CATALOG STRUCTURE AND USE

Full bibliographic citations including keywords and abstracts for National Institute of Standards and Technology (NIST) (formerly National Bureau of Standards (NBS)) papers published and entered into the National Technical Information Service (NTIS) collection are cited in the "NIST Publications Announcements" section of this catalog. (Also included are papers published prior to 1989 but not reported in previous supplements of this annual catalog.) Entries are arranged by NTIS subject classifications which consist of 38 broad subject categories (see back cover) and over 350 subcategories. Within a subcategory, entries are listed alphanumerically by NTIS order number. Four indexes are included to allow the user to identify papers by personal author, keywords, title, and NTIS order/report number. Each entry lists the appropriate title, the NTIS order number, and the abstract number.

Papers may also be identified by searching the NTIS database either online via commercially available systems such as DIALOG, or in the issues of NTIS's Government Reports Announcements and Index and its Government Reports Annual Index.

AVAILABILITY AND ORDERING INFORMATION

The highest quality and least expensive copies of NIST publications published as Government documents are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Publications cited with stock numbers (SN) should be ordered by these numbers. GPO will accept payment by check, money order, VISA, MasterCard, or deposit account. For availability and price, write to the GPO or telephone (202) 783-3238. Should an NIST publication be out of print at the GPO, its continued availability is assured at NTIS which sells publications in microfiche or paper copy reproduced from microfiche.

If an entry has a price code, such as PC A04/MF A01, the publication may be ordered from NTIS In paper copy (PC) or microfiche (MF) or both if both codes are given. Order from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. A copy of the latest price code schedule is available from NTIS. NTIS will accept payment by check, money order, VISA, American Express, MasterCard, or deposit account. NTIS is the sole source of Federal Information Processing Standards (FIPS), Interagency Reports (IRs), and Grant/Contract Reports (GCRs). For more information call (703) 487-4650.

Papers noted "Not Available NTIS" may be obtained directly from the author or from the external publisher cited. Such papers are not for sale by either the GPO or NTIS.

Two other sources for NIST publications are depository libraries (libraries designated to receive Government publications) and Department of Commerce District Offices. The depository libraries listed in Appendix A receive selected NIST publications (see inside back cover for a description of the various NIST publication series). While not every Government publication is sent to all depository libraries, certain depositories designated as Regional Depositories receive and retain one copy of all Government publications made available. Contact the depository library in your area to obtain information on what is available and where.

Department of Commerce District Offices listed in Appendix B provide ready access at the local level to publications, statistical data and summaries, and surveys. Each District Office serves as an official sales agency of the Superintendent of Documents, U.S. Government Printing Office. A wide range of Government publications can be purchased from these offices. In addition, the reference library of each District Office contains review copies of many Government publications.

Abstract

ADMINISTRATION & MANAGEMENT

Public Administration & Government

900.001 PB89-161905

PC A04/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Computing and Applied Mathematics

Internal Revenue Service Post-of-Duty Location Modeling System: Programmer's Manual for PASCAL Solver.

P. D. Domich, R. H. F. Jackson, M. A. McClain, and D. M. Tate. Feb 89, 66p NISTIR-86/3472-1 See also PB87-165171 and PB89-161913. Sponsored by Internal Revenue Service, Washington, DC.

Keywords: *Facilities management, *Programming manuals, Mathematical models, Computer programs,

Heuristic methods, Lagrangian functions, *Internal Revenue Service. *Site selection. User manuals(Computer programs), PASCAL subroutines.

The report is a programmer's manual for a microcomputer system designed at the National Institute of Standards and Technology for selecting optimal locations of IRS posts-of-duty. The mathematical model is the uncapacitated, fixed charge, facility location model which minimizes travel and facility costs. The package consists of two sections of code, one in FORTRAN and the other in PASCAL. The FORTRAN driver handles graphics displays and controls input and output for the solution procedure. The report discusses the mathematical techniques used to solve the mathematical model developed and includes a Greedy procedure, an Interchange procedure, and a Lagrangian approach to the related linear program. A description of these PASCAL routines and definitions of key data structures and variables are provided.

Internal Revenue Service Post-of-Duty Location Modeling System: Programmer's Manual for FOR-**TRAN Driver Version 5.0.**

P. D. Domich, R. H. F. Jackson, and M. A. McClain. Feb 89, 68p NISTIR-86/3473-1

See also PB89-161905. Sponsored by Internal Revenue Service, Washington, DC.

Keywords: *Facilities management, Regional planning, Cost engineering, Computer graphics, *Internal Revenue Service, *Site selection, Fortran subroutines, Input output processing.

The report is a programmer's manual for a microcomputer package which was designed by the National Institute of Standards and Technology to assist the Internal Revenue Service in choosing locations for its posts-of-duty which will minimize costs to the IRS and to the taxpayer. The package was written in two sections of code, one in FORTRAN and the other in PASCAL. The manual describes the FORTRAN driver which handles graphics displays and controls input and output for the solution procedure.

National Inst. of Standards and Technology, Gaitners-burg, MD. National Engineering Laboratory's 1989 Report to the National Research Council's Board on Assess-ment of NIST (National Institute of Standards and Technology) Programs. Rept. for Apr 88-Apr 89. G. Ehrlich. Mar 89, 45p NISTIR-89/4060

Keywords: *Research management, *Technology innovation, Manufacturing, Buildings, Chemical engi-neering, Computers, Measurements, Application of mathematics, Energy methods, Law(Jurisdiction), Standards, Inventions, *National Institute of Stand-ards and Technology.

The 1989 report to the National Research Council's (NRC's) Board on Assessment of the National Institute of Standards and Technology (NIST) programs provides an overview of the National Engineering Laboratory (NEL). It describes the climate that influences NEL's work, program and budget trends, and the ex-ternal interactions with industry, academia, and trade and professional organizations. Descriptions of NEL's accomplishments, trends, and significant budget changes are also included. The programs described are Electronic and Electrical Measurements, Manufacare Electronic and Electrical Measurements, Manufac-turing Research and Standards, Building Research, Fire Research, Chemical Engineering Metrology, Mathematical Sciences, Computing Support, Energy Related Inventions, and Law Enforcement Standards. The impact of the recently enacted Omnibus Trade and Competitiveness Act of 1988 is discussed.

PB89-175293 (Order as PB89-175194, PC A06) European Molecular Biology Lab., Heidelberg (Germa-

ny, F.R.). **Computational Analysis of Protein Structures:** Sources, Methods, Systems and Results. Bi-monthly rept. A. M. Lesk, and A. Tramontano. 1989, 9p

Prepared in cooperation with Medical Research Council, Cambridge (England). Lab. of Molecular Biology. Sponsored by Istituto Internazionale di Genetica e Biofisica, Naples (Italy). Included in Jnl. of Research of the National Institute of

Standards and Technology, v94 n1 p85-93 Jan-Feb 89

Keywords: *Proteins, *Molecular structure, Informa-tion retrieval, Information systems, Models, *Proteins conformation, Molecular biology, Data banks, Computer graphics.

Computational molecular biology is a relatively new specialty that has arisen in response to the very large amount and quality of data currently being produced, including gene and protein sequences and nucleic acid and protein structures. Many important biological in-vestigations can be carried out only through effective computational access to the entire corpus of data. This has stimulated the development of data banks and information retrieval systems. The article describes the kinds of inferences that are possible if such a relationship is found.

AGRICULTURE & FOOD

Food Technology

900,011 PB89-186399

٩

Food Technology

National Bureau of Standards (NML), Gaithersburg, MD. Ionizing Radiation Physics Div. **Comprehensive Dosimetry for Food Irradiation.**

Final rept.

W. L. McLaughlin. 1988, 16p

Pub. in Health Impact, Identification, and Dosimetry of Irradiated Foods, p384-399 Jun 88.

Keywords: *Food processing, *Ionizing radiation, *Food irradiation, Quality control, Radiation protection, Dosimetry, *Radiopreservation, *Gamma dosimetry, Commercipation Residue Gamma radiation, Reprints.

When ionizing radiation is used to process food of many kinds, comprehensive dosimetry is the most expeditious method of assuring that the process has been accomplished within specifications and without excess energy deposition. The term 'comprehensive dosimetry' then implies that, before, during, and after the radiation process, a number of modifying factors with some complexity must be considered and applied. This is particularly the case with the radiation food processing, where achieving success and maintaining wholesomeness and health and safety of the consumer are paramount. The main steps and considerations for practical and relevant food irradiation dosimetry and documentation are reviewed, which will satisfy regulatory authorities and encourage successful trade and safe marketing of food commodities. The process properly controlled with the aid of good dosimetry gives the opportunity to circumvent unsafe chemical additives and treatments to enable means of meeting legal requirement of quarantines and to improve public health through improved diets.

PB90-107046

PC A03/MF A01 National Inst. of Standards and Technology, Gaithersburg, MD.

Glass Bottles for Carbonated Soft Drinks: Voluntary Product Standard PS73-89. Product std.

B. M. Meigs. Jul 89, 18p

Also available from Supt. of Docs. as SN003-003-02958-1. Sponsored by Glass Packaging Inst., Inc., Washington, DC.

Keywords: *Food packaging, *Packaging materials, *Bottles, Design standards, Silica glass, Manufactur-ing, Carbonation, Defects, Impact strength, ing, Carbonation, I Tolerances(Mechanics). Defects,

The Voluntary Product Standard covers conventional refillable and nonrefillable glass bottles that are manu-factured from soda-lime-silica glass that have a nominal capacity of up to and including 36 fluid ounces, and that are intended for use in the packaging of soft drinks carbonated to a maximum of five volumes. Manufacturing requirements for bottles are provided for temper number, thermal shock resistance, internal pressure, strength, impact resistance, abrasion resistance, detection of visual defects, wall thickness, dimensional tolerances for height and maximum outside diameter, tolerances for capacity and mass (weight), perpen-dicularity, bottom characteristics, and bottle identification. A model statement is included for use on manufacturing orders and invoices specifying the maximum carbonation volumes intended for the bottles. Terms are defined or described that include trade terms and methods for identifying bottles that conform to the Standard.

Microarcsecond Optical Astrometry: An Instrument and Its Astrophysical Applications. Final rept.

R. D. Reasenberg, R. W. Babcock, J. F. Chandler, M. V. Gorenstein, J. P. Huchra, M. R. Pearlman, I. I. Shapiro, R. S. Taylor, R. Bender, A. Buffington, B. Carney, J. A. Hughes, K. J. Johnston, B. F. Jones, and L. E. Matson. 1988, 15p Grapter, DEE DHV94, 00671, NEE ASTER 10762

Grants NSF-PHY84-09671, NSF-AST85-19763 Sponsored by National Science Foundation, Washing-ton, DC., and National Aeronautics and Space Admin-istration, Washington, DC. Pub. in Astronomical Jnl. 96, n5 p1731-1745 Nov 88.

Keywords: *Astrometry, *Optical interferometers, Gravitation, Reprints, Laser metrology, POINTS interferometer.

POINTS, an optical astrometric interferometer to be operated in space, would be a means of performing a wide variety of astrophysical studies, including a vastly improved deflection test of general relativity, a precise and direct calibration of the Cepheid distance scale, and the determination of stellar masses. The nominal 5 microarcsecond uncertainty in the measurement of the angular separation of two stars in the sky and the estimated measurement rate of 60 star pairs per day would support a rich mixture of scientific projects during the nominal mission life of ten years. Useful results would be available after less than a year. The key to the instrument's success is the control of systematic error, which is addressed by instrumentation and pos-tanalysis of the astrometric data.

Doppler Imaging of AR Lacertae at Three Epochs. Final rept

F. M. Walter, J. E. Neff, J. L. Linsky, and M. Rodono.

Pub. in A Decade of UV Astronomy with the IUE Satel-

Keywords: Stellar atmospheres, Doppler effect, Ultra-violet spectra, Magnesium, Reprints, *AR Lacertae star, *Stellar chromospheres, Image analysis, Late stars, IUF.

Doppler imaging analysis allows use of the information contained in a time sequence of spectral line profiles to deduce the size, location, and surface flux of re-gions of contrasting brightness on rotating stars. The authors have used IUE observations to study the structure of the lower chromosphere of AR Lacertae in the light of Mg II k. They have obtained sequences of LWR/P-HI images distributed around the binary period at three epochs. Discrete plage-like regions of en-hanced Mg II surface flux in this system were identified. Even with the limited S/N attainable with the IUE, one can map the gross structures of active stellar at-mospheres. With such information, one can begin to study the true 3-D structure of the atmospheres of latetype stars.

900,016 PB89-149207 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Quantum Physics Div.

Late Stages of Close Binary Systems-Clues to Common Envelope Evolution. Final rept.

R. F. Webbink. 1985, 44p

Pub. in Proceedings of Beijing Colloquium on Models for Close Binary Systems, Beijing, China, November 7-13, 1985, p397-440.

Keywords: *Binary stars, Mass flow, Planetary nebulae, *Stellar envelopes, Cataclysmic variables, Symbiotic stars. Barium stars.

Those circumstances are outlined which theoretically lead to engulfment of one star by its companion, creating a common envelope binary. This evolutionary course is believed to lead to the formation of cataclysmic binaries, and other very compact systems containing degenerate components. The implications of these and other evolved binaries which, directly or indirectly, provide insight into the occurrence and nature of common envelope evolution, are examined.

900,017

PB89-157663 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Sci-

entific Computing Div. Proper Motion vs. Redshift Relation for Superluminal Radio Sources.

Final rept. B. W. Rust, S. G. Nash, and B. J. Geldzahler. 1989, 30p

Pub. in Astrophysics Space Science 152, p141-170 1989.

Keywords: *Radio sources(Astronomy), *Red shift, *Quasars, Reprints, *Proper motion, Superluminal motion, Astronomical models.

Two models for superluminal radio sources predict sharp lower bounds for the apparent velocities of sep-aration. The light echo model predicts a minimum velocity v(min) = 2c, and the dipole field model predicts v(min) = 4.446c. Yahil (1979) has suggested that, if either of these models is correct, then v(min) provides a 'standard velocity' which can be used to determine the cosmological parameters H and q sub 0. This is accomplished by estimating a lower envelope for the proper motion vs redshift relation. Yahil also argued that the procedure could easily be generalized to in-clude a nonzero cosmical constant Lambda. The authors derive the formulas relating the proper motion theta dot to the redshift z in a Friedmann universe with a nonzero Lambda. They show that the determination of a lower envelope for a given sample of measured points (z sub i, theta dot sub i) yields an estimate of the angle of inclination phi sub i for each source in the sample. The authors formulate the estimation of the lower envelope as a constrained maximum likelihood problem with the constraints specified by the expected value of the largest order statistic for the estimated phi sub i. The authors solve this problem numerically using an off-the-shelf nonlinearly constrained nonlinear opti-mization program from the NAg library.

ASTRONOMY & ASTROPHYSICS

Astrophysics

Rotational Modulation and Flares on RS CVn and BY Dra Stars IX. IUE (International Ultraviolet Ex-plorer) Spectroscopy and Photometry of II Peg and V711 Tau during February 1983. Final rept.

Final rept. A. D. Andrews, C. J. Butler, M. Rodono, S. Catalano, J. L. Linsky, A. Brown, F. Scaltriti, M. Busso, I. S. Nha, J. Y. Oh, M. C. D. Henry, J. L. Hopkins, H. J. Landis, and S. Engelbreklso. 1988, 16p Contract NASA-NAG5-82 See also PB88-189055. Sponsored by National Aero-nautics and Space Administration, Washington, DC. Pub. in Astronomy and Astrophysics 204, p177-192 1988.

Keywords: *Binary stars, Stellar atmospheres, Ultra-violet spectra, Reprints, Stellar flares, Starspots, Facu-lae, IUE.

Evidence is presented for spots, plages and flares on the non-eclipsing RS CVn system II Peg and V711 Tau, based on sixty spectra obtained with the IUE satellite between 2-7 February 1983 and on supporting ground-based photometry. The large spot originally found on II Peg in 1981.8 could still be identified in 1983. Two spectroscopic flares of II Peg were detected. On V711 Tau at least two flares were observed. For both stellar systems the fluxes from the higher temperature emission lines showed the greatest variations. The ratio of the Mg II k and h fluxes was the same for the active component in each stellar system and was closely similar to the solar chromospheric value.

Hummer. 1989, 18p Grants NSF-AST85-05919, NAGW-766

See also PB87-153680. Sponsored by National Science Foundation, Washington, DC., and National Aer-onautics and Space Administration, Washington, DC. Pub. in Astrophysical Jnl. 340, p1073-1090, 15 May 89.

Keywords: *Stellar atmospheres, Line spectra, Hydro-gen, Helium, Luminosity, Reprints, *Hot stars, Early stars, Stellar winds, O stars.

The authors have obtained hydrogen and helium line profiles with high signal-to-noise ratios for four stars of spectral type O9/5 (alpha Cam, xc' Ori A, delta Ori A, AE Aur) that form a sequence in luminosity: Ia, Ib, II, V. The basic stellar parameters of these stars are determined by fitting the observed line profiles of weak pho-tospheric absorption lines with profiles from models which include the effect of radiation scattered back onto the photosphere from their stellar winds, an effect referred to as wind blanketing. The stellar parameters derived for these four O9.5-type stars vary in a mono-tonic way with luminosity class. The authors argue that helium enrichment, and by implication CNO processed material as well, is probably a general characteristic of stars with Of and O la spectral classifications.

Stellar Winds of 203 Galactic O Stars: A Quantitative Ultraviolet Survey.

Final rept.

I. D. Howarth, and R. K. Prinja. 1989, 66p Pub. in Astrophysical Jnl. Supplement Series 69, p527-592 Mar 89.

Keywords: Ultraviolet spectra, Reprints, *Stellar winds, *O stars, Early stars, IUE.

The paper presents a homogeneous set of column densities and maximum observed velocities derived from the C IV, N V, and Si IV resonance doublets of the 203 O stars observed at high resolution with IUE prior to 1987 January 1. In addition, fundamental parameters (T(eff), L(*), M(*)) are estimated for 201 of these stars. The relationships between observed velocities and physically relevant velocities in the wind and be-tween column densities and mass-loss rates are discussed.

Interpretation of Emission Wings of Balmer Lines in Luminous Blue Variables.

Final rept.

I. Hubeny, and C. Leitherer. 1989, 4p Grants NSF-AST85-20278, NSF-AST88-02937

Sponsored by National Science Foundation, Washing-

Pub. in Publications of the Astronomical Society of the Pacific 101, n635 p114-117 Jan 89.

Keywords: *Vanable stars, Line spectra, Stellar atmos-pheres, Reprints, *Balmer lines, Blue stars, Stellar winds

The authors discuss H(alpha) line profiles calculated with plane-parallel, hydrostatic NLTE model atmos-pheres. In their lowest log g models the profiles show extended emission wings. Qualitatively, these wings are similar to the extended wings generated by elec-tron scattering of line photons in the stellar wind. It is proposed that the line wings observed in luminous blue unroblem may be due to a combination on the NLTE variables may be due to a combination on the NLTE effect discussed here and the traditional scattering mechanism.

IUE Observation of the Interstellar Medium Toward Beta Geminorum. Final rept.

J. Murthy, J. B. Woffard, R. C. Henry, H. W. Moos, A. Vidal-Madjar, J. L. Linsky, and C. Gry. 1989, 5p Pub. in Astrophysical Jnl. 336, p949-953, 15 Jan 89.

Keywords: *Interstellar matter, Ultraviolet spectra, Reprints, Galactic center, IUE.

The authors present a high-dispersion (Delta lambda = 0.1A) IUE spectrum of the hydrogen Ly(alpha) emis-sion line of the nearby late-type star beta Gem from which they have derived the density, velocity disper-sion and bulk velocity of the interstellar H1 in that di-sortion. While interstellar density is a logarity of the interstellar H1 in that direction. While interstellar deuterium Ly(alpha) is clearly seen in absorption in the line profile, the authors do not obtain a useful limit on the ratio. The present result is important in confirming the generality of the 'emptiness' of the interstellar medium away from the Galactic center.

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Molecular Spectroscopy Div. Laboratory Measurement of the 1(sub 01)-0(sub 00) Transition and Electric Dipole Moment of SiC2. Final rept.

R. D. Suenram, F. J. Lovas, and K. Matsumura. 1989, 3p

Pub. in Astrophysical Jnl. 342, pL103-L105, 15 Jul 89.

Keywords: *Interstellar matter, *Silicon carbides, Microwave spectroscopy, Reprints, *Electric dipole moments.

The 1(sub01)-0(sub00) transitions of (28)SiC2, (29)SiC2, and (30)SiC2 have been measured in the laboratory using a laser-ablation source coupled to a pulsed nozzle Fabry-Perot Fourier transform micro-wave spectrometer. The measured frequencies are

23600.242(4) MHz, 23257.511(8) MHz and 22937.583(8) MHz, respectively. The electric dipole moment for (28)SiC2 has been measured to be mu = mu sub alpha = 2.393(6) debye. Using this value for the dipole moment, the column density of SiC2 in IRC + 10216 has been recalculated to be 2.7x10 to the 14th power/sq cm(-2), which is approximately a factor of 2 larger than the previous estimate for which a theo-retical value of the dipole moment was used.

Keywords: *Binary stars, Ultraviolet spectra, Red shift, Reprints, *AR Lacertae stars, Stellar chromospheres, Stellar flares, Faculae.

Using a series of high-resolution ultraviolet spectra, the authors have derived a series of images of the chromosphere of AR Lacertae. In September 1985, chromosphere of AR Lacertae. In September 1985, neither star in this system was uniformly bright. The trailing hemisphere of the KOIV star was globally brighter than the leading hemisphere. The position, size, and surface flux of three distinct plage regions on the K star were measured with the spectral imaging procedure. The factor of 3 variability in total emission from the G2IV star was interpreted as due to a large chromospherically inactive region on its surface. The authors were able to constrain the position, size, and surface flux of a flaring region on the G star and to measure a significant redshift and broadening of the line emission from the flaring region. They used the rotational modulation of the integrated low-resolution line fluxes to determine the far-ultraviolet spectra of the global K and G stars and of the plage and flare regions alone. regions alone.

The authors have conducted a continuous spectral line survey of the Orion A position from 330.5 to 360.1 GHz. This survey covers nearly the entire 870 microm-GHz. This survey covers hearly the entire 670 microm-eter atmospheric window accessible from ground-based observations. Approximately 160 distinct spec-tral features composed of about 180 lines were detect-ed, 29 of which could not be readily identified. In addi-tion, they also surveyed Orion A from 200.7 to 202.3 GHz and from 203.7 to 205.3 GHz and detected 42 distinct, new spectral lines, including four that are un-detected to be seen to be for the first the identified at present. These data sets are the first thorough survey results in these spectral regions. The new interstellar lines in the survey bands are tabulated and displayed graphically. Moreover, the data are being made available to the Astronomical Data Center at the Goddard Space Flight Center for distribution by re-quest to the astronomical community.

Keywords: *Standards, *Lightning, *Measurement, Electric current, Regulations, Atmospheric electricity, Thunderstorms, Specifications, Reprints.

A revised international standard for the measurement of lightning and front-chopped lightning impulses is presently under consideration. The standard states that the accuracy of these measuring systems is to be determined by comparison to reference systems main-tained by appropriate national laboratories. Investigations have been made of the interactions between two systems configured for simultaneous measurements and of methods for minimizing these interactions. Step responses were measured for different configurations and a model developed to predict divider response. Simultaneous measurements were made of full and chopped lightning impulses using different divider systems to determine the effects of divider interactions on measurements.

Keywords: *Gas analysis, *Carbon dioxide, *Mass spectroscopy, Error analysis, Temperature control, Performance evaluation, Concentration(Composition), Reprints, *Atmospheric chemistry, *Isotope dilution.

An absolute method, based on isotope dilution mass spectrometry, is described for the determination of at-mospheric concentrations of carbon dioxide (CO2) in dry air. In the study, the relative amounts of sample and spike gases are measured manometrically under temperature control before blending. In the study, the major contributors to uncertainty and imprecision are the predetermination of the gas volume ratio and the measurement of the isotopic composition of the blended CO2, respectively.

Non-Aqueous Dental Cements Based on Dimer and Trimer Acids. Patent.

3. M. Antonucci. Filed 16 Oct 86, patented 23 May 89, 11p PB89-219281, PAT-APPL-6-922 811 See also PB85-203628. Prepared in cooperation with

National Inst. of Standards and Technology, Gaithersburg, MD.

This Government-owned invention available for U.S. Il-censing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Patents, *Dental materials, *Acid bonded reaction cements, Polymerization, Crosslinking(Chemistry), Cations, Carboxylic acids, PAT-CL-106-35.

Non-aqueous polycarboxylic acids such as dimer and trimer acids are reacted with a variety of polyvalent metal bases to yield a new, versatile class of cements. Many of these cements have unique energy-absorbing properties and excellent dimensional stability yielding mechanically tough and ductile materials. They also do not inhibit the polymerization of resin-based dental ma-terials and thus can be formulated to yield hybrid resin-composite-cement materials. The bulky, hydrophobic nature of these acids with their relatively low carboxylic content results in cements that are low shrinking, hydrolytically resistant and biocompatible.

Effects of Purified Ferric Oxalate/Nitric Acid Solutions as a Pretreatment for the NTG-GMA and PMDM Bonding System.

Final rept. R. L. Blosser, and R. L. Bowen. 1988, 7p Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Dental Materials 4, p225-231 1988.

Keywords: *Dental materials, *Acid bonded reaction cements, *Nitric acid, Dentin, Adhesives, Oxalates, Iron, Bonding strength, Electron microscopy, Reprints.

Nitric acid, found to be a contaminant left over from the synthesis of ferric oxalate, has been shown by this in vitro study to be responsible for the cleansing effect previously associated with ferric oxalate pretreat-ments. When 2.5% (w/w) nitric acid solution was sub-stituted for ferric oxalate solution and then used in conjunction with the experimental dental bonding system junction with the experimental dental bonding system of NTG-GMA (the adduct of N(p-tolyl)glycine and glyci-dyl methacrylate) and PMDM (the adduct of pyromelli-tic acid dianhydride and 2-hydroxyethyl methacrylate), the result was strong adhesion of both dentin and enamel surfaces to Adaptic (registered trademark) Dental Restorative. When a solution containing 3.4% (w/w) purified ferric oxalate was used with this system, the average bond strengths on both dentin and enamel decreased (p is less than 0.001) as compared with 3.4% (w/w) ferric oxalate solution containing 2.5% (w/w) nitric acid. The effects of pretreatment solutions containing 2.5% (w/w) nitric acid and varying concentrations of purified ferric oxalate on dentin and enamel were demonstrated by adhesion testing and scanning electron microscopy.

Bonding Agents and Adhesives: Reactor Response. Final rept.

R. L. Bowen. 1988, 3p

Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Advances in Dental Research 2, n1 p155-157 Aug 88.

Keywords: *Dental materials, *Acid bonded reaction cements, Dentin, Adhesives, Composite materials, Di-mensional stability, Polymers, Reprints.

Adhesive materials must form multiple bonds with sound tooth substrates for maximum adhesion. Adhe-sive resins can be applied in incremental layers to bond composite materials to enamel and dentin. Hardening shrinkage and stress concentrations are factors that have detrimental effects on adhesive bonding with resins and composites. Improvements in dimensional stability of composites can therefore allow for better bonding and sealing of preventive and restorative materials.

Liposome-Enhanced Flow Injection Immunoanalysis.

Final rept R. A. Durst, L. Locascio-Brown, A. L. Plant, and M. V. Brizgys. 1988, 2p See also PB88-217914.

Pub. in Clinical Chemistry 34, n9 p1700-1701 1988.

Keywords: Antibodies, Fluorescein, Bioassay, Feed-back control, Antigens, Reprints, *Immunoassay, *Biomedical engineering, Liposomes, Immobilized cells.

