TN595. **Effect of ceramic spectral emissivity variations on the computed luminous emissivity of the NBS standard of light,** W. B. Fussell, Nat. Bur. Stand. (U.S.), Tech. Note 595, 58 pages (Sept. 1971).

Key words: Ceramic; light; photometry; spectral emissivity; standard.

A simplified model of the National Bureau of Standards (NBS) 1970 design for the standard of light (platinum point blackbody) is introduced. This model is used to calculate the apparent luminous emissivity of the base of the sighttube of the standard of light, and of the wall near the base, by two different methods. The first method includes the effect of variations with wavelength in the spectral emissivity of the ceramic composing the sighttube; the second method does not include the effect of ceramic spectral emissivity variations. The results of the two methods are compared and their difference (about 6×10^{-6}) is found to be negligible for the NBS 1970 design when the sighttube is made of alumina, compared with other uncertainties and the precision of measurement. A formula is derived for estimating the apparent luminous emissivity of the standard of light, given: a. the length-to-diameter ratio of the sighttube; b. the half-angle of the conical base; c. the wall thickness of the sighttube; d. the thermal conductivity of the sighttube ceramic; e. the average thermal and luminous emissivities of the sighttube ceramic.

TN596. **The flammable fabrics program 1970. U.S. Department of Commerce report of activities under the Flammable Fabrics Act 1970,** Nat. Bur. Stand. (U.S.), Tech. Note 596, 68 pages (Sept. 1971).

Key words: Annual report to Congress; blankets; carpets and rugs; children's sleepwear; cooperation; flammability; flammability reduction; mattresses; research; small carpets and rugs; standards; test development.

This Annual Report to the Congress, required by the Flammable Fabrics Act, covers calendar year 1970. Specific flammability standards outputs were standards for carpets and rugs and for small carpets and rugs, a proposed standard for children's sleepwear, and notices of possible need and institution of proceedings for standards for certain items of children's apparel, all blankets, and all mattresses. Research included studies, in-house and by contract, on subjects such as full scale carpet burn experiments and heat transfer from burning fabrics. Studies of the feasibility of reducing flammability included pyrolysis of textile materials and chemical aspects of fire retardancy. Test development was completely related to the standards outputs, and training ranged from the preparation of bibliographies through Congressional and public presentations to full time Research Associateship participation in the program. Cooperation was carried out with HEW, the public, industry, and voluntary standards groups.

TN597. **Tabulation of data on semiconductor amplifiers and oscillators at microwave frequencies,** C. P. Marsden, Nat. Bur. Stand. (U.S.), Tech. Note 597, 48 pages (Dec. 1971).

Key words: Amplifiers; basic characteristics; microwave; oscillators; semiconductor; solid state.

This tabulation includes some of the basic characteristics of semiconductor microwave devices, specifically amplifiers and oscillators of foreign and domestic origin.

TN598. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report January 1 to March 31, 1971,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 598, 54 pages (Oct. 1971).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, eleventh of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include application of tuning and other related procedures for ultrasonic wire bonders in an industrial environment with a reported reduction of rejection rate at visual inspection by more than a factor of two, more complete evaluation of the photovoltaic method for determining radial resistivity profiles of circular semiconductor wafers, and identification of test conditions in which a d-c calibration curve may properly be used in measurements of thermal resistance. Work is continuing on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; specification of germanium for gamma-ray detectors; evaluation of wire bonds and die attachment; measurement of thermal properties of semiconductor devices, transit-time and related carrier transport properties in junction devices, and electrical properties of microwave devices; and characterization of silicon nuclear radiation detectors. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN599. **A survey of selected document processing systems,** E. Fong, Nat. Bur. Stand. (U.S.), Tech. Note 599, 67 pages (Oct. 1971).

Key words: Bibliographic system; computer package; data base; document processing; document storage and retrieval; information retrieval; text; text processing.

There are many document processing systems that are commercially available or government-owned. These systems emerged in the evolution from early efforts in library automation to current on-line systems. Due to the diverse nature of the facilities provided in the document processing systems, it is difficult to evaluate them. The purpose of this paper is to present a list of features as a set of dimensions along which to compare the surveyed systems. The feature list is also developed to serve as a common basis for describing document processing systems. Another purpose of this paper is to provide a reference tool for the eight systems surveyed. They are CIRCOL, DDC ITIRC, The Mead Data Central, MEDLARS II, New York Times Information Bank, ORBIT II, and RECON/STIM. This paper first explored the characteristics of available, large document processing systems in general. An overview of the eight systems surveyed is presented. The paper then defines the feature list. The description of the eight systems surveyed according to the feature list outline is included as an Appendix.

TN600. **Corrections and calculations on an x-ray diffraction line profile: a computer program,** R. E. Schramm, Nat. Bur. Stand. (U.S.), Tech. Note 600, 34 pages (June 1971).

Key words: Computer programs; Fourier analysis; nickel steels; statistics; x-ray analysis; x-ray diffraction.

This computer program was written to perform corrections and make calculations on an x-ray diffraction profile before Fourier analysis. The corrections are for background and for variations of intensity with the Bragg angle. Also calculated are the separation of the $K\alpha_1$-$K\alpha_2$ doublet and the centroid and position of peak maximum with their standard deviations. There is also an option to smooth the profile.

TN601. **Unassigned.**

TN602. **A broadband noncontacting sliding short,** W. Larson and R. D. Hunter, Nat. Bur. Stand. (U.S.), Tech. Note 602, 18 pages (June 1971).

Key words: Microwave; reflection coefficient; return loss; shorted termination; sliding short; waveguide.

A new sliding short that eases microwave measurements also yields superior electrical and mechanical properties. Easily fabricated by encasing noncontacting cylindrical brass slugs in a block of polytetrafluoroethylene, the device slides smoothly and prevents metal-to-metal contact with the inside walls of precision waveguide.

Design details and results of intercomparing other short circuits are given.

TN603. **Construction of a flashlamp-pumped dye laser and an acousto-optic modulator for mode-locking,** D. A. Jennings and D. L. Baldwin, Nat. Bur. Stand. (U.S.), Tech. Note 603, 33 pages (July 1971).

Key words: Acousto-optic modulator; flashlamp-pumped dye laser; mode-locking; subnanosecond pulses.

In this paper is presented the design of a flashlamp-pumped dye laser capable of emitting light pulses 500 ns (FWHM) with a risetime of 300 ns. The energy output in the visible region of light is 1 to 10 mJ with an energy conversion efficiency of about 0.01% at a repetition rate of 30 pps. The design of an acousto-optic modulator used to mode-lock the dye laser by intracavity loss modulation is presented. The laser output for a given cavity length depends on the frequency and voltage applied to the modulator; a 10–100% modulated output can be obtained with 1–20 V rms, whereas a train of light pulses narrower than 0.8 ns (FWHM) can be obtained with 80 V rms.

TN604. **Efficient numerical and analog modeling of flicker noise processes,** J. A. Barnes and S. Jarvis, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 604, 22 pages (June 1971).

Key words: Analog noise simulation; computer noise simulation; digital filters; flicker noise; fractional integration; recursive digital filters.

It is shown that by cascading a few simple resistor-capacitor filters, a filter can be constructed which generates from a white noise source a noise signal whose spectral density is very nearly flicker, $|f|^{-1}$, over several decades of frequency f. Using difference equations modeling this filter, recursion relations are obtained which permit very efficient digital computer generation of flicker noise time-series over a similar spectral range. These analog and digital filters may also be viewed as efficient approximations to integrators of order one-half.

TN605. **An evaluation of positive displacement cryogenic volumetric flowmeters,** J. A. Brennan, J. W. Dean, D. B. Mann, and C. H. Kneebone, Nat. Bur. Stand. (U.S.), Tech. Note 605, 134 pages (July 1971).

Key words: Cryogenic; flow; flowmeters; liquid nitrogen; measurement; positive displacement.

The National Bureau of Standards (NBS) and the Compressed Gas Association (CGA) have jointly sponsored a research program on cryogenic flow measurement. A cryogenic flow research facility was constructed and was first used to evaluate commercially available cryogenic flowmeters operating on a positive displacement principle.

The operation and the accuracy of the flow facility is briefly described. The performance of the flowmeters on liquid nitrogen is described by reporting the precision and bias of the meters before and after an 80-hour stability test and by defining the existence of temperature, flow rate, subcooling, and time order (wear) dependencies.

Meters were evaluated with flow rates ranging from 0.0012 to 0.0063 m^3/s (20 to 100 gpm), pressures ranging from 0.22 to 0.77 MN/m^2 (32 to 112 psia), and with temperatures ranging from 72 to 90 K.

TN606. **Cryogenic flow research facility provisional accuracy statement,** J. W. Dean, J. A. Brennan, D. B. Mann, and C. H. Kneebone, Nat. Bur. Stand. (U.S.), Tech. Note 606, 40 pages (July 1971).

Key words: Accuracy statement; cryogenic; flow facility; liquid nitrogen; measurement.

The National Bureau of Standards and the Compressed Gas Association have jointly sponsored a research program on cryogenic flow measurement. A cryogenic flow research facility was constructed and was first used to evaluate commercially available cryogenic flowmeters operating with liquid nitrogen on a positive displacement principle.

The performance of the flow facility was simultaneously being evaluated during the meter tests. This is a summary report of the performance evaluation of the flow facility. An accuracy statement is given for both totalized mass and volumetric flow.

TN607. **The errors in plasma measurements by the microwave cavity techniques,** K-B Persson and E. G. Johnson, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 607, 64 pages (Oct. 1971).

Key words: Collision frequency; helium negative glow discharge; microwave cavity; plasma density.

This report presents the results of a theoretical and experimental study of the microwave cavity techniques used in measuring electron density and collision frequency in transient plasmas. Sources of errors are discussed and certain calibration procedures are recommended to minimize the error. In particular, the abnormal negative glow discharge in helium is presented as an inexpensive reference plasma for calibration purposes.

TN608. **Steam-water, critical flow in a venturi,** R. V. Smith, Nat. Bur. Stand. (U.S.), Tech. Note 608, 25 pages (July 1971).

Key words: Critical flow; pressure profile; steam; venturi; water.

This paper is the second part of an analytical and experimental investigation, in which the primary object was to test the hypothesis that the flow of the gas phase controls critical and near critical two-phase flow for cases where the gas and liquid flow essentially in separate streams. In the first part of the investigation, a two-component system (air-water) was used. The results presented here substantiate the hypothesis. The analytical results also indicate the use of one dimensional flow equations with reasonably accurate estimates for droplet size and for the drag and heat transfer coefficients (without consideration of mass transfer–vaporization or condensation) describe critical and near-critical flow reasonably well. This indicates that mass transfer may be a secondary effect for these flow conditions.

TN609. **Study of cryogenic storage tank fatigue life. Low temperature testing of AISI 304 and 310 stainless steels,** R. P. Reed, R.

. Durcholz, R. E. Schramm, and T. J. Patrician, Nat. Bur. tand. (U.S.), Tech. Note 609, 86 pages (Aug. 1971).

Key words: Fatigue; fracture; impact; low temperature; mechanical property equipment; stainless steel.

wo 300 series stainless steels were tested for impact-fatigue and tensile properties as a function of temperature, percent nsformed phase (martensite), stress level, and specimen metry. These alloys were studied to predict the fracture racteristics of parent material and weld joints in large ogenic dewars which are subjected to periodic stresses. Nor- ly, AISI 304 is employed in the construction of such dewars. der fatigue loading conditions at cryogenic temperatures, the avior of AISI 304 is complicated by the gradual transforma- n to a martensitic structure. The influence of this transforma- n on the fracture characteristics was studied. For this purpose, new impact-fatigue test and necessary equipment were veloped.

he fatigue strength of AISI 304 and 310 exhibit similar nds, but at a given fatigue life and temperature, the fatigue ength of AISI 304 is slightly superior. AISI 310 displays an durance limit of about 20,000 psi; the 304 limit is 25-30,000 . However, the lowest endurance limit (weakest) specimens ear to be the triaxially-loaded AISI 304 weld specimens ich have an endurance limit near 10,000 psi. Little tempera- e-dependence of the impact-fatigue properties was observed.

N610. **Application of VLF theory to time dissemination,** W. F. Hamilton and J. L. Jespersen, Nat. Bur. Stand. (U.S.), Tech. Note 610, 170 pages (Nov. 1971).

Key words: Diurnal phase; Omega; time; time dissemination; VLF propagation; zonal harmonics.

The characteristics of time dissemination systems are scussed. Particular emphasis is placed on the advantages and oblems of very low frequency (VLF) timing systems. The rameters affecting VLF propagation along with causes of riations in these parameters, are discussed. Three methods of mputing VLF propagation delays—mode theory, geometric- otics, and zonal harmonics—are compared. The method of nal harmonics, used for the calculations in this paper, is scussed in more detail. A method of calculating reflection coef- cients for a continuously varying ionosphere is described. The eoretical values are compared with experimental measure- ents. Graphical results of the calculations are included.

N611. **NBS frequency-time broadcast station WWV, Fort Collins, Colo.,** P. P. Viezbicke, Nat. Bur. Stand. (U.S.), Tech. Note 611, 29 pages (Oct. 1971).

Key words: High frequency; standard radio frequencies; time-frequency broadcasts; time signals; WWV.

This report describes the design and construction of the National Bureau of Standards frequency-time broadcast station ocated at Fort Collins, Colo. The principal function of the station is to broadcast basic standards of frequency and time signals n frequencies of 2.5, 5, 10, 15, 20, and 25 MHz. These high requency transmissions, which can be received on the simplest f equipment, provide the necessary accuracy required to fulfill ome of the needs of industry, Government, and the public. The echnical and administrative supervision of the station is under he Time and Frequency-Time Broadcast Services Section, National Bureau of Standards, Boulder, Colo.

TN612. **Frequency shifts due to Ramsey type interrogation in atomic beam tubes,** H. Hellwig, J. A. Barnes, D. J. Glaze, and P. Kartaschoff, Nat. Bur. Stand. (U.S.), Tech. Note 612, 25 pages (Feb. 1972).

Key words: Cavity phase shift; cesium beam tube; frequency accuracy; frequency standard; power shift; resonance line shape.

Part I: A phase difference between the two interaction regions of a Ramsey excitation resonance structure results in a frequency bias in the measured beam resonance. A simple mathematical model is discussed which describes the dependence of this bias on the phase difference, the microwave power level, the modulation amplitude, and the resonance linewidth. This dependence results from the interaction of the modulated microwave excitation frequency with the asymmetric shape of the slightly shifted resonance line. In a first order approximation, no dependency on the frequency modulation amplitude is expected. Near-linear dependencies on the linewidth and microwave power level which are quite pronounced even at relatively small cavity phase differences are predicted. The theoretical results are compared with one set of experimental data on the microwave power dependence as measured in 1969 with the primary cesium beam standard NBS-III. After a correction is applied to remove the power dependence due to spectral impurity of the microwave excitation, the remaining measured power dependence agrees quantitatively with that calculated using a cavity phase difference of about 3 milliradians.

Part II: One of the most serious effects limiting the accuracy of atomic beam resonators is the uncertainty of phase shifts between the oscillating fields in a Ramsey excitation cavity. A technique using the linewidth dependence on the excitation power to measure the phase-shift induced bias has recently been proposed. The conditions under which this method is valid and their implications on the design of beam optics will be discussed with consideration of available experimental results.

TN613. **Martensite transformation detection in cryogenic steels (magnetometer development),** F. R. Fickett, Nat. Bur. Stand. (U.S.), Tech. Note 613, 31 pages (Dec. 1971).

Key words: Fatigue monitor; low temperature; magnetometer; martensite; nondestructive.

This report presents design criteria for a magnetometer device developed to determine the martensite concentration in 304 stainless steel. Specifically, the device is designed to monitor the cold tank of an airborne liquid oxygen container which is subject to periodic stress pulses. The amount of martensite is relatable to the plastic strain and thus provides a mechanism for the prediction of impending failure.

The magnetometer, developed after a critical review of the constraints, is an excitation coil-Hall effect system. The system is very versatile in design and is easily adapted to particular problems. It is relatively insensitive to thermal and mechanical shock and easily capable of detecting martensite at the 1 percent level.

TN614. **Longitudinal magnetoresistance in polar semiconductors,** R. L. Peterson, Nat. Bur. Stand. (U.S.), Tech. Note 614, 47 pages (Apr. 1972).

Key words: Magnetophonon effect; magnetoresistance; semiconductors; transport theory.

The magnetophonon effect due to resonant interactions of charge carriers with optical phonons in nondegenerate polar semiconductors is studied when several elastic scattering mechanisms are simultaneously active also. The simple model of the band structure, and the displaced Maxwellian distribution function are used. Analytical expressions for drift mobility are given for $B = 0$ and the quantum limit, and are compared with the results of other techniques where possible. The numerical calculations show that whenever magnetophonon oscillations are seen in the ohmic regime, maxima occur near the resonance magnetic

fields for all lattice temperature and strengths of scattering mechanisms which compete with the optical phonon scattering. This is in contrast with typical experimental findings, in which minima usually (but not always) appear near the resonance fields for ohmic, longitudinal, conditions. The explanation of the minima must therefore be sought in the use of a distribution function in which carrier-carrier scattering is less important.

TN615. **WR15 thermal noise standard,** W. C. Daywitt, W. J. Foote, and E. Campbell, Nat. Bur. Stand. (U.S.), Tech. Note 615, 154 pages (Mar. 1972).

Key words: Error analysis; millimeter wave; noise; Nyquist's theorem; thermal noise standard.

This note describes the design and construction of a WR15 thermal noise power standard. The standard is designed to operate around the Silver Point Temperature (963.19 °C) with a noise temperature output accurate to approximately ± 2 K.

Complete details of the theory, design, construction, and performance tests are given.

TN616. Revised March 1974. **Frequency standards and clocks: A tutorial introduction,** H. Hellwig, Nat. Bur. Stand. (U.S.), Tech. Note 616 (Revised), 72 pages (Mar. 1974) SD Catalog No. C13.46:616 (Rev.).

Key words: cesium beam; clocks (atomic); crystal oscillator; frequency accuracy; frequency stability; frequency standards; hydrogen maser; quartz crystal; rubidium gas cell; timekeeping.

The topic of frequency standards and clocks is treated in a tutorial and nonmathematical way. The concepts of time, frequency stability, and accuracy are introduced. The general physical principles and design features of frequency standards and clocks are described. The design, performance, and limitations of quartz crystal oscillators and atomic devices (cesium, hydrogen, rubidium) are discussed in detail and critically compared for laboratory devices as well as for devices intended for field usage.

TN617. **Thermophysical properties of parahydrogen from the freezing liquid line to 5000 R for pressures to 10,000 psia,** R. D. McCarty and L. A. Weber, Nat. Bur. Stand. (U.S.), Tech. Note 617, 169 pages (Apr. 1972).

Key words: Density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; hydrogen; index of refraction; Joule-Thomson; latent heat; melting point; Prandtl number; specific heat; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

Tables of thermophysical properties of para hydrogen are presented for temperatures from the melting line to 5000 R for pressures from 1 to 10,000 psia. The tables include entropy, enthalpy, internal energy, density, volume, speed of sound, specific heat, thermal conductivity, viscosity, thermal diffusivity, Prandtl number and the dielectric constant for 65 isobars. Also included in the isobaric tables are quantities of special utility in heat transfer and thermodynamic calculations: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_V$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V)_T$, $1/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vapor and liquid are given which include all of the above properties, plus the surface tension. Tables for the P-T of the freezing liquid, index of refraction and the derived Joule-Thomson inversion curve are also presented.

TN618. **WR15 microwave calorimeter and bolometer unit,** M. E. Harvey, Nat. Bur. Stand. (U.S.), Tech. Note 618, 41 pages (May 1972).

Key words: Calorimeter; microwave; power; standard.

A microwave calorimeter which serves as the National Bure of Standards (NBS) standard for power measurements in frequency range 50 to 75 GHz has been completed and eva ated recently. Included here are descriptions of the princi changes in the calorimeter and bolometer unit from the WR models which are of similar design. Also included are constr tion details, accessory equipment, operation procedure, a error analysis. An improved thermal isolating waveguide secti and calorimeter flange are features of this calorimeter.

A careful error analysis permits the determination of the eff tive efficiency of a standard bolometer unit to estimated limits systematic uncertainty of ±0.23%. The estimated 3σ limit random uncertainty is 0.05%.

TN619. **Millimeter attenuation and reflection coefficient measu ment system,** B. C. Yates and W. Larson, Nat. Bur. Sta (U.S.), Tech. Note 619, 175 pages (July 1972).

Key words: Attenuation; measurement system; millimet reflection coefficient, VSWR.

This paper presents the details to implement a WR 15 atten tion and reflection coefficient magnitude measurement syste A discussion of precision and of systematic error is given alo with equations for estimating limits of the error. Machi drawings are provided to fabricate the waveguide standards a necessary hardware not commercially available.

TN620. **Frequency and phase stabilization of an HCN laser locking to a synthesized reference,** J. S. Wells and D. Halfo Nat. Bur. Stand. (U.S.), Tech. Note 620, 56 pages (May 19 60 cents, SD Catalog No. C13.46:620.

Key words: Fast linewidth; frequency noise; HCN las infrared frequency synthesis; laser frequency measu ments; laser linewidth; laser stabilization; phase lock laser.

Infrared frequencies as high as 88 THz have recently be synthesized using diode harmonic mixers with accuracies parts in 10^9. Stabilized lasers are needed to make frequency m surements of higher accuracy. The HCN laser is the low frequency basis laser used in these synthesis schemes and its s bilization has been the subject of recent interest. The laser is s bilized by locking it to a phase locked microwave referer chain. Two servo loops are utilized. The first loop is a relativ slow frequency lock loop with the correction applied to a P

TN621. **Liquid-vapor equilibrium in the binary systems of H and He^3 with nD_2 and nH_2,** M. J. Hiza, Nat. Bur. Stand. (U.S Tech. Note 621, 66 pages (July 1972).

Key words: Binary systems; gas solubility; He^4-nD_2; H nD_2; He^4-nH_2, He^3-nH_2; liquid-vapor equilibrium; n vapor pressure; nH_2 vapor pressure.

Experimental data are reported for the equilibrium liquid a vapor phase compositions of the He^4-nD_2 and He^3-nD_2 syste from 20 to 30 K and the He^4-nH_2 and He^3-nH_2 systems from to 28 K. The maximum experimental pressures were 20 and atm (2.0 and 1.6 MN/m²) for the He^4 and He^3 systems, resp tively. In addition, vapor pressures were measured from 20 to K for nD_2 and from 20 to 30 K for nH_2.

Values of Henry's constants, enhancement factors, K-valu and heats of solution were derived from the experimental d for each system. The derived properties are compared with th derived from previous data for the He^4-nH_2, He^4-pH_2, and H nH_2 systems.

river. This loop not only accommodates thermal expansion of ne laser, but also serves as an acquisition aiding loop for the econd servo. The latter is a phase locked system with the cor-ection applied to the laser discharge current.

Details of the laser design and some noise considerations rela-ve to the microwave reference chain are presented along with ome experimental data which indicate the results of the sta-ilization techniques. Data regarding the system stability and im-roved fast linewidth are included.

N622. **Thermophysical properties of helium-4 from 4 to 3000 R with pressures to 15,000 psia,** R. D. McCarty, Nat. Bur. Stand. (U.S.), Tech. Note 622, 141 pages (Sept. 1972).

Key words: Density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; helium 4; index of refraction; Joule-Thomson coefficient; lambda line; latent heat; melting point; Prandtl number; specific heats; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

Tables of thermophysical properties of helium 4 are presented r temperatures from 4 to 3000 Rankine for pressures to 15,000 ia. The tables include entropy, enthalpy, internal energy, den-y, volume, speed of sound, specific heat, thermal conductivity, scosity, thermal diffusivity, Prandtl number and the dielectric nstant for 74 isobars. Also included in the isobaric tables are antities of special utility in heat transfer calculations: $(\partial P/\partial V)_T$, $P/\partial T)_\rho$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V)_T$, $1/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vapor id liquid are given which include all of the above properties, us the surface tension. Tables for the $P\rho T$ of the freezing quid, $P\rho T$ of the lambda line, index of refraction and the rived Joule-Thomson inversion curve are also presented.

N623. **Invariance of the cross ratio applied to microwave network analysis,** R. W. Beatty, Nat. Bur. Stand. (U.S.), Tech. Note 623, 23 pages (Sept. 1972).

Key words: Anharmonic ratio; automatic network analyzers; cross ratio; microwave network analysis; reflection coefficient; scattering coefficient.

The historical background and theory is given of the applica-on of the mathematical principle "invariance of the cross ratio" microwave network analysis. Further developments to im-rove the accuracy of automatic network analyzers are sug-ested.

N624. **An evaluation of several cryogenic turbine flowmeters,** J. A. Brennan, R. W. Stokes, D. B. Mann, and C. H. Kneebone, Nat. Bur. Stand. (U.S.), Tech. Note 624, 90 pages (Oct. 1972).

Key words: Cryogenic; flow; liquid nitrogen; mass; mass flowmeters; measurement; turbine flowmeters; volume flowmeters.

The National Bureau of Standards (NBS) and the Compressed as Association (CGA) have jointly sponsored a research pro-am on cryogenic flow measurement. A cryogenic flow research cility was constructed and has been used to evaluate cryogenic owmeters operating on several different principles.

The operation and the accuracy of the flow facility is briefly escribed. The performance of the flowmeters in liquid nitrogen described by reporting the precision and bias of the meters be-re and after an 80-hour stability test and by defining the ex-tence of temperature, pressure, flow rate, subcooling, and time rder (wear) dependencies.

Meters were evaluated with flow rates ranging from 20 to 210 gpm (1.3 to 13.2 l/s), pressures ranging from 32 to 112 psia (0.22 to 0.77 MN/m²), and with temperatures ranging from 72 to 90 K.

TN625. **Computer programs for thermodynamic and transport properties of hydrogen (Tabcode-II),** H. M. Roder, R. D. McCarty, and W. J. Hall, Nat. Bur. Stand. (U.S.), Tech. Note 625, 226 pages (Oct. 1972) $1.75, SD Catalog No. 13.46:625.

Key words: Computer programs; density; enthalpy; entropy; heat capacity at constant pressure; heat capacity at constant volume; heat capacity ratio; heat transfer coefficient; hydrogen; pressure; saturation boundary; temperature; thermal conductivity; velocity of sound; viscosity.

The thermodynamic and transport properties of para and equilibrium hydrogen have been programmed into a series of computer routines. Input variables are the pair's pressure- temperature and pressure-enthalpy. The programs cover the range from 1 to 5000 psia (34 MN/m²) with temperatures from the triple point to 6000 °R (3300 K) or enthalpies from − 130 Btu/lb (− 623 J/mol) to 25,000 Btu/lb (117000 J/mol). Output variables are enthalpy or temperature, density, entropy, thermal conductivity, viscosity, velocity of sound, heat capacity at constant pressure, heat capacity at constant volume, the heat capacity ratio, and a heat transfer parameter. Property values on the liquid and vapor boundaries are conveniently obtained through two small routines. The programs achieve high speed by using linear interpolation in a grid of precomputed points which define the surface of the property returned. The maximum errors arising from the linear interpolation are shown on individual deviation plots for each combination of variables. Error estimates for the sources of data are similarly displayed.

TN626. **The generation of an accurate and uniform time scale with calibrations and prediction,** K. Yoshimura, Nat. Bur. Stand. (U.S.), Tech. Note 626, 64 pages (Nov. 1972) 60 cents, SD Catalog No. C13.46:626.

Key words: Accurate and uniform time scale; Allan variance; dispersion of time scale; ensemble time (error); prediction interval; primary standard and clocks.

We express a predicted time interval (or frequency) of a single clock as a weighted sum of frequency data obtained by calibrations against a primary standard, and derive a matrix equation for the optium weighting coefficients (called the optimum filter response function) involving the Allan variances. Two approaches are used. One of the approaches turns out to be a generalization of Barnes' approach in his 1966 IEEE paper.

We solve the matrix equation to get the optimum filter response functions for white noise frequency modulation (FM), flicker noise FM and linear combinations of them. Other important time dispersive mechanisms exist in practice but are not considered here. We obtain the result that the mean square time prediction error would increase as elapsed time t^2 for the case without intermediate calibrations.

We obtain the result that with a small number of good clocks one can construct a time scale whose accuracy is limited by the accuracy of a primary standard. We show that, over a long time range, linear prediction algorithms based on frequency calibrations with a primary standard give a time scale of much better accuracy and stability than when intermittent calibrations are not used, and that (at least for statistically identical clocks), *no advantage is gained* by using the time scale itself as a "primary standard" for intermediate calibrations.

TN627. **Computation of spectral data for a Josephson junction circuit,** E. G. Johnson, Jr. and D. G. McDonald, Nat. Bur.

Stand. (U.S.), Tech. Note 627, 63 pages (Nov. 1972) 60 cents, SD Catalog No. C13.46:627.

Key words: Differential equation; fast Fourier transform; Josephson junction; nonlinear integral-differential equation; spline theory.

A computer program has been developed to study power flow between different frequency channels in a Josephson junction circuit. This paper discusses the mathematical assumptions used to get such results. They are the trapezoidal approximation from spline theory and the use of a finite range of frequencies to characterize the frequency spectrum. This paper describes the program and provides the FORTRAN listing, flow charts, and discusses how to use the program. A discussion of possible sources of errors is also included.

TN628. **On the utility of the m-6-8 potential function,** H. J. M. Hanley and M. Klein, Nat. Bur. Stand. (U.S.), Tech. Note 628, 77 pages (Nov. 1972) 70 cents, SD Catalog No. C13.46:628.

Key words: Dispersion coefficients; m-6-8 potential; parameter selection; second virial coefficients; transport properties.

The calculation of transport and equilibrium properties of simple gases with the m-6-8 potential function is discussed. Properties referred to specifically are the viscosity, diffusion, thermal conductivity and second virial coefficients, and the thermal diffusion factor. Gases referred to are argon, krypton, xenon, nitrogen, oxygen, carbon dioxide and methane. We also discuss in detail the general behavior of a model potential with respect to the fitting of data and the selection of potential parameters. The m- 6-8 appears to be the simplest model potential which can satisfactorily be used to fit data over a wide temperature range. The relationship of the potential to independent theory is briefly examined.

TN629. **Superconducting quantum interference devices: An operational guide for rf-biased systems,** D. B. Sullivan, Nat. Bur. Stand. (U.S.), Tech. Note 629, 47 pages (Nov. 1972) 50 cents, SD Catalog No. C13.46:629.

Key words: Electrical measurements; quantum interference devices; superconductivity.

The report discusses a number of practical considerations concerning the operation and application of rf-biased Superconducting QUantum Interference Devices (SQUID's). In the course of routine operation of these devices one amasses a set of operational rules, many of which never reach the open literature. This report is aimed at filling that void. Topics of discussion include: the readout circuitry, operational limits of the SQUID, rf-coupling to the SQUID, flux transformers, and shielding.

TN630. **Developments in cryoelectronics,** R. A. Kamper and D. B. Sullivan, Nat. Bur. Stand. (U.S.), Tech. Note 630, 73 pages (Nov. 1972) 70 cents, SD Catalog No. C13.46:630.

Key words: Electronics; Josephson effect; precise measurements; superconductivity.

This is a survey of progress to date in the development of new electronic instruments taking advantage of the unique properties of superconductors.

TN631. **Thermophysical properties of helium-4 from 2 to 1500 K with pressures to 1000 atmospheres,** R. D. McCarty, Nat. Bur. Stand. (U.S.), Tech. Note 631, 161 pages (Nov. 1972) $1.25, SD Catalog No. C13.46:631.

Key words: Density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; helium 4; index of refraction; Joule-Thomson coefficient; lambda line; latent heat; melting point; Prandtl number; specific heats; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

Tables of thermophysical properties of helium 4 are presented for temperatures from 2 to 1500 K for pressures to 1000 atmospheres. The tables include, entropy, enthalpy, internal energy, density, volume, speed of sound, specific heat, thermal conductivity, viscosity, thermal diffusivity, Prandtl number and the dielectric constant for 62 isobars. Also included in the isobaric tables are quantitites of special utility in heat transfer calculations: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_\rho$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V)_T$, $1/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vapor and liquid are given which include all of the above properties, plus the surface tension. Tables for the $P\rho T$ of the freezing liquid, $P\rho T$ of the lambda line, index of refraction and the derived Joule-Thomson inversion curve are also presented. A computer program to calculate the various properties is also available. Inquiries should be addressed to the National Bureau of Standards, Cryogenic Data Center, Boulder, Colorado 80302.

TN632. **Frequency stability specification and measurement: High frequency and microwave signals,** J. H. Shoaf, D. Halford, and A. S. Risley, Nat. Bur. Stand. (U.S.), Tech. Note 632, 70 pages (Jan. 1973) 65 cents, SD Catalog No. C13.46:632.

Key words: Allan variance; frequency stability measurements; measurement system description; phase noise, spectral density; stability definitions; terminology standards.

This report gives concise definitions for specifying stability for measurements in the frequency domain and time domain. Standards of terminology and of measurement techniques are recommended. Measurement systems in the high frequency and microwave regions are described in adequate detail so that the systems may be duplicated.

TN633. **Critical two-phase flow for cryogenic fluids,** R. V. Smith, K. R. Randall, and R. Epp, Nat. Bur. Stand. (U.S.), Tech. Note 633, 80 pages (Jan. 1973) 70 cents, SD Catalog No. C13.46:633.

Key words: Analyses; analytical models; choking flow; critical flow; cryogenic fluids; helium; hydrogen; oxygen; reviews; two-phase flow.

This work presents a state-of-the-art survey intended to be useful to a designer of equipment involving two-phase flow of cryogenic fluids. It is desirable to assess the probability of critical, or choking flow in such a system and, if possible, estimate the critical flow rate. The literature is surveyed, primarily since Smith (1963), and the predictive results for several analytical models are evaluated and compared with experimental data. These results are discussed; however, no firm conclusions are reached because, often, the spread of experimental data is equivalent to the predictive results from the models. Finally, computer evaluations are presented for oxygen, hydrogen and helium along with some design recommendations.

TN634. **Lorenz ratios of technically important metals and alloys,** J. G. Hust and L. L. Sparks, Nat. Bur. Stand. (U.S.), Tech. Note 634, 133 pages (Feb. 1973) $1.25, SD Catalog No. C13.46:634.

Key words: Alloys; compilation; cryogenic; electrical resistivity; Lorenz ratio; metals; thermal conductivity.

A comprehensive review and compilation of the world liter-

re on Lorenz ratio of technically important metals and alloys presented. Lorenz ratio, electrical resistivity, thermal conductivity and characterization data are compiled in tabular form and e Lorenz ratio data are presented in graphical form as well. ata are included here only if the research reported both thermal nductivity and electrical resistivity of the specimens. No attempt has been made to smooth data or present recommended alues.

N635. **Some applications of cryogenics to high speed ground transportation,** V. C. Arp, A. F. Clark, and T. M. Flynn, Nat. Bur. Stand. (U.S.), Tech. Note 635, 29 pages (Feb. 1973) 35 cents, SD Catalog No. C13.46:635.

Key words: Levitation; magnetic suspension; materials fatigue data; refrigeration; superconducting magnets; transportation.

The current status (December 1972) of worldwide research on gh speed ground transportation techniques is reviewed. Parcular attention is given to studies of magnetic levitation using perconducting magnets, including comparison with alternative agnetic techniques and with air suspension systems. Superconucting levitation appears to be a strong contender in the U.S. epartment of Transportation hopes to select in the late 1970's he best of the possible levitation techniques for subsequent adanced development. Cryogenic engineering research needed in upport of major development of a superconducting levitated ystem is identified.

N636. **Modeling of atomic clock performance and detection of abnormal clock behavior,** W. A. Ganter, Nat. Bur. Stand. (U.S.), Tech. Note 636, 39 pages (Mar. 1973) 50 cents, SD Catalog No. C13.46:636.

Key words: Atomic clock model; detection; flicker noise; sequential test; time scale.

We have assumed that the nominal performance of an atomic lock can be well characterized by (1) a noise amplitude and (2) mix of white and flicker pure noise processes. A number of pecific kinds of changes are assumed that a clock might encounter. We assume that these changes can occur with either ign and with varying magnitudes. The changes considered are noise amplitude different from nominal, a flicker component in he noise mix which is different from nominal, a step jump in the ime counts for a clock and a linear (frequency jump) or uadratic (frequency drift) trend in the time counts for a clock.

Detection of a change is accomplished with a multiple sequenial test having compound limits. The test is designed to respond uickly to an actual change but to make few incorrect detections identify the wrong change) or false detections (when no change rom nominal operation has occurred). When a change is deected for a clock, the laboratory time scale can be adjusted accordingly for this condition.

TN637. **Theory of UHF and microwave measurements using the power equation concept,** G. F. Engen, Nat. Bur. Stand. (U.S.), Tech. Note 637, 68 pages (Apr. 1973) 70 cents, SD Catalog No. C13.46:637.

Key words: Microwave; microwave measurements; power equation; power measurement; terminal invariant.

Theoretical considerations indicate that, in addition to other advantages, UHF and microwave measurements based on the power equation concept should exhibit reduced sensitivity to certain connector imperfections. This has now been experimentally confirmed in a number of laboratories, and interest in these methods is increasing. The previously described measurement techniques, for implementing this concept, have relied heavily upon tuning procedures, while current trends are towards automation where tuning is impractical if not impossible.

By assuming a phase detection capability (such as is found in automated systems) it is possible to eliminate the tuning requirement. Moreover, this generalization has made it possible to summarize the earlier results in a compact form. In addition, this paper includes a number of new measurement ideas.

It is expected that this report will serve as a major reference in the continuing development of detailed measurement procedures which exploit the power equation concept.

TN638. **A synchronous satellite time delay computer,** W. F. Hamilton and D. W. Hanson, Nat. Bur. Stand. (U.S.), Tech. Note 638, 39 pages (July 1973) 45 cents, SD Catalog No. C13.46:638.

Key words: Satellite timing; slant range; synchronous satellites; time delay.

A special purpose slide rule designed to compute the free space propagation delay between a synchronous satellite and points on the earth's surface is discussed. The slide rule was developed to provide users of time information relayed by geostationary satellites a means of computing the propagation delays without dealing directly with the satellite's orbital elements. The delays computed with the slide rule are compared with the values obtained from orbital elements using a high precision digitial computer. The limitations and accuracy of the slide rule are discussed. A sample slide rule which may be cut out and used is included in the report.

TN639. **Publications and services of the National Bureau of Standards, Cryogenics Division, Institute for Basic Standards, Boulder, Colo. 80302, 1953-1972,** J. R. Mendenhall, V. J. Johnson, and N. A. Olien, Nat. Bur. Stand. (U.S.), Tech. Note 639, 82 pages (Aug. 1973) 75 cents, SD Catalog No. C13.46:639.

Key words: Author indexes; bibliography; cryogenics; liquefaction; metrology; properties of fluids; properties of solids; subject indexes; superconductivity; transport processes.

This NBS Technical Note catalogs the publications of the Cryogenics Division, along with author and subject indexes, for the period 1953 through 1972. It also contains a listing of available thermodynamic properties charts, bibliographies, and miscellaneaous reports of cryogenic interest.

A resumé of the activities of and services provided by the Cryogenics Division is also included.

TN640. **Considerations for the precise measurement of amplifier noise,** D. F. Wait, Nat. Bur. Stand. (U.S.), Tech. Note 640, 129 pages (Aug. 1973) $1.25, SD Catalog No. C13.10.46:640.

Key words: Amplifier noise; effective input noise temperature; mismatch error; mismatch uncertainty; noise figure.

For the best accuracy in measuring noise figure, attention needs to be given to the choice of the hot and the cold noise standards and to mismatch problems. Tables and graphs are presented to aid in choosing the proper measurement conditions, and an example is given to demonstrate their use. This paper essentially supplements a previous paper (included in an appendix), treating in more detail topics that become important when state-of-the-art measurements are required.

TN641. **Survey of the properties of the hydrogen isotopes below their critical temperatures,** H. M. Roder, G. E. Childs, R. D. McCarty, and P. E. Angerhofer, Nat. Bur. Stand. (U.S.), Tech. Note 641, 122 pages (Oct. 1973) $1.25, SD Catalog No. C13.46:641.

Key words: Compilation; density; deuterium; electrical properties; enthalpy; entropy; fixed points; hydrogen; mechanical properties; optical properties; specific heat; thermophysical properties; transport properties; tritium; vapor pressure.

The survey covers PVT, thermodynamic, thermal, transport, electrical radiative and mechanical properties. All isotopic as well as ortho-para modifications of hydrogen have been included. Temperatures are limited to those below the respective critical points, in general below 40 K. The pressure range is not restricted, that is solid, liquid, and gas phases are covered. However, with the exception of hydrogen, very little data exists at pressures other than saturation. The literature surveyed includes all references available to the Cryogenic Data Center up to June of 1972, and for several subjects, through March of 1973. The total number of documents considered was nearly 1500 of which about 10 percent contain pertinent information and are referenced in this report. The various properties are presented in the form of tables of graphs; if extensive tables have been published elsewhere, the reader is referred to the original sources.

TN642. **Summary of WR15 flange evaluation at 60 GHz,** B. C. Yates and G. J. Counas, Nat. Bur. Stand. (U.S.), Tech. Note 642, 32 pages (Oct. 1973) 40 cents, SD Catalog No. C13.46: 642.

Key words: Attenuation; flange measurements; reflection coefficients; VSWR.

The measurement results of flange loss and reflection coefficient magnitude at 60 GHz (WR15 waveguide) of various flange configurations are presented. Included are the effects of alignment pins, surface finish, metallic contact surface, contact area, and flange bolt torque.

TN643. **Measurement of rf power and attenuation using superconducting quantum interference devices,** R. A. Kamper. M. B. Simmonds, C. A. Hoer, and R. T. Adair, Nat. Bur. Stand. (U.S.), Tech. Note 643, 93 pages (Aug. 1973) $1.00, SD Catalog No. C13.46:643.

Key words: Josephson effect; quantum interference; rf attenuation; rf measurement; rf power; superconductivity.

This report is the product of the first two years' work on a project to exploit an entirely new principle for the measurement of rf power and attenuation, namely the Superconducting QUantum Interference Device (SQUID). This is a simple circuit of superconducting metal, operating at a very low temperature in a bath of liquid helium. It functions as a sensor of magnetic flux with an almost perfectly periodic response over a wide dynamic range. It may therefore be used to measure dc or rf electrical quantitites such as current, power, attenuation, etc., in circuits inductively coupled to it. Measurements of these quantities can be made by counting off periods in the response of the SQUID (flux quanta) in the same way that we measure length with a laser by counting off wavelengths of light.

This work is partly funded by the CCG under project number 72-72. It has reached the stage of a demonstration that the new principle can indeed be used for precise measurement. We have developed and tested prototype systems for measuring power and attenuation as accurately as we can test by the conventional means available to us. A single calibration with dc is required to measure absolute rf power in the range of frequency from 0 to 1 GHz at levels from 10^{-8}W to 10^{-3}W with an uncertainty of ± 0.1 dB at the port of the SQUID. Transferring this measurement to calibrate a source of power would require a proper evaluation of the intervening network over the full range of frequency. We have demonstrated the feasibility of extending our measur ments of power to much lower levels. No external calibration required to measure rf attenuation directly over a dynamic ran of 45 dB with an rms deviation of ± 0.002 dB from calibratio performed by the NBS Calibration Service.

After an elementary exposition of the basic principles of o technique, we describe: the SQUIDs themselves; the prototy systems we have developed to measure rf power and attenu tion; systematic errors and fundamental limitations of the me surements that can be performed with them; and the obvious a immediate improvements that can be applied to them. V reserve an appendix for detailed drawings and instructions f the fabrication of components.

In order to make this report self-contained, we have includ the material from previous reports that has successfu withstood the test of time.

TN644. **Application of a non-ideal sliding short to two-port l measurement,** M. P. Weidman and G. F. Engen, Nat. B Stand. (U.S.), Tech. Note 644, 40 pages (Oct. 1973) 50 cen SD Catalog No. C13.46:644.

Key words: Efficiency; loss; reflectometer; sliding sho two-port.

A detailed, applications-oriented, description of a method measuring two-port losses is given. The technique involved u a non-ideal sliding short circuit and a tuned four-arm reflecto ter. Most, if not all, of the components used in this technique c be put together using commercially available items. It is the tent of this discussion to provide enough detail and explanati so that a technician with some working knowledge of microwa measurements can set up and make loss measurements.

The reference made to two-ports implies a broad range devices from a simple flange or connector to waveguide coa adaptors and even more elaborate configurations with a defi ble input and output connection.

TN645. **Time and frequency broadcast experiments from ATS-3 satellite,** D. W. Hanson and W. F. Hamilton, Nat. B Stand. (U.S.), Tech. Note 645, 115 pages (Nov. 1973) $1. SD Catalog No. C13.46:645.

Key words: Dissemination; frequency; satelli synchronization; time.

An experiment designed to reveal the advantages and spe problems associated with the broadcasting of time and freque information from geostationary satellites is discussed. Inclu are discussions concerning satellite motion, time delay variat doppler shift due to the motion, and calculation of de Receiver or ground station equipment requirements, t recovery techniques, timing resolution and accuracy, and spe advantages of satellite broadcasts for time and frequency semination are also discussed. Specially equipped sites in N and South America gathered data from the experimental sate broadcast which in turn were used to determine the potential curacy of satellite dissemination, the results of which presented. Delay computation aids for the user were designe provide a simple and inexpensive means of computing free sp delays between the master clock and the user via a geostatio satellite. The aids, delay overlays on an earth map and a circ slide rule, are discussed with examples. Qualitative discuss of the signals and broadcast format are given. Final comm are made concerning the results of the experiment and how t might reflect upon a final system design for a permanent ser using one or more geostationary satellites.

TN646. **Status report on primary frequency standards,** H. H

wig, Nat. Bur. Stand. (U.S.), Tech. Note 646, 15 pages (Sept. 1973) SD Catalog No. C13.46:646.

Key words: accuracy; atomic frequency standards; cesium beam tubes; clocks; hydrogen masers; lasers; primary frequency standards.

This report surveys the state-of-the-art in atomic frequency standards with exclusive regard to their use as primary frequency reference; i.e., only accuracy is discussed. The report covers operational standards as well as devices which are still in the research or exploratory development phase. It is predicted that accuracies of better than 1×10^{13} will be achieved within a few years, and that, as a consequence of new techniques, accuracy may be treated statistically in the not too distant future. Also, clocks may become available which state accuracy continually.

TN647. **Microwave attenuation measurement system (series substitution),** W. Larson and E. Campbell, Nat. Bur. Stand. (U.S.), Tech. Note 647, 28 pages (Feb. 1974) SD Catalog No. C13.46:647.

Key words: attenuation; measurement; rotary-vane attenuator; series substitution.

A dual detection microwave bridge circuit has been incorporated in a series substitution system for the measurement of microwave attenuation devices. The use of an optical rotary-vane attenuator in the system yields practical resolution and stability of 0.00005 dB from zero to 30 dB. The dual detection system has several favorable features: (1) it employs a single microwave source which reduces cost, (2) measurements are obtained without power stabilization of the microwave signal source, and (3) this waveguide configuration enables measurements of attenuation devices at any length with minimum of effort and movement of waveguide components.

The system configuration is convenient for both attenuation difference, and insertion loss measurements from zero to 70 dB over the WR90 waveguide band of 8.2 to 12.4 GHz.

TN648. **Thermophysical properties of nitrogen from the fusion line to 3500 R (1944 K) for pressures to 150,000 psia (10342 $\times 10^5$ N/m²),** R. T. Jacobsen, R. B. Stewart, R. D. McCarty, and H. J. M. Hanley, Nat. Bur. Stand. (U.S.), Tech. Note 648, 162 pages (Dec. 1973) SD Catalog No. C13.46:648.

Key words: density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; index of refraction; Joule-Thomson; latent heat; melting point; nitrogen; Prandtl number; specific heat; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

Tables of thermophysical properties of nitrogen are presented for temperatures from the fusion line to 3500 R for pressures to 3000 psia, and from the fusion line to 1500 R for pressures above 3000 psia to 150,000 psia. The tables include values of entropy, enthalpy, internal energy, density, specific volume, velocity of sound, specific heats (C_v and C_p), thermal conductivity, viscosity, thermal diffusivity, Prandtl number, and the dielectric constant for selected isobars. Additional tables are included for values of: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_\rho$, $V(\partial H/\partial V)_\rho$, $(\partial P/\partial U)_v$, $V(\partial P/\partial V)_T$, and $(\partial V/\partial T)_p$, which have special utility in heat transfer calculations. Tables of selected isobars for the liquid and vapor phases, and for the saturated vapor and saturated liquid are included.

An equation of state is presented for liquid and gaseous nitrogen for the temperature and pressure ranges of these tables. In the determination of the equation of state, all of the P-ρ-T (pressure-density-temperature) data available from the published literature were reviewed, and appropriate corrections made to bring experimental temperatures into accord with the International Practical Temperature Scale of 1968. The coefficients of the equation of state were determined by a weighted least squares fit to selected P-ρ-T data and simultaneously to C_v data determined by corresponding states analysis from oxygen data, and to data which defined the phase equilibrium criteria for the saturated liquid and saturated vapor. A vapor pressure equation, melting curve equation, and an equation to represent the ideal gas heat capacity of nitrogen are also presented. The equation of state is estimated to be accurate to within 0.5 percent in the liquid region, to within 0.1 percent for supercritical isotherms up to 15,000 psia, and to within 0.3 percent from 15,000 to 150,000 psia. The vapor pressure equation is accurate to within ± 0.01 K between the triple point and the critical point.

TN649. **The standards of time and frequency in the U.S.A.,** J. A. Barnes and G. M. R. Winkler, Nat. Bur. Stand. (U.S.), Tech. Note 649, 91 pages (Feb. 1974) SD Catalog No. C13.46:649.

Key words: astronomical time measurements; clock synchronization; clocks; Coordinated Universal Time (UTC); frequency; frequency standards; International Atomic Time (TAI); International Radio Consultative Committee (CCIR); International Scientific Radio Union (URSI); International Time Bureau (BIH); international time organizations; leap seconds; national time/frequency standards; NBS time and frequency; Precise Time and Time Interval (PTTI); time; time coordination; time interval; time scales; Treaty of the Meter (standards); U.S.A. standard time zones; USNO time and frequency.

This paper describes the national responsibilities for standards of time and frequency in the U.S.A. The National Bureau of Standards (NBS) and the U.S. Naval Observatory (USNO) are the two organizations chiefly involved in distributing accurate and precise time and frequency information within the U.S.A. The NBS is responsible for the "custody, maintenance, and development of the national standards" of frequency and time (interval) as well as their dissemination to the general public. The mission of the USNO includes the "provision of accurate time" for electronic navigation systems, communication, and space technology. This is an integral part of its work concerned with the publication of ephemerides which are used in support of navigation and in the establishment of a fundamental reference system in space.

Both agencies provide the U.S. contribution to the Bureau International de l'Heure (BIH) [International Time Bureau], which has the responsibility of publishing definitive values of Universal Time (UT), International Atomic Time (TAI), and Coordinated Universal Time (UTC).

TN650. **An evaluation of selected angular momentum, vortex shedding and orifice cryogenic flowmeters,** J. A. Brennan, R. W. Stokes, C. H. Kneebone, and D. B. Mann, Nat. Bur. Stand. (U.S.), Tech. Note 650, 69 pages (Mar. 1974) SD Catalog No. C13.46:650.

Key words: angular momentum; cryogenic; flow; liquid nitrogen; mass; mass flowmeters; measurement; orifice; volume flowmeters; vortex shedding.

The National Bureau of Standards (NBS) and the Compressed Gas Association (CGA) have jointly sponsored a research program on cryogenic flow measurement. Cryogenic flowmeters operating on the principles of angular momentum (mass flow), vortex shedding (volume flow), and pressure drop are reported.

The operation and the accuracy of the flow facility is briefly described. The performance of the flowmeters in liquid nitrogen is described by reporting the precision and bias of the meters before and after an 80-hour stability test and by defining the existence of temperature, pressure, flow rate, subcooling, and time order (wear) dependencies.

Meters were evaluated with flow rates ranging from 20 to 210

gpm (0.00126 to 0.0132 m^3/s), pressures ranging from 32 to 112 psia (0.22 to 0.77 MPa), and with temperatures ranging from 72 to 90 K.

TN651. **Scattering-matrix description and near-field measurements of electroacoustic transducers,** D. M. Kerns, Nat. Bur. Stand. (U.S.), Tech. Note 651, 40 pages (Mar. 1974) SD Catalog No. C13.46:651.

Key words: electroacoustic transducer measurement techniques; near-field measurement techniques; scattering matrix description of electroacoustic transducers.

Recently developed and successfully applied analytical techniques for the measurement of microwave antennas at reduced distances are "translated" into corresponding techniques for the measurement of electroacoustic transducers in fluids. The basic theory is formulated in scattering-matrix form and emphasizes the use of plane-wave spectra for the representation of sound fields. This theory, in contrast to those based on asymptotic description of transducer characteristics, is suitable for the formulation and solution of problems involving interactions at arbitrary distances. Two new techniques (in particular) are described: One, utilizing deconvolution of planar scanning data, taken with a known transducer at distances d which may be much less than the Rayleigh distance d_R ($\equiv D^2/2\lambda$), provides a means of obtaining complete effective directivity functions, *corrected for the effects of the measuring transducer.* Applicability of a (two-dimensional, spatial) sampling theorem and the "fast Fourier transform" algorithm, which greatly facilitate the necessary computations, is shown. The second technique provides a means of extrapolating received signal as a function of distance (observed with $d \sim d_R$) to obtain on-axis values of effective directivity. Other possible applications are indicated. These techniques rigorously utilize observed output of nonideal (but linear) measuring transducers.

TN652. **Development and construction of an electromagnetic near-field synthesizer,** F. M. Greene, Nat. Bur. Stand. (U.S.), Tech. Note 652, 44 pages (May 1974) SD Catalog No. C13.46:652.

Key words: electromagnetic-field hazards; electromagnetic-field synthesizer; electromagnetic radiation-exposure testing (non-ionizing); near fields; RF biological hazards.

This publication describes work done by the National Bureau of Standards for the USAF School of Aerospace Medicine at Brooks AF Base involving the development, design, construction and testing of a prototype EM near-field synthesizer. The purpose of the contract was to provide a means of independently generating high-level electric and magnetic near fields in the frequency range 10 to 30 MHz. These fields are to be used in various ratios by the USAFSAM in their EM radiation exposure program for determining the biological effects of hazard-level, non-ionizing EM fields on human beings.

The synthesizer consists of a balanced, parallel-plate strip line to generate the "desired" electric field, and a single-turn quadruple-feed inductor placed parallel to and midway between the plates to generate the "desired" magnetic field. Methods used to reduce the "unwanted" E- and H-field components associated with the above, as well as the methods used to reduce the coupling between the two field systems are discussed. The result is a synthesizer in which the electric- and magnetic-field components can be adjusted essentially independently over wide ranges of magnitude, relative time-phase, and spatial orientation to simulate various near-field configurations.

Previous research has been largely limited to the use of plane-wave fields for evaluating RF biological hazards. This new device will allow researchers to investigate any near-field effects that may occur at high field levels.

TN653. **The thermophysical properties of methane, from 90 to 500 K at pressures to 700 bar,** R. D. Goodwin, Nat. Bur. Stand. (U.S.), Tech. Note 653, 280 pages (Apr. 1974) SD Catalog No. C13.46:653.

Key words: densities; enthalpies; entropies; equation of state; internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; PVT data; specific heats; speeds of sound; vapor pressures.

Thermophysical properties of methane are tabulated at uniform temperatures from 90.68 to 500 K along isobars to 700 bar. A novel equation of state is employed for the first time, having origin on the vapor-liquid coexistence boundary. Computations are based almost entirely on ideal gas specific heats and experimental P-ρ-T data via the equation of state, without weighting to data for derived properties. Good agreement with such data confirms validity of the equation and method. New P-ρ-T data are reported at 0.3 to 1.7 times the critical density.

TN654. **Electromagnetic noise in Robena No. 4 coal mine,** W. D. Bensema, M. Kanda, and J. W. Adams, Nat. Bur. Stand. (U.S.), Tech. Note 654, 194 pages (Apr. 1974) SD Catalog No. C13.46:654.

Key words: amplitude probability distribution; coal mine noise; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier Transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; spectra density; time-dependent spectral density.

Two different techniques were used to make measurements o the absolute value of electromagnetic noise in an operating coa mine, Robena No. 4, located near Waynesburg, Pa. On technique measures noise over the entire electromagnetic spec trum of interest for brief time periods. With present instrumenta tion, the spectrum can be covered from 40 Hz to 400 kHz. It i recorded using broad-band analog magnetic tape, and the nois data are later transformed to give spectral plots. The othe technique records noise envelopes at several discrete frequen cies for a sufficient amount of time to provide amplitude proba bility distributions.

The specific measured results are given in a number of spectra plots and amplitude probability distribution plots. The genera results are that at frequencies below 10 kHz, power line nois within the mine is severe. Impulsive noise is severe near arcin trolleys, and at lower frequencies near any transmission line Carrier trolley phone signals and harmonics are stron throughout the mine whenever the trolley phone is in operatio

Additional information beyond that included in this report ma be obtained from the authors, who are with the Electromagnetic Division of the National Bureau of Standards.

TN655. **Cryogenic refrigerators—an updated survey,** T. R Strobridge, Nat. Bur. Stand. (U.S.), Tech. Note 655, 12 page (June 1974) SD Catalog No. C13.46:655.

Key words: cost; cryogenic refrigerators; efficiency volume; weight.

In 1969, we gave efficiency, weight, volume, and cost data fo 95 cryogenic refrigerators and liquefiers excluding air separatio plants. Recently, the survey was repeated. The original data an those for 49 additional refrigerators and liquefiers are presente spanning refrigeration capacities from 0.2 to 10^6 W and tempera tures from 1.85 to 90 K. Generally, there is no change in th trends exhibited by the older data except that the high tempera ture, low capacity new units seem to be larger, heavier, an slightly less efficient than in prior years. Presumably, these e fects are due to efforts to increase useful life and reliabilit

sts remain the same as predicted before even though no dollar ue adjustments were made.

656. **Standard time and frequency: Its generation, control, and lissemination by the National Bureau of Standards,** J. B. Mil- on, Nat. Bur. Stand. (U.S.), Tech. Note 656, 21 pages (June 974) SD Catalog No. C13.46:656.

Key words: clock synchronization; frequency and time dissemination; primary frequency standard; standard frequency broadcasts; time interval; time scales.

The Time and Frequency Division of the National Bureau of ndards maintains primary frequency standards, which pro- e a realization of the internationally-defined second, and two mic time scales, AT(NBS) and UTC(NBS). AT(NBS) is de- ndent upon the primary frequency standards, an ensemble of mmercial cesium clocks, and a computer algorithm to process data. The UTC(NBS) scale is derived from AT(NBS) by the dition of small annual frequency adjustments and leap second ustments to keep its time nominally synchronous with the in- national time scale UTC. The UTC(NBS) time scale is used calibrate the clocks and secondary standards necessary for the eration of the NBS radio stations, WWV, WWVH, WWVB, d WWVL. These stations transmit various standard frequency d time signals throughout the world, and, in addition, provide tain official announcements such as geoalert warnings, marine ather advisories, and radio propagation forecasts.

N657. **Calculated and measured S_{11}, S_{21}, and group delay for simple types of coaxial and rectangular waveguide 2-port standards,** R. W. Beatty, Nat. Bur. Stand. (U.S.), Tech. Note 657, 67 pages (Dec. 1974) SD Catalog No. C13.46:657.

Key words: Automatic network analyzers; coaxial; coaxial line step discontinuities; group delay; scattering coefficients; standards; 2-ports; waveguide; waveguide discontinuities.

Formulas, simple computer programs, graphs and tables are ven to aid in the design and construction of 2-port standards r rectangular waveguide and coaxial line. Only standards nsisting of reduced height waveguide, increased ODIC (out- de diameter of inner conductor), or reduced IDOC (inside ameter of outer conductor) coaxial line are considered. xamples of the calculation of S_{11}, S_{21} and group delay, and their easurement with automatic network analyzers are given. ome of the important sources of error in the standards are scussed and design data are presented for specific standards.

N658. **Development of electric and magnetic near-field probes,** F. M. Greene, Nat. Bur. Stand. (U.S.), Tech. Note 658, 53 pages (Jan. 1975) SD Catalog No. C13.46:658.

Key words: electric near-field probe; electromagnetic-field hazard; field-strength measurements; magnetic near-field probe; near-field measurements; r-f hazard measurements; semiconducting transmission line.

This publication describes the development and design of mall electric and magnetic near-field probes for measuring azard-level fields up to 20,000 V/m and 100 A/m, respectively. hey were originally designed to be used over the frequency ange from 10 to 30 MHz, and consist of short dipole antennas nd small, single-turn balanced, loop antennas to measure the lectric- and magnetic-field components, respectively. The robes are intended for use by various researchers in their elec- romagnetic, radiation-exposure programs for determining the ef- ects of hazard-level, nonionizing, EM fields on living tissue, lectroexplosive devices, and volatile fuels.

In order to later extend the use of the probes to frequencies bove 30 MHz, a detailed analysis was made of several types of measurement errors likely to be encountered. The principal errors result from a variation with frequency in: the effective length and impedance of the dipoles; and the electric-dipole response and partial resonance of the loops. Corresponding corrections are given for each type of error as a function of the operating frequency from 10 to 1000 MHz, and as a function of the physical and electrical sizes of the probes.

As a result of the analysis, the dipoles can now be used for measurements at frequencies up to 750 MHz and the loops to 75 MHz with an estimated uncertainty of 0.5 dB. Applying recommended corrections will provide a substantial further increase in the usable frequency range.

TN659. **An earth-based coordinate clock network,** N. Ashby, Nat. Bur. Stand. (U.S.), Tech. Note 659, 35 pages (Apr. 1975) SD Catalog No. C13.46:659.

Key words: clocks; coordinate time; general relativity; time.

This paper investigates some of the possible operational procedures for synchronizing clocks at fixed sites spread around on the earth's surface, to within a 1 nanosecond level of accuracy. Since a common synchronization procedure is by transport of standard clocks in commercial jet airline flights, and most of the effects we shall discuss are fractional corrections to the elapsed time, as a criterion of whether an effect is significant at the 1 nanosecond level we take for comparison purposes an elapsed time $T_e = 10$ hours. This is a typical time for an intercontinental airplane flight. Analysis of a number of effects which might affect clock synchronization is carried out within the framework of general relativity. These effects include the gravitational fields of the earth, sun, and moon, and orbital motion, rotation, and flattening of the earth. It is shown that the only significant effects are due to the gravitational field and rotation of the earth, and motion of the transported clocks. Operational procedures for construction of a synchronized coordinate clock network using light signals and transported standard clocks are discussed and compared.

TN660. **Molecular beam tube frequency biases due to distributed cavity phase variations,** S. Jarvis, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 660, 43 pages (Jan. 1975) SD Catalog No. C13.46:660.

Key words: accuracy evaluation; atomic beam frequency standards; cavity phase shift.

For atomic beam frequency standards, an analysis is described for estimating the frequency bias due to distributed cavity phase difference over finite beam widths, and for estimating the resulting inaccuracy in power shift and beam reversal experiments. Calculated atomic trajectories and simplified rf-field distributions are used, as well as certain assumptions about beam tube alignment. The results are applied to one of the present NBS primary time and frequency standards and a shorter tube geometry.

One conclusion is that beam reversal experiments are not necessarily much more accurate than power shift experiments and that the use of both methods (plus the use of pulse techniques) is desirable.

TN661. **Advances in the measurement of rf power and attenuation using SQUIDS,** R. A. Kamper, M. B. Simmonds, R. T. Adair, and C. A. Hoer, Nat. Bur. Stand. (U.S.), Tech. Note 661, 27 pages (Sept. 1974) SD Catalog No. C13.46:661.

Key words: Josephson effect; quantum interference; rf attenuation; rf measurement; rf power; superconductivity.

This report covers the progress made in the application of Superconducting QUantum Interference Devices (SQUIDs) to the measurement of rf power and attenuation during the year from July 1973 to June 1974. The earlier work on this project was re-

ported in NBS Technical Note 643, which contains a detailed introduction to the principles involved. We will assume the reader to be familiar with the material we presented there, since we do not repeat it in this report. In order to make the connection as smooth as possible, we have retained our earlier chapter titles as far as possible.

During the year we have developed stable SQUIDs with preset junctions which survive thermal cycling and mechanical shock. Further work is required to arrive at a version suitable for precise rf measurements. We have assembled a "breadboard" system capable of measuring rf power at levels down to 10^{-15}W in the range of frequency from 100 MHz to 1 GHz. We have extended the dynamic range of our system to measure rf attenuation to 60 dB, and developed the hardware to partially automate its operation and to accommodate step attenuators. We have tested a portable version of this system, and are in process of designing an improved version based on what we learned from the first one.

TN662. **A review of precision oscillators,** H. Hellwig, Nat. Bur. Stand. (U.S.), Tech. Note 662, 24 pages (Feb. 1975) SD Catalog No. C13.46:662.

Key words: accuracy; atomic clocks; clocks; crystal oscillator; frequency standards; stability; survey of clocks.

Precision oscillators used in PTTI applications include quartz crystal, rubidium gas cell, cesium beam, and hydrogen maser oscillators. A general characterization and comparison of these devices is given including accuracy, stability, environmental sensitivity, size, weight, power consumption, availability and cost. Areas of special concern in practical applications are identified and a projection of future performance specifications is given. An attempt is made to predict physical and performance characteristics of new designs potentially available in the near future.

TN663. **Characterization of a high frequency probe assembly for integrated circuit measurements,** R. L. Jesch and C. A. Hoer, Nat. Bur. Stand. (U.S.), Tech. Note 663, 55 pages (Apr. 1975) SD Catalog No. C13.46:663.

Key words: high frequency probe assembly; integrated circuit transistors; parasitic element; S-parameters.

A detailed, applications-oriented description of a measurement technique that characterizes a high-frequency probe assembly for integrated circuit measurements is given along with the procedure that extracts the parasitic effects of the probe assembly from measurements made at the input connectors of the probe assembly. The scattering parameters of an integrated-circuit device or transistor can now be extracted and accurately determined up to 2 GHz at the wafer stage of assembly. This represents a significant advance over conventional techniques that enable only dc parameters to be measured. Measurement results using this technique are given along with the precision of values obtained as well as the nature of the measurement bias introduced by the probe assembly.

TN664. **Hydrogen-future fuel—A bibliography (with emphasis on cryogenic technology),** N. A. Olien and S. A. Schiffmacher, Nat. Bur. Stand. (U.S.), Tech. Note 664, 131 pages (Feb. 1975) SD Catalog No. C13.46:664.

Key words: cryogenic technology; data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; production; safety; storage.

This NBS Technical Note is a compilation of references dealing directly and indirectly with the possible future use of hydrogen as a fuel. The references were selected using an automated information system operated by the Cryogenic Data Center. This bibliography of references emphasizes the use of cryogenic technology in the hydrogen field. Articles are indexed under 40 subject headings and an author index is included. Over 1600 references are included in this bibliography.

TN665. **A pyroelectric power meter for the measurement of low level laser radiation,** C. A. Hamilton and G. W. Day, Nat. Bur. Stand. (U.S.), Tech. Note 665, 41 pages (Feb. 1975) SD Catalog No. C13.46:665.

Key words: laser; power; pyroelectric.

A 1 cm² plastic (PVF_2) pyroelectric detector, developed in this laboratory, has been applied to measure low level laser power. The result is a compact instrument which has a low noise equivalent power (10^{-8} W/Hz$^{1/2}$), and fast response (1 s averaging time), and which is precise ($\sigma \sim \pm 1\%$), uniform ($\sim \pm 1\%$), and inherently free from short term drift. This note describes the fabrication of the detector, the design of the instrument, and the results of an extensive evaluation of three such instruments.

TN666. **Efflux of gaseous hydrogen or methane fuels from the interior of an automobile,** J. M. Arvidson, J. Hord, and D. B. Mann, Nat. Bur. Stand. (U.S.), Tech. Note 666, 56 pages (Mar. 1975) SD Catalog No. C13.46:666.

Key words: automobile; detection; dispersion; explosion; fire; hydrogen; leakage; methane; safety; vents.

Gasoline-powered automobiles are being converted to operate on gaseous fuels such as H_2 or CH_4. These fuels are commonly stored in containers located in the trunk of the car. Potential leakage of these gaseous fuels into the passenger compartment of the vehicle constitutes a safety threat. Definitive experiments were performed to identify the explosion hazards, establish venting criteria and obviate general safeguards for H_2 or CH_4 fueled passenger vehicles. Appropriately designed ventilation systems significantly reduce the safety hazards associated with accumulated combustible gases. Vents are recommended for all autos *converted* to burn H_2 or CH_4 and may possibly be eliminated in new cars that are *designed* for gaseous fuel operation. Combustible gas warning systems are recommended, at least in the interim, for all (converted and new-design) gaseous fueled vehicles. H_2 and CH_4 gases appear equally safe as vehicular fuels in used in properly designed vehicles.

TN667. **Upper-bound errors in far-field antenna parameters determined from planar near-field measurements. Part I: Analysis,** A. D. Yaghjian, Nat. Bur. Stand. (U.S.), Tech. Note 667, 120 pages (Oct. 1975) SD Catalog No. C13.46:667.

Key words: antennas; error analysis; far-field pattern; near-field measurements; planar scanning; plane-wave spectrum.

General expressions are derived for estimating the errors in the sum or difference far-field pattern of electrically large aperture antennas which are measured by the planar near-field scanning technique. Upper bounds are determined for the far-field errors produced by (1) the nonzero fields outside the finite scan area, (2) the inaccuracies in the positioning of the probe, (3) the distortion and nonlinearities of the instrumentation which measures the amplitude and phase of the probe output, and (4) the multiple reflections. Computational errors, uncertainties in the receiving characteristics of the probe, and errors involved with measuring the input power to the test antenna are briefly discussed.

TN668. **The use of National Bureau of Standards high frequency broadcasts for time and frequency calibrations,** N. Hironaka and C. Trembath, Nat. Bur. Stand. (U.S.), Tech. Note 668, 4 pages (May 1975) SD Catalog No. C13.46:668.

Key words: dissemination; frequency; high frequency broadcasts; standard; time.

Methods to determine time or frequency by reception of NBS gh frequency radio broadcasts are discussed. Results are lown for calibration of time signals to within ±100 icroseconds and calibration of frequency offset with a resolu-on of better than 1 part in 10^9. These results are achieved by sing a systematic approach and refined measurement technique.

N669. **The measurement of frequency and frequency stability of precision oscillators,** D. W. Allan, Nat. Bur. Stand. (U.S.), Tech. Note 669, 31 pages (May 1975) SD Catalog No. C13.46:669.

Key words: accurate frequency measurement; accurate time measurement; frequency; frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements.

The specification and performance of precision oscillators is very important topic to the owners and users of these oscilla-ors. This paper presents at the tutorial level some convenient ethods of measuring the frequencies and/or the frequency sta-ilities of precision oscillators—giving advantages and disad-antages of these methods.

Conducting such measurements, of course, gives additional nderstanding into the performance of the given pair of oscilla-ors involved. Further it is shown that by processing the data rom the frequency measurements in certain ways, one may be ble to state more general characteristics of the oscillators being neasured. The goal in this regard is to allow the comparisons of lifferent manufacturers' specifications and more importantly to elp assess whether these oscillators will meet the standard of erformance the user may have in a particular application.

The methods employed for measuring frequency are designed or state-of-the-art oscillators, and an effort has been made to llow for fairly simple, inexpensive, and/or commonly available components to be used in the measurement systems. The method or measuring frequency stability is basically that recommended y the IEEE subcommittee on Frequency Stability of the Technical Commitee on Frequency and Time of the IEEE Group on Instrumentation & Measurement.

TN670. **An infrared spectrometer utilizing a spin flip Raman laser, IR frequency synthesis techniques, and CO_2 laser frequency standards,** J. S. Wells, F. R. Petersen, G. E. Streit, P. D. Goldan, and C. M. Sadowski, *Nat. Bur. Stand. (U.S.), Tech. Note 670,* 54 pages (Jan. 1976) SD Catalog No. C13.46:670.

Key words: air quality measurements; improved resolution spectroscopy; infrared frequency measurements; infrared spectrometer; spin flip laser; tunable IR laser.

The central part of this spectrometer is a cw spin flip Raman laser which operates between 1900 and 1800 cm^{-1}. The spin flip laser has so far demonstrated capabilities of resolving spectra separated by 0.01 cm^{-1} and shows promise of exceeding this resolution capability. When used with an opto-acoustic detector or with a detector and a flow system, it is capable of making a variety of measurements of environmental interest. Many of these environmental applications require only wavelength metrology.

By using CO_2 laser standards as frequency references and incorporating infrared frequency synthesis techniques, spectroscopy with the spin flip Raman laser can be put on a frequency metrology basis. A CO_2 laser has been used with a metal-oxide-metal diode to synthesize a known frequency reference which was used to stabilize the CO pump laser. The MOM diode also has the potential for measuring the frequency difference between the SFRL and the CO pump laser, a step which will complete absolute frequency measurements with the SFRL. The progress toward achieving this goal, the potential capabilities of this unique spectrometer, and some future applications are discussed.

TN672. **Time domain automatic network analyzer for measurement of RF and microwave components,** W. L. Gans and J. R. Andrews, Nat. Bur. Stand. (U.S.), Tech. Note 672, 176 pages (Sept. 1975) SD Catalog No. C13.46:672.

Key words: attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis.

This technical note describes in detail a new NBS instrument for the measurement of the scattering parameters (S_{ij}) of RF and microwave components. The instrument is the Time Domain Automatic Network Analyzer (TDANA). It utilizes time domain pulse measurements to obtain frequency domain parameters. The frequency range is dc to 18 GHz with a lower upper limit for large values of attenuation. The instrument consists of three major components: an ultra-fast pulse generator, a broadband sampling oscilloscope, and a digital minicomputer.

TN673. **Using six-port and eight-port junctions to measure active and passive circuit parameters,** C. A. Hoer, Nat. Bur. Stand. (U.S.), Tech. Note 673, 29 pages (Sept. 1975) SD Catalog No. C13.46:673.

Key words: admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage.

This review paper brings together a number of old and new methods for measuring voltage, current, power, impedance, and phase angle using only amplitude type detectors. Vector voltmeters and reflectometers can be constructed to measure all of these quantities in terms of four amplitude measurements made on four arms of a six-port junction. Whereas previous uses of this type of instrument depended on precision components for accuracy, new equations switch this dependence primarily to detector linearity and only secondarily on the properties of the measuring device itself.

TN674. **Report on the 1975 survey of users of the services of Radio Stations WWV and WWVH,** J. A. Barnes and R. E. Beehler, Nat. Bur. Stand. (U.S.), Tech. Note 674, 91 pages (Oct. 1975) SD Catalog No. C13.46:674.

Key words: frequency; questionnaire; standard frequency and time broadcasts; time.

The users of the National Bureau of Standards (NBS) radio stations WWV and WWVH were surveyed by means of a questionnaire. The questionnaire was distributed to the station mailing list, published in some periodicals, and its availability was announced on the stations themselves and publicized in other periodicals. More than 12,000 completed questionnaires were returned, which revealed, among other things, that the 5, 10, and 15 MHz transmissions were the most used frequencies; 25 MHz was the least used. Of the information contained on the broadcasts, the voice time-of-day announcement was the most important, and the DUT1 values the least important. In general the returns were very supportive of the services, with only two of the more than 12,000 responses advocating a complete shutdown of the broadcasts.

TN675. **Heat transfer and flow of helium in channels—Practical limits for applications in superconductivity,** M. C. Jones and W. W. Johnson, *Nat. Bur. Stand. (U.S.), Tech. Note 675,* 45

pages (Jan. 1976) SD Catalog No. C13.46:675.

Key words: buoyancy; channels; film boiling; forced convection; helium I; helium II; mixed convection; nucleate boiling; subcritical; supercritical; transition; turbulent flow.

Heat transfer and fluid mechanics of helium flowing in channels are reviewed. Emphasis is placed on observed or anticipated limits of operation which might be expected to apply in applications of superconductivity. Topics included are: the high-heat-flux degradation of heat transfer and possible effects of buoyancy forces in supercritical helium; transition to film boiling in subcritical helium; limiting heat currents in helium II; and the possibility of oscillations in forced flow helium systems.

TN677. **Laser attenuators for the production of low power beams in the visible and 1.06 μm regions,** B. L. Danielson and Y. Beers, *Nat. Bur. Stand. (U.S.), Tech. Note 677,* 25 pages (Jan. 1976) SD Catalog No. C13.46:677.

Key words: beam splitter; laser attenuation; neutral density filter.

Some methods were investigated for the accurate attenuation of laser beams to very low levels; approximately 10^{-11} watts. This work was done at 1.06 and 0.6471 μm, but the conclusions are applicable throughout the visible region as well. Two types of devices were considered: wedged beam splitters and neutral density filters. The theory of the attenuation of a wedged beam splitter was described and some of the errors associated with these devices were discussed.

TN678. **An electrically calibrated pyroelectric radiometer system,** C. A. Hamilton, G. W. Day, and R. J. Phelan, Jr., *Nat. Bur. Stand. (U.S.), Tech. Note 678,* 50 pages (Mar. 1976) SD Catalog No. C13.46:678, $1.25.

Key words: detector; pyroelectric; radiometry.

A new type of radiometer based on an electrically calibrated pyroelectric detector is described. Emphasis is placed on system design and analysis with careful consideration of design tradeoffs. An evaluation of both systematic and random errors for the complete system yields an expression for the accuracy relative to the *electrical standards* by which it is calibrated. Throughout the paper the analysis should be sufficiently general that it can be applied to any Electrically Calibrated Pyroelectric Radiometer which employs the same basic principles.

TN679. **Frequency domain stability measurements: A tutorial introduction,** D. A. Howe, *Nat. Bur. Stand. (U.S.), Tech. Note 679,* 27 pages (Mar. 1976) SD Catalog No. C13.46:679.

Key words: fractional frequency fluctuations; frequency stability; phase fluctuations; power law noise processes; spectral density; spectrum analysis.

This report introduces the concept of stability measurements of oscillators by spectral analysis. Development of topics does not rely heavily on mathematics. The equipment and setup for stability measurements in the frequency domain are outlined. Examples and typical results are presented. Physical interpretations of common noise processes are discussed. The last section provides a table by which typical frequency domain stability characteristics may be translated to time domain stability characteristics.

TN680. **Application of infrared frequency synthesis techniques with metal-insulator-metal diodes to the spin flip Raman laser,** J. S. Wells, G. E. Streit, and F. R. Petersen, *Nat. Bur. Stand. (U.S.), Tech. Note 680,* 14 pages (Apr. 1976) SD Catalog No. C13.46:680.

Key words: frequency measurements on tunable lasers; IFS with a tunable laser; infrared frequency synthesis; SFRL frequency measurement; spin flip Raman laser.

Infrared frequency synthesis techniques with a metal-insulator-metal (MIM) diode have been extended to include the measurement of the frequency of a spin flip Raman Laser (SFRL). As a result of this extension, spectroscopy in the 5.3 μm region can be put on a frequency rather than a wave-length metrology basis. Additional observations with the diode are in qualitative agreement with recent work relating to nonlinear tuning over axial SFRL modes.

TN681. **A satellite-controlled digital clock,** J. V. Cateora, D. D. Davis, and D. W. Hanson, *Nat. Bur. Stand. (U.S.), Tech. Note 681,* 46 pages (June 1976) SD Catalog No. C13.46:681.

Key words: clock; microprocessor; satellite; time; time code.

A digital clock, resettable and controlled by the time code relayed by NOAA's SMS/GOES Satellites, is discussed. The clock's design is based upon a four bit microprocessor and uses the redundancy of the data to improve its performance. Satellite position is included in the clock's display for delay corrections to the received time.

A discussion of the generation, distribution, and reception of the time code is also included to aid the explanation of the clock's operation and performance.

TN682. **Implementation of the notch technique as an rf peak pulse power standard,** P. A. Simpson and P. A. Hudson, *Nat. Bur. Stand. (U.S.), Tech. Note 682,* 30 pages (July 1976) SD Catalog No. C13.46:682.

Key words: notch wattmeter; pulse-CW equalization; pulse modulated carrier systems; rf peak pulse power.

The theory and operation of a standard for measuring rf peak pulse power is described. The standard is based on the "notch" principle. It is constructed in coax for frequencies up to 4.4 GHz, and in WR-90 waveguide (8.2-12.4 GHz). The basic range is 1 to 10 mW but is extendable to cover 10 μW to 10 kW using directional couplers. Risetime of the system is 14 nanoseconds. A comprehensive error analysis is given. The uncertainty in coax is 3 percent and in waveguide is 4 to 6 percent depending upon peak power level.

TN683. **Models for the interpretation of frequency stability measurements,** J. A. Barnes, *Nat. Bur. Stand. (U.S.), Tech. Note 683,* 44 pages (Aug. 1976) SD Catalog No. C13.46:683.

Key words: flicker noise; frequency; frequency stability; oscillators; phase noise; stationary models.

The results of measurements of frequency stability are normally interpreted in the terms of models. Typically, these models are expressed as a power-law for the power spectral density (e.g., $S_y(f) = h_{-1}f^{-1}$). The experiments which provide the basis for these models are always limited in their range and include neither zero nor infinite Fourier frequency. Some authors have neglected the limits to the actual physical devices and the underlying data and have encountered mathematical difficulties with the models at either zero or infinite frequency or both. These problems are associated with the model and not the actual oscillators being modeled. By carefully taking into account actual limits of the device and constraining discussions to be concerned only with quantities which can be observed in a practical sense, one can avoid the problems of nonconvergence and nonstationarity.

Even for stationarity and convergent models, however, there is growing evidence that the typical Gaussian models may be inadequate. There appear to be occasional (sporadic) steps in the frequency of oscillators of a magnitude which is difficult to explain with conventional models.

TN684. **Thermophysical properties of ethane, from 90 to 600 K at pressures to 700 bar,** R. D. Goodwin, H. M. Roder, and G. C. Straty, *Nat. Bur. Stand. (U.S.), Tech. Note 684,* 326 pages (Aug. 1976) SD Catalog No. C13.46:684.

Key words: densities; enthalpies; entropies; equation of state; ethane; internal energies; isobars, isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds of sound; vapor pressures.

The thermophysical properties of ethane are tabulated at integral temperatures over the entire range of fluid states at temperatures from 90 to 600 K along isobars to 700 bar. A new form of the equation of state is employed for the first time. Thermodynamic functions in the compressed liquid at $T < T_c$ are obtained by use of specific heats C_v (T) along a high-density isochore, and C_σ (T) for the saturated liquid. Use of these new specific heat data and also of new PVT data provide the first reliable set of thermodynamic functions for compressed liquid ethane at temperatures below its normal boiling point.

TN686. **Ultrasonic calorimeter for beam power measurements,** T. L. Zapf, M. E. Harvey, N. T. Larsen, and R. E. Stoltenberg, *Nat. Bur. Stand. (U.S.), Tech. Note 686,* 36 pages (Sept. 1976) SD Catalog No. C13.46:686.

Key words: calorimeter; ultrasonic calorimeter; ultrasonic power measurements.

An ultrasonic calorimeter has been designed and constructed at the National Bureau of Standards for the measurement of beam power up to a few watts from ultrasonic transducers. The calorimeter, described as a twin, series flow, ultrasonic calorimetric comparator, operates in the frequency range from 1 to 15 MHz with uncertainties less than $\pm(7\% + 0.2$ mW). Twin vessels are provided so that thermal effects of an ultrasonic sound beam absorbed in one vessel can be compared rapidly with accurately measured dc electrical power in the other vessel. Absorbing liquid enters each vessel near the ultrasonic input port. The temperatures of the absorbing liquid at the input ports are equalized by a heat exchanger, and the mass-flow rates are the same in both vessels. Twin temperature sensors, located in the output flow from the vessels, are connected in an electrical bridge circuit. In automatic operation the bridge is connected to a feedback circuit. With ultrasonic power introduced into one vessel, the feedback circuit promptly applies power to an electrical heater in the other vessel to regain bridge balance. The ultrasonic power then equals the measured dc power corrected for known errors.

TN687. **Measurement of rf power-absorption in biological specimens (10 to 100 MHz),** F. M. Greene, *Nat. Bur. Stand. (U.S.), Tech. Note 687,* 29 pages (Nov. 1976) SD Catalog No. C13.46:687.

Key words: electromagnetic field hazards; electromagnetic field synthesizer; electromagnetic radiation-exposure testing (nonionizing); near-fields; rf biological hazards.

A method is described for accurately determining the rf power being absorbed by a biological specimen during nonionizing radiation-exposure testing using the NBS RF Near-Field Synthesizer in the frequency range 10 to 100 MHz. This method is based solely on measuring the forward and reflected power on the transmission line feeding the synthesizer. Commercially available rf wattmeters can be used, and an automatic data-acquisition system employed, if desired, to "read" the meters and rapidly calculate, display, and record the rf power flow.

The method has the advantage that the exact measuring point on the feed line is not critical, as it is with methods employing direct impedance measurements, and that the required measurements can be made without interfering with the exposure tests.

TN688. **Yagi antenna design,** P. P. Viezbicke, *Nat. Bur. Stand. (U.S.), Tech. Note 688,* 27 pages (Dec. 1976) SD Catalog No. C13.46:688.

Key words: antenna; director; driven element; gain; radiation pattern; reflector; Yagi.

This report presents data, using modeling techniques, for the optimum design of different length Yagi antennas. This information is presented in graphical form to facilitate the design of practical length antennas—from 0.2λ to 4.2λ long—for operation in the HF, VHF, and UHF frequency range. The effects of different antenna parameters on realizable gain were also investigated and the results are presented. Finally, supplemental data are presented on the stacking of two or more antennas to provide additional gain.

TN689. **A simulation of the fluctuations of international atomic time,** J. A. Barnes, *Nat. Bur. Stand. (U.S.), Tech. Note 689,* 23 pages (Nov. 1976) SD Catalog No. C13.46:689.

Key words: frequency stability; international atomic time: models; simulation; time scale simulation.

In the Annual Report for 1975 the International Time Bureau (BIH) published estimates of noise levels which model the fluctuations in the International Atomic Time Scale (TAI). Based on these noise levels for each type of noise, an Auto Regressive, Integrated, Moving Average (ARIMA) model is constructed. A resulting ARIMA model, which can simulate time fluctuations in TAI, is given by the relation

$$(1 - \phi_1 B - \phi_2 B^2)\,\Delta^2 \chi_t = (1 - \theta_1 B - \theta_2 B^2 - \theta_3 B^3 - \theta_4 B^4) a_t$$

where χ_t represents the time fluctuations in nanoseconds (ns) of TAI measured at successive intervals of ten days; B is the index-lowering operator defined by $B^n \chi_t \equiv \chi_{t-n}$; Δ^2 is the second difference operator equivalent to $(1 - B)^2$; a_t are random, independent variables with a normal distribution, zero mean, and variance of $(147 \text{ ns})^2$ and the coefficients ϕ_i and θ_i are given by

$$\phi_1 = 1.79, \theta_1 = 2.93,$$

$$\phi_2 = -.795, \theta_2 = -3.12, \theta_3 = 1.419, \theta_4 = -0.233.$$

TN690. **Is hydrogen safe?,** J. Hord, *Nat. Bur. Stand. (U.S.), Tech. Note 690,* 38 pages (Oct. 1976) SD Catalog No. C13.46:690.

Key words: explosion; fire; fuel; gasoline; hydrogen; methane; safety.

The safety aspects of hydrogen are systematically examined and compared with those of methane and gasoline. Physical and chemical property data for all three fuels are compiled and used to provide a basis for comparing the various safety features of the three fuels. Each fuel is examined to evaluate its fire hazard, fire damage, explosive hazard and explosive damage characteristics. The fire characteristics of hydrogen, methane and gasoline, while different, do not largely favor the preferred use of

any one of the three fuels; however, the threat of fuel-air explosions in confined spaces is greatest for hydrogen. Gasoline is believed to be the easiest and perhaps the safest fuel to store because of its lower volatility and narrower flammable and detonable limits. It is concluded that all three fuels can be safely stored and used; however, the level of safety risk for each fuel will vary from one application to another. Generalized safety comparisons are made herein but detailed safety analyses will be required to establish the relative safety of different fuels for each specific fuel application and stipulated accident. The technical data supplied in this paper will provide much of the framework for such analyses. Hydrogen safety guidelines, regulatory codes applicable to the distribution of hydrogen, and safety criteria for liquid hydrogen storage are compiled and presented.

TN691. **Clock synchronization and comparison: Problems, techniques and hardware,** J. E. Gray, *Nat. Bur. Stand. (U.S.), Tech. Note 691,* 12 pages (Nov. 1976) SD Catalog No. C13.46:691.

Key words: chronograph; frequency-stability measurement; instrumentation; laboratory technique; time measurement.

This report summarizes a lecture-discussion of practical problems in measurement electronics as experienced in a laboratory for precise timekeeping. It includes environment problems, instrumentation problems, procedural problems, and ends with a description of a convenient automatic measuring instrument, the chronograph.

TN700. **COMBO: A general-purpose program for searching, annotating, encoding-decoding, and reformatting data files,** R. McClenon and J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 700, 68 pages (1972).

Key words: Alphanumeric data files; data retrieval; editing program; file editor; FORTRAN program; general-purpose modular programming; reformatting program; report generator; searching program.

COMBO, a FORTRAN program for searching magnetic tape files, generating reports, and reformatting the file, is described and listed. The program is capable of reading separate card images from a file blocked in physical records and recognizing logical blocks marked by a fixed-field ID. Up to 99 different types of lines, each with its own format, can be recognized by examining a special code or label. The program can be instructed to search for the occurrence of each of certain character strings, using a different list for each type of line and two levels of Boolean logic. Lines can be broken into pieces, using either a fixed-field format or a single separator or flags to define the pieces, and the pieces can be rearranged, with labels or comments optionally inserted between them. Editing, in which specified strings are replaced by other strings, can also be performed. The program can accommodate a variable number of cards of each type per block. It was assembled from general-purpose subroutines of modular design and is substantially machine-independent.

TN701. **Unassigned.**

TN702. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report April 1 to June 30, 1971,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 702, 45 pages (Dec. 1971).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, twelfth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include a demonstration of the high sensitivity of the infrared response technique by the identification of gold in a germanium diode doped to a level of 10^{11} gold atoms per cubic centimeter, verification that transient thermal response is significantly more sensitive to the presence of voids in die attachment than steady-state thermal resistance, and development of a simplified circuit for screening transistors for susceptibility to hot-spot formation by the current-gain technique. Work is continuing on measurement of resistivity of semiconductor crystals; study of gold-doped silicon; specification of germanium for gamma-ray detectors; evaluation of wire bonds and die attachment; measurement of thermal properties of semiconductor devices, transit time and related carrier transport properties in junction devices, and electrical properties of microwave devices; and characterization of silicon nuclear radiation detectors. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN703. **ARPA-NBS program of research on high temperature materials and laser materials, reporting period January 1 to June 30, 1971,** A. D. Franklin and H. S. Bennett, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 703, 39 pages (Dec. 1971).

Key words: Al_2O_3; crystal growth; damage threshold; glass; high temperature materials; laser; oxides; oxygen diffusion; pure materials; sapphire.

Progress reports are given for projects on the growth of ultrapure Al_2O_3 crystals, the development of a mass spectrometer-based sectioning technique for measuring oxygen diffusion in oxides and the development of a precision facility for measuring the threshold energy in a laser beam producing damage in a transparent substance.

TN704. **Unassigned.**

TN705, Superseded by Technical Note 762.

TN706. **Structural performance evaluation of innovative building systems,** F. Y. Yokel and N. F. Somes, Nat. Bur. Stand. (U.S.), Tech. Note 706, 16 pages (Aug. 1972).

Key words: Building; connections; housing; neoprene; performance criteria; performance evaluation; performance testing; reinforced concrete; standard tests; structure, testing.

Considerable attention has recently been focused on the development of performance criteria. Performance criteria are presently used in the U.S. by the Building Research Division of the Institute for Applied Technology, National Bureau of Standards, to evaluate innovative building systems.

While building codes and design standards are usually related to specific building materials and design solutions, performance criteria are derived from user requirements and are independent of specific technological solutions.

Many attributes inherent in traditional building systems which are acceptable to the user may not be present in untried innovative systems. The performance criteria therefore address themselves to many aspects of structural performance which are not considered in present codes and design standards.

The successful application of performance criteria depends on the feasibility of evaluating compliance.

Performance can be evaluated by analysis by judgment based on past experience, or by physical simulation. Deterioration with time must be considered, and performance criteria are viewed as minimum requirements which should be met at any time during the service life of a structure. An example is presented where physical testing was used to evaluate the performance of a high-rise housing system.

TN707. **Three-year inspection of nature-tone porcelain enamels on steel,** M. A. Baker, Nat. Bur. Stand. (U.S.), Tech. Note 707, 16 pages (Dec. 1971).

Key words: Acid resistance; color; continuity of coating; porcelain enamel; weather resistance.

A weather exposure test on nature-tone porcelain enamels on steel was initiated by the National Bureau of Standards and the Porcelain Enamel Institute in 1966. Laboratory measurements for changes in gloss and color were made after the enamels had been exposed for 0.5, 1 and 3 years at Kure Beach, N.C., Miami, Fla. and Gaithersburg, Md. The average gloss and color retained for all 450 specimens exposed at 3 sites for 3 years were 90.5 and 89.1 respectively. There was a tendency for the enamels exposed at the marine sites to rust around pinhole-type defects. Scanning electron microscope studies of these defects showed a layer of readily corrodible enamel on the bottom of the defects. A high-voltage test for continuity of coating was effective in detecting specimens that were apt to rust during the first year's exposure.

TN708. **Interlaboratory evaluation of smoke density chamber,** T. G. Lee, Nat. Bur. Stand. (U.S.), Tech. Note 708, 80 pages (Dec. 1971).

Key words: Building materials; fire tests; interlaboratory tests; optical density; round robin; smoke; smoke density chamber; statistical analysis.

Results are reported of an interlaboratory (round-robin) evaluation of the smoke density chamber method for measuring the smoke generated by solid materials in fire. A statistical analysis of the results from 10 material-condition combinations and 18 laboratories is presented. For the materials tested, the median coefficient of variation of reproducibility was 7.2 percent under non-flaming exposure conditions and 13 percent under flaming exposure conditions. A discussion of errors and recommendations for improved procedures based on user experience is given. A tentative test method description is included as an appendix.

TN709. **An x-ray diffraction method for determining the amount of austenite in an austenite-ferrite mixture,** C. J. Bechtoldt, Nat. Bur. Stand. (U.S.), Tech. Note 709, 15 pages (Feb. 1972).

Key words: Austenite; computer; ferrite; phase measurement; quantitative analysis; retained austenite; x-ray diffraction.

A method for determining the relative phase volume of austenite in an austenite-ferrite mixture is described in detail. Results obtained by applying this method to an austenite-ferrite stainless steel composite material are presented. The method can be extended to other multi-phase materials.

TN710-1. **Building research translation: Account of the principles of modular coordination: Industrialization in building,** G. Blachère, Nat. Bur. Stand. (U.S.), Tech. Note 710-1, 15 pages (Mar. 1972).

Key words: Conventions; dimensional coordination; industrialized production; modular coordination; tolerance.

This paper is translated from the French original and is published under the Building Research Division/Centre Scientifique et Technique du Bâtiment information exchange program.

Modular coordination is indispensable to the industrialized production of units for assembly in buildings. It must be subject to the limitations which are strictly necessary to achieve this end. A large module must be chosen, the reference for the coordinating dimensions must be fixed, and the tolerance problem solved. This is the theme of the report.

TN710-2. **Building research translation: An investigation of the protection of dwellings from external noise through facade walls,** P. Gilbert, Nat. Bur. Stand. (U.S.), Tech. Note 710-2, 26 pages (Mar. 1972).

Key words: Facade; noise; sound insulation; sound pressure level; walls.

This paper is translated from the French original and is published under the Building Research Division/Centre Scientifique et Technique du Bâtiment information exchange program.

An investigation was conducted to determine to what extent the installation of balconies and loggias at various angles of elevation from a noise source could improve the sound insulation of a facade wall. Measurements of the sound pressure level were first carried out on two types of facade, one incorporating traditional window joinery and the other incorporating sealed glazing. Following this, the sound insulation provided by facades fitted with open and closed balconies and loggias (with and without sound absorbent materials applied) was determined and compared with the previous measurements. It was found that for angles of elevation greater than 30°, both the closed balcony and the loggia fitted with absorbent materials appreciably improve the sound insulation, whereas the open balcony does not.

TN710-3. **Building research translation: New regulation on ventilation of dwellings, fixed heating facilities, and flues,** A. Chalandon, M. Schumann, and P. Dechartre, Nat. Bur. Stand. (U.S.), Tech. Note 710-3, 46 pages (May 1972).

Key words: Air infiltration and extraction, airtightness; discomfort index; duct system, collective and individual branch; flow rates; noise; pressure-loss-depression; thermal convection; ventilation.

Following studies on the ventilation of dwellings, the results of which have been published in CSTB "Cahiers," the CSTB has proposed certain changes in the regulations governing the ventilation of dwellings. At the same time, in the light of recent statistics on secondary emergency and relief heating, changes in the regulations governing fixed heating installations and flues were proposed. These proposals led to a new revised text of the French regulations, which we publish below, together with a new chapter on "ventilation" from the CSTB Technical Report.

TN710-4. **Building research translation: Thermal comfort requirement adjacent to cold walls—application to glazed opening,** J. Anquez and M. Croiset, Nat. Bur. Stand. (U.S.), Tech. Note 710-4, 54 pages (May 1972).

Key words: Curtains, effect of; environmental conditions; glazed openings; human response; thermal comfort requirement.

This paper is translated from the French original and is published under the Building Research Division/Centre Scientifique et Technique du Bâtiment information exchange program.

The thermal comfort of an individual inside a closed room in winter is essentially a function of the temperature of the air with which the human body transfers heat by convection, and also of the temperature of the room's walls with which the human body transfers heat by radiation. The presence of glazed openings (windows) which in winter are generally the coldest walls in a residence room, can thus be a source of discomfort.

The first part of the paper reports research conducted with a view to determining the thermal comfort requirement near to a cold wall. The research led to the definition of the "air-radiation requirement" for a plane surface element parallel to the wall, the requirement being that, at about 1 m from the wall, this temperature must remain above 16 or 17 °C.

The second part of the paper studies ways of satisfying the requirement near to glazed openings in a living room in winter. The solution to the problem will depend on numerous factors: climatic zone, average temperature of the room, position of heat sources, dimensions of the openings, type of glazing (single or double), presence or absence of curtains or screens.

TN710-5. **Building research translation: Use of an air-to-air heat exchanger to recover heat from air exhausted by mechanical ventilation,** P. Garrivier, Nat. Bur. Stand. (U.S.), Tech. Note 710-5, 62 pages (July 1972).

Key words: Exchanger dimensions; frost formation; heat exchanger; heating costs; mechanical systems; pollution; pressure loss; ventilation.

When a building is equipped with a mechanical system which both exhausts and supplies outdoor air, it may be profitable to install a heat exchanger between the two circuits. The CSTB has perfected such an exchanger, which meets the two principal requirements of the problem: good efficiencies and elimination of the polluted air intake. A method of calculating the optimal dimensions of the exchanger has also been devised.

TN710-6. **Building research translation: Ventilation air inlets for dwellings,** M. Croiset and H. Bizebard, Nat. Bur. Stand. (U.S.), Tech. Note 710-6, 62 pages (Jan. 1973) $1.00, SD Catalog No. C13.46:710-6.

Key words: Air inlet; discomfort index; draft; outside wall; ventilation; wind.

Preliminary tests have shown the existence of a "discomfort index," a function firstly of the difference between the temperature in the room and the temperature of the air current and, secondly of the speed of the air stream. The permissible limit for this index has been fixed at 2 °C, at least in that part of the room situated more than 20 cm from the outside walls and less than 2 meters in height.

Systematic artificial tests have resulted in satisfactory solutions being found for the air inlets into the outside walls.

- An elongated aperture placed above a radiator and fitted with a deflector so that cold air entering the room mingles with the ascending warm air current.
- An aperture located behind a convector heater so that the same result is achieved as in the case of the radiator.
- A row of apertures located along the heated ceiling placed so that entering air is diffused into the warm air before reaching the occupied zone.

Some calculations aimed at determining the orders of magnitude of the necessary sections and the possible force of the air current in a high wind, have revealed the need for a manual or an automatic regulator where a wall is exposed to wind.

TN710-7. **Building research translation: Weak thermal points or thermal bridges,** J. Berthier, Nat. Bur. Stand. (U.S.), Tech. Note 710- 7, 96 pages (May 1973) $1.25, SD Catalog No. C13.46:710-7.

Key words: Floors and panels; moisture condensation; thermal bridges; thermal insulation; U-values of walls.

Uniformity of temperature on the internal face is one of the essential hygrothermal qualities for a wall.

Cold bridges, which are the cause of uneven temperatures, constitute a weakness which ought to be corrected.

The author describes a large number of tests carried out with various types of wall (dense walls and lightweight panels) in order to assess the importance of cold bridges and to determine the effectiveness of possible remedies; he shows that the accepted theory used in the calculation of U-coefficients is unsatisfactory when estimating surface temperatures. The results obtained can be explained, however, by means of two simple hypotheses; on the basis of these there are practical rules which can be used in establishing the importance of cold bridges, and recommendations for reducing them.

TN711. **Measures for air quality, annual report—FY 1971,** J. R. McNesby and R. Byerly, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 711, 77 pages (Jan. 1972).

Key words: Air pollution; carbon monoxide; hydrocarbons; nitrogen oxide; ozone; particulates; standard reference materials; sulfur dioxide.

A compilation of reports covering the air pollution related projects at NBS during FY 1971. There are 23 projects in all, and they cover many areas of air pollution measurement. A table of contents lists descriptive project titles.

TN712. **Manual and computerized footprint identification,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 712, 13 pages (Feb. 1972).

Key words: Computerized-footprint-identification; footprint; pattern recognition.

Part 1 describes a manual footprint classification system that utilizes the ridge patterns adjacent to the toes on the sole of the right foot. This system is an extension of the FBI footprint classification system. Part 2 describes a method of coding minute details of these prints for storage in a computerized file. The computer can then search a similarly coded unknown print against this file and identify the most likely matching prints from the file.

TN713. **Electromagnetic multipole transitions in the recoupling picture, or, electron scattering without curls,** J. S. O'Connell, Nat. Bur. Stand. (U.S.), Tech. Note 713, 20 pages (Feb. 1972).

Key words: Electric transitions; electromagnetic operators; electron scattering; magnetic transitions; multipoles; recoupling.

The formation of the multipole operators from the fundamental charge, current, and moment operators of electron-nucleus scattering is carried through as an angular momentum recoupling problem rather than the usual vector algebra derivation. This point of view allows the electric and magnetic transition operators to be obtained in a simple and intuitive manner. The single particle reduced matrix elements of the charge, current, and moment operators are then calculated in the j-j coupling scheme using a flow chart technique developed by Danos.

TN714. **Reactor Radiation Division: Annual progress report for the period ending October 31, 1971,** R. S. Carter, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 714, 108 pages (Mar. 1972).

Key words: Crystal structure; diffraction; isotope, molecular structure; neutron; nuclear reactor; radiation.

The report is the annual progress report of the Reactor Radiation Division for the period October 1, 1970 to October 1, 1971. It summarizes the activities of the large number of users outside the Division as well as the work in the Division.

TN715. **Tabulation of published data on electron devices of the U.S.S.R. through December 1971,** C. P. Marsden, Nat. Bur. Stand. (U.S.), Tech. Note 715, 108 pages (June 1972).

Key words: Electron devices; electron tubes; semiconductors; U.S.S.R.

This tabulation includes published data on U.S.S.R. electron devices as collected from publications, mostly handbooks, published by the various ministries and institutes of the U.S.S.R. Information is given on all active devices ranging from receiving to microwave devices, semiconductor devices, and miscellaneous devices such as photographic flash tubes and thermistors. Supersedes NBS TN526.

TN716. **The ideal Lovibond color system for CIE standard illuminants A and C shown in three colorimetric systems,** G. W. Haupt, J. C. Schleter, and K. L. Eckerle, Nat. Bur. Stand. (U.S.), Tech. Note 716, 115 pages (Apr. 1972).

Key words: Chromaticity, Lovibond; CIE and Lovibond; colorimetry, Lovibond; color, Lovibond; glass color standards; Lovibond and CIE.

Tables are given which list luminous internal transmittances, luminous transmittances, and chromaticity coordinates of the ideal Lovibond color system for CIE standard illuminants A and C according to (1) the CIE 1931 (x,y)-system, (2) the CIE 1960 uniform-chromaticity-scale (UCS) (u,v)-system, and (3) the CIE 1964 (U*, V*, W*,)-system. Chromaticity diagrams for the (x,y)- and (u,v)-systems are shown together with horizontal and vertical cross-sections of the (U*, V*, W*) color solid for the entire ideal Lovibond color system produced by single-color units and two-color combinations of units for each illuminant. In addition, chromaticity diagrams and cross-sections are shown indicating the single color units of red, yellow, and blue for each CIE system and illuminant.

TN717. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report, July 1 to September 30, 1971,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 717, 52 pages (Apr. 1972).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, thirteenth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period included the disclosure of substantial differences in measurements of transistor delay time, a device characteristic frequently used as a screen in radiation hardness assurance tests, as measured with two different instruments; successful application of the infrared response technique to the study of radiation-damaged, lithium-drifted silicon detectors; and identification of a condition that minimizes wire flexure and reduces the failure rate of transistors under slow thermal cycling conditions. Work is continuing on measurement of resistivity of semiconductor crystals; study of gold-doped silicon; specification of germanium for gamma-ray detectors; evaluation of wire bonds and die attachment; measurement of thermal properties of semiconductor devices; noise properties of microwave diodes; and characterization of silicon nuclear radiation detectors. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN718. **Magnetic recording of acoustic data on audiofrequency tape recorders,** E. D. Burnett, E. L. R. Corliss, and R. D. Berendt, Nat. Bur. Stand. (U.S.), Tech. Note 718, 29 pages (Apr. 1972).

Key words: Acoustic measurements; calibrated tape recordings; data acquisition; magnetic recording; psychoacoustic data; recordings in the field; tape recording.

This Technical Note discusses the application of magnetic tape recording to storage and analysis of data obtained in the course of acoustic measurements. In general, the most suitable machines are those designed primarily for recording studios. Advantages in signal-to-noise ratios and extended linear range can be realized by careful choice of recording medium, adjustment of the equipment to optimum performance, and proper care in monitoring the recording process. General instructions for realizing these advantages are given. Particular emphasis is given to the procedures for making well-calibrated recordings in the field, for analysis of noise problems.

TN719. **A simple correction procedure for quantitative electron probe microanalysis,** K. F. J. Heinrich, R. L. Myklebust, H. Yakowitz, and S. D. Rasberry, Nat. Bur. Stand. (U.S.), Tech. Note 719, 49 pages (May 1972).

Key words: Absorption; atomic number; chemical elements; computation procedure; data reduction; electron probe microanalysis; fluorescence; time-sharing; x-ray analysis.

A calculation technique for data reduction in quantitative electron probe microanalysis is described. This technique is embodied in a computer program, called MULTI8, written in FORTRAN IV for batch processing. Six chemical elements may be determined simultaneously without redimensioning the program. The relative x-ray intensity data are corrected for atomic number, absorption and secondary fluorescence due to the characteristic lines. Options for calculating the mass fraction of one chemical element by difference or by stoichiometry are available in the program. Supersedes and extends NBS TN521.

TN720. **A simple hydraulic sinusoidal pressure calibrator,** J. S. Hilten, P. S. Lederer, and J. Sethian, Nat. Bur. Stand. (U.S.), Tech. Note 720, 27 pages (Apr. 1972).

Key words: Calibrator; dynamic; hydraulic; InterAgency Transducer Project; pressure transducer; sinusoidal pressure.

This paper describes a simple, accurate device for the sinusoidal calibration of pressure transducers. Calibration is achieved by vibrating a liquid tube on an electrodynamic shaker (vibration generator); the pressure transducer mounted at the base of the tube senses the sinusoidally varying pressure in the tube. The frequency range is 15 Hz to 2000 Hz with a maximum obtainable amplitude of 19.5 psi (134 kN/m^2) peak to peak. The transducer can easily be calibrated statically in the same device, thus permitting precise correlation between static and dynamic calibrations. Agreement between static and dynamic calibrations to within 0.1% has been achieved.

TN721. **NBS Special Foreign Currency Program in Israel 1970-71,** H. S. Peiser and M. Klein, Nat. Bur. Stand. (U.S.), Tech. Note 721, 175 pages (Apr. 1972).

Key words: Binational research cooperation; international scientific cooperation; Israel science and technology; physical science research administration; PL-480 programs; research planning; scientific research abstracts.

An overview is given of grants awarded by the National Bureau of Standards under the Special Foreign Currency Program in Israel authorized by Public Law 480 and its amendments. Each grant is identified by title, principal investigator, institution in Israel, NBS monitor working in close technical touch with the project in Israel, and the monitor's organizational unit within NBS. The relevant work is then described briefly under the three headings "Summary of Description of Project Goals," "Results and Implications to Date" and "List of Publications that Resulted from the Project." To demonstrate the wide use of such grants over the entire Program Structure of NBS, the grant descriptions are ordered by the elements of that Program Structure. Editorial comment on the significance and purpose of the NBS/PL 480 grant program is confined to a Foreword and Introduction. The editors judge this grant program to have had a high benefit to cost ratio from the viewpoint of NBS.

TN722. **Tensile creep of boron epoxy and boron epoxy-reinforced 7075-T6 aluminum alloy,** D. J. Chwirut, Nat. Bur. Stand. (U.S.), Tech. Note 722, 60 pages (May 1972).

Key words: Aluminum alloy; boron/epoxy; composite materials; creep; elastic follow-up technique; sandwich specimen.

Tensile creep tests were performed on twelve specimens of 0° unidirectional boron/epoxy and on twenty-four specimens of 7075-T6 aluminum alloy reinforced with 0° unidirectional boron/epoxy. An analytical procedure for predicting the creep properties of composite-reinforced metals is presented. Agreement between calculated and experimental creep curves varies with test temperature. These discrepancies between experiment and analysis are probably not due to an error in the analysis itself, but rather to uncertainty in the residual stresses in the specimens.

TN723. **A laser technique for investigating the effects of thermal transients on pressure transducer performance characteristics,** P. S. Lederer and J. S. Hilten, Nat. Bur. Stand. (U.S.), Tech. Note 723, 43 pages (May 1972).

Key words: Laser; performance characteristic; pressure transducer; temperature effects; test method; thermal transient.

A simple and repeatable testing technique was developed which makes it practical to obtain information on the zero shift and change in sensitivity of a pressure transducer while it is subjected to a thermal transient generated by a mechanically chopped cw laser beam. Several commercial, flush diaphragm, pressure transducers with ranges from up to 50 psi (3.45×10^5 N/m^2) were tested and showed zero shifts and changes in sensitivity of the order of 20% FS due to thermal transients with power densities up to 100 K W/m^2. The transducer under test can be pressure cycled while it is irradiated. In this way, zero shifts and sensitivity changes may be directly displayed in a procedure which requires a testing time of only about one minute.

TN724. **Properties of selected superconductive materials,** B. W. Roberts, Nat. Bur. Stand. (U.S.), Tech. Note 724, 100 pages (June 1972).

Key words: Bibliography; compilation of data; composition; critical field; critical temperature; crystallographic data; low temperature; superconductivity.

This is a noncritical compilation of data on superconductive materials with the exception of data on the elements that has been extracted from a portion of the literature published up to early 1971. The properties concerned are composition, critical temperature, critical magnetic fields, crystallographic data, and the lowest temperature tested for materials specifically explored for superconductivity. The compilation also includes, bibliography, general reference review articles and a special tabulation of high magnetic field superconductors. Supersedes and extends NBS TN482.

TN725. **A neutron moments computer code, moment I,** C. M. Eisenhauer, G. L. Simmons, and L. V. Spencer, Nat. Bur. Stand. (U.S.), Tech. Note 725, 38 pages (May 1972).

Key words: Carbon; computer code; gauss quadrature; moments; neutron transport; shielding.

In this paper we discuss a computer code for generating spatial-angular moments of neutron flux in an infinite medium. The equation for the flux moments is given and the techniques used for the solution are discussed. The structure of the computer code and of the main subroutines is also discussed. Details of the input and output data are given and the printout from a sample problem is included.

TN726. **Testing and fabrication of wire-bond electrical connections—a comprehensive survey,** H. A. Schafft, Nat. Bur. Stand. (U.S.), Tech. Note 726, 140 pages (Sept. 1972).

Key words: Bonding; degradation (wire bond); discrete devices; electrical interconnection; fabrication (wire bond); failure (wire bond); hybrid circuits; integrated circuits; microelectronics; reliability; semiconductor devices; survey (wire bond); testing (wire bond); thermocompression bonding; ultrasonic bonding; wire bond.

The fabrication and testing of wire-bond electrical connections used in integrated circuits, hybrid circuits, and low-power discrete semiconductor devices are surveyed comprehensively. The survey is generally restricted to wire-bond electrical connections where the wire diameter is less than 2 mils and where the wire is bonded either by thermocompressive or ultrasonic means. Under the general heading of fabrication, the essential features of the thermocompression and ultrasonic bonding processes, the fabrication procedures, and the characteristics of the constituent materials of the wire bond pertinent to high reliability are surveyed. Also included is a review of the interaction of gold and aluminum as one of the primary failure mechanisms in wire bonds. Both new and old test methods are surveyed with emphasis on their capabilities and limitations. In particular, the following test methods are discussed: visual inspection; pull, shear, air blast, push, ultrasonic stress, centrifuge, mechanical shock, variable frequency vibration, vibration fatigue, short-duration stress pulse, temperature cycling, thermal shock, bond interface resistance, and electrical continuity tests; noise measurement; and ultrasonic bond monitoring. Analyses of some of the methods with regard to the stress that the test imposes on the wire bond have been made and the results are used in discussing the relevant methods.

