89

Keywords: Resonance, Reprints, *Hydrogen atoms, *Multi-photon processes, *Photoionization, Laser radiation.

The resonance-enhanced four-photon ionization of atomic hydrogen was measured. The degenerate fourphoton process occurs via a three-photon resonance between the 1s and the 2p levels, with subsequent one-photon ionization near threshold. The highly asymmetric resonance-enhanced profile was studied, i.e., the photo ion yield as a function of laser detuning from three-photon resonance between the 1s and 2p levels. In particular, the authors have determined the width, shift, peak, and asymmetry of the profile as a function of laser intensity. The experimental results are compared to theoretical models. These models involve both the properties of the atom in an intense near-resonant radiative field, and a detailed model for the multimode laser field, particularly the field fluctuations due to mode beating. The asymmetric reso-nance-enhanced photoionization profile is well reproduced by both a random-phase and a chaotic-light model.

PB89-201578 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Molecular Spectroscopy Div. Influence of the ac Stark Effect on Multiphoton

Transitions In Molecules. Final rept.

W. L. Meerts, I. Ozier, and J. T. Hougen. 1989, 8p Pub. in Jnl. of Chemical Physics 90, n9 p4681-4688, 1 May 89.

Keywords: *Molecular beams, *Stark effect, Electronic spectra, Photons, Linear differential equations, Computerized simulation, Resonance absorption, Boundary value problems, Mathematical models, Reprints.

A multiphoton mechanism for molecular beam transitions is presented which relies on a large first-order ac Stark effect to modulate the energy separation of the which does not require the multiphoton transition, but which does not require the presence of any intermedi-ate level(s). The algebraic formalism is checked by computer solution of an initial value problem involving four real coupled linear differential equations. It is then used to explain the multiphoton transitions previously observed in molecular beam electric resonance studies on the two symmetric top molecules OPF3 and CH3CF3, where the number of photons involved in a given transition varies from 1-40. Application of the analysis to other experiments is briefly discussed.

Modeling of the Bremsstrahlung Radiation Pro-duced in Pure Element Targets by 10-40 keV Electrons. Final rept.

J. A. Small, S. D. Leigh, D. E. Newbury, and R. L. Myklebust. 1987, 11p Pub. in Jnl. of Applied Physics 61, n2 p459-469 1987.

Keywords: *X ray analysis, *Bremsstrahlung, Mathe-matical models, Electron irradiation, Microanalysis, Reprints, KeV range 10-100.

A new global relation has been developed for predicting electron-excited bremsstrahlung intensities over a wide range of accelerating voltages, atomic numbers, and x-ray energies. The new relation was determined from the mathematical modeling of extensive data and is designed for calculating bremsstrahlung intensities in analytical procedures, such as those requiring peakto-background measurements, where the direct measurement of the bremsstrahlung intensities is impracti-cable. The distribution of errors between the data and the model is symmetrical, centered around zero error with 63% of the values falling between plus or minus 10% relative error.

tral Radiance. Final rept.

J. H. Walker, A. T. Hattenburg, and R. D. Saunders. 1987, 10p

Pub. in Metrologia 24, n2 p79-88 1987.

Keywords: *Radiance, *Spectroradiometers, Preci-sion, Blackbody radiation, Measuring instruments, Ra-diometry, Electromagnetic scattering, Linearity, Re-prints, *Calibration standards.

The paper describes the measurement methods and instrumentation used in the realization and transfer of the NBS scale of spectral radiance. The application of the basic measurement equation to both blackbody and tungsten strip lamp sources is discussed. The polarizance, response linearity, spectral responsivity function, and 'size-of-source effect' of the spectrora-diometer are described. The analysis of sources of error and estimates of uncertainty are presented. The assigned uncertainties in spectral radiance range from about 1.75% at 225 nm to 0.25% at 2400 nm.

MD. Electricity Div. History of the Present Value of 2e/h Commonly Used for Defining National Units of Voltage and Possible Changes in National Units of Voltage and Resistance.

Final rept.

B. N. Taylor. 1987, 6p Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Instrumentation and Meas-urement 36, n2 p659-664 1987.

Keywords: *Electrical measurement, *Electric poten-tial, *Electrical resistance, Metrology, Hall effect, Units of measurement, Reprints.

The national standards laboratories of most major industrialized countries employ the Josephson effect to define and maintain their national or laboratory unit of voltage V(LAB). The value of the Josephson frequency-voltage ratio commonly used for this purpose, 2e/h = 483594 GHz/V(LAB), is now known to be about eight parts-per-million less than the absolute or SI value. Consequently, the different national units of voltage are smaller than the SI unit by the same amount. One of the purposes of the paper is to review how this value of 2e/h was selected and hence the origin of the present inconsistency between national voltage units and the SI unit. The motivation for such an historical study is the hope that it can benefit the selection of a new, more accurate value of 2e/h planned for the near future. Also discussed is the status of national units of resistance and the effect of defining and maintaining such units using a value of the quantized Hall resistance consistent with the SI as may also be suggested in the near future.

