UNITED STATES DEPARTMENT OF COMMERCE
National Institute of Standards and Technology
Gaithersburg, Maryland 20899

Dear Colleague:

The past year (1991) marked the 90th Anniversary of the National Institute of Standards and Technology (NIST) formerly the National Bureau of Standards (NBS). As with other anniversaries, this is an opportunity to review the past and to plan and chart new directions for the future.

At the 50th Anniversary of NBS, Dr. Vannevar Bush asked, "Should an agency that is committed to the duty of setting standards also do research?" In my opinion the answer to his question is very clear. Those who set scientific standards cannot limit themselves only to the application of science but must constantly seek to improve the state of the art of the measurement process that can only be achieved through a concomitant effort of applied and basic research. Within this precept lie the uniqueness and strengths of NIST Standard Reference Materials (SRMs).

This catalog contains standards that were developed by scientists at NIST to aid and support industry, government, and science. Many of the SRMs were certified in cooperation with industry, others were certified using technology and scientific research based here at NIST. SRMs offered in this catalog can assure measurement compatibility and, in many cases, connect the measurement process to the "National Measurement System."

The number and type of SRMs described in the catalog have increased to over 1,200 since our previous issue. The catalog contains a guide and two revised indexes, each of which groups the SRMs and RMs according to a distinctive characteristic or descriptor. Please read the section entitled "How to Use This Catalog" as a starting point in examining NIST's available SRMs.

Many of you have informed us by letter or personally at exhibits of the need for new SRMs. We hope that some of the new SRMs recently developed at NIST will meet your standards needs. We have endeavored to provide at least some modest growth in our certification activities to accommodate your many requests. If you have a requirement that we currently do not meet, please contact us. There is a section in this catalog entitled "Guide for Requesting Development of Standard Reference Materials," that will facilitate processing your requests.

We appreciate your continued support for the SRM program and look forward to being able to serve you in the coming year.

Sincerely,

William P. Reed

SRM and the SRM Logo

The term SRM and the SRM logo are Federally registered trademarks of the National Institute of Standards and Technology and the Federal Government, who retain exclusive rights in the term. Permission to use the term and/or the logo is controlled by NIST as is the quality of the use of the term SRM and of the logo itself.

Acknowledgments

The editor acknowledges L. T. Best of SRMP—who arranged for the catalog photographs and designed the cover, and S. K. Maxwell of SRMP—who constructed the catalog's Numerical and Certificate Index. Very special thanks is due R. J. Pardee, formerly of NIST—who edited, proofread and performed catalog page layout adjustments, and I. E. Putman of NIST who electronically typeset this catalog in its entirety.

Abstract and Key Words

This catalog provides technical and general ordering information for the Standard Reference Materials (SRMs) and Reference Materials (RMs) currently available from the National Institute of Standards and Technology (NIST) Standard Reference Materials Program (SRMP). The materials are arranged according to technical category and classified as follows: Standard Reference Materials for Chemical Composition; Standard Reference Materials for Physical Properties; and Standard Reference Materials for Engineering Materials. Technical descriptions are given for all materials and may include certified values. However, these values may be incomplete as they appear in the catalog and therefore cannot be referenced for actual measurement purposes. The certificates issued by SRMP are the only legitimate sources of certified information for NIST reference materials.

Key Words: analysis, calibration, Certified Reference Materials, characterization, composition, concentration, material, measurement, property, quality assurance, quality control, Reference Materials, Standard Reference Materials, standardization.

NIST Policy Regarding Use of Metric (SI) Units

In February 1991, the Director of NIST established the following policy:

"In accordance with the Metric Conversion Act of 1975 as amended by Section 5164 of the Omnibus Trade and Competitiveness Act of 1988 and as required by related provisions of the Code of Federal Regulations, the National Institute of Standards and Technology (NIST) will use the modern metric system of measurement units (International System of Units; abbreviation: SI) in all publications. When the field of application or the special needs of users of NIST publications require the use of non-SI units, the values of quantities will be first stated in SI units and the corresponding values expressed in non-SI units will follow in parentheses."

This policy is part of the NIST Metric Transition Plan, developed in response to the legislation which mandates adoption of the SI system of units by all Federal agencies as the preferred system of weights and measures for United States trade and commerce. Governmental commitment to metrification has been further reinforced with the signing of Executive Order 12770 on July 25, 1991, by the President of the United States, which requires each Federal Agency to adopt use of the metric (SI) system into all its business-related activities by September 30, 1992.

The technical information contained in this catalog is consistent with the above-stated NIST policy. Only SI units and symbols have been used to describe the reference materials contained herein. Therefore, abrogated or obsolete quantifiers (i.e., the term, ppm), no longer appear, but rather have been replaced with the correct SI term, (mg/kg), and reference material values previously expressed in only inch-pound units, have been converted to the appropriate SI units. [1,2] Due to space limitations, the non-SI units converted are not shown in the catalog. The user should consult those SRM and RM certificates where data have been expressed in both SI and non-SI units. Lastly, in cases where SI unit conversions are not involved, terms in widest current usage (i.e., Wt. %), have been adopted and applied consistently throughout the catalog.

[2] The International System of Units (SI), NIST Special Publication 330, 1991 Edition.

How to Use This Catalog

The *NIST Standard Reference Materials Catalog 1992-93* lists Standard Reference Materials (SRMs) and Reference Materials (RMs) issued by the NIST Standard Reference Materials Program. It consists of a guide and two (2) indexes, each of which groups the SRMs and RMs according to a distinctive characteristic or descriptor. Selection of the guide or one index over another to locate the information desired will depend on the user's prior knowledge of a specific SRM or RM and intended SRM or RM application.

Guide to SRM/RM Technical Categories – This is a general listing based on the three major categories into which all the SRMs and RMs have been assigned. The *categories* are divided into sequentially numbered sections, each of which describes a material class or technical property class. The *sections* are further divided into subsections, each of which describes a specific type of material or technical property and the physical form(s) of the SRMs and RMs contained therein. The titles of the *subsections* are the descriptors for the tables comprising the catalog.

EXAMPLE

- Category – Standard Reference Materials for CHEMICAL COMPOSITION, 21 through 91 (page nos.)
- Section – 102. Nonferrous Metals, 36 (page no.)
- Subsection – Zinc Base Alloys (chip form), 43 (page no.)
- (Descriptor)

SRM/RM Subject Index – This index is based on short word descriptors (one to four words) of the SRMs and RMs in the catalog. These descriptors may identify a section, subsection, a material class, a specific SRM property, a specific SRM application, or a measurement technique. Some descriptors may coincidentally also identify an individual SRM or RM; however, only a few SRMs or RMs will be so described. The index is arranged in *alphabetical order of the first word of the descriptor*. Because of the variety of descriptors used, some SRM and RM materials may be cross-referenced.

EXAMPLE

- Index Entry – ALLOYS (NONFERROUS)
- Descriptor (s) – See NONFERROUS METALS, 36-43 (page nos.)

- Index Entry – ZINC
- Descriptor – Spelter (ZINC BASE ALLOYS), 43 (page no.)

SRM/RM Numerical and Certificate Index – This index is based on the unique numerical identifier assigned to each and every SRM and RM issued by NIST. This identifier is the *SRM or RM Number*, an integral part of the reference material name which appears on each SRM certificate or RM report of investigation. The index lists all the SRMs and RMs sequentially by this number, beginning with SRM 1c and ending with RM 9529. A short word descriptor of the SRM or RM, the category subsection in which it is assigned, and the *certificate or report-of-investigation date of issue* is also provided for reference.

EXAMPLE

SRM	-	94c
Descriptor	-	Zn Base Die Casting Alloy
Certificate Date	-	Aug 73
Section Code	-	102
Page	-	43 (page no.)

HOW TO LOCATE SPECIFIC INFORMATION

About an unknown SRM or RM material needed for a particular technical application –

Refer to the **Guide to SRM/RM Technical Categories**, select the most appropriate of the three categories, review all the sections and subsections therein and note the page numbers.

About a material from a specific class of materials and of known technical application –

Refer to the **SRM/RM Subject Index**, check for alternative descriptors and cross-references, and note page numbers.

About a material whose SRM or RM number is known –

Refer to the **SRM/RM Numerical and Certificate Index** and note the page number.

Program Information

The National Institute of Standards and Technology (NIST) offers for sale over 1,000 different materials through its Standard Reference Materials Program (SRMP). These materials are primarily Standard Reference Materials (SRMs) certified for their chemical compositions, chemical properties, or physical properties, but also include other reference materials. All materials bear distinguishing names and numbers by which they are permanently identified. Thus, each material bearing a given description is identical (within the specified limits) to every other sample bearing the same designation—with the exception of individually certified items, which are further identified by serial number.

Definitions

From "Terms and definitions used in connection with reference materials," ISO Guide 30-1981 (E):

1. "Reference Material (RM): A material or substance, one or more properties of which are sufficiently well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials."
2. "Certified Reference Material (CRM): A reference material, one or more of whose property values are certified by a technically valid procedure, accompanied by or traceable to a certificate or other documentation which is issued by a certifying body."

NIST Standard Reference Materials (SRMs): Certified reference materials issued by NIST. These are well-characterized materials produced in quantity to improve measurement science. SRMs are certified for specific chemical or physical properties, and are issued by NIST with certificates that report the results of the characterization and indicate the intended use of the material. They are prepared and used for three main purposes:

- (1) To help develop accurate methods of analysis (reference methods);
- (2) To calibrate measurement systems used to:
 - (a) facilitate exchange of goods,
 - (b) institute quality control,
 - (c) determine performance characteristics, or
 - (d) measure a property at the state-of-the-art limit; and
- (3) To assure the long-term adequacy and integrity of measurement quality assurance programs.

NIST certified values are obtained by one of three routes of measurement:

- (1) A previously validated reference method,
- (2) Two or more independent, reliable measurement methods, or
- (3) A network of cooperating laboratories, technically competent and thoroughly knowledgeable with the material being tested.

These measurement routes are described in "The Role of Standard Reference Materials in Measurement Systems," NBS Monograph 148, 54 pages (Jan. 1975).

Reference Materials (RMs) listed in this catalog are sold, but not certified, by NIST. They meet the ISO definition for RMs, and many meet the definition for CRMs. The documentation issued with these materials is either a:

(1) "Report of Investigation," the sole authority being the author of the report. RMs are intended to further scientific or technical research on particular materials. The principal consideration in issuing RMs is to provide a homogeneous material so that investigators in different laboratories are assured that they are investigating the same material.

(2) "Certificate," issued by the certifying agency (other than NIST), e.g., other national laboratories, other government agencies, other standardizing bodies, or other non-profit organizations. When deemed to be in the public interest and when alternate means of national distribution do not exist, NIST acts as the distributor for such materials. This service is available to organizations that qualify and have the reference materials that would help meet national measurement needs.

SRM Catalog

New catalogs of NIST Standard Reference Materials (SRMs) are published approximately every 2 years, listing materials available and renewal materials in preparation, and deleting discontinued materials. The Catalog is supplemented by Price Lists issued simultaneously with each new catalog and approximately every 6 months to keep the catalog current between editions. These supplements list current prices, and reflect any changes in material availability—listing new and renewal materials and deleting discontinued ones.

A guide and two indexes are provided for user convenience. They are described in the section, **How to Use This Catalog**.

Preparation and Availability of Standard Reference Materials

New and renewal Standard Reference Materials (SRMs) are being prepared continually. While these SRMs are included in the next edition of the catalog and its supplements, prospective users whose names are on the SRM mailing list are notified as soon as the new items become available. Requests for placement on the SRM mailing list can be submitted at any time to SRMP.

Renewal SRMs are intended to be completed before the supply of an existing SRM is exhausted. However, this is not always possible and an SRM may be out of stock for a time. When this occurs, those ordering the material are so notified and possible substitute SRMs are suggested. When a renewal is issued, customers who have ordered the previous lot are promptly notified of the price and availability of the renewal. If little demand exists or if an alternate source of supply becomes available, production of an SRM may be discontinued permanently.

Renewal SRMs may not be identical to the preceding lot; however, they meet the same specifications and can be used for the same purpose. For example, the first 0.1% carbon Bessemer steel was prepared in 1909 (Standard Sample No. 8). Since then a number of renewals, 8a, 8b, 8c, etc., have been prepared. The current SRM 8j, 0.1% C, represents the eleventh lot of the material. Each lot differs somewhat in detailed analysis; thus the use of the specific certificate for that lot is essential.

Guide for Requesting Development of Standard Reference Materials

The National Institute of Standards and Technology has the responsibility to develop, produce, and distribute Standard Reference Materials (SRMs) that provide a basis for comparison of measurements on materials, and that aid in the control of production processes. To carry out this function, the Standard Reference Materials Program (SRMP) evaluates the requirements of science, industry, and government for well-characterized reference materials, and directs the production and distribution of such materials.

NIST currently has over 1,000 SRMs available, about 100 new ones in preparation, and requests for the production of many others.

To become an SRM, a candidate material must meet one or more of these criteria:

1. It would permit users to attain more accurate measurements.
2. Its production elsewhere would not be economically or technically feasible.
3. It would be an industry-wide standard for commerce from a neutral source not otherwise available to the public.
4. Its production by NIST would assure continued availability of a well-characterized material important to science, industry, or government.

NIST has recognized and responded to requests to enlarge the scope of the SRM program to include all types of well-characterized materials for use in calibrating measurement systems, or for producing scientific data that can be referred to a common base. However, the requests for new SRMs greatly exceed the Institute's capacity to produce and certify such materials. Consequently, requests for new SRMs of limited need or use are deferred in favor of requests that clearly show a critical need. To determine which requests receive priority, NIST seeks and uses information supplied by industry and such organizations as the American National Standards Institute (ANSI), American Nuclear Society (ANS), American Petroleum Institute (API), American Society for Testing and Materials (ASTM), etc., to objectively assess the urgency and importance of proposed new reference materials.

Requests to SRMP for the development of a new SRM should provide the following information:

1. Short title of the proposed SRM.
2. Purpose for which the SRM would be used.
3. Reasons why the SRM is needed.
4. Technical characteristics and requirements for the material. Include additional requirements and reasons if more than one SRM is necessary for standardization in this area.
5. Estimates of the probable present and future (6-10 years) demand for such an SRM, nationally and internationally.
6. Justification for SRM preparation by NIST, particularly if a similar one could be produced or obtained from another source.
7. Pertinent information to aid justification for the SRM, such as: (a) an estimate of the potential range of application, monetary significance of the measurement affected, scientific and technological significance including, when feasible, estimates of the impact upon industrial productivity, growth, quality assurance or control, and (b) supporting letters from industry leaders, trade organizations, interested standards committees, and others.

All such requests should be addressed to:

Standard Reference Materials Program
ATTN: SRM Development
Room 215, Building 202
National Institute of Standards and Technology
Gaithersburg, MD 20899

Ordering Standard Reference Materials

General

Purchase orders for all SRMs should be addressed to:

Standard Reference Materials Program
Room 204, Building 202
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-OSRM [6776]

FTS: 879-OSRM [6776]

Fax number: (301) 948-3730

Telex: TRT 197674NIST UT

Each order should give the number of units, catalog number(s), and name(s) of the material(s) requested. For example: "1 each, SRM 79a, Fluorspar (Customs Grade)." The materials described in this catalog are sold only in the units listed or multiples thereof.

Acceptance of an order does not imply acceptance of any provisions set forth in the order contrary to the policy, practice, or regulations of the National Institute of Standards and Technology or the U.S. Government.

In general, orders received for "out-of-stock" material will be filled with the renewal material, if available; otherwise they will be canceled. Customers are notified when an order is canceled and their names are placed on a notification list. This list is used when a renewal material is issued to notify customers of the price and availability of the item. Customers so notified are requested to submit a new order if they still want the item.