TN727. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report October 1 to December 31, 1971,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 727, 79 pages (June 1972).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonding; wire bonds.

This quarterly progress report, fourteenth of a series, describes NBS activities directed toward the development of

methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period included the determination of the reasons for substantial differences in measurements of transistor delay time, a device characteristic frequently used as a screen in radiation hardness assurance tests, as measured with different instruments or with the same instrument at different frequencies; identification of an energy level model for gold-doped silicon that yields a calculated dependence of resistivity on gold concentration that agrees very well with experimental measurements on *p*-type gold-doped silicon; and finding of evidence that it does not appear to be necessary for an ultrasonic bonding tool to grip the wire and move it across the substrate metallization to make the bond. Work is continuing on measurement of resistivity of semiconductor crystals; study of gold-doped silicon; development of the infrared response technique; evaluation of wire bonds and die attachment; measurement of thermal properties of semiconductor devices, delay time and related carrier transport properties in junction devices, and noise properties of microwave diodes; and characterization of silicon nuclear radiation detectors. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN728. **Torsional instabilities in composite and composite-reinforced aluminum-alloy thin-walled cylinders,** D. E. Marlowe, Nat. Bur. Stand. (U.S.), Tech. Note 728, 77 pages (June 1972).

Key words: Aircraft structures; boron/epoxy; composite materials; reinforced aluminum; stability; thin shells; torsion buckling.

The elastic buckling strength has been determined for thin-walled aluminum-alloy tubes fabricated with and without unidirectional boron/epoxy and glass/epoxy composite materials applied as reinforcement to their outer surfaces. Three boron/epoxy ply orientations were investigated. The results of these tests have been compared with the buckling strengths predicted by two analytical techniques. It was found that reinforcement of the metal tubes with an equal thickness of the composite material increased the buckling strength about threefold. The effect on buckling strength of the ply angles investigated is small when compared with the overall effect of adding the reinforcement. The analyses have approximately the same degree of accuracy as that generally attributed to Donnell's treatment of isotropic tubes.

TN729. **Design, construction, and testing of a new high accuracy spectrophotometer,** K. D. Mielenz and K. L. Eckerle, Nat. Bur. Stand. (U.S.), Tech. Note 729, 60 pages (June 1972).

Key words: Beam non-uniformity; circular entrance and exit apertures; high accuracy spectrophotometer; linearity; parabolic mirrors; stray radiant energy; transmittance.

A new spectrophotometer is described which has an accuracy of approximately 0.0001 transmittance units. The spectrophotometer utilizes a collimated beam in the sample area. This is accomplished by means of off-axis parabolic mirrors in the monochromator and sample compartment. Also, circular holes are used as entrance and exit apertures in the monochromator. All components of this spectrophotometer were chosen to achieve maximum accuracy. The result of this work is a "state of the art" instrument. The instrument was tested to evaluate its performance. Systematic errors such as detector non-linearity, stray radiant energy, and beam non-uniformity are measured. A correction for non-linearity of the photomultiplier and electronics is applied.

TN730. **Manual and automated fingerprint registration,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 730, 26 pages (June 1972).

Key words: Computerized-fingerprint-identification; fingerprint; pattern-recognition.

A method is described for manually positioning a fingerprint so that manually read minutiae data can be searched by computer against a file of fingerprint data that has been previously read by machine. A procedure is also described whereby a computer can utilize machine-read ridge-direction data in manipulating minutiae data to effect a registration of the fingerprint prior to filing its minutiae data.

TN731. **Calibration of secondary standard magnetic tape cassettes (computer amplitude reference) Phase I,** S. B. Geller and P. A. Mantek, Nat. Bur. Stand. (U.S.), Tech. Note 731, 60 pages (July 1972).

Key words: Cassette tapes; cassette transport; computer amplitude reference; magnetic tape cassette; secondary standard; standard reference material; unrecorded references.

This Technical Note discusses a method for developing and maintaining a reference system which will produce NBS Secondary Standard Magnetic Tape Cassettes (Computer Amplitude Reference). It describes both centerline tape search procedures and an interim signal amplitude measurement system for the reference magnetic tape cassette candidates. The results of the initial experiments with cassette tapes and transports are given.

TN732. **A computer terminal network for transparent stimulation of the user of an on-line retrieval system,** S. Treu, Nat. Bur. Stand. (U.S.), Tech. Note 732, 39 pages (July 1972).

Key words: Computer terminal network; human characteristics; interactive information retrieval; man-computer interface; transparent stimulation; unobtrusive monitoring.

A computer terminal network to enable "transparent stimulation" of the user of an on-line retrieval system has been designed, implemented, and pilot tested. Its basic purpose is to provide a suitable and effective framework and methodology for experimental identification/validation of those human characteristics which should be recognized/reinforced in man-computer interface design. The rationale behind the transparent stimulation approach is presented and the methodology employed for such real-time, unobtrusive scanning and manipulation of the man-computer dialogue is described. A general overview of the hardware and software features of the implemented stimulation network is included.

TN733. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report January 1 to March 31, 1972,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 733, 59 pages (Sept. 1972).

Key words: Aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; nuclear radiation detectors; probe techniques (a-c); resistivity; ribbon wire bonding; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonding; wire bonds.

This quarterly progress report, fifteenth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting

period include development of a procedure to correct for the substantial differences of transistor delay time, a device characteristic frequently used as a screen in radiation hardness assurance tests, as measured with different instruments or with the same instrument at different frequencies; association of infrared response spectra of poor quality germanium gamma-ray detectors with spectra of detectors fabricated from portions of a good crystal that had been degraded in known ways; and confirmation of the excellent quality and cosmetic appearance of ultrasonic bonds made with aluminum ribbon wire. Work is continuing on measurement of resistivity of semiconductor crystals; study of gold-doped silicon; development of the infrared response technique; evaluation of wire bonds and die attachment; and measurement of thermal properties of semiconductor devices, delay time and related carrier transport properties in junction devices, and noise properties of microwave diodes. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN734. **OMNITAB II. Segmentation structure for the SCOPE operating system,** S. T. Peavy and R. N. Varner, Nat. Bur. Stand. (U.S.), Tech. Note 734, 25 pages (June 1972).

Key words: ANSI FORTRAN; general-purpose computer program; implementation of OMNITAB II; links; OMNITAB II; overlay procedures; SCOPE operating system; segmentation.

OMNITAB II is an interpretive system developed and maintained by the National Bureau of Standards to enable scientists to use a large computer easily, effectively and accurately for numerical, statistical and data analysis without prior computer experience. The system is as machine independent as possible, making implementation relatively easy. Since OMNITAB II has a large memory requirement, segmentation and overlay are virtually essential.

Overlay procedures are dependent upon the operating system of the computer. Changes are necessary to the OMNITAB II program when the overlay procedure requires specific overlay CALL statements to external procedures in other overlay links. This Technical Note describes a method of segmentation and overlay for a particular operating system (CDC-6000 series). The method can readily be adapted to other operating systems with modifications to the control statements.

TN735. **The effects of magnetic fields on magnetic storage media used in computers,** S. B. Geller, Nat. Bur. Stand. (U.S.), Tech. Note 735, 35 pages (July 1972).

Key words: Erasure, magnetic media; erasure, permanent magnet; erasure, shielding against; erasure, signal loss due to; magnet fields, erasure with; magnetic media, computer; magnetic media, information damage; permanent magnet, erasure with; permanent magnets; shielding.

Experiments have been performed with different types of magnets to determine their effects on the information stored on magnetic storage media. The test results that were obtained with recorded computer tapes are discussed and guidelines are suggested to computer installation managers for protecting their recorded tapes, disks and drums against unwarranted erasure by magnetic fields. The effects of other forms of energy on recorded magnetic media are briefly considered.

TN736. **Carrier lifetime measurement by the photoconductive decay method,** R. L. Mattis and A. J. Baroody, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 736, 52 pages (Sept. 1972).

Key words: Carrier lifetime; germanium; photoconductive decay; silicon.

The photoconductive decay (PCD) method of carrier lifetim measurement is discussed with emphasis on experimental an analytical work done at NBS. The relationship betwee photoconductive decay time τ_{PCD}, bulk decay time τ_B, an lifetime is described briefly and the PCD method is summarize The determination of τ_B from τ_{PCD} and the influence of highe modes of recombination are discussed.

Experimental data, supported by theoretical consideration are presented to demonstrate the dependence of τ_{PCD} on exces carrier density, the type of light source, specimen homogeneity filter thickness, and temperature. The dependences of τ_{PCD} on ex cess carrier density and temperature are consequences of th statistics of the recombination process. Measurements mad with chopped light excitation are shown to be less in error due t higher modes of recombination than are measurements mad with pulsed light excitation. The presence of inhomogeneities i verified in two crystals. Use of a filter is also shown to reduce th influence of higher modes. An unexpected reduction in τ_{PCD} wit increasing filter thickness is shown to be caused by an in homogeneity.

Other experimental conditions are discussed as they affect th measurement of τ_{PCD}. It is shown that the light turnoff must b sufficiently fast and the series resistance sufficiently large tha they do not interfere with the measurement. Equations ar developed whereby the specimen current and illumination pat tern can be chosen such that carrier sweep-out at the ends of th specimen and ohmic heating are avoided. The end contacts mus be sufficiently ohmic that excessive contact resistance does no interfere with the measurement.

Trapping is defined and the means for identifying it ar discussed briefly. The PCD method is inappropriate for deter mining minority carrier lifetime when trapping is present o under other circumstances when the hole and electron lifetime are unequal.

TN737. **Interior/exterior noise levels of over-the-road trucks: re port of tests,** W. A. Leasure, Jr., T. L. Quindry, D. E Mathews, and J. M. Heinen, Nat. Bur. Stand. (U.S.), Tech Note 737, 317 pages (Sept. 1972).

Key words: Acoustics; noise measurement; noise (sound); truck noise (exterior); truck noise (interior); trucks.

This report presents the results of interior and exterior nois measurements which were made on a representative sample o fifteen over-the-road trucks under various operational modes In-cab measurements were made six inches from the right an left ears of the driver with windows open and closed. Simultane ous exterior measurements were made utilizing a six-microphon array. Graphic histories of A-weighted sound level versus tim are presented for all test conditions and microphone locations The National Bureau of Standards made the field measurement and tabulated the data; however, interpretation of the results i the responsibility of the Department of Transportation and th American Trucking Associations—the joint sponsors of the stu dy. These data supplement the limited in-cab data available i the public domain and will form part of public Docket No. MC 22 Advanced Notice of Proposed Rule Making concerning vehi cle interior noise levels which was issued by the Bureau of Moto Carrier Safety, Department of Transportation, in response t Federal Regulations concerning occupational noise exposure.

TN738. **Subroutine for the calculation of CODEN check charac ters,** D. Garvin, Nat. Bur. Stand. (U.S.), Tech. Note 738, 12 pages (Sept. 1972).

Key words: Check characters; CODEN; computer pro gram; journal abbreviations.

A FORTRAN subroutine is described that computes the check character for an ASTM CODEN for Journal Titles. This routine, written for input in Hollerith characters, is adaptable to other coding schemes. A listing of the routine is provided.

TN739. **A universal dropout tester for magnetic storage media,** S. B. Geller, Nat. Bur. Stand. (U.S.), Tech. Note 739, 32 pages (Sept. 1972).

Key words: Dropouts, cassette tapes; dropouts, computer magnetic tapes; dropouts, instrumentation magnetic tapes; dropouts, measurement system; magnetic storage media; signal amplitude, dropouts.

This Technical Note describes a signal dropout detection and counting system which was designed to make measurements on 1/2 inch magnetic computer tape, magnetic instrumentation tapes and magnetic cassette tapes as required by existing and potential Federal Specifications. The calibration and operational procedures for the system are described in detail.

TN740. **SETAB: An edit insert program for automatic typesetting of spectroscopic and other computerized tables,** R. C. Thompson and J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 740, 30 pages (Dec. 1973) 55 cents, SD Catalog No. C13.46: 740.

Key words: Automatic typesetting; computer-assisted typesetting; edit insertion program; FORTRAN program; phototypesetting of spectroscopic tables; typesetting of tables.

SETAB is a FORTRAN program which accepts a card deck or FORTRAN records on magnetic tape and inserts the appropriate flags and shift symbols required by many programs associated with phototypesetting devices. The program is specialized to the particular application, the phototypesetter and typography programs, and to the desired typefaces by means of parameter cards supplied at run time. Examples are shown of spectroscopic tables typeset on the Linofilm phototypesetter at the Government Printing Office using the Autoset Typography Program. The program has also been used for tables of other types of data. The program can handle any records which can be read by a FORTRAN "READ" statement under "A" format control. The original record can be divided into as many as 40 fields and these fields can be combined in any order with any of 26 strings in front of or between the pieces. The program will, on a signal, replace a field by another field or by a combination of fields and strings. The output lines are blocked and paged via the insertion of the required strings between blocks and pages.

TN741. **Unassigned.**

TN742. **United States and Canadian fabric flammability standards,** R. G. Katz, Nat. Bur. Stand. (U.S.), Tech. Note 742, 59 pages (Oct. 1972).

Key words: Blankets; Canada; carpets; clothing; fabric flammability testing; fabrics; Flammable Fabrics Act; Hazardous Products Act; mattresses; sleepwear; standards; United States.

Current fabric flammability standards of the United States and Canada are described. The 1967 amendment to the Flammable Fabrics Act of 1953 gave impetus to basic and applied research in the United States and to the development of new test methods and standards for fabric products. Commercial Standard 191-53, the 45-degree angle test, applies to most clothing items, but a new stringent vertical test was developed for children's sleepwear. A small flame source, i.e., a standard methenamine tablet, is used to test carpets and rugs, while a smoldering cigarette is the ignition source for a mattress standard. The test methods attempt to simulate actual conditions.

In 1970, Canada amended the Hazardous Products Act of 1969 to (a) ban from sale those products already declared dangerously flammable by the United States, and (b) ban from sale some berets and sweatshirts that did not meet the 45-degree angle test. Later amendments (1971) deleted the 1970 amendments and established a basic minimum flammability standard covering all textile products for consumer use. A more stringent standard was established for children's sleepwear and bedding (excluding mattresses, mattress pads and pillows) that use the same 45-degree angle test but with a time of flame spread of 7 seconds or less.

TN743. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report April 1 to June 30, 1972,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 743, 57 pages (Dec. 1972).

Key words: Aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; generation centers; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; nuclear radiation detectors; probe techniques (a-c); recombination centers; resistivity; ribbon-wire bonding; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; trapping centers; ultrasonic bonding; wire bonds.

This quarterly progress report, sixteenth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include verification of the applicability of resolution of forces in interpreting pull test measurements on unannealed wire bonds on single-level substrates, completion of the feasibility study of ribbon-wire bonding with the important finding that ribbon-wire bonds can be made with a wider range of bonding parameters than round-wire bonds of the same strength, and development of test procedures in preparation for studies of high-frequency measurements of transistors on the wafer by means of probes. Work is continuing on measurement of resistivity of semiconductor crystals; study of gold-doped silicon; development of the infrared response technique; evaluation of wire bonds and die attachment; and measurement of thermal properties of semiconductor devices, delay time and related carrier transport properties in junction devices, and noise properties of microwave diodes. New work has been started on development of procedures for analysis of the characteristics of generation-recombination-trapping centers in silicon. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN744. **Disclosures on: New syntheses of perfluorostyrene and other highly fluorinated derivatives; temperature-, radiation-, and vacuum-resistant magnetic tape; conductometric titration cell; mill work positioner; process for fabricating superconducting microbridges; apparatus for displaying average wind vane or other shaft position; and document numbering machine responsive to a staple in a print area for printing in an alternate area,** D. Robbins and A. J. Englert, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 744, 31 pages (Nov. 1972).

Key words: Conductometry; decoding matrix; fluoroolefins; integrator; magnetic sensing probe; magnetic tape; microbridge; numbering machine; perfluorostyrene; shaft position encoder; staple detector; superconducting; synthesis, chemical; titration; wind vane; work positioner.

This Note describes and illustrates seven developments that are believed to embody interesting and unusual solutions to current problems in their fields.

TN745. **Neutron dose and fluence distributions in an infinite air medium,** G. L. Simmons and C. M. Eisenhauer, Nat. Bur. Stand. (U.S.), Tech. Note 745, 39 pages (Jan. 1973) 65 cents, SD Catalog No. C13.46:745.

Key words: Benchmark problems; dose distributions; moments method; neutron penetration; shielding; weapons radiation.

The moments method is applied to the problem of calculating the neutron dose and fluence distributions in an infinite medium of air. These calculations are compared with Monte Carlo and Discrete Ordinates (S_n) results. Simple parametric representations for the distributions are given which facilitate the calculation of dose and flux distributions in air with a different density.

TN746. **Estimates of the nature and extent of lead paint poisoning in the United States,** J. F. Gilsinn, Nat. Bur. Stand. (U.S.), Tech. Note 746, 163 pages (Dec. 1972).

Key words: Childhood diseases; estimation; health problems; lead; lead paint; lead paint poisoning; lead poisoning; mathematical modeling; models; urban health problems.

This report evaluates the nationwide magnitude and extent of pediatric lead poisoning resulting from the ingestion of lead-based paint. Estimates are given of the number of children who have elevated blood lead levels (40 μg or more of lead per 100 ml of whole blood) in each of 241 Standard Metropolitan Statistical Areas throughout the country. The mathematical models used to obtain these estimates are documented together with the assumptions and data upon which those models are based. Partial validation of both models and assumptions is also reported.

TN747. **Critical evaluation of data in the physical sciences—A status report on the National Standard Reference Data System, June 1972,** S. A. Rossmassler, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 747, 79 pages (Nov. 1972).

Key words: Atomic and molecular data; chemical kinetics; colloid and surface properties; data systems design; information services; mechanical properties; nuclear data; standard reference data; solid state data; thermodynamic and transport properties.

This is a report on the status of the National Standard Reference Data System as of June 1972. Recent activities of the Office of Standard Reference Data are summarized and future plans are indicated. A complete list of data evaluation projects supported by the Office of Standard Reference Data during Fiscal Year 1972 is included; this list also includes projects which received financial support during an earlier fiscal year, and which are still actively involved in some aspect of data compilation and evaluation, or which are still preparing a product for publication. Progress in data processing and in information services is reviewed. The appendix includes a listing of continuing data centers in the United states and a list of publications resulting from the standard reference data program.

TN748. **An adjoint gamma-ray moments computer code, ADJ-MOM-I,** G. L. Simmons, Nat. Bur. Stand. (U.S.), Tech. Note 748, 23 pages (Feb. 1973) 30 cents, SD Catalog No. C13.46:748.

Key words: Adjoint; buildup factor; dosimetry; gamma-ray transport; moment methods; shielding.

In this paper we discuss a computer code for generating spatial-angular moments of the adjoint gamma-ray flux in an infinite medium. The equation for the flux moments is given and techniques used for the solution are described. Details of the input data and a sample problem are also supplied.

TN749. **The flammable fabrics program 1971. U.S. Department of Commerce report of activities under the Flammable Fabrics Act 1971,** Nat. Bur. Stand. (U.S.), Tech. Note 749, 92 pages (Dec. 1972).

Key words: Annual report to Congress; blankets; children's sleepwear; flammability; flammability reduction; mattresses; research; sampling plans; standards; test development; upholstered furniture.

This Annual Report to the Congress, required by the Flammable Fabrics Act, covers calendar year 1971. Specific flammability standards outputs were standards for children's sleepwear in sizes 0 through 6X, a proposed standard for mattresses, and a finding of possible need for amendment of the children's sleepwear standard to add sampling plans for the periodic testing by manufacturers of subject garments and materials. Research included studies, in-house and under contract, on subjects such as the contribution of floor covering systems to fire spread along building corridors and the parameters related to the burning of cotton/polyester blends and of multilayer fabrics. Studies of the feasibility of reducing flammability included the effects of treatments on combustion products and the effects of heavy metal ions on flammability. Test development, in addition to that basic to the standards developments already mentioned, included work on a blanket test, an upholstered furniture test, and on a general apparel test. A series of formal training sessions was initiated to supplement the continuing informal training, presentations, etc. Extensive cooperation was carried out with HEW, the public, industry, and voluntary standards groups.

TN750. **Matches and lighters in flammable fabric incidents: The magnitude of the problem,** J. A. Slater, B. Buchbinder, and H. Tovey, Nat. Bur. Stand. (U.S.), Tech. Note 750, 27 pages (Dec. 1972).

Key words: Fabric fires; FFACTS; fire injuries; flammable fabrics; ignition sources; lighters; matches.

Matches and lighters were a major factor in the 1,838 flammable fabric incidents studied for which ignition sources are known. They accounted for 430, almost one-fourth, of the ignitions and led to 375 injuries, of which 57 were fatal. Children and the elderly were the groups most frequently involved in fires started by matches or lighters. Nearly half the incidents involved children under age 11, and two-thirds of these were children under age 6. Forty-four of the 57 fatalities were children under age 11 or adults over 65. The highest fatality rate, 57 percent, was experienced by persons over age 65. The home was the predominant location of fires involving matches and lighters. Of the fabric items ignited by matches and lighters, garments were first to ignite four times as frequently as nonapparel items such as furnishings and bedding. Over one-third of the incidents involved intermediary materials in the ignition sequence. Match ignitions outnumbered lighter ignitions by 6 to 1. Among the 430 match and lighter incidents, fires involving children were overwhelmingly the result of playing with matches and lighters, whereas for persons over age 16, smoking was the single most prevalent activity at the time of ignition.

TN751. **Studies of calibration standards used in the Department of Defense Equipment Oil Analysis Program,** D. W. Golightly and J. L. Weber, Nat. Bur. Stand. (U.S.), Tech. Note 751, 48 pages (Jan. 1973) 75 cents, SD Catalog No. C13.46:751.

Key words: Calibration standards; concentration validity; flash point; lubricating oil; pour point; spectrometric analysis; stability; trace elements; viscosity.

At the request of the Naval Systems Air Command, Department of the Navy, studies have been conducted on organo-metallic calibration standards and diluent oil used in the Department

Defense Equipment Oil Analysis Program. Consultation on standards has been provided, and measurements of physical properties of base oil, concentrations of major elements in standards, concentrations of trace contaminants, and stability of solutions have been performed. Results of studies accomplished fiscal year 1972 are detailed in this report.

N752. **Directory of law enforcement and criminal justice associations and research centers,** B. J. Latka, Nat. Bur. Stand. (U.S.), Tech. Note 752, 49 pages (June 1973) 80 cents, SD Catalog No. C13.46:752.

Key words: Associations; criminal justice; directory, law enforcement; research centers.

This directory lists national, non-profit professional and volunteer social action associations and research centers which are active in the fields of law enforcement and criminal justice. The International and foreign organizations which are listed either have large number of American members, have a United States chapter, or are doing work which is applicable to the United States. The local organizations which are listed either cover several states or are of national interest. The organizations are listed alphabetically with a subject index included. The format of an entry is: title of organization; mailing address; officer; telephone number; year when founded; number of members, number of staff; description of purpose and activities; affiliations; publications, meetings.

N753. **NBS Special Foreign Currency Program in Yugoslavia 1971-72,** H. S. Peiser, S. E. Chappell, E. Horowitz, H. Yakowitz, and D. Bluebond, Nat. Bur. Stand. (U.S.), Tech. Note 753, 72 pages (Jan. 1973) 90 cents, SD Catalog No. C13.46:753.

Key words: Binational research cooperation; international scientific cooperation; physical science research administration; research planning; scientific research abstracts; Special Foreign Currency Program; Yugoslavia science and technology.

An overview is given of grants awarded by the National Bureau of Standards under the Special Foreign Currency Program (SFCP) in Yugoslavia, authorized by Public Law 480 and other legislation. Each grant is identified by title, principal investigator, institution in Yugoslavia, NBS monitor, and the monitor's organizational unit within NBS. The work is then described briefly under the three headings "Summary Description of Project Goals," "Results and Implications to Date" and "List of Publications that Resulted from the Project." To demonstrate the relevance of such grants to the programs of NBS, the grant descriptions are ordered by the elements of that Program Structure. The significance and purpose of the NBS/SFCP grant program are discussed in the Foreword, the Introduction and an Appendix. The NBS monitors and the program manager judge this grant program to have had a high benefit to cost ratio from the viewpoint of NBS.

N754. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report July 1 to September 30, 1972,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 754, 55 pages (Mar. 1973) 80 cents, SD Catalog No. C13.46:754.

Key words: Aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; generation centers; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; nuclear radiation detectors; probe techniques (a-c); recombination centers; resistivity; ribbon wire bonding; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; trapping centers; ultrasonic bonding; wire bonds.

This quarterly progress report, seventeenth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include design of a plan to provide standard silicon wafers for four-probe resistivity measurements for the industry, publication of a summary report on the photoconductive decay method for measuring carrier lifetime, publication of a comprehensive review of the field of wire bond fabrication and testing, and successful completion of organizational activity leading to the establishment of a new group on quality and hardness assurance in ASTM Committee F-1 on Electronics. Work is continuing on measurement of resistivity of semiconductor crystals; characterization of generation-recombination-trapping centers in silicon; study of gold-doped silicon; development of the infrared response technique; evaluation of wire bonds and die attachment; and measurement of thermal properties of semiconductor devices, delay time and related carrier transport properties in junction devices, and noise properties of microwave diodes. New efforts were initiated in both the die attachment and wire bond evaluation tasks. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes. A description of breakdown tracks, a primary failure mode of monolithic integrated circuits stressed with voltage pulses, is given in a separate appendix.

TN755. **Some aspects of the setting and hardening of gypsum plaster,** J. R. Clifton, Nat. Bur. Stand. (U.S.), Tech. Note 755, 33 pages (Jan. 1973) 55 cents, SD Catalog No. C13.46:755.

Key words: Colloidal theory; crystallization theory; gypsum; hydration; induction period; plaster of paris; setting mechanisms.

The mechanisms by which gypsum plaster sets and hardens have been investigated and the results generally are consistent with the crystallization theory. No evidence for the presence of colloidal intermediates has been found. The crystallization theory is modified to include, as an intermediate species, solvated calcium sulfate hemihydrate molecules. Evidence is presented that supports the belief that more than one reaction is responsible for the setting and hardening of gypsum plaster.

The roles of accelerators and retarders have been studied by calorimetric, differential thermal analysis, and scanning electron microscopic techniques. The cation is more effective than the anion in accelerating the setting and hardening of gypsum plasters; the catalytic order follows the sequence M^{+} M^{2+} M^{3+}. Small amounts of retarders can severely retard the setting and hardening processes.

Influences of temperature, impurities, and production conditions on the setting rates of gypsum plasters are discussed.

TN756. **A user's guide to the OMNITAB command "STATISTICAL ANALYSIS,"** H. H. Ku, Nat. Bur. Stand. (U.S.), Tech. Note 756, 44 pages (Mar. 1973) 75 cents, SD Catalog No. C13.46:756.

Key words: Computing, statistical; documentation for users; OMNITAB; statistics.

This Technical Note is the first of a series of interpretive notes for a number of commands in the OMNITAB system that have the automatic printout feature. Others planned in the series in-

clude commands FIT and POLYFIT, TWOWAY analysis, ONEWAY analysis, and CORRELATION.

These notes aim to be self-contained so that users may have sufficient information on hand for the understanding of the statistics computed and to use them for their immediate applications. Computation formulas are given in the text, and a number of statistical tables are reproduced in the Appendix for the convenience of users.

TN757. **The smoke density chamber method for evaluating the potential smoke generation of building materials,** T. G. Lee, Nat. Bur. Stand. (U.S.), Tech. Note 757, 20 pages (Jan. 1973) 45 cents, SD Catalog No. C13.46:757.

Key words: Building materials; fire; fire services; smoke; smoke density chamber; smoke potential; test method; visibility.

The paper reviews the Smoke Density Chamber Test Method and illustrates its use and application to assess smoke generation of building materials in fire situations. It shows how test results may aid the Fire Services and code authorities in evaluating and reducing the potential light-obscuration hazard of smoke in buildings. An example is given for calculating visibility in a simplified fire situation involving material of known smoke generation. The smoke generation of some common interior finish and construction materials is given.

TN758. **NBS reactor: Summary of activities October 1971 to September 1972,** R. S. Carter, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 758, 140 pages (Mar. 1973) $2.10, SD Catalog No. C13.46:758.

Key words: Activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from October 1971 through September 1972. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics and neutron standards to sample irradiations for activation analysis, isotope production, and radiation effects studies.

TN759. **The NBS lead paint poisoning project: Housing and other aspects,** H. W. Berger, Nat. Bur. Stand. (U.S.), Tech. Note 759, 25 pages (Feb. 1973) 30 cents, SD Catalog No. C13.46:759.

Key words: Hazard elimination; lead analysis; lead paint; lead poisoning.

The National Bureau of Standards is providing technical support required by the Department of Housing and Urban Development to carry out its research responsibilities under PL 91-695, The Lead Based Paint Poisoning Prevention Act. The program at NBS has involved three major areas of research: (1) an estimation of the numbers of children at risk and with excessive body burdens of lead and the geographical distribution of those children; (2) the capabilities and characteristics of analytical methods for the detection of lead in paint and other building materials; and (3) the identification and evaluation of materials, techniques and systems for removing or eliminating the lead paint hazard from housing. This paper is a brief presentation of the activities and conclusions of NBS in the areas listed above.

TN760. **Description of the magnetic tape version of the Bulletin of Thermodynamics and Thermochemistry, No. 14 (1971),** R. McClenon, W. H. Evans, D. Garvin, and B. C. Duncan, Nat. Bur. Stand. (U.S.), Tech. Note 760, 51 pages (Mar. 1973) 75 cents, SD Catalog No. C13.46:760.

Key words: Bibliography; chemical thermodynamics; extended character codes; information retrieval; magnetic tape.

The substance-property index and bibliography sections of the Bulletin of Thermodynamics and Thermochemistry, No. 14 (May 1971) have been converted to a magnetic tape version designed for computerized searching written in an extended form of the American National Standard Code for Information Interchange (X 3.4-1968). In this version each substance-property entry has been supplemented by a searching key. This report describes the magnetic tape version.

TN761. **Project SOAP: A systems approach to biomedical research program management—A case study,** R. S. Cutler, Nat. Bur. Stand. (U.S.), Tech. Note 761, 75 pages (Apr. 1973) 95 cents, SD Catalog No. C13.46:761.

Key words: Biomedical research; "health relevance"; program planning and budgeting; R&D management; systems analysis; systems approach.

This case study describes the activities of an interagency task group that applied systems analysis to improve management controls within a biomedical research agency of the federal government. The results were the formulation and implementation of a discipline for program management, which explicitly makes use of multiple criteria in arriving at resource allocation decisions.

The text details the necessary preliminary analysis describing operational activities, information flows, and key decision points within the organization. It goes on to identify the techniques employed and the difficulties encountered while attempting to improve the decision-making process for selecting research projects, under conditions of reduced funding. In particular, a comparison is made between: (1) the agency's traditional single criterion "peer review" judgment for determining budget priorities, and (2) the multiple-criteria judgments required to effect more positive management control. The systematic use of separate "scientific merit" and "health relevance" ratings is compared with the organization's actual experience. The criteria used by various participants in the decision process are analyzed, and a dollar allocation "investment" procedure based on these findings is developed.

A procedure which organizes relevant information for research program planning and evaluation is presented, and extension of this recommended procedure to wider use by science administrators elsewhere in government is discussed.

TN762. **Tabulation of voluntary standards and certification programs for consumer products,** S. J. Chumas, Nat. Bur. Stand. (U.S.), Tech. Note 762, 119 pages (Mar. 1973) $1.25, SD Catalog No. C13.46:762.

Key words: Certification programs; consumer products; household products; industry standards; international recommendations; national standards; product standards; recommended practices; specifications; test methods.

This tabulation is a revised and enlarged version of NBS Technical Note 705, "Tabulation of Voluntary National Standards, Industry Standards, International Recommendations and Certification Programs for Consumer Products," issued December 1971.

Technical Note 705 was a revision of the Draft Tabulation compiled by the American National Standards Institute and issued in April 1970. The categories and products covered in the tabulation were originally based on those listed in the Consumer Product Safety Index (CPSI) of the National Commission on Product Safety, published in July 1970. The products and categories in the current revision are based on those developed

for the National Electronic Injury Surveillance System (NEISS) of the Food and Drug Administration. The NEISS listings are an expansion and revision of the CPSI. NEISS product areas were slightly altered to conform to the scope of this tabulation.

The tabulation lists over 700 product areas and over 1000 standards' titles covering products found in and around the home. (The major consumer product areas not included are foods, beverages, and drugs.) The tabulation also indicates the applicable voluntary national, industrial, and international standards which deal primarily with either safety or performance or both aspects of the products listed. For some of the product areas, there are no applicable standards. Available information on certification programs and standards under development, and the Standard Industrial Classification (SIC) numbers for the products are also provided. Supersedes NBS Technical Note 705.

TN763. **A set of debugging and monitoring facilities to improve the diagnostic capabilities of a compiler,** E. N. Fong, Nat. Bur. Stand. (U.S.), Tech. Note 763, 25 pages (Mar. 1973) 50 cents, SD Catalog No. C13.46:763.

Key words: Compiler; debugging; error diagnostic; high-level programming languages; monitoring; procedural-oriented languages.

Increasing concern with the quality of computer software today makes it important to evaluate critically the debugging facilities available in high-level languages. This paper presents a collection of program debugging and monitoring facilities to improve the diagnostic capabilities of a compiler. A distinction is made between debugging and monitoring facilities performed at compile time, at link/load time and at execution time. These facilities are described in terms of this breakdown with a conscious attempt to move the detection of errors from execution time to compile or link/load time, and to collect information when the information is available during the compilation process.

TN764. **An investigation of the stability of and insulation leakage in some high temperature resistance thermometers: An interim report,** S. D. Wood, Nat. Bur. Stand. (U.S.), Tech. Note 764, 31 pages (May 1973) 50 cents, SD Catalog No. C13.46:764.

Key words: Freezing point of zinc; high temperature resistance thermometer; insulation resistance; platinum resistance thermometer; resistance thermometer; stability; tungsten thermometer; zinc.

Data are presented concerning the stability of high temperature resistance thermometers. Two types of platinum and one type of tungsten thermometer were tested at 1065 °C and 960 °C. Some of the platinum thermometers were also tested at 900 °C and at the freezing point of zinc. Results of tests are also given on the insulation resistance of sensor supports and lead assemblies for the two types of platinum thermometers. A new design for a zinc-point cell is discussed briefly. Suggestions for future work are indicated.

TN765. **Low temperature thermometry: Interim report,** G. Cataland and H. H. Plumb, Nat. Bur. Stand. (U.S.), Tech. Note 765, 23 pages (May 1973) 40 cents, SD Catalog No. C13.46:765.

Key words: Acoustical thermometer; calibrator; germanium thermometers; heat conduction; NBS P2-20 (1965) scale; "speed of sound" isotherms; viscosity.

Earlier acoustical thermometer "speed of sound" isotherms are compared with recent measurements. Where systematic deviations had appeared in "smoothing" through acoustically derived temperatures via germanium thermometers, a possible solution has emerged; more precise temperature control of the acoustical thermometer is desirable and has been realized. A cursory examination of the applicability of the Helmholtz-Kirchhoff equation was made with a modified sonic chamber. Measurements with the modified instrument have shown no changes in the experimental results.

The maintenance of the NBS P2-20 (1965) scale is described. A new calibration apparatus was constructed to accommodate more germanium thermometers thus reducing the calibration cost per thermometer during a calibration run.

TN766. **A gamma ray moments computer code, GAMMOM-I,** C. M. Eisenhauer, G. L. Simmons, and L. V. Spencer, Nat. Bur. Stand. (U.S.), Tech. Note 766, 41 pages (Apr. 1973) 75 cents, SD Catalog No. C13.46:766.

Key words: Computer code; gamma rays; gamma ray transport; gauss quadrature; moments; shielding.

In this paper we describe a computer code for generating spatial-angular moments of gamma ray energy fluence in an infinite medium. The equation for moments of the energy fluence is given and the techniques used for the solution are discussed. The structure of the code and of the main subroutines is also given. Details of the input and output data are presented and the printout from a sample problem is included.

TN767. **Microelectronic interconnection bonding with ribbon wire,** H. K. Kessler and A. H. Sher, Nat. Bur. Stand. (U.S.), Tech. Note 767, 31 pages (Apr. 1973) 50 cents, SD Catalog No. C13.46:767.

Key words: Aluminum wire; bonding; fabrication (wire bonds); microelectronics; ribbon wire; round wire; testing (wire bond); ultrasonic bonding; wire bond.

The feasibility of using aluminum ribbon wire for ultrasonic bonding of semiconductor microelectronic interconnections was studied, and several advantages over the use of round wire of equivalent cross-sectional area were found. Ribbon wire bonds exhibited little deformation or heel damage, and a greater percentage of bonds of a certain quality (as judged by pull strength and appearance) could be made over much greater ranges of the bonding machine parameters, time and tool tip displacement, using ribbon wire than was possible with round wire. The ease of positioning ribbon wire was indicated by making multiple ribbon wire bonds side-by-side on a 5-mil square pad, or by stacking up to four bonds one on top of another. However, bonding with harder than normal wire, previously thought to offer certain advantages with respect to higher bond tensile strength, yielded inconsistent results.

TN768. **Nonmetallic coatings for concrete reinforcing bars. Coating materials,** J. R. Clifton, H. F. Beeghly, and R. G. Mathey, Nat. Bur. Stand. (U.S.), Tech. Note 768, 40 pages (Apr. 1973) 65 cents, SD Catalog No. C13.46:768.

Key words: Chlorides; concrete; corrosion; epoxy coatings; organic coating; steel reinforcing bars.

This work was undertaken in order to determine the feasibility of using organic coatings, especially epoxies, to protect steel reinforcing bars embedded in concrete from accelerated corrosion attributed to the depassivation of steel by chloride ions.

Coatings have been evaluated on the basis of their chemical and physical durabilities as well as their protective qualities. In this study, attention has also been directed to the following: application methods; surface preparation of the steel reinforcing bar; and site of application.

TN769. **A rigorous correction procedure for quantitative electron probe microanalysis (COR 2),** J. Hénoc, K. F. J. Heinrich, and R. L. Myklebust, Nat. Bur. Stand. (U.S.), Tech. Note 769, 132 pages (Aug. 1973) $2.10, SD Catalog No. C13.46:769.

Key words: Continuum fluorescence; data reduction; electron probe microanalysis; fluorescence correction; quantitative analysis.

This publication describes a rigorous data reduction procedure for quantitative electron probe microanalysis, which avoids simplifications present in conventional schemes. In addition, the program contains a correction for fluorescence due to the continuum, and separate computation of the fluorescent effects of each exciting primary x-ray line. Constants characteristic of elements are stored in a permanent data file, and the constants and parameters needed for the calculation of mass absorption coefficients are contained in a sub-program. These provisions and decision-making sections in the development of the fluorescence corrections reduce the required input considerably.

TN770. **Hazard elimination procedures for leaded paints in housing,** D. Waksman, L. F. Skoda, and E. J. Clark, Nat. Bur. Stand. (U.S.), Tech Note 770, 99 pages (May 1973) $1.25, SD Catalog No. C13.46:770.

Key words: Building material; housing; leaded paint; lead hazard elimination methods; lead paint poisoning; performance attributes.

Methods currently used to control the hazard caused by leaded paints in housing vary in effectiveness from complete elimination of the hazard to a minimal effort that runs a high risk for recurrence of the hazard. A series of guidelines has been drawn up to acquaint municipal planners and other decision makers with the factors that should be considered in implementing a hazard elimination program. Formats are presented to describe attributes of the various methods that should be considered.

TN771. **Some experiments on the stirring of viscous liquids,** A. Napolitano, Nat. Bur. Stand. (U.S.), Tech. Note 771, 60 pages (May 1973) 85 cents, SD Catalog No. C13.46:771.

Key words: Agitators; borosilicate glass; glass melt; glass tank; liquids; stirrer; viscosity.

The stirring actions of several designs of small stirrers were observed and photographed in transparent viscous model liquids. The fluidity of the liquids was comparable to that of a molten borosilicate glass at fining temperatures. The most efficient features of one or more of these stirrers were incorporated into larger model stirrers and observed under actual stirring conditions. As a result of these performance tests, a final design of stirrer was selected and fabricated of platinum-rhodium metal and used in an experimental glass tank. The design of one of the pots in the experimental glass tank was modified to obtain the maximum stirring action with the selected stirrer.

TN772. **A performance comparison of labeling algorithms for calculating shortest path trees,** J. Gilsinn and C. Witzgall, Nat. Bur. Stand. (U.S.), Tech. Note 772, 92 pages (May 1973) $1.25, SD Catalog No. C13.46:772.

Key words: Algorithms; networks; paths; shortest-paths; trees.

Many applications in transportation and communication require the calculation of shortest routes between points in a network, and several algorithms for the solution of this problem exist in the literature. This paper examines one class of such algorithms, that which calculates a shortest route from one point in the network to all other intersection points. Computer da handling techniques which can be used to improve the two bas algorithms in this class are investigated. Results of computer tir ing runs on various types and sizes of networks are compare and the differences, sometimes of an order of magnitude, a analyzed. Detailed flowcharts and computer programs of t tested algorithms are also included.

TN773. **Methods of measurement for semiconductor materia process control, and devices. Quarterly report, October 1 December 31, 1972,** W. M. Bullis, Editor, Nat. Bur. Stan (U.S.), Tech. Note 773, 56 pages (June 1973) 80 cents, S Catalog No. C13.46:773.

Key words: Base transit time; carrier lifetime; delay tim die attachment; electrical properties; electronics; epitaxi silicon; four-probe method; generation centers; germaniu gold-doped silicon; infrared response; methods of measur ment; microelectronics; microwave diodes; probi techniques (a-c); pull test; recombination centers; resisti ty; resistivity standards; semiconductor devices; semico ductor materials; semiconductor process control; silicon; parameters; switching transients; thermal resistance; the mally stimulated measurements; trapping centers; wi bonds.

This quarterly progress report, eighteenth of a serie describes NBS activities directed toward the development methods of measurement for semiconductor materials, proce control, and devices. Significant accomplishments during this r porting period include (1) completion of the investigation of t effects of current, probe force, and surface condition on the me surement of resistivity of bulk silicon wafers by the four-pro method, (2) establishment of operating conditions appropria for determining the sensitivity of transient thermal respon measurements to voids in transistor die attachment, and (3) i itiation of an interlaboratory comparison of transistor scatteri parameter measurements. Because of the general applicability the first of these, details are presented in a separate appendi Work is continuing on measurement of resistivity of semicondu tor crystals; characterization of generation-recombinatio trapping centers in silicon; study of gold-doped silicon; develo ment of the infrared response technique; evaluation of wi bonds and die attachment; measurement of thermal properties semiconductor devices; determination of S-parameters, del time, and related carrier transport properties in junction device development of a-c probing techniques; and characterization noise and conversion loss of microwave detector diodes. Suppl mentary data concerning staff, standards committee activitie technical services, and publications are included as appendice

TN774. **Fire service location-allocation models,** D. Colner and J Gilsinn, Nat. Bur. Stand. (U.S.), Tech. Note 774, 46 pag (June 1973) 75 cents, SD Catalog No. C13.46:774.

Key words: Algorithms; fire station location; heuristics; l cation-allocation models; location analysis; resource alloc tion analysis; transportation network analysis.

This paper compiles the various types of location-allocati models which analyze the impact of varying the number and l cation of fire stations. The assumptions of each model, the rel tionships between models, and possible heuristics and algorithn are discussed. In addition, a methodology of spatial concep analogous to those used in transportation planning is presente

TN775. **Coordinated evaluation system (CES) project, moc documentation for building regulation,** R. D. Dikkers, N Bur. Stand. (U.S.), Tech. Note 775 (16 pages) 35 cents, S

Catalog No. C13.46:775.

Key words: Building regulation; evaluation; inspection; manufactured building; mobile homes; model documents; state-of-art study.

Background information, objectives and the current status February 1973) of various tasks and reports pertaining to the Coordinated Evaluation System (CES) project are described. The goal of the CES Project is to develop model informational documentation that will assist state building regulatory agencies n establishing a coordinated and uniform evaluation, approval and inspection system. The model documentation will be related o the following building regulatory functions: (1) data submittal, 2) evaluation, (3) approval, (4) compliance assurance (inspection), (5) installation, and (6) owner information.

TN776. **A new method for generating waterdrops of specified mass,** J. E. Potzick, Nat. Bur. Stand. (U.S.), Tech. Note 776, 12 pages (May 1973) 35 cents, SD Catalog No. C13.46:776.

Key words: Drop generator; liquid drop; waterdrop.

A waterdrop generator has been constructed, based on the mechanical resonance of a vibrating waterdrop, which can enerate drops of 1.5 to 37 mg with standard deviations in the ange of 0.1 percent to 10 percent of drop mass. Drop mass over his range and drop interval are remotely controlled.

TN777. **Cost analysis of blood banking alternatives,** T. Miller, M. King, J. Flannagan, E. Nilsson, and B. Lemieux, Nat. Bur. Stand. (U.S.), Tech. Note 777, 121 pages (Sept. 1973) $1.35, SD Catalog No. C.13.46:777.

Key words: Blood banks; blood utilization statistics; cost benefit analysis; donor profiles; peer review; regulatory activities; sensitivity analysis.

This report provides a description of the current blood banking ystem and of the collection and derivation of quantitative information concerning system operation and blood cost. A easonably accurate but somewhat incomplete profile of practices, attitudes, and likely costs of present and alternative ystems has been developed. Among the topics presented are: 1) discussion of the blood collection process including statistics n present use and future needs; 2) information relating to donor notivation, attitudes and incentives; 3) a brief summary of demonstration programs in the U.S. and national blood programs n other countries which provides some insight concerning neans for improving blood quality and availability; 4) a description of blood processing, storage and distribution procedures; 5) narrative and statistical information relating to blood utilization practices; 6) discussions of post transfusion reactions and frozen blood programs; 7) a discussion of current governmental and professional standards, regulations and controls which influence many, but not all, concerns involved in blood collection and processing.

This information serves as the basis for the selection of alternatives analyzed in a cost effectiveness analysis of eight apparently viable alternatives to the current system. Because of the possible variation which might be ascribed to many of the parameters used as a basis for costing alternatives, the sensitivity analysis is crucial in the comparison of alternatives.

TN778. **Guidelines for selection of and use of foam polyurethane roofing systems,** W. C. Cullen and W. J. Rossiter, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 778, 46 pages (May 1973) 75 cents, SD Catalog No. C13.46:778.

Key words: Durability; fire safety; performance guidelines; protective coatings; rigid polyurethane; roofing.

The use of spray-in-place polyurethane foam for roofing application in the United States is increasing at a rapid rate. Little unbiased information is available to guide the user in the specification, selection, application, and performance of this innovative roofing system. This report describes the current state-of-the-art of rigid polyurethane technology as applied to roofing systems. The performance parameters as observed during the field survey are discussed in terms of protective coatings, fire safety, durability and problem areas. Guidelines to assist the supplier and user alike in the use and selection of polyurethane foam roofing systems are given. Finally, a performance specification for spray-in-place polyurethane foam roofing system is suggested.

TN779. **Data communications system throughput performance using high speed terminals on the dial telephone network,** D. S. Grubb, Nat. Bur. Stand. (U.S.), Tech. Note 779, 40 pages (May 1973) 65 cents, SD Catalog No. C13.46:779.

Key words: Data communications; modems; terminals; throughput; TRIB.

Throughput performance of high speed data terminals using the dial telephone network is calculated for signaling rate of 1200 to 4800 bits per second using the ANSI X3.28-1971 control procedures and measured in terms of the proposed ANSI strand TRIB described in X3S35/80. The performance calculations are shown graphically with TRIB as a function of block length, error rates of the telephone connection, signaling rate and telephone line delays. Error rates are based on a published survey involving several hundred telephone connections to geographically distributed parts of the United States.

TN780. **Controlled accessibility bibliography,** S. K. Reed and M. M. Gray, Nat. Bur. Stand. (U.S.), Tech. Note 780, 15 pages (June 1973) 35 cents, SD Catalog No. C13.46:780.

Key words: Confidentiality; controlled accessibility; data integrity; data security; security.

A bibliography of 96 references on controlled accessibility has been compiled. The purpose in compiling this limited bibliography was to free the effort to solve the problems of controlled accessibility from domination by discussion of the issues of privacy. Insofar as possible, except when the two subjects are referred to in the same work or for overriding historical considerations, references dealing with privacy have not been included.

TN781. **A study of six university-based information systems,** B. Marron, E. Fong, D. W. Fife, and K. Rankin, Nat. Bur. Stand. (U.S.), Tech. Note 781, 98 pages (June 1973) $1.25, SD Catalog No. C13.46:781.

Key words: Computer-based systems; information systems, university; university computer systems.

A methodology for categorically describing computer-based information systems was developed and applied to six university-based, NSF-supported, systems. The Systems under study all operate as retail information centers primarily serving campus communities by accessing large commercially-available data bases using 3d generation computer configurations. The systems vary in design philosophy, mode of user service, transferability characteristics, and operational status. A summary matrix is included.

TN782. **Application of systems analysis to the operation of a fire department,** E. K. Nilsson, J. A. Swartz, and M. Westfall, Nat. Bur. Stand. (U.S.), Tech. Note 782, 52 pages (June 1974) SD Catalog No. C13.46:782.

Key words: Alexandria; fire department; location; operations research; resource allocation; simulation; systems analysis.

Rising labor costs and increasing competition for tax dollars to provide urban services demand that a more precise methodology be used in the management of fire departments. A pilot program was conducted with the cooperation of the Alexandria, Va. Fire Department to evaluate the applicability and usefulness of selected Operations Research tools. These tools, in the form of computer models, were modified and adapted to assure that they could be implemented to provide information which would facilitate fire department management. In this effort queuing, facility location, and simulation models were applied to sample data extracted from the historical records of the Alexandria Fire Department. It was established that such models do provide valuable information which may assist managerial decisions. This paper describes the city of Alexandria and its fire department, the O.R. models, output from their application, and evaluations of the output.

TN783. **Durability and maintenance as related to the selection of flooring,** W. C. Wolfe, R. F. Roberts, and M. Russell, Nat. Bur. Stand. (U.S.), Tech. Note 783, 68 pages (Aug. 1973) 90 cents, SD Catalog No. C13.46:783.

Key words: Carpets; durability; economics; field studies; flooring; floor coverings; life-cost; maintenance; user needs.

This report is addressed to the problem of selection and maintenance of flooring to the best advantage in terms of durability, type and severity of service, appearance, comfort, and safety. The selection of flooring is discussed with respect to service life, maintenance, obsolescence, and trade-off advantages. Two articles by maintenance administrators include information and discussion helpful in determining maintenance cost, trade-offs, and selection of flooring for different types of service. Field observations and preliminary field tests by the National Bureau of Standards indicate areas in which research is needed, as in laboratory tests for wear and slip resistance. Observations and field tests are impracticable to use for procurement.

This report is helpful in the selection and maintenance of flooring and floor finishes. More important, it points up areas in which research is needed to develop information for this purpose.

TN784. **Unassigned.**

TN785. **Scanning electron microscope examination of wire bonds from high-reliability devices,** K. O. Leedy, Nat. Bur. Stand. (U.S.), Tech. Note 785, 35 pages (Aug. 1973) 55 cents, SD Catalog No. C13.46:785.

Key words: Aluminum wire; high reliability; integrated circuit; metallization; scanning electron microscope; transistor; ultrasonic bonding; wire bonding.

An examination with a scanning electron microscope was made of the wire bonds of over 75 high-reliability microelectronic devices. The device interconnects were ultrasonically bonded aluminum wires. Of primary interest were the bonds themselves; their appearance and its significance are described. Also described is the appearance of the metallization and the wire. Comments and explanations are given where the phenomena are understood. Although the devices studied had passed preliminary electrical tests and pre-encapsulation visual examinations, many potential reliability problems were identified such as weak bonds, electrical shorts and contamination.

TN786. **Methods for testing wire-bond electrical connections,** H. A. Schafft, Nat. Bur. Stand. (U.S.), Tech. Note 786, 23 pages (Nov. 1973) 50 cents, SD Catalog No. C13.46:786.

Key words: Bonding; electrical connection; failure (wire bond); integrated circuits; microelectronics; reliability; semiconductor devices; testing (wire bond); wire bond.

A significant fraction of the failures that occur in integrated circuits are due to failures of the wire-bond electrical connections that are used. Therefore, a critical area for reliability improvement is in the methods for testing and evaluating wire bonds. Several of these methods are surveyed. In particular, analyses with regard to the stress that the test imposes on the wire bond in the pull, centrifuge, mechanical shock, vibration and temperature cycling tests are presented and used in discussing the capabilities and limitations of these methods.

TN787. **Heuristic cost optimization of the Federal Telpak network,** R. G. Saltman, G. R. Bolotsky, and Z. G. Ruthberg, Nat. Bur. Stand. (U.S.), Tech. Note 787, 52 pages (June 1973) 80 cents, SD Catalog No. C13.46:787.

Key words: Communications network; computer program; heuristic; minimum cost; network configuration; optimization; Telpak rate structure.

A heuristic method of optimizing the design of a very large communications network is described. The procedure is employed to configure the routes of 5552 communications service requests involving 1633 nodes. A FORTRAN IV program was developed to solve for actual needs of the Defense Communications Agency for leased-line service employing the Telpak tariff structure.

TN788. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report January 1 to March 31, 1973,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 788, 79 pages (Aug. 1973) 95 cents, SD Catalog No. C13.46:788.

Key words: Base transit time; carrier lifetime; delay time; die attachment; electrical properties; electronics; epitaxial silicon; four-probe method; generation centers; germanium; gold-doped silicon; infrared response; methods of measurement; microelectronics; microwave diodes; probing techniques (a-c); pull test; recombination centers; resistivity; resistivity standards; semiconductor devices; semiconductor materials; semiconductor process control; silicon; S parameters; switching transients; thermal resistance; thermally stimulated properties; trapping centers; wire bonds.

This quarterly progress report, nineteenth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include (1) development of a comprehensive large-area test pattern for evaluating planar junction structures, (2) completion of experimental work on the evaluation of the destructive, double-bond pull test for wire bonds, (3) initiation of a scanning electron microscope facility, and (4) completion of the investigation of the mechanism of emitter-base junction reverse breakdown during rapid switching of transistors. Because of the general applicability of the last of these, details are presented in a separate appendix. Work is continuing on measurement of resistivity of semiconductor crystals; characterization of generation-recombination-trapping centers in silicon; study of gold doped silicon; development of the infrared response technique; evaluation of wire bonds and die attachment; measurement of thermal properties of semiconductor devices; determination of S-parameters, delay time, and related carrier transport properties in junction devices; development of a-c probing techniques; and characterization of noise and conversion loss of microwave detector diodes. Supplementary data concerning staff, standard committee activities, technical services, and publications are included as appendices.

TN789. **Technical options for energy conservation in buildings**

National Conference of States on Building Codes and Standards and National Bureau of Standards Joint Emergency Workshop on Energy Conservation in Buildings held at the U.S. Department of Commerce Washington, D.C., June 19, 1973, Nat. Bur. Stand. (U.S.), Tech. Note 789, 184 pages (July 1973) $2.35, SD Catalog No. C13.46:789.

Key words: Building design; energy conservation; mechanical systems.

The purpose of this report is to provide reference material on he technical options for energy conservation in buildings. It was prepared for the National Conference of States for Building Codes and Standards-National Bureau of Standards Joint Emergency Workshop on Energy Conservation in Buildings held at he U.S. Department of Commerce in Washington, D.C. on June 19, 1973.

This report describes actions pertinent to existing buildings and new buildings. Regarding existing buildings, principal topics include summer cooling, winter heating, and other energy conserving features—i.e., insulation, fenestration, lighting, appliances, domestic hot water, and human comfort. Suggested actions include those which can be accomplished voluntarily or without expense, and also actions which require some modest effort or expense on the part of the building owner or occupant.

Regarding new buildings, energy conservation actions are described that deal with building design and mechanical systems. The report concludes with a summary of mechanisms for implementation of such actions and criteria for use in evaluation of them.

TN789-1. **Emergency workshop on energy conservation in buildings,** S. A. Berry, Nat. Bur. Stand. (U.S.), Tech. Note 789-1, 31 pages (July 1975) SD Catalog No. C13.46:789-1.

Key words: building codes; buildings; energy conservation; standards.

This report contains the non-technical presentations given at the National Conference of States on Building Codes and Standards/National Bureau of Standards Joint Emergency Workshop on Energy Conservation in Buildings.

Presentations included in this document are those of other Federal Agencies, States, technical societies and industry organizations.

This document is a companion document to NBS Technical Note 789, "Technical Options for Energy Conservation in Buildings."

TN790. **MIDAS modular interactive data acquisition system—description and specification,** C. H. Pepenoe and M. S. Campbell, Nat. Bur. Stand. (U.S.), Tech. Note 790, 49 pages (Aug. 1973) 75 cents, SD Catalog No. C13.46:790.

Key words: Computer-controlled experiment; computer interfacing; data acquisition system; digital interface; instrumentation; laboratory automation; MIDAS; programmable controller.

The task of interfacing experiments to computers and data-logging systems should be made as painless as possible for the scientist. With this intent, MIDAS, a user-oriented, modular digital interface system based on CAMAC hardware and USASCII-bus data communication has been developed. MIDAS modules enable the experimenter to set up, program, modify and operate automated or computer-controlled experiments independently of the experts. Salient features of the concept are described and operating configurations discussed both with and without computer control. System interface requirements are specified in sufficient detail to enable one skilled in the art to design and construct modules operable within a MIDAS system.

TN791. **Dose calibrator pilot study,** S. B. Garfinkel and G. J. Hine, Nat. Bur. Stand. (U.S.), Tech. Note 791, 7 pages (Aug. 1973) 30 cents, SD Catalog No. C13.46:791.

Key words: Dose calibrators; indium-113m; molybdenum-99; nuclear medicine; radiopharmaceuticals; technetium-99m; tin-113.

Results of measurements of six sources in dose calibrators used in nuclear medicine facilities at eight hospitals in the Washington metropolitan area are given.

TN792. **Investigation of viscous flow in glass during phase separation,** J. H. Simmons, S. A. Mills, A. Napolitano, D. H. Blackburn, and W. K. Haller, Nat. Bur. Stand. (U.S.), Tech. Note 792, 43 pages (Sept. 1973) 65 cents, SD Catalog No. C13.46:792.

Key words: Glass; microstructure; phase separation; viscosity.

The isothermal viscosity of two borosilicate glasses, of which one is a commercial glass widely used for chemical glassware, shows a large increase (4 to 5 orders of magnitude) with heat-treatment time (ranging up to 100,000 min) near the annealing point. The two glasses have similar compositions, but differ greatly in their phase separation characteristics. Electron micrographs are used to analyze the development of microstructure during the suspected phase separation. In both glasses, it is found that the structure development is primarily responsible for the viscosity increase. An analysis of the data, and a theoretical interpretation of the effect are presented.

TN793. **Development of a procedure for measuring the noise of paper caps,** M. A. Cadoff, D. E. Mathews, and D. S. Blomquist, Nat. Bur. Stand. (U.S.), Tech. Note 793, 23 pages (Oct. 1973) 50 cents, SD Catalog No. C13.46:793.

Key words: Acoustics; cap guns; children; consumer safety; hearing damage; noise; paper caps; standard apparatus; toys.

In recent years, a great concern has been expressed for consumer protection and safety, especially for children. As an outgrowth of this concern, acoustical testing of potentially hazardous noise-producing toys has been carried out at the National Bureau of Standards for the Bureau of Product Safety (FDA) under the authority of the Toy Safety Act of 1969. This paper discusses in detail the testing work carried out on commercial cap guns and caps, which culminated in the development of a standard firing apparatus for testing paper caps. Engineering drawings of the standard apparatus are given as well as a recommended procedure for using this apparatus to test paper caps.

TN794. **NBS corridor fire tests: Energy and radiation models,** F. C. W. Fung, R. Suchomel, and P. L. Oglesby, Nat. Bur. Stand. (U.S.), Tech. Note 794, 127 pages (Oct. 1973) $1.40, SD Catalog No. C13.46:794.

Key words: Ceiling radiation; corridor fires; critical energy input; flame spread, calculation, and observations; floor covering evaluations; heat balances; heat transfer mechanisms; models, energy balance, radiation, and scaling.

The NBS corridor fire program is a continuing program to investigate the growth and spread of fire and smoke through a corridor when fire is initiated in an adjoining room. Due to recent fires involving floor coverings [1], and controversies over current floor covering flammability test methods, floor coverings have received special attention during the first phase of the cor-

ridor fire program. Results of the NBS program on corridor fires are presented under the unifying concepts of energy and radiation models. The major findings are: (1) One type of carpet fire hazard has been identified as the rapid flame spread over pile surface; (2) The dominant mechanism that causes this flame spread is energy transfer from ceiling radiation. This is substantiated by measurements and calculations; (3) Carpet evaluation by critical cumulative energy input into the corridor has been found to be feasible and informative in terms of heat transfer mechanisms; (4) Finally, a radiant panel test appears to be a promising approach to simulate the corridor environment for second generation flooring tests.

TN795. **Review of network management problems and issues,** A. J. Neumann, Nat. Bur. Stand. (U.S.), Tech. Note 795, 77 pages (Oct. 1973) $1.00, SD Catalog No. C13.46:795.

Key words: Academic computing; networks; network management; regional networks; research computing.

Computer networking is broadly considered including hardware, software, procedures and people. Networking encompasses many activities; such as, creation of network products, distribution processes, user activities, and supporting services like marketing, documentation, information services and maintenance. Network management covers both the establishment of networking operations and actual operation of the network facilities. It includes all management functions performed at such network nodes as computing centers, documentation facilities, and service distribution centers. In order to survey the problems facing development of network management, user requirements and system requirements are outlined in a qualitative manner. Examples of political, economic and legal constraints are summarized, such as the economic impact of extended networks on regional and local computing activities. Critical issues for networking management, and other areas of significant management concern are outlined. Organizational alternatives are conceived in terms of a four layer organization model. Conclusions deal with continuing problem areas, the need for a structural model for network management, critical experiments and tasks to be undertaken to further networking capabilities, and a suggestion to establish planning teams to initiate some of the initial steps required for further networking development.

TN796. **FRAME: An on-line correction procedure for quantitative electron probe microanalysis,** H. Yakowitz, R. L. Myklebust, and K. F. J. Heinrich, Nat. Bur. Stand. (U.S.), Tech. Note 796, 51 pages (Oct. 1973) 80 cents, SD Catalog No. C13.46:796.

Key words: Electron probe; mini-computer; on-line correction; quantitative microanalysis.

A procedure using a mini-computer for on-line correction of x-ray data from electron microprobe analysis has been developed. This program, called FRAME, allows mass fractions to be computed on-line by the ZAF approach. Besides x-ray intensities, the only input data required are the atomic numbers of the elements present, the analytical line being used, and the operating voltage. Other required parameters such as atomic weights and x-ray mass attenuation coefficients are stored or calculated by the program. FRAME is in FORTRAN IV, and requires about 4K of computer core. Results from FRAME are very close to those of COR2, which is considered to be the most accurate program available for quantitative electron probe microanalysis.

TN797. **Static language analysis,** G. Lyon, Nat. Bur. Stand. (U.S.), Tech. Note 797, 23 pages (Oct. 1973) 50 cents, SD Catalog No. C13.46:797.

Key words: Data archives; language use; programming aids; programming languages; source-statement analys syntax analysis.

Although many variants of programming languages exist, lit information is available on how language features are actua used by programmers. Several data collection schemes discussed here; each would provide empirical data on langua use. Some internal details are given for analyzers for FO TRAN and COBOL. In addition, a suggestion is made for a s cial systems option which would allow a compiler to conti ously record source statement characteristics or programs giv to it.

TN798. **Collaborative research program between NBS and Ind Scientific Institutions. Special foreign currency program 1 status,** H. S. Peiser, M. B. McNeil, and D. M. Bluebond, E tors, Nat. Bur. Stand. (U.S.), Tech. Note 798, 139 pa (Nov. 1973) $1.50, SD Catalog No. C13.46:798.

Key words: Binational research cooperation; internatio scientific cooperation; India science and technology; ph cal science research administration; research planni scientific research abstracts; Special Foreign Currency.

An overview is given of grants awarded by the National l reau of Standards under the Special Foreign Currency Progr in India, authorized by Public Law 480 and its amendme Each grant is identified by title, principal investigator, institut in India, NBS monitor charged with working in close techni touch with the project in India, and the monitor's organizatio unit within NBS. The relevant work is then described bri under the three headings "Summary Description of Proj Goals," "Results and Implications to Date," and "List of Pu cations that Resulted from the Project." To demonstrate wide use of such grants over the entire Program Structure NBS, the grant descriptions are ordered by the elements of t Program Structure. Editorial comment on the significance purpose of the NBS/SFCP grant program is confined to a Fo word and Introduction. The editors judge this grant program have had a high benefit to cost ratio from the viewpoint of NI

TN799. **User procedures standardization for network access,** J. Neumann, Nat. Bur. Stand. (U.S.), Tech. Note 799, pages (Oct. 1973) 70 cents, SD Catalog No. C13.46:799.

Key words: Network access procedures; networking; st dardization; user protocols.

User access procedures to information systems have beco of crucial importance with the advent of computer netwo which have opened new types of resources to a broad spectr of users. This report surveys user access protocols of representative systems. Functional access requirements are c lined, and implementation of access procedures is analyzed means of a common methodology.

Qualitative assessment of standardization possibilities iden standardization candidates such as: system and user signals, line user entries, system requests, and network wide catego of message content.

TN800. **Computer networking: Approaches to quality service surance,** R. B. Stillman, Nat. Bur. Stand. (U.S.), Tech. N 800, 26 pages (Jan. 1974) SD Catalog No. C13.46:800.

Key words: compiler; computer network; documentati dynamic software analysis; interpreter; quality control; s ware testing; software verification; static software analy structured programming; system errors; system p formance; theorem-proving.

The problem of quality service assurance in a (generaliz

computer networking environment is addressed. In the absence of any direct, well-defined, quantitative measure of service quality and reliability, error collection and analysis is the only basis for service quality control. Therefore, mechanisms are described which facilitate reporting of operational errors, documentation of error corrections, and collection of system performance data. Since techniques for hardware quality control are well known, these mechanisms focus on collecting data which can be used to assess and control software quality. Finally, specific network facilities are described which support research in the area of software quality, and potential areas of new research using the network are identified.

TN801. **Research considerations in computer networking to expand resource sharing,** D. W. Fife, Nat. Bur. Stand. (U.S.), Tech. Note 801, 24 pages (June 1974) SD Catalog No. C13.46:801.

Key words: computer networking research; computer network management; management evaluation; resource sharing.

Computer networking technology is adequately developed now to support research and experimentation to expand computing resource sharing. Whether progress will be made depends upon organizational initiative among multiple institutions, to pool personnel and capital so as to effectively address the major issues in management approach, support and software design that limit the feasible interdependence of computing operations. The organizational requirements are partially revealed by examining progressive stages of resource sharing in organizational and operational terms rather than such technical aspects as load sharing or program sharing that have been introduced in the past. Five stages are identified, ranging from simply establishing multiple service access to the advanced stage where multiple institutions organize for joint development of new resources. A preliminary evaluation framework for new management arrangements results when these stages are mapped against the four functional levels inherent in computer network management. Future needs for networking experimentation and research are briefly described, and other NBS technical results are identified in context.

TN802. **Network user information support,** A. J. Neumann, Nat. Bur. Stand. (U.S.), Tech. Note 802, 27 pages (Dec. 1973) 60 cents, SD Catalog No. C13.46:802.

Key words: Computers; consultation; documentation; information support; networks; on-line support; user needs; user support.

With increasing interest in the development of computer networks and the proliferation of remote entry capability from user terminals, user support takes on new dimensions. Some user characteristics are outlined as they affect user support. User support requirements are identified for training, terminal operation, and general information to aid in network operations. Support capabilities include on-line aids, information available on request, and tutorial information available at the terminal. User support also includes pertinent documentation and human consultation. Areas of future research are identified as: interactive language design, tutorial design, integration of hard-copy and on-line capabilities, and further development of user feedback capability.

TN803. **A guide to networking terminology,** A. J. Neumann, Nat. Bur. Stand. (U.S.), Tech. Note 803, 29 pages (Mar. 1974) SD Catalog No. C13.46:803.

Key words: computer networks; glossary; telecommunications; teleprocessing; terminology; vocabulary.

A selected set of terms and definitions relating to computer networking is presented in a coherent manner. An introduction gives the rationale for the glossary, defines the scope by a brief tutorial overview, and states the glossary format and conventions. The glossary is arranged alphabetically and contains about 140 definitions and associated terms. The sources of many terms are cited and modifiers indicate the status of definitions. A complete listing of source material is appended.

TN804. **Review of computer networking technology,** R. P. Blanc, Nat. Bur. Stand. (U.S.), Tech. Note 804, 135 pages (Jan. 1974) SD Catalog No. C13.46:804.

Key words: computer networks; computer-to-computer transfers; interactive terminals; minicomputer-based systems; network configuration; remote job entry; resource sharing.

This report gives a descriptive summary of the technical characteristics of existing computer networks, including data communication technology and configuration related to support of resource sharing services for a computer network. Included are discussions of terminal support capabilities for the communications network and a development of relevant network terminology. The report concludes with a comparative evaluation of existing technological approaches to networking.

TN805. **Network management survey,** I. W. Cotton, Nat. Bur. Stand. (U.S.), Tech. Note 805, 91 pages (Feb. 1974) SD Catalog No. C13.46:805.

Key words: computer network; management; network, network management.

This report presents the results of a study of management practices in different computer networks. Five networks were chosen as typical of different approaches to network implementation and management: Defense Advanced Research Projects Agency (ARPA) Network, MERIT Network, Triangle Universities Computation Center (TUCC), Oregon State Regional Network and Tymnet, a commercial network. A common format is employed to survey each network. While the report is not intended to be prescriptive, some empirical observations are presented for each topic covered.

TN806. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report April 1 to June 30, 1973,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 806, 77 pages (Nov. 1973) $1.00, SD Catalog No. C13.46:806.

Key words: Beam leads; carrier lifetime; delay time; die attachment; electrical properties; electronics; epitaxial silicon; generation centers; gold-doped silicon; methods of measurement; microelectronics; microwave diodes; mobility; pull test; recombination centers; resistivity; resistivity standards; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; S-parameters; spreading resistance; thermal resistance; thermally stimulated properties; trapping centers; wire bonds.

This quarterly progress report, twentieth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Significant accomplishments during this reporting period include (1) completion of an initial identification of the more important problems in process control for integrated circuit fabrication and assembly as a basis for and expanded effort to be conducted in cooperation with ARPA, (2) completion of preparations for making silicon bulk resistivity wafer standards available to the industry, and (3) undertaking of new work to establish the relationship between carrier mobility and impurity density in silicon and to investigate test patterns for use in

process control and evaluation. Because of the general applicability of the first of these, a summary of the findings is presented in a separate appendix. Work is continuing on measurement of resistivity of semiconductor crystals; characterization of generation-recombination-trapping centers, including gold, in silicon; evaluation of wire bonds and die attachment; study of scanning electron microscopy for wafer inspection and test; measurement of thermal properties of semiconductor devices; determination of S-parameters and delay time in junction devices; and characterization of noise and conversion loss of microwave detector diodes. Supplementary data concerning staff, standards committee activities, technical services, and publications are also included as appendices. This is the last report in this form; future reports in this series will appear under the title, Semiconductor Measurement Technology.

TN807. **Building performance in the 1972 Managua earthquake,** R. N. Wright and S. Kramer, Nat. Bur. Stand. (U.S.), Tech. Note 807, 155 pages (Nov. 1973) $1.60, SD Catalog No. C13.36:807.

Key words: Building codes; buildings; earthquakes; hazards; natural disasters; structures.

Following the Managua, Nicaragua, earthquake of Dec. 23, 1972, a team of engineers representing the U.S. Department of Commerce's National Bureau of Standards (NBS) and the National Academy of Engineering (NAE) performed field investigations in Managua, Nicaragua, from Dec. 26, 1972, to Jan. 4, 1973. The objectives were to assist the Nicaraguan government in surveying major buildings to determine whether each was suitable for emergency use, repairable, or appropriate for clearance. The team also viewed the patterns of successful performance and damage to identify needs for improvements in building practices for mitigation of earthquake hazards and opportunities for more detailed investigations which could provide information for future improvements in practices. In general, the damages cannot be attributed to unusual intensities of ground shaking or severity of surface faulting. Most damages appeared to result from deficiencies in building practices; deficiencies which had been exhibited many times before in previous earthquakes, deficiencies which would be avoided by implementation of up-to-date provisions for earthquake resistant design and construction. However, Managua did not employ a building code with seismic design requirements appropriate to its earthquake risk, and furthermore, did not have a building regulatory system capable of effective implementation of its building code provisions. This report documents the observations of damages by the NBS/NAE team and points out relationships to inadequacies in the building practices employed. Most of these inadequacies have been well known; however, the Managuan experience may serve as an incentive to improvement of building practices in many other areas which are subject to substantial earthquake risks and have not consistently accounted for these risks in their building codes and building regulatory system.

TN808. **Potential systems for lead hazard elimination: Evaluations and recommendations for use,** D. Waksman, J. B. Ferguson, M. Godette, and T. Reichard, Nat. Bur. Stand. (U.S.), Tech. Note 808, 192 pages (Dec. 1973) $1.95, SD Catalog No. C13.46:808.

Key words: Abrasion; adhesion; colorfastness; covering; flame spread; flash point; impact resistance; lead paint poisoning; materials; performance; properties; scratch resistance; smoke generation; toxic combustion products; toxicity; washability; water vapor permeance.

The National Bureau of Standards is providing technical support to the Department of Housing and Urban Development which is required by Public Law 91-695 (the Lead Paint Poisoning Prevention Act) to carry out a research program to evaluate and make recommendations regarding technology for the removal of the lead based paint hazard from the Nation's housing.

Potential hazard elimination methods have been identified by means of a survey of available technology. This report describes testing and evaluation methodologies used to determine (1) the suitability for use of a series of removal and lead barrier systems (2) the results of this evaluation, and (3) recommendations concerning the use of said systems.

Paint removal systems were evaluated in terms of the hazards that they present in the course of their use. Both the flammability and the toxicity of the solvents found in removers were considered. Covering systems were evaluated for their suitability for use as barrier layers over lead bearing paints in housing. The effectiveness of covering systems in protecting children from leaded paint, their fire hazard properties and functional properties which are related to their serviceability were considered in making this evaluation. The properties of the systems were assessed in terms of minimum acceptable performance levels and recommendations are given for their use in a field evaluation program.

TN809. **Government looks at privacy and security in computer systems. A summary of a conference held at the National Bureau of Standards, Gaithersburg, Maryland, November 19-20, 1973,** C. R. Renninger and D. K. Branstad, Eds., Nat. Bur. Stand. (U.S.), Tech. Note 809, 47 pages (Feb. 1974) SD Catalog No. C13.46:809.

Key words: computer systems, privacy and security; confidentiality; privacy; security.

This publication summarizes the proceedings of a conference held for the purpose of highlighting the needs and problems of Federal, State and local government in safeguarding individual privacy and protecting confidential data contained in computer systems from loss or misuse. The Conference was held at the National Bureau of Standards on November 19-20, 1973.

The origin of governmental problems is discussed in the context of the public's concern for privacy arising out of computer-based recordkeeping, the diverse legislative actions now being taken to safeguard privacy, the threats to the security of computer-based information systems and the technological problems associated with protecting against such threats. Useful distinctions are drawn between privacy, confidentiality and security to clarify the issues and allocate responsibilities for solving the problem among lawmakers, technologists and management.

Major needs are described. These include the need for cohesive Federal, State and local legislation, technological guidelines and standards for assuring uniform compliance with legislative requirements; management guidelines for identifying and evaluating threats to security; and improved technological mechanisms for controlling access to computer systems and networks. Cost implications of providing security measures are discussed.

TN810. **Fire incidents involving sleepwear worn by children ages 6-12,** J. A. Slater, Nat. Bur. Stand. (U.S.), Tech. Note 810, 23 pages (Dec. 1973) 50 cents, SD Catalog No. C13.46:810.

Key words: Accidents; burns; children; clothing fires; deaths; FFACTS; fire; flammable fabrics; injury; sleepwear; standards; statistics.

Sleepwear was the first fabric item ignited more frequently than any other item in over 1,900 fire incidents reported to the

ional Bureau of Standards Flammable Fabrics Accident e and Testing System (FFACTS). Information acquired e promulgation of the current sleepwear flammability stan- l protecting children of ages 0-5 indicates a problem of com- able magnitude exists for children of ages 6-12. Of 316 in- nts involving non-contaminated sleepwear that was first to te, about one-fourth involved children 0-5 years old and one- rth involved children 6-12 years old. For the 6-12 group, pwear ignited first more often than all other garment items bined. Females outnumbered males 4-to-1 in the 6-12 group, mostly to the involvement of nightgowns and kitchen ranges, most common ignition source for this age group. Five of the 2 year old children died and 52 of 74 victims were hospital- l. Almost all of the first-to-ignite sleepwear in this group was on. Data from Shriners Burns Institute and the National n Information Exchange provide further evidence of the in- vement of children ages 6-12 in garment fires. It is recom- nded that a new standard be issued covering sleepwear sizes rough 14 to effectively protect 6-12 year old children.

811. **Evaluation of the column connections used in a precast oncrete modular housing system,** F. Y. Yokel and T. W. eichard, Nat. Bur. Stand. (U.S.), Tech. Note 811, 63 pages Mar. 1974) SD Catalog No. C13.46:811.

Key words: building system; column connection; concrete triaxial strength; ductility; neoprene bearing pad; Operation Breakthrough; performance test; precast concrete; structural design.

The column connections used in a housing system employing cked precast concrete box modules were tested to evaluate ir structural performance. The system was proposed for con- uction in Operation Breakthrough, a research and demonstra- n program sponsored by the Department of Housing and ban Development. The system uses innovative structural sign concepts, which include: confinement of the concrete in vicinity of the column bearings by reinforcing ties in order to rease concrete compressive strength; neoprene pads between umn bearings in the upper stories; steel-neoprene-steel sand- ch in the lower stories; and a grouted dowel through the center the columns to provide resistance to tension and shear.

The test program included the following: tests to determine the ect of various bearing pads on the load capacity of the connec- n; tests to determine the load-deformation characteristics of neoprene pads; a test to determine the performance of a ver-story connection using a steel-neoprene-steel sandwich d a grouted dowel; and tests to evaluate the strength and duc- ty of the connections when subjected to a shear force. The test sults are presented and interpreted and the findings are sum- arized. Supersedes NBSIR 73-148 (PB 220366/7).

812. **Tensile behavior of boron/epoxy-reinforced 7075-T6 alu- minum alloy at elevated temperatures,** D. J. Chwirut and G. F. Sushinsky, Nat. Bur. Stand. (U.S.), Tech. Note 812, 31 pages Mar. 1974) SD Catalog No. C13.46:812.

Key words: aluminum alloy; boron/epoxy; co-cure; composite materials; fabrication process; load-deformation characteristics; residual stress; rule of mixtures; sandwich specimen; stress-strain curves; tensile properties.

Static tensile tests were performed on specimens of 7075-T6 minum alloy, 0° unidirectional boron/epoxy, and 7075-T6 minum alloy reinforced on the surface with 0° unidirectional ron/epoxy laminate, at four temperatures up to 300 °F (149). Analytical load-strain curves are formulated for the rein- ced-metal specimens using the rule of mixtures, assuming that longitudinal strains in the composite and the metal remain ial, and taking account of the residual stresses caused by the rication process. Two analytical curves are plotted for each reinforced-metal specimen, one based on the measured ply thickness of the composite, and one based on a nominal 0.005-in (0.13-mm) ply thickness. In general, the experimental load-strain curves fall between the two analytical curves for each specimen.

TN813. **NBS Reactor: Summary of activities July 1972 to June 1973,** R. S. Carter, Nat. Bur. Stand. (U.S.), Tech. Note 813, 135 pages (Feb. 1974) SD Catalog No. C13.46:813.

Key words: activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1972 through June 1973. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics and neutron standards to sample irradiations for activation analysis, isotope production and radiation effects studies.

TN814. **A mechanized information services catalog,** B. Marron, E. Fong, and D. Fife, Nat. Bur. Stand. (U.S.), Tech. Note 814, 56 pages (Feb. 1974) SD Catalog No. C13.46:814.

Key words: bibliographic data bases; computer-based systems; information services; information systems.

NBS is mechanizing a catalog of currently available information sources and services. Information from recent surveys of machine-readable, commercially-available bibliographic data bases, and the various current awareness, batch retrospective, and interactive retrospective services which can access them, has been correlated and converted into a machine-readable data base. A prototype searching capability has been established on an operational interactive retrieval system. Reasons for establishing the catalog and the choice of the initial information are detailed and the prototype implementation is described. Sample queries are included, as well as a to-date listing of the catalog. Plans for future development are discussed.

TN815. **Fire accidents involving the ignition of sleepwear worn by children under the age of three,** E. A. Tyrrell, Nat. Bur. Stand. (U.S.), Tech. Note 815, 23 pages (Feb. 1974) SD Catalog No. C13.46:815.

Key words: accidents; burn injuries; case histories; children's sleepwear; fabric fires; FFACTS; fires; flammable fabrics; garment fires; ignition sources; standards.

Accident case histories of children under age 3 involved in sleepwear fires are examined in detail. Of 434 persons involved in sleepwear ignition incidents in the NBS Flammable Fabrics Accident Case and Testing System as of January 1973, 101 were children under age 6; 22 of these were children under age 3. In 15 of these 22 accidents, the child was a victim of his own actions, while in 7 more accidents, the child played a passive role in the ignition sequence. Matches and kitchen ranges were the most frequent ignition sources found for this group of children. Seven of these small children died; the remaining 15 victims sustained burn injuries covering from one to 65 percent of their bodies. Most of the sleepwear items involved in these 22 accidents were made of cotton and 14 of these 22 items were pajamas. Children under age 3 were most frequently involved in fire accidents during the morning hours in the kitchen or bedroom. Only one child was under the supervision of an adult at the time of the accident. From the information found in the case history reports, an analysis of the severity of the injuries received by the victims was made and it was determined that the severity of the injuries received by one of the 3 infants under the age of one and 15 of the remaining 19 one- and two-year-olds probably would have been reduced if they had been afforded the protection of a flammability standard.

TN816. **Engineering and construction manual for an instrument**

to make burn hazard measurements in consumer products, L. A. Marzetta, Nat. Bur. Stand. (U.S.), Tech. Note 816, 48 pages (Feb. 1974) SD Catalog No. C13.46:816.

Key words: consumer products; contact temperature; thermesthesiometer; thermometry.

Surface temperature measurement alone is insufficient to establish the hazard of human contact with a hot or cold object. A metal surface is more likely to cause thermal injury than a plastic surface at the same temperature. An instrument equipped with a measuring probe has been developed for indicating the tissue temperature that would be experienced if human contact were made with the hot surface in question. The correct value of interface contact temperature can be read for a selected contact time without knowing the composition or temperature of the heated material under test.

A detailed set of instructions and drawings for assisting in the construction of the device is included in the manual. Several test procedures are described for use in checking the performance of the measuring probe and instrument.

TN817. **Kitchen ranges in fabric fires,** A. K. Vickers, Nat. Bur. Stand. (U.S.), Tech. Note 817, 23 pages (Apr. 1974) SD Catalog No. C13.46:817.

Key words: accidents; burns; FFACTS; flammable fabrics; garments; ignition sources; injuries; kitchen ranges.

Kitchen ranges played a major role in the 1616 fabric accident case histories recorded in the Flammable Fabrics Accident Case and Testing System as of May 1972. They accounted for 214 or 35 percent of the direct garment ignitions in FFACTS. Female victims outnumberd males by 3 to 1; females under 16 and over 65 were particularly heavily represented. Reaching over and leaning against the range caused the majority of the garment ignitions. Shirts, robes, pajamas, nightgowns and dresses were the most frequently ignited garments. Thirty-four victims died from injuries resulting from garment ignitions from ranges; 24 of these fatalities were people over 65 years old.

TN818. **Occupant behavior in building fires,** A. I. Rubin and A. Cohen, Nat. Bur. Stand. (U.S.), Tech. Note 818, 28 pages (Feb. 1974) SD Catalog No. C13.46:818.

Key words: disaster research; high rise building fires; occupant safety.

Fire safety in buildings is important in building design and the formulation of codes and standards. However, an examination of the information concerning the *needs* of occupants in fire emergencies (as opposed to ensuring a degree of structural integrity for the building) indicates that the scientific information base is woefully inadequate. The increasing prominence of high rise buildings having many occupants intensifies the need for better information about the behavior of occupants during fire emergencies. Fire researchers have indicated that it is often not feasible to evacuate buildings because of time constraints. Instead, designers use techniques such as safe areas within buildings and requiring people to respond differentially, based on their particular location. This approach emphasizes communications and warning systems to transmit messages. These systems such as loud noises or blinking lights should be designed to "take advantage" of the usual responses made by people. Occupants can actively be a part of the fire warning and fighting system instead of being unwilling victims. This possibility is pursued and a human factors approach is taken to suggest some means of better understanding the capabilities of occupants.

TN819. **A technical index of interactive information systems,** D. W. Fife, K. Rankin, E. Fong, J. C. Walker, and B. A. Marron, Nat. Bur. Stand. (U.S.), Tech. Note 819, 73 pages (Mar. 1974) SD Catalog No. C13.46:819.

Key words: bibliographic systems; computer programs computer syst ems; data base; data management; informa tion retrieval; information services; interactive system query language; software selection; text processing.

This report constitutes a reference to technical features an operational status of interactive information systems, i.e. thos providing a "conversational" usage mode to a "non-pro grammer" through a data terminal device. It is aimed at the ADI service manager, for his use in the state-of-the-art assessment preparatory to a detailed system selection process. It contains a index that describes 46 systems in terms of a list of over 5 technical features plus descriptive, identification, an background information. In addition, there are aids and exam ples contributing to the intended use of the index.

TN820. **Complete clear text representation of scientific document in machine-readable form,** B. C. Duncan and D. Garvin, Na Bur. Stand. (U.S.), Tech. Note 820, 55 pages (Feb. 1974) SI Catalog No. C13.46:820.

Key words: graphic character sets; information analysi centers; information interchange codes; recordin typewriters; scientific computer technology.

Science and technology use a large variety of symbols t represent physical properties, chemical formulas and mathemat cal expressions.

Data centers that codify and evaluate physical properties nee to use this conventional symbolism in their work. It is recom mended that these data centers adopt the symbols and terminol gy specified by the various International Unions both in manu operations and in the creation of machine-readable data bases.

It is demonstrated that these conventional symbols can b produced by modern communications devices that are compat ble with the international standard codes for information in terchange. A set of characters suitable for representing scientifi data and text is presented and proposed as an extension of th ISO information interchange code.

The use of this extended character code by computer oriente data centers at the National Bureau of Standards is describe The equipment needed for this level of performance and criteri for their selection are outlined.

TN821. **Photometric data variability of automotive lighting com ponents,** B. G. Simson and J. Mandel, Nat. Bur. Stand. (U.S. Tech. Note 821, 15 pages (Mar. 1974) SD Catalog N C13.46:821.

Key words: Federal Motor Vehicles Safety Standards; in terlaboratory test evaluation; motor vehicles; photometri testing; safety standards.

Four automotive lighting components were tested in thre commercial testing laboratories to estimate the degree photometric data repeatability and reproducibility. The laborat ries used the photometric testing techniques required by Feder Motor Vehicle Safety Standard No. 108. The precision of th test method was placed in a range of about 10 percent coefficie of variation. However, this value should be considered more an indication of existing conditions than as a predictive param ter.

TN822. **A review of Federal and military specifications for flo coverings,** W. C. Wolfe, Nat. Bur. Stand. (U.S.), Tech. No 822, 99 pages (Apr. 1974) SD Catalog No. C13.46:822.

Key words: carpets; floor coverings; government; pe formance; procurement; specifications; standards; test user needs.

In this manual, which is organized so as to aid ready reference, requirements and test methods in Federal and military specifications for flooring, or floor coverings are combined, indexed and reviewed. The manual covers carpet, resilient flooring, monolithic surfacings or seamless flooring, and polyurethane coatings related to seamless flooring. It also covers all serviceability requirements except those relating to flammability, fire safety and acoustical properties.

Physical and material requirements in Federal specifications for floor coverings are considered in separate sections. Military specifications for monolithic surfacings and Federal specifications for floor coverings and polyurethane coatings are summarized in comprehensive tables. Under each physical requirement, comments indicate whether it is a quality control or a performance requirement. Each comment is followed by a list of those Federal specifications which include the requirement and a brief description of the criteria and test methods in the specifications. Comments on materials requirements relate to their adequacy and applicability to the product for which they were written. Finally, recommendations are made for improvements in performance requirements which should be considered for inclusion in future flooring and floor covering specifications.

TN823. **Cryogenic Physics Section, summary of activities 1973,** R. J. Soulen, Jr., Ed., Nat. Bur. Stand. (U.S.), Tech. Note 823, 23 pages (Mar. 1974) SD Catalog No. C13.46:823.

Key words: Josephson junctions; noise thermometer; nuclear orientation; paramagnetism; superconductivity; temperature.

This report summarizes the research activities of the Cryogenic Physics Section which specifically relate to thermometry. The topics range from superconductive fixed points to nuclear orientation thermometry, as well as Josephson junction noise thermometry and paramagnetism.

TN824. **A laboratory study of some performance characteristics of an aluminum oxide humidity sensor,** S. Hasegawa, L. Greenspan, J. W. Little, and A. Wexler, Nat. Bur. Stand. (U.S.), Tech. Note 824, 28 pages (Mar. 1974) SD Catalog No. C13.46:824.

Key words: aluminum oxide sensor; humidity; humidity sensor; hygrometer; measurement of frost points; moisture measurement; water vapor measurement.

A laboratory study was made of the performance of aluminum oxide humidity sensors over a range of ambient temperatures from +20 °C to − 60 °C encompassing dew points from +18 °C to frost points of − 100 °C. Information was obtained on such characteristics as sensitivity, hysteresis, temperature effect, pressure-altitude effect and short-term and long-term repeatability. The sensors were found to be capable of detecting frost points as low as − 100 °C at ambient temperatures of − 40 °C and − 60 °C. It is estimated that the total uncertainty inherent in these sensors is approximately 4 °C.

TN825. **Properties of selected superconductive materials—1974 supplement,** B. W. Roberts, Nat. Bur. Stand. (U.S.), Tech. Note 825, 1974 Supplement, 88 pages (Apr. 1974) SD Catalog No. C13.46:825.

Key words: bibliography; composition; critical fields; critical temperature; crystallographic data; data compilation; low temperature; superconductive materials; superconductivity.

This report includes data on additional superconductive materials extracted from a portion of the world literature up to mid-1973. The data presented are new values and have not been selected or compared to values (except for selected values of the elements) previously assembled by the Superconductive Materials Data Center. The properties included are composition, critical temperature, critical magnetic field, crystal structure and the results of negative experiments. Special tabulations of high magnetic field materials with Type II behavior and materials with organic components are included. All entries are keyed to the literature and a list of reviews centered on superconductive materials is included. Extends NBS Technical Note 724.

TN826. **Cost-benefit analysis of computer graphics systems,** I. W. Cotton, Nat. Bur. Stand. (U.S.), Tech. Note 826, 47 pages (Apr. 1974) SD Catalog No. C13.46:826.

Key words: computer graphics; cost-benefit analysis; cost-effectiveness; economics; performance evaluation.

This report assesses the state-of-the-art in cost benefit analyses of computer graphics systems and suggests an approach for developing improved methodology. Cost-benefit analyses are distinguished from analyses of system performance in that the latter are directed at optimizing system performance at a given level of investment, while the former are directed at justifying the investment itself.

Computer graphic system design alternatives are first outlined. Then methods of analyzing the performance and costs of computer systems in general and graphic systems in particular are discussed. With this information it is shown how cost-effectiveness analyses may be performed. The next crucial step is to conduct benefit analysis, an ill-defined art. The results of benefit analysis must be combined with cost-effectiveness analysis in order to perform the desired cost-benefit analysis.

An experimental methodology is suggested for better performing benefit analyses of computer graphic systems. A more rigorous formulation of the cost-benefit procedure is then outlined. No attempt is made in this report to actually perform such an analysis.

TN827. **Controlled accessibility workshop report. A report of the NBS/ACM Workshop on Controlled Accessibility, Rancho Santa Fe, Calif., Dec. 10-13, 1972,** S. K. Reed and D. K. Branstad, Eds., Nat. Bur. Stand. (U.S.), Tech. Note 827, 86 pages (May 1974) SD Catalog No. C13.46:827.

Key words: access control; computer security; controlled accessibility; EDP management control; identification; measurement; security audit.

A report has been prepared of the NBS/ACM Workshop on Controlled Accessibility, December 1972, Rancho Santa Fe, Calif. The Workshop was divided into five separate working groups: access controls audit, EDP management controls, identification, and measurements. The report contains the introductory remarks outlining the purpose and goals of the Workshop, summaries of the discussions that took place in the working groups and the conclusions that were reached. A list of participants is included.

TN828. **Measures for air quality (1972-1973). Annual report-FY 1973,** J. R. McNesby, Nat. Bur. Stand. (U.S.), Tech. Note 828, 143 pages (May 1974) SD Catalog No. C13.46:828.

Key words: air pollution; measurement; standard reference material; water pollution.

This report is a project-by-project description of the Measures for Air Quality program covering the fiscal years 1972 and 1973. Participation in the program is bureau-wide but the program office operates out of the Institute for Materials Research. Although air pollution measurement science has formed the major thrust of the program, it has been extended in FY 73 to include the beginnings of a water pollution effort to respond to new needs, particularly those arising out of the requirements of the Federal Water Pollution Control Act of 1972. A report on the MAQ program for FY 72 was not issued. However, the project

reports in the current document include progress made during FY 72 for those FY 73 projects which were active in FY 72. Where a project was terminated at the end of FY 72 its description is included in the present document with appropriate notation.

In water pollution the situation is much more complex since there are many more pollutants in more types of water that will be subject to control under the Federal Water Pollution Control of 1972. When a pollutant is of concern in the discharge permit program, water quality standards, the toxic pollutant list and in the specimen bank program, the state of the measurement art is scrutinized at NBS and the need for development assessed.

TN829. **Multicommodity network plotting via program NETPLT,** Z. G. Ruthberg, G. R. Bolotsky, and W. Slater, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 829, 67 pages (June 1974) SD Catalog No. C13.46:829.

Key words: communication network; multicommodity network; network; network display; plotting algorithm; plotting program.

In the design and operation of complex networks, it is often an advantage to obtain a visual representation that readily allows for a quick appraisal of the network's current configuration or of its changed appearance due to variations of its nodes and links. The program NETPLT enables a user to plot the two leading characteristics of any multicommodity network: (1) nodes and links and (2) the multiple source-sink structure (multi-commodity property). The unique feature of NETPLT is its unambiguous planar representation of links. NETPLT uses an arc of a circle instead of the usual straight line, to represent a connector between a node pair (link).

TN830. **NBS cryogenic thermometry and the proposed cryogenic extension of the IPTS,** G. Cataland, R. P. Hudson, B. W. Mangum, H. Marshak, H. H. Plumb, J. F. Schooley, R. J. Soulen, Jr., and D. B. Utton, Nat. Bur. Stand. (U.S.), Tech. Note 830, 32 pages (May 1974) SD Catalog No. C13.46:830.

Key words: acoustical thermometry; γ-ray anisotropy thermometry; noise thermometry; nuclear magnetic resonance; nuclear quadrupole resonance; paramagnetism; superconductivity; temperature.

This article outlines a comprehensive and long-term program being carried out by NBS scientists of the Cryogenic Physics and Temperature Sections. The goals of the program are the extension of IPTS 68 below 13.81 K and the development of devices which make practical realizations of that scale convenient and reliable. We propose to contribute to international adoption of a thermodynamically accurate scale below 13.81 K by analyzing the results of three thermometers: the NBS Acoustical Thermometer (already in operation for several years), noise thermometry using the Josephson effect (recently developed), and γ-ray anisotropy thermometry (recently studied in detail at NBS). Such a temperature scale will most likely be disseminated by the use of certain superconductors as thermometric reference points. Practical interpolation devices will be based on the principles of nuclear and electronic paramagnetism, nuclear quadrupole resonance, and nuclear magnetic resonance. Details of operation, measurement schemes and experimental progress made to date are included in nine appendices.

TN831. **Introduction to liquid flow metering and calibration of liquid flowmeters,** L. O. Olsen, Nat. Bur. Stand. (U.S.), Tech. Note 831, 60 pages (June 1974) SD Catalog No. C13.46:831.

Key words: calibration; liquid flow; liquid flowmeters; metering.

These notes are intended to serve as an instruction manual for technicians and engineers engaged in metering liquids and calibrating liquid flowmeters. It is a condensed review of the properties of liquids and the mathematical relations required in this work. References to more complete sources of properties of liquids, theoretical relations and instructions for metering liquids are included. Separate chapters discuss liquids and their properties as they affect flow, the theory of incompressible flow of liquids and the measurements required in the metering of liquids. One chapter describes several different apparatus and their use in the calibration of liquid flowmeters. The last chapter contains brief descriptions of the many types of flowmeters such as differential pressure, positive displacement, electromagnetic and ultrasonic. It also includes a discussion of the physical principles involved in their design and use.

TN832. **Report on planning session on software engineering handbook,** S. L. Stewart, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 832, 18 pages (Nov. 1974) SD Catalog No. C13.46:832.

Key words: programming; quality software; software engineering.

This report from a planning committee sponsored by the National Bureau of Standards, the National Science Foundation, and the Association for Computing Machinery discusses the need for, coverage of, and audience for a proposed Software Engineering Handbook.

TN833. **Fire department ground ladders—results of a preliminary study,** H. P. Utech, Nat. Bur. Stand. (U.S.), Tech. Note 833, 82 pages (July 1974) SD Catalog No. C13.46:833.

Key words: aluminum; fire department; ladders; performance requirements; standards.

The key performance requirements for fire department ground ladders were determined. Existing ladder standards were reviewed and found to be unnecessarily restrictive in some areas and inadequate and unrealistic in others. Included in the report are metallurgical studies of three ladders that failed in service as well as a correlation of hardness with tensile and yield strength for 6061-T6 alloy.

TN834. **Information handling needs within the U.S. Patent Office,** S. Jeffery, Nat. Bur. Stand. (U.S.), Tech. Note 834, 17 pages (June 1974) SD Catalog No. C13.46:834.

Key words: administrative operations; data handling; data storage and retrieval; information handling technology; information processing; intellectual process; patent examination; Patent Office; patent storage; production statistics.

This paper examines aspects of the Patent Office's needs that make it different from other existing information retrieval systems. The paper than reviews current technology and assesses its ability to provide effective and economical tools to aid the Patent Office.

TN835. **Tabulation of published data on electron devices of the U.S.S.R. through December 1973,** C. P. Marsden, Nat. Bur. Stand. (U.S.), Tech. Note 835, 130 pages (Nov. 1974) SD Catalog No. C13.46:835.

Key words: electron devices; electron tubes; semiconductors; U.S.S.R.

This tabulation includes data on U.S.S.R. electron devices as collected from publications, mostly handbooks, published by the various ministries and institutes of the U.S.S.R. Information is given on all active devices ranging from receiving to microwave devices, semiconductor devices, and miscellaneous devices such as photographic flash tubes and thermistors. Supersedes NBS TN715.

TN836. **Detector actuated automatic sprinkler systems—a preliminary evaluation,** R. L. P. Custer, Nat. Bur. Stand. (U.S.), Tech. Note 836, 27 pages (July 1974) SD Catalog No. C13.46:836.

Key words: bedding fires; design criteria; detector actuated automatic sprinklers; detectors; levels of protection; life safety; sprinklers.

An investigation was conducted to evaluate the capabilities of a detector actuated automatic sprinkler system to protect individuals who are intimately associated with the first materials ignited such as bedding materials. Tests were conducted in a simulated nursing home bedroom. System response was evaluated for both smoldering and open flaming ignition sources. It was determined that barring electrical or mechanical failure the system could be nearly 100 percent effective with smoldering fires. The effectiveness with open flaming fires was difficult to evaluate. Although these fires were extinguished with minimum damage in times as short as 36 seconds the possible effects of flammable blankets and sleepwear were not tested. It was estimated that perhaps one third of the potential victims of open flaming fires might be saved. Although these tests were limited in scope, some tentative design criteria for detector actuated sprinkler systems are presented and possible alternatives offered.

TN837. **Barrier penetration tests,** R. T. Moore, Nat. Bur. Stand. (U.S.), Tech. Note 837, 191 pages (June 1974) SD Catalog No. C13.46:837.

Key words: barrier penetration; intrusion detection; intrusion resistance; physical security.

Sixteen structural barrier panels were tested to determine their resistance to forcible penetration through the use of readily available tooling. Thirteen of these represented experimental techniques to reinforce an existing structural barrier of low penetration resistance; the other three were designs which would be most appropriate to consider as replacement barriers. Minimum man-passable sized openings were made in the barriers in working times which averaged 7.85 minutes and ranged from 1.52 to 25.56 minutes. One of the replacement and two of the reinforcing designs showed superior cost-effectiveness.

Seven woven, wire-mesh security fence specimens were also tested for their intrusion deterrence capability. The test results indicate that the deterrent influence of unelectrified fences of the type tested is largely psychological rather than physical. All of the specimens could be penetrated in 0.14 minutes or less.

Samples of the acoustical and vibrational data produced during the penetration tests add to the growing body of data which are expected to be useful in the design and selection of electronic intrusion alarm equipments.

TN838. **The use of weather and climatological data in evaluating the durability of building components and materials,** L. W. Masters and W. C. Wolfe, Nat. Bur. Stand. (U.S.), Tech. Note 838, 101 pages (Aug. 1974) SD Catalog No. C13.46:838.

Key words: accelerated aging; building components and materials; climatological data; durability; environmental factors; long-term tests; short-term tests; weathering factors.

The durability of building components and materials is dependent, to a large extent, on the in-service environment to which they are subjected in service. Thus, the prediction of durability requires knowledge of the service environment.

Weathering factors, which comprise one group of environmental factors, are the subject of this report. The objectives of this report are to indicate how, in the present state of knowledge, weather and climate data can be used to aid in quantifying weathering factors so that durability tests for building components and materials may be designed.

TN839. **Fire detection: The state-of-the-art,** R. L. P. Custer and R. G. Bright, Nat. Bur. Stand. (U.S.), Tech. Note 839, 119 pages (June 1974) SD Catalog No. C13.46:839.

Key words: fire detection; fire detection code requirements; fire detector testing and standards; fire detectors; fire signatures.

The current state-of-the-art in fire detection technology is reviewed considering the nature of fire signatures, detection modes used, test methods, performance requirements and code requirements for fire detection. Present trends in standards development and recommendations for future work are included. An extensive bibliography is provided.

TN840. **Reference materials for collaborative tests of air quality methods,** R. H. Johns and J. K. Taylor, Nat. Bur. Stand. (U.S.), Tech. Note 840, 17 pages (Aug. 1974) SD Catalog No. C13.46:840.

Key words: air pollution; chemical analysis; Standard Reference Materials.

Reference materials and associated distribution apparatus were developed for seven ambient air contaminants and for two smokestack contaminants. These established the reference base for collaborative tests of ASTM procedures for ambient air quality and smokestack emissions carried out under a three-year program known as Project Threshold.

TN841. **Review of reverberant sound power measurement standard and recommendations for further research,** Nat. Bur. Stand. (U.S.), Tech. Note 841, 24 pages (Aug. 1974) SD Catalog No. C13.46:841.

Key words: acoustics; noise; reverberation room; sound power; statistical room acoustics.

This report presents a critical review of American National Standard S1.21-1972, "Methods for the Determination of Sound Power Levels of Small Sources in Reverberation Rooms." This standard, as now embodied, represents a major advance in the state-of-the-art of reverberation room measurement of sound power. This report was prepared in order to identify additional analytical and experimental information needed for further refinement of this standard. This report presents a detailed critique of specific items in the standard. Indications are given of both general research areas for statistical room acoustics and of specific research areas for improved reverberant room sound power measurements.

TN842. **Concepts in quality software design,** S. L. Stewart, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 842, 89 pages (Aug. 1974) SD Catalog No. C13.46:842.

Key words: control structures; GOTO-less programming; program validation; programming; proofs of correctness; referential transparency; software quality; structured programming; top-down programming.

A seminar series on quality software, sponsored by the Systems and Software Division, was held at the National Bureau of Standards during the summer of 1972. This Note includes five of these seminars in edited form. (I) A brief background provides motivation for studies in software quality. The authors mention some factors which influence software manufacture, and propose measures which might quantify concepts of "software quality." Several approaches to establishing program correctness receive attention. (II) Elements of top-down programming are sketched out and then examined in detail. An extended critique of another

top-down experiment provides example material. (III) Powers of various structured control constructs are compared within a framework of weak and strong program equivalence. Results include a demonstration that Dijkstra's D-programs are strongly equivalent to programs built from functions and one-input/two-output predicates. (IV) After a review of Quine's notion of referential transparency, the author examines elements of good and bad programming practice. In addition, a table of programming proverbs provides guidance to a programmer, and should be especially useful to a novice. (V) Discussions on problem and program specification provide an introduction to a review of proof-of-correctness techniques. Then, noting some practical limitations on proving correctness, the author goes on to examine selected facets of program synthesis.

TN843. **A technical guide to computer-communications interface standards,** A. J. Neumann, B. G. Lucas, J. C. Walker, and D. W. Fife, Nat. Bur. Stand. (U.S.), Tech. Note 843, 111 pages (Aug. 1974) SD Catalog No. C13.46:843.

Key words: ADP standards; communications disciplines; computer networks; data communications.

A technical summary and guide is given for existing and forthcoming Federal and National standards on data communications pertinent to computer networking. Selected international standards and industry practices are included for completeness. Prepared to assist the application of standards within the World Wide Military Command and Control System, this handbook should be useful to all ADP system designers interested in uniform data terminal interfaces, character sets and codes, keyboard arrangements, and communications line disciplines for effective message exchange between computers.

TN844. **Designs for the calibration of small groups of standards in the presence of drift,** J. M. Cameron and G. E. Hailes, Nat. Bur. Stand. (U.S.), Tech. Note 844, 35 pages (Aug. 1974) SD Catalog No. C13.46:844.

Key words: calibration; calibration design; experiment design; instrumental drift; measurement process; statistical analysis; trend elimination.

The process of calibrating a small number of "unknown" standards relative to one or two reference standards involved determining differences among the group of objects. Drift, due most often to temperature effects, or a "left-right" polarity effect can bias both the values assigned to the objects and the estimate of the effect of random errors. This note presents schedules of measurements of differences that eliminate the bias from these sources in the assigned value and variances at the same time gives estimates of the magnitude of these extraneous components. The use of these designs in measurement process control is discussed and a computer program in BASIC is presented.

TN845. **Cost analysis for computer communications,** R. P. Blanc, Nat. Bur. Stand. (U.S.), Tech. Note 845, 40 pages (Sept. 1974) SD Catalog No. C13.46:845.

Key words: computer networking; cost study; interactive terminals; value-added networks.

This report summarizes a communication cost study relevant to the needs of the NSF Networking for Science Program. The primary purpose of this report is to provide an approximation to the communications costs of connecting a specified number of host computers in selected locations with a specified number of interactive user terminals. Cost factors from existing, proposed, and modeled value-added networks are applied to hypothetical traffic demands to arrive at cost estimates.

TN847. **Dataplot 70: Fortran-callable plotting routines,** C. V. Young and P. G. Stein, Nat. Bur. Stand. (U.S.), Tech. Note 847, 32 pages (Oct. 1974) SD Catalog No. C13.46:847.

Key words: digital plotter; graph; graphics; minicomputer plotter.

A description is given of Dataplot 70, a program which enables plotting 1) lines between pairs of X-Y coordinates and 2) a string of ASCII characters at a given X-Y coordinate on the electrostatic printer/plotter. Detailed instructions are provided enabling the user to 1) convert data to plotter format, 2) draw axis, 3) label axis, 4) scale data, 5) handle arrays, 6) produce symbols at end points, and 7) offset the origin. Hardware and software requirements as well as loading and operating instructions are given.

A sample FORTRAN calling program is included and each instruction is explained in detail. The output of the calling program is shown. Error messages produced by Dataplot 70 are explained.

TN848. **A bibliography of the Russian reference data holdings of the library of the Office of Standard Reference Data,** G. B. Sherwood and H. J. White, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 848, 20 pages (Sept. 1974) SD Catalog No. C13.46:848.

Key words: bibliography; reference data; Russian literature.

This text presents a listing of the Russian reference data holdings of the library of the Office of Standard Reference Data of the National Bureau of Standards as of March 1974. In addition to the bibliographic listing, information on the status of translations into English is given where available.

TN849. **A FORTRAN analyzer,** G. Lyon and R. B. Stillman, Nat. Bur. Stand. (U.S.), Tech. Note 849, 28 pages (Oct. 1974) SD Catalog No. C13.46:849.

Key words: computation and flow analysis; FORTRAN language use; programming aids; syntax analysis.

Details of a FORTRAN analysis package are presented. Examples illustrate a current operational level which gathers FORTRAN statement and frequency-of-execution statistics. Arguments support a simple technique for monitoring FORTRAN executions.

TN850. **Gasoline and gasoline container fire incidents,** E. A. Tyrell, Nat. Bur. Stand. (U.S.), Tech. Note 850, 34 pages (Jan. 1975) SD Catalog No. C13.46:850.

Key words: accidents; FFACTS; gasoline; gasoline containers; gasoline incidents; gasoline-related fires; ignition causing activities; ignition sources; volatile flammal liquids; volatile flammable liquids incidents.

Gasoline was involved in 72 percent of the 645 volatile flammable liquids fire incidents found in the NBS Flammable Fabrics Accident Case and Testing System as of December 1973. These gasoline incidents, particularly those that were container-related, were studied in detail. Male victims out-numbered females approximately 5 to 1. Both males and females, ages 6-7 were injured more frequently than would have been expected if the incidents for each sex had been distributed uniformly over age groups. Starting or tending an open fire caused ignitions most frequently and involved primarily males ages 13-45. Children were injured most from knocking over or dropping a container of gasoline close to an ignition source and playing with gasoline near an ignition source. Matches were the most frequent ignition source. Containers ranged from large gasoline cans to kitchen measuring cups, although gasoline cans were reported most often. The youngest children were involved most with some of the largest containers. The remaining victims were involved primarily with smaller, more easily managed containers. There was no indication that the gasoline containers, by themselves, contributed substantially to these incidents. The problem was one of human error—misuse or abuse of the gasoline, the container or both.

TN851. **Computer system capacity fundamentals,** D. J. Kuck, Nat. Bur. Stand. (U.S.), Tech. Note 851, 25 pages (Oct. 1974) SD Catalog No. C13.46:851.

Key words: capacity; computer; evaluation; measurement; performance.

A framework for the study of computer capacity is given by means of a definition of capacity in terms of speeds of various parts of a comuter as well as memory size. The calculation of theoretical capacity is given for several combinations of processor, memory, and I/O bandwidth for both overlapped and nonoverlapped machines. The tradeoff between primary memory size and I/O bandwidth is discussed in terms of the new definition.

TN852. **A study of wind pressures on a single-family dwelling in model and full scale,** R. D. Marshall, Nat. Bur. Stand. (U.S.), Tech. Note 852, 40 pages (Oct. 1974) SD Catalog No. C13.46:852.

Key words: aerodynamics; boundary layers; buildings; codes and standards; wind loads; wind tunnels.

Wind pressures measured on a single-family dwelling are compared with results obtained from a 1:80 scale model placed in a turbulent boundary layer. It is shown that the fluctuating components of surface pressures far exceed the mean or steady pressures and are well correlated over sizeable roof areas. The consistently low fluctuating pressure coefficients obtained from the wind tunnel model are attributed to improper simulation of the lower portion of the atmospheric boundary layer. Comparisons between actual loads and specified design loads suggest that certain current provisions are marginal for tributary areas and excessive for localized areas such as ridges, eaves and corners. A procedure for expressing loads on both localized and extended roof areas in terms of mean pressure coefficients and a peak factor is described.

TN853. **State building regulatory programs for mobile homes and manufactured buildings—a summary,** P. W. Cooke, H. K. Tejuja, R. D. Dikkers, and L. P. Zelenka, Nat. Bur. Stand. (U.S.), Tech. Note 853, 35 pages (Sept. 1974) SD Catalog No. C13.46:853.

Key words: building regulation; enforcement; evaluation; inspection; legislation; manufactured building; mobile homes; rules and regulations; state-of-the-art study.

Information describing State mobile home and manufactured building regulatory programs are presented in two series of summary tables. The tables provide information on salient elements of the enabling legislation and the administrative rules and regulations promulgated for each State program. Other features of the various enforcement programs, including the status of reciprocity for the interstate acceptance of mobile homes and manufactured buildings are also enumerated.

TN854. **A system of Fortran IV computer programs for crystal structure computations,** L. W. Finger and E. Prince, Nat. Bur. Stand. (U.S.), Tech. Note 854, 133 pages (Feb. 1975) SD Catalog No. C13.46:854.

Key words: computer programs; contour plotting; constrained refinement; crystallographic calculations; Fourier section; Fourier synthesis; least squares.