The development of a repetitive immunoassay is im-portant for monitoring and feedback control in biopro-cessing. The assay should be fast and the immunoreactor, which uses immobilized antibodies, regenerable. The automated system employs flow injection analysis for solution manipulation and contains an immunoreactor column with covalently bound Fab' fragments. Recognition of the antigen is through competitive binding on this column of sample antigen and anti-gen contained in the membrane of liposomes. The concentration of sample antigen is proportional to the amount of liposomes competitively excluded from the column. Liposomes are spherical structures com-posed of a phospholipid bilayer, and are detectable through the marker species which is entrapped inside their aqueous compartment. Detection is through a fluorescent marker, carboxyfluorescein. Liposomes ex-cluded from the column in the competitive assay flow downstream where they are chemically disrupted, and the contents measured. The signal enhancement provided by the liposome marker is approximately 100,000 per analyte binding event making this tech-nique competitive in sensitivity with radioimmunoassays.

MD. Polymers Div. Interaction of Cupric lons with Calcium Hydroxyla-

patite. Final rept.

D. N. Misra. 1988, 5p

Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Materials Research Bulletin 23, n11 p1545-

1549 1988.

Keywords: *Copper, *Calcium, *Dental materials, lons, Phosphates, Hydroxides, X-ray analysis, Chemical composition, Bonding, Reprints.

The interaction of aqueous cupric ions with calcium hydroxylapatite produces cupric orthophosphate, Cu3(PO4)2 times 3H2O, and libethenite, Cu2(OH)PO4. The latter product was identified and characterized by chemical analysis and powder X-ray diffraction. The orthophosphate itself changes to libethenite under various experimental conditions. Contrary to a published report, it was not cupric hydroxylapatite that was previously identified. These findings are important to understand the chemistry of and composite bonding to bone and teeth.

M. Brauer. 1988, 10p Contract PHS-DE-06675

Sponsored by National Institutes of Health, Bethesda, MD

Pub. in Dental Materials 4, p341-350 1988

Keywords: *Dental materials, *Adhesives, *Histology, *Pathology, Tissue extracts, Cells(Biology), Implanta-tion, Peritoneum, Connective tissue, Inflammation, Zinc oxides, Phosphates, Vanillin, In vivo analysis, Reprints, Eugenol.

The cellular and tissue responses to 3 dental cements were studied by 2 methodologies, the connective tissue implantation technique (CTI), recommended by the ADA, and the peritoneal cavity implantation tech-nique (PCI), which has emerged as a method to quantitatively study the cellular response to implanted materials. While similar histopathological results were obtained for the implantation of cements using both methodologies, the PCI technique offers a more thorough investigation of cellular and tissue responses to implanted materials. In addition to histopathological evaluation, the PCI technique allows quantitative investigation of the specific cells responding to the implants, and provides a mechanism, using chemical analysis techniques, to quantify the concentration of specific degradative products within the retrieved cells and host tissue. Finally, the results from these 2 meth-odologies demonstrated the acceptable biological performance of zinc hexyl vanillate cement compared with the clinically acceptable zinc phosphate and zinc oxide-eugenol cement formulations.

Adhesion to Dentin by Means of Giuma Resin. Final rept.

E. Asmussen, J. M. Antonucci, and R. L. Bowen. 1988, 6p

Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Scandinavian Jnl. of Dental Research 96,

p584-589 1988

Keywords: *Dental materials, *Resins, *Bonding strength, *Dentin, *Adhesives, Composite materials, Pyruvates, Enamels, Amino acids, Camphor, Quin-ones, Methacrylic acid, Glycine, Glutarates, Reprints.

In its present version, the Gluma system for bonding restorative resin to dentin involves the application of an enamel bonding agent prior to the composite resin. Conceivably, pretreating the dentin with solutions of amino acids, and incorporating camphorquinone and selected methacrylic monomers into the Gluma adhesive would nullify the need for the enamel bonding agent. A bond strength to dentin of 13.4 MPa was obtained in the control experiment. Using a solution of pyruvic acid and glycine as pretreatment, and an optimized adhesive mixture containing glutaraldehyde, HEMA, BIS-GMA, camphorguinone, and water, bond strengths to dentin of 14.5 MPa and to enamel of 23.3 MPa were obtained. Thus, the new Bluma bonding system gave acceptable bond strengths without the prior application of enamel bonding agents.

Mesh Monitor Casting of Ni-Cr Alloys: Element Effects.

Final rept.

J. A. Tesk, O. Okuno, and R. Penn. 1986, 1p Pub. in Jnl. of Dental Research 65, p301 1986.

Keywords: *Dental materials, *Castings, *Nickel.

*Chronium, Metal alloys, Computerized simulation, Temperature, Silicon, Beryllium, Solidus, Design, Mo-lybdenum, Niobium, Boron, Aluminum, Reprints.

A mesh monitor is used for quantitatively evaluating the casting of dental alloys. A castability value, C(sub v), is defined as the fraction of completely cast grid segments. For statistical analysis, a transformed castability value, C(sub vt), is used and one equation for C(sub vt) was found to fit all of the Ni-Cr alloy data at the 95% confidence level: C(sub vt) = a + bT(sub A)(sup 1/2) T(sub M)(sup 2) where, C(sub vt) = In (2/3) A)(sup 1/2) (sub w)(sub 2) where, C(sub w) = III(2/3) + the square root of C(sub v))/(2/3 + the square root of 1 - C(sub v)) - a and b are characteristic constants for each alloy. T(sub A) = T(sub c) - T(sub s), with T(sub c) the casting temperature, T(sub s) the solidus temperature, and T(sub M) the mold temperature. A series of alloys were selected to determine effects of critical elements on casting. Compositions were chosen to assure the avoidance of correlated effects. chosen to assure the avoidance of correlated effects. Assuming a linear dependence, the following equation was found to describe C(sub vt): C(sub vt) = K(sub o) Ni/Cr + K(sub 1)(Mo) + K(sub 2)(Si) + K(sub 3)(Nb) + K(sub 4)4(B) + K(sub 5)(Al) + K(sub 6)(Be) + K(sub 7)(Be x Si) where () are elemental concentra-tions in weight percent, and K(sub i) is a coefficient for the lith term Because composition is constant for each the ith term. Because composition is constant for each alloy, K(sub i) = f(sub i) (T(sub A), T(sub M)) = g(sub i) (T(sub c), T(sub m)). The temperature dependent coefcients were determined for seven elements and the (Ni)/(Cr) ratio. It was also found that Si and Be produce a synergistic effect. The results can be used in computer aided design of Ni-Cr alloys.

Adsorption of 4-Methacryloxyethyl Trimellitate Anhydride (4-META) on Hydroxyapatite and its Role In Composite Bonding. Final rent

D. N. Misra, 1989, 6p

Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Jnl. of Dental Research 68. n1 p42-47 Jan 89.

Keywords: Adsorption, Dental materials, Reprints, *Hydroxyapatite, *Composite bonding, *Methacrylox-yethyl trimellitate anhydride, Absorption isotherm.

The adsorption of 4-methacryloxyethyl trimellitate anhydride (4-META) was studied from ethanol and dichloromethane onto synthetic hydroxyapatite (containing about 1.5 monolayers of physisorbed water) in order to study its role in restorative composite bonding to teeth. The adsorption isotherm of 4-META was S-shpaed and reversible from ethanol and followed the Langmuir plot at lower concentrations. The isotherm was irreversible from dichloromethane and a constant amount of adsorbate was removed from the solutions above a certain concentration. The irreversibly adsorbed compound was completely removed by washing with ethanol. Therefore, the bonding between teeth and the re-storative resin containing 4-META as a coupling agent is micromechanical and not chemical in nature. An analysis of isotherms showed that the benzene rings of the adsorbate molecules lie flat on the surface for both solvents.

PB89-179253 Not available NTIS National Bureau of Standards (IMSE), Gaithersburg, MD. Polymers Div. Oligomers with Pendant Isocyanate Groups as Ad-

hesives for Dentin and Other Tissues.

Final rept. C. H. Lee, and G. M. Brauer. 1989, 5p

Pub. in Jnl. of Dental Research 68, n3 p484-488 Mar 89

Keywords: *Dentin, *Adhesives, Dental materials, Bonding strength, Isocyanates, Reprints, *Oligomers, Isocyanic acid/dimethylbenzyl-isopropenyl, Methacrylate/isocyanatoethyl.

Oligomers containing pendant isocyanate groups were synthesized from various vinyl monomers, m-isopropenyldimethylbenzyl isocyanate (TMI), and 2-isocyan-atoethyl methacrylate (IEM). The liquids were charac-terized by their refractive indices, infrared spectra, and percentage of isocyanate groups in the molecule. Adhesive properties of these compounds were compared with those of oligomers prepared from methacrylate esters, IEM, and/or TMI, which had been synthesized previously. These adhesive compositions, especially formulations synthesized from vinyl monomers, adhered at least as well to dentin as did other dentin bonding agents. Oligomers synthesized with methac-rylate esters bonded more strongly to bone than did other hard-tissue adhesives. These oligomeric compositions are also excellent soft-tissue adhesives. Provided that their biological properties prove satisfactory, these compositions could find many applications as hard-and soft-tissue adhesives in clinical dentistry.

Thermophysical Properties for Bioprocess Engineering.

Final rept. N. A. Olien. 1987, 4p Pub. in Chemical Engineering Progress, p45-48 Oct 87.

Keywords: *Thermophysical properties, Solutions, Bio-logical products, Reprints, *Biotechnology, Data bases.

The commercialization of biotechnology requires the development of techniques for routine, scientifically-based scaleup of bioprocesses. Many of the engineering problems associated with scaleup are in downstream processing, which is comprised primarily of separation and purification. In traditional process in-dustries, accurate data and predictive models for the thermophysical properties of fluid mixtures play significant roles in the design and operation of separation processes. In a workshop it was concluded that sever-al steps must be taken: develop experimental capability for obtaining thermophysical property data on biological solutions; begin theoretical studies which can lead to the development of predictive models; identify candidate biomolecules for experimental measure-ments and begin acquisition of a database for their solution properties.

Radiation-induced lesions directly adjacent to large metallic restorations have been associated with scatmetallic restorations have been associated with scat-ter of low energy electrons and positrons generated within the restorative material by high energy incident beams. These normally self-resolving lesions very often result in the interruption of the normal course and timing of the radiation treatment. Demonstrated is a simple absorptive intra-oral shield utilizing materials and techniques adaptable to any dental office or radio-therapy treatment facility. The use of the shielding technique can attenuate the low energy scatter to a level where damage to surface tissues can be avoided. The simple intraoral shielding technique utilizes readily available commercial impression materials and can be easily adapted to any radiotherapy treatment setting or dental office. The elimination of the painful and debilitating side effect or radiotherapy will allow for adherence to the most effective therapy course and improvement in the patient's quality of life.

Final rept.

E. N. Cobb, R. L. Blosser, R. L. Bowen, and A. D. Johnston, 1989, 9p

Pub. in Jnl. of Adhesion 28, p41-49 1989.

Keywords: *Dental materials, *Acid bonded reaction cements, *Nitric acid, *Oxalates, Dentin, Iron, Enam-els, Composite materials, Tensile strength, Adhesive strength, Surface finishing, Resin cements, Reprints.

Strong adhesive bonding of composite resins to dentin and enamel is obtained by conditioning the surface and applying adhesion-promoting compounds. The study examines tensile adhesive bond strengths and effects of the conditioners having various concentra-tions of ferric oxalate (FO) and nitric acid. In the first part of the study, the average tensile bond strengths increased with concentrations of commercial FO as received up to about 6.8% and averaged no higher with higher concentrations. After the first part of the testing had been completed, it was discovered that the FO as received contained a small amount of nitric acid. Use of solutions having from 6.8% to 20% ferric oxalate as received yielded bonds with strengths that averaged about 13 MPa psi) to dentin and 16 MPa (2,400 psi) to enamel. In the second part of the study, the FO was stripped of the fortuitous nitric acid and, based on results from the first part of the study, solutions were made up to contain a fixed concentration of purified FO (6.8% Fe2(C2O4)3) and various known concentra-tions of nitric acid. The highest bond strengths to dentin and enamel were obtained with the purified FO solution which contained approximately 2.5% nitric acid.

Transient and Residual Stresses In Dental Porcelains as Affected by Cooling Rates.

Final rept.

K. Asaoka, and J. A. Tesk. 1989, 17p Pub. in Dental Materials Jnl. 8, n1 p9-25 Jun 89.

Keywords: *Dental materials, Cooling rate, Residual stress, Computerized simulation, Reprints, *Dental porcelain.

The development of either transient or residual stress in a slab of dental porcelain during cooling was simu-lated by use of a super-computer. The temperature dependences of the elastic modulus, the thermal expansion coefficient, the shear viscosity, and the cooling rate dependence of the glass transition temperature were considered in the calculation. Internal stress and viscoelastic creep were computed for several cooling rates. Calculated results display stress profiles which agree reasonably well with reported measured profiles in quenched, tempered glasses. The method by which residual stress develops is also discussed. The discussion suggests a method for strengthening of the porcelain by the development of high-compressive residual stress on the surface.

Pub. in Proceedings of Southern Biomedical Engineering Conference (7th), Greenville, SC., October 27-28, 1988, p189-191.

Keywords: *Microwaves, *Plasmas(Physics), *Sterilization, Spores.

The development of a low temperature gas plasma sterilizing process was sought using electromagnetic radiation from a conventional microwave oven providing energy for both igniting and sustaining the plasma. It was found that a gas plasma readily ignites, but causes rapid heating of the vacuum chamber contents and its walls. Bactenal spore strips showed that sterili-zation can be achieved with the gas plasma.

Keywords: *Adhesive bonding, *Dental materials, *Composite materials, Adhesive strength, Enamels, Dentin, Teeth, Dentistry, Reprints.

Although the strength and durability of adhesive bonds to enamel have been adequate for numerous clinical procedures for many years, commercial products that demonstrate a range of effectiveness of adhesion to dentin are relatively new. The paper discusses several of the more popular commercial dentin and enamel components and instructions for use. Since simple technique errors can lead to failure, it is important that practitioners understand not just the sequence of pro-tocol steps, but the function of each system component. Dentists are encouraged to try dentin and enamel adhesives supported by research literature in referred journals to determine which works best for them, and to provide feedback to dental manufacturers and researchers so that the materials and clinical techniques can be further improved.

Keywords: *Adhesive bonding, *Dentin, *Surfactants, Surface reactions, Glycine, Reprints.

A number of related compounds were investigated using bond strength measurements in order to eluci-date the role of the surface-active ingredient N-phenylglycine (NPG) in experimental two-step and threestep bonding protocols resulting in adhesive bonding to dentin. All active compounds identified for the twostep or the three-step protocol were N-aryl-alpha-amino acids, and the results delineate some of the key features of the NPG molecule for bonding. For the three-step protocol, there was a requirement for a secondary or tertiary aromatic amino group, a carboxylic acid group, and a single (secondary or tertiary) methyl-ene unit between those two functional groups of the amino acid. For the two-step protocol, additional sub-stitutions at the para position of the phenyl ring on the amine improved the bond strength. In both protocols, para-methyl- and para-chloro-substituted NPG ana-logues ranked higher than NPG. A 'catalytic' effect of the aromatic tertiary amino group on the polymeriza-tion of the adhering resin in both procedures could not be ruled out.

Dental Materials and Technology Research at the National Bureau of Standards: A Model for Government-Private Sector Cooperation. Final rept.

J. A. Tesk. 1989, 8p Pub. in Materials Research Society Symposia Pro-

ceedings, v110 p177-184 1989.

Keywords: *Dental materials, *Technical societies, *Research, Composite materials, Acid bonded reaction cements, X ray apparatus, Resins, Prosthetic devices, Weibull density functions.

In 1919 the United States Army commissioned the Na-tional Bureau of Standards (NBS) to develop a federal specification for dental amalgam. In 1928, the Ameri-can Dental Association (ADA) joined forces with the NBS for dental research and in 1964 the National Institute of Dental Research (NIDR) initiated support. Today, the program involves personnel from the NBS, ADA, NIDR, two dental companies and numerous re-searchers from around the world. Major advances in dentistry have emanated from the collaborative effort; among them are the panoramic x-ray unit, the high speed, turbine, contra-angle handpiece, numerous cements, and the basic formulation of modern composite restoratives. The latter alone has been estimated at saving the American public an annual amount that exceeds the current, combined, appropriated budgets of the NIDR, NBS and the ADA. Current efforts are focussing on tissue adhesives, biocompatible cements, ath-erosclerotic plaque, new resins for composites, char-acterization of materials via Weibull Statistics and reliability analysis of dental prosthetic systems.

Oligomers with Pendant Isocyanate Groups as Tissue Adhesives. 1. Synthesis and Characterization. Final rept.

G. M. Brauer, and C. H. Lee. 1989, 15p See also PB89-179253. Pub. in Jnl. of Biomedical Materials Research 23, p295-309 1989.

Keywords: Synthesis(Chemistry), Methacrylates, Re-prints, *Tissue adhesives, *Biocompatible materials, Oligomers.

A series of methacrylate oligomers containing pendant isocyanate groups were synthesized by reacting 2-iso-cyanatoethyl methacrylate (IEM) and/or m-isoprope-nyl-alpha, alpha-dimethylbenzyl isocyanate (TMI) in ethoxyethyl acetate with metacrylates ranging from methyl to stearyl methacrylate or allyl-, cyclohexyl-, glycidyl-, i-borryl-, or dicyclopentenyloxyethyl methac-rylate. The oligomers which are stable at room temperature were characterized by IR for NCO, ester, and C=C groups and by their refractive indices. HPLC showed no residual monomer. GPC and intrinsic vis-cosity of selected oligomers indicated a molecular weight range from 1400 to 2600. Isocyanate groups were determined titrimetrically and ranged from 15.9% to 5.1%. Concurrent studies have demonstrated that these oligomers bond strongly to hard and soft tissues. Thus, subject to their biocompatibility, they could find many applications as tissue adhesives.

Keywords: *Methacrylates, *Isocyanates, *Bones, Tissues(Biology), Materials tests, Tensile strength, Re-prints, *Tissue adhesives, Biocompatible materials, prints, *Tissue Dental cements.

The adhesive properties of a series of oligomers pre-pared from 2-isocyanatoethyl methacrylates (IEM) and/or m-isopropenyl-alpha, alpha-dimethylbenzyl isocyanate (TMI) and various acrylates or methacrylates were studied. The bond strength of bone, dentin, or soft tissue specimens joined with these oligomers respectively to bone, dental composite restorative, or denture base resin were determined by tensile adhesion or shear tests. These oligomers are more effective in forming stronger bonds to bone than are other tissue adhesives. Fracture occurs cohesively, usually within the bone. Thermocycling in water for 1 week be-tween 5 C and 55 C did not decrease adhesion indicating that exposure to water or thermal shock produced no deterioration of the bond. Tensile adhesion of bovine or human dentin joined to composite restorative resin by means of the oligomers is similar to that of the best dental bonding agents such as Gluma (glutaraldehyde and 2-hydroxy-ethyl methacrylate) or ferric oxalate + N-phenylglycine + dimethylacryloxyethyl pyromellitate. These oligomers also strongly bond soft tissues and calfskin and to acrylic resins and composites

A small test house having a pitched roof/ventilated attic was installed in a high-bay environmental cham-ber. The test house and its attic were extensively instrumented for measuring heat and moisture transfer. Strumented for measuring heat and moisture transfer. The test house was subsequently exposed to a series of steady diurnal outdoor climatic conditions. Repre-sentative conditions of a residence were simulated within the test house. A mathematical model was de-veloped that included the adsorption of water vapor at wood surfaces in the attic. This model closely predict-ed the attic dewpoint temperatures for both the steady and dynamic outdoor cycle tests. The model showed that wood surfaces of the attic at a moisture content of 12.5% (by weight) adsorbed water vapor and main-tained the wood surface dewpoint temperature below the roof sheathing temperature, thereby preventing condensation.

ZIP (the ZIP Code Insulation Program) is a computer program developed to support the DoE 'Insulation Fact Sheet' by providing users with customized esti-mates of economic levels of residential insulation for any location in the United States, keyed to the first three digits of its ZIP Code. The program and support-ing files are contained on a single 5-1/4 in, diskette for use with microcomputers having an MS-DOS operat-ing system capability. The ZIP program currently calcu-lates economic levels of insulation for attic floors, exterior wood-frame and masonry walls, floors over un-heated areas, slab floors, and basement and crawl-space walls. The economic analysis can be conducted for either new or existing houses. Climate parameters are contained in a file on the ZIP diskette and automatically retrieved when the program is run. Regional renergy and insulation price data are also retrieved from the ZIP diskette, but these can be overridden to more closely correspond to local prices. ZIP can be run for a single ZIP Code and specified heating and cooling system. It can also be run in a 'batch' mode for any number of consecutive ZIP Codes in order to provide a table of economic insulation levels for use at the state or national level.

Field Measurement of Thermal and Solar/Optical Properties of Insulating Glass Windows. Final rept.

M. E. McCabe, and D. Hill. 1987, 16p Sponsored by Department of Energy, Washington, DC. Solar Buildings Technology Div. Pub. in ASHRAE (American Society of Heating, Refrig-

erating and Air-Conditioning Engineers) Transactions 93, pt1 p1409-1424 1987.

Keywords: *Calorimeters, *Heating load, *Optical properties, *Window glass, Insulation, Transmittance, Coatings, Leakage, Measurement, Emittance, Reprints.

The thermal performance of windows with alternative glazing systems were compared by field testing in a side-by-side arrangement using portable calonmeters. Existing double-hung windows installed in an NBS test building were replaced with new sash and insulating glazings provided by the original window manufacturer. Two of the new glazing units had insulating glass with a low-emittance coating applied to one glass surface. The other two glazing units were identical except there was no coating present. Portable calorimeters were placed on the interior of the two northfracing windows, which included a low-emittance and an uncoated control window. Comparative measurements of air leakage, heat loss and solar transmittance were made for these windows. Nightime heat loss for the uncoated window was approximately 23% greater than that of the low-emittance window, although the U-values for both windows were greater than indicated by the manufacturer's laboratory test results. Possible causes for the discrepancy between laboratory and field test data are evaluated and the potential use of portable calori-meters for both comparative and absolute measurements of windows is discussed.

National Bureau of Standards (NEL), Gaithersburg, MD. Building Physics Div. Indoor Alr Quality.

Final rept. P. E. McNall. 1986, 7p

Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Jnl. 28, n6 p39-42, 44, 46, 48 Jun 86.

Keywords: *Buildings, *Ventilation, Design, Air condi-tioning, Environmental engineering, Maintenance, Air filters, Efficiency, Quality control, Heat recovery, Re-prints, *HVAC systems, *Air Quality, *Indoor air pollution.

The paper outlines in a general way, the methods which are available to the HVAC engineer in the practical design, operation and maintenance of systems which impact the air quality in buildings. The general control methods are: exclude the pollutant source; prevent the source from emanating pollutants into the air; dilute the air with purer air (ventilation); remove pollut-ants from the air (air cleaners); provide other ventila-tion strategies (ventilation effectiveness, local ex-haust, etc.); discuss occupant actions which reduce their exposure. Strategies which can be used now are: ventilation quantities (ASHRAE Standard 62-1981 and 62-1981P); commissioning and testing and balancing; exhaust air reentry; heat recovery; system design for less contamination; particulate filtering; gaseous filter-ing; local exhaust. Strategies which are under development or need further application knowledge are: use of ventilation effectiveness; better gaseous removal standards; air washers; air ionization; differential pressure control.

MD. Building Equipment Div. Interzonal Natural Convection for Various Aperture Configurations.

Final rept.

B. M. Mahajan, and D. D. Hill. 1986, 7p

Sponsored by Department of Energy, Washington, DC. Passive and Hybrid Solar Energy Div. Pub. in Proceedings of ASME (American Society of Mechanical Engineers) Winter Annual Meeting, Ana-heim, CA., December 7-12, 1986, 7p.

Keywords: *Air flow, *Buildings, Doors, Heating, Heat transmission, Walls, Mathematical models, Mass flow, *Natural convection, *Aperture shape.

Experiments were conducted to study the interzonal natural convection for different aperture configurations for a two-zone set-up. The following four aperture configuration were studied: a center door; a side door; a window; and (4) a split window, i.e., two small windows situated symmetrically about the horizontal bisector of the common wall. One of the two zones was heated with baseboard electric heaters placed adjacent to the floor and the wall opposite to the common wall. For each aperture configuration, tests were conducted with various heat inputs to the warmer of the two zones. The data indicate that the discharge coefficient used in a simple one-dimensional model for interzonal airflow varies with the aperture configuration and status of heat input to the warmer zone. The variations in the discharge coefficient are apparently due to the different flow fields and temperature distributions for each aperture configuration.

BUILDING INDUSTRY TECHNOLOGY

Architectural Design & Environmental Engineering

To evaluate the impact of ventilation on air quality within mechanical ventilated office buildings, one must examine both the outside air intake or ventilation rate and the performance of the air distribution system in delivering this outside air to the building occupants. Inadequate air distribution may lead to air quality problems, even if a building's total ventilation rate is adequate. Tracer gas measurement procedures have been developed to evaluate these air distribution characteristics of mechanical ventilation systems or their ventilation effectiveness. The paper examines the use of one such technique, tracer gas measurement em-ploying age distribution analysis in modern, mechanically ventilated office buildings. The measurement and analysis techniques are described, along with those features of the building type which impact on their ap-plication. The results of the measurements indicate that there is good mixing in a whole building scale, but also provide evidence of local, stagnant zones in the occupied space. These apparently contradictory results are suspected to be due to the fact that the layout of an actual building is much more complex than the measurement theory assumes.

In order to gather reliable information on the dynamic performance of heating, ventilating and air conditioning systems and their controls in buildings, the Center for Building Technology (CBT) at the National Bureau of Standards (NBS) has developed a Building Manage-ment and Controls Laboratory. The Laboratory con-sists of a distributed computerized Energy Management and Control System (EMCS) developed at NBS and used to control a number of different experiments. These experiments currently include the control of an eleven-story office building on the NBS site, a thor-oughly instrumented air handler in a laboratory environment, and a large air handler used to condition part of the perimeter of the building housing the Center for Building Technology.

Office of Solar Heat Technologies. Pub. in Proceedings of ASME-JSME-JSSES (American Society of Mechanical Engineers-Japan Society of Me-chanical Engineers-Japanese Solar Energy Society) Solar Energy Conference, Honolulu, HI., March 22-27, 1987, p300-306.

Keywords: *Convection, *Air flow, *Heat transfer coefficient, Temperature distribution, Heat measurement, Environmental engineering, Thermal expansion, Tests, Temperature control, Energy conservation.

Experiments to determine the flow coefficients for interzonal natural convection were carried out at the Na-tional Bureau of Standards' Passive Solar Test Facility. Interzonal natural convection was studied for ten dif-ferent apertures. One of the two zones was heated with baseboard electric heaters placed adjacent to the floor along the wall opposite to the common wall. Ex-periments were conducted with various heat inputs to the warmer of the two zones. The flow coefficients used in simple one-dimensional models for interzonal airflow varies with the aperture configurations, aper-ture to wall area ratio, and the level of heat input to the warmer zone. Variations in the flow coefficients are apparently due to the different flow fields and tempera-ture distributions for each aperture configuration.

The dynamic performance of buildings and the service systems within them is becoming more and more important as the use of computenzed building management systems become less expensive and increasingly popular. In an effort to understand the dynamic inter-actions between the building shell, the HVAC system, and building controls, the National Bureau of Stand-ards (NBS) has begun work on a non-proprietary build-ing system simulation program. Called HVACSIM+, which stands for HVAC SIMulation PLUS other systems, this program employs advanced equation solving techniques and a hierarchical, modular approach to simulate the dynamic performance of entire building/HVAC/control systems. The paper discusses the architecture of HVACSIM+, the HVAC component models and building shell model being developed, and other important features of the program. A bnef status report on the development of HVACSIM+ and a timetable for completing various portions of the program are also presented.

