of the total density-of-states curve for the outer electronics in face-centered cubic transition metals is derived numerically from the present results and those available in the literature as a first approximation. Such a curve shows qualitative agreement with the first peak below Fermi level of the theoretical total *s-d* energy of Pd calculated by Janak et al.

Density of states of transition metal binary alloys in the electron-to-atom ratio range 4.0 to 6.0, E. W. Collings and J. C. Ho, *SP323*, pp. 587-596 (Dec. 1971).

Key words: Alloys; bcc transition metal alloys; charging effect; electronic density of states; Ginzburg-Landau coherence length; G.P. zone; Hf-Ta; low-temperature specific heat; magnetic susceptibility; omega phase; rigid-band approximation; superconducting transition temperatures; tantalum-tungsten (Ta-W); Ti-Mo; titanium-molybdenum (Ti-Mo) alloy; tungsten (W); W-Re.

Using Ti-Mo as a prototype of binary bcc transition metal alloys for $4 < e/a < 6$, densities-of-states at the Fermi level, $n(E_F)$, have been studied using low-temperature specific heat augmented by magnetic susceptibility (χ) measurements. A survey of the literature has revealed that the principal descriptors of density of states, γ (the electronic specific heat coefficient), and T_c (the superconducting critical temperature), generally decrease as e/a decreases below about $e/a \sim 4.3$ to 4.5. The maxima in γ and T_c so induced have usually been interpreted as indicating the existence of maxima in $n(E_F)$ near $e/a \cong 4.5$ for bcc alloys. But since the region $e/a \lesssim 4.5$ also corresponds to that in which a submicroscopic hexagonal-structured precipitate (ω-phase) always appears in quenched alloys, a detailed study of microstructure was undertaken in conjunction with the electronic property measurements. It was concluded that a steadily increasing abundance of an ω-phase precipitate was responsi-

ble for the observed drops in γ, T_c, and χ below $e/a \cong 4.5$. Because of the fineness of the precipitate (70-330 Å) the physical property results themselves are indistinguishable from those usually associated with single-phase materials. Using magnetic susceptibility at elevated temperatures, where the prototype Ti-Mo alloy is known to be single phase bcc, it has been shown that $n(E_F)_{bcc}$ increases monotonically as e/a is reduced from 6 to 4, in agreement with deductions based on the results of recent band-structure calculations on bcc $3d$ transition metals.

Specific heat of vanadium carbide, 1-20 K, D. H. Lowndes, Jr., L. Finegold, D. W. Bloom, and R. G. Lye, *SP323*, p. 597 (Dec. 1971).

Key words: Electronic density of states; specific heat vanadium carbide.

Relevance of Knight shift measurements to the electronic density of states, L. H. Bennett, R. E. Watson, and G. C. Carter, *SP323*, pp. 601-642 (Dec. 1971).

Key words: Electronic density of states; hyperfine fields; Knight shift; nuclear magnetic resonance; susceptibility; wave functions.

The Knight shift, $\mathscr{K}$, measures the magnetic hyperfine field at the nucleus produced by the conduction electrons which are polarized in a magnetic field. Knight shifts are often dominated by the Pauli term and, in its most simple form, can be written as $\mathscr{K} = \langle a \rangle \chi_p$. Here χ_p is the conduction electron Pauli spin susceptibility which depends on the density of states at the Fermi level, $N(E_F)$, and $\langle a \rangle$ is an average magnetic hyperfine coupling constant associated with the wave function character at the nucleus, $|\psi_F(0)|^2$, for conduction electrons at the Fermi surface.

The Knight shift therefore provides, through $\langle a \rangle$, insight into the wave-function character associated with $N(E_F)$. Calculations of $\langle a \rangle$ involving an averaging over k-space have been attempted for a few simple metals up to the present time. For alloys and intermetallic compounds, rather different $\langle a \rangle$'s are experimentally observed for different local environments, indicating that $\mathscr{K}$ samples the variation in *local* wave-function character, or a variation in *local* density of states. There is no unique way of separating the local variation of $N(E_F)$ from $|\psi_F|(0)|^2$.

In this article the methods developed for relating $\mathscr{K}$ to the electronic properties for most of the types of cases encountered in the literature are reviewed. We discuss "simple" metals including problems of orbital magnetism and changes in $\mathscr{K}$ caused by electronic transitions such as melting. Knight shifts and their temperature dependence in metals and intermetallic compounds involving unfilled d shells, are discussed. We give estimates of atomic hyperfine fields due to single electrons, appropriate to those cases where problems due to electronic configurations do not make deductions from experiment too ambiguous. A density of states curve calculated for Cu is given, showing the relative importance of s-p, and d character for that metal. In a qualitative sense this Cu curve implies such information for other transition metals. We discuss alloy solid solutions for the cases where a "rigid" band model might be used to explain the results, and for cases where local effects have to be taken into account. The charge oscillation and RKKY approaches and their limitations are reviewed for cases of dilute nonmagnetic and d- or f-type impurities.

Pauli paramagnetism in metals with high densities of states, S. Foner, *SP323*, p. 645 (Dec. 1971).

Calculation of the Knight shift in beryllium, J. Gerstner and P. H. Cutler, *SP323*, p. 649 (Dec. 1971).

Key words: Beryllium; Knight shift; orthogonalized plane wave (OPW); pseudopotential.

Knight shifts of the alkali metals, A. Meyer, G. M. Stocks, and W. H. Young, *SP323*, pp. 651-657 (Dec. 1971).

Key words: Alkali metals; alloys; cesium; Knight shift; lithium; potassium; pressure dependences; pseudopotential; resistivity ratios; rubidium; sodium; thermoelement power.

K, Rb and Cs, being leading members of transition series, have pseudoatoms with virtual bound d states; Li has a somewhat analogous p state. By contrast, Na has no such states. Evidence is offered of how the associated scattering accounts for the following observed electron transport properties: (a) Under pressure, the resistance of Li rises and, eventually, so do those of Cs, Rb and K, (b) the thermopower of Li is anomalous (positive) and stays so under pressure while that for Cs very quickly becomes positive when pressure is applied.

The same features can now be used in the theory of Knight shifts to explain the following observations. (c) The conduction electron susceptibility for Li is enhanced very significantly above that for free (and even interacting) electrons, (d) the nuclear contact density in Li is much lower than that predicted by one-OPW theory, (e) the Knight shifts of Li and Na decrease and those for Rb and Cs increase when pressure is applied, (f) the Knight shift for a given ion increases when it is successively resonated in Na, K, Rb, and Cs matrices. The key to the interpretation of (e) and (f) is the variation in the density of states (and therefore susceptibility) under conditions of pressure change and alloying.

Role of exchange effects on the relationship between spin susceptibility and density of states of divalent metals, P. Jena, T. P. Das, S. D. Mahanti, and G. D. Gaspari, *SP323*, pp. 659-662 (Dec. 1971).

Key words: Be; Cd; density of states; divalent metals; exchange enhancement; Mg; spin susceptibility.

The influence of exchange and correlation of conduction electrons on the spin susceptibility, χ_s, is well understood in alkali metals. There is reasonable agreement between theoretical and experimental results where the latter are available. No such comparison has been reported for the divalent metals, mainly because of a lack of experimental information. Only for Be is χ_s known (from spin resonance measurements). We have made semi-empirical estimates of χ_s for Mg and Cd by adjusting the measured Knight shifts with theoretical values of the core polarization and $\langle \psi^2(0) \rangle$. The values of χ_s so deduced are compared to theoretical estimates made by the method of Silverstein, who treated the exchange enhancement by an interpolation procedure analogous to that of Nozières and Pines for calculating correlation energies, and included the effects of band structure through the calculated thermal (band) effective mass. Agreement is good for Mg, which behaves more like a free electron metal, and poor for Be and Cd. Possible sources of the discrepancies are discussed.

Correlation of changes in Knight shift and soft x-ray emission edge height upon alloying, L. H. Bennett, A. J. McAlister, J. R. Cuthill, and R. C. Dobbyn, *SP323*, pp. 665-670 (Dec. 1971).

Key words: Aluminum oxide (Al_2O_3); electronic density of states; gold aluminide ($AuAl_2$); Knight shift; magnesium-aluminum alloy phases; nickel aluminide (NiAl); soft x-ray emission.

In simple metals and alloys—those having no significant local *d*-character at or near the Fermi level—the Knight shift provides a measure of the local *s*-electron density of states. If the particular atom under study has a *p*-like core level, then soft x-ray emission arising from transitions of electrons at the Fermi level into *p*-like core vacancies should provide a similar measure. Using Al as the example, we compare results of these two techniques by studying fractional changes, relative to Al metal, of the Knight shift and $L_{2,3}$ soft x-ray emission edge height of Al in NiAl, $AuAl_2$, Mg_2Al_3, $Mg_{17}Al_{12}$, and Al_2O_3. A distinct correlation is observed.

Tunneling measurements of superconducting quasi-particle density of states and calculation of phonon spectra, J. M. Rowell, *SP323*, pp. 673-679 (Dec. 1971).

Key words: Density of states; phonons; semiconductors; superconductivity; tunneling.

It is an unfortunate fact that the tunneling technique, which has proved incredibly successful in the study of superconductivity, has given little information about the normal state properties of metals and semiconductors. It will be shown that, in the determination of the superconducting quasi-particle density of states, it is the change in density induced by the onset of superconductivity which is measured rather than the total density.

Returning to the problem of normal materials, a review of the limited achievements and failures of tunneling will be presented. This will include the influence of band edges on tunneling in *p-n* diodes and metal-semiconductor contacts, the structures observed in tunneling into bismuth and the negative results obtained in nickel and palladium. The dominant effect of the change in barrier shape in most of these tunneling characteristics will be illustrated.

Density of states from superconducting critical field measurements, G. Dummer and D. E. Mapother, *SP323*, pp. 681-684 (Dec. 1971).

Key words: Critical field; density of states; In; pressure dependence; superconductivity; Tl.

For a superconducting metal, the entropy difference, ΔS, between the normal and superconducting states is thermodynamically related to the critical field, H_c, by the equation

$$\Delta S = S_n - S_s = 1\ (VH_c/4\pi)\ (dH_c/dT),$$

where V is the molar volume and T is the absolute temperature. As the temperature approaches 0 K, it can be shown that ΔS is dominated by the normal electronic entropy, γT, where γ is the temperature coefficient of the normal electronic specific heat. This behavior has been known for a long time but its application has been largely confined to inferences based on conjectural extrapolations of H_c data measured about 1 K. In the limit of very low temperatures where $\Delta S = \gamma T$, it follows that

$$H_c^2(T) = H_0^2 - (4\pi\gamma/V)T^2,$$

where H_0 is the limiting value of H_c at 0 K. For most superconductors the range of validity of this expression lies below 1 K but new techniques have made this range relatively accessible in recent years. Within this range precise static measurements of H_c and T permit determination of the ratio, $\gamma^* = (\gamma/V)$, with a relative accuracy of about 1:3000. This is considerably better than the accuracies typically obtained in low temperature calorimetry. This method has been used to study the change in γ^* under hydryostatic pressures up to 1000 atm for In and Tl. Nonlinear changes in γ^* are clearly resolved for the first time, despite the relatively low values of applied pressure. For In the values of γ^* show a parabolic decrease with increasing pressure. The results for Tl show an initial increase in γ^* which reaches a maximum near $p =$ 500 atm. For larger pressures the value of γ^* shows the normal decrease with increasing p.

Temperature dependence in transport phenomena and electronic density of states for transition metals, M. Shimizu, *SP323*, pp. 685-690 (Dec. 1971).

Key words: Chromium; electronic density of states; iridium; low-temperature specific heat; magnetic susceptibility; molybdenum; niobium; palladium (Pd); platinum; rhenium; rhodium; rigid band approximation; tantalum (Ta); thermal conductivity; thermoelectric power; transition metal; transport properties; tungsten (W).

The calculated results of the temperature variations of electronic specific heat and spin susceptibility and their comparison with the experimental results for various transition metals are briefly summarized. In these calculations the empirical densities of states, which were determined in the rigid band model from the experimental data of low temperature specific heat coefficient, were made use of. In a model similar to the Mott model of *s-d* scattering, the electrical resistivity, thermal conductivity, and thermoelectric power have been calculated at high temperatures for palladium, platinum, rhodium, iridium, molybdenum, and tungsten, by assuming appropriate electronic structures and making use of the same empirical densities of states. The calculated temperature dependences of electrical resistivity, thermal conductivity, and thermoelectric power and the sign of the thermoelectric power at high temperatures are found to be strongly dependent on the shape of the density of states and the position of the Fermi level. It is shown that all of these temperature dependences and the sign of the thermoelectric power are consistent with the experimental results. It is confirmed that there is a strong correlation between these temperature dependences and those of the electronic specific heat and spin susceptibility.

Metal-semiconductor barrier junction tunneling study of the heavily doped n-type silicon density of states function, Y. Hsia and T. F. Tao, *SP323*, pp. 693-712 (Dec. 1971).

Key words: Antimony-doped silicon; arsenic-doped silicon (As doped Si); band absorption; band tailing; depletion layer barrier tunneling; electronic density of states; Esaki diode; gallium-arsenide (GaAs); heavy doping with As, Ga, P, Sb; luminescence experiments; P doped Si; Schottky-barrier; silicon; transport properties; tunneling.

Experimental and analytic techniques and procedure used in the study are described. Experimental data showing the dependency of the Fermi level on the dopant types of the heavily doped *n*-type silicon are reported. A dopant type dependent density of states effective mass is postulated to describe the effect of different dopants on the Fermi level. The deviation of the experimental data curve from the calculated curve is ascribed to the effect of degenerate semiconductor band tailing. In addition, through interpretation of incremental conductance versus applied bias characteristic curves of the different tunnel junction evaluated, a consistent description of the density of states function of the heavily doped silicon is obtained. The density of states function, dependent on the dopant type and dopant concentration, is generally parabolic above the band edge, but towards the band edge, band tailing can be severe.

The effect of hydrostatic pressure on the galvano-magnetic properties of graphite, I. L. Spain, *SP323*, pp. 717-725 (Dec. 1971).

Key words: Electronic density of states; galvano-magnetic properties; graphite; Hall Effect; magneto-resistance; pressure effects.

Measurements of the Hall Effect and magneto-resistance in crystals of graphite with current flow in the basal planes at high pressures are described. Galvano-magnetic measurements enable the magneto conductivity tensor components σ_{xx} and σ_{xy} to be obtained, and from them the electron and hole densities and mobilities. The results are compared with the band model for the semi-metal graphite proposed by Slonczewski and Weiss. Of particular interest at the present time is the information that these results give about the assignment of carriers at the symmetry point K in the Brillouin zone of graphite and the properties of mobile minority carriers.

Electrical resistivity as a function of hydrogen concentration in a series of palladium-gold alloys, A. J. Maeland, *SP323,* pp. 727-729 (Dec. 1971).

Key words: Electron donation model; electronic density of states; gold-palladium alloys; hydrogen absorption; hydrogen in palladium-gold alloys; palladium-gold alloys; rigid-band approximation.

The changes occurring in the electrical resistance of a series of gold-palladium alloys during hydrogen absorption have been measured. The results are presented for each alloy in the form of relative resistance, R/R_0 vs. hydrogen concentration H/M; R is the resistance of a particular gold-palladium alloy containing a certain amount of hydrogen, given by H/M, the atomic ratio of hydrogen to metal, and R_0 is the resistance of the same *hydrogen free* alloy. For pure palladium the relative resistance increases as a function of hydrogen concentration to a maximum value of ~ 1.80 at $H/M \simeq 0.75$; further hydrogen absorption results in a decrease in R/R_0. Similar maxima are found in some gold-palladium alloys; however, the maxima occurs at decreasing R/R_0 values and also shifts to lower H/M values with increasing gold concentrations. At sufficiently high gold contents the maximum disappears and a continuous decrease in resistance with increasing hydrogen content occurs. The results are evaluated in terms of the band model.

The volume dependence of the electronic density of states in superconductors, R. I. Boughton, J. L. Olsen, and C. Palmy, *SP323,* pp. 731-734 (Dec. 1971).

Key words: Aluminum (Al); electronic density of states; electronic specific heat; gallium; Gruneisen parameter, electronic; superconductivity; thermal expansion; thorium; volume dependence of density-of-states.

The volume dependence of the electronic specific heat coefficient γ can be obtained from measurements of the low temperature thermal expansion, from observations on the pressure dependence of the superconducting threshold curve, and from the volume change occurring at transition. We make use of recent theoretical results to obtain values of the change in the density of states with volume from the existing experimental data for a number of metals.

Alloy Fermi surface topology information from superconductivity measurements, H. D. Kaehn and R. J. Higgins, *SP323,* pp. 735-736 (Dec. 1971).

Key words: Electronic density of states; Fermi surface; In-Cd alloys; pressure; strain; superconductivity.

Hydrogenation effects on palladium tunnel junctions, W. N. Grant, R. C. Barker, and A. Yelon, *SP323,* pp. 737-739 (Dec. 1971).

Key words: Al-oxide-Pd; electronic density of states; hydrogen in palladium; rigid-band approximation; tunnel junctions.

The effects of hydrogenation on the electron tunneling characteristics of Al-oxide-Pd junctions have been investigated. It is found that the impedance of the junctions increases from 1 to 5 percent with increasing hydrogenation, with the greatest increase occurring at large positive bias on the Pd. We attribute this effect to the introduction of electrons from hydrogen into the *d* bands of palladium.

Calculation of thermodynamic information based on the density of states curves of two allotropes of iron, D. Koskimaki and J. T. Waber, *SP323,* pp. 741-752 (Dec. 1971).

Key words: Electronic density of states; iron; phase transitions; thermodynamic information.

The use of density of states curves to obtain thermodynamic information associated with the allotropic phase transitions in iron is discussed. The density of states curves for both body-centered cubic and face-centered cubic iron are determined using a program which randomly interpolates between previously calculated eigenvalues to generate a large number of new energy solutions. These new eigenvalues enable a more accurate determination of density of states curves than is possible by plotting and averaging the original eigenvalues themselves. The density of states curves determined for each phase are used to obtain the energy sum of the eigenvalues of the valence electrons, the shift in the Fermi potential with temperature for the two curves, and the electronic specific heat versus temperature curves for both phases of iron over the temperature range from 0 K to the melting point.

Potential-independent features of crystal band-structure, M. M. Saffren, *SP323,* p. 755 (Dec. 1971).

Key words: Band structure; crystal potential; electronic density of states; pseudopotential.

Nonlinear optical susceptibility of semiconductors with zinc blende structure, M. I. Bell, *SP323,* pp. 757-766 (Dec. 1971).

Key words: Electronic density of states; gallium arsenide (GaAs); indium antimony (InSb); indium arsenide (InAs); joint density of states; nonlinear optical susceptibility; optical properties; semiconductors; zincblende structure; ZnTe.

A simple model for the band structure and electronic density of states in zincblende semiconductors has been used to calculate the dispersion of the nonlinear susceptibility responsible for second-harmonic generation. The calculation. A surprising result of this calculation was the position of the "gold *d*-band" states. These states were located at about -7 eV in $AuAl_2$ and at similar energies in $AuGa_2$ and $AuIn_2$. The interesting optical properties of gold intermetallic compounds (e.g., $AuAl_2$ is violet) are often attributed to the proximity of the gold *d*-bands to the Fermi energy, E_F. If these states really lay at E_F-7 eV, and were as flat (i.e., the $\rho(E)$ peak was as narrow) as the calculation indicated, then they could scarcely affect the compounds' optical properties. To help resolve this "*d*-band dilemma," we undertook measurements of the valence-band spectra of $AuAl_2$ and $AuGa_2$ by x-ray photoelectron spectroscopy (XPS). This method has been described elsewhere: accordingly we describe below only those experimental features of this work that were peculiar to the $AuAl_2$-$AuGa_2$ problem. The two compounds are first treated in separate sections. The results are then discussed in the final section

The reliability of estimating density of states curves from energy band calculations, E. B. Kennard, D. Koskimaki, J. T. Vaber, and F. M. Mueller, *SP323*, pp. 795-800 (Dec. 1971).

Key words: Aluminum; electronic density of states; free electron parabola; QUAD scheme; reliability of smoothing procedures.

The density of states curve for aluminum was calculated for different initial energy bands using the quadratic interpolation method (QUAD) developed by Mueller et al. In one case, a true parabolic energy band was used as input and in the second, the $E(\mathbf{k})$ values were those obtained for aluminum by Snow using the APW method. Deviations from the parabolic density of states curve were found to be inversely proportional to the number of $E(k)$ values per histogram box and hence inversely proportional to the square root of the number of **k** points in the Brillouin zone. It was necessary to use 100,000 points to obtain a relative deviation of 0.3%. In the second case, the self consistent band calculations for 2048 points in the full Brillouin zone and for a subset of 256 of these were used as input data. The effect of increasing the number of input values was assessed for 25,000 random points in the Brillouin zone. The relative errors were 26 and 9 respectively for 256 and 2048 points.

The effects of "smoothing" as an alternative method of reducing statistical error in computing density of states curves are also discussed.

tion requires no adjustable parameters, and results have been obtained for GaAs, InAs, ZnTe, and InSb in substantial agreement with experiment in the energy range 0-2.0 eV.

Model density of states for high transition temperatures beta-ungsten superconductors, R. W. Cohen, G. D. Cody, and L. J. ieland, *SP323*, pp. 767-773 (Dec. 1971).

Key words: Beta-tungsten; lattice transformation; model electronic density of states; superconductivity.

We have applied a simple density of states model to the problem of superconductivity in high T_c beta-tungsten superconductors. If we assume that the interaction responsible for superconductivity is predominately between d-band carriers and acoustic phonons via a deformation potential matrix element, simple analytic expressions for the effective electron-electron coupling constant λ and $T_c(\lambda)$ can be obtained. The quantities λ and T_c can then be estimated using parameters determined from an application of the density of states model to the cubic state constants. We are able to establish the simple condition $\lambda > \lambda_{crit} \approx 0.7$ for the existence of a cubic-tetragonal lattice transformation in these materials. Using our result for T_c, we find $T_c \gtrsim 15$ K for all materials which exhibit a lattice transformation. Thus, we have established the relation between high T_c superconductivity and lattice transformation in the β-W compounds.

Summary of the conference on electronic density of states, H. hrenreich, *SP323*, pp. 775-781 (Dec. 1971).

Thermal electron effective mass of rubidium and cesium, D. . Martin, *SP323*, p. 783 (Dec. 1971).

Key words: Cesium; effective mass; electronic density of states; rubidium; specific heat.

Density of states and numbers of carriers from the dHvA effect, S. Hornfeldt, J. B. Ketterson, and L. R. Windmiller, *P323*, pp. 785-790 (Dec. 1971).

Key words: Electronic density of states; de Haas van Alphen effect; Fermi surface; Fermi velocity; Fourier series; spherical harmonics; symmetrized techniques.

With the dHvA effect, one can determine the angular dependence of the extremal area and effective mass over all sheets of the Fermi surface. Using recently developed techniques this data can be inverted and the angular dependence of the Fermi radius and Fermi velocity determined. Techniques have been developed to allow the inversion of both open and closed surfaces. For closed surfaces we use an expansion in symmetry adapted spherical harmonics (to order $l=60$) while for open surfaces a three-dimensional Fourier series representation is used. With this information one may determine, for a given sheet of the surface, the number of carriers $n(E_F)$ and density of states $N(E_F)$ by performing the appropriate integrations.

A note on the position of the "gold 5*d* bands" in $AuAl_2$ and $AuGa_2$, P. D. Chan and D. A. Shirley, *SP323*, pp. 791-793 (Dec. 1971).

Key words: Electronic density of states; gold aluminum two ($AuAl_2$); gold gallium two ($AuGa_2$); x-ray photoelectron spectroscopy.

Switendick and Narath recently proposed a solution for the "$AuGa_2$ dilemma" pointed out by Jaccarino et al. This solution was based on the results of band structure calculations. The density of states for $AuAl_2$ derived from these band-structure calculations were presented at this con-

SP324. **The NBS Alloy Data Center: permuted materials index,** G. C. Carter, D. J. Kahan, L. H. Bennett, J. R. Cuthill, and R. C. Dobbyn, Nat. Bur. Stand. (U.S.), Spec. Publ. 324, 683 pages (Mar. 1971).

Key words: Alloy data; bibliography; index; information; Knight shifts; NMR; soft x ray.

This Index contains literature references to ~ 10,000 research papers on physical properties of metals and alloys. The Index contains all NMR Knight shift papers and soft x-ray emission papers. It also contains many soft x-ray absorption papers and a number of papers on generally related topics such as susceptibilities, specific heats, hyperfine fields, and band structures. The papers are annotated in depth and the coded information put onto a magnetic tape. The Permuted Materials Index was created from this tape, listing alloys under each of their constituent components (i.e., CuNi appears under CuNi and under NiCu alloys).

SP325. **Technical highlights of the National Bureau of Standards Annual Report Fiscal Year 1969,** Nat. Bur. Stand. (U.S.), Spec Publ. 325, 243 pages (Mar. 1970).

Key words: Annual report; technical highlights.

This is an illustrated digest of NBS technical and scientific activities during the fiscal year ending June 30, 1969. It lists major programs as they were carried out by the three NBS institutes: Institute for Basic Standards, Institute for Materials Research, Institute for Applied Technology and by the Bureau's Center for Radiation Research and Center for Computer Science and Technology. Summaries are given of typical projects in measurement engineering, applied mathematics, electricity, metrology, mechanics, heat, atomic physics, radio standards, laboratory astrophysics, cryogenics, analytical chemistry, polymers, metallurgy, inorganic materials, physical chemistry, engineering standards, weights and measures, invention and innovation, vehicle systems research, product evaluation, building research, electronic technology, technical analysis, computer sciences, and radiation research. Also included are discussions of the Clearinghouse for Federal Scientific and Technical Information, the National Standard Reference Data System, Standard Reference Materials program, and national and international cooperative activities.

SP326. **Accurate characterization of the high-pressure environment.** Proceedings of a Symposium held at the National Bureau of Standards, Gaithersburg, Md., October 14-18, 1968, E. C. Lloyd, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 326, 343 pages (Mar. 1971).

Key words: Accurate measurement; equation-of-state; fixed points; high pressure; high-pressure equipment; instrumentation; pressure scale; shock wave technique; temperature.

The volume contains 38 papers prepared for the Symposium on Accurate Characterization of the High-Pressure Environment held on October 14-18, 1968, at Gaithersburg, Maryland, under the sponsorship of the National Bureau of Standards and the Geophysical Laboratory at the Carnegie Institution of Washington. The papers are presented with the discussions that occurred during the sessions. The book also includes reports of several informal committees of the conferees on choices of reference pressure materials and on other matters relevant to improved measurement and calibration. The Symposium was intended to provide an authoritative survey of problems and techniques presently in use or proposed for precise high-pressure measurement and for temperature measurement at high pressure. *These proceedings include the following papers (indented):*

Hydrostatic pressures of 50 kbar in a piston-cylinder device: measurement of pressure and characterization of the pressure medium, A. Jayaraman and R. G. Maines, *SP326,* pp. 5-8 (Mar. 1971).

A method suited for making resistivity and other electrical measurements to 50 kbar hydrostatic pressure, using a conventional piston-cylinder device, is described. In this method a Teflon cell is used to contain the pressure medium, which is a 1:1 mixture of *n*-pentane and isoamyl alcohol. After the fluid mixture freezes (at about 46 kbar), further advance of the piston results in uniaxial stress. However, this can be readily relaxed by heating the medium to 70 °C. The resultant isotropic pressure distribution stays when the pressure medium is cooled back to room temperature. The technique of probing the pressure distribution inside the cell, as well as pressure calibration procedure, is described.

Ultrasonic and dilatometric measurements at very high pressures, P. L. M. Heydemann and J. C. Houck, *SP326,* pp. 11-22 (Mar. 1971).

Key words: Bulk modulus; density; dilatometric measurements; high pressure; liquids; solids; ultrasonics.

A short-cylinder and piston assembly and its use for dilatometric and ultrasonic measurements on solids and liquids at pressures up to 40 kbar are described. All necessary corrections for the evaluation of measurements are discussed and the systematic uncertainties are given. It is demonstrated that ultrasonic methods can significantly reduce the uncertainties in the determination of density and bulk modulus of both solids and liquids.

Characterization of the bismuth I-II and barium I-II points under hydrostatic pressure, R. J. Zeto, H. B. Vanfleet, E. Hryckowian, and C. D. Bosco, *SP326,* pp. 25-33 (Mar. 1971).

Hydrostatic pressure experiments were made which have new and important relevance to high-pressure calibration in both liquid and solid pressure systems for the bismuth I-II and barium I-II points on the high-pressure scale. The bismuth I-II transformations were characterized and the mechanism of the solid-state reactions was related to pressure calibration. The strain hysteresis commonly associated with the bismuth I-II point was shown to be invalid and was alternatively explained on the basis of a thermally activated nucleation and growth mechanism which was demonstrated to govern these transformations. With hydrostatic pressure, initiation of the bismuth I-II transformation was observed as a function of kinetic times as long as 15 hours while pressure and temperature were maintained constant. The transformation behavior was a function also of the microstructure, purity, and thickness of the sample. The bismuth I-II transformation was not necessarily sharp with respect to kinetic time. As long as 42 hours were observed for completion of the transformation with very thin samples. Under hydrostatic pressure the bismuth I-II equilibrium point was not midway between the initiation of the I-II and II-I transformations but was located appreciably closer to the former transformation. The bismuth I-II calibration point was correlated between liquid and solid pressure systems. For solid systems it was shown that the "apparent" hysteresis was completely one-sided toward the low-pressure side and that the equilibrium point coincided with the initiation of the I-II transformation which should be employed as the pressure calibration point. The bismuth I-II region of indifference was characterized with respect to nature of the sample and manner of measurement. An experimental technique was indicated by which the center of the region of indifference was reproducible within ±5 bars. The barium I-II point was measured at 56.27 kbar on the basis of a manganin gage under hydrostatic pressure.

The upper bismuth pressure calibration point, J. C. Haygarth, H. D. Luedemann, I. C. Getting, and G. C. Kennedy, *SP326,* pp. 35-37 (Mar. 1971).

The Bi III-V and IV-V equilibrium boundaries were studied by monitoring electrical resistance changes. Extrapolation of the III-V data to 25 °C yields an equilibrium transition pressure of 77.5 ± 1.0 kilobar (kbar). The extrapolation also agrees within experimental error with the pressure of 78.2 kbar determined in a separate experiment at 22 °C. The use of the transition as a calibration point is discussed, and a procedure for estimating the compression-stroke transition pressure from the equilibrium transition pressure is proposed.

Optical interferometry at high pressures, K. Vedam, *SP326,* pp. 39-43 (Mar. 1971).

After a brief review of the present status of optical interferometry at high pressures, the experimental technique of measuring the variation of refractive index with pressure to 7 and 14 kbars with one- and two-stage optical pressure vessels respectively, is described along with some typical results obtained. The need for such measurements on liquids and gases which are used as fluid pressure media is emphasized.

Equipment for generating pressures up to 800 kilobars, N. Kawai, *SP326,* pp. 45-47 (Mar. 1971).

A type of high-pressure apparatus has been developed which extends considerably the range of attainable very high static pressure. It consists basically of a sphere segmented into tapering truncated pistons. Hydrostatic pressures in the sample chamber in the centre of the sphere have reached 800,000 bars (11,600,000 psi). Pressures of over one million bars should be possible with the present technology. Some new and interesting results from high-pressure studies are described.

Manganin resistance gages as accurate instruments for high pressure measurements, Yu. A. Atanov and E. M. Ivanova, *SP326,* pp. 49-51 (Mar. 1971).

The rapid development of modern science and technology foretells the wide application of high hydrostatic pressures from 20 to 40 kbar in the near future. The measurement of

pressures in this range is usually carried out by manganin resistance gages. Many authors, however, report different metrological characteristics of individual manganin gages and present widely differing values of pressure coefficient, reproducibility, stability, nonlinearity, etc. There is no common basis for the selection of interpolation and extrapolation equations relating the change of resistance of a manganin gage with the measured pressure.

In this work an attempt is made to investigate the scatter of metrological characteristics of a large group of identical manganin gages by means of an absolute free piston gage, to find the best extrapolation equation and to evaluate possible errors of pressure measurements over 15 kbar.

A critical review of the effect of pressure on thermocouple emf's, R. E. Hanneman, H. M. Strong, and F. P. Bundy, *SP326,* pp. 53-61 (Mar. 1971).

The effects of high pressure on the emf's of thermocouples are critically reviewed and best currently available thermocouple corrections are presented. The important factors affecting these thermocouple corrections are discussed, including pressure-temperature gradients, contamination, and deformation. A novel method for simultaneous and continuous *in situ* measurement of pressure and temperature within a high-pressure cell through use of dual thermocouples is briefly described.

The effect of pressure on the thermal emf of the platinum/platinum 10 percent rhodium thermocouple, P. M. Bell, F. R. Boyd, Jr., and J. L. England, *SP326,* pp. 63-65 (Mar. 1971).

Pressure dependence of the thermoelectric power of thermocouple materials, P. J. Freud and P. N. La Mori, *SP326,* pp. 67-75 (Mar. 1971).

Single-wire measurements of the pressure dependence of the thermoelectric power were made hydrostatically to 8 kbar for chromel, alumel, copper, and constantan and in a piston cylinder apparatus to 40 kbar for chromel, alumel, platinum, and platinum 10 percent rhodium. The temperature interval covered for the hydrostatic measurements was − 195 to 290 °C and for the piston cylinder measurements it was 30 to 380 °C. A detailed discussion is given of the pressure-temperature distribution within the piston cylinder cell. Pressure emf values are presented with an uncertainty of ± 7 percent.

The effect of pressure on the E.M.F. of thermocouples, I. C. Getting and G. C. Kennedy, *SP326,* pp. 77-80 (Mar. 1971).

Temperature measurement by thermal noise at high pressures, R. H. Wentorf, Jr., *SP326,* pp. 81-89 (Mar. 1971).

The temperature of a small carbon resistor (700 to 3,000 Ω) in a high-pressure cell next to a Pt-Pt10 percent Rh thermocouple was measured by thermal noise. Runs were made at 40 and 50 kbar to temperatures of about 1,400 K. The results suggest that at the highest temperatures the thermocouple indicated temperatures from 40 to 60 K too low, in fairly good agreement with estimates made by other methods.

Equations of state for sodium and aluminum, D. J. Pastine and M. J. Carroll, *SP326,* pp. 91-103 (Mar. 1971).

Equations of state are calculated for sodium and aluminum. In each case this is done by first calculating the 0 K isotherm and then adding the thermal contributions to the pressure. The calculations in both cases are theoretical and very few experimental data are used. Comparisons of theoretical prediction and experimental data are very favorable.

An atomistic theory of shock compression of a perfect crystalline solid, D. H. Tsai, *SP326,* pp. 105-122 (Mar. 1971).

Key words: Equation of state of solids; lattice dynamics; shock compression; shock wave; thermal relaxation.

Lattice dynamical calculations have been employed to study the process of compression of a perfect, two-dimensional, fcc lattice by a strong shock wave. The interaction energy between the lattice points is assumed to be the Morse-type potential function, and the interaction is assumed to extend to the fourth nearest neighbors. The formulation of the dynamical problem is described. The details of the computation of the shock wave stress and density profiles, shock velocity, energy density profile, local energy distribution, velocity distribution, and the components of the Grueneisen parameter are discussed. Of special interest is the thermal relaxation process behind the shock front. It is found that the relaxation time is not constant, and that the steady, relaxed region in the shock profile trails farther behind the shock front with increasing time. The implications of these results on the calculation of the high-pressure equation of state of a crystalline solid are examined.

Effect of 2024 aluminum alloy strength on high-pressure shock measurements, M. van Thiel and A. Kusubov, *SP326,* pp. 125-130 (Mar. 1971).

A shock wave technique is described by which wave profiles may be determined in metals. Piezo-resistance manganin gages were used to determine these profiles to 130 kbars in 2024 aluminum alloy. The data are consistent with the assumption that the Hugoniot is the hydrostat. A maximum of 28 kbars is obtained for the maximum yield strength on the release wave following the strongest shock. The derived loading-unloading curves in the pressure volume and pressure mass velocity planes indicate that errors of about 2 percent are produced by use of purely hydrostatic release paths.

Calculation of equation of state from high-pressure sound velocity data, A. C. Holt and R. Grover, *SP326,* pp. 131-135 (Mar. 1971).

We describe a method for calculating the Mie-Grüneisen equation-of-state parameters for simple metals from shock Hugoniot data and a knowledge of the volume variation of longitudinal sound velocity at high pressure. The theory is applied to the calculation of the equation of state of aluminum.

Shock temperature calculations for silicone fluid, M. Cowperthwaite and J. H. Blackburn, *SP326,* pp. 137-145 (Mar. 1971).

The problem of calculating shock temperature indirectly from experimental data without assuming thermodynamic properties is formulated and solved theoretically. In principle, the $(e-p-v)$ and $(T-p-v)$ equations of state can be constructed in an overlapping domain of the $(p-v)$ plane from a family of Hugoniot curves centered at points of known energy and temperature.