Determination of Binary Mixture Vapor-Liquid Critical Densities from Coexisting Density Data. Final rept.

L. J. Van Poolen, and J. C. Rainwater. 1987, 21p Pub. in International Jnl. of Thermophysics 8, n6 p695-715 1987.

Keywords: *Mixtures, *Critical density, Nitrogen, Meth-ane, Thermodynamic equilibrium, Thermodynamic properties, Experimental data, Liquids, Two phase flow, Vapors, Reprints, *Isochoric processes.

Two-phase vapor-liquid equilibrium ((VLE) isochores for binary mixtures are defined as the thermodynamic for binary mixtures are defined as the thermodynamic paths along which the overall density and composition are fixed. Data along such isochores are generated from a modified Leung-Griffiths model fit to experimen-tal data for the binary system nitrogen-methane. The behavior of the liquid volume fraction along these iso-chores is found to be similar to that for pure fluids. Rectilinear diameters for varying overall densities (fixed composition) are seen to be nearly coincident. Straight-line diameters and the critical liquid volume Straight-line diameters and the critical liquid volume fraction method are utilized to predict critical densities using data near and removed from the critical point. Both methods give acceptable results but the critical liquid volume fraction method is more accurate. A criti-cal literature review of the need for binary mixture criti-cal densities is presented and a proposed experimental procedure is given for the determination of mixture critical densities.

Computer Simulation Studies of the Soliton Model. 3. Noncontinuum Regimes and Soliton Interactions.

Final rept.

K. J. Wahlstrand. 1988, 7p Pub. in Polymer 29, n2 p256-262 1988.

Keywords: *Elementary excitations, *Klein-Gordon equation, Computerized simulation, Correlation, Inter-actions, Temperature, Field theory(Physics), Energy

levels, Scaling, Phonons, Mathematical models, Reprints, *Solitons, Coupling constants.

The Klein-Gordon soliton model is studied by performing stochastic molecular dynamics computer simula-tions for a wide range of both temperatures and coupling constants. Three general regimes of behavior are found: the continuum limit or non-interacting regime; the pinned or transition state theory limit, where solinoncontinuum regime, where soliton-soliton interac-tions or 'multiple soliton effects' are important. In the noncontinuum regime the correlation function changes as a function of temperature and coupling constant. This will lead to deviations from the continuum limit temperature scaling and soliton energy scaling ob-served in the dynamics of Klein-Gordon systems.

Quantum-Defect Parametrization of Perturbative Two-Photon Ionization Cross Sections. Final rept

M. G. J. Fink, and P. Zoller. 1989, 15p Sponsored by National Science Foundation, Washing-

ton, DC. Pub. in Physical Review A 39, n6 p2933-2947, 15 Mar

89

Keywords: *Hydrogen, Photons, Perturbation theory, Energy levels, Quantum theory, Reprints, *Ionization cross sections, Rydberg states, Coulomb potential.

A multichannel quantum-defect theory (MQDT) para-metrization of two-photon ionization (2PI) of atoms, suitable for use with ab initio calculations of perturba-tive 2PI amplitudes in the presence of intermediateand/or final-state Rydberg resonances is developed. The rapid energy variation of such amplitudes is ex-tracted in terms of elementary functions of energy and a set of MQDT parameters, which are smooth functions of energy. As an example, results of numerical computations of MQDT parameters for 2PI of atomic hydrogen (1s, 2s, and 3s) by circularly polarized light are presented. MQDT parameters for the many-channel case are derived, and an analysis of their phaseshifted Coulomb functions, and simple analytic formu-las are given for the energy dependence of the amplitude as a function of a small set of physical parameters.

MD. Reactor Radiation Div. Calculations and Measurement of the Performance of Converging Neutron Guides. Final rept.

J. R. D. Copley, and C. F. Majkrzak. 1989, 12p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Thin-Film Neutron Optical Devices: Mirrors, Supermirrors, Multilayer Monochromators, Polarizers, and Beam Guides, v983 p93-104 1989.

Keywords: Neutron beams, Convergence, Mirrors, *Neutron guides, Neutron reflectors, Supermirrors.

If properly designed, converging guides may be used to increase the current density of neutrons in a beam from a parallel neutron guide. The disadvantage of this type of device is that there is an increase in beam divergence. The spatial and angular distributions of the beam emerging from a converging guide are generally nonuniform, and the performance of the guide is de-pendent on the neutron's wavelength. Analytic and numerical methods of calculation are briefly discussed, and the results of selected Monte Carlo numerical cal-culations are presented. Measurements on a scaled down version of a converging guide system are report-ed and found to compare well with calculation.

Liquid-Supported Torsion Balance: An Updated Status Report on Its Potential for Tunnel Detection.

Final rept.

J. E. Faller, P. T. Keyser, and M. P. McHugh. 1988, 22p

Sponsored by Air Force Weapons Lab., Kirtland AFB, NM.

Pub. in Proceedings of Technical Symposium on Tunnel Detection (3rd), Golden, CO., January 12-15, 1988, p412-433.