Systems Used to Assess Thermai Anomalies.

Y. M. Chang, and R. A. Grot. 1986, 14p Y. M. Chang, and R. A. Grot. 1986, 14p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Thermal Imaging, v636 p17-30 1986.

Keywords: *Infrared thermal detectors, *Temperature measuring instruments, *Temperature distribution, Performance evaluation, Thermal stability, Environ-mental engineering, Buildings, Spatial distribution, Im-aging techniques, Energy conservation.

An evaluation of various infrared imaging systems was performed to determine their abilities to identify thermal anomalies in buildings. The systems were tested under environmental temperatures from -20 C to 25 C for their minimum resolvable temperature differences (MRTD) at spatial frequencies between 0.03 to 0.25 cv/mrad. The temperature dependence of MRTD was analyzed and compared with the predicted values in ASHRAE Standard 101-83 for thermal imaging sys-tems. The temperature dependence of infrared systems object temperature calibrations was investigated. The signal transfer functions (SiTF) of infrared sensors are generated to verify and calibrate the dynamic range of each sensor. Also discussed are the results of measurements of modulation transfer function (MTF) of infrared imaging systems, which are based on Founer Transforms of the line spread function (LSF). It is shown that the results of the MTF calculations can be correlated with their MRTD measurements.

Evaluating Office Lighting Environments: Second Level Analysis.

B. L. Collins, W. S. Fisher, G. L. Gillette, and R. W. Marans. Apr 89, 143p NISTIR-89/4069

See also PB88-164512. Prepared in cooperation with Lighting Research Inst., New York, and Michigan Univ., Ann Arbor. Sponsored by International Council for Educational Development, New York, and New York State Energy Research and Development Authority, Albany.

Keywords: *Office buildings, *Lighting equipment, Lamps, Energy consumption, Energy conservation, Evaluation, Illuminance, Luminance.

Data from a post-occupancy evaluation (POE) of 912 work stations with lighting power density (LPD), photowork stations with lighting power density (L-D), photo-metric, and occupant response measures were exam-ined in a detailed, second-level analysis. Seven types of lighting systems were identified with different combi-nations of direct and indirect ambient lighting, and task lighting and daylight. The mean illuminances at the primary task location were within the IES target values for office task with a range of mean illuminances from 32 office task with a range of mean illuminances from 32 to 75 fc, depending on the lighting system. The median LPD was about 2.36 watts/sq ft, with about one-third the work stations having LPD's at or below 2.0 watts/ sq ft. Although a majority of the occupants (69%) were satisfied about their lighting, the highest percentage of those expressing dissatisfaction (37%) with lighting had an indirect fluorescent furniture mounted (IFFM) system. The cenative reaction of some many neople to system. The negative reaction of so many people to the IFFM system suggests that the combination of task lighting with an indirect ambient system had an important influence on lighting satisfaction, even though task illuminances tended to be higher with the IFFM system. Concepts of lighting quality, visual health, and control were explored, as well as average luminance to explain the negative reactions to the combination of indicati lighting with were used to the combination of indirect lighting with furniture mounted lighting.

J. Axley, and A. Persily. Oct 88, 40p NISTIR-88/3855 Presented at the Air Infiltration and Ventilation Centre Conference, Effective Ventilation held at Novotel Gent, Belgium, September 12-15, 1988. Sponsored by Department of Energy, Washington, DC.

Keywords: *Air flow, *Ventilation, *Buildings, Ducts, Environmental engineering, Air circulation, Measuring instruments, Air quality, *Tracer techniques, *HVAC systems, Energy conservation.

Tracer gas techniques for measuring airflow rates in building systems are considered. These techniques are classified in terms of tracer gas injection strategy employed and mass balance relationships used to analyze measured tracer concentration data. The discussion focuses on one class of tracer techniques, the pulse injection techniques, based upon pulse injection strategies and integral mass balance relationships. These pulse injection techniques have not been commonly used in the past yet they provide practically useful means for the determination of airflow rates in building systems. Pulse injection techniques are presented for measuring airflows in ducts, and for studying single-zone and multi-zone building airflow sys-tems. Experimental procedures for these three cases are discussed, and preliminary results from field appli-cations of these techniques are presented. The possibility of flow variation is accounted for in all cases, and the sensitivity of the single-zone pulse injection technique to these flow variations is compared to that of the single-zone constant injection technique. This companion leads to integral formulations of the constant injection technique for duct, single-zone, and multi-zone situations that may provide means to improve the accuracy of the commonly used constant injection tracer technique.

The Radiation Oncology Branch (ROB) is located in the Clinical Center of the National Institutes of Health (NIH). The occupants of the ROB facility have expressed dissatisfaction with the air quality within the facility for several years. To identify the sources of the air quality problems in the ROB facility and to obtain recommendations for their solution, the Center for Building Technology at the National Institute of Standards and Technology (NIST, formerly The National Bureau of Standards) conducted an indoor quality in-vestigation of the ROB facility. Results revealed sever-al deficiencies in the design and current condition of the ROB ventilation system, such as significant differences between the design airflow rates and those recommended in current standards and guidelines. The airflow measurements showed many instances in which measured airflow rates were different from their design values and revealed the existence of airflows leading to the potential for pollutant transport within the building. The contaminant measurements fell gen-erally well below the maximum values in the ASHRAE air quality standard. Thermal comfort measurements revealed instances when the temperature and relative humidity were outside of ASHRAE comfort limits. Recommendations are made to remedy the deficiencies noted and to control the conditions contributing to the building's air quality problems.

The paper describes the techniques used to study a Washington, D.C. office building with a long history of indoor air quality and thermal comfort complaints. More than twenty investigations, mostly relatively short term, have been conducted since 1978 to determine the causes of the building's problems and to recom-mend corrective actions. More recently a long term, intensive study of the building has been undertaken to study the building more thoroughly and to investigate the application of several techniques for studying office building air quality. These techniques include tracer gas measurements of air exchange rates, ventilation system performance and ventilation effectiveness, and measurements of the levels of various indoor pollutants including bioaerosols. The paper reviews the previous investigations of the building and describes the procedures used in the current study. Some preliminary results of the current effort are presented.

Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p169-178 1989.

Keywords: *Air flow, *Doors, *Heat loss, Flow rate, Flow measurement, Leakage, Energy dissipation, Comparisons, *Energy conservation.

A generalized relationship is presented for determining air flow rates through narrow gaps around door edges. The relationship provides values of leakage rates for steady laminar flow through gaps over a wide rates of pressure difference and eliminates approximations associated with the often inappropriate use of discharge coefficients and exponents in the flow equation Q = C A(delta p)n. The analysis covers straight-through, single bend and double bend gaps of constant thick-ness, as well as connected gaps of constant thicknesses. Comparison of measured flow rates for installed stairwell door assemblies with those predicted by use of the relationship shows agreement within 20%. The volumetric flow of heated air through simple door gaps has been calculated by use of the relation-ship. The results show that the flow rate may increase or decrease with temperature depending on gap size and flow region.

Advanced Heat Pumps for the 1990's Economic Perspectives for Consumers and Electric Utilities. S. R. Petersen. 1989, 6p Sponsored by Electric Power Research Inst., Palo

Alto, CA.

Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Jnl., p36, 38, 40, 42, 44, and 46, Sep 89.

Keywords: *Heat pumps, *Electric power demand, Hot water heating, Electric utilities, Economic analysis, Air conditioning equipment, Heating, Cooling systems, Reprints

Advanced heat pumps promise improved energy efficiency and reduced peak-power demand for space heating, space cooling and water heating in houses. Economic analysis shows that they can be cost effec-tive in much of the United States, both for consumers and electric utilities. Consumers will benefit from greatly reduced electric bills; utilities will benefit from improved load management and the increased competi-tiveness of electric heating. A new program, HPEAK (Heat Pump/Economic Analysis of Kilowatt-hours), developed at the National Institute of Standards and Technology, evaluates the hourly performance of conventional and advanced heat pump systems, both from consumer and utility perspectives. HPEAK analy-ses demonstrate the economic benefits of an advanced air-source heat pump with adjustable-speed control and integrated water-heating capability in five locations in the United States.

R. A. Grot, and A. K. Persily. 1986, 33p

Pub. in Measured Air Leakage of Buildings, ASTM STP 904. p151-183 1986.

Keywords: *Office buildings, *Ventilation, *Air flow, *Flow measurement, Safety engineering, Human fac-tors engineering, Measuring instruments, Design standards, Building codes, Environmental engineering, Reprints.

Air infiltration and ventilation rate measurements were made during all seasons of the year in eight federal office buildings using an automatic air infiltration system designed at the National Bureau of Standards. system designed at the National Bureau of Standards. The eight federal office buildings were located in An-chorage, Alaska; Ann Arbor, Michigan; Columbia, South Carolina; Fayetteville, Arkansas; Huron, South Dakota; Norfolk, Virginia; Pittsfield, Massachusetts; and Springfield, Massachusetts. These buildings ranged in size from 1730 sq m (18,600 sq ft) for the building in Pittsfield to 45,500 sq m (490,000 sq ft) for the Anchorage federal building. All were constructed within the last 10 years. Air infiltration rates were found to vary from 0.2 to 0.7 air changes per hour and consti-tuted from 23% to 61% of the building design load. Minimum ventilation rates in the tighter buildings were found to be less than what would be recommended for found to be less than what would be recommended for occupied offices.

The paper presents a historical review of control system simulation in North America from around 1970 until the present. The subject Is divided Into the topics

of Regulation, Supervisory Control, and Optimized Building Controls. Different research efforts and simulation programs that have made a significant contribution to advancing the state of the art are reviewed. The current emphasis and what the author believes will be some future trends in this important field are also discussed.

Keywords: *Buildings, *Maintenance, *Operations, Automation, Robots, Cleaning, Delivery, Security, Services, Barriers, *Robotics.

The report provides a state-of-the-art survey of robotic technology useful for building operation and mainte-nance. Floor cleaning, mail delivery, security, and stor-age facility operations represent current and near term opportunities for robotic application. Likely future applications may include: bathroom, office and window cleaning; lawn mowing; trash handling; wall painting; and miscellaneous material handling. Potential bar-riers to the use of robotics within buildings are identi-fied. Amendments to the GSA Handbook on 'Quality Standards for Design and Construction' to accommodate the use of service robots in Federal buildings are suggested. The suggested amendments are not ex-haustive and as the knowledge base expands, should be refined and augmented.

Keywords: *Fire alarm systems, *Smoke, *False alarms, *Hospitals, *Military facilities, Warning systems, Medical centers, Veterans Administration.

A study of 133 VA Medical Centers (VAMC) out of a total of 172 throughout the U.S. coupled with visits to 20 facilities was conducted to gather data on false alarms of smoke detectors. Data collected included name of the detector manufacturer and model number, control unit manufacturer and model number, number and type of detectors installed, where installed, number of false and real alarms for preceding year, date of installation, and policies on smoking, testing, cleaning, and maintenance. VAMC personnel involved with the installations were requested to indicate the maximum level of false alarms that could be tolerated and to provide any recommendations to reduce their occurrence. The study included a total of approximateoccurrence. The study included a total of approximate-ly 37,000 system type smoke detectors of which 69% were of ionization (ion) type and 31% photoelectric, 3000 duct detectors (90% ion and 10% photo), and 1100 smoke detector modules (80% ion and 20% photo) integral with door holder closers. Also included are approximately 100 single station smoke alarms. Analysis of data collected from operating facilities through forms, site visits, and staff interviews resulted in a series of recommendations which could result in a substantial reduction in observed false alarms.

Keywords: *Fires, *Bulldings, *Sprinkler systems, Ventilation, Ducts, Computer systems programs, Comput-erized simulation, Safety engineering, Environment simulation, Fire safety, Graphs(Charts).

Presented Is a User Guide for the computer code LAVENT (Link-Actuated VENTs) and an associated graphics code GRAPH. LAVENT has been developed to simulate the environment and the response of sprin-kler links in compartment fires with draft curtains and fusible-link-actuated ceiling vents. The use of LAVENT is presented by a series of exercises in which the reader reviews and modifies a default input data file which describes vent and sprinkler actuation during fire growth in an array of wood pallets located in a curtained warehouse-type of configuration. Results of the default simulation are discussed. LAVENT is written in FORTRAN 77. The executable code operates on PCcompatible computers and requires a minimum of 252 kilobytes of memory.

Test Results and Predictions for the Response of Near-Ceiling Sprinkler Links in a Full-Scale Com-partment Fire. Final rept.

L.Y. Cooper, and D. W. Stroup. 1989, 10p See also PB88-113741. Sponsored by Fire Administra-

Pub. in Proceedings of International Symposium Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p623-632, 1989.

Keywords: *Spinkler systems, *Fire tests, *Safety en-gineering, Fire prevention, Smoke, Heat transfer, Buildings, Fire detection systems, Comparisons, Detectors.

Data acquired during tests involving full-scale, sprink-lered compartment fires are presented and analyzed. Attention is focused on key features of the typical sprinker link deployment/response problem. It is found that the elevated temperature smoke layer which develops inevitably in compartment fires can have a major impact on the thermal response of sprinkler links. It is shown that traditionally accepted methods of predicting sprinkler link response which do not ac-count for this upper layer can be totally inadequate. Link response predictions used here involve a method of calculation which does take account of the smoke layer. Favorable comparisons between predictions and experiment are obtained and further validation of the method is recommended. Finally, it is found that sprinkler link-to-ceiling spacing can have a significant effect on the thermal response of links and it is recommended that a method which accounts for this effect be developed and validated.

PC A04/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research. Galinersburg, MD. Center for Fire Research. Development of a Multiple Layer Test Procedure for inclusion in NFPA (National Fire Protection As-sociation) 701: Initial Experiments. S. Davis, and K. M. Villa. Aug 89, 63p NISTIR-89/

4138

Keywords: *Curtains, *Flammability testing, Fire tests, Fabrics, Textiles, Tables(Data), Graphs(Charts).

The research program investigated the flammability behavior of multiple layer fabric assemblies used for draperies and developed a laboratory-scale test proto-col for predicting full-scale fire behavior. The need for such a study arose from recent findings that showed multiple layers of fabrics, comprised of individual fab-rics which meet the requirements of National Fire Pro-tection Association (NFPA) 701, may present a serious fire hazard. Eight combinations of four drapery fabrics and two lining fabrics were examined using variants of two established test procedures for single haver; the two established test procedures for single layers: the ASTM D3659 Semi-Restraint Test Method and the NFPA 701 Large-Scale Test Method. The study concludes that neither of the methods, as currently written, adequately predict the full-scale fire behavior of multiple layer fabric assemblies. Based on the results of the study, it is too early to recommend any test pro-tocol for inclusion in NFPA 701.

Tests were conducted in the experimental fire tower at the National Research Council of Canada to study smoke movement caused a large fire and to determine the effectiveness of mechanical pressurization in keeping the elevator shaft and lobbies tenable for evacuation of the handicapped and fire-fighting. The tests indicated that pressure control is required to cope with loss of pressurization due to open doors. Equations were developed to assist in designing pres-sure control systems involving either a variable supply air rate with feedback control or relief dampers in the walls of the elevator shaft or lobbies. Tests conducted in the tower indicated that for both methods of pressure control, comparison of measured and calculated values of supply air rates and pressure differences are in good agreement.

Keywords: *Earthquake resistant structures, *Structural design, Design standards, Safety engineering, Structural engineering, Concrete construction, Steel construction, Collapse, Failure.

Buildings and other structures represent a substantial portion of a nation's wealth. For example, the total construction value of buildings and other structures in the United States was estimated at \$2.3 Trillion in 1980. These facilities support a variety of activities ranging from providing basic shelter to facilities hous-ing commercial and industrial functions. Safety and economy are two important factors that must be considered in the design and construction of buildings. Most deaths and injuries during earthquakes result from the failure of man-made structures. Building col-lapse, falling debris within and around buildings, and the loss of life support systems represent significant hazards. Immediate and long-term economic losses are a direct consequence.

Probabilistic Models for Ground Snow Accumulation.

Final rept.

B. Ellingwood. 1984, 10p Pub. in Proceedings of Eastern Snow Conference, v41 p49-58 1984.

Keywords: *Roofs, *Design standards, *Snow, *Loads(Forces), *Meteorological data, Buildings, Structural design, Probability theory, Statistical distri-bution, Climatology.

Snow loads specified in modern structural design standards, e.g., American National Standard A58 and the National Building Code of Canada, are calculated as the product of a ground show load and a ground-to-roof conversion factor. The design-basis ground show loads are sensitive to the choice of probability distribution, since they must be obtained by extrapolating into tion, since they must be obtained by extrapolating into the upper tail of the distribution beyond the range cov-ered by the historical data. The paper considers the selection of probability distributions for modeling annual extreme ground loads, sampling errors caused by limitations in the data, and the sensitivity of nominal design-basis snow loads to these factors. Extensive water-equivalent data from weather stations in the northern United States and Canada are analyzed. The analysis strongly suggests that the log-normal probaanalysis strongly suggests that the log-normal probaextreme ground snow loads at sites in the north-cen-tral United States, while the Type I distribution appears preferable in the northeast United States and in Canada.

Keywords: *Building codes, *Design standards, *Gov-ernment policies, Regulations, Construction industry, Research, *Center for Building Technology.

Most of the technical requirements in building codes find their basis in national standards which may be adopted by reference or incorporated directly into the adopted by reference or incorporated directly into the body of building codes. National Consensus Stand-ards, which are most widely used and accepted, have their technology based on experience and research. The primary activity of the Center for Building Technol-ogy (CBT) at the National Institute of Standards and Technology is research. The research results are pro-vided to standards committees which use the findings for the experience of National Conserve Standards for the preparation of National Consensus Standards. Such standards are widely used by the building community for both construction specifications and regula-tory requirements. CBT does not directly produce standards, nor does it have any regulatory authority. This is left to other agencies of federal, state, and local government.

Final rept.

H. E. Marshall. 1987, 10p Sponsored by Foras Forbartha Teoranta, Dublin (Ireland).

Pub. in Construction Management and Economics 5, pS43-S52 1987.

Keywords: *Investments, *Construction industry, Ben-efit cost analysis, Cost engineering, Management methods, Project planning, Thermal efficiency, Cost effectiveness, Return on investment, Reprints.

Building economics is described in the narrow context methods of capital investment analysis applied to building investments in the United States. The common characteristic of all the methods described is that they consider benefits (savings) and costs over the project's life cycle or study period. Eight steps in-volved in making an economic evaluation are present-ed. The process is illustrated with a problem in choosing the economically efficient thermal resistance level of attic insulation. Appropriate applications are de-scribed for the following methods: life-cycle cost; net benefits; benefit-to-cost and savings-to-investment ratios; and internal rate of return. Federal and state agencies that use these methods are identified. The role of standards societies and professional organiza-tions in encouraging the use of these methods is de-scribed. Three projects in which these methods have been used are examined briefly in terms of methodolo-gy to illustrate the use of building economics methods. A description of difficulties in applying the methods concludes the paper.

Pub. in Proceedings of CIB International Symposium on Building Economics (4th), Copenhagen, Denmark, September 14-17, 1987, p23-57.

Keywords: *Construction industry, Technology as-sessment, Economic analysis, Return on investment, Decision making, Benefit cost analysis, *Building technology, Life cycle costs.

The building community needs technically correct, but practical, methods and guidelines for evaluating the economic performance of alternative building technol-ogies. Some of the methods described in the literature and used in practice do not provide the technically correct economic measure. Improved methods help the building community achieve building performance ob-jectives at affordable costs. The paper provides formu-las for computing and guidelines on the appropriate use of life-cycle costing, net benefits, benefit-to-cost use of life-cycle costing, net benefits, benefit-to-cost ratio, internal-rate-of-return, and payback methods. These methods are evaluated for making building deci-sions on accepting or rejecting a given building invest-ment, the cost-effective design or size of a building or component, and the economically efficient combina-tion of projects competing for a limited budget. Tech-niques available for measuring uncertainty and risk when applying the methods are surveyed. Some expe-riences of the United States in applying these methods are described.

MD. Center for Fire Research. Calculating Flows through Vertical Vents In Zone Fire Models under Conditions of Arbitrary Cross-Vent Pressure Difference.

L. Y. Cooper. May 88, 17p NBSIR-88/3732

Keywords: *Mathematical models, *Air flow, Algo-rithms, Pressure gradients, Pressure vessels, Fires, Buildings, Fire safety, *Fire studies.

In typical compartment fire scenarios, ratios of cross-vent absolute pressures are close to 1. When such is the case, algorithms are available to predict the resulting cross-vent room-to-room flows. There are, however, important situations where this pressure condition does not prevail, for example, in fire scenarios involv-ing relatively small penetrations in otherwise hermeti-cally-sealed compartments of fire origin. It is important for a versatile compartment fire model to have a capability of predicting vent flows for the entire range of possible cross-vent pressure conditions. The paper develops a unified analytic description for flows through vertical vents between pairs of two-layer room fire environments under conditions of arbitrary crossvent pressure difference. The analysis, which takes advantage of generally useful modeling approxima-tions, leads to a concise result which is not significantly more complicated than the result for simple, low-pressure-difference cases.

Keywords: *Fasteners, *Corrosion, *Roofs, Joining, Durability, Deterioration, Roofing, Research projects.

BUILDING INDUSTRY TECHNOLOGY Construction Management & Techniques

The paper presents the results of a study conducted to summarize available information on the corrosion issue, and to identify research needed to correct problems. In particular, the incidence of loss of fastener se-curement due to corrosion could not be established because of the inaccessibility of installed fasteners within roofs. In reviewing factors affecting fastener corrosion, water was the only one that stood out on the basis of the information obtained. Uniform corrosion (rust on some or all of the surface) was the predominant type that inspectors have observed in service. Nevertheless, some evidence of localized corrosion processes (e.g., crevice corrosion) has also been ob-served. Both types of corrosion may lead to loss of fastener securement in service. The results of the study indicated that there are three major gaps in the knowledge base: (1) evaluation test procedures for the corrosion resistance of fasteners are limited and need to be improved; (2) a data base on field performance of fasteners is lacking, and; (3) non-destructive diagnos-tic procedures for assessing the condition of inplace fasteners are not available.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Building Materials Div. Interim Criteria for Polymer-Modified Bituminous **Roofing Membrane Materials.**

Final rept.

W. J. Rossiter, and J. F. Seiler. Feb 89, 52p NIST/ **BSS-167**

Also available from Supt. of Docs. as SN003-003-02922-0. Library of Congress catalog card no. 89-600702. Sponsored by Tri-Service Building Materials Committee, Washington, DC.

Keywords: *Roofing, *Bituminous coatings, *Poly-mers, Bitumens, Stability, Fire resistance, Viscosity, Mechanical properties, Absorption, Moisture content, Performance standards, Military facilities.

The report presents the results of a study to develop interim criteria for the selection of polymer-modified bi-tuminous roofing membrane materials. The criteria are based on a review of existing standard specifications and related documents. They are intended for use by the construction agencies of the Department of Defense in specifying polymer-modified bituminous roof-ing membrane materials until voluntary consensus standards are developed in the United States. The suggested interim criteria are generally presented using a performance criteria format. The membrane characteristics for which performance criteria are sug-gested are: dimensional stability, fire, flow resistance, hail impact, moisture content and absorption, pliability, strain energy, uplift resistance, and weathering resist-ance (heat exposure). Prescriptive criteria for five membrane characteristics are used to complement the suggested performance criteria. The approach of using complementary prescriptive criteria is taken to incorporate in the performance criteria test methods which can be relatively rapidly performed for characterization or identification of the membrane material.

Damage Accumulation in Wood Structural Members Under Stochastic Live Loads.

Final rept.

J. Murphy, B. Ellingwood, and E. Hendrickson. 1987, 11p Pub. in Wood and Fiber Science 19, n4 p453-463

1987.

Keywords: *Structural forms, *Construction materials, *Loads(Forces), *Wood products, *Damage, *Creep rupture tests, Stochastic processes, Stress concentration, Specifications, Reprints.

Damage accumulation in wood structural members is assessed using realistic stochastic models of live load. It is found that practically all damage occurs at times when the live load intensity is equal, or nearly equal to the nominal live load, L sub n, required by codes for design. The time spent at or above the nominal life load, L sub n, is about 40 days during a reference period of 50 years, and not the presently assumed time of 10 years. Using 10 years as the basis for setting allowable stresses for wood should be reexamined.

900.116 PB89-172514 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Chemical Engineering Science Div. Specific Heat of Insulations.

Final rept. J. G. Hust, J. E. Callanan, and S. A. Sullivan. 1985, 18p

Pub. in Thermal Conductivity 19, p533-550 1985.

Keywords: *Thermal insulation, *Specific heat, Ther-mophysical properties, Latent heat, Heat of vaporiza-tion, Moisture content, Temperature, Thermal conduc-tivity, Measurement, Thermal diffusivity, Reprints, *Standard Reference Materials.

The specific heats of insulation Standard Reference Materials(SRMs) have been measured for tempera-tures from 250 to 400 K for both dry and moist specimens. Measurements were performed on SRM 1450b, SRM 1451, a high temperature SRM candidate, and on specimens of the phenolic binder used in SRM 1451. The measured specific heats of moist specimens are significantly larger than the specific heats of dry speci-mens due to the effect of latent heat of vaporization and desorption of the moisture. These results are ana-lyzed in terms of the differences that may be observed between steady-state and transient thermal conductance measurements.

Final rept.

Final rept. F. D. Martzloff. 1988, 10p Pub. in Conference Record of the IEEE (Institute of Electrical and Electronics Engineers)-IAS (Industry Ap-plications Society) Annual Meeting, Pittsburgh, PA., October 3-6, 1988, p1467-1476.

Keywords: *Surges, *Industrial buildings, *Power lines, Measurement, Electric wire, Electromagnetic interference, Electromagnetic radiation, Coupling circuits, Wave propagation.

Measurements were made in an industrial building to determine the propagation characteristics of surges in the AC power wiring of the facility. The surges, of the unidirectional type or the ring-wave type described in ANSI/IEEE C62.41-1980, were injected at one point of the system and the resulting surges arriving at other points were measured. The results show how unidirec-tional surges couple through transformers and produce a ring wave component in the response of the eventor. system. An unexpected side effect of these surges, applied to the power lines only, was apparent damage suffered by the data line input components of some computer-driven printers.

Thermal Resistance Measurements and Calcula-tions of an Insulated Concrete Block Wall. Final rept.

D. M. Burch, B. A. Licitra, D. F. Ebberts, and R. R.

D. M. Burch, D. A. Licita, O. F. Ebberts, and B. H. Zarr. 1989, 7p Sponsored by Department of Energy, Washington, DC. Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Transactions 95, pt1 7p 1989.

Keywords: *Concrete blocks, *Thermal resistance, *Thermal insulation, *Thermal measurements, *Walls, Temperature gradients, Polystyrene, Temperature, Reprints.

Thermal resistance measurements of an insulated concrete block wall were conducted using a calibrated hot box at four different mean temperatures. The hollow concrete block wall was insulated by installing hollow concrete block wall was insulated by installing partial-size inserts composed of expanded polystyrene insulation with reflective air spaces into the cores of the blocks. The thermal resistance measurements were compared with the ASHRAE isothermal plane and parallel path methods. The isothermal plane method was subsequently used to calculate the ther-mal resistance of uninsulated concrete block, concrete block with full on insulated concrete block, concrete block with full-size insulation inserts, and concrete block with partial-size insulation inserts. Both ways of insulating the concrete block increased the thermal re-sistance of the uninsulated block by more than a factor of three.

Keywords: *Construction materials, *Service life, Du-rability, Design criteria, Reliability, Forecasting, Quality control, Maintenance, Standards, Cost engineering, Reprints.