Experiments were performed in an attempt to construct these equations of state for silicone fluid 210. Shock and free surface velocities were measured to determine Hugoniot curves in the 300-kbar regime, and energies and densities were measured from − 30 to + 260 °C along the atmospheric isobar to determine the initial states of the shock wave experiments. In practice, it was necessary to assume a form for the $(e-p-v)$ equation of state, since the differences in volumes between states on Hugoniot curves at the same pressure above 40 kbar were found to be comparable with the experimental error in measuring the volumes of

each of these states. The data were fitted to a Mie-Grüneisen type ($e-p-v$) equation of state with variable C_v and $(\partial p/\partial T)_v$, since Hugoniot point indicated a linear dependence of energy on pressure along an isochore, and C_v varied along the atmospheric isobar. Shock temperatures on the 25 °C Hugoniot were calculated at points of intersection with isentropes and by integrating with constant atmospheric pressure values of C_v. The position of the 296 °C isentrope limits the temperature calculation with isentropes to values below 522 °C and 58 kbar, and the values around 50 kbar are 8 percent lower than those calculated with the 25 °C value of C_v, since C_v increases along the Hugoniot curve. Temperature calculations above 58 kbar assumed the 296 °C value of C_v. Considerably more experimental work would be required over the entire pressure range to permit determining equations of state of silicone 210 without making assumptions.

The equation of state of selected materials for high-pressure references, W. J. Carter, S. P. Marsh, J. N. Fritz, and R. G. McQueen, *SP326*, pp. 147-158 (Mar. 1971).

Effect of pressure on the lattice parameters of lead chalcogenides and nickel arsenide-type compounds, S. Minomura, H. Nagasaki, and I. Wakabayashi, *SP326*, pp. 159-165 (Mar. 1971).

The compressibility and thermal expansion of LiF to 60 kbar and 600 °C as determined by x-ray diffraction: report of progress, L. C. Carrison and C. B. Sclar, *SP326*, pp. 167-171 (Mar. 1971).

Measurements were made of the compressibility of LiF to 60 kbars over the temperature range 25 to 600 °C by high-pressure high-temperature x-ray powder diffraction methods. Pressures were determined by using NaCl as an internal calibrant. These results also provide data on the thermal expansion of LiF between 25 and 600 °C at pressures of 38 and 57 kbar. This paper demonstrates the feasibility of determining the unit-cell volume of crystalline solids under concomitant high pressure and high temperature by *in situ* x-ray methods.

Ultrasonic and static equation of state for cesium halides, G. R. Barsch and Z. P. Chang, *SP326*, pp. 173-186 (Mar. 1971).

Calculation of the *P-V* relation for sodium chloride up to 300 kilobars at 25 °C, J. S. Weaver, T. Takahashi, and W. A. Bassett, *SP326*, pp. 189-199 (Mar. 1971).

The *P-V* relation for the B1 phase of NaCl was calculated up to 300 kilobars at 25 °C by means of the Hildebrand and Mie-Grüneisen equations. The effect of (1) the uncertainty in the parameters used, (2) the functional form for the temperature-dependent part of internal energy, (3) the anharmonic contribution, and (4) the second nearest neighbor repulsion on the calculated *P-V* relation is discussed. It was found that the calculated *P-V* relation for NaCl is sensitive to the value chosen for Bt_0, and that the effect of (2), (3), and (4) on the calculated *P-V* relation is small. The precision for the present calculation has been estimated to be ± 2.5 percent. The calculated *P-V* relation is in agreement within experimental uncertainties with the fixed points on the absolute pressure scale, with that determined by Bridgman up to 100 kilobars, and that obtained by Fritz from shock wave data up to 260 kilobars. Simultaneous determinations of the effect of pressure on the volumes of NaCl and MgO were made by x-ray diffraction on an intimate mixture of these two materials. It was found that the pressure values calculated from the volume of NaCl using the calculated *P-V* relation are in agreement with those calculated from the volume of MgO using the *P-V* relation calculated from the values of Bt_0 and Bt_0' with the Murnaghan equation. This agreement verifies not only the calculated *P-V* relation for NaCl, but also establishes the validity of the internal standard method for pressure determination.

The Hugoniot equation of state of sodium chloride in the sodium chloride structure, J. N. Fritz, S. P. Marsh, W. J. Carter, and R. G. McQueen, *SP326*, pp. 201-208 (Mar. 1971).

The Hugoniot equation of state of NaCl has been obtained by measuring the shock velocity through NaCl on copper and 2024 aluminum base plates. Shock velocities through the base plates and standard impedance-matching were used to obtain the Hugoniot curves for both single-crystal (in various orientations) and pressed-powder samples. The smooth behavior of the resulting shock locus up to 230 kbar indicates that NaCl exists in the sodium chloride structure up to this pressure. In the shock-particle velocity plane the best linear fit to the data reported here is $u_s(\text{km/s}) = (3.528 \pm .012) + (1.343 \pm .009)u_p$. A quadratic fit, which gives a large weight to the measured bulk sound speed in NaCl, is $u_s = 3.403 + 1.5422u_p - 0.07345u_p^2$. Isotherms at 293 K, using different forms for the Grüneisen parameter and a simple Debye model for the specific heat, are calculated from the Hugoniots and are presented here. They should prove useful when NaCl is used as an internal standard in high-pressure x-ray devices.

Consistency in the high-temperature equation of state of solids, L. Thomsen and O. L. Anderson, *SP326*, pp. 209-217 (Mar. 1971).

Four equations of state for solids are examined theoretically for mutual consistency in the high-temperature regime. It is found that neither the Birch-Murnaghan nor the Murnaghan equation can be shown to be consistent with either the Mie-Grüneisen or the Hildebrand equation. An expression is derived for the volume dependence of the Grüneisen parameter $\gamma(\rho)$. A recent theoretical treatment of NaCl, proposed for use as a pressure standard, is neither internally consistent, nor is it sufficiently precise for such a purpose.

The solid-liquid phase line in Cu, R. G. McQueen, W. J. Carter, J. N. Fritz, and S. P. Marsh, *SP326*, pp. 219-227 (Mar. 1971).

Shear strength effects on phase transition "pressures" determined from shock-compression experiments, O. E. Jones and R. A. Graham, *SP326*, pp. 229-237 (Mar. 1971).

Plane-wave shock compression experiments provide an independent, and often unique, method for establishing pressures at which phase transitions occur in solids. The transition stress which is measured in a shock experiment consists of two components: a mean isotropic pressure, and a deviatoric shear stress which is related to the yield strength, i.e. the Hugoniot elastic limit (HEL), of the solid when subjected to shock compression. The effects of the nonzero shear strength of a solid on the measured shock transition stress are discussed, and methods outlined for calculating the isotropic pressure component needed for comparison with hydrostatic results. Comparison requires that the compression to initiate the transition be independent of shear distortion. The shock propagation characteristics of a solid which are necessary for establishing a reliable equilibrium transition pressure are considered. Existing HEL data are collected in an Appendix and permit the importance of shear strength to be assessed for various materials. Shock compression data for phase transitions in Bi, Fe, Ge, CdS, and InSb are analyzed and shear strength corrections applied to obtain transition pressures.

Study of phase transitions in insulators by the dielectric constant technique, G. A. Samara and W. L. Chrisman, *SP326,* pp. 243-249 (Mar. 1971).

This paper proposes the measurement of the dielectric constant and dielectric loss as a probe for detecting and studying the properties of pressure-induced phase transformations in insulators. The measurement is very sensitive, relatively simple, and can be adapted for use in many types of high pressure apparatus. To illustrate the general usefulness of the technique, results on a variety of substances (solids and liquids) obtained from measurements in three different pressure apparatus will be presented and discussed. The substances investigated include a number of alkali and thallous halides, strontium titanate, and water.

Experimental determination of Curie points of ferromagnets up to 90 kilobars—possible use for calibration of high pressure, J. M. Leger, C. Susse, and B. Vodar, *SP326,* pp. 251-256 (Mar. 1971).

Second-order phase transformations which occur without volume discontinuity and theoretically without any hysteresis are suggested as secondary pressure gauges and for interpolation under high pressure in different temperature ranges. Results are presented concerning the shifts of Curie temperatures of some ferromagnets up to 90 kbar. The pressure effect is generally small but may be accurately determined.

Fixed points on the high-pressure scale identified by phase transitions in ammonium fluoride, R. Kaneda, S. Yamamoto, and K. Nishibata, *SP326,* pp. 257-262 (Mar. 1971).

The I-II and II-III transitions in NH_4F, as fixed points on the high-pressure scale, have been investigated under purely hydrostatic conditions at the temperatures of 0, 25 and 50 °C. By means of manganin resistance gages, the transition pressures at 25 °C have been determined to be 3605 ± 10 bar for the I-II and 11531 ± 23 bar for the II-III. Their respective dependences on temperature are +2.5 bar/°C and +20.7 bar/°C. The realization of both transition points is easy at and above room temperature, but at low temperatures the II-III transition is very sluggish.

A review of resistance-jump phase changes useful for high-pressure calibration, F. P. Bundy, *SP326,* pp. 263-270 (Mar. 1971).

The coesite-stishovite transition, S. Akimoto and Y. Syono, *SP326,* pp. 273-277 (Mar. 1971).

The coesite-stishovite transition curve has been determined over the temperature range 550 to 1,200 °C in the pressure range 82.0 to 98.0 kbar by means of a tetrahedral-anvil type of high-pressure apparatus. Amorphous anhydrous silica, α-quartz, coesite, and stishovite were used as starting materials. The transition curve was fitted by the linear equation $P(\text{kbar}) = 69 + 0.024\ T(°\text{C})$ using pressure scale proposed by Jeffery et al. This determination was found to be in a reasonable agreement with the previous data, if the common pressure scale is used. Experimental information for the coesite-stishovite transition was also compared with the stability relation derived from enthalpies and entropies of coesite and stishovite. It was suggested that the pressure scale proposed by Jeffery et al. was underestimated considerably around 100 kbar.

The use of solid-solid transitions at high temperatures for high-pressure calibration, P. N. La Mori, *SP326,* pp. 279-282 (Mar. 1971).

Transition pressures have been determined for bismuth I → 2 and bismuth 2 → 3 to the melting point (183 °C). The transitions parameters of thallium 2 → 1, 1 → 3 and 2 → 3 have been measured to 40 kbar and 220 °C. The thallium 1 → 2 → 3 triple point has been determined as 114 ± 1 °C and 37.4 ± 0.4 kbar. The use of the determined transition parameters as high-pressure, high-temperature fixed points is discussed.

The use of iron and gold for calibration of higher pressure and temperature points, H. M. Strong and F. P. Bundy, *SP326,* pp. 283-290 (Mar. 1971).

Transition pressures of Bi 3-5, Sn, and Fe, M. Contré, *SP326,* pp. 291-296 (Mar. 1971).

Making use of "X type anvil," the change in resistance of two reference metals in each run was simultaneously recorded in order to compare their transition pressures. A linear extrapolation through the well-known points below 60 kbar showed inconsistencies in the most commonly used high pressure scales. The recording of the pistons displacements lead to an exponential extrapolation which gave transition pressures of 78 ± 2 kbar for Bi 3—5, of 102 ± 4 kbar for Sn and of 140 ± 15 kbar for Fe.

On application of mercury melting curve for accurate high-pressure measurements, V. S. Bogdanov, Yu. L. Levin, S. S. Sekoyan, and Yu. I. Shmin, *SP326,* pp. 297-301 (Mar. 1971).

High-pressure scale as determined by x-ray diffraction techniques up to approximately 100 kbar, H. T. Hall, *SP326,* pp. 303-305 (Mar. 1971).

Pressure inhomogeneity: a possible source of error in using internal standards for pressure gages, J. C. Jamieson and B. Olinger, *SP326,* pp. 321-323 (Mar. 1971).

Studies have been made on two intimate mechanical mixtures of NaCl and Nb having different composition at high "pressures" using x-ray diffraction. A plot of V_p/V_o for Nb versus V_p/V_o for NaCl showed a different curve for each of the two mixtures. Our analysis and the consequences of this apparent violation of the criteria for an internal pressure gage are discussed.

Comparison of four proposed *P-V* relations for NaCl, J. S. Weaver, *SP326,* pp. 325-329 (Mar. 1971).

Some comparisons among four *P-V* relations for the Bl phase of NaCl discussed at this symposium are presented. The two scales (Models III and V) proposed by Weaver et al. (this volume) and a 1968 revision of Decker's *P-V* relation (D_{68}) are shown to agree closely. The three models yield zero-pressure thermal expansion curves in reasonable agreement with experiment, but give values for B_{to}' smaller than the measured value. This appears to be due, in part, to the form used for the lattice energy. The three models yield pressures about 2.5 percent smaller than those calculated from the pressure scale (F_{68}) based on Hugoniot data proposed by Fritz et al. (this volume). Comparison of Models III, V, and F_{68} in the $u_s - u_p$ plane suggests that part of this difference must result from either the form chosen for the lattice energy in Models III and V or from the Hugoniot data upon which F_{68} is based. Omission of part of the data used in F_{68} improves the agreement of this model with the sonic value of B_{to}' and partially removes the discrepancy between F_{68} and Models III and V. Suggestions for additional studies which may be useful in choosing a *P-V* relation for NaCl for pressure calibration purposes are presented. It is concluded that, since the differences among these scales are comparable to the experimental uncertainties involved in applying them, and since there is no compelling reason to choose one over the others, any of these scales may be used for the present.

SP327. **Equilibrium critical phenomena in fluids and mixtures: A comprehensive bibliography with key-word descriptors,** S. Michaels, M. S. Green, and S. Y. Larsen, Nat. Bur. Stand. (U.S.), Spec. Publ. 327, 235 pages (June 1970).

Key words: Binary liquid mixtures; critical opalescence; critical phenomena; critical point; critical region; equilibrium critical phenomena; gases; liquids; liquid-vapor systems; phase transitions; ternary liquid mixtures; thermodynamics.

This bibliography of 1088 citations comprehensively covers relevant research conducted throughout the world between January 1, 1950 through December 31, 1967. Each entry is characterized by specific key word descriptors, of which there are approximately 1500, and is indexed both by subject and by author. In the case of foreign language publications, effort was made to find translations which are also cited.

SP329. **An index of U.S. voluntary engineering standards,** W. J. Slattery, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 329, 1,000 pages (Mar. 1971).

Key words: Engineering standards, index of; index of standards, recommended practices, specifications, and test methods; Key-Word-In-Context index of voluntary standards; standards, voluntary, index of.

This computer-produced Index contains the permuted titles of more than 19,000 voluntary engineering and related standards, specifications, test methods, and recommended practices, in effect as of December 31, 1969, published by some 360 U.S. technical societies, professional organizations, and trade associations. The title of each standard can be found under all the significant key words which it contains. These key words are arranged alphabetically down the center of each page together with their surrounding context. The date of publication or last revision, the standard number, and an acronym designating the standards-issuing organization appear as part of each entry. A list of these acronyms and the names and addresses of the organizations which they represent are found at the beginning of the Index.

SP329. Supplement 1. **An index of U.S. voluntary engineering standards,** W. J. Slattery, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 329, Suppl. 1, 459 pages (Dec. 1972).

Key words: Engineering Standards, index of; index of standards, recommended practices, specifications, test methods; Key-Word-In-Context index of voluntary standards; standards, voluntary, index of.

This supplement contains the permuted titles of more than 6,300 standards, specifications, test methods, and recommended practices published by 225 U.S. technical societies, professional organizations and trade associations. Each title can be found under all the significant key words which it contains. These key words are arranged alphabetically down the center of each page together with their surrounding context. The date of publication or last revision, the standard number and an acronym designating the standards-issuing organization appear as part of each entry.

SP329. Supplement 2. **An index of U.S. voluntary engineering standards,** W. J. Slattery, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 329, Suppl. 2, 472 pages (May 1975) SD Catalog No. C13.10:329, Suppl. 2.

Key words: engineering standards, index of; index of standards, recommended practices, specifications, test methods; Key-Word-in-Context index of voluntary standards; KWIC index of standards; standards, voluntary, index of.

This supplement contains the permuted titles of more than 5,700 voluntary engineering standards, specifications, test methods, codes and recommended practices published by 164 U.S. technical societies, professional organizations and trade associations. Each title can be found under all the significant key words which it contains. These key words are arranged alphabetically down the center of each page together with their surrounding context. The date of publication or last revision, the standard number and an acronym designating the standards-issuing organization appear as part of each entry.

SP330, 1972 Edition. **The international system of units (SI),** C. H. Page and P. Vigoureux, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 330, 45 pages (Apr. 1972).

Key words: General Conference of Weights and Measures; International Committee of Weights and Measures; International System of Units; SI; Système International des Unités; Units of Measurement.

This translation from the French "Le Système International d'Unités, (SI)" published originally by the International Bureau of Weights and Measures (BIPM) has been prepared jointly by the National Physical Laboratory, UK, and the National Bureau of Standards, USA. Included are Resolutions and Recommendations of the General Conference of Weights and Measures (CGPM) on the International System of Units, together with relevant extracts from the International Organization for Standardization (ISO) for the practical use of the system.

Appendix I gives in chronological order the decisions promulgated since 1889 by CGPM and the International Committee of Weights and Measures (CIPM) on units of measurement and on SI. Appendix II outlines the measurements, consistent with the theoretical definitions given in this document which metrological laboratories can make to realize the units and to calibrate precision material standards. Appendix III describes the laboratory and the committees which come under the Metre Convention. (Supersedes NBS Special Publication 330, 1971 Edition.)

SP331. **Radioactivity calibration standards.** Proceedings of a special session of the International Conference of the American Nuclear Society Meeting on the Constructive Uses of Atomic Energy, Washington, D.C., November 10-15, 1968, W. B. Mann and S. B. Garfinkel, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 331, 120 pages (Aug. 1970).

Key words: Alpha-particle standards; calibration consistency; coincidence counting; decay-scheme effects; efficiency tracing; gamma-ray standards; international comparisons; liquid-scintillation counting; radionuclide half-lives; radionuclide standards.

Experimental procedures and methods used in nine international radioactivity standardization laboratories are described by eight authors. The possibility of attaining accuracies of the order of 0.01% are discussed. The desirability of carrying out consistency checks of gamma-ray standards with time, using a 4π ionization chamber is emphasized. The validity of radioactivity standards is examined. International comparisons organized by the Bureau International des Poids et Mesures are discussed. An analogue method of liquid-scintillation counting is described. Certain types of radioactivity standards are criticized. The fields of interest of the two Canadian laboratories are discussed. Details of the work in progress at the Boris Kidrič Institute and National Bureau of Standards are presented. *These proceedings include the following papers (indented):*

Aspects of radionuclide standardization in the IAEA, H. Houtermans, *SP331,* pp. 5-12 (Aug. 1970).

Some aspects of radioactivity standardization at the CBNM of Euratom, A. Spernol, *SP331,* pp. 13-24 (Aug. 1970).

International comparisons of calibrated radionuclide sources, A. Rytz, *SP331,* pp. 25-36 (Aug. 1970).

Standardization of radionuclides by efficiency-tracing methods using a liquid-scintillation counter, D. G. Jones and A. McNair, *SP331,* pp. 37-52 (Aug. 1970).

Validity of radioactive standards, Y. Le Gallic, *SP331,* pp. 53-68 (Aug. 1970).

Radioactivity standardization in Canada, J. G. V. Taylor and A. P. Baerg, *SP331,* pp. 69-77 (Aug. 1970).

Metrology of radioactive isotopes at the Boris Kidrič Institute of Nuclear Sciences at Vinča-Beograd, Yugoslavia, Dj. N. Bek-Uzarov, *SP331,* pp. 79-103 (Aug. 1970).

Recent activities of the NBS Radioactivity Section, with special reference to the standardization of thallium-208, S. B. Garfinkel and J. M. R. Hutchinson, *SP331,* pp. 105-118 (Aug. 1970).

SP332. **Spectrum formation in stars with steady-state extended atmospheres.** Proceedings of the International Astronomical Union Colloquim No. 2, Commission 36, Munich, Germany, April 16-19, 1969, H. G. Groth and P. Wellmann, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 332, 342 pages (Aug. 1970).

Key words: Chromospheres; coronae; extended atmospheres; non-classical atmospheres; non-LTE.

Commission 36 of the International Astronomical Union sponsored a symposium on Spectrum Formation in Extended Stellar Atmospheres held 16-19 April, 1969. The host was the Observatory of the University of Munich. A major problem is the definition of what is meant by an extended stellar atmosphere. There are intuitive notions in the literature, but the question of specific definitions in various kinds of objects was discussed. Questions of what specifically cause the anomalous extent were largely by-passed. Attention focused mainly on the type spectrum to be expected in various situations. The spectral features to be expected in both static and dynamic atmospheres, including and excluding departures from LTE, were discussed. The symposium was divided into four sections: A. Type of Problems Which Exist; B. Theoretical Methods for Handling Non-LTE Problems; C. Chromospheres and Coronae of Stars; D. Summary. This volume contains the mms of the formal papers that were presented plus an edited and abridged version of the discussions following each paper. *These proceedings include the following papers* (*indented*):

Definition of the types of problems that exist in steady-state extended atmospheres, A. B. Underhill, *SP332,* pp. 3-37 (Aug. 1970).

Key words: Extended atmospheres; interpretation of stellar spectra; line formation.

In section 1 practical details concerning the equivalence of observational and theoretical descriptions of stellar spectra are reviewed, particularly the difficulty of identifying the observed reference level (continuum) with the theoretical continuum in the case when many lines are present. In this connection thought must be given to how integrals over frequency should be normalised and evaluated because the effective continuous absorption coefficient does not remain constant over the range from 0 to ∞. The choice of spectroscopic details by which to determine T_{eff}, log g and abundances requires careful consideration.

In section 2 the factors by which an extended atmosphere are recognized are summarized and the question is posed do all stars have extended atmospheres. Another question requiring an answer is whether the concepts microturbulence and macroturbulence are physically real concepts or whether they are merely fitting parameters to make a simple LTE theory account for the observed spectra of supergiants in which rather wide lines occur and many multiplets show rather steep gradients. In section 3 the types of line sensitive to non-LTE conditions are described. These are resonance lines, lines arising from metastable levels, subordinate lines for which the upper level is sufficiently separated from the continuum and other levels that this upper level is chiefly populated by radiative processes from the ground or other low lying levels and lines which go into emission in low density atmospheres as a result of optical-pumping (fluorescent) processes. Such lines should not be used for abundance determinations by means of LTE theory though this is frequently done.

Theoretical considerations are discussed in Section 4 where first the problem of the two-level atom is sketched and then the problem is generalised to a many-level atom. The parameter λ which gives the probability that a photon is lost from the line by de-excitation processes other than spontaneous emission is defined and it is pointed out that non-LTE physics has the effect of adding a scattering term to the expression for the source function. One example is given of the effect of changing the line source function from the Planck function to a form suitable for isotropic coherent scattering. The line becomes deeper and wider for the same number of atoms. Interpretational problems in stellar spectra are discussed in section 5. It is noted that many lines in main-sequence early type spectra show the effects of departures from LTE. These effects are shown to a conspicuous degree by the spectra of shell stars. The example of He I 5876 in 10 Lacertae, 09V, is discussed and the implication for interpreting the He I lines in all B type main-sequence stars are touched upon. Helium-weak and helium-strong spectra probably indicate variations in density of the outer atmosphere rather than true abundance differences. The spectra of supergiants are also considered and it is pointed out that the Ia supergiants of type B may be hydrogen-poor.

Finally in section 6 the problem of choosing simplified physical representations of line forming when non-LTE physics must be used is discussed. Some relevant points concerning the observed spectral lines used for spectral classification are illustrated by means of partial energy-level diagrams.

Definition of the physical problems connected with extended atmospheres, R. N. Thomas, *SP332,* pp. 38-53 (Aug. 1970).

Key words: Classical atmosphere model; extended stellar atmosphere.

The necessity of carefully defining the phenomenological basis for classification of atmospheres as being "extended" is emphasized, and four alternative bases for such classification are suggested (1) the necessity to include curvature terms; (2) the presence of an ejected shell surrounding a central star; (3) an observational discrepancy between predicted and observed density gradient; (4) an anomaly between predicted and observed phenomena in stars with "dynamic" atmospheres such as cepheids. A number of physical problems connected with the presence of an extended stellar atmosphere are then categorized according to these alternative bases.

Extended atmospheres of planetary nuclei, K. H. Böhm and J. Cassinelli, *SP332,* pp. 54-60 (Aug. 1970).

Key words: Central stars of planetary nebulae; instability limit; nongray; Wolf-Rayet nuclei.

Exploratory calculations on nongray, hydrostatic-equilibrium model envelopes for central stars of planetary nebulae of high temperature and possibly near the instability limit are reported. It is conjectured that these may be related to Wolf-Rayet type nuclei; it appears possible to obtain an OV absorption, and OVI emission, spectrum even in an LTE calculation.

The N IV λ5820 multiplet in WN stars, H. Nussbaumer, *SP332*, pp. 61-64 (Aug. 1970).

Key words: HD 192163 WN6; N IV transition probabilities.

Evaluating transition probabilities of N IV 2p3d $^3P^0$ to 2s4s ^3S and 2p3p ^3P and an emission feature at λ7410 it is shown that a disputed emission at λ5810 in WN stars may not be attributed to N IV.

A self-consistent model atmosphere program with applications to solar OI resonance lines, R. G. Athay and R. C. Canfield, *SP332*, pp. 65-84 (Aug. 1970).

Key words: Non-LTE line formation; resonance lines; solar UV lines.

Profiles and total intensities are computed for solar OI resonance lines at λ1302 and λ1305 using a model atmosphere program that includes non-LTE effects in both hydrogen and oxygen and that includes microturbulence both as a line broadening mechanism and as a contribution to the gas pressure. Good agreement is obtained between computed and observed intensities. The computed profiles appear to have too much self-reversal.

Theoretical methods of treating line formation problems in steady-state extended atmospheres, G. B. Rybicki, *SP332*, pp. 87-118 (Aug. 1970).

Key words: Moving atmospheres; radiative transfer; spectral line formation; spherical geometry; stellar atmospheres.

Theoretical methods applicable to the study of line formation in steady-state extended atmospheres are reviewed. The formal solution of the transfer equation is considered, as well as numerical and analytical methods of determining the source function. Topics discussed include: the local frequency transformation, geometrical effects, and the case of large velocity gradients. A new plane-parallel approximation for spherically symmetric moving atmospheres is given that takes account of transverse velocity gradients.

Application of Monte Carlo methods in transfer problems, C. Magnan, *SP332*, p. 119 (Aug. 1970).

Line formation in moving atmospheres, W. Kalkofen, *SP332*, pp. 120-133 (Aug. 1970).

Key words: Line formation; line-profile computation; moving atmospheres.

We discuss an integral equation method that permits the calculation of the line source functions and of the emergent profiles in finite and semi-infinite atmospheres with macroscopic motion normal to the surface. Solutions are presented for a semi-infinite atmosphere with a temperature rise in the outward direction and with a flow that decays with increasing depth. The computed profiles have the form of P Cygni lines.

Laser action in non-LTE atmospheres, D. H. Menzel, *SP332*, pp. 134-137 (Aug. 1970).

Key words: Laser action; radiative transfer.

The radiative transfer equation is written in microscopic form, and from some simplifications on the ratio of occupation numbers for upper and lower level, a laser action is suggested.

Line formation in multi-dimensional media, H. P. Jones and A. Skumanich, *SP332*, pp. 138-170 (Aug. 1970).

Key words: Line formation in multi-dimensional media; matrix methods for integro-differential operators; numerical methods in transfer; radiative transfer in inhomogeneous media.

The flux divergence technique of Athay and Skumanich (1967) is generalized for application to media whose properties vary in more than one spatial dimension. In this method, the flux divergence is viewed as an integro-differential functional of the source function. The source function is then expanded in terms of basis functions along characteristic paths, and, with the help of various interpolations, the flux divergence is converted to an approximate linear algebraic operator on a discrete spatial grid. A large but finite set of linear, inhomogeneous, simultaneous algebraic equations with known matrix coefficients is thus generated and is solved by direct matrix inversion for the source function at each point of the spatial grid.

Some aspects of the accuracy, stability, and computational convenience of the technique are discussed. Sample solutions for depth dependent, axially symmetric variations of temperature are shown.

The continuous spectrum of hydrogen in a low-density envelope, H. Gerola and N. Panagia, *SP332*, pp. 171-178 (Aug. 1970).

Key words: Collisional excitation; low-density envelope; recombination case.

A progress report on theoretical work on the formation of a continuum in low-density stellar envelopes. Preliminary results are given on a comparison between the recombination case and the case for a semi-empirical approach including the effect of collisions from the ground state.

Bandwidth requirements in spectral line transfer calculations, R. G. Athay, *SP332*, pp. 179-188 (Aug. 1970).

Key words: Bandwidth requirements; line source function.

Accurate evaluation of a line source function, S, requires that the frequency bandwidth be sufficiently large to include properly transfer effects in the line wings. The bandwidth required to achieve a given level of accuracy in the evaluation of S can be specified, in units of the Doppler width, in terms of three parameters: the ratio of continuum to line opacity, r_o, the probability for collisional de-excitation, ϵ, and the Voigt wing parameter a. Bandwidths required to give S to an accuracy of 2 percent are given for values of ϵ and r_o from 10^{-2} to 10^{-8} and for values of a from 10^{-2} to 10^{-5}.

Comparison of discrete space and differential equation methods in non-LTE line transfer problems, P. P. Grant and C. E. Hunt, *SP332*, pp. 189-225 (Aug. 1970).

Key words: Inhomogeneous non-LTE atmospheres; line formation; numerical methods.

Numerical methods are essential to the treatment of line formation in inhomogeneous non-LTE atmospheres. The new methods due to Hummer and Rybicki and to Feautrier now make it possible to make such calculations, although these are often quite time-consuming.

We shall describe an alternative approach using discrete space techniques depending on concepts of invariance. The solution algorithm is closely related to the method of Hummer and Rybicki, whose equations are obtained as a limiting case. The stability and errors of our algorithm are susceptible to mathematical analysis, and make it possible to identify the critical parameters in the calculation with precision. The results for a two-level problem will be compared with those from an implementation of the Rybicki-Hummer equations and a comparison will be made of the performance of the two procedures in respect of speed of computation and storage requirements.

Coherent line formation with depth-dependent parameters, T. L. Carson, *SP332*, pp. 226-238 (Aug. 1970).

Key words: Coherent line formation; numerical methods.

A discrete ordinate method is developed for solving the equation of coherent line formation, for arbitrary given variations with depth in an atmosphere of the temperature (or Planck function, assuming local thermodynamic equilibrium) and the line absorption and scattering coefficients. The direct solution thus obtained can then be used as the starting point of an iterative procedure. Results obtained for an exactly soluble case indicate the utility of the method.

What do we know through spectral information on stellar chromospheres and coronas?, F. Praderie, *SP332*, pp. 241-258 (Aug. 1970).

Key words: Chromosphere; conservation equations; corona; spectral indicators.

Four problems in interpreting spectra to infer chromospheres-coronas are summarized. (1) The *a priori* difficulties in interpreting spectra lie in uncertainty on the range of possible models, coming from uncertainty as to which conservation equations may be applied, and from lack of an exhaustive list of spectral indicators that may be used for uniqueness tests. (2) As spectral indicators we consider: emission lines, self-reversed emission cores, the presence of He I lines in stars not of early type, coronal-type high ionization, excess continuum emission in the rocket UV and the far infrared. (3) To determine what we can infer from observations, we summarize information: inferred by comparison of models to data, on velocity fields, and on spectral variability which might suggest chromospheric activity. (4) We summarize the evidence for chromospheres in A stars, as being those where convection-induced acoustic heating is marginal.

What should we do to know more about chromospheres and coronae of stars?, R. N. Thomas, *SP332*, pp. 259-282 (Aug. 1970).

Key words: Chromospheres; classical atmosphere model; coronas.

Chromospheres-coronas satisfy the last two of the proposed classification schemes: inadequacy of the classical atmosphere (CA) model to represent observations and a priori rejection of the CA model. So we survey the question of what is required for more knowledge from the standpoint of asking what conceptual modifications will increase knowledge and what new observations are required. We stress that continued progress requires a continual interchange of ideas between the solar situation and the range of stellar situations.

Observations of ζ aurigae stars and their interpretation, H. W. Groth, *SP332*, pp. 283-289 (Aug. 1970).

Key words: Chromosphere; chromospheric clouds; Russell-Adams effect; super-excitation.

A summary of information on the extended atmosphere of the K component coming from three eclipsing binaries consisting of a K supergiant and a main sequence B star. Various anomalies exist: (1) Discrepancy between electron density and metallic density inferred from observations, noting that the electrons should come from the metals. This suggests a cloud structure in the atmosphere. (2) Anomalous excitation temperatures and populations of the second quantum level of hydrogen suggests a solar-chromosphere type behavior for these K atmospheres. (3) Significant changes in the profiles of the Ca^+ lines from one eclipse to another. The necessity to distinguish between effects coming from radiation of the B star on the K atmosphere and chromospheric-like effects is emphasized.

Ionization in nova atmospheres, P. Wellmann, *SP332*, pp. 290-294 (Aug. 1970).

Key words: Expansion; ionization; novae shell.

Calculations on the expansion of novae shells are presented, from which the degree of ionization is obtained using a simplified form of a non-LTE ionization equation. From this, estimates of the time of vanishing of the Balmer absorption spectrum can be made.

Circumstellar Ca II K lines in G, K, and M giants and supergiants, A. H. Vaughan, Jr., and A. Skumanich, *SP332*, pp. 295-299 (Aug. 1970).

Key words: Ca^+ emission core; circumstellar absorption lines; late-type giants.

Tentative evidence based on photoelectric observations of the Ca^+ emission core, is presented for the existence of circumstellar envelopes in several G and K type "giants." A significant emission asymmetry in α Tau may imply a chromospheric rather than a circumstellar source.

A physical mechanism for the generation of extended stellar atmospheres, R. W. Hillendahl, *SP332*, pp. 300-319 (Aug. 1970).

Key words: Cepheids; extended atmospheres; hydrodynamics; shock waves.

A physical mechanism that can result in the generation of extended expanding atmospheres is discussed. The process involves the unloading of stellar material following the arrival of a shock wave at the edge of the star. The basic principles are developed from a discussion of a simplified case that has been studied in the laboratory; they are then applied to the atmosphere of a star. A radiation-hydrodynamics computation of a model cepheid is then used to obtain quantitative atmospheric profiles. The computed continuum and spectral lines during the unloading process are then examined. A discussion of the possibility that the unloading process occurs in stars other than cepheids suggests the existence of a shock visibility factor associated with ionization or dissociation in the region behind the shock front and leads to a possible alternate interpretation of the variable star instability strips in the H-R diagram.

SP333. **Research materials developed under the NBS inorganic materials program,** F. E. Brinckman and J. B. Wachtman, Jr., Nat. Bur. Stand. (U.S.), Spec. Publ. 333, 71 pages (September 1970).

Key words: Chemical properties; composition; gases; glasses; liquids; multiphase materials; physical properties; polycrystals; preparation; research.

The National Bureau of Standards develops many specialized materials in the process of carrying out research supporting its measurements, standards, and service activities. These materials include gases, liquids, glasses, single crystals, polycrystals, and various multiphases materials; their compositions (including trace elements in some cases) and physical characteristics are tailored to specific research needs, but the materials are often of use for other research purposes. Production is usually limited to immediate internal needs and samples are not generally available for distribution, but knowledge of production techniques and materials characteristics which may be helpful to other scientists is available. The present listing of research materials developed in the Inorganic Materials Division accordingly gives names of scientific staff members who may be contacted for this type of information as well as giving a brief summary of the nature, method of preparation and properties determined for each material.

SP334. **Industrialized building in the Soviet Union, (a report of the U.S. Delegation to the U.S.S.R.),** J. R. Wright, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 334, 81 pages (Dec. 1970).

Key words: Building economics; building systems; construction industry; housing; precast concrete; production capacity; production management; production methods; standardization; United Soviet Socialist Republics.

The 1969 Exchange delegation to the USSR reports the status of Soviet building industrialization, with emphasis on Soviet housing. The report describes the State management hierarchy, production of precast concrete components and housing construction procedures. The loadbearing panel system, the mainstay of Soviet prefabricated housing, is compared with the newer three-dimensional box system. Detailed analysis is made of the cost of a nine-story panel prefabricated apartment building in the USSR, and the cost of the same building if constructed in the U.S.

SP335. **Innovative metrology—key to progress.** Proceedings of the 1970 Standards Laboratory Conference held at the National Bureau of Standards, June 15-17, 1970, H. L. Mason, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 335, 132 pages (Mar. 1971).

Key words: Metrology management; National Conference of Standards Laboratories; physical measurement; Proceedings NCSL.

The biennial Standards Laboratory Conference of the National Conference of Standards Laboratories convened at the Gaithersburg facilities of the National Bureau of Standards June 15-17, 1970. The theme of the meeting, Innovative Metrology—Key to Progress, was amplified by 23 papers presented at technical sessions devoted to new technologies and applications, laboratory management and operations, new methods of optimizing calibration intervals, new ways of managing, and new international developments. *These proceedings include the following papers (indented):*

The evolution of a radiological mensuration technique, H. Bardach and S. Wisnieff, *SP335*, pp. 11-21 (Mar. 1971).

Key words: Attenuation of betas; beta-transmission phenomenology; counting geometry; mass absorption coefficient derivation; strontium 90 wall-thickness measurement gage; thin-wall mensuration.

A radiological mensuration technique was devised to measure the minimum wall thickness anchoring from interior corner points of small castings invested with internal cavities. The factors involved in the development of the mensuration technique which culminated in the manufacture of a semi-automatic machine tooled with a strontium 90 gage were examined in detail. These factors included the phenomenology of beta transmission through plural media, the subtleties of counting geometry, and the characteristics of the beta spectrum, all of which contributed in some measure to the efficacy and uniqueness of the beta emitter as a mensuration tool.

The technique involved the positioning of an encapsulated strontium 90 point source contiguous with the interior points at which the minimum wall thicknesses were to be measured and determining these thicknesses by referencing the observed beta transmission counting rates to a calibration curve.

An automated time domain instrument test console, L. S. Kreyer, *SP335*, pp. 23-28 (Mar. 1971).