For some individually certified SRMs, production lots are small and may entail frequent stock outages. In these cases, the notification list is used to fill orders on a "first come, first served" basis. For such SRMs, customers are notified that the SRM is again available and are requested to confirm their original purchase orders.

Terms

Prices quoted are in U.S. dollars (\$), and are published in the catalog supplements (price lists). When price lists are issued, they are sent to persons or organizations on the SRM mailing list. These prices are subject to change without notice and orders will be billed for the prices in effect at the time of shipment. Discounts are given on individual purchases of 50 or more units of SRMs, or combinations thereof.

Remittances of the purchase price need not accompany the purchase order. Payment of invoices is expected within 30 days of the receipt of the invoice. Payment on domestic or foreign orders may be made by any of the following:

- a. Banker's draft against U.S.A. bank,
- b. Bank to bank transfer to U.S.A. bank,
- c. Cash against documents,
- d. VISA or Mastercard only,
- e. International money order, or
- f. UNESCO coupons.

Letters of credit: If a letter of credit or any method of payment other than those listed above is to be used, the services of an agent in the United States must be secured to act in the customer's behalf. The agent must purchase the material and the NIST invoice will indicate that the agent is the purchaser. The material is then shipped to the agent, who transships in accordance with customer instructions.

NOTE: A customer identification number, i.e., social security number (SSN) for consumer customers; tax identification number (TIN) for commercial customers; or agency location code (ALC) for government customers, is required with each order.

Late Charges

Payment is due within 30 days of shipment of the order to the customer unless otherwise notified by NIST. U.S. Treasury regulations require that late charges be assessed for each 30-day period, or portion thereof, that the payment is overdue.

Proforma Invoice (Price Quotation)

Proforma service will be provided only upon request for such service.

Domestic Shipments

Shipments of material (except for certain restricted categories and refrigerated items) intended for the United States and Canada are normally shipped prepaid, provided the parcel does not exceed the weight limitations prescribed by postal laws and regulations. Refrigerated items are shipped prepaid air express with shipping costs added to the invoice. Hazardous shipments will have an additional handling charge added to the invoice.

Foreign Shipments

The regulations of various nations covering the importation of SRMs differ widely; any attempt to list all possible variations would be impractical. Therefore, where the shipping practices described as follows do not apply, customers will be informed of the best method of shipment for their countries.

Shipping Practices: Most foreign orders are shipped by prepaid International Air Parcel Post. Exceptions are those items in restricted categories, those items requiring refrigeration, and shipments exceeding parcel post weight limits. The exceptions are shipped FOB Gaithersburg, MD, unless an agent (shipping or brokerage firm) located in the United States is used or required. In this case, the customer is notified, requested to obtain the services of an agent and inform NIST of the agent's name and address. The material is then packed for overseas shipment and forwarded to the agent FOB Gaithersburg, MD.

Documentation

The documents NIST furnishes are:

- a. Two (2) commercial invoices,
- b. One (1) packing slip, and
- c. One (1) air waybill for air shipments.

All documents are printed in English.

If documents other than those listed above are required, the services of an agent in the United States must be used to purchase and ship the material.

NOTE: Orders and inquiries submitted in English will be processed more rapidly than those requiring translation.

Certified Reference Materials From Other Sources

Special Nuclear Materials

The U.S. Department of Energy New Brunswick Laboratory issues special nuclear reference materials as NBL Certified Reference Materials (CRMs). These CRMs include the plutonium and uranium assay and isotopic materials previously issued by the National Institute of Standards and Technology. All orders or inquiries should be addressed to:

U.S. Department of Energy
New Brunswick Laboratory
Attn: Reference Materials Sales
9800 S. Cass Avenue, Bldg. 350
Argonne, IL 60439
(312) 972-2767

Other Services of the National Institute of Standards and Technology

Calibration and Related Measurement Services

The measurement services of NIST include the calibration of standards, test of instruments, and certain interlaboratory testing programs. These services are described in NIST Special Publication 250, National Institute of Standards and Technology Calibration Services Users Guide, 1991 ed. [Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.] For information on available measurement services, consult Special Publication 250, or write or telephone:

Physical Measurement Services Program
Room A112, Building 411
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-2002
FAX: (301) 975-2128

Requests for measurement services available in Boulder should be addressed to:

Measurement Services Clerk
National Institute of Standards and Technology
Boulder, CO 80303

Telephone: (303) 497-3753
FAX: (303) 497-3970

National Standard Reference Data System

The National Standard Reference Data System (NSRDS) is a nationwide program established to compile and critically evaluate quantitative physical science data and assure its availability to the technical community. The program publishes compilations of critically evaluated data, critical reviews of experimental techniques, and bibliographies. A complete list of NSRDS publications is available from the Standard Reference Data Program (SRDP). SRDP responds to inquiries within the scope of the program by providing references, referrals, documentation, or data, as available. Inquiries should be directed to:

Standard Reference Data Program
Room A323 Physics Building
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-2208
FAX: (301) 926-0416

Accreditation of Testing Laboratories

The National Voluntary Laboratory Accreditation Program (NVLAP) accredits public and private testing laboratories, based on evaluation of their technical qualifications and competence for conducting specific tests or types of tests in specified fields of testing. Accreditation is based on criteria published in the Code of Federal Regulations as part of the NVLAP procedures. Accreditation is granted following successful completion of a process which includes submission of an application and payment of fees by the laboratory, an on-site assessment, resolution of any deficiencies identified during the on-site assessment, participation in proficiency testing, technical evaluation, and administrative review. The accreditation is formalized through issuance of a Certificate of Accreditation and Scope of Accreditation

and publicized by announcement in various government and private media. Application packages may be obtained from:

Laboratory Accreditation Program
Room A146, Building 411
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-4016
FAX: (301) 975-3839

National Center for Standards and Certification Information

The National Center for Standards and Certification Information (NCSCI) contains title information or full texts for engineering or related standards issued by U.S. technical societies, professional organizations, and trade associations; State purchasing offices; U.S. Federal Government agencies; and major foreign national and international standardizing bodies. NCSCI publishes general and specific indexes of standards. Information services, which are free, consist of searching various indices to determine whether any published standards, specifications, codes, test methods, or recommended practices exist for a given item or product. Inquiries should be directed to:

National Center for Standards and Certification Information
Room A163, Building 411
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-4040
FAX: (301) 926-1559

Weights and Measures Program

The NIST Weights and Measures Program operates a Type Evaluation Program which provides for an evaluation of (1) prototype weighing and measuring devices to determine compliance with the requirements of NBS Handbook 44, "Specifications, Tolerances, and Other Technical Requirements for Commercial Weighing and Measuring Devices," (2) standards to determine compliance with the requirements of NBS Handbook 105-1, 105-2, 105-3, "Specifications and Tolerances for Reference Standard and Field Standard Weights and Measures." This program may be used by manufacturers and weights and measures officials in determining the acceptability of devices for commercial use or the suitability of reference and field standards. For information on programs of NIST and the States, write or telephone:

Weights and Measures Program
Room A617, Administration Building
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-4004
FAX: (301) 926-0647

Proficiency Sample Programs

General information on the Proficiency Sample Programs may be obtained from:

Materials Reference Laboratories
National Institute of Standards and Technology
Gaithersburg, MD 20899

Telephone: (301) 975-6704
FAX: (301) 330-1956

Information is available on the following programs:

Proficiency Sample Programs for Hydraulic Cements, Pozzolans, and Portland Cement Concrete,
Proficiency Sample Programs for Soils, Aggregates, and Bituminous Materials,
Inspection of Cement and Concrete Testing Laboratories,
Inspection of Soils and Bituminous Testing Laboratories.

- Smoke Toxicity (sheet form), 129
- Flooring Radiant Panel (sheet form), 129

309. Miscellaneous Performance

- Engineering Materials, 130–131**
- Socketed Ball Bar, 130
- Charpy V-Notch Test Blocks, 130
- Tape Adhesion Testing (sheet form), 131

SRMs/RMs by Category

Standard Reference Materials for Chemical Composition

101. Ferrous Metals

Plain Carbon Steels (chip form)

These SRMs are for checking chemical methods of analysis. They consist of steel alloys selected to provide a wide range of analytical values for elements. They are furnished in 150-g units (unless otherwise noted) as chips usually sized between 0.4 to 1.2 mm, prepared from selected portions of commercial ingots.

Steel SRMs described in this and the following five (5) pages are furnished in various forms. The 600 series is for microchemical methods of analysis, such as electron probe microanalysis, laser probe analysis and spark source mass spectrometry. The 1100, 1200, and 1700 series are for optical emission and X-ray spectrometric methods of analysis. These materials have been prepared to ensure high homogeneity.

Nominal Sizes for Solid Steel SRMs:

600 Series: 3.2 mm diameter, 51 mm long.

1100 and 1200 Series: 31 mm diameter, 19 mm thick.

1700 Series: 34 mm diameter, 19 mm thick.

A "C" preceding the SRM number indicates a chill cast sample: 31 mm diameter, 19 mm thick.

Copper Base Alloys (block and disk forms)

The SRMs with "C" prefix are chill-cast blocks, 31 mm square, 19 mm thick; the others are wrought disks, 31 mm in diameter and 19 mm thick. Both forms have nearly identical elemental compositions.

Values in parentheses are not certified and are given for information only.

Values in brackets are subject to greater error since only one method of analysis was employed.

* SI unit: Replaces terms "ppm" and "μg/g".

† SRM 885 values are in Wt. %.

RM 1R—Ultra-Purity Aluminum Polycrystalline (rod form)

This RM is intended for use in research on the mechanical and physical properties of extremely pure aluminum; e.g., in the determination of resistivity as a function of strain at cryogenic temperatures to facilitate the design of cryogenic magnets, or superconductor stabilizing elements. Unit of issue: 4.2 mm in diameter and 25.4 mm long.

Paul Paulsen, *Research Chemist*, Inorganic Analytical Research Division; Ellyn Beary, *Research Chemist*, Inorganic Analytical Research Division

Stoichiometry (powder form)

These SRMs are defined as primary, working, and secondary standards in accordance with recommendations of the Analytical Chemistry Section of the International Union of Pure and Applied Chemistry [Ref. Analyst 90, 251 (1965)]. These definitions are as follows:

Primary Standard:

a commercially available substance of purity 100 ± 0.02 percent (Purity 99.98 + percent).

Working Standard:

a commercially available substance of purity 100 ± 0.05 percent (Purity 99.95 + percent).

Secondary Standard:

a substance of lower purity which can be standardized against a primary grade standard.

SRM	Type	Unit Size (in g)	Certified Use	Stoichiometric Purity
17d	Sucrose	60	Polarimetric Value	(99.9) ^a
40h	Sodium Oxalate	60	Reductometric Value	99.972
41c	Dextrose (D-Glucose)	70	Reductometric Value	99.9
83d	Arsenic Trioxide	60	Reductometric Value	99.9926
84j	Potassium Hydrogen Phthalate	60	Acidimetric Value	99.996
136e	Potassium Dichromate	60	Oxidimetric Value	99.984
350a	Benzoic Acid	30	Acidimetric Value	99.9958
723a	Tris(hydroxymethyl)aminomethane	50	Basimetric Value	99.9703
951	Boric Acid	100	Acidimetric and Boron Isotopic Value	100.00
987	Strontium Carbonate	1	Assay and Isotopic	99.98
999	Potassium Chloride	60	Assay Standard for: Potassium Chloride	99.981 99.99

^a Sucrose = Moisture <0.02 percent, Ash <0.005 percent.

* These SRMs are radioactive, containing Lead-210 of natural origin. All users and purchasers must comply with all national and international regulations regarding the use and disposal of these SRMs.

Light Stable Isotopic Materials (gas, liquid and solid forms)

These Reference Materials (RMs) are for calibration of isotope-ratio mass spectrometers and associated sample preparation systems. They are distributed by NIST on behalf of the International Atomic Energy Agency (IAEA). Quantities of these materials are limited to *one (1) unit of each RM per laboratory every three (3) years*.

The isotopic compositions are given in parts per thousand (1000) difference from isotope-ratio standards—Vienna Standard Mean Ocean Water (VSMOW), Vienna PeeDee Belemnite (VPDB), atmospheric N₂ (Air), NBS28 Silica Sand (optical), and Canyon Diablo Troilite (CDT); with the exception of Lithium (Li), which is expressed as an absolute isotopic ratio.

RM	Type	Nominal Isotopic Composition (in parts per 1000)						
		δD_{VSMOW}	${}^6\text{Li}/{}^7\text{Li}$	$\delta {}^{13}\text{C}_{VPDB}$	$\delta {}^{15}\text{N}_{Air}$	$\delta {}^{18}\text{O}_{VSMOW}$	$\delta {}^{30}\text{Si}_{NBS28}$	$\delta {}^{34}\text{S}_{CDT}$
8535	VSMOW-water	0 *				0 *

Freeze-dried Urine (powder form)

These SRMs are for determining toxic substances and drugs of abuse in human urine. SRMs 2670, 2671a and 2672a are provided in sets of four (4) 30-mL bottles, two (2) bottles each at normal and elevated levels. SRMs 1507b, 1508, and RM 8444 are also provided in sets of four (4), one (1) each at blank, low, medium, and high levels. SRMs 1507b and 1508 are contained in 20-mL bottles; RM 8444 is contained in 10-mL vials. The values listed for these SRMs apply only to reconstituted urine.

2679a	Quartz on Filter Media	Set of 4	Quartz Clay	≤ 2 (370)	30.8 (370)	80.2 (370)	202.7 (370)

Values in parentheses are not certified and are given for information only.

Blank Filters

These SRMs are for use in evaluating the performance of air sampling filter methods.

SRM	Type	Diameter (in mm)	Pore Size (in μm)	Filter Weight (in g)
2678	Cellulose Acetate Membrane	47	0.45	0.09
2680	Cellulose Acetate Membrane	37	0.80	0.05
2681	Ashless	42.5	—	0.14

Respirable Silica (powder form)

This SRM is a crystalline silica with particles in the respirable range. It is intended for use in determining the level of respirable material in an industrial atmosphere by X-ray diffraction.

Note: This is not a particle size reference material.

SRM	Type	Unit Size	Component (in Wt. %)
1879	Respirable Cristobalite	5 g	Crystalline Cristobalite, 98.0

Asbestos

Reference Material (RM) 8411 consists of a 1-cm² section of collapsed mixed cellulose ester filter with a high concentration of chrysotile asbestos and a medium concentration of grunerite asbestos. It is intended for use in evaluating the techniques used to identify and count chrysotile and grunerite (Amosite) asbestos fibers in filter samples by transmission electron microscopy (TEM).

RM	Type	Fiber Loading
8411	Mixed Asbestos Research Filter	43 fibers/0.01 ² mm Grunerite

SRM 1866a consists of a set of the three (3) common bulk mine-grade asbestos materials and one (1) synthetic glass fiber sample. There are ~4 g of each material in the set. The three asbestos materials are chrysotile, grunerite (Amosite), and riebeckite (Crocidolite). Their optical properties, as observed by polarized light microscopy (PLM), have been characterized so that they may serve as primary calibration standards for the identification of asbestos types in building materials.

SRM	Type	Asbestos Type
1866a	Common Commercial Asbestos	Chrysotile, Grunerite, Riebeckite

106. Inorganics

Metal Constituents (liquid and solid forms)

These SRMs are for analysis of materials of health or environmental interest.