Keywords: *Torsion balances, *Tunnel detection, Var-iometers, Precision, Measurement, *Gradiometers.

At the Joint Institute for Laboratory Astrophysics, the authors have been developing the liquid-supported torsion balance (LSTB), also known as the fluid-fiber torsion balance, for a variety of precision measurement applications. Recent work has concentrated on curvaapplications, necent work has concentrated on curva-ture variometers and 'split-disc' vertical gradiometers as an auxiliary to 'Fifth-Force' tests. The authors review the history and design of the LSTB and de-scribe the theoretical and experimental progress since the last Symposium on Tunnel Detection. Significant increases in experimental sensitivity to changes in the curvature of the level surface have been made together with advances in understanding and reducing var-ous noise terms. The current limiting noise terms and sensitivity to tunnel evolution are discussed.

Mean Density Approximation and Hard Sphere Ex-pansion Theory: A Review. Final rept.

L J. Chen, J. F. Ely, and G. A. Mansoori. 1987, 27p Sponsored by Gas Research Inst., Chicago, IL. Pub. in Fluid Phase Equilibria 37, p1-27 1987.

Keywords: *Liquids, *Mixtures, Density, Computer simulation, Approximation, Van der Waals equation, Ther-modynamic equilibrium, Thermodynamic properties, Reprints, *Mean density approximation, *Hard sphere expansion theory, Liquid vapor equilibrium.

The review surveys research dealing with the Mean Density Approximation (MDA) and the Hard Sphere Expansion (HSE) theory developed by Leland and coworkers. MDA and its modifications provide a simple way to predict radial distribution functions of inixtures from the pure fluid information. Comparisons with computer simulation data show the MDA to be superior to the van der Waals approximation for mixture radial dis-tribution functions. Derivations of the HSE theory and the HSE Conformal Solution Theory (HSE-CST) are also described. For Lennard-Jones mixtures, the HSE theory is proven to be superior to the van der Waals theory by using a proper method to determine the hard-sphere diameter. The major problem associated with the development of a consistent method to determine the hard-sphere diameter of the HSE-CST and the requirements regarding the extension of the HSE-CST to polar mixtures are discussed.

National Bureau of Standards (NEL), Boulder, CO. Thermophysics Div. Method for Improving Equations of State Near the

Critical Point. Final rept. D. D. Erickson, T. W. Leland, and J. F. Ely. 1987,

21p Sponsored by Gas Research Inst., Chicago, IL Pub. in Fluid Phase Equilibria 37, p185-205 1987.

Keywords: *Equations of state, *Carbon dioxide, *Pentanes, *Critical point, Thermodynamic properties, Ideal gases, Reprints.

Accurate nonanalytic equations of state have been developed for pentane and carbon dioxide for use as reference equations in the critical region. This was done using a method which transforms any analytic equation of state into a nonanalytic equation of state. For this study, a 32 constant analytic BWR equation of state was transformed into a nonanalytic equation of state. The nonanalytic equation of state is more accurate in the critical region for the prediction of the PVT properties of carbon dioxide than is a Schmidt-Wagner analytic equation of state developed at the National Bureau of Standards. The nonanalytic equation of state is slightly less accurate over the whole PVT sur-face than the Schmidt-Wagner equation of state, but the predicted nonanalytic surface makes a smooth transition into the classical region. This is an improvement over the scaled fundamental equation of state which breaks down at a small distance away from the critical point.

Low Field Determination of the Proton Gyromagnetic Ratio in Water.

Final rept.

E. R. Williams, G. R. Jones, S. Ye, R. Liu, H. Sasaki, P. T. Olsen, W. D. Phillips, and H. P. Layer. 1989, 5p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 38, n2, p233-237, Apr 89.

Keywords: *Fundamental constants, Nuclear magnet-ic resonance, Electrical resistance, Solenoids, Preci-sion, Reprints, *Gyromagnetic ratio, Quantum Hall effect, Fine structure constant.

The authors measured the proton gyromagnetic ratio in H2O by the low field method, gamma'(p)(low). The result gamma'(p)(low) = 2.67 513 376 10 to the 8th power/s(T(NBS)) (0.11 ppm), leads to a value of the fine structure constant of 1/alpha = 137.0 359 840 (0.037 ppm) and a value for the quantized Hall resist-ance in SI units of R(H) = 25 812.80460 ohm (0.037 ppm). To achieve this result they measured the dippm). To achieve this result, they measured the dimensions of a 2.1-m solenoid with an accuracy of 0.04 micrometer, and then measured the NMR frequency of a water sample in the field of the solenoid.

New Realization of the Ohm and Farad Using the NBS (National Bureau of Standards) Calculable Capacitor. Final rept.

J. Q. Shields, R. F. Dziuba, and H. P. Layer. 1989, 3p Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Instrumentation and Meas-urement 38, n2, p249-251, Apr 89.

Keywords: *Electric measuring instruments, Ohmmeters, Electrical measurement, Electrical resistance meters, Capacitors, Reprints, *National Institute of Standards and Technology, *Absolute ohm, *Absolute farad.