Key words: Automatic measuring devices; automatic performance test; computer control systems; instrument calibration procedures; instrument performance testing; pulse technology; time domain testing.

This paper describes a computer-controlled system which automatically tests the performance of oscilloscopes and other time domain instruments. The system utilizes advances in pulse technology to speed up the calibration process by replacing frequency domain test methods with time domain test methods. Cost effectiveness of this system in terms of reduced man hours to calibrate an instrument, reduction of systematic errors due to operator bias, and consistent reporting of test results are described.

Standards laboratory applications of a computer-automated system, F. B. Seeley, *SP335*, pp. 29-33 (Mar. 1971).

Key words: Computer automation; resistance thermometers; resistor intercomparison; standard cell surveillance.

A computer-automated calibration system whose accuracy and precision make it suitable for standards laboratory applications is described. The system has been applied to electrical, radio-frequency, electro-optical, and electromechanical measurements. Results are summarized that include saturated standard cell, standard resistor, resistance thermometer, micropotentiometer, and attenuator calibrations. Additional topics include the experience in computer programming, reliability, and systems operation.

Cost reduction in calibrating bolometer mounts, W. F. Dentinger and L. dePian, *SP335*, pp. 35-37 (Mar. 1971).

Key words: Automated dc substitution; bolometer calibration; radiofrequency power measurement; self-balancing Wheatstone bridge.

Ordinarily a great deal of time is spent in calibrating bolometer mounts. Manual bridges require considerable care for proper balances, bias adjustments, and calibration procedures. New instruments have been designed to automate many of the manual operations. These instruments are self-balancing and maintain precise power levels with minimum adjustments. Due to the fact that in previous setups a series of measurements had to be made in order to average out errors caused by temperature changes, the new automated system described in this paper can save about 90 percent in measurement time. In addition, a less skilled operator can perform the measurement with the same accuracy.

Measurement comparison programs, H. S. Ingraham, Jr., *SP335*, pp. 39-40 (Mar. 1971).

Key words: Accelerometer round robin; computer program for Youden diagrams; correlation effect; end standard of length.

The measurement comparison program of 1965 circulated unknowns in pairs, allowing use of Youden diagrams to distinguish systematic from random error. In 1969, two pairs were sent out several months apart, allowing check of the correlation effect; a round robin was started on acceleration; a 24-inch end standard was included in the physical package.

Report on the 1968-69 mass measurement agreement comparison round robin, L. B. Macurdy, *SP335,* pp. 41-45 (Mar. 1971).

Key words: Between-group variance; mass comparisons of 1969; systematic and random weighing errors; within-group variance.

Seventeen laboratories took part in the round robin measurements of the NCSL Mass Comparison packages during 1968 and 1969. In order to speed up the measurements the laboratories were divided into two groups. The weights were calibrated by the NBS Mass Laboratory at the beginning and again at the end, and Mettler Instrument Corporation measured all sets near the middle of the series. Two sets of weights were sent to each laboratory at times separated by two months or more in order to provide data on errors made on the same day (within-group variance) and on errors between measurements at longer intervals (between-group variance). Each set of weights consisted of four pairs of one-piece stainless steel weights of 100 g, 25 g, 10 g, and 1 g. Data include weighing errors of the various laboratories and Youden plots of the measurements. Some errors proved to be larger than had been expected. The results illustrate the need for verifying the accuracy of measurement on some rational basis.

NCSL specification presentation, F. J. Dyce, *SP335,* pp. 47-50 (Mar. 1971).

Key words: Calibration records; calibration system specification; intervals; procedures; recall; reliability; traceability.

This paper describes in summary the requirements of the National Conference of Standards Laboratories "Calibration System Specification." It indicates how the specification was written by members of the NCSL Specifications Committee in answer to a DOD request. The specification contains the minimum essential requirements of a calibration system. The paper discusses the steps required to approve the specification as a recommended practice and to obtain Government approval and adoption.

Cost visibility exchange program—a new approach to cooperative savings, R. J. Barra, *SP335,* pp. 51-55 (Mar. 1971).

Key words: Calibration and maintenance manhours; digital counters; digital voltmeters; exchange program on costs; oscilloscopes.

A preliminary survey by the Calibration Systems Management Committee indicates 600,000 manhours per year spent on 9 types of instruments, including oscilloscopes. Member organizations are asked to contribute cost data with the objective of saving one million dollars in calibration and maintenance costs by 1972.

Keys to optimum calibration intervals, R. B. F. Schumacher, *SP335,* pp. 57-64 (Mar. 1971).

Key words: Calibration intervals; economy in adjusting quality level; measurement uncertainty; reliability of working instruments.

The search for optimum calibration intervals or for methods to obtain them can be frustrating. Our theories concerning the behavior of measuring instruments are deficient. and as a result, so are all theoretical models attempting to establish optimum intervals. Nor can we hope to determine empirically what optimum intervals should look like. The many variables in calibration control systems, affecting quality and behavior and performance evaluation of measuring instruments, forbid us to compare the meaning and merit of calibration intervals achieved in one calibration control system with those achieved in another such system. Time does not permit us to experiment in one system until we achieve calibration intervals which are even near optimum. We must be modest and practical. We must lower our sights.

This paper attempts to show the main sources of our ignorance about instrument behavior and about the influence of a calibration control system on instrument behavior and on our evaluation of this behavior. It offers seven keys to the establishment of an efficient method for calibration interval adjustment. Emphasis is on efficiency, practicability, economy. The purpose of adjusting calibration intervals is to maintain a given level of instrument quality level at the lowest cost. Having found a satisfactory calibration interval adjustment method, one should look to other components of the entire calibration control system for opportunities to lower costs.

Intervals by exception, J. Glassman, *SP335,* pp. 65-72 (Mar. 1971).

Key words: Calibration intervals; exponential distribution; reliability, systems effectiveness, tradeoffs.

"Intervals by exception" is a new approach devised at the Navy Metrology Engineering Center to control the evaluation and adjustment of calibration intervals for the Navy Calibration program. It furnishes management with a powerful tool with which to monitor calibration intervals and assure reliability of equipment.

What are some of the interesting features of this new technique?

(1) It enables management to concentrate on problem equipment by pinpointing "dogs" and "gems," i.e., statistically poor and statistically good equipments.

(2) It allows management to select "optimum" intervals based on automatically derived reliability tradeoffs.

(3) It motivates laboratory personnel by providing an information feedback loop for problem instruments.

(4) It lowers operating costs by funneling analysis and engineering effort into the areas of greatest needs and most promising returns.

(5) It lowers costs by lengthening intervals on family types and stabilizing reliability levels.

(6) It provides automatic computer monitoring of all decisions (cause-effect feedback).

This system is presented with charts that illustrate its operation, outputs, and management-oriented controls. The presentation includes data analyses, adjusting of intervals, detection of "dogs" and "gems," resultant changes in system operating characteristics, underlying mathematical assumptions, and mathematical models.

Optimizing calibration intervals, D. J. Greb, *SP335,* pp. 73-79 (Mar. 1971).

Key words: Data support; fixed calibration interval; instrument reliability; statistical validitv; two-method optimization.

This paper describes a two-method system for using simple attributes calibration data to adjust and optimize calibra-

tion intervals. Each method is used only where its superior characteristics predominate; the combination of methods produces a total system which exploits the advantages of each without having to suffer with the disadvantages. The "fixed interval through data" method is employed where there are at least 27 bits of data, the application being unique in that the data is treated as a random sample from an infinite population, sampling variations are accounted for, and all decisions to extend calibration intervals are characterized by statistical validity. When there are only from 5 to 26 bits of data, statistical validity is not possible and the "fixed interval through engineering intuition" method is utilized. However, intuition and judgment are applied only to a set of decision rules, and strong, specific data support is required. The system has not been extended to less than 5 bits of data, although there would seem to be no problem in so doing. Net results in the first 18 months of use are 495 changes involving 34,200 units, with annual savings of 24,100 technician hours, and with no noticeable deterioration in overall instrument reliability.

Optimum cycles determined with confidence, P. A. Seamans, *SP335,* pp. 81-84 (Mar. 1971).

Key words: Calibration histories; equal likelihood; oscilloscopes; RX meters; vacuum-tube voltmeters.

The calibration history of a family of instruments provides data on how often the instruments were recertified and whether each was in calibration when recertified. These data permit the calculation of the optimum calibration interval for a desired level of confidence in the instrument readings. Three case histories (oscilloscope, RX meter, VTVM) show this method is effective. The histories of a family of oscilloscopes over a thirteen-year period show that calibration cost tends to be roughly constant with time and thus does not seem to follow the "bathtub curve." All instruments investigated seem to have equal likelihood of failure in all intervals, and thus the bathtub curve does not seem to hold in general.

Breakthrough techniques for metrology work, L. B. Wilson, *SP335,* pp. 85-88 (Mar. 1971).

Key words: Managerial breakthrough techniques; personnel selection for metrology; steady control versus sudden change.

Metrology work involves the conflicting and diametrically opposed problems of control versus breakthrough. Controls are vital to assure accuracy and reliability. However, breakthroughs are necessary to provide improved accuracies, ranges, and types of measurements. The dichotomy of this situation comes principally from the differences in attitudes involved. Ideally, control and breakthrough should be carried out by two different types of people because of these differences.

Breakthrough techniques, coupled with proper attitudes and a systematic method for establishing objectives and evaluating alternatives, provide a powerful set of new tools for improvement. Examples are given showing the possibilities for applying these tools to reduce costs and provide needed measurement and calibration services.

Data system for improving instrument reliability, F. J. Dyce, *SP335,* pp. 99-104 (Mar. 1971).

Key words: Calibration data system; calibration interval adjustment method; instrument reliability; instrument standardization.

This paper discusses the importance of monitoring and control of instrument reliability. It suggests that a minimum reliability level be set as a goal. It discusses the interval adjustment scheme used at Martin Marietta wherein individual instrument performance determines calibration interval as well as repair and surplus. A thorough explanation is given of the computerized data system used at Martin Marietta to monitor instrument reliability and to isolate repetitive problem areas. Several examples are given of reliability problems which were solved through use of the system.

A unique standardization committee is discussed which justifies the company's sole-source purchase of general-purpose, reliable electronic test equipment.

The paper concludes that striving towards a reliability goal will result in improved reliability and reduced cost.

The importance of visibility and control in laboratory management systems, J. L. King, *SP335,* pp. 95-98 (Mar. 1971).

Key words: Data for decision; standards laboratory management; test equipment records; use, storage, or surplus.

The Test Equipment Control Engineering Section has overall responsibility for 2719 different models of 40,000 items, from purchase to final disposition. Computerized system shows decision-makers the history of costs, locations, and interface with operations; yields savings of $800,000 per year.

The new state standards program, R. Mills, *SP335,* pp. 89-94 (Mar. 1971).

Key words: Length measurements; mass measurements; metrology; standards; state laboratories; volume measurements.

In 1965, Congress appropriated funds for new state standards and instruments in mass, length, and volume. The laboratories receiving this package are, in most cases, under the administration of state offices of weights and measures. These labs not only check the accuracy of field standards used by weights and measures inspectors, but also serve as local measurement centers to perform industrial tests. The equipment and training given to laboratory personnel are described in this paper, as well as some of the administrative details and the utilization we foresee for the state laboratories.

New U.S. Air Force audit program, L. W. Root, *SP335,* pp. 105-109 (Mar. 1971).

Key words: Audit examinations; audit package; Precision Measurement Equipment Laboratories (PMEL); technician skills; U.S. Air Force.

This paper describes a unique quality assurance audit program used for testing worldwide Precision Measurement Equipment Laboratories (PMEL's). Conventional methods utilized during previous audits are examined briefly and disadvantages noted. The advent of highly sophisticated systems and test equipment has placed increased emphasis on the experience and skill level of the technicians who provide calibration support at PMEL's. Specific configuration of a unique package designed to evaluate this skill level is discussed in some detail and results obtained during the past year are presented.

NPL work on the determination of $2e/h$ by the ac Josephson effect, B. W. Petley and K. Morris, *SP335,* pp. 111-115 (May 1971).

Key words: Inductive ratio divider; Josephson effect; NPL of UK; potential-divider resistor; quantum standard of voltage; solder-drop Josephson junctions; superconductivity.

The a-c Josephson effect in superconductivity appears to be an exciting possibility for use as a quantum method of maintaining the volt as an SI unit, through the relations $2\ eV = h\nu$. A potential-divider resistor was devised for precise comparison of a Wesson-cadmium cell with millivolt outputs from various solder-drop junctions excited at 36.8 GHz. The value found for $2\ e/h$ is 483.5941 ± 0.0010 $MHz/\mu V_{69NPL}$.

The impact of advanced electronic technology on measurements, R. F. Clark, *SP335*, pp. 117-119 (Mar. 1971).

Key words: Attenuation measurement; automatic data correction; auxiliary receiver for microwave measurements; dual admittance Woods bridge; Engen microcalorimeter; rf coaxial impedance standards.

Advances in electronic technology have made possible significant improvements in both accuracy and precision of measurements. Some comments will be made on the increase in accuracy through automatic application of data corrections (which were previously too difficult to be practicable) and the elimination of many "human" errors. Better precision coming from increased speed of measurement and improved control of the environment of the measurement will be discussed.

Design and development through metrology, P. Prakash, *P335*, pp. 121-124 (Mar. 1971).

Key words: Designing to specification; fabrication of balances; legal metrology; mass standards; NPL of India.

The National Physical Laboratory of India, in implementing the 1956 Standards of Weights and Measures Act, adjusted and calibrated mass standards of 50 to 10^{-6} kg for 250 State Laboratories. Most of the 5000 balances needed by Inspectors were designed and fabricated by four commercial manufacturers in India, with specifications, technician training, and performance testing supplied by NPL. With this experience, two manufacturers designed and fabricated the higher precision balances for District-level laboratories. The technique is recommended to developing countries faced with similar projects.

Telecommunication measurements for automatic production and maintenance, H. Fleischer, *SP335*, pp. 125-127 (Mar. 971).

Key words: Automatic noise-level recorders; calibration of carrier-frequency filters; microwave transmission lines; Siemens-Halske AEG; Wandel & Goltermann.

Automatic recorders with uncertainties no greater than 0.1 dB up to 18 MHz are used in one channel of a microwave link to measure effective equivalence and noise level to provide production calibration control for filters and attenuators. Details of two German-made systems are described.

Present status of electrical standards and their traceability in Japan, M. Kanno, *SP335*, pp. 129-132 (Mar. 1971).

Key words: Absolute measurements; basic electrical standards; quantum electric standards; radio-frequency standards.

The national electrical standards for Japan described herein are established and maintained in the Electrotechnical Laboratory. Dissemination is by two public agencies. Committees on traceability and on measuring techniques are active in the Institute of Electrical Engineers.

SP336. **Space simulation.** Proceedings of a Conference held at NBS, Gaithersburg, Maryland, September 14-16, 1970, J. E. Richmond, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 336, 985 pages (Oct. 1970).

Key words: Ablation; particulate radiation; re-entry; space simulation; thermal radiation; vacuum; weightlessness.

This volume contains all of the papers presented at the Fifth Space Simulation Conference held at the National Bureau of Standards September 14-16, 1970, that were available for publication. The general scope of the conference was the effect of the space environment on materials, components, structures, and man. The range of topics is too wide to permit a simple classification, but contamination, ablation, degradation of materials by the space environment and predictive testing account for approximately half of the papers presented. Other topics range from purely laboratory problems such as radiometry standards, calibration of vacuum gages, cryopumping and operation of space simulation facilities to gravity simulation, with neutral buoyancy for zero gravity and a man-rated centrifuge for high gravity, use of a drifting submarine to study the psychological aspects of long-duration missions in a space station, and simulation of (1) atmospheric balloon environments, (2) radiation from nuclear power sources, (3) solar wind, (4) micro-meteoroid bombardment, (5) soil friction on the moon, and (6) the Martian atmosphere. *These proceedings include the following papers (indented):*

Molecular contamination in environmental testing at Goddard Space Flight Center, J. C. Goldsmith and E. R. Nelson, *SP336*, pp. 1-24 (Oct. 1970).

Key words: Chemical analysis; contamination; organic residues; outgassing; polymeric materials; residual gas analysis; test facility; vacuum.

A discussion of the various techniques used to detect and analyze materials outgassing from a spacecraft during the environmental test is presented. In addition, a number of compounds that have been detected and their parent outgassing sources are listed. The two major methods for reducing the threat of contamination (i.e., proper choice of spacecraft materials and proper operation of the test facility) are also discussed.

Contamination measurement in space environment simulation chambers, C. M. Wolff and M. L. Ritter, *SP336*, pp. 25-49 (Oct. 1970).

Key words: Contamination collection units; gas-liquid chromatography; infrared spectrometry; mass spectrometry; quartz crystal oscillator mass monitors; radiometry; reflectometry; space environment simulation chambers.

Contamination measurement is classified according to the requirements; i.e., the identity, sources, and effects of contamination by active and passive sampling. The chemical nature of the most common contaminants found in space environment simulation is discussed. Qualitative and quantitative techniques for contaminants analyses are described and evaluated. These techniques include mass spectrometry, quartz crystal oscillator mass monitors, infrared spectrometry, and gas-liquid chromatography. Also, the uses of optical surfaces and thermal control coatings as contaminants effects monitors are described.

Contamination studies in a space simulated environment, D. L. Enlow, *SP336*, pp. 51-77 (Oct. 1970).

Key words: Absorption; condensation; contamination control; evaluation; far infrared; fluid dynamic force; microorganisms; optical properties; planetary quarantine; polymers; shock force; space simulation; testing; volatile products.

Biological and optical contamination problems can be best investigated experimentally. Studying the dynamics of microorganisms in a vacuum environment showed that shock forces in the order of a 1000 g's will liberate 20 percent of the previously bound particles and the effect of simulated attitude control gas jet firing will remove more than 50 percent of the bound particles.

A potential source for optical degradation to infrared systems is identified as the absorption phenomena of condensed volatile products from certain polymeric materials. The effects of this condensation were analyzed by a combination of surface photography and IR spectroscopy. These preliminary investigations point out the need for proper materials selection for far infrared space-borne optical systems.

External spacecraft contamination modeling and countermeasures, T. Baurer, M. H. Bortner, I. M. Pikus, and A. M. Cooper, *SP336,* pp. 79-103 (Oct. 1970).

Key words: Contamination; mass transfer; spacecraft.

The problem of spacecraft external contamination is a function of both the spacecraft and the receptors, in relation to the natures and quantities of contaminants involved, i.e., the problem depends on both design and mission. The relevant phenomenology may be conceptualized in a model which assumes that a mass-transfer mechanism is operative, including sources, transport modes, and sinks. Typical sources include engine debris, jettisoned wastes, outgassing, and cabin leakage. Gaseous contaminant transport is based on the complex interaction of gas-surface interaction potentials and hydrodynamic, electrostatic, and magnetic fields. Condensed-phase materials are subject to hydrodynamic coupling, induced polarization, and electrostatic field effects. The sink or deposition mechanism assumes differential charge development on conducting (e.g., vehicle skin) and dielectric (e.g., windows, lenses) external surfaces, such as to cause preferential attraction to the latter. The net electrostatic potentials at the dielectric surfaces cause charge neutralization of impinging ions, followed by bonding, scattering, and desorption. Impacting particulates adhere or scatter at the dielectric surface depending on the relative magnitudes *of local surface potential,* strength of induced dipoles, and particle velocity vectors normal to the surface. Flowing and adhering contaminants continually cover the surface, preserving its dielectric nature. This model suggests the applicability of at least three complementary approaches to the problem of counteracting contamination, viz., passive prevention of the appearance of contaminants, active removal measures during the transport of contaminants which do appear, and means of counteracting or discounting the effects of contaminants which complete their transit to sensitive surfaces.

Particulate contaminant measurement by quartz crystal microbalance, R. L. Chuan, *SP336,* pp. 105-111 (Oct. 1970).

Key words: Particulate sampling; quartz crystal microbalance; spacecraft contamination.

A piezo-electric crystal executing vibrations in a shear mode can be used as a mass balance with very high sensitivity. Various methods have been used by investigators in diverse fields to bring the mass to be measured to such a balance. Some of these are: absorption of a gas into the surface of the crystal; condensation of a gas onto a cooled crystal; chemical reaction with material bonded to the crystal surface; and impaction of particulate matter onto the crystal surface. The present paper deals with this last mass-accretion mechanism as applied to the measurement of contamination in the form of particulate matter present in space environment (actual and simulated).

The QCM (quartz crystal microbalance) responds to a mass change on its surface typically in the following manner: $\Delta f = -Cf^2\Delta m$, where Δf is the change in the crystal resonant frequency f due to the addition of mass Δm, and C is a constant whose magnitude is about 10^6. For a nominal frequency of 10^7 Hz the sensitivity, $\Delta f/\Delta m$, is of the order of 10^8 Hz/gm, from which it is seen that the mass resolution of the QCM depends directly on frequency resolution. Frequency resolution, in any given oscillator, depends on the characteristic time within which measurements are taken—the resolution generally degrading as the time increases. Thus for small mass change occurring in a long time (by which we mean seconds or tens of seconds) the frequency resolution is commonly not better than about 0.1 to 1 Hz for a 10^7 Hz oscillator. However, if the characteristic measurement time is less than, say, 10^{-2} sec, the frequency resolution can be quite good—being of the order of 10^{-2} Hz or better. This consideration lends itself to the sensitive and accurate measurement of discrete particulate mass, because when such a mass is deposited on the crystal there is an almost instantaneous, though small, frequency shift. By utilizing this very high rate of frequency shift it is possible to measure particulate mass down to the order of 10^{-11} gm. This is equivalent to a single particulate of 2 micron diameter with mass density 2 gm cm^{-3}.

In addition to measuring the mass of particulate matter, the technique also provides information on whether the material is volatile. If subsequent to its impaction onto the crystal surface, with an accompanying frequency shift, the particulate material evaporates, there will not only be a loss of mass but, more importantly, there will be cooling of the crystal. The crystal can be chosen so as to exhibit a frequency change of a sign opposite to that caused by mass addition. Then the instantaneous frequency change caused by the impaction of particulate will be followed closely by an opposite frequency change due to evaporation.

Experimental data will be presented showing the response of the QCM to nonvolatile and volatile particulate matters.

Space measurements of the contamination of surfaces by OGO-6 outgassing and their cleaning by sputtering and desorption, D. McKeown and W. E. Corbin, Jr., *SP336,* pp. 113-127 (Oct. 1970).

Key words: Cleaning; desorption; ions; outgassing; quartz crystal microbalance; solar panels; space; sputtering; surface contamination.

Results of the contamination of surfaces by outgassing of the OGO-6 satellite and the rates at which these surfaces are now being cleaned by sputtering and desorption after being in space for five months are given. The contamination measurements are being made with a quartz crystal microbalance to define the conditions of Al and Au surfaces used in an experiment to measure gas-surface energy transfer. It was found that the primary source of outgassing on the satellite was its two solar panels baking out in the sun. The time constant for the exponential decay of the outgassing is 1,000 hours. The maximum amount of contamination adsorbed by the surfaces exposed to the outgassing was reached after five months in orbit and is 96 mg/m^2 for the Al surface and 52 mg/m^2 for the Au surface. The contamination has a desorption activation energy of 26 kcal/g mol which falls into the energy range of materials, such as, epoxies and vacuum oils. The surfaces are now undergoing cleaning by desorption at 1.2×10^{-9} g/m^2s and sputtering by upper atmospheric neutral impacts at 2.3×10^{-9} g/m^2s. A method to greatly increase the cleaning rate by removal of the contamination by sputtering with upper atmospheric ions is discussed.

Simulation of radiation from RTG power sources, P. A. Newman, Jr., *SP336*, pp. 129-140 (Oct. 1970).

Key words: Evaluation; MOSFETS, neutrons; Pu^{239}-Be; radiation simulation; RTG; test.

The recent interest in Radioisotope Thermoelectric Generator (RTG) power systems for deep space missions, and the ever increasing use of the radiation sensitive MOSFET in spacecraft electronics has made it essential that an assessment of the radiation effects for this combined application be determined. An RTG with its continuous flux of neutrons and gamma photons provides a long term hostile environment for electronic components. This paper deals with a radiation source (Pu^{239}-Be) selected to simulate, for the most part, the neutron effects of the RTG. Preliminary experiments with this source have indicated that for most electronic applications the neutron contributions of the RTG over a five year mission in present spacecraft configurations will not be a major problem. An analysis of the data from several experiments indicate that predictions of the radiation effects can be made for "hotter" configurations with a reasonable degree of confidence.

In situ vacuum gauge calibration by the reference transfer method, L. D. Blado and R. H. Lilienkamp, *SP336*, pp. 141-150 (Oct. 1970).

Key words: Reference transfer method; vacuum gauge calibration.

Application of the Reference Transfer Method to in situ calibration of ionization gauges was evaluated in order to ascertain the effectiveness of the method when applied in a manner determined both by the commercial availability of equipment and by the restraints of an operating space environment simulation facility. A prototype Reference Transfer Calibrator (RTC) was assembled from standard vacuum components. Transfer ratio determinations were made in the range 10^{-4} to 10^{-8} torr. These experimental measurements were then compared with theoretical calculations, thereby verifying the feasibility of the technique.

Methods of determining residual gas composition from residual gas analyzer data, R. H. Lilienkamp, *SP336*, pp. 151-164 (Oct. 1970).

Key words: Mass spectrometry; residual gas analysis computer simulation; residual gas analysis data reduction; space vacuum system gas.

Three methods of determining residual gas composition from Residual Gas Analyzer (RGA) data are compared using a computer simulation of an RGA to generate the data for analysis. Typical vacuum system gas mixtures and errors from shot noise were simulated. Errors were also introduced into the calibration data used to interpret the RGA data. The first method is an iteration technique which proved to be inferior to the other methods. The second is a matrix inversion method which worked well for the gases used in this study but which must be evaluated for each gas mixture. The third method is a multiple regression analysis giving least squares fit to the data. This method uses all of the data from the RGA and is usable with any mixture of gases. The effect of the calculation of the residual gas composition is also shown.

Spectral absolute reflectance measurements of CO_2 frosts in the 0.5 to 12.0 micron region, B. E. Wood, A. M. Smith, B. A. Seiber, and J. A. Roux, *SP336*, pp. 165-183 (Oct. 1970).

Key words: Absorbing; anomalous dispersion; carbon dioxide; cryodeposit; cryogenics; frost; infrared; integrating sphere; Mars; reflectance; scattering; simulation; spectral.

In situ absolute reflectance measurements have been made for carbon dioxide frosts formed on liquid-nitrogen cooled substrates. Data were obtained spectrally in the wavelength range from 0.5 to 12.0μ using an infrared integrating sphere. CO_2 frosts were found to exhibit an anomalous dispersion reflectance peak at 4.3 microns which was shown to be a very sensitive indication of the presence of solid CO_2. Also CO_2 frosts scatter short wavelength radiation ($\Lambda < 1.0\mu$) significantly and is semi-transparent for much of the wavelength range between 2.0 and 12.0. The application of these results to problems associated with cryogenically cooled surfaces is discussed.

NBS radiometric standards—present and future, H. J. Kostkowski, *SP336*, pp. 185-187 (Oct. 1970).

Key words: Irradiance; radiometric standards; radiometry; spectral irradiance; spectral radiance.

One of the primary functions of the National Bureau of Standards is to realize, maintain and disseminate national standards of measurement. In radiometry, the currently available standards consist of various types of tungsten lamps or blackbodies that have been calibrated in terms of spectral irradiance, or total irradiance.

The standards of spectral radiance are either tungsten strip lamps or blackbodies, have temperatures from 500 to 3000 K, and are calibrated, depending on the temperature and source, from 0.2 to 15 μm. Their uncertainty varies from about 0.1 to 5% depending on the temperature and wavelength. Two additional, useful standards that do not require calibration and are available commercially are the graphite arc and the copper-point blackbody.

At present, there are two standards of spectral irradiance. The first is a 1000-watt coiled coil tungsten filament quartz-halogen lamp and the second consists of this lamp mounted in a ceramic reflector. Their spectral irradiances at a wavelength of 0.9 μm and working distances of 50 and 40 cm are about 25 and 105 $\mu w\ cm^{-2}\ nm^{-1}$ respectively, and they both vary with wavelength roughly as a 3200 K blackbody. These standards are uncertain by values ranging from 3% at 2.5 μm to 8% at 0.25 μm. However, a research effort is now under way which is expected to reduce these uncertainties within a year by a factor of about 3.

The standards of total irradiance consist of the same lamps used for spectral irradiance standards and in addition 100, 500, and 1000 watt projection lamps. They have irradiances varying from about 0.5 to 135 mw cm^{-2} at working distances from 100 to 40 cm. The uncertainty of these sources has been estimated to be about 1%.

Radiometric detectors that can be calibrated electrically are becoming commercially available and appear useful in replacing irradiance source standards for some applications, particularly at the upper levels of approximately 100 mw cm^{-2}. Such absolute or calorimetric detectors, as they are sometimes referred to, are being developed and extensively evaluated at NBS. An uncertainty and reproducibility of a few tenths of a percent is anticipated for some models of these detectors.

A description of the standards, of how they are realized, of current attempts and limitations in extending their range or reducing their uncertainties, and the present NBS policy for their dissemination will be included in the verbal presentation.

Apparatus for laboratory simulation of ionospheric flow over on-board instruments of an AES, E. N. Evlanov, V. B. Leonas, and S. V. Umansky, *SP336*, pp. 189-196 (Oct. 1970).

Key words: Apparatus; beam diagnostic; ion source; ion transportation; laboratory space simulation; vacuum system.

An apparatus for a simulation of ionospheric plasma flow over on-board instruments of an artificial earth satellite (AES) is described. The simulated fluxes of nitrogen, hydrogen, and other ions have energies in the range of 5 -10^2 eV, current density of $1 \cdot 10^{-8}$ A/cm and provide good simulation of the natural working conditions of on-board instruments. A description of diagnostic means which are used for analysis of the flow parameters is given.

Thermal conductivity measurements of a candidate Viking heat-shield material after sterilization, and during exposure to vacuum, and to a simulated Martian atmosphere, L. R. Greenwood and R. M. Fleming, *SP336*, pp. 197-208 (Oct. 1970).

Key words: Ablation material; thermal conductivity; vacuum effect.

An experimental program has been conducted to measure the thermal conductivity of the proposed Viking heat-shield material, Martin SLA-561, after sterilization (60 hours at 276 °F) and during exposure to vacuum and to a simulated Martian atmosphere (74.4 percent CO_2, 12.8 percent N_2, 12.8 percent Ar). In situ thermal conductivity measurements were made at 75 °F using the line-source technique. The thermal conductivity of SLA-561 was measured to be 0.0298 Btu/ft-hr-°F at atmospheric pressure. In the first environmental sequence consisting of atmosphere, vacuum, and simulated Martian atmosphere exposure, a 60-percent reduction in thermal conductivity was measured in vacuum. After a 4-hour exposure to a 7-torr pressure in the simulated Martian atmosphere, the thermal conductivity increased 67 percent from the value measured in vacuum. The second environmental sequence consisted of measurements in the atmosphere, after sterilization and during exposure to vacuum and the simulated Martian atmosphere. The results of these measurements showed that sterilization had no effect on the thermal conductivity measured at atmospheric pressure nor on the changes measured in vacuum and in the simulated Martian atmosphere. Thermal conductivity was measured at varying pressures during both environmental sequences and the results showed the thermal conductivity to be essentially independent of pressure below 10^{-4} torr with the transition from molecular to continuum flow occurring in the 10^{-2} to 10 torr pressure range.

Method for rock property determination in ultrahigh vacuum, E. R. Podnieks and P. G. Chamberlain, *SP336*, pp. 209-223 (Oct. 1970).

Key words: Anisotropy; compression tests; mass spectroscopy; mechanical properties; outgassing; pressure measurements; rock mechanics; space environment simulation; ultrahigh vacuum.

A special ultrahigh vacuum system was designed for determining deformational and strength properties of simulated lunar rocks. The system provides a vacuum of 10^{-9} to 10^{-10} torr (10^{-7} to 10^{-9} N/m^2) depending on the specimen size and rock type. The vacuum was measured by various types of gages and also by ion pump current measurements. The partial pressure measurements of the various gas components were obtained by a quadrupole residual gas analyzer. The vacuum chamber has two stainless steel bellow-type feedthroughs for loading and a spring mechanism to compensate for the atmospheric pressure effect on the rock specimen. The uniaxial load was applied to the specimen by a servo-controlled hydraulic testing machine. Specimens of tholeiitic basalt, dacite, and semiwelded tuff were used. Special procedures in specimen preparation and preconditioning were developed. During the pumpdown period, prolonged roughing and an initial bakeout produced significantly low final pressures in the chamber. Test data presented include a typical load-deformation curve from rock specimen in ultrahigh vacuum, outgassing characteristics during loading in terms of pressure variation, and changes in the composition of gases being released by the specimen.

Friction between solids and simulated lunar soils in ultrahigh vacuum and its significance for the design of lunar roving vehicles, L. L. Karafiath, *SP336*, pp. 225-244 (Oct. 1970).

Key words: Adhesion; basalt; fiberglass; friction; steel; titanium; ultrahigh vacuum.

The initial and kinetic friction between various solids and ground basalt, simulating the lunar soil, was measured in ultrahigh vacuum with a rotating disk-type apparatus designed for this purpose. Pressures below $p = 10^{-9}$ torr have been routinely reached with the vacuum system consisting of a turbomolecular, a getter-ion and a liquid-N_2-cooled titanium sublimation pump. The testing program included tests with steel, titanium, and fiber-glass disks and ground basalt in two particle size ranges, coarse (250-500μ) and fine (38-62μ). The experimental results show that both the initial and kinetic friction invariably increase in ultrahigh vacuum. For the range of normal stresses applied in the experiments, the total kinetic friction was highest for fiberglass followed by titanium and steel; the total initial friction was highest for fiberglass followed by steel and titanium.

Real time simulation of atmospheric balloon environment, A. J. Paillous and M. Roussel, *SP336*, pp. 245-259 (Oct. 1970).

Key words: Atmospheric environment; balloon; computer; ozone; plastic material; simulation; solar ultraviolet radiation.

A simulation chamber was designed in order to study the behaviour of several balloon materials during long time flights. Solar ultraviolet radiation, pressure, temperature and atmospheric composition are the simulated constituents of the atmospheric balloon environment. Samples are irradiated without mechanical strain. A computer program, taking the values of different parameters (of the environment and of the material) against wavelength into account, gives the information for conducting the simulation. Experiments are performed in real-time. Exact ultraviolet energy doses, in each spectral wavelength interval, between 300 and 410 nm, are delivered every day to samples. A night-day cycle is simultaneously achieved with a thermal cycle.

Analysis of the simulation of the solar wind, D. E. Zuccaro, *SP336*, pp. 261-277 (Oct. 1970).

Key words: Charge exchange; charge neutralization; ion optics; mass separators; proton sources; solar wind; sputtering; ultrahigh vacuum systems.

This analysis surveys the properties of the solar wind, establishes a set of requirements for solar wind simulation, and develops a conceptual design of a simulator system. The significant features of the design are the following. The protons are formed in an r-f excited plasma discharge ion source. A 20° deflection magnetic mass separator is used to purify the proton beam of other ions, energetic charge exchange neutrals, and Lyman alpha photons. The use of a small diameter beam permits differential pumping of the ion source and the sample chamber. The proton beam either can be expanded to flood the sample, or it can be scanned over the sample.

Solar wind simulator, H. J. King, *SP336*, pp. 279-296 (Oct. 1970).

Key words: Ion beam deflection; ion optics; mass separator; proton source; solar wind simulator.

It is necessary to expose samples of thermal control coating materials to a proton flux in the laboratory in order to

estimate the stability of their reflective and absorptive properties when exposed to the solar wind. The choice of the ion source, mass separator, and beam transport system which make up an experimental apparatus to perform these tests is discussed. A final system design is presented which is capable of irradiating 10 standard samples 2 cm in diameter with a proton beam ranging in energy from 0.5 to 3.0 KeV and in intensity from 1 to 1000 times that of the nominal solar wind.

Laboratory experiment on solar wind interaction with eomagnetic field, E. M. Dubinin, G. G. Managadze, and I. M. odgorny, *SP336,* p. 297 (Oct. 1970).

Key words: Earth magnetic field; earth tail; magnetosphere; plasma theory; shock wave; solar wind.

It is impossible to reproduce in a laboratory all phenomena which exist at the interaction of the solar wind and the Earth magnetic field. In previous works it was shown that choice of experimental conditions permits one to simulate some of the most interesting effects, for example, the collisionless shock near the Earth magnetosphere. According to the principle of limited simulation, to reproduce the magnetosphere and the collisionless shock the parameters of the artificial solar wind should be: plasma density—$n = 10^{13}$ cm^{-3}, electron temperature—$T_e = 15-20$ eV, embedded magnetic field—$B \sim 40$ Oe, ion temperature—$T_i \sim 5$ eV, stream velocity—$V = 3 \cdot 10^7$ cm/sec.

At these conditions the plasma flux compressed the dipole magnetic field on the day side and formed a configuration of the magnetic field similar to the magnetic field of the Earth tail. Between the artificial magnetosphere and the plasma flow the collisionless shock is displayed. The thickness of the shock is in agreement with plasma theory and has the same order of magnitude in dimensionless expression as in space measurements. In the shock high level magnetic field microfluctuation was discovered. The dimension of the fluctuations is about that of the Larmour radium of ions. The microfluctuations were predicted in plasma theory as a result of Alfven and magnetosound instability.

In addition to the shock investigations, measurements of the plasma density, velocity and magnetic field strength were carried out before and behind the shock.