SRM	Type	Unit Size	Elemental Composition				
			Pb	Ni	S	Hg	V
1579	Powdered Lead Base Paint	35 g	11.87 Wt. %				
1618	Vanadium and Nickel in Residual Fuel Oil	100 mL		75 mg/kg (4.3 Wt. %)			423 mg/kg
1630	Trace Mercury in Coal	50 g				0.13 mg/kg	
1638b	Lead in Reference Fuel	12 vials	767 mg/kg				
1641b	Mercury in Water	6 × 20 mL				1.52 µg/mL	
2712	Lead in Reference Fuel	6 × 20 mL	11.4 mg/kg				
2713	Lead in Reference Fuel	6 × 20 mL	19.4 mg/kg				
2714	Lead in Reference Fuel	6 × 20 mL	28.1 mg/kg				
2715	Lead in Reference Fuel	6 × 20 mL	784 mg/kg				
RM 8505	Vanadium in Crude Oil	250 mL					(390 mg/kg)

Simulated Rainwaters (liquid form)

This SRM was developed to aid in the analysis of acidic rainwater by providing a stable, homogeneous material at two levels of acidity.

SRM	Type	Unit of Issue	
		2694a-I	2694a-II
2694a	Simulated Rainwater	Set of 4: 2 of 50 mL at each of 2 levels	
	Constituent Element/Parameter	2694a-I	2694a-II
	pH, 25 °C	4.30	3.60
	Electrolytic Conductivity (S/cm, 25 °C)	25.4	129.3
	Acidity, meq/L	0.0544	0.283
	Fluoride, mg/L	0.057	0.108
	Chloride, mg/L	(0.23)	(0.94)
	Nitrate, mg/L	(0.53)	7.19
	Sulfate, mg/L	2.69	10.6
	Sodium, mg/L	0.208	0.423
	Potassium, mg/L	0.056	0.108
	Ammonium, mg/L	(0.12)	(1.06)
	Calcium, mg/L	0.0126	0.0364
	Magnesium, mg/L	0.0242	0.0484

Values in parentheses are not certified and are given for information only.

Thin Films for X-ray Fluorescence

These SRMs are for standardizing X-ray spectrometers. They may be useful in elemental analysis of particulate matter collected on filter media, and where X-ray spectrometer calibration functions are determined using thin film standards. Each SRM is individually certified and consists of a silica base glass film (0.5 µm thick) deposited on a 47-mm diameter polycarbonate filter mounted on an aluminum ring.

SRM	Type	Elemental Composition per area (in µg/cm ²)											
		Al	Ca	Co	Cu	Fe	Pb	K	Mn	Si	Ti	V	Zn
1832	Thin-Glass Film	15	20	1	2				5	36		5	
1833	Thin-Glass Film					15	17	18		35	14		4

Carbon Modified Silicon (powder form)

This SRM is intended for the calibration of instruments used to measure total elemental carbon. The SRM consists of three (3), 1-g bottles of chemically modified microparticulate silica.

SRM	Type	Bottle	% Carbon
1216	Carbon Modified Silicon	I	0.7
		II	9.06
		III	17.04

107. Analyzed Gases

Mixtures and Pollutants

These SRMs are for calibrating apparatus used to measure various components of gas mixtures and atmospheric pollutants. All cylinders conform to the appropriate DOT specifications.

Permeation Devices

These SRMs are primarily intended for use in calibrating air pollution monitoring apparatus and for calibrating air pollution analytical methods and procedures. Each tube is individually calibrated and certified according to NIST procedures and protocols.

SRMs 1625 and 1627 are certified over the temperature range of 30 to 35 °C. SRM 1629a is calibrated at 25.0 °C only and cannot be shipped by air.

SRM	Type	Tube Length (in cm)	Permeation Rate at 30 °C (in µg/min)	Concentration* (in µmol/mol) @ Flow Rate (L/min) of		
				1	5	10

Reference Liquids for Rating Fuels

SRMs 1815a and 1816a are high purity liquids intended for use in maintaining the integrity of the octane rating of motor and aviation fuels as specified in the ASTM Manual for Rating Motor, Diesel, and Aviation Fuels.

SRM	Type	Purity (in Wt. %)	Unit Size
1815a	n-Heptane	99.987	100 mL
1816a	<i>Iso</i> octane (2,2,4-Trimethylpentane)	99.987	100 mL

109. Organics

Organic Constituents (liquid and solid forms)

These SRMs are further described in the following five (5) pages.

SRM	Type	Unit of Issue (per ampule)
1491	Aromatic Hydrocarbons in Hexane/Toluene	Set of 5, 1.2 mL
1492	Chlorinated Pesticides in Hexane	Set of 5, 1.2 mL
1580	Shale Oil	Set of 5, 1.2 mL
1581	Polychlorinated Biphenyls in Oil	Set of 8, 2.5 mL
1582	Petroleum Crude Oil	Set of 5, 1.2 mL
1583	Chlorinated Pesticides in <i>Iso</i> octane	Set of 6, 1.2 mL
1584	Phenols in Methanol	Set of 5, 1.2 mL
1585	Chlorinated Biphenyls	Set of 5, 1.2 mL
1586	Isotopically Labelled Priority Pollutants	Set of 6, 1.2 mL
1587	Nitro PAH in Methanol	Set of 4, 1 mL
1588	Organics in Cod Liver Oil	Set of 5, 1.2 mL
1589	Polychlorinated Biphenyls (as Aroclor 1260) in Human Serum	Set of 3, 2 g/ampule
1596	Dinitropyrene Isomers and 1-Nitropyrene in Methylene Chloride	Set of 5, 1.3 mL
1597	Complex Mixture of Polycyclic Aromatic Hydrocarbons	Set of 4, 1.2 mL
1614	Dioxin (2,3,7,8 TCDD) in <i>Iso</i> octane	Set of 6, 1.2 mL
1639	Halocarbons (in Methanol)	Set of 5, 1.5 mL
1647b	Priority Pollutant PAH (in Acetonitrile)	Set of 5, 1.2 mL
1649	Urban Dust/Organics	10 g
1650	Diesel Particulate Matter	Set of 5, 0.1 g
1939	Polychlorinated Biphenyls in River Sediment A	50 g
1941	Organics in Marine Sediment	70 g
1974	Organics in Mussel Tissue	Set of 3, 15 g/ampule
2260	Aromatic Hydrocarbons in Toluene	Set of 5, 1.2 mL
2261	Chlorinated Pesticides in Hexane	Set of 5, 1.2 mL
2262	Chlorinated Biphenyls	In Prep
RM 8464	Aldrin (neat)	In Prep
RM 8465	Dieldrin (neat)	In Prep
RM 8466	γ -HCH (Lindane) (neat)	In Prep
RM 8467	4,4'-DDE (neat)	In Prep
RM 8468	Heptachlor (neat)	In Prep
RM 8469	4,4'-DDE (neat)	In Prep

SRM 1581 Polychlorinated Biphenyls in Oils

Matrix	Aroclor Type	Concentration (in mg/kg)
Motor Oil	1242	100
Motor Oil	1260	100
Transformer Oil	1242	100
Transformer Oil	1260	100

SRM 1583 Chlorinated Pesticides in 2,2,4-Trimethylpentane

Pesticide	Concentration (in mg/kg)
γ -BHC (Lindane)	1.11
δ -BHC	0.76
Aldrin	0.86
Heptachlor Epoxide	(0.997)
4,4'-DDE (p,p'-DDE)	1.23
4,4'-DDT (p,p'-DDT)	1.90

SRM 1584 Priority Pollutant Phenols in Methanol

Component	Concentration (in mg/L @ 25 °C)
2-Chlorophenol	64.4
Phenol	29.7
2-Nitrophenol	25.2
2,4-Dimethylphenol	51.6
2,4-Dichlorophenol	35.6
4-Chloro-m-cresol	27.4
2,4,6-Trichlorophenol	20.4
4-Nitrophenol	20.7
4,6-Dinitro-o-cresol	20.1
Pentachlorophenol	15.4
2,4-Dinitrophenol	(22.4)

Organic Constituents (liquid and solid forms) – Continued

SRM 1585 Chlorinated Biphenyls in 2,2,4-Trimethylpentane (*Iso*octane)

Polychlorinated Biphenyl (PCB)	Concentration (in mg/kg)
PCB 3	43.3
PCB 15	9.53
PCB 28	3.70
PCB 52	7.72
PCB 77	6.62
PCB 101	5.24
PCB 138	2.37
PCB 153	3.06

SRM 1586 Isotopically Labeled and Unlabeled Priority Pollutants in Methanol

Component	Concentration (in mg/kg)	
	1586-1 (unlabeled)	1586-2 (labeled)
Carbon Tetrachloride	128.5	124.4
Benzene	101.1	99.0
Chlorobenzene	133.0	144.0
Phenol	117.0	116.0
Nitrobenzene	126.0	134.5
2-Nitrophenol	103.6	101.9
2,4-Dichlorophenol	102.5	82.2
Naphthalene	126.5	126.6
Bis(2-ethylhexyl)phthalate	63.9	60.4
Benzo[a]pyrene	49.2	44.1

SRM 1587 Nitrated Polycyclic Aromatic Hydrocarbons in Methanol

Component	Concentration (in mg/kg)
2-Nitrofluorene	9.67
9-Nitroanthracene	5.01
3-Nitrofluoranthene	9.24
1-Nitropyrene	8.95
7-Nitrobenz[a]anthracene	9.27
6-Nitrochrysene	8.13
6-Nitrobenzo[a]pyrene	(6.1)

Values in parentheses are not certified and are given for information only.

Biomass Materials (powder form)

These Reference Materials, RMs 8491 Sugar Cane Bagasse (*Saccharum spp. hybrid*), 8492 Eastern Cottonwood (*P. deltoides*), 8493 Pinus Radiata, and 8494 Wheat Straw (*Triticum aestivum*) are intended primarily for use in fundamental studies on the chemical and physical properties of cellulose, hemi-cellulose and lignin and of their effects on various conversion processes. As part of the International Energy Agency (IEA) Voluntary Standards Activity Group's work, these materials were selected initially for use as research materials for a world-wide round robin analytical laboratory comparison using the Uppsala Method. They were supplied by various institutions and were prepared, packaged and are being distributed by NIST.

At this time, no extensive property measurements have been made on these materials beyond ensuring that the materials are homogeneous. A round robin is in progress with participation by international laboratories and as results become available, the Report of Investigation that accompanies each of these materials will be revised to reflect those changes.

All of the ground and homogenized materials were irradiated with Cobalt-60. The irradiation was required to meet customs regulations for shipment of biomass materials to international destinations.

RM	Type	Unit Size
8491	Sugar Cane Bagasse	5 bags, 10 g
8492	Eastern Cottonwood	5 bags, 10 g
8493	Pinus Radiata	5 bags, 10 g
8494	Wheat Straw	5 bags, 10 g

In addition to the elements listed above, the glass SRMs contain the following 25 elements: As, Be, Bi, Cs, Cl, F, Ge, Hf, Hg, Li, Lu, Mg, Nb, P, Pr, Se, S, Te, Tb, Tm, Sn, W, V, Y, and Zr.

NOTE: Glass—Nominal Composition; 72% SiO₂, 12% CaO, 14% Na₂O, and 2% Al₂O₃.

Values in parentheses are not certified and are given for information only.

* Also certified for isotopic ratio – ⁸⁷Sr/⁸⁶Sr = 1.20039.

113. Cement

Portland Cements (powder form)

These SRMs are for X-ray spectroscopic and chemical analysis of portland cements and related materials. Each unit consists of three (3) sealed vials, each containing ~5 g of material.

Portland Cement Clinkers

These Reference Materials (RMs) are intended primarily for use in the determination of the abundance of major phases in cement clinkers, i.e., the percentages of alite (C_3S), belite (C_2S), aluminate (C_3A), and ferrite (($C_2(A,F)$)). Note: In cement chemist notation, $C=CaO$, $S=SiO_2$, $A=Al_2O_3$ and $F=Fe_2O_3$.

114. Engine Wear Materials

Metallo-Organic Compounds (liquid form)

These SRMs are for preparing solutions in oils of known and reproducible concentrations of metals. Each SRM consists of 5 g of material.

SRM	Type	Elemental Composition (in Wt. %)	
1051b	Barium cyclohexanebutyrate	Barium	28.7
1052b	Bis(1-phenyl-1,3-butanediono)oxovanadium (IV)	Vanadium	13.01
1053a	Cadmium cyclohexanebutyrate	Cadmium	24.8
1057b	Dibutyltin bis (2-ethylhexanoate)	Tin	22.95
1059c	Lead cyclohexanebutyrate	Lead	37.5
1060a	Lithium cyclohexanebutyrate	Lithium	4.1
1065b	Nickel cyclohexanebutyrate	Nickel	13.89
1066a	Octaphenylcyclotetrasiloxane	Silicon	14.14
1069b	Sodium cyclohexanebutyrate	Sodium	12.0
1070a	Strontium cyclohexanebutyrate	Strontium	20.7
1071b	Triphenyl phosphate	Phosphorus	9.48
1073b	Zinc cyclohexanebutyrate	Zinc	16.66
1075a	Aluminum 2-ethylhexanoate	Aluminum	8.07
1077a	Silver 2-ethylhexanoate	Silver	42.60
1078b	Tris (1-phenyl-1,3-butanediono)chromium (III)	Chromium	9.6
1079b	Tris (1-phenyl-1,3-butanediono)iron (III)	Iron	10.45
1080a	Bis(1-phenyl-1,3-butanediono)copper (II)	Copper	16.37

Lubricating Base Oils (liquid form)

These SRMs are for determining the concentrations of a single element in lubricating base oil. SRM 1818 consists of five (5) bottles, 20 g each; SRM 1836 consists of four (4) vials, ~4 g each.

SRM	Type	Elemental Composition (in mg/kg)				
		I	II	III	IV	V
1818	Total Chlorine	29	63	78	231	558
1836	Total Nitrogen	9.0	50.9	113.3	166.2	

Catalyst Package for Lubricant Oxidation (liquid form)

These reference materials are for evaluating the oxidation stability of lubricating oils, i.e., automotive crankcase lubricants. SRM 1817c consists of a set of five (5) ampules of each of three (3) materials. The fuel fraction and the metal mixture are sealed under inert atmosphere. RM 8501 consists of a set of five (5) ampules of each of four (4) materials. The fuel fraction, model compound, and metal mixture are sealed under inert atmosphere.

SRM	Type	Consisting of
1817c	Catalyst Package	1) an Oxidized/Nitrated Fuel Fraction, 2) a Metal Naphthenate Mixture, and 3) Distilled Water
RM 8501	Catalyst Package IIIE	1) an Oxidized/Nitrated Fuel Fraction, 2) a Nitro-Paraffin Model Compound, 3) a Metal Naphthenate Mixture, and 4) Distilled Water

Wear-Metals in Oil (liquid form)

SRM	Type	Elemental Composition (in mg/kg)

Values in parentheses are not certified and are given for information only.

Catalyst Characterization Materials (liquid and powder forms)

These Reference Materials (RMs) are for determining the activity of FCC Catalysts by Microactivity Test. They are distributed by NIST in cooperation with the American Society for Testing and Materials (ASTM).

RM	Type	Unit Size
8589	Fluid Cracking Catalysts (FCC)	Set of 6, 50 g each
8590	High Sulfur Gas Oil Feed	946 mL

Standard Reference Materials

for

Physical Properties

201. Ion Activity

pH Calibration (powder form)

These SRMs are used to prepare solutions of known hydrogen ion concentration to calibrate commercial pH instruments. SRMs 186Ie and 186IIe, 191a and 192a, and 922 and 923 are each certified for use as an admixture only. SRMs 186Ie and 186IIe may be used to prepare solutions with a pH of 6.863 at 25 °C, or a physiological buffer solution with a pH of 7.41 at 25 °C.