This report gives detailed descriptions and instructions for use of a system of programs for crystallographic calculations, including least-squares refinement with generalized systems of constraints, calculation of bond distances and angles with errors, Fourier synthesis, plotting of contours in Fourier maps, and preparation of structure factor tables for publication.

TN855. **An experimental technique for the evaluation of thermal transient effects on piezoelectric accelerometers,** C. F. Vezzetti and P. S. Lederer, Nat. Bur. Stand. (U.S.), Tech. Note 855, 48 pages (Jan. 1975) SD Catalog No. C13.46:855.

Key words: accelerometer; performance characteristics; piezoelectric; test method; thermal radiation; thermal transient; zero shift.

A simple, inexpensive method was developed for determining the effects of thermal transients on the zero output and sensitivity of piezoelectric accelerometers. Thermal transient stimuli are generated by an incandescent lamp and can be made to heat the top or side of the test accelerometer. Fourteen commercial accelerometers were tested using this technique. Zero shifts with magnitudes as high as 640 g_n* were observed. Zero shifts up to 2 percent of full-scale resulted from one-second duration transients, and up to 7 percent of full-scale from fifteen-second transients. These results were obtained at a radiation power density of 1.8 W/cm². No changes of accelerometer sensitivity exceeding experimental uncertainties were noted as a result of the thermal transients used.

TN856. **Note on a vibratory phenomenon arising in transducer calibration,** R. Kraft, Nat. Bur. Stand. (U.S.), Tech. Note 856, 13 pages (Feb. 1975) SD Catalog No. C13.46:856.

Key words: boundary initial problems; measurement; pressure transducer; transducer calibration; vibration.

By making appropriate physical approximations and idealizations a theoretical explanation is found for a vibratory phenomenon observed in calibrating pressure transducers inside thin liquid filled cylinders. The theoretical explanation requires proving the equivalence of two boundary initial problems which define the vibratory phenomenon. A short, general and complete proof of this equivalence is given.

TN857. **Real-time acquisition and processing of fluorimetry data,** P. S. Shoenfeld, Nat. Bur. Stand. (U.S.), Tech. Note 857, 45 pages (June 1975) SD Catalog No. C13.46:857.

Key words: analytical chemistry; computers; data acquisition; data processing; fluorimetry; laboratory automation; real-time.

The National Bureau of Standards Analytical Chemistry Division uses a centralized computer system to automate a number of experiments. Computer software for a fluorimetry application is described in this report. The file and program structure used is quite general and can be applied to other experiments as well.

TN858. **A program for survey of fire loads and live loads in office buildings,** C. Culver and J. Kushner, Nat. Bur. Stand. (U.S.), Tech. Note 858, 229 pages (May 1975) SD Catalog No. 13.46:858.

Key words: buildings; fire loads; occupancy live loads; load surveys; structural engineering; survey techniques.

The development of a survey program for determining the fire loads and live loads in office buildings is described. Considerations involved in planning the program which is directed toward establishing the factors affecting the loads in buildings are presented. The type of data to be collected and a data collection technique which utilizes visually observed information on the characteristics of building content items to determine weight are discussed. Procedures employed to select buildings to be included in a nation-wide office building load survey being conducted by the National Bureau of Standards and a sampling plan for selecting rooms to be surveyed in these buildings are also discussed.

TN859. **Literature search: Law enforcement facilities—planning, design, construction,** R. Kapsch and J. Stroik, Eds., Nat. Bur.

Stand. (U.S.), Tech. Note 859, 221 pages (Nov. 1975) SD Catalog No. C13.46:859.

Key words: architecture; bibliography; building; construction; design; law enforcement facilities.

Citations and abstracts are provided on literature concerning the planning, design, and construction of law enforcement facilities in the United States and in foreign countries. In addition, plans of 21 select law enforcement facilities are included.

TN860. **NBS reactor: Summary of activities July 1973 to June 1974,** R. S. Carter, Nat. Bur. Stand. (U.S.), Tech. Note 860, 143 pages (Apr. 1975) SD Catalog No. C13.46:860.

Key words: activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation; radiography.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1973 through June 1974. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics, and neutron standards and neutron radiography to sample irradiations for activation analysis, isotope production and radiation effects studies.

TN861. **A survey for the collection of professional opinion on selected fire protection engineering topics,** G. A. Harrison and J. L. Houser, Nat. Bur. Stand. (U.S.), Tech. Note 861, 30 pages (Mar. 1975) SD Catalog No. C13.46:861.

Key words: building construction; detectors; flame spread; furnishings; interior finishes; noncombustible; smoke development; sprinklers; survey.

A questionnaire survey on selected fire protection engineering topics was sent to 422 persons from every state and major city in the United States and, also, parts of Canada. The surveyed included architects, engineers, insurance and government representatives, academics, and fire services personnel. One hundred and eighty-six questionnaires were returned, a 46.2 percent return rate. This return rate is more than double the National average on survey returns. The questionnaire covered topics such as the adequacy of the term "noncombustible" as contained in the National Fire Protection Association's National Fire Code, hazards of fire loading concepts, code regulation and enforcement, furnishings, sprinkler systems and smoke detectors. In addition to the questionnaire data, many of the surveyed took the time to write in various unsolicited comments.

Although this survey does not represent a statistical study approach, it is the best effort to date to gather and document the current professional thinking on fire protection matters. When the data permitted, obvious and significant group thought ideas and patterns are documented. The objective of this survey is to collect and document professional opinions on selected fire protection engineering topics for the purpose of determining current professional thinking, and indications of future trends of thought.

TN862. **Application of ion beam milling to the characterization of cracks in metals,** L. K. Ives, A. Harper, and A. W. Ruff, Nat. Bur. Stand. (U.S.), Tech. Note 862, 29 pages (Apr. 1975) SD Catalog No. C13.46:862.

Key words: cracks; flaws; ion beam milling; metals; microscopy; surfaces.

The technique of ion beam milling coupled with subsequent optical and scanning electron microscopy has been applied as a means of detecting and characterizing small surface intersecting cracks. Two types of cracked specimens involving different metals were studied. Various orientations of the crack plane, crack direction, and ion beam were explored. The technique is capable of increasing the sensitivity for detection of small cracks and also removing distorted surface layers and revealing the crack more accurately.

TN863. **Fatigue tests of bituminous membrane roofing specimens,** G. F. Sushinsky and R. G. Mathey, Nat. Bur. Stand. (U.S.), Tech. Note 863, 32 pages (Apr. 1975) SD Catalog No. C13.46:863.

Key words: bituminous roof membranes; fatigue testing; flexural fatigue; performance criteria; roofing; temperature effects; tensile fatigue; test methods.

Tensile and flexural fatigue tests were performed on built-up roof membrane specimens (ASTM Designation: D2523-70) fabricated from four different material systems. The tensile fatigue tests were run under cyclic load control conditions while specimens tested in flexural fatigue were run under cyclic mid-span displacement control. Tests were run at ambient laboratory conditions, generally 70 ± 2 °F (21 ± 1 °C), and at 0 ± 2 °F (-18 ± 1 °C). Curves based on the experimental results are plotted relating the peak load or displacement to the median fatigue lifetimes for specimens fabricated from each material. Performance criteria for roof membranes subject to fatigue loading are recommended.

TN864. **Cost recovery in pricing and capacity decisions for automated information systems,** J. A. Dei Rossi, Nat. Bur. Stand. (U.S.), Tech. Note 864, 60 pages (Apr. 1975) SD Catalog No. C13.46:864.

Key words: automated information retrieval; cost benefit; public good; scientific and technical information; semi-public good; subsidization; total cost recovery; user charges.

This paper examines the cost-benefit implications of alternative pricing and capacity investment decisions for automated scientific and technical information retrieval systems. Two typical systems are examined and numerical examples presented. In the first system, search requests are entered on-site. The numerical examples show how setting price to maximize net social benefit precludes total cost recovery and implies subsidization. In the second hypothetical system, search requests are entered from remote access terminals. Allowance is made for random arrival rates, and distinction is made between system charges to users and other user incurred costs. With these refinements, the numerical examples show how, for certain ranges of output, total cost recovery is consistent with the maximization of net social benefit. The paper then examines the "public good" attributes of scientific and technical information retrieval systems and concludes that such systems can be viewed as "semi-public goods," since the information stored has the characteristics of a public good while access to this information has the characteristic of a private good. Based on the public good considerations and the numerical examples, the paper concludes that subsidization for the fixed costs is warranted to the extent that all reasonable alternatives which maximize net social benefit preclude total cost recovery.

TN865. **Critical electrical measurement needs and standards for modern electronic instrumentation,** P. Richman, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 865, 74 pages (May 1975) SD Catalog No. C13.46:865.

Key words: data conversion; dynamic measurements; electrical measurements; electronic instrumentation; signal conditioning; systems; time domain.

Recognizing the proliferation of sophisticated modern electronic instrumentation in the field of electrical measurement, the Electricity Division of the National Bureau of Standards

recently initiated a new program in the general area of dynamic measurements and standards in support of such instrumentation. Recognizing further that the vastness and complexity of the field would require, at the earliest stages of the program, identification of the most critical problem areas, the Electricity Division held a workshop on 23 and 24 September, 1974, at the Bureau's Gaithersburg site, to assist it in ascertaining just what these areas in fact were. The basic idea of the Workshop was to bring together a broadly representative group of some twenty-five leading manufacturers and prime users, working in a free and open atmosphere, in order to have them delineate the present and future critical support needs in the field of dynamic electrical measurements for modern electronic instrumentation, with emphasis on physical standards, standardized measurement methods, new calibration and measurement assurance services, relevant data, and most important, new measurement methodologies. The overall objectives of the Workshop were generally met, and a number of significant specific programs and projects consistent with the mission of the Electricity Division were identified.

TN866. **Chemical kinetic and photochemical data for modelling atmospheric chemistry,** R. F. Hampson, Jr., and D. Garvin, Eds., Nat. Bur. Stand. (U.S.), Tech. Note 866, 118 pages (June 1975) SD Catalog No. C13.46:866.

Key words: atmospheric chemistry; chemical kinetics; data evaluation; gas phase; photoabsorption cross section; photochemistry; quantum yield; rate constant.

A table of data for gas phase chemical reactions and photochemistry of neutral species is presented. Specifically, it gives preferred values for reaction rate constants, photoabsorption cross sections, and quantum yields of primary photochemical processes and also cites recent experimental work. It is intended to provide the basic physical chemical data needed as input data for calculations modelling atmospheric chemistry. An auxiliary table of thermochemical data for the pertinent chemical species is given in the appendix.

TN867. **Relationship of garment characteristics and other variables to fire injury severity,** L. B. Buchbinder, Nat. Bur. Stand. (U.S.), Tech. Note 867, 41 pages (June 1975) SD Catalog No. C13.46:867.

Key words: accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions.

This final report on an in-depth study of apparel fire accident variables focuses on the physical parameters of fabrics and garments involved in apparel fires and the relationship between these parameters and injury severity. Interactions between accident variables are summarized and recommendations for remedial action and further research are included. Garments involved in apparel fire accidents were classified by degree of fit and amount of the body covered. Fires in which the garment configurations involved covered over half the body (the dress/shift and pants/top configurations) were shown to be associated with more extensive burn injuries than fires involving configurations covering smaller areas (loose tops, fitted pants, and loose pants). Degree of fit could not be shown to be directly related to injury severity. Within garment configuration classifications, age was shown to be a major determinant of injury severity, with victims over 65 years of age receiving a significantly higher percentage of severe burns than those in the 21-65 age group. In accidents involving loose tops, fitted pants, and loose pants the presence of flammable liquids in the accident sequence appeared to be the dominant factor in determining injury level. In addition, when accidents involved flammable liquids, (1) the fabrics involved tended to be heavier, (2) the fit of the garment at point of ignition was closer, and (3) the proportion of cellulosic/synthetic blend and 100 percent synthetic fabrics was higher than in accidents which did not involve flammable liquids. Because of the many human and physical variables shown to be associated with an apparel fire accident, the author suggests a broad fire prevention program which includes both product regulation and public education.

TN868. **Statistical analysis of extreme winds,** E. Simiu and J. J. Filliben, Nat. Bur. Stand. (U.S.), Tech. Note 868, 52 pages (June 1975) SD Catalog No. C13.46:868.

Key words: building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds.

With a view to assessing the validity of current probabilistic approaches to the definition of design wind speeds, a study was undertaken of extreme wind speeds based on records taken at 21 U.S. weather stations. For the purpose of analyzing extreme value data, a computer program was developed, which is described herein. The following results were obtained: (1) the assumption that a single probability distribution is universally applicable to all extreme wind data sets in a given type of climate was not confirmed, and (2) predictions of 100-year wind speeds based on overlapping 20-year sets of data taken at the same station differed between themselves by as much as 100 percent. Similar predictions for 1000-year winds differed by as much as a few hundred percent. Since wind pressures are proportional to the square of the wind speeds, errors of such magnitude are unacceptably high for structural design purposes. It is therefore suggested that while, in principle, probabilistic methods provide the most rational approach to specifying design wind speeds, it is of the utmost importance that the possible errors inherent in this approach be carefully taken into account.

TN869. **Temperature section activity summary, 1974,** J. F. Schooley, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 869, 28 pages (June 1975) SD Catalog No. C13.46:869.

Key words: annual report; calibrations; progress report; standards; temperature scale; thermometry.

This report summarizes the progress in calendar 1974 of the technical program of the temperature section of the Heat Division, Institute for Basic Standards. Separate sections of the report are devoted to the various projects, to highlights of the year's activities, and to other agency interactions.

TN870. **Sampling techniques for electric power measurement,** R. S. Turgel, Nat. Bur. Stand. (U.S.), Tech. Note 870, 35 pages (June 1975) SD Catalog No. C13.46:870.

Key words: analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; simulation; wattmeter.

A system is described that determines average electric power by periodically sampling current and voltage waveforms and calculating the result from digitized values of measured instantaneous currents and voltages. System performance is modeled on a digital computer to investigate the effects of noise, harmonics and sampling time errors on the result of a simulated power measurement. With 15 bit analog-to-digital conversion and 512 measured sample points an accuracy of 0.01 percent can theoretically be obtained from dc up to 5 kHz.

TN871. **Geometrical calibration of the NBS electron scattering apparatus,** S. Penner, S. P. Fivozinsky, J. W. Lightbody, Jr., L. S. Cardman, and W. P. Trower, Nat. Bur. Stand. (U.S.), Tech. Note 871, 79 pages (June 1975) SD Catalog No. C13.46:871.

Key words: absolute cross section; beam profile; electron scattering; scattering angle; solid angle; spectrometer.

A comprehensive calibration of the geometry of the NBS electron scattering apparatus is described. A complete set of measured parameters is tabulated in this report. Combining these parameters with observed values of certain variables as described herein permits the accurate determination of the solid angle, scattering angle, and target angle for each cross section measurement made with the apparatus. The uncertainty in a cross section measurement due to the imprecision of the geometry calibrations is less than one part in 10^3.

TN872. **Computer program package for metric conversion: Reference manual,** R. K. Anderson and J. O. Harrison, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 872, 145 pages (July 1975) SD Catalog No. C13.46:872.

Key words: Caterpillar Tractor Co.; computer program; documentation; engineering drawing; General Motors Corporation; metric conversion; rounding; test problem; tolerance.

The programs in this package are designed to convert dimensions and other quantities appearing on engineering drawings from metric to U.S. customary units and vice versa. They were developed by Caterpillar Tractor Co. and General Motors Corporation. In addition to the programs themselves, the package contains documentation explaining how to get the programs running on different computers and how to use them, and test problems to permit users to verify that the programs run correctly on their own computers. The Caterpillar program converts 31 different metric units to their U.S. customary equivalents. In contrast, the General Motors programs convert in both directions but work with millimetres and inches only. The General Motors programs also use rounding conventions differing somewhat from those employed in the Caterpillar program. Both the Caterpillar and the General Motors programs are written in American National Standard FORTRAN and are suitable for use on a wide range of computers with little or no modification. The Caterpillar program is operated in batch mode while the General Motors programs are interactive.

TN873. **Electro-optical deflection measuring device,** R. A. Crist, R. D. Marshall, and H. I. Laursen, Nat. Bur. Stand. (U.S.), Tech. Note 873, 24 pages (Dec. 1975) SD Catalog No. C13.46:873.

Key words: buildings; deflections; instrumentation; structural response; wind loads.

The development and testing of an electro-optical device for the direct measurement of lateral deflections of tall structures are described. The device utilizes a tracking telescope mounted on a fixed reference and a light source attached to the structure of the level for which lateral deflections are to be measured. Operating characteristics of the system are based on the results of tests carried out over a period of several months in one of the elevator shafts of a 12-story building.

TN874. **Software testing for network services,** R. B. Stillman and B. Leong-Hong, Nat. Bur. Stand. (U.S.), Tech. Note 874, 40 pages (July 1975) SD Catalog No. C13.46:874.

Key words: dynamic analysis; NBS analyzer; NBS FORTRAN test routines; networking; systematic testing; testing tools.

This report is a first step toward indentifying effective software test and measurement tools, and developing a guide for their usage network-wide. The utility of two tools, the NBS FORTRAN Test Routines and the NBS Analyzer, is studied experimentally, and indications of their role in systematic testing in a networking environment are given.

TN875. **Interlaboratory intercomparisons of radioactivity measurements using National Bureau of Standards mixed radionuclide test solutions,** B. M. Coursey, J. R. Noyce, and J. M. R. Hutchinson, Nat. Bur. Stand. (U.S.), Tech. Note 875, 20 pages (Aug. 1975) SD Catalog No. C13.46:875.

Key words: environment; intercalibration; intercomparison; radioactivity; radionuclide; radiostrontium.

In 1973 the National Bureau of Standards (NBS) distributed three calibrated test solutions to interested laboratories. Two of these solutions each contained nine gamma-ray-emitting radionuclides that the participants were asked to identify and quantify. The third solution contained ^{89}Sr and ^{90}Sr-^{90}Y, and participants were asked to perform a quantitative radioactivity analysis of the mixture. The results reported by all of the participating laboratories are given here. Most of the activity values reported for the mixed gamma-ray-emitting solutions were within ± 20 percent of the corresponding NBS values, but less than half of the laboratories reported ^{89}Sr and ^{90}Sr-^{90}Y activity values both of which were within ± 20 percent of the NBS values.

TN876. **Exploring privacy and data security costs—A summary of a workshop,** J. L. Berg, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 876, 35 pages (Aug. 1975) SD Catalog No. C13.46:876.

Key words: computer security; data security; privacy; privacy costs; security costs.

On February 20, 1975, the ICST hosted a one-day round-table discussion on the economic aspects of privacy and data security costs. The workshop was chaired by Gary Bearden, U.S. Civil Service Commission. The participants were Walter L. Anderson, General Accounting Office; Richard A. Eberhart, Office of the Secretary, Department of Commerce; Earl P. Bassett, Jr. Vice President, 3M Company; Robert Caravella, Federal Trade Commission; Theodore Clemence, Bureau of Census; Richard L. Nolan, Harvard Business School; Stan Halper, Coopers and Lybrand; and Larry Simonette, Peat, Marwick, Mitchell and Company. The group discussed the benefits EDP managers or data base administrators might gain from the privacy requirements, the processes for identifying direct or hidden costs, and processes for allocating costs.

TN877. **A basis for standardization of user-terminal protocols for computer network access,** A. J. Neumann, Nat. Bur. Stand. (U.S.), Tech. Note 877, 29 pages (July 1975) SD Catalog No. C13.46:877.

Key words: command languages; computers; man-machine systems; networks; system commands; user protocols.

A user-terminal protocol is defined which enables a user at a terminal to access computerized information systems. The basic functions such as identification, authorization, and validation are outlined and various signals and messages making up the protocol are identified. The purpose of the paper is to establish a basis for standardization and development of a unified user protocol.

TN878. **The M40 fingerprint matcher,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 878, 14 pages (July 1975) SD Catalog No. C13.46:878.

Key words: computerized fingerprint identification; fingerprint; pattern recognition.

A procedure is described for automatically determining whether two fingerprint impressions were made by the same finger. The procedure uses the x and y coordinates and the in

dividual directions of the minutiae (ridge endings and bifurcations). The identity of the two impressions is established by computing the density of clusters of points in Δx, Δy space where Δx and Δy are the differences in coordinates that are found in going from one of the fingerprint impressions to the other.

TN879. **Fire buildup in a room and the role of interior finish materials,** J. B. Fang, Nat. Bur. Stand. (U.S.), Tech. Note 879, 49 pages (June 1975) SD Catalog No. C13.46:879.

Key words: buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; smoke; wood crib.

A variety of wall and ceiling panels in a full-scale room corner have been exposed to a fire from a standardized wood crib, simulating the environment produced by the burning of a single item of furniture, to evaluate their contribution to room fire growth. A total of twenty room corner tests were performed using selected combinations of eight wood-base and gypsum board-base interior finish materials on the walls and ceiling. Gas temperatures and velocities, surface temperatures, heat fluxes, smoke densities, and concentrations of oxygen, carbon dioxide and carbon monoxide were measured. Ignition times of newsprint, cotton fabric and plywood in the lower part of the room were also recorded. The results of these full-scale tests were compared with laboratory tests of the ease of ignition, surface flame spread, heat release rate and smoke generation on the same materials. The maximum upper room gas temperature has been found to agree with the ignition of such indicators as newsprint and plywood, and to represent a measure of fire hazard in terms of potential involvement of all combustible contents or room flashover. A temperature range of 450 to 650 °C appears to be the boundary between limited and full involvement.

TN880. **The service concept applied to computer networks,** M. D. Abrams and I. W. Cotton, Nat. Bur. Stand. (U.S.), Tech. Note 880, 38 pages (Aug. 1975) SD Catalog No. C13.46:880.

Key words: computer networks; interactive computing; man-machine interaction; performance measurement; time-sharing.

The Network Measurement System (NMS) represents the implementation of a new approach to the performance measurement and evaluation of computer network systems and services. By focusing on the service delivered to network customers at their terminals, rather than on the internal mechanics of network operation, measurements can be obtained which are directly relevant to user needs and management concerns. Furthermore, the type of measurement necessary to implement this approach can be made directly, without perturbing the network system under test.

This technical note introduces the service concept and other background information necessary to understand the need for and use of the NMS. The fundamental distinction between service and internal efficiency is clarified, both in general and in the environment of computer networks. A number of different measures of service are then discussed, followed by the presentation of several models of interactive use of networks. Then, the practical aspects of gathering data and applying this information to service measurement are reviewed, leading to a presentation of the NMS as it is implemented. The note ends with a discussion of applications for the NMS.

TN881. **Critical evaluation of data in the physical sciences—A status report on the National Standard Reference Data System, April 1975,** S. A. Rossmassler, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 881, 53 pages (Sept. 1975) SD Catalog No. C13.46:881.

Key words: atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; solid state data; standard reference data; thermodynamic data, transport properties.

This is a report on the status of the National Standard Reference Data System as of April 1975. Current activities and functions of the Office of Standard Reference Data are summarized. A complete list of data evaluation projects supported by the Office of Standard Reference Data during Fiscal Year 1975 is included; this list also includes projects which received financial support during the previous fiscal year, and which are still actively involved in some aspect of data compilation and evaluation. The list of projects includes continuing data centers in the United States whose activities fall within the scope of the system, but which are not formally affiliated with it. A list of publications resulting from the Standard Reference Data program is provided.

TN882. **Criteria for the performance evaluation of data communications services for computer networks,** D. S. Grubb and I. W. Cotton, Nat. Bur. Stand. (U.S.), Tech. Note 882, 36 pages (Sept. 1975).

Key words: computer communications; computer networking; data communications; networks; performance requirements; telecommunications.

In general, when telecommunications services are used as a means of interchanging information between information processing systems, or between terminals and systems, a number of parameters determine how well that interchange is performed. This report examines the following characteristics of telecommunications services: 1. Transfer Rate; 2. Availability; 3. Reliability; 4. Accuracy; 5. Channel Establishment Time; 6. Network Delay; 7. Line Turnaround Delay; 8. Transparency; 9. Security.

These terms are all defined and their significance discussed. The effects of these factors on data communication networks are illustrated.

TN883. **Waterproofing materials for masonry,** E. J. Clark, P. G. Campbell, and G. Frohnsdorff, Nat. Bur. Stand. (U.S.), Tech. Note 883, 86 pages (Oct. 1975) SD Catalog No. C13.46:883.

Key words: accelerated weathering; durability of waterproofing materials; masonry; performance criteria; waterproofing materials; water repellent materials.

The initial effectiveness and durability characteristics of fifty-five clear masonry waterproofing materials were evaluated using laboratory tests. This report contains the results of initial performance tests including water absorption, water vapor transmission, resistance to efflorescence and change in appearance. Durability tests, including periodic measurement of water absorption after exposures to accelerated weathering and outdoor exposures, were also conducted. Based on test results, performance criteria for clear waterproofing materials were developed. In addition, recommendations for the application of waterproofing materials were formulated. Finally, the report contains a summary of a survey concerning field experiences with waterproofing and a brief theoretical discussion of water flow.

TN884. **Calibration of unrecorded low and medium density type magnetic disk pack surfaces,** N. P. Goumas, Nat. Bur. Stand. (U.S.), Tech. Note 884, 23 pages (Oct. 1975) SD Catalog No. C13.46:884.

Key words: calibration factor; computer amplitude reference; computer storage media; disk calibration; disk

pack; magnetic disk; Standard Reference Surface; unrecorded disk surface.

This publication describes the design requirements and the operation of the NBS test bed that is used for calibrating unrecorded magnetic disk pack surfaces for low and medium density use. The signal level calibration is made with respect to a reference level that is derived from the NBS Standard Amplitude and Data Reference Surfaces that are held in repository at NBS. The techniques for calibrating the measurement system with the NBS repository Reference Surfaces and the calibration of candidate reference disks are described in detail.

TN885. **A technical review of the Nicaraguan building regulatory system,** R. N. Wright and I. A. Lamana, Nat. Bur. Stand. (U.S.), Tech. Note 885, 85 pages (Oct. 1975) SD Catalog No. C13.46:885.

Key words: architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety.

This report on the Nicaraguan Building Regulatory System has been prepared under the auspices of the Organization of American States and the United States Agency for International Development. It presents an overview of the building regulatory system in Nicaragua; its activities in review of designs, issuance of building permits, inspection of construction, control of quality of materials, and issuance of occupancy permits. The technical bases for these activities are the building code and standards, the laboratory facilities for control of the quality of building materials, and the processes for development and application of codes and standards. Recommendations address the status and development of this system and its technical bases.

The losses in the December 23, 1972, Managua Earthquake provided dramtic evidence of the need for effective implementation of good building standards. Repetitions of these tragic losses elsewhere in Nicaragua and in a reconstructed Managua are certain unless a good building code is developed and adopted, its use and design by architects and engineers enforced by careful review of designs, and the implementation of these designs by the builders assured by inspection of construction and testing of building materials. A summary and critical review of U.S. building regulatory practices for areas with severe natural hazards is presented in Appendix B for guidance in building regulatory system planning and development. A survey of housing performance in Managua is presented in Appendix C to illustrate that earthquake resistant construction is feasible and economical for Nicaragua and other nations with comparable resources.

TN886. **Modification of fluorescent luminaires for energy conservation,** R. W. Beausoliel, W. J. Meese, and G. Yonemura, Nat. Bur. Stand. (U.S.), Tech. Note 886, 15 pages (Oct. 1975) SD Catalog No. C13.46:886.

Key words: capacitors; energy conservation; fluorescent lamp; fluorescent luminaire; lighting efficiency; power factor.

Reducing energy consumption in existing buildings by reducing the number of lamps presents technical problems when more than one fluorescent lamp operates from a single ballast. A preliminary investigation was made whereby capacitors were substituted for one fluorescent lamp in a two-lamp luminaire which operated with a single ballast. Under optimum conditions, lighting efficiency (foot-candles per watt) was nearly as high at reduced power input as it was with two lamps operating normally. No failures in lighting equipment or capacitors occurred and no fire hazards, other safety hazards or other unsatisfactory occurrences were observed. A more thorough investigation involving a number of parameters is needed to ascertain the feasibility of this modification.

TN887. **Six data base management systems: Feature analysis and user experiences,** E. Fong, J. Collica, and B. Marron, Nat. Bur. Stand. (U.S.), Tech. Note 887, 84 pages (Nov. 1975) SD Catalog No. C13.46:887.

Key words: data base applications; data base management systems; selection criteria; software features; system evaluation; system features; user experiences.

This report presents an objective overview of features of six selected data base management systems (DBMS) and Federal user experiences with these systems. Application criteria were developed in order to aid in the evaluation and selection of DBMS.

The advantages of generalized DBMS over traditional methods of software system development are discussed. The criteria for choice of the six systems' features are presented. The data reported were gathered from two sources: vendors and users. Vendor information consisted of side-by-side presentation of features of the six DBMS. User experiences reported are summarized under appropriate headings. This information is used to derive application criteria for assessing the usability and operational suitability of DBMS to a variety of data processing requirements.

The six systems reviewed are: ADABAS, IMS/VS, INQUIRE, MODEL 204, SYSTEM 2000, and TOTAL.

TN888. **Nuclear Science Education Day,** F. J. Shorten, Ed., Nat. Bur. Stand. (U.S.), Tech. Note 888, 95 pages (Nov. 1975) SD Catalog No. C13.46:888.

Key words: biology; career; ecological; electricity; energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities.

These proceedings are a collection of invited papers given at the Nuclear Science Education Day Conference held on November 29, 1973 at the National Bureau of Standards, Gaithersburg, Md. The program was sponsored jointly by the ANS (Washington Chapter) and the NBS for secondary school science teachers and outstanding science students in the Washington area. Four main topics are covered: research and development in nuclear energy applications; man, environment and nuclear energy; nuclear science frontiers; and career opportunities in nuclear science. *These proceedings include the following papers (indented):*

Nuclear power: Everyone's involved, J. L. Liverman, *TN888*, pp. 1-12 (Nov. 1975).

Energy research and the Electric Power Research Institute, R. L. Loftness, *TN888*, pp. 13-33 (Nov. 1975).

The role of the public in the evaluation process, G. Charnoff, *TN888*, pp. 34-37 (Nov. 1975).

Assessing environmental effects, the risk and benefit concept, B. E. Leonard, *TN888*, pp. 38-45 (Nov. 1975).

Ecological monitoring techniques, B. Jensen, *TN888*, pp. 46-49 (Nov. 1975).

Radiation utilization in medicine and biology, V. P. Bond, *TN888*, pp. 50-61 (Nov. 1975).

Advanced concepts in applied nuclear science, G. A. Graves, *TN888*, pp. 62-76 (Nov. 1975).

Projected national and regional manpower needs for environmental and nuclear scientists, R. L. Murray, *TN888*, pp. 77-80 (Nov. 1975).

Educational opportunities at institutions of higher learning, D. Duffy, *TN888*, pp. 81-84 (Nov. 1975).

TN889. **Trace hydrocarbon analysis: The National Bureau of Standards Prince William Sound/Northeastern Gulf of Alaska baseline study,** S. N. Chesler, B. H. Gump, H. S. Hertz, W. E. May, S. M. Dyszel, and D. P. Enagonio, *Nat. Bur. Stand. (U.S.), Tech. Note 889,* 73 pages (Jan. 1976) SD Catalog No. C13.46:889.

Key words: baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbons; liquid chromatography; petroleum analysis; trace analysis.

The low concentration of hydrocarbons anticipated in pollution baseline studies necessitates the development of analytical techniques sensitive at the submicrogram per kilogram concentration level. The method of analysis developed in this laboratory involves dynamic headspace sampling for volatile hydrocarbon components of the sample followed by coupled-column liquid chromatography for the nonvolatile components. These techniques require minimal sample handling, reducing the risk of sample component loss and/or sample contamination. Volatile sample components are separated from the matrix in a closed system and concentrated on a TENAX-GC packed precolumn, free from large amounts of solvent and ready for GC/GC-MS analysis. Nonvolatile compounds, such as the benzpyrenes, may be extracted from large volumes of water and concentrated on a Bondapak C18 packed precolumn for coupled-column liquid chromatographic separation and analysis. Results of the application of these techniques are presented and discussed.

TN890. **Productivity measurement in R&D: Productivity measurement experiment (PROMEX) in selected research and development programs at the National Bureau of Standards,** J. T. Hall and R. A. Dixon, Nat. Bur. Stand. (U.S.), Tech. Note 890, 52 pages (Dec. 1975) SD Catalog No. C13.46:890.

Key words: impact; objectives, output; performance measurement; production indices; production measurement.

This report describes an experiment in productivity measurement conducted at the National Bureau of Standards. The experiment concludes that no matter how sophisticated the analysis and synthesis processes become, statistical counts of output media (e.g., publications, citations, invited talks) will not serve as reliable measures of R&D productivity.

The conduct of the experiment included a work sampling study, a communications study, an output analysis, a value analysis approach to developing criteria for selection and evaluation of programs, construct of a rating system for evaluation of programs, and construction of a model of the R&D process.

TN891. **Issues in fire vehicle replacement: Users' views and synthesis,** P. B. Saunders, R. H. F. Jackson, P. R. Meyers, and M. H. Pearl, *Nat. Bur. Stand. (U.S.), Tech. Note 891,* 19 pages (Jan. 1976) SD Catalog No. C13.46:891.

Key words: engine pumper; fire vehicle; ladder truck; maintenance; replacement; specifications; standards.

This report documents the findings and recommendations from a study of fire vehicle replacement procedures. Exploration of that subject proved to require consideration of related issues arising in : (1) writing apparatus specifications, (2) maintaining and repairing vehicles, and (3) obtaining spare parts. The topics and most of the recommendations described herein are synthesized directly from visits and/or telephone interviews with fire department officials across the country. The recommendations of the study call for greatly increased communication among departments, the development of standards for vehicle performance, maintenance staff size, etc., and national and/or regional centers for training personnel and establishing standard vehicle testing procedures.

TN892. **Retrofitting a residence for solar heating and cooling: The design and construction of the system,** J. E. Hill and T. E. Richtmyer, Nat. Bur. Stand. (U.S.), Tech. Note 892, 99 pages (Nov. 1975) SD Catalog No. C13.46:892.

Key words: retrofitted solar residence; solar collector; solar heating and cooling system; solar-powered absorption refrigeration.

During 1972 and 1973, the National Bureau of Standards conducted controlled laboratory tests on a factory-built four-bedroom house having a floor area of 110 m^2 (1200 ft^2) equipped with a conventional gas furnace and central electric air conditioner incorporated into a forced air distribution system. During 1974, the house was moved onto the NBS grounds and a solar heating and cooling system was designed to be added to the house. Calculations have been made to show that more than 75 percent of the yearly energy needs for heating, cooling, and supplying domestic hot water could be obtained from the sun.

This report deals with the design and construction of the retrofitted system. It consists of 45 m^2 (485 ft^2) of double-glazed, flat-plate solar collector, 5.7 m^3 (1500 gallons) of water storage, and a 10,000 W (3 ton) lithium bromide absorption air cooling unit.

TN893. **Computer programs for structural chemistry: MATCH1 and MATCH2, FORTRAN programs to predict and evaluate mutual orientation of polycrystals,** B. Dickens and L. W. Schroeder, *Nat. Bur. Stand. (U.S.), Tech. Note 893,* 71 pages (Jan. 1976) SD Catalog No. C13.46:893.

Key words: computer calculations; crystal structure; epitaxy; lattice misfit; pattern recognition; twinning.

Two computer programs to evaluate possible structural matches for use in epitaxy and twinning studies have been written in FORTRAN V for the UNIVAC 1108. They should be readily convertible to other comparable computers.

The first program, MATCH1, requires knowledge of the unit cell parameters. It obtains all matching networks in two unit cell lattices and sorts the matches into an order of probable epitaxy (or twinning if the two unit cells are the same) based solely on criteria of dimensional mismatch and network area.

The second program, MATCH2, requires knowledge of positional parameters of the atoms in the crystal structures. It calculates the degree of structural fit for slices supplied from visual inspection of the crystal structures or as matching networks determined by MATCH1.

The slice comparison is carried out in terms of the vector set of the environment of each atom in each slice. The procedure is not valid when the twin operation is a rotation about the normal of the compositional plane or a reflection in a mirror parallel to this plane. The atomic patterns comprising the slices are matched piece by piece in MATCH2. A third program, MATCH3, will match whole patterns once three fiducial atoms in each pattern have been picked from the output of MATCH2 and will handle all the twinning cases. MATCH3 will be described in a future National Bureau of Standards Technical Note.

TN894. **Apparatus for testing oceanographic resistance thermometers,** G. T. Furukawa and J. L. Riddle, *Nat. Bur. Stand. (U.S.), Tech. Note 894,* 59 pages (Jan. 1976) SD Catalog No C13.46:894.

Key words: bridge; deep-sea thermometer; high pressure; oceanographic thermometer; platinum resistance thermometer; pressure; pressure intensifier; pressure seal; pressure vessel; resistance; resistance thermometer; test; thermometer; thermometer leads; thermostated bath; vacuum; water tight.

The design and construction of an apparatus for testing resistance-type oceanographic thermometers to 6.89×10^4 kPa(10,000 psi) are described. Detailed operating procedures for the apparatus are given. The results of performance tests with the apparatus are discussed.

TN895. **An overview of floor slip-resistance research with annotated bibliography,** R. J. Brungraber, *Nat. Bur. Stand. (U.S.), Tech. Note 895,* 113 pages (Jan. 1976) SD Catalog No. C13.46:895.

Key words: building safety; floor surface friction; occupancy safety; slip-resistance; slip-resistance testers; walking friction.

Slips and falls in the home as well as in public buildings have reached serious proportions (8,000,000 accidents per year in the home, resulting in 9,600 deaths and 1,600,000 disabling injuries). This paper reviews the literature relating to this problem. Based on studies of kinesiology and anthropometry, the coefficient of friction between foot surfaces and floor surfaces is found to be a significant parameter controlling slips and falls. A review of the general study of friction and a critical appraisal of methods for determining the coefficient of friction on slip-resistance of floors leads to a guide for selection of slip-resistance criteria. The paper concludes with a discussion of the legal aspects of the problem and the present status of slip-resistance specifications.

TN896. **NBS Reactor: Summary of activities July 1974 to June 1975,** R. S. Carter, *Nat. Bur. Stand. (U.S.), Tech. Note 896,* 150 pages (Jan. 1976) SD Catalog No. C13.46:896.

Key words: activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1974 through June 1975. The programs range from the use of neutron beams to study of the structure and dynamics of materials through nuclear physics and neutron standards to sample irradiations for activation analysis, isotope production and radiation effects studies.

TN897. **Interpretation of data in the network measurement system,** S. W. Watkins and M. D. Abrams, *Nat. Bur. Stand. (U.S.), Tech. Note 897,* 46 pages (Mar. 1976) SD Catalog No. C13.46:897.

Key words: computer networks; data analysis; interactive; network service; performance evaluation; performance measurement; service.

The Network Measurement System (NMS) represents an implementation of a new approach to the performance measurement and evaluation of computer network systems and services. In this report, the interpretation of data within the NMS is described. These data have been acquired by the Network Measurement Machine (NMM) component of the NMS and are then interpreted by a Data Analysis Package (DAP), which produces meaningful information concerning the quality of network service delivered to interactive terminal users as well as a characterization of user demands and network communication facility utilization.

This report traces the flow of data from the time of capture by the minicomputer-based NMM through the several phases of modeling and structuring in the DAP. Included in this description is the statistical treatment of the data which provides quantitative measures of various aspects of network performance.

TN898. **A prototype semi-automated system for measuring air infiltration in buildings using sulfur hexafluoride as a tracer,** C. M. Hunt and S. J. Treado, *Nat. Bur. Stand. (U.S.), Tech. Note 898,* 24 pages (Mar. 1976) SD Catalog No. C13.46:898.

Key words: air infiltration instrumentation; air infiltration measurement; building ventilation rates; sulfur hexafluoride tracer.

A system is described which automatically operates a small gas chromatograph and measures parts per billion concentrations of sulfur hexafluoride (SF_6) in air. It samples air on a 10 minute cycle and records the response on a strip chart recorder. When SF_6 is distributed in the air of a building, data is obtained from which air infiltration rates may be determined.

TN899. **Development of proposed standards for testing solar collectors and thermal storage devices,** J. E. Hill, E. R. Streed, G. E. Kelly, J. C. Geist, and T. Kusuda, *Nat. Bur. Stand. (U.S.), Tech. Note 899,* 265 pages (Feb. 1976) SD Catalog No. C13.46:899.

Key words: solar collector; solar energy; solar radiation; standard; standard test; thermal performance; thermal storage.

A study has been made at the National Bureau of Standards of the different techniques that are or could be used for testing solar collectors and thermal storage devices that are used in solar heating and cooling systems. This report reviews the various testing methods and outlines a recommended test procedure, including apparatus and instrumentation, for both components. The recommended procedures have been written in the format of a standard of the American Society of Heating, Refrigerating, and Air Conditioning Engineers and have been submitted to that organization for consideration.

TN900. **Deflection performance criteria for floors,** R. A. Crist and J. R. Shaver, *Nat. Bur. Stand. (U.S.), Tech. Note 900,* 29 pages (Apr. 1976) SD Catalog No. C13.46:900.

Key words: deflection; dynamic; floor systems; human responses; performance criteria; serviceability; static; vibration.

Serviceability performance criteria for floor systems are discussed in terms of their static and dynamic components. Development of traditional static stiffness criteria is given along with a review of their strengths and weaknesses. Criteria for serviceable floors are presented from a vibration viewpoint and the derivation of an improved criterion is given. A new approach for future vibration criteria is described.

TN901. **Comparison of theoretical and experimental photoeffect data 0.1 keV to 1.5 MeV,** J. H. Hubbell and W. J. Veigele, *Nat. Bur. Stand. (U.S.), Tech. Note 901,* 43 pages (Apr. 1976) SD Catalog No. C13.46:901.

Key words: attenuation coefficients; cross sections; gamma rays; photoelectric effect; photons; x rays.

Graphs of calculated and experimental atomic photoeffect cross sections as a function of photon energy 0.1 keV to 1.5 MeV are presented for all elements Z=1 to 94. The calculated results presented are (a) the nonrelativistic Hartree-Fock self-consistent-field (SCF) results of Veigele, Henry, et al., over the range 0.1 keV to between 1.0 and 8.0 keV for all elements Z=1 to 94 and (b) the relativistic Hartree-Slater SCF results of Scofield over the range 1.0 keV to 1.5 MeV for all elements Z=1 to 101. The "experimental" data-points are derived by subtract-

ng theoretical scattering cross sections from total attenuation oefficient measurements in the literature. Differences between heoretical and experimental photoeffect data are typically a fac- or of two from 0.1 to 1.0 keV, 5-10 percent from 1.0 to 5.0 keV nd 1-5 percent from 5.0 keV up to energies, ranging from 20 eV for carbon up to 500 keV for lead, above which the photoef- ect cross section becomes fractionally too small to be accurately etermined from the total attenuation coefficient.

TN902. **Evaluation, revision and application of the NBS stylus/computer system for the measurement of surface roughness,** E. C. Teague, *Nat. Bur. Stand. (U.S.), Tech. Note 902,* 151 pages (Apr. 1976) SD Catalog No. C13.46:902.

Key words: amplitude density function; arithmetic average; autocorrelation function; average wavelength; kurtosis; minicomputer software; random error; skewness; surface microtopography; surface roughness; surface texture; systematic error.

This report describes in detail the hardware and software used t NBS to implement on a stylus instrument/minicomputer ystem the process of calibrating the system with an intererometrically measured step and the calculation of important haracterizations of surface profiles. The characterizations of a rofile which may be calculated include the arithmetic average alue, the mean square value, the amplitude density function, the utocorrelative function and the average wavelength. The report lso includes a statistical evaluation, using empirical and analytial techniques, of the calibration procedures' long term stability.

TN903. **The NIRA computer program package (Photonuclear Data Center),** H. J. Vander Molen and H. M. Gerstenberg, *Nat. Bur. Stand. (U.S.), Tech. Note 903,* 30 pages (Feb. 1976) SD Catalog No. C13.46:903.

Key words: central computer; computer programs; data manipulation; digital data; mass storage; NIRA; Photonuclear Data Center.

The Photonuclear Data Center's NIRA library of programs, executable from mass storage on the National Bureau of Standard's central computer facility, is described. Detailed instructions are given (with examples), for the use of the library to analyze, evaluate, synthesize, and produce for publication, camera-ready tabular and graphical presentations of digital photonuclear reaction cross-section data. NIRA is the acronym for Nuclear Information Research Associate.

TN904. **Correlation of floor vibration to human response,** J. R. Shaver, *Nat. Bur. Stand. (U.S.), Tech. Note 904,* 29 pages (May 1976) SD Catalog No. C13.46:904.

Key words: analysis; experimental; floor systems; human response; random process; spectral analysis; vib tion.

A new approach to the problem of perceptible floor vibrations is presented predicated on the realization that human activity and human response to this activity are random variables. Techniques for data reduction are discussed and a detailed description of one approach is given along with the associated computer program. Data from floor vibrations is compared with current criteria for human response to vibration.

TN905. **A test method for determining the effect of thermal transients on pressure-transducer response,** J. S. Hilten, C. F. Vezzetti, J. F. Mayo-Wells, and P. S. Lederer, *Nat. Bur. Stand. (U.S.), Tech. Note 905,* 52 pages (Mar. 1976) SD Catalog No. C13.46:905.

Key words: calibration; dynamic; electronic flash; photographic flashbulb; pressure; pressure measurement; pressure transducer; thermal transient; transducer; zero shift.

A test method for evaluating the effects of short-duration, thermal radiant-energy transients on pressure-transducer response is described. The method consists of monitoring pressure-transducer output (zero shift with the transducer at atmospheric pressure) as the transducer is exposed to radiation resulting from the ignition of a photographic flashbulb or from the discharge of an electronic flash. The method is intended to serve as an initial screening test. Thermal energy pulses as great as 0.1 J/cm^2, with durations of about 6 ms, have been generated using an electronic flash; pulses of up to 2.2 J/cm^2, with durations of about 37 ms, have been generated using No. 22 flashbulbs. In tests with No. 22 bulbs, 25 commercial pressure transducers have shown zero shifts ranging from 0.4 to about 400 percent of the full-scale output.

TN906. **A methodology for evaluating alternative technical and information management approaches to privacy requirements,** R. C. Goldstein, H. H. Seward, and R. L. Nolan, *Nat. Bur. Stand. (U.S.), Tech. Note 906,* 72 pages (June 1976) SD Catalog No. C13.46:906.

Key words: computer security; confidentiality; cost model; data security costs; PL 93-597; privacy; Privacy Act of 1974; privacy compliance techniques; privacy costs; privacy model; security costs.

Cost becomes an early concern in applying privacy safeguards to any computerized record-keeping system. To determine privacy cost impact one requires a concrete and rigorous approach that permits repeated analysis of carefully documented assumptions. Such a methodology appears in the work reported in the book *The Cost of Privacy* by Dr. Robert C. Goldstein. This report represents the application of that methodology to the technical requirements flowing from the Privacy Act of 1974 (PL 93-579).

The methodology presented reduces the legislation to 17 compliance steps. Each compliance step then decomposes into one or more specific actions required of the record-keeper. The actions, in turn, translate into the expenditure of different resources. The resources, in dollars, are computed by a set of algorithms collectively called a privacy model and implemented as a computer program.

The privacy model contains algorithms reflecting resource expenditures for 56 distinct actions. Written as a FORTRAN program, the model produces several printouts that show the user the consequences of the input data. In addition to a total cost for conversion and an annual operating cost, the model provides sub-total costs for each compliance step. The model's potential uses include the comparison of costs associated with alternative safeguards, the selection of an optimal set of cost-effective safeguards, and the analysis of those factors having the greatest impact on costs.

TN908. **Measurement of computer communication networks,** M. D. Abrams, S. Treu, and R. P. Blanc, *Nat. Bur. Stand. (U.S.), Tech. Note 908,* 95 pages (July 1976) SD Catalog No. C13.46:908.

Key words: communications networks; computer networks; cost; interactive service; measurement; measures; performance; usability.

This report is concerned with aiding those responsible for the procurement of computer services from a Remote Access Network by providing a description of the measures, tools, and techniques applicable to the performance measurement of com-

puter communication networks. Cost considerations are discussed as a major component of evaluation. Measurement and evaluation methodology are surveyed, including various operational tools and techniques. Some exemplary data are also presented. Although the constituents are already present, a neatly packaged methodological product, perhaps in the form of a well-structured user's guide to network performance measurement, is not yet available.

TN909. **Investigation of wind damage in the Metropolitan Washington, D.C. area, April 3-4, 1975,** F. Y. Yokel, C. W. Yancey, L. E. Cattaneo, and R. D. Marshall, *Nat. Bur. Stand. (U.S.), Tech. Note 909,* 65 pages (May 1976) SD Catalog No. C13.46:909.

Key words: building codes; design standards; masonry construction; roofs; siding; structural engineering; wind; wind damage; wind engineering.

A limited investigation was conducted of wind damage that occurred on April 3 and 4, 1975 in the Metropolitan Washington, D.C. area. Meteorological data indicate that the winds were somewhat less severe than those that should be anticipated by designers. Thus, most of the observed damage reflects inadequacies in design or construction. Damage was observed in occupied buildings, as well as in buildings under construction. Damaged elements of occupied buildings included: masonry curtain walls; masonry gable walls; masonry veneer; roofs with overhangs; roofing; and cladding. Damaged elements of buildings under construction included roofs and masonry walls.

TN910-1. **Self-study manual on optical radiation measurements: Part I—Concepts, Chapters 1 to 3,** F. E. Nicodemus, Ed., *Nat. Bur. Stand. (U.S.), Tech. Note 910-1,* 93 pages (Mar. 1976) SD Catalog No. C13.46:910-1.

Key words: optical radiation measurement; photometry; radiometry; spectroradiometry.

This is the initial publication of a new series of Technical Notes (910) entitled "A Self-Study Manual on Optical Radiation Measurements." It contains the first three chapters of this Manual. Additional chapters will be published, similarly, as they are completed. The Manual is a definitive tutorial treatment of the measurement of incoherent optical radiation that is complete enough for self instruction. Detailed chapter summaries make it also a convenient authoritative reference source.

The first chapter is an introduction that includes a description of optical radiation and the ray approach to its treatment in this Manual (based on geometrical optics), a discussion of relevant parameters and their use in a measurement equation as a systematic technique for analyzing measurement problems, and a presentation of the system of units and nomenclature used.

The second chapter, on the distribution of optical radiation with respect to position and direction, introduces the basic radiometric quantity, radiance, and its important invariance properties. It is shown how to determine the total power in a beam from the radiance distribution and to determine the distribution of radiance at any surface, through which the beam passes, in terms of the distribution at any other surface that also intersects the entire beam.

TN912. **The network measurement machine—A data collection device for measuring the performance and utilization of computer networks,** R. Rosenthal, D. E. Rippy, and H. M. Wood, *Nat. Bur. Stand. (U.S.), Tech. Note 912,* 91 pages (Apr. 1976) SD Catalog No. C13.46:912.

Key words: computer networks; data acquisition; man-machine interaction; minicomputer; network measurement; performance measurement.

The Network Measurement Machine (NMM) is a device used to acquire data for the performance measurement of computer network systems and services. By focusing on the service delivered to network customers at their terminals, measurements can be made that are directly relevant to user needs and to management concerns.

This technical report presents the details of a data acquisition device. The device is a minicomputer-based system that employs regular (off-the-shelf) and special purpose hardware under the control of a specially written software acquisition system. The technical aspects of inserting the NMM into the data communications portion of a computer network are discussed. The detailed nature of both the hardware and the software data acquisition system is presented with a discussion of the important design decision trade-offs.

TN913. **Modification of an NBS reference spectrophotometer,** K. L. Eckerle, *Nat. Bur. Stand. (U.S.), Tech. Note 913,* 43 pages (July 1976) SD Catalog No. C13.46:913.

Key words: averaging spheres; high accuracy transmittance; light averaging devices; linearity; photometric precision; reference spectrophotometer; ultraviolet; wavelength calibration.

The description of a new reference spectrophotometer capable of making transmittance measurements accurate to 0.0001 transmittance units has already been reported. The purpose of this publication is to describe some modifications that have been made to this instrument and to report some further measurements performed with it. The extension of the range of the instrument down to 200 nm, providing a capability for making measurements over the spectral range 200 to 800 nm, is outlined, and extensive testing of the light averaging effectiveness of several types of devices and spheres is reported here.

TN914. **A new dynamic pressure source for the calibration of pressure transducers,** C. F. Vezzetti, J. S. Hilten, J. F. Mayo-Wells, and P. S. Lederer, *Nat. Bur. Stand. (U.S.), Tech. Note 914,* 35 pages (June 1976) SD Catalog No. C13.46:914.

Key words: calibration; dynamic; dynamic calibration; dynamic pressure; dynamic pressure source; liquid column; pressure; pressure source; pressure transducer; sinusoidal pressure; transducer.

A dynamic pressure source is described for producing sinusoidally varying pressures of up to 34 kPa zero-to-peak, over the frequency range of approximately 50 Hz to 2 kHz. The source is intended for the dynamic calibration of pressure transducers and consists of a liquid-filled cylindrical vessel, 11 cm in height, mounted upright on the armature of a vibration exciter which is driven by an amplified sinusoidally varying voltage. The transducer to be calibrated is mounted near the base of the thick-walled aluminum tube forming the vessel so that the pressure-sensitive element is in contact with the liquid in the tube. A section of the tube is filled with small steel balls to damp the motion of the 10-St dimethyl siloxane working fluid in order to extend the useful frequency range to higher frequencies than would be provided by an undamped system.

The dynamic response of six transducers provided by the sponsor was evaluated using the pressure sources; the results of these calibrations are given.

TN915. **Metrication problems in the construction codes and standards sector,** C. T. Mahaffey, *Nat. Bur. Stand. (U.S.), Tech*

Note 915, 25 pages (June 1976) SD Catalog No. C13.46:915.

Key words: building regulations; dimensional coordination; metric conversion; planning and scheduling.

This report is a response to a request for an outline of problems to be faced by the building standards development and building regulatory sectors of the American building industry. It includes a discussion of the SI metric units themselves, giving examples of the conventions regarding their use adopted in other countries to illustrate the nature of the decisions that must be made by the U.S. building industry. It discusses the relationship of dimensional coordination to the metric conversion effort, its impact on the U.S. building regulatory system and illustrates some of the decisions these sectors need to make. It also discusses some of the organizational problems required to involve all segments of the industry in this decision-making process, and for implementing these decisions in a coordinated way on a national scale.

TN916. **Software exchange directory for university research administration,** Z. G. Ruthberg and G. R. Bolotsky, *Nat. Bur. Stand. (U.S.), Tech. Note 916*, 215 pages (Apr. 1976) SD Catalog No. C13.46:916, $2.80.

Key words: directory; equipment management software; fiscal administration software; grant/contract software; personnel management software; proposal/award software; research administration; software exchange; software summary; software survey; space management software; university systems.

The Institute for Computer Sciences and Technology (ICST) at the National Bureau of Standards (NBS) has developed a Software Exchange Directory for the University Research Administration under a contract with the Research Management Improvement Program (RMIP) at the National Science Foundation (NSF). The one hundred Universities and Colleges receiving the largest Federal funding for research and development were sent an Office of Management and Budget (OMB) approved survey instrument developed for this purpose at ICST. Seventy-five institutions sent responses suitable for 83 Directory entries under Administrative Information and 315 Directory entries under Software Package Summaries. An administrative entry contains information on the reporting unit, the basic administrative structure and parameters, computer usage, automated functional areas, and comments. A package entry contains a functional description, software and hardware characteristics, history, availability and comments. The administrative entries have been indexed by funding size, size of research staff, number of Federal granting agencies, and number of contracts and grants awarded in Fiscal Year 1974. The software packages have been indexed by function, computer used and language used. The detailed entries and indexes should help open communication channels for this community of computer users and thus maximize transferability of these programs between institutions. They also draw a comprehensive state-of-the-art picture of this area of computer use.

TN917. **A review of network access techniques with a case study: The network access machine,** R. Rosenthal, *Nat. Bur. Stand. (U.S.), Tech. Note 917*, 36 pages (July 1976) SD Catalog No. C13.46:917.

Key words: access procedures; command language; computer networks; job control language; macros; minicomputers; protocols; teleprocessing.

The computer industry's ability to serve a diverse and expanding user community is evidenced by the rapid growth of computer network services. Computer service providers design and market their own offerings as they deem best, given their own market and their own set of resources. This has led to a proliferation of similar resources requiring different user access procedures. With emphasis on currently operating and planned systems that assist users in accessing available network services, this report identifies the techniques used in network access devices. By examining these devices, the trend toward improving the interface between the user and the computer is brought more clearly into focus and up to date.

One specific solution—A Network Access Machine (NAM)—is described in detail. The NAM is a minicomputer system that acts as a network access point for a user at his terminal and assists the user through the automatic execution of access procedures. This minicomputer facility allows the user to specify (or to have specified) his own network command sequences for execution on a specified network and host connected to that network. Computer responses are analyzed to assure agreement with those anticipated for specific commands. Conditional parameterized expansions allow the use of the same commands on different host computer and different networks.

TN918. **Survey of building code provisions for historic structures,** M. Green and P. W. Cooke, *Nat. Bur. Stand. (U.S.), Tech. Note 918*, 47 pages (Sept. 1976) SD Catalog No. C13.46:918.

Key words: building codes; cities; health and safety; historic preservation; states.

In order to resolve conflicts between health and safety objectives and historic preservation objectives, a number of states and cities have adopted special building code provisions. A survey was conducted to determine the extent of adoption of such special provisions. The survey included the states, territories and member cities of the Association of Major City Building Officials (AMCBO). The survey responses revealed that sixteen of the forty-seven responding states have special provisions or regulations as do fifteen of the twenty-four responding cities. The majority of states and cities have established a special preservation appeals board. Legislation and special provisions are reviewed in the report. Recommendations for additional research are included.

TN919. **Operating system structures to support security and reliable software,** T. A. Linden, *Nat. Bur. Stand. (U.S.), Tech. Note 919*, 51 pages (Aug. 1976) SD Catalog No. C13.46:919.

Key words: capability; capability-based addressing; computer security; extended-type objects; operating system structures; protection; reliable software; reliability; security; small protection domains; types.

Security has become an important and challenging goal in the design of computer systems. This survey focuses on two system structuring concepts that support security; namely, small protection domains and extended-type objects. These two concepts are especially promising because they also support reliable software by encouraging and enforcing highly modular software structures—in both systems software and in applications programs. Small protection domains allow each subunit or module of a program to be executed in a restricted environment that can prevent unanticipated or undesirable actions by that module. Extended-type objects provide a vehicle for data abstraction by allowing objects of new types to be manipulated in terms of operations that are natural for these objects. This provides a way to extend system protection features so that protection can be enforced in terms of applications-oriented operations on objects. This survey

also explains one approach toward implementing these concepts thoroughly and efficiently—an approach based on the concept of capabilities incorporated into the addressing structure of the computer. Capability-based addressing is seen as a practical way to support future requirements for security and reliable software without sacrificing requirements for performance, flexibility, and sharing.

TN920. **Use of synthetic benchmarks for estimating service bureau processing charges,** D. M. Conti, *Nat. Bur. Stand. (U.S.), Tech. Note 920,* 47 pages (July 1976) SD Catalog No. C13.46:920.

Key words: benchmarking; charging algorithms; service bureaus; synthetic benchmarking; workload characterization.

This report describes the development of a new synthetic benchmark technique for estimating batch processing charges at service bureau sites. This technique was used to estimate the cost of processing a large batch workload at a number of service bureaus within the same mainframe family. The method was found to be low-cost, yet reasonably accurate for a certain class of service bureau charging algorithms. Refinements of this method are suggested which will extend its applicability to other algorithms. The procedures used to create and run the benchmark, together with the projection of total workload cost are described.

TN921. **Survey manual for estimating the incidence of lead paint in housing,** W. G. Hall and L. T. Slovic, *Nat. Bur. Stand. (U.S.), Tech. Note 921,* 111 pages (Sept. 1976) SD Catalog No. C13.46:921.

Key words: lead paint; lead paint detection; lead paint programs; lead poisoning; portable x-ray fluorescence; random sampling; x-ray fluorescence.

This manual is intended as a guide for municipal managers in performing a survey to determine the prevalence of lead based paint in their community's dwelling units. There are four parts to the Manual, each is intended for a different audience.

Part I discusses the preliminary considerations for a survey. It is intended for the department head or executive who will initiate plans for the survey. It presents a managerial overview of the processes, the cost determinants, criteria for the establishment of objectives and the resources required.

Part II is intended for the survey manager and the inspector supervisors. It contains more detailed information on the planning, staffing, training, and execution of the data collection phase of the survey.

Part III is for the use of the person responsible for the control and management of the data collected and for the analysis of these data.

The Appendices contain quite detailed information about procedures we have used in previous surveys. These may be used as they are described or may be modified or adapted to meet specific objectives.

TN922. **Economic analysis of experimental lead paint abatement methods: Phase I,** R. E. Chapman, *Nat. Bur. Stand. (U.S.), Tech. Note 922,* 112 pages (Sept. 1976) SD Catalog No. C13.46:922.

Key words: abatement; building economics; building materials; economic analysis; housing; lead-based paint; lead poisoning.

Public and private concern about the potential for lead poisoning in children due to the ingestion of lead-based paint chips has resulted in a Federally sponsored program to develop technologies by which lead-based paint may be eliminated from the nation's housing. Through this program lead-based paint abatement techniques were tested in field deleading operations conducted in Washington, DC, and Atlanta, GA. The program also focused on the collection of data on the direct costs of labor, materials and special equipment associated with these abatement techniques.

This report provides a statistical analysis by abatement technique and building component (i.e., walls, doors, door frames, windows and frames, and miscellaneous trim) of this direct cost data. Abatement techniques are then ranked according to their relative costs. A cost model is developed for each category (ranking) which identifies the key factors which affect direct cost and provides a framework whereby direct costs may be estimated. Recommendations are made for further refinement of the model; a methodology through which the optimal combination of lead-based paint abatement techniques can be identified is also outlined.

TN923. **Applications of thermography for energy conservation in industry,** C. W. Hurley and K. G. Kreider, *Nat. Bur. Stand. (U.S.), Tech. Note 923,* 31 pages (Oct. 1976) SD Catalog No. C13.46:923.

Key words: energy conservation; energy surveys; infrared; nondestructive evaluation; thermographic surveys; thermography.

Infrared thermography has been developed as a tool to measure the temperature of various types of surfaces. Notable applications include thermal detection of diseases such as cancer and circulatory problems in human beings, aerial land mapping of hot surfaces to detect thermal pollution and geological formations, and remote scanning of buildings to detect heat losses. More recently, infrared scanning has been used to detect defects in high amperage electrical connections, transformers, and steel processing furnaces in industrial environments.

It was the intent of the NBS IR program to build on these technologies to assist energy conservation engineers to assess heat losses in industrial plants. IR teams from the NBS Center for Building Technology had previously used the equipment to survey heat losses in buildings where the IR camera was found to be particularly useful in detecting infiltration problems, missing insulation, and construction defects. Our intent in this project was to survey furnaces and heating systems in addition to electrical and mechanical systems to find areas suggesting energy conserving actions. This qualitative survey has been found to be an excellent method to detect heat losses in unit process equipment and auxiliary systems. This survey method described in this paper was carried out in fifteen industrial plants in order to develop a methodology and examine the feasibility of the approach.

In addition to the qualitative survey quantitative data was gathered by calibrating the temperature of the "hot spots" uncovered in the survey. This information was very useful in developing priorities and estimating the magnitude of the heat loss due to a given defect.

TN924. **Procedures for the calibration of ASTM E127-type ultrasonic reference blocks,** D. J. Chwirut, G. F. Sushinsky, and D. G. Eitzen, *Nat. Bur. Stand. (U.S.), Tech. Note 924,* 43 pages (Sept. 1976) SD Catalog No. C13.46:924.

Key words: aluminum ultrasonic reference standards; ASTM-type reference standards; calibration; interim reference standard; longitudinal beam; measurement system; nondestructive evaluation; pulse-echo; ultrasonics.

A service for the calibration of ASTM E127-Type ultrasonic ference blocks has been established at the National Bureau of andards. A single well-characterized reference block, carefully osen to be as close as possible to "typical" or "nominal," has en designated as an interim standard against which other ocks can be compared. As refinements are made and the stem becomes better understood, new standards may be veloped leading to the development of an absolute national andard. The facilities and procedures used in this calibration rvice are described herein.

N925. **Overviews and justifications for low gravity experiments on phase transition and critical phenomena in fluids,** M. R. Moldover, R. J. Hocken, R. W. Gammon, and J. V. Sengers, *Nat. Bur. Stand. (U.S.), Tech. Note 925,* 99 pages (Oct. 1976) SD Catalog No. C13.46:925.

Key words: critical point; gravity effects; phase transitions.

Important scientific questions concerning pure fluids and fluid ixtures near critical points are identified and are related to the rogress of several disciplines. Consideration is given to uestions about thermodynamic properties, transport properties, nd the complex nonlinear phenomena which occur when fluids ndergo phase transitions in the critical region. We discuss, uantitatively, the limitations to answering these questions by xperiments in the earth's gravitational field. The distinction is ade between practical limits which may be extended by adances in technology and intrinsic ones which arise from the odification of fluid properties by the earth's gravitational field. he kinds of experiments near critical points which could best xploit the low gravity environment of an orbiting laboratory are entified. These include studies of the index of refraction, conant volume specific heat, and phase separation.

N927. **Development of dynamic calibration methods for pogo pressure transducers,** J. S. Hilten, P. S. Lederer, C. F. Vezzetti, and J. F. Mayo-Wells, *Nat. Bur. Stand. (U.S.), Tech. Note 927,* 58 pages (Nov. 1976) SD Catalog No. C13.46:927.

Key words: bias pressure; calibration; dynamic calibration; dynamic pressure; high pressure; liquid medium; pogo pressure; pressure source; pressure transducer; sinusoidal; space shuttle; transducer.

Two dynamic pressure sources are described for the calibraon of pogo pressure transducers used to measure oscillatory ressures generated in the propulsion system of the space shute. Rotation of a mercury-filled tube in a vertical plane at equencies below 5 Hz generates sinusoidal pressures up to 48 Pa, peak-to-peak; vibrating the same mercury-filled tube inusoidally in the vertical plane extends the frequency response rom 5 Hz to 100 Hz at pressures up to 140 kPa, peak-to-peak. he sinusoidal pressure fluctuations can be generated by both ethods in the presence of high pressure (bias) up to 55 MPa.

Calibration procedures are given in detail for the use of both ources. The dynamic performance of selected transducers was valuated using these procedures; the results of these calibraions are presented. Calibrations made with the two sources near Hz agree to within 3 percent of each other.

TN928. **Computer programs for the evaluation of activity and osmotic coefficients,** B. R. Staples and R. L. Nuttall, *Nat. Bur. Stand. (U.S.), Tech. Note 928,* 56 pages (Dec. 1976) SD Catalog No. C13.46:928.

Key words: activity coefficients; aqueous; computer programs; data evaluation; electrolytes; electromotive force; isopiestic method; osmotic coefficients; nonlinear least squares; thermodynamic properties; vapor pressure.

A number of specialized computer programs have been developed for the purposes of calculating thermodynamic properties directly from experimental data and for subsequent data manipulation, including nonlinear least-squares fitting of the data to empirical or semiempirical equations that describe the function over a range of compositions, temperatures or other parameters. The details of the programs used in the critical evaluation of mean activity and osmotic coefficients and sample runs for each program are discussed. Osmotic coefficients can be calculated from direct vapor pressure measurements or from isopiestic molalities. Activity coefficients can be calculated from electromotive force measurements of galvanic cells, both without liquid-junction and with transference. A nonlinear least-squares program fits data from all sources as a function of ϕ and ln γ. Once the parameters of the fitting equation have been obtained, another program can be used to calculate a table of m, γ, ϕ, a_w, and ΔG^{ex} at rounded molalities.

TN929. **A survey of current literature on sampling, sample handling, and long term storage for environmental materials,** E. J. Maienthal and D. A. Becker, *Nat. Bur. Stand. (U.S.), Tech. Note 929,* 40 pages (Oct. 1976) SD Catalog No. C13.46:929.

Key words: chemical analysis; environmental samples; long-term storage; microbiologicals; organics; pesticides; radionuclides; sample handling; sampling; trace elements.

This article is the result of an extensive literature survey to establish optimum sampling, sample handling and long term storage techniques for a wide variety of environmental samples to retain sample integrity. The components of interest in these samples are trace elements, organics, pesticides, radionuclides or microbiologicals. This survey was done both manually and by use of various bibliographical retrieval services. Also the advice and opinions of workers in various aspects of the fields was obtained.

TN930. **A measurement assurance program for electric energy,** N. M. Oldham, *Nat. Bur. Stand. (U.S.), Tech. Note 930,* 23 pages (Sept. 1976) SD Catalog No. C13.46:930.

Key words: electric energy; electricity; electric power; measurement assurance; transport standard; watthour meter.

A Measurement Assurance Program for Electric Energy is described which enables a meter laboratory to evaluate the accuracy of its calibration process relative to the legal units of energy maintained by the National Bureau of Standards. A laboratory participating in this program periodically determines its process offset by testing an NBS transport standard as part of its regular workload (using the same procedures used to test its working standards). Subsequent monitoring and tests for local control can improve the reliability and assure the adequacy of the participant's calibration process.

TN931. **Environmental effects on microphones and type II sound level meters,** E. B. Magrab, Ed., *Nat. Bur. Stand. (U.S.), Tech. Note 931,* 120 pages (Oct. 1976) SD Catalog No. C13.46:931.

Key words: acoustic calibrators; A-weighting; barometric pressure; crest factor; ground cover; humidity; instrumentation; microphones; sound level meters; statistical control processes; temperature.

For four different manufacturer's Type II sound level meters numerous experimentally determined data concerning the effects of frequency, temperature, angle of incidence of the sound, and types of ground cover and reflecting surfaces on sound level meter readings are presented. Data are also given for the effects of ambient barometric pressure on several manufacturers'

acoustic calibrators, the effect of frequency and crest factor on the sound level meters' detector circuit, the linearity of the sound level meters' range potentiometer and meter scale, and the precision of the A-weighted response in a randomly incident (diffuse) sound field. Additional data are given concerning the effects of temperature and humidity on the sensitivity of electret, condenser, and ceramic microphones. Finally, important statistical concepts and recommended data monitoring procedures are presented to insure that the precision of repeated sound level measurements is known.

TN932. **Concrete strength during construction,** H. S. Lew, T. W. Reichard, and J. R. Clifton, *Nat. Bur. Stand. (U.S.), Tech. Note 932,* 56 pages (Dec. 1976) SD Catalog No. C13.46:932.

Key words: compressive strength; concrete; maturity; mechanical properties; nondestructive evaluation; pull-out strength; splitting tensile strength.

The early strength gain characteristics of a concrete at various temperatures was investigated in this study. In addition, the applicability of two widely known nondestructive evaluation methods were examined for the purpose of determining the compressive strength of concrete at early ages.

For destructive evaluation, standard cylinder compresso tests, splitting tensile tests and pull-out tests were made o specimens cured at 73 °F (22.8 °C), 55 °F (12.8 °C) and 35 ° (1.7 °C). For nondestructive evaluation, both probe penetrati and rebound hammer tests were performed on slabs. Tests we carried out at the age of 1, 2, 3, 5, 7, 14, 28 and 42 days aft casting the concrete.

Statistical analyses were made to examine the possibility using maturity of concrete as a parameter to correlate test resul of concrete cured at different temperatures. Rate of gain of tl splitting tensile strength, pull-out bond strength and elast modulus were compared with that of compressive strength.

The results show that when related to maturity, the rate of i crease in the splitting tensile strength is about the same as that the compressive strength, whereas the rate of increase in tl pull-out strength and the modulus are slightly greater than that the compressive strength. The results of nondestructive evalu tions revealed that the compressive strength could not be es mated correctly by the probe method using the manufacture conversion charts. Because of lower rebound readings, tl rebound hammer could not be used to estimate the compressi strength at early ages.

3.18. CONSUMER INFORMATION SERIES

Practical information, based on NBS research and experience. vering areas of interest to the consumer. Easily understand- le language and illustrations provide useful background owledge for shopping in today's technological marketplace.

IS1. **Fibers and fabrics,** J. M. Blandord, Nat. Bur. Stand. (U.S.), Consumer Info. Series 1, 31 pages (Nov. 1970).

Key words: Apparel, textile; blends, fabric; care instructions, textiles; consumer goods, textile; fabrics, textile; fibers, textile; flammability, textile; glossary, textile; properties, textile fiber; textiles; wash-and-wear textiles.

Fibers and fabrics is especially designed for the consumer ho purchases and cares for fabrics, apparel, home furnishings, id household textile products. It characterizes the properties. ethods of care, and major uses of the consumer textile products the United States. Included in the booklet are sections on fabric ends, wash-and-wear textiles, and a glossary of commonly- sed textile terms.

IS2. **Tires, their selection and care,** A. Brenner, Nat. Bur. Stand. (U.S.), Consumer Info. Series 2. 32 pages (Nov. 1970).

Key words: Construction; maintenance; passenger car tires; safety; tires, passenger car; wear.

The booklet provides the information needed to obtain maxi- num safety, wear, and performance from tires. It discusses such actors as matching the tire to driving habits, types of roads ormally driven, and loads to be carried. Also covered are proper ire maintenance, and the relationship among driving habits, ire wear, and safetv.

CIS3. **Adhesives for everyday use,** K. F. Plitt, Nat. Bur. Stand. (U.S.), Consumer Info. Series 3. 17 pages (No . 1970).

Key words: Adhesion; adhesive properties; adhesive selection; adhesives, bonding; surface preparation.

This publication is intended to assist the consumer in selecting nd using adhesives for ordinary applications. It covers the type f adhesives generally available in retail stores and points out ne major features of each type.

IS4. **Facts about hearing and hearing aids,** E. L. R. Corliss, Nat. Bur. Stand. (U.S.), Consum. Inf. Ser. 4, 35 pages (Nov. 1971).

Key words: Audition; communications; hearing; hearing aids; selection of hearing aids; speech communication.

A consumers information publication containing information n hearing aids including selection, use, and maintenance.

CIS5. **Care of books, documents, prints and films,** W. K. Wilson and J. L. Gear, Nat. Bur. Stand. (U.S.), Consum. Inf. Ser. 5, 19 pages (Dec. 1971).

Key words: Films; negatives; paper; photographs; preservation of records; prints; records; repair of records; storage of records; slides.

This paper describes what the average person can do to care for the books, documents, films and prints that he hopes to preserve for a long time. It tells (1) what *can* be done with respect to storage and simple repair, (2) what *not* to do, such as storage in hot attics and damp basements, (3) when to seek professional help and (4) where to go to find more detailed information.

CIS6. **Color in our daily lives,** D. B. Judd, Nat. Bur. Stand. (U.S.), Consum. Inf. Ser. 6, 32 pages (Mar. 1975) SD Catalog No. C13.53:6.

Key words: color; environment; experimenting with; harmony; hues; illumination; light; personal uses; relationships; uses.

If you are like most consumers, color is at once a delight, a challenge, and a problem. Color is a delight because it can convert an otherwise drab costume, scene, or room into a thing of beauty. It is a challenge because it brings out our creative ability and enables us to brighten and enliven our surroundings at a comparatively cheap cost. It is a problem because, improperly used, it can fail in its purpose, and if we are unsure of the ways in which colors go together, the choice of a tie, a lipstick, a drapery fabric, or a wall paint to match furniture and carpet can become an unpleasant chore.

Because of the importance of color in our daily lives, and the widespread lack of knowledge about the relationship of colors, we are pleased to bring you this extraordinary booklet as a part of our Consumer Information Series. It has been written in simple language, but in its scientific accuracy, and in the precise

CIS7. **What About Metric?,** L. E. Barbrow, Nat. Bur. Stand. (U.S.), Consum. Inf. Ser. 7, 16 pages (Oct. 1973) 80 cents, SD Catalog No. C13.53:7.

Key words: Metric system; SI; weights and measures.

The metric system of measurement, how it compares with our customary system, and how it will affect everyday life are described in everyday terms. Examples of computations of the type frequently encountered by the average citizen are included to illustrate the relative simplicity of the metric system. Although extensive use of the metric system in the United States is envisioned to be several years in the future, the reasons for at least becoming acquainted with the system now are discussed. The necessary acquaintanceship for everyday life involves the learning of fewer than ten metric units of measurement.

CIS8. **Making the most of your energy dollars in home heating and cooling,** M. Jacobs and S. Petersen, Nat. Bur. Stand. (U.S.), Consum. Inf. Ser. 8, 20 pages (June 1975) SD Catalog No. C13.53:8. 2nd Printing, Oct. 1975. 17 pgs.

Key words: building economics; consumer information; energy conservation; home economics; home improvements; insulation.

This booklet is a consumer-oriented adoption of BSS64 (Retrofitting Existing Housing for Energy Conservation: An Economic Analysis) which provides basic energy conservation information of an economic nature to homeowners. It is concerned primarily with energy conservation improvements which will decrease heating and cooling costs in houses. Investment in insulation, storm windows and doors, and weatherstripping/ caulking is examined with regards to different climates and different energy prices in order to determine the combination of these improvements which will provide the greatest long-run economies in space heating and cooling to the homeowner. Information of a general nature on the proper use of such improvements is outlined and further references are listed.

3.19. NBS INTERAGENCY REPORTS

A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution by the National Technical Information Service (NTIS), Springfield, Va. 22151, in paper copy or microfiche form. This series MUST be ordered from NTIS by the "COM, PB, or AD" number listed at the end of each entry.

NBSIR 73-101. Penetration Resistance Tests of Reinforced Concrete Barriers, R. T. Moore, 83 pages (December 1972). Order from NTIS as COM 73-10867. [See 13384 for abstract.]

NBSIR 73-102. Energy Conservation Through Effective Utilization, C. A. Berg, 53 pages (February 1973). Order from NTIS as COM 73-10856. [See 13385 for abstract.]

NBSIR 73-105. Environmental Evaluation of Polyurethane Foam Core Sandwich Panel Construction, J. R. Shaver, L. W. Masters, T. W. Reichard, and J. H. Pielert, 47 pages (December 1972). Order from NTIS as PB 219-118. [See 13386 for abstract.]

NBSIR 73-108. **City games—City I operator's manual,** J. E. Moriarty, 24 pages (Oct. 1973). Order from NTIS as COM 74-10701-2.

Key words: city; computer; directors; economic; games; government; metropolitan; players; sectors; simulation; social; urban.

City 1 is an operational simulation game in which participants make economic, government, and social decisions affecting a hypothetical metropolitan area. The game is run on an IBM 1131 Central Processor with at least 8K and single disc storage.

This manual describes the methods of operating the Central Processor relative to the game along with the special coding required to change and/or update the computer program and core mapping.

It is assumed throughout this manual that the operator knows how to cold start the 1130, change carriage tapes, and load and clear the card reader.

NBSIR 73-109. **City games—City I director's manual,** J. E. Moriarty, 76 pages (Sept. 1973). Order from NTIS as COM 74-10701-1.

Key words: city; computer; director's; economic; games; government; metropolitan players; sectors; simulation; social urban.

City I is an operational simulation game in which participants make economic and government decisions affecting a hypothetical metropolitan area. Through the use of a computer, the simulated urban system responds to the participant's as any real city would. The City I Director instructs the players in procedure and coordinates the overall game play. This manual describes the details of administering the game from the Director's point of view and presents examples of decision codes, formats, and general information necessary to direct the game.

NBSIR 73-110. **City games—City I player's manual,** J. E. Moriarty, Ed., 150 pages (Mar. 1973). Order from NTIS as COM 73-11191.

Key words: city; computer; directors; economic; games; government; metropolitan; players; sectors; simulation; social; urban.

City I is an operational simulation game in which participants make economic, government, and social decisions affecting a hypothetical metropolitan area. Through the use of a computer, the simulated urban system responds to the participant's decisions as any real city would. Each player in City I is assigned to a team which shares an economic and governmental role. This manual describes the player details for the economic and government sectors along with general information required for game play. It is one of three manuals necessary for game play (Player's Manual, Director's Manual, Computer Operator's Manual). Each of these manuals are designed to be used for reference and by themselves will not describe enough details for a complete game play. The game is run on an IBM 1130 computer with 8K core and single disc.

NBSIR 73-112. **City games—City 4 computer operator's manual,** J. E. Moriarty, 56 pages (Sept. 1973). Order from NTIS as COM 74-10702-3.

Key words: City IV; computer; Fortran; gaming; IBM 360/70; JCL; simulation.

This manual is written for an IBM 360/70 computer. It describes the necessary Fortran & JCL commands required for computer operation of the CITY IV game. Test commands and sequences are presented along with complete computer operating instructions for the Game. It is expected that this manual along with a Game Director's manual will provide complete instructions for the operation of CITY IV.

NBSIR 73-113. **City games—City 4 director's manual,** J. E. Moriarty, Ed., 286 pages (Mar. 1974). Order from NTIS as COM 74-10702-1.

Key words: city; computer; director's; economic; games government; metropolitan players; sectors; simulation; social; urban.

City 4 is an operational simulation game in which participant make economic and government decisions affecting a hypothetical metropolitan area. Through the use of a computer, the simulated urban system responds to the participant's as any real city would. The City 4 Director instructs the players in procedure and coordinates the overall game play. This manual describes the details of administering the game from the Director's point of view and presents examples of decision codes, formats, and general information necessary to direct the game.

NBSIR 73-114. **City games—City 4 player's manual,** J. E. Moriarty, Ed., 276 pages (Feb. 1974). Order from NTIS as COM 74-10702-2.

Key words: city; computer; directors; economic; games government; metropolitan; players; sectors; simulation; social; urban.

City 4 is an operational simulation game in which participant make economic, government, and social decisions affecting a hypothetical metropolitan area. Through the use of a computer the simulated urban system responds to the participant's decisions as any real city would. Each player in City 4 is assigned to a team which shares an economic and governmental role. This manual describes the player details for the economic and government sectors along with general information required for game play. It is one of three manuals necessary for game play (Player's Manual, Director's Manual, Computer Operator's Manual). Each of these manuals are designed to be used for reference and by themselves will not describe enough details for a complete game play. The game is run on an IBM O.S./360 computer.

NBSIR 73-116. Study of the Local Resistance of Conventional Plywood Subflooring to Concentrated Load, F. Y. Yokel, 64 pages (March 26, 1973). Order from NTIS as PB 220-432. [See 13388 for abstract.]

BSIR 73–119. Laser Damage in Materials, A. Feldman, D. Horowitz, and R. M. Waxler, 52 pages (February 1973). Order from NTIS as AD 75–789. [See 13529 for abstract.]

BSIR 73–121. Structural Tests of a Wood Framed Housing Module, C. W. Yancey and N. F. Somes, 111 pages (March 26, 1973). Order from NTIS as COM 73–10860. [See 13389 for abstract.]

BSIR 73–125. Interlaboratory Evaluation of the Tunnel Test (ASTM E 84) Applied to Floor Coverings, T. G. Lee and C. Huggett, 56 pages (March 1973). Order from NTIS as COM 73–11189. [See 13530 for abstract.]

BSIR 73–126. Structural Tests of Mechanical Connections for Concrete Panels, L. E. Cattaneo and F. Y. Yokel, 118 pages (November 1972). Order from NTIS as PB 219–124. [See 13390 for abstract.]

BSIR 73–127. Evaluation of Lead Paint Hazard Elimination Methods Part II, D. Waksman, L. F. Skoda, E. J. Clark, M. Godettee, 77 pages (March 1973). Order from NTIS as PB 213–352. [See 13391 for abstract.]

BSIR 73–128. Resistivity and Carrier Lifetime in Gold-Doped Silicon, W. R. Thurber, D. C. Lewis, and W. M. Bullis, 56 pages (January 31, 1973). Order from NTIS as AD 760–150. [See 13419 for abstract.]

BSIR 73–129. Evaluation of GRP Rod and Rope Materials and Associated End Fittings, N. Halsey, R. A. Mitchell, and L. Mordfin, 87 pages (December 1972). Order from NTIS as AD 759–913. [See 13392 for abstract.]

BSIR 73–131. Human Factors Evaluation of a Voice Encoding System, V. J. Pezoldt and J. J. Persensky, 51 pages (March 1973). Order from NTIS as COM 73–10863. [See 13393 for abstract.]

BSIR 73–132. State of the Art on Durability Testing of Building Components and Materials, L. W. Masters, W. C. Wolfe, W. J. Rossiter, Jr., and J. R. Shaver, 128 pages (March 1973). Order from NTIS as PB 222–300. [See 13637 for abstract.]

BSIR 73–135. Fire Endurance Tests of Steel Sandwich Panel Exterior Wall and Roof/Ceiling Constructions, B. C. Son, 38 pages (December 1972). Order from NTIS as PB 221–310. [See 13394 for abstract.]

BSIR 73–138. Time Series Forecasting of Highway Accident Fatalities, A. R. Craw, 37 pages (March 1973). Order from NTIS as COM 73–10868. [See 13395 for abstract.]

BSIR 73–140. Fire Endurance Test of Plywood-Faced Exterior Walls for Single Family Housing, B. C. Son, 24 pages (March 1973). Order from NTIS as PB 220–226. [See 13396 for abstract.]

BSIR 73–141. Fire Endurance Tests of Plywood on Steel Joist Floor Assemblies, With and Without Ceiling, H. Shoub and B. C. Son, 35 pages (March 1973). Order from NTIS as PB 220–430. [See 13397 for abstract.]

BSIR 73–144. Climatological Data at the Proposed Prototype Sites in the United States for the Evaluation of HUD Operation BREAKTHROUGH Housing Systems, T. Kusuda, 136 pages (April 10, 1973). Order from NTIS as PB 220–849. [See 13398 for abstract.]

BSIR 73-145. **Study of relationships between activity, reaction, garment parameter patterns and injury severity for fire incidents involving apparel,** L. B. Buchbinder, 33 pages (Apr. 1973). Order from NTIS as COM 75-10541.

Key words: accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; garment fires; garment parameters; injury severity; victim's activity; victim's reactions.

Fire accidents result from the interaction of a number of environmental, human, and physical factors, all of which may effect the severity of the burn injury. Using information gathered from case histories in the Flammable Fabrics Accident Case and Testing System, this study seeks to identify patterns in the apparel fire accident variables: (1) activity preceding the accident, (2) parameters of fabrics and garments involved, (3) reaction of victim, and (4) severity of the burn injury. It will also attempt to define the extent and nature of the relationships between these accident variables.

This interim report gives a detailed description of the methodology employed in the development and completion of the study, with emphasis on accident pattern identification and classification for apparel fire incidents. Preliminary results of the study are included which identify certain recurring patterns of activity leading to burn injuries.

NBSIR 73–146. Outdoor Performance of Plastics X. Final Update of Weathering Data, W. J. Rossiter, Jr., 113 pages (March 1973). Order from NTIS as COM 73–10989. [See 13399 for abstract.]

NBSIR 73–148. Evaluation of the Column Connections Used in a Precast Concrete Modular Housing System, F. Y. Yokel and T. W. Reichard, 90 pages (March 26, 1973). Order from NTIS as PB 220–366. [See 13401 for abstract].

NBSIR 73–151. On Uncertainty in Mass Measurement, J. R. Donaldson, 10 pages (March 1973). Order from NTIS as COM 73–10866. [See 13402 for abstract.]

NBSIR 73-152. **Measurement of transit time and related transistor characteristics,** D. E. Sawyer, G. J. Rogers, and L. E. Huntley, 131 pages (Oct. 1973). Order from NTIS as AD 914258.

Key words: delay time; electronics; high-frequency probes; Sandia bridge; scattering; S-parameters; transistors; vector voltmeter.

Two instruments for transistor delay-time measurements, the vector voltmeter and Sandia bridge, were analyzed and comparative measurements were made on several types of commercial and two special transistors. It was found that extraneous pickup at the measurement frequency can cause large errors in measured delay time. A technique for minimizing these errors was developed and verified for the Sandia bridge by removing the frequency dependence of delay force, probe tip protrusion and lateral motion (skating) with loading were recorded for special probe assemblies to be used in an automatic wafer prober for measurements on transistors in custom-designed integrated circuit wafers. The data is used to assist in adjusting the probers. A technique was developed for determining the effects of the probe assemblies on transistor measurements made from 0.1 to 2.0 GHz. Each probe assembly may be represented by an equivalent circuit consisting of three unknowns; these unknowns are determined by making impedance measurements at the input connectors with the probe tips contacted by combinations of open circuits, short circuits, and resistors of known value. Arrays of such terminations were successfully fabricated and characterized. An S-parameter interlaboratory testing program was developed. The plan calls for six of each of three types of transistors to be measured by participants at frequencies from 0.11 to 2.0 GHz. Additionally, a 10-dB attenuator and R-C networks on TO-72 headers are to be circulated to pinpoint measurement discrepancies.

NBSIR 73–154. A Summary of the Relationships Between Accident Indices and Rates Following a Redefinition of "Failure", A. R. Craw, 17 pages (March 1973). Order from NTIS as COM 73–10865. [See 13403 for abstract.]

NBSIR 73–156. A Study of the Strength Capabilities of Children Ages Two Through Six, W. C. Brown and C. J. Buchanan, 56 pages (August 7, 1973). Order from NTIS as COM 73–11286. [See 13595 for abstract.]

NBSIR 73–157. National Program of Metrology for Ecuador, T. M. Stabler, 33 pages (April 1973). Order from NTIS as COM 74–10394. [See 13777 for abstract.]

NBSIR 73–159. U.S. Membership in the International Organization of Legal Metrology, T. M. Stabler, 12 pages (April 1973). Order from NTIS as COM 73–11174. [See 13454 for abstract.]

NBSIR 73–161. Field Test of Hydraulic Performance of a Single-Stack Drainage System at the Operation BREAK-THROUGH Prototype Site in King County, Washington, R. S. Wyly and D. E. Rorrer, 66 pages (May 1973). Order from NTIS as PB 225–310. [See 13778 for abstract.]

NBSIR 73–162. Executive Summary of a Proficiency Test Assessment of Clinical Laboratory Capability in the United States, P. W. Finkel and T. R. Miller, 9 pages (May 1973). Superseded by NBSIR 73–162. Order from NTIS as COM 74–10542. [See 13404 for abstract.]

NBSIR 73–163. A Proficiency Test Assessment of Clinical Laboratory Capability in the United States, P. W. Finkel and T. R. Miller, 114 pages (May 1973). Supersedes NTIS Nos. COM 73–11190 and COM 73–11193. Order from NTIS as COM 74–10542. [See 13779 for abstract.]

NBSIR 73–164. Fire Endurance Test of a Steel Sandwich Panel Floor Construction, B. C. Son, 25 pages (April 1973). Order from NTIS as PB 221–642. [See 13405 for abstract.]

NBSIR 73–165. Fire Endurance Test on a Steel Tubular Column Protected with Gypsum Board, B. C. Son, 23 pages (April 1973). Order from NTIS as PB 221-474. [See 13406 for abstract.]

NBSIR 73–166. Fire Endurance Test of an Interdwelling Double Wall Construction of Paper Honeycomb and Gypsum Board, B. C. Son, 24 pages (April 1973). Order from NTIS as PB 222–297. [See 13407 for abstract.]

NBSIR 73–167. Fire Endurance Test of a Roof/Ceiling Construction of Paper Honeycomb and Gypsum Board, B. C. Son, 20 pages (January 1973). Order from NTIS as PB 222–298. [See 13408 for abstract.]

NBSIR 73–168. Fire Endurance Test of a Fiber Glass Reinforced Polyester Double Wall Assembly, B. C. Son, 26 pages (April 1973). Order from NTIS as PB 221–184. [See 13409 for abstract.]

NBSIR 73–169. Fire Endurance Test of a Wood Stud Interdwelling Double Wall Construction, B. C. Son, 21 pages (April 1973). Order from NTIS as PB 221–185. [See 13410 for abstract.]

NBSIR 73–170. Fire Endurance Test of an Interdwelling Double Wall Constructed of Polyurethane Foam-Filled Sandwich Panels, B. C. Son, 27 pages (April 1973). Order from NTIS as PB 221–193. [See 13411 for abstract.]

NBSIR 73–172. Standardization and Measurement Services in Turkey, H. S. Peiser, R. J. Corruccini, and S. B. Newman, 91 pages (October 14–28, 1972). Order from NTIS as COM 73–11175. [See 13476 for abstract.]

NBSIR 73–173. Fire Endurance Tests of Double Module Walls of Gypsum Board and Steel Studs, B. C. Son, and H. Shoub, 32 pages (April 1973). Order from NTIS as COM 73–10844. [See 13412 for abstract.]

NBSIR 73–175. Estimates of Vehicular Collisions with Multistory Residential Buildings, S. L. Fribush, D. Bowser, and R. Chapman, 72 pages (April 1973). Order from NTIS as COM 74–10395. [See 13781 for abstract.]

NBSIR 73-177. **Comparison of the fire performance of neopren and flame retardant polyurethane mattresses,** W. J. Parker, 4 pages (Apr. 1973). Order from NTIS as COM 75-10336.

Key words: fire retardant; fire test; heat release ignition mattress; smoke; toxic gases.

Full scale fire tests of a neoprene and two different types c flame-retardant polyurethane mattresses were performed in room-sized compartment at the National Bureau of Standard The mattresses were tested in two orientations, horizontal an vertical and with two types of coverings, a fire retardant treate cotton and a high temperature nylon ticking, in addition to th bare mattress insert. In addition to the visual observations, th burning rates, ceiling temperatures, optical density of the smok and the toxic gas concentrations were measured. This series c tests were repeated on small mattress sections to examine th relevance of small scale tests as a means of predicting full scal behavior. The flame spread index was measured with the radiat panel (ASTM E162); and the smoke and toxic gas concentra tions were measured in the NBS smoke density chamber. Mea surements were also performed in the heat release rate calorim ter and the ease of ignition test apparatus.

NBSIR 73-180. **Testing of the NBS clinical microcalorimeter,** E J. Prosen and R. N. Goldberg, 31 pages (Apr. 1973). Orde from NTIS as COM 74-10139.

Key words: clinical chemistry; clinical microcalorimetry microcalorimeter; NBS microcalorimetry; testing of micro calorimeter.

The NBS Clinical Microcalorimeter has been tested for sta bility, sensitivity, ease of operation, and accuracy. The accurac was tested by means of electrical calibration and the determina tion of the heat of neutralization of HCl(aq) with NaOH(aq). Th heat of this reaction agrees with the best literature value withi the precision of the calorimeter. The precision is about 0.6 pe cent when measuring about 50 mJ of heat of chemical reactio The accuracy is estimated as 1 percent. The precision of electr cal energy determination is about 0.4 percent for energies c from 1 to 1400 mJ.

NBSIR 73–182. Analyses for Decision in the Office of Flan mable Fabrics: The Level of the Standard, A. R. Crav 80 pages (April 1973). Order from NTIS as COM 73 11284. [See 13596 for abstract.]

NBSIR 73–184. A Cell Model for Isoperibol Calorimeter K. L. Churney, E. D. West, and G. T. Armstrong, 1(pages (April 1973). Order from NTIS as COM 73–1111 [See 13474 for abstract.]

NBSIR 73–185. Standardization and Measurement Servic in Korea, H. S. Peiser, T. D. Coyle, and R. K. Eby, 4 pages (June 19–30, 1972). Order from NTIS as COM 7 11287. [See 13608 for abstract.]

NBSIR 73–187. The Effect of Impact Loadings on the Pe formance of Wood Joist Subflooring Systems, H. S. Lev 49 pages (May 1973). Order from NTIS as PB 221–18 [See 13472 for abstract.]

NBSIR 73–188. Structural Tests on Housing Components Glass Fiber Reinforced Polyester Laminate, T. W. Reicl ard, W. E. Greene, Jr., L. E. Cattaneo, and L. W. Ma ters, 98 pages (April 1973). Order from NTIS as PB 221 183. [See 13473 for abstract.]

NBSIR 73–189. A Comparison of Several Methods f Forecasting U.S. Traffic Fatalities, A. R. Craw, 45 pag (May 1973). Order from NTIS as COM 73–11173. [S 13510 for abstract.]

BSIR 73–190. Acoustical Evaluation of a Single Family Attached Steel Frame Modular Housing System Constructed on an Operation Breakthrough Prototype Site, T. L. Quindry, 21 pages (April 1973). Order from NTIS as PB 221–189. [See 13414 for abstract.]

BSIR 73–191. Acoustical Evaluation of a Single Family Attached Wood-Frame Modular Housing System Constructed on an Operation Breakthrough Prototype Site, T. L. Quindry, 21 pages (April 1973). Order from NTIS as PB 221–695. [See 13455 for abstract.]

BSIR 73–192. Acoustical Evaluation of a Single Family Detached Honeycomb Panel Housing System Constructed on an Operation Breakthrough Prototype Site, T. L. Quindry, 19 pages (April 1973). Order from NTIS as PB 222–231. [See 13415 for abstract.]

BSIR 73–197, (Revised). Clinical Laboratory Performance Analysis Using Proficiency Test Statistics, P. W. Finkel and J. W. Rowen, 63 pages (December 1973). Order from NTIS as COM 74–10468. [See 13564 for abstract.]

BSIR 73–198. General Purpose Scientific Document Code Operations Under Exec 8, R. McClenon, 21 pages (May 1973). Order from NTIS as COM 73–11289. [See 13598 for abstract.]

IBSIR 73-199. **Experimental and analytical studies of floor covering flammability with a model corridor,** W. Denyes and J. Quintiere, 115 pages (May 1973). Order from NTIS as COM 74-10129.

Key words: flame spread; floor covering materials; model corridor; scaling laws; test method.

An experimental model corridor facility was designed, constructed, and instrumented. The facility examines flame spread over floor covering materials in a small scale corridor under a forced air flow condition. A gas burner flame serves as the ignition source.

A study was made of the factors influencing flame spread in the model corridor. These factors included energy release rate of the ignition source, air velocity, and model corridor geometry. Twenty-six carpet materials and 5 other floor covering materials were studied in the model corridor, and 369 flame spread runs were conducted.

It was found that flame spread behavior in the model corridor generally involves either a rapidly accelerating flame front which propagates the full 8 foot length of the test section ("flameover"), or involves a decelerating flame front which results in extinction a short distance from the ignition source. Radiant heating of the floor material due to hot products of combustion heating the ceiling is a significant factor in causing flameover. Carpet assembly was found to affect flame spread more significantly than pile fiber type.

The data have been analyzed to determine quantitatively the effects of the factors influencing flame spread. Scaling relationships have been presented to attempt to extrapolate the model corridor results to full scale corridor fires.

Finally a procedure has been suggested for using the facility in a floor covering flammability test method. The procedure is based on determining the minimum energy input rate to cause flameover.

NBSIR 73-200. **A model corridor for the study of the flammability of floor coverings,** W. Denyes and J. W. Raines, 40 pages (May 1973). Order from NTIS as COM 74-10478.

Key words: air flow, energy input; flameover; flame spread; floor covering flammability; model corridor; test repeatability.

A program was carried out to develop a laboratory test method that would measure the flame propagation characteristics of floor covering materials. A facility was designed which included a floor mounted specimen in a rectangular cross-sectional duct having a forced supply of air and a gas burner ignition source. The effects of variations in duct size, ignition source, and air flow were studied. Factors influencing repeatable test results were explored. Flame spread was measured by an observer and temperature and heat flux measurements were recorded on an electronic digital data acquisition system.

NBSIR 73–201. Composite-Overlay Reinforcement of Cutouts and Cracks in Metal Sheet, R. A. Mitchell, R. M. Woolley, and D. J. Chwirut, 94 pages (February 1973). Order from NTIS as COM 73–11221. [See 13607 for abstract.]

NBSIR 73-202. **Conservation via effective use of energy at the point of consumption,** C. A. Berg, 37 pages (Apr. 1973). Order from NTIS as COM 74-10479.

Key words: buildings; energy conservation; industrial equipment.

The practices and equipment employed at the point of energy consumption in buildings and in industrial processes permit excessive consumption of energy. It is estimated that if full application of the economically justifiable technical improvements presently available were made to equipment and practices in buildings and industry, as much as 25 percent of the total primary fuel consumption in the U.S.A. could be conserved. The reasons why economically justifiable application of effective technology at the point of energy consumption has not been widely adopted in the past are considered. The needs to facilitate adoption of effective equipment and practices in the future are discussed.

NBSIR 73-210. **LEAA police equipment survey of 1972. Volume I: The need for standards—priorities for police equipment,** R. Ku, E. Bunten, and P. Klaus, 212 pages (July 1973). Order from NTIS as COM 74-11767.

Key words: police; police equipment; standards.

The report describes the methodology of and summarizes a portion of the data from the LEAA Police Equipment Survey of 1972. One of a series of seven reports resulting from this nationwide mail survey of a stratified random sample of 1386 police departments, the present report summarizes the answers of 1100

police departments concerning the need for performance standards for items of law enforcement used in their departments. Each sample department was asked to rank one list of equipment categories and nine lists of equipment items within those categories in terms of the need for standards for those equipment within their own departments. The data are presented by all responding departments, by all city departments, by seven department types, and by ten LEAA geographical regions. Data describing the characteristics of the responding departments are also presented.

NBSIR 73-211. **LEAA police equipment survey of 1972. Volume II: Communications equipment and supplies,** S. Mumford, P. Klaus, E. Bunten, and R. Cunitz, 175 pages (Final July 1971-July 1973). Order from NTIS as COM 74-10950.

Key words: communications; mobile radio; police; police equipment; portable radio; standards.

The report outlines the methodology of and summarizes a portion of the data from the LEAA Police Equipment Survey of 1972. One of a series of seven reports resulting from this nationwide mail survey of a stratified random sample of police departments, the present report summarizes the answers of 428 police departments concerning their communications equipment and supplies: use of mobile radios and portable radios; power supplies for portable radios; scramblers; portable/mobile radios; helmets with built-in communications; needs for standards and problems associated with communications equipment and supplies. The data are presented by all responding departments and by seven department types.

NBSIR 73-212. **LEAA police equipment survey of 1972. Volume III: Sirens and emergency warning lights,** P. Klaus and E. Bunten, 141 pages (July 1971-Sept. 1973). Order from NTIS as COM 74-11009.

Key words: emergency warning lights; police equipment; sirens; standards.

The report outlines the methodology of and summarizes a portion of the data from the LEAA Police Equipment Survey of 1972. One of a series of seven reports resulting from this nationwide mail survey of a stratified random sample of police departments, the present report summarizes the answers of 437 police departments concerning their sirens and emergency warning lights: use of sirens and lights; experience with most commonly used electronic sirens, electromechanical sirens, and emergency warning lights; purchasing, repair and replacement of this equipment; and training of officers in use of this equipment. The data are presented by all responding departments and by seven department types.

NBSIR 73-213. **LEAA police equipment survey of 1972. Volume IV: Alarms, security equipment, surveillance equipment,** J. L. Eldreth, E. D. Bunten, and P. A. Klaus, 147 pages (July 1971-Oct. 1973). Order from NTIS as COM 74-11771.

Key words: alarm systems; cameras; police; police equipment; security equipment; surveillance equipment.

The report outlines the methodology of and summarizes a portion of the data from the LEAA Police Equipment Survey of 1972. One of a series of seven reports resulting from this nationwide mail survey of a stratified random sample of police departments, the present report summarizes the answers of 447 police departments concerning their use of alarm systems, cameras, security equipment, and surveillance equipment: purchasing practices, typical patterns of use, and needs for standards for such equipment. The data are presented by all responding departments and by seven department types.

NBSIR 73-214. **LEAA police equipment survey of 1972. Volume V: Handguns and handgun ammunition,** S. Bergsman, E. Bunten, and P. Klaus, 102 pages (July 1971-Aug. 1973). Orde from NTIS as COM 74-11239.

Key words: ammunition; handguns; police; police equip ment; standards.

The report outlines the methodology of and summarizes a po tion of the data from the LEAA Police Equipment Survey 1972. One of a series of seven reports resulting from this natio wide mail survey of a stratified random sample of police depar ments, the present report summarizes the answers of 445 polic departments concerning their officers' use of handguns an handgun ammunition: on-duty and off-duty use, types an calibers in use, and problems encountered. The data a presented by all responding departments and by seven depar ment types.

NBSIR 73-215. **LEAA police equipment survey of 1972. Volun VI: Body armor and confiscated weapons,** G. B. Hare, P. Klaus, and E. D. Bunten, 104 pages (Oct. 1973). Order fro NTIS as COM 74-11010.

Key words: ballistic protective equipment; body armo confiscated weapons; police; standards.

The report outlines the methodology of and summarizes a po tion of the data from the LEAA Police Equipment Survey 1972. One of a series of seven reports resulting from this natio wide mail survey of a stratified random sample of police depar ments, the present report summarizes the answers of 440 poli departments concerning body armor and confiscated weapon preference for hidden or visible body armor; use of other ballist protective equipment; routine operations where body arm would be most useful; current problems and failures with prese equipment; needs for standards for the testing and assessment penetration capabilities of body armor; disposition of confiscate weapons. The data are presented by all responding departmen and by seven department types.

NBSIR 73-216. **LEAA police equipment survey of 1972. Volun VII: Patrolcars,** E. D. Bunten and P. A. Klaus, 115 pages (Ju 1973). Order from NTIS as COM 74-11011.

Key words: patrolcar; police; police vehicles; standards.

The report outlines the methodology of and summarizes a pc tion of the data from the LEAA Police Equipment Survey 1972. One of a series of seven reports resulting from this natio wide mail survey of a stratified random sample of police depa ments, the present report summarizes the answers of 449 poli departments concerning their patrolcars: purchasing practice types of options and accessories usually selected; types of equi ment stored in the patrolcar; typical patterns of use; and nee for standards for systems or aspects of patrolcars. The data a presented by all responding departments and by seven depa ment types.

NBSIR 73–217. Use of Computer Networks in Support Interactive Graphics for Computer-Aided Design a Engineering, M. D. Abrams, J. A. Hudson, P. Meissn T. N. Pike, Jr., R. M. Rosenthal, and F. H. Ulmer, pages (June 30, 1972). Order from NTIS as COM 7 10470. [See 13784 for abstract.]

NBSIR 73–218. NEPA and the Environmental Moveme A Brief History, L. G. Llewellyn and C. Peiser, 40 pa (July 1973). Order from NTIS. [See 13785 for abstrac

NBSIR 73–220. Test of a Polyester Composite Wall Pa for Moisture Accumulation and Potential Removal Moisture Through Venting, C. I. Siu, W. M. Ellis, and Kusuda, 18 pages (May 1973). Order from NTIS as 222–437. [See 13610 for abstract.]

NBSIR 73–221. Abnormal Loading on Buildings and P gressive Collapse, N. F. Somes, 76 pages (May 197

Order from NTIS as PB 220-849. [See 13475 for abstract.]

BSIR 73–223. Penetration Tests on J-SIIDS Barriers, R. T. Moore, 86 pages (June 4, 1973). Order from NTIS as COM 73–11220. [See 13562 for abstract.]

BSIR 73-228. Summary of Flame Spread and Smoke Generation Tests Conducted for Operation Breakthrough, J. B. Ferguson, 27 pages (July 1973). Order from NTIS as PB 222–425. [See 13609 for abstract.]

BSIR 73–231. Response Characteristics of a Portable X-ray Fluorescence Lead Detector: Detection of Lead in Paint, J. C. Spurgeon, 37 pages (June 1973). Order from NTIS as PB 224–645. [See 13766 for abstract.]

BSIR 73-233. **Non-metallic antenna-support materials,** D. E. Marlowe, N. Halsey, R. A. Mitchell, and L. Mordfin, 53 pages (Apr. 1973). Order from NTIS as COM 74-11770.

Key words: Composite materials; end fittings for FRP rod; environmental resistance of GRP rod; fiber-reinforced-plastic rod; glass-reinforced-plastic rod; guys, antenna; mechanical properties of GRP rod; pultrusion; reinforced plastic rod; stress rupture of GRP rod.

A program was initiated to develop a non-conductive FRP rod aterial for use as guy lines and catenaries in large antenna stems. It is intended that the longterm structural properties of e new material, under adverse weathering conditions, be surior to those exhibited by the GRP rod and rope materials nich are available at the present time. Two new end fittings for RP rod were developed which out-perform commercially ailable fittings. These two fittings, which enable the tensile engths of the rod materials to be accurately determined, inude a shear-type fitting and a compression-type fitting. Defiencies in the physical characteristics of existing GRP rod aterials were identified, and modifications to the manufacturing ocesses were proposed to overcome these deficiencies. A subntract was let for the manufacture of experimental GRP rods ing the modified processes. A bank of six high-capacity creep sting machines was designed and is being assembled. These achines, which will accomodate long specimen lengths, are uipped with environmental chambers to permit stress-rupture sting under elevated temperature and saturated humidity conitions.

BSIR 73-234. **Drapery and curtain fires—data element summary of case histories,** A. K. Vickers, 28 pages (July 1973). Order from NTIS as COM 74-10128.

Key words: burns; case histories; curtains; death; draperies; FFACTS; fires; flammable fabrics; houses; standards; statistical data.

A preliminary examination of 1,567 computerized case histoes from the NBS Flammable Fabric Accident Case and Testing ystem has found 77 incidents in which curtains and draperies ere involved in fires. This report is a summary of information lating to these 77 incidents, and includes the location of inidents, ignition sources, personal injury, fabrics involved and rsonal characteristics of victims. Fifteen people died from ese fires and 32 others were injured. Curtains or draperies ere the first fabric item to ignite in 28 of 55 curtain and drapery cidents in which the ignition source is known.

BSIR 73–240. Effects of Electroless Nickel Process Variables on Quality Requirements, F. Ogburn and C. E. Johnson, 34 pages (June 1973). Order from NTIS as COM 74–10986. [See 13786 for abstract.]

BSIR 73–242. Pilot Demonstration of Lead Based Paint Hazard Elimination Methods, T. H. Boone, T. R. Ray, W. G. Street, 38 pages (June 1973). Order from NTIS as PB 224–654. [See 13767 for abstract.]

NBSIR 73–244. The Role of Passive Film Growth Kinetics and Properties in Stress Corrosion and Crevice Corrosion Susceptibility, J. Kruger and J. R. Ambrose, 75 pages (July 1973). Order from NTIS as AD 767–326. [See 13769 for abstract.]

NBSIR 73-246. **Fire research publications, 1969-1972,** N. H. Jason, R. G. Katz, and P. A. Powell, 14 pages (July 1973). Order from NTIS as COM 74-10989.

Key words: bibliographies; construction materials; fire departments; Fire Research and Safety Act; fire tests; flammability tests; flammable fabrics; Flammable Fabrics Act; protective clothing.

A list of publications is provided representing the papers and journal articles prepared by Fire Technology Division and by Building Fires and Safety Section of the Center for Building Technology personnel and by external laboratories under contract to the Fire Technology Division from 1969 through 1972.

NBSIR 73–248. A Survey of the Sanitary Conditions of Migrant Labor Camps, C. Fried, R. Ramsburg, and S. Butler, 83 pages (August 1973). Order from NTIS as COM 74–10474. [See 13787 for abstract.]

NBSIR 73–251. Analytical Methods for the Detection of Toxic Elements in Dry Paint Matrices—A Literature Survey, M. Paabo, 49 pages (July 1973). Order from NTIS as PB 224–688. [See 13768 for abstract.]

NBSIR 73–252. MFPG Detection, Diagnosis, and Prognosis, 268 pages (September 1973). Order from NTIS as AD–772082. [See 13789 for abstract.]

NBSIR 73-254. **A mercury vapor generation and dilution system,** E. P. Scheide, R. Alvarez, B. Greifer, E. E. Hughes, and J. K. Taylor, 12 pages (Oct. 1973). Order from NTIS as COM 74-10987.

Key words: atomic absorption; gas generation system; mercury; occupational safety.

This report describes a system capable of producing well-defined test atmospheres of mercury in air or other diluent gas at concentrations between 0.005 and 0.5 μg/l and an analytical system for the analysis of these gas mixtures. Various parameters that affect the generator and analytical system and their interactions are discussed. This system provides a means of calibration of the various analytical systems for mercury now in use. The analytical unit of the system can also be used for the determination of mercury in industrial atmospheres by collecting the mercury on a silver wool collector, and then desorbing it by heat into a flameless atomic absorption spectrometer.

NBSIR 73-256. **Development of reference materials for atmospheric analysis of the occupational environment: Filter samples containing toxic metals,** R. Mavrodineanu, J. R. Baldwin, and J. K. Taylor, 16 pages (Oct. 1973). Order from NTIS as COM 75-11443.

Key words: analysis of toxic materials; atmospheric analysis; industrial hygiene; reference materials.

Techniques are described that may be used to prepare filters on which are deposited prescribed amounts of heavy metals, for use as reference materials in industrial atmospheric analysis. Working solutions, prepared from pure metals and highly purified acids and water, are pipetted onto the filters held in jigs to facilitate their application. The techniques were used to prepare three sets of reference materials containing the following metals: Set 1—Pb, Cd, Zn, Sn; Set 2—Pb, Zn, Mn; Set 3—Be. The amounts of each metal deposited on the filters correspond to those expected when collecting personal samples, in atmospheres when the concentrations are both below and above the TLV levels.

NBSIR 73-257. **A system for producing test atmospheres containing hydrogen cyanide,** E. P. Scheide, E. E. Hughes, and J. K. Taylor, 12 pages (Oct. 1973). Order from NTIS as COM 75-11444.

Key words: gas blending system; hydrogen cyanide; ion selective electrode; occupational safety.

A system capable of producing well-defined test atmospheres of HCN in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. This system provides a means of calibration of the various analytical systems for HCN now in use. The analytical unit of the system can also be used for the determination of hydrogen cyanide in industrial atmospheres. By collecting the HCN in a sodium hydroxide solution, and measuring the cyanide content by the use of a cyanide-ion selective electrode, concentrations of HCN in air between 5 and 500 ppm were measured. This method is rapid and convenient and can easily be performed by a technician or adapted to automation.