Effect of photodegradation on organic coatings, P. J. Hearst, *SP336,* pp. 299-312 (Oct. 1970).

Key words: Atmospheric exposure; ATR spectroscopy; clear and pigmented films; infrared analysis; internal reflection spectroscopy; mercury-arc irradiation; organic coatings; photodegradation; surface degradation; volatile degradation products; xenon-arc irradiation.

Clear and pigmented coating films were irradiated with a mercury arc, a xenon arc, and sunlight. Strips of the free films, consisting chiefly of alkyd, vinyl, and epoxy coatings, were exposed in a quartz chamber. The major volatile product, as determined by infrared spectroscopy, was carbon dioxide, but the products varied depending on the irradiation, the pigmentation, and the type of coating. Internal reflection spectra indicated primarily the formation of carbonyl groups, and the greatest changes were obtained for coatings that did not have high initial carbonyl absorption.

Relation between dose rate effects and laboratory simulation of space radiation damage, A. Roizès and R. Schuttler, *SP336,* pp. 313-321 (Oct. 1970).

Key words: Defect annealing; impurities; silicon; space simulation.

The experimental simulation of space radiation damage is usually done on a much shorter time scale than the satellite lifetime. The defect annealing in the semiconductor may lead to an overestimation of the real space degradation; indeed the irradiation time may be of the same magnitude order than the annealing time constant. Cleland's experiments on germanium show that for a sufficient dose the defect number electron induced may be half as much in the long irradiation case than in the shorter one.

The higher density of punctual defects introduced by a greater flux rate enhances the production of multiple defects as reducing the production of vacancy-impurity complexes.

Different factors that can influence the defect center distribution are analysed in the range -100 to $+100$ °C.

It is shown that to improve the device hardness against radiation, we must study the production rate of defects in the bulk material coming from different growing methods and makers, as we know that the damage depends on impurity constant.

Moreover a second improvement can be reached by annealing enhancement. Thus we must choose a material whose defect annealing temperature is as near as possible than the device temperature operation. A combination of these two requirements can help to select an optimal crystal for devices in space environment.

It is shown that with a better knowledge of the recovery process it will be possible to simulate long irradiation time with reasonable operation time of a particle accelerator by irradiating devices at a controlled temperature higher than the usual temperature operation.

For example, calculations made on the E center defect (vacancy—phosphorous association) show that one year irradiation at 300 K can be simulated with the same dose, in one hour irradiation at 400 K.

We deduced that in a room temperature simulation the number of defects, in this case, is overestimated by about 50% approximately.

Some problems concerning the simulation of plastic films degradations by ionizing radiations, A. J. Paillous and Ph. Fayet, *SP336,* pp. 323-344 (Oct. 1970).

Key words: Electron damage; electron energy; electron spin resonance; evaluation; gel; mechanical properties; optical properties; plastic films; poly(ethylene terephtalate); proton damage; proton energy; radiation effect; radiation intensity; recovery; solubility; space simulation; temperature effect; tests; viscosity.

Simulation in the laboratory, of the action of polyenergetic proton- and electron-fluxes encountered in Space is necessary for a convenient estimate of polymeric film materials. In order to select the best simulation conditions, the following points were experimentally investigated on poly(ethylene terephtalate) films, irradiated in vacuum by 1.5 MeV-protons and by 0.35-, 0.6-, 2.0 MeV-electrons: a) dose rate effects; b) effects of interruptions during irradiation (samples being kept in vacuum); c) recovery during post-irradiation exposures to air or to vacuum; d) effect of the sample temperature during irradiation; e) effect of particles' energy; and f) effect of the particles' nature.

It appears that accelerated tests in a vacuum can be used to predict the damage created during missions in Space which are of a longer duration than that of the tests themselves. Electron damage in Space can be simulated by a monoenergetic electron irradiation which introduces into the sample the same absorbed energy dose than the computed dose which would be absorbed in Space. For plastic films there is no practical equivalence in the effects of proton- and electron-irradiation, except for the optical trans-

mission properties. The need for an in situ testing of mechanical and optical properties is outlined.

Ultraviolet and charged particle degradation of aluminum and silver coated FEP teflon second surface mirrors, F. G. Cunningham, B. L. Bean, and S. G. Park, *SP336,* pp. 345-358 (Oct. 1970).

Key words: Aluminum coated teflon; electron degradation; proton degradation; silver coated teflon; teflon film; ultraviolet degradation.

An experimental program has been undertaken in which bare FEP Teflon films were subjected to ultraviolet irradiation and charged particle bombardment, and in which five mil aluminum and silver coated FEP Teflon films were: i) ultraviolet irradiation in vacuum and oxygen; ii) irradiated with 5, 10 and 25 or 30 KeV electrons and protons; and iii) exposed to simultaneous ultraviolet-proton and ultraviolet-electron bombardment.

The charged particle irradiations indicate that a measurable change occurs in the spectral reflectance of both silver and aluminum backed material at a dose of about 1×10^{15} particles/cm^2, and that this degradation increases as the total dose is increased. This spectral reflectance change appears first and is the most pronounced in the ultraviolet for a given total dose. At a total dose of 1×10^{16} particles/cm^2 the surfaces generally look cloudy and oftimes mottled. Upon closer examination this mottling is found to be due to the presence of Litchenberg figures within the teflon—especially in the case of electron irradiation—which are caused by charge storage and subsequent electric discharge. The calculated changes in integrated solar absorptance generally agree with those reported by other observers. The ultraviolet results confirm that silver coated teflon is stable when irradiated in vacuum and indicate that aluminum coated material undergoes a small decrease in integrated solar absorptance (i.e., an improvement) when so irradiated.

The interaction of low energy electrons with polymeric perfluorinated ethylenepropylene (FEP), J. B. Schutt, *SP336,* pp. 359-382 (Oct. 1970).

Key words: Degradation mechanising; electron bombardment; electron degradation; polymeric perfluorinated ethylenepropylene; proton bombardment; thermal control coatings.

Photomicrographs are presented showing the effects of 30 KeV electrons on FEP. Depicted are Lichtenberg patterns, bubbles and a buckling effect. The attempt to explain these observations is derived from a theoretical analysis based on a diffusion mechanism for charge flow using beam current as a source term. The solution is used to demonstrate that charge is stored centrosymmetrically with respect to ground. These effects are discussed in terms of an "electrolysis" mechanism resulting from charge storage and beam energy thermalization. Explicit expressions are given for surface charge storage and voltage across the sample resulting from such charge accumulation. Buckling is treated from a thermodynamic basis using the Helmholtz free energy and assuming the distortion develops isothermally. "Electrolysis" is postulated via a mechanism selecting the tertiary carbon as the active site for mobile moiety generation.

The usefulness of optical data for purposes of thermal design taken from samples irradiated with low energy electrons in the laboratory is questioned. Because FEP is an electrical insulator, these experiments must, therefore, be carried out in a neutral laboratory environment, or be characterized in the space environment from carefully designed electrical experiments.

The degradation of Alzak by short wavelength ultraviolet radiation, M. J. Donohoe, R. McIntosh, Jr., and J. H. Henniger, *SP336,* pp. 383-392 (Oct. 1970).

Key words: Alzak; thermal control coatings; ultraviolet degradation; vacuum UV.

Experimental evidence is presented to further support earlier findings on the UV induced degradation of Alzak, which was found to be inversely proportional to wavelength between 220 and 300nm. UV and vacuum UV exposures at selected wavelengths between 123.6 and 300nm indicate degradation to be inversely proportional to wavelength down to 185nm. Equivalent exposure to 123.6nm radiation however, produced less degradation indicating a change in the damage dependency below 185nm. Degradation of up to 12% change in reflectance at 295nm is reported for Alzak exposed to less than 50 equivalent sun hours of vacuum UV radiation.

The photo-response at an alkaline paint interface with aluminum, W. A. Wappaus, *SP336,* pp. 373-402 (Oct. 1970).

Key words: Alkaline paint; conduction of paints during ultraviolet exposure; electrode potential of paints; photo degradation; thermal control coatings; ultraviolet degradation.

When a spacecraft coating comprised of aluminum oxide and potassium silicate is applied to an aluminum alloy (6061) substrate and subsequently partially coated with evaporated gold electrodes, a measurable potential is developed between the substrate and the gold electrodes. This effect is observed when the coating is in darkness and in vacuum. A dark current is also observed. Prior to observation, the specimen is heated in vacuum to 150 °C for 24 hours.

When the coating is irradiated in situ with UV shorter in wavelength than 3600 Angstroms, the current and voltage is found to increase. Upon exposure to prolonged irradiation this current level decays exponentially with time. The voltage similarly decays with time in an exponential manner indicating that photo-degradation of the electronic transport properties is occurring.

The transport mechanism proposed to account for this behavior is a migration of protons toward the aluminum substrate and negative hydroxyl ions toward the gold electrodes resulting in the electrolysis of water in the coating! In the presence of UV this process is accelerated resulting in an increased current flow of three orders of magnitude. Since the current flow during UV radiation decays exponentially, this suggests a diffusion limited process.

Plans and status of NMAB ad hoc committee on testing for prediction of material performance in structures and components, R. S. Shane, *SP336,* pp. 403-404 (Oct. 1970).

Key words: Combined environments; components; material performance; predictive testing; structures.

National Materials Advisory Board—National Research Council—National Academy of Sciences—*ad hoc* Committee on "Testing for Prediction of Material Performance in Structures and Components"—Interim Report.

At the request of the Office of the Director of Defense Research and Engineering, the National Materials Advisory Board of the National Academy of Sciences has undertaken to review "Testing for Prediction of Material Performance in Structures and Components."

The basic purposes of the study have been identified as: (a) make a selective survey of the needs for new and/or improved predictive (including accelerated) testing techniques, (b) consider predictive methods for forecasting the per-

formance of materials in structures and components under combined stresses in service; (c) identify the factors of predictive testing and explore approaches for development of methods and techniques of predictive testing; (d) appraise the benefits of predictive testing as well as the risks of predictive testing; (e) provide guidance in establishing a policy for Government and/or Industry interaction; (f) recommend mechanisms for implementing this policy.

An *ad hoc* Committee has been appointed and convened. The principal problem areas appear to be (a) interaction phenomena, (b) design of multi-factor tests which forecast definitively the behavior of structures and components in the presence of known or foreseeable failure modes, involving materials (c) lack of systematic accumulation of existing information so that gaps in needed knowledge become apparent and remedial action can be taken before design choices are irrevocably made, (d) peripheral failure modes are frequently overlooked.

NMAB plans to co-sponsor the ASTM National Symposium on Predictive Testing, Anaheim, California, April 21-23, 1971.

Monitoring service testing by nondestructive testing, R. W. McClung, *SP336,* p. 405 (Oct. 1970).

Key words: Compaction density; eddy current measurements; fuel rods; impregnation density; monitor tests; neutron radiography; ultrasonics; x rays.

Applications of nondestructive testing techniques to monitor tests include the use of x rays with both film and television detection to monitor thermal cycling of fuel rods, neutron radiography on irradiation experiments, eddy-current measurement of space interval between components, and interim monitoring by ultrasonics of the wall thickness of a vessel in a reactor experiment. Studies during fabrication development include multiple interim measurements of compaction density of fuel rods and impregnation density of graphite using quantitative gamma and x-ray attenuation as well as use of eddy-currents to monitor changes in quality of sodium bonding in a fuel rod. Recommended approaches include the use of eddy-current methods to monitor changes in electrical properties, dimensions or flaw character, ultrasonics to measure changes in elastic properties, dimensions of flaw character, penetrating radiation to observe or measure changes in density, or dimensions and other forms of energy for similar applications.

Signature analysis—nonintrusive techniques for incipient failure identification application to bearings and gears, B. Weichbrodt and K. A. Smith, *SP336,* pp. 407-448 (Oct. 1970).

Key words: Bearings; diagnostics; gears; reliability; signature analysis; vibration.

This paper describes how acoustic and vibration signals generated by operating machinery can be used to diagnose its internal condition without using internal sensors which might perturb the system of interest.

It is shown how characteristic "signatures" can be electronically extracted from the overall noise and vibration signals. By interpreting these signatures in the light of engineering knowledge of the machinery under study, it is often possible to identify incipient failure modes long before final failure. This technology opens up many new possibilities to avoid unscheduled maintenance, improve product quality and reduce testing time.

The paper discusses in detail specific applications to bearing and gear diagnostics and shows how the diagnostic process can be electronically implemented and automated. Several other application areas are briefly discussed.

A major part of the work which is reported in this paper was sponsored by the Condition Monitoring Engineering Operation of General Electric's Aircraft Engine Group, for development of jet engine diagnostic systems.

Measurement methods for microcircuits, W. M. Bullis, *SP336,* pp. 449-455 (Oct. 1970).

Key words: Device fabrication; environmental testing; integrated circuits; measurement methods; microcircuits; silicon.

One of the problems encountered with testing in either simulated or real environments is associated with the necessity of demonstrating that the failures observed are, in fact, due to the environment rather than random effects which would occur even in the absence of the environmental stimulus. This problem is particularly acute in the case of high-reliability electronic components such as silicon monolithic integrated circuits. For these parts, desired levels of reliability can be achieved only if all process steps in their manufacture can be carried out in a controlled and reproducible fashion. This paper surveys the status and availability of standard test methods suitable for making the measurements which are necessary to achieve such control. Consideration is given to standard measurement methods appropriate for thin film integrated circuits and hybrid microcircuits as well as those for silicon monolithic integrated circuits fabricated by the epitaxial, planar process.

Life testing using continuous acceleration, E. Rabinowicz and B. Shiralkar, *SP336,* pp. 457-471 (Oct. 1970).

Key words: Accelerated testing; cumulative damage; failure; life testing; mechanical reliability.

One method of carrying out accelerated tests consists of increasing the stress at a uniform rate with time until failure. It is shown that from such tests the life under normal stress conditions can be predicted by plotting the results on a stress-time curve on which the stress axis has been modified so that area represents amount of damage. Tests with electric light bulbs, whose failure obeys a cumulative damage criterion, give good agreement between predicted and measured life. The danger of the continuous acceleration procedure is that the stress may become so high that new failure modes are introduced.

Establishment of an optimum duration for spacecraft component thermal vacuum tests, W. L. Harvey, *SP336,* pp. 473-485 (Oct. 1970).

Key words: Absorption; adsorption; "bake out"; components; decomposition; degassing; environment; evaporation; outgassing; simulation; sublimation; thermal conduction; thermal vacuum tests; volatile constituents; volatilization.

The duration of planetary space missions precludes performing component thermal vacuum tests which simulate the mission time period. Many arbitrary approaches have been taken to establish adequate durations for these tests. This paper outlines an approach which considers the probable effects of the thermal vacuum environment on the components and their constituent materials. In general these effects are found to be related to outgassing rate which is time and temperature dependent. A test cycle is proposed which considers this situation and utilizes any prior "bake out" heat exposure to reduce the test duration to a reasonable period.

Equipment to study high velocity dislocations in materials, V. R. Parameswaran and J. Weertman, *SP336,* pp. 487-508 (Oct. 1970).

Key words: Dislocation velocity; high speed dislocations; impact stress pulse; piezoelectric stress gauge; quartz; slip bands.

The microstructural and physical properties of a material deformed under high strain rates are quite different from those of the slowly deformed material. This is attributed to the motion of a shock front consisting of an array of high speed dislocations through the shock loaded material. An equipment was constructed to shock load single crystals of metals by shooting small steel pellets using a gas gun. The slip bands generated on the surface of the crystals by the stress pulses give a measure of the dislocation mobility in the material. In this paper the equipment used to produce the stress pulses and that used to measure and record the stress pulses are described.

Some effects of equalization on acceleration response and fatigue life expectancy, R. M. Mains, *SP336,* pp. 509-524 (Oct. 1970).

Key words: Acceleration response; evaluation; fatigue life; lumped parameter system; mechanical impedance; random vibration; test; transfer impedance; transmissivity equalization; vibration.

A set of calculations is reported for various transmissibilities of a 10-mass system, intended to be representative of an exciter, fixture, test article arrangement. The difficulties of achieving equalization at some coordinate when it has a transmissibility range of 10^6 or more are noted. By comparison of r.m.s. responses to a level power spectral density input, it is shown that factors of 5 to 10 or more difference in acceleration response result from equalization at different coordinate locations. These differences in r.m.s. response would produce corresponding differences in predicted real-time behavior. The differences in r.m.s. spring stress responses were smaller for various equalization locations, but still large enough that predictions of fatigue life expectancy (for the system used) would be much affected by the choice of equalization location.

Charged particle track implications for accelerated testing, T. M. Flanagan and V. A. J. van Lint, *SP336,* pp. 525-534 (Oct. 1970).

Key words: Radiation damage; radiation testing.

This work considers the ionization effects produced by the passage of energetic particles through material, emphasizing the fact that the ionization is formed along particle tracks rather than being uniformly distributed throughout the material. Thus, the particle track through a material can be visualized as a cylinder centered on the particle path disturbed by ionization and carrier trapping. The dimension of the disturbed region is related to the range of the electron ejected by the ionization event, while the density of carriers within the disturbance depends on the ejected electron range and on the ionization efficiency of the energetic particle. The disturbed regions then relax with characteristic times ranging from the very short to the very long. The dose-rate dependence arises from the relationship of the characteristic relaxation times and the average time for two particles to disturb the same volume. At low doses, each particle track traverses primarily unirradiated material, and the effects are additive. At higher doses, nonlinearities are expected, since particles penetrating a previously disturbed region may find the carrier traps in a different charge state than in virgin material. Another source of nonlinearities is the density of ionization which will vary with particle type and energy. The size of the disturbance around a track varies from 100 to about 2000 Å, depending on the material. This quantity can be used to calculate the average overlap time for a given dose rate. The dose which must accumulate before nonlinearities are apparent can be estimated from the trap density of the material. Each of these factors must be taken into account when planning on assessing simulation of radiation effects.

A simulation to validate future space missions, T. P. Foley, A. W. Metz, and A. W. Yonda, *SP336,* pp. 535-547 (Oct. 1970).

Key words: Simulation; space systems; system test bed.

A simulation tailored to be responsive to the needs of aerospace systems analysts has been developed. The simulation is written in FORTRAN so that it can easily be transferred between different computers. The simulation is modularly structured so that new functions can be simulated and easily added. The level of detail of the simulation of model elements can vary widely. When macroscopic system aspects have been studied and optimal configurations established, then sub-systems of interest can be modeled in greater detail and embedded in the macroscopic simulation for more detailed study. Thus, design engineers can study the performance of their design in a total system environment before hardware is fabricated.

The parameters of the simulation permit the configuration of models rapidly. These can be run against a scenario of input parameters which when varied provide information on system performance. Thus, many different projected system configurations can be quickly exercised and discarded until only a few feasible system configurations remain. These then can be exercised with model elements being more detailed enabling a more comprehensive analysis. Provision is made for entry of errors into the system so that performance characteristics of the system in a degraded state can be studied. The exercising of Executive Program strategies is provided for. Thus, a tool which is oriented toward supporting the systems analysis requirements for studying dynamic system performance has been developed.

General purpose centralized automatic testing for improvement of shipboard system performance, F. J. Zupan, *SP336,* pp. 549-568 (Oct. 1970).

Key words: Data acquisition; data dissemination; data processing; maintenance; operational readiness; performance monitoring; testing.

Increased operational effectiveness of Navy shipboard systems is the primary goal of the Navy automatic testing program. This paper discusses the rationale and techniques utilized in developing an experimental model which will help update and modernize traditional methods and approaches to systems monitoring and maintenance. Developments in acquisition, processing and dissemination of information are related to a centralized on-line performance monitoring system are covered. Both laboratory and shipboard functional tests were performed, with a laboratory model system monitoring typical Navy electronic and non-electronic systems. Test results, a discussion of problem areas, and prediction of the impact of centralized testing on the shipboard maintenance and operating organization are included.

Explosive oxidations initiated by simulated meteoroid penetration into spacecraft atmospheres, W. H. Carden, *SP336,* pp. 569-585 (Oct. 1970).

Key words: Blast over-pressure; combustion front; hypervelocity impact; meteoroid penetration; oxidative detonation; oxidative flash; oxygen atmosphere; spacecraft.

Hypervelocity impact tests were conducted in an evacuated range on target samples which simulated a NASA S

IVB wall configuration since this stage is planned as the primary structure in the NASA Orbiting Workshop program. The samples formed part of the wall of a large tank which contained an oxygen-rich atmosphere. The explosive oxidations which occurred inside the tank as a result of perforation were observed and the results were analyzed. The bare thermal insulation on the inside of the wall further enhanced the otherwise severe reaction which occurs with a metallic wall in the presence of enriched oxygen.

The dynamic environment simulator—a multienvironmental an-rated centrifuge, D. B. Rogers, M. McCally, and K. L. appel, *SP336,* pp. 587-598 (Oct. 1970).

Key words: Combined environmental stress; dynamic environment simulator; man-machine system; man-rated centrifuge; simulation research.

The U.S. Air Force Dynamic Environment Simulator is a man-rated centrifuge with multiple environment simulation capabilities. This facility can generate combinations, either simultaneous or sequential, of acceleration, vibration, temperature, barometric pressure, gas composition, noise and related environmental stresses. Simulation of a broad variety of aerospace flight mission environments is now possible using this facility. The man rating of this facility was carried out in the last six months of 1969 and resulted in the first manned run in December of that year. Although presently programmed to meet Air Force data requirements for the design of planned and proposed aircraft systems, the Dynamic Environment Simulator represents a national research capability capable of supporting the requirements of many R & D programs including manned space flight, high speed surface transportation and other systems or functions where man is exposed to physical environmental stresses in combination.

Use of the BEN FRANKLIN submersible as a space station mulator, M. J. Ferguson and C. B. May, *SP336,* pp. 599-621 Oct. 1970).

Key words: Closed ecological system; habitability; maintainability prediction; microbiology; microflora shift; physiology; psychology; space station simulator; submersible.

This paper presents the NASA-sponsored effort using the Ben Franklin submersible as a space station analog during the 30-day drift mission in the Gulf Stream, starting 14 July and ending 14 August 1969. The areas of investigation include: (1) Psychological and physiological measurements during the pre-mission, mission, and post-mission phases were related to observed crew behavior. The results reveal that detailed consideration must be given early in the design to those aspects which could cause crew annoyance and frustration, and which could be further aggravated by long confinement. Selection of crew pairs for compatibility of personality will help reduce stress in small closed systems. (2) Habitability in a closed ecosystem was investigated. The objective was to determine the suitability of BEN FRANKLIN submersible habitability data for providing guidelines for future spacecraft design. These include provision for privacy, control of temperature and humidity, and adequate facilities for personal hygiene. (3) Microbiological investigation as a study of the effect of total biological isolation upon the flora of the crew, environmental and life support subsystems. The continuing shift and simplification of microbial flora on the 30-day mission indicates a need for investigation of the problem in association with longer space missions. (4) The maintainability experiment objective was to obtain detailed information on the frequency, duration, type, and complications of onboard maintenance during the mission.

Development of an open circuit cryogenic life support system for use in neutral buoyancy space simulation, C. M. McClure and C. W. Williams, *SP336,* pp. 623-649 (Oct. 1970).

Key words: Cryogenics; liquid air; liquid nitrogen; liquid oxygen; neutral buoyancy; space simulation.

Marshall Space Flight Center has a need for a self contained underwater life support system which can supply a breathing mixture to the neutral buoyancy test subject, without the need for a surface tethered supply line. A prototype system has been developed which utilizes a mixture of liquid oxygen and liquid nitrogen contained in a single supply tank. Development and testing has shown that this system will supply the quantity and quality of gas required under completely controlled and predictable conditions to depths of at least 60 feet.

Advanced diving techniques applicable to extended mission neutral buoyancy space simulation. J. B. MacInnis and C. M. McClure, *SP336,* pp. 651-659 (Oct. 1970).

Key words: Diving; hyperbaric; neutral buoyancy; simulation; space.

Diving methodology is reviewed. Nonsaturated diving is recognized as the basis for almost all neutral buoyancy testing to date. Saturated diving methodology is reviewed and its possible special adaptation for extended duration mission neutral buoyancy simulation is proposed. The advantages of using the new closed circuit rebreather SCUBA gear is also reviewed and proposed as an aid to extended mission simulation.

A method to obtain an ultraclean environment, M. S. Cridlin and J. W. O'Connor, *SP336,* pp. 661-668 (Oct. 1970).

Key words: Anti-migration traps; cold shrouding; contamination; environment; ion pumping; low pressure; low temperature; pumping; ultraclean; vacuum.

The Goddard Space Flight Center has designed and fabricated a system which offers an effective approach toward solving the problems usually encountered in creating an ultra high vacuum. The vacuum techniques described find application in an Auger Spectrometry System.

This ionization pumped system is unconventional in that: (1) Interior chamber cryogenic shrouding is eliminated. In lieu of the internal shrouds the method is to submerge the entire chamber exterior in a dewar of liquid nitrogen. Eliminating the shrouds within the chamber eliminates sources of contamination and the exposing of the wall exterior to the cryogenics eliminates the typical ambient temperatures that chamber walls normally experience, (2) The ionization pump is located within the ultrahigh vacuum chamber, rather than outside. This eliminates the gate valve typically associated with an externally mounted pump and permits greatly increased realization of the conductance pump capacity. The pump is protected by use of gas purging when pressures are increased to atmospheric.

The method of precleaning, prior to bakeout, involving high temperature gas purging is described as well as the entire systems operation. Pressures in the order of 7×10^{-13} torr have been observed.

This paper describes a Micrometeoroid Impact Simulation System (MIMS) at NASA Langley Research Center and outlines current research efforts. The MIMS electrostatically accelerates electrically charged, micrometer-size

particles to velocities in excess of 30 km/s. Particles can be accelerated one at a time or at various rates to above 10/s. The major components of the MIMS are a microparticle charger-injector, a horizontal 4-million-volt Van de Graaff accelerator, an assemblage of particle detectors, a particle deflection system, a data system, and a series of target chambers. The data system is a computer-controlled, real-time system which records information to determine the velocity, mass, and diameter of each particle which enters the target area. The system also controls and selects particles, and rejects particles which do not have the desired velocities. The system is used to study damage to sensitive surfaces, develop micrometeoroid detectors, and obtain data about meteoroid entry physics.

Properties of optical materials in space, F. W. Paul, *SP336,* pp. 949-959 (Oct. 1970).

Key words: Information center; interferometric measurements; optical materials; physical property changes; space environment.

A program has been established to provide a central clearinghouse for information about the effects of space environment on the optical and other physical properties of optical materials. Information is being collected and organized on the effects of space environment on refractive index, dispersion, transmittance, reflectance, thermal expansion coefficient, Young's modulus, birefringence, and yield and breaking points of all materials of interest for the transmission or reflection of optical radiation in space.

In technical areas where information about the behavior of materials does not exist a program of laboratory investigations will provide the required information. In preparation for some in-house studies of materials at very low temperatures and also during exposure to a charged particle flux an experiment has been devised and instrumented to provide measurement of dimensional changes and refractive index changes at several wavelengths. The essence of the method is the use of Fabry-Perot interferometry to measure independently the dimensions of the sample of material and the optical path length through the material.

A space radiation environment simulator for the evaluation of solar cells, P. A. Newman, J. J. Hirshfield, H. E. Wannemacher, and M. Eck, *SP336,* pp. 935-947 (Oct. 1970).

Key words: High vacuum; solar cells; space radiation; space simulation; thermal control.

A facility for studying the properties of solar cells and other optically sensitive devices under a wide range of environmental conditions such as could be found on extra-terrestrial space missions has been developed at the NASA Goddard Space Flight Center. The system includes control of temperature, vacuum and solar irradiation while irradiating a 23 cm by 23 cm array of samples with 4 MeV protons or electrons. Typically the samples can be controlled in temperature between − 170 and 150 °C, while a shroud, used to control radiative coupling, can be independently controlled between − 196 and 150 °C. The vacuum system, which is virtually free of hydrocarbon contamination, will evacuate the chamber to less than 1×10^{-8} torr in less than 4 hours. A 400 l/s Noble Vac-Ion pump backed by a titanium bulk sublimator and a titanium filament evaporator has been designed to accommodate the large gas loads possible during irradiation. A 4.2 KW compact Xenon arc solar simulator provides a close match to the solar spectrum from low irradiances to an irradiance of four solar constants. An automatic data acquisition system modified to generate digital solar cell I-V characteristics is used to collect data in a form suitable for computer processing.

A programmable dynamic thermal vacuum system for solar array component testing, J. W. Fairbanks and M. B. Eck, *SP336,* pp. 669-682 (Oct. 1970).

Key words: Gaseous nitrogen heater; gas stream blower; GN temperature conditioning; solar array; solar cell; thermal cycle vacuum testing; thermal shroud.

The Programmable Dynamic Thermal Vacuum System (PDTVS) was designed to provide long-term laboratory evaluation of solar array components undergoing thermal cyclic effects anticipated for specific missions. This system is capable of duplicating the temperature excursions, including rate-of-change of temperature, for practically all missions currently under consideration at NASA. The equipment can obtain test specimen temperatures between + 150 °C to − 120 °C with a rate-of-change of at least 6 °C/min. The PDTVS can accommodate thirty-six 6 in × 6 in test specimen holders and position each one in front of a illumination port for periodic in situ electrical measurement with a solar simulator.

Basically, the facility consists of an ion-pump vacuum system with 2 bell jars, thermal conditioning equipment, a stage blower, a programmable control unit and an LN storage tank. The novel developments in this system include a high-energy low-mass heater which employs radiative convective coupling of a gas stream to an IR source. The test carrousel shaft is used for specimen positioning and an instrumentation penetration. Initial difficulties required modification of the blower bearings, shaft and housing to accommodate the wide range of gas stream temperature without affecting performance.

The cryopumping system for the space simulation chamber, H. Nakagawa and R. Tsunoda, *SP336,* pp. 683-698 (Oct. 1970).

Key words: Cryopumping; ion pump; pumping speed; space simulation chamber; vacuum.

Recently, the space simulation facility which has distinctive feature was completed in Japan. This facility consists of main- and sub-chamber and other necessary equipment. The main-chamber, having 1.8 m dia. and 6 m length, is accompanied by the pumping system of very high pumping speed. The pumping system consists of cryopump, diffusion pump, mechanical Roots booster pump and rotary vacuum pump. The ultimate pressure of the order of 10^{-9} torr was achieved by this system. The sub-chamber, having 60 cm dia. and 120 cm length, is accompanied by the pumping system which is completely oil free. The pumping system consists of cryopump, sputter-ion pump and cryosorption pumps. The ultimate pressure of the order of 10^{-10} torr was achieved by this system. Determination of the pumping speed of the cryopump is a very complicated procedure and in this study we propose the new factor: "Arrival Probability" which is computed by Monte Carlo method. The dynamic performance of oil free pumping system, especially the usual order of cryosorption pump was investigated, and the residual gases were analyzed by mass-filter. The concept of "Self-contamination Factor" proposed by Dr. R. Chuan is adopted to this study to determine the performance of the system, and the factors of 0.006 and 0.0012 were obtained under the actual operating condition.

Simulation of surface-atmosphere interaction processes for Mars, K. M. Foreman, *SP336,* pp. 699-723 (Oct. 1970).

Key words: Convective processes; Mars atmosphere exploration; planetary atmosphere-surface interaction; planetary meteorology; research facility; simulation technique; space research.

Landings of unmanned spacecraft on Mars can be affected by the dynamics of the lower planetary atmosphere. In an effort to understand the convective motion and effect of surface topography and soil on local atmospheric motion, a laboratory-scale simulator has been designed and built to examine parameters of significance systematically. Scaling law relationships were used in sizing the facility and appropriate test conditions within the terrestrial gravitational environment. This facility is a 4-foot diameter by 8-foot high stainless steel chamber capable of maintaining test conditions to about 10 microns absolute pressure and gas temperatures between -85 °C[b] and $+65$ °C[b]. The planetary surface is simulated by an electrically heated aluminum surface controlled to within $\sim\pm 0.7$ °C[b] of the initial set conditions.

Measurements of test gas temperature above the simulated planetary surface are made with a specially designed traversing mechanism carrying thin film and thermistor sensors. Temperature profiles above the surface are similar to theoretical calculations for equatorial Mars regions at midmorning, if the lower Martian atmosphere is assumed to have an eddy viscosity of about 5×10^5 cm²/s. Additional data show that temperature gradients increase near the surface as the gas pressure is decreased below atmospheric level, and that the degree of turbulence (as evidenced by temperature fluctuations) appears to diminish with lower pressure.

Exploratory tests of thin film sensors as wind speed indicators at simulated Mars surface pressure of 5mb show possible difficulty in differentiating velocity from temperature at wind speeds less than several m/s magnitude. However, thin films appear quite responsive as temperature sensors to pressures on the order of less than 1 mm Hg A.

Operation of a large thermal vacuum chamber at Martian ressure levels, T. Buna and J. R. Ratliff, *SP336*, pp. 725-748)ct. 1970).

Key words: Evacuating; heat transmission; infrared scanning; Mars environmental simulation; outgassing; thermal insulation; thermal-vacuum chambers.

A test program was conducted to evaluate techniques of insulating the cold shroud of a large thermal-vacuum chamber from its outer shell, in order to prevent excessive cooling of the latter during Mars environmental simulation tests. A fluidized insulation concept using polystyrene flakes in the shroud/shell interspaces was found to best meet both thermal and operational requirements. With 140 R (77.8 K) shroud, convective transport through the insulation was negligible up to 20 mm Hg chamber pressure, and did not exceed permissible levels up to 50 mm Hg. At the higher pressure levels local heat transfer through the insulation was found to be of a cyclic nature. Thermal data are presented in the form of Nusselt-Rayleigh type correlations. Unique techniques devised for rapid installation and removal of the insulation are described; chamber shell temperature monitoring techniques (including infrared scanning) are evaluated; and the pumpdown characteristics of the insulated chamber are established.

A cryopump for steady-state testing of rocket engines under titude conditions, M. J. Triplett and W. E. Riggs, *SP336*, p. 49 (Oct. 1970).

Ablative heat shields for planetary entries—a technology view, G. D. Walberg and E. M. Sullivan, *SP336*, pp. 751-2 (Oct. 1970).

Key words: Ablation; evaluation; heat shields; heat transfer; planetary entry; radiation.

A review of ablation technology is carried out to assess the present state of the art and point out areas in which further research is required for planetary entry heat shields. Analyses and test techniques which have been developed to treat heat shields for Earth entry with combined radiative and convective heating are reviewed. With the lessons learned from Earth-entry research in mind, the work carried out to date for entry into various planetary atmospheres is reviewed and technological problem areas are discussed. In defining significant phenomena, various mechanisms and processes are discussed and their relative importance is illustrated by describing the analysis of a manned planetary-return Earth entry. In discussing the work to date on planetary entry, two broad categories of research are considered: (1) entry into tenuous atmospheres and (2) entry into the dense atmospheres of Venus and the giant planets. In each of these categories, atmospheric characteristics, entry velocities and modes, vehicle geometries, heating levels and candidate ablation materials are discussed. Present ground and flight-test capabilities are summarized and compared with planetary entry conditions. Particular attention is paid to coupled ablative-radiative phenomena which require the radiation spectrum of the facility to essentially duplicate that of the planetary atmosphere under study.

Ablation phenomena in supersonic laminar and turbulent flows, E. M. Winkler, M. T. Madden, R. L. Humphrey, and J. A. Koenig, *SP336*, pp. 813-835 (Oct. 1970).

Key words: Ablation; ablation-induced transition; cross-hatched striations; Teflon.

Arc tunnel experiments using pipe specimens of TFE-7 examine the ablation of Teflon under a supersonic laminar and turbulent boundary layer. Test conditions include Mach numbers of 2.3 and 3.0, supply pressures of 2×10^6 N/m² to 3×10^6 N/m² and supply temperatures of 2200 to 5000 °K. Experimental results are compared with computer predictions. In two laminar boundary-layer tests, parallel striations appear; in all turbulent boundary-layer tests, criss-cross striations appear.

Prediction of mechanical erosion of charring ablators, L. H. Hillberg, *SP336*, pp. 837-851 (Oct. 1970).

Key words: Ablation; aerodynamic shear; carbon; char; cork; epoxy-novolac; erosion; phenolic carbon; silicone rubber.

A simple method has been developed for predicting the mechanical erosion of charring ablators exposed to an aerodynamic environment. The method requires the knowledge of two variables: the aerodynamic shear stress at the ablating surface and the surface temperature. Test data are used to obtain two empirical constants necessary for correlating the erosion recession rate in terms of these two variables. The empirical constants have been determined for phenolic cork, phenolic carbon, epoxy-novolac, and high density silicone rubber.

Heating in cracks on ablative heat shields, E. M. Winkler, R. L. Humphrey, M. T. Madden, and J. A. Koenig, *SP336*, pp. 853-877 (Oct. 1970).

Key words: Ablation; catastrophic ablation; substructure heating; surface cracks.

An experimental program has been carried out in the U.S. Naval Ordnance Laboratory (NOL) 3 Megawatt Arc Tunnel to study the effect of cracks in an ablative heat shield on the substructure heating. The tests used a supersonic contoured nozzle with a Teflon duct attached to it. The ducts had transverse and longitudinal cracks machined into the surface. They were instrumented for pressure, temperature,

heat transfer and skin-friction measurements. The cracks were found to have pronounced effects on the ablative behavior. The heating is moderate under a laminar boundary layer, but can be catastrophic when the boundary layer is turbulent, depending upon the size and direction of the crack. The results for the transverse cracks were compared with an available analytical prediction. The heat-transfer measurements tend to support the concept of vortex cells existing within the cracks. Cracks that are deep as compared with their width result in very little substructure heating.