SRM	Type	pH(S) Values (at 25 °C)	Unit Size (in g)
185g	Potassium Hydrogen Phthalate	4.006	60
186Ie	Potassium Dihydrogen Phosphate	(see above)	30
186IIe	Disodium Hydrogen Phosphate		30
187c	Sodium Tetraborate Decahydrate (Borax)	9.180	30
188	Potassium Hydrogen Tartrate	3.557	60
189a	Potassium Tetroxalate	1.681	65
191a	Sodium Bicarbonate	10.011	25
192a	Sodium Carbonate		30
922	Tris(hydroxymethyl)aminomethane	7.699	25
923	Tris(hydroxymethyl)aminomethane Hydrochloride		35
2193	Calcium Carbonate		30

pD Calibration (powder form)

These SRMs are for the preparation of solutions of known deuterium ion concentration to calibrate pH instruments to indicate pD data. SRMs 2186I and 2186II, and 2191a and 2192a are each certified for use as an admixture only.

SRM	Type	pD(S) Values (at 25 °C)	Unit Size (in g)
2185	Potassium Hydrogen Phthalate	4.518	60
2186I	Potassium Dihydrogen Phosphate	7.428	30
2186II	Disodium Hydrogen Phosphate		30
2191a	Sodium Bicarbonate	10.732	30
2192a	Sodium Carbonate		30

Zwitterionic Buffer Systems (powder form)

These SRMs are used to calibrate clinical instruments (e.g., blood pH measurements), in the physiologically important range of pH 7 to 8. They are based on a Zwitterionic buffer system for clinical pH measurements and are each certified for use as an admixture only. The pH(S) values for the buffer solutions are certified at 0.05 molal and 0.08 molal with respect to the free acid and the sodium salt admixture as a function of temperature. The certified temperature range is from 0 to 50 °C.

SRM	Type	pH(S) Values (at 37 °C)		Unit Size (in g)
		0.05 molal	0.08 molal	
2181	HEPES Free Acid	7.364	7.373	60
2182	NaHEPESate			60
2183	MOPS Free Acid	6.699	6.676	60
2184	NaMOPSOate			60

Ion-Selective Electrode Calibration (powder form)

These SRMs are certified for the calibration of ion-selective electrodes and have conventional ionic activities based on the Stokes-Robinson hydration theory for ionic strengths greater than 0.1 mol/L.

SRM	Type	Certified Component	Unit Size (in g)
2201	Sodium Chloride	pNa, pCl	125
2202	Potassium Chloride	pK, pCl	160
2203	Potassium Fluoride	pF	125

Electrolytic Conductivity (liquid form)

These SRMs are for calibrating and standardizing conductivity cells and meters used in water purity determinations and in clinical applications. SRM 3190 is an aqueous solution of hydrochloric acids; SRMs 3191 through 3195 are solutions of high-purity potassium chloride in de-ionized water in equilibrium with atmospheric carbon dioxide.

SRM	Type	Nominal Conductance ($\mu\text{S}/\text{cm}$)	Unit Size (in mL)
3190	HCl in de-ionized H ₂ O	25	500
3191	KCl in de-ionized H ₂ O	100	500
3192	KCl in de-ionized H ₂ O	500	500
3193	KCl in de-ionized H ₂ O	1000	500
3194	KCl in de-ionized H ₂ O	10000	500
3195	KCl in de-ionized H ₂ O	100000	500

8453	Polyethylene Socket T Joint		0.508	
8454	Polyethylene Butt T Joint		0.996	

* Expressed as Yield Stress/Strain at Yield (Strain Rate = 81% per minute).

Rubbers and Rubber Compounding Materials

These SRMs have been prepared to provide the rubber industry with standard materials for rubber compounding. They are useful for the testing of rubber and rubber compounding materials in connection with quality control of raw materials and for the standardization of rubber testing.

Each material has been statistically evaluated for uniformity by mixing rubber and rubber compounds, vulcanizing them in accordance with ASTM Designation D-3182 and determining the stress-strain properties of the resulting vulcanizates. Certificates are issued for the rubber SRMs 386j and 388p, because the properties of different lots are not the same. Replacement lots of rubber compounding SRMs 371h, 372i, and 383a, impart essentially the same characteristics to rubber vulcanizates so that certificates are not issued for these SRMs.

SRM	Type	Unit Size (in kg)
371h	Sulfur	6
372i	Stearic Acid	3.2
383a	Mercaptobenzothiazole	3.2
386j	Styrene-Butadiene 1500	34
388p	Isobutylene-Isoprene (Butyl Rubber)	34

203. Thermodynamic Properties

Combustion Calorimetry (powder form)

These SRMs are for use as standards for calibration of combustion bomb calorimeters used in checking the performance of apparatus and analytical procedures and for the characterization of high-purity compounds, fuels, and related fuel materials.

SRM	Type	Heat of Combustion (in MJ/kg)*	Unit Size (in g)
39i	Benzoic Acid	26.434	30
1656	Thianthrene	33.480	30
1657	Synthetic Refuse Derived Fuel	13.87 **	100
2151	Nicotinic Acid	22.184	25
2152	Urea	10.536	25
2682a	Coal, Sub-bituminous: %S = 0.486; %Ash = 6.3	25.96 **	50
2683a	Coal, Bituminous: %S = 1.89; %Ash = 6.8	32.22 **	50
2684a	Coal, Bituminous: %S = 3.06; %Ash = 11.0	28.77 **	50
2685a	Coal, Bituminous: %S = 4.730; %Ash = 16.21	27.10 **	50

* The calorific values (MJ/kg) may decrease upon the aging or normal oxidation of the coals. NIST will continue to monitor these calorific values and report any substantive change to the purchaser.

** Gross calorific value or HHV (Higher Heating Value).

Solution Calorimetry

SRM	Type	Heat of Solution (in MJ/kg)	Unit Size (in g)
724a	Tris(hydroxymethyl)aminomethane	HCl Evolved - 0.24576	50
1655	Potassium Chloride (Water Solution Calorimetry)	NaOH Absorbed - 0.1418 Absorbed (0.235)	30

Enthalpy and Heat Capacity (solid forms)

SRM	Type	Unit Size	Temperature Range (in K)	Molecular Weight (in g/mol)
RM 5	Copper	0.19 D × 12 cm	25–300	
705a	Polystyrene	5 g	10–350	170,900
720	Synthetic Sapphire	15 g	10–2250	
781-D1	Molybdenum	0.32 D × 10 cm	273.15–2800	
781-D2	Molybdenum	0.64 D × 10 cm	273.15–2800	

Differential Scanning Calorimetry (solid forms)

These SRMs are for calibrating differential scanning calorimeters, differential thermal analyzers, and similar instruments. SRM 1514 is for evaluating methods of determining purity by differential scanning calorimetry. It consists of pure phenacetin and phenacetin doped with p-aminobenzoic acid.

SRM	Type	Unit Size	Melting Temperature (in K)	Enthalpy of Fusion (in MJ/kg)
1514	Thermal Analysis Purity Set	Set of 4, 0.5 g/vial		*
2220	Tin (99.9995%)	2.5 × 2.5 × 0.0127 cm	505.10	60.22
2221a	Zinc (99.999%)	2.5 × 2.5 × 0.005 cm	692.74	107.46
2222	Biphenyl (99.984%)	1 g	342.41	120.41
2225	Mercury	2.5 g	234.30	11.469

* Certified for four (4) levels of p-ABA (in mol %).

Differential Thermal Analysis (liquid and solid forms)

These Reference Materials (RMs) are issued by NIST in cooperation with the International Confederation of Thermal Analysis (ICTA) for differential thermal analyzers, differential scanning calorimeters, and thermogravimetry equipment.

RM	Type	Peak Temp. (in °C)	Unit Size (in g)
754	Polystyrene (glass transition)	105	10
757	1,2-Dichloroethane (melting point)	-32	4 mL
	Cyclohexane (transition point)	-83	4 mL
		7	
	Phenyl Ether (melting point)	30	4 mL
	o-Terphenyl (melting point)	58	5
758	Potassium Nitrate (transition point)	128	10
	Indium (melting point)	157	3
	Tin (melting point)	232	3
	Potassium Perchlorate (transition point)	300	10
	Silver Sulfate (transition point)	430	3
759	Potassium Perchlorate (transition point)	300	10
	Silver Sulfate (transition point)	430	3
	Quartz (transition point)	573	3
	Potassium Sulfate (transition point)	583	10
	Potassium Chromate (transition point)	665	10
760	Quartz (transition point)	573	3
	Potassium Sulfate (transition point)	583	10
	Potassium Chromate (transition point)	665	10
	Barium Carbonate (transition point)	810	10
	Strontium Carbonate (transition point)	925	10
761	Permanorm 3 (magnetic transition)	259	1
	Nickel (magnetic transition)	353	1
	Mumetal (magnetic transition)	381	1
	Permanorm 5 (magnetic transition)	454	1
	Trafoperm (magnetic transition)	750	1

Superconductive Thermometric Fixed Point Device

This SRM is composed of six (6) small cylinders of high-purity materials mounted in a threaded copper stud and enclosed in a measuring coil pair. It is intended to provide superconductive fixed points, i.e., temperature of transitions from the normal to the superconductive state.

SRM	Type	Material	Temperature (in K)
767a	Superconductive Thermometric Fixed Point Device	Niobium	9.2
		Lead	7.2
		Indium	3.4
		Aluminum	1.2
		Zinc	0.9
		Cadmium	0.5

Defining Fixed Point, International Temperature Scale, ITS-90 (solid forms)

These SRMs are for use in preparing defining fixed points of the International Temperature Scale of 1990 (ITS-90).

SRM	Type	Temperature (in °C)	Unit Size (in g)
740a	Zinc (Freezing Point)	419.58	200, shot
741	Tin (Freezing Point)	231.928	350, ingot
743	Mercury (Triple Point)	-38.8344	680, ampule

Secondary Reference Points (solid forms)

These SRMs are for use in preparing secondary reference-point devices and for calibrating thermometers, thermocouples and other temperature-measuring devices.

SRM	Type	Temperature (in °C)	Unit Size (in g ingot)
43h	Zinc (Freezing Point)	419.5	350
44f	Aluminum (Freezing Point)	660.3	200
45d	Copper (Freezing Point)	1084.8	450
49e	Lead (Freezing Point)	327.45	600
742	Alumina, 99.9 + %	2052	10 (powder)

Melting Point and Triple Point (liquid and powder forms)

These SRM fixed point devices are for use in the realization of internationally accepted secondary reference points and/or triple points.

SRM	Type	Temperature (in °C)	Unit Size (in g)
1968	Gallium, 99.9999 + %	29.7646	25, sealed cell
1969	Rubidium, 99.9 + %	39.3	154, sealed cell
1970	Succinonitrile, 99.999 + %	58.0642	60, sealed cell
1971	Indium, 99.9999 + %	156.598	100, sealed cell

LGC Melting Point Materials

Reference Material (RM) 8000 is issued by NIST in cooperation with the Laboratory of the Government Chemist (LGC) Office of Reference Materials at the National Physical Laboratory (NPL) in Teddington, England. This set of five (5) highly purified substances is intended for use in the calibration of thermometers used in determining the melting points of samples in glass capillary tubes. Both the meniscus point and the liquefaction point for each substance are certified by NPL.

RM	Type	Meniscus Point (in °C)	Liquefaction (in °C)	Unit Size (in g)
8000	4-Nitrotoluene	51.81	52.34	1 each
	Benzil	95.08	95.49	1 each
	Benzoic Acid	122.47	122.92	1 each
	Anisic Acid	183.72	184.16	1 each
	Carbazole	246.21	246.58	1 each

Laboratory Thermometer (mercury in glass)

This thermometer is for use in clinical laboratories. Its main scale extends from 24.00 to 38.00 °C, in 0.05 °C divisions. It has an auxiliary scale from -0.20 to +0.20 °C.

SRM	Type	Calibrated Points (in °C)	Unit Size
934	Clinical Laboratory Thermometer	0, 25, 30, 37	1 each

Thermocouple Material, Platinum (wire form)

SRM	Type	Temperature Range (in °C)	Unit Size
1967	Pt, High Purity (99.999 + %)	197–1767	0.051D × 100 cm

Vapor Pressure of Metals (rod and wire forms)

SRM	Type	Pressure Range (in Pa)	Temperature Range (in K, ITS-90)	Unit Size (in cm)
745	Gold	10^{-4} to 10^{+2}	1300–2100	wire, 0.14 × 15.2
746	Cadmium	10^{-6} to 10^{+1}	350–594	rod, 0.64 × 6.4
748	Silver	10^{-7} to 10^{+2}	800–1600	rod, 0.64 × 6.4

Thermal Conductivity of Graphite and Metals (rod form)

SRM	Type	Unit Size (in cm)	Temperature Range (in K)	Conductivity at 293 K (in W/m/K)
1460	Stainless Steel	0.64D × 5.0	2–1200	14.1
1461	Stainless Steel	1.27D × 5.0	2–1200	14.1
1462	Stainless Steel	3.4D × 5.0	2–1200	14.1
RM 8420	Electrolytic Iron	0.64D × 5.0	2–1000	77.9
RM 8421	Electrolytic Iron	3.17D × 5.0	2–1000	77.9
RM 8422	Sintered Tungsten	0.32D × 5.0	2–3000	173
RM 8423	Sintered Tungsten	0.64D × 5.0	2–3000	173
RM 8424	Graphite	0.64D × 5.0	5–2500	90.9
RM 8425	Graphite	1.27D × 5.0	5–2500	90.9
RM 8426	Graphite	2.54D × 5.0	5–2500	90.9

Thermal Expansion of Glass and Silica (rod form)

SRM	Type	Temperature Range (in K)	Unit Size (in cm)
731	Borosilicate Glass	L1: 80–680 L2: 80–680 L3: 80–680	0.64 × 5.1 0.64 × 10.2 0.64 × 15.2
736	Copper	20–800	0.64 × 5.1
738	Stainless Steel (AISI 446)	293–780	0.64 × 5.1
739	Fused Silica	L1: 80–1000 L2: 80–1000 L3: 80–1000	0.64 × 5.1 0.64 × 10.2 0.64 × 15.2

Thermal Resistance of Glass and Silica (solid forms)

SRM	Type	Unit Size (in cm)	Temperature Range (in K)	Thermal Resistance (in m ² K/W)
1449	Fumed Silica Board	60 × 60 × 2.54	297.1	1.2
1450b	Fibrous Glass Board	60 × 60 × 2.54	100–330	0.75
1451	Fibrous Glass Blanket	60 × 60 × 2.54	100–330	0.60
1452	Fibrous Glass Blanket	60 × 60 × 2.54	297.1	0.60
1459	Fumed Silica Board	30 × 30 × 2.54	297.1	1.2

204. Optical Properties

Molecular Absorption and Molecular Luminescence (filter, solid, and solution forms)

The optical SRMs for spectrophotometry are certified transfer standards that fall into three (3) general categories—transmittance, wavelength, and stray radiant energy—each of which addresses a specific instrumental parameter of an ultraviolet/visible absorption spectrometer that must be in control for accurate optical transmittance measurements. To obtain optimum verification results, each SRM must be used within the specified range of conditions for which it is intended.

SRM 930d: This SRM is for the verification and calibration of the transmittance and absorbance scales of visible absorption spectrometers. It consists of three (3) individual Schott NG-type glass filters in separate metal cuvette-style holders and an empty filter holder. The nominal percent transmittances of the three filters are 10, 20, and 30%T. The three filters are individually certified for transmittance at five (5) wavelengths in the visible spectrum: 440.0, 465.0, 546.1, 590.0, and 635.0 nm. The optical transmittance neutrality of SRM 930d is sufficient for the filters to be used to accurately verify absorption spectrometers with maximum spectral bandpasses ranging from 2.2 to 6.5 nm for the five wavelengths at which the transmittances are certified. When SRM 930d is used in combination with SRM 1930, a 6-point stepwise verification of the transmittance scale is possible over the transmittance range from 1 to 50%T. A detailed discussion of this SRM and SRM 1930 are given in Special Publication 260–116 which accompanies each unit.