Results of a new realization of the ohm and farad using the NBS calculable capacitor and associated apparatus are reported. The results show that both the NBS representation of the ohm and the NBS representation of the farad are changing with time: the ohm at the rate of-0.054 ppm/year and the Farad at the rate of 0.010 ppm/year. The realization of the ohm is of particular significance at this time because of its role in assigning an SI value to the guantized Hall resistance. The estimated uncertainty of the ohm realization is 0.022 ppm while the estimated uncertainty of the farad realization is 0.014 ppm.

Pub. in Astrophysical Jnl. 344, n2 p949-965, 15 Sep 89.

Keywords: *Hydrogen, Absorption spectra, Emission spectra, Approximation, Distribution functions, Re-prints, Lyman lines, Line broadening, Redistribution.

Simple approximate formulae are given for the coupled redistribution of Ly(alpha), Ly(beta, and H(alpha), by using well-defined approximations to an essentially exact formulation. These formulae incorporate all the essential physics including Raman scattering, lower state radiative decay, and correlated terms representing emission during a collision which must be retained in order that the emission coefficients are properly behaved in the line wings. Approximate expressions for the appropriate line broadening parameters are collected. Finally, practical expressions for the source functions are given. These are formulated through newly introduced non-impact redistribution functions, which are shown to be reasonably approximated by existing (ordinary and generalized) redistribution functions.

 J. R. D. Copley, and C. A. Stone. 1989, 12p
 Pub. in Nuclear Instruments and Methods in Physics Research A281, p593-604 1989.

Keywords: *Neutron absorption, *Neutron scattering, Monte Carlo method, Neutron radiography, Reprints, Activation analysis, Self-shielding.

In general there is a systematic error in the results of any in-beam neutron absorption experiment because of neutron scattering in the sample. The error is largest when scattering predominates over absorption, when the transmission of the sample is small, and when the lateral dimensions of the sample are large compared with its thickness. The ratio of the reaction rate in the sample to the rate calculated ignoring both scattering self-shielding due to absorption may be signifiand cantly less than or greater than unity, depending on the scattering properties of the sample and its size and shape. The conclusions are derived from Monte Carlo calculations based on a very general expression for the rate of a neutron absorption reaction in a sample which scatters and absorbs neutrons. The expression for the reaction rate, written as a sum over orders of scattering within the sample, was obtained using the technique adopted by V.F. Sears in his study of multiple scattering effects in neutron scattering experi-ments. The authors' calculations were performed for slab samples placed in a narrow, monoenergetic, monodirectional neutron beam. The assumed scattering cross section was isotropic and also static, meaning that no change in neutron energy was permitted to occur within the sample. The work has potentially important implications in various areas of neutron research including activation analysis and radiography.

PHYSICS

General

Multicharged ions, Colliding beams, Electron impact, Autoionization.

Experimental cross sections for single ionization of La(1+), La(2+), and La(3+) ions as well as for double ionization of La(1+) and La(2+) ions and for triple ionis ation of La(2+) is no safe presented in an electron-impact energy range from threshold up to 1000 eV. By using a fast energy-scanning technique with step widths of about 40 meV and an energy resolution of 0.4 eV, fine details in the cross sections and especially resonant contributions could be observed. Resonant excitation of La(2+) at 95 eV with subsequent emission of three electrons appears in the authors' inter-pretation to account for 30% of the total measured double-ionization cross section. The data are interpreted on the basis of calculations of energy levels and distorted-wave calculations of direct ionization from various electron sub-shells and of excitation-autoionization processes. A detailed analysis of the La(3+ single ionization both for ground-state and 5p(5)4f metastable ions is presented.

S. M. Seitzer. 1988, 34p Sponsored by Department of Energy, Washington, DC. Pub. in Monte Carlo Transport of Electrons and Photons, Chapter 4, p81-114 1988.

Keywords: *Bremsstrahlung, *Ionization, Positrons, Reprints, *Electron impact, *Electron transport, Ionization cross sections, Electron-atom collisions, Electronmolecule collisions.

The paper discusses the cross section for two proc-esses that are important in electron transport calculations: bremsstrahlung production by electrons and po-sitrons in the fields of atomic nuclei and orbital electrons, and electron-impact ionization of atoms and molecules. In the discussion of bremsstrahlung, the author outlines the synthesis of various theoretical results that were involved in the development of a comprehensive set of cross sections, differential in emitted photon energy, for the production of bremsstrahlung by electrons, illustrates the generally good agreement between these cross sections and the results of measurement, and indicates the differences in the corre-sponding positron cross sections. In the case of electron-impact ionization, the author describes exploratory calculations of the shell-by-shell cross section, differential in ejected electron energy, based on a Weizsacker-Williams treatment.

Performance of a High-Energy-Resolution, Tender X-ray Synchrotron Radiation Beamline. Final rept.

B. L. Cowan, S. Brennan, T. Jach, D. W. Lindle, and B. A. Karlin. 1989, 5p

Pub. in Review of Scientific Instruments 60, n7 p1603-1607 Jul 89.