Apparent operating limits of arc heaters with respect to total enthalpy and stagnation pressure, R. Richter, *SP336,* pp. 879-892 (Oct. 1970).

Key words: Arc currents; arc heaters; constricted arc; enthalpy; operational limits; stagnation pressure.

For many years arc heaters have been operated over a wide range of operating conditions. An apparent upper limit with respect to stagnation pressure and total enthalpy was found which could not be exceeded. It is attempted to show that this limit is not imposed by the enthalpy-pressure combination but is caused by the limit in total power input that can be achieved with the non-segmented constricted arc heater. The failure or fast deterioration of arc heater components is found to be primarily due to high arc currents which are employed to heat the gas to maximum temperature. It is concluded that the enthalpy-stagnation limit of nonsegmented constricted arc heaters operating under similar constraints can be exceeded.

Operating characteristics on the Air Force flight dynamics laboratory reentry nose tip (RENT) facility, J. C. Beachler, *SP336,* pp. 893-904 (Oct. 1970).

Key words: Ballistic missiles; heat protection; reentry; test facility.

Reentry missile nose tip development requires ground test facilities capable of simultaneously producing extreme pressures and heat transfer rates. The Reentry Nose Tip (RENT) Facility was developed by the Air Force Flight Dynamics Laboratory to produce this high pressure hyperthermal environment. The present and planned capability of this facility is described and typical pressure and heat transfer profiles of the test jet are shown.

Investigation of the characteristics of fluids vented into a vacuum, R. Steddum, D. Maples, and F. M. Donovan, *SP336,* pp. 905-914 (Oct. 1970).

Key words: Flow rate tests; high speed movies; particle velocities; vacuum tests; water jet.

For manned space stations planned for the future, it becomes necessary to eject fluids into the space environment. These ejected fluids form ice clouds which remain in the vicinity of the spacecraft and could interfere with optical instrumentation. In order to study the dynamics of fluid jets in a space environment, a high vacuum system was modified to allow the injection of fluids into a vacuum region while maintaining a pressure below 0.1 N/m². The cone angles, individual particle velocities, and mass flow rates of water sprays under vacuum conditions were measured. The individual particle velocities of sprays produced by outgassed water were lower than the particle velocities of sprays produced by water with a definite amount of dissolved gas.

Micrometeoroid impact simulation system, R. A. Golub and J. R. Davidson, *SP336,* pp. 915-933 (Oct. 1970).

Key words: Hypervelocity; impact damage; micrometeoroid; particle detectors.

SP337. Silicon device processing. Proceedings of a symposium held at Gaithersburg, Maryland, June 2-3, 1970. C. P. Marsden, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 337, 46[7] pages (Nov. 1970).

Key words: Analysis; device processing; diffusion; epitaxy; junctions; resistivity; surface preparation.

This Proceedings contains the information presented at th Symposium on Silicon Device Processing held at the Nationa Bureau of Standards on June 2-3, 1970.

This Symposium covered the measurement field and was pur posefully restricted to the generic topics of diffusion, epitaxy surface preparation and interdependence of unit processin operations. This emphasis on measurement during th processing operation or on the characteristics of the processe material, showed the necessity and more important, the ambigu ties of current methods of measurement. The application of som new techniques to measurement were also discussed. *Thes proceedings include the following papers (indented):*

Some thoughts on how we might improve our materials an process work, D. G. Thomas, *SP337,* pp. 3-10 (Nov. 1970).

Crystallographic imperfections as related to silicon cryst growth, J. A. Lenard, *SP337,* pp. 11-18 (Nov. 1970).

Epitaxial growth of silicon, B. A. Joyce, *SP337,* pp. 19-2 (Nov. 1970).

Diffusion in silicon: properties and techniques, C. F. Gibbo *SP337,* pp. 21-35 (Nov. 1970).

Measurement and control of dielectric film properties durin semiconductor device processing, B. E. Deal, *SP337,* pp. 36-5 (Nov. 1970).

Equipment considerations for silicon epitaxial reactors, M. Hammond and W. P. Cox, *SP337,* pp. 51-59 (Nov. 1970).

A comparison of a resistance-heated reactor for silicon epita ial growth with other epitaxial systems, W. A. Kohler, *SP33* pp. 60-65 (Nov. 1970).

Techniques for depositing highly uniform and defect-fr epitaxial silicon, D. C. Gupta, *SP337,* pp. 66-78 (Nov. 1970

Control of thin silicon films grown from silane, D. J. Dumi *SP337,* pp. 79-86 (Nov. 1970).

SP338. **Status of thermal analysis.** Proceedings of a Symposium on the Current Status of Thermal Analysis held at Gaithersburg, Maryland, April 21-22, 1970, O. Menis, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 338, 189 pages (Oct. 1970).

Key words: Atherosclerotic plaque; DSC; elastomers and vulcanizates; explosives; high temperature DTA; kinetics by TGA; selection of DTA parameters; temperature standards; TGA; theory of isoperibol and adiabatic shield calorimeters.

The symposium papers offer contributions in differential thermal analysis (DTA), differential scanning calorimetry (DSC), development of standards for DTA temperature scales, and applications in high temperature biochemical, polymer and explosive materials. The selection and the effect of experimental parameters on the types of information on thermal curves is described. The measurement theory of isoperibol and adiabatic shield calorimeters by the method of intermittent heating is described and the magnitude of calorimetric instrumental errors is outlined. In an analysis of a differential scanning calorimeter, three instrumental time constants are described and the necessary corrections for the various instrumental and thermal time constants are recommended. The need for and the status of temperature scale standards for DTA is discussed. An evaluation of 12 materials for use as standards by cooperating laboratories is presented. High temperature (> 1900 K) DTA, problems of high temperature calorimetry to 1300 K are discussed. The implications concerning the nature of biological membranes and decomposition of atherosclerotic plaques are derived from differential scanning calorimetry of three-component systems of phospholipid, cholesterol or one of its esters and water.

A description is given of an apparatus developed for measuring the rate at which vapors are evolved during the thermal degradation of material in a modified thermogravimetric apparatus. The modifications of a DTA cell to minimize explosions is described. Data derived from the use of lead azide was used to evaluate the technique. Thermogravimetric analysis for establishing basic composition of elastomer compounds and vulcanizates were reviewed. A careful study of oxidation characteristics of carbon black in the formulation is also included. *These proceedings include the following papers (indented):*

Standardization of differential thermal analysis test methods, P. D. Garn, *SP338,* pp. 1-22 (Oct. 1970).

Key words: DTA atmosphere effects; DTA experimental design; DTA peak structure; DTA sample shapes; DTA standardization.

The appearance of a differential thermal analysis curve depends greatly, for many materials, upon the method of experimentation. This is because the physical properties of the specimen will have differing effects upon the actual events taking place. The experimental parameters, mainly the sample holder and atmosphere, should be selected to learn as much as possible about the properties of most interest. The use of a single set of conditions as a general practice will be ineffective.

Macrocalorimetry—how accurate?, K. L. Churney, G. T. Armstrong, E. D. West, *SP338*, pp. 23-59 (Oct. 1970).

Key words: Adiabatic shield; calorimetric errors; calorimetry; isoperibol; measurement theory.

The measurement theory of isoperibol and adiabatic shield calorimeters operated by the method of intermittent heating is reviewed and recent developments indicated. Implications of the theory in terms of calorimeter design and tests for systematic errors are discussed. Some idea of the magnitude of calorimetric errors (as compared to errors arising from uncertainties in the change of state of the system under study) is outlined.

Status of thermal analysis temperature scale standards, O. Menis and J. T. Sterling, *SP338*, pp. 61-86 (Oct. 1970).

Key words: ASTM Committee; differential thermal analysis; International Committee on Thermal Analysis; temperature scale region of 40 to 900 °C; temperature scale standards.

Current status in the development of suitable temperature scale standards for differential thermal analysis is described. It involved the cooperative effort at NBS in the collection and evaluation of data on 12 materials studied by the Standards Committee of the International Committee on Thermal Analysis. In addition the results of the study group of an ASTM Committee with the cooperation of NBS are presented. The selected temperature values depend on the transition temperature of a number of compounds as well as two low temperature melting metals. The temperature scale region of 40 to 900 °C can be covered effectively with the ten materials, which will serve as calibration standards.

High temperature differential thermal analysis, R. D. Freeman, *SP338*, pp. 87-98 (Oct. 1970).

Key words: Differential thermal analysis; dynamic calorimetry; high temperature chemistry.

Three areas are discussed: (1) high temperature (> 1900 K) differential thermal analysis (DTA); (2) some problems in conventional high temperature calorimetry, which may be relevant to high temperature dynamic calorimetry; and (3) a brief description of our efforts to achieve dynamic calorimetry to at least 1300 K.

Thermal studies on lipid-water systems by differential scanning calorimetry with reference to atherosclerosis, G. J. Davis and R. S. Porter, *SP338*, pp. 99-117 (Oct. 1970).

Key words: Atherosclerosis; cholesterol and its fatty acid esters; differential scanning calorimetry; lecithin; lipid-water systems; phospholipids; sphingomyelin; thermal studies.

Studies have been performed on lipid-water systems by differential scanning calorimetry. Three-component systems were investigated. The components consisted of a phospholipid, cholesterol or one of its esters, and water. The phospholipids studied included lecithin and sphingomyelin. The cholesteryl derivatives used in the ternary systems included cholesterol and its oleate, linoleate, and stearate esters. The temperatures and heats of transition for these systems were investigated. The results reveal considerable differences in the stability of complexes formed in these ternary systems with the unsaturated esters generally leading to the least stable structures. The morphologies likely represent compositions and order similar to the layered structures observed for the same and related phospholipid-cholesteryl derivative molecular organization. The results have implications concerning the nature of biological membranes and the deposition of atherosclerotic plaques.

An analytical evaluation of differential scanning calorimetry (DSC), J. H. Flynn, *SP338*, pp. 119-136 (Oct. 1970).

Key words: Analyses of thermal apparatus; differential scanning calorimetry; evaluation of heats and temperatures of transition; instrumental time constants; interfacial thermal conductivity; thermal analyses.

Three instrumental time constants were found in an analysis of the (Perkin-Elmer DSC-1B) Differential Scanning Calorimeter: an energy pulse response (1.5 s), a temperature-averaging network response (≈ 15 s) and a temperature programming response (8.0 s). The first constant may be determined from the decay of the response to infrared light pulses. It affects the shape of a transition curve but not the heat of transition calculated from the area. The second constant affects only the base line and the third, the temperature calibration.

Application of elementary heat flow theory to a wide range of experimental variations in the interfacial thermal resistance demonstrated that interfacial time constants are a negligible factor in determining the melting transitions of many substances.

It was concluded that corrections for the various instrumental and thermal time constants are necessary if meaningful parameters are to be deduced, especially at fast heating rates.

Apparatus for rate studies of vapor producing reactions, R. J. McCarter, *SP338*, pp. 137-150 (Oct. 1970).

Key words: Differential thermal analysis; DTA; kinetics; pyrolysis; TGA; thermal analysis; thermal degradation; thermogravimetric analysis.

An apparatus was developed for measuring the rate at which vapors are evolved during the thermal degradation of materials and thereby deriving the kinetics of such reactions. Requisite to the operating scheme of the apparatus is the provision of a high-temperature zone to convert condensable or tarry vapors into noncondensable form.

The apparatus yields a direct measure of reaction velocity, rather than the integrated indication obtained with thermogravimetric analysis. This simplifies the identification and calculation of kinetic parameters. Increases in sensitivity and operating range are also achieved. Flexibility in operation is obtained that permits the separate recording of reactions that tend to overlap.

Although the apparatus has been operated principally with a combustible gas indicator serving to meter the evolved product vapors, a number of options are available for the latter function, including flow meters and various continuous gas analyzers. The applicability of the method appears promising.

Differential thermal analysis of primary explosives—modified technique, R. J. Graybush, F. G. May, A. C. Forsyth, *SP338*, pp. 151-164 (Oct. 1970).

Key words: Differential thermal analysis; Dupont 900 DTA remote cell; lead azide; lead styphnate; mercury fulminate; metastable materials; potassium dinitrobenzfuroxan; primary explosives.

The usefulness of differential thermal analysis (DTA) in the study of metastable materials has been hindered by the tendency of samples to explode during the experiment. A description is given of modifications which have been made to the remote cell used in conjunction with a Dupont 900 DTA such that the possibility of explosion is minimized. Using lead azide to evaluate the technique it is shown that complete curves for the exothermic decomposition

$$PbN_6 \rightarrow Pb + 3N_2$$

are reproducibly obtained. The endotherm in the curve corresponding to the fusion of the product lead serves as a confirmation of the reaction. Illustrations are given to show extensions of the system to other sensitive compounds, namely lead styphnate, mercury fulminate, and potassium dinitrobenzfuroxan.

Thermogravimetry of vulcanizates, J. J. Maurer, *SP338,* pp. 65-185 (Oct. 1970).

Key words: Carbon black; curatives; elastomer compounds and vulcanizates; oxidation; thermogravimetric analysis.

Thermogravimetric analysis provides an important advance in the analysis of elastomer compounds and vulcanizates. This paper reviews the current state of such investigations including a consideration of key experimental variables, precision and accuracy for estimating basic composition of different types of practical formulations. Additional information can be obtained by careful study of the oxidation characteristics of the carbon black in the formulation. The latter is influenced by both physical (e.g., surface area) and chemical (type of cure system or polymer) effects. Finally, an isothermal oxidation procedure is discussed for demonstrating differences in carbon black(s) and/or curatives in routine comparisons of samples.

339. **Source listing of OMNITAB II program,** S. T. Peavy, R. N. Varner, and D. Hogben, Nat. Bur. Stand. (U.S.), Spec. Publ. 339, 371 pages (Dec. 1970).

Key words: Accuracy; algorithms; ANSI FORTRAN; documentation; error checking; machine independent; OMNITAB II operating system subprograms; OMNITAB II source listing; programming techniques; transportable; user-oriented computing system.

OMNITAB II is a general-purpose interpretive computing stem designed to allow a nonprogrammer to use a high-speed mputer easily, accurately and effectively. The system permits user to perform arithmetic operations including complex thmetic, trigonometric calculations, miscellaneous function culations, statistical analysis, Bessel function calculations, d operations on matrices and arrays.

The OMNITAB II system contains 177 subprograms written the ANSI FORTRAN language. Every effort has been made make the system transportable. This publication contains a mplete listing of all these subprograms. The listing is preceded a brief introduction which describes the programming hniques used; the use of system library functions; and the programs used to control the flow of operations in the OMTAB system.

340. **Technical highlights of the National Bureau of Standards, Annual Report Fiscal Year 1970,** Nat. Bur. Stand. (U.S.), Spec. Publ. 340, 258 pages (Feb. 1971).

Key words: Annual report; technical highlights.

This is an illustrated digest of NBS technical and scientific activities during the fiscal year ending June 30, 1970. It lists major programs as they were carried out by the three NBS institutes: Institute for Basic Standards, Institute for Materials Research, Institute for Applied Technology and by the Bureau's Center for Radiation Research and Center for Computer Science and Technology. Summaries are given of typical projects in measurement engineering, applied mathematics, electricity, metrology, mechanics, heat, atomic physics, radio standards, laboratory astrophysics, cryogenics, analytical chemistry, polymers, metallurgy, inorganic materials, physical chemistry, engineering standards, weights and measures, invention and innovation, vehicle systems research, product evaluation, building research, electronic technology, technical analysis, computer sciences, and radiation research. Also included are discussions of the Clearinghouse for Federal Scientific and Technical Information, the National Standard Reference Data System, Standard Reference Materials program, and national and international cooperative activities. A special section is devoted to NBS and the Consumer, Metric Study, Flammable Fabrics Program, Measurements for Air Quality and Building Technology.

SP341. **Damage in laser materials.** Proceedings of a symposium sponsored by the American Society for Testing and Materials and by the National Bureau of Standards June 24-25, 1970, NBS, Boulder, Colorado, A. J. Glass and A. H. Guenther, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 341, 126 pages (Dec. 1970).

Key words: Ferroelectric materials; glass; laser damage; lasers.

The second ASTM Symposium on Damage in Laser Materials was held at the National Bureau of Standards at Boulder, Colorado on June 24th and 25th, 1970. About 150 attendees heard papers by fourteen speakers, representing the major manufacturers of laser glass, government, industrial and university laboratories. Although the primary emphasis was on Nd:glass as a laser material, damage mechanisms and morphology in ruby, sapphire, and nonlinear optic materials were also considered. It was clear that substantial advances have been made in the last year in the production of damage-resistant laser glass for use in conventional Q-switched lasers. New diagnostic techniques have been developed, and in some cases, adopted as quality control procedures by the glass manufacturers. Theoretical understanding of the fundamental damage mechanisms is beginning to emerge, and material properties relevant to these damage mechanisms are beginning to be measured. It was equally clear that a great deal of effort remains to be expended to develop techniques suitable for nondestructive testing of laser materials, and that many properties of laser materials at high energy density are presently poorly understood.

SP342. **Report of the 55th National Conference on Weights and Measures 1970,** F. C. Bell and H. F. Wollin, Report Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 342, 315 pages (Apr. 1971).

Key words: Conference; weights and measures; weights and measures—history; weights and measures—law; weights and measures—regulations; weights and measures—technical requirements.

This is a report of the proceedings (edited) of the Fifty-fifth National Conference on Weights and Measures, sponsored by the National Bureau of Standards, held in Salt Lake City, Utah, July 13-17, 1970, and attended by state, county, and city weights and measures officials and representatives of the Federal Government, business, industry, railroads, and associations.

SP343. **Precision measurement and fundamental constants.** Proceedings of the international conference held at the NBS, Gaithersburg, Maryland, August 3-7, 1970, D. N. Langenberg and B. N. Taylor, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 343, 543 pages (Aug. 1971).

Key words: Fundamental constants; least squares adjustments; precision measurements.

This volume presents the Proceedings of the International Conference on Precision Measurement and Fundamental Constants, held at the National Bureau of Standards in Gaithersburg, Maryland, from August 3 through August 7, 1970. The conference brought together theoretical, experimental, and applied scientists for the purpose of discussing modern techniques of precision physical measurement and their application, along with modern theoretical developments, to the determination of the fundamental constants. The topics covered were: frequency and time standards; length standards; the velocity of light; the Rydberg constant; electrical standards; the proton gyromagnetic ratio; the Faraday constant; atomic masses; the proton magnetic moment; Josephson effects; x rays; fine and hyperfine structure in simple atoms; lepton g-factor anomalies; the gravitational constants; least squares adjustments of the constants. These Proceedings contain the invited tutorial talks as well as the contributed papers presented at the Conference. Also included are the post-paper discussions and a panel discussion entitled "Should Least Squares Adjustments of the Fundamental Constants be Abolished?"

SP344. Superseded by Special Publication 398.

SP345. **A metric America. A decision whose time has come,** D. V. De Simone, Nat. Bur. Stand. (U.S.), Spec. Publ. 345, 189 pages (July 1971).

Key words: Metrication; metric conversion; metric system; metric usage; Public Law 90-472; U.S. Metric Study.

This publication is the comprehensive report on the U.S. Metric Study undertaken by the National Bureau of Standards pursuant to Public Law 90-472. The report evaluates and distills the information contained in the twelve interim reports of the study series and also covers what has been learned from Great Britain and other countries that are now in or have been involved in a metric changeover. Data in the report show that America is already metric in some respects and that the great majority of businessmen, educators and other informed participants in the study reported that increased use of the metric system is in the best interests of America. Included in the publication are the recommendations of the Secretary of Commerce to Congress that the United States change to the metric system through a coordinated national program over a ten-year period.

SP345-1. **International Standards. U.S. Metric Study Report,** Nat. Bur. Stand. (U.S.), Spec. Publ. 345-1, 157 pages (Dec. 1970).

Key words: Engineering standards; IEC; ISO; International standardization; metric study; PL 90-472; product certification; standards; U.S. Metric Study.

This report discusses developments on the international scene that have occurred since the passage in 1968 of the Metric Study Act, PL 90-472. Australia, Canada and other countries of the British Commonwealth have recently taken steps toward the adoption of the metric system for their customary weights and measures. European countries are harmonizing their national standards and are developing international agreements for quality assurance and product certification. These harmonized standards are being based on recommendations issued by the International Electrotechnical Commission (IEC) and the International Organization for Standardization (ISO).

The issue of international standardization is separate and distinct from those of the Metric Study, but the two subjects overlap somewhat, particularly in the case of dimensional standards. The extent to which U.S. standards are adopted by IEC and ISO depends mostly on U.S. participation in committees or groups drafting the international standards and only secondarily on the measurement units. The report recommends the development of a firm U.S. policy on participation in international standardization and product certification, without awaiting the outcome of the U.S. Metric Study.

SP345-2. **U.S. metric study interim report. Federal Government: civilian agencies,** R. E. Clark and J. M. Tascher, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-2, 328 pages (July 1971).

Key words: Federal Government; International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; SI; U.S. Metric Study.

This publication reports the findings of a survey to ascertain the views of the civilian agencies of the Federal Government on the issues raised by the U.S. Metric Study Act. With regard to internal operations of the Federal agencies, the report covers present metric (International System of Units, or SI) usage and its advantages and disadvantages, expectations of future changes in measurement usage if the U.S. continues its laissez faire policy toward the SI, and attitudes toward a possible nationally coordinated metrication program. In the latter connection, the report contains estimates of added cost or savings impacts on agency internal operating budgets to be expected from a nominally 10-year planned metrication program, both during the transition and thereafter. The survey also assessed the impacts of metric usage and of its increase on the areas of responsibility of the Federal agencies in the society at large (e.g., communications, science and technology, health, labor affairs, international affairs and trade), and on the agencies' interfaces therewith.

SP345-3. **U.S. metric study interim report. Commercial weights and measures,** S. L. Hatos, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-3, 116 pages (July 1971).

Key words: Commercial weights and measures; International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; SI; U.S. Metric Study.

This publication, one of a series prepared pursuant to the U.S. Metric Study Act, explores the impacts metrication would have on commercial weights and measures activities. More specifically, the report concerns: (1) the cost of adapting or changing commercial weighing and measuring devices to record and/or indicate in metric units, and (2) the effects of metrication on state and local weights and measures jurisdictions.

SP345-4. **U.S. metric study interim report. The manufacturing industry,** L. E. Barbrow, Coordinator, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-4, 172 pages (July 1971).

Key words: International System of Units; manufacturing industry; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; SI; U.S. Metric Study.

This publication reports the results of a study to assess the impacts of increasing metric usage—past, present and future—on U.S. manufacturing industry. The study, conducted pursuant to the U.S. Metric Study Act, is based on responses from more than 2,000 manufacturing companies. Information was obtained on: past and present experience with use of the metric system, including advantages and disadvantages thereof, and the views of the firms with regard to future U.S. policy—whether the

country should continue its laissez faire approach to metric usage, or should undertake some sort of national program to encourage more widespread use of metric weights and measures. A separate survey of a smaller number of selected firms obtained detailed information as to estimated cost impact of a national metrication effort.

SP345-5. **U.S. metric study interim report. Nonmanufacturing businesses,** J. R. Cornog and E. D. Bunten, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-5, 200 pages (July 1971).

Key words: International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; nonmanufacturing businesses; SI; U.S. metric Study.

This publication, prepared pursuant to the U.S. Metric Study Act, reports on the experiences and views of nonmanufacturing businesses with regard to metric usage and its increase. The study is based on a survey of more than 2500 companies and firms primarily involved in: agriculture, forestry, fisheries, mining, construction, transportation, communications, utilities, wholesale/retail trade (including exporters/importers), finance, insurance, real estate or services. Information was obtained on: past or present experience with use of the metric system (including perceived advantages and disadvantages thereof), attitudes toward future metrication in a world of increasing metric usage (including preferred U.S. policy regarding), and estimated cost impacts and benefits which would be attendant to a national metrication program.

SP345-6. **U.S. metric study interim report. Education,** B. D. Robinson, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-6, 216 pages (July 1971).

Key words: Education; International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; SI; U.S. Metric Study.

This publication concerns the effects of increasing worldwide use of the metric system on education in the United States. The study was carried out and the report prepared for the U.S. Metric Study by the Education Development Center in Newton, Massachusetts. The aims of this education study were fourfold: (1) to assess the educational advantages and disadvantages of both the metric and the customary systems of units, (2) to determine the current usage of metric measures in U.S. schools and trends in that usage, (3) to find the ways in which education would have to change as the U.S. accommodates to increased worldwide use of the metric system, under a laissez faire or a planned approach, and estimate the costs of the changes, and (4) to make recommendations of ways in which to take best advantage of said changes. The report also discusses and suggests ways of achieving curriculum changes needed in view of increasing metric usage. The publication includes the program of the Education Conference, held in October 1970, as one of a series of National Metric Study Conferences, and the texts of the key papers presented at that conference by the National Education Association and the National Science Teachers Association.

SP345-7. **U.S. metric study interim report. The consumer,** B. D. Rothrock, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-7, 152 pages (July 1971).

Key words: Consumers; International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; National Metric Study Conferences; SI; U.S. Metric Study.

This report, one of a series prepared pursuant to the U.S. Metric Study Act, presents information on U.S. consumers' knowledge of the metric system and attitudes and opinions regarding metrication in the U.S., and discusses the effects of increasing worldwide metric usage on selected areas of consumer concern. This study is based on (1) an extensive survey conducted by the Survey Research Center of the University of Michigan and (2) prepared expert papers on selected areas of consumer interest. The survey data permitted an analysis of the receptivity of consumers to metrication, and of the need and possible effectiveness of a program to educate citizens should planned metrication be undertaken.

SP345-8. **U.S. metric study interim report. International trade,** G. F. Gordon, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-8, 188 pages (July 1971).

Key words: Foreign trade; International System of Units; metrication; metrication, impact of on foreign trade; metric conversion; metric conversion, effect on foreign trade; metric system; metric usage; metric usage, effect on foreign trade; SI; U.S. Metric Study.

This publication, one of a series prepared pursuant to the U.S. Metric Study Act, evaluates the potential effects that a U.S. conversion to the metric system may have on the Nation's foreign trade. The report is based on a survey of exporters and importers trading in measurement-sensitive products, which was conducted by the Bureau of Domestic Commerce of the Department of Commerce.

SP345-9. **U.S. metric study interim report. Department of Defense,** L. E. Barbrow, Coordinator, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-9, 132 pages (June 1971).

Key words: Department of Defense; International System of Units; metrication; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; SI; U.S. Metric Study.

This publication reports the results of a Department of Defense study, conducted pursuant to the U.S. Metric Study Act, to determine and evaluate the advantages and disadvantages, including impact on operational capability, that would attend adoption of the International System of units of weights and measures (otherwise known as the Modernized Metric System) for use in the Department (DoD). The report includes estimates for each of the major components of the DoD of the costs of a transition to metric system usage. In addition to discussing the specific advantages and disadvantages that would be expected within the Department, the report describes the dependence of the DoD on the National Industrial Base, and discusses how this interaction would be involved in a national metrication effort.

SP345-10. **U.S. metric study interim report. A history of the metric system controversy in the United States,** C. F. Treat, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-10, 312 pages (Aug. 1971).

Key words: Metric system; weights and measures.

A review of the debate between 1790 and 1968 on the question of whether or not the United States should adopt the metric system of weights and measures. Legislative activities with respect to weights and measures and campaigns for and against adoption of the metric system are reviewed. Significant investigations of the question by both public and private bodies are highlighted. An extensive bibliography is included.

SP345-11. **U.S. metric study interim report. Engineering standards,** R. D. Stiehler, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-11, 264 pages (July 1971).

Key words: Engineering standards; international standards; International System of Units; metrication; metrication

and engineering standards; metric conversion; metric system; SI; standards; U.S. Metric Study.

This report, one of a series prepared pursuant to the U.S. Metric Study Act, is concerned with (1) the relationship between measurement language and engineering standards, and (2) the compatibility of U.S. Standards with corresponding international standards. Incompatibilities between corresponding standards result from differences of engineering practice. Measurement units contribute to the incompatibilities among many dimensional specifications which comprise about 25% of engineering standards. In the remaining standards, measurement units are either not involved or serve merely as a language. The study compares U.S. standards with other national and international standards.

SP345-12. **U.S. metric study interim report. Testimony of nationally representative groups,** J. V. Odom, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 345-12, 180 pages (July 1971).

Key words: International System of Units; metrication; metrication, attitudes toward; metrication, costs and benefits of; metrication, impact of; metric conversion; metric system; metric usage; National Metric Study Conferences; SI; U.S. Metric Study.

This publication, a part of the U.S. Metric Study series, summarizes the inputs received from the more than 700 associations, societies, unions and other groups which were invited to submit their opinions and viewpoints on the issues raised by the U.S. Metric Study Act. Most of these submissions were publicly presented at hearings held during the course of the Study.

SP346. **Hydraulic research in the United States 1970. Including contributions from Canadian Laboratories,** G. Kulin and P. H. Gurewitz, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 346, 354 pages (Mar. 1971).

Key words: Fluid mechanics; hydraulic engineering; hydraulic research; hydraulics; hydrodynamics; model studies; research summaries.

Current and recently concluded research projects in hydraulics and hydrodynamics for the years 1969-1970 are summarized. Projects from more than 250 university, industrial, state and federal government laboratories in the United States and Canada are reported.

SP347. **Proceedings of joint meeting of government operations research users and producers, held at the National Bureau of Standards, Gaithersburg, Maryland, June 5-6, 1969,** E. H. Hustvedt, Conference Coordinator and M. L. Friend, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 347, 164 pages (May 1971).

Key words: Conference proceedings; contract research; federal government; information exchange; NBS; operations research/systems analysis studies; OR users and producers; planning.

Frequently government agencies are unsure as to whom to contact when they want Operations Research/Systems Analysis studies made, and many agencies know very little about what other agencies might be doing in the field of operations research. Many public and private agencies have little knowledge as to which government agencies might derive the most benefit from their kinds of expertise and experience.

The Joint Meeting of Government Operations Research Users and Producers was organized to improve the communications among Users of operations research within the government, and Producers of operations research in public and private organizations.

Government agencies were invited to report on exactly what they expect of their OR producers, what they expect to have done with the results, what the purposes and their uses of systems analysis are, and to give a general profile of their in-house work.

Universities were invited to report on their capabilities and their desires and to discuss the OR projects currently in progress on their campuses.

This meeting was the second in a planned series of meetings. It had for its purpose the longer range goal of providing more responsive and more adequate studies for improving government agency management and productivity.

SP348. **The science of ceramic machining and surface finishing.** Proceedings of a symposium sponsored by the American Ceramic Society, the Office of Naval Research, and the National Bureau of Standards, Nov. 2-4, 1970, held at NBS, Gaithersburg, Md., S. J. Schneider, Jr., and R. W. Rice, Editors, and C. F. Bersch, A. M. Diness, and J. B. Wachtman, Jr., Associate Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 348, 431 pages (May 1972).

Key words: Ceramic machining; ceramics; mechanical effects of machining; removal and shaping of ceramics; surface treatment.

This volume presents the proceedings of the Symposium on the Science of Ceramic Machining and Surface Finishing held at the National Bureau of Standards in Gaithersburg, Md., on Nov. 2-4, 1970. The symposium was jointly sponsored by the Baltimore-Washington Section of the American Ceramic Society, the Office of Naval Research, and the National Bureau of Standards. The purpose of the conference was to survey the developing science of ceramic machining and to stimulate further progress by discussion of current problems and research programs. In addition to a panel discussion, 37 review and original research papers were presented with attention focused on four main areas: (1) Techniques and Mechanisms of Removal and Shaping (2) Surface Treatment (3) Analysis and Characterization of Machining Effects and (4) Mechanical and Other Effects of Finishing. An edited version of the floor discussion following each paper is given. *These proceedings include the following papers (indented):*

Science and the machining and surface finishing of ceramics, R. W. Rice, C. F. Bersch, and A. M. Diness, *SP348,* pp. 1-3 (May 1972).

Key words: Machining; machining costs; methods of machining and finishing; surface-dependent properties; surface finishing.

Historically, the technology of machining and surface finishing of ceramics has advanced by empirical methods. Further advances appear limited without gaining basic knowledge of the mechanisms of removing or redistributing material from or on ceramic surfaces. Because of the diversity of ceramic behavior, this is a challenging scientific problem. However, meeting this challenge can result not only in improved or new machining and finishing processes but also in greater understanding of the character of the resultant surface and sub-surface, and hence of the surface dependent properties.

Mechanical methods of ceramic finishing, P. J. Gielisse and J. Stanislao, *SP348,* pp. 5-35 (May 1972).

Key words: Abrasive; ceramics; diamond; fracture; grinding; grinding forces; grinding temperatures; machining; polishing; residual stresses; stock removal; surface analysis; theory of grinding.

Mechanical methods of finishing ceramics have been reviewed based on current practice as well as past and present research results. A total systems evaluation is

volves technical process and economic parameters. State of the art information indicates a need for scientific evaluation of the basic stock removal process.

Experiments simulating grinding with single point diamond tools have generated quantitative and qualitative data on mechanical, dynamic, and thermal aspects of the stock removal process. Generation of the data involved specially designed techniques.

Analysis of the results have been made in terms of mechanical, geometric, and material parameters. A mechanical and thermodynamic model is presented.

Direct observation of material removal process during grinding of ceramics by micro-flash technique, O. Imanaka, S. Fujino, and S. Mineta, *SP348*, pp. 37-43 (May 1972).

Key words: Alumina; brittle fracture; chip removal process; forsterite; glass-ceramics; grinding of ceramics; micro-flash technique; observation of chips during grinding; steatite.

In order to make the mechanism of grinding ceramics clear, chip removal processes have been observed during grinding with a specially-built setup which consists of a flash lamp, synchronizer, microscope, and motor-driven camera. Duration time of the flash is about 0.8 μs in half-value width, and a storage capacitor in the flash lamp circuit can store an energy of about 10 W · s. By choosing the flashing point, grinding phenomena at different positions on the contact arc can be photographed at certain time intervals.

The experiments were done mainly by using one grain of diamond attached to a disk which was mounted on a shaft of a surface grinding machine. Workpiece materials examined were glass-ceramics and several types of oxide ceramics, e.g., alumina, forsterite, and steatite ceramics. The main results obtained are as follows: Under moderately large depth of cut, the chips generated from ceramics are generally of a fragment type and are distinguished from those of ductile materials. Part of these chips were observed to be removed, of course, directly by the grain, but a considerable part of them were found to splinter out of the workpiece surface in a short time after the grain has passed over. Possible explanations are proposed for those phenomena. The above-mentioned facts suggest that a damaged layer may remain under the ground surface of ceramic materials. It is also demonstrated that chips of continuous type are occasionally observed at high grinding speed and under moderately small depth of cut. The chip formation of this type depends delicately on the materials to be ground.

Grinding—A means of shaping and sizing ceramics, J. A. Mueller, *SP348*, pp. 45-52 (May 1972).

Key words: Capability; ceramics; grinding wheels; selection; shaping; sizing.

The shaping and sizing of ceramic bodies can be done with abrasive grinding wheels. From a grinding wheel point of view, ceramic bodies may be classified into two groups. One group that is harder than 800 Knoop and the other group that is softer than 800 Knoop.

The materials that are harder than 800 Knoop generally require the use of diamond wheels. Diamond wheels have the capability to remove stock, to generate precise geometry, and to produce finishes as fine as those that are measured in light bands.

The selection of the diamond grinding wheel is critical because improper selection can cause excessive grinding costs, poor quality, and low productivity. The selection of the diamond grinding wheel includes not only the selection of the specification of the wheel formulation but also the selection of the geometry of the wheel.

Case histories of finishing and shaping ceramic bodies illustrate the capability of the grinding wheel in these areas. Suggestions for starting speeds, feeds, and wheels together with a list of practical everyday "Rules of Thumb" for efficient grinding are documented.

Aspects of machining glass-ceramic materials, G. H. Allgeyer and L. V. Colwell, *SP348*, pp. 53-57 (May 1972).

Key words: Abrasive machining; brittle chip formation; brittle fracture; chip accommodation; glass; glass-ceramics; machining and grinding technical ceramics; material removal rate; specific energy; wheel structure.

The manufacture of optical and mechanical parts from glass-ceramic materials usually requires the removal of unwanted stock resulting from casting, hot forming, or the cutting of blocks from large ingots or blanks. Desired surface finishes at specified dimensions are the usual requirements. Conventional metalworking cutting tools did not produce satisfactory results. Scratching, splintering, and brittle fracture were responsible for the material removal action in the sawing, drilling, turning, and milling operations attempted. Very rough unsatisfactory surfaces resulted.

The physical and mechanical properties of CER-VIT® material classify it as a brittle, crystalline material in the usual machining state. The best controllable means of material removal was found to be abrasive machining. The high hardness (550 Knoop) and abrasive character of these materials conclusively recommend diamond as the most satisfactory cutting medium. Machinability studies were conducted on CER-VIT® glass-ceramic material using diamond abrasive tooling while adjusting the controllable machining variables. The results and relationships of these techniques as applied to CER-VIT® glass-ceramic are discussed.

Significance of the experimental results is explored with particular emphasis being placed upon the predictable performance of diamond tools and the feasibility of programming of machining variables for utilization of numerically controlled machining processes.

The principles of grinding, R. S. Hahn and R. P. Lindsay, *SP348*, pp. 59-71 (May 1972).

Key words: Abrasive wear parameter; grinding; material removal parameter; principles of grinding; surface finish in grinding; surface integrity in ground surfaces; wheel dressing.