SRM 931e: This SRM is for the verification and calibration of the absorbance scales of ultraviolet and visible absorption spectrometers having narrow spectral bandpasses. SRM 931e consists of three (3) sets of four (4) solutions in sealed 10-mL ampules. The four solutions include a blank solution and three concentrations of an empirical inorganic solution prepared from high-purity cobalt and nickel metals dissolved in a mixture of nitric and perchloric acids. The user must transfer the blank and standard solutions to cuvettes of known pathlength. The spectrum has absorption maxima at 302, 395, and 512 nm, and a plateau in the region of 678 nm at which the absorbances are certified. The nominal absorbances of the three empirical inorganic solution standards are 0.3, 0.6 and 0.9, respectively, at wavelengths 302, 395, and 512 nm. At wavelength 678 nm, the nominal absorbances of the three solutions are 0.1, 0.2, and 0.3, respectively. The liquid filters may be used to verify absorption spectrometers with maximum spectral bandpasses ranging from 1.5 to 8.5 nm for the four wavelengths at which the absorbances are certified.

SRM 935a: This SRM is for the verification and calibration of the absorbance scales of ultraviolet absorption spectrometers having spectral bandpasses not exceeding 2 nm. Issued in 15-g units, SRM 935a consists of crystalline potassium dichromate of established purity. Solutions of ten (10) known concentrations of this SRM in 0.001 N perchloric acid (between 20 and 200 mg/kg) are certified for their specific absorbances under well-defined conditions. The user must prepare the liquid solutions from SRM 935a and then transfer them to cuvettes of known pathlength. The certified specific absorbances for the solutions prepared may be converted to their corresponding reference absorbance values using Beer's Law. Acidic SRM 935a solutions may be prepared anywhere within the concentration range of 20 to 200 mg/kg to provide a standard with the desired absorbance at a specified wavelength. The spectrum has absorption maxima at 257 and 350 nm, and absorption minima at 235 and 313 nm at which the specific absorbance values are certified, and also at 345 nm, near one of the predicted isobestic points of the spectrum. A detailed discussion of this SRM is given in Special Publication 260–54 which accompanies each unit.

SRM 1930: This SRM complements SRM 930d for the verification and calibration of the transmittance and absorbance scales of visible absorption spectrometers. SRM 1930 consists of three (3) individual Schott NG-type glass filters in separate metal cuvette-style holders and an empty filter holder. The nominal percent transmittances of the three filters are 1, 3, and 50%T. The three filters are individually certified for transmittance at five (5) wavelengths in the visible spectrum: 440.0, 465.0, 546.1, 590.0, and 635.0 nm. The optical transmittance neutrality of SRM 1930 is sufficient for the filters to be used to accurately verify absorption spectrometers with maximum spectral bandpasses ranging from 2.2 to 6.5 nm for the five wavelengths at which the transmittances are certified. When SRM 1930 is used in combination with SRM 930d, a 6-point stepwise verification of the transmittance scale is possible over the transmittance range from 1 to 50%T. A detailed discussion of this SRM and SRM 930d is given in Special Publication 260–116 which accompanies each unit.

SRM 2009a: This SRM is for use in the verification and calibration of the wavelength scale in the visible wavelength region of scanning absorption spectrometers having nominal bandwidths in the range 1.5 to 10.5 nm. SRM 2009a consists of a single (1) didymium glass filter in a metal cuvette-style holder. Depending upon the bandwidth of the absorption spectrometer, 12 to 22 wavelength verifications can be determined from 389 to 760 nm. The certified wavelengths correspond to transmittance minima and to selected inflection points. A detailed discussion of this SRM is given in the Special Publication 260–66 which accompanies each unit.

SRM 2031: This SRM is for the verification and calibration of the transmittance and absorbance scales of ultraviolet and visible absorption spectrometers. SRM 2031 consists of three (3) individual non-fluorescent, fused-silica filters in separate metal cuvette-style holders and an empty filter holder. The nominal percent transmittances of the three filters are 10, 30, and 90%T. The fused-silica base plates of the 10 and 30%T filters carry different thicknesses of semi-transparent chromium metal that are optically contacted to fused-silica cover plates. The nominal 90%T filter is a single clear fused-silica plate. The three filters are individually certified for transmittances at ten (10) wavelengths in the ultraviolet and visible spectral regions: 250.0, 280.0, 340, 360.0, 400.0, 465.0, 500.0, 546.1, 590.0, and 635.0 nm. The optical transmittance neutrality of SRM 2031 is such that wider spectral bandpasses can be used. Consequently, SRM 2031 is the only transmittance SRM that is suitable for use with those absorption spectrometers with large spectral bandpasses, e.g., 8 to 20 nm. A detailed discussion of this SRM is given in Special Publication 260-68 which accompanies each unit.

NOTE: Because the 10 and 30%T chromium-coated filters attenuate incident radiation by reflection to a large extent, SRM 2031 may possibly generate interreflections between optical surfaces in the sample compartment of some absorption spectrometers. Such interreflections may result in isochromatic stray radiant energy that affects the accuracy of the transmittance measurement. Consequently, when contemplating the purchase of SRM 2031, the user should contact the instrument manufacturer to verify that metal-on-fused silica filters are compatible with the spectrometer.

SRM 2032: This SRM is for use in the assessment of heterochromatic stray radiation energy (stray light) in ultraviolet absorption spectrometers in the spectral region below 260 nm. Issued in 25-g units, SRM 2032 consists of reagent-grade crystalline potassium iodide (KI). Solutions of this SRM in distilled water are certified for their specific absorbances under well-defined conditions at 240, 245, 250, 255, 260, 265, 270, and 275 nm. The KI solutions exhibit sharp cutoffs in transmittances below about 260 nm. The user must prepare a liquid KI solution from SRM 2032 and then transfer it to a cuvette of known pathlength. The certified specific absorbance for the solution prepared is then converted to its corresponding reference transmittance or absorbance value using Beer's Law. The amount of heterochromatic stray light in the absorption spectrometer at a wavelength below 260 nm may be determined from the equations given in the certificate.

SRM 2033: This SRM has two different purposes in the assessment of stray radiant energy (stray light) in ultraviolet absorption spectrometers in the spectral region below 260 nm: (1) an extended dynamic range test for heterochromatic stray light, and (2) an assessment of isochromatic stray light. In addition to the reagent-grade crystalline potassium iodide as issued in SRM 2032, SRM 2033 also includes a radiation attenuator to extend the dynamic range of the heterochromatic stray light test for those absorption spectrometers that can not make measurements in the low-transmittance region. The radiation attenuator consists of two (2) non-fluorescent, semi-transparent metal-on-fused silica filters, each having a nominal percent transmittance of 10%T. One filter is mounted in a metal cuvette-style holder, and the other filter is mounted in one of the two removable sliding shutters of the holder. For the extended dynamic range test of heterochromatic stray light, the cuvette containing the KI solution is inserted into the sample-beam position and the radiation attenuator is used to provide stepwise 10- and 100-fold attenuations of the reference beam. For the isochromatic stray light test, the KI solution is not used, and the metal-on-fused silica filter is inserted into the sample-beam position.

SRM 2034: This SRM is for use in the verification and calibration of the wavelength scale of ultraviolet and visible absorption spectrometers having nominal spectral bandwidths not exceeding 3 nm. SRM 2034, a liquid consisting of 4% (w/v) holmium oxide in an aqueous solution of 10% (v/v) perchloric acid, is sealed in a non-fluorescent, fused-silica cuvette of optical quality. SRM 2034 is batch-certified for wavelength location of minimum transmittance of 14 bands in the spectral range from 240 to 650 nm for six spectral bandwidths from 0.1 to 3 nm. A detailed discussion of this SRM is given in Special Publication 260–102 which accompanies each unit.

SRM 936: This SRM is for use in the evaluation of methods and the calibration of fluorescence spectrometers. Issued in 1-g units, SRM 936 consists of solid quinine sulfate dihydrate. It is certified for the relative molecular emission spectrum, $E(\lambda)$, in radiometric units for a solution of 1.28×10^{-6} mol/L quinine sulfate dihydrate in 0.105 mol/L perchloric acid using an excitation wavelength of 347.5 nm. The values of the molecular emission spectrum are certified at 5-nm wavelength intervals from 375 to 675 nm. The user must prepare the solution and transfer it to a cuvette of known pathlength. A detailed discussion of this SRM is given in Special Publication 260–64 which accompanies each unit.

SRM 1931: This SRM is for use in the evaluation and calibration of the relative spectral response of fluorescence spectrometers. It consists of four fluorescence standards and a “blank” specimen mounted in anodized aluminum cuvette-sized holders. The standards are composed of inorganic phosphors in a sintered polytetrafluoroethylene matrix. The fluorescence standards are certified for the relative corrected emission spectrum, $E(\lambda)$, in energy/wavelength units. The values of the blue (400–550 nm), green (490–600 nm), yellow (490–740 nm) and orange (530–740 nm) emission spectra are certified at 2-nm wavelength intervals. SRM 1931 L and R are oriented for left- and right-handed fluorescence spectrometers, respectively, as defined by viewing the fluorescent sample along the excitation beam. If the first emission optical component is located to the right of the sample then this orientation is designated R, and if it is to the left then it is designated L.

SRM	Type	Wavelength Range (in nm)	Unit Size
930d	Glass Filters, Transmittance	440–635	3 filters/4 holders
931e	Liquid Filters, Absorbance	302–678	Set of 12 vials
935a	Potassium Dichromate, UV Absorbance	235–350	15 g
936	Quinine Sulfate Dihydrate, Fluorescence	375–675	1 g
1930	Glass Filters, Transmittance	440–635	3 filters/4 holders
1931	Fluorescence Corrected Emission Spectra	400–760	Set of 4 holders
2009a	Didymium-oxide Glass, Wavelength	400–760	1 filter/1 holder
2031	Metal-on-Quartz Filters, Transmittance	250–635	3 filters/4 holders
2032	Potassium Iodide, Stray Light	240–280	25 g
2033	Potassium Iodide with Attenuator	240–280	25 g and attenuator
2034	Holmium-oxide Solution, Wavelength	240–650	1 sealed cuvette

Specular Spectral Reflectance (plate form)

These SRMs are for calibrating the reflectance scale of integrating sphere reflectometers used to evaluate materials for solar energy collectors and to calibrate reflectometers used in evaluating the appearance of polished metals and metal-plated objects.

SRM	Type	Wavelength Range (in nm)	Unit Size (in cm)
2003e	First Surface, Aluminum on Glass	250–2500	5.1D × 0.95
2011	First Surface, Gold on Glass	600–2500	5.1D × 1.2
2023a	Second Surface, Aluminum on Fused Quartz	250–2500	5.1D
2026	First Surface, Black Glass	In Prep	

Infrared Reflectance (solid form)

This SRM is for establishing the accuracy of the near infrared (IR) wavelength scale of reflectance spectrophotometers.

SRM	Type	Wavelength Range (in nm)	Unit Size (in cm)
1920	Rare Earth Oxide Mixture	740–2000	holder: 5.1D × 1.2

Nancy Winchester, *Chemist*, Inorganic Analytical Research Division;
Melody Smith, *Physical Science Technician*, Inorganic Analytical Research Division

Directional Hemispherical Reflectance (wafer form)

SRM	Type	Wavelength Range (in nm)	Unit Size (in cm)
2015	Opal Glass	400–750	2.5 × 5.0 × 0.64
2021	Black Porcelain Enamel	280–2500	5.1 × 5.1 × 0.20

Optical Rotation (powder form)

These SRMs are for calibrating or checking polarimetric apparatus. In aqueous solution, the optical rotation of SRM 17d is certified at three (3) wavelengths, while that of SRM 41c is certified at two (2) wavelengths. SRM 41c is also certified at one (1) wavelength in a dimethyl sulfoxide solution.

SRM	Type	Optical Rotation (in mrad) – Aqueous Solution		Unit Size (in g)
		Wavelength (in nm)		
		546	589	633
17d	Sucrose	711.64	604.26	519.17
41c	Dextrose	1101.1	931.8	798.6

X-ray and Photography (chart and tablet forms)

SRM 1001 is a calibrated X-ray film step tablet of 17 steps that cover the optical density range from 0 to 4; it has a blue tint and emulsion on both sides. SRM 1008 is a calibrated photographic step tablet of 21 steps that cover the optical density range from 0 to 4; it has a black tint and emulsion on a single side.

SRM 1010a is used to test the resolving power of cameras or of whole microscopy systems. It consists of five (5) charts printed photographically on paper, which have 26 high-contrast, 5-line patterns ranging in spatial frequency from one cycle per mm to 18 cycles per mm. Instructions for the use of the charts are supplied with each unit.

SRM	Type	Unit Size
1001	X-ray Film Step Tablet (0–4)	1 tablet, 17 steps
1008	Photographic Step Tablet (0–4)	1 tablet, 21 steps
1010a	Microscopy Resolution Test Chart	Set of 5 charts

205. Radioactivity

Radiation Dosimetry (wire form)

This SRM is a cobalt-in-aluminum alloy wire 0.5 mm in diameter and 1 m in length for use as a neutron density monitor standard.

SRM	Type	Cobalt Composition (in Wt. %)
953	Neutron density monitor wire (Co in Al)	0.116

Fission Track Glass (wafer form)

These SRMs, which contain uranium, will aid laboratories performing fission track analyses in interlaboratory comparisons of data and in monitoring neutron fluences. The materials were irradiated in the NIST 10 Megawatt Research Reactor, at two different neutron energies. Each unit consists of four (4) unirradiated glass wafers and two (2) irradiated wafers.

SRM	Uranium Composition (in mg/kg)	Uranium-235 (in Atom %)	Reactor Position	Neutron Fluence Copper Foil	Neutron Fluence Gold Foil
961	461.5	0.2376	RT-4: RT-3: (10^{12} n/cm ²)	1.31 4.56	1.46 5.43
963a	0.823	0.2792	RT-4: RT-3: (10^{14} n/cm ²)	39.5 41.2	43.0 45.8

The SRMs in the following four (4) pages are shipped express or air freight (shipping charges collect). The amount of a radionuclide in an SRM, at a specified time, is stated as (1) the number of atoms (or the mass for old radium SRMs), (2) the activity, or "decays per second," or (3) the emission rate of a particular radiation, depending on the method of calibration or the intended use. For solution SRMs, the quantity is usually specified per gram of liquid. The active portion of gamma-ray "point-source" standards is usually restricted to the central few millimeters of a low-mass, low-Z support to minimize scattering. Alpha particle-emitting radionuclides are deposited or plated on metal backings.

The unit for activity has traditionally been the curie (Ci), but simpler relations between activity, emission rate, and counting rate result if the current SI (International System of Units) unit "1 per second" is used. This is symbolized as " s^{-1} " and has been given the special name becquerel (Bq). The relationship between the curie and the becquerel is: $1\text{ Ci} = 3.7 \times 10^{10}\text{ Bq}$.

Many SRMs are measured and certified in terms of emission rate. In this catalog, αs^{-1} , $\beta^- s^{-1}$, $\beta^+ s^{-1}$, $Kx s^{-1}$, and γs^{-1} are used for the emission rates of alpha particles, negatrons, positrons, K X-rays, and gamma rays, respectively.

The SRMs without an asterisk (*) may be ordered singly, without a license, under the general licensing provisions of the Atomic Energy Act of 1954, As Amended. Those marked by an asterisk (*) are available only under the special licensing provisions of the Atomic Energy Act of 1954, As Amended.