A major need in construction technology is to be able to predict the service lives of materials. The need is shared with other technologies, and prediction of the service life of construction materials can use techniques of reliability engineering used in other indus-tries. In the last decade, several important steps have been taken toward development and standardization of a methodology for service life prediction of con-struction materials and components. These activities have influenced the way service lives of construction materials are evaluated, but more needs to be done. It is recommended that the materials science and engineering community encourage the development of improved methodologies for service life prediction and provide guidance on how the methodologies should be applied.

Office of Solar Heat Technologies. Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Transactions 92, pt1A p453-473 1986.

Keywords: *Windows, *Thermal insulation, Solar energy, Design, Architecture, Tests, Wind velocity, Performance evaluation; Simulation, Comparisons, Reprints, *Energy conservation.

Different laboratory test procedures (ASTM 236, ASTM C976 and AAMA 1503.1) are discussed in the context of measuring the U-Value of direct gain fenes-tration (DGF) components. Four representative DGF components, including a multiple-glazed window and a single-glazed window with movable insulation sys-tems, were purchased and prepared for testing. U-Values were measured for each test article at two commercial testing laboratories, using the ASTM 236 and AAMA 1502.6 test methods for a range of simulated outdoor conditions. For the three movable insulation test articles, manufacturer's claims for energy sav-ings were also overstated, suggesting the need for a standard method for estimating energy performance. Test results between individual laboratories are compared and significant differences are noted where wind speeds of 6.7 m/s (15 mph) were simulated. The dif-ferences are attributed to the different directions (parallel and perpendicular) used by each laboratory for simulating wind. The suitability of a single test condi-tion for measuring U-Value is discussed in relation to the use of that test data for estimating seasonal thermal performance.

Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) International Conference on Thermal Infrared Sensing for Diagnostics and Con-trol, Cambridge, MA., September 17-20, 1985, p152-155 1986.

Keywords: *Construction materials, *Defects, *Ther-mography, Degradation, Nondestructive tests, *Image processing, Image enhancement, Image analysis.

An image processing system has been coupled to either a thermographic or a video camera for quantifying defects in images of building materials. Several applications to building materials are presented including the detection of delaminations in single-ply roofing membrane seams, the characterization of the extent of corrosion under pigmented organic coatings on metal-lic substrates, the determination of the fractal dimensions of a sandblasted metallic substrate, and the de-termination of the percent porosity in hydrated cement. It is concluded that infrared thermography and image processing are useful analysis tools in detecting and quantifying defects in building materials.

Fire Risk Analysis Methodology: Initiating Events. Final rept.

M. D. Brandyberry, and G. E. Apostolakis. Mar 89, 165p NIST/GCR-89/562 Grant NANB-6-D0649

Sponsored by National Inst. of Standards and Tech-nology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Fires, *Ignition, *Space heaters, *Uphol-stery, Heat transfer, Drawings, Tables(Data), Models, Probability distribution functions, *Risk assessment.

The report outlines a method for assessing the frequency of ignition of a consumer product in a building and shows how the method would be used in an exam-ple scenario utilizing upholstered furniture as the prod-uct and radiant auxiliary heating devices (electric heat-ers, wood stoves) as the ignition source. Deterministic thermal models of the heat transport processes are coupled with parameter uncertainty analysis of the models and with a probabilistic analysis of the events involved in a typical scenario. This leads to a distribu-tion for the frequency of ignition for the product.

Effect of Water on Piloted Ignition of Cellulosic Materials.

Doctoral thesis

M. Abu-Zaid, and A. Atreya. Feb 89, 187p NIST/ GCR-89/561

Grant NANB-5DO578

See also PB87-127732. Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Water, *Ignition, *Fire protection, Pyrolysis, Fire extinguishing agents, Wood, Flame propaga-tion, Drops(Liquids), Graphs(Charts), Flammability testing, Heat transfer, Porous materials, *Cellulosic materials.

The experimental study is an attempt to quantify the effect of water on extinguishment; thermal decomposition and piloted ignition of wood. In the extinguishment part, cooling of hot porous and non-porous ceramic solids by water droplets was studied. These solids were used to simulate low thermal diffusivity porous and non-porous combustible building materials and were instrumented by several surface and in-depth thermocouples. Temperature measurements in the solid were used to quantify the heat transfer during droplet evaporation. Thermal decomposition of wood in air was also studied as a function of sample moisture content and externally applied radiation prior to the ignition experiments. Simultaneous measurements of weight loss rate; surface, bottom and in-depth tem-peratures; O2 depletion and production of CO2, CO, total hydrocarbons and water were made. It was found that the presence of moisture delayed the decomposition process and diluted the decomposition products. Piloted ignition experiments were conducted on Douglas fir for four different moisture contents and at different levels of externally applied radiation. It was found that the presence of moisture increases the ignition time, surface temperature and the evolved mass flux at ignition. A single equation was derived to correlate all the ignition data. This correlation accounts for the moisture dependent thermal properties and the heat loss from the sample surface.

PC A03/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research. Calculation of the Flow Through a Horizontal Cell-

L. Y. Cooper. Mar 89, 31p NISTIR-89/4052 Sponsored by Naval Research Lab., Washington, DC.

Keywords: *Air flow, *Vents, *Fire safety, *Buildings, Algorithms, Mathematical models, Pressure gradients, Fires, Temperature.

Calculation of the flow through a horizontal vent located in a ceiling or floor of a multi-room compartment is considered. It is assumed that the environments of the two, vent-connected spaces near the elevation of the vent are of arbitrary relative buoyancy and cross-vent pressure difference, delta p. An anomaly of the standpressure difference, delta p. An anomaly of the stand-ard vent flow model, which uses delta p to predict stable uni-directional flow according to Bernoulli's equation is discussed. The problem occurs in practical vent configurations of unstable hydrostatic equilibrium, where, for example, one gas overlays a relatively lessdense gas, and where delta p is relatively small. In such configurations the cross-vent flow is not uni-di-rectional. Also, it is not zero at delta p = 0. Previously published experimental data on a variety of related flow configurations are used to develop a completely general flow model which does not suffer from the standard model anomaly. The model developed leads to a uniformly valid algorithm, called VENTCL, for horizontal vent flow calculations suitable for general use in zone-type compartment fire models.

A literature review was undertaken to identify engineering formulas or models which can be used to predict key features of the corridor-filling process. The results of that review are presented and assessed. The filling process is viewed as a series of three events: a forward gravity current moving away from the fire source, a reflected or return gravity current moving toward the source, followed by uniform filling of the entire corridor. Recommendations for estimating the filling during each of these stages are presented.

Keywords: *Thermal insulation, *Fire resistant materials, *Friability, Mechanical tests, Brittleness, Tough-ness, Shear, Tests, Abrasion, Compressive strength.

The report describes results of the third and final phase of a study conducted for the General Services Administration (GSA) to develop a field test method to measure the friability of spray-applied fireproofing and thermal insulation materials. Field tests were conduct-ed on 17 fibrous and 2 cementitious spray-applied ma-terials to assess surface and bulk compression/shear, indentation, abrasion, and impact properties. The tests were performed using prototype devices developed in an earlier phase of the study. As expected, the field specimens displayed varying response to dislodgment or indentation in the tests. The field tests confirmed that the goal of the study had been achieved.

Keywords: *Fire safety, *Fires, *Buildings, Smoke, Air flow, Convection, Mathematical models, Elevators, Combustion, Vents.

The following driving forces of smoke movement in buildings are discussed: stack effect, buoyancy of combustion gases, expansion of combustion gases, wind effect, and elevator piston effect. Based on an analysis of elevator piston effect, it is concluded that the likelihood of smoke being pulled into an elevator shaft due to elevator car motion is greater for single car shafts than for multiple car shafts. Methods of evaluating the location of the neutral plane are presented. It is shown that the neutral plane between a vented shaft and the outside is located between the neutral plane height for an unvented shaft and the vent elevation.

Army Facilities. W. J. Rossiter, and J. F. Seiler. Jun 89, 28p NISTIR-89/4085

Sponsored by Construction Engineering Research Lab. (Army), Champaign, IL.

Keywords: *Roofs, *Ethylene copolymers, *Perform-ance evaluation, Maintenance, Military facilities, Me-chanical properties, Weathering, Seams(Joints), Surveys.

The report presents a summary of a survey to obtain information on the performance of EPDM roofing at Army facilities. Emphasis in the survey was on the performance of seams fabricated with unaged rubber and also patches made on existing, aged rubber. The results are intended to help provide guidelines for the maintenance of EPDM roofs at Army facilities, as well as to define research needs to overcome problems identified. Based on the results of the survey, it is recommended that studies be carried out to provide the technical basis for preparing the surfaces of aged rubber membranes before making seams or patches. The effect of aging on the surface characteristics of EPDM rubber has received little attention in the roofing literature.

Keywords: *Roofing, *Ethylene copolymers, *Mem-branes, *Mechanical tests, Elongation, Loads(Forces), High temperature tests, Shear properties, Stress relax-ation, Seams(Joints), Failure.

Commercially-available ethylene propylene diene ter-polymer (EPDM), neoprene, and chlorosulphonated polyethylene (CSME) roofing membrane specimens with adhesive-bonded seams were tested in tension in lap-shear configuration. Some T-peel tests of an a lap-shear configuration. Some 1-peel tests of an EPDM material were also conducted. The lap-shear tests were conducted at temperatures ranging from - 20 to 75 C (-4 to 167 F), and at rates of loading from 0.05 to 50 cm/min (0/02 to 20 in/min). In most cases, the EPDM and neoprene specimens failed by seam delamination; otherwise, they failed by membrane rupture with partial delamination of the seam. The CSME specimens always failed by membrane rupture without seam delamination. In general, the results indicated that, as the temperature of the test increased, the ultimate load and elongation at failure decreased. Also, at a given temperature, the ultimate load and elongation general decreased, for most specimens, as the rate of loading decreased. For stress relaxation experiments, specimens strained to 15% remained intact for over 15 failed in about five weeks. The results of the tests are discussed with regard to the development of tests for seams in single-ply membranes.

The study was conducted to revise the performance criterion for tensile strength of bituminous built-up membranes. Bituminous membrane samples, fabricated from polyester fabric, polyester-glass composite fabric, and single plies of APP- and SBS-modified bitumen, were tested in tension to determine their loadelongation properties and to measure their strain energy. The results of the tensile tests of the new bitu-minous membranes indicated wide variability of load minous membranes indicated wide variability of load and elongation among the different types of materials. As an alternative to the criterion that a bituminous built-up membrane have a tensile strength of 200 lbf/ in (35 kN/m), it was recommended that the strain energy should be a minimum of 3 lbf/in/in (14 N/m/m), when tested at 0 F (-18 C) in the weaker direction.

standards, Waterproofing, Construction materials, Reprints.

The use of single-ply membrane materials as the waterproofing component of low-sloped roofing systems has become commonplace in the United States. The growth in their use has not been without concern. One of the key issues confronting the roofing industry since the single-ply materials first appeared has been a lack of standard specifications to aid material selection as of standard specifications to aid material selection as well as roofing systems design. ASTM Committee D08 on Roofing, Waterproofing, and Bituminous Materials is the lead organization to which the U.S. roofing indus-try turns for guidance in developing voluntary stand-ards. The paper presents an update of the latest devel-opments at ASTM regarding single-ply standards, and in particular, details concerning the expected appear-ance of the long-awaited specification for EPDM.

Final rept.

A. K. Kulkarni. Jun 89, 70p NIST/GCR-89/565 Grant NANB-4-D0037 Sponsored by National Inst. of Standards and Tech-nology (NEL), Gaithersburg, MD. Center for Fire Research

Keywords: *Walls, *Pyrolysis, *Flame propagation, Burning rate, Particle boards, Fire safety, Fires, Mathe-matical models.

Reported is a study of upward flame spread on vertical walls. First, a detailed review of literature on upward flame spread is presented. A 'complete procedure' for predicting upward flame spread on practical materials, which can be used in a global fire hazard assessment model, is then described. Experimental results on upward flame spread on various materials are ob-tained and the validity of the model is established.

Grant NANB-S-D0556

Sponsored by National Inst. of Standards and Tech-nology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Furniture, *Fire safety, *Models, Burning rate, Fires, Computer program applications, Uphol-stery, *Validation.

The technical document reports on the validation of the furniture fire model with the furniture calorimeter data and on the restructure of the program 'HEM-FAST'. Significant restructuring of the model and its code resolve various problems associated with the first version of HEMFAST. Comprehensive descriptions of the current model and its code structure bene-fit the HEMFAST users. The descriptions include: data processing of the bench scale fire tests database, effective time integrations of surface temperatures, flame spreads, and burn time, effective couple solutions of pyrolysis rates, burnates, soot production, and thermal radiation, and the effective interfacing be-tween the furniture fire model and FAST. The model is wild to the furniture for the factor of the fact validated with fire tests for a 4-cushion mockup fire with three different fabric/foam cushion types. The comparisons include: burn area fractions of each cushion as a function of time, burnrate of the mockup as a function of time with fire test data from the furniture calorimeter, mass loss rate of the furniture as a function of time, and the overall levels of soot production.

The Center for Fire Research has developed HAZARD 1, a method for predicting the hazards to building occu-pants from a fire. Within prescribed limits, HAZARD 1 allows the user to predict the outcome of a fire in a building populated by a representative set of occu-pants in terms of which persons successfully escape and which are killed, including the time, location, and likely cause of death for each. Specifically, the micro-computer program involves four procedures that combine expert judgment and calculations to estimate the consequences of a specified fire. Software descrip-tion: The software is written in Fortran, Basic, Assembly and Clipper programming languages for implemen-tation on an IBM-PC (XT, AT, PS/2) microcomputer under MS-DOS 3.0 (or higher). Memory requirement is 640K. A math co-processor (8087, 80287, or 80387) and a 2Mb hard disk drive are required to operate the system.

Ing Five Insulating Materials. J. G. Hust, and D. R. Smith. Jan 89, 25p NISTIR-89/

3908

Sponsored by Oak Ridge National Lab., TN.

Keywords: *Thermal conductivity, *Thermal insulation, *Thermal measurements, Heat transmission, Thermophysical properties, Thermal resistance, Test facilities, Comparison, Standard deviation.

Measurements of apparent thermal conductivity performed by five different laboratories are compared. Subcommittee C-16.30 (Thermal Measurements) of the American Society for Testing and Materials (ASTM) sponsored the interlaboratory comparison. Two different types of line-source apparatus were used: the needle and the hot wire. The five laboratories measured thermal conductivity of Ottawa silica sand, paraffin wax, and three insulating materials (fi-brous glass, expanded polystyrene, and extruded poly-styrene). Comparison of the test results illustrates the interlaboratory reproducibility. The standard deviation of the thermal conductivity results for the needle appa-ratus is 26%, whereas the standard deviation of the results for the hot-wire apparatus is 17%.

Window U-Values: Revisions for the 1989 ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Handbook - Fundamentals.

Final rept.

M. E. McCabe. 1989, 7p

Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Jnl. 31, n6 p56-62-Jun 89.

Keywords: *Window glazing, *Thermal insulation, *Heat transfer, *Storm windows, Solar energy, Tem-perature control, Solar radiation, Performance evalua-tion, Reprints, *U values, Energy conservation.

Recently, high-performance insulated glass has been introduced into the window market. However, with reduced heat flow in the central glazed portion of a window, heat conduction in the edge spacer and in the frame and sash members has become more important in determining the overall U-Value of the system. Characterization of frame heat transfer coefficients is complicated by the variety of frame configurations for oper-able windows, the different materials, and the different product sizes available. Standard methods for measuring frame heat transfer are not generally available. Chapter 27 in the ASHRAE Handbook of Fundamentals is the authoritative source of technical information on fenestration products such as windows, patio doors, skylights, shading devices, etc. The ASHRAE Handbook is revised every four years based on updat-

ed technical information. A number of changes have been made to the window U-Value table appearing in the 1989 Handbook. The article discusses the technical basis for the changes to appear in the 1989 Handbook and compares data with that from the 1985 Handbook.

Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Fire Science and Engineering Div. Note on Calculating Flows Through Vertical Vents in Zone Fire Models Under Conditions of Arbitrary Cross-Vent Pressure Difference. Final rept.

L. Y. Cooper. 1989, 8p Pub. in Combustion Science and Technology 64, n1-3 p43-50 1989.

Keywords: *Vents, *Pressure gradients, *Airflow, *Fire tests, Ventilation, Algorithms, Pressure, Fluid flow, Reprints.

In typical compartment fire scenarios, ratios of cross-vent absolute pressure are very close to 1. When such is the case, algorithms are available to predict the resulting cross-vent room-to-room flows. There are, however, important situations where this pressure con-dition does not prevail. For example, in fire scenarios involving relatively small penetrations in otherwise heretically-sealed compartments of fire origin, cross-pen-etration pressure differences can be of the order of an atmosphere and pressure ratios, outside-to-insider, can be several tenths less than one. It is important for a versatile compartment fire model to have a capability of predicting vent flows for the entire range of possible cross-vent pressure conditions. The paper presents a unified analytic description of flows through uniformwidth vertical vents connecting pairs of two-layer room fire environments under conditions of arbitrary crossvent pressure difference. The algorithm presented is not significantly more complicated than previouslyavailable algorithms which are restricted to low-pressure-difference cases.

PB90-118076 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Fire Science and Engineering Div. Heat Transfer in Compartment Fires Near Regions of Ceiling-Jet impingement on a Wall. Final rept. L. Y. Cooper. 1989, 6p

Pub. in Jnl. of Heat Transfer 111, p455-460 May 89.

Keywords: *Fire tests, *Fires, *Heat transfer, *Jet flow, Ceilings(Architecture), Walls, Enthalpy, Two di-mensional flow, Flux(Rate), Impingement, Momentum, Reprints.

The problem of heat transfer to walls from fire-plumedriven ceiling jets during compartment fires is introduced. Estimates are obtained for the mass, momentum, and enthalpy flux of the ceiling jet immediately upstream of the ceiling-wall function. An analogy is drawn between the flow dynamics and heat transfer at ceiling-jet/wall impingement and at the line impingement of a wall and a two-dimensional plane free jet. Using the analogy, results from the literature on plane free-jet flows and corresponding wall-stagnation heat transfer rates are recast into a ceiling-jet/wall-impingement-problem formulation. This leads to a readily usable estimate for the heat transfer from the ceiling jet as it turns downward and begins its initial descent as a negatively buoyant flow along the compartment walls. Available data from a reduced-scale experiment provide some limited verification of the heat transfer estimate.

The effects of material characteristics on piloted igni-PS, samples and two different poly(methyl methacrylate), PMMA, samples. The difference between the

BUILDING INDUSTRY TECHNOLOGY

Construction Materials, Components, & Equipment

two PS samples was melt viscosity due to two different MMA samples was thermal stability and melt viscosl-ty also due to two different initial molecular weights. Ignition delay times and time histories of surface temperature and sample weight changes were measured in the external radiant flux range of 0.9-3.0 W/sq cm. A comparison of results between the two PS samples and between the two PMMA samples was made. The comparison indicates that the transport process of in-depth degradation products through the molten poly-mer layer to the sample surface has negligible effects on piloted ignition. However, the thermal stability of the material has significant effects on the piloted ignition delay time and the surface temperature at ignition.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Fire Science and Engineering Div. Fire Growth and Development. Final rept.

J. G. Quintiere. 1989, 24p Pub. in Proceedings of International Symposium on Fire Safety and Engineering, Sydney and Melbourne, Australia, April 27, 1989, p1-24.

Keywords: *Fire tests, *Furniture, *Fires Fire resist-ance, Fire safety, Fire hazards, Flammability, Fla-shover, Combustion.

The phenomena of fire initiation and development is described and discussed. Fire behavior in closed and vented compartments is considered along with the factors important to spread beyond the compartment. The role of furnishings and contents is reviewed and fla-shover is found to be principally responsible for haz-ardous conditions, both thermal and toxic. Exceptions to this are discussed. The use of current and emerging test methods are described. Emphasis is on the interpretation and use of engineering measurements needed in innovative design hazard assessment, in constrast to the conventional practice of performance rankings of materials by a test method.

900,153 PB90-130311 PC A04/MF A01 National Inst. of Standards and Technology (NEL), Boulder, CO. Chemical Engineering Science Div. Microporous Fumed-Silica Insulation as a Stand-ard Reference Material of Thermal Resistance at

Flammability of Uphoistered Furniture with Flam-Ing Sources. Final rept.

V. Babrauskas. 1989, 27p

Pub. in Cellular Polymers 8, p198-224 1989.

Keywords: *Furniture, *Upholstery, *Flammability test-ing, Fire tests, Ignition, Fire safety, Fire resistance, Ca-lonmeters, Reprints.

A number of countries and localities have either re-cently adopted furniture flammability regulations, or are actively considering them. In addition, a number of furniture flammability test methods have been developed in recent years in the course of research. Some of the methods share certain similarities; but, even so, many different testing philosophies exist. The paper compares the more widely used of the methods and examines their advantages and limitations. The impact of some recent research results on test method design is also considered. The methods are discussed only on their technical features and not on their regulatory as-pects. The scope is limited to methods for testing the behavior under flaming the cigarette ignition resistance. Some unresolved areas where further research is desirable are also cited.

Final rept. R. S. Ladd, R. Dobry, P. Dutko, F. Y. Yokel, and R. M. Chung. 1989, 10p Pub. in Geotechnical Testing Jnl. 12, n1 p77-86 Mar

89.

Keywords: *Pore pressure, *Water pressure, *Sands, *Liquefication, Shear strain, Soil properties, Mechani-cal tests, Dynamic response, Reprints, *Earthquake engineering.

The prediction of pore-water pressure buildup in sands caused by undrained cyclic loading is one of the key items in evaluating the potential for liquefaction of sandy sites during earthquakes. Presented herein are data indicating that, in strain-controlled tests, there is a predictable correlation between cyclic shear strain, number of cycles, and pore-water pressure buildup; this correlation is much less sensitive to factors, such as relative density and fabric than comparable results

obtained from stress-controlled tests. The data indi-cate that, for clean sands, this threshold shear strain, as well as the pore-water pressure buildup for strains slightly above the threshold, are basically independent of relative density, grain size distribution, fabric, and method of testing (triaxial and direct simple shear). However, both threshold shear strain and pore-water pressure buildup do depend on the overconsolidation ratio.

Keywords: *Meetings, *Structural analysis, Loads(Forces), Detectors, Measurement, Research, Structural engineering, Earthquake engineering.

The report identifies research and development efforts needed to advance the state-of-the-art in instrumentation and measurement techniques for assessing struc-

tural performance. Four topic areas consisting of seismic effects; wind effects; effects due to occupancy, traffic, snow and other loads; and sensor technology were addressed by respective task groups during a two-day meeting of international experts. The fortyeight specific recommendations presented in the report are intended to serve as a research agenda for use by universities, research establishments and funding agencies.

Residual Stress. Final rept.

D. T. Read. 1989, 7p Sponsored by Naval Sea Systems Command, Washington, DC.

Pub. in Engineering Fracture Mechanics 32, n1 p147-153 1989.

Keywords: *Plates(Structural members), *Strain measurement, *Determination of stress, *Welded joints, *Stress analysis, Mechanical properties, Bend-ing, Elasticity, Cracks, Surface defects, Fractures(Materials), Reprints.

An approximate method for measuring the applied Jintegral produced by residual stresses was developed and applied to four wide plates. The technique uses multiple strain measurements during the cutting of a notch in the weld. Results for welded and post-weld-heat-treated (PWHT) plates with semi-elliptical surface cracks and tube hole ligament cracks were compared. The PWHT plates had much lower J levels. Comparisons with the Newman-Raju linear elastic calculation for surface cracks in bending indicated that the present results are reasonable. Comparison of the present result for the ratio of stress intensity factor to crack mouth-opening displacement with values calculated for through and surface cracks provides additional confidence in the correctness of the present results.

Final rept.

E. K. Budnick, and D. D. Evans. 1986, 6p Pub. in Fire Protection Handbook (16th Edition), Sec-tion 21, Chapter 3, p21-19-21-24 1986.

Keywords: *Enclosures, *Fire protection, *Mathemati-cal models, Containers, Expansion, Growth, Forecasting, Reprints,

In the chapter, a brief discussion of enclosure fire effects is presented, along with equations that can be evaluated using hand calculators to provide estimates of particular effects. Generally, the equations present-ed are well documented and are widely used for such estimates. However, the user is cautioned that most of esumates. However, the user is cautioned that most of the equations were developed based on data from ex-periments that were conducted for very specific, and sometimes idealized, conditions. Therefore, some judgment must be exercised when applying these equations to complex conditions occurring in enclo-sure fires of general interest.

BUILDING INDUSTRY TECHNOLOGY

Structural Analyses

They have been used by engineers and architects for building design, by building officials for plan review, by the fire service for prefire planning, by investigators for post fire analysis, by groups writing fire codes, and by materials manufacturers, fire researchers, and educators. While these models are not a replacement for the building and fire codes they can be a valuable tool for fire professionals. The report focuses on a representa-tive selection of models. At the end of the chapter an in-depth review of models is given.

It is difficult to perform a comprehensive literature survey in several technical fields, and in fire research the problem is compounded by the diverse nature of the field. Fire research cuts across many boundaries, e.g., chemistry, physics, fluid mechanics, mechanical engineering. In an effort to enhance the retrieval rate of information from the Fire Research Information Services (FRIS) collection, the Center for Fire Re-search, National Bureau of Standards decided to automate its literature collection. Using available supermi-cro hardware and software, FIREDOC was created as the on-line bibliographic database for the FRIS collection. Analysis of the alternatives which led to the creation of FIREDOC will be discussed, as well as some retrieval methods to locate relevant information in the database.

10p Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p481-490 1989.

Keywords: *Fire tests, *Computerized simulation, *Buildings, Safety engineering, Fire safety, Model tests, Environmental engineering, Comparisons.

The NBS/Harvard VI multi-room fire model was used to simulate results of previously reported full-scale multi-room fire experiments. The tests and simulations involved: four different compartment configurations of two or three rooms connected by open doorways, four different fire types generated by a methane burner and up to four different doorway openings between the burn room and adjacent space. A total of nineteen dif-ferent tests were carried out and simulated. Selected comparisons between simulated and measured pa-rameters of the fire-generated environments are re-viewed. While the computer code is found to provide generally favorable simulations for the entire range of tests, several areas of modeling detail are identified for further improvement.

Keywords: *Technology transfer, *Businesses, Surveys, State government, National government, Organizations, Improvement, Extension services.

The report presents the findings of a Nationwide survey of state and federal organizations providing

business and technology assistance to small and medium-sized businesses. Information was collected on the nature of the services provided by these organi-zations, the type of firms being assisted, and methods used to reach potential clients. In addition, the survey solicited the views of program managers regarding the needs of small and medium-sized businesses for information on new and existing technologies and ways to improve the transfer of federal technology to potential users in the small business community. The report also contains short descriptions of specialized technology extension services in seven states. Finally, the report recommends actions states should take in expanding their technology assistance efforts and the federal government should take to support these efforts.

Effect of Chinese Standardization on U.S. Export Opportunities.

Y. Lin. Dec 88, 16p NISTIR-88/4000

Keywords: *China, *International trade, *Standards, Requirements, Electric devices, Economic develop-ment, Technology transfer, Exports, Information exchange.

The paper describes the standardization system as it exists in the Peoples Republic of China and identifies the role of the China State Bureau of Standards (CSBS) in the standards coordination process. The standards development and approval process is also described. The implementation of the IECQ program in China for producing electronic products in conformance with internationally recognized quality require-ments is explained and the organizations responsible for the several aspects of the system are identified. The paper advocates technical information exchange programs between the U.S. and the Peoples Republic of China and more U.S. trade missions to China to encourage the adoption of U.S. standards as well as to increase trade between the two countries.

Sponsored by Civil Engineering Lab. (Navy), Port Hue-

Pub. in Oceans 86--Conference Record, Washington, DC., September 23-25, 1986, p1141-1145.