NBSIR 73-258. **A gas dilution system for acrolein,** E. P. Scheide, E. E. Hughes, and J. K. Taylor, 11 pages (Oct. 1973). Order from NTIS as COM 75-11445.

Key words: acrolein; gas chromatography analysis; gas dilution system; occupational safety.

A system capable of producing well-defined test atmospheres of acrolein in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. Using a bulk mixture of 9.0 ppm acrolein in nitrogen, and accurately blending this with a stream of clean, dry air, concentrations between 0.05 and 0.50 ppm can be produced. This system provides a means of calibration of the various analytical systems for acrolein now in use.

NBSIR 73-259. **A gas dilution system for methyl bromide,** E. P. Scheide, E. E. Hughes, and J. K. Taylor, 11 pages (Oct. 1973). Order from NTIS as COM 75-11446.

Key words: gas chromatography analysis; gas dilution system, methyl bromide; occupational safety.

A system capable of producing well-defined test atmospheres of methyl bromide in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. Using a bulk mixture of 1000 ppm methyl bromide in nitrogen, and accurately blending this with a stream of clean, dry air, concentrations between 5 and 100 ppm can be produced. This system provides a means of calibration of the various analytical systems for methyl bromide now in use.

NBSIR 73-260. **A gas dilution system for arsine-air mixtures,** P. A. Pella, E. E. Hughes, and J. K. Taylor, 14 pages (Oct. 1973). Order from NTIS as COM 75-11440.

Key words: arsine; gas-blending; Gutzeit method; spectrophotometry.

A gas-blending system originally designed for chlorine-air mixtures was modified for producing arsine-air mixtures in the concentration range from 0.02 to 0.25 ppm. This system has been tested in order to provide accurately known concentrations of arsine-in-air for calibration of analytical monitoring devices. An analytical method has been developed for checking the concentration of arsine in the working standard and consists of the spectrophotometric measurement of an arsine-diethyldithiocarbamate complex in solution.

NBSIR 73-261. **A gas dilution system for hydrogen fluoride-air-mixtures,** P. A. Pella, E. E. Hughes, and J. K. Taylor, 23 pages (Oct. 1973). Order from NTIS as COM 75-11441.

Key words: fluoride analysis; gas-blending; HF-air mixtures; ion-specific electrode.

A gas-blending system was constructed for producing hydrogen fluoride-air mixtures in the concentration range from 1 to 20 ppm for the purpose of calibrating analytical monitoring devices. The system has been tested by measuring these HF concentrations using a fluoride ion-specific electrode.

NBSIR 73-262. **Some cutting experiments on human skin and synthetic materials,** J. R. Sorrells and R. E. Berger, 70 pages (Oct. 1973). Order from NTIS as COM 75-10370.

Key words: cut; edges, hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; simulation; skin; skin, cutting; synthetic materials, cutting; toys.

Human skin specimens were cut in vitro with edges of varying geometry over a normal force range of 0 to 89 newtons. Generally, at a given force, the smaller the included angle and the radius of an edge, the deeper the resulting cut. For a given edge and skin specimen, empirical curves fitted to the data indicate that the depth of cut increases with force, and that this rate of increase diminishes exponentially. Based on the experimental data, a convention was proposed for labelling the edges as safe or hazardous.

Synthetic materials were sought which, when applied in a specific manner to the test edges, would be completely penetrated by only those edges labelled hazardous. Then such materials could be used in an inspection procedure for unknown edges. Tests were conducted on many synthetics, but only a few showed possibilities in this regard.

NBSIR 73-263. Fire Endurance Tests of Unprotected Wood Floor Constructions for Single-Family Residences, B. C. Son, 65 pages (July 1973). Order from NTIS as PB 22[illegible] 284. [See 13790 for abstract.]

NBSIR 73-264. **Examination of failed one inch black iron pipe natural gas service line, Iowa Public Service Company, Eagle Grove, Iowa,** T. R. Shives, 24 pages (Aug. 30, 1973). Order from NTIS as PB243541.

Key words: black iron pipe; dimpled rupture; ductile fracture; gas pipe.

A fractured one inch black iron pipe natural gas service line which connected to a building involved in an explosion and fire in Eagle Grove, Iowa, on February 2, 1973, was examined by the NBS Mechanical Properties Section. The fracture was ductile in nature. There was no evidence found to indicate the presence of a preexisting crack. The fracture appeared to have been due to bending stresses caused by loading from an external source.

NBSIR 73-265. The Shirley Highway Express-Bus-On-Freeway Demonstration Project-Users' Reactions to Innovative Bus Features, T. H. Saks, R. F. Yates, and K. M. Goodman, 53 pages (June 1973). Order from NTIS as COM 73-11453. [See 13644 for abstract.]

NBSIR 73-266. Fire Spread on Exterior Walls Due to Flames Emerging from a Window in Close Proximity to a Reentrant Wall Corner, B. C. Son and J. B. Fang, [illegible] pages (April 1973). Order from NTIS as PB 225-28[illegible] [See 13791 for abstract.]

NBSIR 73-267. Report of Fire Tests on Flexible Connectors in HVAC Systems, L. A. Issen, 67 pages (July 197[illegible] Order from NTIS as COM 73-11955. [See 13792 for abstract.]

NBSIR 73-268. Laser Damage in Materials, A. Feldman, D. Horowitz, and R. M. Waxler, 44 pages (August 197[illegible] Order from NTIS as AD 768-303. [See 13793 for abstract.]

BSIR 73–275. Report to AID on an NBS/AID Workshop on Standardization and Measurement Services in Industrializing Economics, M. B. McNeil, 64 pages (September 1973). Order from NTIS as COM 74–10126. [See 13794 for abstract.]

BSIR 73–277. Evaluation of a Pressurized Stairwell Smoke Control System for a 12 Story Apartment Building, F. C. W. Fung, 53 pages (June 1973). Order from NTIS as PB 225–278. [See 13795 for abstract.]

BSIR 73-280. **Thermodynamics of chemical species important to rocket technology,** T. B. Douglas and C. W. Beckett, 109 pages (Jan. 1, 1973). Order from NTIS as COM 74-10549.

Key words: associated vapors; graphite; heat capacity; molybdenum; molybdenum pentafluoride; niobium; radiance temperature; spectral emittance; surface roughness; thermodynamic properties.

The enthalpy of high-purity molybdenum was accurately measured 273-1173 K, and joined smoothly to lower-temperature (German) and higher-temperature (NBS) results to give thermodynamic functions 273-2100 K. The heat capacity of a grade of Poco graphite was measured by a subsecond-duration pulse-heating technique 1500-3000 K (estimated inaccuracy, 3% or less). Based largely on earlier NBS IR and Raman spectroscopy, ideal-gas thermodynamic functions for MoF_5 were generated and are tabulated for 0-6000 K. Three alternative classical-thermodynamic or quasi-chemical treatments are developed for deriving thermodynamic properties from vaporization data on partially associated vapors, with calculations to illustrate experimental-error propagation for one treatment. A subsecond-duration pulse-heating technique was applied to niobium metal to measure its change in normal spectral emittance and radiance temperature at and near its melting point (wavelength, 650 nm), studying dependence on solid-state roughness (0.1 to 0.95 μm).

NBSIR 73-281. **Thermodynamics of chemical species important to rocket technology,** T. B. Douglas and C. W. Beckett, 122 pages (July 1, 1973). Order from NTIS as COM 74-10550.

Key words: electrical resistivity; iron; molybdenum pentafluoride; partly associated vapors; solid-state transformations; solution calorimetry; specific heat; spectral emittance; transition alloys; vapor pressure.

Using a subsecond-duration transient technique, the specific heat, electrical resistivity, and hemispherical total emittance were simultaneously measured 1500-2800 K for iron and the alloy 80Nb-10Ta-10W (estimated uncertainties: 3%, 0.5-1%, and 3% for the respective properties). Comparisons are made with generalized approximations. At the gamma-to-delta transformation of iron (about 1680 K), the temperature, heat of transformation, specific heat, spectral emittance, and electrical resistivity were measured, thereby demonstrating the feasibility of the technique for solid-solid transformations. Two other alloys were likewise measured. Solution calorimetry involving several thermochemical steps (including oxidation by XeO_3 in aqueous HF) gave the standard heat of formation of MoF_5(c). A new static vapor-pressure method, after verification to 1 percent by I_2 and MoF_6, and after modifications to deal with the necessarily added MoF_6, gave the vapor pressure of MoF_5 at 393 K and indicated (using also earlier NBS transpiration data) 85-90 mole percent of monomer in the saturated vapor.

NBSIR 73-287. **Procedures for the calibration of volumetric test measures,** J. F. Houser, 24 pages (Aug. 1973). Order from NTIS as COM 73-11928/1GA.

Key words: air density; calibration; gravimetric; neck; volumetric.

The values for graduated neck type volumetric vessels may be obtained by either gravimetric or volumetric calibrations. This text describes the two methods of calibration and the data reduction associated with each method. Procedures for preparing these vessels for test are discussed. Also included are illustrations for data recording.

NBSIR 73–288. Swiss Building and Housing Research Activities, H. R. Trechsel, 63 pages (August 1973). Order from NTIS as COM 73–11861. [See 13796 for abstract.]

NBSIR 73–289. Characterization and Testing of Interactive Graphics for Computer-Aided Design and Engineering, S. Treu, 36 pages (June 30, 1973). Order from NTIS as COM 74–10475. [See 13797 for abstract.]

NBSIR 73-290. **Development of a dynamic pressure calibration technique. A progress report,** P. S. Lederer, 4 pages (Oct. 15, 1973). Order from NTIS as COM 74-10974.

Key words: dynamic calibration; pressure; transducer.

Plans are described for experimental investigation of a hydraulic sinusoidal pressure calibrator as a basis for development of dynamic pressure calibration techniques for frequencies up to 2000 Hz.

NBSIR 73-294. **Cost sharing as an incentive to attain the objectives of shoreline protection,** H. E. Marshall, 70 pages (Dec. 1973). Order from NTIS as COM 74-10541.

Key words: beach erosion control; cost sharing; economics; efficiency; equity; incentives; shoreline protection.

The nation's shorelines are being eroded by high winds and waves. Nonfederal interests have traditionally received Federal help in the form of cost sharing for protective structures. This study provides the Army Corps of Engineers with an evaluation of alternative cost-sharing rules for shoreline protection with respect to efficiency, equity, and administrative feasibility.

Existing cost-sharing rules are described for hurricane, beach erosion, and emergency protection. The present cost-sharing system appears to induce local interests to choose (1) costly techniques of protection, e.g., engineering rather than management techniques, and (2) overbuilt projects in terms of the efficient scale.

It is concluded that the Association Rule, which requires local beneficiaries of shoreline protection to share in all of the costs of a project purpose in the proportion that local benefits bear to national benefits at the margin, should be applied to all shoreline protection programs. All techniques of protection should be subject to the same percentage cost-sharing rule. It is also concluded that *all* categories of project costs should have the same percentage cost share apply to them. Finally, Federal cost sharing might be used as an incentive to encourage local interests to comply with minimum land use requirements that would prevent shoreline damages.

NBSIR 73–295. Interim Report No. 7. Chemical Resistance and Physical Durability Testing of Coating Materials, J. R. Clifton, H. F. Beeghley, and R. G. Mathey, 22 pages (August 1973). Orde rfrom NTIS as COM 74–10471. [See 13798 for abstract.]

NBSIR 73-297. **Fracture and deformation of alumina,** S. M. Wiederhorn, 14 pages (July 31, 1973). Order from NTIS as AD 772066.

Key words: electron microscopy; fracture; mechanical properties; plastic deformation; sapphire; sodium chloride.

This report summarizes work conducted during the past eight years on the fracture and deformation of ceramic materials. Accomplishments discussed in this report include: an elucidation of fracture process of aluminum oxide and sodium chloride; the development of techniques to study the deformation of alu-

minum oxide during abrasion; and the development of techniques for measuring fracture mechanics parameters on ceramic materials.

NBSIR 73-299. **Examination of failed eight inch welded steel pipe natural gas main, UGI Corp., Coopersburg, Pennsylvania,** M. L. Picklesimer and T. R. Shives, 35 pages (Nov. 1973). Order from NTIS as PB243543.

Key words: brittle fracture; gas main pipe; welded steel pipe.

The Office of Pipeline Safety, Department of Transportation, submitted a four foot length of eight inch diameter welded steel pipe natural gas main containing a crack in the weld to the NBS Mechanical Properties Section for examination. The apparent crack origin was located at about the 4:30 o'clock position, assuming the top of the pipe to be at twelve o'clock and the outside of the bend of the pipe as installed was at three o'clock. The crack had propagated about two-thirds of the way around the pipe circumference. Optical and scanning electron microscopy revealed the fracture to have been predominantly brittle in nature. There was lack of weld penetration around a large part of the weld circumference and the weld metal exhibited some porosity. These features are normal for steel pipe welded by the oxyacetylene practice used at the time the weld was made. While these features of the weld helped to define the path of the fracture, they probably did not contribute to it. Examination of the fracture and comparison of its features with those of fractures produced in the laboratory indicated that failure was probably brought about as a result of a single event, impact loading from an external source.

NBSIR 73–301. Development of Insulation Transfer-Standards Using a Flat Plate Calorimeter, P. R. Ludtke, 43 pages (March 1973). Order from NTIS as COM 73–10762. [See 13416 for abstract.]

NBSIR 73–302. RF Null Detector NBS/SND, R. E. Stoltenberg, 88 pages (June 1973). Order from NTIS as COM 73–10869. [See 13420 for abstract.]

NBSIR 73–303. Fast Fourier Transform Implementation for the Calculation of Network Frequency Domain Transfer Functions from Time Domain Waveforms, W. L. Gans and N. S. Nahman, 53 pages (December 1972). Order from NTIS as AD 759–374. [See 13417 for abstract.]

NBSIR 73-304. **Reference-waveform generation using Debye dielectric dispersion,** N. S. Nahman, R. M. Jickling, and D. R. Holt, 98 pages (Dec. 1972). Order from NTIS as COM 74-10281.

Key words: pulse distortion in transmission lines; pulse techniques; reference waveform generation; time domain measurements; transient response Debye dielectric.

This report discusses the theory, construction, and operation of Reference-Waveform Generators using a tunnel diode transition-waveform generator driving 4.65 meter (15 foot), 3.10 meter (10 foot), and 1.55 meter (5 foot) liquid-dielectric uniform lossy coaxial lines to produce known 0.2 volt transition waveforms across 50 ohms with (10-90%) transition times from 205 to 560 picosecond. Each resultant Available-Waveform is characterized in terms of its departure from the step response of the uniform lossy coaxial line operating into a 50 ohm load. The liquid dielectric solutions are dispersive with relaxation times of the order of 4 picoseconds in which heptane is the solvent and the ketones, butanone, heptanone and octanone are the solutes in concentrations ranging from 0.25- to 2-molal.

NBSIR 73–308. Insulation of Liquid Oxygen Dewars, C. F. Sindt, 44 pages (April 1973). Order from NTIS as AD 763–325. [See 13418 for abstract.]

NBSIR 73–312. Notes on Infrared Absorption Experime in a Methane Molecular Beam, P. Kartaschoff, S. Jarv Jr., 32 pages (May 1973). Order from NTIS as CO 73–11893. [See 13800 for abstract.]

NBSIR 73-316. **Liquid helium pumps,** P. M. McConnell, pages (June 1973). Order from NTIS as AD 769542.

Key words: cavitation; helium; pump performance; pum superfluid.

This report summarizes studies of pump characteristics a performance in supercritical, normally boiling, and superfl helium, and also presents results on a survey of commercia available pumps for helium service. Experimental measureme were made on a centrifugal pump which produced a maxim head of about 15 meters and a maximum flow of about 2.5×1 m^3/s. Performance agreed approximately with classical affin laws, but cavitation appeared to provide less of a performa equipped with environmental chambers to permit stress-rupt testing under elevated temperature and saturated humidity c ditions.

NBSIR 73–318. Mass Quantity Gauging by RF Mode A alysis, R. S. Collier, D. Ellerbruch, J. E. Cruz, R. Stokes, P. E. Luft, R. G. Peterson, A. E. Hiester, pages (June 1973). Order from NTIS as N 73–273 [See 13664 for abstract.]

NBSIR 73–322. Forced Convection Heat Transfer to S critical Helium I, P. J. Giarrantano, R. C. Hess, M. Jones, 45 pages (May 1973). Order from NTIS as 766–221. [See 13666 for abstract.]

NBSIR 73–326. Wavelength of a Slotted Rectangular L Containing Two Dielectrics, H. E. Bussey, 17 pages (J 1973). Order from NTIS as COM 73–11465. [See 13 for abstract.]

NBSIR 73-329. **Theory of adjoint reciprocity for electroacou transducers,** A. D. Yaghjian, 78 pages (Feb. 1974). Order fr NTIS as COM 74-10608.

Key words: adjoint operators; electroacoustic transduce reciprocity; scattering matrices.

Analytical techniques for the measurement of the exter characteristics of electroacoustic transducers have b developed by D. M. Kerns using a plane-wave scattering-mat (PWSM) formulation. Foldy and Primakoff, in their clas papers on linear electroacoustic transducers, utilize a spatial pedance-matrix (SIM) formulation. Both formulations involv continuous, linear "matrix" transformation in which reciproc is defined as a relationship between elements of the matrix.

The first portion of the present report demonstrates tha transducer satisfying the "SIM relations" also satisfies "PWSM equations" (but that the converse theorem does hold), and that the alternate expressions of reciprocity equivalent for transducers that obey both formulations.

The second portion of the report examines the equati which characterize the internal behavior of a large class of el troacoustic transducers. A linear operator approach is emplo to develop a generalized reciprocity lemma which is used establish adjoint reciprocity relations between the fields o given transducer and its adjoint transducers. The linear opera approach facilitates the identification of self-adjoint (reciprc or catireciprocal) transducers, and the adjoint reciprocity r

ons have utility in the extrapolation techniques of the PWSM ormulation. An adjoint "reciprocity theorem" and "principle of eciprocity" are derived from the generalized reciprocity relaons. Finally it is shown that the total power inputs for the adoint transducers belong to the same "value class" as the original ransducer.

BSIR 73-330. **Frequency domain measurement of baseband instrumentation,** N. S. Nahman and R. M. Jickling, 68 pages (July 1973). Order from NTIS as COM 74-10609.

Key words: bandwidth; diode; impedance; sampling; slotted line.

Microwave measurement techniques were developed for haracterizing the wideband feed-through sampling heads asociated with time domain sampling oscilloscopes and frequency omain network analyzers. Such characterization or modeling is ecessary for the removal of the oscilloscope distortion from the bserved waveform to yield the input waveform; also, it is useful or extrapolation in estimating oscilloscope performance at igher frequencies.

The techniques were developed through measurements on a ampling oscilloscope having a 28 picosecond transition time (10 o 90%) and a 12.4 GHz baseband bandwidth. The major results f the work are the development of voltage and impedance meaurement techniques which provide the means for determining he sampling-head equivalent circuit parameters. The techniques re based upon slotted-line measurements and are not inherently mited to any particular frequency range. Experimental results ere obtained for the sampling-head input impedance over the 7-2 GHz frequency range, and for the 10 GHz sampling loop imedance (vs. sampling-diode bias current).

BSIR 73-331. **Refrigeration of superconducting rotating machinery,** V. D. Arp, 75 pages (June 1973). Order from NTIS as COM 74-10238.

Key words: equation of state; helium; hydrodynamics; near-critical flow; refrigeration; superconductors; thermodynamics.

Recent work at the NBS Cryogenics Division in three areas elated to helium refrigeration is summarized: (1) Analysis is iven of a possible high pressure refrigeration cycle which offers n principle a reduced component size, but which turns out to be mpractical because of expansion engine inefficiencies. (2) Exact quations for flow of a real fluid are derived and applied to roblems of fluid flow near the critical point, as may occur with ome helium-cooled superconducting systems, and (3) Three ew equations of state for helium are given, each using different tate variables, to eliminate the need for iterative techniques in elium refrigeration cycle and fluid flow analysis.

NBSIR 73-335. **Calibration of radio receivers to measure broadband interference,** E. B. Larsen, 75 pages (Sept. 1973). Order from NTIS as COM 74-11051.

Key words: broadband interference; field strength meter; impulse standards; receiver bandwidth calibration; spectral intensity.

This report covers one phase of a project to improve the accuracy for calibrating field-strength to measure broadband signals, especially impulse interference. The amplitude of a narrowband signal is commonly expressed in μV, and a broadband signal is expressed in μV/MHz bandwidth. A future report (2nd phase) will deal with standards and techniques for producing a known impulse field to calibrate an antenna-receiver system in μV/(m · MHz). The technique used for initial calibration of a receiver as an RF voltmeter is new, employing a special L-pad with 48 Ω input resistor and 2 Ω output resistor across the receiver. The input power across 50 Ω is leveled, producing a low-impedance, constant-voltage source at the receiver input terminal.

Broadband interference is generally divided into two types: (a) random noise is best characterized by its power spectral density, and (b) impulse interference (uniform periodic pulses) is best quantified by its impulse strength. Several possible approaches were evaluated for defining and measuring various bandwidths of a receiver. The response of a receiver to impulses, as measured with a peak-reading detector, is proportional to the product of receiver impulse bandwidth and signal impulse strength. Of the two types of impulse sources evaluated here (pulsed DC and pulsed RF), the latter appears to be the most accurate and repeatable. We were able to produce a clean RF pulse, choosing an effective duration of 0.1 μs in our experiments, which covered a frequency range of 100 to 1000 MHz. The worst-case uncertainty of this standard source for calibrating receiver impulse bandwidth is $\pm$0.7 dB.

NBSIR 73–338. Calculated Liquid Phase Thermodynamic Properties and Liquid-Vapor Equilibria for Fluorine-Oxygen (FLOX) Mixtures, W. R. Parrish and M. J. Hiza, 28 pages (September 1973). Order from NTIS as COM 73–11660. [See 13803 for abstract.]

NBSIR 73-339. **Preliminary hydrogen freezing studies,** D. E. Daney, W. G. Steward, and R. O. Voth, 281 pages (Oct. 1973). Order from NTIS as COM 73-11985/1GA.

Key words: freezing rates; solid hydrogen; thawing; thermal conductivity.

The study summarized in this report is aimed at developing the technology required to fill space vehicle propellant tanks with solid hydrogen by in-place freezing. Planned continuation of this work was terminated with the loss of NERVA funding by the NASA. Therefore, progress to-date is summarized but substantial experimental results have not yet been obtained.

The program was to have been carried out in two phases: a mathematical analysis and experimental verification of the analysis. Freezing times and heat flux have been calculated for four geometrical shapes, and a range of sizes, refrigerant temperatures, ortho-para concentrations, and heat transfer coefficients. The results of these calculations are presented in generalized graphical form, in a total of 240 graphs.

The freezing experimental apparatus has been built and a preliminary test performed which generally demonstrates the validity of the analytical and experimental approaches. With only minor modifications the apparatus is ready for a full test program of hydrogen freezing and melting techniques.

NBSIR 73-341. **Test results for the Mooring Line Data Line,** D. A. Ellerbruch, 46 pages (Oct. 1973). Order from NTIS as COM 74-10885.

Key words: characteristic impedance; coupler; current; impedance, input impedance; Mooring Line Data Line; propagation characteristics; transmission line.

Results obtained from the Mooring-Line-Data-Line (MLDL) measurements program are presented. Frequency and time domain measurements are made to determine characteristics impedance, input impedance, current, and propagation parameters. Most of the measurements were made with an MLDL deployed specifically for this program; however, some were made on an MLDL deployed buoy.

NBSIR 73-342. **The thermophysical properties of methane, from 90 to 500 K at pressures to 700 bar,** R. D. Goodwin, 279 pages (Oct. 1973). Order from NTIS as COM 73-11978/1AS.

Key words: densities; enthalpies; entropies; equation of state; internal energies; isobars; isochores; isotherms;

Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; PVT data; specific heats; speeds of sound; vapor pressures.

Thermophysical properties of methane are tabulated at uniform temperatures from 90.68 to 500 K along isobars to 700 bar. A novel equation of state is employed for the first time, having origin on the vapor-liquid coexistence boundary. Computations are based almost entirely on ideal gas specific heats and experimental P-ρ-T data via the equation of state, without weighting to data for derived properties. Good agreement with such data confirms validity of the equation and method. New P-ρ-T data are reported at 0.3 to 1.7 times the critical density.

NBSIR 73-343. **Calibration of impulse noise generators,** G. R. Reeve, 77 pages (Oct. 1973). Order from NTIS as COM 75-10282.

Key words: impulse; impulse generator calibration; impulse noise; impulse noise generator.

This report covers work performed by the Electromagnetics Division, Institute for Basic Standards, National Bureau of Standards, on a Signal Corps contract to develop a calibration system for impulse noise generators. Various technical approaches are discussed with their respective problems. A prototype system which was constructed is presented along with some measurements of its capability. Finally another approach is suggested utilizing newer techniques and instrumentation which should come closer to achieving the desired level of performance.

NBSIR 73-344. **Heat transfer and mixing of slush hydrogen,** C. F. Sindt and P. R. Ludtke, 40 pages (Nov. 1973). Order from NTIS as COM 74-10749.

Key words: heat transfer; liquid hydrogen; mixing; mixing power; paddle mixers; slush hydrogen; turbine mixers.

Heat transfer to slush hydrogen and mixing were investigated in a 1 m^3 cylindrical vessel. The effects of heat transfer rates on thermal stratification and on self-pressurization were measured. Temperature profiles in thermal stratification were found to be more dependent on slush level and slush settling rates than on liquid level. Solids in the slush appear to be involved in the heat transfer mechanism as slush level affected the amount of warm liquid reaching the top of the dewar and therefore affected the self-pressurization rates.

Mixing effectiveness and power requirements to mix slush hydrogen were determined for two configurations of turbine mixers and one paddle mixer. Mixing power requirements were found to be sensitive to the mixer location and configuration.

NBSIR 73-345. **Combustion of metals in oxygen phase II: Bulk burning experiments,** A. H. Tench, H. M. Roder, and A. F. Clark, 49 pages (Dec. 1973). Order from NTIS as COM 74-10239.

Key words: alloys; aluminum; combustion; ignition; oxygen; safety; stainless steel; steel, titanium.

This program was started to study combustion of the ordinary metals in oxygen, to provide information useful to designers of bulk oxygen handling equipment, particularly from the point of view of safety. We have studied the ignitability and combustability of carbon steels, stainless steels, aluminum alloys, titanium and copper metals, in oxygen atmospheres up to 60 psig. We encountered a violent reaction involving burning stainless steel and aluminum, a thermite reaction apparently, and have investigated this from a quantitative point of view. We have tried throughout to study the quantitative aspects of the combustion processes, and related quenching effects. Ordinary steel and stainless steel burn quite readily at these low oxygen pressures, and the stainless steel-aluminum reaction produces intense heat, with severe damage to neighboring structures. We are at the stage where further investigations could be carried out quite expeditiously and on a sound statistical basis.

NBSIR 73-346. **RF total mass gauging in large storage containers Empty tank modes,** R. S. Collier and D. Ellerbruch, 28 pages (Oct. 1973). Order from NTIS as COM 74-10240.

Key words: LOX storage container; radio frequency; total mass gauging.

This report describes experiments to determine the feasibility of radio frequency (RF) mass gauging for fluids stored in large containers. The experiments were done at the NASA Mississippi Test Facility using the 460,000 gallon LOX Storage Tank as an electromagnetic resonant cavity. The results show that the RF gauging technique is feasible for large containers.

NBSIR 73-347. **Active and passive mode locking of continuous operating rhodamine 6G dye lasers,** A. Scavennec and N. Nahman, 54 pages (Feb. 1974). Order from NTIS as COM 74-10674.

Key words: DODCI; dye laser; laser; mode-locked picosecond; rhodamine 6G.

Using confined and unconfined fluid flow dye cells with suitable mode locking methods continuously operating rhodamine 6G dye lasers have been built to produce narrow pulses (less than 4 ps) at about a 140 MHz pulse repetition rate. For active (acoustic) amplitude modulation mode locking methods optical pulses were obtained having about a 32 ps pulse width (FWHM). For passive mode locking methods optical pulses of ≤ 35 ps pulse width (FWHM) were obtained.

A three mirror cavity was used for the active mode locking studies while three and five mirror cavities were used in the passive studies. The three mirror passive mode locked laser employed a single dye cell containing both the rhodamine 6G (gain) and DODCI (loss) solutes in a single solution having glycol as the solvent. The active and passive mode locked carrier wavelengths were about 5900 Å and 5800 Å, respectively.

NBSIR 73-348. **An engineering feasibility study for one-way time transfer using the GOES satellite ranging system,** J. B. Milton and W. F. Hamilton, 38 pages (Dec. 1973). Order from NTIS as COM 74-10241.

Key words: clock synchronization; one-way time transfer; satellite timing; synchronous satellite.

The Time and Frequency Division of the National Bureau of Standards has conducted an engineering study to determine the feasibility of using the GOES satellite ranging system for precise (0.1 microsecond, one-sigma) time transfer to a receiving-only timing site. The GOES satellite ranging system, termed a trilateration system, will accurately locate this satellite within some coordinate structure. The sources of time transfer errors have been studied in some detail. These errors can be caused by satellite location errors, ground station location errors, unknown delays caused by the troposphere, the ionosphere, and the various equipments. Simplified designs for an automatic and a manually operated timing site are presented. Some technical problems found in the associated equipment are discussed. The study indicates that a secondary, or slave site, clock could be synchronized to within 0.1 microsecond; one-sigma, of some master clock utilizing a one-way, or receiving-only system.

NBSIR 73-349. **Characterization of a superconducting coil composite,** C. W. Fowlkes, P. E. Angerhofer, R. N. Newton, and A. F. Clark, 51 pages (Dec. 1973). Order from NTIS as COM 74-10241.

Key words: composite; low temperature; Poisson's ratio; superconductor; thermal expansion; Young's modulus.

The superconducting coil composite material being utilized by Annapolis Laboratory of the Naval Ship Research and velopment Center is characterized by its mechanical and ther- l properties. The Young's moduli, Poisson's ratios, and ther- l contractions are measured from room temperature to 4K and orted in this interim report. A micromechanical analysis ed upon volume fractions of constituents is used to predict m-temperature properties, and a comparison is made to the asured values.

SIR 73-351. **Thermal conductivity standard reference materials from 6 to 280 K: VI. NBS sintered tungsten,** J. G. Hust, 58 ages (Jan. 1974). Order from NTIS as AD 775367.

Key words: cryogenics; electrical resistivity; Lorenz ratio; Seebeck effect; standard reference material; thermal conductivity; transport properties; tungsten.

Thermal conductivity, electrical resistivity, Lorenz ratio, and rmopower data are reported for two specimens of NBS sin- ed tungsten for temperatures from 6 to 280 K. Variability of s tungsten was studied by means of electrical resistivity and idual resistivity measurements on 39 specimens. These data icate a material variability of about ± 10 percent in thermal nductivity at helium temperatures. Above 90 K variation in rmal conductivity is only about ± 1 percent. To reduce the un- tainty caused by specimen variation at low temperatures, aracterization by residual electrical resistivity data is scribed. By this procedure the low temperature uncertainty is duced to about ± 3 percent.

SIR 73-402. **NBS materials science and manufacturing in space research,** E. Passaglia and R. L. Parker, 127 pages (Nov. 1973). Order from NTIS as COM 74-10472.

Key words: materials processing; perfection; purity; space manufacturing; space processing; zero-g.

This report describes NBS work for NASA in support of ASA's Materials Science and Manufacturing in Space IS/MS) (now Space Processing) program, covering the period ovember 1, 1972 to October 31, 1973. The objectives of the BS program are to perform ground-based studies of those pects of space that could possibly provide a unique environ- nt for making materials more perfect or more pure. The ap- oach taken deals primarily with experimental and theoretical udies of the possible effects of the absence of gravitational rces on those materials preparation processes where the esence of gravity may be important in reducing perfection or rity. The materials preparation processes studied comprise 5 sks in the areas of crystal growth, purification and chemical ocessing, and the preparation of composites.

SIR 73-403. **Development and analysis of techniques for calibration of Kerr cell pulse-voltage measuring systems VII,** E. C. Cassidy, R. E. Hebner, R. J. Sojka, and M. Zahn, 129 pages (Nov. 1, 1973). Order from NTIS as COM 74-10016/5GA.

Key words: electric field measurement; electro-optic Kerr effect; high voltage measurement; impulse measurement; Kerr constant; liquid insulants; nitrobenzene; peak reading voltmeter; space charge.

To improve the accuracy of pulse voltage systems using the ectro-optic Kerr effect, it is necessary to improve the accuracy calibration of Kerr cells. In the past this has been attempted calibrating the cell under direct voltage and relying on the equency independence of the Kerr coefficient (below 10^8 Hz) insure that the calibration was valid under high voltage pulses. ace charge effects, however, modify the electric field distribu- n in the liquid under direct high voltage. The electric field and ace charge behavior in nitrobenzene have therefore been docu- ented as functions of the level and frequency of the applied oltage. In addition, to improve the efficiency of cell design and to facilitate the investigation of other liquids for use in Kerr cells, the electro-optic Kerr coefficient of nitrobenzene has been measured as a function of temperature and wavelength. Finally a new peak reading voltmeter based on the Kerr effect is described and the results of using the electro-optic Kerr effect to measure the voltage pulses in medical x-ray machines are presented.

NBSIR 73-404. **Mass transport and physical properties of large crystals of calcium apatites: Studies of $Ca(OH)_2$ crystals for use in electrolytic conversion of calcium fluorapatite crystals to calcium hydroxyapatite,** A. D. Franklin and K. F. Young, 37 pages (Sept. 1, 1972-Aug. 31, 1973). Order from NTIS as PB 203952.

Key words: ac impedance; calcium apatites; calcium hydroxide; crystal growth; electrolysis; interfacial polarization; ionic conduction; mass transport.

In order to convert single crystals of calcium fluorapatite to calcium hydroxyapatite, an electrolytic cell technique will be explored. To utilize such a technique, the cathode compartment must consist of a source of hydroxyl ions and a barrier to the flow of all others. Examination of the literature on metallic hydroxides suggests that a suitable cathode might be composed of an oriented $Me(OH)_2$ crystal, where Me is Mg, Ca, Sr, or Ba, backed up by a Pt electrode in an atmosphere containing H_2O and O_2. $Ca(OH)_2$ crystals have been grown from aqueous solution, and Pt electrodes evaporated onto them. An apparatus has been built to study their ac admittance as a function of temperature and atmosphere, and measurements begun. A computer program for handling the complex admittance data has been devised and tested.

NBSIR 73-405. **Use of organic coatings on the interior surfaces of equestrian statues at Memorial Bridge Plaza,** F. Ogburn, 9 pages (Nov. 1973). Order from NTIS as COM 74-10131.

Key words: bronze statuary; organic coatings; restoration; statues.

The equestrian statues at Memorial Bridge Plaza in the District of Columbia are bronze castings. The exterior finish is subject to corrosion processes associated with pores and cracks in the castings. The interior surfaces are subjected to high humidity and condensation. Detrimental corrosion is expected only at discontinuities in the plated coatings on the exterior surfaces. Painting of interior surfaces has been recommended, but the need for painting is not clear. The NCP is advised to keep the statues under close observation till the fall of 1974 and then reconsider their course of action.

NBSIR 73-406. **Reference materials for the determination of trace elements in biological fluids,** P. D. LaFleur, 22 pages (Dec. 1973). Order from NTIS as COM 74-11352.

Key words: arsenic; biological fluids; chromium; copper; fluorine; lead; nickel; reference materials; selenium; trace elements; urine.

The preparation of a number of reference materials for the analysis of trace elements in biological standards is described. The standards produced include mercury in urine at three concentration levels, five elements [Se, Cu, As, Ni, Cr] in freeze-dried urine at two levels, fluorine in freeze-dried urine at two levels, and lead in whole blood at two concentration levels. These reference materials have been analyzed for the element(s) of interest by one or more analytical techniques, and are supplied with known concentration levels.

NBSIR 73-407. **Report on a pre-test of a survey plan for estimating incidence of lead based paint,** L. S. Joel and H. W. Berger, 86 pages (Dec. 1973). Order from NTIS as COM 74-11078.

Key words: lead; lead paint poisoning; paints; poisoning; retail inventory; statistics; survey.

Lead in paint has been indicted as a major cause of lead poisoning of children. Federal regulations have been established to limit the amount of lead which may be added to paints that are intended for residential use. The intent of such a limitation is to curtail the incidence of present and future lead based paint poisoning of children.

This report presents the results of a "pre-test" for a nationwide survey plan that would be used to determine the availability, to the public, of paints that may contain lead compounds in hazardous quantities. Statistical summaries of the chemical analysis of 250 paints purchased by random selection at five retail outlets, are presented along with comments regarding the possible implications of those results. Recommendations are made about survey action beyond the pre-test described herein.

NBSIR 73-412. **The incidence of hazardous material accidents during transportation and storage,** W. A. Steele, D. Bowser, and R. E. Chapman, 40 pages (Nov. 1973). Order from NTIS as COM 74-10512.

Key words: accidents; hazardous material; storage of hazardous material; transportation of hazardous material.

This report is one of a series describing background research concerning the incidence of abnormal loading. The report is organized in terms of modes of hazardous material transportation and storage. These modes—pipeline, water, motor vehicle, and railroad transportation systems—are addressed in four sections with Storage Systems discussed in a fifth. The sections depend on the amount of available data, rather than the risk involved in an accident. A summary of the results is presented in the last section. On the whole, there is little empirical evidence to substantiate a threat to buildings from hazardous materials transport. However, trends in volumes shipped in proximity to structures of interest raises the prospect of future incidents.

NBSIR 73-413. **Measurement of depth-dose distributions in carbon, aluminum, polyethylene, and polystyrene for 10-MeV incident electrons,** J. C. Humphreys, S. E. Chappell, W. L. McLaughlin, and R. D. Jarrett, 54 pages (Nov. 1973). Order from NTIS as COM 74-10750.

Key words: aluminum; carbon; depth dose; depth-dose distributions; dye-film dosimeters; polyethylene; polystyrene; radiochromic dyes; 10-MeV electrons.

Depth-dose distributions of 10-MeV electrons incident on homogeneous media of carbon, aluminum, polyethylene, and polystyrene have been measured using thin radiochromic dye-film dosimeters. Two types of dye-film dosimeters were employed as "cavities" within the media in two different geometrical configurations. One configuration was a stack with the dosimeters interleaved between disks of the medium and placed perpendicular to the incident electron beam direction. The other configuration was a wedge assembly with a single piece of dye film placed between pieces of the medium at a small angle to the beam direction. The results show no significant difference between dosimeter type or experimental arrangement. In addition, good agreement is shown in comparisons of experimental and Monte Carlo calculated depth-dose distributions characterized by such parameters as extrapolated range, depth of peak dose, and ratio of peak to entrance dose.

NBSIR 73-414. **Building and evaluation of a polluted air delivery system,** G. P. Baumgarten and F. W. Ruegg, 36 pages (Apr. 1974). Order from NTIS as COM 74-10866.

Key words: air pollution; critical flow; laminar flow; nozzle; porous plug; sulfur dioxide concentration.

The building and evaluation of a prototype SO_2 polluted air delivery system (PADS) is discussed. The delivery system was built to deliver sulfur dioxide (SO_2) in air at a rate of 5 liters per minute with design concentrations by volume of 1.0, 0.1 and 0. parts per million. It consists of a diluent air delivery syst utilizing a critical flow sonic nozzle and three separate conc trated SO_2 in air flow systems utilizing laminar flow por plugs, one plug for each desired output concentration. T delivery system is contained in a dispatch case and the two ga are delivered to it from pressurized containers through detac ble supply lines. Prospective use by unskilled technicians c tated simplicity and durability and compactness.

By maintaining specific upstream pressures on the critical fl nozzle and the laminar flow porous plugs of 45 and 12 p respectively, the prototype PADS produced average output c centrations of 0.76, 0.100 and 0.003 parts per million of SO_2 air based on concentration measurements with an N calibrated analyzer. The expected output concentrations w 0.98, 0.105 and 0.010 respectively, based on flow calibration the individual components. The uncertainty of the output c centration is estimated to be about ± 10 percent.

NBSIR 73-415. **Noble metal constitution diagrams: Part II,** R. Waterstrat and R. C. Manuszewski, 170 pages (Aug. 197 Order from NTIS as COM 75-11448.

Key words: alloy phases; constitution diagrams; no metals; phase diagrams; phase equilibria; platinum gr metals.

Six binary constitution diagrams involving the noble me are presented. These diagrams include the V-Ru, V-Rh, Nb- Nb-Pd, Nb-Pt and Ta-Pd alloy systems.

Experimental alloys were prepared from starting materi having a nominal purity of at least 99.9 percent and precauti were taken to insure that no significant contamination was troduced during alloy preparation and heat-treatment. Tempe tures were measured to an accuracy within ± 20 °C.

NBSIR 73-416. **Report on meeting of ISO/TC 6/SC 5 test methods and quality specifications for pulp,** W. K. Wilson, J. Schulz, C. E. Brandon, and J. L. Borstelmann, 69 pages (N 16, 1973). Order from NTIS as COM 74-10511.

Key words: ISO recommendations; pulp; pulp, test methods; testing methods for pulp.

The ninth meeting of ISO/TC 6, Paper, SC 5, Test Methods for Pulp, was held in Madrid, Spain, November 2 1973. Over 30 delegates from 11 countries discussed meth for testing of pulp and, to some extent, paper. Methods w agreed upon for the determination of saleable mass of flash dri pulp, disintegration of pulp, laboratory beating of pulp, prepa tion of laboratory sheets, and measurement of ISO brightness pulp. It was agreed that ISO Recommendations for determi tion of saleable mass of pulp in lots, determination of dry mat content, and determination of trace metals in pulp should revised. Plans were made to continue studies of methods for determination of viscosity, aqueous extraction, dirt and shiv total sulphur content, saleable mass of unitized lots of pu statistical evaluation of number of sample bales, preparation laboratory sheets, and fiber classification and drainability.

NBSIR 73-417. **Evaluation of commercial integrating-type no exposure meters,** W. A. Leasure, Jr., R. L. Fisher, and M. Cadoff, 33 pages (Dec. 1973). Order from NTIS as COM 10477.

Key words: acoustics (sound); dosimeter; environmer acoustics; instrumentation; noise exposure; noise expos meters.

As a result of the promulgation of occupational noise expos regulations by the Federal government, there are a number commercial noise exposure meters on the market today that p vide a measure of noise integrated (with appropriate weighti

over a time interval. This report presents the results of an evaluation of such instruments by the National Bureau of Standards (under the sponsorship of the U.S. Environmental Protection Agency) as to their usefulness in monitoring compliance with occupational noise regulations as well as their applicability as instruments for use in achieving the broader goals of the EPA. Tests were designed and conducted to evaluate microphone and system response to sound of random incidence, frequency response, crest factor capability, accuracy of the exchange rate circuitry, performance of the noise exposure meter as a function of temperature, and the dependence of the device on battery voltage. The rationale of the test procedures utilized to evaluate overall system as well as specific performance attributes, details of the measurement techniques, and results obtained are discussed.

NBSIR 73-418. **Test methods for determining coaxial cable response to bending strain, bulk compression (hydrostatic pressure), axial strain, and torsional strain,** J. F. Mayo-Wells, S. Edelman, and J. Jacobs, 119 pages (July 1973). Order from NTIS as COM 74-11783.

Key words: cable; coaxial; mechanical; response; strain.

Test methods have been developed for measuring the response of specimen one-meter lengths of coaxial cables, considered as sensing elements, to four separate types of strain: bending strain, bulk compression, axial tension, and torsional strain. Measurements were made on commercially available coaxial cables made in the laboratory from insulated wire and wire braid. Cable dielectric materials investigated include tetrafluoroethylene (TFE), fluorinated ethylene propylene (FEP), cellular FEP, polyethylene, cellular polyethylene, and polyvinyl chloride. Data from the measurements are included in appendixes.

NBSIR 73-420. **Survey on metallic implant materials,** J. R. Parsons and A. W. Ruff, 55 pages (Dec. 1973). Order from NTIS as COM 74-11092.

Key words: biomaterials; corrosion; implant materials; mechanical properties; metals.

The application of metallic materials as orthopedic implants in the human body is reviewed, concentrating on materials presently in clinical use and undergoing laboratory evaluation for possible future use. The criteria considered explicitly are tissue compatibility, mechanical properties, corrosion resistance, and toxicity. The three principal metallic implant materials, stainless steel, cobalt alloys, and titanium, are discussed in detail. Wherever possible, comparisons are made between the materials in terms of the intended application.

NBSIR 73-421. **An overview of the factors impacting metrication of the U.S. housing industry,** R. G. Hendrickson and D. W. Corrigan, 35 pages (Dec. 1973). Order from NTIS as COM 74-11224.

Key words: codes; construction conference; domestic housing, U.S.; foreign metrication; levels of conversion; metrication; problems of metrication.

This report describes the work undertaken by the National Bureau of Standards for the Department of Housing and Urban Development to ascertain and delineate major problems associated with the metrication of the domestic housing industry of the United States. Source material for the study included, principally, the foreign experiences of Great Britain and Australia; information obtained from interviews with businesses and associations; depositions provided to the 1970 Construction Conference, held for the purposes of the U.S. Metric Study; and documents, both foreign and domestic, pertaining to aspects of metrication.

The results of the study indicate the critical impact of metrication will be the redefinition or accommodation of the 15,000 codes at the local level, and the coordination of the 127 standard-setting organizations in the United States to define, develop and implement standards consonant with requirements and desired industry goals.

NBSIR 73-422. **A study of air traffic data requirements and sources for FAA analyses,** W. F. Druckenbrod, J. F. Gilsinn, R. H. F. Jackson, L. S. Joel, and T. K. Ming, 51 pages (May 1974). Order from NTIS as COM 74-11240.

Key words: air traffic analyses; air traffic data; standard reference air traffic data; users of air traffic data.

This report describes activities undertaken to assess the practicability of establishing a single file or a set of files of standard reference air traffic data samples. These files would serve as a common data base for ongoing and anticipated future forecast and analytical investigations relevant to the accommodation of air traffic in the National Airspace System.

The study entailed surveys of past and present air traffic data collection activities, of existing data files, and of all identifiable users of air traffic data within the FAA, as well as FAA contractors whose work requires air traffic data.

The information resulting from these surveys has been evaluated and aggregated to identify data which will satisfy most of the requirements expressed by the data users. Two data sets are specified for terminal area requirements, two sets for enroute requirements, and one set for oceanic requirements. These data sets will satisfy most input requirements for all anticipated analysis efforts. However, depending on the type of study, supplemental information, which is identified in various parts of this report, will be required in some cases.

NBSIR 73-423. **Guidelines for the use of computer technology in the developing countries,** R. A. Simmons, 172 pages (Dec. 1973). Order from NTIS as COM 74-11722.

Key words: computer education and training; computer technology; less-developed countries; technology transfer; U.S. foreign assistance.

The objective of this report is to contribute to more effective use of computer technology by the developing countries. An intensive survey of computer use and development in nine selected countries and an analysis of other supporting data have resulted in the formulation of specific conclusions. Recommendations for guidance of responsible officials in the developing countries and in the Agency for International Development have been developed in response to the conclusions and are presented in summary form. Later sections of the report include the facts and discussions in support of the conclusions, with emphasis on the responsibilities of the national governments, the problems of education and training, present computer applications, and the role of ADP standards. The results of the individual country surveys are included in the appendix. The report is a part of joint efforts on the part of the Department of Commerce and the Agency for International Development to bring U.S. high technology more effectively to bear on the problems of economic and social development in the less-developed countries of the world.

NBSIR 73-424. **A study of young children's pull-apart strength (an addendum to NBSIR 73-156—a study of the strength capabilities of children ages two through six),** W. C. Brown, C. J. Buchanan, and J. Mandel, 17 pages (Apr. 1974). Order from NTIS as COM 74-10867.

Key words: children; children's strength; pull-apart; safety; strength; test methods; toys; toy safety.

The Child Pull-Apart Strength Study was conducted to provide information which can be used to develop reliable and realistic standards and test methods for children's toys. The study was conducted with over 500 children in the Washington Metropolitan area, and included both black and white children from varying economic and social backgrounds.

The pull-apart test device used is a prototype model designed and constructed at the National Bureau of Standards. This test device was designed to measure the force that children can exert when pulling an object apart.

The results of the pull-apart strength study are consistent with those obtained in the previous child strength study which dealt with twisting, pulling, pushing, and squeezing (NBSIR 73-156). The study provided quantitatively precise and useful information about the effects of age and sex on the pull-apart strength capability of children ages two through six. The results are exhibited in tables of averages, standard deviations, coefficients of variation, and 95th and 5th percentiles.

NBSIR 74-355. **Carbon thin film thermometry,** R. S. Collier, L. L. Sparks, and T. R. Strobridge, 65 pages (Oct. 1973). Order from NTIS as N74-30195.

Key words: calibration; carbon films; low temperature; thermometry; vacuum deposition.

This is a summary of work done on NASA(Marshall Space Flight Center) purchase order H-92167A concerning Carbon Thin Film Thermometry. Optimum film deposition parameters were sought on an empirical basis for maximum stability of the films. One hundred films were fabricated for use at the Marshall Space Flight Center; 10 of these films were given a precise quasi-continuous calibration of temperature vs. resistance with 22 intervals between 5 and 80 K using primary platinum and germanium thermometers. Sensitivity curves were established and the remaining 90 films were given a three point calibration and fitted to the established sensitivity curves. Hydrogen gas-liquid discrimination set points are given for each film.

NBSIR 74-357. **A modified Benedict-Webb-Rubin equation of state for parahydrogen,** R. D. McCarty, 74 pages (Feb. 1974). Order from NTIS as COM 74-10551.

Key words: critical point; equation of state; hydrogen; index of refraction; PVT; saturation properties; scaling laws.

A 32 term modified Benedict-Webb-Rubin equation of state has been applied to data for parahydrogen. The adjustable parameters in the equation of state were determined using data from the triple point to 2500 K, with pressures to 680 atmospheres. Extensive modifications have been made to the previously accepted PVT surface for the saturated liquid and vapor phases in the near critical region. These modifications have been made on the basis of subsequent refractive index data and the application of scaling law equations. Comparisons between experimental and calculated data are given.

NBSIR 74-359. **Semi-annual report on materials research in support of superconducting machinery,** L. L. Sparks, F. R. Fickett, J. G. Hust, P. J. Giarratano, H. M. Ledbetter, E. R. Naimon, W. F. Weston, M. B. Kasen, R. L. Tobler, R. P. Mikesell, R. L. Durcholz, C. W. Fowlkes, and R. P. Reed, 313 pages (Mar. 1974). Order from NTIS as AD 780596.

Key words: composites; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity.

Results of six months research are reported to the sponsor, the Advanced Research Projects Agency of the Department of Defense. Subjects include magneto-thermal conductivity, thermal conductivity, composites, elastic properties, fracture toughness, fatigue, and tensile. All measurements include the temperature range 4 to 300 K. Materials examined are those either presently being used in superconducting machinery or considered for use in future prototypes. Material classes include stainless steels, inconels, titanium alloys, and composites.

Special results include: the thermal conductivity in a magnetic field is considerably lower than would be predicted; a comprehensive review of glass-reinforced composite behavior at low temperatures is included; the elastic moduli of 12 engineering alloys from 4 to 300 K are reported; and fracture toughness and fatigue crack growth rate data on AISI 304, AISI 316, A286, Ti-5Al-4V and Ti-6Al-2.5 Sn at 4, 76 and 300 K have been measured.

NBSIR 74-361. **Electromagnetic interference measurements at ASA, Fort Huachuca, Arizona,** H. E. Taggart and J. W. Adams, 72 pages (Dec. 1973). Order from NTIS as COM 74-11222.

Key words: APD; field strength; interference; power lines.

This report describes the work performed for the U.S. Army Security Agency Test and Evaluation Center (USASATEC), Fort Huachuca, Ariz. during the period from April 1973 to November 1973. The purpose of the project was to measure, analyze, and evaluate the electromagnetic environment at selected sites and to recommend methods of reducing the present levels of electromagnetic interference (EMI). The chief sources of EMI were the power lines in the area and sferics from thunderstorms. Both broadband EMI measurements and amplitude probability distribution measurements were made. Both electric and magnetic fields were measured. The frequency range covered was 15 kHz to 10 GHz. Measurements were made at three locations: 1) at Fort Huachuca USASATEC; 2) Willcox Dry Lake; and 3) Boulder, Colo. The report contains the test results, conclusions, and recommendations.

NBSIR 74-363. **Heat transfer in pulsed superconducting magnets,** V. Arp, P. J. Giarratano, R. C. Hess, and M. C. Jones, 137 pages (Jan. 1974). Order from NTIS as COM 74-11053.

Key words: forced convection heat transfer; pulsed power systems; pulsed superconducting magnets; superconductor losses; supercritical helium; transient heat transfer.

The first section of this report summarizes design problems for the development of advanced superconducting pulse magnets leading to recommendations for future work, primarily in (1) evaluation of eddy-current, hysteresis, and frictional losses, and (2) transient heat transfer between the superconductor and the helium. Two subsequent sections report measurements of forced convection heat transfer respectively to subcooled liquid helium and to supercritical helium just above the critical pressure.

NBSIR 74-364. **Detection of human intruders by low frequency sonic interferometric techniques,** R. E. Stoltenberg, 94 pages (May 1974). Order from NTIS as COM 74-11208.

Key words: human detector; interferometric technique; low frequency acoustics.

This report examines the theory and evaluates the results of over 200 tests of the use of low frequency sonic interference techniques for the detection of a human intruder in a confined area. The conclusions are that this technique is potentially a significant improvement over conventional methods with regard to area coverage and minimum velocity detection.

This work examined the intruder signature and background noise with respect to sonification frequency, source levels, intruder size, intruder velocity, source types, area coverage (to 692 sq. meters), and geometric position of the source and receiver in four radically different areas.

Interference effects of the intruder signature and noise were nalyzed with respect to bandwidth, spectral content, and magitude by both computer drawn spectral displays, and specific requency correlators.

NBSIR 74-365. **Impulse spectral intensity—what is it?,** M. G. Arthur, 25 pages (May 1974). Order from NTIS as COM 74-11375.

Key words: electromagnetic interference; Fourier transform; impulse spectral intensity; spectral intensity; spectrum amplitude; spectrum amplitude density.

The term, impulse spectral intensity, is often used in discus ions concerning electromagnetic interference and broadband ignal processing. In these discussions, the term is not used in a onsistent manner, resulting in confusion, equivocation, and ometimes, errors. As a step towards improving this situation, he mathematical basis for spectral intensity is reviewed and cerain of its features are clarified. Also, misuses of spectral intensiy are discussed, along with its limitations and proper use.

NBSIR 74-366. **Study of cryogenic propellant systems for loading the space shuttle,** R. O. Voth, W. G. Steward, and W. J. Hall, 95 pages (Apr. 1974). Order from NTIS as COM 74-11076.

Key words: computer modeling; cooldown; cryogenic flow; stresses; surges; transient flow; water hammer.

Computer programs have been written to model the liquid oxgen loading system for the space shuttle. The programs allow election of input data through graphic displays which schematially depict the part of the system being modeled. The computed utput is also displayed in the form of graphs and printed nessages. Any one of six computation options may be selected. The first four of these pertain to thermal stresses, pressure urges, cooldown times, flow rates and pressures during cooldown. Options five and six deal with possible water hammer effects due to closing of valves, steady flow and transient response o changes in operating conditions after cooldown.

Procedures are given for operation of the graphic unit and ninicomputer.

NBSIR 74-369. **Surface magnetic field noise measurements at Geneva Mine,** J. W. Adams, W. D. Bensema, and N. C. Tomoeda, 40 pages (June 1974). Order from NTIS as COM 74-11688.

Key words: earth-ionosphere waveguide; electromagnetic noise; EMI measurement technique; sferic interference.

Measurements of surface magnetic field noise were made at arious locations over the Geneva Coal Mine near Price, Utah, n June 12, 1973. The locations selected were on the surface ver emergency locator beacons underground at depths between 50 meters (1150 ft.) and 488 meters (1600 ft.). The surface terain where these measurements were made was mountainous, nd access was difficult. There were no power lines within everal miles, and the weather was clear; therefore, the magnetic oise levels were about as low as will normally occur.

Results of measurements of distant sferics indicate rather harp cutoff frequencies below which broadband, impulsive oise is attenuated. The mechanism of propagation for this noise bove the daytime cutoff frequency of 3500 Hz and the ighttime cutoff frequency of 1700 Hz is deduced to be a vaveguide formed by the D or E layers of ionosphere as an pper plane and the earth as a lower plane.

The measurement systems used are similar to those used earlir. The technique is to record broadband, analog signals, digitize he data, and use a fast-Fourier transform to obtain spectral lots. This technique is novel in that it can measure simultaneusly all magnetic field energy within a limited portion of the spectrum for a limited time, and, after processing, reproduce the events occurring in that time interval in great detail.

NBSIR 74-371. **Broadband pulsed/CW calibration signal standard for field intensity meter (FIM) receivers,** P. A. Simpson, 53 pages (June 1974). Order from NTIS as COM 74-11567.

Key words: broadband signal generator; impulse bandwidth; receiver bandwidth calibration; rf burst generator; spectral intensity.

This report describes the constructional details and the operation of a system for calibrating microwave field intensity meter (FIM) receivers in the frequency range 1 to 12.4 GHz. The system uses known levels of CW power to calibrate the receiver, and short duration (~20 ns) rf bursts to measure the bandwidth. An error analysis of the system is given. Schematic drawings of various circuits in the system are provided along with charts and tables for facilitating computations encountered when performing calibrations.

NBSIR 74-372. **Cryogenic refrigerators for shipboard forward looking infrared applications,** R. O. Voth, 75 pages (June 1974). Order from NTIS as AD-A006037.

Key words: cryogenics; infrared detector; low capacity; reliability; shipboard; 77 K refrigerator.

The Naval Ordnance Laboratory (NOL) has asked the Cryogenics Division of the National Bureau of Standards to investigate and evaluate 1) commercially available refrigerators, 2) refrigerators under development, and 3) new or novel ideas applicable to a refrigerator to cool infrared detectors in a shipboard Forward Looking Infrared (FLIR) system. Although a refrigerator has been selected for two prototype FLIR units, the study was initiated to select the most appropriate refrigerator for additional purchases of FLIR units. The FLIR requires a refrigerator capacity of approximately 2 watts at 77 K and a physical configuration allowing for an interface to the FLIR unit. Information was collected by interviewing FLIR manufacturers, surveying refrigerator manufacturers and by contacting users of similar systems. Correlation of this information with the NOL requirements is presented herein. The primary difference between airborne spaceborne refrigerators and a shipborne refrigerator is the accessibility for minor repairs on-board ship although major repairs may be deferred for extended periods of time. It is anticipated that the shipboard units will operate away from major maintenance facilities, for periods as long as 6 months, with the refrigerator operating at least half of this time. Thus, reliability and ease of maintenance are emphasized when evaluating the various systems.

NBSIR 74-375. **Refrigeration for an 8 K to 14 K superconducting transmission line,** D. E. Daney, 60 pages (Oct. 1974). Order from NTIS as COM 74-11657.

Key words: Brayton cycle; refrigeration; superconducting transmission lines; superconductors.

The performance of three supercritical refrigeration cycles for cooling superconducting transmission lines has been investigated for the temperature range of 8 K to 14 K. This temperature range is applicable to the Stanford superconducting (Nb_3Sn) line. These cycles, which were selected as being the most practical, are the Brayton cycle with the expander before the load, the Brayton cycle with the expander after the load, and the Brayton cycle with a separate supercritical helium loop and circulating pump.

The results are presented as curves of Wc/Q (ratio of the work of compression to the refrigeration load) vs the transmission line exit pressure for various transmission line pressure and tempera-

ture drops. Contrary to popular belief, all three cycles are competitive. Maximum efficiencies (percent of Carnot) are about 25 percent.

Estimated capital and operating costs are presented as a function of transmission line temperature for several values of thermal load per length of line.

NBSIR 74-377. **Picosecond pulse generators using microminiature mercury switches,** J. R. Andrews, 44 pages (Mar. 1974). Order from NTIS as COM 74-11449.

Key words: mercury switch; picosecond; pulse generator; pulse measurement; superconductivity.

Pulse generators have been built using microminiature mercury switches. A commercial RF coaxial switch was also evaluated as a pulse generator. A superconducting delay line ($t_r = 18$ ps, $t_d = 70$ ns) and a sampling oscilloscope ($t_r = 22$ ps) were used to measure the generated pulse 10-90 percent transition time. The best result obtained was a transition time of 39 ps. Pulse amplitudes were independently adjustable up to 50 volts. The microminiature mercury switches in general were found to give very unreliable operation.

NBSIR 74-378. **Time and amplitude statistics for electromagnetic noise in mines,** M. Kanda, 59 pages. Order from NTIS as COM 74-11450.

Key words: Allan variance analysis; amplitude probability distribution; amplitude statistics; average crossing rate; electromagnetic interference; electromagnetic noise; impulsive noise; interpulse spacing distribution; magnetic field strength; man-made noise; pulse duration distribution; time statistics.

The time and amplitude statistics necessary to adequately describe electromagnetic (EM) noise in mines are illustrated through computer software techniques. They are 1) Allan Variance Analyses (AVA), 2) Interpulse Spacing Distributions (ISD), 3) Pulse Duration Distributions (PDD), 4) Average Crossing Rates (ACR), and 5) Amplitude Probability Distributions (APD). These statistics are illustrated using data taken from a rather large store of raw analog data recorded in operational mines.

The curves generated for the illustrations characterize the noise environment in the mines from which the corresponding data were taken, and should aid in the design of reliable communication systems for such mines.

NBSIR 74-379. **Completion of the program to evaluate/improve instrumentation and test methods for electroexplosive device safety qualification,** P. A. Hudson, D. G. Melquist, A. R. Ondrejka, and P. E. Werner, 37 pages (June 1974). Order from NTIS as PB247658.

Key words: electroexplosive device safety; electromagnetic compatibility; electromagnetic interference; stray energy sensor.

Qualification of weapon and missile systems for electroexplosive device (EED) safety has been a continuing problem in the military services. Quantitative measurement of stray energy in EED's has been hampered by limitations of existing sensors. This report describes a new video diode detector instrumented EED (VIDEED) which responds to both the normal pin-to-pin energy (which would heat an EED bridgewire) and to the pin-to-case voltage (which might cause EED ignition due to arcing).

Also described in this report are the amplifiers, cables, adapters and recorders which make up the rest of the measuring system. Mention is also made of the test procedures used in testing the VIDEED system.

NBSIR 74-380. **Planar near-field measurements on high performance array antennas,** A. C. Newell and M. L. Crawford, 100 pages (July 1974). Order from NTIS as COM 74-11686.

Key words: antennas; near-field measurements; phased arrays.

The results of measurements which apply the planar near-field measurement technique to phased array antennas are described. Fast and efficient tests are used to determine the required scan area and data point spacing. The use of these tests can reduce the amount of data required for some antennas without significantly increasing the errors in computed results.

Measurements were made at different distances from the antennas, with the probe transmitting and receiving, and for both sum and monopulse difference patterns. Comparisons between the far-field patterns computed from the near-field data and those measured on far-field ranges are presented.

NBSIR 74-381. **Electromagnetic attenuation properties of clay and gravel soils,** D. A. Ellerbruch, 24 pages (Aug. 1974). Order from NTIS as COM 75-10522.

Key words: attenuation; clay; gravel; measurements; microwave; skin depth.

The objective of this work was to establish the feasibility of using active microwave techniques to differentiate between the different subsurface layers in a pavement system. The electromagnetic attenuation properties of clay and gravel soils were measured as a function of moisture content and frequency. Measurements were done at frequencies in the 0.5-4.5 GHz range. Soil samples were compounded in the laboratory at approximately 10, 50 and 90 percent saturation. Sample thickness was in the range 2.5-20.3 cm. Each homogeneous sample was sealed in a polyethylene container to retain the total moisture and to maintain a constant moisture content with depth.

NBSIR 74-382. **A study of the measurement of G/T using Cassiopeia A,** D. F. Wait, W. C. Daywitt, M. Kanda, and C. K. S. Miller, 199 pages (June 1974). Order from NTIS as AD 783433.

Key words: accuracy; antenna; calibration; Cassiopeia A; G/T; star flux.

This report describes a study intended to estimate the best possible accuracy of measuring the ratio G/T (system gain to system noise temperature) of a satellite communication ground station using the radio star Cassiopeia A (Cas A). The concept of G/T and its measurement using a radio star is briefly discussed. Results of an extensive literature search are presented, summarizing the properties of Cas A and its vicinity described by radio astronomers in order to utilize this information to assess the accuracy of a G/T measurement. Consideration is given to atmospheric effects upon a G/T measurement using Cas A based on information available in the literature. A detailed analysis of errors for gain measurements of large ground antennas, which includes the calibration of a standard gain antenna and the transfer of the calibration of this standard to a large antenna, is provided to validate radio star flux data since this analysis is not available in the literature. The results of these efforts are utilized to show that the best possible accuracy of a G/T measurement for a ground station having a 60 ft. diameter antenna and both practical and reasonable specifications is in the neighborhood of ± 0.25 dB.

NBSIR 74-387. **Microwave measurement of coal layer thickness,** D. A. Ellerbruch and J. W. Adams, 33 pages (Sept. 1974). Order from NTIS as COM 74-11643.

Key words: automation; coal; coal mine safety; dielectric constant; energy; microwave measurement; nondestructive testing; thickness of coal layer.

The possibility of using a microwave system to measure coal layer thickness in a mine was investigated. Measurements were made in two different mines near Pittsburgh, Pa., and near Fairview, West Virginia. Frequencies in the range 0.5 GHz-4.0 GHz were used to measure samples between 10-40 cm thick. All samples were backed with a naturally-occurring draw slate.

The results indicated a definite possibility of determining layer thickness in most cases, although anomalies may introduce enough error to give misleading results in some cases. Anomaly detection may be very useful in some cases. More experimental data and theoretical study are needed for complete verification.

Data from a model and measured data show considerable agreement. The real value of this model is to point out causes and effects, and what additional information is needed in order to obtain a measurement system that is optimum under most conditions.

The dielectric constant of coal is apparently a function of moisture content. Draw slate seems to have a significantly higher dielectric constant than coal. Also, a layer of coal having different electrical characteristics within the layer was detected with the microwave system.

This technique has great potential if fully developed. It would have significant impact in areas of energy, safety, and productivity.

NBSIR 74-388. **Electromagnetic noise in Grace Mine,** J. W. Adams, W. D. Bensema, and M. Kanda, 138 pages (June 1974). Order from NTIS as COM 74-11687.

Key words: amplitude probability distribution; coal mine noise; digital data; electromagnetic interference; electromagnetic noise; electromagnetic pulse (chemical); emergency communications; Fast Fourier Transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; spectral density; time-dependent spectral density.

Two different techniques were used to make measurements of the absolute value of electromagnetic noise in an operating hard-rock mine, Grace Mine, located near Morgantown, Pennsylvania. Diesel-powered haulage equipment is used in this mine, and the electromagnetic noise environment it creates was measured to see how it differs from the environment created by electric-powered haulage equipment. One technique measures noise over the entire electromagnetic spectrum of interest for brief time periods. It is recorded using broadband analog magnetic tape and the noise data is later transformed to give spectral plots. The other technique records noise amplitudes at several discrete frequencies for a sufficient amount of time to provide amplitude probability distributions.

The specific measured results are given in a number of spectral plots and amplitude probability distribution plots.

NBSIR 74-389. **Electromagnetic noise in McElroy Mine,** M. Kanda, J. W. Adams, and W. D. Bensema, 170 pages (June 1974). Order from NTIS as COM 74-11717.

Key words: amplitude probability distribution; coal mine noise; digital data; electromagnetic communications; electromagnetic interference; electromagnetic noise; Fast Fourier Transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; spectral density; time-dependent spectral density.

Two different techniques were used to make measurements of the absolute value of electromagnetic noise in and above an operating coal mine, McElroy Mine, located near Moundsville, West Virginia. 300-volt-dc and 480-volt-ac machinery was measured to see the electromagnetic environment it created. One technique measures noise over the entire electromagnetic spectrum of interest for brief time periods. It is recorded using broadband analog magnetic tape and the noise data is later transformed to give spectral plots. The other technique records noise amplitudes at several discrete frequencies for a sufficient amount of time to provide amplitude probability distributions.

NBSIR 74-390. **Electromagnetic noise in Itmann Mine,** W. D. Bensema, M. Kanda, and J. W. Adams, 113 pages (June 1974). Order from NTIS as COM 74-11718.

Key words: amplitude probability distribution; coal mine noise, digital electromagnetic communications; electromagnetic interference; electromagnetic noise; Fast Fourier Transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; spectral density; time-dependent spectral density.

Two different techniques were used to make measurements of the absolute value of electromagnetic noise in an operating coal mine, Itmann No. 3 Mine, located near Mullens, West Virginia. The electromagentic environment created by 250-volt-dc and 550- and 950-volt-ac machinery in two longwall panels was measured and is reported. One technique measures noise over the entire electromagnetic spectrum of interest for brief time periods. It is recorded using broadband analog magnetic tape, and the noise data is later transformed to give spectral plots. The other technique records noise amplitudes at several discrete frequencies for a sufficient amount of time to provide amplitude probability distributions.

The specific, measured results are given in a number of spectral plots and amplitude probability distribution plots.

NBSIR 74-391. **Electromagnetic noise in Lucky Friday Mine,** W. W. Scott, J. W. Adams, W. D. Bensema, and H. Dobroski, 139 pages (Oct. 1974). Order from NTIS as COM 74-10258.

Key words: amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density.

Measurements of the absolute value of electromagnetic noise and attenuation along a hoist rope were made in an operating hard-rock mine, Lucky Friday Mine, located near Wallace, Idaho. Spectra of electromagnetic noise generated by various pieces of equipment, spectra of specific noise signals at various depths, and noise and attenuation on the 4250 foot (1295 meter) hoist, were measured. Three techniques were used to make the measurements. First, noise was measured over the entire electromagnetic spectrum of interest for brief time periods. Data were recorded using broadband analog magnetic tape for later transformation to spectral plots. Second, noise amplitudes were recorded at several discrete frequencies for a sufficient amount of time to provide data for amplitude probability distributions. A third technique gave attenuation data through the direct measurement of field strength at various depths.

The specific measured results are given in a number of spectral plots, amplitude probability distribution plots and amplitude curves as a function of depth

NBSIR 74-393. **Semi-annual report on materials research in support of superconducting machinery,** R. P. Reed, R. L. Durcholz, F. R. Fickett, P. J. Giarratano, J. G. Hust, M. B. Kasen, H. M. Ledbetter, R. P. Mikesell, E. R. Naimon, R. E. Schramm, L. L. Sparks, R. L. Tobler, and W. F. Weston, 283 pages (Oct. 1974). Order from NTIS as COM 75-10768.

Key words: composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity.

Results of six months of study on Materials Research in Support of Superconducting Machinery (April through September, 1974) are reported to the sponsor, the Advanced Research Projects Agency of the U.S. Department of Defense. The report is divided into five sections: thermal conductivity, magnetothermal conductivity, fatigue and fracture-toughness properties, properties of advanced composites, and elastic properties. The temperature range 4 to 300 K is covered by the study. Materials studied are either being used or are candidates for use in superconducting machinery and include: aluminum alloys, composites, inconels, OFHC copper, stainless steels, and titanium alloys.

Special results of the study include: fracture-toughness and fatigue-crack growth-rate data for AISI 310, Ti-5 Al-2.5 Sn, A286 stainless steel, and Inconel 750 at 4, 76, and 300 K; initial reports of tensile testing of composites at 4 K; a second review paper on advanced-composite low-temperature behavior; magnetothermal conductivity measurements on OFHC copper and Inconel 718 indicate that, in a magnetic field, the thermal conductivity may change by 100 percent; anomalous low-temperature elastic behavior of AISI 300 series stainless-steel alloys; and thermal conductivity data for OFHC copper, Inconel 750, and Inco Low-Expansion-Alloy. These data provide considerable insight into material characteristics at extremely low temperatures, assisting in material selection and efficient design.

NBSIR 74-394. **A rack-mounted precision waveguide-below-cutoff attenuator with an absolute electronic readout,** C. C. Cook, 45 pages (Nov. 1974). Order from NTIS as COM 75-10126.

Key words: absolute (unambiguous) readout; piston; precision attenuator; sensor; waveguide-below-cutoff.

A coaxial precision waveguide-below-cutoff attenuator is described which utilizes an absolute (unambiguous) electronic digital readout of displacement in inches in addition to the usual gear-driven mechanical counter/dial readout in decibels. The attenuator is rack-mountable and has the input and output rf connectors in a fixed position. The attenuation rate for 55, 50, and 30 MHz operation is given along with a discussion of sources of errors. In addition, information is included to aid the user in making adjustments on the attenuator should it be damaged or disassembled for any reason.

NBSIR 74-395. **Bibliography of the Electromagnetics Division, June 30, 1973 to June 30, 1974,** M. L. Woolley, 26 pages (Nov. 1974). Order from NTIS as COM 75-10161.

Key words: antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides.

This bibliography lists the publications of the NBS Electromagnetics Division between June 30, 1973 and June 30, 1974.

NBSIR 74-396. **Specification and measurement of frequency stability,** J. H. Shoaf, 44 pages (Nov. 1974). Order from NTIS as COM 74-11766.

Key words: Allan variance; frequency stability measurements; measurement system description; phase noise; spectral density; terminology standards.

This report gives concise definitions for specifying frequency stability for measurements in the frequency domain and time domain. Standards of terminology and of measurement techniques are recommended. Measurement systems are described in adequate detail so that the apparatus may be duplicated. Proposed extension of the measurement systems through 12.4 GHz is discussed.

NBSIR 74-398. **Provisional values for the thermodynamic functions of ethane,** R. D. Goodwin, 342 pages (June 1, 1974). Order from NTIS as COM 75-10130.

Key words: densities; enthalpies, entropies; equation of state; internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds of sound; vapor pressures.

Thermophysical properties are tabulated at uniform temperatures over the entire range of fluid states from 90 to 600 K along isobars to 700 bar. A new, rational equation of state is employed for the first time. Thermodynamic functions in the compressed liquid at $T < T_c$ are obtained by use of specific heats $C_p(T)$ along a high pressure isobar.

NBSIR 74-426. **Survey plans and data collection and analysis methodologies: Results of a pre-survey for the magnitude and extent of the lead based paint hazard in housing,** W. Hall, T. Ayers, and D. Doxey, 110 pages (Jan. 1974). Order from NTIS as COM 74-11074.

Key words: housing; housing survey; lead; lead hazard; lead paint; lead poisoning; survey; urban health problems.

A pilot survey of housing in Washington, D.C. was carried out in order to develop and test methodologies, data collection procedures and formats that will be used in subsequent full scale surveys of cities to determine the magnitude and extent of the lead-based paint hazard in housing.

On site measurements of lead contents of interior and exterior surfaces were made (with portable x-ray fluorescence lead detectors, hereafter referred to as XRF's) on 115 dwelling units which were randomly selected from a Washington, D.C. city directory.

This report describes the procedures for identifying the survey sample, drawing the sample, and carrying out the survey. Computer programs for data handling and analysis are included and a brief summary of the data obtained from the pilot survey is presented.

NBSIR 74-430. **Chemical kinetics data survey VII. Tables of rate and photochemical data for modelling of the stratosphere (revised),** D. Garvin and R. F. Hampson, 104 pages (Jan. 1974). Supersedes NBSIR 73-203. Order from NTIS as COM 74-10724.

Key words: atmospheric chemistry; chemical kinetics; data evaluation; energy transfer; gas phase; high temperature air chemistry; ion-molecule reactions: optical absorption cross sections; photochemistry; quantum yield; rate constants.

Chemical kinetic and photochemical data for gas phase reactions pertinent to the chemistry of the stratosphere are presented in four tables. These tables give recommended values and also cite recent experimental work. They give data in the following subject areas: chemical reactions and photochemistry of neutral species, energy transfer reactions, high temperature air reactions, and ion-molecule reactions.

NBSIR 74-432. **1972 International Activities Center for Building Technology,** C. C. Raley, 68 pages (Aug. 1973). Order from NTIS as COM 74-10751.

Key words: cooperative programs; foreign visitors; information exchange; international building technology; international organization memberships; professional interaction

This report summarizes the Center for Building Technology's 1972 international activities including formal cooperative programs, exchange programs, special projects, international organization memberships, foreign guests at CBT, and CBT foreign travel.

NBSIR 74-434. **Test and evaluation of baby walkers and walker jumpers,** D. J. Chwirut, 19 pages (May 1974). Order from NTIS as COM 74-11079.

Key words: accident reports; baby walkers; infants; safety standards; test methods; walker-jumpers.

Accident reports from hospital emergency rooms were surveyed to determine the probable causes of accidents involving baby walkers and walker-jumpers. Test methods were developed to simulate service conditions to determine if the characteristics leading to accidents are present in all or only a few of the items in the market. These test methods include tests for dynamic and static stability, step roll-over stability, plastic bead strength, durability, and location of scissor joints. The test methods and performance criteria are intended to supply information leading to federal safety standards.

NBSIR 74-438. **Pilot demonstration of lead based paint hazard elimination methods,** T. H. Boone, T. R. Ray, and W. G. Street, 26 pages (Dec. 1973). Order from NTIS as COM 74-10980.

Key words: cost analysis; housing; lead based paint; lead poisoning; surface preparation; surface refinishing; water wash paint removal.

This report describes the removal of lead base paint from exterior surfaces of a single family attached house using alkaline/solvent thixotropic liquid paint removers followed by a high-pressure/low-volume water spray.

The extent of the reduction of the lead based paint hazard, the cost of the process and the observed problems and merits of this water wash paint removal system are presented.

NBSIR 74-439. **Preparation of reference materials for stationary source emission analysis: Beryllium,** T. C. Rains, C. D. Olson, R. A. Velapoldi, S. A. Wicks, O. Menis, and J. K. Taylor, 12 pages (Mar. 1974). Order from NTIS as COM 74-10985.

Key words: air pollution; atomic absorption spectrometry; beryllium; chemical analysis; fluorimetric analysis.

Techniques are described for the preparation of reference materials useful for evaluating the accuracy and precision of analytical methods for measurement of beryllium emissions from stationary sources. These reference materials consist of membrane filters upon which are deposited microgram quantities of high-fired beryllium oxide and ampoules containing soluble beryllium and suspended beryllium oxide. Methods for measurement of the beryllium content of such materials by atomic absorption spectrometry and by spectrofluorimetry are described.

NBSIR 74-442. **High temperature slow crack growth in ceramic materials,** A. G. Evans, 48 pages (Feb. 1974). Order from NTIS as COM 74-10476.

Key words: ceramics; crack healing; crack propagation; cyclic fatigue; failure prediction; high temperature; static fatigue.

High temperature slow crack growth processes in several ceramic materials are examined under static and cyclic loading conditions. Data obtained at temperatures up to 1400 °C are used for purposes of failure prediction and for analysis of the slow crack growth phenomena. It is shown that purity plays a major role in slow crack growth resistance, particularly in the hot pressed materials, and that cycling in the low frequency regime does not significantly increase the rate of slow crack growth. The slow crack growth mechanisms appear to be primarily plasticity related. Two semi-quantitative mechanisms are presented, one due to dislocation motion and the other due to grain boundary sliding.

NBSIR 74-443. **Weight cleaning procedures,** H. E. Almer, 9 pages (Nov. 1973). Order from NTIS as COM 74-11003.

Key words: cleaning; standards; steam generator; storage; temperature equilibrium; weights.

Accurate and meaningful results in the calibration of weights depend on clean weights. This paper describes a method of cleaning weights.

NBSIR 74-444. **A review of natural stone preservation,** G. A. Sleater, 40 pages (Dec. 1973). Order from NTIS as COM 74-10548.

Key words: air pollution; historic structures; laboratory evaluation; natural weathering; stone decay; stone preservation.

With increased interest in stone preservation, it is desirable to know what causes stone to decay, and what materials can be used to preserve stone. This review covers the following topics: causes of stone decay, including faults in the stone, salts, natural weathering factors, air pollution, living organisms, and most importantly, water action; various materials that have been used to preserve stone, including paints, waxes, oils, inorganic chemical surface treatments and impregnants, silicones, siliconates, and synthetic organic polymers; methods of evaluating stone preservatives. Field and laboratory procedures for testing stone preservatives, the cleaning of stone, a glossary, and a bibliography are given in appendices.

NBSIR 74-449. **Fire endurance tests on walls and plumbing chases containing either metallic or nonmetallic drain waste and vent systems,** W. J. Parker, 83 pages (Nov. 1973). Order from NTIS as COM 75-10049.

Key words: ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; waste.

Two full scale non-load bearing ASTM E-119 fire endurance tests were performed on plumbing chase and wall assemblies containing polyvinyl chloride (PVC) drain, waste, and vent (DWV) systems typical of installations serving two or more stories. For the systems tested which were typical of kitchen sink drain systems constructed and installed according to typical plans, the PVC piping did not contribute to the spread of fire through the plumbing chase to the adjoining dwelling during the test which lasted 50 minutes. A test failure not associated with the plastic piping aborted the test but there was no indication that there would have been a failure due to the piping if the test had continued for one hour.

Three full scale non-load bearing ASTM E-119 fire endurance tests were also run on walls with enclosed DWV systems of acrylonitrile butadiene styrene (ABS), PVC, copper, and iron.

Neither PVC nor ABS piping contributed to fire spread in a plumbing system consisting of 2-inch stacks and 1½-inch back-to-back laterals in a 2×3 fir-stud-and-gypsum-board wall. In one test in which the stacks and laterals were 4 inches in diameter and in another test in which the distance between wall surfaces was decreased by using 2×4 studs, the effective fire endurance rating of the wall assembly was reduced by the installation of the plastic plumbing.

This progress report on the fire endurance evaluation of five plumbing chase and wall assemblies is limited to construction assemblies in which the openings around the laterals were carefully sealed with plaster spackling. Additional tests are in progress to examine the effect of leaving the openings unsealed.

NBSIR 74-451. **Field comparisons of steel surveyors' tapes,** C. L. Carroll, Jr., 16 pages (Nov. 1973). Order from NTIS as COM 74-11385.

Key words: graduation; length; scale; tape; temperature; tension.

Report describes a field procedure to compare a steel surveyor's tape to a standard tape that has been calibrated by the National Bureau of Standards. The procedure requires only a hand-held magnifier, two short scales, and two spring balances. Temperature reading device is not required since both tapes are

made of steel and have the same temperature during the comparison.

NBSIR 74-452. **Design and evaluation criteria for energy conservation in new buildings,** Staff of the Center for Building Technology, NBS, 107 pages (Feb. 27, 1974). Order from NTIS as PB204586.

Key words: air leakage; building design; energy conservation; fenestration; HVAC systems; illumination; insulation; lighting; performance standard; thermal performance; ventilation; water heating.

This document contains design and evaluation criteria for energy conservation in most new buildings. It was prepared in response to a request by the National Conference of States on Buildings Codes and Standards to the National Bureau of Standards. It is intended to be the forerunner of a consensus standard to be promulgated by a national standards organization.

The requirements and criteria are performance-oriented to the extent permitted by present building design technology. The performance concept is applied at the subelement or subsystem level to synthesize an energy-efficient total system. The detailed criteria are directed toward the design of building envelopes with good thermal resistance and low air leakage, and toward practices in the design of mechanical and electrical systems which conserve energy. Design flexibility is achieved by providing for the acceptance of alternative design solutions that can be shown to save equivalent amounts of energy without following every detailed requirement.

NBSIR 74-454. **The equivalence of gravimetric and volumetric test measure calibration,** R. M. Schoonover, 16 pages (Feb. 1974). Order from NTIS as COM 47-10988.

Key words: check standard; closure; gravimetric calibration; standard deviation; test measure; volumetric transfer calibration.

This report discusses the statistical importance of observed differences between gravimetric and volume transfer calibrations of volumetric test measures. The data presented are results from the present NBS calibration program and conclusively show there are negligible differences between the two methods of calibration.

NBSIR 74-455. **Abstracts of papers on testing and analysis of flammable fabrics October 1972 to October 1973,** J. F. Krasny, 27 pages (Mar. 1974). Order from NTIS as COM 74-10865.

Key words: burn injuries; carpets; clothing; fabrics; fire retardants; flammability testing.

This collection of abstracts covers papers on textile flammability testing and analysis of flame retardant fibers and finishes, for the period October 1972 to October 1973. It is hoped that this collection will facilitate research in this area in which there has been great interest in connection with the introduction of fabric and garment flammability standards by the Federal and several state governments. Similar collections appear in the Proceedings of the Annual Meetings of the Information Council on Fabric Flammability, available from the Council, Room 510, 1457 Broadway, New York, N.Y. 10036.

NBSIR 74-456. **Evaluation of the fire performance of a dibromotetrafluoroethane—blown rigid polyurethane foam,** T. G. Lee, W. J. Parker, and M. Tryon, 17 pages (Apr. 1974). Order from NTIS as COM 74-11793.

Key words: dibromotetrafluoroethane; fire tests; flame spread index; heat release rate; ignition temperature; rigid urethane foam; smoke.

The fire performance characteristics of a dibromotetrafluoroethane—blown rigid polyurethane foam were measured by several laboratory test methods. Measurements included: surface flammability, smoke and gases generated at elevated temperature and during combustion, ignition temperature, rate of heat release, and fire growth. The maximum concentration of the blowing agent in the specimen was approximately 13 Wt%. Specimen density was 0.046 g/cm^3. As a function of temperature, release of blowing agent from collapsed cells began at about 60 °C and became considerable at 135 °C. The material had a flame spread index (ASTM E-162) of 11 with smoke levels of 170 and 480 (maximum specific optical density) under nonflaming and flaming exposures, respectively. The measured rate of heat release was 8.8 W/cm^2, about 5 times that of a fibrous glass insulation. The measured flash ignition temperature was 530 °C for the material.

NBSIR 74-457. **Transmission of electrons through foils,** S. M. Seltzer, 84 pages (Apr. 1974). Order from NTIS as COM 74-11792.

Key words: angular distribution; electrons; energy spectra; reflection; transmission; transport calculation.

The transmission of electrons through foils has been studied by a Monte Carlo method. Cases involving electrons with energies from 50 keV to 1 MeV normally incident on beryllium, mylar, aluminum, and titanium foils are considered. Good agreement with experimental results has been found for quantities such as the number transmission, the energy and angular distribution of the emergent electrons, and the spatial distribution of energy deposited in the foil.

A comprehensive set of results has been generated for 100, 150, 200, 300 and 400-keV electrons incident on beryllium, mylar, aluminum, and titanium foils that are commonly used as vacuum windows in conjunction with low energy electron accelerators. Quantities given are the electron number and energy transmission and reflection, the energy absorbed, and the energy and angular distribution of the transmitted electrons. It is shown that much of the results can be presented in a scaled form which reduces the explicit dependence on, and facilitates the interpolation with respect to, the incident energy.

NBSIR 74-458. **Laser damage in materials,** A. Feldman, D. Horowitz, and R. M. Waxler, 16 pages (Mar. 1974). Order from NTIS as AD 776-337.

Key words: absorption coefficient; damage threshold; electrostriction; inclusion damage; intrinsic damage; Kerr effect; laser damage; laser glasses; laser rod materials; modulator crystals; nonlinear index of refraction; optical glasses; polarizer materials; self-focusing.

This report summarizes the study of damage and self-focusing in materials used in Q-switch solid-state laser systems. In borosilicate crown glass, fused silica, dense flint glass, and yttrium aluminum garnet, self-focusing appears to be the main cause of damage. An analysis of damage threshold measurements with linearly polarized radiation suggests that the Kerr effect is the dominant self-focusing mechanism with a significant contribution to self-focusing from the thermal effect. The electrostrictive effect is negligible. The damage threshold in Nd:doped laser glasses appears to be intrinsic. In all the above materials, the damage threshold for circular polarization is greater than the damage threshold for linear polarization. In lithium niobate, calcite, potassium dihydrogen phosphate, and deuterated dihydrogen phosphate, damage at the lowest levels is caused by inclusions. Bulk and surface damage thresholds in Nd:doped thoria:yttrium oxide ceramic are obtained relative to bulk damage thresholds in several optical materials. Relationships, under different geometric boundary conditions are also derived for solid materials between the stress-optic coefficients and the electrostrictive coefficients.

NBSIR 74-461. **The calibration of small volumetric laboratory glassware,** J. Lembeck, 34 pages (Dec. 1974). Order from NTIS as PB246623.

Key words: burets; capacity; flasks; meniscus; pipets; volumetric calibration.

This report describes a procedure for testing small volumetric apparatus. The procedure is based upon a determination of the volume of water either contained or delivered by the vessel. There are techniques described for cleaning, reading the meniscus, filling, draining and weighing the contained or delivered volume.

NBSIR 74-464. **The Shirley Highway Express-Bus-On-Freeway Demonstration Project—second year results,** J. T. McQueen, R. F. Yates, and G. K. Miller, 87 pages (Nov. 1973). Order from NTIS as COM 74-10785.

Key words: bus transit; busway operations; commuter travel behavior; express bus-on-freeway operations; project evaluation; transit operations.

This report contains: (a) A review of the performance of the Shirley Highway Express-Bus-On-Freeway Demonstration Project between 1969 and 1973; (b) A description of the methodology and data use to estimate project measures of effectiveness; (c) A discussion of factors considered in commuter mode choice decision making.

NBSIR 74-465. **Shear and tension-bending fatigue test methods for threaded airframe fasteners,** D. J. Chwirut, D. E. Marlowe, and J. S. Steel, 56 pages (Sept. 1974). Order from NTIS as COM 75-10417.

Key words: airframe fastener; double shear; fatigue; single shear; tension-bending; test methods.

Fatigue test methods for threaded airframe fasteners loaded in other than direct tension are described. The types of loading considered are single shear, double shear, and tension-bending. The test fixtures used in these tests are described. Results of tests on lots of fasteners from different manufacturers indicate that fasteners considered identical on the basis of direct tension procurement tests exhibit different fatigue life characteristics when loaded in shear and/or tension-bending. Thus the test methods described herein may be of future value as procurement tests for airframe fasteners.

NBSIR 74-466. **Management of data elements in information processing,** H. E. McEwen, Ed., (Proceedings of a Symposium Sponsored by the American National Standards Institute and by The National Bureau of Standards, held at NBS, Gaithersburg, Maryland, Jan. 24-25, 1974), 490 pages (Apr. 1974). Order from NTIS as COM 74-10700.

Key words: American National Standards; American National Standards Institute; data; data base systems; data elements; data management; data processing; Federal Information Processing Standards; information interchange; information processing; information systems.

Recent technological advances in computers and communications make possible the integration of data systems and the exchange of data among them on an expanding scale. However, the full effect of these advances cannot be realized unless the need for uniform understanding of the common information (data elements) and their expression in data systems is recognized and means provided to effectively manage this information. The increasing interrelationships among the data systems of Federal, State, and local governments, and with industry and the public add emphasis and dimension to the need for the improved management of data elements in information processing.

These Proceedings are for the first Symposium on the Management of Data Elements in Information Processing held at the National Bureau of Standards on 1974 January 24 and 25. Over 400 representatives of Federal and State governments, industry and universities from 30 states, from Canada, and Sweden were in attendance. Thirty-four speakers discussed data element management in the fields of health care, water resources, state government information systems, transportation, libraries, market research, manufacturing, banking, information retrieval systems, military systems, computer programming and software systems, and motor vehicle registration.

NBSIR 74-467. **Simulated solar heat tests on M.U.S.T. air-inflatable, double-wall hospital ward shelters,** L. W. Masters, J. W. Grimes, and R. A. Crist, 64 pages (May 1974). Order from NTIS as COM 74-11754.

Key words: adhesives; air-inflatable shelter sections; cloth webs; polyester and nylon fabrics; sewn seams; sewn seam strapping; solar heat load; test procedure.

At the request of the United States Army Natick Laboratories (USANLABS), the Center for Building Technology conducted solar heat load tests on five sections of M.U.S.T. air-inflatable, double-wall hospital ward shelters. The purpose of the tests was to evaluate the effect of solar heat load, as simulated by infrared heat lamps, on various materials and construction designs proposed for use in shelters.

NBSIR 74-470. **Interaction of plasma proteins with surfaces,** C. A. Fenstermaker, W. H. Grant, B. W. Morrissey, L. E. Smith, and R. R. Stromberg, 83 pages (Mar. 22, 1974). Order from NTIS as COM 74-10984.

Key words: adsorption; blood protein; bound fraction; ellipsometry; polymer adsorption; protein adsorption.

The interaction of blood proteins with surfaces has been investigated with principal attention focused on those proteins that are either major constituents of blood plasma or are implicated as being important in the clotting process. Emphasis has been placed on molecular conformational changes occurring upon the interaction of such proteins with surfaces. The extension of adsorbed molecules of fibrinogen, albumin, and prothrombin on a number of selected materials was studied by ellipsometry. The results indicate a dependence of conformation on surface energy. Measurements of the bound fraction (number of carbonyl surface attachments) of these adsorbed blood proteins on a silica surface showed that approximately ten percent of the carbonyl groups were attached to the surface for prothrombin and serum albumin at all values of surface population for the solution concentrations studied. Competitive interactions of prothrombin and fibrinogen during the process of adsorption, displacement, and desorption have been measured and rates of adsorption of albumin were measured on chrome and silica surfaces.

NBSIR 74-471. **Life cycle costing of police patrol cars: Summary report,** R. T. Ruegg, 23 pages (Mar. 1974). Order from NTIS as COM 74-10981.

Key words: fleet management; life cycle costing; patrol cars; police fleets; vehicle leasing; vehicle management.

There are many different choices to be made with respect to police vehicle acquisition, utilization, maintenance, and disposition. Cost comparisons among the different alternatives are an important element in the choices to be made. To make valid cost comparisons, it is necessary to employ the techniques of life-cycle costing. This means the inclusion of all relevant costs and the conversion of costs to an equivalent basis to take into account differences in the timing of expenditures.

This report briefly summarizes the results of a larger study which compares the life cycle costs of some of the alternatives associated with police fleet management. The full report from which this report is derived is entitled *Life Cycle Costing: Efficiency in Vehicle Acquisition, Operation, and Disposition.*

The focus of the study is on police patrol cars, but the methods are applicable to other types of vehicles. Specific topics addressed by the larger study and summarized here are the cost effects of purchasing different sizes of patrol cars and different optional equipment, the advantages and disadvantages of direct ownership of vehicles as compared with leasing, the costs of contracting out maintenance as compared with self-maintenance of vehicles, the cost effects of alternative utilization practices, the optimal timing of vehicle replacement, and the comparative efficiency of different methods of vehicle disposition.

NBSIR 74-473. **Natural disasters: Some empirical and economic considerations,** G. T. Sav, 72 pages (Feb. 1974). Order from NTIS as COM 74-11719.

Key words: benefit-cost analysis; disaster mitigation; earthquakes; economics; efficient; floods; hurricanes; natural disasters; optimal; tornadoes; total cost minimization.

This study examines the extent of some of the losses resulting from natural disasters. An estimate of these losses is necessary in order to determine the potential benefits that might be realized from mitigating the negative economic impacts from natural disasters. Absolute and relative losses resulting from hurricanes, floods, earthquakes, and tornadoes are examined. This data will help individuals, communities, and the Federal government make better decisions as to how and what extent protection against disasters should be provided. The application of benefit-cost analysis for choosing the optimal level of protection against disasters is also discussed. Recommendations are made for further research in determining the economic feasibility of various techniques designed to mitigate the losses from disasters.

NBSIR 74-474. **Metallurgical analysis of wear particles and wearing surfaces,** A. W. Ruff, 59 pages (Apr. 1974). Order from NTIS as AD 778340.

Key words: bearings; electron diffraction; electron microscopy; gears; lubrication; particles; wear.

Results are presented from a program involved in characterizing the wear particles and surface degradation produced by wear in bearing and gear tests in which the effects of several variables on failure of the wearing surfaces has been examined. The information obtained has been correlated with the results of allied studies conducted by others in an attempt to develop an understanding of the processes producing wear and degradation of metal surfaces in sliding, rubbing, rolling, and/or rotating contact and the effects of lubricants, lubricant additives, bearing materials, etc. on these processes. The characterization of the wear particles and wearing surfaces should aid in the establishment of the interrelationships between wear particle shape, size, size distribution, chemical compositions, metallurgical structure, and surface damage prior to failure.

NBSIR 74-477. **Performance characteristics of a "bulk effect" humidity sensor,** J. W. Little, S. Hasegawa, and L. Greenspan, 33 pages (May 1974). Order from NTIS as COM 74-11784.

Key words: "Brady Array" sensors; electric hygrometer; humidity; humidity sensor; moisture measurement; relative humidity; water vapor measurement.

A laboratory study was made of the performance of "Brady Array" humidity sensors over a range of ambient temperatures from − 40 °C to + 20 °C encompassing relative humidities from 0 to 90 percent. Information was obtained on such characteristics as sensitivity, hysteresis, temperature effect, short-term and long-term repeatability.

NBSIR 74-479. **Analysis of cost-sharing programs for pollution abatement of municipal wastewater,** H. E. Marshall and R. T. Ruegg, 145 pages (Sept. 1974) Order from NTIS as COM 74-11769.

Key words: cost sharing; efficiency; equity; financing; nor plant treatment; sewage treatment, user fees; water pollu tion.

This study evaluates existing cost-sharing programs for waste water pollution abatement as described in the Federal Water Po lution Control Act Amendments of 1972, describes alternativ cost-sharing programs that provide improvements in terms of na tional efficiency and equity criteria as defined herein, and sug gests related areas for further research. Emphasis is on ho Federal cost sharing biases communities in favor of certain kinc of techniques. The approach is to describe the current cost-sha ing programs for both plant and nonplant techniques; to examir cost-sharing, legal, and other institutional biases against certai techniques; to analyze efficiency and equity effects of alternativ cost-sharing programs; and to describe the incentive effects c cost-sharing on nonfederal interests with respect to their choice among abatement techniques. Findings of the study are th more efficient abatement will result if the *same* percentage co share applies to all plant and nonplant techniques of abatemen the *same* percentage also applies to all categories of cost (e.g capital, land, operation and maintenance) for a given techniqu the *same* percentage applies to large and small communities; i stitutional constraints on the selection of nonplant techniques a removed; and if the program provides for Federal cost sharing every abatement technique that is technically viable.

NBSIR 74-481. **Absolute calibration of vibration standards by th three-mass reciprocity method,** J. D. Ramboz, 50 pages (Ap 1974). Order from NTIS as COM 74-11794.

Key words: absolute calibration; accelerometers; calibra tion; reciprocity calibration; vibration exciters; vibratio pickups; vibration standards.

Reciprocity calibration of electrodynamic vibration exciters reviewed. A new method is proposed. The theory for the ne Three-Mass reciprocity calibration method is developed. Th process requires that the electrical impedance of the exciter drive coil be measured for three added masses separate mounted on the exciter's armature. The sensitivity of the a celerometer mounted in the armature is solved in terms of change of electrical impedance for a change of mass, voltag ratio, electrical resistance, and frequency. A set of 38 measur ments were made at 1000 Hz to experimentally verify th theory. The value of sensitivity was 2.070 pC/g ± 1.3 percer This agreed to within about ± 0.65 percent of a transfer calibr tion from Bouche-Levy calibrated standards and the manufa turer's estimated value. Measurements were made to verify th theory; improvement to an uncertainty of about ± 0.2 percent ultimately possible in the absolute calibration using this metho

NBSIR 74-482. **An automated system for precision calibrati of accelerometers,** B. F. Payne, 196 pages (Apr. 1974). Ord from NTIS as COM 75-10147.

Key words: acceleration; automation; calibration; measur ments; minicomputer; shakers; standards; transducer vibration; vibration exciters; vibration pickups.

The report describes an automated system for acceleromet calibration under realtime control by a small, dedicated digit computer. The hardware components of the system and th software programs are given. The software automatically reg lates the rate and amount of data collected based on analysis input data. Printout of the frequency response of test acceleror eters is on a teletypewriter and also can be stored on a magne tape. Manual operation of the system is also described.

NBSIR 74-485. **Strength of glass—a fracture mechanics a proach,** S. M. Wiederhorn, 24 pages (May 1974). Order fro NTIS as AD 780704.

Key words: crack growth; fracture; glass; static fatigue; strength.

After a brief review of those factors that determine the strength of glass (brittleness, surface flaws, susceptibility to stress corrosion cracking), a discussion will be given of how fracture mechanics techniques can be used to understand the physics and chemistry of glass strength. In this paper we assume that the strength of glass is limited by the growth of cracks that are always present in normal glass surfaces. Fracture mechanics techniques can be used to characterize the crack growth and to relate the growth to experimental parameters such as temperature, environment, and glass composition. Crack growth data obtained in this manner can be used to develop a deeper understanding of fracture mechanisms, and to develop charts that can be used for the design of glass structural components. Examples of both applications are given in the paper.

NBSIR 74-486. **Reliability, life prediction and proof testing of ceramics,** S. M. Wiederhorn, 62 pages (May 1974). Order from NTIS as AD 780705.

Key words: ceramics; crack propagation; delayed failure; fracture; proof testing; Weibull analysis.

A critical review is presented of the use of proof testing as a design method for assuring the reliability of structural components. The advantage of proof testing over the statistical approach used for design lies in the insensitivity of the proof testing method to the detailed history of handling or processing of structural components. Methods are presented for developing and using proof test diagrams to assure component lifetime after proof testing. Procedures of proof testing and precautions that must be followed during proof testing are discussed. Provided these precautions are followed, proof testing offers a general method for assuring the reliability of structural components under stress.

NBSIR 74-487. **Proposed revision of American National Standard COBOL,** R. E. Rountree, Jr., Ed., 544 pages (Jan. 1974). Order from NTIS as COM 74-10886.

Key words: COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software.

This document is for review purpose only in anticipation of its becoming an American National Standard and subsequent adoption as a Federal Information Processing Standard. The American National Standard COBOL defines the elements of the COBOL programming language and the rules for their use. The standard is used by implementors as the reference authority in developing compilers and by users for writing programs in COBOL. The primary purpose of the standard is to promote a high degree of interchangeability of programs for use on a variety of automatic data processing systems.

NBSIR 74-488. **Measurements of railroad noise-line operations, yard boundaries, and retarders,** J. M. Fath, D. S. Blomquist, J. M. Heinen, and M. Tarica, 108 pages (Dec. 1974). Order from NTIS as COM 75-10088.

Key words: acoustics; noise measurement; noise (sound); railroad yard; trains.

A field investigation of noise emission from railroad operations was conducted. The objectives of the study were the establishment of a data base on the noise levels associated with railroad operations, both line (trains in transit) and yard, and the development of measurement procedures that could be utilized in regulations applicable to the noise from rail carrier equipment and facilities. For trains in transit, measurements were made as a function of horizontal distance from the tracks [five locations at 25, 50, 100, 200 and 400 feet] and as a function of microphone height [three different heights at the 25 and 50 foot microphone locations]. Train passby data are presented as the maximum A-weighted sound level observed during the passby and as Single Event Noise Exposure Levels (both A-weighted and one-third octave band levels). A-weighted sound level measurements were made at the boundary of the railyard, at 0.1 second intervals, for periods of time ranging from 1 to 23 hours over several days. These data are presented as the energy equivalent sound level and the level exceeded ten percent of the time. The directionality of retarder noise was also investigated. Measurements were made of the noise emitted in various directions during retarder operation.

NBSIR 74-495. **Development of a radiant panel test for flooring materials,** L. G. Hartzell, 79 pages (May 1974). Order from NTIS as COM 74-11575.

Key words: carpet; fire test; flammability; flooring; heat flux; ignition; radiant panel.

This paper summarizes the work of a year long program to continue the development of a radiant panel type test for flooring materials, the original concept of which was developed at the Armstrong Cork Company's Research and Development Center in Lancaster, Pennsylvania. This program at the National Bureau of Standards had as its goal, the further development of the test for possible adoption as a standard ASTM test method.

The program work was divided into five phases. During the first phase, an attempt was made to duplicate the performance of the original apparatus in a similar one at the National Bureau of Standards Laboratory. The proof of this duplication was shown in replicate testing using a wide range of flooring on both apparati.

In the second phase of the program, a new set of test conditions were found in an attempt to eliminate some of the more serious equipment and procedural problems of the test. These new conditions provided the test with the ability to rate flooring materials according to their ability to resist the surface spread flames.

Under the third and fourth phases of the program, the effects of changes in some test parameters was investigated and other test characteristics were measured. Phase V, the data analysis and report, concluded the program.

NBSIR 74-496. **Standard measurements of the resistivity of silicon by the four-probe method,** W. M. Bullis, 75 pages (Aug. 1974). Order from NTIS as COM 74-11576.

Key words: ASTM Committee F-1; electronics; four-probe method; resistivity; semiconductors; silicon.

An improved standard procedure for measurement of circular silicon slices with four in-line point probes has been developed in cooperation with the Resistivity Task Force of ASTM Committee F-1. Detailed analysis of a series of round-robin experiments showed that the procedure can attain a precision of ± 2 percent (three standard deviations) for interlaboratory comparisons of slices with room temperature resistivity between 0.005 and 120 ohm-cm. Resistivity nonuniformity in the test slices was shown to be a significant factor in limiting the precision which could be achieved. The importance of including correction factors for temperature, finite thickness, finite diameter, and unequal probe separations was demonstrated. The results of the round-robin experiments also emphasized that the precision quoted can only be achieved if the measurements are carefully and correctly made on a well maintained, accurately calibrated test system which meets the requirements imposed by the test method. Determination of the precision to be expected from the method in nonreferee applications such as routine production and quality control will require additional study of such factors as surface conditions, probe force, current levels, etc. Neverthe-

less, use of the various procedures of the method, in particular the sections on probe and measuring circuit evaluations and on thermal sinking of the wafer, would be expected to yield significantly improved precision in such applications. Use of these procedures on a regular and widespread basis should be encouraged.

NBSIR 74-497. **US/UK joint complementary research program in building, (wind loads, water supply, fire detection), July 1972-June 1973,** C. C. Raley, I. A. Benjamin, R. D. Marshall, and J. E. Snell, 24 pages (Oct. 1973). Order from NTIS as COM 74-11269.

Key words: cooperative programs; fire safety; hydraulics; international building technology; wind loads.

This is a status report of the progress achieved under the "Joint Complementary Research Program" sponsored by the Building Research Establishment (UK) and the Center for Building Technology (US), during the period July 1972 through June 1973. The program includes three projects: Wind Loads on Buildings, Design of Water Supply and Drainage Installations in Buildings, and Fire Detection in Buildings, each of which is discussed in the report.

NBSIR 74-499. **An analysis of the aging of paper: Possible reactions and their effects on measurable properties,** W. K. Wilson and E. J. Parks, 37 pages (Apr. 26, 1974). Order from NTIS as COM 74-11378.

Key words: accelerated aging; aging; aging of cellulose; aging of paper; cellulose; cellulose aging; natural aging; paper; paper aging; tests for paper.

Various reactions that cellulose can undergo are reviewed in relation to their bearing on the aging of paper. The principal reactions of cellulose are hydrolysis, oxidation, crosslinking, change in lateral order in the bonding area, and, during accelerated aging, thermal decomposition. The effects these various reactions might have on tests that are available for evaluating changes that occur during the aging of paper are reviewed. Some special examples of these reactions that occur during natural aging, because of special composition characteristics of the paper, are discussed. Suggestions are made concerning most sensitive tests for use in detecting changes in paper and tests, regardless of sensitivity, available for determining *what* happens during aging. Some general guidelines regarding specifications for permanent record papers are discussed.

NBSIR 74-501. **Development of specifications for archival record materials,** W. K. Wilson, 17 pages (May 23, 1974). Order from NTIS as COM 75-10131.

Key words: aging of paper; archival materials; natural aging; old paper; paper, aging of; paper, stability of; paper testing; stability of paper.

Effort on a long range program on the Development of Specifications for Archival Record Materials has included: (1) Reappraisal of research needs; (2) a study of 18 papers made in 1937, tested before and after dry accelerated aging in 1937, and tested again in 1973; (3) evaluation of 19 commercial papers, evaluated before and after moist accelerated aging in 1963, and tested again in 1973; and (4) development of specifications for copies from office copying machines.

A review of the literature on stability of paper and data obtained in this laboratory over the past several years indicate that a fresh approach is needed to a study of the stability of paper. The following tasks are suggested: (1) Continue to use handsheets of known composition; (2) study old papers to determine changes that probably have occurred during natural aging; (3) confine testing to methods that give some clues concerning what happens during aging such as zero span tensile, wet strength, peroxide formation, functional group content, and molecular chain length distribution; and (4) study the effect of cycling of relative humidity on the properties of paper.

NBSIR 74-506. **Development of a national anthropometric data base: A preliminary study report,** H. L. Steinberg, 85 pages (June 1974). Order from NTIS as COM 74-11632.

Key words: anthropometric survey; biostereometric body-dimensions; National Data Base.

A study was made to determine the need for development of a Nationally Representative Anthropometric data base. Potential users and their needs are identified and the inability of existing anthropometric data to satisfactorily meet these needs is established. Three scenarios for developing a useful data base are considered. Two involve the use of biostereometrics while the third takes a relatively conventional approach to obtaining body dimensions. Conclusions relevant to each of these scenarios, as well as the potential advantages/disadvantages of each, are developed. Salient conclusions common to all three scenarios include: The need for a (R & D type) pilot study; the desirability of linking the actual anthropometric survey to a National Center for Health Statistics (NCHS) "Health and Nutrition Examination Survey" (HANES); and a data base development time of at least 7 years. Program costs, detailed in an appendix, ranged from $2.4M to $5.2M. Mechanisms for administering and funding this survey were considered briefly. An estimation of the optimal sampling dimensions for the proposed survey, based on clothing industry needs, is given.

NBSIR 74-507. **Mercurous chloride polarizer material,** R. Forman, W. S. Brower, and H. S. Parker, 31 pages (June 1, 1974). Order from NTIS as ADA000343.

Key words: infrared; mercurous chloride; polarizer material; visible.

This contract report covers a feasibility study on the potential use of mercurous chloride crystals for construction of prism polarizers, primarily for the infrared region of the spectrum. In particular, the research has consisted of crystal growth from the vapor phase and optical characterization of the absorption, dichroism, and birefringence.

Crystal growth has been performed in quartz or Vycor ampoules sealed off under a pressure of 10^{-5} torr or better. Crystals are grown in a vertical modified Bridgman furnace by vapor transport. Repeated regrowth has been found to produce a continuous improvement in clarity, the best samples being virtually colorless. The growth rates used of 2 mm/day in tubes of 17 mm inside diameter have been found to be satisfactory for producing the crystals used to date, but strain patterns and a tendency to polycrystallinity indicate that slower growth rates should be attempted. Conditions for growth have not yet been optimized, but reasonably good growing conditions have been delineated.

Single crystal samples have been oriented by Laue back reflection techniques and measurements made of optical absorption, dichroism, and birefringence. Proper sample handling procedures have been determined to minimize thermal shock and thermal etching. The index of refraction has been measured at selected wavelengths, and calorimetric absorption studies have been performed at AFML on some of the samples produced.

NBSIR 74-509. **Strength and stability testing of high chairs,** D. J. Chwirut, 17 pages (June 1974). Order from NTIS as COM 74-11377.

Key words: accident reports; high chairs; infants; safety standards; stability and strength; test methods.

Accident reports from hospital emergency rooms were surveyed to determine the probable causes of accidents involving high chairs. Possible test methods for determining the characteristics of the high chairs leading to the accidents were investigated, including the test methods recommended in the Juvenile Products Manufacturers Association Voluntary Safety Standard for High Chairs. These tests included tests for tray strength, chair static strength, foot rest strength, restraining strap strength, and stability. These test methods and performance characteristics are intended to supply information leading to federal safety standards.

NBSIR 74-510. **Effect of phase separation on the physical and chemical properties of glasses-density and chemical durability,** J. H. Simmons, S. A. Mills, and B. F. Howell, 33 pages (July 1974). Order from NTIS as AD 782793.

Key words: borosilicate glass; chemical durability; density; immiscibility.

This report covers results from density and chemical durability measurements on a borosilicate glass widely used commercially for chemical glassware while the glass undergoes liquid-liquid immiscibility. A net decrease in density is observed during an isothermal heat-treatment below the transition temperature. This density or molar volume change is related to the effect of pressure on the phase transition temperature by means of equations derived herein. The chemical durability of the material is measured following the ASTM titration technique and shows a large degradation of chemical resistance to attack by water as a result of sub-immiscibility structure development. The effect is analyzed in terms of the change in composition of the phases associated with the immiscibility transition.

NBSIR 74-511. **Fire research publications, 1973,** N. H. Jason, 13 pages (June 1974). Order from NTIS as COM 74-11448.

Key words: bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing.

A list of publications is provided representing the papers and journal articles prepared by members of the Programmatic Center for Fire Research (PCFR) and by NBS personnel under contract to PCFR and by external laboratories under contract to the PCFR during 1973.

NBSIR 74-514. **1973 international activities, Center for Building Technology,** C. C. Raley, 54 pages (July 1974). Order from NTIS as COM 75-10102.

Key words: cooperative programs; foreign visitors; information exchange; international building technology; international organization memberships; professional interaction.

This report summarizes the Center for Building Technology's 1973 international activities including formal cooperative programs, exchange programs, special projects, international organization memberships, foreign guests at CBT, and CBT foreign travel.

NBSIR 74-515. **Report of conference on making service industries more productive through computers and automation,** A. K. McAdams and M. M. Henderson, 176 pages (June 1974). Order from NTIS as COM 74-11498.

Key words: automation; computers; productivity; service industries.