NOTE: Certain radionuclides are not economical to maintain in stock because of short half lives or low demand. When sufficient demand exists, based on letters of inquiry, these materials are prepared and users who have expressed interest are notified of their availability. Requests for any radionuclide not listed, should be submitted to the Radioactivity Group, Ionizing Radiation Division, Room C114 Radiation Physics Building, National Institute of Standards and Technology, Gaithersburg, MD 20899: Telephone (301) 975-5531; FAX (301) 869-7682.

In addition, chemically stable solutions of many radionuclides may be submitted to NIST for calibration as described in Calibration Services Users Guide, NIST Special Publication 250 (1992 Edition). Requests for such tests should be submitted, with full source information, for approval of suitability to the Radioactivity Group at the above address.

Alpha Particle, Beta Particle, Gamma Ray, and Electron Capture (solution form)

SRM	Type Radionuclide	Activity per gram, at time of calibration (in Bq g ⁻¹)	(month/year)	Mass of Solution (in g)	Overall Uncertainty (in %)

4906C*	Plutonium-238	$1 \times 10 - 3 \times 10^2$	10/87 1.3

* License certification is required by NIST.

Radiocarbon Dating and Ground Water Studies (solid and solution forms)

Low-Level Tritiated-Water Standard

SRM	Material	Description
4361B	Hydrogen-3	490 g in a flame-sealed bottle. The radioactivity concentration was 1.123 Bq g^{-1} , as of the date of the most recent gas-counting measurement – August 1, 1987.

Contemporary Standard for Carbon-14 Dating

SRM	Material	Description
4990C	Oxalic Acid	225 g taken from specially prepared material for use as a common contemporary standard against which world-wide measurements can be compared.

Gaseous Materials

SRM	Type Radionuclide	Activity or radioactivity concentration at time of calibration (month/year)	Volume (in cm^3)	Pressure (in Pa)	Overall Uncertainty (in %)
4235B*	Krypton-85	$1 \times 10^7 \text{ Bq}$	10/86 3	1.013×10^5	1.1
4308C	Krypton-85	$2 \times 10^6 \text{ Bq}$	11/82 30	3.039×10^4	3.2
4415LN*	Xenon-133	$5 \times 10^8 \text{ Bq}$	3/90 5	1.013×10^4	1.5
4935C*	Krypton-85	$5 \times 10^7 \text{ Bq mol}^{-1}$	3/74 10	1.013×10^5	0.9

* License certification is required by NIST.

Gamma Ray and X-ray Point Sources

These SRMs are usually prepared by depositing the radioactive material and sealing it between two layers of polyester tape, mounted on an aluminum ring.

SRM	Type Radionuclide	Principal Photon Energy (MeV)	Activity at time of calibration (in Bq)	Activity at time of calibration (month/year)	Overall Uncertainty (in %)
4200B	Cesium-137-Barium-137m	0.662	4×10^4	9/79	1.6
4201B	Niobium-94	0.702	5×10^3	4/70	1.5
4202D	Cadmium-109-Silver-109m	0.088	4×10^5	10/86	2
4203*	Cobalt-60	1.173–1.332	2×10^4 to 2×10^5	3/84	0.9

4218E*	Europium-152	0.122 to 1.408	5×10^4 to 5×10^5	11/82	1.5
4241B*	Barium-133	0.081–384	2×10^5	6/81	1.4
Long-Lived Mixed Radionuclide:					
4275C	Antimony-125-Tellurium-125m Europium-154 Europium-155	0.027 to 1.596	5×10^4 6×10^4 3×10^4	9/88	

* License certification is required by NIST.

Low Energy Photon Point Sources

This SRM consists of a thin-layer deposit of the radionuclide on a thin stainless steel or platinum foil cemented to a monel disk.

SRM	Type Radionuclide	Principal Photon Energy (MeV)	Emission rate at time of calibration (month/year)	Overall Uncertainty (%)
4264B	Tin-121m-Antimony-121	0.0372	$5 \times 10^2 \text{ s}^{-1}$	11/82 3.0

Radon Analysis (solution form)

These SRMs are contained in flame-sealed glass ampules.

SRM	Type Radionuclide	Radium Content (month/year)	Mass of Solution (in g)	Uncertainty (in %)
4950E	Radium-226	4×10^{-10}	6/84	5 1.3
4952B	Blank	8×10^{-15}	8/76	2 68
4953D	Radium-226	4×10^{-9}	6/84	5 1.2

Natural Matrix Materials (powder form)

SRM 4350B – Columbia River Sediment

This material was collected from a river downstream from a nuclear reactor facility. Concentrations of fission and activation products are elevated over typical world-wide levels. $^{239/240}\text{Pu}$ and ^{241}Am are very homogeneously distributed through the sample and are in acid-leachable forms. Inhomogeneity is 3% or better for other radionuclides.

SRM 4351 – Human Lung

This material contains radioactivity concentrations on the order of 10^{-4} Bq g $^{-1}$. It has been freeze-dried, cryogenically ground, homogenized, and packed in a glass bottle under vacuum. There is significant inhomogeneity in $^{239/240}\text{Pu}$ which is unavoidable because plutonium was taken into the lungs in particulate form. Assessments of accuracy of measurement techniques can be improved by averaging over several samples.

SRM 4352 – Human Liver

This material contains radioactivity concentrations on the order of 10^{-4} Bq g $^{-1}$. It has been freeze-dried, cryogenically ground, homogenized, and packed in a glass bottle under vacuum.

SRM 4353 – Rocky Flats Soil Number 1

This material was collected within 13 cm of the soil surface at Rocky Flats, CO. $^{239/240}\text{Pu}$ and ^{240}Am concentrations are about an order of magnitude higher than typical world-wide levels. Approximately 10% of the plutonium is in an acid-resistant form. The material also contains “hot” particles and a statistical method is provided for dealing with these. Inhomogeneities, excluding hot particles, are on the order of 3% or better.

SRM 4354 – Freshwater Lake Sediment

This material (gyttja) contains approximately 25 g of freeze-dried, pulverized freshwater lake sediment (approximately 50% organic by weight) in a polyethylene bottle. The SRM is intended for use in tests of measurements of environmental radioactivity contained in matrices similar to the sample, for evaluating analytical methods, or as a generally available calibrated “real” sample matrix in interlaboratory comparisons.

SRM 4355 – Peruvian Soil

This material has non-measurable radioactivity concentrations for many fallout radionuclides and can be used as a blank or for sensitive tests of radioanalytical procedures at low-radioactivity concentrations for other radionuclides. The results of a trace-element study are given for 57 elements.

206. Electrical Properties

Electrical Resistivity and Conductivity of Metals (rod form)

These materials are for evaluating methods of measuring electrical resistivity over wide temperature ranges.

SRM	Type	Temperature Range (in K)	Resistivity at 293 K (in $\mu\Omega \cdot \text{cm}$)	Unit Size (in cm)
1461	Stainless Steel	5 to 1200	80.5	rod: 1.27D \times 5.0
1462	Stainless Steel	5 to 1200	80.5	rod: 3.40D \times 5.0
RM 8420	Iron	6 to 1000	10.1	rod: 0.64D \times 5.0
RM 8421	Iron	6 to 1000	10.1	rod: 3.17D \times 5.0
RM 8422	Tungsten	4 to 3000	5.4	rod: 0.32D \times 5.0
RM 8423	Tungsten	4 to 3000	5.4	rod: 0.64D \times 5.0

Electrical Resistivity and Conductivity of Silicon (block and wafer forms)

SRMs 2526, 2527, 2528, and 2529 are mounted on beveling blocks for two-probe test equipment.

SRM	Type	Resistivity (in $\Omega \cdot \text{cm}$)	Unit Size (in mm)
2526	111 p-Type Silicon, Spreading Resistance	0.001 to 200	16 levels: 5 \times 10 \times 0.625
2527	111 n-Type Silicon, Spreading Resistance	0.001 to 200	16 levels: 5 \times 10 \times 0.625
2528	100 p-Type Silicon, Spreading Resistance	0.001 to 200	16 levels: 5 \times 10 \times 0.625
2529	100 n-Type Silicon, Spreading Resistance	0.001 to 200	16 levels: 5 \times 10 \times 0.625
2541	Silicon Resistivity	In Prep	
2542	Silicon Resistivity	In Prep	
2543	Silicon Resistivity	In Prep	
2544	Silicon Resistivity	In Prep	
2546	Silicon Resistivity	In Prep	
2547	Silicon Resistivity	In Prep	
2548	Silicon Resistivity	In Prep	
2549	Silicon Resistivity	In Prep	
2550	Silicon Resistivity	In Prep	

Residual Resistivity Ratio (rod form)

This SRM is a set of five (5) aluminum rods for use in checking four-terminal dc and eddy current decay techniques. The residual resistivity ratio (RRR), $\rho(273\text{ K})/\rho(4\text{ K})$, is a sensitive indicator of purity and of the mechanical state of a material.

SRM	Type	RRR Values	Unit Size (in cm)
769	Aluminum	130, 683, 1205, 2650, and 11,000	0.64D × 5.2

Eddy Current (block form)

This SRM is for the calibration of eddy current conductivity meters and of secondary electrical conductivity standards. Eddy current measurements are used in nondestructive inspection of conducting materials and in the sorting of alloys for composition and heat treatment.

SRM	Type	Conductivity	Unit Size (in cm)
1860	Aluminum	60% IACS*	4.4 × 4.4 × 0.95

* IACS—International Annealed Copper Standard.

Superconducting Critical Current (wire form)

This SRM is for checking the performance of measurement systems used in superconductor technology. It consists of 2.2 m of a multifilamentary niobium titanium, copper-stabilized superconducting wire wound in a single layer onto a spool with a core diameter of 8.7 cm.

SRM	Type	Magnetic Field (in T)	Critical Current (in A)
1457	Nb-Ti Wire	2.000	293.30
		4.000	187.38
		6.000	124.72
		8.000	69.72

207. Metrology

Scanning Electron Microscope (SEM)

These SRMs are for calibrating the magnification scale and evaluating the performance of scanning electron microscopes. SRM 484f, on a 6.5-mm specimen mount, can be used to calibrate the magnification scale of an SEM from 1000 to 20,000 X. SRM 2069b consists of graphitized rayon fibers with smooth and uniform edges on a 3-mm SEM specimen mount.

SRM	Type	Size
484f	SEM Magnification Standard	11 mm D
2069b	SEM Performance Standard	12 mm D

Optical Microscope Linewidth Measurement (wafer form)

This SRM is for use in calibrating optical microscopes used to measure the widths of opaque lines and clear spaces on integrated-circuit photomasks. It can also be used to calibrate line spacings and line-to-space ratios. It is not for use with partially transmitting materials, in reflected light with opaque materials, or in a scanning electron microscope. SRM 476 is patterned with bright chromium.

SRM	Type	Spacings (in μm)	Unit Size (in cm)
476	Linewidth Measurement Standard	0.5 to 12	6.35 \times 6.35 \times 0.15

Depth Profiling (wafer form)

These SRMs are for calibrating equipment used to measure sputtered depth and erosion rates in surface analysis. SRM 2135c consists of nine (9) alternating metal thin-film layers—five (5) layers of pure chromium and four (4) of pure nickel—on a polished silicon (100) substrate. It is certified for total chromium and total nickel thickness, for individual layer uniformity, for Ni/Cr bi-layer uniformity, and for individual layer thickness. The nominal thicknesses for Cr and Ni are 53 and 66 nm, respectively.

SRM	Type	Unit/Size (in cm)
2135c	Ni-Cr Thin-Film Depth Profile Standard	In Prep
2136	Cr/CrO Thin-Film Depth Profile Standard	1 \times 2.54 \times 0.04

Copper and Chromium Coating on Steel (plate form)

These SRMs are used to measure the thickness of nonmagnetic coatings on steel. The steel substrates have the properties of AISI 1010 steel and may be used to measure the thickness of paint and other organic coatings on steel, as well as zinc (galvanized) and other nonmagnetic metallic coatings.

SRM	Unit Size 30×30 mm	Coating Thickness (in μm)
1321	Set of 4	34, 37, 42, 47
1322	Set of 4	53, 60, 69, 80
1323	Set of 4	4, 112, 135, 167
1357	Set of 3	6, 20, 48
1358	Set of 3	80, 225, 1000
1359	Set of 4	48, 140, 505, 800
1360	Set of 4	2.5, 6, 12, 20
1361a	Set of 4	6, 12, 25, 48
1362a	Set of 4	40, 80, 140, 205
1363a	Set of 4	255, 385, 505, 635
1364a	Set of 4	800, 1000, 1525, 1935

Nickel Coating on Steel (plate form)

These SRMs are used for calibrating thickness gauges of the magnetic type. The nickel coating has the magnetic property of a Watts nickel electrodeposit free of iron.

SRM	Unit Size 30×30 mm	Coating Thickness (in μm)
1331a	1 each	3
1332a	1 each	9
1333a	1 each	15
1334a	1 each	20
1335a	1 each	25
1336a	1 each	34
1337a	1 each	40
1338a	1 each	50
1339a	1 each	62

Solder Thickness (plate form)

This SRM is for calibrating X-ray fluorescence equipment. Each unit, which consists of a 1.5×1.5 cm plate of an electroplated tin-lead alloy coating on a copper substrate, is individually certified for composition and mass per unit area.

SRM	Type	Composition (in Wt. %)	Mass per Unit Area (in mg/cm^2)
2321	Sn-Pb Alloy	Sn: 54	6.8

Gold Coating on Nickel (plate form)

These SRMs are for calibrating equipment used to measure weight per unit area of gold coating of equivalent purity. They were measured by beta-ray backscatter and X-ray fluorescence techniques relative to NIST gold coating materials for which the average weights per unit area were determined by weight and area measurements.

SRM	Unit Size 15×15 mm	Coating Weight (in mg/cm ²)	Coating Thickness (in μm)
1375	1 each	1.5	0.8
1376	1 each	3.0	1.5
1377	1 each	6.0	3
1378	1 each	14.0	7
1379	1 each	0.35	0.175
1380	1 each	0.55	0.275

Gold Coating on Fe-Ni-Co Alloy (plate form)

SRM	Unit Size 15×15 mm	Coating Weight (in mg/cm ²)	Coating Thickness (in μm)
1371	1 each	1.5	0.8
1372	1 each	3.0	1.5
1373	1 each	6.0	3
1374	1 each	14.0	7

Ellipsometry (wafer form)

These SRMs are certified for the ellipsometric parameters of delta (Δ) and psi (Ψ) and the derived thickness and refractive index of the silicon dioxide layer on the silicon wafer.

SRM	Type	Unit Size 76 mm D	Thickness (in nm)
2531	Thin Film Thickness	1 each	50
2532	Thin Film Thickness	1 each	100
2533	Thin Film Thickness	1 each	200
2534	Thin Film Thickness	1 each	25
2535	Thin Film Thickness	1 each	12

**Barbara Belzer, Physical Science Technician,
Semiconductor Electronics Division**

Gas Transmission Film

This SRM is for use in the measurement of gas transmission rates using a volumetric method (ASTM D1434), manometric method (ASTM D1434), or coulometric method (ASTM D3985) of measurement. The permeances of nitrogen, oxygen, carbon dioxide, and helium through this polyester film at 296.15 K are 0.0421, 0.352, 1.722, and 13.79 pmol·s⁻¹·Pa⁻¹, respectively.

SRM	Type	Unit Size (in cm)
1470	Polyester Plastic Film for Gas Transmission	15 sheets: 23

NIST Time Software

The NIST Automated Time Service (ACTS) is a telephone time service designed to provide computers with telephone access to NIST time at occurrences approaching 1 millisecond (0.001 s). Features of the service include automated compensation for telephone-line delay, advanced alert for changes to and from daylight savings time and advanced notice of insertion of leap seconds. The ASCII-character time code should operate with standard modems and most computer systems. While the system can be used to set up computer time-of-day, simple hardware can be developed to set non-computer clock systems.