Three distinct actions are shown to take place in the grinding process, namely rubbing, ploughing, and cutting. A clue to the relative importance of each of these can be obtained by plotting the volumetric rate of stock removal against the wheelwork interface force for unit width (force intensity). Such plots show for some materials a threshold force intensity below which no stock removal occurs. Equations relating the stock removal rate and the interface force intensity are developed and a "material removal parameter" is defined. Similar equations for the wheel wear and a "wheel-wear parameter" are also developed. It is found for many materials that the stock removal rate is a linear function of the interface force intensity. However, the abrasive removal rate or dimensional wheel wear is found to vary approximately as the square of the interface force intensity. Increasing wheel surface speed is generally found to raise the material removal parameter.

The essential parameters in dressing with single pointed

diamonds are introduced and their effect on controlling the sharpness of a grinding wheel is discussed. Semi-empirical equations for predicting wheel wear are given in terms of force intensity, wheel hardness, and wheel-workpiece conformity. The factors influencing surface finish are described, including the dressing lead, the depth of cut of the dresser diamond, and the interface force intensity. Thermal damage and surface integrity are discussed. The existence of a threshold force intensity (or feed rate) below which no thermal cracking takes place is shown. Raising the workspeed tends to raise this threshold. Wheel sharpness is also found to be an important variable, and means for quantitatively measuring wheel sharpness are given.

A basic study of the diamond grinding of alumina, D. M. Busch and J. F. Prins, *SP348*, pp. 73-87 (May 1972).

Key words: Abrasion; chatter vibrations; forces in grinding; fracture of alumina grains; grinding noise; grinding of alumina; scratching of glass; single diamond cutting of alumina.

Experiments were performed using single diamond points to cut Coors AD96 alumina under conditions simulating the grinding of this material. These studies involved different diamond particles and the forces were recorded during the cutting action.

Parallel to the single diamond experiments, grinding tests were performed on the same ceramic material using the same types of diamonds with which the single point studies were done. The grinding experiments and the single diamond experiments were then compared to get a better understanding of the actual cutting mechanism involved when grinding aluminium oxide.

The wear of the diamond particles and the damage inflicted on the ceramic material were studied with the aid of electron microscopy. A relationship was found between the forces measured, the deterioration of the bonding material, and the wear of the diamonds.

Special attention was given to diamonds of the MDA-S type, a blocky, sharp-edged diamond grit, and diamond spheres. These two types of diamonds were compared in grinding and showed similar results due to the production of flat areas on the spheres and the movement and wear of the blocky particles in the bonding material to present flat faces to the workpieces.

The grinding experiments also entailed a study of machine vibrations, especially chatter vibrations and the grinding noise associated with it.

On the strength of ceramics as a function of microstructure, grinding parameters, surface finish, and environmental conditions, R. Sedlacek, F. A. Halden, and P. J. Jorgensen, *SP348*, pp. 89-96 (May 1972).

Key words: Alumina; delayed fracture; grinding of ceramics; microstructure; stress corrosion; vacuum strength.

The tensile strength of four aluminas is described in terms of their microstructure and composition. The effect of microstructure on the attainable surface finish is discussed, and the results of profilometric evaluation of ground surfaces are presented. Various postgrind treatments are shown to have differing effects on microstructure. Griffith's flaw theory is applied to aluminas of different grain sizes, and calculated strengths are found to agree with experimental data. The phenomena of delayed fracture and stress corrosion are discussed; the strength of alumina is found to be higher under vacuum than in air and is independent of stress rate.

Grinding alumina with diamond abrasives, R. J. Caveney and N. W. Thiel, *SP348*, pp. 99-112 (May 1972).

Key words: Alumina; cylindrical grinding; diamond grinding wheel; electron microscopy; removal mechanism; surface damage; surface finish; surface grinding; wear mechanism.

This paper is the result of a preliminary investigation into the grinding of high density alumina with diamond abrasive grinding wheels.

Following extensive work on the application of diamond for tungsten carbide and steel grinding, the De Beers Diamond Research Laboratory recently embarked on a research programme to study the various aspects of ceramic grinding. In the Diamond Abrasive Technology Centre's Grinding Section, ceramics with three different alumina contents were ground with a variety of diamond types both natural and synthetic to establish what effect changes in wheel speed have when surface grinding these materials. The mode and extent of damage of the ground surfaces of the specimens were investigated using conventional electron microscopy. In addition to these investigations, measurements were made of the quality of the surface finishes that can be obtained under different grinding conditions. Variations in grinding efficiency, machining costs, and surface damage are discussed for the three alumina grades tested. The mechanism of wear of the different diamond types was studied and is demonstrated by means of scanning electron micrographs.

Also reported in this paper are the initial results obtained from tests on cylinders of the same three alumina grades mentioned above. These initial tests were aimed at finding the most suitable combination from the point of view of wheel life, of wheel and workpiece speeds, and incorporated tests with both natural and synthetic grits.

Ceramic substrate and specimen fabrication, H. C. Leistner and W. A. Wilson, *SP348*, pp. 113-117 (May 1972).

Key words: Ceramics; finishing; grinding; specimens; substrates; ultrasonic machining.

Procedures have been developed to fabricate ceramic materials used as substrates for precision, coaxial, thin film resistors. Excellent radio frequency characteristics have been obtained from this procedure in developing radio frequency standards at the National Bureau of Standards at power levels of 10 milliwatts to 100 watts and frequencies from direct current to 4.0 gigahertz. Substrates fabricated for this purpose require precise tolerances and surface finish to insure uniformity of thin films deposited on a ceramic substrate.

In addition, procedures have been developed to fabricate specimens used in determining the dielectric and magnetic properties of ferrites, insulating ceramics, glass, fused silica, and single crystal materials. A variety of shapes are required including spheres, rods, disks, and ellipsoids. Precise tolerances are required to obtain qualitative property measurements of the materials involved.

In both procedures, special techniques are used with existing equipment in grinding ultrasonic machining, lapping, and polishing to obtain the required end product. This paper deals with both the application of the required products and the methods used to fabricate these products.

On the shaping of brittle solids by erosion and ultrasonic cutting, H. L. Oh, K. P. L. Oh, S. Vaidyanathan, and I. Finnie, *SP348*, pp. 119-131 (May 1972).

Key words: Abrasion; brittle-ductile transition; erosion; fracture location; ring cracking; shaping; size-effect; statistical nature of strength; ultrasonic cutting; Weibull distribution.

In mechanical shaping processes for brittle solids, materials are removed by the propagation and intersection of cracks. To control the resulting surface finish, the extent of cracking is localized by loading the surface in very small regions, usually with small abrasive grains. Thus, in analyzing such processes as erosion and ultrasonic cutting, we have to examine the fracture patterns produced by small hard indenters.

As a starting point, it is shown that fracture loads for indenters subjected to normal force may be predicted from conventional strength tests by using Weibull's statistical treatment of brittle strength. It is then shown that Weibull's procedures may be extended to predict the distribution of fracture location in brittle solids. For the case of a spherical indenter under normal and tangential forces, many cracks may form as the load is increased. It is shown that the location of the outermost of these cracks may be predicted. Estimates may also be made of the depth of cracking and thus the extent of the cracking produced by a single contracting particle may be described.

These results may be applied directly to study the process of erosive shaping. The influence on volume removal of changes in the velocity and size of the impacting particles is predicted and shown to be in accord with experiment. Many other features of the erosion process may be described including a transition to "ductile" behavior in the case of glass when the impacting particles are small enough. The analysis of ultrasonic cutting presents greater difficulty because the distribution in size of the abrasive grains is of great importance. However, predictions may be made for the influence of load, grain size, and material properties on the rate of volume removal and these are shown to be in general accord with experiment.

Sonic machining of ceramics, W. B. Campbell, *SP348,* pp. 33-139 (May 1972).

Key words: Abrasive; ceramic machining; sonic machining; vibrational machining; wheel machining.

The effect of 10 kHz sonic vibrations on the shaping and finishing of fired ceramic shapes was investigated to identify optimum machining conditions commensurate with product and surface quality. Sonic motors, developed at The Ohio State University and with outputs up to 15 horsepower, were used to activate the machine tool. Significant improvements in tool wear were observed in impact-tuned systems that produced removal rates greater than 45 cu in per min. Template and profile tooling were successfully used to obtain open cutting surfaces. Over 3,000 test cuts provided the data necessary to identify optimal parameters of operation.

Environment-sensitive machining behavior of nonmetals, A. R. C. Westwood and R. M. Latanision, *SP348,* pp. 141-153 (May 1972).

Key words: Adsorption; ceramics; drilling; environmental effects; fracture; glasses; machining; mechanical behavior.

Liquid environments can influence the efficiency of machining nonmetallic solids in a variety of ways, e.g., by serving as lubricants, coolants, or particle dispersants. More importantly, however, certain environments can markedly increase or decrease the hardness of the near-surface regions of such solids, and thereby exert a profound influence both on the rate of material removal and on tool life. Because of its technological potential, the characteristics and possible mechanisms of this latter phenomenon—the Rebinder effect—receive primary consideration in this paper.

For crystalline ceramics, Rebinder effects in machining arise because of the influence of the environment on near-surface dislocation behavior. Effects resulting from adsorption-induced changes in the surface free energy of the solid are of minor importance. Rebinder effects can also occur in noncrystalline solids, however, and recent observations on such effects in various glasses are described. The possibility that these effects are caused by a stress-plus-chemisorption-induced redistribution of sodium ions in the near-surface region is discussed.

The importance of considering the total cutting system, environment-solid-tool, in any account of environment-sensitive machining is stressed, for environments which facilitate material removal when one type of tool is used can be detrimental to the effectiveness of another tool with a different cutting action.

Shaping or figuring ceramic surfaces by ion-beam bombardment, P. W. Levy, *SP348,* pp. 155-168 (May 1972).

Key words: Figuring; ion-beams; optical surfaces; polishing; radiation damage; sputtering.

The shaping or figuring of glass and ceramic surfaces by ion-beam erosion is a relatively new technique. All operations are carried out in a vacuum. Usually the optic is bombarded by a collimated beam of rare gas ions whose energy is between 1-100 keV. Selected areas can be eroded by electrostatically deflecting the beam or, less conveniently, by moving the optic. The erosion area can be controlled by focusing the beam with electrostatic or magnetic lenses. The basis of the erosion process is the physical phenomenon known as sputtering. This occurs when the incident ions scatter elastically with atoms near the surface of the target and some of the displaced atoms, after participating in one or more collisions, acquire sufficient velocity to escape from the solid. Other dislodged atoms become interstitials and, together with vacancies created in the recoil process, create a radiation-damaged layer just below the eroding surface, whose thickness is roughly the range of the bombarding ions. For ceramic materials, typical erosion rates are on the order of angstroms/μamp/cm^2/min and increase with increasing angle of incidence. Ion-beam currents up to 100 μamp/cm^2 are practical. Under these conditions, the material struck by the beam may reach temperatures between 300 and 700 °C. The maximum lattice disruption occurs at a depth of one incident ion range from the original surface just as the eroding surface reaches this point. Additional bombardment does not increase the damage beyond this maximum. Furthermore, the damage is minimized by using bombardment conditions which maximize the temperature in the target. It is not known if there are any radiation damage effects which reduce the usefulness of ion-beam figured optics. At the moment, it would appear that ion-beam figuring is a practical technique for "touching up" conventional optics and, more importantly, for fabricating nonspherical or nonaxially symmetrical optics. Also, the ion-beam erosion process is particularly amenable to computer control.

The effect of sputtering on surface topography and strength of ceramics, R. W. Rice, *SP348,* pp. 171-187 (May 1972).

Key words: Carbides; glass, ion beam sputtering; nitrides; oxides; RF sputtering; strength; surface finish; twins.

The topography developed as a result of RF sputtering on a variety of ceramic surfaces is described showing that sur-

face cracks, scratches, pits, etc., are fairly rapidly rounded out. Generally, this occurs without differential grain boundary sputtering. However, some bodies develop a rough finish due to nonuniform microstructural removal. Limited trials with ion beam sputtering show it also rounds cracks, etc., but does not develop a rough finish on bodies that will with RF sputtering.

Because of the rounding of stress concentrating features and generally similar effects on single and polycrystalline bodies, sputtering was investigated as a substitute for flame polishing, but with much wider applicability. Flame polished strengths were not obtained. However, some materials (e.g., $MgAl_2O_4$) do show greater improvements in strengths than others (e.g., Al_2O_4) as a result of sputtering. These differences will be discussed and results compared with other methods of surface finish.

Both the detailed nature of the sputtered surface as well as enhancement of grain boundaries and other microstructural features under certain conditions indicate that sputtering may also be useful as an etching technique.

Computer controlled ionic polishing of optical surfaces, J. W. Douglass, *SP348*, pp. 189-192 (May 1972).

Key words: Computer controlled process; ion beam technology; ionic polishing; optical fabrication; optical scatter; sputtering.

Results of the development of an ionic polishing investigation are described. During this investigation many controlled polishing experiments were performed. The results of two of these experiments are presented. In the first of these, a 0.203 m diameter optical flat of fused silica was polished to a diffraction limited surface quality of 95A (9.5 nm) rms. The second experiment described was the conversion of a 0.203 m diameter Cervit sphere into an f/5 paraboloid of diffraction limited quality by using analytical expressions to generate the removal distribution. The ionic polishing process was computer controlled for this experiment. The temporal stability and optical scatter performance of ionically polished surfaces has been determined to be as good as or better than conventional surfaces.

Arc, laser, and electron beam machining of ceramics, R. W. Rice, *SP348*, pp. 193-195 (May 1972).

Key words: Arc machining; cutting; drilling; electron beam machining; laser machining; shaping; thermal shock control.

The various types of arc, laser, and electron beam machining, the considerations that are required in their operations, and some of the applications for which they have been tried or used, are briefly reviewed. The most general consideration is whether thermal shock and stress cracking will be a problem. The environmental and material parameters, which vary substantially with the types of these different machining processes, can also be quite important. Meeting the requirements of all these considerations does limit the versatility and applicability of these techniques. Nevertheless, they deserve consideration for a variety of applications.

The techniques and mechanisms of chemical, electrochemical, and electrical discharge machining of ceramic materials, D. W. Lee and G. Feick, *SP348*, pp. 197-210 (May 1972).

Key words: Ceramic materials; chemical machining (CHM); electrical discharge machining (EDM); electrochemical machining (ECM); intermetallic compounds.

Electrochemical Machining (ECM), Electrical Discharge Machining (EDM), and Chemical Machining (CHM) techniques have not been extensively used as a material removal process for ceramics. The fact that these processes are not dependent upon the hardness of the workpiece should make them attractive for the shaping of ceramics. However, ECM and EDM techniques are limited to material with reasonably good electrical conductivity while CHM may be limited by the availability of effective etchants and the nature of the ceramic itself.

The theory and techniques of chemical, electrochemical, and electrical discharge processes will be reviewed. The variables and important parameters of the material removal processes will be discussed, including etchants and mask techniques for chemical milling; current-voltage characteristics, dielectric fluids, electrode materials, etc., for EDM; electrolytes, gap effects, current density, etc., for ECM. The available information and experiences developed on metals and alloys will be used to examine the applications and limitations of these processes to ceramic materials. Where possible, the effects of the material removal process on the surface condition, microstructure, and subsequent material properties will be pointed out. Finally, comments will be made on the technical and economic feasibility of ECM, EDM, and CHM processes for the shaping, cutting, and finishing of crystalline ceramics.

Improvements in the surface finish of ceramics by flame polishing and annealing techniques, M. J. Noone and A. H. Heuer, *SP348*, pp. 213-232 (May 1972).

Key words: α-Al_2O_3; annealing; flame-polishing; reinforcements; ruby; sapphire; strength; surface perfection.

Improvements in the surface perfection (i.e., "smoothness") of ceramics can be achieved by thermal treatments at temperatures where material transport may be induced at the surface. Such treatments include annealing in controlled environments, where surface diffusion, vapor transport mechanisms, etc., may be active, and flame polishing, where a thin layer at the surface of the material is melted, allowed to flow freely, and then resolidified.

The effects of these treatments on the surface of single crystals of α-Al_2O_3 are reviewed in this paper. The most sensitive assessment of the degree to which surface perfection is attained is the measurement of the strength of the treated crystals; for this reason, strength data are used extensively to characterize the thermal treatments described. In the case of flame polishing, it found that a sufficient degree of surface perfection can be attained so that the strength is no longer limited by surface defects (the usual experience with ceramics) but by defects within the material. The technological significance of high strength Al_2O_3 filaments for reinforcement of metals and the unfortunate deterioration of the surface in these applications is briefly described.

Healing of surface cracks in ceramics, F. F. Lange, *SP348*, pp. 233-236 (May 1972).

Key words: Abrasive machining; ceramics; crack healing; sintering; surface damage.

Grinding, cutting, thermal shocking, impacting, and roug handling all introduce surface cracks that degrade th strength of ceramics. Within the last year, it has been show that, once introduced, these cracks can be eliminated b either resintering the damaged ceramic component for th case of oxides or oxidizing the component for the case c materials such as SiC.

Results of crack healing experiments, performed o Al_2O_3, ZnO, and SiC will be reviewed. The technical impl

cations of these results will be discussed as related to abrasive machining.

Flame polishing of flat oxide bars, P. F. Becher and R. W. Rice, *SP348*, pp. 237-244 (May 1972).

Key words: Flame polishing; glass; rutile; sapphire; spinel; strength; surface characterization; twinning.

Some of the problems and limitations of flame polishing flat bars are discussed. Results are presented for single crystal, α-Al_2O_3, as well as for more limited trials of $MgAl_2O_3$, TiO_2, and soda lime glass. The wide variability of strength is partially related to variations in surface, but twinning also appears to be important in sapphire and TiO_2. Preliminary results on twin sources and their effect on strength of sapphire are discussed.

Continuous flame polishing of sapphire filament, J. T. A. Pollock, *SP348*, pp. 247-256 (May 1972).

Key words: Characterization; continuous flame polishing; sapphire filament; strength enhancements.

Continuous flame polishing of nominal 2.5×10^{-4} m diameter single crystal sapphire filament oriented with the c-direction parallel to the filament axis has resulted in considerable enhancement of the tensile fracture strength. Optimum increases of approximately 1.1×10^9 N/m² (1.6×10^5 psi) have been obtained on flame polishing many lengths of filament exhibiting as-grown tensile strength of $2.2 - 2.8 \times 10^9$ N/m² ($3.2 - 4.0 \times 10^5$ psi). Flame polishing was carried out in a continuous manner at 6.3×10^{-4} m/sec using an oxygen/hydrogen flame. Data are presented which suggest that the enhancement is not entirely dependent on the production of a more perfect Al_2O_3 surface. Increases in strength of approximately 5.5×10^8 N/m² (8×10^4 psi) are reported for filament which has passed through flames not sufficiently hot for surface melting to occur. Maximum strength enhancement is obtained when the oxygen/hydrogen flame temperature is such that an axial molten zone two to three times the filament diameter is produced at the filament surface. When the flame temperature is too high, the geometric integrity of the filament is lost and an apparent fall in tensile strength from the peak value is observed.

Metallographic evidence is presented indicating that the molten zone has a radial depth of less than 6.5×10^{-6} m. Scanning electron microscopy and related surface analysis studies are reported which confirm that optimum polishing results in a smoother filament surface. Experiments to determine the state of stress in the filament before and after polishing are described.

The relative contributions to the reported tensile strength enhancement of thermal strain relieving, thermally activated atomic diffusion leading to blunting of possible fracture sources, and the creation of a more perfect Al_2O_3 surface are discussed.

Preparation of smooth crystalline, damage free, sapphire surfaces by gaseous etching, W. A. Schmidt and J. E. Davey, *SP348*, pp. 259-265 (May 1972).

Key words: Crystalline sapphire surfaces; fluorinated-hydrocarbon etch; fluorotrichloromethane; freon etching; hydrogen annealing; sapphire; sapphire substrates; sapphire surface preparation.

Sapphire has a combination of properties such as relative chemical inertness, exceedingly high resistivity, optical transparency, and crystalline structure that suggests its use as a substrate material for various semiconductor devices. Its successful use for silicon vapor phase epitaxy substrates indicates that similar results might be possible with other semiconductors. Previous epitaxial studies have shown that surface crystalline disorder and topographic imperfections inhibit epitaxial growth; therefore, highly polished, well ordered sapphire surfaces were needed. Mechanical polishing alone is insufficient as it results in cold flow and work damage.

Initial experiments in removing surface damage were performed with hot phosphoric acid and with hydroxide etches. Undesirable preferential etching was observed for both processes and the processes did not seem amenable to the routine production of high quality surfaces. Two other surface treatments for which successful results have recently been reported were investigated.

The first was a hydrogen firing technique in which the substrates were heated in hydrogen in an Mo wound resistance furnace at 1500 °C. The second was a simple laboratory process in which the sample is heated by means of RF heating of a carbon susceptor to 1350 °C in an atmosphere of helium and fluorotrichloromethane (Freon-11). Commercial reagents were used throughout and a fused quartz tube was used for the reaction chamber for the second technique.

Reflection electron diffraction (RED) was used to determine the surface crystalline order, and electron microscopy (EM), using high resolution replication techniques, was used to examine the topography structure of the surfaces. A number of different substrates from various industrial sources, with different surface topographies and different orientations, were used.

Hydrogen firing at 1500 °C results in an etch rate of 0.1 10^{-6} m/min. Firing for times up to 45 min did not produce consistent surfaces on the 0, 60 or 90° orientations. While hydrogen firing did produce high quality, well ordered crystallograph surfaces by RED, their topographic condition was poor. Resolvable surface structures could be detected on some with standard optical microscopy (200x, dark field) and for all high resolution EM measurements. The final surface finish quality was related to the quality of the prefired surface, indicating that complete damage removal was not accomplished.

Freon firing at 1350 °C resulted in an etch rate of 1.5 10^{-5} m/min. This technique consistently produced well ordered, high quality surfaces for the 60 and 90° oriented surfaces. EM viewed 60 and 90° freon-fired surfaces had no resolvable surface structure after a 5 min etch and were well ordered crystallographically as measured by RED. The same etch produced strongly etched surfaces on 0° oriented material.

The strength of gas polished sapphire and rutile, R. W. Rice, P. F. Becher, and W. A. Schmidt, *SP348*, pp. 267-269 (May 1972).

Key words: Chemical polishing; rutile; sapphire; spinel; strength; twinning.

Surface polishing of α-Al_2O_3 using a helium-freon gas mixture at elevated temperatures is shown to yield bend strengths comparable to flame polished sapphire. However, the gas polishing process proved to be more versatile as evidenced by the success with flat bar surfaces. Further, the process can be readily applied to some other materials as demonstrated by the substantial improvements in the strength of TiO_2 after gas polishing. Limited attempts at polishing other ceramic materials are also discussed, as well as observations on strength variations and fracture behavior.

Analysis and characterization of ceramic surfaces for electronic applications, R. C. Sundahl and L. Berrin, *SP348*, pp. 271-290 (May 1972).

Key words: Aluminum oxide; Auger electron spectroscopy; crystallographic texture; ion microprobe; scanning electron microscopy; substrates; surface defects; surface segregation; thin film adhesion; thin film circuit imperfections.

The criteria which are used to evaluate the surfaces of ceramic substrates for use in the electronics industry must be related to the specific application of the surface. This article emphasizes one such application— the use of a ceramic surface as a support for complex thin film conductor patterns which serve to interconnect silicon integrated circuit chips. Those ceramic surface parameters which are found to be critical to this application are (1) topographical properties, (2) chemical properties, and (3) crystallographic properties.

These properties are characterized using such tools and techniques as optical, transmission electron and scanning electron microscopy, profilometry, electron microprobe analysis, ion microscope analysis, Auger electron spectroscopy, and electron diffraction. Special emphasis is placed on the relationship between the results of such analyses and the performance of the surface as part of the SIC interconnect system.

Surface characteristics of ceramic substrates for hybrid and microwave electronic circuits, J. K. Emery, *SP348*, pp. 293-300 (May 1972).

Key words: Camber; ceramic; fired; flatness; ground; lapped; microwave; polished; roughness; substrate; surface; thick film; thin film; waviness.

Several methods currently used for finishing ceramic substrates in ready-for-deposition state are discussed, including firing, glazing, burnishing, grinding, lapping, and polishing. Each method tends to exhibit a different and typical combination of surface characteristics, such as variations in thickness, parallelism, camber, waviness, roughness, and localized defects; each of these in turn may influence the deposition process, performance, and reliability. Analysis of some typical surface details, particularly roughness and waviness, as significant surface factors capable of affecting process or function, is presented with comments on instrumentation and measurement procedures.

Significant differences exist in the use of terms relating to substrate surfaces and their characteristics; a need is indicated for more particularized use of such terms and for recognition of uniform definitions. Clarification of terminology may facilitate improved communications and measurements, which in turn may correlate with current and future requirements in circuit production. Several existing applicable standards are referenced, and definitions of terms are suggested. A number of choices of surface characteristics are presented which may be related with process controls and function, but no recommendations for particular values of surface details are intended.

Ceramic surface texture by reflective replica technique, W. C. Lo, *SP348*, pp. 301-307 (May 1972).

Key words: Alumina substrates; surface replica; surface texture.

Surface texture is a parameter of general concern in the study of thin film metallizing adherence on ceramic substrates. It refers to the geometrical character of the surface irregularities recurring many times across the ceramic surface tending to form a pattern. In this context, surface texture is determined by the size, shape, arrangement, and distribution of the surface constituents.

This note presents a convenient method by which the surface texture of ceramic substrates can be visually assessed and recorded photographically using a simple metallographic microscope.

Examples in applying this technique for distinguishing and differentiating surface textures of different types of ceramic substrates are given. Use of the technique for identifying surface defects is also shown.

The simplicity of the method should warrant its use for monitoring the physical surface quality of ceramic substrates.

Quantitative surface finish characterization by CESEMI, E. W. White, H. A. McKinstry, and A. Diness, *SP348*, pp. 309-316 (May 1972).

Key words: Ceramic materials; CESEMI (Computer evaluation of scanning electron microscope images); digital magnetic tape recordings; profilometer; profilometer rasters; quantitative characterization; scanning electron microscope; surface finish analysis; surface morphology; surface roughness; surface topography; three-dimensional images.

A feasibility for quantitative characterization of surface finishes based on the computer evaluation of scanning electron microscope images (CESEMI) has been established. Measurement of the number, size, shape, and orientation of isointensity (or selected intensity interval) regions constitute the basic analysis. Brightness in SEM images varies as a function of the steepness of slope of the surface at a given point. In their analysis, the characteristics of grooves, pits, ridges, etc., can be studied separately. Detailed interpretation of the results is not attempted in this preliminary study.

A feasibility for recording and analyzing profilometer rasters has also been demonstrated. Such recordings are, in essence, true three-dimensional images of surface topography insofar as the profilometer stylus faithfully follows the surface morphology. Analysis of these profilometer recordings by the basic CESEMI computer programs yields direct descriptions of the topography. The SEM image and profilometer "image" analyses appear to be complementary techniques. One obvious advantage of the SEM image analysis is that it is a no-contact technique; hence, there are no problems introduced by stylus damage.

An assessment of surface and subsurface damage introduced in ceramics by semifinish grinding operations, B. G. Koepke, *SP348*, pp. 317-332 (May 1972).

Key words: Ceramics; etch pits; fracture; grinding damage; plastic deformation; surface condition; surface grinding.

The nature and extent of grinding damage introduced by surface grinding a number of ceramics having widely varying mechanical properties have been studied. Surface damage has been characterized by optical and electron microscopy, and subsurface damage has been observed using etch pit techniques. Grinding damage was found to depend strongly on wheel type and rate of material removal as well as on the mechanical behavior and microstructure of the workpiece. The results indicate that grinding damage is mainly composed of mixtures of three types depending on the mechanism of material removal.

When material is removed efficiently from low impact resistance ceramics (e.g., magnesium oxide and ferrite), the surfaces are generated by brittle fracture and are composed of regions of transgranular and intergranular fracture. When grinding is inefficient, i.e., when the grinding wheel loads up material is removed by plastic flow. The resultant surface on deformable ceramics (e.g., magnesium oxide, ferrite, and silicon) are smooth and burnished but may contain thermal cracks due to the heat generated. In this instance, subsurface damage consists of a discrete, highly deformed layer containing cracks in most cases.

When material is removed efficiently from high impact resistance, nondeformable ceramics (e.g., alumina and boron carbide) material is removed by plastic flow and by transgranular and intergranular fracture. The presence of extensive plastically flowed regions on the ground surfaces of extremely hard ceramics is surprising and points out the extremes of stress and temperature existing under the wheel-workpiece interface during a grinding pass.

Observations on mechanically abraded aluminum oxide crystals by transmission electron microscopy, B. J. Hockey, *SP348,* pp. 333-339 (May 1972).

Key words: Abrasion; aluminum oxide; dislocations; ion-bombardment; microtwins; scanning electron microscopy; subsurface damage; transmission electron microscopy.

Use of the argon ion-bombardment thinning technique has made possible the examination of the near surface regions of mechanically abraded aluminum oxide by transmission electron microscopy. Observations on diamond-polished (0.25 μm), alumina-polished (0.3 μm), and diamond-ground specimens have shown that subsurface damage as well as surface damage is typically produced.

Specifically, mechanical polishing introduces relatively high densities of dislocations to a depth of approximately 1 μm from the original surface. The dislocations are generally in the form of half-loops and are clearly associated with surface scratches produced by individual abrasive particles.

The magnitude of residual surface stresses and the irregular surface topography produced by grinding necessitated the removal of at least 2–4 μm from the original surfaces. At this depth, both the nature and extent of subsurface damage in polycrystals varied from grain to grain. Most grains contained either tangled dislocation arrays or microtwins (either basal or rhombohedral). A number of grains, however, were found to be completely free of damage and may correspond to regions below fracture surfaces which are apparent in observations of ground surfaces by scanning electron microscopy.

Acoustic emission monitoring of surface-damaged ceramic materials, L. R. Bunnell, J. C. Crowe, and P. E. Hart, *SP348,* pp. 341-342 (May 1972).

Key words: Acoustic emission; glass; Lucalox; Pyroceram; surface damage.

The acoustic emission response of Lucalox, fused silica, single crystal alumina, Pyroceram, and soda-lime-silica glass to surface damage is reported. Low temperature annealing at 200 °C reduces the response levels; annealing at 400 °C removes all of the induced acoustic activity.

Effects of surface finishing on mechanical and other physical properties of ceramics, R. J. Stokes, *SP348,* pp. 343-352 (May 1972).

Key words: Ceramics; cracks; dislocations; electrical properties; electro-optical; ferrite; machining; magnetic properties; mechanical properties; optical properties; residual stress.

This paper reviews the effects of mechanical finishing operations on the physical properties of ceramics. Ceramic machining results in a defective surface containing cracks, dislocations, point defects, and residual stresses. The relative significance of these defects depends on the physical property of interest. The mechanical properties of single crystals are sensitive to dislocations (semibrittle) and surface cracks (brittle); the mechanical properties of polycrystals are sensitive to surface cracks; the electrical properties of semiconductors are sensitive to surface trapping sites; magnetic, piezoelectric, and optical properties are particularly sensitive to residual stresses. To optimize physical properties, these defects must be eliminated by mechanical lapping, chemical etching, or thermal annealing.

Strength effects resulting from simple surface treatments, H. P. Kirchner, R. M. Gruver, and R. E. Walker, *SP348,* pp. 353-363 (May 1972).

Key words: Abrasive machining; alumina ceramic; chemical polishing; crack healing; delayed fracture; glazing; humidity; refiring; strength; surface flaws; surface treatments; thermal shock.

In well made polycrystalline alumina ceramics subjected to external loads, fracture originates, in almost every case, at surface flaws rather than at volume flaws. This susceptibility to surface flaw failure has been reliably established in experiments in which compressive surface layers were used to obtain substantial improvements in strength. Knowing that the failures occur at surface flaws, the artificial introduction of surface flaws can be used to obtain an understanding of the ways in which surface flaws affect the strength. Additional information can be gained by using simple treatments to change these artificial surface flaws and by observing the effect of these treatments on the strength.

In the present investigation, artificial flaws were introduced by single point tools, abrading, thermal shock, and abrasive machining. The flaws were treated by refiring, chemical and flame polishing, chemical etching, glazing, and prolonged storage in various environments.

The changes in the flaws were characterized by microscopy and to a limited extent by profilometry. Both flexural and tensile strengths were measured. The effects of the treatments are discussed in terms of changes in the average strength and variations in the distributions of the individual strengths.

The effect of grinding direction on the strength of ceramics, R. W. Rice, *SP348,* pp. 365-375 (May 1972).

Key words: Carbides ceramics; fracture; grain size; grinding; hardness; mechanical testing; nitrides; oxides; strengths.

It is shown that grinding bars in a direction parallel with the tensile axis has limited effects on their strength while grinding perpendicular to the tensile axis may have no effect or can reduce strengths as much as 50 percent. In single crystals, the reduction in strength generally increases with the hardness of the material but can also depend on crystallographic orientation. In polycrystalline bodies, the reduction also depends a great deal on grain size, with the effect generally increasing with decreasing grain size. Also the effect tends to be greater in polycrystalline bodies that are weaker than normal. The effect of grinding direction on strength is attributed to stress concentrations due to grinding stria, whose continuity and depth generally increase with hardness. The severity of these stria tends to increase as the amount of plastic deformation in the machined surface decreases. The amount of plastic deformation is shown to vary approximately inversely with hardness. The effect of varying strength with grinding direction on the interpretation of various tests is discussed.

The influences of material removal on the strength and surface of an alumina, H. S. Starrett, *SP348,* pp. 377-388 (May 1972).

Key words: Alumina; surface finish; surface treatments; Weibull.

Southern Research is conducting a quantitative investigation of test methods used to evaluate brittle materials. The material for this study is a high purity, high density alumina manufactured by Coors Porcelain Co. of Golden, Colo. The primary scope of the total program is a study of test methods, scaling laws, and surface finish effects. The scope has been broadened to include the effects of property interactions on strength and the relationships between micro and macro characterization and the mechanical properties.

Initial tensile and flexural data indicated that surface finish had no effect on the tensile strength of this particular alumina. Since this was contrary to generally accepted results, considerable effort has been expended in investigating this phenomenon. It has been postulated that the lack of an effect may have been due to subsurface damage that occurred during the grinding operations.

The investigations into surface/subsurface damage have focused into four principal areas. Microstructural characterization has been used to characterize the surfaces of interest, to look for evidence of damage, and to look for microstructural events which may be normalizing the data. A study of fracture source distribution has been made in order to determine the depth of damage which would have a significant effect on the flexural data. Surfaces have been and are being subjected to different treatments such as refiring in modified environments and deep lapping in order to define the nature of the surface/subsurface damage, if it exists.

The microstructural work has not revealed any obvious damage; however, it was found that even by proceeding from a shop grind to a metallurgically lapped surface, certain features such as exposed pores, interfaces between alumina matrix and second phase, and evidence of the original ground surface did not totally disappear. The study of the fracture source distribution provided quantitative evidence that damage on the order of 0.005 in (approximately five maximum grain diameters) would have a significant effect on the flexural data. Results from the surface treatments, deep lapping, and refiring show that these different preparations did not affect the flexural strength of the material. Other indirect evidence (statistical data) show this material to be insensitive to surface effects within the range of surface finishes investigated.

The effect of grinding variables on the strength and surface finish of alumina, R. Sedlacek, F. A. Halden, and P. J. Jorgensen, *SP348*, pp. 391-397 (May 1972).

Key words: Alumina; diamond grinding; surface finish; tensile strength.

The tensile strength of alumina is used as a criterion for the evaluation of the effects of variables encountered in diamond grinding of ceramics. The variables studied include the grit size of diamond, rate of material removal, and spark-out. The difference in performance of natural and synthetic diamond is shown, and the feasibility of dry grinding is discussed. The ground surfaces were examined using profilometry, and transmission electron and scanning electron microscopy. The strengths of test specimens having ground or as-fired surfaces are compared.

Edge effect on the modulus of rupture of ceramic substrates, *W.* C. Lo, *SP348*, pp. 399-400 (May 1972).

Key words: Alumina substrate; edge damage; flexural strength.

Because of its simplicity, the modulus of rupture (or flexural strength) test is often used to evaluate the mechanical strength of ceramics. For large flat substrates, the natural tendency is to test specimens cut from the substrate.

Depending on the method of cutting and the resulting edge condition of the specimen, the flexural strength can be significantly different. This is illustrated by 3-point loading data on CO_2-laser-scribed and diamond-sawed specimens. The modulus of rupture of a laser-cut sample is about 70 percent of that of a diamond-sawed sample.

SP349. **Heavy-atom kinetic isotope effects, an indexed bibliography,** M. J. Stern and M. Wolfsberg, Nat. Bur. Stand. (U.S.), Spec. Publ. 349, 39 pages (June 1972).

Key words: Author index; bibliography; heavy-atom isotope effects; isotope effects; kinetic isotope effects; reaction kinetics; subject index.

A bibliography of heavy-atom kinetic isotope effects has been compiled covering the complete literature from the earliest entry found (1911) through 1965. Review articles and theoretical papers are listed through 1968. The bibliography is divided into a list of the references, an author index and a subject index. The subject index has been annotated to describe, in brief, the type of reaction being observed. The following areas have been excluded: geochemistry (except for specific laboratory reactions), living systems, mass spectrometry and electron impact, electrochemistry, diffusion-controlled processes, hot-atom chemistry, photochemistry involving selective excitation of isotopes and processes involving no chemical change.

SP350. **Time and frequency: a bibliography of NBS literature published July 1955-December 1970,** B. E. Blair, Nat. Bur. Stand. (U.S.), Spec. Publ. 350, 52 pages (June 1971).