The Engineering Foundation and the National Bureau of Standards, Institute for Computer Sciences and Technology, cosponsored this conference to bring together persons actively concerned with the subject to identify gaps in knowledge, needs and opportunities in the area, and to point up governmental goals and programs to respond to such needs. This report contains the principal presentations and the texts of Workshop Panel reports prepared during the conference.

NBSIR 74-516. **Chemical kinetics data survey VIII. Rate constants of ClO_x of atmospheric interest,** R. T. Watson, 51 pages (June 1974). Order from NTIS as COM 74-11384.

Key words: absorption cross sections; atmospheric chemistry; chemical kinetics; chlorine; chlorine dioxide; chlorine monoxide; data evaluation; gas phase; optical; rate constants; stratospheric chemistry.

The quantitative data on reactions of chlorine atoms and the chlorine oxides are compiled. Preferred values for rate constants are given where possible. Optical absorption cross sections are given for the species that may photolyze in the atmosphere. The experimental techniques used to obtain the rate data are discussed.

NBSIR 74-518. **Instrumental colorimetry of retroreflective sign materials,** I. Nimeroff and W. A. Hall, 89 pages (Aug. 1974). Order from NTIS as PB239633.

Key words: colorimetry; highway signs; photoelectric tristimus colorimeters; photometry of retroreflective materials; retroreflective sign materials.

Because color-coded applications of highway signs increase, specifications of colors and color tolerances are required. In order to assure that the requirements are met within specified regions, a measurement technique needs to be developed and described. To accomplish these goals the U.S. Department of Transportation contracted with the National Bureau of Standards to conduct the required studies and make the necessary recommendations. Having previously performed a study for daytime conditions, the National Bureau of Standards was competent to perform a study for nighttime conditions. The colorimetric properties of 126 samples of retroreflective materials of 7 different colors were measured with 3 telecolorimeters in simulated nighttime conditions. One spectrophotometer was used to measure color of 38 of the samples in simulated daytime conditions. The colors measured were: red, orange, brown, yellow, green, blue and silver (white). Differences of color measured by means of different telecolorimeters on the same samples were evaluated.

As a result of these studies procedures for making colorimetric and photometric measurements were developed and are included in this report. On the basis of the color measurements and their variability tentative recommendations for color boundaries were prepared and are also included in this report.

NBSIR 74-519. **Photometric tests of vehicle glazing materials,** W. A. Hall, E. L. Walters, I. Nimeroff, and C. A. Douglas, 33 pages (Nov. 1974). Order from NTIS as PB 238284.

Key words: automobile paint colors; automobile windshield color; photometric tests; spectral reflectance; spectral transmittance; transmittance variation; vehicle glazing materials.

Measurements were made on the spectral transmittance of representative vehicle glazing materials and spectral reflectance of representative automobile paints. Colorimetric data were derived from these spectral measurements.

By varying the instrumental parameters of the in-laboratory procedure described in NBS Report No. 10902 for measuring the transmittance of glazing materials, errors in transmittance were obtained and were evaluated. The standard deviation of the transmittance measurements was less than 0.01 except at incidence angles of 70° where it was about 0.02.

NBSIR 74-520. **Evaluation of structural properties of masonry in existing buildings,** S. G. Fattal and L. E. Cattaneo, 127 pages (July 1974). Order from NTIS as COM 74-11480.

Key words: analysis; compressive strength; deflection; design; flexural strength; masonry walls; racking strength; seismic loading; shear strength; shear wall; stiffness.

The current state of knowledge on the structural behavior of masonry is synthesized to develop a methodology for the evaluation of the load capacity of masonry walls in existing buildings. A procedure is described for direct sampling and testing of specimens removed from masonry walls of buildings to determine their strength in shear, flexure and compression, and to measure their load-deformation characteristics. A documentation of strength and stiffness properties obtained from available test data is included to provide an alternate source of information on masonry of comparable construction. Sample calculations of masonry building analysis for seismic forces are given in Appendices A and B.

NBSIR 74-521. **HATCH—A model for fish hatchery analysis,** F. C. Johnson, 73 pages (July 8, 1974). Order from NTIS as COM 75-10187.

Key words: benefit/cost; fish hatchery analysis; fish hatchery management; fish hatchery operation; mathematical model.

The HATCH model is an automated system for analyzing the physical, biological and economic factors of fish hatchery operation and for computing optimal hatchery management policies.

NBSIR 74-522. **First interim report on salmon fishery modelling,** F. C. Johnson, 21 pages (July 8, 1974). Order from NTIS as COM 75-10080.

Key words: analysis of biological processes; economic performance; fisheries management; fisheries regulation; mathematical models; salmon fisheries model.

The salmon fishery modelling project is a joint State-Federal program for the development of improved techniques for analyzing the economic and biological effects of changes in the Pacific Coast salmon fishery regulatory parameters. This interim report covers the initial program design phase of the project.

NBSIR 74-523. **Preparations for gage block comparison measurements,** C. D. Tucker, 14 pages (July 9, 1974). Order from NTIS as COM 75-11126.

Key words: deburring; gage blocks, gage block comparator; linear variable differential transformer.

The methods described here for the cleaning and deburring of gage blocks can be useful to those individuals who have not established formal laboratory procedures for these operations. Many individuals may employ valid methods that vary somewhat from those employed at the National Bureau of Standards.

Many of the gage block comparators that are in use have not been periodically evaluated by the user. It is the intent of this report to set forth guidelines and procedures that may be used conveniently by metrologists to aid in obtaining more meaningful comparisons of gage blocks by the use of probe-type transducers.

NBSIR 74-524. **Practicality of diversion path analysis,** W. M. Murphey and J. C. Schleter, 36 pages (July 1974). Order from NTIS as COM 74-11568.

Key words: analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear material safeguards; safeguards.

One can define the safeguards system for nuclear material as the set of all protective actions taken to prevent or to deter attempts to divert nuclear material to unauthorized use. Maintenance of effective safeguards requires a program for routine assessment of plant safeguards systems in terms of their capabilities to satisfy safeguards aims. Plant internal control systems provide capabilities for detection of unprevented diversion and can provide assurance that diversion has not occurred. A procedure called Diversion Path Analysis (DPA) enables routine assessment of the capabilities of internal control systems in this regard and identification of safeguards problem areas in a plant. A framework for safeguards system design is also provided which will allow flexibility to accommodate individual plant circumstances while maintaining acceptable diversion detection capability. The steps of the procedure are described and the practicality of the analytical method is shown by referring to a demonstration test for a high throughput process where plant personnel were major participants. The boundary conditions for the demonstration case are given, along with some conclusions about the general procedure.

NBSIR 74-525. **Optical materials characterization,** A. Feldman, D. Horowitz, R. M. Waxler, I. Malitson, and M. J. Dodge, 20 pages (July 1974). Order from NTIS as AD 782564.

Key words: As_2S_3; chalcogenide glass; coefficient of thermal expansion; elastic constants; infrared laser window materials; KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index.

A program has been established for measuring refractive index, n, stress-optical constants, q_{ij}, change of index with temperature, dn/dT, thermal expansion coefficient, α, and elastic compliances, s_{ij}, of infrared laser window materials. These parameters are necessary for determining the optical distortion that occurs in windows due to heating by the absorption of high power laser radiation. n and dn/dT are measured over a spectral range 0.2 to 50 μm by the method of minimum deviation on precision spectrometers. Twyman-Green and Fizeau interferometers which operate at 0.6328 μm, 1.15 μm, and 10.6 μm, are used for measuring q_{ij}, α, dn/dT and s_{ij}. Materials currently under study are polycrystalline ZnSe, As_2S_3 glass, chalcogenide glass (Ge 33%, As 12%, Se 55%), and KCl. Results are given for n and dn/dT in KCl, and q_{ij} and s_{12} in ZnSe, As_2S_3 glass, and chalcogenide glass.

NBSIR 74-526. **Analysis of non-reinforced masonry buildin response to abnormal loading and resistance to progressive col lapse,** W. McGuire and E. V. Leyendecker, 67 pages (Nov 1974). Order from NTIS as COM 75-10087.

Key words: abnormal loading; building; gas explosion; load bearing masonry; load-bearing walls; masonry; masonr research; progressive collapse.

Five case studies of susceptibility to progressive collapse wer made of non-reinforced masonry bearing wall buildings. All wer assumed to comply with governing building codes. Based on th assumed failure mechanisms, analysis indicated that two of th structures had excellent resistance to progressive collapse, on was marginal, and two had little resistance to progressive co lapse. Analytical approaches used are illustrated and areas c needed research are identified.

NBSIR 74-527. **Development of solid state samplers for work a mospheres,** B. Greifer, B. C. Cadoff, J. Wing, and J. K. Taylo 54 pages (June 1974). Order from NTIS as COM 74-11720.

Key words: air analysis; air sampler; charcoal; chlorin fluorine; gas analysis; hydrogen cyanide; hydrogen fluorid industrial hygiene; phosphine; sodium acetate; sorber, soli work atmosphere.

A program is described for evaluating the efficiency of solid sorbers for collecting trace quantities of hydrogen fluoride, phosphine, hydrogen cyanide, chlorine, and fluorine in work atmospheres for subsequent laboratory analysis. The gas handling and sampling instrumentation is described, and experimental results to date are presented.

Sodium acetate is a very efficient sorber for hydrogen fluoride, and its solubility in water proves to be highly advantageous for subsequent HF determination by ion selective electrode. Potassium permanganate impregnated silica gel sorbs phosphine effectively, and Ascarite has been found to sorb hydrogen cyanide, but quantitative experiments on the latter two systems are still in progress.

Work on chlorine and fluorine systems will be initiated in the near future.

NBSIR 74-529. **Project plans fiscal year 1974,** J. J. Diamond, 72 pages (July 1973). Order from NTIS as COM 74-11495.

Key words: anthropometry; communications equipment; forensic science; Law Enforcement Standards Laboratory; LESL; performance standards; project plans; protective equipment; security equipment; standards; warning lights and sirens.

Plans are presented for nineteen projects approved and funded for FY-74. They include plans for the preparation of performance standards, user guidelines and reports on law enforcement equipment in the communications, security, protective equipment, investigative aid, emergency equipment and clothing areas.

NBSIR 74-530. **Preparation of charcoal sampling tubes containing known quantities of adsorbed solvents,** B. C. Cadoff, E. E. Hughes, R. Alvarez, and J. K. Taylor, 36 pages (July 1974). Order from NTIS as COM 75-10041.

Key words: activated carbon; air sampling; gas standards; industrial hygiene.

The method in widespread use for the determination of the concentration of organic solvents in the work atmosphere consists in collection of the solvent by adsorption on activated charcoal followed by desorption with carbon disulfide and measurement by gas chromatography. This report describes techniques developed to produce reference standards for this determination and modifications in the analytical procedure to improve its precision and accuracy.

NBSIR 74-533. **Influence of windshield tint on the temperature in automobile passenger compartments,** W. S. Hurst and M. G. Scroger, 113 pages (Sept. 1974). Order from NTIS as PB 238573.

Key words: automobile compartment temperatures; automobile windshields; glazing materials; transmittance of vehicle glazing materials.

The effect of tinting in the glass of windshields on the air temperature in automobile passenger compartments was investigated. Measurements were performed with two nearly identical vehicles, one equipped with tinted windshield glass and one equipped with clear windshield glass. All other glass in both vehicles was tinted. Tests were performed statically, with the cars parked facing south, and dynamically, with the cars driven at approximately 80 km/h. In the static tests, the interior air temperatures as determined by liquid-in-glass thermometers were typically 2 to 3 °C cooler in the vehicle with the tinted windshield. In the dynamic tests, the differences in the interior air temperatures were smaller, typically about 0.5 to 1.5 °C. The interior air temperature differences determined with thermocouples varied with the thermocouple position. The differences typically ranged from a negligible amount (less than 1 °C) to about 6 °C; temperature differences as large as 16 °C were observed on the car dash.

NBSIR 74-535. **A selected and annotated bibliography of compilations of data relevant to biochemical thermodynamics,** G. T. Armstrong, G. R. Janes, and R. N. Goldberg, 81 pages (July 1974). Order from NTIS as COM 74-11659.

Key words: bibliography; biochemistry; biology; data compilations; thermochemistry; thermodynamics.

This report is a selected and annotated bibliography of sources of data compilations relevant to biochemical thermodynamics. Included in the annotations are brief descriptions of the type of thermodynamic properties tabulated, the class of materials dealt with, and the degree of completeness of the compilations.

NBSIR 74-537. **CODATA guidelines on reporting data for chemical kinetics,** 18 pages (Aug. 1974). Order from NTIS as COM 74-11577.

Key words: chemical kinetics; guidelines; recommended procedures for reporting data; standardization; units.

This document is a copy of the report, June 1974, of the Task Group on Data for Chemical Kinetics of the Committee on Data for Science and Technology (CODATA). In this report recommendations are made about the reporting of experimental chemical kinetics data.

NBSIR 74-539. **Energy conservation at the NBS laboratories,** J. D. Hoffman, 81 pages (July 1974). Order from NTIS as COM 74-11574.

Key words: contingency plans; electricity; energy conservation; heating fuels; humidity control; transportation.

An Energy Task Force was established at NBS to effect energy conservation, to develop contingency plans to keep the Laboratories functioning in the event of reduced energy supply and to assist employees with transportation problems. The NBS Laboratories use a total of ~ 115 million kWh of electricity and ~ 780 billion BTU of heating fuel annually to power equipment and to provide a reliable environment. The Task Force conducted a systems analysis of energy use and found that 85 percent of the energy is used in climate control. A mathematical model for the climate control system was developed that affords an accurate comparison between observed and calculated energy use. As part of the analysis of energy use, conservation measures were identified and implemented. These measures include lighting reductions, building and zone shut-downs, thermostat adjustments, and changes in cooling coil control parameters. The conservation actions resulted in a reduction of ~ 12 percent in electricity and ~ 18 percent in heating fuel. The Task Force formulated contingency plans to reduce energy use on short notice in preparation to respond to area-wide energy problems. These plans provide for a set of priorities to produce a reduction of 2-5 megawatts in electrical demand and for an effective doubling in oil storage capacity. Task Force recommendations address all phases of energy use and implementation of them will increase electricity conservation to ~ 15 percent and heating fuel conservation to ~ 21 percent.

NBSIR 74-541. **An evaluation of potentially useful separator materials for nickel-cadmium (Ni-Cd) satellite batteries,** H. A. Baker, S. D. Toner, and W. F. Cuthrell, 37 pages (Oct. 1974). Order from NTIS as COM 75-10618.

Key words: battery separators; nickel-cadmium batteries; satellite batteries; separator materials.

An evaluation intended to determine the potential suitability and probable efficacy of a group of separator materials for use in nickel-cadmium (Ni-Cd) satellite batteries was carried out. These results were obtained using test procedures established in

an earlier evaluation of other separator materials, some of which had also been used in experimental battery cells subjected to simulated use conditions.

The properties that appear to be most important are: high electrolyte absorptivity, good electrolyte retention, low specific resistivity, rapid wettability and low resistance to air permeation. Wicking characteristics and wet-out time seem to be more important with respect to the initial filling of the battery with the electrolyte.

While the properties of some of these materials indicate that they would be satisfactory, no specific conclusions can be drawn as to their actual effectiveness without further testing after they have been subjected to simulated use conditions in experimental cells.

NBSIR 74-542. **Economics of protection against progressive collapse,** R. E. Chapman and P. F. Colwell, 34 pages (Sept. 1974). Order from NTIS as COM 75-10081.

Key words: benefit-cost analysis; building safety; economics; progressive collapse; standards.

Public and government concern about the progressive collapse of buildings caused by abnormal loading has resulted in the development of draft standards to provide protection against progressive collapse. From society's viewpoint, standards for protection against progressive collapse should result in a level of protection which is more efficient (i.e., the net social benefits from protection should be increased). An economic model utilizing the principles of benefit-cost analysis is developed which establishes a methodology for determining the efficiency of various levels of protection against progressive collapse. An application of the model to a partial evaluation of a specific standard demonstrates some of the capabilities of the model. Recommendations are made for a complete evaluation of this standard and for the further refinement of the model.

NBSIR 74-543. **High temperature MHD materials,** S. J. Schneider, W. Capps, H. P. R. Frederikse, W. R. Hosler, D. A. Kauffman, E. M. Levin, C. L. McDaniel, T. Negas, and E. R. Plante, 129 pages (Aug. 1974). Order from NTIS as COM 74-11772.

Key words: coal slag; electrical conductivity (MHD); electrodes; insulators; MHD; MHD materials; MHD materials testing; phase equilibria (MHD); vaporization (MHD); viscosity (MHD).

Under the auspices of the Office of Coal Research the National Bureau of Standards has underway a program of materials research appropriate to magnetohydrodynamics (MHD). The overall objective of the work is to provide materials property information necessary for the design, construction, and operation of an open cycle, coal fired MHD electric generation plant. The program consists of several interrelated investigations in the areas of phase equilibria, electrical properties, vaporization, viscosity and materials testing. Initial work has centered on the behavior of coal slag but also encompasses the physical and chemical characteristics of other MHD process contaminants (alkali seed) and important electrode and insulator materials. The report summarizes the important technical results obtained during the period July 1, 1972-June 30, 1974 under the combined NBS-OCR program.

NBSIR 74-544. **Kerr coefficients of nitrobenzene and water,** R. E. Hebner, Jr., R. J. Sojka, and E. C. Cassidy, 35 pages (Aug. 7, 1974). Order from NTIS as COM 74-11525.

Key words: dielectric fluids; electrical properties of fluids; high voltage measurements; Kerr coefficient; Kerr effect; nitrobenzene; pulse measurements; water.

The Kerr coefficients of both water and nitrobenzene were measured and the variation of these quantities with temperature and wavelength was investigated. At a temperature of 296 K and at a wavelength of 632.8 nm, the following values for the Kerr coefficients were obtained $B(C_6H_5NO_2) = 3.24 \times 10^{-12}$ m/V^2, and $B(H_2O) = 3.43 \times 10^{-14}$ m/V^2.

The estimated uncertainty in the measurement in nitrobenzene is ± 6 percent while in water the estimated uncertainty is ± 8 percent.

The primary conclusion drawn is that although nitrobenzene can be used for accurate measurement of a wide, and fairly well defined, variety of high voltage pulses, the situation in water is more poorly understood. The primary areas of difficulty using water are the existence of turbulence under pulses of duration of a few microseconds and the possibility of a voltage dependence of the Kerr coefficient due to a saturation of the alignment of the molecules with the applied field.

NBSIR 74-545. **Notes on the fundamentals of measurement and measurement as a production process,** P. E. Pontius, 65 pages (Sept. 1974). Order from NTIS as COM 74-11656.

Key words: calibration; comparator; interferometer; length; long gage blocks; measurement process; uncertainty.

The concept of a measurement process as a production process is relatively new, having evolved in the last ten years. There have been significant contributions from many sources which have served to refine the initial ideas. The generalized concept of a measurement process is discussed together with techniques and examples for verifying the validity of the result. While some of the techniques may not be appropriate for certain highly specialized measurement processes, it is felt that the concepts are applicable to practically all measurement processes. For certain types of general measurement processes, which must operate in a variety of environments, and which must accommodate a variety of materials and properties, the techniques have been invaluable in understanding the manner in which measurement processes operate in a "real" world.

NBSIR 74-550. **Report to AID on an NBS/AID workshop on standardization and measurement services in industrializing economies,** M. B. McNeil, 92 pages (May 11-24, 1974). Order from NTIS as COM 74-11755.

Key words: AID; assistance; economics; foreign relations; industrializing nations; LDC's; measurement services; standardization.

On May 11-24, 1974, a Workshop was held at the National Bureau of Standards (Gaithersburg), under the sponsorship of AID, whose object was to give standards officials of industrializing nations insight into the standards and measurement systems in the United States and the role of the National Bureau of Standards, so that these officials might consider what parts of the U.S. system might usefully be adapted to conditions in their home countries. The report contains copies of speeches and presentations by representatives of both the U.S. and the industrializing nations, in addition to a general agenda of talks, presentations, and tours of laboratories both of NBS and of other organizations.

NBSIR 74-551. **An appraisal of methods for estimating self-reaction hazards,** W. Tsang and E. S. Domalski, 100 pages (June 1974). Order from NTIS as COM 74-11658.

Key words: activation energy; bond dissociation energy; computer programs; explosive sensitivity tests; heat of decomposition; oxygen balance.

The ability to identify and specify the thermal instability of chemical substances has been appraised as a result of examining

ertain test methods used to measure explosive sensitivity, and ertain computer programs designed to estimate reaction azards from a thermochemical approach. The bond dissociation nergy emerges as the parameter giving the best correlation with aterial sensitivity. The computer programs overemphasize exosive power as opposed to explosive sensitivity and label many ompounds hazardous when they are not. At present, regulations ecifying the handling and transport of commodities should folw the concept of self-reactivity based upon functional groups.

BSIR 74-552. **Technical manual for phosphor standards calibrator,** M. L. Greenough and H. K. Hammond III, 84 pages (Aug. 12, 1974). Order from NTIS as COM 74-11644.

Key words: fluorescence measurement; instrumentation, luminescence measuring; luminescence measurement; phosphorescence measurement.

This project involved two activities, 1) the fabrication and alibration of phosphor standards for use in the Postal Service lodel 4A8 Phosphoremeter and 2) the construction of an instruent to perform the calibration function. Both of these relate to andardization of the phosphorescent and fluorescent activity the luminescent coating applied to postage stamps by the Buau of Engraving and Printing. The purpose of the luminescent atings is to facilitate detecting the orientation of envelopes in cer-canceler machines during mail processing.

Work on the project entailed the fabrication of approximately phosphor standards, which are hand-sized aluminum blocks to which stamp-sized wafers of luminescent materials are ounted. Fabrication was carried out following the specific rocedures supplied by the Postal Service, with however, uthority to verify or alter the process as necessary. On the other ajor project effort, an instrument was designed and constructed llowing in general the basic design of an earlier breadboard evice developed under a prior project. In the system, quantitave evaluations are ultimately referred to calibrations at NBS of e relative irradiance of a lamp in the ultraviolet and visible reons of the spectrum.

This report, one of two covering the project, is in the form of chnical manual for the calibration instrument, and includes eory of operation, mechanical construction and detailed perating procedures.

BSIR 74-553. **Preparation and calibration of phosphor standards,** M. L. Greenough and H. K. Hammond, III, 70 pages (Oct. 1974). Order from NTIS as COM 75-10058.

Key words: fluorescence measurement; instrumentation, luminescence measuring; luminescence measurement; phosphorescence measurement.

This project involved two activities, 1) the fabrication and alibration of phosphor standards for use in the Postal Service lodel 4A8 Phosphormeter and 2) the construction of an instruent to perform the calibration function. Both of these relate to e standardization of the phosphorescent and fluorescent activi- of the luminescent coatings applied to postage stamps by the ureau of Engraving and Printing. The purpose of the luinescent coatings is to facilitate detecting the orientation of enelopes in facer-canceler machines during mail processing.

Work on the project entailed the fabrication of approximately phosphor standards, which are hand-sized aluminum blocks to which stamp-sized wafers of luminescent materials are ounted. Fabrication was carried out following the specific rocedures supplied by the Postal Service, with however, uthority to verify or alter the process as necessary. On the other ajor project effort, an instrument was designed and constructed llowing in general the basic design of an earlier breadboard evice developed under a prior project. Quantitatively in the system, evaluations are ultimately referred to calibrations at NBS of the relative irradiance of a lamp in the ultraviolet and visible regions of the spectrum.

This report, one of two covering the project activities, describes the preparation of luminescent wafers, their assembly into phosphor standards and the test procedures on completed standards. It includes a tabulation of the calibrated values of the new standards.

NBSIR 74-554. **City games, disk and tape generation,** J. Moriarty, 12 pages (Sept. 1973). Order from NTIS as COM 74-10703-2.

Key words: city model; computer; computer disks; computer tapes; duplicate tapes and disks.

This document contains the instructions for initializing duplicate disks for the CITY I model and duplicate tapes for the CITY IV model.

NBSIR 74-555. **City games, an executive's overview,** J. E. Moriarty, 50 pages (May 1974). Order from NTIS as COM 74-10704.

Key words: city; computer; computer games; economic; government; metropolitan; simulation; social.

The City Games are realistic gaming simulations of the operation of contemporary cities. They have been in continuous development since the 1960s with their completion by the National Bureau of Standards in 1973-74. In the City Games, participants experience intensive transactions in collaborative planning and in competitive negotiations for the allocation of limited resources. They emulate elements of the government, economic and social sectors of the city system and make planning decisions involving land use, schools, transportation systems, water and sewer facilities, zoning, tax structure, etc., etc.. In a 3-hour round of game play, representing a telescoped fiscal year, the decision maker makes quantitative decisions, implements them, and (through the computer aided simulation) sees the consequences of his actions. In successive rounds of play, the participant gains experience in trade-off negotiations, learns systematic approaches to typical problems and acquires new insights into the interdependences of the numerous components of a city system. City Game demonstrations can be conducted over a 2-3 day period and can accommodate between 30 and 60 active participants.

NBSIR 74-556. **City games, mathematical foundations,** J. E. Moriarty, Ed., 92 pages (Nov. 1973). Order from NTIS as COM 74-10703-1.

Key words: computer programs; computers; computer simulation; equations; mathematical foundations; mathematics; simulation; simulation module.

The CITY models are operational simulation games in which the participants make economic, government and social decisions affecting a hypothetical metropolitan area. Through the use of a computer, the simulated urban system responds to the participant's decisions as any real city would. To simplify the description of the theory of the CITY GAMES modules, this manual is written for the four module game. The equations for the other games can easily be obtained by eliminating the descriptors that do not apply to the particular game of intetest. The theoretical structure of all models is consistent and relevant only within the range from a central city area to a regional configuration. The description of the module components and equations are meant to show the scope of decisions including those by the user and by the programs and algorithms of the computer model.

NBSIR 74-557. **Non-metallic antenna-support materials,** N. Halsey, D. E. Marlowe, and L. Mordfin, 45 pages (June 1974). Order from NTIS as COM 75-11439.

Key words: composite materials; fiber-reinforced-plastic rod; glass-reinforced-polyester rod; guys, antenna; processing parameters, pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods, FRP rod; weatherability, FRP rod.

Thirteen samples of pultruded, glass fiber-reinforced-polyester rod material were manufactured using a different combination of the manufacturing process parameters for each. These samples were tested to evaluate the effects of nine different process parameters on the properties and characteristics of the rods. Elevated-temperature stress-rupture tests under saturated humidity were used as an accelerated measure of long-term weatherability. The test results were somewhat inconsistent, but it appears that certain process parameters, such as collimation and ultrasonic agitation of the rovings during pultrusion, were beneficial to both tensile strength and weatherability. Other parameters, such as pretensioning of the rovings, were beneficial to weatherability but detrimental to tensile strength. Additives to the resin system were generally detrimental.

A high speed tension test method was developed and it was found that the strength of the rod is substantially greater under high loading rates.

An approximate relationship was observed between transverse tensile strength and electrical breakdown voltage. However, neither of these characteristics, nor surface hardness, correlated with axial tensile strength or weatherability.

NBSIR 74-561. **Analysis of methodology for measuring national highway traffic safety,** R. G. Hendrickson and A. R. Craw, 42 pages (Sept. 1974). Order from NTIS as COM 74-11576.

Key words: highway traffic safety; indicators; safety program impact; traffic data systems.

This report covers a critique of current measures used by NHTSA to report and evaluate National Traffic Safety, and presents the development of proposed measures for evaluating the impact of NHTSA priority programs on the vehicle-driver-highway mix. The proposed measures emphasize the use of injury-severity levels and an extended set of driver-vehicle-highway descriptors to depict critical factors in National traffic patterns and trends. The conclusions and recommendations address extensions of current indicators to describe accident phenomena by driver and vehicle attributes, to enlarge the number and detail of descriptors of accident data and accomodate these extensions by more comprehensive development. Surrogates for National statistics and concentration of certain programs were investigated.

NBSIR 74-564. **Development and analysis of techniques for calibration of Kerr cell pulse-voltage measuring systems VIII,** R. E. Hebner, Jr., E. C. Cassidy, and R. J. Sojka, 55 pages (Aug. 21, 1974). Order from NTIS as COM 74-11726.

Key words: calibration; electrical measurements; high voltage measurements; insulating fluids; Kerr coefficient; nitrobenzene; pulse voltage measurement; space charge; water.

This report documents recent progress in the refinement of techniques for accurate calibration of pulsed voltage measurement based on the electro-optic Kerr effect. The work includes a discussion of calibration techniques and a comparison of calibrations performed in various laboratories. In addition the Kerr coefficients of water, nitrobenzene and Halowax oil were determined. The measurements in Halowax oil were performed under direct, 60 Hz alternating, and pulsed high voltage. The measurements of the Kerr coefficient of nitrobenzene and water were performed under pulsed high voltage, but measurements of the space charge dynamics in nitrobenzene under low frequency alternating voltage are discussed.

NBSIR 74-567. **FY 74 progress report on design criteria an methodology for construction of low-rise buildings to resi typhoons and hurricanes,** N. J. Raufaste, Jr., and R. D Marshall, 276 pages (July 1, 1974). Order from NTIS as CON 74-11631.

Key words: buildings; construction; data acquisition equip ment; design criteria; extreme winds; information transfe instrumentation; wind loads; wind tunnel modeling.

This report gives the major accomplishments of the secon phase of a three year project to provide engineering and technica assistance to the Agency for International Development (AID Department of State in developing improved design criteria fo low-rise buildings to better resist extreme winds. During FY 74 the Center for Building Technology project staff members com menced several tasks. These tasks will serve as major inputs t the development of improved design criteria. The principal task include: 1) selecting a second and third field test site in th Philippines, 2) instrumenting four full scale houses, at the site 3) instrumenting the University of Philippines wind tunnel facil ty, 4) participating in an International Workshop at Manila du ing November 1973, and 5) developing, in conjunction wit short-term consultants in Bangladesh and Jamaica, a methodolo gy for the transfer of technology.

NBSIR 74-568. **FY 75 project plans Law Enforcement Standard Laboratory,** 62 pages (Sept. 1974). Order from NTIS as CON 74-11578.

Key words: communications equipment; forensic science Law Enforcement Standards Laboratory; LESL; per formance standards; project plans; protective equipmen security equipment; standards.

Plans are presented for seventeen projects approved an funded for FY-75. They include plans for the preparation of pe formance standards, user guidelines and reports on law enforce ment equipment in the communications, security, protectiv equipment, investigative aids, courtroom equipment and com pliance testing areas.

NBSIR 74-572. **Torsional buckling of composite cylindrical shells** D. E. Marlowe and G. F. Sushinsky, 60 pages (Sept. 1974) Order from NTIS as COM 74-11791.

Key words: aircraft structures; buckling; composite materi als; metal reinforcement; stability; stacking sequence; thi shells; torsion.

The elastic buckling strength has been determined for thin walled composite and composite-reinforced-metal cylindrica shells. Tests were performed on boron/epoxy and graphite/epox y-all-composite specimens, on boron/epoxy-reinforced-titaniur specimens and on boron/epoxy and graphite/epoxy-reinforce aluminum specimens. Cylinders were tested with severa unidirectional-ply and cross-ply layups.

The results of the tests were compared with the bucklin strengths predicted by the torsional buckling analysis of Cha For the cylinders which fail by buckling, the experimental buck ling torques were approximately 81 percent of the torques pre dicted by the analysis.

The experimental results of tests on 39 specimens ar presented. Torsional buckling strengths which differ by as muc as a factor of two may result from reversing the direction of twi of a thin-walled cross-ply composite cylinder. This has bee shown to be equivalent to reversing the stacking sequence of th laminate. This is of potential importance in applications wher reversals of loading may occur. An "optimum" stackin sequence which produced significant increases in the predicte and measured buckling loads was determined. Cylinder fabricated with this stacking sequence exhibit considerable in creases in the strength-to-weight ratio over other sequences ex amined.

NBSIR 74-577-1. **Remittance processing system, Volume I (Refer to Volume II)**, P. D. Shupe, Jr., P. Meissner, and J. R. Park, 194 pages (Sept. 1974). Order from NTIS as COM 74-11723.

Key words: audit trail; check endorsement; check handling; data entry; document labeling; labeling; listing; man machine interface; MICR printing; remittance processing; remittance register.

The Remittance Processing System is a prototype developed for the Internal Revenue Service to test a new concept in automating the processing of taxpayer remittances. Central to the new processing concept was the integration of the Direct Data Entry System. Initial Entry Station with equipment components that would eliminate a number of individual manual operations, permit operator interface with the central DDES computer, and provide for verification of initial entry, check endorsement, audit trail data, remittance documentation, and affixing information to taxpayer documentation accompanying the remittance. This report describes the equipment which was configured to implement these processes and to demonstrate the viability of the concept.

NBSIR 74-577-2. **Remittance processing system. Volume II (Reference Volume I)**, P. D. Shupe, Jr., P. Meissner, and J. R. Park, 317 pages (Sept. 1974). Order from NTIS as COM 74-11724.

Key words: audit trail; check endorsement; check handling; data entry; document labeling; labeling; listing; man machine interface; MICR printing; remittance processing; remittance register.

The Remittance Processing System is a prototype developed for the Internal Revenue Service to test a new concept in automating the processing of taxpayer remittances. Central to the new processing concept was the integration of the Direct Data Entry System. Initial Entry Station with equipment components that would eliminate a number of individual manual operations, permit operator interface with the central DDES computer, and provide for verification of initial entry, check endorsement, audit trail data, remittance documentation, and affixing information to taxpayer documentation accompanying the remittance. This report describes the equipment which was configured to implement these processes and to demonstrate the viability of the concept.

NBSIR 74-578. **Development of microwave hygrometer model III**, D. P. Stokesberry and S. Hasegawa, 14 pages (Sept. 1974). Order from NTIS as COM 74-11765.

Key words: dew-point; hygrometer; microwave hygrometer.

This is a progress report on the design and construction of NBS microwave hygrometer, Model III. The hygrometer is intended for field or laboratory operation with a dew point range of − 40 to 40° C.

NBSIR 74-580. **Spectral characteristics of additional Bar Code Readers. II**, J. Cohen, 12 pages (Sept. 1974). Order from NTIS as PB248465.

Key words: bar code reader; filters; optical wedge; photodetector; relative spectral output; wavelength.

The spectral characteristics of two bar code readers (submitted by the U.S. Postal Service under Task No. 1, Agreement No. 74-02934 [Mod. No. 1]) have been measured as a function of wavelength in the approximate interval of 450 to 1200 nm.

NBSIR 74-581. **Development of a solid sorption tube for sampling hydrogen fluoride in the work atmosphere**, J. Wing and J. K. Taylor, 45 pages (Oct. 1974). Order from NTIS as COM 75-10127.

Key words: air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene; sodium acetate; sorber; solid; work atmosphere.

The efficiencies of several solid substances in a sorption tube for collecting trace quantities of hydrogen fluoride gas in work atmosphere have been evaluated. Reagent-grade sodium acetate crystals proved to be a very efficient sorbent for hydrogen fluoride. Its solubility in water and pH buffer properties are highly advantageous for subsequent fluoride determination by the ion selective electrode. Experimental results are presented for collection efficiencies of hydrogen fluoride gas at several concentration levels, flow rates, and collection times, the effects of elevated temperatures and humidity, and also breakthrough, bleed-out, storage and shipment studies. Specifications for construction of the sorption tubes are also given.

NBSIR 74-582. **FY 1973 progress report on design criteria and methodology for construction of low-rise buildings to better resist typhoons and hurricanes**, N. J. Raufaste and R. D. Marshall, 31 pages (July 2, 1973). Order from NTIS as COM 74-11645.

Key words: construction; design criteria; extreme winds; full-scale test buildings; housing; instrumentation; wind tunnel.

This report highlights the major accomplishments of the initial phase of a three fiscal year project to provide engineering technical assistance to the Agency for International Development (AID) for the development of design criteria for low-cost/low-rise buildings to better withstand the effects of extreme winds. This phase represents approximately a 3 month level of effort. During this period CBT project staff members commenced six introductory tasks. These tasks will set the pace for the second fiscal year level of effort. The tasks included: initiate dialogue with local organizations and institutes in developing countries, establish a local Philippine advisory committee; conduct on-site visits to developing countries to identify local professional candidates for short term consultating; conduct on-site visits to developed countries to collect information from research centers; purchase initial wind tunnel and full-scale field test instrumentation; and commence library search of related subject documents.

NBSIR 74-583. **The role of passive film growth kinetics and properties in stress corrosion and crevice corrosion susceptibility**, J. Kruger and J. R. Ambrose, 88 pages (Sept. 1974). Order from NTIS as AD767326.

Key words: chloride; crevice corrosion; ellipsometry failure prediction; molybdenum; repassivation kinetics; stainless steels; stress corrosion; testing techniques.

A study of the effect of alloying chromium and molybdenum in ferritic stainless steels has been made using techniques to study repassivation kinetics (tribo-ellipsometry) and depassivation kinetics (a recently developed ellipsometry technique for studying optical changes occurring within a crevice). Results indicate that chromium additions affect both repassivation and depassivation processes while molybdenum appears to affect only the repassivation processes. A discussion is given of a generalized mechanism for localized corrosion which postulates that susceptibility to attack is determined by the competition between depassivation and repassivation processes.

Constant strain rate studies were performed using AISI 304 stainless steel exposed to acidified 1.ON NaCl solution (pH = 3.0). In this particular environment, repassivation kinetics measurements using the tribo-ellipsometric technique had shown

that the metal dissolution rates were rather large due to reduced film repair kinetics, indicating the possibility of susceptibility to stress corrosion cracking (SCC). Reduced time to failure and maximum sustained load at a one strain rate suggest a relationship between SCC, repassivation kinetics,,and rate of pure metal production.

A review of current approaches to the study of stress corrosion and a discussion of how these approaches can lead to new failure prediction tools is given.

NBSIR 74-586. **Calibration of platinum resistance thermometers using an intercomparison scheme,** R. M. Schoonover and H. H. Ku, 19 pages (Dec. 1974). Order from NTIS as COM 75-10525.

Key words: adjustment for trend; calibration; capsule type thermometers; intercomparison; IPTS-68; platinum resistance thermometers; wire-to-wire calibration.

In this report we describe a procedure for the calibration of capsule type platinum resistance thermometers, PRT(s), using one or more standard platinum resistance thermometers, SPRT(s), in the temperature range of 0-35 °C. These PRT(s) were designed to be used in density work through hydrostatic weighing where SPRT(s) cannot be used because of space and other limitations, but the procedure is thought to be generally useful in other applications as well.

The schedule of intercomparisons was designed to eliminate possible trends in temperature variations of the constant temperature bath setup. Results of calibration can be expressed either in terms of the two constants alpha (α) and delta (δ), or in a table relating $R(t)/R(0)$ to t_{68} within the range of calibrations.

The uncertainty of the values of t_{68} calibrated by this procedure is believed to be within 2 millidegrees Celsius, not including the uncertainty of the SPRT that is used as standard.

NBSIR 74-588. **Development of a bench test for Type X core gypsum board,** J. L. Houser, 26 pages (Dec. 1974). Order from NTIS as COM 75-10040.

Key words: building codes; construction materials; fire endurance ratings; fire tests; gypsum.

This paper describes the development of a test method for determining that the core material in a gypsum board sample qualifies as Type X. A 2 inch (5.08 cm) by 16 inch (40.64 cm) specimen is flexurally stressed during the test by suspending a weight from the cantilevered end of the test sample. The specimen is swiveled into the center of a two burner turbulent flame at an average temperature of 1,780 °F (971 °C). The burners are positioned from above and below. The test is terminated when the specimen either breaks or deflects through an arc three times the specimen thickness. Results show this method to be repeatable with a coefficient of variation equal to ± 8 percent for a given type of material from a single manufacturer.

NBSIR 74-590. **A study of the feasibility of establishing generic environmental test parameters for all consumer products,** S. D. Toner, 9 pages (Mar. 1975). Order from NTIS as COM 75-11434.

Key words: environmental tests; product safety.

A study was conducted to determine the feasibility of establishing a set of generic environmental test parameters that would be applicable to all types of consumer products, with a potential for developing injury producing hazards as a result of environmentally induced failure. It was concluded that this approach is not a practical one. It is apparent that the safeness of a product or type of product should be determined on the basis of simulated environmental tests appropriate to its specific end use.

NBSIR 74-591. **Some problems noted in the use of Taguchi semiconductor gas sensors as residential fire/smoke detectors,** R. W. Bukowski and R. G. Bright, 12 pages (Dec. 1974). Order from NTIS as COM 75-10101.

Key words: false alarm; fire detector; fire test; residential smoke detector; semiconductor gas sensor; sensor contamination.

This paper examines some aspects of Taguchi semiconductor gas sensors and their use as residential fire/smoke detectors based on theoretical and experimental considerations. It was found that these sensors have difficulty detecting fires involving complete combustion along with a greater than normal propensity to false alarm to other than fire conditions. Both of these problems raise serious questions as to the suitability of these sensors as residential fire/smoke detectors, at least at their present state of development.

NBSIR 74-595. **A procedure for estimating automobile fuel consumption on congested urban roads,** D. M. Levinsohn and J. T. McQueen, 20 pages (Aug. 1974). Order from NTIS as COM 75-10057.

Key words: automobile fuel consumption; congestion; energy conservation; fuel consumption; impact assessment; roadway operating environment; urban roads; vehicle characteristics.

Energy consumption is an important measure of the performance of a transportation system. To be able to accurately measure associated automobile fuel consumption will improve the evaluation of urban transportation alternatives. An estimated procedure is proposed that is designed to be particularly sensitive to automible fuel consumption in congested, peak hour traffic. This procedure is based upon vehicle attributes and roadway operating conditions which were determined through an extensive review of the auto fuel consumption literature. Vehicle attributes include characteristics of the automobile that affect fuel consumption. Roadway operating conditions comprise the types of driving to which the automobiles are subjected. Vehicles are classified by weight and model year. The proposed roadway classifications are expressway, arterial, and local street. For each vehicle type category, base fuel consumption rates are determined. These base consumption rates are then modified by adjustment factors which reflect the roadway operating conditions. The rates are multiplied by the vehicle miles of each vehicle category and summed over all categories to compute the total fuel consumption on the road under analysis. An example application of the procedure including sensitivity analyses is presented. The base fuel consumption rates can be obtained from EPA emissions test data. Research is required to determine the adjustment factors, particularly under conditions of extreme roadway congestion.

NBSIR 74-596. **Radiative heat transfer from products of combustion in building corridor fires,** K. Bromberg and J. G. Quintiere, 28 pages (Feb. 1975). Order from NTIS as COM 75-10209.

Key words: combustion products; full-scale fire; radiative heat transfer.

The contribution of radiative heat transfer from hot combustion products to corridor floors is examined. Data from full-scale corridor fire experiments is used to calculate emissivity and absorptivity of the combustion products. An empirical model based on attenuation by absorption is used to specify the absorption coefficient due to particulates in the products. In these experiments it is shown that radiation from the combustion products is just as significant as radiation from convectively heated walls and ceiling of the corridor. Calculations show that

he ratio of radiant heat transfer to the floor due to ceiling emis-ion to that by combustion product emission ranges from about .2 to 0.7. Also, molecular gas radiation and particulate radiation an both be significant for the combustion products. Calculations now that the emissivity of the gaseous combustion products lone would be about 0.3, but the inclusion of soot particles ields an emissivity for the total combustion product mixture of s high as 0.73, based on the experimental data considered.

IBSIR 74-597. **Piezoelectric accelerometer low-frequency response by signal insertion methods,** R. S. Koyanagi and J. D. Pollard, 33 pages (May 1975). Order from NTIS as COM 75-11069.

Key words: accelerometer; calibration; low frequency; signal insertion; vibration.

The purpose of this study was to compare the frequency esponse of selected piezoelectric accelerometers using a signal nsertion method to the response using traditional mechanical ibration tests. Signal insertion methods included "voltage inser-on" and "change insertion" techniques. The signal is inserted t series with the electrical low-side of the accelerometer by neans of a suitable series resistance. Commercially available in-ertion devices were used. Confidence in the use of insertion nethods is increased where there is agreement between the esults from insertion tests and mechanically excited tests.

IBSIR 74-600. **Thermodynamics of chemical species important to rocket technology,** C. W. Beckett, 200 pages (Oct. 1, 1974). Order from NTIS as ADA008935.

Key words: bibliography on spectroscopy of fluorides and oxides of the lanthanide series; calculation of dissociation energies; electrical resistivity; enthalpy of transition; graphite; infrared matrix isolation spectroscopy; melting point; radiance temperature; reaction of Ba(g) and excited ozone; reaction of Fe(g) and oxygen; review of literature on rate of effusion and mass-spectrometric data; scandium group and rare-earth gaseous monoxides; specific heat; total emittance; vanadium; zirconium.

Using a subsecond-duration transient technique the specific eat, electrical resistivity, and hemispherical total emittance ere simultaneously measured over the temperature range 1500-000 K for some grades of graphite. Similar measurements were ade on vanadium, and zirconium in the temperature range of 500-2100 K. Melting points and radiance temperature (at 650 m) are reported for zirconium and molybdenum. The tempera-re of the transition from the α-β phase of zirconium and the nergy difference of these phases has also been measured using he subsecond duration transient technique.

The products of the reaction of Fe(g) and 0_2 have been in-estigated and identified using the methods of infrared matrix olation spectroscopy. A preliminary report on the study of the eaction of Ba(g) with vibrationally excited ozone is also resented.

The dissociation energies of the scandium group and rare-arth gaseous monoxides are evaluated by reviewing the litera-re available on Knudsen effusion rates and mass-spectrometric ata. Criteria are discussed for choosing data for evaluation of issociation energies. A bibliography of the available literature n the spectroscopy of fluorides, oxides, and oxyfluorides be-onging to the lanthanide series is given.

IBSIR 74-602. **Efficient methods of extreme-value methodology,** J. Lieblein, 32 pages (Oct. 1974). Order from NTIS as COM 75-10048.

Key words: distribution of largest values; efficient estimators; extreme values; linear unbiased estimators; statistics; Type I distribution.

This report presents the essentials of modern efficient methods of estimating the two parameters of a Type I extreme-value distribution. These methods are an essential phase of the analysis of data that follow such a distribution and occur in the study of high winds, earthquakes, traffic peaks, extreme shocks and extreme quantities and phenomena generally. Methods are given that are appropriate to the quantity of data available—highly efficient methods for smaller samples and nearly as efficient methods for large or very large samples. Necessary tables are provided. The methods are illustrated by examples and summarized as a ready guide for analysts and for computer programming. The report outlines further work necessary to cover other aspects of extreme-value analysis, including other distribution types that occur in failure phenomena such as consumer product failure, fatigue failure, etc.

NBSIR 74-605. **Crush characteristics of automobile structural components,** D. C. Robinson, 65 pages (Jan. 1975). Order from NTIS as COM 75-10464.

Key words: automobile side impact; crush characteristics; displacement measurements; door structure; drop tests; dynamic crush tests; impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures.

Static and dynamic test procedures were developed for evaluating the crush characteristics of automotive structural components which perform a major structural function in side impacts. Laboratory tests were conducted on several 1969 to 1971 4-door intermediate size automobiles to evaluate the crush characteristics of some of their structural components. Static crush tests were conducted in the 12-million-lbf capacity universal testing machine at the National Bureau of Standards, employing its large working space. The dynamic tests were conducted using the monorails attached to the sensitive crosshead and the tie-down floor system which is incorporated in the foundation of this machine. The crush loads were applied perpendicular to the vehicle side for each of the tests. The response of the structural components was established based on the evaluation of displacement and/or strain measurements and detailed examination of the permanently deformed components following each test. Empirical factors were obtained which are useful for comparison of static and dynamic crush characteristics of a vehicle side door structure over a limited loading range. Further development of the test procedures is required in order to extend the range over which such results would be meaningful.

NBSIR 74-606. **Consumer product noise: A basis for regulation,** P. G. Weissler, G. A. Zerdy, and S. G. Revoile, 80 pages (Nov. 1974). Order from NTIS as COM 75-10340.

Key words: consumer products; criteria for safety standards; federal regulations; hearing impairment; hearing survey; noise emission; speech communication interference.

The Consumer Product Safety Commission is charged with the responsibility for promulgating safety standards to protect the public against unreasonable risks of injury associated with consumer products. There is a risk of injury from noisy products, directly by damage to hearing and indirectly by degradation of essential speech communication. This report develops criteria relevant to the specification of Safety Standards for noisy consumer products. Consumer product noise is discussed in relation to the existing body of knowledge regarding noise induced hearing loss and speech communication. Levels of product noise are identified that should protect against hearing impairment and against speech communication degradation. Methods of measurement for consumer product noise are described and a bibliography of standards relevant to the regulation of noisy consumer products is provided. A list of products that are potentially hazardous to the hearing of the operator is included with

typical levels and usage patterns. The list is based upon reported data and some measurements made at NBS. Possible discrepancies among noise regulations established by different governmental agencies are discussed with suggestions for obtaining uniformity.

NBSIR 74-608. **Procedure for measuring noise emission from power lawn mowers,** J. I. Adler, 19 pages (Nov. 1974). Order from NTIS as COM 75-10056.

Key words: emergency messages; hearing loss; lawn mowers; noise emission; noise pollution; product safety.

A procedure is described for measuring the noise emission from power lawn mowers. The procedure covers both walk-behind and riding mowers, including suggestions of maximum noise levels for protection from hearing loss and for reception of emergency messages. The procedure employs a microphone located near the ear of the operator and mounted on a back-pack worn by the operator.

NBSIR 74-610. **Investigation of procedures for determination of thermal performance characteristics of plastic piping used in housing,** M. Tryon, 36 pages (Nov. 1974). Order from NTIS as COM 75-10072.

Key words: chlorinated polyvinyl chloride; hardness; internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe.

The rapid growth of the use of thermoplastic pipe for plumbing in housing has prompted a study to determine the critical factors affecting the performance of the pipe materials. The emphasis in this preliminary study is on thermal properties such as the softening point, relaxation of thermal stress, glass transition temperature, hardness-temperature relationship, and decomposition temperature. The techniques used were thermal mechanical analysis (TMA), thermogravimetric analysis (TGA), and hardness. Preliminary results obtained on several pipe samples of PVC and CPVC commercial samples are reported.

NBSIR 74-612. **Building and evaluation of a second polluted air delivery system,** G. P. Baumgarten, 11 pages (Nov. 1974). Order from NTIS as COM 75-10414.

Key words: air pollution; critical flow; laminar flow; nozzle; porous plug; sulfur dioxide concentration; carbon dioxide concentration.

The building and evaluation of a second configuration of a prototype SO_2 and CO polluted air delivery system (PADS) is discussed. The delivery system was built to deliver sulfur dioxide (SO_2) and carbon monoxide (CO) at a rate of 5 liters per minute. The design concentrations by volume were 1.0, 0.5, 0.1, and 0.04 parts per million (ppm) of SO_2 in air and 50, 20, and 2 parts per million of CO in nitrogen. It consists of a diluent air delivery system utilizing a critical flow sonic nozzle and three separate pollutant flow systems utilizing laminar flow porous plugs, one plug for each desired output concentration. The system is contained in a dispatch case and the gases are delivered to it from pressurized containers through detachable supply lines.

By maintaining specific upstream pressures on the critical flow nozzle and the laminar flow porous plugs, PADS 2 produced average output concentrations of: 0.95, 0.50, 0.117, and 0.057 ppm of SO_2; and 52.9 and 18.1 ppm of CO. These concentrations were determined by measurements with NBS calibrated analyzers. The expected output concentrations were 0.03, 0.52, 0.103, and 0.05 ppm of SO_2 and 51.2, 18.0, and 1.49 ppm of CO based on flow calibrations of the individual components. The uncertainty of the output concentration is estimated to be about 7 percent.

NBSIR 74-613. **Preliminary study of the slipperiness of flooring,** A. P. Cramp and L. W. Masters, 42 pages (July 1974). Order from NTIS as COM 75-10059.

Key words: floor slipperiness; resilient flooring; slipperiness standards; frictional tests; slip tests; coefficient of friction; human perambulation.

The National Commission on Product Safety reported in 1970, that falls in the home each year kill about 12,000 and injure 6,000,000 in the U.S.A. Slippery floors are listed as a large contributor to these very high casualty figures. Although there are some standardized test methods that are or might be suitable for such standards, there are no slipperiness standards for flooring. Thus, there is an immediate need for studies aimed at the development and establishment of such standards. Consequently, a preliminary study of floor slipperiness was sponsored by the Building Safety Section of the Center for Building Technology. The study included a state-of-the-art investigation on flooring slipperiness research and a laboratory evaluation of three existing test methods for measuring floor slipperiness. Samples of the three most commonly used resilient flooring materials, namely: vinyl asbestos, vinyl and linoleum were used in the study. The sliding material components for the frictional tests were leather and a commonly used styrene butadiene sole and heel rubber. The tests were performed both dry and wet. The results from this study were used in planning a large comprehensive study, which would lead to the development of accepted floor slipperiness standards. This report contains the results of the preliminary study.

NBSIR 74-614. **Mechanical tests of flammable liquid containers,** N. Halsey, A. F. Kirstein, and R. E. Snyder, 35 pages (Dec 1974). Order from NTIS as COM 75-11013.

Key words: consumer products; flammable liquid containers; gasoline cans; mechanical tests; product standards safety.

Because of the concern for safety in the storage and use of gasoline and other flammable liquids around the home, this study was made to determine if standards can be established to minimize the flammable liquid hazard by controlling or standardizing the containers. Attention was focused on performance standards for stability, leakage, carrying handle strength, and pour spout strength. In general, it was found that the technology involved in existing voluntary standards for safety cans could be applied to flammable liquid containers for home use for all of the above factors except pour spout strength.

NBSIR 74-618. **US/UK joint complementary research program in building, (wind loads, water supply, fire detection), July 1973 June 1974,** C. C. Raley, I. A. Benjamin, L. S. Galowin, and R. D. Marshall, 23 pages (Oct. 1974). Order from NTIS as COM 75-11014.

Key words: building technology; cooperation; fire safety hydraulics; wind loads.

This is a status report of the progress achieved under the "Joint Complementary Research Program" sponsored by the Building Research Establishment (UK) and the Institute for Applied Technology (US), during the period July 1973 through June 1974. The program includes three projects: Wind Loads on Buildings, Design of Water Supply and Drainage Installations in Buildings, and Fire Detection in Buildings, each of which is discussed in the report.

NBSIR 74-619. **Measurement methodology for determining the sound output of toy guns,** M. A. Cadoff and D. S. Blomquist, 17 pages (Aug. 1974). Order from NTIS as COM 75-10047.

Key words: children; consumer safety; guns; hearing damage; noise; standard apparatus; toys.

In recent years, a great concern has been expressed for consumer protection and safety, especially for children. As an outgrowth of this concern, acoustical testing of potentially-hazardous noise-producing toys has been carried out at the National Bureau of Standards for the Consumer Product Safety Commission under the authority of the Toy Safety Act of 1969. This report outlines a methodology which was developed to measure the noise levels of toy guns. In addition, the rationale and technical back-up for the methodology are discussed, and the regulations setting allowable noise levels for toy guns are given.

NBSIR 74-620. **An in-line density and viscosity sensor,** L. O. Olsen and F. W. Ruegg, 20 pages (Nov. 1974). Order from NTIS as PB246622.

Key words: capillary tubes; density sensor; flow nozzle; laminar flow; liquid properties; viscosity sensor.

In-line density and viscosity sensors for liquids are developed to utilize measurements of differential pressure across a nozzle and a coiled capillary tube respectively, with known flowrates through each provided by a flow generator. Theory and principles of operation and instructions for calibration and use of the sensors are discussed, along with design consideration for the sensors and associated equipment. A calibration of the sensors demonstrated that viscosity and density each could be measured with a computed standard deviation of one percent. Viscosity was varied over the range of about 1 to 11 centistokes whereas density of the fluids used was near 0.8 g cm^{-3}. Application of well known similarity considerations is used to make the results applicable to other liquid densities, provided influence of other liquid properties (high vapor pressure, for instance) does not interfere.

NBSIR 74-621. **Stability and strength of home playground equipment,** B. M. Mahajan, 39 pages (Dec. 1974). Order from NTIS as COM 75-10422.

Key words: home playground equipment; stability; strength; test; testing; tipping.

Stability tests were performed on some items of home playground equipment to measure the magnitude of the force, applied to generate tipping moment, required to start the tipping of the equipment.

Strength tests were conducted by loading certain components of home playground equipment with estimated loads to determine if the tested equipment had adequate strength.

NBSIR 74-623. **Stability and abuse tests of riding toys,** W. C. Brown and H. A. Baker, 87 pages (Jan. 1975). Order from NTIS as COM 75-10210.

Key words: abuse testing; dynamic stability; hazards; obstruction; riding toys; stairway; static stability; test weight; tilt angle; toy testing.

Stability and abuse tests were conducted on 88 riding toys in order to provide information which can be utilized to set realistic abuse performance levels for riding toys, as well as characterize the types of stability hazards associated with this class of toys. The results of these tests are summarized in tabular form and a description of the discrepancies encountered as well as photographs of these discrepancies are presented.

The appendices of this report contain photographs of each test specimen as well as the tabulated raw data for each test conducted.

NBSIR 74-624. **The Shirley Highway Express-Bus-on-Freeway Demonstration Project. A study of reverse commute service,** R. Waksman, 44 pages (Dec. 1974). Order from NTIS as COM 75-10412.

Key words: bus-on-freeway operations; choice and captive riders; cost allocation formula; incremental costs and revenues; reverse commute bus service; Shirley Highway; transportation planning.

Bus-on-freeway operations generally provide peak period commuter transit service to persons traveling from suburban residences through congested corridors to jobs in the major employment centers of metropolitan areas. In a few cases, peak period reverse commute operations may provide service to persons traveling from residences near the downtown employment centers to jobs in the suburbs. In early 1973, two major Shirley Highway Express-Bus-on-Freeway Demonstration Project reverse commute routes began service to office buildings in Northern Virginia.

An analysis of this reverse commute service revealed that it was a successful operation because it provided considerable benefits to its patrons and was slightly profitable to the bus operator on an incremental cost basis.

Four conditions which were important for the success of the service were found to be important for the success of reverse commute operations, in general. The conditions are as follows: (1) A given route should serve a concentrated, high employment area. (2) The route should be accessible to people currently working within the employment area and to captive riders who can fill jobs there. (3) It should be possible to fit most of the reverse commute trips into existing bus schedules. (4) It should be possible to pair with peak direction trips any trips that cannot be fit into existing bus schedules.

Using a procedure which incorporates these conditions, one employment area within the Shirley Highway Corridor was identified as having potential as a market for a reverse commute service.

NBSIR 74-625. **Examination of failed two inch steel pipe natural gas main, Columbia Gas Company, Spring Garden Township, York County, Pennsylvania,** T. R. Shives, 41 pages (Jan. 1975). Order from NTIS as PB243547.

Key words: brittle fracture; gas main pipe; impact; low carbon steel; stress corrosion cracking.

The Mechanical Properties Section of the National Bureau of Standards examined a length of a cracked two inch diameter plain carbon, welded steel natural gas main pipe at the request of the Office of Pipeline Safety. The pipe had a transverse crack extending about 85 percent of the circumference. The pipeline had suffered considerable mechanical damage in the vicinity of the failure, and the crack, which propagated in an essentially brittle manner, appeared to have initiated in a gouged area near the bottom of the pipe. There was a considerable amount of corrosion product on the surface of the pipe in the gouged area. The amount and distribution of corrosion product on the fracture surface indicated that the crack had formed in at least two stages, and that a crack was present prior to the time of failure. During the first stage, the crack may have penetrated the entire wall thickness of the pipe in one region opposite the crack origin near the bottom of the pipe. The likely mechanism of fracture for the first stage of the crack appears to be stress corrosion cracking. For the second stage of the crack, either stress corrosion cracking or impact appears to be the likely mechanism of failure.

NBSIR 74-626. **Semiconductor nuclear radiation detector studies—A final report,** A. H. Sher, 10 pages (Sept. 1974). Order from NTIS as COM 75-10411.

Key words: carrier trapping; gamma-ray detector; germanium; Ge(Li) detector; infrared response; silicon.

In response to a problem that arose with regard to the availability of germanium for lithium-drifted germanium detectors [Ge(Li) detectors], a comprehensive program was undertaken aimed toward the development of a method for the rapid specification of germanium quality for nuclear radiation detector use, and the determination of factors affecting germanium quality. Measurements on a large number of germanium crystals, most of which had been rejected for detector use, and intercomparison of these measurements and the methods employed, led to significant developments in the measurement of lithium mobility and driftability, carrier trapping, and semiconductor defect and impurity determination via an improved infrared response (IRR) technique. The present improvement of the infrared response technique resulted in the observation of a number of discrete energy levels lying within the forbidden gap of germanium unobserved in previous studies. It was possible to assign the proper position of energy levels detected by IRR in the upper or lower half of the energy gap. It was thus possible, in some instances, to determine the nature of the defects responsible for the observed energy level from results reported in the literature. The goal of developing a method for the rapid specification of germanium quality was achieved.

NBSIR 74-627. **The influence of ink on the quality of fingerprint impressions,** R. T. Moore, 16 pages (Dec. 12, 1974). Order from NTIS as COM 75-10134.

Key words: film thickness; film uniformity; fingerprint impressions; fingerprint readers; image quality; ink films; lubricity.

Tests were conducted on several types of ink to determine their influence on the quality of fingerprint impressions which they could produce. The thickness and uniformity of the film used to ink the fingers were found to be the most significant factor in providing high quality impressions. A method is described for metering out printer's ink and estimating whether or not a uniform film of near optimum thickness has been rolled out on a glass inking plate.

NBSIR 74-628. **Mass transport and physical properties of large crystals of calcium apatites: Studies of $Ca(OH)_2$ crystals for use in electrolytic conversion of calcium fluorapatite crystals to calcium hydroxyapatite,** A. D. Franklin and K. F. Young, 22 pages (Sept. 1, 1973-Aug. 31, 1974). Order from NTIS as COM 75-10514.

Key words: Ac impedance; calcium apatites; calcium hydroxide; crystal growth; electrolysis; interfacial polarization; ionic conduction; mass transport.

In order to convert single crystals of calcium fluorapatite to calcium hydroxyapatite, an electrolytic cell technique will be explored. To utilize such a technique, the cathode compartment must consist of a source of hydroxyl ions and a barrier to the flow of all others. $Ca(OH)_2$ has been selected for the cathode material, backed by a Pt electrode in an atmosphere containing H_2O and O_2. $Ca(OH)_2$ crystals have been grown and Ag as well as Pt electrodes applied to them. Their ac admittance as a function of temperature has been measured and analyzed. A Warburg contribution to the admittance was observed to depend upon the presence of O_2. Equivalent circuits have been generated from the data allowing us to tentatively characterize the electrical properties of the electroded crystal system.

NBSIR 74-629. **Thermal properties of selected plastic piping used in housing,** M. Tryon, 28 pages (Apr. 1975). Order from NTIS as COM 75-11281.

Key words: ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; polybutene; polyvinyl chloride; PVC; residual stress; thermoplastic piping.

In a study of four thermoplastic piping materials, the following performance-related properties were measured: coefficient of thermal expansion, glass transition temperature, residual stress, hardness, and hardness-temperature coefficient. The purpose of the study was to determine typical values of these properties for each of the piping materials. Results are given with recommendations for performance tests and changes in previously-proposed interim performance criteria.

NBSIR 74-631. **Analysis of proposed air drying process,** L. Greenspan, 11 pages (Dec. 1974). Order from NTIS as COM 75-10208.

Key words: absorption; drying; phosphorous pentoxide; water vapor.

NASA proposal No. 7401-6-01A by the GCA Corporation describes a proposed air drying process which has been analyzed. The drying process, intended to reduce the water vapor content of a stratospheric sample to below one part per million by weight, is based upon the removal of the water as it passes through a phosphorous pentoxide absorber. The analysis indicates that the method is feasible. Dependence on ram pressure to maintain flow through the absorber appears questionable and consideration should be given to other means.

NBSIR 74-632. **Comparison of accelerated aging of book papers in 1937 with 36 years natural aging,** W. K. Wilson and E. J. Parks, 96 pages (Dec. 19, 1974). Order from NTIS as PB246554.

Key words: accelerated aging; aging; natural aging; paper, permanent; paper, stability; permanent papers; record papers; stability of paper.

A group of 36 book papers made in the NBS paper mill in 1937 were tested in 1937 before and after accelerated aging for 72 hours at 100 °C, and in 1973 after 36 years of natural aging. The data show that fairly good correlations exist between accelerated aging and natural aging when changes in alpha cellulose, copper number and, to a lesser extent, tearing strength, were used as criteria of change. pH is a reasonably good criterion of stability. It appears that zero span tensile strength, wet strength as a percentage of dry strength, and brightness are useful criteria for evaluating the aging of paper. When data in this report are compared with data from earlier reports, it appears that dry accelerated aging at 100 °C more nearly corresponds to natural aging than accelerated aging at 90 °C and 50 percent relative humidity.

NBSIR 74-633. **The NBS computerized carpool matching system User's guide,** J. F. Gilsinn and S. Landau, 64 pages (Dec 1974). Order from NTIS as COM 75-10691.

Key words: carpool matching; carpools; computer programs; transportation; urban transportation.

This report documents the NBS computerized carpool matching programs and the procedures used in maintaining the coordinate data base required by the matching system. The report includes flowcharts, input/output formats, and program listings for the programs, plus details of the manual process for coordinate coding. The matching program produces, for each person desiring it, a list of others residing within a pre-specified distance of him, and is thus applicable to a single work destination having primarily one work schedule. The system is currently operational on the National Bureau of Standards' UNIVAC 1108 computer and was run in March of 1974, producing lists for

bout 950 employees in less than four minutes computer time. ubsequent maintenance of the system will be carried out by the IBS Management and Organization Division.

IBSIR 74-634. **Method of testing for rating thermal storage devices based on thermal performance,** G. E. Kelly and J. E. Hill, 45 pages (May 1975). Order from NTIS as COM 74-10685.

Key words: solar energy; standard; standard test; thermal performance; thermal storage; thermal test.

A study has been made at the National Bureau of Standards of ie different techniques that could be used for testing thermal orage devices and rating them on the basis of thermal per-rmance. This document outlines a proposed standard test ocedure based on that study. It is written in the format of a andard of the American Society of Heating, Refrigerating, and ir Conditioning Engineers and specifies the recommended ap-ratus, instrumentation, and test procedure.

BSIR 74-635. **Method of testing for rating solar collectors based on thermal performance,** J. E. Hill and T. Kusuda, 63 pages (Dec. 1974). Order from NTIS as COM 75-10276.

Key words: solar collector; solar energy; solar radiation; standard; standard test; thermal performance.

The National Bureau of Standards has made a study of the dif-rent techniques that could be used for testing solar collectors d rating them on the basis of thermal performance. This docu-ent outlines a standard test procedure based on that study. It is itten in the format of a standard of the American Society of eating, Refrigerating, and Air Conditioning Engineers and ecifies the recommended apparatus, instrumentation, and test ocedure.

BSIR 75-637. **Note on simplified estimators for type I extreme-value distribution,** J. Lieblein, 14 pages (Dec. 1974). Order from NTIS as COM 75-10055.

Key words: bias; efficiency; extreme values; linear unbiased estimators; simplified estimators; statistics; type I distribution.

Methods for extreme-value analysis (for the Type I extreme-lue distribution) that have optimum properties involve up to 20 antities (depending on sample size) whose values are known 6 decimal places. The present note shows how to modify these much simpler values involving 2 decimal places that are more nvenient to use yet sacrifice very little of the optimum fea-es.

BSIR 75-639. **Optical materials characterization,** A. Feldman, D. Horowitz, R. M. Waxler, I. Malitson, and M. J. Dodge, 17 pages (Jan. 1975). Order from NTIS as COM 75-10135.

Key words: coefficient of thermal expansion; elastic constants; infrared laser window materials; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index.

We have measured the following parameters of chemical vapor posited polycrystalline ZnSe (CVD ZnSe): Refractive index d change of index of refraction with temperature (dn/dT) over e wavelength range 0.5 μm to 18 μm using the method of nimum deviation; the coefficient of linear thermal expansion d dn/dT at 10.6 μm using Fizeau interferometry; and the stic moduli and photoelastic moduli using Fizeau and yman-Green interferometry. A sensitive technique has been veloped for measuring stress-optical constants of materials t exhibit a small stress-optical effect.

NBSIR 75-641. **Performance of mobile homes data acquisition and analysis methodology,** J. H. Pielert, W. E. Greene, Jr., L. F. Skoda, and W. G. Street, 75 pages (Feb. 1975). Order from NTIS as COM 75-11209.

Key words: construction; Hurricane Agnes; housing; mobile homes; mobile home parks; performance data; regulatory process; standards.

In a study at the National Bureau of Standards (NBS), funded by the Department of Housing and Urban Development (HUD), methods for inspecting mobile homes to identify performance problems, recording the problems and analyzing the problem data were developed. Maintenance work orders for 2881 mobile homes, a part of 12,500 provided by HUD for emergency housing in the aftermath of Hurricane Agnes, at Wilkes-Barre, Pa., were reviewed and computer coded by an interdisciplinary team of engineers. Also, performance data were obtained from State and other Federal agencies for over 967 privately owned mobile homes. A second task was the field inspection of 257 mobile homes to assist in the determination of the causes and consequences of the problems identified in the data acquisition task. Computer techniques were developed to process the data and print out problem summation tables, graphs to establish trends, compile data on obvious problems and ferret out those problems which may not be obvious. This first report documenting the data acquisition and analysis methodology will be followed by a series of reports which will present results and relate them to current standards, the regulatory and insurance processes.

NBSIR 75-647. **Mechanical tests of FAA-E2491 airport in-pavement approach and threshold lights,** D. C. Robinson, 26 pages (Jan. 1975). Order from NTIS as COM 75-10418.

Key words: airport approach and threshold lights; glass prism; impact tests; light bases; optical cover assembly; photometric measurements; static tests.

Static and impact load tests were performed on two style FAA-E-2491 airport in-pavement approach and threshold lights which were mounted in light bases encased in concrete. Static tests were conducted using either a 6-inch diameter steel plate or a rubber pad through which loads were applied to the center of the light optical cover assembly. Drop tests were conducted using a 5-lb steel ball which was directed to impact at various locations on the optical cover assembly. The old style lights were found to comply with load requirements for the current specification. The maximum load sustained by both style lights when loaded through a rubber pad was about two-thirds of the maximum load sustained when loading directly through the steel plate. A discussion is given of the photometric measurements of the light beam displacement measured during the load tests, the deflections and strains of two new style lights measured under two loading conditions and the test procedures for determining the performance of approach and threshold lights.

NBSIR 75-649. **Computer applications at the Ecuadorian Institute of Standardization (INEN): Observations and recommendations,** J. Hilsenrath, 16 pages (Apr. 1975). Order from NTIS as PB241237.

Key words: computer applications; OMNITAB II: Minitab; statistical computing; text editing.

This report contains specific suggestions for computer applications at the Ecuadorian Bureau of Standards (INEN). The suggestions, based on observations and discussion during a 10-day visit by the author in Quito, Ecuador, cover editing and typesetting of Ecuadorian standards, data storage and retrieval, and statistical analysis of experimental data.

NBSIR 75-651. **Procedural options to reduce the risk of injury from products installed in residences,** S. W. Stiefel, C. W. Hand, and D. W. Corrigan, 94 pages (June 1975). Order from NTIS as COM 75-11211.

Key words: building codes; Consumer Product Safety Act; product safety; residence-related products; residential safety; safety implementation approaches; safety standards.

The Consumer Product Safety Commission's (CPSC) list of consumer products with high relative incidence of reported injuries includes many products which are integral parts of the consumer's residence, such as stairs, doors, architectural glass, furnaces and water heaters. The safety aspects of these products are influenced by on-site construction practices and design considerations which are regulated through local building codes. The problem is to identify operational methods the CPSC can employ in dealing with unreasonable hazards associated with component parts of residential units.

This report identifies, for products installed in homes, (1) the product history stages, (2) institutional groups, (3) hazard sources, and (4) countermeasures available to the CPSC. It structures relationships among these four elements for evaluating the impacts of alternative countermeasures. Current mechanisms for control of products installed in homes are presented and sixteen potential countermeasures are postulated.

NBSIR 75-652. **Procedures for estimating sound power from measurements of sound pressure,** C. I. Holmer, 78 pages (July 1975). Order from NTIS as COM 75-11399.

Key words: air compressors; error of sound power measurement; noise; noise measurement; sound power level; standard test procedures for sound power measurement.

This report describes investigations of the accuracy and precision of various measurement methodologies for determining the estimated sound power output of "large" machines in the free field over a reflecting plane. One purpose of this investigation is to place empirical error bounds on many of the free field measurement procedures currently proposed or in use; and in particular, compare the results of "near-field" and "far-field" measurements. The sources used for the investigation included 17 portable air compressors of various types (powered by internal combustion engines), a "reference" sound source, and a loudspeaker driven by a pure tone source. The data recorded include sound pressure level (A-weighted, linear, and 1/3-octave band) on an 84 point hemispherical array of seven metre radius, and "near-field" measurements, sampled every square metre, on a rectangular surface one metre from the machine surface. These data were reduced to provide information on the deviation of "near field" sound power determinations from "far-field" power level (using subsets of the data as appropriate to various methodologies). The measured data for seventeen sources suggests that the value of a sound power estimate based on "near-field" sound pressure level measurements may be an upper bound to the sound power level estimated from far field measurements, subject to the limitations of sampling error. Estimates of total achievable measurement error of A-weighted sound power level of near field determinations relative to far field determinations are made for several measurement methodologies, based on the experimental data.

NBSIR 75-653. **Measurement methodology and supporting documentation for portable air compressor noise,** C. I. Holmer, 48 pages (Jan. 1975). Order from NTIS as PB248097.

Key words: acoustics; air compressor; internal combustion engine; noise; sound power level; sound pressure level.

This report presents recommendations and supporting rationale on a measurement methodology for portable air compressors. The methodology provides for the determination of A-weighted sound power level or the equivalent weighted sound pressure level at a reference distance. A-weighted level is used because of its correlation with community response to noise from internal combustion engine noise. It is recommended, however, that the spectra associated with the regulated source be monitored in some manner to insure that the spectra remain similar to those for which A-weighted sound level retains good correlation with community response. The methodology uses weighted sound level measurements at eight positions on a curved surface surrounding the source at a distance of one metre from the surface of the machine. Data recorded at these positions are used to calculate the average weighted sound pressure level of the machine on the measurement surface. This is combined with the area of the measurement surface to give the sound power level of the machine. From this value, a rating sound pressure at a rating distance may be calculated by subtracting a constant value. Procedures which permit the rapid estimation of A-weighted sound level are included. These are applicable for estimation of A-weighted sound level in a variety of circumstances when the sound power or equivalent sound pressure level at a reference distance is known.

NBSIR 75-654. **NBS interagency transducer project—A project report,** P. S. Lederer and J. S. Hilten, 15 pages (Feb. 20, 1975). Order from NTIS as COM 75-10367.

Key words: calibration; dynamic; photo flashbulb; pressure; pressure measurement; pressure transducer; thermal transient; transducer.

A method is being developed to apply short-duration thermal transients to pressure transducers and to observe the effects of these transients on transducer performance. The method consists of monitoring pressure transducer output as the transducer is exposed to radiation resulting from the ignition of a photographic flashbulb or from the discharge of an electronic flash. During this reporting period, the work has been exploratory in nature to determine values for method parameters. Thermal energy pulses as high as 0.4 J lasting 4 ms have been generated using an electronic flash; pulses as high as 1 J lasting 18 ms have been generated using No. 22 flashbulbs.

Work being performed for other agencies is also described briefly.

NBSIR 75-658. **Electron microscopic observations of microcracking about indentations in aluminium oxide in silicon carbide,** B. J. Hockey and B. R. Lawn, 39 pages (Jan. 1975). Order from NTIS as AD-A007445.

Key words: brittle solids; dislocation networks; electron microscopy; healing; indentations; microcracking; moiré patterns.

Transmission electron microscopy is used to examine the nature of microcracking about small-scale indentations in two highly brittle solids, sapphire and carborundum. The observed crack geometry is discussed in terms of an earlier model of indentation fracture beneath a point force, in which both loading and unloading half-cycles contribute to the crack growth. The residual interfaces are characterised mainly by moiré patterns sometimes by dislocation networks. These observations are discussed in relation to spontaneous closure and healing mechanisms, and the "lattice mismatch" necessary for the production estimated at about one part in a thousand. It is shown that cleavage steps comprise the main source of obstruction to lattice restoration across the interfaces. Mechanical and therm

eatments of the indented surfaces are found to influence the ex-nt of the residual cracking. Some practical implications of the bservations are discussed.

BSIR 75-659. **A new mode of chipping fracture in brittle solids, and its application in a model for wear under fixed abrasive conditions. I. Mode of chipping fracture. II. Wear model,** B. R. Lawn, 49 pages (Feb. 1975). Order from NTIS as COM 75-10515.

Key words: abrasion; brittle solids; brittle surfaces; chipping; fracture; hardness; indentation; residual stress; stress analysis; wear rate.

A description is given of the mode of chipping fracture ob-rved in highly brittle solids. It is pointed out that residual resses about indentation deformation centers play a vital role. he implications of this mode in a number of mechanical nenomena are discussed.

An explicit model for the wear of brittle surfaces under fixed brasive conditions is presented in terms of indentation fracture ncepts. The predicted wear rate for glass agrees with that ob-rved experimentally to within an order of magnitude. Some im-ications concerning the parameters which influence the abra-on process, particularly the hardness, are discussed.

BSIR 75-660. **Voluntary labeling program for household appliances and equipment to effect energy conservation: Annual report for calendar year 1974,** B. J. McGuire and E. A. Vadelund, 46 pages (Feb. 1975). Order from NTIS as COM 75-10609.

Key words: consumer information; consumer products; energy conservation; energy efficiency; energy use; household appliances; household equipment; labeling; residential.

The Voluntary Labeling Program for Household Appliances d Equipment to Effect Energy Conservation was established response to an April 18, 1973 Presidential directive. Final ocedures for the program became effective October 26, 1973. nly major energy consuming household appliances and equip-ent are covered. Purposes of the program are to encourage anufacturers to place energy efficiency labels on their ap-iances and to encourage consumers to utilize this information making purchase decisions.

Specifications containing labeling requirements for each type product are developed by NBS with assistance from con-mers, retailers, manufacturers and interested Federal agen-es. During the first full year of program operation, final specifi-tions for labeling room air conditioners and proposed specifi-tions for labeling refrigerators, combination refrigerator-eezers, and freezers were issued. Two consumer information mphlets were published and other consumer information and ucation activities were undertaken. Labeling specifications for ater heaters, clothes washers and dryers, and ranges and ovens ere under development. This was accomplished, with sistance from manufacturers, retailers, consumers and other encies, by a staff of six funded at a level of $375,000 per year.

At year's end, twenty-four room air conditioner manufacturers d private brand labelers, representing an estimated 95 percent U.S. sales of this appliance, were participating in the program.

BSIR 75-661. **Strength degradation of brittle surfaces: Sharp indenters,** B. R. Lawn, E. R. Fuller, and S. M. Wiederhorn, 38 pages (May 1975). Order from NTIS as COM 75-10763.

Key words: brittle solids; ceramic surfaces; degradation; fracture; indentation; strength.

A theory of strength loss for brittle surfaces in contact situations, developed in a previous paper for "blunt" indenters, is here extended to the case of "sharp" indenters. A prior fracture mechanics analysis of crack growth beneath ideal cone indenters serves as the basis for predetermining the prospective surface degradation of ceramic components in service. Compared to blunt indenters, severe degradation can occur at the lower contact loads. However, at high loads the extent of degradation becomes remarkably insensitive to indenter geometry. Essential theoretical predictions are verified by bend tests on glass slabs. The effect of indenter "sharpness" and initial specimen surface flaw state are investigated systematically, along with some secondary rate effects in the contract process. The possibility of minimizing degradation via adjustment of material parameters (including hardness) or surface condition (e.g., residual stresses, frictional properties) is briefly discussed.

NBSIR 75-662. **Sulphur dioxide reference materials,** J. K. Taylor and E. R. Deardorff, 16 pages (Feb. 1975). Order from NTIS as COM 75-10420.

Key words: air pollution; chemical analysis; pararosaniline method; quality control; reference materials; sulfur dioxide.

The development of reference materials to serve for quality control and performance evaluation of measurements of sulfur dioxide by the pararosaniline method is described. Powder samples consisting of sodium sulfite dispersed in mannitol can be prepared to evaluate measurements for the concentration levels of ambient interest. The samples are sufficiently stable in routine use, with a service life of at least three months. By the use of a series of five samples of graded sulfite content, measurement errors greater than five percent are significantly detected. A detailed procedure for preparation of the samples is included. Preliminary studies of an alternate method for preparation of quality control samples, by a freeze-drying process are also described.

NBSIR 75-664. **Strength degradation of brittle surfaces: Blunt indenters,** B. R. Lawn, S. M. Wiederhorn, and H. H. Johnson, 40 pages (Feb. 1975). Order from NTIS as ADA007447.

Key words: brittle solids; ceramic surfaces; cracks; degradation; fracture; Hertzian; indentation; strength.

Indentation fracture mechanics is used to develop a theoretical basis for predetermining the strength properties of brittle surfaces in prospective contact situations. Indenters are classified as "blunt" or "sharp," of which only the first is considered in the present work. The classical Hertzian cone crack conveniently models the fracture damage incurred by the surface in this class of indentation event. Significant degradation is predicted to occur at a critical contact load; however, with increasing load beyond this critical level the degradation rate becomes relatively slight. Bend tests on abraded glass slabs confirm the essential features of the theoretical predictions. The role of controlling variables in the degradation process, notably starting flaw size and indenter radius, is systematically investigated. An indication is also given as to optimisation of material parameters. The analysis leads to some novel suggestions concerning surface preparation procedures that might be followed in order to minimize strength losses.

NBSIR 75-665. **Point-to-Point Trip Management Program (preliminary analysis),** W. G. Kienstra and D. J. Minnick, 26 pages (Feb. 7, 1975). Order from NTIS as COM 75-10421.

Key words: computers; information systems; mass transportation; telephone systems.

This preliminary analysis of Point-to-Point Trip Management (PTPTM) was prepared for the Urban Mass Transit Administra-

tion in Washington, D.C. PTPTM is concerned with providing prospective riders of mass transit with the necessary detailed information for particular trips. This report contains the results of a literature search on automation in the telephone information center, and analyzes the data collected from 29 existing centers. Additionally, on-site visits were made to three operational centers, and tapes of actual telephone inquiries and responses were obtained and analyzed. The use of microfiche and computers are examined as an aid to the operators in these centers. Total automation of these centers is also discussed. Conclusions and recommendations for further study in this area, and an annotated bibliography, are also part of this report.

NBSIR 75-666. **Post optimality and parametric analysis with the National Bureau of Standards' linear programming subroutine RVSMPX,** T. B. Ayers, 47 pages (Feb. 1975). Order from NTIS as COM 75-11381.

Key words: algorithms; linear programming; parametric programming; post-optimality analysis.

This report is a sequel to NBS Report 10695 (February 1972), "The National Bureau of Standards' Linear and Quadratic Programming Subroutines," which documented one phase of an effort to provide users, of the facility operated by the National Bureau of Standards' Computer Services Division, with reliable, clearly-described solution algorithms for selected frequently-arising classes of special mathematical problems. The present report presents subroutines which perform post-optimality analysis and parametric programming studies on linear programming problems solved by the National Bureau of Standards' RVSMPX subroutine. (The present versions of these codes use internal storage only).

NBSIR 75-667. **Interaction of blood proteins with solid surfaces,** R. R. Stromberg, B. W. Morrissey, L. E. Smith, W. H. Grant, and C. A. Fenstermaker, 42 pages (Jan. 15, 1975). Order from NTIS as PB241267.

Key words: adsorption; blood protein; bound fraction; ellipsometry; implants; polymer adsorption; protein adsorption; synthetic implants.

The adsorption of blood proteins on surfaces has been investigated in order to develop a detailed understanding of the initial series of events that occur when a synthetic material is implanted in the cardiovascular system. The overall objective of the investigation is to help provide a rational basis for the characterization and design of materials and the development of test methods. The relationship between surface charge and protein-surface interaction was investigated quantitatively by in situ ellipsometry to determine the molecular extension and adsorbance of fibrinogen, serum albumin, and γ-globulin on platinum as a function of impressed surface potential. For all three proteins, no change in adsorbance from the value at rest potential occurred as the surface potential was progressively made more anodic until a critical potential was attained, at which time the adsorbance increased significantly. The changes in extension observed as a result of changes in induced surface potential indicated, however, that conformational changes in the adsorbed layer were occurring as a result of surface potential. The determination of the bound fraction (fraction of carbonyl groups directly in contact with the surface) and extension of adsorbed γ-globulin and β-lactoglobulin as a function of solution concentration indicate conformational changes with surface population. Similar measurements on γ-globulin crosslinked prior to adsorption indicate that the native conformation exists at low surface coverage. Investigation of the rates of desorption of albumin from silica into buffer indicates a fast initial desorption followed by a considerably slower desorption removing most, but not all, of the adsorbed protein during the time periods investigated.

NBSIR 75-672. **A preliminary approach to performance requirements and criteria for electrical connections in residential branch circuit wiring,** W. J. Meese, R. L. Cilimberg, and A. A. Camacho, 37 pages (Mar. 1975). Order from NTIS as COM 75-10338.

Key words: branch circuits; contact resistance; electrical codes; electrical connections; fire safety; housewiring; performance testing.

During the Operation BREAKTHROUGH Research and Demonstration program the U.S. Department of Housing and Urban Development became concerned with the inability to properly evaluate innovative electrical connections. Innovation in electrical connections has been very slow because of the long life requirements, stringent fire safety requirements, long established conventional practices and evaluation procedures and lack of a performance base for describing requirements. This preliminary report presents the framework for a proposed method to evaluate electrical connections on a performance basis and supplements information contained in a previous report on current technology of electrical connections used in residential branch circuit wiring. Innovations involving electrical connections may lead to significant advancements in housing construction if it can be demonstrated that functional and safety requirements over the expected life of electrical connections were adequately satisfied. Research is needed to enable prediction of long-term performance of electrical connections based on the results of accelerated performance tests.

NBSIR 75-673. **Development of a fire test method for flexible connectors in air distribution systems,** L. A. Issen, 31 pages (April 1975). Order from NTIS as COM 75-10921.

Key words: aluminum; ducts; fire tests; flexible connectors; furnace pressures; glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units.

The report describes fire tests on four flexible connectors of the type used in air conditioning systems. Four flexible connectors (aluminum, felted glass fiber, steel, and woven glass fiber) were exposed to a standard ASTM E-119 fire test. The results were in agreement with previous results in which a different sized branch duct was used in the assemblies. The results indicated a need to control furnace pressures. The test results were used to develop a proposed test method for fire testing flexible connectors. This proposed test method is described in the report.

NBSIR 75-675. **Evaluation of x-ray fluorescence analysis for the determination of mercury in coal,** R. L. Myklebust, M. M. Darr, and K. F. J. Heinrich, 20 pages (Dec. 1974). Order from NTIS as COM 75-10686.

Key words: background; mercury in coal; trace analysis; x-ray fluorescence; x-ray spectrography.

Limits of detection for mercury in coal have been determined on both a wavelength-dispersive and an energy-dispersive x-ray spectrometer. They are between 2 and 3 ppm under best conditions for both spectrometers. Techniques for reducing the background intensity measured by the energy-dispersive system are discussed along with methods of preparing coal specimens for analysis in both instruments.

NBSIR 75-677. **Hazard assessment of aluminum electrical wiring in residential use,** E. D. Bunten, J. L. Donaldson, and E. McDowell, 58 pages (Dec. 1974). Order from NTIS as COM 75-10516.

Key words: aluminum wire; consumer product safety; electrical failures; electrical fires; electrical wiring; fire hazard

In the mid-1960s, aluminum wire began to be used in significant quantities for residential branch-circuit wiring. Reports of problems from various localities in the U.S. raised serious concern and controversy as to the safety of this application. An official determination on this matter is within the jurisdiction of the Consumer Product Safety Commission. This report reviews the history of the use of aluminum in residential wiring and describes the characteristics essential to data to be used to evaluate the performance of aluminum wiring in the field. The examination of existing field data shows that no available data have the characteristics necessary to develop a reliable estimate of the level of risk to consumers associated with aluminum wiring. Neither can the available data be used to establish the relative risk of aluminum compared to copper wiring. There is only a gross estimate of the extent to which aluminum wiring is now in use in U.S. residences. Statistically sound estimates of risk would be possible only after data collection on a large scale.

NBSIR 75-678. **Analysis of construction systems for the thermal classification of residential buildings,** S. T. Liu, 59 pages (Nov. 24, 1975). Order from NTIS as PB248687.

Key words: building classification; building thermal mass; building thermal performance; building thermal time constant; housing systems; industrialized housing; mass per unit area; Operation BREAKTHROUGH; U-value.

This report is the result of a study to classify various kinds of residential buildings in relation to their thermal behavior. A collection of various building data and construction systems taken from the proposals of 18 of the 22 Housing System Producers participating in the Department of Housing and Urban Development (HUD) Operation BREAKTHROUGH Program is presented. Thermal performance parameters of buildings, such as: U-value, thermal mass, thermal time constant, and mass per unit area were computed and analyzed. The report recommends one way in which construction systems could be classified. Since the housing systems studied represented a cross section of the conventional residential construction systems in the building industry, it is felt that a realistic classification procedure for typical residential buildings can be established and based upon the parameter: mass per unit area. A more refined procedure of subviding the building within each mass class on the basis of the building thermal time constant is also discussed.

NBSIR 75-679. **Measurements of the behavior of incidental fires in a compartment,** J. B. Fang, 29 pages (Mar. 1975). Order from NTIS as COM 75-10419.

Key words: buildings; combustibility; fire intensity; flames; furnishings; heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle.

A variety of upholstered chairs and wood cribs were burned within a ventilated compartment. The experimental measurements of weight loss, smoke concentration, temperature and heat flux levels are summarized. A reproducible fire obtained from burning a standardized wood crib array was found to be capable of representing the essential features of incidental fires of moderate intensity.

NBSIR 75-680. **Mobile home construction standards adopted by state regulatory programs—an analysis,** P. W. Cooke, L. P. Zelenka, and H. K. Tejuja, 107 pages (Mar. 1975). Order from NTIS as COM 75-10423.

Key words: enforcement; legislation; mobile homes; regulation; standards; state-of-the-art study.

This study examines the extent to which the nationally recognized standard for the construction of mobile homes (i.e., ANSI Standard A119.1/NFPA 501B) has been adopted and amended by the individual States that have implemented enforcement programs for the regulation of mobile homes. Summary data is presented on the existing status of the various versions of the standard adopted in each State. State-adopted amendments to the technical requirements in the national standard are compiled by State and construction discipline for comparative analysis.

NBSIR 75-682. **Basic considerations of densitometer adjustment and calibration,** R. E. Swing, 18 pages (Feb. 3, 1975). Order from NTIS as COM 75-10524.

Key words: calibration; calibration table; densitometer; densitometry; optical density; optical density standard.

The adjustment and calibration of a densitometer are considered. This is accomplished through the use of physical measurement standards with a procedure appropriate for the instrument, and brings the instrument response in line with measurements traceable to NBS. The difference between primary and secondary physical measurement standards for diffuse (visual) density is discussed. A calibration table is suggested for best use of the instrument and a computer program (BASIC language) is provided that will calculate and print a table relating instrument reading to diffuse (visual) density.

NBSIR 75-685. **Improved ultrasonic standard reference blocks,** D. G. Eitzen, G. F. Sushinsky, D. J. Chwirut, C. J. Bechtoldt, and A. W. Ruff, 83 pages (Apr. 1975). Order from NTIS as COM 75-10690.

Key words: aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics.

A program to improve the quality, reproducibility and reliability of nondestructive testing through the development of improved ASTM-type ultrasonic reference standards is described. Reference blocks of aluminum, steel, and titanium alloys are to be considered. Equipment representing the state-of-the-art in laboratory and field ultrasonic equipment was obtained and evaluated. RF and spectral data on ten sets of ultrasonic reference blocks have been taken as part of a task to quantify the variability in response from nominally identical blocks. Techniques for residual stress, preferred orientation, and micro-structural measurements were refined and are applied to a reference block rejected by the manufacturer during fabrication in order to evaluate the effect of metallurgical condition on block response. New fabrication techniques for reference blocks are discussed and ASTM activities are summarized.

NBSIR 75-687. **Effective use of computing technology in vote-tallying,** R. G. Saltman, 140 pages (Mar. 1975). Order from NTIS as COM 75-11137.

Key words: computer security; computing technology; election administration; public administration; state and local government; systems analysis; technology utilization; vote-tallying.

The results of a systems analysis and evaluation conducted on the role of automatic digital processing in vote-tallying are presented. Included in the report are descriptions of hardware, software, and administrative problems encountered in fourteen elections in which electronic computing technology was utilized.

Methods of assuring more confidence in the accuracy and security of the vote-tallying process are presented and described. These methods include aids to audits of calculations, physical controls over ballots and computer records, and guidelines for the use of computer programs, computer facilities, and teleprocessing. Methods of improving the election preparation process also are presented and described. These involve the

development and implementation of design specifications and acceptance tests for computer programs, election equipment and supplies, and guidelines for pre-election checkout of vote-tallying systems and for assurance of management control.

Institutional factors are discussed which should be considered if improved accuracy and security controls and more effective election preparations are to be implemented. Recommendations for additional research and other activities including a possible Federal role are provided.

NBSIR 75-688. **Performance of mobile homes—A field inspection study,** L. F. Skoda, J. H. Pielert, W. E. Greene, and W. G. Street, 119 pages (June 1975). Order from NTIS as COM 75-11222.

Key words: enforcement process; field inspection; house trailers; housing; Hurricane Agnes; mobile homes; performance data; standards.

A field inspection study of mobile homes was conducted for the Department of Housing and Urban Development. The objective of the study was to evaluate the causes of mobile home problems by physically inspecting available units at various locations in the United States. A total of 257 units were inspected consisting mostly of mobile homes purchased by HUD and used as temporary housing for victims of the 1972 Hurricane Agnes disaster. The total number of problems found was 3,528 for the 257 units inspected. Of these problems, 2120 were directly related to inadequacies in the ANSI A119.1 Standard for Mobile Homes or the mobile home enforcement process (plan review, certification of designs, plant inspection), 934 were routine maintenance problems, and 374 were attributed to mechanical/electrical appliances and equipment. This report presents a computer listing of all problems plus photographic examples of observed problems.

The number of mobile homes included in this study is small when compared to the total number of mobile homes now in use in the United States. Additionally, this was a problem oriented study and did not attempt to document the many areas of satisfactory mobile home performance.

NBSIR 75-689. **The Shirley Highway Express Bus-on-Freeway demonstration project/a study of park-and-riding,** J. T. McQueen, G. K. Miller, and C. Harrison, 51 pages (Mar. 1975). Order from NTIS as COM 75-11190.

Key words: bus-on-freeway operations; commuter surveys; mode choice decisions; park-and-ride; Shirley Highway; transportation planning.

The market for fixed route transit operations is not limited to travelers within walking distance of transit stops. This was demonstrated by the Shirley Highway Express-Bus-on-Freeway Project as project promoted park-and-ride operations led to sizable increases in bus patronage: Park-and-riders, commuters who traveled by auto to a bus stop and then by bus to work, greatly expanded the market for the fixed route bus service in the Shirley Highway Corridor area.

This report presents results of a study of the successful park-and-ride operation within the Shirley Highway Corridor area: Suburban fringe parking lots coupled with the high speed buses of the Shirley Highway Express-Bus-on-Freeway Project. Demographic characteristics of the park-and-riders as well as characteristics of their present park-and-ride and previous commute trips are examined. Factors important in the commuters' decisions to park-and-ride are identified. The report also describes the survey procedures used in the study.

NBSIR 75-690. **A compilation of problems related to the performance of mobile homes,** W. G. Street, W. E. Greene, J. H. Pielert, and L. F. Skoda, 86 pages (Apr. 1975). Order from NTIS as COM 75-11207.

Key words: computer techniques; enforcement process; housing; Hurricane Agnes; mobile home parks; mobile homes; performance data; standards.

Performance of mobile homes as housing units is of broad concern to mobile home owners. This study report prepared at the National Bureau of Standards (NBS) and funded by the Department of Housing and Urban Development (HUD) presents mobile home problem data obtained from two separate data sources. The first data base for 2881 units was selected from maintenance records retained by HUD on 12,500 mobile homes used as emergency housing following the Hurricane Agnes disaster at Wilkes-Barre, Pennsylvania. The second source consisted of data for 967 privately-owned units collected from the files of various Federal, state, and private agencies responsible for regulation or consumer protection functions with regard to mobile homes. The mobile home performance problem data was processed using computer techniques to produce problem summation tables which facilitated evaluation. Although the mobile home problems experienced in various categories are highlighted in this report, no attempt was made to relate these results to current standards, regulatory or mortgage insurance (durability) processes. Analyses of this kind are planned for future reports in this series.

NBSIR 75-691. **A characterization and analysis of NBS corridor fire experiments in order to evaluate the behavior and performance of floor covering materials,** J. G. Quintiere, 89 pages (June 1975). Order from NTIS as COM 75-11015.

Key words: corridor fire spread; energy release rate; fire induced flow; flame propagation; flashover; floor coverings; radiant heat flux.

Data is presented for four fire experiments which examine the fire propagation from a room fire to a floor covering material in a corridor. The four floor covering materials include a nylon and an olefin carpet, vinyl sheet, and red oak flooring. Limited flame spread occurred for the vinyl sheet material; however, the three other materials involved full fire propagation in the corridor. The data are analyzed to examine the factors influencing fire propagation. Included in this analysis is the rate of energy contribution from the room fire and floor covering material, the rate of flame spread, heat transfer to the floor covering, and flow interactions between the room and corridor. A review of previous related experiments is also presented.

NBSIR 75-692. **A minicomputer-based system for the measurement and analysis of community noise,** R. L. Fisher, D. S. Blomquist, J. S. Forrer, and D. M. Corley, 106 pages (May 1975). Order from NTIS as PB250385.

Key words: community noise; computer interface; instrumentation; minicomputer; noise.

An operating system for the measurement and analysis of community noise was turned over to the Army for their use in February 1975, thus accomplishing the transfer of technology developed by NBS to the Bioacoustics Division, U.S. Army Environmental Hygiene Agency. This report documents the hardware and software packages prepared by NBS in support of this system.

NBSIR 75-693. **Measurement methodology for determining the sound output of model airplanes and noise producing bicycle attachments,** M. A. Cadoff and W. A. Leasure, Jr., 24 pages (Apr. 1975). Order from NTIS as COM 75-11194.

Key words: bicycle attachments; children; consumer safety; model airplanes; noise; toys.

n recent years, a great concern has been expressed for con-ner protection and safety, especially for children. As an out-wth of this concern, acoustical testing of potentially-rardous noise producing toys has been carried out at the Na-nal Bureau of Standards for the Consumer Product Safety mmission under the authority of the Toy Safety Act of 1969. is report outlines a methodology which was developed to mea-e the noise levels of model airplanes and noise producing ycle attachments. The technical back-up and rationale for the velopment of the methodology are discussed. In addition, data en using the proposed methodology are presented.

SIR 75-696. **Proceedings of GSA/ETIP Symposium on Procurement Practices, May 29-31, 1974,** 96 pages (Jan. 1975). Order from NTIS as COM 75-10527.

Key words: ETIP; incentives; innovation; procurement; product improvement; specifications.

The topic of the symposium was "Government and Indus-– A Joint Effort Toward Technological Innovation in oduct Development for Government and Public Procure-nt." The general objectives of the symposium were to open vernment-industry dialogue on ways to encourage technologi-innovation in the development of products purchased by the deral Government; to explore methods of developing a "spin-' effort so that the consumer marketplace might benefit from h innovations; to set up a procedure for analyzing the effect the consumer marketplace and to establish procedures for tinuing a government-industry dialogue. The plenary session vided participants with information designed to generate di-gue and to develop source material. Workshops were or-nized to consider specific product grouping in: Office achines (typewriters, calculators, copiers, and microfiche); rniture (wood and metal office types); Containeriza-n/Packaging; ADP-Peripheral/Supplies; Instrumentation (op-al and electrical measuring devices); Electrical Equipment pliances and powered hand tools); Automotive Products ter market replacement parts and tires); Photographic and dio Visual; Chemical (coatings, cleaning agents and deter-nts).

SIR 75-697. **Consideration in the use of sampling plans for ef-ecting compliance with mandatory safety standards,** V. L. Broussalian, A. J. Farrar, U. W. Lyons, C. O. Muehlhause, M. J. Natrella, J. R. Rosenblatt, R. D. Stiehler, and J. H. Winger, 18 pages (June 1975). Order from NTIS as COM 75-10920.

Key words: quality assurance; regulation; safety standards; sampling plan; sampling scheme.

Various means available to a regulator for gaining compliance h mandatory safety standards are examined. Particular atten-n is given to his option of mandating a sampling plan or eme along with the standard. It is concluded that this option well as the others identified are all viable under suitable condi-ns and should be available to the regulator for his possible ap-cation on a case by case basis.

SIR 75-699. **The calibration of photographic edges at NBS,** R. E. Swing, 37 pages (Apr. 22, 1975). Order from NTIS as COM 75-11016.

Key words: acutance; calibration; computer programs; microdensitometry; photographic edges; transfer function.

The method by which photographic edges made at NBS are ibrated is presented and discussed in some detail. The pro-ms associated with the computational aspects of the analysis listed, covered in narrative form, and their limitations and op-ns are presented. The possible use of these edges to determine crodensitometer transfer function is discussed and limitations and relative error of all the calculations and procedures are covered in detail. Program listings are in BASIC language.

NBSIR 75-700. **Results of full-scale fire tests with photoelectric smoke detectors,** R. W. Bukowski and R. G. Bright, 55 pages (Sept. 1975). Order from NTIS as COM 75-11280.

Key words: fire detectors; ionization chamber smoke detectors; photoelectric smoke detectors; smoke detectors; Taguchi gas sensors.

In February 1974, a series of full-scale fire tests were conducted to determine whether photoelectric-type smoke detectors could respond to the same types of fires used to assess the performance of ionization-type smoke detectors. The types of fires employed in the tests are the same as those outlined in Underwriters' Laboratories, Inc., Standard No. 167. In addition to the UL-167 standard fires, fires involving polyurethane (flaming mode) and cotton (smoldering mode) were added to the test series. One detector, utilizing a Taguchi gas sensor (TGS), was included in the test series for evaluation purposes. The test results indicated that the better photoelectric smoke detectors, i.e., those having little obstruction to slow-moving smoke can, in general, detect the same test fires as the ionization chamber smoke detectors in approximately the same time scale. For the smoldering cotton fire, the photoelectric detectors were significantly faster than the ionization chamber detectors. The TGS fire detector was unable to detect most of the test fires.

NBSIR 75-701. **Evaluation of smokeproof stair towers and smoke detector performance,** F. C. W. Fung and R. H. Zile, 23 pages (Sept. 1975). Order from NTIS as COM 75-11282.

Key words: high-rise buildings; photoelectric smoke detector; smoke control; smoke movement simulation; smokeproof tower.

A study was made by the National Bureau of Standards to evaluate the effectiveness of a smokeproof stairwell tower installed in a high-rise apartment building. Tests were also made of photoelectric-type corridor smoke detectors. A quantitative experimental technique of smoke simulation and smoke movement measurement was used. Factors diminishing the effectiveness of the stair towers, preventing smoke infiltration and limiting the response of the detectors, are noted.

NBSIR 75-702. **Design criteria for firefighters' turnout coats,** J. W. Eisele, 37 pages (Oct. 1975). Order from NTIS as COM 75-11433.

Key words: firefighters; firefighter's turnout coats; protective clothing.

These design criteria cover requirements for the sizing, construction, outer shell, inner linings, weight, and thickness for firefighters' turnout coats as well as test methods, labeling requirements, and design considerations. Included also is a list of options and other items of concern to potential users of the criteria and a sample purchase specification to be used in conjunction with the criteria.

NBSIR 75-703. **A failure hypothesis for masonry shearwalls,** F. Y. Yokel and S. G. Fattal, 38 pages (May 1975). Order from NTIS as COM 75-11278.

Key words: brick; failure; failure theories; masonry; shear strength; shear test; shear walls; stress distribution; stresses; structural engineering.

Various failure hypotheses for wall panels subjected simultaneously to diagonal compressive load and to vertical compressive edgeload are compared with the results of thirty-two tests on four types of brick masonry walls which were published elsewhere. It is concluded that failure can occur by joint separa-

tion or by splitting. A failure hypothesis is advanced which is shown to be in good agreement with the test results examined.

NBSIR 75-705. **Thermal and flow characteristics of the ASTM E 84 tunnel test method,** J. G. Quintiere and J. W. Raines, 38 pages (Sept. 1975). Order from NTIS as COM 75-11217.

Key words: ASTM E 84; carpets; energy balance; flame spread; mass balance; test method.

Five experiments were conducted using an ASTM E 84 tunnel test facility. These included a calibration test, three standard tests involving carpet materials, and one test in which a carpet material was tested on the floor of the duct. In addition to the measurements recorded during a standard test, instrumentation was added to measure inlet air velocity, temperature within the test section of the duct, and heat flux. From these measurements mass and energy balances were determined for each experiment. The results indicate that inlet air mass flow rate dropped during a test and appears to depend on the extent of burning in the duct. The energy balance results indicate that for the calibration run about half of the energy of the gas burner is lost by radiation and convection to the walls in the test section of the tunnel. During combustion of a test specimen, significant energy losses occur in the last 9 feet of the test section even after the flame tip has reached the exit of the tunnel.

NBSIR 75-706. **Calculations of radiant heat flux in the proposed floor covering flame spread test apparatus,** J. Quintiere and K. Bromberg, 21 pages (Dec. 1975). Order from NTIS as PB248640.

Key words: floor covering; heat flux; radiant panel test method.

Calculations have been made to determine the radiant heat flux distribution to the test specimen in the proposed radiant panel flame spread test for floor covering materials. Comparison with measured heat flux indicates a significant heat transfer contribution from the enclosure of the test apparatus. Also, nonuniformities in the temperature of the radiant panel affect the resultant flux distribution. Based on these results, it is expected that two similar test apparatuses would not have identical heat flux profiles along the specimen. Additional calculations were made to illustrate possible heat flux profiles capable with the present apparatus under various panel temperatures and orientations.

NBSIR 75-707. **Tamper-resistant televisior surveillance system,** O. B. Laug and K. W. Yee, 38 pages (May 1975). Order from NTIS as COM 75-11017.

Key words: safeguards; surveillance; tamper-resistant; television.

This report describes a tamper-resistant television system. This system will be part of a larger system used for verifying compliance with certain international arms control or safeguard agreements. This work is part of a joint U.S.-Canada safeguards research program to develop and evaluate tamper-resistant, tamper-indicating techniques and instrumentation that might be applicable in safeguarding reactors or other nuclear facilities. The principal design objectives are to provide a system capable of unattended operation, data storage capacity for a period up to 90 days, and resistance to deception by insertion of false video information on the transmission line or substitution of false scenes in the camera's field of view. These objectives are accomplished by utilizing commercial high-resolution closed-circuit TV and photography coupled with a video encoding technique which permutes the luminance signal in a different pattern for each recorded picture. Motion detectors, utilizing the video signal, provide the ability to selectively record pictures when motion occurs in preselected areas, and protect the system against insertion of false scenes. The incorporation of these addi tional features adds comparatively little complexity to ordinar closed circuit TV while greatly increasing its effectiveness as surveillance tool for safeguards applications.

NBSIR 75-708. **Development of a dynamic pressure calibratio technique—A progress report,** C. F. Vezzetti, J. S. Hilten, an P. S. Lederer, 20 pages (June 5, 1975). Order from NTIS a COM 75-10817.

Key words: calibration; dynamic; liquid column; pressure sinusoidal pressure; transducer.

Work continues on the development of a method of producin sinusoidally varying pressures of at least 34 kPa zero-to-pea with amplitude variations within ± 5 percent up to 2 kHz for th dynamic calibration of pressure transducers.

Sinusoidally varying pressures of 34 kPa zero-to-peak hav been produced, to date, between 40 Hz and 750 Hz by vibratin a 10-cm column of a dimethyl siloxane liquid at 36 g_n zero-to peak. Damping of the liquid column was accomplished b packing the fixture tube with a number of smaller diameter tube

NBSIR 75-710. **A small-scale enclosure for characterizing the fir buildup potential of a room,** W. J. Parker and B. T. Lee, 2 pages (June 1975). Order from NTIS as COM 75-11030.

Key words: fire growth; fire tests; flashover; room fire scale models; thermal radiation.

A 0.76 by 0.76 m (30 by 30 inch) enclosure with a 0.61 m (2 inch) high ceiling was used to model some fires in a $3 \times 3 \times 2.4$ (10 × 10 × 8 ft) burnout room. Temperatures, oxygen concentra tions, air velocity, and conductive and radiative heat fluxes wer measured. The highest average air temperature in the upper pa of the room was taken as a measure of the fire buildup potenti of the room. Upper air temperatures attained in the model wer similar in most cases to those in the full-scale compartmen From energy balance considerations this air temperature was re lated to the oxygen depletion in the room and was shown to co relate well with the oxygen content of the combustion gas and a exhausting from the model and full-scale room fires.

NBSIR 75-711. **Site analysis and field instrumentation for a apartment application of a total energy plant,** J. B. Coble and F R. Achenbach, 65 pages (May 1975). Order from NTIS a COM 75-10689.

Key words: air conditioning; air pollution; central utilit systems; data acquisition system; efficiencies; electric power; energy conservation; energy costs; fuel utilizatio heat recovery; total energy systems; utilities for housin utility system performance.

Under sponsorship of the Department of Housing and Urba Development, the National Bureau of Standards develope criteria in a feasibility study to select a site for, and to evaluat the requirements of a total energy system on one or mo OPERATION BREAKTHROUGH housing sites. The tot energy system produces its own electrical, heating and coolir energy services independent of the local utility system. S OPERATION BREAKTHROUGH sites were selected for th feasibility study: Jersey City, N.J.; Macon, Ga.; Memphi Tenn.; Indianapolis, Ind.; St. Louis, Mo.; and Sacramento, Cal Ranking parameters for final selection were: number of dwellir units, density of dwelling units, climatic factors, energy utiliz tion, owning and operating costs, and developer's attitude.

The Jersey City site was chosen as the location for the install tion, evaluation, and field study of the total energy system. Th site covers six acres, has four apartment buildings containing 4

dwelling units, a 50,000-sq.ft commercial building, an elementary school, a swimming pool, and the total energy plant.

The buildings and the total energy plant are being extensively instrumented to provide data on fuel utilization, system efficiencies, electrical and thermal energy generation, energy utilized and rejected. The environmental impact of the total energy plant with respect to noise, vibration, air pollution, and esthetics is under evaluation. The installed system will be compared with several types of conventional energy systems.

NBSIR 75-712. **Solar heating and cooling in buildings: Methods and economic evaluation,** R. T. Ruegg, 47 pages (July 1975). Order from NTIS as COM 75-11070.

Key words: economic optimization; HVAC systems; life-cycle cost analysis; solar energy; solar heating and cooling.

This report addresses economic issues important to the design, and evaluation of solar heating and cooling systems in buildings. It explains and illustrates with simple, but realistic examples the use of life-cycle cost analysis and benefit-cost analysis to evaluate and compare the economic efficiency of solar and conventional energy systems. It also explains the conditions for making cost-effective tradeoffs in solar system/building design. By presenting the basic methods and assessing the appropriateness of alternative assumptions, the paper provides a resource document for researchers and analysts.

NBSIR 75-713. **A file management system for a laboratory automation facility,** P. S. Shoenfeld and L. J. Kaetzel, 54 pages (June 1975). Order from NTIS as COM 75-11134.

Key words: data acquisition; file system; laboratory automation; multiprogramming; operating system; real-time.

The National Bureau of Standards' Analytical Chemistry Division operates a centralized laboratory automation facility built around a multiprogrammed minicomputer. A file manager was developed which allows the dynamic creation and manipulation of sequential disk files. Although the system was developed for real-time data acquisition, it is a general purpose addition to the computer's operating system and may be used for a variety of applications. A new operating system function was developed to allow the queued scheduling of programs. This is used to achieve more efficient multiprogramming. A comprehensive file utility package is also provided.

NBSIR 75-714. **Report on test on a sample of non-standard size baby cribs,** R. Pierson, Jr., R. I. Beall, and J. A. Huckeba, 33 pages (June 1975). Available from the author, NBS, Washington, D.C. 20234.

Key words: baby cribs; children's furniture; product safety; product testing; safety regulations; standard development.

A sample of non-standard size baby cribs was tested for compliance with the Consumer Product Safety Commission's Proposed Regulation for Non-Standard Size Baby Cribs in order to evaluate the Proposed Regulation, especially the tests and test procedures. The test procedures were found to be easy to interpret and to carry out. This report presents the results obtained from testing the cribs for compliance with the Proposed Regulation, a detailed description of some of the hazards, and some evaluative comments on the Proposed Regulation.

NBSIR 75-715. **The implementation of a provision against progressive collapse,** F. Y. Yokel, J. H. Pielert, and A. R. Schwab, 23 pages (Aug. 1975). Order from NTIS as COM 75-11208.

Key words: building systems; housing systems; large-panel structures; precast concrete construction; progressive collapse; structural design; structural joints.

The design solutions used by five U.S. precast concrete housing systems to comply with a provision against progressive collapse are studied and compared. Some common characteristics of the design solutions are identified.

NBSIR 75-716. **Proceedings of procurement practices symposium, Federal, State and local, January 28-30, 1975,** T. J. Fody and J. G. Berke, 168 pages (May 1975). Order from NTIS as COM 75-11210.