Keywords: Reprints, *NSLS, *Beamlines, Synchrotron radiation sources, X-ray sources, High resolution.

Beamline X-24A at the National Synchrotron Light Source was designed for optimal performance in the x-ray spectral region 500-5000eV. This choice of energy range placed a number of constraints on the beamline design, requiring a crystal monochromator in a win-dowless UHV environment. Although this increased the complexity of the design, there were compelling scientific reasons for the desire to work in this range. In addition to tunability over the selected energy range, a primary goal was to obtain the highest possible energy resolution in the primary beam. The authors have achieved incident energy resolution significantly better than the typical core-level lifetime broadening for this energy range. This has permitted studies of processes that are not broadened by lifetimes, such as resonant scattering and back-reflection x-ray standing-wave ef-fects. In addition to high resolution, it was designed to collect and focus as much flux as possible from the bending magnet source.

Progress on Spin Detectors and Spin-Polarized Electron Scattering from Na at NIST. Final rept.

J. J. McClelland. 1989, 13p

Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of Symposium on Polarization and Correlation in Electronic and Atomic Collisions, Hoboken, NJ., p1-13 Aug 89.

Keywords: *Electron scattering, *Thorium, Electron spin, Detectors, *Sodium atoms, *Electron spin polar-ization, Sherman functions, S matrix.

Recent progress in the Electron Physics Group at Hecent progress in the Electron Physics Group at NIST is discussed. Improvements have been made on the low-energy diffuse-scattering spin analyzer, reduc-ing instrumental asymmetries and boosting the effec-tive Sherman function. A figure of merit of0.00023 has been achieved. Thorium has been used as a target in a 100 ke V retarding Mott spin analyzer, resulting in an effective Sherman function as birth as 0.40. This ineffective Sherman function as high as 0.49. This in-creased Sherman function, together with an increased scattering intensity, results in a factor of 2 increase in the figure of merit. Good agreement is seen between experiment and theoretical predictions of the Sherman function for thorium. A hierarchial description of the Tmatrix is discussed as a context for interpreting recent results on spin-polarized electron scattering from opti-cally pumped sodium. Results are presented for elastic and superelastic scattering at 20 eV incident energy.

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 40, n5 p2321-2329, 1 Sep 89

Keywords: *Electron scattering, Polarization(Spin alignment), Reprints, *Sodium atoms, *Electron spin polarization, EV range 01-10, EV range 10-100.

Superelastic scattering of spin-polarized electrons Superelastic scattering of spin-polarzed electrons from laser-excited sodium atoms has been measured at incident energies of 2.0, 17.9, and 52.3 eV over the angular range 10 deg - 120 deg. Circularly polarized excitation of the sodium atoms was used to produce pure 3 doublet P(3/2) (F=3,Mf=plus or minus 3) states, which are deexcited by collisions with spin-po-larized electrons. The spin polarization of both the target electron and the incident electron allows the resolution of triplet and signed contributions to 1 (1) resolution of triplet and singlet contributions to L(1), the angular momentum transferred in the collision per-pendicular to the scattering plane, and the measure-ment of r, the ratio of triplet to singlet cross sections. At low energy, agreement with theory is good over the entire angular range for r, but only at small angles for L(1). At high energy, agreement is excellent over the full angular range.

Mobility Spectra. Final rept.

Hina fept. M. Misakian, W. Anderson, and O. Laug. 1989, 4p Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of International Symposium on High Voltage Engineering (6th), New Orleans, LA., August 28-September 1, 1989, p1-4.

Keywords: *Ionic mobility, *Atmospheric pressure, *Spectra, Measurement, Alternating current, Direct current, Transport properties, Atmospheric tides, Elec-tric fields, Spectral emittance, *Drift tubes.

Two drift tubes constructed of insulating cylinders with conductive guard rings on the inside walls are exam-ined to determine their suitability for measuring ion mobility spectra at atmospheric pressure. One drift tube is of the pulse time-of-flight (TOF) type with adjustable drift distance and the other is an ac-TOF drift tube similar in principle to a device reported by Van de Graaff. The latter drift tube is evaluated using sinusoidal and alternating-polarity pulse-voltage waveforms for gating the shutters.

J. G. Amar, and F. Sullivan. 1989, 9p

Pub. in Computer Physics Communications 55, p287-295 1989

Keywords: *Ferromagnetism, *Computerized simula-tion, Mathematical models, Monte Carlo method, Algo-rithms, Reprints, Computer applications, Parallel processina.

A fast multispin algorithm for the Monte Carlo simulation of the two-dimensional spin-exchange kinetic Ising model has been adapted for use on the Connection Machine and applied as a first test in a calculation of domain growth. Features of the code include: the use of demon bits, the simulation of several runs simulta-neously to improve the efficiency of the code, the use of virtual processors to simulate easily and efficiently a larger system size, the use of the (NEWS) grid for fast communication between neighboring processors and updating of boundary layers, the implementation of an efficient random number generator much faster than that provided by Thinking Machines Corp., and the use of the LISP function 'funcall' to select which proces-sors to update. Overall speed of the code when run on a (128 X 128) processor machine is about 130 million attempted spin-exchanges per second, about 9 times faster than the comparable code, using hardware vectorized-logic operations and 64-bit multispin coding on the Cyber 205. The same code can be used on a larger machine (65536 processors) and should produce speeds in excess of 500 million attempted spin-exchanges per second.