Key words: Atomic clocks; atomic standards; clock dissemination; crystal oscillators; definition of second; flicker noise; frequency; frequency stability; lasers; length standards; measurement standards; spectral density; speed of light; standard frequency broadcasts; statistics of time/frequency measurements; time; time/frequency dissemination; time scales; timing (HF, LF, satellite, TV, VLF); wavelength standards; WWV; WWVB; WWVH; WWVL.

This publication gives bibliographic references to NBS time and frequency papers (principally those of the Time and Frequency Division or its predecessor sections) published over the past 15 years. The NBS material is classified under five general sections: Time and Frequency Standards; Time Scales, Time; Distribution/Reception of Time and Frequency Signals; Statistics of Time and Frequency Analyses, Frequency Stability; and General, Summary, and Status Reports. An additional section lists outside publications which describe the use of NBS time and frequency services or illustrate their varied use in seismic research, industrial practice, navigation, and propagation studies, among others. The bibliography documents past progress, will aid access to available literature, and gives an indication of the present direction, scope, and status of NBS time and frequency research.

SP351. **Analytical chemistry: key to progress on national problems.** Proceedings of the 24th Annual Summer Symposium on Analytical Chemistry sponsored by *Analytical Chemistry*, ACS Division of Analytical Chemistry, and NBS Analytical Chemistry Division, and held at the National Bureau of Standards, Gaithersburg, Md., June 16-18, 1971, W. W. Meinke and J. K. Taylor, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 351, 481 pages (Aug. 1972).

Key words: Agriculture; air pollution; analytical chemistry; biomedicine; clinical chemistry; electronics; oceanography; solid state; water pollution.

This book is the formal report of the proceedings of the 1971 Summer Symposium in Analytical Chemistry held at the National Bureau of Standards, June 16-18, 1971, and cosponsored by the Analytical Chemistry Division of NBS, *Analytical Chemistry*, and the American Chemical Society's Division of Analytical Chemistry. It contains six invited papers by subject matter experts comprehensively reviewing urgent research problems for which advanced analytical techniques need to be developed in the important areas of agriculture, air pollution, clinical chemistry and biomedicine, oceanography, solid state research and electronics, and water pollution. Summaries of related discussions by leading analytical chemists serving as panel members or in attendance at the Symposium are included. Hundreds of important analytical problems retarding progress in these important areas are described and extensive references are given to permit a deeper insight into the problem areas. Accordingly this volume should not only stimulate interest in important problems but should provide a valuable guide for highly relevant analytical research for some time to come. *These proceedings include the following papers (indented):*

The chemical analysis of things as they are, G. E. F. Lundell, *SP351*, pp. 1-18 (Aug. 1972).

Opportunities for analytical chemistry in solid state research and electronics, R. A. Laudise, *SP351*, pp. 19-77 (Aug. 1972).

Key words: Analytical chemistry; electronic materials; materials characterization; solid state research; stoichiometry; trace analysis.

Current practices and problems in analysis in solid state research and development are reviewed. A plea that the analyst assume a broadened responsibility for characterization of materials is made. Examples of solid state problems which were caused by inadequate appreciation and application of analysis are given. In particular, it is pointed out that trace analysis at and below the ppb level, the careful assessment and mapping of physical perfection by x-ray and related techniques and the use of solid-state physical measurements such as conductivity and magnetic resonance will become more important in the future. Mapping techniques and perfection techniques are reviewed in some detail. Recent new methods of stoichiometry assessment are described, and it is suggested that the determination of perfection and defects should become an orderly subdiscipline under the aegis of analytical scientists. The case is made that, insofar as both research and technological progress in solid state and electronics are rate limited by the availability of materials with appropriate properties, it is limited in many cases by our ability to characterize materials. It is concluded that with a modest reorientation of viewpoint and disciplinary content, analytical science could become the core discipline of materials characterization.

Analytical problems in biomedical research and clinical chemistry, G. N. Bowers, Jr., and J. Meyer II, *SP351*, pp. 77-159 (Aug. 1972).

Key words: Biomedical research; clinical chemistry; clinical enzymology; enzyme standardization; health science; hospital laboratory; medical research.

The key to progress in national problem areas in health rests over the long term with the success of our country's biomedical research efforts. Analytical chemistry can contribute significantly to these vital efforts by providing the sound base of quantitative chemical measurements required by these health investigations. But health research must not be construed too narrowly. The responsibility for the chemistry related to our national health needs cannot be assigned exclusively to any one scientific group. Indeed, some of the most profound insights may well originate far beyond the usual confines of the medical research community. This will be especially true in the environmental health areas where analytical chemists from many fields will make important contributions.

The elucidation and cure of disease processes are becoming ever more dependent upon chemistry. As a direct result of successful recent past biomedical research, the demand for diagnostic chemistry tests has increased faster than almost any other health service. Service chemistry is thus closely related to medical research and also medical education activities, as will be demonstrated by experience with transaminase assays in heart attacks and calcium determinations in hyperparathyroidism.

To support the rational development and utilization of automated analytical systems in health service and research laboratories, there is a clearly defined need for high purity standard reference materials and certified reagents. Clinical laboratories urgently require the development of high accuracy referee methods to improve the specificity and systematic bias of routine methods.

In short, *life is a chemical system.* Meaningful quantitative chemical measurements are essential to our understanding of its complex internal interactions as well as our profound interdependency upon other life forms in the environment.

Analytical problems in agricultural science, G. W. Irving, Jr., and W. C. Schaefer, *SP351*, pp. 161-243 (Aug. 1972).

Key words: Agricultural pollution; agricultural products analysis; agricultural science; amino acid analysis; biomedical research; clinical chemistry; diagnostic chemistry; food analysis; pesticide residue analysis.

This paper presents a review and analysis of the widespread applications of analytical chemistry and analytical instrumentation in the research and regulatory programs of the Agricultural Research Service of the Department of Agriculture. Analytical chemistry is one of the essential sciences needed in advancing the commodity and people-oriented programs which can achieve the national goals of the Department. Chemical analysis will be shown to play a vital role in assuring an adequate supply of farm and forest products and in assuring the consumer a better product while minimizing costs for processing and distribution. In people-oriented programs, such as consumer health, safety and pollution abatement, analytical methodology is the key procedure for providing the basic data to get action programs into motion.

Along with the far-ranging applications of analytical chemistry in agriculture come many unsolved analytical problems. In fact, few agricultural scientists will admit complete satisfaction with any of their current methodologies. Yet some problems are more important than others. An assessment of these problems is made including an analysis of their relative importance in conjunction with the urgent needs of agriculture. Possible ways of classifying or categorizing these problems will be suggested. For example, amino acid analysis touches almost every branch of agricultural science whereas pesticide analysis is more restricted but has a great many more complexities. For any given pesticide, methodologies may be needed for controlling its application and for measuring its residues in free and bound form, its metabolites, trace contaminants, and the inert ingredients in its formulation.

Other problems are discussed for which there appears no current solution. This will challenge the ingenuity and creativity of analytical chemists in the future.

Analytical problems in air pollution control, A. P. Altshuller, *SP351*, pp. 245-295 (Aug. 1972).

Key words: Air pollution; air quality instrumentation; air quality measurements; anion analysis; Clean Air Act; elemental analysis; measurement of atmospheric gases and vapors; measurement of atmospheric particles.

The role of measuring techniques in activities ranging from research to regulatory activities of the Environmental Protection Agency will be discussed. Field and laboratory instruments and manual techniques will receive consideration. Both point-sampling and remote types of instrumentation developments will be reviewed. Chemical and physical transformations contribute to the formation of new or modified pollutant species. Air quality measurements must be capable of properly following such transformations. Especial emphasis needs to be given to the conversion of gaseous into various submicron particulate species. The mass, particle-size distribution and details of chemical composition of these particles is required. Examples will be given of new and improved types of air quality measurements, stationary source and mobile source emission measurements which may be needed to meet air quality and emission standards.

Analytical problems in water pollution control, K. H. Mancy, *SP351*, pp. 297-430 (Aug. 1972).

Key words: Aquatic environment; environmental analysis; trace analysis; water analysis; water pollution; water pollution control.

The analytical chemistry of natural and waste waters requires subtle correlation between theory and experience, an insight into the nature and mode of action of interferences, and the ability to interpret analytical results in correlation with pertinent field observations. Because of the complexity of the system under investigation, water pollution characterization is one of the most challenging tasks to confront the analytical chemist.

Design of measurement systems begins with defining (a) WHY the analysis is needed, (b) WHAT are the parameters to look for, and (c) HOW to perform the analysis. Water pollution measurement programs usually incorporate a multitude of physical, chemical and biochemical procedures. The characterization of physicochemical and biochemical transformations in aquatic environments takes into account interactions between atmosphere, hydrosphere and lithosphere and their influence on the aquatic habitat. Trace characterization of persistent organic residues or heavy metals is based on defining their distribution dynamics in the aquatic system, *e.g.*, storage and release by bottom sediments and accumulation and tolerance by aquatic biota.

Recent trends in water pollution measurement rely heavily on advanced instrumental methods and automated analytical techniques. *In situ* sensor systems and remote noncontact optical measurement have been applied for monitoring water quality in rivers, lakes and waste effluents. The effects of environmental factors and interferences on the reliability of the measurement system have been under intensive research.

As America's water pollution problems become more complex, more complex measurement techniques are needed to cope with them. Above all, the effectiveness of pollution control programs are limited by their measurement reliability.

SP352. **World index of plastic standards,** L. H. Breden, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 352, 458 pages (Dec. 1971).

Key words: Index of plastics standards; plastics standards, world index; standards, plastics.

This computer-produced Index contains the printed titles of more than 9,000 national and international standards on plastics and related materials which were in effect as of December 31, 1970. These standards are published by technical societies, trade associations, government agencies and military organizations. The title of each standard can be found under all the significant key words which it contains. These key words are arranged alphabetically down the center of each page together with their surrounding context. The date of publication or last revision, the standard number, and an acronym designating the standard-issuing organization appear as part of each entry. A list of these acronyms and the names and addresses of the organizations which they represent are found at the beginning of the World Index.

SP353. **The Menzel symposium on solar physics, atomic spectra, and gaseous nebulae in honor of the contributions made by Donald H. Menzel.** Proceedings of a symposium held at the Harvard College Observatory, Cambridge, Massachusetts, April 8-9, 1971, K. B. Gebbie, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 353, 213 pages (Aug. 1971).

Key words: Atomic energy levels; gaseous nebulae; non-LTE thermodynamics; solar physics; transition probabilities.

A symposium in honor of Donald H. Menzel's contributions to astrophysics was held on his 70th birthday at the Harvard College Observatory, Cambridge, Massachusetts, 8-9 April 1971. Menzel and his school have made distinguished contributions to the theory of atomic physics, solar physics, and gaseous nebulae. The work on planetary nebulae represented the first investigations of non-equilibrium thermodynamic conditions in astronomy; the solar work extended these investigations to stellar atmospheres. The applied atomic physics laid the basis for what we now call laboratory astrophysics and, together with work on non-equilibrium thermodynamics, inspired the founding of the Joint Institute for Laboratory Astrophysics. Menzel has served as a distinguished consultant to the National Bureau of Standards, and publication of this volume represents a grateful acknowledgment of his service to the Bureau. The papers summarize the current status of work in the three fields he pioneered.

SP354. **Dental materials research.** Proceedings of the 50th Anniversary Symposium held at the National Bureau of Standards, Gaithersburg, Md., Oct. 6-8, 1969, in Recognition of Fifty Years of Dental Research at NBS, G. Dickson and J. M. Cassel, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 354, 238 pages (July 1972).

Key words: Adhesives; composite restorative materials; dental materials research; dental restorative materials; future dental needs; laboratory testing and clinical research; mechanical properties; metals research; specifications.

A Symposium on Dental Materials Research was held at the National Bureau of Standards, October 6-8, 1969, on the occasion of the fiftieth anniversary of the dental research program at NBS. The Symposium brought together outstanding researchers in the dental materials field from throughout the world for a comprehensive examination of the present state of research and a look at future dental needs and expectations. The program covered the broad dental materials field—from an examination of the oral environment to a consideration of future needs from the viewpoints of dental practice, dental education, dental industry, and basic science. Invited papers covered metals research, new developments in nonmetallic restorative materials, dynamic methods for determining the mechanical properties of dental materials, and problems of evaluating dental materials and making such evaluations useful to clinical dentistry through the

development of specifications. *These proceedings include the following papers (indented):*

Dental research at the National Bureau of Standards—reminiscences, W. Souder, *SP354*, pp. 3-6 (July 1972).

Key words: Amalgam, dental; American Dental Association; dental materials; Dental Research Section, NBS; interferometer, dental; specifications, dental.

In 1918 dental amalgams had a high rate of failure and few data on their physical properties were available. Using the interferometer for determination of the dimensional changes of amalgam and scientific test methods of other properties, NBS began to obtain information on the physical properties of dental materials. The specification for dental amalgam developed in the early days with numerical limits for physical and clinical properties and details of test methods has served as a model for specifications for dental materials for over 40 years. Although the early results were challenged and the program opposed by some, the dental profession soon recognized the value of the work and requested its expansion. In time schools, dental associations, and manufacturers joined in commending the research program.

Dental research at the National Bureau of Standards—history and individuals, W. T. Sweeney, *SP354*, pp. 7-11 (July 1972).

Key words: Amalgam, dental; American Dental Association; casting, dental; dental research; Dental Research Section, NBS; guest workers; Paffenbarger, George C.; Schoonover, Irl C.; Souder, Wilmer; specifications, dental.

Dental research at NBS was initiated in 1919 by Dr. Wilmer Souder with work on dental amalgams. Dr. Souder built the Section on the principle of cooperation between research laboratories, manufacturers and the dental profession. In the 1920's research associates, first from the Weinstein Research Laboratory and later from the American Dental Association were added to the NBS dental research staff. Dr. N. O. Taylor and Dr. George C. Paffenbarger were the first ADA Research Associates. In 1945 while Dr. Irl C. Schoonover was Chief of the Section, the laboratory staff was further enlarged by the addition of Guest Workers from the Armed Services. Among the many important areas of research were precision casting, dental cements, polymers for dentures bases, composite restorative materials, high speed turbine handpieces, panoramic x-ray equipment, studies of natural tooth structure and development of standards and specifications.

The need for basic research in dental materials, F. A. Peyton, *SP354*, pp. 15-17 (July 1972).

Key words: Basic research related to dental materials; dental materials; interdisciplinary research; training of dental researchers.

The field of dental materials has benefited from basic studies of the silver-tin alloy system, of cobalt alloy systems, of polymers, and of many other areas. Future basic studies of the surface phenomena of wetting, spreading of liquid films, adhesion, diffusion into dental tissues, boundary interactions, and principles of viscoelasticity related to dental materials offer productive opportunities. Basic research is essential if advances are to be made in the improvement, modification, refinement, and development of serviceable materials for the practice of dentistry. It is anticipated that such studies will increase in importance in the next quarter century and that basic scientists in many fields will be contributing to the improvement of dental service.

Research needed by the Federal Dental Services, H. I. Copeland, *SP354*, pp. 19-21 (July 1972).

Key words: Capabilities and needs of Federal Dental Services; dental research laboratories, Federal; dental staff; Federal Dental Services.

The dental research laboratories of the Federal Government function within the Departments of Commerce; Health, Education and Welfare; and Defense. These laboratories and the multidisciplined scientists therein along with those of the Veterans Administration provide a much needed national resource. The Federal Dental Services have problems in common with each other and with the profession at large, in addition to having problems unique to themselves. Each Federal Dental Service needs a scientific staff capability to solve its own immediate problems or to contract for the solutions.

Research needed by the dental industry, J. F. Glenn, *SP354*, pp. 23-26 (July 1972).

Key words: Clinical and laboratory data correlation; dental industry research needs; dental materials; dental research, necessity for rapid communication of.

Dental industry requires new research information which must come from nonindustrial research-oriented institutions. Two major requests of dental industry are for basic research and better clinical correlation with laboratory data. Many compilations of physical test data on a variety of existing materials or ill-defined experimental ones are being reported, but the major need is for evaluation of these same materials in well controlled clinical applications. More rapid access to results of investigations, especially government-supported grant research, is needed.

Research needed for dental education and practice, R. W. Phillips, *SP354*, pp. 27-30 (July 1972).

Key words: Dental education; dental materials, research needs; dental practice future; dental research; materials, dental, research.

The current research effort in dentistry, and that which will occur during the next decade indicate that dental practice will be characterized by certain trends. These trends will require an acceleration of research on adhesive film forming systems, sealants for pit and fissures and means of improving anticariogenic characteristics of restorative materials. The interdisciplinary aspects of dental materials will be increasingly important. Greater focus will be on the biological properties of materials, materials and devices for oral rehabilitation, materials for implantation and the interaction of tissue and substances used to restore lost tooth structure. Further definition of the oral cavity can be expected to become a responsibility of the materials scientist. Increased emphasis can be expected in dental education on a more intimate basic science-clinical application orientation.

Amalgams in dentistry, K. D. Jørgensen, *SP354*, pp. 33-41 (July 1972).

Key words: Amalgam, dental; amalgam, dental, effect of technique on corrosion; clinical failure of amalgam; corrosion, dental amalgam; dental materials; marginal fracture, dental amalgam; mercuroscopic expansion, dental amalgam; porosity of dental amalgam.

Corrosion is a major factor in the failure of amalgam restorations through the deposition of corrosion products

which may cause chronic periodontitis or through corrosion fracture of the margins which may cause secondary caries. Galvanic corrosion attacks only the tin-mercury γ_2 phase. Mercury released by this corrosion causes a mercuroscopic expansion resulting in a deflection of the amalgam from the cavity wall at the margin. Corrosion can be considerably reduced by minimizing the porosity of the amalgam restoration through overfilling the cavity, burnishing the margins, eliminating excess by carving and using zinc-containing amalgams.

Basic metallurgy of dental amalgam, L. B. Johnson, Jr., and H. G. F. Wilsdorf, *SP354*, pp. 43-59 (July 1972).

Key words: Amalgam, dental; amalgam, metallurgy; amalgam, strength; corrosion of dental amalgam; dental materials; metallurgy of dental amalgam.

An "equilibrium" mixture of components of dental amalgam would contain the phases β_1, γ_1 and γ_2 shown by Gaylor. Because dental amalgam is formed clinically at relatively low temperature only γ_1 and γ_2 are generally found. The tensile strengths of the Ag-Hg and the Sn-Hg matrix phases of dental amalgam are considerably below the tensile strength of the amalgam while the tensile strength of Ag_3Sn is considerably above that of the amalgam. Cleaning the alloy powder with 5 percent HCl promotes better bonding between matrix and Ag_3Sn and significantly increases the tensile strength. The γ_2 phase of amalgam is the only phase subject to destructive corrosion. The γ_2 phase has been successfully eliminated from amalgam by two methods: (1) by inclusion of powder consisting of the Ag-Cu eutectic in the alloy and (2) by substitution of 10 percent Au for Ag in the alloy.

Casting alloys in dentistry, K. Asgar, *SP354*, pp. 61-66 (July 1972).

Key words: Castings, dental, accuracy; castings, lost wax technique; dental materials; gold alloys, dental; high heat casting technique; hygroscopic expansion; investment, dental; thermal expansion casting technique; wax, inlay casting.

A major difference between the two techniques, hygroscopic and high heat or thermal expansion, used for casting gold alloys is that the wax pattern can offer some resistance to hygroscopic expansion of the mold while it does not resist thermal expansion. Researchers have condemned the hygroscopic technique because of nonuniform expansion of the wax pattern but have not given sufficient attention to other nonuniform dimensional changes which are present in both techniques and which may combine to affect favorably or unfavorably the accuracy and retention of the casting. Studies in this field should not be limited to simple measurements of thermal, setting and hygroscopic expansions of the investment but should be expanded to include strength of the investment along with its roughness, strength and behavior of waxes, and shrinkage patterns of molten metals. A need for new types of investments is presented by the recent development of many new nonprecious alloys for dental castings.

Basic metallurgy of dental casting alloys, J. P. Nielsen, *SP354*, pp. 67-73 (July 1972).

Key words: Alloys, dental casting; ceramic-metal systems; chrome-cobalt alloys; dental materials; gold alloys; metallurgy, dental alloy; porcelain-gold materials; solder, gold alloy.

The complex dental casting alloys have arrived at their present useful state mostly by trial and error. The three areas of technical significance for these alloys are: inertness in the oral environment, fabricability (including soldering), and alloy strengthening. Basic metallurgical studies are being made in this area, and as the gap between the art and basic metallurgy is closed, improvement in properties and the cutting down of precious metal content can be expected. There are prospects of new alloy systems and improvement in casting technique, particularly in automatic casting. Ceramic metal systems need further study. For the long range, investigations of the prosthetic material-human tissue reactions are necessary. To assist studies in this field a dental materials handbook on properties of dental alloys and related materials should be compiled and published.

Dental porcelain, J. W. McLean, *SP354*, pp. 77-83 (July 1972).

Key words: Aluminous porcelain; ceramic materials, dental; dental materials; dental porcelain; dispersion strengthening of glass; porcelain, dental; porcelain-gold techniques and materials.

Current research on dental porcelain has been concentrated on methods of improving fracture resistance of porcelain restorations. Enamelling of metals or dispersion strengthening of glasses offer the greatest possibilities for this purpose. The fusion of porcelain to metal copings has proved very successful under clinical conditions, but the necessity for masking the metal substructure presents difficulties in obtaining the desired aesthetic characteristics. Replacement of the metal copings by a higher strength ceramic should improve aesthetics and reduce productive costs. Dispersion strengthening of glass with high strength alumina crystals has resulted in the production of a new range of aluminous porcelains for jacket crown and bridge pontic construction.

Dental silicate cements, A. D. Wilson, *SP354*, pp. 85-92 (July 1972).

Key words: Aluminum phosphate, amorphous; dental materials; dental silicate cements; electron probe microanalysis; glass, alumino-silicate; silica gel; silicate cements, dental; silicate cements, mechanism of hardening, microstructure of, chemical nature; silicate cements, susceptibility to acid attack.

A systematic search for improvement of dental silicate cements requires detailed knowledge of their formation and structure. Experimental evidence shows the effective bonding medium in these cements is an amorphous aluminum phosphate. Physicochemical examination of a number of dental silicate powders showed them to be powdered fluorine-containing alumino-silicate glasses. The mechanism of the cement-forming reaction was studied for one cement following extraction of soluble ions by water at various time intervals after preparation. Infrared spectroscopy was used to record the changing absorption spectra of the setting cement. The microstructure of a number of fully hardened cements was studied by a variety of techniques: optical and electron microscopy, electron probe microanalysis infrared spectroscopy and x-ray diffraction. Dissolution in acidic media of aluminum phosphate bonded silicate cements is an inherent defect stemming from the fundamental chemistry of the system.

Composite restorative materials, R. L. Bowen, J. A. Barton, Jr., and A. L. Mullineaux, *SP354*, pp. 93-100 (July 1972).

Key words: Biomaterials; composites; dentistry; fillers; glass; methacrylates; monomers; prostheses; resins; restorative material.

This article describes the development of dental composite materials, which have quickly established a place in the practice of dentistry because of the shortcomings of alternative esthetic direct filling materials. The goal-directed basic research in which the composite materials were developed was initiated at the National Bureau of Standards in 1956. Late in 1957, a monomer was synthesized that is suitable for use with reinforcing fillers. Commercial dental composite materials available in 1969 use this resin together with particulate fillers and various additives; they have lower polymerization shrinkage and coefficient of thermal expansion, and higher compressive strength and stiffness relative to unreinforced resins. Compared to silicate cements, the composites have lower solubility, higher tensile strength, and comparable compressive strength. Composite restorative materials, when they have been fully developed, should provide the dental profession and the public with greatly improved restorations for anterior teeth.

Cements containing *o*-ethoxybenzoic acid (EBA), G. M. Brauer, *SP354*, pp. 101-111 (July 1972).

Key words: Crown and bridge cements; dental cements; EBA cements; EBA sedative bases; intermediate restorative; *o*-ethoxybenzoic acid cements; pulp capping materials; zinc oxide-EBA-eugenol cements.

Cements containing *o*-ethoxybenzoic acid (EBA) are reviewed. Studies of the mechanism of hardening of zinc oxide-eugenol cements indicated the potential usefulness of other chelating agents in dental cements. Products with greatly enhanced physical and mechanical properties are obtained by the partial substitution of EBA for eugenol. Similar to zinc oxide-eugenol cements, these materials are well tolerated by the tissues, but they also stimulate the formation of reparative dentin. Physical properties of the EBA-containing cements approach those of the biologically and physiologically less desirable zinc phosphate cements. The EBA cements have become commercially available and have been well accepted as luting agents for fixed restorations and as insulating bases. They appear to be the materials of choice for indirect pulp capping. Resin modified EBA restoratives show good stress-bearing characteristics and should find applications as an intermediate restorative. Possible studies to further improve these versatile materials are discussed.

Organic adhesives, H. Alter and A. Fookson, *SP354*, pp. 113-123 (July 1972).

Key words: Critical surface tension; dental adhesion improvement through liners, coupling agents, fillers, and surface treatment; dental adhesives to include acrylates, cyanoacrylates, epoxy resins and polyurethanes; dental materials; polyurethane.

The materials and means for improving joint strengths in a wet environment between dentin or enamel and restoration or cavity liner are reviewed. Critical surface tension, γ_c, a descriptive property of surfaces, offers a basis to evaluate capacity of adhesives to wet tooth surfaces. Used as a pretreatment, an adhesive may function by displacing water. Attachment to tooth surface through hydrogen bonding may also occur. Adhesion may be improved by use of liners, coupling agents, fillers and tooth surface treatments such as etching processes. Dental adhesive materials include acrylics, cyanoacrylates, epoxy resins and polyurethanes, the latter having apparently good promise as a dental adhesive of the future.

Viscoelastic behavior, P. L. Oglesby, *SP354*, pp. 127-144 (July 1972).

Key words: Amalgam, dental; creep; dental materials; denture base reins; indentation test method; mechanical properties, dental materials; rocking beam oscillator; stress relaxation; torsion pendulum; viscoelastic methods.

Since the mechanical responses of many dental materials are functions of time as well as of applied stress, viscoelastic theory, and experimental methods should be used in describing and characterizing these materials. Both static and dynamic methods may be used. Viscoelastic theory useful for characterization of dental materials and for interrelation of responses under different types of static and dynamic tests includes the Boltzmann superposition principle for linear materials and as modified and extended for non-linear materials, the time-temperature superposition principle and approximation methods for calculation of relaxation and retardation spectra. Methods which have been applied to dental materials such as amalgam, polymeric restorative materials, elastic impression materials and natural tooth structure include creep, stress relaxation, indentation and forced vibration methods.

Low frequency determination of mechanical properties, R. L. Myerson, *SP354*, pp. 145-160 (July 1972).

Key words: Activation energy; dental materials; glass, sodium phosphate; internal friction; mechanical properties; polymers, dental; torsion pendulum.

The torsion pendulum is a valuable tool for use in determining the mechanical properties and molecular structure of dental materials. With the torsion pendulum the modulus of a material may be determined from the frequency of oscillation; the internal friction can be obtained from the rate of damping. Change in internal friction with change in frequency provides insight into type of structure and relaxation mechanisms. Activation energy of processes can be determined from shift in peak energy absorption temperature with change in frequency. A principal advantage of low frequency testing is in the resolution of dispersions or of internal friction peaks. The torsion pendulum method has been applied to various polymer materials in studies of the relationship of composition and transitions, effects of cross-linking, comparison of cast poly(methyl methacrylate) and powder-liquid molded poly(methyl methacrylate) and the relationship of impact resistance to peak energy absorption temperatures. Studies have been made of the relationships between peak temperatures and composition and cross-linking in sodium phosphate glasses. A review of equipment is presented.

Ultrasonic methods for determination of mechanical properties, G. Dickson, *SP354*, pp. 161-168 (July 1972).

Key words: Dental amalgam; dental materials; elastic properties; mechanical properties; nondestructive testing; ultrasonic techniques.

Elastic characteristics, shear modulus, Young's modulus, bulk modulus and Poisson's ratio for materials can be determined by a variety of ultrasonic methods, most of which involve the measurement of the velocity of sound in the material. The methods are precise, rapid, nondestructive and applicable to small specimens. As a number of reports in the literature indicate, ultrasonic methods offer particular advantages to the study of dental materials and mineralized tissues.

Stress analysis of dental structures, R. G. Craig, *SP354,* pp. 169-175 (July 1972).

Key words: Brittle coatings for stress analysis; dental materials; denture, artificial, stress analysis; photoelasticity, dental applications; porcelain-gold restorations, stress analysis; stress analysis of dental structures.

Because of the complex geometry of dental structures, most stress analysis studies in dentistry have been experimental. Brittle coatings have provided generally semiquantitative information on the magnitude, direction and sign of surface stress of fixed bridges, removable partial dentures, complete dentures and the mandible under various loading conditions. Data from electrical resistance strain gages attached to the metal surfaces of pontics on a gold bridge with various load applications are shown. Applications of both two and three dimensional photoelastic techniques are illustrated. This method, which provides information on the magnitude, direction and sign of boundary and internal stresses is dependent upon how well the model represents the real structure. Other stress analysis methods involve photoelastic coatings, thermophotoelasticity, moire fringe patterns, holography and x-ray diffraction.

Relations between mechanical properties and clinical behavior, D. B. Mahler, *SP354,* pp. 177-180 (July 1972).

Key words: Amalgam, dental; correlation of laboratory and clinical evaluations; creep of dental amalgam; dental materials; dynamic creep; fracture, marginal of dental amalgam; mechanical properties of dental materials; rheological properties of dental amalgam.

A dilemma in the field of dental materials is that in many instances the critical physical properties that are relevant to the failure of restorative materials have not been identified or when identified the limiting values which separate successful from unsuccessful materials have not been established. To determine the critical property relevant to clinical marginal fracture of dental amalgam restorations, dynamic creep and other physical properties including compressive, tensile and transverse strength and transverse deflection of nine amalgam alloys were determined. Clinical evaluation of restorations made using alloys widely separated in dynamic creep showed that marginal fracture was associated with the rheological properties of dynamic creep, static creep and slow compressive strength, but showed little relationship to the other physical properties measured. Although the relationship between creep and marginal fracture may not be a cause and effect mechanism, creep appears to be reasonably predictive of clinical marginal fracture.

Need for research to develop performance characteristics, H. P. L. Schoenmakers, *SP354,* pp. 183-186 (July 1972).

Key words: Clinically related strength properties of dental materials; dental materials; dental materials, correlation of bulk and marginal properties; dental materials, performance characteristics; dental restorations, the role of oral environment factors in stability thereof.

To develop the most important characteristics of restorative materials, an understanding of the processes by which margins of such restorations become damaged is needed. Bulk and margin properties should be correlated. The mechanical forces developed in mastication and chemical attack by the oral environment are important factors. Tensile strength appears a more meaningful data than either shear or compressive strength. Research for selection of proper tensile test procedures is needed. Cracks and voids in specimens complicate their strength behavior. The role of temperature in laboratory evaluation is important. The mechanisms of corrosion and erosion of dental restorations require further research.

Need for correlation between laboratory testing and clinical research, B. Hedegård, *SP354,* pp. 187-189 (July 1972).

Key words: Aging processes, relation to dentistry; clinical research, dental; correlation of laboratory and clinical results; dental materials; dentistry, preventative; dentistry, restorative; epidemiological information, dental.

Although priority must be given to basic and clinical research in preventive dentistry, this does not eliminate the need for research on materials and methods for restorative dentistry which is in itself a preventive measure. There is an urgent need for collaborative and correlative studies involving properties of materials to be studied in the laboratory and tested in the clinic. Clinical research with materials is slow, and with the present incomplete information on oral environment and function, it is often difficult to assess properly the results, but there is no alternative. With sound clinical research on a larger and more penetrating scale, data and information may be obtained that will make it possible to set up more meaningful test procedures in the laboratory. And that is the goal: to be able to characterize the dental material in the laboratory and correctly predict its clinical performance.

Biological evaluation of dental materials, G. Ryge, *SP354,* pp. 191-200 (July 1972).

Key words: Biological evaluation of dental materials; clinical evaluation of dental materials; correlation of laboratory and clinical performance; dental materials; restorative materials; toxicity tests.

Biological evaluation of dental materials includes (1) screening for toxic or other untoward effects of the materials, and (2) clinical evaluation of materials that pass the screening tests. Screening tests must take into account the functional requirements of various types of and service conditions for dental and auxiliary materials. Methodology for evaluation of clinical performance of materials must include examiner training and calibration in the use of rating scales. Emphasis is placed on the need for correlation of laboratory properties with clinical performance.

Corrosion testing in the mouth, K. Nagai, *SP354,* pp. 201-205 (July 1972).

Key words: Base-metal alloys, dental; copper-zinc dental alloy; corrosion, clinical tests; corrosion of dental alloys; dental amalgam; dental materials.

For many years various base-metal alloys were used as substitutes for gold alloys for dental restorations in Japan. The adoption of an official requirement that these alloys should not have a weight loss of more than 3 mg/cm^2 when immersed in solutions of 0.05 percent hydrochloric acid, 1 percent lactic acid, 1 percent sodium chloride, and 0.1 percent sodium sulfide for three days, prompted a study of corrosion of a copper-zinc alloy and dental amalgam in the mouth. Cast copper-zinc specimens had average weight losses in the mouth in the range of 0.022 to 0.034 mg/cm^2 per day. Conventional amalgams had losses as small as 0.0063 mg/cm^2 per day. Weight losses in the test solutions ranged up to 150 times those in the mouth while weight losses in artificial saliva in vitro were about twice those in the mouth. It is believed that the lower corrosion in the mouth (which varies from place to place) results from a cleaning and inhibiting action by the saliva.

International specification program—Australian experience, A. R. Docking, *SP354,* pp. 209-211 (July 1972).

Key words: Accreditation of dental materials, Australian experience; Australian dental specifications; dental materials; dental standards; specifications, dental.

The Australian dental specifications as a basis for a certification program were developed through the Standards Association of Australia and not within the dental association. Products are accredited by the Australian Dental Association on the basis of meeting these specification tests. The Commonwealth Bureau of Dental Standards assists in preparation of specifications and in accreditation of products. Approximately thirty Australian dental standards have been issued. Participation in international specification work has proved of great benefit especially in the raising and maintenance of the quality of dental goods used by the Australian dental profession.

Development of European specifications and testing, P. Laplaud, *SP354,* pp. 213-215 (July 1972).

Key words: Certification; dental specification; European dental specifications; FDI; ISO; terminology, dental.

The development of a European specification program is difficult because of the many differences of race, nationality, politics, and social systems. One of the first problems is the establishment of a common dental terminology. The lack of sufficient data on the relationship of properties and clinical results is another difficulty. However, Europe has a long heritage of standardization in other fields and this has made it logical to think of the ISO as the proper organization to introduce international dental standards into Europe. Many European countries have already achieved promising results on a national basis. Cooperation on a regional or continental level in the development of a specification and certification program will help to provide better dental health for the public.

Development of South American specifications and testing—Brazilian experience, L. W. Süffert, *SP354,* pp. 217-220 (July 1972).

Key words: Brazilian experience, dental materials specifications; dental materials; dental specifications; dental specifications and testing, South American.

A successful program of specifications for dental materials requires extensive knowledge of and participation in the program on the part of teachers in dental schools. In turn the dental teachers can involve dental industry and dental societies. In Brazil a specifications program in dental materials was initiated by holding annual meetings to which persons recognized as authorities in dental materials were invited to lecture and give assistance in specification aspects. Certification testing of dental materials has been initiated in only two dental schools, but it is planned to have dental materials departments at selected dental schools responsible for three or four materials in a general certification testing program.

USA specification and evaluation programs, J. W. Stanford, *SP354,* pp. 221-224 (July 1972).

Key words: Dental materials and devices, specifications for and certification of; dental specifications; specifications; standards, dental.

Reliable and valid laboratory tests which delineate satisfactory materials and rule out unsatisfactory ones are essential to the development of a satisfactory specifications program. Factors guiding the American Dental Association in the formulation of specifications are: Relevant tests; correlation of laboratory, structural, and service tests; and quality of product. An important change in organization for the development of dental specifications involves the formation of the USA Standards Committee for Dentistry, operating under the United States of America Standards Institute. The Certification Program provides a means for recognition of those materials complying with existing specifications. A new evaluation program on dental devices is currently issuing pertinent status reports on the safety and efficiency of such devices. Safety and usefulness are based primarily upon information established under conditions of clinical use.

SP355. **Universal testing machine of 12-million-lbf capacity at the National Bureau of Standards,** A. F. Kirstein, Nat. Bur. Stand. (U.S.), Spec. Publ. 355, 18 pages (Sept. 1971).

Key words: Force calibration; large test facilities; structural testing; universal testing machine.

A 12-million pounds-force capacity universal testing machine, which is believed to be the largest of its kind in the world, has been put into operation in the Engineering Mechanics Laboratory of the National Bureau of Standards in Gaithersburg, Maryland. This hydraulically operated machine, which has an overall height of over 100 feet, was designed to test full scale structural components and to apply the forces needed to calibrate large capacity force measuring devices. The testing machine is capable of applying axial forces of 12,000,000 lbf in compression, 6,000,000 lbf in tension, and a transverse force of 4,000,000 lbf to a flexural specimen.

SP356. **Damage in laser materials: 1971.** Proceedings of a symposium sponsored by the American Society for Testing and Materials and by the National Bureau of Standards, May 19-20, 1971, NBS, Boulder, Colo., A. J. Glass and A. H. Guenther, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 356, 174 pages (Nov. 1971).

Key words: Laser damage; laser materials; self-focusing.