SRM	Type	Unit Size
8101	Automated Computer Time Service (ACTS)	13.34 cm diskette

208. Ceramics and Glasses

Chemical Resistance (Durability) of Glass (solid form)

This SRM is for checking test methods and calibrating equipment used to determine the resistance of glass containers to chemical attack. The value given represents the volume of 0.02 N sulfuric acid used to titrate to the methyl-red end point the alkaline extract from a crushed sample of glass after exposure to high-purity water at 121 °C.

SRM	Type	Unit Size	mL of N/50 H ₂ SO ₄
623	Borosilicate	2.2 kg	0.34

Electrical Properties of Glass (bar and powder forms)

SRM 624 is for checking test methods and for calibrating equipment used to determine the dc volume resistivity of glass per ASTM C657. SRM 774 is for checking methods used to determine dielectric constant and ac loss characteristics of insulating materials per ASTM D150.

SRM	Type	Unit Size	Value
624	Lead-Silica, for dc resistivity	200 g	$\log_{10} \rho \sim 9.9 \text{ } \Omega\text{-cm at } 300 \text{ } ^\circ\text{C}$
774	Lead-Silica, for dielectric constant	5 × 5 × 2.5 cm	K ~ 7.47
1414	Lead-Silica, for resistivity (molten range)	4 × 4 × 12 cm	13.5 Ω·cm at 1300 °C

Viscosity of Glass (bar form)

SRMs 710a, 711, and 717 are for checking the performance of high-temperature viscosity equipment (rotating cylinders) and low-temperature viscosity equipment (fiber elongation, beam bending, parallel plates, etc.).

SRM	Type	Temperature (°C) at Log 10 Viscosity (in Pa · s*)										
		1	2	3	4	5	6	7	8	9	10	11
710a	Soda-Lime-Silica	1464	1205	1037	918							
711	Lead-Silica	1327.1	1072.8	909.0	794.7	710.4	645.6	594.3	552.7	518.2	489.2	464.5
717	Borosilicate	1545.1	1248.8	1059.4	927.9	831.2	757.1	698.6	651.1	611.9	579.0	550.9

* SI unit. Replaces term, "poise". (Pa · s = poise × 10⁻¹)

Viscosity Fixpoints (solid forms)

These SRMs are for the calibration of equipment for the determination of the softening, annealing, and strain points of glass.

SRM	Type	Unit Size	Softening Point, °C	Annealing Point, °C	Strain Point, °C
709	Extra Dense Lead	4 × 4 × 5 cm	384	328	311
710a	Soda-Lime-Silica	10 × 10 × 4 cm	730.6	(545)	(504)
711	Lead-Silica	1.3 kg	602	432	392
712	Mixed Alkali Lead Silicate	225 g	528	386	352
713	Dense Barium Crown 620/603	225 g	738	631	599
715	Alkali-Free Aluminosilicate	200 g	961	764	714
716	Neutral	250 g	794	574	530
717	Borosilicate	4.2 × 4.2 × 12.5 cm	720	516	471

Relative Stress Optical Coefficient (bar form)

These glasses are for calibrating instruments used to measure relative stress optical coefficient of glass.

SRM	Type	Unit Size	Relative Stress Optical Coefficient (C) at $\lambda=546.1$ nm (Value $\times 10^{-12}$ m ² /N)
708	Glass A-Lead Silica	625 g	C = 2.857
	Glass B-Borosilicate	275 g	C = 3.652
709	Extra Dense Lead	4 × 4 × 5 cm	C = -1.359

Glass Liquidus Temperature (plate form)

This SRM is for checking test methods and for calibrating equipment used to determine the liquidus temperature of glass by the gradient furnace methods per ASTM C829.

SRM	Type	Unit Size	Method	Temperature, °C
773	Soda-Lime-Silica	2.5 × 2.5 × 0.6 cm	A (boat) B (perforated plate)	988 991

209. Miscellaneous Properties

Density and Refractive Index (liquid and solid forms)

These SRMs are for reference in the determination of the density of liquids and solids. The certified densities of SRMs 211c, 2211 and 2212 were measured with a special-design picnometer; the certified refractive indexes were measured with a precision spectrometer. The certified densities of SRMs 1825, 1826 and 1827 were determined by means of hydrostatic weighing.

SRM	Type	Unit Size	Density* (in g/cm ³)	Refractive Index **
211c	Toluene	5-mL ampule	0.86686	1.5180
1822	Soda-Lime Glass	slab – 3.8 × 3.8 × 0.6 cm		1.5200
1825	Fused Silica	rod – 1.6 × 5.0 cm	2.201855	
1826	Soda-Lime Glass	button – 3.20 × 1.3 cm	2.549382	
1827	Lead Silica Glass	slab – 0.6 × 4.0 × 2.5 cm	3.04948	1.528761
1919	Lead Silica Glass	slab – 0.6 × 4.0 × 2.5 cm	Indiv. Cert.	
2211	Toluene	8-mL ampule	0.86686	1.5180
2212	Toluene	22-mL ampule	0.86686	1.5180

* Values are at 20 °C.

** Values are at 20 °C and 435.83 nm (mercury spectral source).

Bleached Kraft Pulps (sheet form)

These Reference Materials, RMs 8495 Northern Softwood Bleached Kraft Pulp and 8496 Eucalyptus Hardwood Bleached Kraft Pulp, are intended primarily for use in fundamental studies on the physical properties of fibers and paper sheets. The materials selected for these two RMs are bleached dried lap pulp, each from a single lot of a standard commercial production run. The materials were selected because of their differing fiber size, differing papermaking properties, and similarity to commercially available materials.

RMs 8495 and 8496 were developed and prepared with input and support from the Pulp Material Research Committee (PMRC), a sub-committee of the Fundamental Research Committee. These materials were donated by industry and are being distributed by the Standard Reference Materials Program. At this time, no extensive property measurements have been made on these materials beyond ensuring they were within the control limits of the normal production run. A measurement error study is in progress with participation by international paper technical laboratories. As results become available, they will be published and added to the Report of Investigation that accompanies each of these materials.

RM	Type	Unit Size
8495	Northern Softwood	10 standard lap sheets × 0.5 kg
8496	Eucalyptus Hardwood	10 standard lap sheets × 0.5 kg

X-ray Diffraction of Ferrous Materials (disk and wafer forms)

SRMs 485a, 486, 487, and 488 are for calibrating X-ray diffraction equipment used in determining the amount of retained austenite in ferrous materials. SRM 493 is for calibrating X-ray diffraction and Mössbauer equipment to determine the relative amounts of iron carbide in steel.

SRM	Type	Unit Size (in cm)
485a	Austenite in Ferrite 5%	disk: 2.1D × 0.24
487	Austenite in Ferrite 30%	disk: 2.1D × 0.24
488	Austenite in Ferrite 2.5%	disk: 2.1D × 0.24
493	Spheroidized Iron Carbide (Fe_3C) in Ferrite	wafer: 2.9 × 2.9 × 0.24

X-ray Fluorescence Emission Target (disk form)

This SRM is for determining the detector window absorption in semiconductor X-ray spectrometers according to ANSI-IEEE Standard STO 759. When excited by a ^{55}Fe source, this glass target will emit fluorescent X-rays in the range 1.0 to 5.2 keV.

SRM	Type	Unit Size (in cm)
477	Glass Fluorescence Source	2.5D × 2

X-ray Diffraction of Powder Materials

These SRMs are to be used as internal standards for powder diffraction measurements. SRM 674a is a set of five (5) oxides for use in the quantitative analysis (intensity measurement) of materials.

SRM	Type	Lattice Parameter at 25.0 °C (in nm)	Unit Size (in g)
640b	Silicon Powder	0.5430940	7.5
660	LaB ₆ -2Theta X-Ray Profile	0.415695	3
674a	Powder Diffraction Intensity Al_2O_3 (α -alumina) CeO_2 Cr_2O_3 TiO_2 (Rutile) ZnO	(0.4759397) (0.5411102) (0.4959610) (0.4593939) (0.3249074)	10 10 10 10 10
675	Powder Diffraction (Mica)	0.998104	5
676	Crystalline Alpha Alumina	In Prep	20
1976	Alumina Plate, Sintered	0.4758846	4.5 × 0.16 cm

Values in parentheses are not certified and are given for information only.

James Cline, Ceramic Scientist, Ceramics Division

Standard Reference Materials for Engineering Materials

301. Sizing

Particle Size

SRMs 1003b, 1690, 1691, and 1960 are for calibrating various types of particle size measuring instruments, including light and electrical zone flow-through counters and optical and electron microscopes. SRMs 1004a, 1017a, 1018a, and 1019a are for calibrating test sieves.

SRM	Type	Particle Size (μm)	Unit Size
1003b	Glass Spheres	8–58	In Prep
1004a	Glass Spheres	34–120	In Prep
1017a	Glass Spheres	100–310	84 g
1018a	Glass Spheres	225–780	74 g
1019a	Glass Spheres	760–2160	200 g
1690	Polystyrene Spheres (0.5 Wt. % in H_2O)	0.895	5-mL vial
1691	Polystyrene Spheres (0.5 Wt. % in H_2O)	0.269	5-mL vial
1692	Polystyrene Spheres (0.25 Wt. % in H_2O)	2.982	5-mL vial
1960	Polystyrene Spheres (0.4 Wt. % in H_2O)	9.89	5-mL vial
1961	Polystyrene Spheres (0.5 Wt. % in H_2O)	29.64	5-mL vial
1962	Polystyrene Spheres (0.5 Wt. % in H_2O)	2.978	5-mL vial
1963	Polystyrene Spheres (0.5 Wt. % in H_2O)	0.1007	5-mL vial
1965	Polystyrene Spheres (0.5 Wt. % in H_2O)	9.94	1 slide

Cement Turbidimetry and Fineness

This SRM is for calibrating the Blaine fineness meter according to the latest issue of Federal Test Method Standard 158, Method 2101 or ASTM Designation C204; to calibrate the Wagner turbidimeter according to ASTM Designation C115; and to determine sieve residue according to ASTM Designation C430. Each set consists of twenty (20) sealed vials, each containing approximately 10 g of cement.

SRM	Type	Properties Certified	Value
114n	Portland Cement	Residue on 45 μm , electroformed sieve wet method Surface area (Wagner turbidimeter) Surface area (Air permeability)	8.3% $2020 \text{ cm}^2 \cdot \text{g}^{-1}$ $3460 \text{ cm}^2 \cdot \text{g}^{-1}$

Surface Area of Powders

These materials are for calibrating and checking instruments used to determine the specific surface area of powders by the Brunauer, Emmett and Teller (BET) method. Reference Materials (RMs) 8005, 8006, 8007, and 8008 are issued by NIST in cooperation with the Laboratory of the Government Chemist (LGC) Office of Reference Materials at the National Physical Laboratory in Teddington, England. RMs 8570, 8571, and 8572 are issued by NIST in cooperation with ASTM. Their surface areas were determined by both the static (volumetric) and single-point methods.

RM	Type	Surface Area (in m ² /g)		Unit Size (in g)
		Static	Single Point	
8005	α-Alumina		2.1	50
8006	α-Alumina		0.3	50
8007	α-Alumina		0.1	50
8008	α-Alumina		0.8	50
8570	Calcined Kaolin	10.9	10.3	10
8571	Alumina	158.7	153.2	10
8572	Silica-Alumina	291.2	277.6	10

302. Surface Finish

Microhardness (block form)

These SRMs are for use in calibrating and checking the performance of microhardness testers. Each is 1.25×1.25 cm and was made by electroforming the test metal on AISI 1010 steel substrate.

SRM	Type	Load (in Newtons)	Hardness (in kg/mm ²)
1893	Bright Copper (Knoop)	0.245, 0.490, 0.981	125
1894	Bright Copper (Vickers)	0.245, 0.490, 0.981	125
1895	Bright Nickel (Knoop)	0.245, 0.490, 0.981	600
1896	Bright Nickel (Vickers)	0.245, 0.490, 0.981	600
1905	Bright Nickel (Knoop)	2.943	600
1906	Bright Nickel (Knoop)	4.905	600
1907	Bright Nickel (Knoop)	9.81	600

Abrasive Wear (block form)

This SRM is for use in the dry sand/rubber wheel abrasion test per ASTM G65, Procedure A.

SRM	Type	Unit Size
1857	D-2 Tool Steel	2 blocks: $0.78 \times 2.5 \times 7.6$

Corrosion (plate form)

This SRM is for determining the reliability of step test measurements of electrochemical potential and thickness of multilayered nickel deposits. It consists of a 5.0×5.0 cm plate of copper-plated steel over which a duplex nickel coating has been deposited.

SRM	Type	Step Test Potential (in mV)	Nickel Coating Thickness Bright Semibright (in μm)
2350	Nickel Step Test	110–150	7 20

Surface Roughness (block form)

These SRMs are for calibrating stylus instruments that measure surface roughness. These electroless-nickel coated steel blocks have a sinusoidal roughness profile machined on the top surface.

SRM	Type	Roughness (in μm)	Wavelength (in μm)	Unit Size (in cm)
2071a	Sinusoidal Roughness	0.3 μm	10	block: 2.4×3.3
2072	Sinusoidal Roughness	1.0 μm	100	block: 2.4×3.3
2073	Sinusoidal Roughness	3.0 μm	100	block: 2.4×3.3
2074	Sinusoidal Roughness	1.0 μm	40	In Prep
2075	Sinusoidal Roughness	1.0 μm	800	In Prep

303. Nondestructive Evaluation

Ultrasonics

SRM 1855 is for point-by-point calibration of apparatus used to measure ultrasonic power. SRM 1856 is a displacement-measuring transducer to be used to determine the size and character of surface vibrations.

SRM	Type	Frequency Range (in MHz)	Unit
1855	Ultrasonic Power Transducer	1.6 to 21.6	1 each
1856	Acoustic Emission Transducer	0.1 to 1	1 each

Dye Penetrant Test Blocks

These SRMs are for checking the performance of liquid dye penetrants and dye penetrant crack detection systems and devices for surface defect detection. These test blocks, composed of a laminate cross section of electrodeposited nickel and copper, have four (4) synthetic cracks, approximately 0.2, 0.5, 1, and 2 μm wide.

SRM	Type	Surface	Unit Size (in cm)
1850	Penetrant Test Block	Bright Finish	5D \times 1
1851	NDE Penetrant Test Block	Matte Finish	5D \times 1

Artificial Flaw for Eddy Current NDE

This Reference Material (RM) 8458 provides a flaw of known size and geometry that closely resembles an actual fatigue crack. It is intended to produce a response suitable for calibrating eddy current non-destructive evaluation (NDE) systems. The flaw size is 3.0×0.1 mm long by 1.0 mm deep in a $7 \times 7 \times 2$ cm block of 7075-T651 aluminum alloy, heat treated to the T6 temper.

304. Automatic Data Processing

Magnetic Computer Storage Media

These SRMs are for evaluating the performance of magnetic computer storage media and systems in accordance with relevant standards and for maintaining control over their production. Each SRM is individually calibrated and certified.