Key words: certification programs, ETIP; incentives; innovation; life cycle costing; procurement; product testing; specifications; unsolicited proposals.

The general objectives of the conference are to recommend ways to encourage information interchange and interaction between federal, state and local procurement levels and industry; to explore the use of special incentives such as life cycle costing, value incentives clauses, and unsolicited proposals as a means to promote innovation in products purchased by all levels of government; to establish the interrelationship between marketing, R&D and procurement and develop approaches to acquire the latest technology through the procurement process; to explore various product testing and evaluation efforts such as certification programs, tests by independent, company owned and association laboratories, university and government laboratories. Workshops were organized to consider procurement mechanisms, information interchange, testing and evaluation of products, and the interrelationship between marketing, R&D and procurement. Workshops were grouped as follows: (1) Procurement Incentives, (2) Interaction and Information Interchange, (3) Marketing, R&D and Government Procurement Cycles, (4) Product Testing and Evaluation, (5) Qualified Products Lists and Bid Samples, (6) Qualified Manufacturers, (7) Methods and Techniques of Contracting.

NBSIR 75-718. **Report of fire test on an AM General Metro Bus,** E. Braun, 21 pages (June 1975). Order from NTIS as COM 75-10750.

Key words: AM General Bus; arson; critical radiant flux; fire retardant; flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; urethane.

The Center for Fire Research at the National Bureau of Standards has conducted a study of the fire safety of a bus supplied by the Washington, D.C., Metropolitan Transit Authority. The objectives of the work were: (1) to determine the minimum ignition from source necessary to initiate a fire in the bus, and (2) to determine the means by which a fire, once started, is most likely to grow and spread.

A series of small-scale laboratory tests were run in addition to the three full-scale tests. Tests showed that accidental ignition by a cigarette or dropped match is unlikely. However, the seat can be ignited with one or two matches, if applied at the proper location, as by an arsonist. In full-scale tests, ignition of the seat occurs readily with the following ignition sources: (1) a small bag of paper trash on the seat, (2) a newspaper under the seat, (3) if the contents of a can of lighter fluid is poured on the seat.

Fire growth and spread in the bus is primarily through involvement of the seat cushioning. Fire spreads from seat to seat with little direct involvement of other interior materials. In all three tests, between one and two minutes after the urethane ignited, dense smoke filled the bus space seriously reducing visibility. Spread of fire beyond the seat of origin is not necessary for the level of smoke to be formed.

NBSIR 75-719. **A compliance testing system for NILECJ,** R. Mills, 24 pages (Feb. 1976). Order from NTIS as PB251410.

Key words: acceptance testing; compliance testing; laboratory evaluation; performance testing; qualified products lists; testing.

In order to assure that NILECJ equipment standards have the impact intended, a Compliance Testing and Laboratory Accreditation program is needed to establish which items available on the market do, in fact, meet the requirements of the standards. This report contains recommendations for such a NILECJ program. In brief, the proposed program would (a) result in a body of qualification and acceptance test data, (b) establish a list of testing laboratories competent to perform these tests, and (c) set up a "compliance information system" for the dissemination of this information to officials in the criminal justice system.

NBSIR 75-721. **Economic objectives of utility companies and developers in evaluating a MIUS,** B. J. Bartter, 39 pages (Nov. 1975). Order from NTIS as PB246864.

Key words: economic incentives; housing development; integrated utilities; utilities.

This report provides information to the Department of Housing and Urban Development-Modular Integrated Utility System (HUD-MIUS) program about the *economic* decision-making process for implementation of a MIUS by utility companies, developers, and a combination of these two groups.

Information was obtained through informal telephone interviews from these participant groups about their economic analysis of utility investment alternatives. The content of these conversations was synthesized into economic criteria which are perceived by each participant to be most important in evaluating alternative utility investments. From the analysis of these economic criteria, the possible combinations of participants and roles in the implementation of a MIUS are specified. These combinations are ranked, according to the degree of likelihood that each method will actually be employed.

The conclusion of this report is that a MIUS is most likely to be implemented by a governmental body, such as a municipal utility or governmental developer.

NBSIR 75-722. **Closure testing equipment instruction manual,** M. S. Morse, 42 pages (Oct. 1975). Order from NTIS as PB248641.

Key words: bottle caps; child protection; closure testing; containers; medicine bottles; poison packaging.

The NBS Closure Testing Equipment is designed to make accurate measurements of the critical parameters of the "child-proof" closures required by the Poisoning Prevention Packaging Act of 1971. In general, these parameters are defined as the forces necessary to open these closures, either in the manner by which the closure was designed to be opened, or in an undesired manner. This manual discusses the design and construction of the testing instrument and gives detailed instructions for its operation.

NBSIR 75-723. **Aluminum branch circuit wiring in residences summary report for the Consumer Product Safety Commission January-September 1974,** J. Rabinow, 91 pages (June 1975). Order from NTIS as COM 75-10753.

Key words: aluminum wire; consumer product safety; current cycle testing; electrical connection failure; electrical receptacles; residential wiring.

This report is a compendium of information on aluminum wiring in residences, originally prepared for the Consumer Product Safety Commission. It contains a summary of experimental research carried on at the NBS laboratories on the problems of terminating aluminum wires to screw connections as well as other pressure connectors. Since this report is an overview of the technical aspects of the aluminum wiring problem, it also contains a review by NBS staff members of available material furnished by Underwriters Laboratories and Battelle Institute. Both of these institutions are major contributors to this particular field of information.

The report also includes abstracts by NBS staff of some four volumes of testimony taken at public hearings at Washington, D.C. and Los Angeles, California during the spring of 1974. Additional information on the pertinent physical properties of aluminum, information on failure mechanisms, possible corrective actions, connector cycling tests, etc., is given in a brief literature survey and two relevant memoranda on the subject. The report concludes with a fairly extensive bibliography.

NBSIR 75-729. **Nondestructive tests to determine concrete strength—A status report,** J. R. Clifton, 39 pages (July 1975). Order from NTIS as PB246858.

Key words: compressive strength; concrete; flexural strength; formwork removal; nondestructive testing; surface hardness.

Individual and combined nondestructive test methods have been critically reviewed as potential methods to determine safe formwork removal times. The techniques reviewed are the Windsor probe, the Schmidt Rebound Hammer, pull-out measurements, push-out cylinders, ultrasonic pulse velocity measurements, and the maturity and equivalent age concepts. The individual methods themselves do not give good estimates of the in situ strengths of concretes and it is recommended that future research emphasize combined methods.

A proposed research program which emphasizes combined nondestructive test methods has been developed.

NBSIR 75-730. **Equilibrium penny-like crack in indentation fracture,** B. R. Lawn and E. R. Fuller, Jr., 28 pages (Sept. 1975). Order from NTIS as COM 75-11461.

Key words: contact fracture; degradation; Hertzian cracks; indentation fracture; median vents; penny crack.

A study is made of the mechanics of two basic types of indentation fracture, *cone cracks* ("blunt" indenters) and *median cracks* ("sharp" indenters). The common feature which forms the central theme in this work is that both crack types, in their well-developed stages of growth, may be regarded as essentially "penny-like." On this basis a universal similarity relation is derived for equilibrium crack dimension as a function of indentation load. Experimental measurements confirm the general form of this relation. A more detailed fracture mechanics analysis is then given, to account for additional, contact variables evident in the data. Notwithstanding certain analytical limitations, the study serves as a useful basis for investigating a wide range of contact-related problems, both fundamental and applied, in brittle solids.

NBSIR 75-731. **A study of air-gap breakdown at 28.5 kilohertz,** F. R. Kotter, 42 pages (June 20, 1975). Order from NTIS as COM 75-11071.

Key words: air gap; electrical breakdown; insulator flashover; lightning protection; VLF antenna; voltage breakdown.

Measurements of the electrical breakdown of both quasi-uniform and highly nonuniform-field air gaps at a frequency of 28.5 kHz are reported. Gaps between a variety of electrode geometries ranged from a few centimeters to over two meters in length.

Breakdown voltages significantly below the corresponding 60 Hz values were observed with electrodes for which appreciable pre-breakdown discharges occurred, and a pattern of "anomalous" flashovers at considerably lower than the normal breakdown voltages was noted with quasi-uniform field gaps. The results obtained appear to correlate well with the data found in the literature for higher frequencies but lower voltages.

On the basis of the gap behavior observed, a prototype protective gap system designed for application to the tower base insulator assembly of a VLF (15 to 30 kHz) radio transmitter was tested and found satisfactory.

NBSIR 75-732. **NBS InterAgency transducer project—A project report,** P. S. Lederer, J. S. Hilten, and C. F. Vezzetti, 23 pages (June 27, 1975). Order from NTIS as COM 75-11022.

Key words: calibration; dynamic, electronic flash; photoflash bulb; pressure; pressure transducer response; thermal transient; transducer.

The continuing development of a test method for evaluating the effects of short-duration thermal radiant-energy transients on pressure transducer performance is described. The method consists of monitoring pressure transducer output as the transducer is exposed to radiation resulting from the ignition of a photographic flashbulb or from the discharge of an electronic flash. Precision of the method is to be at least adequate for the method to serve as a first-cut screening test. During this reporting period, the following three parameters were investigated for each of three radiation sources: (1) the amount of energy per unit area available as a function of distance from the source, (2) the response of a selected transducer as a function of distance from the source, and (3) flash duration. Repeatability of the method for each source was determined. Work being performed for other agencies is also described briefly.

NBSIR 75-733. **An evaluation of proposed safety requirements for infants' pacifiers,** S. D. Toner and H. A. Baker, 20 pages (Aug. 1975). Order from NTIS as COM 75-11139.

Key words: consumer products, CPSC proposed regulation; pacifiers; product safety; safety requirements; safety testing.

This report is concerned with a review of a regulation proposed by the Consumer Product Safety Commission on the safety of infants' pacifiers. In addition, the results of a laboratory evaluation of the efficacy of various requirements and testing procedures are given.

NBSIR 75-734. **Report on an investigation of the high speed hazards of steel belted patrol tires on police patrol cars,** J. J. Collard, 51 pages (June 1975). Order from NTIS as COM 75-11212.

Key words: certification of steel belted radial tires; high speed radial tire hazard; radial tire failures.

Two police fatalities and one permanent disability have been caused by catastrophic failures of steel belted radial ply tires during high speed police operations. More than 200 other failures were reported by one State highway patrol department. The report recommends that police departments use caution in selecting tires for patrol cars, and that tire manufacturers be required to provide evidence that the tires sold for police use have been tested and certified at speeds of at least 125 miles per hour.

NBSIR 75-735. **An expandable total energy data editor,** R. H. F. Jackson, 151 pages (Aug. 1976). Order from NTIS as PB256295.

Key words: computers; data editing; energy conservation.

This report documents the Total Energy Data Editor, a computer program developed to process the data to be collected by the ongoing Total Energy Project at the National Bureau of Standards. Consisting of a mix of FORTRAN and RAYTHEON machine language subroutines, the Editor is a powerful, interactive program written to be run on a Raytheon 704 minicomputer with two tape drives and a disk pack. Since this document is also meant as a user's manual, it includes a dictionary of commands, complete discussions and listings of individual subroutines, as well as an explanation of the workings of the program.

NBSIR 75-736. **Fire research publications, 1974,** N. H. Jason, 11 pages (June 1975). Order from NTIS as COM 75-11018.

Key words: bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing.

"Fire Research Publications, 1974" is a supplement to the previous editions which covered the years 1969-1972 (NBSIR 73-246) and 1973 (NBSIR 74-511). Only publications prepared by the members of the Center for Fire Research (CFR), by National Bureau of Standards (NBS) personnel under contract or grant to the CFR, or by NBS personnel or external laboratories under contract or grant from the CFR are cited. Articles published in NBS house organs also are cited.

NBSIR 75-737. **Mathematical methods of site selection for electronic message systems (EMS),** C. Witzgall, 44 pages (June 1975). Order from NTIS as COM 75-11472.

Key words: communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; network optimization; satellite; service improvement.

The concept of electronic message (mail) transmission has been the subject of several feasibility studies during the past decade. It requires the installation of electronic message handling facilities at selected locations. If transmission is to be via communications satellite, then any such facility can transmit to and receive from any other one. In this report, the mathematical aspects of choosing the number and locations of these facilities are examined. An inventory of solution methods is presented, along with recommendations as to which among them should be employed or developed further.

NBSIR 75-738. **A method and means of calibrating an air-bearing force plate for use with a towed pavement friction test trailer,** R. W. Kearns and J. F. Ward, 40 pages (Dec. 1974). Order from NTIS as COM 75-11279.

Key words: calibration procedures; force plate; pavement skid resistance; skid accident reduction; tire-pavement interface forces.

The equations for the variation of the external forces acting at the tire-pavement interface of a symmetrical two-wheeled towed trailer are given. Estimates, derived from experimental results, have been made for the displacement of the tire-plate interface with respect to the ground of an unrestrained locked test tire on the trailer. A description of the force plate calibration test frame, instrumentation and test method is given. The means of applying simultaneous vertical (normal) and horizontal (longitudinal) forces at the contact surface of the air-bearing plate in accordance with the equations are discussed. The change in force plate output with changes in the dimensions of the trailer calibrated in-turn with the force plate are given. A method of locating the coordinate axes of the internal force sensors with respect to level is given. Consistent application of these methods to both the force plate and trailer transducer calibrations results in reduced vertical-to-horizontal cross-axis differences.

NBSIR 75-739. **Development of specifications for archival record materials,** W. K. Wilson and E. J. Parks, 19 pages (Mar. 1975). Order from NTIS as COM 75-11189.

Key words: accelerated aging; natural aging; permanence; record materials; record papers; stability.

A specification for copies from office copying machines for permanent records has been prepared and is progressing through a standards organization. A project on the effects of 36 years of natural aging on a group of book papers of known composition was completed and reported. Work on the accelerated aging of handsheets at various relative humidities is incomplete, but data already obtained show that a low relative humidity is desirable in an accelerated aging procedure. Data on the sorption of oxygen by papermaking pulp at elevated temperatures are inconclusive.

NBSIR 75-740. **Piezoelectric polymer transducer for impact pressure measurement,** A. S. DeReggi, 39 pages (July 1975). Order from NTIS as COM 75-11127.

Key words: calibration; construction; impact; interface; piezoelectric polymer; polymer; pressure; pressure transducer; theory; transducer.

Described are development efforts relating to the design, construction, and calibration of a piezoelectric polymer transducer for the recording of pressure transients developed over the interface between two bodies as a result of impact. A bilaminate design was selected which uses electrically poled sheets of 25-μm poly(vinylidene fluoride) as the active material. The intended primary response of the transducer is to compression in the thickness direction, which is produced by either hydrostatic or normal pressure; the transducer was also found to respond to extension in the membrane direction. Individual-sheet activity in the thickness-compression mode is approximately 15 pC/N, resulting in a bilaminate transducer pressure response of 4.5 μV/Pa(30 mV/psi). Instructions for poling sheets and for constructing transducers are given in detail. Static and dynamic methods for characterizing transducer output are described. In particular, in order to simulate field conditions in which the transducer may bend or stretch, or both, during impacts, a drop-test procedure with curved impactors has been devised and a theoretical analysis (simplified to the extent of considering the membrane-stress contribution negligible) has been developed to yield the interface pressure.

NBSIR 75-741. **Mechanistic studies of triphenylphosphine oxide-poly (ethyleneterephthalate) and related flame retardant systems,** J. W. Hastie and C. L. McBee, 45 pages (Aug. 1975). Order from NTIS as COM 75-11136.

Key words: flame retardancy; mass spectrometry; optical spectroscopy; phosphorus; polyester.

A combination of mass spectrometric and optical spectroscopic studies has been made to establish a mechanism for phosphorus controlled flame retardancy in thermoplastics. It is shown that a vapor phase mode of flame inhibition can account for the known flame retardancy effect of triphenylphosphine-oxide in polyester substrates.

NBSIR 75-742. **Mixed oxides for fuel cell electrodes,** U. Bertocci, M. I. Cohen, W. S. Horton, T. Negas, and A. R. Siedle, 56 pages (Jan. 1976). Order from NTIS as PB248744.

Key words: electrocatalysis; fuel cells; mixed oxides; oxygen reduction; phosphoric acid; ternary metal-sulfur arrays; transition elements; triphenylphosphine; tungsten bronze.

Studies of mixed oxides were made in order to determine if such materials could act as oxygen-reducing electrocatalysts in an acid fuel cell. Included were strontium and barium cobaltates and manganates with and without added titanium; lanthanum titanates, with and without calcium or strontium; calcium, strontium, and barium ruthenates; and mixed oxides of the systems Ti-Ta-O, V-Nb-O, Ce-Ta-O, Pr-Ta-O, Ce-Nb-O, and Ce-Pr-Ta-O. Choices were based upon producing variable valence and upon conferring stability at elevated temperatures ($\leq$ 150 °C) in phosphoric acid. Barium ruthenate and the systems Ti-Ta-O, V-Nb-O, V-Ta-O, Ce-Ta-O, were hot-acid stable. The thermal reactions of $CeTaO_{4+x}$ with $O \leq x \leq 0.5$ were studied in air up to about 1960 °C.

Potentiodynamic and galvanostatic studies are reported on materials from the Ti-Ta-O system, TiO_2 as grown, TiO_2 reduced with hydrogen, TiO_2 with 0.1 percent Nb, lanthanum titanates with and without calcium or strontium, a tungsten bronze, barium ruthenate, and strontium titanate with 0.03 and with 0.15 percent Nb.

Preparation of inorganic compounds with ternary metal-sulfur arrays similar to the arrays in nitrogen reductase was attempted. The following were made: $(Ph_3P)_4Cu_2W_2S_6$, $(Ph_3P)_6Ag_5W_2S_6O_2$, and $[(Ph_3P)_3Ag]_2W_2S_6$, where Ph_3P refers to the triphenylphosphine moiety. Also prepared were $(Ph_3PAu)_2W_2S_4$, $(Ph_3AsAu)_2WS_4$, $(diphos)NiWO_2S_2$, $(diphos)_2Pd_3W_2S_6O_2$, and $(Ph_3P)_3PtW_2S_6O_2$, where "diphos" refers to 1,2-bis(diphenylphosphino)ethane.

NBSIR 75-744. **Proposed implementation for development of user-terminal protocols for computer network access,** A. J. Neumann, 16 pages (July 1975). Order from NTIS as COM 75-11072.

Key words: command languages; computer; man-machine systems; networks; system commands; user protocols.

This report summarizes activities undertaken at the National Bureau of Standards in the area of User-Terminal Protocol Standardization with support from the National Science Foundation, during the latter part of 1974 and 1975. Also discussed are present status of related standardization activities in areas of command languages, terminal keyboards, and terminology. Legal implications of standardization are indicated, and establishment of a Federal Task Group for Standardization is proposed to work under the Federal Information Processing Standards Coordinating and Advisory Committee (FIPSCAC).

NBSIR 75-745. **A model for salmon fishery regulatory analysis** F. C. Johnson, 33 pages (July 10, 1975). Order from NTIS as PB247657.

Key words: fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State; Washington State Fisheries.

The salmon fishery modeling project is a joint State-Federal program for the development of improved techniques for analyzing the economic and biological effects of regulatory changes in the Pacific Coast salmon fisheries. This interim report covers the second segment of the project – the implementation of a multi-species, multi-stock fishery analysis model. This segment of the project was sponsored by the Washington State Department of Fisheries under Service Contract No. 588.

NBSIR 75-746. **Preparation of reference data sets for character recognition research.** M. L. Greenough and R. M. McCabe, 5 pages (June 30, 1975). Order from NTIS as COM 75-11437.

Key words: character recognition; context research; data bases; optical character recognition; pattern recognition; reading machines.

A reference data set contained on magnetic tape has been enerated for research in optical character recognition and re-ated fields. The data set contains video data in 16 levels for each oint in a 24 × 24 scanning grid, applied to approximately 30 000 haracters. The input material, on some 2200 simulated address ailpieces, includes a range of character quality from excellent o poor.

The data set was prepared by first microfilming the address elds and printing positive transparencies. Then preselected haracters were scanned in the NBS FOSDIC. Through the use f calibrated gray scales which were filmed and scanned along ith the addresses, corrections were applied to assure linearity f overall response.

A second reference data set was also prepared from the same put material of simulated mailpieces. Through analysis of the cognition results printed out during runs on one address ader, details of identification on both alphabetic and numeric cognition modes were noted. These were encoded into six-haracter groups on the data tapes, formatted to provide one ch group for each input character in the original addresses. ecognition results are shown for approximately 110 000 input haracters.

BSIR 75-747. **Building energy authority and regulations survey: State activity,** R. M. Eisenhard, 25 pages (June 1975). Order from NTIS as COM 75-11131.

Key words: authority; building; energy; legislation; regulations; state.

Information describing the status of State regulations and uthority to regulate energy use in new and existing buildings is resented in tabular form. The tables reference available infor-ation on pending bills, acts, or general authority which is em-odied in a State Building Code Act. Programs relating to solar nergy, insulation, and other building energy items are also sted.

BSIR 75-748. **Power saws: A review of injury data and power saw industry survey,** V. J. Pezoldt and J. J. Persensky, 95 pages (July 1975). Order from NTIS as COM 75-11031.

Key words: accident research; consumer products; injury data; opinion survey; portable circular saws; power saws; radial arm saws; safety; table saws.

Two activities of an investigation of power saws are described: review of power saw injury data and two surveys of saw manu-acturers' opinions concerning safety aspects of saw use and esign. The injury data reviewed consisted of information from he National Electronic Injury Surveillance System and from ummaries of In-Depth Investigation Reports compiled by the onsumer Product Safety Commission. The two surveys, deal-ng with portable circular saws and table and radial arm saws espectively, were directed toward obtaining the opinions of chnical representatives of power saw manufacturers on five ajor areas of saw use and design, i.e., electrical safety, blade ontact hazards and prevention, accidental starting, the design of arious saw components and the judged adequacy of saw in-ruction manuals. Power saw engineers and designers recognize me problems with present saw designs, especially relating to ickbacks. Overall, however, the survey respondents believe aws to be reasonably free from hazards introduced by product esign. The area in which the saw manufacturers believe the ost hazards to exist is that of the operator's use of power saws. his human element in saw accidents is recognized as a major ntributor to saw related injuries, but little is known about how assure that safe practices will be followed. Areas for further udy are suggested.

NBSIR 75-750. **The calibration of indexing tables by subdivision,** C. P. Reeve, 38 pages (July 1975). Order from NTIS as PB249934.

Key words: angle standard; autocollimator; calibration; complete closure design; indexing table; least squares estimation; partial closure design; standard deviation; subdivision; variance-covariance matrix.

The indexing table plays a vital role in the calibration of angle standards at the National Bureau of Standards. It is often useful to know the values of several different intervals on the table as precisely as possible. The usual measurement designs call for a complete intercomparison of two tables which are being calibrated simultaneously. Two new types of measurement designs have been developed which call for only a fraction of this effort. One type of design subdivides the entire circle on each table into equal segments, and the other design subdivides these into smaller segments. Together the designs form a flexible system for calibrating any desired intervals on the two tables. Formulae are given for the propagation of random errors through all levels of subdivision. An example is included.

NBSIR 75-751. **Thermodynamics of chemical laser and high temperature species,** C. W. Beckett, 37 pages (Oct. 1975). Order from NTIS as ADA017626.

Key words: chemiluminescent; diatomic molecules; dissociation energies; high temperature; PbO; thermophysical measurements.

This report (covering July 1974 through June 1975) gives summaries (a) for high-speed thermophysical measurements on hafnium, iron, tantalum, and molybdenum and (b) for an interpretation of the Raman spectra of PF_5, AsF_5, and VF_5. Details of these activities have been or are in the publishing process. In addition, this report includes two articles which are current and have not started the publication process. One is a study on the chemiluminescence of the $Pb(g)+O_3(g)$ reaction, and the other is a review of the literature for dissociation energies of diatomic oxides and fluorides relevant to chemical lasers in the visible region. Finally, some related bibliographies on chemical kinetics are indicated.

NBSIR 75-755. **The CPSC road test of bicycle braking performance—Experimental evaluation,** D. E. Marlowe, 32 pages (Aug. 1975). Order from NTIS as PB248642.

Key words: bicycles; braking; consumer safety; handbrake; safety; testing.

The brake performance criteria to be published as part of a mandatory regulation on bicycle safety requirements has been evaluated. Fifteen bicycles were tested in accordance with the regulation. A mathematical adjustment of the actual test speed of the bicycle to 24 km/hr (15 mph) is necessary before the weight allowance can be made to the stopping distance in the evaluation of these tests. A danger of injury to the test rider exists during the tests and future efforts should be made toward replacement of these tests with a simpler laboratory procedure.

NBSIR 75-757. **A technique for the measurement of flash fire potential of polymeric materials,** J. E. Brown and J. J. Comeford, 33 pages (Dec. 1975). Order from NTIS as PB248914.

Key words: aircraft fires; fire hazard; flash fire; polyurethane; pyrolysis.

This report summarizes work for the period February-August 1974 on a continuing program to characterize the chemical and physical parameters of importance in a flash fire and to develop

laboratory scale methods for measuring the flash fire potential of materials.

Significant modifications have been made to a flash-fire cell developed earlier to measure the flash fire potential of materials by characterizing the condition required to produce an ignitable pyrolyzate-air mixture by thermally degrading a polymer. The furnace temperature, cell geometry and orientation, and sample size are specified. These modifications have resulted in an improved technique, especially in terms of reproducibility, for evaluation of flash fire potential of materials.

Experiments have been conducted on rates of combustible gas formation from flexible polyurethanes to assist in the optimization of the flash-fire cell operating conditions.

In the rate study, two successive major stages of degradation were found for polyurethane as the temperature approached 500° at a rate of about 60 °C/min. It was also found that the products of the second stage appear to be responsible for flash fires in the flash-fire cell. A minimum polyurethane weight to enclosure volume ratio greater than 0.2 g/l and a sample pyrolysis temperature greater than 380 °C were required to produce a flash fire in this apparatus.

NBSIR 75-760. **Proceedings of piezoelectric and pyroelectric symposium-workshop,** M. G. Broadhurst, 222 pages (Sept. 1975). Order from NTIS as COM 75-11436.

Key words: electrets; hydrophone; piezoelectric; polymers; polyvinylidene fluoride; pyroelectric; radiometer; transducers.

The purpose of this Symposium-Workshop was to bring together scientists and program managers from federal (primarily DoD), industrial, university, and foreign laboratories who are involved in the research on and manufacture of piezoelectric and pyroelectric polymer materials and devices, in order to exchange information about and stimulate further work on the new and rapidly developing measurement technology involving polymer transducers. This meeting is particularly important at this time because highly active polymer films are not yet available to device manufacturers in the U.S. or to potential users such as DoD.

NBSIR 75-761. **The demonstration of experimental lead paint hazard abatement methods in Washington, D.C.,** T. H. Boone, H. W. Berger, A. P. Cramp, and H. A. Jackson, 105 pages (June 1975). Order from NTIS as COM 75-11377.

Key words: abatement; barrier materials; building materials; housing; lead-based paint; lead poisoning; paint removal.

This report describes the first stage of an experimental lead paint hazard abatement program carried out in 30 dwelling units in Washington, D.C. The entire program will ultimately involve the abatement of lead paint hazards in a total of approximately 250 dwelling units located in three or more cities.

The procedures, demonstrated in Washington, included: paint removal methods using chemical solvents and a heat producing device; the replacement of components such as windows, doors and wood trim; and the installation of flexible sheet and rigid board barrier materials over existing lead paint on wall.

The report presents procedures and the forms used in inspecting and selecting dwellings for lead paint hazard abatement, evaluations of the suitability and implementation characteristics of the abatement methods and recommendations for their use.

Subsequent reports will present the results of comparable programs in additional cities and a final report will compare the cost-effectiveness of the alternative abatement methods.

NBSIR 75-763. **Thermodynamic and transport properties of ethylene and propylene,** I. A. Neduzhii (Principal Author), 210 pages (June 1972). Order from NTIS as COM 75-11276.

Key words: critically evaluated data; ethylene; propylene; thermodynamic properties data; transport properties data.

A comprehensive review of the data on the thermodynamic and transport properties of ethylene and propylene is given. Subjects covered include equation of state for liquid and vapor, second virial coefficient, enthalpy, etc., heat capacity, speed of sound, viscosity, and thermal conductivity. New experimental measurements are given for several properties, especially speed of sound, densities of the liquid and transport properties. Tables of properties covering the temperature range from 160 K to 500 K are given. The book has been translated into English from the original Russian.

NBSIR 75-766. **Properties and interactions of oral structures and restorative materials,** J. M. Cassel, 51 pages (July 1975). Order from NTIS as COM 75-11376.

Key words: adhesive materials; composites; dental materials; polymer grafting; resins; restorative materials; sealants; wear resistance.

A diversity of experimental approaches is being investigated to develop techniques which can be applied in formulation of adhesive restorative and caries-preventive dental materials. A newly developed testing procedure, still in the evaluation stage, has demonstrated expected ranking of adhesive bond strengths within a group of selected coating agents, both coupling and release types. Deterioration on exposure to water of cohesive bond strength in the Bis-GMA matrix has been indicated without concurrent deterioration of the coupling agent. A monomer system with potential as a composite or pit and fissure sealant resin and giving a polymerizable liquid of desired viscosity at room temperature was derived from three low-melting, crystalline isomers of ether-ester linked aromatic dimethacrylates. A series of monomers of varying chemical structure was evaluated for possible application in photopolymerization experiments designed to investigate modification of hard tissue by grafting. Modifications to extend the running time of a dental restorative wear-generating experiment three-fold and which allow the computerized recording of ten, instead of two, depth of wear measurements around the circular wear track have significantly reduced the standard error of measurement. Surface coating techniques being developed to strengthen interfacial bonding in dental cements and other dental materials show more promise with titanate than with carbon reinforcing fibers.

NBSIR 75-767. **A methodology for establishing conditioning requirements for building materials and composites,** L. W. Masters and M. Tryon, 35 pages (Oct. 1975). Order from NTIS as PB246879.

Key words: building composite; building material; conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing.

The measured properties of building materials and their composites sometimes reflect the conditions to which they have been exposed while being prepared for test. Conditioning these materials to some standard reference state is sometimes used to minimize this effect.

A methodology for establishing conditioning requirements for building composites and materials is presented and its use illustrated by applying it to two building composites.

NBSIR 75-768. **Reevaluation of the densities of the four NBS silicon crystal standards,** H. A. Bowman, R. M. Schoonover, and

C. L. Carroll, 36 pages (Aug. 1975). Order from NTIS as PB247943.

Key words: density standard; phase shift; silicon.

There were a few features of our recently completed density standard experiment which were based upon ideas which, we believe, should be changed. This report lists these changes and their justification. The result is to increase the assumed values of the densities of the crystals by about 1.7 ppm. The new assumed values are: X2 = 2.329 1289 g/cm^3; X3 = 2.329 1253 g/cm^3; X4 = 2.329 1228 g/cm^3; X5 = 2.329 1226 g/cm^3.

Additionally, we now believe that the densities of the crystals are stable, and not appreciably changing due to oxidation – a point left unresolved in our published report.

NBSIR 75-769. **Report on an NBS/AID/OAS Workshop on standardization and measurement services in industrializing economies,** H. S. Peiser, R. S. Marvin, M. McNeil, and J. Mejeur, Eds., 227 pages (Sept. 1975). Order from NTIS as PB247978.

Key words: AID; assistance; economics; foreign relations; industrializing nations; LDC's; measurement services; OAS; standardization.

On November 3-16, 1974, a Workshop was held at the National Bureau of Standards, Gaithersburg, under the sponsorship of AID and the Organization of American States, the object of which was to give standards officials of industrializing nations insight into the standards and measurement systems in the United States and the role of the National Bureau of Standards, so that these officials might consider what parts of the U.S. system might usefully be adapted to conditions in their home countries. The report contains copies of speeches and presentations by the U.S. hosts and the participants from the other nations. In addition, information is given on the general agenda of discussions, presentations, and tours of laboratories at NBS and other U.S. organizations.

NBSIR 75-770. **The equation of state for ammonia,** L. Haar and J. Gallagher, 27 pages (Sept. 1975). Order from NTIS as COM 75-11370.

Key words: ammonia; correlation; gas; liquid; thermodynamic properties; thermodynamic surface.

An outline is presented of the basic results of the extensive correlation for the thermodynamic properties of ammonia recently completed at this laboratory. Computer programs are presented for the calculation of thermodynamic properties in the range including the triple point temperature to 5/3 the critical temperature and pressures from the dilute gas to 8000 bar.

NBSIR 75-772. **The dynamic response of helicoid anemometers,** J. M. McMichael and P. S. Klebanoff, 54 pages (Nov. 1975). Order from NTIS as PB246861.

Key words: air; analytical; anemometer; dynamic response; experimental; lag; unsteady flow.

The results of an analytical and experimental investigation of the dynamic response of a helicoid anemometer are presented. The experimental investigation was conducted using the NBS Unsteady Flow Facility and data are presented which illustrate the dynamic behavior in a spatially uniform, fluctuating flow with varying amplitudes, frequencies, and mean velocities. An analytical model governing the dynamic response is also presented and compared with the experimental results.

NBSIR 75-774. **Calibration of Kerr systems used to measure high voltage pulses,** R. E. Hebner, Jr., 51 pages (Aug. 7, 1975). Order from NTIS as COM 75-11364.

Key words: automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; Kerr effect; nitrobenzene; pulse measurements; space charge.

The purpose of this work is to define, develop and refine techniques for calibrating pulse voltage measurement systems, particularly those based on the electro-optic Kerr effect. The approach used exploits the assumed frequency independence of the Kerr coefficient of nitrobenzene. Theoretically, the Kerr coefficient should exhibit the same frequency dependence as the relative permittivity. Measurements have shown the relative permittivity to be approximately frequency independent over the frequency range from direct voltage to 10^9 Hz. The realization of this calibration approach has been hampered by the fact that the electric field distribution, in the liquid exhibiting the electro-optic Kerr effect, is itself frequency dependent.

This report describes the present best comparison of cell calibration under direct voltage with calibration under low frequency alternating voltage and calibration under pulsed high voltage. The results under all three types of waveforms agree to within ± 0.5 percent. From these results it can be inferred that it is feasible to use an electro-optic Kerr system as an independent, and possibly more accurate, device against which to calibrate other pulse voltage measurement systems.

In addition to this discussion of Kerr system calibration, the report contains two appendices. One presents an improved technique for analysis of data obtained from a Kerr system and the other discusses space charge in a nitrobenzene-filled Kerr cell.

NBSIR 75-775. **Electrical measurement of high voltage pulses in diagnostic x-ray units,** R. E. Hebner, Jr., 62 pages (Nov. 1, 1975). Order from NTIS as PB248684.

Key words: calibration; electrical measurements; electro-optics; frequency response; high voltage; Kerr effect; operational amplifier; pulses; radiation; safety; x-ray generators; x rays.

The report describes a method of calibrating dividers used to measure high voltage pulses in diagnostic x-ray units. The experimental development emphasized four areas. These were the divider ratio under direct voltage, the frequency dependence of the ratio, the voltage dependence of the ratio and the effect of self-heating on the device. The results of measurements on approximately fifteen different dividers are summarized.

In addition, this report contains two appendices. The first discusses conventional and electro-optical methods of measuring the high voltage pulses, while the second presents a more detailed analysis of the feasibility of electro-optical measurement of these pulses.

NBSIR 75-778. **ETIP: THE FIRST 18 MONTHS. A progress report of the experimental technology incentives program, National Bureau of Standards,** J. D. Lewis, 74 pages (Aug. 1975). Order from NTIS as PB246435.

Key words: civilian R&D policy; ETIP; incentives; innovation; procurement policy; regulatory policy; small business policy; technology.

This internally prepared report describes the overall accomplishments of the experimental Technology Incentives Program in carrying out its mission. Progress is compared with the plans that were established in a program plan approved by the Secretary of Commerce in February of 1974. An appendix to the report describes the purpose and shows progress of each of the individual projects that ETIP has launched.

NBSIR 75-779. **The development of an improved compression test method for wall panels,** C. W. C. Yancey and L. E. Cattaneo, 107 pages (Dec. 1975). Order from NTIS as PB249935.

Key words: compression; eccentric loading; flat-end; kern; loading rate; pin-end; test method; wall panels; walls.

An experimental and analytical investigation of the primary factors involved in the testing of prototype wall panels under axial compression loading is reported. The objective of the investigation was to develop a method of testing wall specimens that incorporates the best features of ASTM Standard Method E72 while at the same time incorporating improvements in the areas of deficiency in the Standard. Twenty-five laboratory tests were conducted on samples composed of five types of wall panel construction. The panels were tested to failure under either of two different eccentricities of load, while being supported with one of two types of idealized end conditions. Selected test results and detailed descriptions of the laboratory procedures used are presented. A computer-aided analytical study of the variables affecting the degree of uniformity of loading was conducted. Equations based on the analogy of beams supported on elastic foundations were used in the analysis. A study of the statistical parameters commonly used to interpret test results was conducted to establish useful guidelines for predicting structural performance on the basis of small sample test results. A compression test method applicable to traditional and innovative wall constructions is presented. The principal additions in the revised test method are as follows: (a) a provision for variable eccentricity, (b) a procedure for selecting a load distribution assembly which will be compatible with the test panel.

NBSIR 75-781. **Optical materials characterization,** A. Feldman, D. Horowitz, R. M. Waxler, I. H. Malitson, and M. J. Dodge, 24 pages (Aug. 1975). Order from NTIS as COM 75-11375.

Key words: birefringence; elastic constants; infrared-laser window materials; interferometry; KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe.

The refractive index of each of two prismatic samples of chemical vapor deposited (CVD) ZnSe was measured from 0.5086 μm to 18.2 μm by means of the minimum-deviation method on a precision spectrometer. Data were obtained at temperatures near 20 and 34 °C and each set of data was fitted to a three-term Sellmeier-type dispersion equation, which permits refractive index interpolation within several parts in 10^{-5}. From the data obtained at the two temperatures, dn/dT was calculated for both samples. A comparison of refractive index and dn/dT is made with other types of ZnSe. Preliminary photoelastic data are presented for single crystal specimens of Ge, reactive atmosphere processed (RAP) KCl, and KCl doped with KI. The Ge data, which were obtained at 10.6 μm differ from previously reported data. Data on the two types of KCl were obtained at 10.6 μm, 0.633 μm and 0.644 μm. These data are compared with values from the literature. Also presented are revised photoelasticity data for CVD ZnSe. The design of an improved stressing apparatus that was developed for the measurement of photoelastic constants is discussed.

NBSIR 75-782. **Full-scale corridor fire experiment using a glass fiber carpet,** L. H. Breden, 33 pages (Dec. 1975). Order from NTIS as PB248643.

Key words: carpet; corridor test; fire testing; flammability; glass fiber.

A corridor fire experiment was carried out using a glass fiber carpet. It was observed that with a fuel loading of 2.7 pounds per square foot of wood in an adjacent fire room, no propagation of the fire occurred down the corridor. The glass fiber carpet in the burn-room became discolored and there was a significant weight loss of the carpet directly in contact with the fire. The carpet did not produce significant levels of smoke and did not spread the fire into the corridor.

NBSIR 75-783. **Validation of the DELCAP airport simulation model,** J. F. Gilsinn, 167 pages (July 1975). Available from the author at the National Bureau of Standards, Washington, D.C. 20234.

Key words: airport; airport capacity; airport simulation; models; model validation; runway capacity; simulation; validation.

This report documents exercises of the DELCAP airport simulation model performed to validate the outputs of that model. Airport throughput levels were calculated by DELCAP for five runway configurations, with three or four appropriate operating policies chosen for each, and for three different mixes of aircraft types. These estimates from DELCAP agreed well, generally within 6 to 8 percent, with current values provided by the FAA. An attempt at validating DELCAP's delay-figure output, using existing data on scheduled and actual times of aircraft departures and arrivals, is also reported. It proved unsuccessful, because available data are not sufficient to isolate that portion of total delay which DELCAP is designed to measure, i.e., terminal area ATC delay. A collection effort to accumulate the necessary data is formulated. Appendices to the report contain program listing, flowcharts, descriptions of program changes from earlier versions, and user instructions for the model's operation.

NBSIR 75-784. **Fire incidents involving flammable liquids, gas and dry explosives,** E. A. Tyrrell, 58 pages (Oct. 1975). Orde from NTIS as PB246862.

Key words: accidents; burn injuries; burn severity; explosives; fabric fires; FFACTS; flammable liquids; gas gasoline; ignition-causing activities; ignition sources; injur disposition.

From the NBS Flammable Fabrics Accident Case and Testin System as of December 1973, flammable liquids, gas, and dr explosives were found to be involved in 832 incidents, injurin 863 victims. Volatile flammable liquids represented 77 percen of the incidents; 72 percent of these liquids were gasoline. Mal victims outnumbered females more than 3 to 1. Young adults ages 21-45, and youth, ages 13-20, were injured most frequently Children and youth were injured primarily through what wa considered as play activities. Adults generally were injured whil engaged in activities traditionally considered as being oriented t the particular sex involved. Streetwear, particularl shirts/blouses, was reported most frequently as igniting firs Thirty-six percent of the fabrics represented in these incident were contaminated with a flammable liquid. Most of the victim sustained burn injuries covering 1-10 percent of their bodie only 6 percent sustained burn injuries covering 61 percent o more of their bodies. Most of the victims were hospitalized fo treatment of their injuries. Although the very young and the e derly were involved in these incidents less frequently than othe age groups, they generally were burned more severely an represented 46 percent of the victims who died in the hospital c were dead on arrival.

NBSIR 75-785. **The review of standardization and measuremen services at the Ecuadorian Institute for Standardization,** R. E trada and H. S. Peiser, 17 pages (June 27-29, 1974). Orde from NTIS as PB246345.

Key words: AID; development assistance; economic Ecuador; less developed countries; measurement service review; standardization; survey.

An international team of standards and measurement specialists visited the Ecuadorian Institute for Standardization on June 27-29, 1974, to review the operations of that organization in light of the recommendations made two years earlier by a Survey of Standardization and Measurement Services in Ecuador conducted by a team which was organized and sponsored by the U.S. National Bureau of Standards and the U.S. Agency for International Development. The review consists of the historical background of the Institute, results of the 1972 Survey, and recommendations for future planning.

NBSIR 75-786. **The CPSC road test of bicycle braking performance—Kinetic and error analyses,** L. Mordfin, 75 pages (Oct. 1975). Order from NTIS as PB251411.

Key words: bicycle brakes; brakes, bicycle; dynamics, bicycle; error analysis; friction, tire/pavement; kinetics, bicycle; measurements, bicycle braking; pitchover; standards, bicycle safety; test method, bicycle.

The Consumer Product Safety Commission has promulgated a safety standard for bicycle braking systems based on the stopping distances achieved in road tests under specified conditions. This report presents an error analysis of the test method, for the Commission's use in justifying or modifying the test criteria. The error analysis is based on experimental data, for the most part, and on theoretical principles where sufficient data are lacking. The theory, a kinetic analysis of the bicycle braking process, is included in the report together with proposed definitions of terms intended to quantify important aspects of bicycle braking performance.

The error analysis produced estimates of rather large lab-to-lab and test-to-test variabilities to be expected from the test method. These, in turn, were found to be principally dominated by errors resulting from an incorrect overweight-rider allowance specified by the Commission, and by variations in rider reaction times, respectively. Suggestions are made for more accurate methods of accommodating variations in rider mass, for reducing the effects of the test-to-test variability, and for reducing the danger of pitchover in the performance of the road test.

NBSIR 75-787. **Piezo- and pyroelectric properties of electrets,** M. G. Broadhurst and G. T. Davis, 55 pages (Oct. 1975). Order from NTIS as COM 75-11471.

Key words: electrets; piezoelectricity; polarization; polymers; polyvinylchloride; polyvinylfluoride; polyvinylidenefluoride.

A model for piezo- and pyroelectricity in polymers is presented. These effects are true piezo- and pyroelectricity rather than electrostriction, conduction, electromechanical effects or the motion of conductors in the field of space charges. Two distinct types of polymers can be piezoelectric. Amorphous polymers are piezo- and pyroelectric by virtue of a nonequilibrium but kinetically stable net dipole orientation. The semicrystalline polymers are piezoelectric due to alignment of polar, ferroelectric crystals dispersed in the amorphous phase. In both types the magnitudes of the piezo- and pyroelectric effects are in accord with the expected temperature and pressure dependence of the dipolar polarization. Space charges embedded in the polymer normally will not produce a piezo- or pyroelectric current. Those embedded near the crystal-liquid interfaces tend to reduce the piezo- and pyroelectricity. Improved orientation of dipoles and reduction of ionic impurities should increase p and d for PVF_2 by a factor of three above typical values presently reported. The sensitivity of amorphous polymers is limited mainly by dipole moment per unit volume and breakdown strength.

NBSIR 75-788. **Evaluation of the fire hazard in a mobile home resulting from an ignition on the kitchen range,** E. K. Budnick and D. P. Klein, 28 pages (Feb. 1976). Order from NTIS as PB250843.

Key words: fire test; flame spread; kitchen cabinets; kitchen range; kitchen range hood; limited combustibility; mobile home.

A series of fire tests was conducted in a typical mobile home to evaluate the potential fire hazard resulting from an accidental ignition from cooking on the kitchen range. Specific attention was directed to (a) ease of ignition of the kitchen cabinets as a function of the clearance between the range and the underside of the cabinets with and without the presence of a metal hood and (b) flame spread following the ignition.

The tests, which used a preheated pan of cooking oil as an ignition source, were conducted in a mobile home kitchen area. The materials tested were printed lauan plywood, printed particle board, and molded polystyrene, representative of materials used in kitchen cabinet construction in mobile homes.

Under the test conditions employed, it was found that ignition of the kitchen cabinets occurred in all cases in which a metal hood was not used. The time to ignition of the materials was only slightly affected by the clearance between the specimen (cabinet bottom) and the range. A significant time delay or no ignition resulted from the installation of a metal range hood.

An additional problem area revealed by the tests was the ignition and burn-through of the partition directly behind the range.

Specific design recommendations based on test results are presented along with suggestions for further investigation.

NBSIR 75-790. **FY75 progress report on design criteria and methodology for construction of low-rise buildings to better resist typhoons and hurricanes,** R. D. Marshall and N. J. Raufaste, Jr., 362 pages (Nov. 1975). Order from NTIS as PB250848.

Key words: buildings; codes and standards; housing; hurricanes; low-rise buildings; natural disaster; structural connections; typhoons; wind loads.

This report represents the major accomplishments conducted during the third phase (FY75) of a three year project to develop improved design criteria for low-rise buildings in developing countries to better resist extreme winds. The research study sponsored by the Agency for International Development commenced in March 1973. Two other reports were prepared: NBSIR 74-582 FY73 Progress Report (first phase of the research—4 months) and NBSIR 74-567 FY74 Progress Report (second phase of the research—12 months). During FY75, 6 major tasks were completed (instrumentation of fifth and sixth of six test houses to collect full scale field wind data, continuation of technician training at the field sites and at the wind tunnel facility, analyzed of extreme wind data, development of draft improved design criteria reports, participation in regional conferences in Manila and scheduling of regional dissemination of project results conference in Jamaica for November 1975). Research activities will be completed in December 1975. A final report will be published by the end of FY76.

NBSIR 75-791. **Procedural options for modification of architectural glass in residences to improve occupant safety,** S. W. Stiefel, 57 pages (Dec. 1975). Order from NTIS as PB253229.

Key words: architectural glass products; Consumer Product Safety Act; residence-related products; residential safety modification; safety implementation approaches.

The U.S. Consumer Product Safety Commission has the responsibility for developing and promulgating mandatory safety standards for products which pose unreasonable risks of injury for consumers. One of the first products selected for development of a safety standard under the Consumer Product Safety Act of 1972 was architectural glass. The prospects for regulation of many other residential unit component parts are wide open. Nevertheless, the initial impact of the adoption of a mandatory standard for architectural glass would be rather limited. The limited impact is largely due to the fact that people will continue to occupy existing housing that will not be immediately subject to the new rule.

This report documents the second and final phase of a project which considered the possible modifications for architectural glass products and the means for encouraging their implementation. The report evaluates available injury data, defines the population of hazardous architectural glass products and compares the relative level of hazard among the products. A set of possible retrofit options is presented, suggested by accident pattern review, and criteria are developed, which are useful in assessing their effectiveness. A model has been developed and exercised to calculate benefit-cost ratios for retrofit modification based upon averted injury medical costs attributable to injuries prevented by product modification. A set of implementation approaches has been postulated for consideration by the CPSC, for encouraging safety modification of component parts of residential units.

NBSIR 75-793. **Microsecond-resolution pulse calorimetry for semiconducting materials at high temperatures (a feasibility study)**, A. Cezairliyan and C. W. Beckett, 51 pages (Oct. 1975). Order from NTIS as PB247538.

Key words: capacitor discharges; heat capacity; high-speed measurements; high temperature; thermodynamics; uranium dioxide.

A feasibility study is conducted for the applicability of microsecond-resolution pulse heating techniques to the measurement of selected thermodynamic properties of semiconducting substances at high temperatures. The method of pulse heating of the specimen using capacitor discharges is described and general design considerations, including electrical circuitry and various physical, electrical and chemical phenomena, are presented. Measurements of experimental quantities, such as current, voltage, temperature, and pressure are described. The special problems in relation to measurements of heat capacity and vapor pressure of uranium dioxide in the temperature range 2000 to 6000 K are discussed. It is concluded that the capacitor discharge circuitry and the measurement of the experimental quantities, although difficult, are not likely to present major problems. However, problems are likely to stem from the experiment chamber and the specimen. The nature of these problems is discussed, and the performance of some preliminary experiments is suggested.

NBSIR 75-794. **Heat transfer in furnaces for CIB cooperative program and heat balance analysis of wall furnace**, J. B. Fang and J. T. Scott, 48 pages (Nov. 1975). Order from NTIS as PB247203.

Key words: fire resistance ratings; fire test furnace; heat balance; heat transfer; temperature-time curve.

Tests were conducted in the NBS wall panel furnace as part of a CIB international cooperative program to measure and compare heat transfer in fire endurance furnaces. Additionally, a heat balance analysis showed that a cellular concrete block wall specimen absorbed more heat by convection than by radiation. The rate of radiant heat transfer was found to decrease slowly, while the furnace exhaust heat loss increased during the test from 42 to 58 percent of the heat output. The calculated radiant heat fluxes incident at furnace walls was found to be somewhat lower than the experimental values measured at the test wall.

NBSIR 75-795. **Recommended criteria for retrofit materials and products eligible for tax credit**, W. J. Rossiter, Jr. and R. G. Mathey, Eds., 44 pages (Nov. 1975). Order from NTIS as PB246866.

Key words: caulks and sealants; clock thermostats; energy conservation; insulation; retrofitting; storm doors; storm windows; tax credit; vapor barriers; weatherstripping.

The Federal Energy Administration requested the National Bureau of Standards to develop criteria for retrofitting for possible use by the Internal Revenue Service in implementing the Presidential initiative authorizing tax credit to homeowners. Criteria are recommended for materials and products considered eligible for proposed tax credit for retrofitting one and two family residences to conserve energy. The materials considered include insulation and vapor barriers, storm windows and doors, caulking and weatherstripping, and clock thermostats. A list of these retrofit materials was compiled by generic type and recommendations made on their installation.

In addition to recommended criteria for materials and products eligible for tax credit, desired levels of performance for the retrofit materials are presented as a guide to homeowners to achieve maximum benefits in energy conservation through retrofitting.

NBSIR 75-796. **An analysis of the Salmon Statistical Information System**, F. C. Johnson, 20 pages (Sept. 29, 1975). Order from NTIS as PB247656.

Key words: Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries.

This report contains an analysis of the official salmon statistical information system of the Washington State Department of Fisheries relative to the changing data requirements of the Department. Recommendations are given for revising the current system in order to assure the availability of complete, accurate statistics on a timely basis. In addition, the principal requirements are identified for the development of improved procedures for generating input to the hatchery and fishery management models in use by the Department. This project was sponsored by the Washington State Department of Fisheries under Service Contract No. 626.

NBSIR 75-797. **An evaluation of a range-top warning light system**, M. E. Stefl and J. J. Persensky, 22 pages (July 1975). Order from NTIS as COM 75-11465.

Key words: consumer products; human factors; kitchen ranges; reaction time; safety; warning lights.

A descriptive analysis of In-Depth Injury Investigations of range-related accidents revealed a series of incidents where range-users were unaware that surface elements were energized. One proposed solution to this problem involved a system of four warning lights to indicate individual surface unit activation. A laboratory study using human subjects evaluated the effectiveness of such a system. The backgrounds against which the warning lights were fitted and the intensity of the lights were not shown to influence subjects' responses in a reaction time task; however, the position of the lights and the type of ancilliary task

veing performed by the subject did. These results are discussed n terms of product design and safety, and implications of the tudy for methodological development are considered.

NBSIR 75-801. **A bibliography on automated measurements (July 1, 1969, to July 1, 1974),** G. A. Teamer and A. Y. Rumfelt, 158 pages (Apr. 1976). Order from NTIS as PB252044.

Key words: automated measurements; computer-aided measurements; computer-controlled instruments.

This bibliography lists approximately 1000 citations pertinent o the field of automated measurement of electrical/electronic uantities and characteristics. In addition, approximately 400 itations are included that should be helpful in applying compuers to the automation of measurements. Only references appearng in the open literature between July 1, 1969, and July 1, 1974, re listed.

NBSIR 75-804. **Generation of standard EM fields for calibration of power density meters 20 kHz to 1000 MHz,** M. L. Crawford, 44 pages (Jan. 1975). Order from NTIS as COM 75-10395.

Key words: hazard level fields; power density meter calibration; TEM transmission cells.

This report describes techniques for calibrating power density neters used by the Department of Defense in measuring high inensity (hazard level) RF fields in the frequency range 20 kHz to 000 MHz. It reports on part of the work sponsored by the Calibration Coordination Group (CCG), of the Department of Defense covering the frequency range 20 kHz to 20 GHz.

Several techniques were considered for producing a standard ield including parallel plate and parallel wire transmission lines, ransverse electromagnetic mode (TEM) transmission cells, varius directive antennas and open ended waveguide (OEG). The najor emphasis in this report is on the TEM cells, which are ecommended for the frequency range 20 kHz to 500 MHz. Design and evaluation details and an error analysis associated vith the TEM cell measurement system are given. Power densiy levels can be established in the cells from a few $\mu W/cm^2$ to 00 mW/cm^2 with uncertainties less than $\pm$ dB.

Limited information is also given describing the use of OEG, he recommended technique for the frequency range 500 MHz o 2.6 GHz, and giving the results of intercomparisons among arallel plate lines, TEM cells, OEG, and standard gain horns.

NBSIR 75-805. **Calibration techniques for electromagnetic hazard meters: 500 MHz to 20 GHz,** R. R. Bowman, 38 pages (Apr. 1976). Order from NTIS as PB252971.

Key words: calibrations; electromagnetic hazards; field meters; gain; microwave; near-field.

The calibration techniques discussed are suitable for producng fields for calibrating most electromagnetic (EM) hazard meers to within $\pm$1.0 dB using a minimum of laboratory space and scillator power. Above about 2.6 GHz, adequate equipment nd standards have been available for these calibrations. Below his frequency the large apertures of the usual horn radiators equire more power than is available from medium power oscillaors. Further, calibrations in closed systems are difficult except t frequencies well below 1 GHz. Thus there is a need for smallperture gain standards from about 500 MHz to 2.6 GHz. The nain portion of the work reported here consists of accurate gain neasurements for open-ended hollow waveguide radiators OEG) for use from 500 MHz to 2.6 GHz. Other characteristics f this type of radiator important for EM hazard meter calibraions were also determined: near-field corrections, reflection oefficients, and aperture scattering. The suitability of the alibration scheme was tested by performing calibrations at 2 GHz on an EM hazard meter with both a horn radiator and an OEG radiator.

NBSIR 75-806. **Phase equilibrium and flow-induced desorption data for He-CO, He-N_2O, and He-N_2 systems,** W. G. Steward, R. O. Voth, J. Hord, W. R. Parrish, C. F. Sindt, and J. M. Arvidson, 62 pages (Mar. 1975). Order from NTIS as COM 75-10368.

Key words: binary mixture; cavitating venturi; enhancement factors; experimental vapor-liquid equilibria; flow induced desorption; helium-carbon monoxide system; helium-nitrous oxide system; Henry's law constants; two phase choking; two phase flow.

Liquid-vapor equilibrium data were obtained for the helium-carbon monoxide and helium-nitrous oxide systems at pressures to 138 bars. Liquid and vapor phase compositions were measured at nominal temperatures of 80, 85, 90, 100, and 120 K (144, 153, 162, 180, and 216 °R) for the helium-carbon monoxide system, and at 235, 245, 265, and 285 K (423, 441, 477, and 513 °R) for the helium-nitrous oxide system. Internal consistency of the data was checked by using pseudo-Henry's law constants and enhancement factors.

The effects on flow of helium absorption and subsequent flow-induced desorption were investigated by means of reduced scale model experiments. Friction losses attributable to helium desorption in the long channels proved to be negligible both in experimental measurements and in calculations based on assumed equilibrium of liquid and gas. Contrarily, the assumption of phase equilibrium leads to gross miscalculations of flow rates in cavitating or near cavitating nozzles or venturis. Actual venturi mass flow rates reached in the experiments were fifty times the theoretical choking flow rates; however, definite mass flow rate reductions due to helium desorption were measured, ranging from four percent for nitrogen to twelve percent for nitrous oxide. Pertinent experiences in handling these fluids and operating the test equipment are also discussed.

NBSIR 75-807. **Turbulent natural convection of liquid deuterium, hydrogen, and nitrogen within enclosed vessels,** D. E. Daney, 82 pages (Feb. 1975). Order from NTIS as COM 75-10396.

Key words: cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium, liquid hydrogen, liquid nitrogen; natural convection; sphere; vertical cylinder.

Quasi-steady natural convection of liquid deuterium, hydrogen, and nitrogen within a sphere, hemisphere, horizontal cylinder, and vertical cylinder has been studied experimentally for the case of a nearly isothermal wall. A single expression relating the Nusselt and Rayleigh numbers,

$$Nu = 0.104\ Ra^{0.352},$$

fits the deuterium and nitrogen data over the range $7 \times 10^8 < Ra < 6 \times 10^{11}$, while the hydrogen Nusselt numbers are 8 percent lower. The temperature field within the vessels is virtually free of horizontal temperature gradients. A single dimensionless temperature profile characterizes the vertical temperature distribution for each vessel shape, with the profiles for the sphere, hemisphere, and horizontal cylinder being nearly identical.

NBSIR 75-809. **Non-planar near-field measurements: Spherical scanning,** P. F. Wacker, 67 pages (June 1975). Order from NTIS as COM 75-10989.

Key words: antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry.

The advantages and limitations of near-field antenna measurements are compared with those of conventional far-field measurements. Further, the advantages and limitations of planar, circular cylindrical, and spherical scanning are compared.

Spherical scanning is advantageous for arrays steered well off-axis and for antennas with wide angle side lobes, but the data processing has been quite impractical except for very simple antennas and probes. A new highly efficient data processing scheme is given for spherical scanning with and without probe pattern correction. The translation-of-centers transformation of the probe pattern coefficients (required only with the probe pattern correction) is carried out once and for all for a given probe, scanning radius, and frequency. The routine computations involve Fast Fourier "Transforms" and multiplication by matrices with constant elements, matrices which are independent of the detailed nature of the probe, the radius of the scanning sphere, the points at which measurements are made, and the nature of the test antenna. The FFT's and matrix multiplications supplant matrix inversion, ordinary solution of simultaneous equations in more than two unknowns, ordinary numerical integration, and (in routine processing) ordinary evaluation of functions, even for computation of the far field. Except for the truncation of the infinite series of spherical modes, no analytical or data processing approximations are made, even in the use of the FFT.

So that readers may draw from their understanding of planar and cylindrical scanning, a unified theory of near-field data processing is given, treating planar, cylindrical, and spherical scanning as mere special cases.

NBSIR 75-810. **Semi-annual report on materials research in support of superconducting machinery,** R. P. Reed, J. G. Hust, M. B. Kasen, H. M. Ledbetter, R. P. Mikesell, R. E. Schramm, L. L. Sparks, R. L. Tobler, and W. F. Weston, 201 pages (Apr. 1975). Order from NTIS as COM 75-10919.

Key words: composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity.

Results of six months of study on materials in support of superconducting machinery (October 1974 through March 1975) are reported to the sponsor, the Advanced Research Projects Agency of the U.S. Department of Defense. The report is divided into five sections: thermal conductivity, magnetothermal conductivity, fatigue and fracture-toughness properties, properties of advanced composites, and elastic properties. The temperature range 4 to 300 K is covered by the study. Materials studied are either being used or are candidates for use in superconducting machinery and include: aluminum alloys, composites, copper, age-hardened, nickel-base superalloys, stainless steels, and titanium alloys.

Special results of the study include: thermal conductivity data for comparison of the effects of heat treatment on age-hardenable alloys, the first determination of a complete set of elastic constants for a composite at liquid helium temperature, boron-aluminum composite tensile data at 4 K, and a summary of fatigue crack-growth rate behavior at 4 K for a number of different structural alloys. These data provide considerable insight into material characteristics at extremely low temperatures, assisting in material selection and efficient design.

NBSIR 75-812. **The Kapitza conductance of the (100) surface of copper and polycrystalline indium and niobium,** N. S. Snyder, 51 pages (June 1975). Order from NTIS as COM ADA012889.

Key words: heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper.

Measurements of the Kapitza conductance to liquid helium II across the (100) surface of single crystals of copper are presented. The temperature range of these measurements was 1.6 to 2.1 K.

The sample surfaces were subjected to several different treatments. Some surfaces were cleaned by low energy argon ion bombardment, annealed in an ultrahigh vacuum system, and preserved under vacuum until purified liquid helium was admitted. Other surfaces were intentionally damaged by machining and/or exposure to the atmosphere. The conductance after these latter treatments was found to be about a factor of three higher than that of the more ideally cleaned and annealed surfaces, and a significant increase in the temperature dependence of the conductance was also observed. Indications are that these effects on the conductance are produced primarily by the last few atomic layers of the solid, so extensive cold-working, which impairs the thermal conductivity of the bulk, need not be undertaken to improve surface heat transfer. This finding has important implications for the design of practical heat transfer surfaces. Good reproducibility was found for the conductances of similarly treated surfaces and good correlation with studies of damage carried out by x-ray diffraction. The relationship of these results to the numerous current theories of the Kapitza conductance is discussed. Conductance measurements of polycrystalline niobium and indium are presented in the appendices.

NBSIR 75-814. **A modified Benedict-Webb-Rubin equation of state for parahydrogen-II,** H. M. Roder and R. D. McCarty, 54 pages (June 1975). Order from NTIS as COM 75-11132.

Key words: critical point; density; enthalpy; equation of state; hydrogen; index of refraction PVT; saturation properties; scaling laws; specific heat.

A 32 term modified Benedict-Webb-Rubin equation of state has been applied to data for parahydrogen. The adjustable parameters in the equation of state were determined using 266 points including very recent measurements at low temperatures and high pressures. The new values extend the range of the PVT data sufficiently to warrant a refitting of the equation of state. Temperatures for the data range from the triple point to about 700 K with pressures reaching 3000 atmospheres near ambient temperatures. The PVT data were adjusted to the T_{68} scale. In addition, extensive modifications have been made to the previously accepted PVT surface in the region near the critical point. These adjustments have been made on the basis of more recent refractive index data and the application of scaling law equations. Detailed comparisons between experimental and calculated values are given for density. Corresponding comparisons are made for enthalpy and the specific heat at constant pressure.

NBSIR 75-816. **Performance characteristics of a liquid helium pump,** P. R. Ludtke, 55 pages (July 1975). Order from NTIS as COM 75-11133.

Key words: cavitation; cryogenic motors; induction motors; liquid helium pumps; motor efficiency; net positive suction head; pump efficiency; pump performance.

Part A of this report presents performance data for a simple preinduced, single stage, centrifugal liquid helium pump powered by a close-coupled submersible cryogenic induction motor. Data on pump efficiency and the motor efficiency are given, and the effects of decreasing the pump leakage loss and removing the pre-inducer were also investigated.

Part B describes a study of the cavitation characteristics of the pump in liquid helium I. The net positive suction head at cavita

tion of the pump was extensively investigated, and found to be near zero; the effects of removing the inducer, changing the pump inlet geometry, and varying the helium temperature were determined.

NBSIR 75-818. **Bibliography of the Electromagnetics Division June 30, 1974 to June 30, 1975,** M. L. Woolley, 27 pages (Sept. 1975). Order from NTIS as PB246439.

Key words: antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides.

This bibliography lists the publications of the NBS Electromagnetics Division between June 30, 1974 and June 30, 1975.

NBSIR 75-819. **Sensitive isotropic antenna with fiber-optic link to a conventional receiver,** E. B. Larsen, J. R. Andrews, and E. E. Baldwin, 108 pages (Sept. 1976). Order from NTIS as PB258554.

Key words: electromagnetic compatibility; fiber optics; field strength measurement; isolated EMC antenna; sensitive isotropic probe.

A broadband, active, isotropic receiving antenna was developed at NBS for the frequency range 15 kHz to 150 MHz. It was designed for use with a conventional receiver to measure weak, near-zone electric fields of unknown polarization, such as leakage emanations from electronic equipment placed within a shielded enclosure. The antenna system consists of three mutually-orthogonal active dipoles, each 31 cm long by 3.5 cm diameter. The entire frequency range of each of the three field components is amplified and used to modulate a high-speed light emitting diode (LED) located inside the dipole. The modulated infrared (IR) signals are guided through glass fibers 10 meters long which connect the "isolated" dipoles to avalanche photodiodes at the far end of the fiber guides. These photodetectors recover the rf modulation from the IR carrier for input to the receiver.

The fiber-optic antenna system described in this paper has high sensitivity (down to 10 μV/m) and fast response time (rf modulations up to 150 MHz). The readout indication at each receiver frequency is proportional to the Hermitian magnitude of E, which is the root-sum-square value of three orthogonal E field components at the measurement point. The linear dynamic range of the antenna system depends on the receiver bandwidth and signal frequency. It is 70 to 75 dB at frequencies between 0.02 and 2 MHz (for 0.5 kHz receiver bandwith), 60 to 70 dB between 2 and 25 MHz (for 5 kHz receiver bandwidth) and 40 to 55 dB between 25 and 200 MHz (for 50 kHz bandwidth).

NBSIR 75-820. **Study of cryogenic propellant systems for loading the space shuttle—Part II, Hydrogen systems,** W. G. Steward, 63 pages (Oct. 1975). Order from NTIS as PB246658.

Key words: computer modeling; cooldown; cryogenic flow; stresses; two phase flow.

This report covers computer simulation studies of liquid hydrogen fill and vent systems for the space shuttle. The computer programs calculate maximum and minimum permissible flow rates during cooldown as limited by thermal stress considerations, fill line cooldown time, pressure drop, flow rates, vapor content, vent line pressure drop and vent line discharge temperature. The input data for these programs are selected through graphic displays which schematically depict the part of the system being analyzed. The computed output is also displayed in the form of printed messages and graphs. Digital readouts of graph coordinates may also be obtained.

Procedures are given for operation of the graphic display unit and the associated minicomputer and timesharing computer.

NBSIR 75-822. **Study of errors in absolute flux density measurements of Cassiopeia A,** M. Kanda, 34 pages (Oct. 1975). Order from NTIS as PB246933.

Key words: accuracy; antenna; calibration; Cassiopeia A; error analysis; flux density; ground station; G/T (system gain/system noise temperature); radio star.

An error analysis for absolute flux density measurements of Cassiopeia A is discussed. The lower-bound quadrature-accumulation error for state-of-the-art measurements of the absolute flux density of Cas A around 7 GHz is estimated to be 1.71 percent for 3σ limits. The corresponding practicable error for the careful but not state-of-the-art measurement is estimated to be 4.46 percent for 3σ limits.

NBSIR 75-823. **Helium research in support of superconducting power transmission,** V. D. Arp, D. E. Daney, N. V. Frederick, M. C. Jones, P. R. Ludtke, W. R. Parrish, and R. L. Powell, 79 pages (Oct. 1975). Order from NTIS as PB246436.

Key words: cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; thermometers.

This is the first annual report on a program of helium-related research in support of superconducting power transmission. Program areas reported on are concerned with the dynamics of helium cooling systems—theoretical aspects of oscillatory behavior and experiments—and helium related measurements. The latter include pressure measurement, temperature measurement and the problem of impurity levels in the helium refrigerant.

NBSIR 75-825. **The National Measurement System for cryogenics,** T. M. Flynn, 76 pages (Oct. 1975). Order from NTIS as PB258913.

Key words: cryogenics; data; flowmeter; instrumentation; measurements; National Measurement System.

The Cryogenics Division of NBS has evolved as the nation's central laboratory for cryogenics, much as NBS itself has evolved as the nation's central laboratory with both broad and specific responsibilities. Cryogenic measurement and data outputs provide the common foundation for all the institutions and agencies throughout the nation employing cryogenics to solve their problems.

This Study of the National Measurement System showed that the Cryogenics Division of NBS provides almost every category of measurement and data service that NBS itself provides: not just an instrumentation system (including, for example, pressure, temperature, density, liquid level, flow rate, etc.), but also properties of fluids (both thermodynamic and transport properties); properties of solids (thermal, mechanical and electrical); an interface with the users through systems integration and advisory and consulting services; and a dissemination network through the Cryogenic Data Center.

This study documents the impact, status and trends of the cryogenic measurement system and specifically illustrates these characteristics wherever possible with a specific case study, a recently completed measurements and data program for the flow-metering of liquid nitrogen.

NBSIR 75-827. **Report on NBS dual mixer time difference system (DMTD) built for time-domain measurements associated with Phase 1 of GPS,** D. W. Allan, 21 pages (Jan. 1976). Order from NTIS as PB247938.

Key words: frequency measurement; frequency mixing; global positioning system; isolation amplifiers; low-noise amplifiers; precision frequency measurements; precision time measurements; time difference measurements; time-domain frequency stability; time interval.

Based on a previous work reported at the 1975 Frequency Control Symposium, the National Bureau of Standards was asked to build a Dual Mixer Time Difference (DMTD) measuring system. This report includes the design, construction, and testing of this DMTD system in fulfillment of this request. The precision of time difference measurement with this system was shown to be about 0.1 picosecond and the accuracy about 10 ps; similarly, the frequency stability precision was shown to be described by $\sigma_y(\tau) \simeq 10^{-13}\,\tau^{-1}$, $0.1\text{s} < \tau < 10^3\text{s}$ and equal to 10^{-16} at τ equal about half a day.

The request for this DMTD system was for measuring the clocks that will go on board the satellites for Phase 1 of the Global Positioning System (GPS) program. The DMTD system described in this report is the only system that can easily meet all of the time-domain measurement requirements for this program.

NBSIR 75-828. **Semi-annual report on materials research in support of superconducting machinery,** R. P. Reed, J. G. Hust, M. B. Kasen, H. M. Ledbetter, D. T. Read, E. R. Naimon, R. E. Schramm, L. L. Sparks, R. L. Tobler, and W. F. Weston, 193 pages (Jan. 1976). Order from NTIS as PB249041.

Key words: composites; copper alloys; cryogenic temperatures; elastic properties; engineering materials; fatigue; fracture; iron alloys; mechanical properties; nickel alloys; superconducting machinery; thermal conductivity.

Results are reported of a six-month study, March through August 1975, on candidate materials for superconducting machinery. The results cover five areas—advanced composites, elastic properties, fatigue resistance and fracture toughness, magnetothermal conductivity, and thermal conductivity. Material properties were studied over the temperature range 4 to 300 K. Materials studied include: oxygen-free copper; copper-nickel alloys; a precipitation-hardening copper alloy; invar; nickel-chromium-iron alloys; stainless steels; and the composite materials boron/aluminum, boron/epoxy, S-glass/epoxy, graphite/epoxy, and an organic-fiber/epoxy. Some notable results of the study are: the first 4 K fatigue data on a composite material; a ten-fold increase in the fatigue life of a uniaxial glass/epoxy composite between room temperature and liquid-helium temperature; the first 4 K fatigue fracture toughness studies on a nitrogen-strengthened chromium-nickel-manganese steel, which show this material has higher yield strength and adequate toughness compared to conventional stainless steels; room-temperature elastic properties of a copper-cadmium-chromium precipitation-hardening alloy, which are quite different from those of unalloyed copper and show a nonparallel behavior of the shear modulus and the bulk modulus; the thermal conductivity of 304 stainless steel may be reduced one third at 4 K by a 6 MA/m (80 k0e) magnetic field; the first systematic study of the tensile properties of fiber-reinforced composite materials between room temperature and liquid-helium temperature.

This work was supported by the Advanced Research Projects Agency of the U.S. Department of Defense.

NBSIR 75-829. **Radiation characteristics of dipole sources located inside a rectangular, coaxial transmission line,** J. C. Tippet and D. C. Chang, 35 pages (Jan. 1976). Order from NTIS as PB248855.

Key words: EMC measurements; radiation resistance; rectangular coax; shielded strip line; TEM cell.

When making EMC measurements inside a shielded enclosure, the radiation characteristics of the device being tested changes. In this report the change in radiation resistance of dipole sources located inside a National Bureau of Standards TEM transmission cell is determined. In many cases a practical device can be modeled by dipole sources. In these cases, the analysis allows one to predict the device's radiation characteristics in other environments, e.g., free space.

NBSIR 75-900. **Liquid level instrumentation in volume calibration,** R. M. Schoonover, H. H. Ku, J. R. Whetstone, and J. F. Houser, 37 pages (Oct. 1975). Order from NTIS as PB250859.

Key words: density measurement; electromanometer; large volume calibration.

The technique of pressure head measurement for determining liquid levels in tanks has been used for the intercomparison of commercially available electromanometers with themselves and a sight glass. In addition to obtaining intercomparison information, the high precision of these devices coupled with that of volumetric transfer techniques demonstrates the applicability of the calibration method in determining departures of the actual tank geometry from that of a model straight-walled geometry. It is shown that the calibration of the volume-to-height relationship of a 3300 liter tank may be accomplished with an uncertainty in this relationship of ~4 parts in 10,000.

NBSIR 75-901. **Smoke and carbon monoxide formation from materials tested in the smoke density chamber,** T. Y. King, 40 pages (Oct. 1975). Order from NTIS as PB246860.

Key words: carbon monoxide; electrostatic precipitation; heat flux; oxygen depletion; particulate mass; scanning electron microscope; smoke.

The effects of physical and chemical factors on the smoke and carbon monoxide generated by burning polymers and red oak in the NBS Smoke Density Chamber are reported.

NBSIR 75-902. **A survey of fire accidents involving curtains and draperies—deaths, injuries and financial loss,** L. D. Moore and A. K. Vickers, 35 pages (Dec. 1975). Order from NTIS as PB249539.

Key words: curtains; draperies; FFACTS system; fire; flammable fabrics; NFPA.

A case history survey of 286 fire accidents was conducted. This survey was composed of three groups of case histories in which curtains or draperies (C/Ds) were involved. The cases were analyzed in detail, attempting to ascertain the extent to which these products represented fire hazards.

As none of the three files were chosen on a statistical basis, projection of the data to the overall fire hazard situation is not technically feasible.

To learn more of the physical nature of burning C/Ds, and to supply information that may be utilized to judge the extent of hazard, it is recommended that full-scale experiments be conducted.

Smoke and carbon monoxide formation was found to depend on irradiance level and oxygen concentration in the chamber. Smoke optical density correlations with particulate mass density showed that the ratio of these two varied with material composition and burning conditions.

NBSIR 75-903. **San Antonio Veterans Administration Hospital smoke movement study,** F. C. W. Fung and R. H. Zile, 37 pages (Nov. 1975). Order from NTIS as PB246859.

Key words: experiments; full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF_6); Veterans Administration Hospital.

A series of full-scale smoke movement experiments was conducted using a sulfur hexa-fluoride (SF_6) gas tracer, smoke simulation system. The experiments were designed to study smoke movement in a hospital building with an interstitial space between floors. The penetration of smoke through ceiling and interstitial space and the vertical smoke movement in such a building were investigated.

NBSIR 75-908. **Characterization of sharp points and edges by electrical breakdown,** J. Cohen, 21 pages (Aug. 1975). Order from NTIS as PB247270.

Key words: consumer products; electrical breakdown; gases; hazard; high voltage; sharp edges; sharp points; threshold.

Experiments were made to determine the feasibility of using the phenomenon of electrical breakdown in air to characterize sharp metallic edges and points. A fixed voltage was applied between a sample edge or point and a parallel plane, and threshold gap length for breakdown observed. Results were quite favorable for edges, but not for points, and the polarity on the sample was required to be negative.

NBSIR 75-909. **Index of automated system design requirements as derived from the OMB Privacy Act implementation guidelines,** D. K. Branstad and R. A. Krell, Standards Coordinators, 14 pages (Oct. 1975). Order from NTIS as PB246863.

Key words: computer; data processing; index; information processing; privacy; requirements definition; security; systems design.

This index is a list of certain requirements which must be considered by Federal technical and administrative personnel in order to comply with those provisions of the Privacy Act of 1974 relating to automated systems design and development. This index has been derived from the Office of Management and Budget (OMB) guidelines for implementing those provisions. Each requirement listed contains a reference to an applicable part of the Privacy Act and to a page and column number of the OMB guidelines as they appear in the *Federal Register*. Therefore, these documents must be used in conjunction with this index. Furthermore, a familiarity with these documents will increase the utility of this index.

NBSIR 75-910. **The role of chemical kinetics in energy conservation,** H. M. Rosenstock, D. Garvin, J. T. Herron, and W. Tsang, 123 pages (Oct. 1975). Order from NTIS as PB248646.

Key words: combustion; data base; energy conservation; estimation schemes; kinetics; modeling; oxidation; pyrolysis.

Many of the technological areas of pertinence to energy independence involve chemical transformation of gas phase materials at high temperatures. The design, control and optimization of such devices and processes have come to depend increasingly on mathematical modeling. Among the most important input data required for these models are information on the detailed chemical mechanisms and the rates of the individual processes. It is concluded that although many resources are available there does not exist at present an adequate, publicly available data base for the modeling of high temperature systems. A detailed program involving a combination of experimentation and compilation, evaluation and dissemination of gas kinetic data is proposed.

NBSIR 75-913. **Structural test procedures for bicycles,** D. E. Marlowe, 50 pages (Oct. 1975). Order from NTIS as PB248911.

Key words: bicycle; consumer safety; regulations; safety; structural testing.

Tests for several structural performance criteria have been included in a mandatory regulation on bicycle safety which has been proposed by Consumer Product Safety Commission. The apparatus and procedures developed to conduct these tests and results from 15 representative bicycles are described. Several of the bicycles tested failed to meet the requirements for the seat and handlebar stem friction clamp strength.

NBSIR 75-915. **A source of error in paper extract pH determinations: Contact between paper and reference electrodes,** E. J. Parks and R. L. Hebert, 17 pages (Jan. 31, 1975). Order from NTIS as PB249775.

Key words: acidity; contact; decantate; electrode; error; extract; paper; pH; suspension.

If the reference electrode of a pH meter is permitted to contact paper suspended in an aqueous medium, the pH observed is lower than that observed with no contact. The effect has been observed with papers of widely different pH, and varies in magnitude with the proximity of contact and with different papers. The problem can be avoided by taking measurements on decanted equilibrium solutions instead of suspensions of paper.

The cause of this effect may be analogous to the suspension effect in colloidal systems.

NBSIR 75-916. **The role of passive film growth kinetics and properties in stress corrosion and crevice corrosion susceptibility,** J. Kruger, J. R. Ambrose, and T. Kodama, 85 pages (Oct. 1975). Order from NTIS as ADA019648.

Key words: chemical breakdown of passivity; chloride; crevice corrosion; ellipsometry; iron; molybdenum; repassivation kinetics; stress corrosion.

This report consists of four parts as follows: Part I – A study of the influence of molybdate ions on the repassivation kinetics of iron in chloride solutions. Results indicate that molybdate ions precipitated as ferrous molybdate in pits inhibit propagation but not initiation. Part II – Using a technique that allows ellipsometric studies to be made in a crevice, this work has found significantly lower film growth rates in a crevice on iron as compared to the rates observed outside the crevice. Part III – A review of the current state of our understanding of chemical breakdown of passivity is given with a listing of critical questions that remain to be resolved. A short bibliography on the subject is included. Part IV – A review of the qualitative applications of ellipsometry to study localized corrosion that have been developed at NBS is given.

NBSIR 75-917. **A multiple-chamber humidity apparatus,** L. Greenspan, 22 pages (Dec. 1975). Order from NTIS as PB247655.

Key words: humidity; humdity chamber; microbiological growth; relative humidity; salt solutions; saturated salt.

An apparatus has been developed for studying the growth of microbiological organisms on food under controlled conditions of humidity and temperature. This apparatus contains twenty-eight individual humidity chambers within a temperature controlled bath. A wide range of humidities can be provided within the individual chambers by means of saturated salt solutions. These chambers can be maintained at stable temperatures from 5 to 50 °C with a constancy and uniformity within ± 0.02 °C. In-

dividual chambers may be conveniently removed or changed without affecting the other chambers.

NBSIR 75-918. **Machine-readable mapping from National Network Simulation (NNS) zones to Bureau of Economic Analysis (BEA) areas,** D. W. Lozier and J. R. Stiehler, 77 pages (Sept. 1975). Order from NTIS as PB251412.

Key words: commodity flow analysis; economic analysis; National Network Simulation system.

This report describes the allocation of freight flow data from the National Network Simulation (NNS) zone system to the Bureau of Economic Analysis (BEA) area system. The NNS zone system was developed for use in the analysis of national modal freight flows. The BEA area system was primarily developed for the allocation of national economic data to regions of the United States. The BEA area system contains approximately 175 distinct areas and the NNS zone system, approximately 500. Assuming flows of commodities are known among the NNS zones, the NNS zone to BEA area mapping enables the determination of flows among the BEA areas. When an NNS zone is completely contained in one BEA area, flows entering and leaving the NNS zone accrue entirely to that BEA area. When an NNS zone overlaps more than one BEA area, the mapping specifies the allocation of incoming and outgoing flows among the affected BEA areas. This report presents the NNS zone to BEA area mapping which utilizes 1970 economic data as the basis for allocating flows when an NNS zone overlaps more than one BEA area. It also presents computer programs that could be used to generate a mapping using economic data from some other year. Closely related reports are R. Schofer, "Final Report on the National Network Simulation," NBS Internal Report 75-912 and R.H.F. Jackson, "A National Network Data Base System," NBS Internal Report 75-911.

NBS1R 75-920. **Distribution of water through a vertical plane from automatic sprinkler heads,** R. L. P. Custer and K. Wahle, 48 pages (Dec. 1975). Order from NTIS as PB248913.

Key words: automatic sprinkler; corridor sprinkler systems; discharge patterns; spray distribution; water distribution; water spray.

An investigation was conducted to evaluate the distribution of water through a vertical plane from automatic sprinkler heads as a function of water discharge rate and sprinkler spacing. Tests were conducted to simulate discharging an automatic sprinkler head in a corridor to determine the effectiveness of the sprinkler head in covering a doorway with water spray when positioned at various locations. Major differences in distribution characteristics between sprinkler heads produced by different manufacturers were observed. It was determined that only sprinklers installed on the centerline of the doorway and discharging water at a flow rate of 20 gallons-per-minute or more would cover the top of the doorway.

NBSIR 75-923. **Corrosion of metallic piping on military bases—A survey,** P. W. Brown and J. R. Clifton, 21 pages (Nov. 1975). Order from NTIS as PB250767.

Key words: corrosion; corrosion control; metallic piping; nondestructive evaluation; survey; water hardness.

The results of surveys of the extent of corrosion of metallic piping systems at selected military installations have been analyzed. Potable water, fire protection, heat distribution, cooling, and natural gas distribution systems are included in these surveys. The corrosion evaluation techniques used in these surveys and the types of protection applied are discussed. General recommendations regarding continuation and extension of these surveys are given.

NBSIR 75-924. **Evaluation, revision and application of the NBS stylus/computer system for surface roughness measurement: Minicomputer software,** E. C. Teague, 79 pages (Apr. 1975). Order from NTIS as PB248686.

Key words: amplitude density function; arithmetic average; autocorrelation function; linear least-squares fit; machine language; minicomputer software; surface texture measurement.

A thorough description of all the software used at NBS for characterizing surface texture is given in this report. The description includes flow diagrams and detailed, annotated listings of machine language programs for step-calibrating the system, for acquiring digitized surface profiles and for calculating from these profiles important parameters and statistical functions. Parameters and functions included are the arithmetic average value, mean square value, average wavelength, average slope, amplitude density function and autocorrelation function.

NBSIR 75-926. **The National Measurement System for length and related dimensional measurements, Part I,** J. W. Lazar and R. L. Bach, 115 pages (Aug. 1976). Order from NTIS as PB257467.

Key words: dimensional; gage; instrument; laser; length; machine; measurements; standard.

The determination of length and related dimensional measurements constitute the largest group of measurements made in science, manufacturing and technology. We have shown that length and related dimensional measurements have impact upon many areas of the economy. We have also shown that the National Measurement System is viable and is adaptable in conforming to the changing requirements of industry. The greater accuracy requirements of some industries brought new measurement techniques into use, e.g., the fringe counting laser interferometer systems now used in many tool rooms and metrology laboratories. We have found no deficiencies in the system but only in individuals or the measurement technique that they use as shown in the comparison measurement on audit packages that were made by the various standards laboratories.

NBSIR 75-927. **The national measurement system for surface finish,** R. D. Young, 51 pages (July 1976). Order from NTIS as PB255809.

Key words: economic factors; measurement; surface; surface finish; surface roughness; technology assessment.

NBS has conducted a study of the National Measurement System for Surface Finish. The proposed system model is discussed including the role of standards committees, instrument manufacturers and measurement users. The economic dimensions of the measurements impact areas and the technological base from which new measurement technology springs is described.

NBSIR 75-929. **A study of the National Force Measurement System,** D. E. Marlowe, 40 pages (June 1975). Order from NTIS as PB261498.

Key words: dynamic force; economic; force; metrication; national measurement system; standards.

A study of the National Force Measurement System has been conducted. The overall structure of the system has been defined, and the size of several of its component elements has been measured. The interactions of many of these components within the system have been assessed. The position which NBS has and the role it plays in the system are better understood as a result of this study.

The best assessment of the condition of the National Force easurement System is that areas such as static force measure-nt are fully adequate with the levels of accuracy now provided ile other areas such as dynamic force measurements and in-rmation transfer, are very inadequate to serve even our present eds.

BSIR 75-930. **The national measurement system for fluid flow,** W. C. Haight, P. S. Klebanoff, F. W. Ruegg, and G. Kulin, 66 pages (Aug. 1976). Order from NTIS as PB258250.

Key words: aerodynamics; air flow; flow measurement; fluid flow; fluid metering; hydraulics.

Fluid flow is a diverse field concerned with the motion of a de variety of fluids encountered both in daily life and in scien-c applications. It encompasses movement of weather systems atmospheric winds, travel and dispersion of air pollutants, w around aircraft and spacecraft bodies, oil and gas pipeline w, irrigation and waste water flow, and many others. The pes of fluid motions encountered in descriptions of these enomena include closed-conduit, open channel, supersonic, bsonic, steady, unsteady, laminar, and turbulent flow. Mea-rements of the properties of these flows are instrumental in the nctioning of the nation's industries and the advancement of ientific technology, and impact the lives of every consumer.

This report presents the concept of the National Measurement stem for Fluid Flow as it exists today and the activities and echanisms employed within it to generate and implement mea-rement data. The system structure is presented, and data and formation gathered on the interrelationships between the entifiable parts are reported. To further the study, more than 40 contacts were made with trade associations, government encies, private companies, universities and laboratories.

This study was conducted over the time span June 1973 to ecember 1975.

BSIR 75-931. **The National Measurement System for pressure,** P. L. M. Heydemann, 42 pages (Sept. 1976). Order from NTIS as PB261030.

Key words: calibration; calibration chain; pressure; pressure measurement.

The state of the national measurement system for pressure in e range where NBS presently provides calibrations and related rvices is in a satisfactory state. Needs for expansion of the nge have been identified and most of these needs will be tisfied in the near future.

Rapid changes in the needs of the system are generated by the creased use of transducers to transfer measurements and plans e being implemented at NBS to provide all necessary services.

BSIR 75-932. **The National Measurement System for temperature,** J. F. Schooley, 61 pages (Aug. 1976). Order from NTIS as PB257425.

Key words: data; International Practical Temperature Scale; measurements; National Measurement System; standards; thermometry.

The National Temperature Measurement System reaches uite literally into all phases of American life. Comfort control in ome, school, office and factory, health care, manufacturing, ood preparation and storage, and all forms of powered transpor-tion are just a few of the many facets of America's human ac-vities that depend for their trouble-free operation on the ex-tence of reliable thermometry.

The Heat Division of the National Bureau of Standards col-borates with the national laboratories of other nations in establishing an International Practical Temperature Scale which represents thermodynamic accuracy insofar as current scientific practice permits. The NBS is the only U.S. agency bearing this responsibility; in addition, only the NBS is responsible for disseminating the International Scale to U.S. scientific and technical activities.

The Study of the National Temperature Measurement System shows that the NBS continues to contribute energetically to the quality of the International Scale. It further indicates that NBS maintains a consistent and deliberate effort not only to provide access to the Scale at the several levels required by U.S. science and technology, but also to participate in solving special problems in thermometry. These are problems for which the nature of NBS as an objective, expert resource in thermometry uniquely qualifies it to furnish effective, practical solutions.

In briefly describing the many aspects of the National Temperature Measurement System, this Study attempts to portray its great diversity of products, services, and people. The System is largely organized, as might be expected, for the purpose of economic gain; the NBS enters the picture only in those areas where highly accurate or intricate thermometry is essential.

NBSIR 75-933. **A study of the national humidity and moisture measurement system,** A. Wexler, 52 pages (Aug. 1975). Order from NTIS as PB248983.

Key words: humidity; humidity measurement system; measurement of humidity; measurement of moisture; moisture; moisture measurement system; water vapor.

This study analyzes and assesses the status of the National Measurement System for humidity and moisture. It focuses on the physical process of measuring and controlling water vapor and moisture. It describes the nature, extent and economic dimensions of the system. It indicates impacts and trends, identifies deficiencies and shortcomings and shows the role NBS plays in the system. The study presents an overview of the complex structure of interrelated scientific, technological, social and economic components that form the basis of this system.

NBSIR 75-937. **The national measurement system for medical ultrasonics,** P. A. Hudson, 20 pages (Feb. 1976). Order from NTIS as PB265614.

Key words: electroacoustics; medical diagnostics; radiation safety; radiation therapy (ultrasonic); ultrasonics.

The rapid increase in the use of ultrasonics in medical diagnostics has been brought about by recent advances in imaging techniques employing sophisticated electronic systems. Along with the proliferation of this equipment in the medical community has come concern about possible tissue damage due to this type of radiation. Research on damage thresholds is being carried out in laboratories across this country and overseas. Agreement between various researchers is hampered by lack of accurate standards for measurement of transducer beam power and intensity.

The National Measurement System for medical ultrasonics is, at this time, inadequate, fragmented and largely uncoordinated. The Electromagnetics Division is in process of developing standards for measurement of transducer beam power, intensity, and beam pattern. These standards will be disseminated widely throughout the country to provide the needed accuracy and measurement agreement among biomedical researchers and ultimate users (hospitals, physicians, clinics, etc.). Interim standards for beam power were developed 1 1/2 years ago and are already in use by standards laboratories of manufacturers and universities. It is estimated that another 5 years will be required to bring the measurement system under some form of control.

NBSIR 75-942. **The national measurement system for optics,** D. A. Swyt, 63 pages (Aug. 1976). Order from NTIS as PB256644.

Key words: imaging optics; lens testing; microcopy resolution charts; National Measurement System; photographic density; technology assessment.

NBS has conducted a study of the National Measurement System for Optics. The proposed system model is discussed including the role of standards committees, instrument manufacturers and measurement users. The economic dimensions of the measurements impact areas and the technological base from which new measurement technology springs are described.

NBSIR 75-943. **Transactions matrix description of the National System of Physical Measurements,** R. C. Sangster, 91 pages (Aug. 1976). Order from NTIS as PB258914.

Key words: acoustic quantities; electrical quantities; electromagnetic quantities; end-use measurements; ionizing radiation; measurement activities; measurement institutions; mechanical quantities; National Measurement System; optical quantities; thermal quantities; time and frequency.

The interactions among the various elements of the National Measurement System are described in a series of transactions matrices. The National Measurement System consists of all of the activities and mechanisms used by this country to produce measurement data. The transactions matrices describe both the flow of measurement knowledge, goods, and services from suppliers to users in this System, and the activities within a given supplier-user sector. Semiquantitative estimates are made for the magnitude of the transactions, the rate of change of that magnitude, the relative importance or criticality of the transactions, and their adequacy. Basic supplier-user matrices have been developed for the system as a whole and for some 24 different measurement sectors (time and frequency; length and related dimensional measurements; vibration and shock; surface finish; mass, volume and density; force; fluid flow; pressure; temperature; humidity and moisture; thermodynamic properties of fluids; cryogenics; electricity; electromagnetics; medical ultrasonics; acoustics; radiometry and photometry; spectrophotometry; far ultraviolet radiometry; optics; lasers; physical properties of atoms and molecules; surface properties; and ionizing radiation). Some 25 supplier-user sectors have been defined, ranging from technical infrastructural institutions through governmental agencies to a series of commercial-industrial sectors defined by Standard Industrial Classification codes, to the "general public." Combination of like rows or columns from the basic supplier-user matrices for the different measurement sectors has allowed the generation of total input and output matrices for each supplier-user sector.

NBSIR 75-944. **National measurement system for the physical properties of atoms and molecules,** J. W. Cooper, A. V. Phelps, and S. J. Smith, 39 pages (Sept. 1976). Order from NTIS as PB258372.

Key words: atom; energy generation; industrial technology; molecule; primary standards; properties.

National activity in measurement, compilation, evaluation, and dissemination of atomic and molecular data, estimated at 20-25 million dollars annually, impacts directly upon applied research and development projects costing over one-third billion dollars annually. NBS atomic and molecular programs, costing about 3 million dollars annually, provide the basis for the accepted standards for length, time and frequency; provide advanced measurement techniques; set rigorous performance standards for generation of atomic and molecular data, and provide for the construction of a sound data base for the user community. The largest users are programs aimed at energy generation and conversion. Basic sciences of aerodynamics, astrophysics, atmospheric physics and plasma physics are important users. Benefits for a broad range of industrial research activities are potentially large. It is recommended that NBS undertake to ensure the reliability and adequacy of the data base needed for important national programs, expand its contacts with private industry, develop increased awareness of the methodology for applying atomic and molecular data to technological development, and encourage effective utilization of this sector of the measurement system for the benefit of the economy.

NBSIR 75-947. **Collected executive summaries. Studies of the National Measurement System 1972-75,** R. C. Sangster, 56 pages (Aug. 1976). Order from NTIS as PB258323.

Key words: acoustics; atomic properties; economics; electrical quantities; ionizing radiation; mechanical quantities; national measurement system; optical quantities; surface properties; thermal quantities; time and frequency.

This report contains the Executive Summaries of the reports of the 1972-75 study by the NBS Institute for Basic Standards of the U.S. National Measurement System, which consists of all of the activities and mechanisms which provide physical measurement data required by our society. A series of microstudies focused on specific technical measurement sectors. A macroeconomic study looked at costs of instrumentation and labor for measurement-related activity in our economy. University economists were retained to assist the microstudy authors and to prepare an overall economics report. A central coordinator set a basic pattern for the microstudies, prepared an overall summary report, and generated several documents relating to the system as a whole. Abbreviated titles of the executive summaries are: Final summary report. Direct measurements transactions matrices. Economic analysis. Structure and functions of measurement system. Time and frequency. Length and related dimensional measurements; vibration and shock. Surface finish. Mass, volume and density. Force. Fluid flow. Pressure. Temperature. Humidity and moisture. Thermodynamic properties of fluids. Cryogenics. Electricity. Electromagnetics. Medical ultrasonics. Acoustics. Radiometry and photometry. Spectrophotometry. Far ultraviolet radiometry. Optics. Physical properties of atoms and molecules. Surface properties. Ionizing radiation.

NBSIR 75-950. **Proposed criteria for use of the critical radiant flux test method,** I. A. Benjamin and C. H. Adams, 49 pages (Dec. 1975). Order from NTIS as PB250664.

Key words: fire hazard; fire safety; flooring test; radiant panel.

The objective of this discussion is to present background and other technical data that will help in suggesting criteria to be used in conjunction with the Flooring Radiant Panel Test to determine the potential contribution to fire growth of floor covering systems for use in corridors and exitways.

NBSIR 75-951. **Correlation of floor vibration to human response,** J. R. Shaver, 32 pages (Dec. 1975). Order from NTIS as PB249094.

Key words: analysis; experimental; floor systems; human response; random process; spectral analysis; vibration.

A new approach to the problem of perceptible floor vibrations is presented predicated on the realization that human activity

nd human response to this activity are random variables. echniques for data reduction are discussed and a detailed escription of one approach is given along with the associated mputer program. Data from floor vibrations is compared with rrent criteria for human response to vibration.

BSIR 75-952. **An error analysis of failure prediction techniques derived from fracture mechanics,** S. M. Wiederhorn, E. R. Fuller, Jr., J. Mandel, and A. G. Evans, 41 pages (Dec. 1975). Order from NTIS as PB248910.

Key words: crack propagation; error analysis; failure prediction; failure prevention; fracture; statistics; strength.

Three principal methods of failure prediction for brittle materis are analyzed statistically. Each method depends on fracture echanics for its predictive value and hence, the variance of the ilure time is found to depend on the scatter in the fracture echanics data and the scatter in the estimate of the initial size the strength limiting crack. The variance is used to calculate nfidence limits for the prediction of failure for two materials, ass and silicon carbide. Procedures for the collection and anal- is of data are discussed, and the implications of the analysis for etime prediction are evaluated.

NBSIR 75-953. **A procedure for determining bicycle braking performance,** D. E. Marlowe, 26 pages (July 1976). Order from NTIS as PB256219.

Key words: bicycles; braking; consumer safety; handbrakes; testing.

A procedure which could be used to determine bicycle braking erformance for compliance with the Federal Bicycle Safety egulation, Requirements for Bicycles, has been developed. The rocedure includes tests for brake system integrity and stopping istance performance. Sample data collection sheets and calcula- ons are given.

NBSIR 75-954. **A survey of manufacturers' views on the ETIP procurement experiment. Volume one: Refrigerator-freezers,** P. C. Goodman, 36 pages (Dec. 1975). Order from NTIS as PB253242.

Key words: energy-efficient products; Experimental Technology Incentives Program; life-cycle costing; procurement experiments; refrigerator-freezers.

This report describes the findings of a survey of six refrigera- r-freezer manufacturers by the Center for Consumer Product echnology. The survey was conducted for the Experimental echnology Incentives Program (ETIP) as part of its evaluation f a Federal Supply Service (FSS) procurement of refrigerator- eezers. Survey questions were designed to obtain manufac- rers' views on the use of Government procurement policies as means of increasing the rate of introduction of new technolo- es into the consumer market place. The questions covered the llowing areas: (1) reasons for participation or nonparticipation f a manufacturer in the ETIP experiment; (2) problems that a anufacturer encountered with existing Federal procurement ractices; (3) acceptability of using life-cycle costing in the idding procedure; and (4) effect of the most recent Govern- ent procurement on present and future company operations, in- luding support for engineering and investment in research, ypes of themes used in advertising campaigns, etc. Results of he survey are reported, and implications are drawn for future TIP involvement in Government procurement activities.

NBSIR 75-955. **Durability and related tests for selected elements and materials used in the exterior envelope of buildings,** L. W. Masters, E. J. Clark, G. A. Sleater, and A. Hockman, 151 pages (Nov. 1975). Order from NTIS as PB248685.

Key words: aging test; building elements and materials; degradation factors; durability; property measurement test; standard test methods.

This report contains a compendium of state-of-the-art methods to aid in the durability testing of selected elements and materials used in the exterior envelope of buildings. The purposes of the report are to identify currently available property measurement tests and aging tests that can be used for durability testing and to identify the degradation factors included in each aging test. The report will form the basis for selecting specific elements and materials for inclusion in subsequent comprehensive durability studies. These additional studies are needed because existing short-term methods are seldom fully adequate for predicting long-term performance.

The sources of the methods include the American Society for Testing and Materials (ASTM), the American National Standards Institute (ANSI), building industry trade associations, Federal Specifications and Federal Standards. Indications are made for each test method to show if the methods described include a property measurement test, an aging test or both. If the method contains an aging test, the degradation factors included in the test are listed.

NBSIR 75-956. **An interference simulator for quantitative determination of the susceptibility of flame detectors to false alarm,** A. Scheidweiler, 16 pages (Nov. 1975). Order from NTIS as PB247654.

Key words: false alarms; false alarm simulator; fire detection; fire detector; flame detection; flame detector.

All fire detectors are susceptible to false alarms, i.e., responding to fire-like conditions when no fire is present. Of all the known fire detectors, flame detectors are probably the most false alarm prone of any of the fire detectors, primarily because these detectors are subjected to more environmental influences resembling the detectors' operating mode than any other fire detector.

In this paper, the author describes an investigation into the susceptibility of flame detectors to false alarms. The author describes a test apparatus, constructed and used by his firm, to evaluate the susceptibility of currently-available flame detectors to false alarms. In addition, the apparatus can be used to evaluate prototype flame detectors.

The data developed indicates the false alarm susceptibility of each type of flame sensor. The data also provides a means of selecting a flame detector having the greatest resistance to known or predictable pseudo-fire sources.

NBSIR 75-957. **Finite element analysis of spotwelded, bonded and weldbonded lap joints,** R. A. Mitchell, R. M. Woolley, and S. M. Baker, 25 pages (Dec. 1975). Order from NTIS as PB250769.

Key words: adhesive-bonded joints; bonded joints; double-lap joint analysis; finite element analysis; joining; joints; single-lap joint analysis; single-lap-joint bending; spotwelded joints; weldbonded joints.

Finite element computer analyses of single-lap and double-lap structural joints are described. A planform analysis articulates the in-plane deformation of the joined sheet material and the lap-shear stresses acting through the spotwelds and/or adhesive. A longitudinal cross-section analysis computes out-of-plane bending effects, particularly important in single-lap joints, and adhesive peel stresses. Numerical results are presented that suggest a reasonable degree of mutual consistency between the planform analysis and the cross section analysis. Although the basic finite element formulation is linear, nonlinear deformation can be simulated by a series of linear solutions. The computer output in-

cludes contour plots of stress and strain fields and exaggerated-scale plots of displacements.

NBSIR 75-958. **Simulated precipitation reference materials,** J. K. Taylor, E. R. Deardorff, R. A. Durst, E. J. Maienthal, T. C. Rains, and E. P. Scheide, 25 pages (Oct. 1975). Order from NTIS as PB248743.

Key words: chemical analysis; rainwater analysis; reference materials.

The preparation of a series of reference materials for chemical analysis of natural precipitation is described. The materials consist of ampoules of concentrates which can be diluted to simulate naturally collected samples of rainwater. The analytical measurements made to verify the composition of the samples are also described.

NBSIR 75-960. **The police patrol car: State of the art,** R. G. Massey, 61 pages (Nov. 1975). Order from NTIS as PB249774.

Key words: functional requirements; patrol cars; performance of patrol cars; police patrol cars; problems with patrol cars; state of the art survey.

This report, entitled "The Police Patrol Car: State of the Art" describes the functional requirements of police agencies for patrol cars, the manner in which these requirements are met, or not met, by vehicles currently in use, and a discussion of new automotive technology which might affect patrol car performance in the future.

NBSIR 75-961. **The police patrol car: Economic efficiency in acquisition, operation, and disposition,** R. T. Ruegg, 225 pages (June 1976). Order from NTIS as PB257466.

Key words: fleet management; life cycle costing; patrol cars; police fleets; vehicle leasing: vehicle management.

This study uses the techniques of life cycle costing to analyze some of the decision problems of police fleet management. It addresses the following questions: (1) What are the cost effects of purchasing different sizes of patrol cars and different optional equipment? (2) What are the advantages and disadvantages of direct ownership of vehicles as compared with leasing vehicles? (3) How do the costs of contracting out maintenance compare with costs of an in-house shop? (4) What are the effects of alternative utilization practices on fleet costs? (5) How often should vehicles be replaced? (6) What method of vehicle disposition is most efficient? The techniques used to compare costs of alternative systems are described in a chapter on life cycle costing methodology. Cost estimates and empirical data are presented in the many tables, exhibits, and charts which support the study. Existing fleet practices are described. Findings of the study are expressed as general guidelines for fleet management. The focus of the study is on police patrol cars, but the methods are applicable to other kinds of vehicles.

NBSIR 75-962. **An outdoor noise monitoring system with automatic calibration and remote digital display,** D. S. Blomquist, J. S. Forrer, and D. M. Corley, 11 pages (Oct. 1975). Order from NTIS as PB247639.

Key words: acoustics (sound); environmental acoustics; instrumentation; noise monitoring; outdoor noise.

An Outdoor Noise Monitoring System is described. This system uses a microprocessor for automatic calibration. The design concepts of the system are applicable to other remote noise monitoring systems.

NBSIR 75-966. **Measurements and observations of the toxicological hazard of fire in a Metrorail interior mock-up,** M. M. Birky, A. W. Coats, S. E. Alderson, J. E. Brown, M. Paabo, and B. Pitt, 20 pages (Feb. 1976). Order from NTIS as PB250768.

Key words: blood; carbon dioxide; carbon monoxide; cyanide; fire; hydrogen chloride; hydrogen cyanide; oxygen; rats.

Oxygen depletion, carbon monoxide, carbon dioxide, hydrogen chloride and hydrogen cyanide were selected for measurement and identification in Metrorail fire tests.

Male rats exposed to the combustion products were examined for changes in blood chemistry, gross pathology and loss of function. Hydrogen cyanide and carbon monoxide levels in blood were elevated and functional changes were noted.

NBSIR 75-967. **Radiative ignition of some typical floor covering materials,** K. D. Braven, 22 pages (Dec. 1975). Order from NTIS as PB251413.

Key words: carpets; floor coverings; horizontal; ignition; ignition time; pilot ignition; radiant heat flux.

The ignition time for some typical floor coverings was measured at varying incident radiant flux levels. A large radiant panel was used as a heat source, with a nonimpinging pilot flame 1.0 cm above the sample as an ignition source. Each material was subjected to flux levels varying from 0.5-2.4 W/cm^2. Samples were 5 cm square, mounted horizontally below the radiant panel. A critical flux level, below which ignition did not occur, was determined for each material. No correlation was observed between the ignition time of flooring samples and the time to flashover in full-scale corridor experiments in which the same flooring materials were used.

NBSIR 75-968. **Selected thermochemical data compatible with the CODATA recommendations,** V. B. Parker, D. D. Wagman, and D. Garvin, 35 pages (Jan. 1976). Order from NTIS as PB250845.

Key words: CODATA compatible values; enthalpies of formation; entropy; Gibbs energy of formation; selected thermodynamic values; thermodynamic properties.

Selected thermochemical properties data at 298.15 K are given for 384 substances. The data are compatible with the current recommendations of the CODATA Task Group on Key Values for Thermodynamics. The set of values provided here is suitable for use as auxiliary data in evaluations of the thermochemical properties of compounds of the actinide elements. Rules used in the conversion of units and the rounding of numbers are stated.

NBSIR 75-971. **A fire hazard evaluation of the interior of WMATA Metrorail cars,** E. Braun, 34 pages (Dec. 1975). Order from NTIS as PB249776.

Key words: flame spread; flammability; full-scale fire tests; laboratory fire tests; Metrorail cars; neoprene; smoke; transportation; urethane.

A series of fire tests was conducted for the Washington Metropolitan Area Transit Authority to assist them in assessing the potential for fire hazard in the new Metrorail subway cars. Results of small-scale laboratory tests were found inadequate for this assessment. Results of full-scale tests on mock-ups of the interior (and on a real car for a smoke penetration test) show that the potential for hazard arises primarily from the seat padding and covering and from the plastic wall lining. The hazard arises both from smoke development and from spread of flame and heat. The times to reach unacceptable conditions has been determined for several test conditions. It is recommended that the authorities review these times in the context of what they consider to be appropriate times for safe escape. Recommendations

e made for increasing the amount of time available for escape. hese would require changes in the seating and wall lining aterials.

BSIR 75-972. **Skid resistance measurement tests at the FHWA eastern field test center,** R. W. Kearns and J. F. Ward, 98 pages (July 1976). Order from NTIS as PB259630.

Key words: accident reduction, skidding; correlation, skid resistance; highway safety; pavement, skid resistance; pavement wetting system, tire-pavement interface forces; wet pavement.

The measurement of the skid resistance of highways, under et weather conditions, is part of the Federal Highway Administation (FHWA) skid accident reduction program. To standardize and to improve the precision of the measurements, the rogram includes national and regional reference systems to hich the highway measuring systems may be systematically reted. This report describes evaluation tests conducted at the HWA Eastern Field Test Center (EFTC) which included the se of the Eastern Area Reference System (EARS) and the Inrim Reference System (IRS) maintained by the National Buau of Standards. The performance characteristics of the ARS, its subsystems and a correlation equation between the ARS and the IRS are presented. A method of quantifying ources of dispersion is applied to the measurements made by ie IRS on the EFTC reference surfaces. Recommendations for odifications to the EARS, the test procedures, and EFTC acilities are made.

BSIR 75-973. **Guide to improving the performance of a manipulator system for nuclear fuel handling through computer controls,** J. M. Evans, Jr., J. S. Albus, A. J. Barbera, R. Rosenthal, and W. B. Truitt, 53 pages (Nov. 1975). Order from NTIS as PB249255.

Key words: computer control of automation systems; computer interface; computer software for robot control; hierarchical control of manipulators; position servos; trajectory control.

The Office of Developmental Automation and Control echnology of the Institute for Computer Sciences and echnology of the National Bureau of Standards provides advisg services, standards and guidelines on interface and computer ontrol systems, and performance specifications for the procureent and use of computer controlled manipulators and other omputer based automation systems. These outputs help other gencies and industry apply this technology to increase productivity and improve work quality by removing men from azardous environments.

In FY 74 personnel from the Oak Ridge National Laboratory isited NBS to discuss the feasibility of using computer control echniques to improve the operation of remote control manipulors in nuclear fuel reprocessing. Subsequent discussions led to n agreement for NBS to develop a conceptual design for such a omputer control system for the PaR Model 3000 manipulator n the Thorium Uranium Recycle Facility (TURF) at ORNL. his report provides the required analysis and conceptual esign. Complete computer programs are included for testing of omputer interfaces and for actual robot control in both point-tooint and continuous path modes.

NBSIR 75-974. **The demonstration of experimental lead paint hazard abatement in Atlanta, Georgia,** T. H. Boone, H. W. Berger, A. P. Cramp, and H. A. Jackson, 121 pages (Dec. 1975). Order from NTIS as PB249777.

Key words: abatement; barrier materials; building materials; children; housing; lead-based paint; lead poisoning; paint removal.

This report describes the second stage of an experimental lead paint hazard abatement program carried out in 80 dwelling units in Atlanta, Georgia. The entire program will ultimately involve the abatement of lead paint hazards in a total of approximately 250 dwelling units distributed over three or more cities.

The procedures demonstrated in this field testing program were: paint removal using chemical solvents; paint removal using three heat producing devices; the replacement of components such as windows, doors, and wood trim and the installation of flexible sheet materials, rigid boards, plaster products and aggregate filled coatings, over existing lead paint on walls. Also evaluated was the covering of deteriorated, lead paint coated floors with plywood.

The report includes procedures for inspecting and selecting dwellings for lead paint hazard abatement, evaluations of the suitability and implementation characteristics of the abatement methods, and recommendations for their use.

Subsequent reports will present the results of comparable programs in additional cities and a final report will compare the cost-effectiveness of the alternative abatement methods.

NBSIR 75-975. **The calibration of an optical flat by interferometric comparison to a master optical flat,** C. P. Reeve, 40 pages (Dec. 1975). Order from NTIS as PB253113.

Key words: calibration; diameter; gravitational bending; interferometry; least squares line; linear model; optical flat; profile; standard deviation; uncertainty.

Optical flats are normally calibrated by one of two methods at the National Bureau of Standards. The most frequently used method involves a direct interferometric comparison of a test flat to a master flat. The purpose of this paper is to present a detailed description of this measurement process. Some of the topics discussed are methods of supporting the flats, effects of gravitational bending, measurement of interference fringes, formulation and solution of the linear least squares model, analysis of errors, choice of profile reference line, and graphical display of profiles. An example is worked out in a step-by-step fashion in order to illustrate the process, and a statistical test is incorporated to check whether the process is in control.

NBSIR 75-976. **Standards and measurement capabilities in the Kingdom of Saudi Arabia,** A. A. Bates, 37 pages (Spring 1975). Order from NTIS as PB248986.

Key words: building codes; industrialization; less-developed country; SASO; Saudi Arabia; standardization; tentative standards.

The Saudi Arabian Standards Organization (SASO) is operating under uniquely difficult circumstances. Basic sources of difficulties are: (1) almost total lack of any industries for consultation and cooperation, (2) extreme speed at which Saudi Arabia

is attempting transformation into an urban-industrial state, (3) unavailability of well-trained indigenous Saudi personnel, either scientific-technical or secretarial-clerical, and (4) lack of SASO laboratory facilities for standardization research work.

Operating procedures which SASO has adopted are based on consensus principles utilized in countries with advanced industrial economies. Such procedures are not now applicable in Saudi Arabia. Only the Saudi Portland Cement industry now offers opportunity for consensus standardization.