The third ASTM Symposium on Damage in Laser Materials was held at the National Bureau of Standards in Boulder, Colo., on May 19-20 of this year. The symposium is held as part of the activity of Subcommittee II on Lasers and Laser Materials, of the ASTM. Subcommittee II is charged with the responsibility of formulating standards for laser materials, components, and devices. The chairman of Subcommittee II is John D. Myers, of Owens-Illinois, Inc. Co-chairmen for the damage symposia are Dr. Arthur H. Guenther, of the Air Force Weapons Laboratory, and Professor Alexander J. Glass, Chairman of the Department of Electrical Engineering at Wayne State University.

Approximately 50 attendees at the symposium heard 17 papers on topics relating to laser-induced damage in glass, crystalline materials, nonlinear optical materials, thin film dielectric coatings, and mirrors. Particular attention was given to the processes of plasma formation at dielectric surfaces, and to the role played by self-focusing in bulk damage in solids. The principal recommendations for future investigations are summarized below.

The proceedings of these Symposia represent the major source of information in the field of damage in laser materials. The Symposia themselves, along with the periodic meetings of Subcommittee II, provide a unique forum for the exchange of information regarding laser materials specifications among the manufacturers and users of laser devices, components and systems. The symposium also serves as a mechanism of information gathering, to enable the Subcommittee to write informed and realistic specifications.

SP357. **The mechanisms of pyrolysis, oxidation, and burning of organic materials.** Based on Invited Papers and Discussion, 4th Materials Research Symposium held at the National Bureau of Standards, Gaithersburg, Md., Oct. 26-29, 1970, L. A. Wall, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 357, 199 pages (June 1972).

Key words: Burning; hydrocarbons; organic materials; oxidation; polymers; pyrolysis.

A symposium on The Mechanisms of Pyrolysis, Oxidation, and Burning of Organic Materials was held at the National Bureau of Standards in October 1970. This volume contains the nineteen papers presented and much of the discussion which followed.

These papers review and discuss the current status of kinetic studies on the reactions of organic materials in both gas and condensed phases. The topics covered include: pyrolysis of hydrocarbons, pyrolysis of polymers, oxidation of polymers, oxidation of organic compounds, burning of organic compounds and burning of polymers. Particular emphasis is placed on the elucidation of the mechanisms of reaction in terms of free radicals or other transient species and physical effects. *These proceedings include the following papers (indented):*

The genesis of free radical chemistry, F. O. Rice, *SP357,* pp. 1-6 (June 1972).

Key words: Alchemy; free radicals; genesis; phlogiston; valency.

Modern chemistry is a late-comer among the sciences and came into being only at the beginning of the 19th century when the phlogiston theory was abandoned to be replaced by Dalton's Atomic Theory. As Dalton's Theory became firmly established, there grew with it the belief known as the doctrine of valency which resulted, by the middle of the 19th century, in the denial of the very existence of free radicals.

In the early 20th century, the work of many scientists—Hinshelwood, Bodenstein, Taylor—in the fields of photochemistry and kinetics led to the belief that free radicals not only existed but played an important part in the mechanism of chemical transformations. Paneth's discovery that free radicals could be detected by their removal of certain metallic mirrors was followed by Rice's demonstration that organic compounds did decompose thermally into free radicals and then the Rice-Herzfeld theory that showed it was possible to explain quantitatively the mechanism of the thermal decomposition of organic compounds. In *The Annual Review of Physical Chemistry* (1971), a chapter on Paraffin Pyrolysis contains the following sentence: "All in this field are not agreed that the reactions can basically be described in terms of the Rice-Herzfeld radical chain mechanisms and that, in general, chains are long."

Pyrolysis of organic compounds in the gas phase, A. S. Gordon and R. H. Knipe, *SP357,* pp. 7-15 (June 1972).

Key words: Decomposition; kinetics of decomposition; molecular mechanisms; pyrolysis of hydrocarbons; radical mechanisms; unimolecular decomposition.

A critical review of the pyrolysis of organic compounds is made. The review is divided into hydrocarbons, halides, and oxy compounds. Most hydrocarbon reactions have an important unimolecular component, either the initial step in the case of chain reactions (e.g., saturated hydrocarbon decomposition) or a one-step reaction which may involve a transient biradical structure. There are many types of pyrolysis reactions in the latter category.

For halocarbon pyrolysis, there are two reaction paths, one involving a unimolecular rupture of the carbon-halogen bond and the other a unimolecular elimination of the hydrogen halide molecule via a polarized activated complex. The preferred path is determined by the self-quenching efficiency of the radical path. If highly efficient, the molecular elimination path will dominate and vice versa. In some systems, the two paths are competitive.

Oxy hydrocarbons such as acids and esters pyrolyze via the polarized complex molecular elimination path. Ethers appear to pyrolyze via a free radical chain mechanism while ethylene oxide is initiated by a unimolecular rearrangement to acetaldehyde with excess energy. The vibrationally excited molecule can decompose into two radicals and initiate chain decomposition.

Pyrolysis of hydrocarbons, M. H. Back, *SP357,* pp. 17-25 (June 1972).

Key words: Acetylene; dissociation; elementary reactions; ethane; ethylene; hydrocarbons; kinetics; mechanism; methane; olefins; paraffins; propylene; pyrolysis; rate constants; unimolecular theory.

Some current problems arising from studies of the pyrolysis of hydrocarbons are discussed and two stages of these studies are distinguished. The first stage concerns the description of the mechanism of the pyrolysis in terms of a series of elementary reactions. The types of reactions occurring during the pyrolysis of olefins are discussed from this point of view and the effects of temperature and pressure on these elementary reactions are shown to produce predictable changes in the overall pyrolysis. Some problems in the mechanism for the pyrolysis of acetylene are discussed and a mechanism proposed which relates the reactions occurring in both the high and low temperature regions. The second stage in pyrolysis studies is attained when the mechanism of the reaction may be satisfactorily described in detail and experiments may then be designed to measure the rate constants of the elementary processes. Several studies on the paraffins have attained this goal and the results are examined for consistency with related measurements.

Factors involved in the degradation of polymers in melts, C. R. Patrick, *SP357,* pp. 33-43 (June 1972).

Key words: Degradation of polymers in melts; diffusion-controlled reactions between macroradicals; diffusivities of molecules and radicals in molten polymers; geminate recombination of radicals; pyrolysis of hydrocarbons; rates of reaction in liquids and gases; reaction equilibria in liquids and gases.

The full interpretation of degradation of molten polymers would be facilitated by a better understanding of the elementary chemical processes involved. Suitable analogs of these reactions may often be studied in detail only in the gas phase. Relationships between the kinetics of elementary reactions in gas and liquid phases are desirable. On the basis of thermodynamic arguments, it is concluded that Arrhenius parameters for bimolecular reactions in the two phases should differ, to a small but significant extent, greater than usually accepted, whilst those for unimolecular processes commonly should not. Diffusion may determine the rates of some reactions in liquids particularly of reactions between radicals. Evidence on the mobilities of large and small molecules, models for radicals, in molten polymers, is summarized. Expressions for diffusion-controlled reactions are compared and applied to reactions in molten polymers. Complicating effects in the size dependence of the rates of diffusion-controlled reactions between macroradicals are

surveyed. Other complicating effects, notably of geminate reactions between radicals, are discussed. A case is made out for comparing more extensively the kinetics of thermal degradation of gaseous paraffins, and of molten paraffins and polyethylenes.

Pyrolysis of polymers, L. A. Wall, *SP357,* pp. 47-60 (June 1972).

Key words: Chain scission; crosslinking; polymers; pyrolysis; stripping.

The nature of their pyrolysis products, monomer, oligomers and carbonaceous residues enables one to group polymers into three classes, those that decompose by net main chain scission; by stripping of the main chain, for example the thermal dehydrochlorination of polyvinyl chloride; and by crosslinking of the main chain followed by some production of volatiles. Highly unsaturated or aromatic chains tend to follow the latter course.

At the present time, a theoretical framework exists which permits, provided adequate experiments are performed, the elucidation of the decompositions of the first type. For most of the well-known polymers in this class, this framework of knowledge gives very acceptable mechanistic explanations or interpretations of the decomposition process based on observations of rate of weight loss, of molecular weight changes and composition of volatile products.

Knowledge of the decomposition of the second class of polymers is at an intermediate state of development. However, an important practical research objective would be the acquisition of methods for converting the mechanisms of decomposition of class one substances to that for class two type.

For the third class of materials, knowledge of their pyrolysis mechanisms is nonexistent. This is largely due to the fact that methods for quantitatively following solid-phase processes of decomposition are relatively difficult and unsatisfactory.

Patterns and problems in the pyrolysis behaviour of synthetic addition polymers, G. G. Cameron, *SP357,* pp. 61-70 (June 1972).

Key words: Free radicals; polymer abnormalities; polymer degradation; polymer pyrolysis; transfer reactions.

The types of pyrolytic decomposition reactions undergone by synthetic addition polymers are outlined. Particular attention is given to two classes of polymer—those which undergo unzipping to monomer and those which fragment randomly along the backbone to yield low polymer. Free radical transfer reactions, usually involving tertiary hydrogen atoms, can play an important part in these degradation reactions. The thermal stability of addition polymers is not always predictable from known reactions of small molecules. This is often due to the presence of labile irregularities which are chemically incorporated in the macromolecules and which can initiate thermal decomposition. Also, since polymers are susceptible to chain reactions and neighbouring group effects, these abnormalities can affect the stability of a large proportion of the sample. The effects on pyrolysis of abnormalities such as unsaturation, chain branches, head-to-head links and oxidation products are discussed.

On certain problems connected with the inhibited oxidation theory, Yu. A. Shlyapnikov, *SP357,* pp. 73-78 (June 1972).

Key words: Antioxidants; inhibition of oxidation; initiation of oxidation; oxidation mechanism; oxidation theory.

The oxidative reactions of organic compounds and polymers are discussed in terms of free radical mechanisms, with particular emphasis on initiation, inhibition, and stabilization phenomena.

Mechanism of peroxydation of polymers, A. Chapiro, *SP357,* pp. 79-82 (June 1972).

Key words: Hydroperoxides versus diperoxides; influence of polymer phase on peroxidation; influence of temperature on peroxidation; peroxidation of polyethylene; peroxidation of polymers; peroxidation of polypropylene; peroxidation of poly(vinyl chloride).

The irradiation of polymers in the presence of air leads to polymeric hydroperoxides POOH and diperoxides POOP. When such irradiated polymers are used to initiate the polymerization of a monomer, hydroperoxides generate equal amounts of graft copolymer and homopolymer, whereas diperoxides only generate graft copolymer. This technique was used to study the peroxidation of various polymers under different irradiation conditions. It was found that polypropylene irradiated at temperatures ranging from 10 to 60 °C undergoes hydroperoxidation by a chain reaction. At 0 °C and below (in the vitreous polymer) polymeric radicals are formed but remain trapped. Poly(vinyl chloride) also leads to hydroperoxides when irradiated at 20 to 60 °C but no chain process develops below the glass transition temperature. Irradiation of the plasticized polymer leads to a hydroperoxidation by a short chain mechanism. It is concluded that the propagation of the hydroperoxidation chain, involving hydrogen abstraction by PO_2 radicals, only occurs above T_g when the mobility of polymeric segments is sufficient to ensure the interaction of PO_2 with neighboring molecules.

Polyethylene irradiated at room temperature chiefly generates diperoxides POOP. The chain hydroperoxidation only sets in above 35 °C. Below this temperature, recombination of PO_2 radicals occurs faster than hydrogen abstraction. The behaviour of polymers with respect to peroxidation is discussed and compared with that of low molecular weight model compounds.

Oxidative degradation of polymers and organic compounds via unimolecular decomposition of peroxy radicals, J. Marchal, *SP357,* pp. 85-92 (June 1972).

Key words: Kinetics; mechanism; organic compound; oxidative degradation; peroxy radical isomerization; poly(ethylene oxide); polymer; polypropylene; poly(propylene oxide); polystyrene; polytetrahydrofuran; room temperature; 1,4-dioxane.

Autoxidation of various polymers and organic compounds is shown to include, already at room temperature, chain scissions involving unimolecular decomposition of secondary and tertiary peroxy radicals. Rate and product data are consistent with a scheme including a six-membered ring transition state leading to three fragments, one of them being an alkoxy radical. This oxidative degradation scheme at room temperature does not correspond to a known mechanism.

Mechanisms of oxidation of polyolefins below 150 °C, F. R. Mayo, *SP357,* pp. 95-98 (June 1972).

Key words: Alkoxy radicals; carbonyl compounds; chain initiation; chain propagation; chain termination; kinetics; oxidation; peroxy radicals; polyolefins; polypropylene.

This paper applies what we have learned about oxidations of simple aliphatic hydrocarbons below 150 °C to oxidations of bulk polyolefins. The principal difference between these groups is due to the production of initiating radicals in pairs and to the greatly restricted mobilities of all radicals. Data are given for the efficiency of initiation by di-*t*-butylperoxy

oxalate of the oxidation of atactic polypropylene at 45 °C and for the effect of peroxide concentration on efficiency and kinetic chain length. The following other topics are discussed: chain propagation and geminate and statistical termination by alkylperoxy radicals, nonterminating reactions of two tertiary alkoxy radicals, formation and reactions of alkoxy radicals, sensitivity of oxidation products to further oxidation, intramolecular propagation of alkylperoxy radicals, and the question of the formation of carbonyl groups in oxidations of polyolefins.

Polymer-gas reactions (air pollutants: NO_2 and SO_2) as function of pressure, UV light, temperature, and morphology – a survey, H. H. G. Jellinek, *SP357*, pp. 101-109 (June 1972).

Key words: Air pollutants; butylrubber, degradation, effect of NO_2; degradation, effect of morphology; effect on polymers of NO_2, SO_2, air and UV light; nylon, degradation, effect of NO_2; polymer-gas reactions; polystyrene, atactic, degradation, effect of NO_2; polystyrene, diffusion of NO_2 and degradation; polystyrene, isotactic, degradation, effect of SO_2.

Reactions of various polymers, such as polystyrene and its stereo-specific isomers, butylrubber, nylon, etc., with nitrogen dioxide and sulfur-dioxide were studied by the author and co-workers in recent years. Mechanisms of these reactions in presence of these gases, near ultraviolet light and oxygen were elucidated. Diffusion phenomena have also been investigated and their importance has been pointed out. More recently, work has been initiated on the influence of polymer morphology on degradation of polymers in presence of these gases, near UV radiation and oxygen. Unexpected effects have been observed during chain scission near room temperature. Thus, for instance, isotactic polystyrene of various crystallinities, as far as extent and type are concerned, show marked differences in their degradation characteristics. Thus, for instance, crystalline polymers show faster degradation than amorphous ones, which seems to be contrary to expectations. However, this phenomenon can be explained in quite a consistent manner. The importance of all these reactions in connection with air pollution is briefly discussed.

Controlled gaseous oxidations of organic compounds, C. F. Cullis, *SP357*, pp. 111-117 (June 1972).

Key words: Concurrent reactions; consecutive reactions; controlled oxidation; conventional additive experiments; cool-flames; intermediate products; isobutane; isotopic tracer techniques; isotopically-labelled additives; macroscopic stages; mutual influences; *n*-butane; *n*-heptane; O-heterocycles; radio gas chromatographic analysis; selective inhibition; selectivity; self-inhibition; thermal control; 1-butene; 2-butene.

The homogeneous gaseous oxidation of organic compounds generally leads to a wide variety of products and this may be ascribed not only to the occurrence of a number of consecutive and concurrent reactions but also to the fact that the various constituent elementary steps tend to interact with one another in complex ways. Several methods are outlined for minimizing the extent of unwanted consecutive reactions but it appears to be much more difficult to restrict undesirable concurrent reactions. If the mutual influences of the various part-reactions are to be understood and controlled, it is important to elucidate the nature and role of the intermediate molecular products. Although here carefully planned experiments involving the artificial addition of reactive intermediates can yield some information, a much fuller understanding of the quantitative importance of the different competing reaction paths can be obtained from experiments with isotopically-labelled intermediates. Several examples are given of the use of isotopic tracer techniques in the unravelling of the mechanism of complex gaseous oxidation reactions.

Some current problems in oxidation kinetics, S. W. Benson, *SP357*, pp. 121-129 (June 1972).

Key words: Acetylene reaction with O_3; activation energy for oxidation; chain lengths in oxidation; elementary steps in oxidation; epoxidation; gas-phase oxidation; kinetics liquid-phase oxidation; mechanism; O_3 addition to unsaturates; oxetane formation in oxidation; oxidation; peroxy radicals; radical isomerization; surface effects in oxidation termination rates; transition state for termination.

Experimental data on low temperature (< 150 °C) and high temperature (> 250 °C) oxidations are examined from the point of view of reported quantitative inconsistencies. Activation energies for $tBuO_2$ metathesis reactions with alkanes appear to be 7 kcal/mole higher than for comparable reactions of HO_2. Related isomerization reactions are examined in the light of these differences without reaching any simple conclusions. The Russell mechanism for a 6-membered, cyclic, transition state for termination of primary and secondary alkyl peroxy radicals is shown to be either inconsistent with thermochemical data, or else unique to solution reactions. Addition reactions of O_3 with olefins and acetylenes are shown thermochemically to have the possibility of following concerted and biradical pathways, respectively.

Recent data showing strong inhibition by PbO-coated surfaces of both oxidation and pyrolysis of i-C_4H_{10} are examined in terms of mechanism.

Kinetics and mechanisms of flames and flame suppression, R. M. Fristrom, *SP357*, pp. 131-140 (June 1972).

Key words: Chemical kinetics; combustion, gas phase flame kinetics; flame mechanisms; flame suppression; inhibition; suppression.

A survey is given of the processes important in gas phase combustion with emphasis on chemical kinetics.

Gas phase combustion processes are important to the burning of polymers because the major exothermic reactions occur there. The combustion of many plastics can be roughly divided into a pyrolysis stage occurring at or close to the surface producing combustible gases and a gas phase oxidation stage in the surrounding atmosphere where the evolved gases are burned. Since the pyrolysis is usually endothermic, it is driven by the heat transferred from the gas phase flame by conduction and radiation.

Reaction schemes are outlined for some typical simple gas phase flames and these are related to the complex chemistry of the polymer combustion. A discussion is given of possible mechanisms for gas phase flame inhibition. Sources of information on chemical kinetics are listed and a bibliography is given of compilations of gas phase chemical kinetic rate parameters.

Carbon formation in premixed flames, K. H. Homann, *SP357*, pp. 143-150 (June 1972).

Key words: Acetylene-oxygen flame; benzene flames; bunsen flames; carbon formation; carbon limit; concentration profiles; cyanogen-oxygen flame; flame front curvature; hydrocarbon radicals; hydrogen diffusion; oxidation reactions; particle size; transport processes.

In this paper a survey is given on the processes leading to the formation of solid soot particles in premixed flames. Like most combustion products carbon formation is not exclusively determined by flame chemistry but is also dependent on transport processes. A local increase in the overall C/O ratio in the burning zone which is connected to the back diffusion of hydrogen and hydrogen atoms can reinforce carbon formation. This gives rise to the different types of carbon appearance in burner flames. It is shown that the C/O ratio at the site of carbon formation can be very different from that of the initial mixture.

For the formation of soot particles the presence of both highly unsaturated hydrocarbons and hydrocarbon radicals is necessary. The process of particle growth which cannot be described by equilibrium condensation theory shows two distinct phases: (1) A first phase of rapid growth which is due to the addition of higher unsaturated hydrocarbons to a particle surface with radical character. During this phase the number density of particles decreases while the individual particles retain their almost spherical shape. This is followed by (2) a phase of slow growth governed by the heterogeneous decomposition of a variety of unsaturated hydrocarbons on the particle surface which has lost most of its radical-like properties.

Fluorocarbon combustion, fluorine supported combustion kinetics?, E. A. Fletcher, *SP357*, pp. 153-158 (June 1972).

Key words: Chlorine; combustion; explosion limits; flame speed; fluorine; fluorocarbons; freons; ignition limits; kinetics.

Some interesting characteristics of the combustion behavior of freons and fluorocarbons are presented. The flame speeds and spontaneous ignition limits of chlorine burning in fluorine are easily described by simple models using well-characterized kinetics. The flame speeds of CF_3Cl-F_2 and CF_3Br-F_2 mixtures can be discussed in terms of simple thermal theories. The striking differences in the combustion behavior of homologous fluorocarbons are shown to depend on big differences in the rates at which the fuel molecules are initially attacked by the competitive combustion reactions, but the kinetics are not yet understood.

Burning of polymers, C. P. Fenimore and F. J. Martin, *SP357*, pp. 159-168 (June 1972).

Key words: Burning of polymers; flame retardants; flammability.

After a rod of solid polymer mounted vertically in a slowly rising stream of oxidant/inert gas mixture is ignited at the top end, the oxidant content of the mixture may be varied until that composition is found which will just support burning down the whole length of the sample. For many polymers this limiting volume-fraction of oxidant can be determined with a precision of about one percent and it serves as a convenient measure of flammability of the material.

Experiments show that the simplest model for such burning is one in which the oxidant does not react directly with the polymer, but is consumed in a nearby flame zone which heats and pyrolyzes the polymer to yield fuel gases. This model appears to be valid for some systems, but not for others.

Experiments may be carried out in which the compositions of the sample and the oxidizing atmosphere are varied in a systematic way. The measured flammabilities, together with a simple model of the burning process permit inferences about the manner in which composition variations affect the burning. The mode of inhibition by flame retardant additives may be inferred in this way.

For example an inhibitor which interferes directly with the gasification of the condensed phase should work independently of the flame reactions for the simple two-stage candle-like burning; it should still inhibit when the polymer is burned in N_2O rather than O_2. Such has been observed when chlorine has been substituted into polyethylene.

By contrast an inhibitor which poisons the flame reactions may be specific for reactions with oxygen and not work with another oxidant such as N_2O. Such is the case of Sb_2O_3 added to slightly chlorinated polyethylene.

Effects of different inert gases, of initial temperature and of pressure have also been observed.

Pyrolysis and combustion of cellulosic materials, R. Alger, *SP357*, pp. 171-178 (June 1972).

Key words: Burning of polymers; cellulose; combustion of polymers; decomposition; fire spread; ignition.

Despite centuries of experience with burning cellulosic materials, men still do not agree on the interpretation of their observations. These divergencies of opinion generally involve mechanisms at the microscopic level where areas of ignorance still abound. This review deals with some of these opinions and the supporting experimental evidence pertinent to three chronologically related areas of fire research; namely, pyrolysis, ignition, and fire spread. Some of the ignition concepts and the models for fire spread are not limited to cellulose but should apply to a variety of solids.

The surface pyrolysis boundary condition for the combustion of polymers, R. F. McAlevy III, and W. S. Blazowski, *SP357*, pp. 185-192 (June 1972).

Key words: Combustion; flammability; kinetics; polymer burning; pyrolysis; rapid heating; surface pyrolysis; surface temperature measurement; thermal degradation.

The pivotal boundary conditions for polymer combustion involve the surface pyrolysis-vaporization characteristics. Generally, conditions at the burning surface (e.g., 500 °C or so) are so different from those encountered in classical bulk pyrolysis experiments that these data cannot be extrapolated reliably – data must be obtained at the conditions of interest. A critical review of experiments designed to produce such data, and the possible interpretations of these data are presented.

The authors have employed a combustion self-heating technique. In the experiment a planar diffusion flame is established between an axi-symmetric, "stagnation-point" flow of oxidant and the pyrolysis-product vapors emerging from the polymer surface lying below. The surface temperature, regression rate, and oxidant mass flow rate (the principal control variable) are measured. Recent results of this experiment are presented and discussed.

SP358. 56th National Conference on Weights and Measures 1971, F. C. Bell and H. F. Wollin, Report Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 358, 252 pages (Mar. 1972).

Key words: Administration, weights and measures; conference, weights and measures; laws, weights and measures; technical requirements, weights and measures; weights and measures.

This is a report of the proceedings of the 56th National Conference on Weights and Measures, held July 12-16, 1971, at the Shoreham Hotel, Washington, D.C., and attended by state, county, and city weights and measures officials and representatives of the Federal Government, business, industry, railroads, and associations.

SP359. **Metrology and standardization in less-developed countries: The role of a national capability for industrializing economies.** Proceedings of a seminar held at Airlie House, Warrenton, Va., February 1-4, 1971, H. L. Mason and H. S. Peiser, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 359, 390 pages (Dec. 1971).

Key words: Africa; Asia; engineering standards; industrialization; Latin America; less-developed countries; measurement standards; NBS; quality control; U.S. AID.

The National Bureau of Standards held a 4-day Seminar in an effort to learn how its experience in metrology and standardization for the science and technology of U.S.A. might be used most effectively for less-developed countries. With financial support of the Agency for International Development, participants came from Argentina, Brazil, Ethiopia, Ghana, Guatemala, India, Israel, League of Arab States, New Zealand, Peru, and Vietnam; from several international agencies; and from industries, professional societies, and government in the U.S.A. The papers presented and the informal discussions were organized around the session titles:

Perspective

The Sociological, Economic, and Managerial Environment in Industrializing Countries

Making Scientific and Technological Measurement Meaningful

The Dissemination of Information

Promoting More Effective Use of Science and Technology

Additional Case Histories

Promoting Economic Strength and Commercial Equity

Guidance for NBS Technological Assistance Effort

It was concluded that industrializing economies would benefit from NBS activities in these fields, and specific suggestions were offered to that end. *These proceedings include the following papers (indented):*

Objectives of the Seminar, J. Bernstein, *SP359*, pp. 1-4 (Dec. 1971).

Expectations from the Seminar, L. M. Branscomb, *SP359*, pp. 5-8 (Dec. 1971).

Keynote Address—The role of a national capability in metrology and standardization in industrializing economies, J. D. Perkinson, *SP359*, pp. 9-13 (Dec. 1971).

SP361. Volume 1. **Performance concept in buildings.** Invited papers. Proceedings of a symposium jointly sponsored by the International Union of Testing and Research Laboratories for Materials and Structures (RILEM), the American Society for Testing and Materials (ASTM), and the International Council for Building Research Studies and Documentation (CIB), Philadelphia, Pa., May 2-5, 1972, B. E. Foster, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 361, Vol. 1, 819 pages (Feb. 1972).

Key words: Buildings; components; design procedures; experience in use; materials; performance evaluation; performance requirements; user requirements.

Volume 1 contains all of the invited papers accepted for the joint RILEM-ASTM-CIB Symposium on the Performance Concept in Buildings. Opening addresses and reports of the rapporteurs will be included in Volume 2. The Symposium was held in Philadelphia, Pa. on May 2-5, 1972. The subject matter covered in the papers includes physiological, anthropometrical, psychological, sociological, and economic human requirements and methods of evaluation; physical requirements and methods of evaluation in mechanical, acoustical, thermal, dimensional stability, compatibility, fire properties, and geometry areas; operation and maintenance requirements and methods of evaluation in such areas as maintenance, repair, replacement, and versatility; techniques and problems in applying the performance concept to design; and experience gained in application of the performance concept in design, building, and building use. *These proceedings include the following papers (indented):*

Design specification—operational goals, parameters, synthesis, and performance criteria, J. F. Halldane, *SP361, Vol. 1,* pp. 1-12 (Feb. 1972).

Key words: Design evaluation; design specification; design synthesis; environmental systems; goal statements; parameter definition; performance criteria.

Evaluation, specification and monitoring in design has traditionally been based on the physical aspects of building environments. With a growing concern for human behavior there is a realization that the evaluation of environmental systems finally rests on whether the activities of people are satisfactorily supported by that system. Present methods of specification restrict the physical requirements in the interests of behavior but fail to note the design goals that are intended to be addressed. Further, the categorization of parameters, both physical and non-physical, tend to be isolated into problem areas rather than groups that can be correlated. Performance is also narrowly interpreted in terms of physical entities alone.

A system is presented that coordinates environmental systems through a goal-parameter-synthesis-criterion specification which forms a base for design evaluation. The discussion includes the need for operational goals, a definition of non-physical parameters through an overt communication, a limiting stimulus system which links the organismic and environmental parameters, and criteria appropriate to the performance of operational goals. To illustrate the system certain lighting problems are studied from human behavior to light distribution. Rather than encouraging an attitude of regulatory compliance the system fosters alternative possibilities in design.

Human requirements for buildings, T. Cronberg, Å. Hallquist, R. Hansen, J. Nordan, and A. Saeterdal, *SP361, Vol. 1,* pp. 13-22 (Feb. 1972).

Key words: Human activities; performance criteria; physical environment; planning and design basis; user characteristics.

We build in order to establish certain required environmental conditions.

This set of conditions should be according to the users' requirements. This paper will discuss the users' activities and the users' characteristics as a basis for defining the users' requirements. Further we discuss a possible procedure for identifying the requirements and indicate the use through examples. The paper holds that it is necessary to take the variations in user's characteristics into consideration when defining the requirements. Further the paper tries to expand the use of users' activities to include all kinds of activities that may have consequences for the physical solution. The intention of what is put forward here is to initiate a further discussion of the continuation of this kind of work. It is not meant to give a solution to these problems.

On structuring performance requirements for buildings, T. Cronberg, A. Saeterdal, Å. Hallquist, and J. Nordan, *SP361, Vol. 1,* pp. 23-30 (Feb. 1972).

Key words: Organization of performance factors; performance requirements; required conditions; users' activities; users' characteristics.

This paper treats the problem of transforming users' requirements into relevant properties of a physical solution. From users' characteristics and activities we arrive at the required environmental conditions. Together with the data from the given conditions, this forms the basis for the performance requirements. These (data) must be structured in a way making it operative for design. By classifying the requirements according to their basic functions we are able to get from this point to a set of properties relevant for a chosen type of physical system.

Performance requirements of the thermal environment for human occupancy, R. G. Nevins and P. E. McNall, Jr., *SP361, Vol. 1,* pp. 31-42 (Feb. 1972).

Key words: Air motion; air temperature; comfort; mean radiant temperature; performance; relative humidity; thermal environment; thermal neutrality.

Recent physiological and psychological research is analysed from an engineering point of view to determine the

ranges of the variables which provide satisfaction with the thermal environment. The preferred values of the thermal variables, dry bulb temperature, mean radiant temperature, water vapor pressure in the air and air velocity, are presented for various levels of activity and clothing. Permissible steady-state deviations are defined for practical satisfactory environmental control. The effect of variations with time is discussed and recommendations are given for limiting criteria. The environmental variations associated with different human activities and clothing ensembles are analysed.

The necessary shift in dry-bulb air temperature to maintain subjective comfort in response to variations in the other thermal parameters is presented as the suggested functional requirement and as a means for assessing the quality of existing or proposed environments. Simulation of the total building system is suggested including Man, the Building, Climate and the Environmental Control System. A man-analogue is described for use with design simulation models or for performance ratings with on-site measurements.

Performance requirements of buildings and the whole problem, W. M. Peña and J. W. Focke, *SP361, Vol. 1,* pp. 43-55 (Feb. 1972).

Key words: Analytical procedures; architectural programming; buildings; performance requirements; problem seeking; statement of the whole problem; user needs.

Because so many groups of people (the client owner group, the client user group, and governmental agencies) participate in establishing performance requirements for an architectural project, the approach must be rational enough to withstand public scrutiny and analytical enough for the data to be classified and interrelated for greater mutual understanding.

Programming is a process leading to the statement of an architectural problem and the performance requirements to be met in offering a solution. Architectural programming is problem seeking, resulting in those qualitative and quantitative statements that describe the whole problem in terms of function, form, economy and time. The performance requirements deal with what is to be achieved without regard to the physical response.

The search for performance requirements is evident in each of the five steps of the programming process which follow:

1. Establish Goals (Qualitative)
2. Collect, Organize and Analyze Facts (Quantitative)
3. Uncover and Test Programmatic Concepts (Qualitative)
4. Determine Needs (Quantitative)
5. State the Problem (Qualitative)

The steps and considerations form an analytical framework for classifying and processing data (coming from sources) into information. This framework is also useful in avoiding information clog and as a format for dialogue among the many participants.

A typical problem can involve the rote application of a hardware system without concern for the user. However, if the approach emphasizes the performance requirements of the user, then we have defined a unique problem. A hardware system may then be a part of the solution but it will be applied in the context of the whole problem.

Performance requirements of housing in response to the life cycle: a behavioral approach, L. A. Pastalan, *SP361, Vol. 1,* pp. 57-62 (Feb. 1972).

Key words: Age and perception; complexity; home range; life cycle; life space; loss continuum; macro space; mastery; micro space; redundant cuing; sensory acuity; sensory deterioration; spatial sets; user needs.

This paper concerns the development of a conceptual model dealing with performance requirements of housing in response to the changing physiological and psycho-social needs over the life cycle of the user.

The model relates the range of user needs to the human development continuum beginning with infancy and its extension to old age (100 years plus). Attention is focused on physiological and behavioral change from development in infancy and young adulthood to deterioration in old age. Changes over time in sensory acuity, energy levels, health status and activities of daily living are linked to three basic propositions regarding residential environments and user requirements: 1) The stimulus function must respond to differential sensory changes over the life cycle; 2) The orientation function of residential spaces must have high predictive value for young children and old people as well as young and middle-aged adults in order to elicit behavior appropriate to the setting; and 3) Spaces must be organized in such ways as to assure the expression of autonomy or jurisdictional control over personal space of each user while at the same time providing opportunities for social interaction with significant others.

Performance of systems of constructed facilities, A. C. Leme and F. Moavenzadeh, *SP361, Vol. 1,* pp. 63-71 (Feb. 1972).

Key words: Maintainability; measures of effectiveness multidimensional decisions; reliability; subjective evaluation.

The performance of a constructed facility must be evaluated in terms of the facility's role within the larger social economic-political system of which it is part. It is suggested that performance may be measured in terms of three principal parameters: serviceability, reliability, and maintainability. Serviceability is the degree to which the facility provides satisfactory service to the user, here understood to include a broad range of the recipients of benefits of the facility. Reliability is the probability that service will be adequate throughout the design service life of the facility. Maintainability is a measure of the degree to which continuing effort is required during the service life to keep serviceability at an acceptable level. This approach emphasises the user as the basis for evaluation, and the need to consider the entire service lifetime of a facility in decision. The implementation of procedures to permit usage of these parameters in decision making requires application of techniques from psychology and economics, and from probability theory.

The relationship of the performance concept to the planning process—developing performance requirements for community mental health centers, D. B. Hattis, *SP361, Vol. 1,* pp. 73-8 (Feb. 1972).

Key words: Building procurement; building system hospital planning; office building; performance.

The performance concept is best explained as the description of a system in terms of its output rather than its part. When this concept is applied in the procurement process any system the formal instrument used to effect the procurement is a performance specification.

Several advantages of performance specifications over prescriptive specifications have been suggested, particularly in the areas of economy and technological innovation.

When applied to building, performance specifications can be used at various scales of elements or systems, thus producing a "hierarchy of performance." It has been found that when used at a particular scale, the need to define the scope of the system of a performance specification requires the prescription of elements at the next higher scales.

There are several criteria for determining the scope of a system to be used on any particular project, but in general it is easier for "clear" building types than for "ambiguous" ones.

In attempting to define the scope of a system for "ambiguous buildings," one often finds oneself substituting the question "What is a house?" for the question "How should a house perform?" The former question leads to concern for earlier decisions in the planning process.

Institutional performance and building performance: some nplications of the Judicial Facilities Study, B. Handler, *SP361, ol. 1,* pp. 83-91 (Feb. 1972).

Key words: Activities; communication; courthouse; human performance; institutional performance; judicial system; mutual adaptation; objectives; operations; physical determinism; physical environment.

The performance of the institution or organizations which buildings serve has not been regarded as within the province of architectural analysis. Failure to evaluate institutional requirements can result in buildings which hamper rather than help the performance of institutions. A critical examination of the objectives and operations of the judicial system was a major theme of the Judicial Facilities Study, designed to develop standards and guidelines for courthouse design in the United States. How these facility standards were derived from a detailed examination of the judicial system is explained in terms of: the ways in which judicial system requirements and personal human requirements were handled; the present and future purposes and human needs the system and its facilities seek to fulfill; the manner in which the operations of each court function and specialized proceeding were examined; the ways in which activities, interpersonal relations, communication patterns, environmental and spatial characteristics were analyzed. Certain conceptual and theoretical considerations implicit in the approach to the study are discussed. The assumptions of conventional architectural analysis are stated, and the physical determinism inherent in them criticized. An alternative hypothesis is advanced, namely, that the effect of the physical environment on human performance varies with institutional performance. Buildings and the operations of the institutions they house are seen as interdependent, mutually adapting to each other as the people involved attempt to achieve correspondence between the two. The ideal of perfect consonance is viewed as able to be approached only if the designer has a thorough understanding of the institution both as it is and as it ought to be.

The complementary use of research and negotiations with sers in the development of performance standards, T. Mann nd R. Bender, *SP361, Vol. 1,* pp. 93-100 (Feb. 1972).

Key words: Arguments; decision-making; IBIS (Issue Based Information System); negotiations; research, structured planning discourse; user needs, aspirations, values.

Two assumptions underlying much of the current discussion about industrialized building systems for housing are: (1) research should investigate the needs of users of housing, and (2) the resulting findings can be cast into explicit performance standards or specifications to permit industry to develop and mass produce housing systems conforming to these standards and to the needs of users.

These assumptions are questioned. If user requirements research is to produce useful results, it must focus upon users in actual decision-making situations and be complemented with procedures of negotiation, conflict-detection, argumentation, debate, bargaining and conflict-settling.

An approach is discussed which puts research into the implementation phase of actual projects as a part of the planning discourse and decision-making process.

Application of unobtrusive observation techniques in building performance appraisal, W. F. E. Preiser, *SP361, Vol. 1,* pp. 101-109 (Feb. 1972).

Key words: Behavioral cost; building performance; cultural context; unobtrusive observation; user behavior; user feedback.