Keywords: *Chemical analysis, *Gas chromatography, *Wooden piles, Standards, Extraction, Hydridization, Tin organic compounds, Reprints, *Tin/butyl, *Tin/di-butyl, *Tin/tributyl, *Tin/tetrabutyl, *Flame photometry.

The paper describes methods and results of the determination of release rates for organotin species re-leased from organotin impregnated wood pilings. The analytical method consists of simultaneous extraction/ hydridization of aqueous lechate samples, with organ-otin speciation by gas chromatography coupled with tin selective flame photometric detection. The sensitivtin selective flame photometric defection. The sensitiv-ity of the flame photometric detector to the butylin family of organotins is 0.1 to 0.2 ng, depending on the species. Chromatographic separation of the butylins provides speciation of mono-through tetrabutylin within a 15 min chromatogram, with the additional ca-pability of identifying any methylbutyltin compounds that may be present in the sample. Water samples were collected from the piling leaching tanks immedi-ately upon immersion of the pilings and continued to be collected for approximately 1 year. Speciation and release rate data were obtained on both the early, first order stage of release, and the latter, zeroth order order stage of release, and the latter, zeroth order phase of controlled release. Instrument calibrations were performed using a specially prepared organotin research material.

Keywords: *Uranium 238, *Quantitative analysis, *Urine, Ionization, Mass spectroscopy, Isotope sepa-ration, Health physics, Reprints.

The U concentration in SRM 2670, Toxic Metals in Freeze-Dried Urine, and the urine of two pre-school age children was determined by measuring the chemi-cally separated U by isotope dilution thermal ionization mass spectrometry using ion counting detection. This procedure can detect about 1% of the atoms in the sample and has a total chemical blank of about 5 pg U. The U concentration in SRM 2670 was found to be 113 The U concentration in SHM 2670 was found to be 113 plus or minus 2 pg (sup 238) U/ml (1s). At this level a 1 ml sample is sufficient for a determination with a total uncertainty of less than 5%. The U concentration in the two children was 3.1 plus or minus 0.9 and 3.6 plus or minus 0.9 pg (sup 238) U/g. These low values sug-gest that the U concentration in urine of unexposed persons may be at this level or lower.

*Aromatic polycyclic hydrocarbons, Keywords: *Chemical analyses, *Spectrum analyses, Standards, Gas chromatography, Concentration(Composition), Reprints, *Standard reference materials, Certification, Air pollution detection.

Since 1980 a number of Standard Reference Materials (SRMs) have been issued by the National Bureau of Standards (NBS) to assist in validating measurements for the determination of polycyclic aromatic hydrocar-(PAC). These SRMs are certified for selected PAC and range in analytical difficulty from calibration solutions to complex natural matrix materials, such as air and diesel particulate matter, shale oil, and crude oil. In the past year three new SRMs have been introduced: (1) SRM 1647a 'Priority Pollutant PAH in Acetonitrile'; (2) SRM 1491 'Aromatic Hydrocarbons in Hexane/Tolu-ene'; and (3) SRM 1597 'Complex Mixture of PAH from Coal Tar. The SRMs available from NBS for use in the determination of PAC are described and the concen-trations of PAC determined in the natural matrix SRMs are summarized and compared. The primary analytical techniques used for the measurement of PAC in these SRMs were gas chromatography, liquid chromatography, and gas chromatography/mass spectrometry.

Keywords: *Chromium, *Biological surveys, *Neutron activation analysis, Chemical analysis, Radioche-mistry, Concentration(Composition), Separation, Blood analysis, Solvent extraction, Trace elements, Reprints, Standard reference materials.

Chromium is one of the most difficult elements to accurately determine at the naturally occurring, ultratrace levels normally found in uncontaminated biological samples. In view of the importance of Cr, both as an essential and as a toxic element, efforts have focused on developing a simple, yet reliable, radiochemical procedure for Cr determination using neutron activation analysis. A number of problem areas have been identified in earlier methods, and an improved radiochemical separation procedure, based upon the liquid/ liquid extraction of Cr(VI) into a solution of tribenzylamine/chloroform, has been developed. The fast neutron interference from Fe has been evaluated for the highly thermal FT-4 facility of the NBS Research Reactor, and Cr concentrations have been determined in samples of whole human blood collected under clean conditions and in two certified reference materials.

R. Zeisler, R. Greenberg, S. Stone, and T. Sullivan.

1988, 4p

Sponsored by Environmental Protection Agency, Washington, DC. Pub. in Fresenius' Zeitschrift fuer Analytische Chemie 332, p612-615 1988.

Keywords: *Chemical analysis, *Biological surveys, *Tissue extracts, Standards, Concentration(Composition), Chemical stabilization, Neutron activation analysis, Zinc, Selenium, Arsenic, Trace elements, Liver extracts, Reprints, *Standard reference materials.

Lyophilized and radiation sterilized biological certified reference materials (CRMs) are believed to be stable in their chemical composition. Generally, the certifying agencies consider the certificates of these biological CRMs valid for a 5-year shelf life, i.e., apart from measurable moisture content, the chemical composition should not change during that time. The long-term be-havior of fresh frozen material is not known. In the study the elemental compositions of the Bovine Liver Standard Reference Material (SRM 1577) and human liver tissue samples are evaluated over a time period of more than 7 years. The concentrations of selected elements were determined by neutron activation analysis at various times. The initial evaluation of zinc, selenium and arsenic results gives no indication of changes during 7 years storage of fresh frozen tissues, however, a trend towards lower arsenic concentra-tions has been observed in SRM 1577 during a 10-year period.

Keywords: *Indium, *Standards, *Cadmium, *Copper, *Lead, *Voltmeters, Anodic polarization, Chemical analysis, Reprints.

Indium (III) is used as an internal standard for the determination of cadmium, copper and lead at the 20 ng/

g level by using differential-pulse anodic stripping vol-tammetry; the supporting electrolyte is 1.0 mol/l am-monium bromide/0.25 mol/l nitric acid. For each solution, each stripping peak of interest is normalized to the corresponding peak height obtained in the same voltammogram for a known, added concentration of indium (III). A calibration curve is prepared for each element by using these normalized peak heights. The technique is demonstrated for NBS SRM 1643b (Trace Elements in Water). The relative standard deviations for six independent determinations of Cd, Cu, and 7b at the 20 ng/g level are 1.9%, 5.4%, and 1.2%, respectively. The imprecision for copper is limited by th sloping baseline at its stripping potential. The detection limit for each element is less than 1 ng/g.

tron Beams. Final rept.

R. M. Lindstrom, R. Zeisler, and M. Rossbach. 1987, 10p

Pub. in Jnl. of Radioanalytical and Nuclear Chemistry 112, n2 p321-330 1987.

Keywords: *Radioactivation analysis, Neutron beams, Reprints, *Activation analysis, *Cold neutrons, Neu-tron capture, Prompt gamma radiation.

Guided beams of cold neutrons being installed at a number of research reactors may become increasingly available for analytical research. A guided cold beam will provide higher neutron fluence rates and lower background interferences than in present facilities. In an optimized facility, fluence rates of one billion n/sq cm/sec are readily obtainable. Focusing a large area beam onto a small target will further increase the neutron intensity. In addition, the shift to lower energies will increase the effective cross sections. The absence of fast neutrons and gamma rays permit detectors to be placed near the sample without intolerable background, and thus the efficiency for counting prompt gamma rays can be much higher than in present systems.

CHEMISTRY

Analytical Chemistry

Keywords: *Standards, *Chemical analysis, Mixtures, Calibrating, Concentration(Composition), Chemical stabilization, Gravimetric analysis, Microanalysis, Re-prints, *Volatile organic compounds, *Standard refer-ence materials, *Air pollution detection, Toxic materials

Methodology is described for the microgravimetric preparation and analytical evaluation of accurate, stable multicomponent gas standards in compressed gas cylinders containing volatile toxic organic com-pounds in pure nitrogen at the mid- to low-parts-perbillion (ppb) level. Standard mixtures have been prepared containing up to nine organic compounds at concentrations ranging from 1 to 1000 ppb by mole. Current indications are that the number of organic compounds in a single mixture is more limited by ana-lytical capability than by the preparation methodology. Over 100 standards, of which several will be discussed in the paper, have been prepared and evaluated for long-term stability and internal consistency. Over 25 different volatile organic compounds spanning three concentration decades have been studied. The sum of preparative and analytical error compounds spanning three concentration decades have been studied. The sum of preparative and analytical error components of the uncertainty associated with the concentration of the organic analytes at the 95% confidence level typi-cally ranges from 3 to 10% relative, depending upon the compound and its concentration. Intercomparative analyses of new and previously prepared standards have verified that such mixtures are stable for several vears.

Final rept. J. D. Gnce, J. Van Velthuizen, P. J. Dunn, D. E. Newbury, E. S. Etz, and C. H. Nielsen. 1986, 9p Pub. in Canadian Mineralogist 24, p665-673 Dec 86.

Keywords: *Carbonate minerals, *Qualitative analysis, *Yttrium, *Rare earth minerals, *Borate minerals, Crystal structure, Raman spectroscopy, X-ray analysis, Descripte structure, Raman spectroscopy, X-ray analysis, Reprints, *Moydite.

The complete mineralogy of a newly discovered mineral, recently named moydite, is reported from the appli-cation of classical techniques of mineral characteriza-tion supported by the results of modern microanalytical methods. The mineral is described as a yttrium/rare earth element tetrahydroxoborate carbonate of ideal empirical formula (Y, REE) (B(OH4)) (CO3). The chem-ical composition and formula of moydite were derived from elemental analysis and x-ray crystal structure de-termination. The microanalytical techniques employed include electron and ion probe microanalysis, as well as Raman microprobe spectroscopy to infer molecular and vibrational structure relationships. The data on the new mineral are presented and its properties dis-cussed to illustrate the advantages of applying a range of synergistic analytical techniques to the comprehensive characterization of a new mineral species.

Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Inorganic Analytical Research Div. Role of Neutron Activation Analysis In the Certifi-cation of NBS (National Bureau of Standards) Standard Reference Materials.

Final rept.

R. R. Greenberg. 1987, 15p Pub. in Jnl. of Radioanalytical and Nuclear Chemistry 113, n1 p233-247 1987.

Keywords: *Neutron activation analysis, Standards, Chemical analysis, Spectrum analysis, Performance evaluation, Quality assurance, Reprints, *Standard reference materials, Certification.

Neutron activation analysis (NAA) is extensively used at the National Bureau of Standards as one of the analytical techniques in the certification of Standard Refer-ence Materials (SRMs). Characteristics of NAA which make it valuable in this role are: inherent accuracy; multielemental capability, especially in the instrument tal mode; ability to assess homogeneity; high sensitivi-ty for many elements, and essentially blank-free nature. Examples of recent SRM analyses illustrating these characteristics are described.

W. F. Koch. 1988, 4p Pub. in Analytical Chemistry 60, n19 p2024-2027, 1 Oct 88.

Keywords: *Liver extracts, *Biological surveys, *Chemical analysis, *Coulometers, *Spectrophoto-metry, _Nitric acid, Spectrum analysis, Digestion(Decomposition), Polarographic analysis, Re-prints, *Wet methods,*Voltammetry, *Liquid column chromatography, Benzoic acid/nitro, Standard refer-ence materials.

Residual organic species in nitric acid digests of freeze-dried bovine liver (NBS SRM 1577a) have been identified by use of voltammetry, liquid chromatography, spectrophotometry, and classical chemical tests. Data from these techniques show that major products of microwave-assisted dissolution by nitric acid include o-, m-, and p-nitrobenzoic acids (NBA). In addition to these compounds, other organic species present in these digests irreversibly complex copper, but not zinc, and result in low values for copper by polarography. and result in low values for copper by polarography. The NBAs and these other organic species are all eliminated by refluxing the nitric acid digest in perch-loric acid at atmospheric pressure. Polarographic re-sults obtained for copper following treatment with perchloric acid agree with the certified value. The use of voltammetry in the evaluation of wet ashing proce-dures is discussed. dures is discussed.

Analytical Applications of Resonance Ionization Mass Spectrometry (RIMS).

Final rept.

J. D. Fassett, and J. C. Travis. 1988, 14p

Pub. in Spectrochimica Acta 43B, n713 p1409-1422 1988.

Keywords: *Chemical analysis, *Inorganic com-pounds, Performance evaluation, Rare gases, Mass spectroscopy, Sampling, Solids, Reprints, *Reso-nance ionization mass spectroscopy, State of the art, Isotope dilution.

A perspective on the role of resonance ionization mass spectrometry illustrate these capabilities and define the potential of RIMS in the generalized field of chemical analysis. Three areas of application are reviewed here: (1) noble gas measurements; (2) materi-als analysis using isotope dilution (IDMS); and, (3) solids analysis using direct sampling. The role of RIMS is discussed relative to the more traditional mass spectrometric methods of analysis in these areas. The applications are meant to illustrate the present state-ofthe-art as well as point to the future state-of-the-art of RIMS in chemical analysis.

PB89-172498 Not available NTIS National Bureau of Standards (NML), Gaithersburg,

MD. Gas and Particulate Science Div. Strategy for Interpretation of Contrast Mecha-nisms in Scanning Electron Microscopy: A Tutorlal. Final rept.

D. E. Newbury. 1986, 5p Pub. in Microbeam Analysis - 1986, p1-5 1986.

Keywords: *Laboratory equipment, Performance eval-uation, Design criteria, Topography, Images, Reprints, *Scanning light microscopy.

The interpretation of images in the scanning electron microscope is based upon prior knowledge of the char-acteristics of the contrast mechanism coupled with knowledge of the response of the electron detector. Pertinent contrast and detector properties include the mechanism of contrast encoding by signal carrier, number, trajectory, or energy effects and detector sen-sitivity to these factors. Examples of the interpretation of images of specimens which have compositional and topographic features are given. Compositional fea-tures are best visualized with a number-sensitive and trajectory-insensitive detector, while topographic fea-tures are detected best with a trajectory-sensitive detector.

Comparison of a Cryogenic Preconcentration Technique and Direct Injection for the Gas Chro-matographic Analysis of Low PPB (Parts-per-Bil-lion) (NMOL/MOL) Gas Standards of Toxic Organic Compounds.

Final rept.

G. C. Rhoderick. 1988, 6p

G. C. Hnodenck. 1988, 6p Sponsored by Environmental Protection Agency, Washington, DC. Pub. in Proceedings of EPA/APCA (Environmental Protection Agency/Air Pollution Control Association) International Symposium on Measurement of Toxic and Related Air Pollutants, Research Triangle Park, NC., May 2-4, 1988, p259-264.

Keywords: *Gas analyses, *Gas chromatography, Halogen organic compounds, Performance evaluation, Cryogenics, Emission spectroscopy, *Air pollution de tection, *Volatile organic compounds, *Toxic sub-stances, *Standard reference materials, Environmen-ter en the standard reference materials, Environmen-ter en the standard reference materials, Environmen-ter en the standard reference materials, Environmental monitoring, Electron capture detectors, Flame ionization.

There is an increasing need for multicomponent gas standards containing volatile toxic organic compounds at the low parts-per-billion level for use in environmen-tal monitoring programs. Standards containing many organic compounds, both halogenated and nonhaloorganic compounds, both nalogenated and hormano-genated species within the same mixture, can be very difficult to analyze at the 1-15 ppb concentration level. Analyses of low level multicomponent mixtures have been done using several different techniques. Gas chromatography has been used to separate com-

Analytical Chemistry

pounds in simple and complex mixtures. Original work was done using packed columns with a flame-ioniza-tion detector (FID) and large sample volumes, 10 mL and an electron-capture detector (ECD) to analyze for halogenated compounds at low ppb levels. Therefore, to measure all the compounds in a single analysis, a cryogenic preconcentration technique was developed to increase the sensitivity of both types of compounds to the FID. Temperature programming was coupled with this cryogenic preconcentration technique to increase the quality of baseline separations.

900,194 PB89-175236

(Order as PB89-175194, PC A06) National Inst. of Standards and Technology, Gaithersbura. MD.

Numeric Databases for Chemical Analysis.

Bi-monthly rept. S. G. Lias. 1989, 11p Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n1 p25-34 Jan-Feb 89.

Keywords: *Chemical analysis, Nuclear magnetic resevaluation, Identifying, Chemical compounds, *Nu-merical data bases, Analytical chemistry, Computer applications.

Databases for use with analytical chemistry instrumen-tal techniques are surveyed, with attention to existing databases and collection efforts now underway, as well as needs for new databases. Collections of spectra for use in Nuclear Magnetic Resonance Spectroscopy, infrared spectroscopy, and mass spectroscopy are described. Using mass spectral databases as an example, a critique is presented of automated quality control procedures used to evaluate individual spectra in large collections; the kinds of problems which have been encountered in using these procedures are discussed. Finally, a brief critical review is presented covering the application of computers to the identification of unknown compounds using spectral databases; again, algorithms used with mass spectrometry are taken as the example.

Characterization of Organolead Polymers in Trace Amounts by Element-Specific Size-Exclusion Chromatography.

Final rept.

E. J. Parks, F. E. Brinckman, and L. B. Kool. 1986,

4p Pub. in Jnl. of Chromatography 370, n1 p206-209, 26

Keywords: *Chromatographic analysis, *Size separation, *Exclusion, *Lead organic compounds, *Polymers, Spectroscopy, Detectors, Graphite, Atomic spectra, Absorption spectra, Molecular weight, Metha-crylates, Organometallic compounds, Ultraviolet spectroscopy, Reprints.

Size exclusion chromatography (SEC), coupled with lead-specific graphite furnace atomic absorption (GFAA) spectroscopy and ultraviolet spectroscopy (UV) detectors was applied to the characterization of a 5:1 copolymer of 4-vinylphenyl, triphenyllead and octa-decylmethacrylate. Less than 1.0 micrograms of the polymer, dissolved and injected in tetrahydrofuran

(THF), provided sufficient data to determine the number- and weight-average molecular weights as well as monomer conversion, with approximately 100% recovery of the injected lead. The method is uniquely capable of characterizing trace quantities of organometallic polymers such as may be obtained in preliminary stages of synthetic research, provided the polymers are soluble in column-compatible solvents.

900,197 PB89-176143

Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Gas and Particulate Science Div. Role of Standards in Electron Microprobe Tech-

nlaues.

Final rept

D. E. Newbury. 1986, 26p Pub. in Jnl. of Trace Microprobe Tech. 4, n3 p103-128 1986

Keywords: *Quantitative analysis, *X ray spectrosco-py, *Standards, *Chemical composition, *Electron mi-croscopy, Reprints, *Electron microprobe analysis.

Standards play a vital role in quantitative analysis techniques based upon electron excitation of x-rays. In the technique of electron probe x-ray microanalysis (EPMA), the description of the interaction of electrons and x-rays is sufficiently well known to permit quantitative analysis with a suite of pure element standards and calculated matrix corrections. Such a scheme pro-vides flexibility in responding to problems in analyzing unknowns of arbitrary composition. In analytical elec-tron microscopy (AEM), constraints on the specimen force reliance on an internal reference through the use of relative sensitivity factors coupled with matrix corrections. AEM standards must consist at least of two components and be in the form of thin foils, and each sensitivity factor requires a separate standard, making the standards suite more difficult to obtain.

PB89-176275 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Statistical Engineering Div. Tests of the Recalibration Period of a Drifting In-

strument.

Final rept.

Final rept. W. Liggett. 1986, 6p Sponsored by Environmental Monitoring Systems Lab., Research Triangle Park, NC. Pub. in Proceedings of Oceans 86, Conference Record on National Monitoring Strategies, Washing-ton, DC., September 23-25, 1986, p923-928.

Keywords: *Continuous sampling, *Samplers, *Cali-brating, *Statistical analysis, *Drift(Instrumentation), Sulfur dioxide, Performance evaluation, Quality assur-ance, Reliability, *Air pollution detection, *Air pollution sampling.

The use of a drifting instrument requires that an ade-quately short recalibration period be chosen. After several periods, the calibration data can be used to test the adequacy of the choice. The paper discusses sta-tistical tests of the recalibration period and applies these tests to continuous analyzers for sulfur dioxide. The paper presents two tests, a test of the second differences of the calibration sequence for normality and a test of the upper part of the spectrum for flatness. The paper illustrates these tests with two sequences

each consisting of about fifty recalibrations of a sulfur dioxide analyzer. Also, the power of the tests and some approximations made in their formulation are investigated by Monte Carlo experiments.

PB89-176887 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Gas and Particulate Science Div. Comparison of Two Translent Recorders for Use with the Laser Microprobe Mass Analyzer. Final rept.

R. A. Fletcher, and D. S. Simons. 1985, 3p Pub. in Microbeam Analysis, p319-321 1985.

Keywords: *Laboratory equipment, *Mass spectrosco-py, Performance evaluation, Comparison, Reprints, *Data acquisition systems, *Laser microprobe mass analyzers, Laser spectroscopy.

Two transient recorders have been utilized as data acquisition systems for the Laser Microprobe Mass Ana-lyzer (LAMMA). Past work has shown that one transient recorder degrades from about 8 to 4 bit resolution when subjected to high frequency signals. This contributes to errors quantification of peak intensities. The dynamic precision of the two recorders will be compared, analyzing the bit degradation with rapidly varying waveforms. Spectral quality of the two recorders and the precision and accuracy of isotopic ratios from standard samples will be examined. The advantages and disadvantages of each device will be reporteď.

Supercritical Fluid Chromatograph for Physicochemical Studies.

Bi-monthly rept. T. J. Bruno. 1989, 8p

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n2 p105-112 Mar-Apr 89.

Keywords: *Chromatography, Chromatographic analysis, Chemical analysis, Physicochemical properties, Diffusion coefficient, Molecular weight, Polymers, Solubility, *Supercritical fluid chromatography, *Supercritical fluids.

A supercritical fluid chromatograph has been designed and constructed to make physicochemical measure-ments, while retaining the capability to perform chemi-cal analysis. The physicochemical measurements in-clude diffusion coefficients, capacity ratios, partition coefficients, partial molar volumes, virial coefficients, solubilities, and molecular weight distributions of poly-mers. In the paper, the apparatus will be described in detail, with particular attention given to its unique features and capabilities. The instrument has recently been applied to the measurement of diffusion coefficients of toluene in supercritical carbon dioxide at a temperature of 313 K, and pressures from 133 to 304 bar (13.3-30.4 MPa). The data are discussed and compared with previous measurements on similar systems.

Preparation of Multistage Zone-Refined Materials for Thermochemical Standards. Final rept.

E. Rubinstein, M. E. Glicksman, B. W. Mangum, Q. T.

Fang, and N. B. Singh. 1988, 10p Sponsored by National Aeronautics and Space Admin-istration, Washington, DC.

Pub. in Jnl. of Crystal Growth 89, p101-110 1988.

Keywords: *Calibrating, *Standards, *Purity, *Thermal analysis, *Nitriles, Measurement, Phase diagrams, critical temperature, Hermetic compressors, Crystal structure, Zone melting, Melting points, Chemical equi-librium, Solids, Liquids, Gases, Reprints, Succinonitrile.

The melting, boiling, and triple points of materials have long served to define the International Practical Temperature Scale (IPTS), which is the embodiment of the thermodynamic temperature scale as 13 well-defined fixed points along with interpolative schemes for standardized instruments used for temperature measstandardized instruments used for temperature meas-urement. Techniques have evolved over the past seven years in the laboratory for preparing and charac-terizing ultra-pure organic compounds by multistage hermetic zone-refining. Methods have matured to the point where high-purity succinonitrile (SCN) now pro-vides the triple-point equilibrium defining 58.0796 + or - 0.0015 C relative to the IPTS of 1968. Most recently, the Netional Pursue of Standard through the efficience the National Bureau of Standards, through its office of Standard Reference Materials, has issued certification for Standard Reference Material 1970, which is offered as an evacuated minicell containing approximately 60 g of double-stage hermetically zone-purified SCN. The steps that lead up to the completed minicells filled with SCN are discussed in detail. Since the cells are evacuated prior to the purification process, the succinonitrile is under its own vapor pressure. The solid/liquid equi-librium, as determined by melting and freezing point measurements, is therefore considered to be equivalent to the triple-point. A compilation of recently ac-quired performance data which assess the statistical properties of over 100 SCN triple-point cells is presented and discussed. These data firmly establish the reliability of multistage zone-refining methods for achieving reliable thermometric standards using solid/liquid/ vapor thermochemical equilibria.

Pub. in Analytical Chemistry 61, n8 p823-827, 15 Apr

Keywords: *Distillation equipment, *Acid treatment, *Purification, Condensers(Liquefiers), Tetrafluoroethy-lene resins, Trace elements, Metals, Stills, Chemical analysis, Reprints, *Sub-boiling stills.

The sub-boiling method of acid purification for low trace element blank has now been in use for about 20 years. However, to achieve commercially useful yields, distillates must be produced at approximately 25-100 L/day. Aspects of still design that include throughput have been examined, including variables such as con-denser area, temperatures, distance between the condenser and the liquid in the still pot, and coolant temperature. Designs for several new stills are given and compared to those of prior sub-boiling stills. Perfluoroalkoxy resin construction was used both for ease of fabrication and for the distinct distillate purity.

Final rept.

D. S. Simons. 1988, 15p See also PB86-193232.

Pub. in Appl. Surf. Sci. 31, n1 p103-117 1988.

Keywords: *Mass spectroscopy, Particles, Aerosols, Surfaces, Reprints, *Laser microprobe mass spectros-copy, Time-of-flight spectrometers.

Laser microprobe mass spectrometry (LMMS) uses a high power density pulsed laser beam to ablate a microvolume of material. The fraction of this material that is ionized can be detected using a time-of-flight mass spectrometer. Two different instrumental configurations, 'transmission' and 'reflection,' that satisfy different analytical requirements are characterized by the geometry of ion collection from the specimen. The fea-tures of LMMS include a spatial resolution of about 1 micrometer, high mass range, isotopic selectivity, ppm detection limits for many elements from picograms of material, and molecular structure information from or-ganic materials. The major application areas for this technique are in the analysis of biological tissues and cells, organic materials, particles and aerosols, and surfaces of metals, semiconductors, and dielectric materials.

National Bureau of Standards (NML), Gaithersburg, MD. Gas and Particulate Science Div. Uncertainties In Mass Absorption Coefficients In Fundamental Parameter X-ray Fluorescence Anal-

ysls. Final rept

B. A. R. Vrebos, and P. A. Pella. 1988, 10p Pub. in X-ray Spectrometry 17, n1 p3-12 1988.

Keywords: Reprints, *X-ray fluorescence analysis, Mass absorption coefficients, Intercomparison, Uncertainty.

Various compilations of mass absorption coefficients are currently used in fundamental parameter computer programs for correction of interelement effects in quantitative x-ray fluorescence analysis. Statistically significant differences in results of analysis were observed for certain sample types when three most commonly used compilations were compared, especially when only pure element standards were used for calibration. When type standards combined with a second degree polynomial fit to the standards are used for calibration, differences between compilations become negligible in the analysis results.

Quality Assurance in Metals Analysis Using the Inductively Coupled Plasma.

Final rept. R. L. Watters. 1987, 20p

Pub. in ASTM (American Society for Testing and Materials) Special Technical Publication 944, p108-127 1987.

Keywords: *Quality assurance, *Chemical analysis, *Metals, Accuracy, Precision, Reprints, *Inductively coupled plasma.