Until industrialization has advanced in the Kingdom, SASO should use Interim Procedures to produce Tentative Standards for national use. The Interim Procedures should permit direct and immediate adoption of necessary standards from reliable national and international sources with minimum modification. The nature and terms of use of Tentative Standards must be defined for public understanding.

SASO should not play the central role in the enforcement of SASO standards. SASO should have an advisory relationship with authorities charged with mandatory standards enforcement. SASO should not now undertake the development of a national Saudi building code, although it must produce the standards upon which a building code may be promulgated by a related agency appointed for that purpose.

NBSIR 75-977. **Development of solid state samplers for work atmospheres: Phosphine,** B. Greifer and J. K. Taylor, 32 pages (Jan. 1976). Order from NTIS as PB251220.

Key words: air analysis; air sampling; gas analysis; industrial hygiene; phosphine; sorber; work atmosphere.

Investigations to find suitable solid-state sorber materials for phosphine in work atmospheres at the ppm level are described. The best sorber to date is silver nitrate-impregnated silica gel. Some difficulties remain to be overcome before a procedure for determining the amount of phosphine adsorbed can be recommended.

NBSIR 76-833. **A precision 30 MHz waveguide-below-cutoff attenuator with an absolute electronic readout, NBS model XII,** R. T. Adair, 50 pages (Jan. 1976). Order from NTIS as PB250846.

Key words: absolute (unambiguous) readout; piston; precision attenuator; sensor; waveguide-below-cutoff.

A coaxial precision waveguide-below-cutoff attenuator is described which utilizes an absolute (unambiguous) electronic digital readout of displacement in decibels instead of the usual gear-driven mechanical counter/dial readout in decibels. The attenuator has a fixed-position rf input connector and a movable rf output connector. The attenuation rate for 30 MHz operation is given along with a discussion of sources of errors. In addition, information is included to aid the user in making adjustments on the attenuator should it be damaged or disassembled for any reason.

NBSIR 76-834. **A system for inflating a balloon using helium stored in the liquid phase,** C. F. Sindt and W. R. Parrish, 38 pages (Jan. 1976). Order from NTIS as PB250666.

Key words: balloon; cryogenic balloon inflation; heat transfer; liquid helium; packed bed heat exchangers.

This report covers the design and development of the prototype of a system to be used to fill a balloon that has been launched from an aircraft. The described system uses a hot packed bed heat exchanger to gasify 45.4 kg of liquid helium and warm the gas to 260 K for filling the balloon. The prototype system was successfully demonstrated on the ground by filling an ambient pressure balloon with 300 m^3 of helium gas at an average temperature of 260 K in six minutes and 45 seconds.

NBSIR 76-836. **Low temperature fracture behavior of a Ti-6Al-4V alloy and its electron beam welds,** R. L. Tobler, 49 pages (Apr. 1976). Order from NTIS as PB254459.

Key words: electron beam welding; fatigue; fracture toughness; low temperature tests; mechanical properties; titanium alloy.

The effects of electron beam (EB) welding on the fracture behavior of a recrystallization annealed, extra-low-interstitial Ti-6Al-4V alloy have been investigated at temperatures in the ambient-to-cryogenic range. Plane strain fracture toughness (K_{Ic}) and subcritical crack growth parameters were measured using compact specimens 10 to 25.4 mm-thick. These parameters can be used to predict the safe operating lifetimes of cryogenic pressure vessels and other welded Ti-6Al-4V structures.

Although EB welding transforms the base metal microstructure extensively, its effects on the material's fatigue crack propagation resistance at intermediate stress intensity factors are negligible. The growth rates, da/dN, of fatigue cracks sited in the fusion and heat-affected zones of weldments were temperature insensitive and nearly equivalent to rates for the base metal. However, welding introduces a zone of low fracture toughness at the heat-affected-zone/fusion-zone boundary. The K_{Ic} value for this boundary zone at liquid nitrogen temperature (76 K) was 45 $MN/m^{3/2}$, 16 percent lower than the base metal. The base metal fracture toughness increases between 4 and 295 K, with an abrupt transition to higher K_{Ic} values occurring at temperatures between 76 and 125 K. Static load cracking, temperature effects, and specimen orientation effects on the fracture behavior of this titanium alloy are central topics of discussion.

NBSIR 76-837. **Characterization of a superconducting coil composite and its components,** A. F. Clark, W. F. Weston, V. D. Arp, J. G. Hust, and R. J. Trapani, 143 pages (July 1976). Order from NTIS as PB261709.

Key words: fiberglass cloth; mechanical properties; stress analysis; superconducting coil composite; superconducting wire; thermal properties.

The physical properties of a superconducting coil composite and its components are studied in order to accurately predict the coil behavior under a variety of operating conditions. This second interim report includes data on the Young's moduli, the Poisson's ratios, the shear moduli, and the thermal conductivity of the coil composite as well as the compressive modulus of the fiberglass cloth and the thermal expansion of the superconducting wire. In addition, the development of an acoustic technique for the determination of the elastic moduli of the coil composite and the stress analysis of transversely isotropic magnet coils are reported.

BSIR 76-839. **Semi-annual report on materials research in support of superconducting machinery,** R. P. Reed, J. G. Hust, M. B. Kasen, H. M. Ledbetter, D. T. Read, R. E. Schramm, L. L. Sparks, and R. L. Tobler, 155 pages (Apr. 1976). Order from NTIS as PB252013.

Key words: aluminum alloys; composites; cryogenic temperatures; elastic properties; engineering materials; fatigue; fracture; iron alloys; mechanical properties; nickel alloys; superconducting machinery; thermal conductivity.

Results are reported of a six-month study, ending March 1976, candidate materials for superconducting machinery. The sults cover five areas—advanced composites, elastic proper-s, fatigue resistance and fracture toughness, magnetothermal nductivity, and thermal conductivity. Material properties were idied over the temperature range 4 to 300 K. Materials studied clude: aluminum alloys 1100, 2014, 2219; a nickel-chromium-n alloy; iron-47.5 nickel; and the composite materials ron/aluminum, boron/epoxy, *S*-glass/epoxy; graphite epoxy. me notable results of the study are: First reports of compres-e mechanical testing on composite materials at 4 K; regular nperature behavior of the elastic constants of aluminum 2014 d 2219 and of iron-47.5 nickel, which is magnetic; none of the echanical properties of the nickel-chromium-iron alloy tested ere affected deleteriously by cryogenic temperatures; in alu-num alloy 2219, J_{Ic} and K_{Ic} are not equivalent because of sub-tical crack extension; both electrical and thermal conductivi-s of aluminum alloy 1100 are reduced by magnetic fields.

BSIR 76-840. **FM-CW electromagnetic technique of measuring coal layer thickness,** D. A. Ellerbruch and D. R. Belsher, 38 pages (May 1976). Order from NTIS as PB258324.

Key words: automation; coal; coal mine safety; dielectric constant; energy; microwave measurement; nondestructive testing; thickness of coal layer.

An FM-CW microwave system was investigated for measur-g coal layer thickness. Measurements were made in three dif-rent mines near Pittsburgh, Pa., near Fairview, W. Va., and ar Coffeen, Ill. Microwave frequencies in the range 1-2 GHz ere used to measure samples up to 55 cm thick. All samples ere backed with a naturally occurring shale. Measurements ere also made on coal and shale samples compounded in the poratory at the Bureau of Mines Pittsburgh Mining and Safety esearch Center near Bruceton, Pa.

The results indicate that layer thickness can be determined in ost cases, although large anomalies may, in some cases, oduce misleading results. Many anomalies that were detected th the FM-CW system were verified visually by drilling into e coal layer.

The dielectric constant of coal apparently varies significantly thin a coal seam.

The form of the output signals from the FM-CW system seem simplify the data interpretation and analysis process as com-red to the manually swept microwave system used previously. appears that this technique has the potential of measuring anges in the dielectric constant of a coal seam and providing an tput that can be used for real-time corrections in layer ickness measurement.

BSIR 76-841. **An analytical and experimental determination of the cutoff frequencies of higher-order TE modes in a TEM cell,** J. C. Tippet, D. C. Chang, and M. L. Crawford, 27 pages (June 1976). Order from NTIS as PB256319.

Key words: shielded strip line; TEM cell.

In addition to the TEM mode, higher order TE and TM modes can propagate in a TEM cell. Since only the TEM mode is desired, the higher-order modes restrict the useful frequency range of the TEM cell. In this paper, the cutoff frequency of the first higher-order mode is obtained both analytically and experimentally for several TEM cells of differing geometry. The difference between the experimental and theoretical results is shown to be only a few percent. In addition the field distribution of the first higher-order mode is found explicitly.

NBSIR 76-842. **Error equations used in the NBS precision G/T measurement system,** W. C. Daywitt, 21 pages (Sept. 1976). Order from NTIS as PB258331.

Key words: error analysis; G/T; precision measurements; radio star; satellite communications.

Equations presently being used in the precision NBS G/T measurement system are presented in this report. Included are the assumptions upon which these equations are based and sample calculations showing how the measurement errors vary with antenna elevation angle.

NBSIR 76-844. **A microwave vector voltmeter system,** K. C. Roe and C. A. Hoer, 70 pages (Aug. 1976). Order from NTIS as PB264300.

Key words: amplitude; computer controlled; diode detectors; microwave measurements; phase angle; self-calibration; seven-port junction; vector voltmeter.

This report presents a system description and operating procedure for a vector voltmeter system which covers the frequency range .5 to 12 GHz. The design is based upon a seven-port junction where phase and amplitude information is obtained using only power detectors. The system is computer controlled and self-calibrating for ratio measurements.

NBSIR 76-846. **An NBS phase noise measurement system built for frequency domain measurements associated with the Global Positioning System,** S. R. Stein, 30 pages (Aug. 1976). Order from NTIS as PB258327.

Key words: Global Positioning System; phase-locked loop; phase noise measurement system; spectral density of phase.

A self-contained system is described which was constructed to perform phase noise measurements for the first phase of the Global Positioning System (GPS). It is capable of evaluating a pair of similar oscillators or a single oscillator and a frequency synthesizer using the phase-lock technique. Three features have been included to simplify the operation of the instrument: internal circuitry automatically detects an out-of-lock condition; an optimized second order phase-lock loop reduces phase error by a factor of 10^5 over a first order loop; selection of operating mode is made by a single front panel switch.

NBSIR 76-848. **Semi-annual report on materials research in support of superconducting machinery,** R. P. Reed, J. G. Hust, M. B. Kasen, H. M. Ledbetter, H. I. McHenry, D. T. Read, R. E. Schramm, L. L. Sparks, and R. L. Tobler, 322 pages (Oct. 1976). Order from NTIS as PB261996.

Key words: aluminum alloys; composites; elastic properties; engineering materials; fatigue; fracture; iron alloys; cryogenic mperatures; maraging steels; mechanical properties; nickel alloys; phenolformaldehyde; stainless steels; superconducting machinery; thermal conductivity; titanium alloys.

Results are reported of a six-month study, ending September 1976, on candidate materials for superconducting-machinery

components. The results cover five areas—advanced composites, elastic properties, fatigue resistance and fracture toughness, magnetothermal conductivity, and thermal conductivity. Material properties were studied over the temperature range 4 to 300 K. Materials studied include: aluminum alloy 5083, copper-0.3, cadmium-0.3 tin, copper-28 nickel, iron-48 nickel, 3.5 Ni and 9 Ni steels, titanium-4 aluminum-6 vanadium, titanium-5 aluminum-2.5 tin, stainless steel 21-6-9, several austenitic stainless steels of the 300 series, 300-grade maraging steel, phenolformaldehyde, and the composites boron/aluminum, boron/epoxy, graphite/epoxy, and niobium-titanium/copper. Some notable results of the study are: anomalous elastic properties of stainless steel 21-6-9 due to a Néel transition; complete sets of elastic constants for two composties, B/Al and NbTi/Cu; thermal conductivities of Ti-6Al-4V and Fe-48Ni are reduced by a magnetic field while those of Cu-0.5 Sn and Cu-28Ni are unaffected; a screening method for composites of possible cryogenic use; general trends regarding temperature effects on the fracture toughness and fatigue-crack-growth resistances of structural alloys are correlated with crystal structure class; and the tensile-yield-strength and fracture-toughness data for fourteen commercial structural alloys at 4 K and 295 K are compared demonstrating an inverse relationship between these properties and indicating the optimum combination of properties that are technologically possible. Also, the materials and properties studied experimentally during the three-year program are summarized. This work was supported by the Advanced Research Projects Agency of the U.S. Department of Defense.

NBSIR 76-979. **Intercomparison procedures for gage blocks using electromechanical comparators,** J. S. Beers and C. D. Tucker, 23 pages (Jan. 1976). Order from NTIS as PB248992.

Key words: calibration; comparator; gage blocks; length; measurement process.

The widely used procedures for calibrating gage blocks by comparison with blocks of known length generally lack the redundancy needed to evaluate measurement uncertainty or the controls needed to monitor the process on a continuing basis. A detailed description is given here for the systematized intercomparison of groups of four nominally equal gage blocks using an electromechanical comparator. Two of the blocks are unknowns and two are standards. The process provides the redundancy needed for evaluating uncertainty and for continuous monitoring. Gage block thermal effects, equalization time, handling techniques, and observation sequence are described.

NBSIR 76-980. **NBS space processing research,** E. Passaglia and R. L. Parker, 217 pages (Feb. 1976). Order from NTIS as PB250849.

Key words: convection; crystal growth; crystal perfection; microgravity; purification; space processing.

This report describes NBS work for NASA in support of NASA's Space Processing Program covering the period November 1, 1974 to December 31, 1975. The objectives of the NBS program are to perform ground-based studies (and, where appropriate, space-based studies) of those aspects of space that could possibly provide a unique environment for making materials more perfect or more pure. The approach taken deals primarily with experimental and theoretical studies of the possible effects of the absence of gravitational forces on those materials preparation processes where the presence of gravity may be important in reducing perfection or purity. The materials preparation processes studied comprise six tasks in the areas of crystal growth, purification and chemical processing, and the preparation of composites.

NBSIR 76-982. **Data processing and data analysis procedures fo fire load and live load survey program,** R. M. McCabe, C Culver, L. T. Lee, and J. G. Hirschberg, 344 pages (De 1975). Order from NTIS as PB248699.

Key words: buildings; computers; data processing; fi loads; load surveys.

Data collection and data processing procedures utilized i connection with a nationwide fire load and live load survey pr gram are described. The techniques developed for transferrir the field survey data to a form suitable for computer processi are discussed. Procedures adopted for data analysis are include Documentation of the computer programs developed for th purpose is also presented.

NBSIR 76-983. **A survey of manufacturers' views on the ETI procurement experiment. Volume two: Water heaters,** P. C Goodman, 34 pages (Jan. 1976). Order from NTIS a PB251213.

Key words: energy-efficient products; Experiment Technology Incentives Program; life-cycle costin procurement experiments; water heaters.

This report describes the findings of a survey of seven wat heater manufacturers by the Center for Consumer Produ Technology. The survey was conducted for the Experiment Technology Incentives Program (ETIP) as part of its evaluatic of the Federal Supply Service (FSS) procurement of wat heaters. Survey questions were designed to obtain manufa turers' views on the use of Government procurement policies a means of increasing the rate of introduction of new technol gies into the consumer marketplace. The questions covered tl following areas: (1) reasons for participation or nonparticipatic of a manufacturer in the ETIP experiment; (2) problems that manufacturer encounters with existing Federal procureme practices; (3) acceptability of using life-cycle costing in tl bidding procedure; and (4) effect of the most recent Gover ment procurement on present and future company operations, i cluding support for engineering and investment in researc types of themes used in advertising campaigns, etc. Results the survey are reported, and implications are drawn for futu ETIP involvement in Government procurement activities.

NBSIR 76-984. **Improved ultrasonic standard reference block** G. F. Sushinsky, D. G. Eitzen, D. J. Chwirut, C. J. Bechtolc and A. W. Ruff, 129 pages (Nov. 1976). Order from NTIS PB262020.

Key words: aluminum ultrasonic standards; ASTM-ty reference standards; calibration; fabrication variables; ir mersion testing; interim reference standard; longitudin waves; metallurgical variables; nondestructive evaluatio pulse echo; steel ultrasonic standards; titanium ultrason standards; ultrasonics.

A program to improve the quality, reproducibility and reliabi ty of nondestructive testing through the development of an i proved ASTM-type ultrasonic reference standards system described. Reference blocks of aluminum, steel, and titanium a loys are considered. Equipment representing the state-of-the-a in laboratory and field ultrasonic equipment was obtained a evaluated. RF and spectral data on twenty-two sets of ultrason reference blocks were taken as part of a task to quantify t variability in response from nominally identical block Techniques for residual stress, preferred orientation, and micro tructural measurements were refined and applied to referen blocks rejected by manufacturers during fabrication in order evaluate the effect of metallurgical condition on block respons The effects of certain dimensional variables on block respon

ere studied and new fabrication techniques considered. A udy of the effects of measurement system variables on block sponse was carried out. A calibration service for ASTM E127- pe reference blocks has been established and the development a loaner service for calibration blocks is underway.

BSIR 76-985. **A computer model to determine low cost techniques to comply with the Privacy Act of 1974,** R. C. Goldstein and H. H. Seward, 57 pages (Feb. 1976). Order from NTIS as PB250755.

Key words: computer model; computer security; confidentiality; cost model; data security costs; PL-93-579; privacy; Privacy Act of 1974; privacy compliance techniques; privacy costs; privacy model; security costs.

This document contains a complete description of the steps ecessary to run the Cost of Privacy Model along with a descripon of the computer program which implements the Model. This ocument describes the general system requirements for running e program, how to input information to the Model and how to terpret the output.

The Model, which was developed for the National Bureau of tandards by the D.P. Management Corporation of Lexington, lass., accepts inputs about personal data systems, utilizes algorithms to provide incremental resources required to comply ith the Privacy Act of 1974, and applies cost factors to the sources to provide a cost estimate. Cost estimates of alternave compliance techniques can be generated. These can later be ompared by the user to determine a cost effective method of ompliance.

BSIR 76-986. **Building energy authority and regulations survey: State activity,** R. M. Eisenhard, 52 pages (Jan. 1976). Order from NTIS as PB250858.

Key words: authority; building; energy; legislation; regulations; state.

This report provides the status of State authority to regulate nergy use in new buildings and the status of bills creating such uthority that were pending in the 1975 legislative session. Regutions that have been developed are identified and described. egislation relating to solar energy, retrofitting, insulation and ther building energy matters, is identified and the status inicated.

BSIR 76-987. **Effect of insulation on the surface temperature of roof membranes,** W. J. Rossiter, Jr. and R. G. Mathey, 20 pages (Feb. 1976). Order from NTIS as PB250857.

Key words: built-up roofing; insulation; performance; radiative cooling; roofing; solar heating; surface temperature.

The surface temperatures of black, gray and white roofs were alculated for various thicknesses of insulation located between he membrane and roof deck. The calculations were performed sing a steady-state heat balance equation to illustrate the inrease in roof surface temperatures due to solar radiation.

The calculations indicate that the first increment, about 1 inch 25 mm), of insulation causes a significant rise in the roof surface emperature due to solar radiation. Increasing the amount of inulation above this first increment to greater thicknesses does ot appreciably increase the roof surface temperature.

NBSIR 76-988. **Regional seminar on a system of standardization and metrology for Latin America,** H. S. Peiser and R. S. Marvin, Eds., 100 pages (Feb. 1976). Order from NTIS as PB254469.

Key words: AID; assistance; certification programs; education of metrologists; industrializing nations; LDC's; metrology.

This report contains the papers presented at the first of a series of Regional Seminars, organized under the technical guidance of NBS and sponsored by the U.S. Agency for International Development and the Direccion General de Normas y Tecnologia of Bolivia. The Seminar was held at La Paz on the 24th and 25th of June, 1974, with participants from Bolivia, Brazil, Chile, Ecuador, Korea, Peru, Turkey, Thailand, and the United States of America. The Seminar was organized into four sessions, each of one-half day duration, covering: Session I, "Interactions for Information"; Session II, "Interactions for Standards"; Session III, "Interactions for Solutions to Technical Problems"; and Session IV, "Interaction for Training."

NBSIR 76-990. **Report of fire tests on eight TGS semiconductor gas sensor residential fire/smoke detectors,** R. G. Bright, 17 pages (Apr. 1976). Order from NTIS as PB251769.

Key words: detectors; fire detectors; gas detectors; smoke detectors; Taguchi gas sensors.

At the request of the Bureau of Engineering Sciences Consumer Product Safety Commission, twenty-four Taguchi gas sensor (TGS) detectors, representing eight manufacturers were tested to the requirements of Section 22 (base sensitivity tests) and Section 24 (full-scale fire tests) of Underwriters' Laboratories Standard No. 217, "Standard for Single and Multiple Station Smoke Detectors." Two conventional single-station smoke detectors, one an ionization chamber type and the other a photoelectric type, were included in the test series for comparison. Only one of the TGS detectors was able to meet the requirements of Section 22, base sensitivity tests. None of the TGS detectors were able to meet the requirements of Section 24, full-scale fire tests. The two conventional smoke detectors met the requirements of Section 22 and 24.

NBSIR 76-991. **Evaluation of transparent electro-photographic film and camera system,** T. C. Bagg, 8 pages (Jan. 1976). Order from NTIS as ADA021255.

Key words: add-on films; information storage; microforms; transparent electrophotographic material.

On behalf of the Naval Supply Systems Command, the National Bureau of Standards was requested to assist in the evaluation of new microfilm techniques and materials which permit the adding-on of images at various times. This is an interim report on the initial evaluation of the AB Dick/Scott System 200 which uses transparent electrophotographic materials.

NBSIR 76-992. **Studies of deformation at sliding wear tracks in iron,** A. W. Ruff, 70 pages (Feb. 1976). Order from NTIS as ADA021295.

Key words: electron channeling; iron; metals; plastic deformation; surfaces; wear.

Determinations of strains have been made on the surface and subsurface on specimens of high purity iron after different amounts of sliding wear have taken place. The method involved the measurement of loss of intensity (contrast) of particular electron channeling lines obtained from small selected areas near the wear track. Through the use of a calibration specimen deformed plastically to a range of strain values, the channeling line contrast loss was related to plastic strain. Strain maps lateral to the wear track and below the original surface were obtained for different total sliding distances by removing controlled thicknesses of iron using electropolishing. In all cases the maximum strain was found at the track center location at the surface and the strains

decreased steadily with depth below the track. At 50 g load the strains vanished at about 40 μm depth. Significant strains were found to exist outside the wear track boundaries. The results are compared with other studies previously reported. There was no indication of a soft or less hardened surface layer in any of the specimens studied.

NBSIR 76-993. **The calibration of a pentaprism,** C. P. Reeve and R. C. Veale, 33 pages (Jan. 1976). Order from NTIS as PB253227.

Key words: autocollimator; calibration; constant deviation prism; geometrical model; optical square; pentaprism; reflection; refraction; standard deviation; uncertainty.

A pentaprism, or optical square, is one of a class of objects known as "constant deviation prisms" whose purpose is to bend a beam of light exactly 90° regardless of the angle of incidence of the light. It is used in many optical measurements where the line of sight or a beam of light must be turned at a right angle. The calibration process which is described is fairly simple and requires two mirrors, two autocollimators, and a surface plate. Consideration is given to the effects of small angular errors in both the internal geometry of the pentaprism and the positioning of the pentaprism relative to an autocollimator. An example of the calibration of the important pentaprism parameters is given. A simple statistical test is employed for testing whether the measurement system is in control.

NBSIR 76-996. **Testing for the impact resistance of ophthalmic lenses,** R. E. Berger, 34 pages (Mar. 1976). Order from NTIS as PB251998.

Key words: drop ball test; impact resistance; ophthalmic lens; proof testing; research associate program; sampling test.

The principal findings of the Optical Manufacturers Association's Research Associate Program are summarized. The limitations of the present drop ball test for impact resistance are discussed. Essentially, only a small part of the lens surface and a small part of the edge are subjected to sufficiently high stresses. It is therefore desirable to replace the drop ball test with a sampling procedure from which meaningful information on lens quality can be obtained. Some aspects of the design of a sampling plan, in which the overall quality of a laboratory's lenses is monitored by periodically testing a set of coupon lenses, are discussed.

NBSIR 76-997. **Proceedings of procurement practices symposium—Health care, October 14-16, 1975,** J. G. Berke, Ed., 82 pages (Feb. 1976). Order from NTIS as PB254298.

Key words: certification programs; ETIP; incentives; innovation; life cycle costing; medical products and standards; procurement policies; product testing; specifications; unsolicited proposals; VA.

The general objectives of the conference were to investigate ways for improving interaction between health care personnel and the manufacturers of hospital products and systems, so that the demands of all hospitals for improved and innovative products and systems can be more adequately met; to explore various means available for encouraging innovation and more efficient technological change: from initial research, through product development, user testing and evaluation, marketing and purchasing, to post-delivery assistance for the using services; to develop approaches that will permit hospitals to acquire the latest technologies more expeditiously and economically through the procurement process. Workshops were organized to consider procurement mechanisms, information interchange, testing and evaluation of medical products, and the interrelationshi between marketing, R&D and procurement. Workshops wer grouped as follows: (1) Interaction Between the Hospital Us and the Industry Supplier, (2) Research and Development fo Innovative Products, (3) Product Testing and Evaluation, (4 Specifications, (5) Post Delivery Performance, Warranties an Training by Vendors, (6) Cost Saving and Quality Improvemer Through Innovative Products.

NBSIR 76-998. **Development of a solid sorption tube and analyt cal procedure for hydrogen cyanide in the workplace a mosphere,** B. C. Cadoff and J. K. Taylor, 25 pages (Ap 1976). Order from NTIS as PB253228.

Key words: air analysis; air sampling; gas analysis hydrogen cyanide; industrial hygiene; ion selective ele trode; sodium hydroxide; work atmosphere.

The development of a sampling tube for collecting HCN in th workplace atmosphere is described. The tube contains 4.0 g c flake NaOH and can be readily fabricated in the laboratory. Details are given concerning the construction and use of the tub and data is presented on collection of HCN at levels of five time the TLV, one fifth the TLV, and at the TLV. Analysis of th tube contents using the cyanide ion selective electrode i described. This method is simple, rapid, and relatively free of in terferences. Data on the analyses of tubes containing cyanide i described and estimates of the precision and accuracy of th method are given.

NBSIR 76-1000. **The construction, operation and performance a reactive gas generator; with specific application to HCHO CH_3CHO, CH_2CHCHO, SO_2, HCN and HCl production,** J. A Walker and W. Tsang, 55 pages (Jan. 1976). Order from NTI as PB251219.

Key words: acetaldehyde; acrolein; formaldehyde; ga chromatography; hydrogen chloride; hydrogen cyanide; po lution; pyrolysis; reactive gas generator; sulfur dioxide.

An instrument capable of generating a variety of reactive gase in trace levels has been constructed and tested. Operation details, with specific application to HCHO, CH_3CHO CH_2CHCHO, SO_2, HCN and HCl production are discussed.

NBSIR 76-1002. **Industrial process data for fluids: A survey current research at the National Bureau of Standards,** H. White, Jr., Editor, 55 pages (Apr. 1976). Order from NTIS a PB257469.

Key words: industrial process data; project summaries quantitative numerical data.

This report summarizes current activities sponsored by thre groups within the National Bureau of Standards that are in volved with the production of industrial process data for fluids The three groups involved are the Cryogenics Division, th Equation of State Section of the Heat Division, and the Office c Standard Reference Data; other organizations in NBS and ou side are also involved in various ways. The report takes the for of a listing of projects with some detailed information about eac Some of the projects are designed to provide industrial proces data directly. Others systematically cover types of data that ar of continual utility in industrial process calculations with th result that the data produced will be used for industrial purpose as well as for other purposes. A few of the projects attac problem areas that must be resolved before proper industri process data in the area can be obtained. All of the projects focu on quantitative numerical data obtained for direct measuremen critical evaluation of data from the literature or theoretical est mation or calculation. This report has been prepared to show ir

rested readers the interrelationships within a set of projects at might otherwise pass unnoticed because different organizational units within NBS are involved. Continued interaction tween the program managers involved leads to interactions tween the projects so that the listing is not a listing of independent unreacting projects but rather a listing of interacting projects following broad programmatic lines.

BSIR 76-1003. **Thermal conductivity and electrical resistivity of six copper-base alloys,** M. C. I. Siu, W. L. Carroll, and T. W. Watson, 22 pages (Mar. 1976). Order from NTIS as PB251211.

Key words: copper-base alloy properties; electrical resistivity; Smith-Palmer equation; thermal conductivity.

Measurements of the thermal conductivity, λ, and electrical sistivity, ρ, of oxygen free copper and six copper-base alloys in e temperature range 298 to 924 K are presented. Except for pper, the λ and ρ values of copper alloys having the same emical composition as those given in this paper have not been eviously reported. The measured values of λ(W·m^{-1}·K^{-1}) and Ω·m) were found to conform, within 10 percent, to the predicons of the Smith-Palmer equation, $\lambda=2.39\times10^{-8}$ T/ρ+7.50 W·m^{-1}·K^{-1}], where T is the thermodynamic temperature expressed in kelvins.

BSIR 76-1007. **Psychological deterrents to nuclear theft: A preliminary literature review and bibliography,** P. G. Meguire and J. J. Kramer, 51 pages (Mar. 1976). Order from NTIS as PB252021.

Key words: behavioral impact; cognitive processes; nuclear weapon theft; perceptual processes; psychological deterrence; security systems; sensory processes; threat analysis.

A review of the *unclassified* literature dealing with psychological deterrents was conducted for the Defense Nuclear Agency DNA). Its purpose was to identify techniques that might be useful in DNA's Forced-Entry Deterrent Systems (FEDS) Program for psychologically deterring nuclear weapon theft. The view indicates that while human psychological processes (sensory, perceptual, and cognitive) can be manipulated by various means, definitive empirical data are lacking which *directly* relate deterring nuclear weapon theft. Behavioral impact research hould be undertaken by DNA to (1) ascertain the deterrence alues of the many techniques identified and (2) test the ypotheses implicit in the FEDS concept.

BSIR 76-1008. **Energy conservation through the facilitation of increased blended cement use,** P. W. Brown, J. R. Clifton, and G. Frohnsdorff, 28 pages (Feb. 1976). Order from NTIS as PB251218.

Key words: blast furnace slag; blended cements; energy conservation; fly ash.

About 95 percent of the cement produced in the United States portland cement and its manufacture requires about 2 percent f the energy consumed annually in the nation's industrial rocesses. The production of blended cements containing subantial amounts of fly ash or blast furnace slag and their subitution for portland cement appears attractive from the standoint of energy conservation. While production and utilization of lended cements in other industrialized countries is extensive, lended cements account for less than 1 percent of the total ceent production in the U.S. The reasons for the small U.S. roduction of blended cements are discussed in the contexts of tandards revision and the need for the development of addional data as a basis for this revision.

NBSIR 76-1010. **Optical materials characterization,** A. Feldman, D. Horowitz, R. M. Waxler, I. H. Malitson, and M. J. Dodge, 27 pages (Feb. 1976). Order from NTIS as PB250654.

Key words: birefringence; elastooptic constants; infrared-laser window materials; interferometry; KCl; photoelasticity; piezo-optic constants; refractive index; stress-optical constants; thermal coefficient of refractive index.

Refractive index and the photoelastic constants have been measured on specimens of reactive atmosphere processed (RAP) KCl and KCl nominally doped with 1 percent KI. The refractive indices were measured by the minimum deviation method in the wavelength range 0.25 μm to 15.5 μm. Measurements were made near 20 and near 34 °C on the RAP specimen and near 20 °C on the doped specimen. Each set of experimental data was fitted to a three term Sellmeier-type dispersion equation. The temperature coefficient of index was then computed for the RAP KCl. The data for the different types of KCl were compared to each other and to earlier reported data on commercial KCl. The piezo-optical constants q_{11}, q_{12} and q_{44} and the elasto-optical constants p_{11}, p_{12} and p_{44} were obtained at 10.6 μm for the RAP and doped KCl. The measurements required the use of a modified Twyman-Green interferometer capable of measuring fringe shifts ~0.002 of a wave. Within experimental error the coefficients of the two materials agree. Negligible dispersion was found for q_{11}, q_{12}, p_{11} and p_{12} between the visible and 10.6 μm while a small dispersion was found for q_{44} and p_{44}.

NBSIR 76-1011. **Exploratory study of glowing electrical connections,** W. J. Meese and R. W. Beausoliel, 30 pages (Oct. 1976). Order from NTIS as PB259641.

Key words: arcing/sparking; branch circuit; contact resistance; electrical connections; fire hazard; glowing electrical connections.

This report describes and characterizes with quantifiable electrical and thermal measures the extent to which loose electrical connections in residential-type branch circuits have overheated in the laboratory. With loose electrical connections, which conceivably could be inadvertently duplicated in field installations, but with otherwise normal installation and operating conditions, visible glows have been observed under laboratory test conditions in nominal 120-volt, 15 and 20 ampere branch circuits with both copper and aluminum wire. Characteristics of the glow condition are differentiated from arcing/sparking as sometimes observed in making or breaking electric circuits.

Glowing electrical connections may dissipate as much as 35 watts of power with a current of 15 amps in the circuit and as much as 5 watts with a current of 0.8 amp in the circuit. Temperatures over 750 °F were measured on the "break-off tab" of receptacles. Metal outlet boxes housing glowing connections in an insulated wall test set-up representative of a common type of residential construction attained temperatures in excess of 450 °F. In laboratory tests under repetitive, intermittent and periodic cycles, a connection on a steel wire-binding screw of a receptacle open to the air had sustained glow conditions maintained for over 100 hours. Glowing connections will not perceptibly affect the electrical performance function of lights, appliances or other electrical loads, and will not "blow" fuses, trip circuit breakers or operate ground fault circuit interrupters.

NBSIR 76-1012. **Fire performance testing of bulkhead insulation systems for high strength to weight ship structures,** B. T. Lee. 64 pages (Aug. 1976). Order from NTIS as PB257197.

Key words: aluminum bulkhead; combustion gases; fire endurance; insulation; intumescent paint; potential heat; reinforced plastic; small furnace test; smoke.

Sixteen insulated aluminum bulkhead specimens were subjected to a material screening process as well as evaluated for their comparative fire performance with a 2-foot horizontal slab furnace. Two insulated and two unprotected glass-reinforced plastic specimens were also tested to obtain fire performance data on these structural materials. In addition, painted aluminum and steel panel specimens were included to determine the fire protective merits of two types of intumescent paints. Potential heat release, smoke, and combustion gas generation were also determined for the insulation and coating materials. Specimens insulated with organic base foams released high levels of combustion gases and could contribute considerable heat to an ongoing fire. Specimens insulated with either refractory fibrous material or with mineral wool gave the best overall performance. The same thickness of insulation needed to protect an aluminum panel for over an hour can provide up to 20 minutes of protection for a glass-reinforced plastic panel of the same thickness. The intumescent paints did little to protect the specimens during the fire exposure. Parameters of insulation thickness, heat capacity, density, and thermal conductivity as well as fire duration on specimen temperature were analytically investigated.

NBSIR 76-1013. **Flame spread of carpet systems involved in room fires,** K. M. Tu and S. Davis, 42 pages (June 1976). Order from NTIS as PB256130.

Key words: carpet systems; carpets; fire safety; flame spread; floor coverings; flooring radiant panel test; ignition sources; pill test; room fires.

This study was designed to test the hypothesis that given a situation where a chair or other item of furniture becomes the first item to burn in a room (providing the ceiling and walls are noncombustible), there is little reason to expect involvement of the carpet in the fire beyond the immediate vicinity of the burning object. Four small-sized carpet fire tests and eight full-scale burn room fire experiments were conducted. Experimental data for temperature distribution and incident heat flux to the floor covering were measured in the rooms. General analysis of the experimental results obtained shows this to be the case. It also is evident that the critical radiant flux of the floor covering system is predictive of the extent of burning. From this study, carpet systems used in rooms will not normally spread fire provided they meet the requirements of DOC FF 1-70 (the pill test).

NBSIR 76-1014. **Space heater involvements in fabric fires,** W. D. Hayes, Jr., 25 pages (Mar. 1976).. Order from NTIS as PB251414.

Key words: burns; fabric fires; FFACTS; garments; ignition sources; space heaters.

Space heaters are number six in the ranking of most frequently involved direct fabric ignition sources in the Flammable Fabrics Accident Case and Testing System (FFACTS). Eighty-two of the 1573 direct fabric ignition incidents in FFACTS were caused by space heaters. Gas heaters were responsible for 83 percent of all direct garment ignitions where heater type was known. Nightgowns, dresses and robes account for 82 percent of all the garment items directly ignited. Forty-seven percent of the direct garment ignition incidents would probably not have occurred if the presently existing fabric flammability standards had been in effect at the time.

NBSIR 76-1015. **Management of data elements in information processing.** Proceedings of a Second Symposium Sponsored by the American National Standards Institute and by the National Bureau of Standards, October 23-24, 1975, NBS, Gaithersburg, Md., H. E. McEwen, Ed., 263 pages (Apr. 1976). Order from NTIS as PB249530.

Key words: American National Standards; American National Standards Institute; data; data base systems; data elements; data management; data processing; Federal Information Processing Standards; information interchange; information processing; information systems.

Continuing technological advances in computers and communications make possible the integration of data systems and the exchange of data among them on an expanding scale. However, the full effect of these advances cannot be realized unless the need for uniform understanding of the common information (data elements) and their expression in data systems is recognized and a means provided to effectively manage this information. The increasing interrelationships among the data systems of Federal, State and local governments, and with industry and the public add emphasis and dimension to the need for the improved management of data elements in information processing.

These Proceedings are for the second Symposium on the Management of Data Elements in Information Processing held at the National Bureau of Standards on October 23-24, 1975. Over 300 representatives of Federal and State governments, industry and universities from 29 states, from Japan, and the United Kingdom were in attendance. Twenty-nine speakers discussed the role of the data manager, communications needs for data standards, data element directories, standard codes for character and control, use of check characters, data elements in bibliographic data bases, product coding, coding for clinical medicine, human factors, data resource management, data base management systems, and other subjects related to data standardization and data management efforts. *These proceedings include the following papers (indented):*

On-line tactical data inputting: Research in operator training and performance, I. Alderman, *NBSIR 76-1015,* pp. 1-8 (Apr. 1976).

"Turning the Corner" on MIS, a proposed program of data standards in post-secondary education, D. R. Arnold, *NBSIR 76-1015,* pp. 9-16 (Apr. 1976).

ASCII—The data alphabet that will endure, R. W. Bemer, *NBSIR 76-1015,* pp. 17-22 (Apr. 1976).

Techniques in developing standard procedures for data editing, G. W. Covill, *NBSIR 76-1015,* pp. 23-43 (Apr. 1976).

An adaptive file management system, D. L. Dance and U. W. Pooch, *NBSIR 76-1015,* pp. 45-55 (Apr. 1976).

A focus on the role of the data manager, R. M. Davis, *NBSIR 76-1015,* pp. 57-60 (Apr. 1976).

A proposed standard routine for generating proposed standard check characters, P. A. Desjardins, *NBSIR 76-1015,* pp. 61-67 (Apr. 1976).

Methodology for development of standard data elements within multiple public agencies, L. D. England, S. L. Eberle, B. H. Schiff, and A. S. Huffman, *NBSIR 76-1015,* pp. 69-76 (Apr. 1976).

The role of the internal auditor in data management, R. H. Fahnline, *NBSIR 76-1015,* pp. 77-81 (Apr. 1976).

Semantic coding and data element characterization in medical computing, E. R. Gabrieli, *NBSIR 76-1015,* pp. 83-89 (Apr. 1976).

Principles and concepts of data resource managment system development, A. Hochman, *NBSIR 76-1015,* pp. 91-98 (Apr. 1976).

The design of data elements: A data base perspective, M. A. Huffenberger, *NBSIR 76-1015,* pp. 99-112 (Apr. 1976).

A challenging aspect of word processing, V. G. Kehler, *NBSIR 76-1015,* pp. 113-118 (Apr. 1976).

Data element lexicon needs a new home, R. J. Kirkbride, *NBSIR 76-1015,* p. 119 (Apr. 1976).

Check characters and the "Self-Checking String"—What, where, why, when and how, J. R. Kraska, J. R. Nelson, and E. Hellerman, *NBSIR 76-1015,* pp. 121-138 (Apr. 1976).

The standards implications of the developing interrelationships between on-line bibliographic retrieval, data manipulation and micrographics display, R. M. Landau, *NBSIR 76-1015,* pp. 139-145 (Apr. 1976).

Product coding-one number from maker to user, J. T. Lanigan, *NBSIR 76-1015,* pp. 147-150 (Apr. 1976).

Development of a data dictionary/directory using a data base management system, E. K. C. Lee and E. Y. S. Lee, *NBSIR 76-1015,* pp. 151-162 (Apr. 1976).

Systems design considerations for the U.S. Army Materiel Command (AMC) data element dictionary/directory system, F. Puente, *NBSIR 76-1015,* pp. 163-167 (Apr. 1976).

A data element directory for a state motor vehicles agency, J. Roberts, *NBSIR 76-1015,* pp. 169-190 (Apr. 1976).

An integrated dictionary for systems and data components, C. Shields, *NBSIR 76-1015,* pp. 191-193 (Apr. 1976).

An information documentation language: A framework for deriving information from data, W. M. Taggart, Jr., *NBSIR 76-1015,* pp. 195-210 (Apr. 1976).

International standards for data transmission, V. N. Vaughan, Jr., *NBSIR 76-1015,* pp. 211-220 (Apr. 1976).

An information management view of data management, M. G. Wallis, *NBSIR 76-1015,* pp. 221-230 (Apr. 1976).

Data standardization, H. S. White, Jr., *NBSIR 76-1015,* pp. 231-235 (Apr. 1976).

Data element analysis and use of a relational data, M. E. Williams, S. Preece, and S. Rouse, *NBSIR 76-1015,* pp. 237-252 (Apr. 1976).

Status of the Army Materiel Command's progression from reports control to data element management, E. F. Young, *NBSIR 76-1015,* pp. 253-256 (Apr. 1976).

NBSIR 76-1016. **Mobile home smoke detector siting study,** W. M. Gawin and R. G. Bright, 55 pages (May 1976). Order from NTIS as PB254177.

Key words: detector sensitivity; fire detectors; mobile homes; photoelectric smoke detectors; smoke detector installation; smoke detector placement; smoke detectors.

An investigation was conducted to evaluate the significance of smoke detector locations to response time for a specific set of fire conditions in a mobile home. Parameters having the potential of affecting response time include: the physical location within the mobile home such as inside wall vs. outside wall or wall vs. ceiling installations; the impact of air circulation resulting from the operation of the heating, ventilating, and air-conditioning system; and the basic detector parameter of smoke detector alarm threshold. For the study only photoelectric-type smoke detectors were used. These detectors utilize the Tyndall Effect in their sensing mechanism. This limitation was imposed to limit the number of variables. Detector response was evaluated for fires in both smoldering and flaming modes. The results of the study provide a case for wall installations as opposed to ceiling installations. Further, inside wall installations may be marginally superior to outside wall installations. The most significant finding of the study suggests that, when in operation, the forced-air circulating system has a major delaying effect on detector response time to a given fire size.

NBSIR 76-1017. **Interaction of blood proteins with solid surfaces,** R. R. Stromberg, B. W. Morrissey, L. E. Smith, W. H. Grant, and R. E. Dehl, 38 pages (Mar. 5, 1976). Order from NTIS as PB251917.

Key words: adsorption; blood protein; bound fraction; ellipsometry; implants; polymer adsorption; protein adsorption; synthetic implants.

The overall objective of this investigation is to help characterize materials used for implants in the cardiovascular system and to develop test methods to aid in the selection of the most useful materials. The focus of the work has been an investigation of the adsorption of blood proteins on surfaces with special emphasis on changes in conformation occurring upon adsorption. An important component has been an ellipsometric examination of materials produced by contractors of the NHLI Biomaterials Program that were considered to be of potential clinical value. In contrast to the behavior of serum albumin and prothrombin, conformational changes in γ-globulin and β-lactoglobulin occurring as a consequence of changing surface population were previously reported and were confirmed during this reporting period. An investigation of conformational changes at very short adsorption time was initiated. Adsorption, desorption and exchange of adsorbed protein in solution was studied. The results indicate strong hydrophobic bonding between the protein and the synthetic polymer surface.

NBSIR 76-1018. **Evaluation of the fire performance of carpet underlayments,** S. Alderson and L. Breden, 69 pages (Sept. 1976). Order from NTIS as PB257779.

Key words: carpets; fire; flammability; floor coverings; pad; underlayments.

A series of carpet underlayments was evaluated for fire performance in a corridor configuration using the same carpet in all tests. Carpets with underlayments flashed over during corridor tests. In a series of small-scale tests, such as the smoke density chamber and the radiant panel, the flammability properties of the carpet tended to mask the flammability properties of the underlayment. The exception to this masking effect was the results from the flooring radiant panel test where the thermal conductivity of the underlayment influenced the burning characteristics of the carpet. High concentrations of toxic combustion products were observed at the time of flashover in the corridor, with both cellulosic and synthetic underlayments. Smoke optical density values for the various carpet plus underlayment combinations were approximately the same in the flaming mode, except for the integral pad system which has a higher value.

NBSIR 76-1019. **Notes on the preparation of silicon density artifacts,** R. M. Schoonover, 11 pages (Feb. 1976). Order from NTIS as PB251944.

Key words: density; etching; grinding; sawing; silicon; standard; weighing.

The preparation of single crystal silicon density standards as normally done at the National Bureau of Standards is described.

This description is designed to guide other laboratories in construction of these standard artifacts and to facilitate their intercomparison.

NBSIR 76-1020. **Guide criteria for laboratory evaluation of backflow prevention devices for protection of potable water supplies,** G. C. Sherlin, R. W. Beausoliel, and L. S. Galowin, 44 pages (Mar. 1976). Order from NTIS as PB258256.

Key words: backflow; backflow prevention devices; back pressure; backsiphonage; guide criteria; potable water protection; plumbing guide criteria.

This report describes laboratory evaluation procedures which could be required for the approval of backflow prevention devices used to protect potable water supplies against contamination. Performance-based requirements, criteria, and general evaluation considerations that administrative authorities should require for approval of devices are presented. Recommendations for the development of tracer tests are submitted for further consideration. This document results from an investigation undertaken for the Environmental Protection Agency (EPA).

NBSIR 76-1021. **Fire spread along a mobile home corridor,** E. K. Budnick, 58 pages (July 1976). Order from NTIS as PB257101.

Key words: corridor fire test; interior finish material; intumescent coating; life safety; mobile home; smoke detector; surface flame spread.

A series of tests was conducted in the corridor area of a typically constructed mobile home. These tests were designed to: (1) evaluate the performance of a variety of combinations of wall and ceiling materials as a result of exposure to a typical ignition in a full-scale mobile home corridor, and (2) determine the relationship between full-scale tests and laboratory flammability tests, particularly the ASTM E-84 tunnel test, a measure of surface flame spread.

The tests were restricted to one set of conditions in which the living room at the end of the corridor was exposed to a fire resulting from ignition of a standardized 6.4-kg (14-lb) wood crib. Nine tests were conducted with seven different combinations of wall and ceiling materials.

Performance of the various combinations of wall and ceiling materials was examined based on the time to reach untenable conditions in the corridor. Measurements utilized in evaluating levels of tenability included gas temperatures, surface temperatures, irradiance, concentrations of oxygen and carbon monoxide, and smoke densities.

Under this set of test conditions, it was found that the extent of fire spread and the time to reach untenable conditions are significantly influenced by the surface flame spread characteristics of the wall and ceiling finish materials in the corridor.

For a mobile home corridor with conventional wall and ceiling linings (ASTM E-84:FSC = 200 max), untenable conditions were reached in the corridor in less than four minutes. With class A (FSC = 25 max) wall and ceiling materials in the corridor, untenable conditions were not reached.

NBSIR 76-1022. **Evaluation of thrown objects tests for proposed safety standard for power lawn mowers,** D. C. Robinson and R. B. Clough, 25 pages (June 1976). Order from NTIS as PB259628.

Key words: dispersion tests; lawn mowers; penetration tests; power lawn mowers; safety standard; thrown objects tests.

An evaluation was made of thrown objects dispersion and penetration tests which have been developed for a proposed safety standard for power lawn mowers. To evaluate the proposed laboratory dispersion tests, supplementary outdoor dispersion tests were conducted on walk-behind lawn mowers in which actual grass cutting conditions were simulated. A description of these outdoor tests, a comparison of the outdoor and laboratory dispersion tests for a sample of walk-behind lawn mowers, and an evaluation of the proposed dispersion and penetration tests is given. The evaluation includes a theoretical discussion of the penetration of thrown objects which is related to experimental results in terms of the shape, size and velocity of the thrown projectiles.

NBSIR 76-1023. **Direct comparisons of the NBS absorbed dose calorimeters irradiated with 20 and 50 MeV electrons,** S. R. Domen, P. J. Lamperti, and T. Mikado, 23 pages (July 1976). Order from NTIS as PB256191.

Key words: absorbed dose; calorimeter; calorimetric comparisons; electron beams.

Two NBS absorbed dose calorimeters were compared in 20 and 50 MeV electron beams that were scattered with lead foil of various thickness. The internal structures of the calorimeters are identical. The nonportable model is enclosed in a 40 cm × 40 cm × 30 cm thick graphite medium while a 30 cm diameter × 1 cm thick graphite medium was used to enclose the portable model. Measured results indicate that the three internal bodies of the calorimeters and their measuring circuits were constructed with sufficient care to produce essentially identical calorimetric responses to about 0.1 percent.

NBSIR 76-1024. **Statistical analysis of blood lead levels of children surveyed in Pittsburgh, Pennsylvania: Analytical methodology and summary results,** W. D. Urban, 75 pages (Apr. 1976). Order from NTIS as PB255876.

Key words: blood; blood lead; children; housing; lead paint; lead poisoning; surveys.

A survey was conducted in Pittsburgh, Pennsylvania to estimate the incidence of lead paint in housing and to develop a survey methodology that could be used in other metropolitan communities for that purpose. A secondary objective of the survey was to determine whether a causal relationship could be found between blood lead levels of children aged 7 years or less, living in the surveyed dwellings and the presence of lead paint in those dwellings. This report deals with the latter objective. For the children tested in Pittsburgh, the incidence of elevated blood lead levels defined as 40 micrograms of lead per 100 milliliters of blood or greater, was found to be less than 1 percent, too low to permit the establishment of a causal relationship. There was a significant correlation between the blood lead levels of the children living in the older homes and the fraction of contaminated surfaces within the dwellings. In addition, there was a significant correlation between the blood lead levels and the age of the dwellings in which the children resided. This correlation appeared to be independent of the lead paint levels in the dwellings. This report presents a summary of the survey procedures, the blood lead measurement process and associated problems and the more significant results of the analysis of the housing/blood lead data obtained in Pittsburgh.

NBSIR 76-1025. **Air-mobility rigid shelter systems,** T. W. Reichard and L. F. Skoda, 99 pages (Nov. 1975). Order from NTIS as PB251753.

Key words: durability; field inspection; foam and beam; honeycomb; impact; lightweight structures; military; reliability; sandwich panel; shelter.

This interim report covers the first portion of a long-range investigation dealing with the design and durability of lightweight, d structures (shelters) used by the military as combination pping containers and housing for tactical and life-support ses. This report covers the results of field and laboratory stus intended to correlate functional and structural problems h in-service conditions. It was found that water leakage into shelters and into the sandwich panels was probably the basic blem area although many shelters appeared to have been detive at the time of delivery. It was found that, under adverse nditions, a polyamid paper honeycomb core would be signifintly better for the sandwich panels than is the draft paper core w used. Major delaminations of the sandwich panels could not correlated with impact damage such as would be caused by klift bumps.

Subsequent reports will present the results from a structural alysis of and field test on shelters subjected to typical dynamic d static loading conditions.

BSIR 76-1027. **A survey of manufacturers' views on the ETIP procurement experiment. Volume three: Ranges,** P. C. Goodman, 33 pages (Feb. 1976). Order from NTIS as PB253243.

Key words: energy-efficient products; Experimental Technology Incentives Program; gas and electric ranges; life-cycle costing; procurement experiments.

This report describes the findings of a survey of nine gas and ctric range manufacturers by the Center for Consumer oduct Technology. The survey was conducted for the Experintal Technology Incentives Program (ETIP) as part of its aluation of a Federal Supply Service (FSS) procurement of nges. Survey questions were designed to obtain manufacturers' ews on the use of Government procurement policies to inease the rate of introduction of new technologies into the conmer marketplace. The questions covered the following areas: reasons for participation or nonparticipation of a manufacrer in the ETIP experiment; (2) problems a manufacturer enunters with existing Federal procurement practices; (3) ceptability of using life-cycle costing in the bidding procedure; d (4) effect of the most recent Government procurement on esent and future company operations. Results of the survey e reported, and implications are drawn for future ETIP studies Government procurement activities.

BSIR 76-1028. **A new concept for automatic detection and extinction of fires,** D. Lay, 20 pages (Mar. 1976). Order from NTIS as PB251415.

Key words: automatic sprinklers; carbon dioxide; fire detection; fire extinguishment; flame detection; heat detection; smoke detection.

The use of automatic fire detectors to trigger fire extinguishent systems has gone on for many years. Systems of this type e a variety of extinguishing agents including water, carbon oxide and, most recently, the halogenated agents.

Automatic extinguishing systems with practically an unlimited pply of agent suffer from the fact that these systems often conue in operation long after the fire is out resulting in additional mage. This doesn't occur with those systems having limited pplies such as carbon dioxide systems and the like. However, ese systems are only successful if: (1) their original design was rrect; (2) no unanticipated changes are made in the area or aterials to be protected; and (3) extinguishment commences at ime when successful extinguishment is possible.

This paper describes how the disadvantages recommended óve can be avoided, to a large extent, with a modified design r permanently-installed, automatic extinguishing systems and how systems can be provided which will only discharge extinguishant at the proper time and in the proper amount.

NBSIR 76-1029. **Unitary heat pump specification for military family housing,** C. W. Phillips, B. A. Peavy, and W. J. Mulroy, 30 pages (Aug. 1976). Order from NTIS as PB261199.

Key words: heating and cooling; military family housing; specification; unitary heat pump.

The purpose of this report is to establish, for unitary heat pump equipment, the requirements for performance, testing, rating, design, safety, serviceability and reliability for system and components; and conformance conditions. This report is intended for guidance in military procurement and applies to hermetic electrically-driven vapor-compression unitary heat pumps of the remote (split) and packages (integral) types, the air-to-air and water-to-air classes, and sizes from 17,000 to 84,000 Btu/hr for both heating and cooling functions.

NBSIR 76-1031. **Shape dependence of light-scattering behavior of dust particles,** R. Zerull, 23 pages (June 1976). Order from NTIS as PB253932.

Key words: aerosols; dusts; light-scattering; Mie theory; particles; Rayleigh scattering.

The most important characteristic which determines the light-scattering behavior of particles is their size distribution, their concentration, their shape, and their material composition. This paper concerns itself with the measurement of the effects of shape on light-scattering behavior. Only a few shapes have been appropriately modeled and if the shape dependence can be determined, the remaining characteristics pose no special difficulties.

NBSIR 76-1034. **Chemical thermodynamic properties of compounds of sodium, potassium and rubidium: An interim tabulation of selected values,** D. D. Wagman, W. H. Evans, V. B. Parker, and R. H. Schumm, 76 pages (Apr. 1976). Order from NTIS as PB254460.

Key words: enthalpy; entropy; Gibbs energy; heat capacity; potassium compounds; rubidium compounds; sodium compounds; standard reference data; thermochemical tables.

Selected values are given for the thermochemical properties of the more common compounds of sodium and potassium. A more extensive set of selections is provided for rubidium compounds. The properties included, where data are available, are enthalpy of formation at 0 K and 298.15 K, $\Delta Hf(0)$ and $\Delta Hf(298)$, Gibbs energy of formation, entropy and heat capacity at 298.15 K, $\Delta Gf(298)$, S(298) and Cp(298) and the enthalpy difference between O K and 298.15 K, H(298)-H(O). The values are consistent with the tables issued earlier in the NBS Technical Note 270 series.

NBSIR 76-1037. **Integral measurement procedures for determining particle size in aerosols,** F. J. Kraus, 38 pages (May 1976). Order from NTIS as PB253933.

Key words: aerosols; ionization chambers; light attenuation; scattered light; smoke detectors; test methods.

In assessing the performance of smoke detectors in the laboratory, it is necessary to have standardized smoke measurement devices which function according to the same principles as the smoke detectors under test. In developing these measurement devices, a need exists to determine, as precisely as possible, the effects of the smoke characteristics on the measurement devices. This paper presents the correlation between smoke characteristics and comparative measuring devices important in smoke detector test work and how these measuring devices can also be used as aerosol measuring devices.

NBSIR 76-1038. **NBS InterAgency transducer project, Progress Report No. 3,** P. S. Lederer and J. S. Hilten, 24 pages (Apr. 1976). Order from NTIS as PB251918.

Key words: calibration; dynamic; electronic flash; photoflash bulb; pressure; pressure measurement; pressure transducer; pressure transducer response; response; thermal transient; transducer; zero shift.

Concluding efforts related to the development of a test method for evaluating the effects of short-duration, thermal radiant-energy transients on pressure-transducer response are described. The method consists of monitoring pressure-transducer output (zero shift with the transducer at atmospheric pressure) as the transducer is exposed to radiation resulting from the ignition of a photographic flashbulb or from the discharge of an electronic flash. Thermal energy pulses as great as 0.1 J/cm², with durations of about 6 ms, have been generated using an electronic flash; pulses of up to 2.2 J/cm², with durations of about 37 ms, have been generated using No. 22 flashbulbs. Flood-flash FF-33 lamps were also investigated; their use is not recommended. In tests with No. 22 bulbs, 25 commercial pressure transducers have shown zero shifts ranging from 0.4 to about 400 percent of the full-scale output.

Transducer-related tasks being performed for other agencies are also described briefly, and other recent NBS publications of interest to the transducer community are identified.

NBSIR 76-1039. **Evaluation of selected connectors for aluminum wire in residential structures,** O. B. Laug, 37 pages (Mar. 1976). Order from NTIS as PB254047.

Key words: aluminum wire; splices; terminals.

Systems of connecting aluminum wire for possible use in receptacle outlets and elsewhere in 15 and 20 ampere branch circuits in residences are available as practical alternatives to the presently used mechanisms such as the wire binding screw and the twist-on "wire nut" connector. The alternative systems are based on the principle of high deformation of the wire in the connection to achieve more permanent metal-to-metal fittings and/or wire splice devices of several designs. They involve either crimping the device around the wire or swagging the wire into the device with special tools. Based on tests, basic connection performance of several high-deformation connectors has been established. The results indicate that certain designs of connectors operate with stability and without dangerously over-heating under accelerated laboratory tests. The tools, however, to be used to crimp terminals are not only bulky and awkward to use but quite expensive. Moreover, they must be correctly coordinated with the terminals and sizes of wires used. There is danger that a misadjusted or improper tool and/or terminal may be used with particular wire or wires which could result in a poor connection. Some improvements in the design of the assembly tools and in the devices themselves would reduce certain installation difficulties encountered during testing, and certain connectors could be slightly modified to avoid human errors during assembly. Use of these systems and conformance with established codes and standards do not appear to present major problems.

NBSIR 76-1040. **Points of view in testing flame detectors,** M. Schnell, 24 pages (May 1976). Order from NTIS as PB254178.

Key words: detection; fire detectors; flame detectors; heat detectors; infrared detectors; smoke detectors; testing; ultraviolet detectors.

The general principles for type testing the fire detectors which are already in use in the assessment of heat and smoke detectors are summarized. These include the so-called basic tests and th trial tests. The trial tests were intended to include all test fires i order to ensure comparability of tested fire detectors. Addition test fires are proposed which are intended to permit di ferentiated comparison of flame detectors between one anothe The main problem in assessing the performance of flame dete tors during environmental influences is the selection of a suitab radiation source for reproducibly simulating the characteristi "flame." The requirements that this radiation source must fulfi are dealt with and various realizations involved are discusse The practical testing of infrared flame detectors to the basic tes is described. In addition, a suggested test apparatus for u traviolet flame detectors is dealt with.

NBSIR 76-1041. **Security analysis and enhancements of comput operating systems,** The RISOS Project, Lawrence Livermo Laboratory, 70 pages (Apr. 1976). Order from NTIS a PB257087.

Key words: BBN-TENEX; IBM OS/360; operating syste security; security flaws; software security; taxonomy of i tegrity flaws; UNIVAC 1100 Series OS.

The protection of computer resources, data of value, and i dividual privacy has motivated a concern for security of EDP i stallations, especially of the operating systems. In this repo three commercial operating systems are analyzed and securit enhancements suggested. Because of the similarity of operatir systems and their security problems, specific security flaws a formally classified according to a taxonomy developed her This classification leads to a clearer understanding of securi flaws and aids in analyzing new systems. The discussions security flaws and the security enhancements offer a startir reference for planning a security investigation of an EDP insta lation's operating system.

NBSIR 76-1043. **An economic analysis of residential abando ment and rehabilitation,** P. F. Colwell, 111 pages (May 197 Order from NTIS as PB254347.

Key words: housing; housing demand, supply, needs; hou ing rehabilitation; land economics; market adjustments; o timization and feasibility; rehabilitation, conservation.

This paper is an analysis of market and governmental facto which lead to socially inefficient rehabilitation and abandonme decisions. Its purpose is to abstract from complex problems r lated to the rehabilitation and abandonment of residenti buildings by identifying the essential characteristics of t problems and the role some past and existing social prograr have had on aggravating or mitigating these problems. Altern tive programs are analyzed for their potential effects on the problems, however policy recommendations are not made.

NBSIR 76-1046. **Improved building design through the psychol gy of perception: Perceptual selectivity applied to livability a safety with sample performance requirements,** N. Starnes, Wehrli, and R. Cormack, 103 pages (July 1976). Order fro NTIS as PB256476.

Key words: architectural psychology; architectu research; building research; building safety; perceptio stair safety research.

For over a decade, architects have been calling for applic tions from social science which would contribute to buildi design better suited to the building's users. This report provid such applications relying upon the state-of-the-art knowledge the psychology of perception, showing how human percepti operates in the everyday use of buildings, and then drawing up this rationale to present building requirements to guide t

design and construction of safer stairs in future buildings. The building safety "requirements" have been written in the format and style of the *Guide Criteria for the Design and Evaluation of Innovative Housing Systems*, a housing performance specification written by NBS for HUD's large housing experiment, Operation Breakthrough. The report is directed toward both building designers (who could consider the use of the stair safety requirements for their own building projects) and architectural psychology researchers (who could take the proposed requirements as a set of hypotheses in further research and experimentation).

NBSIR 76-1049. **The electron factor in catalysis on metals electrocatalysis on nonmetallic surfaces,** L. H. Bennett and A. D. Franklin, 71 pages (May 1976). Order from NTIS as PB256600.

Key words: catalysis; electrocatalysis; electrochemistry; electrodes; fuel cells; surface physics and chemistry.

Two related workshops were held at the National Bureau of Standards in Gaithersburg, MD, December 9-12, 1975, in topics of importance for energy conversion. These topics, concerned with some of the science underlying the development of fuel cells for electric utility use, are: (1) The Electron Factor in Catalysis in Metals; and (2) Electrocatalysis on Non-Metallic Surfaces.

This report includes discussions of the needs and expected benefits, lists of attendees, descriptions of the programs, and summaries of the major problems, advances, and opportunities revealed by the workshops.

NBSIR 76-1050. **Tornado-borne missile speeds,** E. Simiu and M. Cordes, 63 pages (Apr. 1976). Order from NTIS as PB253111.

Key words: missiles; nuclear engineering; structural engineering; tornadoes; wind.

At the request of the U.S. Nuclear Regulatory Commission (NRC) the National Bureau of Standards (NBS) has carried out an independent investigation into the question of tornado-borne missile speeds, with a view to assisting NRC in identifying pertinent areas of uncertainty and in estimating credible tornado-borne missile speeds—within the limitations inherent in the present state of the art. The investigation consists of two parts: 1) a study, covered in this report, in which a rational model for the missile motion is proposed, and numerical experiments are carried out corresponding to various assumptions on the initial conditions of the missile motion, the structure of the tornado flow, and the aerodynamic properties of the missile; 2) a theoretical and experimental study of tornado-borne missile aerodynamics, conducted by Colorado State Univ. (CSU) under contract with NBS, to be covered in a separate report by CSU. In the present report, the factors affecting missile motion, and their influence upon such motion, are examined. Information is provided on a computer program developed for calculating missile speeds. Maximum speeds for a number of specified potential tornado-borne missiles are presented, corresponding to a set of assumptions believed by the writers to be reasonable for design purposes. It is pointed out that higher speeds are conceivable if it is assumed that certain circumstances, examined in the body of the report, will obtain. It is the judgment of the writers that the probabilities of occurrence of such higher speeds for any given tornado strike are low. More than qualitative estimates of such probabilities, are however, beyond the scope of this investigation.

NBSIR 76-1052. **Naval shipboard fire risk criteria—Berthing compartment fire study and fire performance guidelines,** B. T. Lee and W. J. Parker, 86 pages (Sept. 1976). Order from NTIS as PB258118.

Key words: fire tests; flame spread; heat release rate; ignition; reduced scale models; room fires.

Judicious application of shipboard materials and choice of compartment furnishings can significantly reduce the threat of serious fire on board ship. Unfortunately the fire performance of materials is currently difficult to ascertain from laboratory fire tests on the materials. Full size and quarter-scale compartment fires in conjunction with an analytical treatment were performed to obtain an improved understanding of the relationships between the laboratory fire test assessment and the observed behavior of materials in actual fires. The compartment fire experiments indicated that the temperature of the hot air layer below the ceiling is a suitable quantitative measure of the level of fire buildup in a compartment. When this temperature exceeds 700 °C there is sufficient radiation from the hot air layer and the heated upper surfaces to cause ignition of all combustible materials in the compartment. For a $3 \times 3 \times 2.1$ m ($10 \times 10 \times 7$ ft) space lined with asbestos millboard having a 0.68×1.9 m (27×75 in) open doorway a heat production rate of about 72 kW/m^2 (6.3 Btu/s/ft^2) of deck area is enough to attain this condition. Fires in some bunk configurations alone could exceed this critical rate of heat generation. Ventilation and its points of application were found to be very important considerations. Observations of the fire scenarios in the compartment tests along with an empirical and analytical analysis of fire growth in compartment spaces have resulted in an improved application of the fire test ratings. Consequently more rational design rules for fire safe material usage have been developed taking into account the ignitability, flame spread, rate of heat release, potential heat and smoke generation potential of materials. The study also indicated the practicality of using quarter-scale fire tests for studying fire performance in full size compartments.

NBSIR 76-1054. **An appraisal of tests and standards for the evaluation of electrical insulating fluids,** D. B. Miller, V. E. Bower, F. R. Kotter, O. Petersons, M. M. Birky, C. M. Huggett, and A. Macek, 124 pages (May 14, 1976). Order from NTIS as PB253110.

Key words: askarel; capacitors; insulating fluids; liquid insulators; polychlorinated biphenyls; transformers.

Based on a literature study and interviews with representatives of the electric utility industry, manufacturers of insulating fluids and electrical apparatus, government regulatory agencies, organizations preparing standards and codes, trade associations and independent testing laboratories, the status of existing standards and test procedures for insulating fluids is reviewed. Askarel-type transformers and capacitors are described and the characteristics of several currently-used as well as new candidate insulating fluids are given. The possible impact of codes and government regulations on the introduction of new fluids into use is reviewed. Needs for new or revised test procedures and standards are noted and recommendations made for research and development efforts as well as administrative actions to facilitate the qualifying of new insulating fluids as acceptable replacements for the askarels currently in use in a certain class of transformers and capacitors.

NBSIR 76-1056. **Analysis of solar energy system for the GSA demonstration office building at Manchester, New Hampshire,** T. Kusuda, S. T. Liu, J. W. Bean, and J. P. Barnett, 35 pages (Mar. 1, 1976). Order from NTIS as PB254179.

Key words: energy conservation; GSA/Manchester building; solar collector; solar heating and cooling; thermal storage.

The energy conservation demonstration building of the General Services Administration to be built in Manchester, New Hampshire, has been planned to be partially heated and cooled by solar energy. Presented in this report are results of a study made at the National Bureau of Standards to determine the effect of solar collector sizes and the amount of storage on the overall energy consumption of the building. It was found that the fuel savings attainable by the use of solar energy for heating and cooling of the building will be less significant as the size of the collector and the amount of storage are increased beyond certain limits.

NBSIR 76-1058. **Performance of mobile homes—Summary report,** J. H. Pielert, W. E. Greene, Jr., L. F. Skoda, and W. G. Street, 143 pages (Apr. 1976). Order from NTIS as PB262097.

Key words: computer techniques; construction; enforcement process; housing; hurricane Agnes; mobile home parks; mobile homes; performance data; regulatory process; standards.

This project was funded at the National Bureau of Standards by the Department of Housing and Urban Development with the objective of documenting mobile home performance problems and relating them to possible inadequacies in the ANSI A119.1 Standard for Mobile Homes and the mobile home enforcement process. Additionally, the durability of mobile home components was a study objective for potential use in mortgage insurance evaluation. Mobile home performance data were obtained for 4,105 mobile homes, categorized and related to the project objectives. This summary report is the last of a series of four project reports. It documents the project approach, results of the various tasks, and presents conclusions and recommendations. This was a problem-oriented study and did not attempt to document the many areas of satisfactory mobile home performance.

NBSIR 76-1059. **Intermediate minimum property standards for solar heating and domestic hot water systems,** Solar Energy Program Team, Center for Building Technology, 171 pages (Apr. 1976). Order from NTIS as PB257086.

Key words: solar buildings; solar collectors; solar domestic hot water systems; solar heating; standards; thermal storage.

This report presents standards for the use of solar heating and domestic hot water systems in residential applications. The standards have been developed for application in numerous housing programs of the Department of Housing and Urban Development and are a companion document to be used in conjunction with the HUD "Minimum Property Standards for One and Two Family Dwellings," 4900 and "Minimum Property Standards for Multifamily Housing," 4910. To the greatest extent possible, these standards are based on current state-of-the-art practice and on nationally recognized standards including the MPS and the HUD "Interim Performance Criteria for Solar Heating and Combined Heating/Cooling Systems and Dwellings."

NBSIR 76-1060. **NBS interagency transducer project. Progress Report No. 4,** P. S. Lederer, J. S. Hilten, C. F. Vezzetti, and J. F. Mayo-Wells, 26 pages (June 10, 1976). Order from NTIS as PB253934.

Key words: coatings; photoflash bulb; pressure transducer; protective coatings; thermal radiant-energy response; thermal transient response; transducer.

Initial experimental efforts are described relating to the development and evaluation of means to reduce the effects produced by thermal radiant-energy transients and other thermal inputs on pressure-transducer response. Results from earlier work suggest that a major source of the thermally induced zero shifts observed in a number of pressure transducer designs is thermal energy propagated through the diaphragm to the sensing element. For many transducer designs, the temperature at the back side of the diaphragm provides a convenient measure of the energy reaching the sensing element. Accordingly, a series of tests was carried out to investigate the effects of a variety of protective coatings on the amount and rate of energy transmission through the diaphragm as revealed by measurements of the diaphragm back-side temperature. For purposes of experimental simplicity, mounted thin metal disks are used to simulate transducer diaphragms, and the temperature histories of both bare and protected disks are measured with thermocouples following exposure of the disks to thermal radiant-energy transients (of approximately 20 mJ/mm^2 at the disk) generated by No. 22 photographic flashbulbs. Protective means investigated include various materials, such as tapes, greases, and room-temperature-vulcanizing rubbers (RTVs), applied directly onto the disks as coatings. Data are given for each protective material tested.

A description of other transducer-related work and publications is given in an appendix.

NBSIR 76-1061. **An annotated bibliography on proton affinities,** K. Hartman, S. Lias, P. J. Ausloos, and H. M. Rosenstock, 52 pages (July 1976). Order from NTIS as PB256328.

Key words: basicity; bibliography, appearance potential; heat of formation; ion-molecule equilibrium; proton affinity; proton transfer.

This bibliography consists of approximately 150 references about proton affinities which covers the period from 1932 through 1975. This includes experimental determinations of proton affinities in the gas phase (through observation of proton transfer reactions, ion-molecule equilibria, and appearance potential measurements) as well as determinations from crystal lattice energies and other miscellaneous techniques. Also included are reviews concerned with or related to proton affinity determinations.

NBSIR 76-1063. **Air leakage measurements in a mobile home,** C. M. Hunt, S. J. Treado, and B. A. Peavy, 27 pages (Aug. 1976). Order from NTIS as PB257102.

Key words: air infiltration measurement; air leakage measurement; mobile home tightness; sulfur hexafluoride tracer measurement.

Air leakage measurements were made in a mobile home using sulfur hexafluoride (SF_6) as a tracer gas. The home was located in an environmental chamber where it was possible to measure and control the temperature outside the home. The effect on infiltration rate of a number of variables was determined. These included inside-outside temperature difference, simulated wind, installation of storm windows, opening of doors, and operation of the furnace fan. Experiments were also performed in which a fan was sealed to an opening in the house and inside-outside pressure difference measured as the fan blew air into or out of the structure at measured rates.

NBSIR 76-1064. **Existing architectural information indexing systems,** R. J. Kapsch, 68 pages (Mar. 1976). Order from NTIS as PB254181.

Key words: architectural indexing systems; architecture; building; construction; design; information; information retrieval system.

Architectural indexing systems are those mechanisms which we use to organize information concerning how and what t

build. Architectural indexing systems are a means of organizing available information in a manner that can readily be grasped by the user. As such, architectural indexing systems are an important component part of architectural information systems. This report reviews and summarizes existing architectural indexing systems presently used in the United States and overseas. Indexing systems reviewed are classified into (1) one way divisions, (2) two way divisions, (3) thesauri and other indexing systems.

NBSIR 76-1066. **Center for consumer product technology publications, November 1974 to April 1976,** S. Halpin, 13 pages (June 1976). Order from NTIS as PB254473.

Key words: bibliographies; consumer product safety; consumer product standards; consumer product technology; law enforcement equipment; law enforcement equipment standards; product performance; product safety.

"Center for Consumer Product Technology Publications, November 1974 to April 1976" lists only publications prepared by the members of the Center for Consumer Product Technology staff, by NBS personnel under contract or grant to the Center or by NBS personnel or external laboratories under contract or grant from the Center are cited. Articles published in NBS house publications also are cited.

NBSIR 76-1067. **Mathematical approaches to evaluating aircraft vertical separation standards,** J. F. Gilsinn and D. R. Shier, 50 pages (May 1976). Order from NTIS as PB257195.

Key words: aircraft; air transportation; air traffic control models; altimetry; altitude; aviation; collision risk; error analysis; mathematical models; safety; separation; vertical separation.

Above Flight Level 290, current regulations require aircraft to be separated vertically by at least 2000 feet. Because of increased traffic desiring to fly at these altitudes, the possibility of reducing the required separation (while maintaining acceptable safety levels) is under study. This report details many of the components of vertical position error and classifies them into three major categories: static pressure system error, altimeter instrument error, and pilot response error. Two models for use in evaluating separation standards, the root sum of squares (RSS) approach and the Reich collision risk model, are described together with their respective advantages and disadvantages. A final section includes recommendations for a carefully designed data collection effort and discusses potentially important considerations for such a design.

NBSIR 76-1069. **Environmental effects on the strength of a glass fiber-reinforced-plastic rod material,** N. Halsey and L. Mordfin, 38 pages (July 1976). Order from NTIS as PB256296.

Key words: antenna-support materials; environmental degradation; guys, nonmetallic; marine atmospheres; plastics, fiber-reinforced; pultrusions; stress-rupture testing; sunlight; ultraviolet radiation; weatherability.

Environmental stress-rupture test methods were developed for studying the weatherability of materials under stressed exposure in marine atmospheres and intense sunshine. These laboratory test methods were applied to a coated, pultruded, glass fiber-reinforced-plastic rod product, with the marine atmosphere simulated by a saltwater fog and intense sunshine simulated by ultraviolet radiation. Static tests of the material, conducted both before and after the environmental exposures, were used to characterize both the as-received mechanical properties of the product and the reductions in tensile strength attributable to the weathering actions. The experimental results essentially confirmed the rod manufacturer's contention that the effects of sunlight and weathering on the product range from none to slight. For applications as antenna guys, the results suggest that the strength limitations imposed on rods by conventional end fittings, and by the fact that rods are frequently bowed rather than straight, tend to overshadow any strength reductions attributable to environments of the types considered here.

A failure analysis of a tower guy, fabricated from material of the type tested in this investigation, is given in an appendix.

NBSIR 76-1070. **Evaluation of backflow prevention devices: A state-of-the-art report,** G. C. Sherlin and R. W. Beausoliel, 142 pages (June 1976). Order from NTIS as PB260913.

Key words: backflow; backflow preventers; back pressure; back-siphonage; cross connections; health hazard; potable water; vacuum breaker; water supply.

A significant potential for potable water supply contamination exists within all water supply systems due to backflow and cross connections. Surveillance of the water supplies to protect from such hazards requires continuing vigilance by the administrators of cross-connection control programs, and continuing upgrading of technical criteria and methods of evaluation.

The Environmental Protection Agency assists local (usually municipal) authorities, through the State water supply agency, in establishing and operating cross-connection control programs. Essential to these programs are (1) information on the suitability of commercially available devices for use in potentially high-hazard locations, and (2) practical and effective standardized test methods for evaluation of devices. The National Bureau of Standards investigation reported herein addresses the two needs identified.

This study includes a systematic review of the literature, together with consultations and visits with water purveyors, plumbing officials, laboratory officials and researchers in this field. Emphasis has been placed on those devices, test methods, and laboratory practices considered most essential to an effective assessment of the state-of-the-art. Also, test development needs were identified in a few areas of greatest concern.

NBSIR 76-1072. **Back-up report for the proposed standard for the flammability of general wearing apparel,** E. Braun, V. B. Cobble, S. Helzer, J. F. Krasny, R. D. Peacock, and A. K. Stratton, 51 pages (June 1976). Order from NTIS as PB255446.

Key words: apparel; burn injury; ease of ignition; fabrics; fire; flammability tests; garments; heat transfer; standards.

A "Proposed Standard for the Flammability of General Wearing Apparel" was submitted to the Consumer Product Safety Commission in February 1976. This report discusses the reasons for the choices of experimental arrangement for the flammability test and the choices of pass-fail criteria. The specimen is cylindrical, to simulate a garment, and to eliminate framed specimens which often burn differently from garments. Criteria for the fire hazard of fabrics are the time to ignite with a specified gas flame and the heat transferred to sensors inside the burning specimen. The proposed standard specifies that fabrics which transfer little heat to the inside of the specimens could be used in all garments but would have to be used in garments which cover most of the body and/or fit loosely. They would also have to be used in children's dresses and skirts (children's nightwear is covered by an earlier standard). Fabrics which transfer larger amounts of heat, and thus have larger injury potential, could be used in garments with normal or tight fit such as most present-day shirts, slacks, etc. If such fabrics ignite in 1/2 second or less, they would be excluded from use in garments. These provisions in the proposed

standard were based on the need to reduce the number and severity of apparel fires with minimum economic and technological impact on the fiber, textile, and apparel industry. The present report summarizes the available knowledge in the area covered by the standard, and points out areas in which additional work is indicated.

NBSIR 76-1074. **Operation manual for 30,000 lbf constant-load testing machine,** D. E. Marlowe and W. H. Appleton, 31 pages (Oct. 1976). Order from NTIS as PB261497.

Key words: creep; instrumentation; stress rupture; testing machine.

A 30,000 lbf (133 kN) constant-load testing machine has been designed, and ten of these machines have been delivered to the NASA Langley Research Center. Each machine is equipped with a self-contained, closed loop load controller which is maintained at a constant temperature, independent of the external ambient conditions.

NBSIR 76-1076. **Flammability limits: Thermodynamics and kinetics,** A. Maček, 27 pages (May 1976). Order from NTIS as PB254180.

Key words: chemical kinetics; diffusion flames; flame extinction; flame temperature; flame velocity; flammability; flammability limits; oxygen index test; thermodynamics.

Extinction limits for both premixed and diffusion flames for n-alkanes and n-alcohols found in the literature are assembled. Several sets of theoretical flame temperatures corresponding to the limits are defined and presented. The implications of the view that flames fail to propagate at temperatures at which reaction rates become too low to overcome the dissipation processes are discussed. Equilibrium flame temperatures indicate that at lean limits the excess oxygen does not act merely as a diluent but takes an active part in promoting the kinetics of flame reactions. The burning-rate data and the results of ignition experiments are shown to be pertinent to the interpretation of flammability limits. Extinction characteristics of methane are shown to be atypical (compared to other alkanes and alcohols) and demand a special explanation. It is also shown that the assumption of thermodynamic equilibrium at the limits is unrealistic, so there is need for experimental temperature and concentration measurements in both premixed and diffusion flames. When the assumption of equilibrium is removed, the chemical kinetic considerations suggest a simple qualitative explanation of the limit phenomenon, based on the stipulation of incomplete combustion. Quantitative data are presented in support of this view.

NBSIR 76-1081. **Progress report on the corrosion behavior of selected stainless steels in soil environments,** W. F. Gerhold, E. Escalante, and B. T. Sanderson, 77 pages (Aug. 1976). Order from NTIS as PB256329.

Key words: coatings; corrosion behavior; field tests; galvanic couples; soil environment; stainless steels; stress-corrosion behavior.

In order to obtain more definitive information regarding the corrosion and stress corrosion of stainless steels in soil environments, NBS in cooperation with the Committee of Stainless Steel Producers, AISI, initiated in 1970 a soil burial program in representative soil environments. Test materials included coated and uncoated sheet specimens in the annealed and sensitized condition, uncoated welded tubing specimens and galvanically coupled and uncoupled stressed and unstressed specimens. To date approximately 10,000 specimens have been buried at six soil test sites. This report contains the results obtained for specimens buried for up to approximately four years.

NBSIR 76-1082. **A survey of State legislation relating to solar energy,** R. M. Eisenhard, 166 pages (Apr. 1976). Order from NTIS as PB258235.

Key words: architecture; buildings; design; energy; legislation; solar; State.

This report reviews enacted State legislation dealing with solar energy. Acts involving tax incentives, reduced property assessments, research and development, solar easements and solar energy promotion are identified and abstracted. The responsible State agency and official are listed. Acts and supporting forms and other information are included as appendices.

NBSIR 76-1083. **Report to AID on a Philippines survey on standardization and measurement services,** H. S. Peiser and R. S. Marvin, Eds., 124 pages (June 1976). Order from NTIS as PB255803.

Key words: building technology; information handling; measurement services; Philippines; standardization; testing facilities.

A survey of standardization and measurement services in the Philippines was carried out in May 1975 as part of a National Bureau of Standards Program sponsored by the Office of Science and Technology of the Agency for International Development. The Survey Team included five NBS staff members, one other U.S. participant, three third-country participants, and a number of Philippine specialists. The Survey was made under the direction of Mr. Vidalito F. Ranoa, Director of the Philippine Bureau of Standards.

The team was divided into five groups which concentrated on: Technical Standards Committee Management, Metrication, Building Technology, Technical Information Handling, and Testing Facilities. Each group made extensive visits to the governmental, academic, and private organizations and facilities relevant to their topic. In each area the report summarizes the existing situation, identifies current problems, and offers suggestions and recommendations for their resolution.

NBSIR 76-1084. **Nondestructive examination of glass-reinforced-plastic rod end fittings,** G. F. Sushinsky and L. Mordfin, 28 pages (Aug. 1976). Order from NTIS as PB257180.

Key words: end fitting; glass-reinforced-plastic rod end fitting; nondestructive examination; neutron radiography; ultrasonics; x-radiography.

An exploratory study was performed on the feasibility of using nondestructive examination techniques to detect voids in two types of potted compression end fittings. Four methods of nondestructive examination were tried: conventional pulse-echo ultrasonics, ultrasonic holography, x-radiography, and neutron radiography. The ultrasonic and x-ray methods that were tried proved unsatisfactory as a nondestructive examination tool for the two types of end fittings, and the neutron radiographic procedures successfully displayed the internal structure of only one of the specimen types. The procedures and results from the different methods of examination are summarized. Additional comments are given regarding the application of the methods to aluminum-jacketed specimens, and regarding improved methods for the inspection of steel-jacketed specimens.

NBSIR 76-1087. **On a scattered-light measuring device for use in testing types of smoke detectors,** M. Pistor, 35 pages (July 1976). Order from NTIS as PB257202.

Key words: fire detection; light extinction; light scatter; light-scatter measurements; photoelectric smoke detectors; smoke detectors.

Generally, the response threshold value of fire detectors is ested with measuring instruments which operate on the same hysical principle as the detectors to be tested. For example, this neans that the response threshold value of an ionization measur- ng chamber and the response threshold value of an optical-type moke detector operating on a light extinction principle is hecked using an extinction measuring instrument. However, ptical-type smoke detectors operating on a light-scatter princi- le (photoelectric in U.S. parlance) have also been checked using n extinction measuring instrument.

Since the light-scatter type of smoke detector is by far the nost commonly used of the optical type of smoke detector it eems appropriate to use a light-scatter measuring instrument to heck the response threshold value of these detectors. In addi- on, the need for such a measuring instrument is emphasized by ne fact that both the parameters of the smoke aerosol and the esign features of the measuring instrument are affected in dif- erent ways by light scatter and light extinction.

The author describes the technical features and design details f a newly-developed, light-scatter measuring instrument along ith some experiments to determine its response to artificially- enerated aerosols.

BSIR 76-1089. **An analysis of inertial seismometer-galvanome- ter combinations,** D. P. Johnson and H. Matheson, 205 pages (June 1976). Order from NTIS as PB254475.

Key words: accelerometer; calibration; electromechanical transducer; galvanometer; galvanometer amplifier; seismic system; seismometer.

This report develops the fundamental equations for an inertial eismometer with an electromechanical transducer. If the in- uctance as well as the resistance of the system are included, the quations of motion are of the third order. These are discussed some detail. Response curves are developed for several ismometer-galvanometer combinations, some of which are uitable for telemetry. Techniques are discussed for calibration, oth in the laboratory and in the field. Practical and theoretical mitations are treated for circumstances in which thermal agita- on is a major source of instrumental noise. The bibliography in- udes lists of equivalent notations.

BSIR 76-1090. **Environmental effects on microphones of vari- ous constructions,** G. R. Hruska, E. B. Magrab, W. B. Penzes, 36 pages (July 1976). Order from NTIS as PB255505, $4.00

Key words: calibration; ceramic; condenser; electret; humidity; microphones; reciprocity; sensitivity; temperature.

The pressure sensitivities of two "1/2-inch" electret, two "1- ch" ceramic, and two back-vented "1-inch" condenser icrophones were measured for numerous combinations of tem- erature, percentage relative humidity, and frequency. The two ondenser microphones were calibrated by the reciprocity chnique at each combination of temperature, relative humidity d frequency. The condenser microphones were then used as libirated sources to determine the pressure sensitivities of the her microphones. Insert voltage techniques were used to minate the environmental effects on the electronics. It was und that the back-vented condenser microphones are insensi- e to changes in relative humidity. At frequencies considerably low their resonance frequencies they exhibited only a very nall change in sensitivity with temperature. At frequencies oser to the resonance frequency the temperature coefficient in- eases approximately fourfold. The temperature and humidity efficient for the electret and ceramic microphones could not be termined due to the instability in their sensitivities which produced changes that were larger than those induced by the temperatures and humidities.

NBSIR 76-1091. **Materials for fuel cells,** L. H. Bennett, M. I. Cohen, A. L. Dragoo, A. D. Franklin, and A. J. McAlister, 39 pages (May 1976). Order from NTIS as PB257768.

Key words: cerium dioxide; degradation; electrocatalysis; fuel cells; refractory hard metal; solid electrolytes.

This report describes the research plans and initial progress on the NBS program of research on Materials for Fuel Cells. Transition metal carbides, borides, and nitrides ("refractory hard metals," or RHM) are being examined as potential hydrogen oxidation electrocatalysts for use in acid fuel cells. Preliminary screening of 19 carbides and borides has revealed apparent stability in hot (up to 160 °C) phosphoric acid for TaB, MoB, NbC, TaC, Mo_2C, and WC. More sophisticated tests for acid stability for these materials are under way. Equipment for examination of the electrochemical behavior of these materials as hydrogen oxidation electrocatalysts in phosphoric acid electrolytes at temperatures up to 150 °C is being completed, and tests will be started on these materials shortly. Additional materials in the general RHM class, including a number of nitrides, have been ordered and will be screened for acid stability. More extensive exploration will be made of the properties of TaC and WC as a function of stoichiometry and presence of other metals and of oxygen. Plans exist for a parallel study of oxides as oxygen reduction electrocatalysts for acid fuel cells not under support of this project. The current effort is devoted to improving and expanding the facility for electrochemical measurements. The long-term stability of CeO_2-based solid electrolytes, which are promising new candidate materials for the high-temperature fuel cells, is under study. Materials for fabricating specimens of CeO_2 doped with Gd_2O_3 or Y_2O_3 have been obtained or ordered, and arrangements made to hot press them. Experiments have been designed to examine degradation of the electrical properties at temperatures from 500 to 1100 °C, with and without a constant current throughout the degradation anneals. Compositions will be chosen around those giving a maximum conductivity, and the oxygen partial pressure will be fixed at a convenient value. AC admittance measurements will be used to monitor the electrical properties. Furnaces and ancillary equipment are being assembled or constructed.

NBSIR 76-1093. **The application of test structures and test patterns to the development of radiation hardened integrated circuits: A review,** K. F. Galloway and M. G. Buehler, 15 pages (Aug. 1976). Order from NTIS as PB256318.

Key words: hardened integrated circuits; integrated circuits; radiation effects; radiation hardening; test patterns; test structures.

Government sponsored research and development on semiconductor devices intended for application in radiation environments often relies on test structures arranged into test patterns for device design information and process characterization. Problems unique to a radiation environment are often analyzed using test structures such as MOS capacitors and break-out transistors. The work reviewed in this report clearly demonstrates the importance of test structures in isolating and identifying problem areas. However, the measurement methodology associated with test structures is seldom reported which makes it difficult to compare the results of different workers. Also, the work reported to date using test structures and test patterns for assessing radiation effects has involved the relatively slow-speed laboratory testing of statistically insignificant numbers of test structures. Test patterns could be used by buyers of radiation hardened devices for (1) vendor selection and qualification, (2)

process validation for hardness screening and hardness assurance, and (3) identification of circuit parameters critical to hardness assurance. However, before this can effectively be done, it is necessary that standardized modular test structures be designed to measure parameters of known importance to device hardness, that statistically significant numbers of test structures be measured with high-speed integrated circuit testers, and that the data reduction and analysis routines be well established.

NBSIR 76-1095. **Properties and interactions of oral structures and restorative materials,** J. M. Cassell, 77 pages (Aug. 1976). Order from NTIS as PB255808.

Key words: adhesion; adsorption; alloys; composites; dental; grafting; investments; polymer; resin; wear.

A diversity of techniques is being directed toward development of new and improved dental restorative and caries-preventive materials. These have included: surface characterization of dental materials and coupling agent-coated hydroxyapatite by water adsorption; further evaluation of a novel testing approach for investigating the adhesive capability of coupling agents; synthesis of selected monomers for potential application as components of a dental composite restorative system or a pit and fissure sealant application; and investigation of techniques such as grafting with 2-cyanoacrylates and urethanes containing free isocyanate groups for modifying natural tooth and bone surfaces so as to achieve a more compatible surface for adhesion. Failure of the data acquisition and control system of a prototype pin on disc *in vitro* wear test procedure for dental restorative materials to record data consistently and to maintain proper measurement point trigger position have dictated construction of a new wear test unit that incorporates the successful design of the prototype unit, but that will allow for testing of multiple specimens and should permit data to be accumulated with a confidence level of 95 percent, as compared to the 90 percent level previously attained. Procedures have been developed for the investigation of nonprecious alloys used in crown and bridge application.

NBSIR 76-1096. **Guidelines for the determination and development of generic safety standards,** R. G. Hendrickson, 58 pages (Aug. 1976). Order from NTIS as PB257076.

Key words: management need; operations research – NS.

These guidelines were prepared to assist the CPSC in the development of generic safety standards. This development is based on conceptual models of product hazard interactions and analyses of accident sequences, product clustering, and hazard characteristics.

The motivation for these guidelines derives from a perceived need to expedite the standard development process and to enhance the efficiency of standards for consumer product safety.

NBSIR 76-1097. **Illustrative generic standard for the control of thermal burn hazards in household appliances,** R. G. Hendrickson, E. M. Robertson, and R. V. Kelly, 49 pages (Aug. 1976). Order from NTIS as PB257141.

Key words: burn hazards, household appliances; fault-tree diagrams; generic safety standards; household appliances; operations research; thermal burn hazards.

This document reports on the development of an illustrative generic standard for controlling hot surfaces associated with certain categories of consumer products. The development includes evaluations of accident data, fault-tree diagrams, theoretical heat-flow phenomena, current standards, and application of the thermesthesiometer as a test instrument.

This work is a companion to the Guidelines for the Development of Generic Safety Standards, and as such, it applies the methods and techniques provided in the Guidelines. The principal tool of analysis is the fault-tree method. This method brings to safety problems a versatile and insightful way of depicting events, conditions, and causes associated with hazards and accidents.

The intent is to demonstrate the feasibility of the generic approach to controlling safety aspects of consumer products. Although the illustrative standard is based on a study of actual data, the conclusions are not to be construed as final or authoritative.

NBSIR 76-1098. **Daylighting of buildings. A compendium and study of its introduction and control,** J. K. Holton, 39 pages (Oct. 1976). Order from NTIS as PB259523.

Key words: daylight gathering; daylighting of buildings; energy conservation; lenses; light conduits; light control; reflectors; skylights; windows.

We can no longer ignore daylight as a valuable natural resource for building illumination. Significant reductions in the energy consumption of buildings are possible by decreasing the dependence on artificial illumination and decreasing air conditioning loads by employing methods which bring in cool light. In order to design buildings utilizing daylight effectively there must be an understanding of the design principles of daylighting. This requires a knowledge of illumination to meet the needs of the building users, an understanding of characteristics of daylight at the location of the building, and imagination in developing ways to introduce and control daylight. This paper is directed toward the identification of innovative techniques for the introduction and control of daylight. It is arranged in three sections: a Compendium, a Study section, and a Reference section. The Compendium presents a number of state-of-the-art methods to assist the designer in successfully employing daylight more extensively. The Study section provides more detailed information on these methods so an increased understanding can be developed of those which appear to have suitability in a given situation. Finally, the References provide background for further investigation.

The Study organizes daylighting methods as they relate to three zones of a building, the perimeter, the intermediate and the deep zone. Each has different characteristics and is suited to daylighting by different methods.

NBSIR 76-1099. **Standardization and measurement services in Bolivia,** H. S. Peiser, R. S. Marvin, and J. Mejeur, Eds., 105 pages (Sept. 1976). Order from NTIS as PB258612.

Key words: Bolivia; measurements; quality control; standardization; testing facilities.

A survey of standardization and measurement services available in Bolivia was carried out in June 1974 as part of a National Bureau of Standards program sponsored by the Office of Science and Technology of the Agency for International Development. The Survey Team included 4 NBS staff members, 3 third-country participants, and 11 leaders of technology and standardization in Bolivia. The Survey was made under the direction of Engineer Orlando Donoso Torrez, then the Director General of the Bolivian General Directorate of Standards and Technology.

After two days of joint activities, the Team was divided into three groups which visited various industrial, university, and government installations in the Cochabamba, Santa Cruz, and La Paz areas respectively. This report contains brief summaries of these visits and of the problems related to standards and measurements reported by the organizations visited. It also includes

the results of a questionnaire distributed to most of the organizations visited in advance of the Survey.

A brief report of the conclusions and recommendations of the Survey Team is included in "Peiser, H. Steffen, and Marvin, Robert S., ed., Regional Seminar on a System of Standardization and Metrology for Latin America, NBSIR 76-988 (U.S.), 96 pages (1976)."

NBSIR 76-1100. **Appraisal of Federal Government Cobol standards and software management: Survey results,** D. R. Deutsch, 75 pages (June 1976). Order from NTIS as PB258371.

Key words: ADP; COBOL; Federal ADP installations; Federal Standard COBOL; impact evaluation; sample; software management; survey.

This report summarizes the results of a survey of selected Federal Government Automatic Data Processing (ADP) installations. Undertaken primarily as an evaluation of National Bureau of Standards (NBS) activities in support of the standardization of the COBOL programming language, the study also dealt with software management tools and practices.

The survey sample was selected from a subset of all known Federal Government ADP units; specifically, only domestic installations with at least one general purpose hardware system capable of supporting a modern COBOL compiler were included. Responses were received from over 70 percent of the 190 installations included in the sample.

The major portion of this document is made up of tabular summarizations of all responses for each survey question. Gross statistics and frequency distributions are presented on a question-by-question basis. No interquestion relationships are analyzed. The appendices include a comprehensive discussion of the sampling methodology and survey mechanics and a reproduction of the survey instrument with cross references to response tabulations appearing in the report.

NBSIR 76-1102. **Computer programs for structural chemistry: STATUS. A FORTRAN program for statistical analysis of crystallographic quantities,** L. W. Schroeder and B. Dickens, 152 pages (July 1976). Order from NTIS as PB257729.

Key words: crystallographic data; errors; probability plots; residuals; statistics; uncertainties.

This report describes a FORTRAN computer program for evaluation of (i) the results of crystallographic least-squares refinements by examination of the residuals, (ii) differences in sets of data collected by different methods from the same crystal, (iii) differences in data sets collected by the same method from different crystals of the same material, and (iv) the differences in parameters in different models representing the crystal structure of the same material.

Part of the evaluation is accomplished by plots of residuals against the expected normal distribution quantiles. Additional plots compare residuals with the independent variable, d*, and with the calculated variable $Fc^2/\sin 2\theta$. The Miller indices can be used to divide a data set into various classes and octants so that the possibility of anisotropic effects can be examined.

The program will treat up to 7200 data points in each of two experimental data sets or 1000 structural parameters, and is oriented specifically towards examining crystallographic data.

NBSIR 76-1107. **Considerations in developing test methods for protective headgear,** R. E. Berger, 55 pages (Aug. 1976). Order from NTIS as PB258322.

Key words: head injury; helmets; math model; protective headgear; safety; test methods.

The purpose of this report is to outline the relationship between test methods for protective headgear and injury prevention. The state-of-the-art concerning the mechanisms of head injury and the relationship of these injuries to the modes of energy input are briefly reviewed. The general guidelines in the design of protective headgear are discussed, and the difficulties with present test methods for helmets are summarized.

In order to provide a quantitative framework, a simple model which incorporates many features of present test methods is defined and executed. The model predicts the effect of changes in test method parameters (headform, impact surface, drop height) for a range of helmet parameters. Among the indications suggested by the model are: 1) the occurrence of reversals in the order of helmet performance when the maximum acceleration is used as a performance measure, 2) the absence of reversals when biomechanical measures are used, and 3) the indicated suitability of compensating for the resiliency of the headform by the resiliency of the impact surface.

NBSIR 76-1109. **Architectural glazing safety standard: Survey of codes and standards,** S. C. Adler, 65 pages (Aug. 1976). Order from NTIS as PB257194.

Key words: architectural glazing; codes; Consumer Product Safety Committee; Consumer Safety Glazing Committee; glazing; impact tests; safety glazing; standards; state law.

The report describes 34 test procedures extracted from 97 codes and standards identified in an extensive library search of English language codes and standards relating to architectural glazing. The report also contains summaries of existing state laws relating to safety glazing. Test descriptions include procedures, kinetic energy levels, purpose of tests, and acceptance/rejection criteria. Test methods, codes and standards, and sources are cross-referenced.

NBSIR 76-1110. **The acoustic pressure field alongside a manikin's head with a view towards *in situ* hearing aid tests,** E. D. Burnett and G. F. Kuhn, 26 pages (Aug. 1976). Order from NTIS as PB257073.

Key words: audiometry; diffraction; head diffraction; hearing aids; instruments for hearing; manikin.

To simulate actual usage conditions, the frequency response of hearing aids was measured on the head of a manikin over the frequency range of 0.2 to 8 kHz. The acoustic pressure around the head can vary rapidly as a function of frequency and location. In order to compare and interpret the hearing aid response at various frequencies and locations on the head, it is necessary to precisely know the pressure variations. The amplitude and phase of the acoustic pressure were measured in increments ranging from 2 mm to 5 mm alongside a manikin's head with frontal sound incidence. The acoustic driver was located in front of the manikin at a distance of 1.0 m from the ear canal axis. The test frequencies were the octave band center frequencies from 0.5 kHz to 4.0 kHz and the third octave band center frequencies from 4.0 kHz to 8.0 kHz. It will also be shown that pink noise of 6 percent and 29 percent bandwidth at 6.3 kHz and 8.0 kHz has a smoothing effect on the acoustic pressure variation with location.

NBSIR 76-1112. **Technical assessment of safety for hair dryer/stylers,** Y. C. Wu, 36 pages (Sept. 1976). Order from NTIS as PB259636.

Key words: air flow rate; electrical, mechanical and thermal hazards; hair dryer/stylers; heat flux; safety; technical analysis; temperature.

The handheld dryer/styler is an efficient and popular small appliance, but a high injury trend associated with such products has been reported. Hazards commonly associated with the product are electrical, mechanical and thermal. In this study, the relation between these hazards and human tolerance limits were analyzed and experiments to investigate the probable cause and potential of such hazards were conducted. Randomly selected samples of the product were subjected to relevant safety performance tests of the UL Standard 859. In addition, air flow rate, heat flux and surface temperature were measured on several samples in order to determine their thermal hazard potential. Based on the results of these investigations, corrective measures are suggested.

NBSIR 76-1115. **Optical materials characterization,** A. Feldman, D. Horowitz, R. M. Waxler, and M. J. Dodge, 20 pages (Aug. 1976). Order from NTIS as PB257196.

Key words: BaF_2; CaF_2; fused silica; interferometry; photoelasticity; piezo-optic constants; refractive index; thermal coefficient of refractive index; thermal expansion coefficient; ZnSe.

The refractive index of a sample of hot-forged CaF_2 was measured from 0.25 μm to 8.0 μm by means of the minimum-deviation method on a precision spectrometer. Data were obtained near 20 and 34 °C. Each data set was fitted to a three-term Sellmeier-type dispersion equation, which permits interpolation of refractive index as a function of wavelength within a few parts in 10^5. With the index values obtained at the two temperatures, the change in index with temperature was calculated. The refractive index and values obtained for this specimen are compared with data previously published. Two new experimental arrangements have been constructed for the interferometric measurement of the thermal coefficient of refractive index, thermal expansion, and piezo-optic constants. The first permits measuring dn/dT and thermal expansion from − 180 to + 200 °C. The second is a highly stable and sensitive interferometer for measuring photoelastic constants in the visible, the near infrared, and the near ultraviolet. Thermal expansion data are obtained on CVD ZnSe, CaF_2 and BaF_2 between − 100 and + 120 °C and fitted to a third degree polynomial in temperature. We obtain dn/dT for CVD ZnSe at 632.8 nm over the same temperature range. The piezo-optic constants of fused silica and CVD ZnSe obtained with the new interferometer at 632.8 nm are in excellent agreement with values obtained by other methods.

NBSIR 76-1120. **Fire research publications, 1975,** N. H. Jason, 17 pages (Sept. 1976). Order from NTIS as PB257837.

Key words: bibliographies; building fires; construction materials; fire departments; fire detection system; fire tests; flame detectors; flammability tests; hazard analysis; interior furnishings; toxicity.

"Fire Research Publications, 1975" is a supplement to the previous editions which covered the years 1969-1972(NBSIR 73-246), 1973 (NBSIR 74-511) and 1974 (NBSIR 75-736). Only publications prepared by the members of the Center for Fire Research (CFR), by National Bureau of Standards (NBS) personnel or external laboratories under contract or grant from the CFR are cited. Articles published in NBS house organs also are cited.

NBSIR 76-1124. **Evaluation system proposal preparation and evaluation procedure,** C. W. N. Thompson, 89 pages (Feb. 1976). Order from NTIS as PB261846, $5.00

Key words: evaluation systems; Experimental Technology Incentives Program; procurement experiments; procurement procedures; proposal evaluation procedures; proposal preparation procedures.

As part of its program with respect to the conduct of procurement experiments, the Experimental Technology Incentives Program of the National Bureau of Standards developed an integrated set of documents to provide information for use by both bidders and the proposal evaluation team in the procurement of two evaluation systems. The set of documents includes the following: (1) Introductory Notes; (2) Some Definitions; (3) Proposal Preparation Procedure (with revisions); (4) Evaluation System Design Process; (5) Statement of Work; (6) Statement of Work (with illustrative subitems for Phase One); (7) Proposed Schedule—Overall; (8) Proposed Schedule—Phase One; (9) Proposal Evaluation Factors; (10) Proposal Evaluation Factors (with Illustrative Questions); (11) Numerical Weights for Proposal Evaluation Factors; and (12) Scope of Effort. Except for introductory and descriptive material, all of the documents are organized on the basis of seven factors (and thirty-three subfactors) to facilitate both preparation and evaluation of proposals. Each subfactor measures the bidder's understanding, present or proposed approach, and present or potential capability to perform with respect to an important problem or characteristic of the program. While the procedure is considered limited to certain systems and related procurements, it is considered a significant departure from prior procedures.

NBSIR 76-1126. **Field investigation of residential smoke detectors,** R. W. Bukowski, 53 pages (Nov. 1976). Order from NTIS as PB260878.

Key words: detector sensitivity; detector siting; escape time; fire tests; heat detectors; residential fires; smoke detectors.

A test program was undertaken to evaluate the effect of sensitivity and placement of residential smoke detectors on their response to fires in homes. The tests were conducted in two homes scheduled for demolition and used actual furnishings in typical configurations. In addition to the detector response times, the homes were highly instrumented with data on smoke, temperature, and gas concentration measured for all tests.

The tests showed that smoke detectors can be highly effective in providing adequate warning of a fire before conditions in the home become dangerous.

NBSIR 76-1130. **Program and abstracts. Symposium on nonbiological transport and transformation of pollutants on land and water: Processes and critical data required for predictive description, May 11-13, 1976, National Bureau of Standards, Gaithersburg, MD,** L. H. Gevantman, Ed., 199 pages (May 1976). Order from NTIS as PB257347.

Key words: adsorption; nonbiological transformation; nonbiological transport; pollutant photochemistry; pollutants; soil pollution; solar spectrum; water pollution.

Program, abstracts and extended abstracts of 21 papers presented at a symposium on nonbiological transport and transformation of pollutants on land and in water are documented. Most of the extended abstracts are detailed and contain figures and references to pertinent literature on the subject matter discussed at the symposium. The subject matter reviewed deals with the physical and chemical behavior of pollutants, including pollutant photochemistry, adsorptive behavior of pollutants, hydrolysis, rates of pollutants, and mathematical models for documenting pollutant behavior in soils and water.

NBSIR 76-1131. **A model performance standard for guardrails,** S. G. Fattal, L. E. Cattaneo, G. E. Turner, and S. N. Robinson, 31 pages (July 1976). Order from NTIS as PB259242.

Key words: design; dynamic loads; guardrails; industrial accidents; nonstructural safety; occupational hazards; performance standard; personnel railings; personnel safety; static loads; stiffness; structural safety.

A model performance standard and design illustrations are presented for the design, construction and evaluation of guardrail systems, which will be used for the protection of employees against occupational hazards. The standard stipulates both structural and nonstructural safety requirements. Each criterion includes a commentary section describing the rationale used in its formulation. This rationale is for the most part, based on independent experimental and analytical research investigations conducted at NBS in behalf of OSHA.

NBSIR 76-1132. **Personnel guardrails for the prevention of occupational accidents,** S. G. Fattal, L. E. Cattaneo, G. E. Turner, and S. N. Robinson, 80 pages (July 1976). Order from NTIS as PB260363.

Key words: anthropometric measurements; guardrails; industrial accidents; nonstructural safety; occupational hazards; performance standard; personnel railings; personnel safety; structural safety.

Existing information is compiled which would assist in determining structural and nonstructural safety requirements for guardrails used for the protection of employees against occupational hazards. Critical aspects of guardrail safety are identified through exploratory studies consisting of field surveys of prototypical installations, reviews of existing standards and industrial accident records, and compilation of relevant anthropometric data. These exploratory studies will be utilized to design an experimental program which will consist of structural tests to determine design loads and nonstructural tests to determine geometric requirements for guardrail safety.

NBSIR 76-1133. **Skid resistance measurement tests of FHWA reference systems at the Western Field Test Center,** R. W. Kearns and J. F. Ward, 167 pages (Oct. 1976). Order from NTIS as PB261228.

Key words: accident reduction, skidding; correlation, skid resistance; highway safety; measurement, skid resistance; pavement, skid resistance; pavement wetting system; tire-pavement interface forces; wet pavement.

The Federal Highway Administration (FHWA) is developing a program to improve the method of measuring wet weather pavement skid resistance (SN) and to reduce the variation in results. At the national level, an interim reference system (IRS) is maintained and operated by the National Bureau of Standards. At the regional level, an area reference system (ARS) is maintained and operated at each FHWA field test center. Intercomparisons between these reference systems and the highway measuring systems at the state level, provide measurement assurance.

In this report, the first correlation results between the IRS and the Western ARS (WARS) are given: $SN_{WARS} = 4.55 + 0.99\ SN_{IRS}$ where the computed standard deviation of a mid-range predicted value is 1 SN. SN is described as a function of test speed, V, in mph (1 mph = 1.609 km/h): for surface 2; $SN(V) = 76.5 - 0.71 + 0.0070V^2$ and the speed gradient is $d(SN)/dV = -0.71 + 0.014\ V$.

The test program is explained from test preparations, tuning and calibration of subsystems, through dynamic measurement of the surfaces. Controlled and uncontrolled variables are identified, discussed, and in some cases, experimentally verified. A ranking of the sources of dispersion is given. A discontinuity in SN of surface 1 is identified due to the unique test plan. A ground station for improved SN calculation precision and on-site statistical analysis is found to meet design objectives.

NBSIR 76-1136. **Failure analysis of fiberglass insulator rods,** L. Mordfin and N. Halsey, 57 pages (July 1976). Order from NTIS as PB261965.

Key words: breakdown, electrical; failure analysis; fiberglass-reinforced plastics; flammability; guy insulators; high-voltage tests; insulators, tower guy; Loran C; pultruded rods; rods, insulator.

Failure analyses were carried out on a group of coated fiberglass-reinforced-plastic insulator rods that had sustained burn damage and loss of coating in service on a radar tower. The investigation included chemical, flammability, electrical and mechanical tests as well as a variety of measurements and inspections. The burn damage, consisting chiefly of carbonaceous tracking and charring, was attributed primarily to the occurrence of electrical discharges, from the energized end fittings to the rods, under conditions in which the electrical leakage path resistance had been reduced by moisture from rain, fog and ocean spray. The effects of this damage on the structural integrity of the rods were evaluated. Recommendations were made for reducing the incidence of such damage in the future, based on the use of skirted insulator rods or more effective coating materials. The principal cause of the coating loss was not positively identified. This form of damage was not found to have serious consequences except as a secondary factor which may have contributed to the occurrence of some partial electrical discharges.

NBSIR 76-1137. **Thermal data requirements and performance evaluation procedures for the national solar heating and cooling demonstration program,** E. Streed, M. McCabe, D. Waksman, J. Hebrank, and T. Richtmyer, 86 pages (Aug. 1976). Order from NTIS as PB257770.

Key words: data requirements; measurement uncertainty; solar energy systems evaluation; thermal performance.

This report presents the results of a study to determine the data requirements and performance evaluation factors to be used in the National Solar Heating and Cooling Demonstration Program. Solar energy systems used for heating hot water, space heating, and space cooling have been considered and specific measurements and analytical procedures have been recommended to determine the thermal effectiveness for daily, monthly, seasonal, or annual operating periods. The sensor accuracy and sampling rate effects on measurement uncertainty for several performance factors is presented. Application of the individual performance factors for the comparison of subsystem and system thermal performance as a function of building type and climatic region is discussed.

NBSIR 76-1138. **A proposed experiment to evaluate environmental dependence of the measurement of noise from medium and heavy duty trucks,** C. I. Holmer and R. D. Kilmer, 68 pages (Sept. 1976). Order from NTIS as PB259522.

Key words: acoustics; environmental conditions; noise measurement; noise (sound); transportation noise; truck.

Increasing concern with the impact of transportation noise on communities has led to an increase in the number of motor vehicle noise regulations at all levels of government. As regulations become more widespread, the accuracy and precision of vehicle noise measurements become more critical since each uncertainty in the measurement requires a corresponding increase in the margin that manufacturers must allow between the regulated noise limit and vehicle design levels. Although considerable uniformity has been achieved by existing voluntary standards,

there remain significant variations between noise measurements made at different sites or at different times on the same site. These variations are attributable to differences in the environment, including site and meterological influences. Thus, there is a need for systematic investigation of the various environmental and test site effects on noise generation, radiation and/or propagation. This report presents the findings of a feasibility study for an experiment to investigate environmental effects on truck noise emission measurements. The result of this study is a proposed experiment designed to examine the systematic and nonsystematic dependence of observed truck driveby noise on the environmental effects present during the measurement. The experiment is designed in such a manner as to permit separation of emission and propagation effects. Although it may not be feasible to determine "correction factors" for environmental effects within the time and financial constraints of this experiment, it is fully expected that the data obtained from this experiment will reveal the magnitude of variations in the measurement and provide a broad enough information base for study of the underlying physical mechanisms.