Measuring the Root-Mean-Square Value of a Finite **Record Length Periodic Waveform.** E. C. Teague. 1989, 5p

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n6 p367-371 1989.

Keywords: *Waveforms, *Surface roughness, Meas-urement, Profiles, Random error, Root mean square value, Uncertainty.

The paper presents a discussion of the uncertainty in measuring the root-mean-square, rms, value of a periodic waveform which results from the use of a finite record length. The analysis was motivated by seeking to understand the source of a random uncertainty of the absolute arithmetic average, R sub a deviation from a mean line of profiles of precision routhness specimens. The profiles of these specimens had an approximately triangular waveform with two wave-lengths and amplitudes. For the longer wavelength specimens the random phasing of the waveform with respect to the recording interval proved to be a major source of uncertainty in the measurements.

Antenna for Laser Gravitational-Wave Observations in Space.

Final rept. J. E. Faller, P. L. Bender, J. L. Hall, D. Hils, R. T. Stebbins, and M. A. Vincent. 1989, 5p Contract NAGW-822 Sponsored by National Aeronautics and Space Administration, Washington, DC. Pub. in Advances in Space Research 9, n9 p(9)107-(9)111 1989.

Keywords: *Astronomical observatories, Continuous radiation, Sensitivity, Reprints, *Gravitational waves, *Gravitational wave antennas, Infrasonic frequencies.

Progress during the past two years on a proposed Laser Gravitational-Wave Observatory in Space (LAGOS) is discussed. Calculated performance for a 1 million km sized antenna over the frequency range of 0.00001 to 1 Hz is given. The sensitivity from 0.001 to 0.1 Hz is expected to be 1 x 10 to the -21st power/(Hz to the 0.5 power). Noise sources such as accelerations of the drag-free test masses by random molecular im-pacts and by fluctuations in the net thermal radiation pressure will limit the sensitivity at lower frequencies. The scientific objectives are the observation of CW gravitational waves from large numbers of binary sys-tems and the detection of pulses which may have been emitted during the period of galaxy formation.

NISTIR-88/3906

See also PB88-194519. Sponsored by Federal Rail-road Administration, Washington, DC.

Keywords: *Ultrasonic testing, *Railroad cars, *Wear, Cracks, Nondestructive tests, Transducers, Residual stress, Birefringence, Wheels, EMAT, Roll-by inspection.

The report is number 18 in a series covering the re-search performed by the National Institute of Stand-ards and Technology (formerly National Bureau of Standards) for the Federal Railroad Administration. The issue collects seven reprints and preprints of papers written by the Fracture and Deformation Divi-sion over the last two years on the ultrasonic nonde-structive evaluation of railroad wheels for the presence of residual stress and cracks. All the work concentrat-ed on the use of electromagnetic-acoustic transducers (EMATs). Tensile residual stresses and tread cracks are major factors in wheel failure. Two ultrasonic techare major factors in wheel failure. Two ultrasonic tech-niques are applicable to these wear defects: (1) Bire-fringence: A stress field effects the velocity of a shear horizontal wave depending on its polarization. Precise velocity measurements in a wheel rim may allow calcu-lation of the amount and direction of stresses; (2) Pulse-echo: A Rayleigh (surface) wave transaction rogate the circumference of a wheel as it rolls by. An echo indicates a flaw's presence and size.

National Inst. of Standards and Technology (IMSE), Boulder, CO. Fracture and Deformation Div. EMATs (Electromagnetic Acoustic Transducers) for Roll-By Crack Inspection of Railroad Wheels.

Final rept. R. E. Schramm, P. J. Shull, A. V. Clark, and D. V. Mitrakovic. 1989, 7p Sponsored by Federal Railroad Administration, Wash-

Ington, DC. Pub. in Review of Progress in Quantitative Nonde-structive Evaluation, v8A p1083-1089 1989.

Keywords: *Cracks, Keywords: *Cracks, *Inspection, *Rolling stock, *Wheels, Nondestructive tests, Ultrasonic tests, Railroad cars, Rayleigh waves, Safety, Reprints.

Railroad safety depends on many factors. The integrity of the wheels on rolling stock is one that is subject to nondestructive evaluation. For some years, ultrasonic testing has been applied to the detection of cracks in wheel treads, with particular attention to automatic, in-rail, roll-by methods. A system using relatively low fre-quency Rayleigh waves generated by electromagnet-ic-acoustic transducers (EMATs) is being developed. The current design uses a permanent magnet to main-tain a compact structure and minimize the size of the pocket machined into the rail. Measurements thus far indicate a responsiveness, even to small flaws. With the development of a signal processing and analysis system, field tests should soon be possible.