The inductively coupled plasma (ICP) technique is a useful approach for multielement analysis of a wide vanety of materials. Published reports have described the successful application of the ICP technique for the analysis of trace, minor, and major elements in metal alloys. When assessing the quality of analytical results using the ICP or any other technique, one must consider the contribution of various parts of the measurement process to the total random error. In addition, a careful evaluation of sources of systematic error must be undertaken, so that the appropriate corrections may be applied to the analytical results. The inherent linearity of the ICP technique offers a corrections scheme for dealing with spectral interferences, but the method of measuring correction factors and account-ing for their variability warrants close examination. Most descriptions of ICP applications report relative freedom from matrix effects. Although the magnitude of systematic errors may be less than for other spectrometric techniques, such errors can cause analytical bias which can appreciably affect the final results. For example, it has been shown that differences in final acid concentration between pure element standards and the sample can cause systematic error. This type of problem can occur when complex alloys are dis-solved for ICP analysis. Examples of these kinds of errors and approaches to correcting for them will be presented.

Preparation of Standards for Gas Analysis.

Final rept.

G. C. Rhoderick, and E. E. Hughes. 1987, 10p Sponsored by Institute of Gas Technology, Chicago,

Pub. in Natural Gas Energy Measurement, p45-54 1987

Keywords: *Gas analysis, *Gravimetric analysis, Concentration(Composition), Chemical analysis, Natu-ral gas, Methane, Reprints, *Standard reference mate-

A primary standard is prepared by an absolute method with the gravimetric method being the preferred technique. The basic method can be modified to prepare samples at very low concentrations (parts per trillion) and containing very specific and complex mixtures such as hydrocarbons. As will be illustrated, it is very important to have standards which are very close and bracket the concentration of the unknown in question. This is especially important when analyzing natural gas. In this case, two methods may be used to determine the concentration of methane in natural gas. However, one method will lead to a much lower uncertainty and thus, a lower uncertainty in the BTU value of the natural gas.

A hybrid expert-database system is being developed to provide advice on the preparation of samples for elemental analysis. The paper describes an expert system component that is designed to assist the analyst in the identification of four analytical descriptors necessary to develop procedures for sample prepara-tion. When completed, the system will be able to furnish information on the dissolution of the sample. Future versions of the system will also provide advice on separations that may be required prior to the analyt-ical measurement. A PC-AT microcomputer and commercially available software were used to develop the system. A compiled version of the system will run on PC-compatible computers.

Microwave Digestion of Biological Samples: Selenium Analysis by Electrothermal Atomic Absorption Spectrometry.

Final rept.

K. Y. Patterson, C. Veillon, and H. M. Kingston. 1988, 12p

Pub. in Introduction to Microwave Sample Preparation, Chapter 7, p155-166 1988.

Keywords: *Atomic absorption, *Selenium, *Analytical chemistry, *Microwaves, Zeeman effect, Tissues(Biology), Isotopic labelling, Standards, Temperature, Pressure, Reprints.

Closed vessel, microwave-heated digestions are used to rapidly destroy the organic matrix of biological samples with nitric acid at elevated temperatures and pressures. The system allows controlled, uniform applica-

tion of microwave power and monitoring of temperature and pressure, and permits reproducible conditions while not exceeding the pressure or temperature limi-tations of the container. Samples are digested and analyzed for selenium by electrothermal atomic ab-Zeeman background correction. Analyte recoveries are established by using a radiotracer (75)Se and ac-curacy is verified with standard reference materials of biological origin.

MD. Radiation Physics Div. Improved Low-Energy Diffuse Scattering Electron-Spin Polarization Analyzer.

 M. R. Scheinfein, D. T. Pierce, J. Unguris, J. J.
 McClelland, and R. J. Celotta. 1989, 11p
 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Review of Scientific Instruments 60, n1 p1-11 Jan 89.

Keywords: *Electron spin, *Polarization(Spin alignment), *Measurement instruments, Diffusion, Energy, Gold, Polycrystalline, Asymmetry, Trajectories, Reprints.

An improved low-energy diffuse scattering electron-spin polarization analyzer is described. It is based on the low-energy (150eV) diffuse scattering of polarized electrons from polycrystalline evaporated Au targets. By collecting large solid angles and efficiently energy filtering the scattered electrons, a maximum figure of merit, FOM = S sup 2 |/| sub o = 2.3 x 10(sub -4) is achieved. Maximum measured values of the Sherman function were S = 0.15. Further, the instrumental (false) asymmetry due to changes in the trajectory of the incident electron beam has been minimized by balancing the angular and displacement asymmetries. A total residual scan asymmetry as low as 0.0035/mm has been measured over 4-mm scan fields at the Au target in the detector. This instrumental asymmetry would produce a maximum error in the polarization in a SEMPA experiment of less than 0.3% for a 100-micron full-field scan. Details of the design and performance of the new detector are given.

Keywords: *lodine, *Trace elements, *Mass spec-trometry, Chemical analysis, Milk, Plants(Biology), Iso-topes, Lanthanum compounds, *Standard reference materials.

A method has been developed for the determination of trace level iodine in biological and botanical materials. The method consists of spiking a sample with (129)I, equilibration of the spike with the natural iodine, wet ashing under carefully controlled conditions, and separation of the iodine by co-precipitation with silver chlo-nde. Measurement of the (129)I/(127)I ratio is accom-plished by negative thermal ionization mass spectrometry using LaB6 for ionization enhancement. The application of the method to the certification of trace iodine in two Standard Reference Materials is described.

Spectrum of Doubly Ionized Tungsten (W III).

Bi-monthly rept. L. Iglesias, M. I. Cabeza, F. R. Rico, and O. Garcia-Riquelme. and V. Kaufman. 1989, 38p Prepared in cooperation with Consejo Superior de In-vestigaciones Científicas, Madrid (Spain). Inst. de Optica.

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n4 p221-258 Jul/Aug 89

Keywords: *Tungsten, *Spectroscopy, *Ionization, Tables(Data).

The spectrum of doubly ionized tungsten (W III) was produced in a sliding-spark discharge and recorded photographically on the NIST 10.7-m normal-incidence vacuum spectrograph in the 600-2680 A spectral region. The analysis has led to the establishment of 71 levels of interacting 5d(4), 5d(3)6s(2) even configura-tions and 164 levels of the interacting 5d(3)6p and 5d(2)656p odd ones. A total of 2636 lines have been classified as transisions between the 235 experimentally determined levels. Comparison between the observed levels and those calculated from matrix diagonalizations with least-squares fitted parameters shows an rms deviation of + or \cdot 87/cm for the even configurations and + or \cdot 450/cm for the odd ones.

Keywords: *Silicon, *Quantitative analysis, *Calibrat-ing, *Oxygen, *Infrared spectroscopy, *Interstitials, Reproducibility, Accuracy, Reprints.

An international interlaboratory dual experiment was performed to determine the calibration factor used to calculate the interstitial oxygen content of silicon from room-temperature (300 K) infrared (IR) absorption measurements. Round robins were conducted for both the infrared and the absolute measurements on the same or equivalent specimens. The calibration factor for computing the oxygen content of silicon in parts per million atomic (ppma) from a room-temperature measurement of the absorption coefficient at 1107/cm was determined to be 6.28 + or - 0.18 ppma/cm. The IR round robin showed a reproducibility on the order of 3%

The concentration of Se and Te have been determined by isotope dilution spark source mass spectrometry (ID SSMS). Discrepancies in Se concentrations prompted an extensive evaluation of the copper benchmarks series. Because certain forms of Se are volatile, a (75)Se tracer study aided in the identification of areas where Se losses could occur. In isotope dilution, slight losses of Se after equilibration of the natural and enriched isotopes would not alter the calculated concentrations. They are based on data generated from the measured isotopic ratio which is established during equilibration. Agreement of Se concentrations between copper samples dissolved in covered teflon beakers with those dissolved in carius tubes assured that no Se was volatilized prior to equilibration. The Cu samples analyzed had Se and Te concentration ranging from 0.59-480 micrograms/g and 0.29-196 micro-grams/g respectively with about a 2% relative stand-ard deviation. The blank contribution was negligible.

M. Olsson, L. C. Sander, and S. A. Wise. 1989, 14p Pub. in Jnl. of Chromatography 477, p277-290 1989.

Keywords: *Aromatic polycyclic hydrocarbons, *Chemical analysis, *Chromatographic analysis, *Dex-trins, Comparison, Separation, Performance evaluation, Molecular structure, Reprints, *Liquid chromatography, Retention, Selection rules.

Selectivity towards polycyclic aromatic hydrocarbons (PAHs) was studied on cyclodextrin bonded phases and compared to selectivity observed on C18 phases. The study included the separation of eleven five-ring PAH isomers on each of three phase types; monomeric C18, polymeric C18 and cyclodextrin. Retention of PAHs ranging in size from three to six condensed rings was also investigated. Retention on the cyclodextrin phase is based on inclusion complexing between the solute and cyclodextrin cavity, resulting in a strong shape dependence. However, the shape selectivity ex-hibited by the cyclodextrin phase is different from that exhibited by either the monomenic or polymeric C18 phases; retention on the cyclodextrin phase is strongly dependent on the shape and shows very little molecular weight dependence. Calculations of solute molecu-lar widths were performed to predict the isomers' abili-ty to enter the cyclodextrin cavity. The effect of sample solvent and injection volume was also investigated for the cyclodextrin phase. A retention model based on the solute shape is proposed for PAH isomers on Betacyclodextrin phase.

PB90-128653 Not available NTIS National Inst. of Standards and Technology (NML), Gaithersburg, MD. Gas and Particulate Science Div. Determination of Experimental and Theoretical k(sub ASI) Factors for a 200-kV Analytical Electron Microscope.

Final rept.

P. J. Sheridan. 1989, 21p Pub. in Jnl. of Electron Microscopy Technique 11, p41-61 1989.

Keywords: *Quantitative analysis, *Electron microsco-py, Glass, X ray analysis, Grinding(Comminution), Standards, Particle size, Reprints.

The relative sensitivity of an analytical electron microscope and energy-dispersive x-ray detector to x-rays of various elements is investigated through an exten-sive k(sub ASi) factor study. Elemental standards, pri-marily National Bureau of Standards multielement research glasses, were dry-ground into submicrometer-

sized particles and analyzed at 200 kV accelerating potential. The effect of self-absorption of x-rays by the particle has been corrected for, allowing the experi-mental k(sub ASi) factors from the study to approximate those that could be obtained from 'infinitely thin' specimens. Whenever possible, elemental k-factors were determined by the analysis of many (up to a maxi-mum of nine) different standard materials. Experimental k(sub ASi) factors were calculated for a wide range of K(sub alpha), L(sub alpha), and M(sub alpha) x-ray lines. For comparison, theoretical k(sub ASi) factors, employing a variety of ionization cross sections, were computed. Good agreement is obtained between several of the theoretical k-factor models and the experimental results. Mass volatilization of Na and K from the small glass particles during analysis is discussed, as are observations that the grinding and/or dispersing of standard materials in a liquid (such as ethanol) may promote leaching of certain elements from the particle matrix.

Final rept. L. I. Yin, J. I. Trombka, and S. M. Seltzer. 1989, 8p Pub. in Nuclear Instruments and Methods in Physics Research A277, p619-626 1989.

Keywords: *Pattern recognition, Alloys, Computation, Reprints, *X-ray fluorescence analysis.

In many applications of X-ray fluorescence (XRF) analysis, quantitative information on the chemical components of the sample is not of primary concern. Instead, the XRF spectra are used to monitor changes in the composition among samples, or to select and classify samples with similar compositions. The authors propose in this paper that the use of pattern recognition technique in such applications may be more conven-ient than traditional quantitative analysis. The pattern recognition technique discussed here involves only one parameter, i.e., the normalized correlation coefficient and can be applied directly to raw data. Its computation is simple and fast, and can be easily carried out on a personal computer. The efficacy of this pattern recgnition approach is luuustrated with the anaylsis of experimental XRF spectra obtained from geological and allov samples.

Pub. in Nuclear Instruments and Methods in Physics Research Section B - Beam Interactions with Materials and Atoms 29, n1-2 p346-354 1987.

Keywords: *Chemical analysis, *Aerosols, *Carbon 12, *Carbon 14, *Mass spectroscopy, Particles, Sam-pling, Performance evaluation, Reprints, *Laser spectroscopy, Atmospheric chemistry.

Carbon isotopic measurements ((12)C, (14)C), derived from chemical measurements of total carbon plus AMS measurements of (14)C'(12)C have become an accepted means for estimating fossil and contempo-rary carbon source contributions to atmospheric carbon. Because of the limited sensitivity of these techniques, however, such measurements are restricted to 'bulk' samples comprising at least 10 - 100 mi-crograms of carbon. Laser mass spectrometry offers an important complementary opportunity to investigate the chemical nature of individual particles as small as 0.1 micrometers in diameter. Although there is little hope to measure (14)C/(12)C in such small samples, the compositional and structural information available with the laser microprobe is of interest for possible source discrimination. Also, the analysis of individual particles, which may reflect individual sources, yields significant potential increases in spatial, temporal and source resolution, in comparison to bulk sample analysis.

Pub. in Jnl. of Electroanalytical Chemistry 271, p325-329 1989.

Keywords: *Spectrum analysis, *Electrochemistry, *Electron transfer, Nernst effect, Nonlinear systems, Numerical analysis, Chemical reactions, Separation, Chemical analysis, Reprints, Potentials.

Analysis of the spectroelectrochemistry of a multi-step electrochemical process in a thin layer cell is presented. Typical characteristic Nernst plots for various formal potential separations and various extinction coefficients of the species are illustrated. A method for calculating the formal potentials from these non-linear Nernst plot is suggested, and an illustrative application is given.

Synthesis and Characterization of Ettringite and Related Phases.

Final rept. L. Struble. 1986, 7p

Sponsored by Department of Energy, Washington, DC.

Passive and Hybrid Solar Energy Div. Pub. in Proceedings of International Congress on the Chemistry of Cement (8th), Rio de Janeiro, Brazil, September 22-27, 1986, p582-588.

Keywords: *Dehydration, *Phase diagrams, *Energy storage, Synthesis, Enthalpy, Compositions, Assess-ments, Evaluation, Reprints, *Ettringite, *Energy storage materials.

Ettringite and related phases were studied to assess their performance as energy storage materials, utiliz-ing the dehydration reaction. Ettringite and four isosing the dehydration reaction. Ettringite and four isos-tructural phases were synthesized and characterized, particularly with regard to thermal properties, to study the effect of chemical composition on such thermal parameters as the temperature and the enthalpy change of the dehydration reaction. Synthesis proce-dures were developed for following phases: (Ca3AI(OH)6)2(SO4)3x26 H2O (ettringite), (Ca3Fe(OH)6)2(SO4)3x26H2O, (Ca3AI(OH)6)2(SO4)3x26H2O, (Ca3AI(OH)6)2(SO4)3x26H2O, (Ca3AI(OH)6)2(SO4)2(CO3)2x24H2O (thaumasite). Each synthesized material was examined for bulk

Each synthesized material was examined for bulk chemical composition, phase composition, unit cell pa-rameters, morphology, and thermal properties. Each phase showed a low-temperature dehydration with ini-tial temperature ranging from 6 C to 33 C. The change in enthalpy associated with the dehydration ranged from 60 to 200 cal/g sample. Thus both the dehydra-tion temperature and the enthalpy change varied sig-nificantly for the isostructural phases studied.

Final rept.

N. D. Shinn. 1989, 13p Sponsored by Department of Energy, Washington, DC. Pub. in Surface Science 214, p174-186 1989.

Keywords: *Oxidation reduction reactions, *Chromium oxides, "Chemisorption, "Carbon monoxide, Electron energy, Annealing, Oxygen, Vibrational spectra, Sur-face chemistry, Reprints, Binding sites.

High resolution electron energy spectroscopy of chemisorbed carbon monoxide is used to distinguish be-tween an annealed, oxidized Cr(110) surface, an intermediate, subsurface Cr(110) oxide, and oxygen-dosed Cr(110). On the annealed oxide, weak signals are ob-served from both the dissociation-precursor (alpha 1-CO) and the terminally-bonded (alpha 2-CO) molecular CO binding states, but only after relatively high CO exposures, reflecting greatly reduced sticking probabil-tites. On the surface with subsurface oxygen, both binding states are sequentially populated with sticking probabilities comparable to that of clean Cr(110); also, an increase in huCO from approximately 1975 to 2035/cm is observed at high coverages of terminally-bonded alpha sub 2-CO. Both the annealed-oxide and subsurface-oxide CO chemisorption results are in contrast to the selective poisoning of only alpha sub 1-CO by chemisorbed atomic oxygen on Cr(110). Comparisons among the three oxygen containing surfaces show how vibrational spectroscopy of chemically-ine-quivalent molecular binding states may be used as a probe of surface oxidation and provide insights into the oxygen-CO surface chemistry.

Summary rept. 1 Oct 87-30 Sep 88. J. Hord. Dec 88, 162p NISTIR-88/3907 See also PB88-164272.

*Chemical *Research Keywords: engineering, rojects, Measurement, Thermophysical properties, Standards, Reaction kinetics, Proteins, Calibrating, Fluid mechanics, Separation, Thermodynamics, Biotechnology.

Technical research activities performed by the Center for Chemical Technology during the Fiscal Year 1988 are summarized herein. These activities include work in the general categories of measurements (standards, processes, and equipment design), properties (ther-mophysical, thermochemical, and kinetic), and biotechnology (protein engineering and separations). They embody: development and improvement of measurement standards, measurement principles, and calibration services for pressure, temperature, volumetric and mass flow rates, liquid volume and density, humidity, and airspeed; generation (via accurate meas-urements and advanced predictive models) of reliable reference data for thermophysical, thermochemical, and kinetic properties of pure fluids, fluid mixtures, and solids of industrial and environmental importance; provision of fundamental understanding of protein structure-function and advanced technology for commercial scale separation of proteins; and development of im-proved correlations, models, and measurement tech-niques for complex flows, heat and mass transport. mixing, and chemically reacting flows of interest in modern unit operations.

Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Chemical Process Metrology Div. Laser Excited Fluorescence Studies of Black

Liquor.

Final rept. J. J. Horvath, and H. G. Semerjian. 1986, 7p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers)-Optical Techniques for In-dustrial Inspection, v665 p258-264 1986.

Keywords: *Black liquors, *Pulping, Near ultraviolet ra-diation, Process control, Papers, Pulps, Inspection, Lignin, *Laser induced fluorescence.

Laser excited fluorescence of black liquor was investi-gated as a possible monitoring technique for pulping processes. A nitrogen pumped dye laser was used to examine the fluorescence spectrum of black liquor soutions. Various excitation wavelengths were used be-tween 290 and 403 nm. Black liquor fluorescence spectra were found to vary with both excitation wavelength and black liquor concentration. Laser excited fluorescence was found to be a sensitive technique for measurement of black liquor with good detection limits and linear response over a large dynamic range.

influence of Reaction Reversibility on Continuous-Flow Extraction by Emulsion Liquid Membranes. Final rept.

D. L. Reed, A. L. Bunge, and R. D. Noble. 1987, 21p Grant EPA-R-811247

Sponsored by Environmental Protection Agency, Washington, DC. Grants Administration Div.

Pub. in ACS (American Chemical Society) Symposium Series 347, p62-82 1987.

Keywords: *Solvent extraction, *Mathematical models, *Liquid filters, *Membranes, *Chemical reac-tivity, *Chemical equilibrium, Performance evaluation, tivity, *Chemical equilibrium, Performance evaluation, Irreversible processes, Emulsions, Continuum mechanics, Reprints.

The paper examines theoretically the continuous flow extraction by emulsion globules in which the transfering solute reacts with an internal reagent. The reversi-ble reaction model is used to predict performance. These results are compared with advancing front calculations which assume an irreversible reaction. A simple criterion which indicates the importance of re-action reversibility on performance is described. Calcu-lations show that assuming an irreversible reaction can lead to serious underdesign when low solute concen-trations are required. For low solute concentrations an exact analytical solution to the reversible reaction problem is possible. For moderate solute concentra-tions, the authors have developed an easy parameter adjustment of the advancing front model which rea-sonably approximates expected extraction rates.

Modelling of impurity Effects in Pure Fluids and Fiuid Mixtures. Final rept.

J. S. Gallagher. 1986, 20p Pub. in Proceedings of American Institute of Chemical Engineers Spring National Meeting and Petroleum Expo'86, New Orleans, LA., April 6-10, 1986, 20p.

Keywords: *Impurities, Mixtures, Ethylene, Thermody-namic properties, *Fluid modelling, *Impurity effects, Isobutane, Isopentane.

An extended corresponding-states model for the Helmholtz free energy for two-component mixtures, based upon existing accurate representations of the principal component as the reference function, has been used to model the effects of impurities. The results give a clearer and more accurate view of the errors caused in the measurement of thermodynamic properties by small amounts of impurity than was previously obtained with simplifying approximations. The model is also extended to include three-component mixtures to allow the estimation of the effects of impu-rities in two-component mixtures. The model is applied to two systems of practical importance: methane as an impurity in ethylene, and n-butane as an impurity in iso-butane-isopentane mixtures. Both of these systems are of commercial importance and commonly used in are or commercial importance and commonly used in their critical regions where the impurities can cause large errors in the thermodynamic properties used and where existing procedures for the estimation of the im-purity effects break down.

Dynamic Light Scattering and Angular Dissymme-try for the In situ Measurement of Sillcon Dioxide Particle Synthesis in Flames. Final rept.

M. R. Zachariah, D. Chin, H. G. Semerjian, and J. L. Katz. 1989, 7p

Pub. in Applied Optics 28, n3 p530-536, 1 Feb 89.

Keywords: *Silicon dioxide, *Particle size, *Light scattering, Diffusion flames, Optical measurement, Proc-ess control, Reprints, *Synthesis(Chemistry).

Particle size measurements have been made of silica formation in a counterflow diffusion flame reactor using dynamic light scattering and angular dissymme-try methods. The results suggest that the techniques compare quite favorably in conditions of high signal to degrades rapidly as the signal strength declines, re-sulting in erroneously small particle diameters. As a general rule, dynamic light scattering does not seem to possess the versatility and robustness of the classical techniques as a possible on-line diagnostic for process control. The drawbacks and limitations of the two techniques are also discussed.

Dichromate Dosimetry: The Effect of Acetic Acid on the Radiolytic Reduction Yield.

Final rept.

M. Al-Sheikhly, M. H. Hussmann, and W. L. McLaughlin. 1988, 7p Pub. in Radiation Physics and Chemistry 32, n3 p545-551 1988.

Keywords: *Reduction(Chemistry), *Potassium chro-mates, *Gamma irradiation, *Visible spectrum, Acetic acid, Nitrogen, Oxygen, Dosimetry, Silver, Hydrogen peroxide, Reprints.

The radiation chemical yield for the reduction of di-chromate, Cr(VI) to Cr(III), in an acidic aqueous perch-loric acid solution of potassium dichromate, may be increased from 0.04 to greater than 0.2 micro mol(J sub -1) by adding acetic acid. The increased yield, G, is about the same in N(sub 2-) and O(sub 2-) saturated solutions. The molar linear absorption coefficient at 350 n also is the same in both solutions. Epsilon sub m = 2800 M(sup -1)cm(sup -1) at pH 0.4. The proposed mechanism to explain the enhanced response in N(sub 2-) saturated solutions involves the efficient re-action of acetic acid with hydroxyl radicals by the abstraction of H from the methyl group; the resulting acid radicals react with relatively high yield to reduce Cr(VI). In O(sub 2-) saturated solution, the acetic acid radical apparently goes through an acetic acid peroxyl radical by a bimolecular reaction to the tetroxide intermediate of acetic acid, which releases H2O2 with relatively high yield by a Bennett-type reaction. This additional H2O2, as a reducing agent, reacts slowly with dichromate and

boosts the value of G. The negative slope of the re-sponse continues to increase during the period immediately after irradiation of oxygenated solution, due to slow reaction of radiolytically-produced H2O2 with di-chromate. There is also in both O(sub 2-) and N(sub 2-) saturated solution a long-term slow reaction involving oxidation of the organic substrate (in this case, acetic acid). Because of these instabilities, the solutions cannot readily be used for dosimetry without the pres-ence of silver ions, which in the oxidized state, Ag(sup 2+), act to stabilize the solution after irradiation.

High Accuracy Determination of (235)U in Nondestructive Assay Standards by Gamma Spectrometry. Final rept.

R. R. Greenberg, and B. S. Carpenter. 1987, 21p Pub. in Jnl. of Radioanalytical and Nuclear Chemistry 111, n1 p177-197 Apr 87.

Keywords: *Uranium 235, *Chemical analysis, *Assay-ing, *Gamma ray spectroscopy, *Accountability, Non-destructive tests, Standards, Accuracy, Uranium oxides, Radioactive isotopes, Mineral deposits, Reprints.

High precision gamma spectrometry measurements have been made on five sets of uranium isotope abundance reference materials for nondestructive assay (NDA). These sets are intended for international safeguards use as primary reference materials for the de-termination of the 235U abundance in homogeneous uranium bulk material by gamma spectrometry. The measurements were made to determine the count rate uniformity of the 235U 185.7 keV gamma-ray as well as the 235U isotope abundance for each sample. Since the samples were packaged such that the U308 is infinitely thick for the 185.7 keV gamma-ray, the measured count rate was not dependent on the material density. In addition, the activity observed by the de-tector was collimated to simulate calibration conditions used to measure bulk material in the field. The results of the study indicate that accuracy of 235U determination via gamma spectrometry, in the range of few hun-dredths of a percent (2 sigma), is achievable. The main requirement for achieving this level of accuracy is a set of standards whose 235U isotope abundances are known to within 0.01% (2 sigma).

Dehydrogenation of Ethanol In Dilute Aqueous Solution Photosensitized by Benzophenones.

Pinal rept. P. Green, W. A. Green, A. Harriman, M. C. Richoux, and P. Neta. 1988, 19p Pub. in Jnl. of the Chemical Society, Faraday Transac-

tions | 84, pt6 p2109-2127 1988.

Keywords: *Ethyl alcohol, *Dehydrogenation, *Photo-chemical reactions, *Benzophenones, Solutions, Chemical properties, Molecular energy levels, Free radicals, Radiolysis, Catalysts, Reaction kinetics, Reprints, *Hydrogen production.

The photochemical properties of a series of watersoluble benzophenones have been evaluated in dilute

aqueous solution. The compounds possess lowest energy singlet and triplet excited states demonstrating considerable n, *character. As such, irradiation of the compounds in aqueous solution containing ethanol (2% v/v) results in pinacol formation via a triplet state hydrogen abstraction process. In the presence of a colloidal Pt catalyst, the intermediate ketyl and 1methyl-1-hydroxyethyl radicals can be used to reduce water to H2. The rate of H2 formation and its total yield depend upon the nature of the substituent used to solubilize the benzophenone. The rate at which the ketyl radical transfers an electron to the Pt particles can be rationalized in terms of thermodynamic and electrostatic factors.

Keywords: *Oxygen, *Carbon dioxide, *Water, *Barium oxides, *Adsorption, *Tungsten, *Photoelec-tric emission, Ultraviolet spectroscopy, Hydroxides, Carbonates, Thin films, Cathodes, Radiation effects, Synchrotrons, Substrates, Reprints

The interaction of O2, CO2, and H2O with bulk BaO and BaO adlayers adsorbed on W(001) has been examined using ultraviolet photoelectron spectroscopy. H2O reacts with bulk BaO to form Ba(OH)2, while CO2 forms a surface layer of BaCO3. Water and carbon dioxide also react with a (2 sup(1/2))R 45-BaO monolayer adsorbed on W(001) to produce adsorbed OH and CO3 species bound to the tungsten substrate. The interaction of O2 with W(001) is enhanced by the presence of a BaO monolayer on the substrate. The observations are compared with the results of previous studies.

Photodissociation of Methyl lodide Clusters. Final rept.

D. J. Donaldson, S. Sapers, V. Vaida, and R. Naaman. 1987, 11p Pub. in Large Finite Systems, p253-263 1987.

Keywords: *Dissociation, *Photochemical reactions, *Iodoalkanes, Absorption spectra, Rare gases, Dimer-zation, Clustering, Ionization, Reprints, Methyl iodide, Rydberg states.