SRM	Type	Used by Standard(s)	Unit Size
1600	Secondary Standard Magnetic Tape Cassette—3.8 mm wide tape, certified for signal amplitude output relative to the NIST Standard Reference Amplitude at 63 flux transitions per mm.	ANSI X3.48, X3.103, X3.104	cassette
3200	Secondary Standard Magnetic Tape—12.7 mm wide tape, certified for signal amplitude outputs relative to the NIST Standard Reference Amplitudes at 8, 32, and 126 flux transitions per mm.	ANSI X3.40, X3.14, X3.22, X3.39	open reel
3201	Secondary Standard Magnetic Tape—12.7 mm wide tape, certified for signal amplitude outputs relative to the NIST Standard Reference Tape at 262 and 394 flux transitions per mm.		cartridge
3202	Secondary Standard Magnetic Tape—12.65 mm wide tape, for use in the calibration of average signal amplitude, resolution and overwrite.	ANSI X3.180	cartridge
3216	Secondary Standard Magnetic Tape—6.3 mm wide tape, certified for signal amplitude outputs relative to the NIST Standard Reference Amplitude at 126 flux transitions per mm.	ANSI X3.55, X3.56, X3.72	cartridge
3217	Secondary Standard High Density Magnetic Tape Cartridge—6.3 mm wide tape, certified for signal amplitude outputs relative to the NIST Standard Reference Amplitude at 252 and 394 flux transitions per mm.	ANSI X3.127, X3.116, X3.136	cartridge
6250	Secondary Standard High Density Magnetic Tape—12.7 mm wide tape, certified for signal amplitude output relative to the NIST Standard Reference Amplitude at 356 flux transitions per mm.	ANSI X3.40, X3.157, X3.54	open reel

Flexible Disks

These Reference Materials (RMs) are issued by NIST in cooperation with the Physikalisch-Technische Bundesanstalt (PTB), Germany, for signal amplitude, overwrite, and resolution. The RM numbers correspond to the ISO standard numbers. The materials conform to relevant standards for flexible disk cartridges.

RM	Type	Unformatted Capacity (in kilobytes)	Used by Standard	Unit Size (in mm)
6596	Flexible Disk Cartridge-130	125	ANSI X3.82	130
9529	Flexible Disk Cartridge-90	2000	ANSI X3.171	90

Centerline Drawings for Optical Character Recognition Style B

This SRM is an exact copy of the centerline drawings that uniquely define each printed character shape and size used in constant strokewidth Style B Size I Optical Character Recognition (OCR-B) applications in accordance with one or more of the following standards: ANSI X3.49-1975 (R 1982), Character Set for Optical Character Recognition (OCR-B); FIPS Publication (OCR), ECMA-11 for the Alphanumeric Character Set OCR-B for Optical Recognition, 3rd Edition, 1976; and ISO 1073/II-1976, Alphanumeric Character Sets for Optical Recognition Part II: Character Set OCR-B.

This SRM contains information on the shape, size, strokewidth, and position relative to the base line of the OCR-B characters.

SRM	Characters	Sheets	Size	Sheet Size
1901	118	118	OCR-B I	32×44×0.01 cm

305. Fire Research

Surface Flammability (sheet form)

This SRM is for checking the operation of radiant panel test equipment in accordance with the procedures outlined in ASTM E162-78.

SRM	Type	Certification	Unit Size
1002d	Hardboard Sheet	Flame Spread Index, I = 153 Heat Evolution Factor, Q = 36.5	Set of 4: 15.2 × 45.7 × 0.63 cm

Smoke Density Chamber (sheet form)

These SRMs are certified for maximum specific optical density and are for performing operational checks of smoke density chambers.

SRM	Type	Maximum Specific Optical Density	Unit Size (in cm)
1006c	Non-flaming Exposure Condition (α -cellulose)	Dm (corr.) = 178	6 sheets: 0.05 (thickness)
1007b	Flaming Exposure Condition (plastic)	Dm (corr.) = 421 to 493	3 sheets: 16 × 16 × 0.076

Smoke Toxicity (sheet form)

This SRM is for checking the operation of the Cup Furnace Smoke Toxicity Method under two (2) observation periods. It consists of eight (8) sheets, 16 × 16 × 0.76 cm each, of acrylonitrile-butadiene-styrene copolymer.

SRM	Type	Combustion Mode	Observation Time	Values	
				LC ₅₀	N-Gas
1048	Smoke Toxicity	Flaming	WE *	27	1.4
			WE & PE **	25	1.5
		Nonflaming	WE *	58	1.2
			WE & PE **	53	1.4

* WE = within 30 min.

** WE & PE = 30 min + 14 d.

Flooring Radiant Panel (sheet form)

This SRM consists of three (3) sheets of kraft paperboard. It is for checking the operation of flooring radiant panel test apparatus used to measure critical radiant flux as per ASTM E648.

SRM	Type	Critical Radiant Flux	Unit Size
1012	Flooring Radiant Panel	0.036 W/cm ²	104.1 × 25.4 × 0.305 cm

309. Miscellaneous Performance Engineering Materials

Socketed Ball Bar

This SRM is for measuring the performance of coordinate measuring machines (CMMs) as per ASME Standard B89.1.12. It consists of a set of three (3) precision balls pinned and cemented onto threaded shafts, one (1) table-mount magnetic socket, one (1) ram-mount magnetic socket, and five (5) partially insulated extension tubes—50, 100, 200, 400, and 800 mm long.

SRM	Type	Measuring Lengths (in 50 mm steps)	Unit Size
2083	Socketed Ball Bar	100 to 1650	Set

Charpy V-Notch Test Blocks

These SRMs are test specimens for certification of Charpy V-Notch impact testing machines. This test is to be done in accordance with ASTM Standard E-23. Each SRM consists of five (5) $10 \times 10 \times 54$ mm bars of 4340 alloy steel. After completing the test and filling out the questionnaire, the bars are to be returned to the Charpy Program Coordinator, National Institute of Standards and Technology, Code 853, 325 Broadway, Boulder, CO 80303.

SRM	Type	Hardness Range (HRC)	Energy Range (in J)	Energy Range (in m · kg)
2092	(Low Energy)	45 ± 1	15–20	(11–15 ft-lbs) 1.5–2.1
2096	(High Energy)	32 ± 1	90–106	(66–78 ft-lbs) 9.1–10.8
2098	(Super High Energy)*	29 ± 1	210–224	(155–165 ft-lbs)

* Until ASTM Standard E-23 is modified to include the use of super high energy specimens for machine certification, these specimens can only be used as reference materials; they cannot be used for certification of Charpy V-Notch testing machines. Incorporation of the super high energy specimens into the above standard is currently being balloted by ASTM. Meanwhile, the user should send the fractured specimens and completed questionnaire to the National Institute of Standards and Technology (NIST), which will review the data and issue a report of its findings to the user's facility. If the user's machine produces acceptable values, this report will document the conformance (acceptable operation) of the machine. If the machine produces values outside the acceptable tolerance of the nominal energy value, this report will suggest changes (machine design, repair or replacement of worn parts, changes in testing procedures, etc.) to bring the machine into conformance.

Daniel Vigliotti, Mechanical Engineering Technician, Materials Reliability Division; Dominique Shepherd, Materials Research Engineer, Materials Reliability Division

Tape Adhesion Testing (sheet form)

This SRM is intended as a uniform source of linerboard for use under ASTM Designation D2860, Procedure A: Adhesion of Pressure Sensitive Tape to Fiberboard at 90 Degree Angle and Constant Stress.

SRM	Type	Unit
1810a	Linerboard for Tape Adhesion Testing	In Prep

SRM/RM Indexes

Subject Index

A

ABSORBANCE
See MOLECULAR . . . SPECTROMETRY, 102–104

ACETANILIDE
use in MICROCHEMISTRY, 46

ACIDIMETRIC VALUE (STOICHIOMETRY), 46
of Benzoic Acid
of Boric Acid
of Potassium Hydrogen Phthalate

ACID RAIN
See SIMULATED RAINWATERS, 58

ACOUSTIC EMISSION TRANSDUCER
See ULTRASONICS, 126

ADHESION (TAPE ADHESION TESTING)
Linerboard for, 131

AGRICULTURAL MATERIALS, 76–77
Apple Leaves
Bovine Muscle
Corn Bran
Corn Kernel
Corn Stalk
Corn Starch
Durum Wheat Flour
Fluoride in Vegetation
Hard Red Spring Wheat Flour
Microcrystalline Cellulose
Peach Leaves
Pine Needles
Potato Starch
Soft Winter Wheat Flour
Wheat Gluten
Whole Egg Powder
Whole Milk Powder

AIR PARTICULATES (FOSSIL FUELS)
See TRACE ELEMENTS, 66

AIR POLLUTION (ANALYZED GASES)
See MIXTURES AND POLLUTANTS, 60–62

ALCOHOL
Ethanol Solutions, 54

ALCOHOLS (REFERENCE FUELS), 64
Alcohol Mixture
Ethanol
Methanol
Methanol-Butanol

ALLOYS (FERROUS)
See FERROUS METALS, 21–35

ALLOYS (NONFERROUS)
See NONFERROUS METALS, 36–43

ALUMINA

as Bauxite (ORES), 79–81
as Burnt REFRACTORIES, 84
Reduction Grade (ORES), 79–81
Secondary Reference Point, 99
for SURFACE AREA OF POWDERS, 124
X-RAY DIFFRACTION OF POWDER MATERIALS, 122

ALUMINUM

Freezing Point of (SECONDARY
REFERENCE POINTS), 99
as a METALLO-ORGANIC COMPOUND, 90
Residual Resistivity Ratio, 114
Secondary Reference (Freezing) Point, 99
SPECTROMETRY Solution, 47–49
Specular Reflectance (Mirrors), 105
Ultra-Purity, 45

ALUMINUM BASE ALLOYS

See NONFERROUS METALS, 36–43

AMERICIUM (RADIOACTIVITY), 107–112

as Americium-241
as Americium-243
Columbia River Sediment
Human Liver
Human Lung
Peruvian Soil

Rocky Flats Soil Number 1

AMMONIUM DIHYDROGEN PHOSPHATE constituent in FERTILIZERS, 78

ANALYZED GASES

See MIXTURES AND POLLUTANTS, 60–62
See PERMEATION DEVICES, 63

ANGIOTENSIN I

See CLINICAL LABORATORY MATERIALS, 53

ANISIC ACID

use in MICROCHEMISTRY, 46

ANION CHROMATOGRAPHY, 50

Bromide Solution
Chloride Solution
Fluoride Solution
Nitrate Solution
Phosphate Solution
Sulfate Solution

ANTICONVULSANT DRUG LEVEL ASSAY

See CLINICAL LABORATORY MATERIALS, 53

ANTIEPILEPSY DRUG LEVEL ASSAY

See CLINICAL LABORATORY MATERIALS, 53

ANTIMONY

as Antimony-125 Mixed Nuclide
(RADIOACTIVITY), 107–112
SPECTROMETRY Solution, 47

Tungsten Concentrate (ORES), 79-81
- TURBIDIMETRY (SIZING)**
Portland Cement (CEMENT TURBIDIMETRY AND FINENESS), 123
- U**
- ULTRASONICS (NONDESTRUCTIVE EVALUATION), 126**
Acoustic Emission Transducer
Ultrasonic Power Transducer
- URANIUM**
SPECTROMETRY Solution, 48
- URANIUM (RADIOACTIVITY)**
as Uranium-232, 108
as Uranium-238, 108
Fission Track Glass, 107
NATURAL MATRIX MATERIALS, 112
- UREA**
CLINICAL LABORATORY MATERIALS, 53
- COMBUSTION CALORIMETRY (THERMODYNAMIC PROPERTIES), 97**
in Human Serum (SERUM MATERIALS), 54
MICROCHEMISTRY (STOICHIOMETRY), 46
- URIC ACID**
CLINICAL LABORATORY MATERIALS, 53
- URINE, FREEZE-DRIED (HEALTH AND INDUSTRIAL HYGIENE), 55**
Cocaine Metabolites in
Cotinine in
Fluoride in
Mercury in
THC (Marijuana Metabolite) in
Toxic Metals in
- VANADIUM**
Bis(1-phenyl-1,3-butanediono)oxovanadium (IV) (METALLO-ORGANIC COMPOUNDS), 90
SPECTROMETRY Solution, 48
Vanadium in Crude Oil (METAL CONSTITUENTS), 58
Vanadium and Nickel in Residual Fuel Oil (METAL CONSTITUENTS), 58
- VAPOR PRESSURE OF METALS (THERMODYNAMIC PROPERTIES), 100**
Cadmium
Gold
Silver
- VICKERS (MICROHARDNESS) (SURFACE FINISH), 125**
Bright Copper
Bright Nickel
- VISCOSE (CERAMICS AND GLASSES)**
VISCOSE FIXPOINTS, 120
VISCOSE OF GLASS, 119
- VITAMINS**
Cholesterol and FSV in Coconut Oil (FOODS AND BEVERAGES), 74-75
Fat Soluble Vitamins in Human Serum (CLINICAL LABORATORY MATERIALS), 53
- VMA**
aka. 4-hydroxy-3-methoxymandelic acid
- W**
- WASPALOY**
NICKEL BASE ALLOYS (NONFERROUS METALS), 41
- WATER ANALYSIS**
ANION CHROMATOGRAPHY in, 50
Mercury in Water (METAL CONSTITUENTS), 58
Silicon in Water (SPECTROMETRY), 47-49
SIMULATED RAINWATERS (INORGANICS), 58
Water (TRACE ELEMENTS) (FOSSIL FUELS), 66
- WAVELENGTH (OPTICAL PROPERTIES)**
Didymium-oxide Glass (MOLECULAR ... SPECTROMETRY), 102-104
Holmium-oxide Solution (MOLECULAR ... SPECTROMETRY), 102-104
- WEAR (SURFACE FINISH)**
D-2 Tool Steel (ABRASIVE WEAR), 125
- WEAR-METALS (ENGINE WEAR MATERIALS)**
WEAR METALS IN OIL, 91
- WHEAT**
Wheat Straw (BIOMASS MATERIALS), 78
- WHEAT FLOUR (FOOD AND AGRICULTURE FOODS AND BEVERAGES), 74-75**
USA/CANADA COLLABORATIVE MATERIALS, 76
- WINE, STABILIZED (FOOD AND AGRICULTURE FOODS AND BEVERAGES), 74-75**
- X**
- XENON (RADIOACTIVITY)**
as Xenon-133 (GASEOUS MATERIALS), 110
as Xenon-133 (RADIOPHARMACEUTICALS), 109

X-RAY

- THIN FILMS FOR X-RAY FLUORESCENCE
(INORGANICS), 59
- X-RAY DIFFRACTION OF FERROUS
MATERIALS, 122
- X-RAY DIFFRACTION OF POWDER
MATERIALS, 122
- X-ray Film Step Tablet (X-RAY AND
PHOTOGRAPHY), 106
- X-RAY FLUORESCENCE EMISSION TARGET, 122

Y**YEAST, BREWERS (FOOD AND AGRICULTURE)**
FOODS AND BEVERAGES, 74–75**YTTERBIUM**
SPECTROMETRY Solution, 48**YTTRIUM**
SPECTROMETRY Solution, 48**Z****ZINC**

- DEFINING FIXED POINT, ITS-90, 99
- DIFFERENTIAL SCANNING CALORIMETRY, 98
- METALS (HIGH PURITY METALS), 45
- Metals on Filter Media (MATERIALS ON FILTER
MEDIA), 56
- SECONDARY REFERENCE POINTS, 99
- SPECTROMETRY Solution, 48–49
- Spelter (ZINC BASE ALLOYS), 43
- ZINC BASE ALLOYS (NONFERROUS METALS), 43
- Zinc Cyclohexanobutyrate (METALLO-ORGANIC
COMPOUNDS), 90

ZIRCONIUM

- SPECTROMETRY Solution, 48–49
 - ZIRCONIUM BASE ALLOYS (NONFERROUS
METALS), 43
- ZWITTERIONIC BUFFER SYSTEMS (ION ACTIVITY), 94**
- HEPES Free Acid
 - MOPS Free Acid
 - NaHEPESate
 - NaMOPSate