Emergency Services & Pianning

901.598

PB89-189203 PC A10/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Computing and Applied Mathematics

Gatinersburg, MD. Center for Computing and Applied Mathematics. Evaluating Emergency Management Models and Data Bases: A Suggested Approach. R. E. Chapman, S. I. Gass, J. J. Filliben, and C. M. Harris. Mar 89, 215p NISTIR-88/3826 Prepared in cooperation with George Mason Univ., Fairfax, VA. Dept. of Operations Research and Applied Statistics. Sopported by Enderal Emergency Manage. Statistics. Sponsored by Federal Emergency Management Agency, Washington, DC.

Keywords: *Mathematical models, Evaluation, Assessments, Management, Tables(Data), Graphs(Charts), *Emergency planning, Emergency preparedness, Crises, Data bases.

Large-scale models and data bases are key informa-tional resources for the Federal Emergency Manage-ment Agency (FEMA). In order to carry out its emer-

gency missions, it is necessary for FEMA to determine which models, modeling techniques and data bases are appropriate for what purposes and which ones need modification, updating and maintenance. The development of evaluation guidelines is therefore of direct benefit to FEMA in discharging its emergency management duties. The purpose of the report is twofold. First, it provides the reader with a generic set of guidelines which can be used to evaluate large-scale, computer-based models and data bases. Second, the guidelines are illustrated through a critical evaluation of the Dynamic General Equilibrium Model (DGEM). DGEM is currently being used by FEMA to analyze a variety of emergency management problems. The evaluation of DGEM serves both as a step-by-step procedure for conducting an indepth model evaluation and as an introduction to a non-proprietary model which has broad applicability to the analysis of macroeconomic issues.

Fire Services, Law Enforcement, & Criminal Justice

PB89-176283 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Law Enforcement Standards Lab.

ACSB (Amplitude Companded Sideband): What Is Adequate Performance.

Final rept.

W. A. Kissick, and M. J. Treado. 1986, 9p Sponsored by National Inst. of Justice, Washington,

DC. Pub. in Proceedings of International Carnahan Conference on Security Technology: Electronic Crime Countermeasures, Gothenburg, Sweden, August 12-14, 1986, p219-227.

Keywords: *Compandor transmission, *Law enforcement, *Voice communication, Single sideband transmission, Modulation, Speech recognition, Intelligibility, Performance evaluation, Amplitude companded sideband.

Amplitude companded sideband (ACSB) is a new modulation technique that uses a much smaller channel width than does conventional frequency modulation (FM). ACSB has been proposed for the land mobile communications needs of law enforcement agencies. Among the requirements of such a communications system is adequate speech intelligibility under a variety of conditions. The paper explores this aspect of 'adequate performance.' First, the basic principles of ACSB are described, with emphasis on those features that affect speech quality. Second, the results of ACSB equipment testing are given. Next, the appropriate performance measures for ACSB are reviewed. Last, a subjective voice quality scoring method is used to determine the values of the performance measures that equate to the minimum level of intelligibility. It is assumed that the intelligibility of an FM system operating at 12 dB SINAD represents that minimum.

Hierarchies for Computer-Integrated Manufacturing: A Functional Description. PB89-172613 900,949
Automated TEM (Transverse Electromagnetic) Cell for Measuring Unintentional EM Emissions.
PB89-173769 900,682 AUTOMATIC CONTROL EQUIPMENT
Semi-Automated PVT Facility for Fluids and Fluid Mix- tures. PB89-157184 900,875
Application of Direct Digital Control to an Existing Build- ing Air Handler. PB89-177141 900,068
Turning Workstation in the AMRF (Automated Manufac- turing Research Facility). PB89-185607 900,954
Inventory of Equipment in the Tuming Workstation of the AMRF (Automated Manufacturing Research Facility), PB89-215339 900,961
AVTOMATIC NETWORK ANALYZERS ANA (Automatic Network Analyzer) Measurement Results on the ARFTG (Automatic RF Techniques Group) Travel- ing Experiment.
PB89-173777 900,715 Some Questions and Answers Concerning Air Lines as
Impedance Standards. PB89-176176 900,747
AUTOMATION Functional Approach to Designing Architectures for Com- puter Integrated Manufacturing. PB89-172589 900,946
Precision Weight Calibration with a Specialized Robot. PB89-173975 900,879
Software for an Automated Machining Workstation. PB89-177109 900,953
Operations Manual for the Automatic Operation of the Vertical Workstation. PB89-183214 900,973
Automated Calibration of Optical Photomask Linewidth Standards at the National Institute of Standards and Technology. PB89-186340 901,315
Progress Report of the Quality in Automation Project for FY88.
PB89-193296 900,982 Mining Automation Real-Time Control System Architec- ture Standard Reference Model (MASREM).
PB89-221154 901,286 Robot Crane Technology.
PB90-111667 900,146 NIST Automated Computer Time Service.
PB90-213711 900,676
General Methodology for Machine Tool Accuracy Enhancement by Error Compensation. PB89-146781 900,996
Use of Artificial Intelligence and Microelectronic Test Structures for Evaluation and Yield Enhancement of Microelectronic Interconnect Systems. PB89-146955 900,768
Preliminary Experiments with Three Identical Ultrapreci- sion Machine Tools. PB89-150841 900,997
Design Protocol Part Design Editor and Geometry Li-