The dissociation of methyl iodide molecules 'solvated' in clusters has been investigated using both direct absorption spectroscopy and multiphoton ionization methods. Clusters of both neat methyl iodide and of methyl iodide with rare gases were studied in a molecular jet. It was found that dimerization slows the predis-sociation rate from the Rydberg states of CH3I, where-as in large clusters the direct dissociation from the valence state is slowed. A model is presented that explains the effect of CH3I dimer formation on the predissociation dynamics. Evidence is also presented for electron delocalization in higher clusters after excitation into the Rydberg states.

Photo & Radiation Chemistry

gen oxide(NO), Energy levels, Microelectronics, Reprints.

A versatile, repetitively pulsed source of translationally fast, reactive molecules suitable for materials process ing experiments is described. The pulsed beams are generated by excimer laser vaporization of cryogenic molecular films that are continuously condensed on transparent substrates. The generation of fast, energy variable pulsed molecular sources of Cl2 and NO is demonstrated. The most probable translational ener-gies of Cl2 and NO molecules can be reproducibly varied monotonically by adjusting the laser fluence or film thickness. Here, the most probable translational energy is quoted as the energy corresponding to the maximum of the time-of-flight trace. Using laser fluences of 2-25 mJ/sq cm from a 193 nm excimer laser, the most probable translational energies of CI2 laser, the most probable translational energies of Cl2 are 0.4-2 eV. Significant fractions of molecules with translational energies greater than 3 eV are observed at the leading edges of the distributions. Very similar results are obtained by vaporizing Cl2 with 248 and 351 nm radiation. Pulses of translationally fast NO molecules are generated in a similar manner; most probable energies from 0.1-0.4eV, with the fastest molecules up to 0.8 eV, are obtained using laser fluences of 1-11 mJ/sq cm at 193 nm. Approximately 10 sup 13 to 10 sup 14 molecules per sq cm of the film are vaporized per laser pulse, depending on film thickness and laser fluence.

Hardis, and J. L. Dehmer. 1989, 6p Contract W-31109-eng-38 Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Chemical Physics 90, n3 p1551-1556, 1 Feb 89

Keywords: *Nitrogen oxide(N2O), *Vibrational spectra, *Photoelectrons, Energy, Fluorescence, Molecular structure, Synchrotron radiation, Molecular spectra, Reprints

Vibrationally resolved photoelectron studies of the 000, 100, 200, and 001 modes of the A state (7sigma(-1)) of N2O+ in the 17.4-26 eV photon-energy range were performed. The vibrational branching ratios sigma(100)/sigma(000) and sigma(001)/sigma(000) sigma(100)/sigma(000) and sigma(001)/sigma(000) agree very well with fluorescence measurements by Kelly et al. and qualitatively with recent theoretical pre-dictions of Braunstein and McKoy. The large non-Franck-Condon variations in the sigma(100)/ sigma(000) and sigma(200)/sigma(000) branching ratios are associated with a predicted 7 sigma -> Epsi-lon sigma shape resonance near 20 eV. Overall, the vibrational branching ratios imply lower resonant ener-gies for the stretching modes (100 and 200) and a similar resonant energy for the asymmetric stretch (001), compared with the 000 mode. The vibrational asymmetry parameters (beta) display a strong variation with energy which is qualitatively reproduced by theory; however, the experimental values for beta(100) and beta(001) exhibit additional structure around 20 eV. When combined with theory and recent fluores-cence data, these results help to demonstrate a corre-lation of shape resonance energy with overall molecu-lar length (RN-N) + R(N-O); this important result im-plies a resonant state which is localized on the entire triatomic molecular frame rather than on the N-N or N-O components.

Bond Selective Chemistry with Photon-Stimulated Desorption.

Final rept.

J. A. Yarmoff, and S. A. Joyce. 1989, 6p Pub. in Materials Research Society Symposia Pro-

ceedings, v143 p91-96 1989.

Keywords: *Desorption, *Fluorine, *Ions, *Synchro-trons,*Silicon, Photons, Electron transitions, Surface chemistry, Irradiation.

Photon stimulated desorption of fluorine ions from sili-con surfaces was studied via excitation of the Si 2p core level with synchrotron radiation. The results showed that the process is chemically selective in that the removal of a fluorine ion from a silicon species in a given oxidation state can be enhanced by tuning the photon energy to the excitation wavelength corre-sponding to a transition from the 2p core level of the bonding atom to the conduction band minimum. The process was studied as a possible means for the production of surfaces with selected compositions of species. The results of selective exposures of fluorinated surfaces to monochromatized radiation indicated that secondary desorption processes and the inherent chemistry of the surface reactions can override the effects of selective desorption. Other possibilities for se-lective surface reactions via core-level excitations are discussed.

Keywords: *Chlorine, *Vaporizing, *Thin films, Ultraviolet lasers, Condensates, Cryogenics, Time, Reprints.

Time-of-flight distributions are obtained for the repeti-tive, unfocused laser vaporization of cryogenic Cl2 films condensed on a transparent substrate held at 25-110K. Translationally fast molecules are observed using 193, 248, 351 and 355 nm, but no vaporization occurs for 532 or 1064 nm. The most probable kinetic energies of the CI2 molecules, estimated from the maxima of the Cl2 time-of-flight traces, range from 0.4 to 2 eV for 193 nm vaporization at laser powers of 0.2-2 MW/sq cm. The energies increase monotonically with increasing laser fluence and film thickness. Less than 7% of the desorbed flux is due to CI atoms formed by dissociation in the desorption process. Energies above 5 eV are obtained with focused 355 nm radiation.

Keywords: *Infrared spectroscopy, *Polyatomic mole-cules, *Photochemical reactions, Vibrational spectra, Rotational spectra, Excitation, Chemical bonds, Fouri-er transformation, Molecular structure, Photolysis, Steric hindrance, Reprints.

A number of dynamical experiments were conducted in which low resolution, time-resolved infrared fluores-cence detection was employed. The experiments used 30-60/cm resolution tunable interference filters for wavelength selectivity. The lack of rotational resolution in those experiments sometimes limited the dynamical detail. In the present account, new experiments are described which utilize a high resolution, time-resolved FTIR emission method to study photofragmentation dynamics of large polyatomic molecules. The capabil-ity to obtain vibrational and rotational state details of the excited dynamics of simple bond-breaking proc-esses. The results include information about the times-cales for breaking several bonds in a single molecule and the constraints on rotational motion due to steric hindrance and energy and angular momentum considerations.

Photo & Radiation Chemistry

bonds, Dipole moments, Chromium, Iron, Molybde-num, Synchrotron radiation, Reprints.

Angle-integrated ultraviolet photoemission studies of carbon monoxide chemisorption on Cr(110) confirm the sequential population of two electronically inequivalent molecular binding states (alpha 1-CO and alpha 2-CO) at 90 K. They are distinguished by differences in the CO 4 sigma binding energies (0.8 eV) and photo-emission cross sections. Work-function measurements indicate that the surface dipole moment associated with alpha 1-CO is significantly less than that for alpha 2-CO. CO/O interaction data exhibit oxygen-in-duced alpha 1-CO site blocking and alpha 1-CO alpha 2-CO binding mode conversion. The results support current models for the CO binding geometries on Cr(110) and related binding states on Fe(100) and Mo(100).

Final rept. D. Behar, P. Neta, J. Silverman, and J. Rabani. 1987, 8p

Pub. in Radiation Physics and Chemistry 29, n4 p253-260 1987.

Keywords: *Polymers, Polyelectrolytes, Radiolysis, Reprints, *Iridium complexes, *Hydroxyl radicals, Ra-diation binding, Aqueous solutions, Covalence.

Irradiation of aqueous solutions of (Ir(C sup 3, N bpy)(bpy)2)(2+) (IrP) produces a variety of OH adducts to IrP. The OH adducts decay by two second order processes separated in time. In the presence of both IrP and a soluble polymer, the OH radicals are shared between the IrP and the polymer, simulta-neously producing OH adducts and polymer radicals. This is followed by radical-radical reactions. The rate constants of the various reactions between the OH adducts and the polymer radicals have been determined. The products of reactions of the OH adducts are dis-cussed. IrP behaves similarly to Ru(bpy)3(2+) which was studied before. This indicates that the radiation method may have a general use in the preparation of polymers with pendant bpy complexes.

1988, 15p Pub. in Jnl. of Photochemistry and Photobiology A-Chemistry 42, n2-3 p207-221 1988.

Keywords: *Gases, *Fluid flow, Energy transfer, Irra-diation, Light pulses, Mixtures, Mercury, Mathematical models, Computerized_simulation, Temperature, Reprints, Laser radiation, Tracer techniques, Density.

Fluid flow processes following laser irradiation of gase-ous mixtures have been modeled in order to facilitate quantitative interpretation of experimental observa-tions. Results of computer simulations are compared with experimental measurements of the temporal changes of temperature and density obtained using the recently developed Hg tracer technique. The model outlined in the work accurately reproduces the experimentally observed changes in temperature and density in pulsed laser irradiated gas mixtures using a variety of cell and laser irradiation geometries. Com-parison of the model result with experimental data shows how Hg tracer technique measurements may be influenced by fluid flow.

Keywords: *Photolysis, Acetylene, Emission spectra, *Fourier transform infrared spectroscopy, Eximer lasers.

The availability of high repetition rate (>300 Hz) excimer lasers provides new opportunities for studies of molecular processes by time-resolved FTIR spectros-copy. An overview of the technique is given and state resolved infrared emission results are presented for the triatomic radical, C2H, generated by photolysis of C2H2 at 193 nm. Electronic emission from the low lying (A tilde) doublet Pi state of C2H is observed, along with high vibrational levels of the ground state which gain intensity by coupling with the vibrationless level of (A tilde) doublet Pi.

The rates of electronic curve crossing processes depend critically on the alignment of atomic orbitals, which determine the symmetries of the electronic powhich determine the symmetries of the electronic po-tentials participating in the reaction or energy transfer event. Recent work from our laboratory is presented on the effect of orbital alignment in near resonant energy transfer processes of electronically excited Ca and Sr atoms. Several energy transfer events are car-ing our on electronical processes of the energy transfer events are carried out on aligned p-states in collisions with rare gases. The simplicity of the rare gas systems in terms of their symmetry and nonreactive nature is advantageous for comparison to accurate theoretical treat-ment. In the context of understanding chemical phe-nomena, collisions of these atoms with molecular partners are also investigated. This opens the possibility to study the correlation of alignment dependent effects in competing reactive and energy transfer pathways. Re-markably state-specific alignment effects are also observed when two or more independent energy transfer pathways are accessible. The current knowledge of thermodynamic properties of ordinary water substance is summarized in a condensed form of a set of skeleton steam tables, where

Physical & Theoretical Chemistry

the most probable values with the reliabilities on specific volume and enhalpy are provided in the range of temperatures from 273 to 1073 K and pressures from 101.325 kPa to 1 GPa and at the saturation state from the triple point to the critical point. About 17,000 experimental thermodynamic data were assessed and clas-sified previously by Working Group 1 of IAPS. About 10,000 experimental data were collected and evaluated in detail and especially about 7000 specific volume data among them were critically analyzed with respect to their errors using the statistical method originaly developed at Keio University by the first three authors. As a result, specific volume and enthalpy values with as-sociated reliabilities were determined at 1455 grid points of 24 isotherms and 61 isobars in the single-fluid phase state and at 54 temperatures along the satura-tion curve. The background, analytical procedure, and reliability of IST-85 as well as the assessment of the existing experimental data and equations of state are also discussed in the paper.

Keywords: *Thermodynamic properties, *Hydrocar-bons, Liquid phases, Solid phases, Enthalpy, Entropy.

An estimation method developed by S.W. Benson and coworkers, for calculating the thermodynamic proper-ties of organic compounds in the gas phase, has been extended to the liquid and solid phases for hydrocar-bon compounds at 298.15 K. The second order approach which includes nearest neighbor interactions has been applied to the condensed phase. A total of 1311 comparisons are made between experimentally determined values and those calculated using additive group values. The good agreement between experi-mental and calculated values shows that the Benson group additivity approach to the estimation of thermodynamic properties of organic compounds is applica-ble to the liquid and solid phases as well as the gas phase. Appendices provide example calcuations of the thermodynamic properties selected hydrocarbon compounds, total symmetry numbers, and methyl repulsion corrections.

Atomic transition probabilities for about 8,800 spectral lines of five iron-group elements, Sc(Z = 21) to Mn(Z = 25), are critically compiled, based on all available literature sources. The data are presented in separate tables for each element and stage of ionization and are further subdivided into allowed (i.e., electric dipole-E1) and forbidden (magnetic dipole-M1, electric quadrupole-M2) transit drupole--E2, and magnetic quadrupole--M2) transitions. Within each data table the spectral lines are grouped into multiplets, which which are in turn ar-ranged according to parent configurations, transition arrays, and ascending quantum numbers. For each line the transition probability for spontaneous emission and the line strength are given, along with the spec-troscopic designation, the wavelength, the statistical weights and the energy levels of the upper and lower weights, and the energy levels of the upper and lower states. For allowed lines the absorption oscillator strength is listed, while for forbidden transitions the type of transition is identified (M1, E2, etc.). In addition, In short introductions, which precede the tables for each ion, the main justifications for the choice of the adopted data and for the accuracy rating are discussed.(Copyright (c) 1988 by the U.S. Secretary of Commerce.)

Final rept. M. J. Kurylo, and P. Ouellette. 1987, 4p Pub. in Jnl. of Physical Chemistry 91, n12 p3365-3368 1987.

Keywords: *Reaction kinetics, *Hydroperoxides, *Ni-trogen, *Nitrogen dioxide, Ultraviolet spectroscopy, Low pressure research, Reprints, Temperature de-pendence.

Rate constants for the title reaction were measured via flash photolysis UV absorption spectroscopy at N2 pressures of 25, 50, and 100 Torr over the temperature range 288 - 358K. The data of the study were at low enough pressure to yield a precise determination of n (which describes the temperature dependence of the low pressure limiting third-order rate constant) but were less sensitive to the determination of m (associated with the limiting high pressure rate constant). For this reason, the final analysis utilizes a composite fit of the temperature dependent data along with similar data at 100 and 700 Torr of N2 obtained by Sander and Peterson.

Multiphoton Ionization Spectroscopy and Vibra-tional Analysis of a 3p Rydberg State of the Hy-droxymethyl Radical. Final rept.

C. S. Dulcey, and J. W. Hudgens. 1986, 9p Pub. in Jnl. of Chemical Physics 84, n10 p5262-5270, 15 May 86.

Keywords: *Energy levels, *Vibrational spectra, *Spectrum analysis, Free radicals, Excitation, Deuteri-um compounds, Isomerization, Reprints, *Hydroxy-methyl radicals, *Rydberg states, *Resonance en-hanced multiphoton ionization spectroscopy, Electronic structure.

The resonance enhanced multiphoton ionization (REMPI) spectra of CH2OH, CH2OD, CD2OH, and CD2OD between 420-495 nm are reported. Analysis of the excited state vibrational band progressions shows that the spectrum originates from simultaneous two photon absorption to form a 3p Rydberg state (v(sub 00) = 40,064/cm) of the radical. Absorption of a third photon ionized the radical. A normal mode analysis of the REMPI spectra enabled assignments of six active vibrational modes in the excited state. The rate that methoxy radicals isomerize into hydroxymethyl radicals was estimated to be less than 2.9/sec at 300K.

Pub. in Molecular Structure and Energetics, v2 p269-314 1987.

Keywords: Heat of formation, Vapor phases, Thermo-chemistry, Alkalinity, Comparison, Gases, Reviews, Reprints, *Proton affinity, Ion molecule interactions.

A review is presented of a recently-published evaluation of the scale of gas phase proton affinities (S. G. Lias, J. F. Liebman, and R. D. Levin, J. Phys. Chem. Ref. Data, 13, 695 (1984)). The discussion includes (1) a description of the rationale used in evaluating different data sets from the literature, and (2) detailed evaluations of the heats of formation of MH(1+) ions used in the assignment of absolute values to the relative thermodynamic ladder which constitutes the gas phase proton affinity scale.

Adsorption Properties of Pt Films on W(110).

Final rept. R. A. Demmin, S. M. Shivaprasad, and T. E. Madey. 1988, 5p

Sponsored by Department of Energy, Washington, DC. Pub. in Langmuir 4, n5 p1104-1108 1988.

Keywords: *Platinum, *Thin films, *Tungsten, *Carbon monoxide, *Chemisorption, Desorption, Reprints.

The surface chemistry of ultrathin Pt films on a W(110) substrate has been investigated by using CO chemis-orption. Carbon monoxide temperature-programmed desorption experiments show that molecular CO is more weakly bound to a monolayer Pt film deposited at 90 K than to either bulk Pt or the W substrate, similar to conclusions drawn from experiments on other metal thin films. Carbon monoxide is also weakly adsorbed on films annealed to 1500 K, even for initial Pt coverages much greater than one monolayer. This has been interpreted as strong evidence for substantial thermal-ly induced structural changes in multilayer films that result in a W surface that is covered by a monolayer Pt film with unique CO chemisorption properties. Platinum films of at least one monolayer also prevent the disso-ciative adsorption of CO normally occurring on the W(110) surface. For submonolayer films annealed to 1500 K, the total amount of dissociative adsorption of CO decreases linearly with increasing Pt coverage, reaching zero at one monoplayer of Pt. This implies that the inhibition of CO dissociation by Pt is very local-Ized. Previously proposed explanations for CO adsorption behavior common to a variety of overlayer-substrate systems are discussed.

National Bureau of Standards (NML), Gaithersburg, MD. Surface Science Div. Core-Level Binding-Energy Shifts at Surfaces and

in Solids.

Final rept. W. F. Egelhoff. 1986, 163p Pub. in Surface Science Reports 6, n6-8 p253-415 1986.

Keywords: *X-ray analysis, *Energy levels, *Photoe-lectrons, Cores, Surfaces, Solids, Spectroscopy, Reprints.

The review presents an overview of the theory and of various successful approaches to the interpretation of core-level binding-energy shifts observed in photoe-lectron spectroscopy. The review specially concen-trates on shifts since most of the chemical and physical insights provided by core levels are derived not from the core-level binding energies themselves but from shifts they exhibit. The theoretical background is presented at a level readily accessible to the general reader. Particular attention is paid to relative merits of the two basically different conceptual frameworks for interpreting core-level binding-energy shifts, the initial-state-final approach and the equivalent-core approach.

Keywords: *X-ray analysis, *Germanium halides, *Germanium hydrides, Scattering, Gases, Absorption spectrum, Molecular structure, Reprints.

X-ray absorption fine-structure (XAFS) measurements of GeCl4, GeH3Cl, and GeH4 were experimentally isolated by comparison of the spectra of the three compounds. The multiple-scattering (MS) amplitude is comparable to the single-scattering (SS) amplitude only within 15 eV of the edge. Beyond 40 eV the MS to SS amplitude ratio is less than 0.06. Calculations are in qualitative agreement with the experiment. Results suggest that XAFS data in the range 1 less than k less than 3 reciprocal Angstroms can be analyzed in a SS picture in many cases.

Thermodynamics of Ammonium Scheelites. 6. An Analysis of the Heat Capacity and Ancillary Values for the Metaperiodates KIO4, NH4IO4, and ND4IO4. Final rept.

R. J. C. Brown, J. E. Callanan, R. D. Weir, and E. F. Westrum. 1987, 10p See also PB88-238498.

Pub. in Jnl. of Chemical Thermodynamics 19, p1173-1182 1987

Keywords: *Specific heat, Scheelites, Thermodynamic properties, Anisotropy, Thermal expansion, Computation, Rotation, Deuterium compound, Reprints, *Ammonium scheelites, Ammonium periodate, Deuterated ammonium compounds.

Physical & Theoretical Chemistry

An analysis of the heat capacity of NH4IO4, ND4IO4, and KIO4 has been carried out in which the effects of the anisotropy of the thermal expansion have been considered, an approach hitherto used successfully for the perrhenates KReO4, NH4ReO4, and ND4ReO4. In the ammonium scheelites, the axial expansivities are very large, but of opposite sign, and as a result the molar volume of the scheelite lattice is nearly independent of temperature. It is shown that the correction from constant stress to constant strain results in a major contribution to the heat capacity of this highly anisotropic lattice. The difference between the experimental and calculated heat capacities, referred to as Delta C P.M, is expressed as the sum of the contributions from the anisotropy and the rotational heat capacity. The results of the analysis show that the rota-tional contribution is much smaller than had previously been thought. However, the exact contribution of the anisotropy cannot yet be calculated because the elastic constants are not known. In calculating the heat capacity, maximum use has been made of external optical-mode frequencies derived from spectroscopic measurements

Keywords: *Platinum, *Ligands, *Reaction kinetics, *Ascorbic acid, *Ammonia, Complex compounds, Mo-lecular orbitals, Electrons, Dissociation energy, Reprints.

The electronic structure of the cis-Pt(ammonia)sub 2 (ascorbate) molecule has been studied by valence electron self-consistent-field calculations. A simpler molecule is used to model the ascorbate in a calculation of ligand binding energies. A comparison of localized ligand bonding orbital charge centroids and density plots supports the validity of the model compound to represent the bonding in the ascorbate. The Pt-C bond energy is calculated to exceed that for Pt-O by about 40 kcal/mole. The dissociation energies for the ammo-nia ligands exhibit a strong trans-influence with a low dissociation energy for the ammonia trans to the Pt-C bond. These results suggest that this ammonia ligand and the Pt-O bond are suitable for exchange in these molecules.

Pub. in Jnl. of Chemical Physics 85, n9 p5232-5237 1986.

Keywords: Polarization(Charge separation), Electric fields, Thin films, Autocorrelation, Dipoles, Reprints, *Dipolar fluids, Dielectric saturation.

Recent experiments and computer simulations of thin films have observed the segregation of nonpolar molecules into layers or sheets parallel to the confining walls. The authors discuss a molecular dynamics study of a thin film of Stockmayer molecules between Len-nard-Jones plates and find that, in the absence of an electric field, the dipoles are mainly oriented parallel to the plates in each layer. The polarization density pro-file, with an electric field perpendicular to the plates, is also studied, and is found to oscillate from layer to layer, with a magnitude that is in excess of that predict-ed by the Debye theory of dielectric saturation by a factor nearly equal to the ratio of the local density to the average bulk density.

Keywords: *Gases, *Microwaves, *Measurement, *Volume, *Spherical shells, Expansion, Heating, Water, Gallium, Resonance, Temperature, Reprints.

Microwave resonances have been used to measure the volumetric thermal expansion of a spherical cavity the volumetric thermal expansion of a spherical cavity between the temperature of the triple point of water (T sub t) and the temperature of the triple point of gallium (T sub g). Using the TM 1,1 and TM 1,2 modes, we find 10 sup 6(V(T sub g)/V(T sub t)-1) = 1418.5 plus or minus 1.0 and 1418.1 plus or minus 0.6, respectively. These results are in agreement with the value 1416.6 plus or minus 1.5 obtained by filling the cavity with mer-oury and using it as a dilatometer. cury and using it as a dilatometer. The microwave measurements are sufficiently accurate that they can be used for primary gas or acoustic thermometry and for measuring the changes in volume standards with temperature, pressure, or time. There is evidence that microwave measurements can be used to determine the volume of a spherical cavity with an uncertainty of the order of 30 ppm and further improvements are likely.

Keywords: *Anions, *Resonance absorption, Stability, Laser spectroscopy, Rare gases, Alkalinity, Ions, *Electron-atom collisions.

Autodetaching states (or resonances) of negative ions are very sensitive to electron correlation effects, and the general rules which determine their energetics and stability are not well understood. The experimental techniques used to study them depend strongly on ele-mental species. For instance, laser photodetachment spectroscopy is one of the preferred ways of investi-gating alkali negative ions, whereas negative ion resonances of noble gases can only be produced by par-ticle impact. This tends to obscure possible corre-spondences between the resonance spectra of different elements. However, evidence of common proper-ties of certain classes of autodetaching states is accu-mulating. The paper describes a few simple examples.

Under pulse radiolytic conditions, B22(sup -1) oxi-dases water-soluble magnesium porphyrins. The stability of the resultant porphyrin radical cations depends upon the relative electron density residing on the por-phyrin ring, which is controlled by the nature of the water-solubilizing groups. Decreasing the electron density on the porphyrin ring by attaching N-methyl-4pyridyl groups at the meso positions or by replacing the central Mg(II) ion with a cation possessing a higher ionization potential renders the radical cation unstable with respect to disproportionation. The rate and total yield of evolved O2 reach a maximum at pH 12.

Qualitative MO Theory of Some Ring and Ladder Polymers. Final rept.

J. P. Lowe, S. A. Kafafi, and J. P. LaFemina. 1986, 9D

Pub. in Jnl. of Physical Chemistry 90, n25 p6602-6610 1986

Keywords: *Substitution reactions, *Aromatic polycy-clic hydrocarbons, *Aliphatic acyclic hydrocarbons, *Polymers, *Band spectra, Polyphenyl hydrocarbons, Thermodynamics, Reprints, *Molecular orbital theory, *Band theory, Polyphenylene, Polypyrrole, Polyacetylene.

The authors apply qualitative molecular orbital techniques to the electronic pi-band structure of substitu-tionally related ring and ladder polymers of the types represented by poly(paraphenylene), poly(pyrrole), and poly(acene). They show how the band structure for a polymer can be qualitatively constructed from a knowledge of the MOs and energies of the monomer, and then go on to show how the band structure is altered by chemical substitution. There are numerous bands whose edge energies should be insensitive to chemical substitution in certain positions. Relative band gap changes resulting from chemical substitution can be understood as well, although this sometimes requires consideration of orbital mixing. They show how qualitative theory gives insight into the relative thermodynamic stabilities of isomeric polymers and also into the structures of polarons. In general, qualita-tive techniques account well for band structures compared at the level of extended Huckel theory and are relevant to results of ab initio calculations as well.

Kinetics of Electron Transfer from Nitroaromatic Radical Anions in Aqueous Solutions. Effects of Temperature and Steric Configuration. Final rept.

M. Mautner, and P. Neta. 1986, 3p Pub. in Jnl. of Physical Chemistry 90, n19 p4648-4650 1986

Keywords: *Reaction kinetics, *Anions, *Nitrogen or-ganic compounds, *Electron transfer, Solutions, Mo-lecular structure, Temperature, Aromatic compounds, Radiolysis, Spectrophotometry, Reprints, *Molecular configurations.

Rate constants for electron transfer from various nitroaromatic radical anions to other nitroaromatic compounds in aqueous solutions have been determined by kinetic spectrophotometric pulse radiolysis. In general, nitroaromatic radical anions donate electrons much more slowly than other radical anions, in reactions with similar driving forces, due to low self-exchange rates for ArNO2/ArNO2(sup -1). The kinetics show no anomalies in supercooled solutions.

Decay of High Valent Manganese Porphyrins in Aqueous Solution and Catalyzed Formation of Oxygen. Final rept.

A. Harriman, P. A. Christensen, G. Porter, K. Morehouse, P. Neta, and M. C. Richoux. 1986, 17p Pub. in Jnl. of the Chemical Society, Faraday Transactions 1 82, n10 p3215-3231 1986.

Keywords: *Oxidation reduction reactions, *Reaction kinetics, *Oxygen, Porphyrins, Catalysts, Radiolysis, Catalysis, Chemical stabilization, pH, Reprints, *Man-ganese porphyrin, *Chemical reaction mechanisms, Pulsed radiation.