NBSIR 76-1140. **Standards referenced in selected building codes,** B. M. Vogel, 447 pages (Oct. 1976). Order from NTIS as PB259626.

Key words: building codes; building regulations; building regulatory system; standards.

This publication provides a compilation of the standards that are referenced in the building codes promulgated by: (1) the three model building code organizations; i.e., Building Officials and Code Administrators International, Inc. (BOCA); International Conference of Building Officials (ICBO); and the Southern Building Code Congress International, Inc. (SBCC); (2) the twenty States that have either mandatory or voluntary building codes; and (3) the thirty largest U.S. cities. In addition to identifying each standard referenced in the above named codes, this publication lists the current date of the standard, its current title, the codes referencing it, the date of the code, the locations within the code where the standard is referenced, and the date of the standard referenced in the code. This publication is intended to provide a base for assisting the building community in updating, utilizing and maintaining the standards referenced in building codes.

NBSIR 76-1141. **Study of initial stages of wear by electron channeling. I. Measurement of plastic strain in copper due to sliding wear, II. Quantitative methods in wear debris analysis,** A. W. Ruff, 53 pages (Sept. 1976). Order from NTIS as ADA031530.

Key words: copper; electron channeling; electron microscope; metals; particle analysis; plastic deformation; surfaces; wear; wear debris; x-ray analysis.

Wear experiments have been conducted to determine the plastic strains that are introduced in the surface material near sliding wear tracks. Both oil lubricated and dry sliding experiments have been carried out at different sliding distances on surfaces of copper. The strain values were determined from selected area electron channeling patterns obtained using a scanning electron microscope from regions as small as 10 μm in size and 0.05 μm deep around the wear track. A deformed calibration specimen was used to relate electron channeling band contrast to deformation strain. Strain maps were obtained on the wear surface lateral to the wear track and also below the surface using electropolishing metal removal techniques. Particular attention was placed on the near-surface strain values. In all cases, the maximum strain was found at the wear surface located at the track center and the strains decreased uniformly with depth. Significant, large strains were also found outside the wear tracks. The results are compared with those previously reported for iron and with recent theoretical models.

Wear debris has been removed from a number of test systems and analyzed using different methods. Those methods produced specific information concerning the particulate size and composition. A magnetic debris recovery method was quantitatively evaluated using actual debris samples and also using collections of manufactured particulates having known sizes and compositions. Small 5 μm diameter SiO_2 spheres, some containing nickel, were used to simulate debris. Other particulates of iron and nickel in different size ranges were also used in order to investigate such matters as size resolution, lubricant dilution techniques, particle overlap difficulties, and the general problem of calibration of debris recovery systems. A comparison between chemical analysis and particulate analysis findings is presented. The application of optical and electron microscope methods and x-ray microanalysis in characterizing the wear particulates was carried out directly on the recovery substrate; those techniques are described.

NBSIR 76-1142. **Considerations and standards for visual inspection techniques,** G. T. Yonemura, 17 pages (Oct. 1976). Order from NTIS as PB263099.

Key words: nondestructive testing; modulation transfer function; vision; visual acuity; visual capacities.

When we look at the capacity of the human visual system we see that it has many capacities depending on the circumstances under which it is used. The sensory data show that man can adjust to a wide variety of operating conditions. But, unless we have detailed information of the conditions for which these processes are to be optimized and quantitative descriptions of the tasks to be performed, the advantages to be obtained by visual science applications cannot be optimally utilized. Physical correlates of the response should be quantified, followed by a systematic scaling of the physical correlates for application to nondestructive testing. The Modulation Transfer Function widely used in optical imaging assessments would be an evaluation technique applicable to hardware, processing and image description.

NBSIR 76-1143. **Plan for the development and implementation of standards for solar heating and cooling applications,** D. Waksman, J. H. Pielert, R. D. Dikkers, and E. R. Streed, 55 pages (Aug. 1976). Order from NTIS as PB257769.

Key words: buildings; solar energy; standards.

A plan is presented concerning the need, implementation and general scope of standards which may be required for solar heating and cooling applications. Overviews of the building regulatory system in the United States are given along with a listing of the various standards which will be required for the various solar systems, subsystems, components and materials. These include Test Method Standards, Recommended Practice Standards and Specification Standards. Activities relative to standards implementation include laboratory accreditation, certification, training and manuals of accepted practice. The development of standards for solar applications by the Federal Government are outlined, as well as the potential interface and utilization of the existing consensus standards generating organizations.

NBSIR 76-1144. **NBS interagency transducer project—Progress report No. 5,** J. S. Hilten, C. F. Vezzetti, J. F. Mayo-Wells, and P. S. Lederer, 26 pages (Nov. 1, 1976). Order from NTIS as PB259243.

Key words: coatings; dynamic; dynamic response; pressure transducer; protective coatings; shock tube; tape; thermal radiant-energy response; thermal transient response; transducers; zero shift.

Experimental efforts are described in the development and evaluation of means to reduce the effects produced by thermal radiant-energy transients on pressure-transducer response. Both unbonded strain-gage and piezoelectric pressure transducers were used in this work with protective coatings applied directly to the diaphragms. The test method employed is to expose a pair of transducers—one protected and the other unprotected, but otherwise nominally identical—to a known radiant-energy transient with an energy density of approximately 20 mJ/mm^2. The resulting zero shift is measured and taken as an index of coating effectiveness.

The effect of the presence of the coating on transducer dynamic response was investigated by means of a shock tube, with a protected and an unprotected transducer pair exposed to the same pressure step of approximately 280 kPa (40 psi). Each transducer output was recorded as a function of time.

Test results with nine coatings and two transducer pairs are presented.

NBSIR 76-1147. **A combined least sums and least squares approach to the evaluation of thermodynamic data networks,** D. Garvin, V. B. Parker, D. D. Wagman, and W. H. Evans, 41 pages (July 1976). Order from NTIS as PB259637.

Key words: computerized data analysis; data evaluation; least squares (L2); least sums (L1); thermochemistry; thermodynamic data networks.

A description is given of a system for computer-based evaluation of interrelated thermodynamic measurements of enthalpies of reaction, equilibria and entropies. This system is an extension of the CATCH program developed by J. B. Pedley, University of Sussex. In the new system linear least sums and least squares techniques are used to solve networks of thermodynamic equations to obtain the enthalpies and free energies of formation and the entropies of chemical substances. The least sums technique is shown to be useful in assessing the consistency of the data. A method combining least sums and least squares solutions, provides a weighted solution that reproduces closely the solutions that are obtained by a detailed analysis of the data using the customary sequential procedure. The results from tests on four large networks involving compounds of B, U, Rb and salts of Sn, Pb, Cd and Hg are discussed.

NBSIR 76-1153. **Microstructural aspects of deformation and oxidation of magnesia-doped silicon nitride,** N. J. Tighe, 11 pages (Sept. 1976). Order from NTIS as PB259638.

Key words: cristobalite; deformation; electron microscopy; microstructure; oxidation; silicon nitride; slow crack growth enstatite.

The microstructural changes that occurred in magnesia-doped silicon nitride as a result of slow crack growth, plastic deformation and oxidation were studied by transmission electron microscopy. Specimens which exhibited slow crack growth showed extensive crack branching along the fracture path and ahead of the primary crack tip. These primary and secondary cracks followed intergranular paths. In samples which were deformed by bending at 1400 °C, dislocation arrays were found as well as intergranular cracks and voids. Silicon nitride oxidized during heating in air at 1400 °C and enstatite and cristobalite were present in the oxide layer. At lower oxidation temperatures, crystalline and amorphous silica formed a semiprotective layer on the silicon nitride surfaces.

NBSIR 76-1154, Vol. 1. **Consideration of fracture mechanics analysis and defect dimension measurement assessment for the Trans-Alaska Oil Pipeline girth welds,** H. Berger and J. H. Smith, Eds., 183 pages (Oct. 18, 1976). Order from NTIS as PB260400.

Key words: fracture control; fracture mechanics; mechanical properties; nondestructive evaluation (NDE); radiography; welding.

In anticipation of a request for waivers on defective girth welds in the Trans-Alaska oil pipeline, DoT requested assistance from the National Bureau of Standards (NBS) in evaluating the fracture mechanics analysis and the nondestructive evaluation (NDE) methods used to detect and determine dimensions of weld defects.

NBS measured the required mechanical properties of the weld metal, developed and evaluated fracture mechanics methods to determine the allowable defect sizes, and evaluated various methods of measuring the size of defects present in the welds from existing field radiographs.

Results of this investigation show that the fracture mechanics analysis can be used to determine the allowable defect sizes concerning the integrity of the pipeline, but that these analyses have not been experimentally verified at this time. Defect dimensions can be determined with sufficient accuracy to be useful in the fracture mechanics analyses if the radiographs are made under carefully controlled conditions. If the radiographs are not made with close control, the accuracy of the defect sizes may not be sufficient to permit their use in establishing allowable defect sizes.

NBSIR 76-1154, Vol. 2. **Consideration of fracture mechanics analysis and defect dimension measurement assessment for the Trans-Alaska Oil Pipeline girth welds,** H. Berger and J. H. Smith, Eds., 135 pages (Oct. 18, 1976). Order from NTIS as PB260401.

Key words: fracture control; fracture mechanics; mechanical properties; nondestructive evaluation (NDE); radiography; welding.

In anticipation of a request for waivers on defective girth welds in the Trans-Alaska oil pipeline, DoT requested assistance from the National Bureau of Standards (NBS) in evaluating the fracture mechanics analysis and the nondestructive evaluation (NDE) methods used to detect and determine dimensions of weld defects.

NBS measured the required mechanical properties of the weld metal, developed and evaluated fracture mechanics methods to determine the allowable defect sizes, and evaluated various methods of measuring the size of defects present in the welds from existing field radiographs.

Results of this investigation show that the fracture mechanics analysis can be used to determine the allowable defect sizes concerning the integrity of the pipeline, but that these analyses have not been experimentally verified at this time. Defect dimensions can be determined with sufficient accuracy to be useful in the fracture mechanics analyses if the radiographs are made under carefully controlled conditions. If the radiographs are not made with close control, the accuracy of the defect sizes may not be sufficient to permit their use in establishing allowable defect sizes.

NBSIR 76-1159. **Fatigue and weatherability studies of aramid-fiber rope slings,** N. Halsey and L. Mordfin, 35 pages (Sept. 1976). Order from NTIS as PB261994.

Key words: aramid fiber rope; breaking load, rope; cable, aramid-fiber; end fittings, rope; fatigue damage; rope, aramid-fiber; slings, cargo; terminations, rope; weathering, simulated.

Tests were carried out on twenty-six sling-leg specimens, fabricated from aramid-fiber ropes, as part of a program to develop improved external cargo slings for helicopters. The ropes included both parallel-strand and cabled-strand varieties, in three different tensile capacities. The tests were intended to evaluate the reductions in rope strength caused by fatigue loading and by exposure to simulated weathering. It was found that the fatigue capabilities of some of the ropes may not be entirely satisfactory; but, because of inadequacies in the end fittings installed by the rope manufacturers, thorough evaluations were not possible. The results indicate that the performances of the ropes could be enhanced through the use of more efficient end fittings, and suggestions for the development of such end fittings are offered.

NBSIR 76-1162. **FY 1975-1976 international building research activities, Center for Building Technology,** S. G. Webber, 67 pages (Nov. 1976). Order from NTIS as PB260879.

Key words: building research; cooperative programs; information exchange; international building research; international organization memberships; special foreign currency programs.

This report documents international building research activities of the Center for Building Technology (CBT) during Fiscal Year 1975 and 1976 (July 1, 1974-June 30, 1976). CBT carries out extensive interactions with foreign and international research organizations to exchange building research efforts. This report presents a summary of CBT's cooperative programs in building technology, international organization memberships, exchange programs, information exchanges, and foreign visits to NBS.

NBSIR 76-1172. **A new test method for automatic fire detection devices,** R. G. Bright, 29 pages (Dec. 1976). Order from NTIS as PB261217.

Key words: fire detector; test methods.

An analysis of the test methods for automatic fire detection devices in the U.S. reveals the fact that different types and different sizes of fires are used to evaluate different classes of detectors. The result is a lack of comparison test data for each detector class and, as a consequence, intelligent decisions cannot be made in the selection of automatic fire detectors for specific fire risks. A new test method is proposed in which all automatic fire detectors, regardless of sensor type, would be subjected to a series of the same test fires. In addition, each test fire series would consist of three different test fire sizes. From the results obtained, it should then be possible to match a detector's characteristics against a specific fire risk resulting in a more intelligent application of automatic fire detectors.

NBSIR 76-1176. **Regional seminar on OMNITAB II,** D. Hogben and S. T. Peavy, 27 pages (Dec. 1976). Order from NTIS as PB261995.

Key words: acceptance tests; AID; Bolivia; CENACO; computing using Spanish; foreign relations; international agreement; lectures; OMNITAB II computing system; technology transfer; terminals.

The authors visited La Paz, Bolivia, from May 11 to May 26 to conduct an AID Regional Seminar on applications of the OMNITAB II computing system. A Spanish, interactive version of OMNITAB II was implemented on the CENACO DEC-10 system computer. From May 17 to 22, lectures were given to thirty participants from five Latin American countries and sessions were held for the participants to gain experience in the use of OMNITAB II from terminals. At the beginning, the computer was not being used; at the end, OMNITAB II was being used extensively to solve important problems. An international agreement was signed by participants from the Latin American countries to cooperate in the utilization of computers.

NBSIR 76-1187. **Interim performance criteria for solar heating and cooling systems in commercial buildings,** 100 pages (Nov. 1976). Order from NTIS as PB262114.

Key words: buildings; cooling; heating; hot water; performance criteria; solar energy; standards.

Public Law 93-409, the Solar Heating and Cooling Demonstration Act of 1974, provides for "demonstration within a three-year period of the practical use of solar heating technology, and .... the development and demonstration within a five-year period of the practical use of combined heating and cooling technology." Under the provisions of the Act, in February 1975, the NASA developed a first edition of this document containing interim performance criteria for the design and evaluation of solar heating and cooling systems to be demonstrated in commercial buildings. Since that time, responsibility for further development of the document has been assumed by the NBS. This second edition of the "commercial criteria" represents the first revision to the NASA document. It is expected that this document will be updated periodically as data and information are gained from the demonstration program.

3.20. GRANTEE/CONTRACTOR REPORTS AND NBS PATENTS

Grantee/contractor reports are prepared by non-NBS persons or organizations working under grant or contract from the National Bureau of Standards. Those contract reports not incorporated into the formal NBS publication series are available directly from the National Technical Information Service (NTIS, Springfield, VA 22161) in paper copy or microfiche form unless otherwise stated. When ordering a report from NTIS you must order it by the "COM, PB, AD, or N" number as indicated.

Patents—legal documents which fully describe inventions in return for the right for 17 years to exclude others from making, using, or selling the inventions—are obtained on NBS inventions of high commercial potential, in order to establish Government ownership of the patent rights. The patents are then made available for the grant of nonexclusive licenses to all qualified applicants. A limited exclusive license may be granted under a particular patent, however, if it appears that some period of exclusivity is necessary as an incentive for the investment of risk capital. For information on licensing any of the patents, write to the Office of the Legal Adviser, National Bureau of Standards, Washington, DC 20234. Copies of patents may be obtained from the U.S. Patent and Trademark Office, Washington, DC 20231 for 50 cents each.

NBS-GCR-73-1. **Characterization of bedding and upholstery fires,** C. A. Hafer and C. H. Yuill, 46 pages (Mar. 1970). Order from NTIS as PB192365.

Key words: bedding; beds; carbon dioxide; carbon monoxide; combustion products; fire gases; fire hazards; furniture; life hazard; oxygen; smoke; temperature; toxicity; upholstery.

Many accidental deaths are attributed to fires started from smoking in bed or in upholstered chairs. Frequently, the victims die as a result of exposure to smoke, heat, or noxious fumes that develop as materials burn rather than from skin burns. The objective of this program was to conduct full-scale tests using bedding and upholstered furniture to determine the life hazards that may be present during fires starting with a small ignition source.

Thirty individual tests were conducted using various combinations of materials. The ease of ignition of bedding and upholstery was demonstrated and the pattern of development of smoke, heat, noxious gases, and oxygen depletion was recorded.

NBS-GCR-73-2. **Fabric flammability test development,** W. R. Brown and F. A. Vassallo, 87 pages (May 1970). Order from NTIS as PB194614.

Key words: fabric flammability; flammability testing; heat transfer; smoldering fabrics.

Heat meter instrumentation and a test chamber are developed for the measurement of heat transfer from burning and smoldering fabrics. The meters yield a signal proportional to heat flux, and a four-channel electronic integrator provides total heat input data as a function of time. Literature data on skin damage vs. heat input are employed in a graphical overlay method of interpreting data in terms of skin damage. Data demonstrating good reproducibility in tests of cotton fabrics at various spacings are presented. Thermoplastic fabrics tended not to burn or smolder regularly in the flat panel form employed in the test, but recommendations are given for study of strip specimens which may be amenable to test by the suggested methods. It was found that all of the fabric specimens which burned regularly in the chamber produced heat inputs at least double those required to inflict second-degree burns.

NBS-GCR-73-3. **Conversion of scientific and technical resources economic challenge—Social opportunity,** E. R. Mottur, 204 pages (Mar. 1971). Order from NTIS as COM 71-00605.

Key words: economic challenge; scientific and technical resources, converting; social opportunity.

This excerpt from the forthcoming overall project report describes the economic challenge and social opportunity presented by conversion of scientific and technical resources, and sets forth 26 policy proposals as a national program for conversion.

The report is concerned solely with conversion of the nation's scientific and technical resources, including manpower (scientists, engineers, technicians, support personnel, and technical management), facilities and equipment, and scientific and technical information. Conversion of scientific and technical resources from the defense sector must be to civilian R&D aimed at ameliorating national social problems.

Need for Conversion: About 100,000 scientists, engineers, and technicians are currently unemployed. About 200,000 (one out of ten technical personnel in the nation) are likely to be unemployed by the end of 1971.

Need for National Program: Report contends conversion can succeed only through cooperation of Federal, State, and local governments, with private industry, universities, and the scientific and technical community; with strong federal leadership.

Existing conversion programs and proposals are reviewed and characterized as essentially job-placement activities. Conversion bills pending in Congress are also analyzed.

NBS-GCR-73-4. **The influence of fine structure on the pyrolysis and combustion of cellulosics,** M. Lewin and A. Basch, 62 pages (1972). Order from NTIS as COM 73-10323.

Key words: cellulosic fibers; combustion; cotton fibers; flame retardant treatments; phosphorous acids; pyrolysis; ramie; rayon; sulfur.

A series of cellulosics comprising cottons, ramies and rayons differing in degrees of crystallinity and orientation were purified, characterized and pyrolyzed in vacuum and in air at low and high temperatures. The kinetics of the low temperature pyrolyses were studied and activation energies were derived by dynamic TGA. The rates of the low temperature pyrolyses in both vacuum and air are shown to be dependent upon the crystallinities and orientations of the cellulosics. In addition, the rates of vacuum pyrolysis are also a function of the D.P., while the rates of air pyrolysis are influenced by the crystallite accessibility. A novel IR technique was developed which indicates that levoglucosan formation during combustion is also a function of crystallinity and orientation. A correlation was found between energies of activation and cellulose crystallinities which suggests that the measured values are the sum of separate contributions from the crystalline and less-ordered regions. Cottons, rayon and ramie were given a variety of flame-retardant treatments with reagents

containing either sulfur or phosphorous as the principal flame-retardant component.

NBS-GCR-73-5. **National fire data system, system design project, final report,** 175 pages (Mar. 9, 1973). Order from NTIS as COM 73-10951.

Key words: design criteria; fire hazards; fire losses; fire reporting; fire safety; information systems; National Fire Data System; specifications; state governments; systems analysis.

The design for a multi-file National Fire Data System is described. Data concerned with fire incidents, deaths, injuries, and fire loss will be collected from the fire service, the insurance industry, health service organizations, and a number of special sources. A time-sharing computer center will be utilized through remote terminals to store, manipulate, and aid the reporting of the collected data. Input consists of a series of specified reports from designated data suppliers of a number and type to provide statistically valid coverage for national projection purposes. Each type of input will be stored as a separate system file. The Auerbach report describes the data sources, the proposed processing facility including staffing requirements, probable outputs, and data base specifications; the procedures for data acquisition, encoding, data preparation, data base maintenance, and quality control; and a plan for implementing the system.

NBS-GCR-73-6. **A study of preignition heat transfer through a fabric-skin system subjected to a heat source,** G. Heskestad, A. S. Kalelkar, and H. C. Kung, 53 pages (Dec. 1971). Order from NTIS as COM 73-10959.

Key words: apparel fabrics; fabrics; fire hazards; flammability testing; ignition; skin; thermal burns; thermal measurements.

Theoretical and experimental studies of preignition events transpiring in fabric-skin systems upon exposure to a radiant heat source are reported. Particular emphasis is placed on determining relationships between time to ignition of the fabric and time to pain in the skin of the fabric wearer which allows assessment of probabilities of ignition. Several common fabrics are ranked in order of decreasing safety as the pain time increases relative to the ignition time and evasive action by the fabric wearer becomes less and less effective.

NBS-GCR-73-7. **Study of ignition and exposure,** L. Fourt, 52 pages (Dec. 31, 1971). Order from NTIS as COM 73-10958.

Key words: apparel fabrics; fabrics; fire hazard; flammability testing; ignition; thermal burns.

Simulated sleeves were exposed to a gas range burner, and the time to ignition determined. For cottons and polyester/cellulose blends, the ignition time was proportional to fabric weight, except for napped flannel and terry cloth which ignited rapidly for their weight. Woven and knit fabrics were similar. Nylon and polyester and, in some cases, acetate, shrunk away from the flames unless seams sewn with cotton thread were exposed.

NBS-GCR-73-8. **A study of hazards from burning apparel and the relation of hazards to test methods,** A. Alkidas, R. W. Hess, W. Wulff, and N. Zuber, 208 pages (Dec. 1971). Order from NTIS as COM 73-10954.

Key words: apparel fabric; fabric; fire hazard; flammability testing; thermal measurements; thermodynamic properties.

The following thermal properties of a selected set of cotton, nylon, polyester, acetate, and blend fabrics were measured: thermal conductance, specific heat, ignition or melting temperature, infrared reflectance and transmittance, activation energy, reaction enthalpy, and ignition time under radiative fabric heating. Detailed distributed-parameter ignition models and simplified analyses based on lumped-parameter models were considered, and seven characteristic groups established which govern the heating and reaction processes. Experimental and theoretical results were compared.

NBS-GCR-73-9. **Study of hazards from burning apparel and the relation of hazard to test methods: Flammability of clothing assemblies,** J. F. Krasny and A. L. Fisher, 50 pages (Jan. 19, 1972). Order from NTIS as COM 73-10953.

Key words: apparel fabrics; fabrics; fire hazard; flammability testing; skin; thermal burns; thermal measurements.

The objective of the project was to estimate the area of the body burned and the depth of burn as a function of the garment assemblies worn by clothing fire victims. Such fires were modeled by burning garment assemblies on mannequins covered with temperature indicators; the temperature indicator measurements were correlated with depth of burn into the skin of rats. Chimneys on garments were found to increase very significantly the area of the mannequin raised to elevated temperatures in a given time from ignition; belts tended to act as fire stops. Tighter fit of dresses appeared to cause higher mannequin temperatures, but direct contact of dress and mannequin slowed down fires. Thermoplastic (nylon and polyester) dresses and fire retardant cotton dresses did not ignite in these experiments unless combined with a flammable slip, though the area of potential injury in such combinations was relatively small. Similar areas were raised to elevated temperatures by burning polyester/cotton dresses with or without polyester/cotton slips, but nylon slips seemed to reduce the area.

NBS-GCR-73-10. **Firefighters' breathing system study,** 171 pages (Apr. 1972). Order from NTIS as COM 73-10952.

Key words: breathing apparatus; closed loop breathing apparatus; equipment design; fire fighters; fire fighting; fire fighting equipment; fire gases; open loop breathing apparatus; protective clothing; smoke inhalation; standards.

This report is the result of a study to produce research and development plans for each of three types of firefighters' breathing support equipment. The three design types are the open loop, the semiclosed loop, and the closed loop. The study identified the improvements possible for each design type. This report includes the recommended improvements and lists the time and cost likely for each development.

In addition to the recommendations and development plans for breathing systems improvement, the report includes sections of specifications, breathing gas sources, materials, and other significant elements of the breathing systems. To support the development plans, there are also recommendations for needed laboratory and engineering studies.

NBS-GCR-73-11. **Study of hazards from burning apparel and the relation of hazards to test methods,** O. A. A. Naveda, P. Durbetaki, P. T. Williams, W. Wulff, A. Alkidas, E. R. Champion W. E. Giddens, R. W. Hess, and B. Kumar, 274 pages (Dec. 31, 1972). Order from NTIS as PB242597.

Key words: apparel, burn injuries; burn injuries, fabric related; burning apparel; fabric related burn injuries.

It was shown that the hazard from fabric-related burn injuries can be quantitatively assessed in terms of the probability that such injury is suffered. This probability depends upon the probabilities associated with the possible events leading to the injury, such as ignition after exposure combustion after ignition and tissue decomposition during and after burning. It was also shown

that the probability of fabric ignition under given exposure depends on the ratio of fabric ignition time to exposure time; hence that the ignition time is an important characteristic required to assess the hazards of fabric-related burn injuries.

NBS-GCR-73-12. **Ease of ignition of fabrics exposed to flaming heat sources,** G. Heskestad, 113 pages (Jan. 1973). Order from NTIS as COM 73-10955.

Key words: apparel fabrics; fabrics; fire hazards; flammability testing; ignition; thermal burns; thermal measurements.

The ease of ignition of fabrics exposed to flames was studied. Ignition or melting times were at a minimum close to the luminous tip of diffusion and to the tip of the inner cone of premixed flames. These minimum ignition times were found to be insensitive to fabric orientation, burner tube diameter, and flame height but varied appreciably for diffusion and premixed flames. With the exception of fabrics with prominent surface structures (e.g., terry cloth), ranking of fabrics by ignition and melting times would be preserved through a large number of exposure modes. A simple theoretical model, which considers the fabric to be impervious and inert, to possess a unique ignition temperature, and to be heated solely by convection, is consistent with the experimental findings. Fabric variables found to be of importance were the fabric weight, average specific heat over the heating interval to ignition and the ignition temperature. Porosity, humidity, proximity to a skin simulant, and weave (except structures like terry cloth) were less important: Flame source variables of importance are the temperature and velocity at the tip, and possibly the diameter of the gas plume at the tip.

NBS-GCR-73-13. **Hazards from burning garments,** G. Arnold, A. Fisher, and G. Frohnsdorff, 85 pages (Mar. 26, 1973). Order from NTIS as COM 73-10957.

Key words: apparel fabrics; fabrics; fire hazard; flammability testing; simulation; skin; thermal burns.

Experiments were carried out to determine the area of the body burned, and the depth of burn likely to be suffered by clothing fire victims as a function of the garment worn, by burning full clothing assemblies on mannequins. It was found that single layer dresses made from nylon, polyester, Nomex, and flame retardant cotton fabrics self-extinguished and could be assumed to cause no injury; single layer dresses of cotton burned somewhat faster than similar weight polyester/cotton blends but the total heat transferred was similar; double layers consisting of dress and slip burned if at least one of the layers was a fabric which would burn in a single layer. The rate of burning and the heat transferred depended on the fabrics used as the dress and the slip; the use of a belt with dresses at least slightly reduced the initial rate of burning and the total heat transferred to the mannequin; all garment combinations which burned transferred sufficient heat to the mannequin to cause second degree and deeper burns, with the greatest burn depth usually on the lower region of the torso.

NBS-GCR-73-14. **Measurement of flammability and burn potential of fabrics, summary report, December 1, 1970-November 30, 1971,** A. K. Mehta and F. Wong, 69 pages (Feb. 15, 1973). Order from NTIS as COM 73-10950.

Key words: apparel fabrics; fire hazard; flammability testing; heat conductivity; simulation; skin.

The objective of this work was to study local skin burn damage due to burning apparel fabrics. Three skin simulants were constructed: two copper-air rod systems simulating the thermal properties of skin with a large depth stretch factor; and one system without depth magnification. Twenty apparel fabrics were burned in the horizontal, 45°, and vertical positions, in the latter two cases with the flame traveling up and down. The injury potential of each fabric was then evaluated.

NBS-GCR-73-15. **Measurement of flammability and burn potential of fabrics,** A. K. Mehta and F. Wong, 331 pages (Feb. 15, 1973). Order from NTIS as PB242582.

Key words: burn, fabric; fabric, burn; flammability.

Two types of inanimate materials having the average thermal properties of human skin were studied. The thermal properties of both types of skin simulants, which were checked by exposing them to known radiant fluxes and monitoring the temperature response, were found to agree closely with the design values.

A set of twenty different fabrics, widely used in apparel, were tested. The depth of thermal damage was found to increase approximately linearly with increase in the total thermal dose to skin, for the exposure times and the magnitudes of the heat fluxes involved in these specific fabric burning experiments. This finding indicates the possibility of rating the burn damage potential of fabrics, crudely, by only two measurements, namely flame spread rate and total thermal damage to skin.

Measurements of the heat transfer rates from the leading edge to the fuel were conducted with the flame spread burner. These experiments indicate that about 2/3 of the preheat energy is delivered ahead of the leading edge of the flame while the highest intensity of energy is confined to a small region under the flame extension.

NBS-GCR-73-16. **Status and prospects for flame resistant polyester/cellulose blend fabrics,** G. C. Tesoro, 56 pages (Mar. 15, 1973). Order from NTIS as COM 73-11265.

Key words: cotton; fabrics; flame retardants; flammability; phosphorus; polyester; rayon; treatments.

This report describes the status of flame retardant finished polyester/cotton and polyester/rayon blend fabrics. While these fabrics represent a large part of the present market, there exists presently no commercial flame retardant treatment for them, though such treatments are available for 100 percent cellulose and 100 percent polyester fabrics. Self-extinguishing behavior can be attained by insolubilizing sufficient phosphorus on the blends, and the amount of phosphorus needed is lowered by the presence of bromine. Phosphorus in the form of phosphine oxide, derived from treatment with tetrakis-hydroxymethyl phosphonium derivatives, has been shown to be more effective than phosphonate or phosphoramine phosphorus. The amount of finish necessary to obtain self-extinguishing behavior, however, tends to stiffen the fabric and raises its cost. Suggestions are made for further research in this area.

NBS-GCR-73-17. **A candidate standard for fundamental BASIC,** J. A. N. Lee, S. R. Bechhardt, and A. 1. Karshmer, 148 pages (Oct. 19, 1973). Order from NTIS as COM 74-10932.

Key words: ADP standards; BASIC; compilers; compiler validation; computer programming; formal language; programming language standards.

Under contract to the National Bureau of Standards, a candidate standard specification and supporting analyses have been developed for a nucleus or fundamental subset of the BASIC programming language. This report, in four parts described below, will be immediately considered for Federal standardization, and is intended also to assist national standardization efforts. Part 1: *Standard Specifications for BASIC*. This specification establishes the form and the interpretation of programs

which are written in the BASIC language, for the purpose of promoting a high degree of interchangeability and transportability of such programs among automatic data processing systems. Part 2: *Explanations, Examples and Recommendations.* This part provides explanations, examples, and recommendations which are additional to, but not part of the BASIC specifications. Part 3: *Programs for the Validation of BASIC Implementations.* The BASIC programs contained herein provide a set of routines for the testing and validation of BASIC language implementations. Part 4. *Formal Description of BASIC.* The formal description of BASIC is composed of three parts: the concrete syntax, the abstract syntax, and a semantic description of the operational meanings of the elements of the program.

NBS-GCR-73-18. **Source mechanisms of microearthquakes associated with underground mines in Eastern Utah,** R. B. Smith, P. L. Winkler, J. G. Anderson, and C. H. Scholz, 46 pages (Oct. 1973). Order from NTIS as COM 73-11783.

Key words: acoustics; coal; earthquakes; geologic faults; mining; tectonics.

A detailed microearthquake survey, with acoustic monitoring, was conducted in the Sunnyside coal district of eastern Utah to investigate the possible relationship between earthquakes and mining. Rates of earthquake activity averaged hundreds of events per day with magnitudes from − 0.5 to + 2.0. The zone of greatest earthquake activity was centered 1 km beneath a portion of the mine which exhibited floor and roof failures. A composite fault plane solution for the main zone of activity defines reverse faulting with nodal planes striking N15°E. The P axis has an azimuth of N75°W and dips 25°W. This is in agreement with the general stress pattern attributed to the tectonic development of the nearby San Rafael Swell and suggests that the main earthquake energy may be derived from regional tectonic stress. Acoustic emissions recorded within the mine showed an average rate of 180 per hour and appear to be due to shear failures near the mine walls. The rate of acoustic activity decreased with time after the latest mining activity. Spectral analyses of direct shear waves from the sub-mine quakes yielded estimates of source parameters at hypocentral distances from 1.3 km to 3.0 km. The data are in agreement with the results of other work and extend the previous studies of source spectra down to magnitudes less than + 1 for short hypocentral distances.

NBS-GCR-73-19. **Regulation and evaluation of industrialized building: A literature review with annotated bibliography,** J. N. Thompson and C. T. Grimm, 60 pages (Dec. 1973). Order from NTIS as COM 74-10481.

Key words: building codes; building laws and regulations; building materials—testing and evaluation; building systems; industrialized housing; mobile homes; modular construction; prefabrication; zoning.

This review, annotated bibliography and index covers literature published in the English language on the regulation and evaluation of industrialized building. The scope of the review includes the period from 1940 to April, 1972.

A summary of the literature precedes the review. The summary follows the subject divisions used in the review.

The review is divided into two parts, titled "Regulation" and "Evaluation." The first part deals with methods used to regulate industrialized housing, including: building codes (local, state, and model); standards; and zoning. The second part deals with the methods used to evaluate industrialized housing, including administration of the evaluation process. Each section of the review presents the literature in chronological order in an attempt to show the development of attitudes, trends, and accomplishments affecting the progress of industrialized housing.

The annotated bibliography is divided into subject sections which correspond to those used in the review. Key words are included for each bibliographic entry. For reference purposes, a comprehensive index includes subjects, authors, and titles cited in the literature review and annotated bibliography.

NBS-GCR-73-21. **Research study on the socioeconomic aspects of low-cost housing in the Philippines,** 149 pages (May 1972). Order from NTIS as COM 74-10722.

Key words: construction; design; developing countries; earthquakes; low-cost housing; natural disasters; Philippines; socioeconomic aspects; typhoons.

The report presents a survey of the historical occurrence of damages by typhoons, selected comparative indices for climate and housing construction, an economic profile of the Philippines, as well as a regional demographic profile. A discussion is also presented on size and density of household dwelling units, trends in housing space expansion, community and municipal facilities; household income and household expenditures; financing sources for housing construction; availability and prices of construction materials and of labor; the capabilities of the housing industries; public reaction to new designs and materials; methods of housing construction and building codes.

NBS-GCR-74-22. **Mechanical and acoustical signature analysis of engine-generator units to be used at the Department of Housing and Urban Development Total Energy Plant, Jersey City, New Jersey,** R. F. Burchill, 374 pages (May 1973). Order from NTIS as COM 74-10934.

Key words: diesel-electric sets; gears; looseness; signature analysis; unbalance; vibration.

This report summarizes the acoustical vibration and stack gas temperature and conditions of each of five diesel-electric sets tested in the vendor's factory. The data in this report was collected simultaneously with fuel, cooling water and electrical transient data during the factory acceptance tests. The tests were supervised by NBS staff and were required by the purchase specifications. The purchase specifications were based upon a total energy performance specification developed by NBS for this project (A Performance Specification For A Total Energy Plant At The Jersey City Breakthrough I Site, NBS Report No. 10313, December 29, 1970). Signature analyses of each engine over the test load range were calculated and plotted. The signature analyses show machinery unbalance rotating component looseness, ball and roller bearing deterioration and gear damage or wear.

These signature analyses are baseline data which will be compared with signature analyses taken at future dates as the engines age. Changes in the signature analysis will be used to predict required maintenance services.

NBS-GCR-74-23. **Survey of lube oil analysis techniques to be used at the Department of Housing and Urban Development Total Energy Plant, Jersey City, New Jersey,** 21 pages (Sept. 1973). Order from NTIS as COM 74-10929.

Key words: chip detectors; ferrograph; lube oil analysis; magnetic drain plugs; oil filters; oil monitors; particle detectors; spectrograph.

Lube oil analysis can be an important consideration in the preventive maintenance program of diesel-engine-generators which provide prime power to a housing site. This report surveyed possible lube oil monitors that would scientifically "in

rm" plant operators when oil needed changing rather than anging the oil after a fixed amount of operating hours.

Several lube oil monitors are discussed. Filter check is used r aircraft gas turbine oil analysis; however, in diesel engines, e presence of combustion products requires a high level of de- ctive skill. Magnetic drain plugs are useful but a failing gear ay only show a small amount of ferrous particles while normal ear from cylinder liners, etc. produces large amounts of ferrous rticles. Other monitors discussed are: chip detectors, oil parti- e detectors; spectroscopic oil analysis and ferrograph chniques.

The report recommends that samples of the lube oil be regu- rly spectroscopically analyzed for wear particles and lubricant egradation. The report also recommends the engine lube oil stems be set-up so that other types of lube oil monitors can be sed.

BS-GCR-74-24. **Development of a test for impact protection,** J. M. Akridge, W. J. Freeston, Jr., W. L. J. Leverett, W. D. McLeod, M. K. Rao, and W. Wullff, 78 pages (Apr. 1973). Order from NTIS as COM 74-10983.

Key words: energy absorption; impact test; protection; protective equipment.

An Impact Test Apparatus has been designed and testing rocedures have been proposed to measure systematically on exible, semi-rigid and rigid impact protection systems their bilities to absorb kinetic energy and to distribute peak impact ressure away from the point of impact.

The proposed impact simulation is based on impact descrip- ons extracted from the findings of an intensive literature search n impact injuries, primarily car crash impact studies.

An impact modeling analysis was performed and solutions are resented. Modeling parameters and procedures for experimen- al impact data evaluation have been derived from the analysis.

A multitude of impact modes on practically all parts of the uman body, namely skull, torso, leg and arm, have been in- luded in the impact simulation. The proposed versatile Impact est Apparatus is considered to be a research tool which is eeded for the fundamental work that could lead to simple stan- ard test methods for specific impact situations.

NBS-GCR-74-25. **Use type tests for comfort and effectiveness of firemen's turnout coats,** N. R. S. Hollies, L. Fourt, G. A. Arnold, and N. Custer, 129 pages (May 1974). Order from NTIS as COM 74-11075.

Key words: clothing; firemen's turnout coats; use type tests for comfort and effectiveness.

This report describes five tests involving the interaction etween a fireman's turnout coat and the fireman working in it. he amount of replication necessary to establish major recog- izable differences in present designs is ascertained, together ith the standard deviation of typical groups of measurements. he man-hours of subjects and observers required to carry out uch comparisons are reported. The tests include the metabolic ost of clothing, rate of mixing of air in spaces inside the coat ith outside air, thermal insulation of clothing while being worn, effect of clothing on sweat production and evaporation, and the water uptake by clothing worn under the spray of a fog nozzle.

NBS-GCR-74-26. **Planning computer compatibility for uniform building regulation documents; final report; advanced information systems,** J. Eberhard, T. Tiedeman, and C. Green, 106 pages (May 1973). Order from NTIS as COM 74-11633.

Key words: automatic data processing; building codes; building regulations; computer applications; computers; enforcement; evaluation; information systems; microfilm; microform; state-of-the-art study.

This report provides an introduction to the use of Automated Data Processing (ADP) and microform systems in the administration and enforcement of building regulation, particularly relating to factory manufactured buildings and mobile homes. The focus of the report is to make the reader aware of the planning considerations which must be dealt with when use of these information handling systems is contemplated. A background knowledge of building regulatory functions is assumed of the reader, but not technical knowledge of ADP or microform. Topics covered include: 1. Basic introduction to ADP and microform use. 2. State-of-the-art examples of microform use in building regulation. 3. State-of-the-art examples of computer use in building regulation. 4. Basic planning guidance for ADP and microform use. 5. Potential building regulatory use areas for ADP and microform. 6. Selected references.

NBS-GCR-74-27. **State-local interface relationship in the regulation of manufactured building,** 102 pages (Oct. 1974). Order from NTIS as COM 75-10143.

Key words: building codes; factory-built housing; industrialized building; inspection; manufactured building; model codes; model documents; NCSBCS; on-site construction; prefabricated construction; standards; state-local relationship; state regulations.

A key element in the statewide regulation of manufactured building is the state-local interface relationship. This study sought to isolate existing interface problems and to provide recommended solutions. Problem analysis and solutions presume a regulatory framework drawn along the lines suggested by the proposed Model Manufactured Building Act and Coordinated Evaluation System Documents. Inadequacies in the legislative areas coupled with the lack of a well defined communication system constitute the prime interface problems. Suggestions for legislative changes, including revisions to the Model Act, are presented in this report together with recommendations designed to achieve better communications. Results of the data collection and analysis of existing state legislation are included.

NBS-GCR-74-28. **Study of teletypewriter interface and communications standard. Volume I,** 265 pages (Jan. 16, 1967). Order from NTIS as PB176912.

Key words: alphanumeric symbols; AUTODIN (Automatic Digital Network); JOSS; keyboards; MAC project.

The final report consists of two volumes. The first volume (PB176912) contains the results of the investigations of existing standards, teleprinters, modems, multiplexors, and data processors, and the systems in which they are used. The second volume (PB176913) contains the Formulation and Recommendations of Factors for Standardization.

NBS-GCR-74-29. **Study of teletypewriter interface and communications standard formulation and recommendation of factors for standardization. Volume II,** 69 pages (Jan. 16, 1967). Order from NTIS as PB176913.

Key words: acceptability; coding; costs; data transmission systems; decisionmaking; economics; errors; information theory; input-output devices; interfaces; malfunctions; man-machine systems; remote control systems; systems engineering; state-of-the-art reviews.

The final report consists of two volumes. The first volume (PB176912) contains the results of the investigations of existing

standards, teleprinters, modems, multiplexors, and data processors, and the systems in which they are used. The second volume (PB176913) contains the Formulation and Recommendations of Factors for Standardization.

NBS-GCR-74-30. **Study of teletypewriter interface and communications standards. Task 1. Review of previous standardization programs and existing standards,** P. J. Mellett, 43 pages (Sept. 15, 1966). Order from NTIS as COM 74-11732.

Key words: coding; interfaces; modems; signal processing; standards; teletypewriters.

The report discusses previous and existing standards for the interfaces between data processing equipment and communications systems.

NBS-GCR-74-31. **Study of teletypewriter interface and communications standards. Task 3. Review and comparison of communications terminal equipment of common carriers and other suppliers,** P. J. Mellett, 25 pages (Sept. 30, 1966). Order from NTIS as COM 74-11733.

Key words: common carriers; computer networks; interfaces; modems; telecommunication.

Interface between the communications line and the data processing equipment is provided by line termination equipment. The function of this equipment is to change the digital pulses of the data processor into signals suitable for transmission over telegraph or telephone channels. This type of equipment is usually referred to as a MODEM (modulator-demodulator). Generally, this equipment is available through the common carriers on a lease basis as part of their communication services. There are some commercial suppliers of such terminal equipment, which is generally used in conjunction with private or military communications networks. This task consists of comparing the available communication line terminals that are suitable for coupling teletypewriter equipment and computer multiplex units to communication lines for speeds less than 300 baud. The various units are discussed and are presented on a comparison chart (appended to report), so that corresponding parameters for each equipment may be directly compared.

NBS-GCR-74-32. **Design concepts for safer matches and lighters,** 60 pages (Sept. 29, 1972). Order from NTIS as COM 75-10039.

Key words: burns; fabric fires; fire injuries; flammable fabrics; ignition hazards; ignition sources; lighters; matches.

A match or cigarette lighter is frequently the source of ignition in fires involving the accidental burning of fabric items. Consequently, any design of book matches or lighters which would contribute to their utilization in a safer manner would be highly desirable.

In this report, eight design modifications for book matches and seven modifications for cigarette lighters are described and discussed. The objective of the new designs is to prevent the accidental ignition of clothing or other fabric material when used by children in a play situation or when used for a bona fide application by the adult population. The designs proceeded from a study of ignition sequences gleaned from accident reports filed with the National Bureau of Standards.

Emphasis was placed on developing a safer match design for the protection of the very young, the 0-10 age group. The judgments of the investigators, when applied to a devised rating system, indicated the following: (1) A matchbook designed with a sleeved striker which requires insertion of a thin match and coordinated action of both hands, is the most promising; (2) A lighter concept which utilizes a screened flame is considered the most desirable. Other designs also show a reasonable degree of improvement and it is a conclusion of this report that one or more of the designs described, if adopted, will lead to increased safety for the entire population.

NBS-GCR-75-33. **Impact noise testing and rating,** T. J. Schultz, 245 pages (Dec. 1974). Order from NTIS as COM 75-10133.

Key words: acoustics; building acoustics; impact noise; noise; structural vibration.

This report presents a review of the historical development of and the current state-of-the-art in testing and rating floor/ceiling building construction assemblies with respect to their capability for isolating against annoying impact noises. This review was prepared in order to identify the technological basis underlying the current state-of-the-art and the relevant analytic and experimental methods. Recommendations for future research directed toward the evolution of improved standard test procedures are presented.

NBS-GCR-75-34. **Dynamics of textile fires,** G. H. Markstein and J. deRis, 54 pages (Mar. 1974). Order from NTIS as COM 75-10128.

Key words: edges; fabric construction; fabric flammability; fire spread; flame spread; flame spread rate; surfaces; textiles.

This report is concerned with fire spread rates over the surface and along the edge of textile fabrics and their controlling mechanisms. In a previous study, upward two-dimensional turbulent fire spread was investigated using side-walls to prevent sideways air entrainment. This resulted in a continuously accelerating flame spread over heights of practical interest. In the present study, three dimensional flow was permitted by eliminating the side walls. The resultant flame spread becomes steady soon after ignition. There is evidence for some correlation between the various tests: (1) the small scale 45° upward-burning test (CS 191-53); (2) Miller's measurements on his rotating drum apparatus; (3) our realistic-scale upward tubulent spread; (4) our edge-spread data; and finally (5) the fundamental downward creep spread. The large scale upward spread experiments tend to emphasize the chemical composition differences of fiber materials due to enhanced radiation from the larger flame while the smaller scale tests emphasize fabric construction differences due to the closer similarity of flame and fabric detail length scales.

NBS-GCR-75-35. **Characterization of pavement macrotexture by profile spectral analysis,** J. M. Lawther and J. J. Henry, 93 pages (June 1974). Order from NTIS as COM 75-10341.

Key words: noise; pavement macrotexture; profile tracer; tires.

This report presents the results of a study by the Pennsylvania State University to demonstrate the feasibility of utilizing a profile tracer to measure pavement macrotexture. Four test pavements – part of the Pennsylvania Transportation Institute Skid Test facility – were measured and spectrum analysis plots of the pavement profiles are presented. In addition, space frequency spectrum analyses of the profiles were generated and site-to-site comparisons were made. The results are presented in terms of their potential relationship to tire noise.

NBS-GCR-75-36. **Methodology for hazard evaluation of buildings, Vol. I: Technical report,** J. H. Wiggins, G. C. Hart, T. Hasselman, and R. W. White, 353 pages (Dec. 1973). Order from NTIS as PB261144.

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornados; wind.

A methodology is presented for evaluation of existing buildings to determine the risk to life safety from natural disasters and to estimate the amount of expected damage. Damage to both structural and nonstructural building components resulting from the extreme environments produced by earthquakes, hurricanes, and tornados is considered. The methodology is capable of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. The procedure for the methodology is based on a computer analysis of the entire structure and is based on the current state-of-the-art. Numerical examples illustrating applications of the procedure are included.

NBS-GCR-75-37. **Methodology for hazard evaluation of buildings, Vol. II: Computer program users manual,** T. K. Hasselman, R. W. White, and G. Brandow, 112 pages (Dec. 14, 1973). Order from NTIS as PB261145.

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornados; wind.

A methodology is presented for evaluation of existing buildings to determine the risk to life safety from natural disasters and to estimate the amount of expected damage. Damage to both structural and nonstructural building components resulting from the extreme environments produced by earthquakes, hurricanes, and tornados is considered. The methodology is capable of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. The procedure for the methodology is based on a computer analysis of the entire structure and is based on the current state-of-the-art. Numerical examples illustrating applications of the procedure are included.

NBS-GCR-75-38. **Methodology for hazard evaluation of buildings, Vol. III: Demonstration report,** J. H. Wiggins, G. C. Hart, and R. W. White, 76 pages (Dec. 1973). Order from NTIS as PB261021.

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornados; wind.

A methodology is presented for evaluation of existing buildings to determine the risk to life safety from natural disasters and to estimate the amount of expected damage. Damage to both structural and nonstructural building components resulting from the extreme environments produced by earthquakes, hurricanes, and tornados is considered. The methodology is capable of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. The procedure for the methodology is based on a computer analysis of the entire structure and is based on the current state-of-the-art. Numerical examples illustrating applications of the procedure are included.

NBS-GCR-75-40. **Polymer flame retardant mechanisms,** D. J. Holve and R. F. Sawyer, 34 pages (Feb. 1975). Order from NTIS as COM 75-10696.

Key words: fire retardant mechanisms; fire retardant polymers; fire retardants; mass transfer number; opposed flow diffusion flame; oxygen index.

An opposed flow diffusion flame technique (Holve and Sawyer, 1974) was used to measure steady state burning rates and extinction velocities for several polymers (with and without added flame retardants) at varying oxygen concentrations in the oxidizing stream. From these results and an analysis based on extinction Damkohler numbers, overall gas phase activation energies and effective mass transfer numbers were derived. Preliminary findings for flame retardant PMMA show that while flame stability is reduced, (i.e., it takes a higher oxygen concentration to sustain combustion) the burning rate increases. In another case for particle board, boric acid flame retardant is found to reduce the burning rate, but not to have any substantial effect on flame stability. These results suggest that both types of retardants are necessary for effective flammability reduction.

NBS-GCR-75-42. **Technological innovation for civilian, social purposes,** E. R. Mottur, 574 pages (July 1971). Order from NTIS as COM 75-10805.

Key words: civilian, technological innovation; social purposes, civilian; technological innovation.

This book presents the results of the Technological Innovation Policy Project which has been carried out in the Program of Policy Studies of George Washington University, under National Bureau of Standards contracts CST-395 and CST-463. The principal sponsors of the research have been the Office of Invention and Innovation, National Bureau of Standards and the U.S. Arms Control and Disarmament Agency. Supplemental research support has been provided by the National Aeronautics and Space Administration, under NASA Institutional Grant NGR 09-010-030 to the Program of Policy Studies in Science and Technology.

NBS-GCR-75-43. **Feasibility study for a diesel engine condition monitoring system for 1179 class LSTs,** M. B. Peterson, 102 pages (Aug. 1975). Order from NTIS as AD-16782.

Key words: diagnostic systems; diesel engines; maintenance costs; monitoring systems.

A study of the maintenance costs and practices on the LST 1179 class ship has been made to determine if a propulsion diagnostic system would result in cost savings to the Navy or other advantages. In the course of this study, a determination of the current propulsion system malfunctions was made and a listing prepared of the necessary sensor measures to detect these malfunctions. Based upon this information, a diagnostic system was proposed and costed. For the LST 1179 ships a simple data system, which measures the trend analysis parameters (plus critical malfunctions), was found to be cost effective.

NBS-GCR-75-44. **Computer/communications networks on a communitywide basis,** E. F. Clark, S. B. Harvey, C. B. Robbins, R. S. Tall, S. S. Tyler, and G. R. Weinberg, 215 pages (June 1975). Order from NTIS as COM 75-10991.

Key words: broadband interactive terminals; cable television uses; checkless society; computer/communications networks; computer/communications services; computer/communications standards; interactive cable television; nonentertainment television; two-way television; wired city; wired nation.

The purpose of this study is to project the possible impact of computer/communications networks on a communitywide basis and to make recommendations for action required by government and/or industry in order to take advantage of such networks and, hopefully, avoid some of the problems inherent in their development. This report reviews, in general, the issues involved with the future development of cable television as one

possible means of "wiring" the community. This report does not attempt to offer detailed solutions to, or discussions of, specific technical, economic, regulatory, legal, or social problems which may be isolated. The report contains a description of two-way cable services, results of a selected opinion survey, the technical and regulatory status of cable television, an outline of network technology, two future contrasting scenarios, a financial model, and conclusions, recommendations, and standards needed. There is a bibliography of 60 sources. The report was prepared under NBS Contract No. 3-36006.

NBS-GCR-75-45. **Pilot investigations into the effect of glare on psychomotor performance,** R. J. Senter, 13 pages (July 1975). Order from NTIS as PB257835.

Key words: glare; lighting; perceptual/motor; psychomotor; safety.

Empirical investigations measured the effects of glare on human psychomotor performance as assessed by a rotary pursuit apparatus. Experiment I demonstrated a minimal performance decrement when glare was reflected off the surface of the pursuit rotor into the subjects' eyes. Following an initial "startle" response, subjects' performance was observed to recover rapidly and at times improve. In Experiment II, then, the glare source was redirected to produce more intense and less diffuse visual interference. Subjects experienced one of two glare levels on three different occasions. A control group was also employed. Again, the major deleterious effect on human performance was a "startle" response produced after intitial exposure to high glare levels. Recommendations were made for future research involving a more complex psychomotor task.

NBS-GCR-75-46. **Methodology for the effective test case selection, Part 1,** W. Howden and L. G. Stucki, 171 pages (Jan. 1974). Order from NTIS as PB247235.

Key words: automatic testing; computer program testing; FORTRAN programs; program analysis; software verification.

The intent of this project was to develop a methodology for partitioning the input domain of a program into equivalence classes. Two sets of input values are to be contained in the same equivalence class if and only if they cause execution of the same path (perhaps to within the number of loop iterations) through a program. The equivalence classes define, therefore, sets of input values which are treated "the same way" by the program. This mapping of input data classes into program execution paths yields a functional description of the program and provides a basis for a systematic approach to test case selection. The investigation began by analyzing the structure of a program and by considering conditions under which certain logical paths are taken. The loop was selected as one of the more complicated structures which had to be investigated. In order to handle loops a boundary-interior methodology was developed. A four phase approach to the general partitioning problem evolved from this methodology. The first phase defines the implicit path description of the partition elements. These descriptions are then simplified in the second phase. The third phase transforms the implicit path descriptions into partially explicit descriptions. The fourth phase consists of predicate solution routines. This boundary interior methodology currently works with simple loops only. Some complex loop structures or improperly nested loops are excluded.

At this point in time, the research efforts documented in this study describe an approach which will achieve the original objective of selecting test data in programs subject to some constraints.

NBS-GCR-75-47. **Methodology for the effective test selection Phase II, Volumes I and II,** W. Howden and L. G. Stucki, 381 pages (Apr. 1975). Order from NTIS as PB247236.

Key words: automatic testing; computer program testing; FORTRAN programs; program analysis; software verification.

The intent of the Effective Test Case Selection Project is to explore and develop methodologies for partitioning the input space of a program into representative subsets. This ongoing research effort addresses in detail one important aspect of the Automated Verification System Concept being developed at McDonnell Douglas. The problem of providing automated assistance in the selection and construction of meaningful test cases is explored in this study. One key issue of concern involves the identification of a set of criteria for grouping together "similar" program paths. We are faced with the problem of forcing ourselves to find a means of cutting down the number of paths through a program which are significant for testing. Structured programming assists us in the better organization of our programs but yet we still find that exhaustive testing of even structured programs is rarely feasible.

Investigation in the area of automatic selection and construction of test cases has led to the design of a general methodology addressing this problem. The goal of Phase II of this research was to design and implement a prototype system in order to assess its utility and come to a better understanding of the basic program testing problems. The approach taken was general and can be applied to programs in different languages although it was designed with FORTRAN programs in mind.

The prototype system breaks a program down into a finite number of standard sets of program paths. It then attempts to simplify and display the relevant statements and predicates for each class to be tested.

NBS-GCR-75-48. **The avoidance of progressive collapse: Regulatory approaches to the problem,** E. F. P. Burnett, 180 pages (Oct. 1975). Order from NTIS as PB248781.

Key words: abnormal loading; building regulations; design process; European; progressive collapse; regulatory process.

The progressive-collapse related provisions of the building regulations of the United Kingdom, Sweden, Denmark, West Germany, Netherlands, Canada, France, and Eastern Europe are studied in detail. The various regulations are discussed individually for their content, background and interpretation. The report is concluded with a discussion of both building regulatory and design problems associated with the implementation of progressive collapse design requirements. A comparative evaluation is then made of the regulations discussed in the report.

NBS-GCR-75-50. **A theoretical analysis of the ASTM E-119 standard fire test of building construction and materials,** A. M. Kanury and D. J. Holve, 141 pages (Aug. 1975). Order from NTIS as PB247939.

Key words: ASTM Standard E119; building construction; charring; combustion; fire endurance; fire test; flame emissivity; heat transfer; pyrolysis; radiant heat; thermal inertia.

This report describes a theoretical analysis of the ASTM E-119 Standard Fire Test. Both analytical and numerical analyses of the test are performed, indicating how various physical, chemical, and structural variables influence the fire endurance of a construction member. Walls, door, floors and ceilings in heavy timber construction are considered, represented mathematically

as "slabs." Wood, gypsum board, and composite wood-gypsum board "slabs" are discussed. The effects of various fire exposure conditions on the endurance time are assessed. Radiant heat transfer is the dominant heat transfer mode and reradiation properties of the exposed material have a strong influence on the fire endurance time. Thus, the true measure of fire severity is given by the heat flux to the specimen, a function of both the furnace temperature and emissivity.

The exact temporal distribution of temperature exposure has little effect on the fire endurance time as compared to the standard ASTM temperature-time curve. Future improvements of the ASTM E-119 test should focus more on the control, measurement, and specification of the heat flux exposure condition rather than the furnace temperature history.

NBS-GCR-75-51. **Detector sensitivity and siting requirements for dwellings,** R. W. Bukowski, T. E. Waterman, and W. J. Christian, 337 pages (1975). Order from NTIS as PB247483.

Key words: detector sensitivity; detector siting; heat detectors; ionization smoke detectors; photoelectric smoke detectors; residential fires; smoke detectors; tenability levels.

A test program was undertaken to investigate the operation of residential smoke detectors under actual field conditions. The main objectives were to determine: 1) minimum sensitivity, 2) best location and 3) escape time provided by a group of typical detectors. Instrumentation was used to determine theoretical response times of an "ideal" detector as a base line for evaluation of detector performance. The tests were conducted using smouldering or flaming ignition of sofas, chairs and mattresses in various rooms in two abandoned, single-family houses scheduled for demolition. Work was carried out during winter and summer seasons with central heating and cooling on and off.

In addition to a description of the tests and discussion of the results, the report contains all raw data for further analysis by the reader.

The tests indicate both photoelectric and ionization detectors at a sensitivity of approximately 1 percent per foot provide adequate escape time from all the test fires when installed using the following guidelines: 1. The detectors should be installed at the head of each stairway; 2. Outside each separate sleeping area; 3. At least one detector on every level of a multi-level home.

NBS-GCR-76-54. **Characterization of the Stanford Research Institute large-scale heat-release-rate calorimeter,** S. B. Martin, 81 pages (Oct. 1975). Order from NTIS as PB251682.

Key words: calorimeter; combustion; fire test; heat release; limiting thermal index; pyrolysis; radiant heat; thermal sensitivity index.

A scaled up version of the NBS heat release rate calorimeter was constructed at SRI. It can measure specimen sizes up to 18 × 24 inches over an incident radiant flux range of 1.5 to 7.0 W/cm². The performance of the instrument is evaluated and various calibration procedures are described. The effect of specimen size and irradiance is investigated and data is compared with that taken in the NBS instrument. The use of the heat release rate calorimeter as a research tool is discussed. In particular a "limiting thermal index" and a "thermal sensitivity index" are defined.

NBS-GCR-76-55. **Technology for the formulation and expression of specifications. Vol. I: Final report,** J. R. Harris, J. W. Melin, R. L. Tavis, and R. N. Wright, 72 pages (Dec. 1975). Order from NTIS as PB250571.

Key words: building codes; computer model; decision theory; networks; specifications; standards; system engineering.

This report describes a systematic approach to the formulation and expression of specifications that is designed to aid in producing complete, clear, and correct documents. The approach is primarily concerned with the format of specifications, however, it is not possible to entirely separate content and format. It is not expected that the technology will be applied to the formulation of project specifications for construction projects without future study. Three basic tools are used: decision tables for examining the detailed logic contained in each provision, a network for representing the precedence of information in the entire specification, and an outline for organizing all of the provisions in the specification. The report is designed for use by individuals concerned with the preparation of specifications. It does not contain rigorous definitions and proofs of the theorems and algorithms used. Two companion volumes to this report contain a user's manual and a reference manual for the computer software developed as a part of the technology. None of the concepts or algorithms require a computer to be understood or used. Many benefits can be realized by the proper understanding and application of the concepts without using the computer programs.

NBS-GCR-76-56. **Technology for the formulation and expression of specifications. Vol. II: Program user's manual,** J. R. Harris, J. W. Melin, and C. Albarran, 63 pages (Dec. 1975). Order from NTIS as PB250572.

Key words: building codes; computer program; decision theory; networks; specifications; standards; systems engineering.

This report describes the use of three computer programs (DECISION TABLE, NETWORK, and OUTLINE) produced as a part of the study, "Technology for the Formulation and Expression of Specifications." The programs are designed for interactive use from a remote console, and the communication with the programs is in free format, making the programs easy to use for those with limited experience in working computers. The programs are operational on the Burroughs B6700 computer at the Civil Engineering Systems Laboratory (CESL) at the Department of Civil Engineering, University of Illinois, Urbana, Illinois. The principles on which the programs are based and examples of the application of these principles are contained in volume I of this report while a more technical description of the three programs, including logic diagrams, data structure, and program listings, is contained in volume III. This volume contains a description of the use of each program preceded by a chapter describing access to and use of the computer facility at which the programs are operational.

NBS-GCR-76-57. **Technology for the formulation and expression of specifications. Vol. III: Technical reference manual,** R. N. Wright, J. R. Harris, J. W. Melin, and C. Albarran, 118 pages (Dec. 1975). Order from NTIS as PB250573.

Key words: building codes; computer program; decision theory; FORTRAN; logic design; networks; specifications; standards; systems engineering.

This report describes the three computer programs produced as a part of the study, "Technology for the Formulation and Expression of Specifications." The programs are written in FORTRAN IV and are operational on the Burroughs B6700 computer at the Civil Engineering Systems Laboratory (CESL), Department of Civil Engineering, University of Illinois, Urbana, Illinois. Transfer of these programs to other computing facilities will be aided by the contents of the manual, because the pro-

grams are not entirely machine independent. The programs make use of the characteristic word size of the Burroughs equipment (6 characters). Transfer to IBM equipment (which uses 4 characters) will require some reprogramming of the input and output routines. The programs are designed for interactive use from a remote terminal. The input is entered in free format and interpreted by a package of scanning routines at CESL known as PARSE. A manual for PARSE will soon be available from CESL. These programs are envisioned to be prototypes for a more refined computer aid for use with the technology described in volume I of this report.

NBS-GCR-76-58. **Residential sprinkler-protection study,** H. C. Kung, 126 pages (Nov. 1975). Order from NTIS as PB256291.

Key words: automatic sprinklers; bedroom fires; droplet size; heat absorption; pool fires; residential sprinkler protection; sprinkler operation.

A research program was initiated to study sprinkler control of residential fires. Hexane pool fires were selected to simulate source fires. The key parameters of investigation were water-discharge rate and drop size. Results show that as the median drop size decreases at constant discharge rate, an increased reduction is observed in: 1) heat-release rate of the fire, 2) convective heat flux through the room opening, 3) ceiling temperature, 4) gas temperature inside the room, and 5) outflow gas temperature. A correlation has been established between heat-absorption rate and the relative median drop size of the spray. The ratio of the heat-absorption rate to the heat release rate, normalized with the water discharge rate, varies as the minus-0.68 power of the relative median drop size.

A realistic bedroom fire test with flaming ignition was also conducted to evaluate the optimum water discharge rate and sprinkler-orifice diameter determined in the pool-fire tests. The result demonstrated that the suggested optimum sprinkler discharge rate is capable of controlling a realistic bedroom fire.

NBS-GCR-76-59. **Sound power measurements in reverberation chambers,** J. Tichy, M. Brien, and K. Roy, 233 pages (Jan. 1976). Order from NTIS as PB256639.

Key words: measurement technology; reverberation rooms; sound measurement; sound power; sound power levels.

Determination of the sound power emitted by small sources using reverberation rooms is becoming increasingly important as society seeks to implement noise control measures. Many of the critical measurement processes are indicated in American National Standard S1.21-1972, "Methods for the Determination of Sound Power Levels of Small Sources in Reverberation Rooms." This standard, as now embodied, represents a major advance in the state-of-the-art of reverberation room measurement of sound power. It incorporates the best currently available interpretation of measurement technology which is the subject of ongoing research.

NBS-GCR-76-60. **Fire fighter mortality report,** T. Balanoff, 170 pages (Mar. 1976). Order from NTIS as PB253588.

Key words: fatalities; fire fighter; occupational safety and health.

This 15-month study involved the investigation of 101 fire fighters in-the-line of duty deaths. The breakdown of cause of death was: 45 heart attacks, 13 building collapse, 12 burns, 9 smoke inhalations, 6 apparatus accidents, 5 electrocutions, and 1 equipment failure. There tended to be a higher incidence of fatalities occurring in the Mid-Atlantic, East, and New England areas. The mean age of fire fighter's fatality was 43.5 and the mean years of service was 15.8. Sixty percent of the fatalities occurred to men holding the rank of fire fighter. The vast majority of fire fighters who died in the line of duty worked either a split shift (10/14) or a 24-hour shift. There were 14 volunteer fire fighter fatalities.

Summaries of every case are provided in one of three sections: *Fire Fighters Killed While Fighting Fires, Fire Fighters Killed in Non-Fire Situations,* and *Fire Fighters Killed by Heart Attack.*

NBS-GCR-76-61. **Method to determine quality of sapphire,** M. T. Duffy, P. J. Zanzucchi, and G. W. Cullen, 88 pages (Sept. 1975). Order from NTIS as PB253553.

Key words: differential reflection; epitaxial semiconductor devices; Kramers-Kronig relation; multiple reflection; sapphire surfaces; silicon films; specular reflection.

Infrared optical techniques including specular reflection, multiple reflection and differential reflection measurements have been used to evaluate the quality of sapphire surfaces used in epitaxial semiconductor devices. The specular reflection data have been analyzed by use of the Kramers-Kronig relations. These data give a basis for interpreting multiple reflection measurements which are being evaluated for both research and production quality control of sapphire substrates. Correlation of optical reflectance data to x-ray, electrical (e.g., Hall measurements), optical microscopy, and chemical (etch) data is in progress to establish the validity of inferring the extent of lattice damage from reflectance measurements. Application of optical techniques to the characterization of sapphire surfaces, and to semiconductor and dielectric materials in general, is considered. In this context, the optical properties of epitaxial silicon films (on sapphire) have been investigated and, where possible, correlated with the electrical properties of the films as well as with the surface condition of the starting substrates.

NBS-GCR-76-63. **Disk drive interface characteristics,** 105 pages (Apr. 9, 1976). Order from NTIS as PB256440.

Key words: computer disk controllers; computer disk drives; computer disk interface; disk controllers; disk drive characteristics; disk pack interchangeability; disk track format; interface electrical characteristics; interface functional characteristics; removable disk packs.

This report describes and compares the various characteristics of the interface between computer disk drives and disk controllers for those drives using removable disk packs having a storage capacity of approximately 100 million bytes or greater. It presents the findings of an investigation conducted for the National Bureau of Standards in support of the possible development of a Federal Information Processing Standard. Disk pack interchangeability, drive performance characteristics, interface functional characteristics, and interface electrical characteristics are described. The conclusion is reached that although nearly all of the drives reviewed use the same type of disk pack, at the circuit and electrical level substantial differences of a detailed engineering nature exist in the interfaces. Two appendices are given describing (A) details of track format (IBM-compatible) and (B) drive cable attachments and pin numbers. Thirty-three tables and five figures are given. This report was prepared under NBS Contract No. 5-35924.

NBS-GCR-76-64. **Automated integrated circuit processing and assembly,** H. G. Rudenberg, 84 pages (Apr. 1975). Order from NTIS as PB255445.

Key words: automation; electronics; integrated circuits; measurement technology; semiconductor devices; semiconductor process control; silicon.

This report describes the results of a study on automated procedures for integrated circuit (IC) processing and assembly by the semiconductor industry. Emphasis is on automated IC production, especially processing of wafers and assembly of chips into devices. Major operations that are already or may be automated are identified, and future directions are recommended. Information has been derived primarily from interviews in industry and analysis of automated production equipment. The report discusses the susceptibility of processes to automation: a major requirement for automation is that measurement and control techniques be available to provide consistent results from the processes chosen. The automation status of the key process steps is outlined, and the expected evolution to complete computer control is characterized. Measurement techniques reported are directed towards categories suitable for automation of production in respect to accuracy, range and type. The report cites economic and technical factors likely to inhibit automation in the future, and some factors favoring its adoption. A number of priorities for further action are presented. Differences between the criteria used in automating commercial IC production and automating fabrication of devices for DOD electronic systems are described. Additional information includes references listed in the last section of the report; and summaries of the companies contacted or making equipment analyzed, and of important problems in IC processing or automation perceived by respondents are presented in appendices.

NBS-GCR-76-69. **Methodology for the effective test case selection, Phase III. Final report,** W. Howden and L. G. Stucki, 123 pages (Mar. 1976). Order from NTIS as PB254276.

Key words: automatic testing; computer program testing; FORTRAN programs; program analysis; software correctness; software verification; symbolic program evaluation.

The intent of the Effective Test Case Selection Project is to explore and develop methodologies for improving the tasks of computer program analysis and testing. This research effort explores in detail the problem of providing automated assistance in the selection and construction of meaningful test cases for computer applications programs. Key issues involve the identification of criteria for grouping together "similar" program paths, and a means of reducing the number of paths through a program which needs to be analyzed to ensure correctness. The investigation has led to design of a general methodology addressing this problem. Phase III of this research has resulted in the completion of a prototype software testing tool called DISSECT. The DISSECT system addresses the general methodology as well as the design and implementation of additional features whose importance was indicated by experiments with an initial Phase II system. DISSECT provides capabilities to analyze FORTRAN program paths and to symbolically evaluate the potential execution results. Commands are available to select program paths based upon branches and number of loop iterations, and to select DISSECT outputs such as path descriptions or the set of input predicates that cause paths to be followed. DISSECT is an experimental program, written in LISP for a Digital Equipment Corporation PDP-10 computer.

NBS-GCR-76-70. **An investigation of test methods for determining the flammability hazards of fabrics,** K. N. Yeh, I. Block, B. F. Smith, and S. Spivak, 67 pages (June 21, 1976). Order from NTIS as PB254748.

Key words: fabric flammability; fabrics; ignition; heat energy; tests.

The measurement of char length and burn time of a variety of sample specimens was conducted to determine the effects of varying sample size, sample shape, ignition source and air flow past the sample, on these two parameters.

In addition, samples tested in the DOC FF3-71 cabinet were subjected to conditioning at various relative humidities prior to evaluation.

The results of this work indicate that flammability test methods should conform to the following guidelines: (1) the suspension method should be such as to exert as little force in the plane of the fabric as possible, (2) the test specimen should be wide enough to permit unlimited burning in all directions, (3) the ignition source should be capable of providing a precise energy input at a constant rate to the fabric, (4) a forced air flow through the cabinet may be required, (5) although preconditioning humidity may not greatly affect the results when testing nonhydrophilic thermoplastics, moisture sorption can be important, and (6) seamed samples are unnecessary except where the added thread is a significant portion of the weight of the fabric under test.

NBS-GCR-76-71. **Extinguishment in apparel textiles,** G. Tesoro and S. Backer, 60 pages (Oct. 1975). Order from NTIS as PB254751.

Key words: cotton; cotton/polyester; extinguishment; fabric flammability; fabrics; fibers; finishes; flame retardant treatments; nylon; wool.

An experimental investigation of the extinguishability during combustion of various apparel fabrics was conducted. Cotton, wool, nylon, cotton/polyester and FR cotton/polyester were ranked according to burning behavior under test conditions of DOC-FF-3-71 with the addition of heat sinks near the fabric. Stationary and movable heat sinks of various thermophysical properties, geometries, dimensions and speeds were considered.

It was found that extinguishability is affected by fiber type and finish, by weight per unit area and structure. Two parameters were identified to measure relative extinguishability: (1) minimum constant spacing (between fabric and heat sink) needed to induce extinguishment, and (2) the maximum char length obtained after extinguishment in the case of a variable fabric to heat sink spacing. It is concluded that relative differences in ease of extinguishment of nonthermoplastic fabrics can be quantitatively and reproducibly measured.

NBS-GCR-76-72. **Evaluation of fire protection spray devices: The state-of-the-art,** W. G. Labes, 102 pages (June 30, 1976). Order from NTIS as PB256190.

Key words: automatic sprinklers; bibliography; droplet size; fire suppression; spray nozzles; spray patterns; test methods; water distribution; water spray.

This report represents a descriptive review of the state-of-the-art on spray nozzle characteristics, drop-size measurement, and drop-size distribution and spray pattern analysis. A discussion of significant information gaps is also included. A list of references supporting these findings has been prepared and appears as an appendix to this report.

It is concluded that the evaluation of fire protection spray devices must be updated to include considerably more than the volume distribution of water at some standardized distance below the deflector of a sprinkler. Since both the fire environment and the spray structure are three dimensional by nature, and, as these opposing forces occur simultaneously in real fire situations, it is desirable to understand in greater detail the application of water to fire by fire protection spray devices.

NBS-GCR-76-73. **Mapping of recurrent behavior patterns in institutional building under fire: Ten case studies of nursing facilities,** L. Lerup, D. Greenwood, and J. S. Burke, 165 pages (July 1976). Order from NTIS as PB257424.

Key words: building fires; case studies; critical events; decisions; episodes; fires; home for the aged; hospital fires; human behavior; institutions; mapping; models; nursing homes; realms.

Report provides a graphical and narrative mapping of the fire and people behavior patterns in 10 institutional buildings under fire conditions. The case studies concentrate on nursing home type facilities. The report maps out the progress of the fire by realms of fire development and critical events separating these realms. A parallel mapping is included for human behavior covering the episodes and decisions involved. A conceptual framework and analysis of the basic concepts and approaches are included.

NBS-GCR-76-74. **Low-rise low-cost housing and extreme wind related problems in Bangladesh,** J. R. Choudhury, 39 pages (Apr. 1975). Order from NTIS as PB256771.

Key words: Bangladesh; housing; low-cost housing; low-rise buildings; wind.

This report furnishes information on socioeconomic factors, the present conditions of urban and rural housing, and housing needs in Bangladesh for the next 10 years. It also provides data on available wind speed records and wind damage statistics and discusses some special problems unique to Bangladesh.

NBS-GCR-76-75. **Accident research methodologies,** N. W. Heimstra, 27 pages (Dec. 10, 1976). Order from NTIS as PB261201.

Key words: accident research; countermeasures; epidimiology; laboratory research; methodology; naturalistic studies; safety.

This overview paper discusses some of the problems encountered and methodologies used in accident research. Several methodologies are briefly presented—the epidimiological approach, laboratory studies, case studies, and naturalistic observations. Special problems in childhood accident research and in countermeasures are emphasized and a model of human accident behavior is presented. Selected references are included.

NBS-GCR-76-76. **Home accidents and safety,** M. Werber, 100 pages (Dec. 10, 1976). Order from NTIS as PB261200.

Key words: accidents; accident research; consumer accidents; epidimiology hazards; home safety; methodology; safety.

This report briefly summarizes published research in home accidents and safety. Areas covered are: theoretical approaches to safety, behavorial interpretations, research design, hazardous products and conditions, childhood and old age accidents, epidimiology and public health, and accident prevention. In addition to the reference and general bibliographies, an author index, a subject index and permuted title index are included.

NBS-GCR-76-79. **A problem in fire safety: Flame spreading across liquid fuels,** F. L. Dryer, I. Glassman, and W. A. Sirignano, 30 pages (Sept. 15, 1976). Order from NTIS as PB259127.

Key words: combustion models; flame spread; fluid flow; laser doppler velocimetry; liquid fuels; solid fuels; surface tension.

This report provides a brief summary of experimental and theoretical work carried out at Princeton University on flame spreading across liquid fuels. The importance of surface tension driven flows ahead of the flame front in controlling flame spread across liquids at temperatures below the flash point was demonstrated experimentally. Buoyancy and radiation effects were also present but were of lesser importance. Variations in the temperature of the liquid surface are attributed to eddies in the gas phase ahead of the flame front. These eddies may also play a role in flame propagation across solid combustibles. It is proposed to investigate these eddies by means of laser doppler velocimetry. A two-dimensional, steady-state computer program is under development for use as a tool in studying flame propagation above liquid and solid fuels.

NBS-GCR-ETIP 73-01. **Study of strategies for market aggregation,** J. D. Lewis and H. S. Kleiman, 253 pages (May 11, 1973). Order from NTIS as COM 73-11373.

Key words: aggregation, market; market aggregation; tool, market.

This report considers the opportunities for stimulating the development and application of technology in the civilian sector through the use of the tool of market aggregation. Market aggregation is defined as a restructuring of demand to reduce variability in the marketplace. Such reduced variability might be manifest in an increased concentration of the purchasing activities of different buyers or in new standards for products or for their use. In addition to discussions of background and methodology, the report develops a conceptual framework for market aggregation that provides a specific aggregation strategy to treat a given problem. Next four case studies are presented to provide insights for the conceptual framework. These are followed by a discussion of major factors to be considered when contemplating or using market aggregation. The report concludes with suggestions on possible experiments with the market aggregation tool. One appendix to the report discusses antitrust considerations in market aggregation and another provides full details on the four case studies.

NBS-GCR-ETIP 73-02. **Government procurement as an incentive to commercial technology and innovation,** 159 pages (Mar. 1973). Order from NTIS as COM 73-11375.

Key words: ETIP; government procurement; performance specifications; procurement mechanisms; technology incentives.

The Federal Government influences the development and application of technology through its procurement of R&D to meet federal needs, its purchase of goods and services for federal use, and its subsidization of purchases made by other bodies. By altering certain aspects of its procurement practices and procedures, which are described and discussed in this study, the government may further stimulate private investment in technological innovation. Some suggested procurement approaches can be implemented within the confines of existing legislation and without major regulatory change. These include incentives (patent and financial) to commercialize the results of government R&D, the increased use of performance specifications in the procurement of commercial goods and services, and a government-wide policy to procure innovative goods and services that impact favorably on particular national needs. The procurement approaches can be tested by experiments of the one-time "demonstration" type or of the more practical "piggy-back" type, in which a planned or ongoing procurement is modified so as to stimulate innovation. Several examples of experiments that meet appropriate criteria are given in the report,

nd recommendations for selecting, designing, performing, and valuating additional experiments are presented.

NBS-GCR-ETIP 73-03. **Technology transfer and technological innovation: Annotated and selected bibliographies,** 107 pages (July 10, 1973). Order from NTIS as COM 73-11374.

Key words: bibliography, technological innovation; innovation, technological; technological innovation.

The works included in the bibliographies have been ategorized according to their relevance to federal and nonederal activities as well as to the general quality and significance f their discussions on technology transfer or technological inovation. The annotated bibliography includes 315 entries relevant to federal government action and all are of high quality. Approximately 50 additional entries for work of high quality with elevance to nonfederal action are also included. The selected ibliography contains approximately 375 entries, categorized in he same manner.

NBS-GCR-ETIP 73-04. **Experimental technology incentives program procurement experiment plan 1: Stimulating noise control technology in consumer products through federal government procurement action,** 18 pages (Oct. 1973). Order from NTIS as COM 74-10256.

Key words: ETIP; government procurement policy; noise reduction; performance specification; technology incentives.

The Experimental Technology Incentives Program (ETIP) of he National Bureau of Standards (NBS) is part of the continuing effort to understand how the federal government can work more effectively with industrial partners from the private sector in the application of science and technology in the nations interest. ETIP has selected the Federal government procurement policy as one of the specific areas in which to focus its investigations. This experimental plan details the particulars of one of a series of experiments to be conducted by ETIP in association with the Federal Supply Services of the General Services Administration. The specific objective of this experiment is to seek the introduction of improved noise control technology into power lawn mowers that are used by both the government and consumers generally. A 2-step fixed-price negotiated procurement experiment will be conducted utilizing a new performance specification relative to noise emission of the lawn mowers.

NBS-GCR-ETIP 73-05. **Experimental technology incentives program procurement experiment plan 2: Stimulating efficiency and noise abatement in room air conditioners through federal government procurement action,** 51 pages (Nov. 1973). Order from NTIS as COM 74-10257.

Key words: energy conservation; ETIP; government procurement policy; noise reduction; performance specification; technology incentives.

The Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards (NBS) is part of the continuing effort to understand how the federal government can work more effectively with science and technology in the nations interest. ETIP has selected the federal government procurement policy as one of the specific areas in which to focus its investigations. This experimental plan details the particulars of one of a series of experiments to be conducted by ETIP in association with the Federal Supply Services of the General Services Administration. The specific objective of this experiment is to seek the introduction of improved noise control technology and improved energy technology into room air conditioners that are used by the government and by consumers. The procurement approach to be tested will be the approach of performance factors in evaluation of bids responding to a formally advertised procurement.

NBS-GCR-ETIP 73-06. **Experimental technology incentives program procurement experiment plan 3: Stimulating increased efficiency in frostless household refrigerators through federal government procurement action,** 45 pages (Nov. 1973). Order from NTIS as COM 74-10258.

Key words: energy conservation; ETIP; government procurement policy; technology incentives.

The Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards (NBS) is part of the continuing effort to understand how the federal government can work more effectively with industrial partners from the private sector in the application of science and technology in the nations interest. ETIP has selected the federal government procurement policy as one of the specific areas in which to focus its investigations. This experimental plan details the particulars of one of a series of experiments to be conducted by ETIP in association with the Federal Supply Service of the General Services Administration. The specific objective of this experiment is to see improved energy technology in production of frostless household refrigerators to be used by government and by consumers. The procurement approach to be tested will be the use of life cycle cost comparison bid evaluation in a formally advertised procurement.

NBS-GCR-ETIP 73-07, Vol. 1. **Development of criteria and an operating procedure for screening government owned patents,** P. G. Dickey, K. D. Brown, R. W. Aaron, and S. A. Lambert, 82 pages (Apr. 30, 1973). Order from NTIS as COM 74-10939.

Key words: ETIP; government-owned patents; patent screening; technology incentives.

This two volume report describes the development of procedures to screen government-owned patents for commercial potential, based on the patent screening practices of a selected sample of industrial firms; results of the research show that the operating procedure developed satisfies the basic requirements of the study. Technology Generalists were about to apply the developed procedure with a minimum of assistance from Technology Specialists. The procedure, however, cannot readily be applied by nonexperts. Test results of screening selected patents were consistent and in accordance with expected results. The conclusion is drawn that the results indicate that the developed operating procedure replicates the approaches both formal and intuitive commonly used by industrial executives and experts to screen patents. The benefits and usefulness of operating procedures are summarized as follows: 1. Systematization of a screening process which heretofore was essentially random; 2. Uniform application of eight criteria consistently regarded as most important by industrial executives in patent screening; 3. A means for prioritizing patents in terms of some quantitative measurement of commercial potential; 4. A means of screening large numbers of patents in an efficient manner; 5. Procedure can be utilized by generalists as well as specialists.

NBS-GCR-ETIP 73-07, Vol. 2. **Development of criteria and an operating procedure for screening government owned patents,** P. G. Dickey, K. D. Brown, R. W. Aaron, and S. A. Lambert, 316 pages (Apr. 30, 1973). Order from NTIS as COM 74-10940.

Key words: ETIP; government-owned patents; patent screening; technology incentives.

This two volume report describes the development of procedures to screen government-owned patents for commercial

potential, based on the patent screening practices of a selected sample of industrial firms; results of the research show that the operating procedure developed satisfies the basic requirements of the study. Technology Generalists were about to apply the developed procedure with a minimum of assistance from Technology Specialists. The procedure, however, cannot readily be applied by nonexperts. Test results of screening selected patents were consistent and in accordance with expected results. The benefits and usefulness of operating procedures are summarized as follows: 1. Systematization of a screening process which heretofore was essentially random; 2. Uniform application of eight criteria consistently regarded as most important by industrial executives in patent screening; 3. A means for prioritizing patents in terms of some quantitative measurement of commercial potential; 4. A means of screening large numbers of patents in an efficient manner; 5. Procedure can be utilized by generalists as well as specialists.

NBS-GCR-ETIP 75-01. **Fiber, textile and apparel research—Cotton polyester blends, July 1974-75,** 143 pages (Aug. 1975). Order from NTIS as COM 75-11369.

Key words: cotton polyester blends; ETIP; flame retardants; flammability; R&D contracting; radiation grafting; research consortia.

As a part of its experimental program with respect to the funding of civilian research and development by the Government, the Experimental Technology Incentives Program of the National Bureau of Standards awarded a contract where the basis for award was rather unique. The two major criteria for the award were: (1) the identification of specific research to be pursued in a general problem area and (2) the efforts at commercialization that the contractor indicated he would pursue. The contract was awarded to a consortium headed by Clemson University. This report covers the technical progress made during the first year of the research activity.

Based on this research, it is now possible to predict with a high degree of certainty, the types of chemical agents which should be effective in rendering cotton and polyester fabrics flame retardant. The interaction which occurs between fiber systems in a blend have been elucidated. Further, it has been possible to determine the effect of various distributions of the flame retardant chemicals among fibers in several systems. Four specific approaches are now under investigation.

NBS-GCR-ETIP 76-03. **Federal funding of civilian research and development, Vol. 1. Summary,** 62 pages (Feb. 1976). Order from NTIS as PB251266.

Key words: decisionmaking; Experimental Technology Incentives Program; federal funding of civilian R&D; federal policies; policies; private sector; R&D; technological change.

As a part of its program with respect to the funding of civilian research and development by the Federal Government, the Experimental Technology Incentives Program of the National Bureau of Standards awarded a contract to Arthur D. Little, Inc. to conduct a study whose purpose was "To better understand how federal funding of civilian research and development has functioned as an agent of technological change in the private sector."

The fundamental conclusion reached in the study was "Federally-funded civilian research and development is not sufficient to bring about technological change in the private sector to any significant extent." This is true because R&D cost is a small part of the total cost of bringing technological innovation into the marketplace. The study finds that this fact is often overlooked by federal policy makers in both the Executive and Legislative Branches. It is cited as one of the reasons why many United States companies with proven records of developing and marketing new products often shun federal R&D funds, and why so many federal R&D projects are shelved.

The authors suggest that the results of the study indicate that federal funding of civilian R&D should be formulated in the larger context of the complex process of technological innovation. This volume provides a summary of the study.

NBS-GCR-ETIP 76-04. **Federal funding of civilian research and development, Vol. 2. Case studies,** 335 pages (Feb. 1976). Order from NTIS as PB251683.

Key words: decisionmaking; Experimental Technology Incentives Program; federal funding of civilian R&D; federal policies; policies; private sector; R&D; technological change.

As a part of its program with respect to the funding of civilian research and development by the Federal Government, the Experimental Technology Incentives Program of the National Bureau of Standards awarded a contract to Arthur D. Little, Inc. to conduct a study whose purpose was "To better understand how federal funding of civilian research and development has functioned as an agent of technological change in the private sector."

The fundamental conclusion reached in the study was "Federally-funded civilian research and development is not sufficient to bring about technological change in the private sector to any significant extent." This is true because R&D cost is a small part of the total cost of bringing technological innovation into the marketplace. The study finds that this fact is often overlooked by federal policy makers in both the Executive and Legislative Branches. It is cited as one of the reasons why many United States companies with proven records of developing and marketing new products often shun federal R&D funds, and why so many federal R&D projects are shelved.

The authors suggest that the results of the study indicate that federal funding of civilian R&D should be formulated in the larger context of the complex process of technological innovation. This volume provides details of the case studies upon which the findings were based.

NBS-GCR-ETIP 76-05. **Analysis of federally funded demonstration projects, Vol. 1. Executive summary,** W. S. Baer, L. L. Johnson, and E. W. Merrow, 32 pages (1976). Order from NTIS as PB253108.

Key words: demonstration projects; Experimental Technology Incentives Program; federal funding of civilian R&D; federal policies; guidelincs; policies; R&D; technological change; technology.

As a part of its program with respect to the funding of civilian research and development by the Federal Government, the Experimental Technology Incentives Program of the National Bureau of Standards awarded a contract to RAND, Santa Monica, CA, to conduct a study whose purpose was "To develop cost benefit and market/industrial/institutional criteria and guidelines for the use of Federally procured demonstration projects as catalysts for technological change."

The analysis indicated that projects successful in diffusion tend to have the following attributes: (1) A technology well in hand, (2) Cost and risk sharing with local participants, (3) Project initiative from non-Federal sources, (4) The existence of a strong industrial system for commercialization, (5) Inclusion of all ele-

nents needed for commercialization, and (6) Absence of tight time constraints.

The study developed guidelines for demonstration projects. These are grouped under the headings of (1) Strategies for Demonstrations, (2) Initial Exploratory Study, (3) Project Planning and Implementation, (4) Management, Monitoring, and Evaluation, and (5) Dissemination of Results. This volume provides an Executive Summary of the research.

NBS-GCR-ETIP 76-06. **Analysis of federally funded demonstration projects, Vol. 2. Final report,** W. S. Baer, L. L. Johnson, and E. W. Merrow, 197 pages (1976). Order from NTIS as PB253918.

Key words: demonstration projects; Experimental Technology Incentives Program; federal funding of civilian R&D; federal policies; guidelines; policies; R&D; technological change; technology.

As a part of its program with respect to the funding of civilian research and development by the Federal Government, the Experimental Technology Incentives Program of the National Bureau of Standards awarded a contract to RAND, Santa Monica, CA, to conduct a study whose purpose was "To develop cost benefit and market/industrial/institutional criteria and guidelines for the use of Federally procured demonstration projects as catalysts for technological change."

The analysis indicated that projects successful in diffusion tend to have the following attributes: (1) A technology well in hand, (2) Cost and risk sharing with local participants, (3) Project initiative from non-Federal sources, (4) The existence of a strong industrial system for commercialization, (5) Inclusion of all elements needed for commercialization, and (6) Absence of tight time constraints.

The study developed guidelines for demonstration projects. These are grouped under the headings of (1) Strategies for Demonstrations, (2) Initial Exploratory Study, (3) Project Planning and Implementation, (4) Management, Monitoring, and Evaluation, and (5) Dissemination of Results. This volume provides a detailed Final Report.

NBS-GCR-ETIP 76-08. **An analysis of venture capital market imperfections executive summary,** 46 pages (Feb. 1976). Order from NTIS as PB254078.

Key words: capital market imperfections; federal technology policy; SBIC's; securities and tax regulation; small firm finances; technological change; technology subsidies; venture capital.

The study estimated the total flow of funds to small technology based firms, and the composition of that flow according to financial instruments. The relative roles of various suppliers of funds to these firms were assessed. No evidence was found of substantial market imperfections that restrict the flow of funds to small technology based firms. There was no indication that small technology based firms paid higher rates of interest or returned their unaffiliated stockholders more than other small firms. There was no indication that suppliers of funds to small technology based firms earned higher profits than could be earned by investing in listed securities. No elements of the structure of behavior in the venture capital industry were found which would enable firms in the business to charge higher rates or earn greater profits than necessary to compensate for the risks assumed.

The conclusion that there are no substantial capital market imperfections does not necessarily imply that the supply of funds to new technology based firms is in some sense ideal. Investment in small technology based firms may generate external effects so that the benefits to society from investment in these firms may not be accurately reflected in the prices those firms can get for their products and services or the rate of return which investors in such firms can expect to earn.

NBS-GCR-ETIP 76-09. **Life cycle costing in the procurement of electric ranges,** 27 pages (1976). Order from NTIS as PB253488.

Key words: electric ranges; energy efficient products; Experimental Technology Incentives Program; life cycle costing; procurement experiments.

This report documents life cycle cost procurements of electric ranges made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why electric ranges were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-10. **Life cycle costing in the procurement of refrigerator-freezers,** 40 pages (1976). Order from NTIS as PB253260.

Key words: energy efficient products; Experimental Technology Incentives Program; life cycle costing; procurement experiments; refrigerators.

This report documents life cycle cost procurements of refrigerators made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why refrigerators were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-11. **An evaluation of the Small Business Administration Innovation Loan Program,** 119 pages (1976). Order from NTIS as PB253115.

Key words: Experimental Technology Incentives Program; federal policies; innovation loans; R&D; small business; Small Business Administration; technological change.

This is an evaluation of the Innovation Loan Program (ILP), developed and administered by the Small Business Administration during 1966-70 to assist small businesses to market innovations they had developed. The agency's objective was to support new products or processes which could be expected to achieve significant societal benefits.

Approximately 90 loans totaling more than $7 million were made during the life of the program. This evaluation was limited to the 37 identifiable loans.

Borrower entities were analyzed to determine patterns of success and failure, and the merits of their innovations. Technological sophistication and social utility of the innovations were as-

sessed. Employment and tax effects of the program were measured. Borrowers were found to be typically small, newly established, undercapitalized firms with a single product. The program was adjudged a qualified success, and revival of this or a similar program is recommended.

NBS-GCR-ETIP 76-12. **An analysis of venture capital market imperfections,** 438 pages (Feb. 1976). Order from NTIS as PB254996.

Key words: capital market imperfections; federal technology policy; SBIC's; securities and tax regulation; small firm finances; technological change; technology subsidies; venture capital.

The study estimated the total flow of funds to small technology based firms, and the composition of that flow according to financial instruments. The relative roles of various suppliers of funds to these firms were assessed. No evidence was found of substantial market imperfections that restrict the flow of funds to small technology based firms. There was no indication that small technology based firms paid higher rates of interest or return their unaffiliated stockholders more than other small firms. There was no indication that suppliers of funds to small technology based firms earned higher profits than could be earned by investing in listed securities. No elements of the structure of behavior in the venture capital industry were found which would enable firms in the business to charge higher rates or earn greater profits than necessary to compensate for the risks assumed.

The conclusion that there are no substantial capital market imperfections does not necessarily imply that the supply of funds to new technology based firms is in some sense ideal. Investment in small technology based firms may generate external effects so that the benefits to society from investment in these firms may not be accurately reflected in the prices those firms can get for their products and services or the rate of return which investors in such firms can expect to earn.

NBS-GCR-ETIP 76-13. **Life cycle costing, procurement case 1, room air conditioners,** 28 pages (July 1975). Order from NTIS as PB253475.

Key words: energy efficient products; Experimental Technology Incentives Program; life cycle costing; procurement experiments; room air conditioners.

This report documents life cycle cost procurements of room air conditioners made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why room air conditioners were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-14. **Life cycle costing, procurement case 2, water heaters,** 24 pages (July 1975). Order from NTIS as PB253476.

Key words: energy efficient products; Experimental Technology Incentives Program; life cycle costing; procurement experiments; water heaters.

This report documents life cycle cost procurements of water heaters made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why room air conditioners were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-15. **Life cycle costing, procurement case 3, gas ranges,** 30 pages (Jan. 1976). Order from NTIS as PB253477.

Key words: energy efficient products; Experimental Technology Incentives Program; gas ranges; life cycle costing; procurement experiments.

This report documents life cycle cost procurements of gas ranges made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why room air conditioners were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-16. **An experiment on accelerating the writing of nuclear standards conducted for the American National Standards Institute,** N. G. Wittenbrock, 237 pages (Sept. 1975). Order from NTIS as PB256129.

Key words: administrative experiment; American National Standards Institute; Experimental Technology Incentives Program; Nuclear Regulatory Commission; standards development; technological change.

This project was an *administrative experiment,* run in cooperation with the NRC and the American National Standards Institute. Its purpose was to determine whether any or all of four changes in the method of developing nuclear standards is a desirable method for accelerating the establishment of responsible standards which are approved by ANSI and adopted by the Nuclear Regulatory Commission. Several changes in the normal way consensus standards are drafted were made to see if their development could be expedited and the information underlying them increased. It tested: (1) the use of a full-time committee chairman (versus a volunteer chairman), (2) the provision of technical editorial services for the preparation of early draft standards, (3) the provision of technical secretarial help to expedite the translation of committee discussion into draft standards, and (4) the convocation of committees for an extended period of time by paying out of pocket costs. It was hypothesized that the changes would substantially reduce the amount of time consumed by coordinating views via the mail, telephone, and through shorter meeting periods.

NBS-GCR-ETIP 76-17. **A guide for applying the concepts of life cycle costing to procurements by state and local governments,** 209 pages (1976). Order from NTIS as PB254233.

Key words: bid evaluation; Experimental Technology Incentives Program (ETIP); innovation; life cycle costing; local government; procurement policy; state government.

This guide has been developed to assist the public purchasing community to more fully understand, and use the elements of life cycle costing in the procurement process.

The guide contains chapters on concept and theory of LCC, use of LCC in equipment purchases, use of warrantees in LCC structuring LCC procurements and selected case studies plus appropriate contract clauses in equipment procurement.

The guide has application at the Federal, State and local levels of procurement activity and for industrial purchasing agents as well.

The guide was developed as part of the Experimental Technology Incentives Program's research in the use of procurement policies in providing incentives to innovation and technological change.

NBS-GCR-ETIP 76-18. **Value incentive program household goods shipping containers,** 40 pages (July 1976). Order from NTIS as PB256642.

Key words: Experimental Technology Incentives Program (ETIP); Federal Supply Service; life cycle costing; procurement policy; specifications; value.

This case study covers the use of the Value Incentive Clause by a GSA/FSS contractor to make product improvement suggestions on Household Shipping Containers. The use of this clause allows for contractors who hold FSS contracts to make suggestions to reduce the overall cost of procurement to the government and to share in the savings resulting from their suggestion. Copies of the GSA order, and the clause itself are included in addition to the specific changes proposed for the household containers. As the result of this suggestion the government will save about $7.5 million dollars over 10 years. The contractor's share of the first year's savings exceeds $150,000.

NBS-GCR-ETIP 76-19. **Life cycle costing in the procurement of window air conditioners,** 38 pages (July 1976). Order from NTIS as PB256643.

Key words: energy efficient products; Experimental Technology Incentives Program; life cycle costing; procurement experiments; window air conditioners.

This report documents life cycle cost procurements of window air conditioners made by the Federal Supply Service (FSS), General Services Administration (GSA). These procurements were part of a program instituted by FSS to apply life cycle costing techniques to its procurement process. This program was instituted in conjunction with the Experimental Technology Incentives Program (ETIP) of the National Bureau of Standards. The material contained in the report explains why refrigerators were selected for LCC, how the LCC criteria were developed, and what results were obtained. Details concerning the screening process used in selecting the products, the preparation of the invitation for bid document, the bids received, and the evaluation, analysis and award process are covered in the report.

NBS-GCR-ETIP 76-22. **Development of flame retardants for polyester/cotton blends,** R. H. Barker and M. J. Drews, 472 pages (Sept. 1976). Order from NTIS as PB257884.

Key words: antimony oxide; bromine; bromine flame retardants; calorimetry; cotton; cotton/polyester; ETIP; fabric flammability; flame retardant mechanisms; flame retardant monomers; flame retardants; hand modifiers; inherently flame retardant polyester; phosphazenes; phosphorus flame retardants; polyester; precondensates; radiation grafting.

Initial studies were carried out to determine the flame retardant characteristics of the individual polyester and cotton fibers. Since previous studies had dealt primarily with cotton and other cellulosic materials, emphasis was placed on the polyester. Structural and chemical factors affecting flammability were determined and evaluated. The interaction of the fibers was studied in both the presence and absence of flame retardants. Several specific types of phosphorus and bromine-containing materials were evaluated to determine their relative retardant efficiencies. Various methods of fixing flame retardants onto polyester were also studied with particular emphasis placed on radiation grafting techniques. Based on the results of these studies several series of model flame retardant treatments were prepared and evaluated on 50/50 blend fabrics. The results of these studies were then used as the basis for designing new flame retardant systems having a potential for commercial application. These systems include phosphonium oligomers, a bromine-containing phosphazene and brominated aromatics with a brominated acrylate binder.

NBS-GCR-ETIP 76-23. **Value incentive program computer room air conditioning units,** 35 pages (July 1976). Order from NTIS as PB258991.

Key words: computer air conditioning units; Experimental Technology Incentives Program (ETIP); Federal Supply Service; life cycle costing; procurement policy; specifications; value incentives.

This case study covers the use of the Value Incentive Clause by a GSA/FSS contractor to make product improvement suggestions on Computer Room Air Conditioning Units. The use of this clause allows for contractors who hold FSS contracts to make suggestions to reduce the overall cost of procurement to the government and to share in the savings resulting from their suggestion. Copies of the GSA order, and the clause itself are included in addition to the specific changes proposed for the computer room air conditioning units. As the result of this suggestion the government will save about $394,000 dollars over 10 years. The contractor's share of the first year's savings exceeds $7,000.

NBS-GCR-ETIP 76-24. **A framework for analyzing commodity supply restrictions,** 240 pages (1976). Order from NTIS as PB258093.

Key words: applied microeconomic framework; commodity supply crisis; econometric analysis; economic impacts; efficiency impacts; income distribution effects; policy alternatives.

Study addresses commodity supply crises due to producer country export policies, and considers the issue of resource exhaustion only as it relates to this problem. The primary concern is with *economic* impacts and policies. Crises in commodity supplies may well have political impacts, but detailed treatment of such effects is beyond the scope of the study. Possible political and diplomatic constraints on U.S. policies are considered, but the primary concern is with economic impacts.

Policies differ in their effects on the distribution of income between producers and consumers. Such effects are considered, where appropriate. Concentration is on efficiency impacts, however, and there is no attempt to address effects on the size distribution of income.

The basic analytical approach is that of the applied microeconomist working in a supply and demand framework. This framework allows the use of available qualitative economic, econometric and engineering information. There has been no use of mathematical programming or input-output techniques as it is

believed that the techniques employed are, for the purposes of this study, more productive within time and budget constraints.

U.S. Patent 3,950,995. **Ambient pressure probe,** R. D. Marshall, (Apr. 20, 1976).

Key words: ambient pressure probe; omnidirectional pressure probe; pressure probe shroud; static pressure; weatherproof pressure probe; wind field pressure measurements.

Ambient or static pressure in a fluid stream is sensed with a hollow circular cylinder placed normal to the fluid stream. A shroud is mounted on the cylinder for adjustment over a ring of ports provided in the cylinder. In this manner, the relationship between the internal pressure in the cylinder and the ambient pressure is controllable. Ideally, the internal and ambient pressures are exactly equal. Further, extension of the cylinder above and below the shroud provides symmetry for positive and negative angles of attack.

U.S. Patent 3,958,269. **Color subcarrier frequency comparator,** D. D. Davis, (May 18, 1976).

Key words: color subcarrier; frequency calibration; frequency comparator; frequency measurements; oscillator calibration; phase comparison; television receiver.

Apparatus for measuring the frequency of a reference signal which utilizes the color subcarrier signal of a television receiver as a standard frequency signal. In a first embodiment, the reference signal controls a circuit to develop bursts of a synthesized color subcarrier signal, gated at the horizontal line rate of a color television receiver. The synthesized signal is superimposed on the broadcast television signal and applied to the receiver to produce a modulation bar on the screen. Any frequency/phase difference between synthesized and broadcast color subcarrier signals will cause the modulation bar to move laterally across the screen, and/or cause the sequence of colors within the modulation bar to vary. Movement of the modulation bar is a coarse indication of frequency difference and change of the color sequence within the bar is a precise indication of phase difference.

In a second embodiment, the locally synthesized color subcarrier signal and the color subcarrier signal of the television receiver are compared in a linear phase comparator to develop a signal having an instantaneous voltage proportional to the phase difference between the two signals. The phase signal controls a generator which develops a cursor line on the screen. Movement of the line across the screen provides a coarse indication of phase difference between the subcarrier signals. The phase signal is also applied to a digital counter which affords a precise readout of the phase difference between the signals.

U.S. Patent 3,966,413. **Electrochemical chlorine flux monitor,** G. Marinenko, (June 29, 1976).

Key words: calibration cell; chlorine concentration; chlorine monitor; electrochemical calibration; internal calibration; iodine detection; potassium iodide.

This apparatus for monitoring the chlorine concentration of water has a unique internal calibration capability and a high sensitivity. A water sample is mixed with a solution of potassium iodide and the reaction produces a mole of iodine for every mole of chlorine present in the water. The mixture is passed through a detection and calibration assembly wherein the iodine is detected amperometrically by a detection cell. Calibrant (known) iodine fluxes, equivalent in effect to the unknown chlorine-produced iodine fluxes, are supplied to the detection cell during calibration runs by means of an upstream calibration cell which electrolyzes the iodide (preferably added to distilled water) to iodine at flux rates given simply by the electrolyzing currents divided by Faraday's constant. An electronics package having gain and offset controls and a concentration display is provided.

U.S. Patent 3,967,140. **Tunnel diode pulse generator,** J. R. Andrews, (June 29, 1976).

Key words: directional coupler; fast risetime; flat pulse baseline/topline; pulse generator; step waveform; tunnel diode.

A tunnel diode pulse generator is triggered through a directional coupler. The tunnel diode is coupled across one end of an output transmission line through an impedance matching network which matches the characteristic impedance of the transmission line. Triggering signals are coupled to the transmission line through the directional coupler for propagation of triggering impulses towards the tunnel diode.

U.S. Patent 3,968,363. **Radiation flux averaging device of high efficiency,** K. D. Mielenz, R. Mavrodineanu, and E. D. Cehelnik, (July 6, 1976).

Key words: averaging sphere; averaging ultraviolet and visible light; radiation converter; ultraviolet averaging sphere; ultraviolet to visible converter.

A flux averaging sphere having an improved efficiency and a high averaging and diffusing effectiveness over the visible and ultraviolet ranges. The interior surface of the sphere is coated with a white diffusing material which has a higher reflectance for visible radiation than for ultraviolet radiation. A radiation converting means is disposed inside the sphere for converting incoming ultraviolet radiation to visible radiation before reflections from the sphere wall occur. The radiation converting means is transparent to incoming visible radiation which therefore remains unaffected. The efficiency of the device is further improved by eliminating the small gap between the output area and the face of the photomultiplier tube. The sphere is formed with a tapered tubular extension at the output area and the face of the photomultiplier tube is abutted against the end of the extension thereby forming a substantially light tight seal.

U.S. Patent 3,970,862. **Polymeric sensor of vibration and dynamic pressure,** S. Edelman, S. S. Roth, and J. F. Mayo-Wells, (July 20, 1976).

Key words: dynamic pressure transducer; polymeric film transducer; sandwiched polymeric films; vibration transducer.

A transducer, and method for making it, comprising a composite film for sensing pressure comprising a pair of film sandwiches, each sandwich comprising a poled polymeric films with metallic film electrodes on opposite surfaces. One electrode does not extend quite to the end of the polymer and is considered the "hot" electrode. Two such transducer film sandwiches are cemented together with the hot electrodes in contact with each other, the center wire from a coaxial cable being in contact with and between them. The outer electrodes are electrically connected to the shield of the cable and the connection is encapsulated.

U.S. Patent 3,973,970. **Additive composition for making dental materials,** C. P. Mabie, (Aug. 10, 1976).

Key words: ammonium stabilized silica and alumina sols; colloidal alumina and silica for dental porcelain; dental porcelain; porcelain balling reduction.

Addition of ammonium stabilized colloidal silica, borax and boric acid to the distilled water in which dental porcelain is fired

greatly increases the firing range by reducing "balling" or edge rounding, and flow deformation. Greatly increased machinability and indefinitely prolonged green-biscuit strength is also obtained by the use of the present additive without deleterious effects on the porcelain.

U.S. Patent 3,975,940. **Portable tester for measuring the static coefficient of friction between a floor surface or the like and a shoe sole or heel material or the like,** R. J. Brungraber, (Aug. 24, 1976).

Key words: floor slipperiness; slipperiness tester; static coefficient of friction measurement.

A portable testing device for determining the static coefficient of friction between a floor surface and a shoe sole or heel material includes an upper, weighted strut movable within a vertical plane and a lower strut pivotably secured to the bottom portion of the upper strut. The upper strut is mounted within a bearing block which is translatably movable within a horizontal plane, and the lower strut has secured to the bottom portion thereof a yoke within which a metal shoe carrying a representative shoe sole or heel material to be tested is pivotably secured. The yoke and shoe project through the base of the device framework so as to rest upon the flooring material being tested, and a trigger is disposed near the shoe so as to be actuated thereby upon the occurrence of slip between the shoe and flooring materials. The trigger is in turn connected to a friction clutch which controls the movement of a graduated rod, which is coupled to the bearing block so as to monitor the movement thereof and upon which the static coefficient of friction data is indicated, and upon the occurrence of slip, the movement of the rod is arrested by the clutch mechanism whereby the friction coefficient may be read directly from the rod.

U.S. Patent 3,996,120. **Laser-induced photochemical enrichment of boron isotopes,** S. M. Freund and J. J. Ritter, (Dec. 7, 1976).

Key words: boron isotope separation; boron trichloride; isotope enrichment; laser isotope separation; photochemical enrichment.

A boron trichloride starting material containing both boron-10 isotopes and boron-11 isotopes is selectively enriched in one or the other of these isotopes by a laser-induced photochemical method involving the reaction of laser-excited boron trichloride with either H_2S or D_2S. The method is carried out by subjecting a low pressure gaseous mixture of boron trichloride starting material and the sulfide to infrared radiation from a carbon dioxide TE laser. The wave length of the radiation is selected so as to selectively excite one or the other of boron-10 BCl_3 molecules or boron-11 BCl_3 molecules, thereby making them preferentially more reactive with the sulfide. The laser-induced reaction produces both a boron-containing solid phase reaction product and a gaseous phase containing mostly unreacted BCl_3 and small amounts of sulfhydroboranes. Pure boron trichloride selectively enriched in one of the isotopes is recovered as the primary product of the method from the gaseous phase by a multi-step recovery procedure. Pure boron trichloride enriched in the other isotope is recovered as a secondary product of the method by the subsequent chlorination of the solid phase reaction product followed by separation of BCl_3 from the mixture of gaseous products resulting from the chlorination.

NBS-114A (REV. 9-78)

15. SUPPLEMENTARY NOTES
Vol. 1 and 2 (1966 - 1976) have been updated by SP 305, Supplement 9.
Library of Congress Catalog Card No. 78-600145.

☐ Document describes a computer program; SF-185, FIPS Software Summary, is attached.

16. ABSTRACT *(A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.)*

The published output of NBS for 1966 through 1976 is cataloged and indexed in this two-volume publication. Parts 1 and 2 of Volume 1 consist of reprints of abstracts and full citations of all published papers during the 11-year period as they originally appeared in the NBS annual publication catalogs - NBS SP 305 and its Supplements 1 through 8. Volume 2 is a consolidated permuted key word index which directs the researcher of NBS literature either to the citations and abstracts of Volume 1 or to the same information in the nine annual catalogs issued during the 11-year period. Annual supplements to SP 305 will continue to update the NBS published output; the 1977 supplement is now available as NBS SP 305, Supplement 9.

Complete catalogs available in two volumes, 2 parts each as follows:

SP 535, Volume 1 (2 parts), order as Stock No. SN003-003-02010-9, price $23.75

SP 535, Volume 2 (2 parts), order as Stock No. SN003-003-02011-7, price $21.25

17. KEY WORDS *(six to twelve entries; alphabetical order; capitalize only the first letter of the first key word unless a proper name; separated by semicolons)*
Catalog of NBS publications; citations and abstracts of NBS publications; NBS publications program; eleven-year key word index (1966 - 1976); index to NBS publications.

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH—The Journal of Research of the National Bureau of Standards reports NBS research and development in those disciplines of the physical and engineering sciences in which the Bureau is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology, and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Bureau's technical and scientific programs. As a special service to subscribers each issue contains complete citations to all recent NBS publications in NBS and non-NBS media. Issued six times a year. Annual subscription: domestic $17.00; foreign $21.25. Single copy, $3.00 domestic; $3.75 foreign.

Note: The Journal was formerly published in two sections: Section A "Physics and Chemistry" and Section B "Mathematical Sciences."

DIMENSIONS/NBS

This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing.

Annual subscription: Domestic, $11.00; Foreign $13.75

NONPERIODICALS

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a world-wide program coordinated by NBS. Program under authority of National Standard Data Act (Public Law 90-396).

NOTE: At present the principal publication outlet for these data is the Journal of Physical and Chemical Reference Data (JPCRD) published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements available from ACS, 1155 Sixteenth St. N.W., Wash., D.C. 20056.

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Order **above** *NBS publications from: Superintendent of Documents, Government Printing Office, Washington, D.C. 20402*

Order **following** *NBS publications—NBSIR's and FIPS from the National Technical Information Services, Springfield, Va. 22161*

Federal Information Processing Standards Publications (FIPS PUB)—Publications in this series collectively constitute the Federal Information Processing Standards Register. Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Services (Springfield, Va. 22161) in paper copy or microfiche form.

BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau:

Cryogenic Data Center Current Awareness Service. A literature survey issued biweekly. Annual subscription: Domestic, $25.00; Foreign, $30.00.

Liquified Natural Gas. A literature survey issued quarterly. Annual subscription: $20.00.

Superconducting Devices and Materials. A literature survey issued quarterly. Annual subscription: $30.00. Send subscription orders and remittances for the preceding bibliographic services to National Bureau of Standards, Cryogenic Data Center (275.02) Boulder, Colorado 80302.