Design Protocol, Part Design Editor, and Geometry Li-brary of the Vertical Workstation of the Automated Manu-

facturing Research Facility at the National Bureau of Standards. PB89-151799 900.936
Integrated Manufacturing Data Administration System
(IMDAS) Operations Manual. PB89-156384 900,916
Optical Sensors for Robot Performance Testing and Calibration.
PB89-157358 900,987 Automated Analysis of Operators on State Tables: A
Technique for Intelligent Search. PB89-157366 900,669
Material Handling Workstation Implementation. PB89-159644 900,988
Material Handling Workstation: Operator Manual. PB89-159651 900.989
Real-Time Control System Modifications for a Deburing Robot. User Reference Manual.
PB89-159669 900,990
Material Handling Workstation, Recommended Technical Specifications for Procurement of Commercially Available Equipment
Equipment. PB89-162564 900,998
Artificial Intelligence Techniques in Real-Time Production Scheduling. PB89-172571 900,945
Functional Approach to Designing Architectures for Com-
puter Integrated Manufacturing. PB89-172589 900,946
Real-Time Optimization in the Automated Manufacturing Research Facility.
PB89-172597 900,947 On-Line Concurrent Simulation in Production Scheduling.
PB89-172605 900,948 Hierarchies for Computer-Integrated Manufacturing: A
PB89-172613 900,949
Vertical Machining Workstation of the AMRF (Automated Manufacturing Research Facility): Equipment Integration.
PB89-176663 900,950
Building Representations from Fusions of Multiple Views. PB89-177059 900,991
Fast Path Planning in Unstructured, Dynamic, 3-D Worlds.
PB89-177067 900,992 Hierarchically Controlled Autonomous Robot for Heavy
Payload Military Field Applications. PB89-177075 901,271
Real-Time Control System Software: Some Problems and an Approach.
PB89-177083 900,951 AMRF (Automated Manufacturing Research Facility) Ma-
terial Handling System Architecture. PB89-177091 900,952
Software for an Automated Machining Workstation. PB89-177109 900,953
Interfaces to Teleoperation Devices. PB89-181739 900,993
Operations Manual for the Automatic Operation of the Vertical Workstation.
PB89-183214 900,973 Dielectric Mixing Rules for Background Test Soils.
PB89-188585 901,289 Workstation Controller of the Cleaning and Deburing
Workstation. PB89-189286 900,955
Progress Report of the Quality in Automation Project for FY88.
PB89-193296 900,982
NBS AMRF (National Bureau of Standards) (Automated Manufacturing Research Facility) Process Planning System: System Architecture.
PB89-193882 900,956
NASA/NBS (National Aeronautics and Space Administra- tion/National Bureau of Standards) Standard Reference Model for Telerobot Control System Architecture
(NASREM). PB89-193940 901,589
Inventory of Equipment in the Cleaning and Debuming Workstation.
PB89-209233 900,958
Data Management Strategies for Computer Integrated Manufacturing Systems. 900,959 900,959 900,959
Inventory of Equipment in the Turning Workstation of the AMRF (Automated Manufacturing Research Facility). PB89-215339 900,961
Recommended Technical Specifications for Procurement of Equipment for a Turning Workstation.
PB89-215347 900,962
Mining Automation Real-Time Control System Architec- ture Standard Reference Model (MASREM). PB89-221154 901,286
Visual Perception Processing in a Hierarchical Control System: Level 1. PB89-221188 900,994

NIST Technical Publications

Periodical

Journal of Research of the National Institute of Standards and Technology – Reports NIST research and development in those disciplines of the physical and engineering sciences in which the Institute is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Institute's technical and scientific programs. Issued six times a year.

Nonperiodicals

Monographs – Major contributions to the technical literature on various subjects related to the Institute's scientific and technical activities.

Handbooks – Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications – Include proceedings of conferences sponsored by NIST, NIST annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series – Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series -- Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NIST under the authority of the National Standard Data Act (Public Law 90-396). NOTE: The Journal of Physical and Chemical Reference Data (JPCRD) is published quarterly for NIST by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements are available from ACS, 1155 Sixteenth St., NW., Washington, DC 20056.

Building Science Series – Disseminates technical information developed at the Institute on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes – Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at **NIST under the sponsorship of other government agencies**.

Voluntary Product Standards – Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NIST administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series – Practical information, based on NIST research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace. Order the above NIST publications from: Superintendent of Documents, Government Printing Office, Washington, DC 20402.

Order the following NIST publications – FIPS and NISTIRs – from the National Technical Information Service, Springfield, VA 22161.

Federal Information Processing Standards Publications (FIPS PUB) – Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NIST pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NIST Interagency Reports (NISTIR) – A special series of interim or final reports on work performed by NIST for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service, Springfield, VA 22161, in paper copy or microfiche form.