Manganese (III) porphyrins (Mn(III)Ps) are easily oxidized to the corresponding Mn(IV)Ps in alkaline aqueous solution. At pH < 5, the oxidation product is a Mn(III)P pi-radical cation. These oxidized metalloportion phyrins have limited stability in water and they revert to the original Mn(III)P upon standing in the dark. The rate and mechanism of this inherent reduction process depends upon pH, with lower pH giving the higher rates. The inherent reduction appears to involve dispropor-tionation and rearrangement of the Mn(IV)Ps but it does not lead to formation of molecular O2. Addition of colloidal RuO2.2H2O, a good O2-evolving catalyst, has a pronounced effect upon the reduction process. The oxidized metalloporphyrin is bound to the catalyst particles by electrostatic forces and, at pH < 11, the bound material decays more slowly than the free compound. For 8 < pH < 11, decay of the bound metallo-porphyrin involves oxidation of water to O2 but the yield of O2 is much less than the stoichiometric values.

Pub. in Jnl. of Chemical Physics 86, n4 p2383-2393 1987.

Keywords: Polarization(Charge separation), Electric fields, Thin films, Dipoles, Reprints, *Dipolar fluids, Stockmayer fluids.

Further molecular dynamics simulations of thin films of Stockmayer molecules between Lennard-Jones plates are discussed when the distance h between the plates ranges from 2.25 sigma to 9.5 sigma, where sigma is the molecular diameter, and the electric field E ranges between 0 and 10 billion V/m. The solvation force is calculated as a function of the plate separation h when E=0 and E= one billion V/m and as a function of the field E when h=4.0 sigma and 7.5 sigma. While, in the absence of a field, the molecules tend to form loops and chain-like structures with the dipoles parallel to the wall, a strong external field orients the dipoles along the field so that the long-range repulsive interaction appears to induce a transition to an imperfect (two-dimensional) triangular lattice at low temperature. In between these states, at low temperatures and high fields, the molecules are packed in parallel chains with their moments perpendicular to the field and in 'ferro-electric domains' of opposite polarization.

PB89-157226 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Thermophysics Div. Local Order in a Dense Liquid.

Final rept. H. J. M. Hanley, T. R. Welberry, D. J. Evans, and G. P. Morriss. 1988, 4p Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 38, n3 p1628-1631, 1 Aug 88

Keywords: *Liquids, Hexagonal lattices, Relaxation time, Anisotropy, Disks(Shapes), Reprints, Order parameters, Structure factors, Transients.

Transient local hexagonal order in a dense liquid is observed in a molecular-dynamics simulation of two-di-

mensional soft disks. Instantaneous local structure factors at a particular density are obtained using an optical transform of the particle coordinates for a single configuration. Local hexagonal order is quantifield using an order parameter, and its lifetime charac-terized by the decay of the order-parameter autocorre-lation function. This type of transient structure is significant at densities greater than 7/10 of the freezing density, and becomes persistent near the freezing density.

Hydrodynamics of Magnetic and Dielectric Colloidai Dispersions.

Final rept.

 J. B. Hubbard, and P. J. Stiles. 1986, 14p
 Pub. in Jnl. of Chemical Physics 84, n12 p6955-6968, 15 Jun 86.

Keywords: *Hydrodynamics, Brownian movement, Magnetic fields, Electric fields, Anisotropy, Reprints, Colloidal dispersions.

The hydrodynamic behavior of colloidal suspensions is considered, the particles of which possess electric or magnetic moments. Particular attention is given to the case where an external electric or magnetic field acts on a system in which the polarization does not relax instantaneously, so that reorientational Brownian motion is coupled to both the field and to hydrodynam-ic degrees of freedom. Magnetosonic and magnetovis-cous effects are derived, with emphasis on anisotropy with respect to the external field.

Lovas. 1988, 9p

Pub. in Jnl. of the American Chemical Society 110, n24 p7991-7999 1988.

Keywords: *Molecular structure, *Dipole moments, *Spectrum analysis, *Microwave spectroscopy, *Ozonization, *Ethylene, Formaldehyde, Stereoche-mistry, Deuterium compounds, Reprints, *Trioxolane, Molecular conformation, Chemical reaction mechanisms. Dioxirane.

The gas-phase structure of ethylene primary ozonide (CH2CH2O3) has been determined from millimeter wave spectra of five isotopic species. The electric dipole moment of the normal isotopic species is 3.43 (4) D. The barrier to pseudorotation is estimated to be high (greater than 300 to 400/cm) in agreement with ab initio MO calculations. Ethylene primary ozonide, dioxirane, formaldehyde, and ethylene secondary ozonide (CH2OCH2O2) are observed as products of the ozone-ethylene reaction in the low-temperature microwave cell. A mechanism of the ozonolysis of ethylene is presented which suggests that the reaction occurs primarily in the condensed phase on the surface of the cell. Microwave techniques utilizing cis- and trans- C2H2D2 show that ozone adds stereospecifically to ethylene in the formation of ethylene primary ozonide.

Physical & Theoretical Chemistry

A methodology has been developed for the measurement of total reaction cross-sections sigma(E) in the range of collision energies E(coll) approx = 5-60 eV (LAB) used for collision-induced dissociation (CID) in triple-guadrupole (QQQ) tandem mass spectrometers. triple-quadrupole (QQQ) tandem mass spectrometers. This methodology has been calibrated by making pseudo-first order kinetics measurements of the sym-metric (resonant) charge transfer cross-sections sigma(E) for Ne(1+) (Ne,Ne)Ne(1+). The sigma(E), for E approx = 5-60 eV and P approx = 0.04-1 mtorr, agree with the Rapp-Francis theory to within 15%. The authors measured identical sigma(E) from both the rate of reactant decay and the rate of product forma-tion. Hence, it should be possible to readily determine tion. Hence, it should be possible to readily determine branching ratios for different reactive channels. The methodology provides a means whereby the absolute target thickness ((actual path length traversed by the ion) x (effective number density of the CiD target)) of gas targets can be accurately calibrated in-situ for col-lision energies in the range of ca. 5-60 eV (LAB).

See also PB88-238829. Pub. in Jnl. of American Chemical Society 108, n24 p7525-7529 1986.

Keywords: *Chemical bonds, *Hydrogen bonds, *Anions, *Dissociation energy, *Dimerization, Enthal-py, Temperature, Solvation, Reprints.

Dissociation energies delta H(sub D) of RO(sup -1 HOR, RCOO(sup -1) HOR and RCOO(sup -1) HOOCR range from 14 to 29 kcal/mol. Large values of delta H(sub D) are observed for the symmetric dimers CH3O(sup -1) HOCH3 (28.8 kcal/mol) and

CH3COO(sup -1) HOOCCH3 (29.3 kcal/mol). Delta H(sub D) decreases as the difference between the acidities of the components increase; e.g., for dimers with large delta H(sub acid) such as CH3O(sup -1) -H2O and HCOO(sup -1) - H2O (delta H(sub acid) = 42.2 and 45.5 kcal/mol, respectively), delta H(sub D) = 16.0 kcal/mol. For 13 dimers, a linear correlation of the form delta H(sub D) = 28.4 - 0.29 delta H(sub acid) is obtained.

Keywords: *Solvation, Temperature, Enthalpy, Entro-py, Clustering, Ammonium, Water, Anions, Cations, Reprints, *Electronic structure, *Ion pairs, Hydroxyl radicals, Peroxy radicals.

Solvent shells can build up by the stepwise attachment of solvent molecules to gas-phase ions. The filling of a solvent shell by the s-th solvent molecule is indicated solvent shell by the s-th solvent molecule is indicated by a discontinuous drop in the attachment energy at the s+1-th solvent molecule, i.e., a discontinuous drop in the plots of H(sup n-1, n) vs. n (i.e., enthalpy se-quences) after n = s. Another indication is a gap in the spacing of consecutive van't Hoff plots after n = s. Thermochemical criteria based on enthalpy se-quences and the spacing of consecutive van't Hoff plots are developed quantitatively and applied to data on clustering about metal longs and onium ions. Satison clustering about metal ions and onium ions. Satis-factory evidence for the distinct filling of shells is found in 11, and tentative evidence is found in another 15 out of the 45 systems where data were examined.

PB89-157580 Not available NIIS National Bureau of Standards (IMSE), Gaithersburg, MD. Metallurgy Div. Phase Equilibrium in Two-Phase Coherent Solids.

Final rept

W. C. Johnson, and P. W. Voorhees. 1987, 16p Pub. in Metallurgical Transactions A-Physical Metallurgy and Materials Science 18, n7 p1213-1228 1987.

Keywords: *Phase diagrams, *Metals, *Thermody-namic equilibrium, Metastable state, Coherence, Solid phases, Stresses, Elastic properties, Free energy, Reprints, Bifurcation theory.

Phase equilibrium in a two-phase coherent solid is analyzed using the conditions necessary for thermody-namic and mechanical equilibrium in nonhydrostatically stressed coherent solids. Subject to the constraints of constant temperature and external pressure, a bulk alloy corresponding volume fractions and the corresponding volume fractions and phase compositions that satisfy the equilibrium conditions are obtained. It is demonstrated that, unlike fluids, a number of equilibrium states (volume fractions) may exist that yield energy minima for a given temperature, pressure and alloy composition and that these multiple metastable states may lead to a nonuniqueness in the observed physical state of the system. These results are a consequence of the elastic and system energies being a function of the volume fraction in a field of two-phase coexistence in coherent solids. As it is difficult to display these ef-fects on a coherent phase diagram, the concept of a phase stability diagram is introduced for both displaying and analyzing the equilibrium conditions in coherent solids. The influence of elastic inhomogeneity and the form of the free energy curves as a function of composition in the absence of stress on phase equilibrium is examined.

PB89-157762 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Semiconductor Electronics Div. Application of Multiscattering Theory to Impurity

Bands in Si:As.

Final rept. J. R. Lowney. 1988, 5p Pub. in Jnl. of Applied Physics 64, n9 p4544-4548, 1 Nov 88.

Keywords: *Additives, *Silicon, *Arsenic, *Electron transitions, Impurities, Computation, Electron scatterina. Reprints.

Impurity bands in arsenic-doped silicon have been calculated for doping densities of $3.3 \times 10(\sup 17)$, $1.2 \times (10 \sup 18)$, and $8.0 \times 10(\sup 18) \operatorname{cm}(\sup -3)$. A multiscattering approach is used with a model potential which provides both electronic screening and the proper bound-state energy for the isolated center. The results are in good agreement with previous calculations based on electron hopping among hydrogenic centers. An advantage of the multiscattering approach is that it treats the conduction-band states as well and shows the loss of these states to the formation of the impurity band. This is a new result and affects the den-sity for the Mott transition. Calculations are also performed for the states associated with the binding of an extra electron to unionized arsenic centers, the so-called D sup minus band. The overall results are in

good agreement with the observed Mott transition in Si:As near 8 x 10 (sup 18) cm(sup -3).

MD. Office of Nondestructive Evaluation. Infrared Absorption of SF6 from 32 to 3000 cm(-1) in the Gaseous and Liquid States.

Final rept.

C. Chapados, and G. Birnbaum. 1988, 29p

Pub. in Jnl. of Molecular Spectroscopy 132, p323-351 1988.

Keywords: *Sulfur hexafluoride, *Infrared spectra, Gases, Liquids, Pressure, Vibrational spectra, Reprints.

Infrared spectra from 32 to 3000/cm of SF sub 6 were recorded at several pressures from below atmospheric pressure up to 20 atm and in the liquid phase at tem-peratures from 228 to 284 K. The infrared active fun-damentals, difference bands, combination and har-monic bands, and the collision-induced band in the farinfrared region were observed. Integrated intensities of 37 bands were measured at several densities. In the gas phase, a weak band containing v2 + v6 was always found at higher frequencies than the much stronger bands containing v3. In the liquid phase, the positions of these bands are lowered in frequency and the intensities tend toward equalization. The pair v3 and v2 + v6 itself is the exception: while the v3 band is displaced and its intensity lowered, the v2 + v6 band is practically not modified. A possible explanation of the modification in the intensity of the bands in passing from the gas to the liquid is the effect of the interaction with the liquid environment on the Fermi resonance connecting v3 and v2 + v6. Within experimental error no collision-induced component was identified in the mid-infrared region in the gas phase. In the liquid phase, the integrated absorption of the bands increases with temperature, surpassing in many cases the gas-phase values.

Secondary-Electron Effects in Photon-Stimulated Desorption.

Final rept. D. E. Ramaker, T. E. Madey, R. L. Kurtz, and H. Sambe. 1988, 13p Pub. in Physical Review B 38, n3 p2099-2111, 15 Jul 88

Keywords: *Desorption, Chemisorption, X rays, Re-prints, *Electron stimulated desorption, *Photon stimu-lated desorption, *Secondary electrons, Oxygen ions, Hydrogen ions, Nitrogen ions.

The magnitude of secondary-electron contributions to electron- or photon-stimulated desorption (ESD) or (PSD) yields is considered. In particular, the authors have reexamined three systems where a dominant x-ray-induced ESD (XESD) effect has been postulated. Recent ESD ion-angular-distribution data on the NH3/ Ni system and a detailed determination of the mechahisms involved in H(1+) desorption indicate that all of the features previously attributed to the XESD effect may in fact arise from direct core-level processes. A reexamination of the PSD N(1+) and O(1+) yields

from condensed N2-O2 reveals that the indirect XESD mechanism contributes just one-third of the N(1+) yield, but dominates the O(1+) desorption. This arises because the direct Auger-stimulated desorption (ASD) process following core-hole excitation is inactive for O(1 +) desorption, but remains active for N(1 +). Finally, a detailed interpretation of H(1 +) desorption from OH/Ti and OH/Cr, and comparison with the system OH/TbO-Sm indicates that the direct ASD process is also inactive in the latter case.

Optically Driven Surface Reactions: Evidence for the Role of Hot Electrons. Final rept.

S. A. Buntin, L. J. Richter, R. R. Cavanagh, and D. S. King. 1988, 4p Contract DE-Al05-84ER13150

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review Letters 61, n11 p1321-1324, 12 Sep 88.

Keywords: *Desorption, *Nitrogen oxide(NO), Plati-num, Reprints, *Laser induced desorption, Hot electrons.

Evidence is presented for the role of excited conduction electrons in the laser-induced desorption of NO from Pt(111). State-specific detection of the desorbed NO establishes that the rotational distributions are non-Boltzmann, that the spin-orbit population is inverted, and that both the translational and vibrational dis-tributions are uncorrelated with the laser-induced surface-temperature jump. The role of optically excited substrate electrons in driving the desorption process is evidenced by a dramatic dependence of the vibrational and translation energy distributions on the desorptionlaser wavelength.

Calculations of Electron Inelastic Mean Free Paths for 31 Materials.

Final rept.

S. Tanuma, C. J. Powell, and D. R. Penn. 1988, 13p Pub. in Surface and Interface Analysis 11, p577-589 1988

Keywords: *Mean free path, *Elastic properties, *Elec-trons, *Surface properties, Ceramics, Metals, Scatter-ing, Energy dissipation, Dielectric properties, Algorithms, Gases, Reprints.

New calculations of electron inelastic mean free paths (IMFPs) for 200-2000 eV electrons in 27 elements (C, Mg, Al, Si, Ti, V, Cr, Fe, Ni, Cu, Y, Zr, Nb, Mo, Ru, Rh, Pd, Ag, Hf, Ta, W, Re, Os, Ir, Pt, Au and Bi) and four compounds (LIF, SIO2, ZnS and Al2O3) are presented. These calculations are based on an algorithm due to Penn which makes use of experimental optical data (to represent the dependence of the inelastic scattering probability on energy loss) and the theoretical Lind-nard dielectric function (to represent the dependence of the scattering probability on momentum transfer). Our calculated IMFPs were fitted to the Bethe equation for inelastic electron scattering in matter; the two parameters in the Bethe equation were then empirically related to several material constants. The resulting general IMFP formula is believed to be useful for predicting the IMFP dependence on electron energy for a given material and the material-dependence for a given energy. The new formula also appears to be a reasonable but more approximate guide to electron attenuation lengths.

Effects of Pressure on the Vibrational Spectra of Liquid Nitromethane. Final rept.

P. J. Miller, S. Block, and G. J. Piermarini. 1989, 5p Sponsored by Army Research Office, Arlington, VA., and Naval Surface Warfare Center, Silver Spring, MD. Pub. in Jnl. of Physical Chemistry 93, n1 p462-466, 12 Jan 89.

*Vibrational spectra, Keywords: *Nitromethane. *Spectrum analysis, *Deuterium compounds, Pres-sure, Intermolecular forces, Pyrolysis, Decomposition reactions, Reprints, Chemical shifts.

A complete normal-coordinate calculation for nitromethane is given using the vibrational frequencies measured from the three isotopes CH3NO2, CD3NO2, and CH3(sup 15)NO2. Pressure effects on the vibrational normal modes of the superpressed liquid to 2.0 GPa also were measured. A softening of the frequency of the asymmetric stretching mode of NO2 with in-creasing pressure indicated a strong intermolecular interaction. By calculating a minimum energy pair configuration and applying two-site exiton theory, the au-thors calculated the shifts of the normal modes of the NO2 stretching vibrations as a function of density and pressure and found them to agree qualitatively with the experimentally measured shifts. The results support the bimolecular nature of the mechanism for the ther-mal decomposition of nitromethane under pressure.

tinuing Challenge to Plasma Spectroscopy. Final rept.

W. L. Wiese. 1988, 7p Pub. in Jnl. of Quantitative Spectroscopy and Radi-ative Transfer 40, n3 p421-427 1988.

Keywords: *Argon, *Spectrum analysis, *Spectral lines, *Emission spectroscopy, Performance evalua-tion, Atomic properties, Reviews, Reprints, *Atom transport.

Determination of the atomic transition probabilities for prominent spectral lines of Ar I and II are classical cases for testing the capabilities of the emission spec-troscopy method. Despite numerous attempts to measure these data accurately, differences of about 30-40% remain in the numerical results, and the available material actually suggests two scales for the transition probabilities, differing by about 30%, as has been pointed out repeatedly. A critical analysis of all emission experiments undertaken in the study is able to remove these differences satisfactorily. A single transition probability value with an error estimated of only + or - 5% is established for a typical Ar I transi-tion; however, discrepancies for the Ar II data are not removed and remain as a challenge to future experiments

Laar Point.

Pinal rept. P. H. E. Meijer. 1989, 9p Pub. in Jnl. of Chemical Physics 90, n1 p448-456, 1 Jan 89.

Keywords: *Van der Waals equation, *Equations of state, *Binary systems(Materials), *Critical points, Phase diagrams, Separation, Thermodynamic properties, Reprints, *Van Laar point.

The discovery of van Laar that the van der Waals equation of state for binary mixtures can be solved analytically at the double point on the critical line, provided one introduces the geometric-mean condition on the interaction parameters, is used to obtain the explic-it expression for the critical line for this case. The critical line is expressed as a function of the density variables, and the origin is shifted to this double point: the van Laar point. By doing so it is possible to show that this double point is also a tricritical point. This is different from the lattice gas, where the double point is always a tricritical point. Small deviations from this point in parameter space induce very different phase diagrams. The influence of excursions from the van Laar point is expressed as a function of the state varia-bles. Both the k factor (the deviation from the geomet-ric-mean rule) and the 'asymmetry' coefficient e (the deviation from the crossing point) are introduced. The results are given in the form of polynomials in local co-ordinates in density space. Conditions under which the double point is maintained are given and the differences between the Scott and van Konynenburg class-es II, III, IV, and IV* are explained.

Benzylic H-atom abstraction rates by diphenylmethyl radicals from a series of donors were determined in nonpolar liquids at elevated temperatures. Relative rates were converted to absolute rates via available equilibrium constant data. Abstraction by diphenyl-methyl from 1,2,3,4-tetrahydronaphthalene (tetralin) was studied over the temperature range 489-573K. Similar reactions with the fluorenyl radical were also studied. In this case, relative rates were converted to absolute rates with an equilibrium constant determined from the observed homolysis rate of the dimer and an assumed recombination rate. In addition, forward and reverse rate measurements yielded the equilibrium constant for hydrogen transfer between fluorenyl and diphenylmethyl.

Measurements of ion velocity distributions are presented for ${\rm Ba}\,+\,$ drifted in helium under well characterfluorescence probing. The reduced mobilities and the Doppler profiles parallel and perpendicular to the elec-tric field vector as a function of the ratio of the field strength (E) to the buffer gas density (N) up to 33.5 Td are presented. The reduced mobility decreases mono-tonically with increasing E/N from the zero-field value of 16.7 plus or minus 0.4 sq cm/V/S at 313 K. The parallel and perpendicular ion temperatures are in very Doppler profiles parallel and perpendicular to the elec-

good agreement with both a repulsive Maxwell model good agreement with both a repulsive Maxwell model and a parametrized version of the three-temperature theory of Lin et al. The parallel temperature is always higher than the perpendicular one. Effects of optical pumping on the Doppler profiles are also presented.

Keywords: *Molecular rotation, *Molecular vibration, *Electron transfer, Ionization, Nitrogen, Carbon mon-oxide, Molecular energy levels, Reprints, *Ion-mole-cule collisions, *Laser induced fluorescence, Franck-Condon principle.

Vibrational and rotational product-state distributions are determined for thermal-energy charge-transfer re-actions and Penning ionization processes using laserinduced fluorescence detection in both a flowing afterglow apparatus and a single-collision molecular beam device. The reactions investigated are the charge transfers between N(+)+CO, A(+)+N2, Ar(+)+CO, and the Penning ionization of N2 by Ne(3P2). Vibraand the Penning ionization of N2 by Ne(3P2). Vibra-tional distributions provide direct information on major features of the dynamics, such as whether a Franck-Condon mechanism is dominant, whether collision complex formation is important, or if selective vibra-tional passageways exist between the electronic po-tential-energy surfaces. The rotational distributions show a variety of additional discriming durantian show a variety of additional discriminating dynamical effects, including corroborating evidence for Franck-Condon channels, pinpointing separate mechanisms for different vibrational product states and detecting microscopic bimodalities within individual vibrational levels, which are indicative of multiple entrance- or exit-channel pathways.

Three-State Lattice Gas as Model for Binary Gas-Liquid Systems.

Final rept. P. H. E. Meijer, and M. Napiorkowski. 1987, 7p Pub. in Jnl. of Chemical Physics 86, n10 p5771-5777 1987.

Keywords: *Binary systems(Materials), *Phase dia-grams, *Critical field, Gases, Liquids, Lattice param-eters, Clustering, Reprints.

The paper deals with the three-state lattice model as applied to binary liquid-gas systems. Schouten, ten Seldam and Traeppeniers (Physica 73,556 (1974)) used this model to describe the transition between the liquid phases as well as the gas-gas separation when varying the interaction parameters of the model. The analysis is aimed at the behavior of the system in the vicinity of its tricritical point in the generalized field space. Different shapes of the critical lines are calcu-lated by using the molecular field method as well as by using the lowest approximation of the cluster variation method. The equivalence between the two approaches is demonstrated. In the immediate neighborhood of the tricritical point, the shapes of the critical lines are also determined analytically.

Keywords: *Vibrational spectra, *Raman spectrosco-py, *Carbon monoxide, *Pressure, Gases, Lasers, Repy, *C prints.

Preliminary results of a high resolution spectroscopic study of the pressure dependence of the Raman vibrational Q-branch spectrum of pure CO are reported. Measurements are made at room temperature over the pressure range 0.5 to 6 atm. The technique of quasi-cw inverse Raman spectroscopy utilizing a pulsed single-frequency laser source is employed. This approach gives enhanced sensitivity compared to ear-lier work which employed cw lasers, allowing exten-sion of that work to higher accuracy, higher J states, and higher pressure. The goal of this work is to test the accuracy of a modified exponential-gap rate law model which is used to predict the pressure dependent spec-

lation. Final rept.

M. Keskin, and P. H. E. Meijer. 1986, 10p Pub. in Jnl. of Chemcial Physics 85, n12 p7324-7333 1986.

Keywords: *Phase diagrams, *Transition temperature, Spin spin interactions. Metastable state. Quenching(Cooling), Reprints.

A spin-1 or three state system will undergo a first or second order phase transition depending on the ratio of coupling parameter alpha. Using the pair correlation approximation, the transition temperature is determined in order to obtain the unstable, the metastable, as well as the stable states of this cooperative system. The dynamics of the system is studied by means of the most probable path method and the flow lines and fixed points of the system are given for zero field. The choice of possible initial conditions is discussed. The role of the unstable points in the phase diagram, as separators between the stable and metastable points, is described and they are computed for a number of cases.

Keywords: *Reaction kinetics, *Hydrogen, *Spectro-photometry, *Free radicals, Cyclohexane, Cyclohex-ene, Oxidation, Metal containing organic compounds, Porphyrins, Hydrocarbons, Reprints, *Peroxyl radicals, Benzene/hexamethyl.

Absolute rate constants have been measured for the reactions of trichloromethyperoxyl radicals with cyclohexane, cyclohexene, and hexamethylbenzene. The CCI3O2 radicals contained various amounts of the hydrocarbons. The rate constants were determined by competition with the one-electron oxidation of metalloporphyrins, using the rate of formation of the metallo-porphyrin radical cation absorption to monitor the re-action by kinetic spectrophotometry.

Microwave Energy for Acid Decomposition at Elevated Temperatures and Pressures Using Biologi-cal and Botanical Samples. Final rept.

H. M. Kingston, and L. B. Jassie. 1986, 8p

Pub. in Analytical Chemistry 58, n12 p2534-2541 1986.

Keywords: *Bioassay, *High temperature tests, *High pressure tests, *Microwave equipment, *Acid treat-ment, *Digesters, Sampling, Digestion(Decomposition), Nitric acid, Sulfuric acid, Hydrochloric acid, Hydrofluoric acid, Comparison, Reprints. Standard reference materials.

A closed vessel microwave digestion system is described. In situ measurement of elevated temperatures and pressures in closed Teflon PFA vessels during acid decomposition of organic samples is demonstrated. Temperature profiles for the acid decomposition of biological and botanical standard reference materials are modeled by the dissolving acid. Microwave power absorption of nitric, hydrofluoric, sulfuric, and hydrochloric acids is compared. An equation is applied to acid microwave interactions to predict the time needed to reach target temperatures during sample dissolu-tions. Reaction control techniques and safety precautions are recommended.

Keywords: *Atomic structure, *Cesium, Molecular orbitals, Hyperfine structure, Electron transitions, Eigenvectors, Reprints.

The theoretical interpretation of Cs II has been extended and now includes the 5p(sup 5)ns (n=6-12), 5p(sup 5)np (n=6-8), 5p(sup 5)nd (n=5-11), 5p(sup 5)nf (n=4-8), 5p(sup 5)ng (n=5-10), and 5p(sup 5)nh (n=6-8) configurations. Most levels are well represented in the single configuration approximation when sented in the single conliguration approximation when far configuration interactions are included through ef-fective electrostatic parameters. Explicit interactions of low-lying 5p(sup 5)nd + 5p(sup 5)(n + 1)s configura-tions have been determined. For most configurations, good jK coupling is found. Purities of the levels in jK coupling and the LS composition of the eigenvectors are given. The intermediate-coupling eigenvectors have been used to calculate magnetic-dipole hyperfine-splitting factors, and these are compared with 167 experimentally determined values from earlier work.

of HNO3. Final rept. A. G. Maki, and W. B. Olson. 1989, 11p Pub. in Jnl. of Molecular Spectroscopy 133, p171-181 1989.

Keywords: *Infrared spectroscopy, *Spectrum analy-sis, *Nitric acid, *Band spectra, Bandwidth, Molecular spectroscopy, Molecular rotation, Numerical analysis, Reprints.

The high-resolution spectrum of nitric acid (HNO3) has been measured from 500 to 800/cm. The nu8 band is a C-type out-of-plane vibration and both nu6 and nu7 are in-plane vibrations giving rise to A-type bands. The band centers are at 580.3035(5)/cm for nu7, 646.8262(5)/cm for nu6, and 763.1543(5)/cm for nu8. Constants are given that allow one to accurately calculate the infrared line positions for all three bands. The intensity of the nu8 band is anomalous with an R branch that is much stronger than the P branch. Effec-tive rotational intensity correction terms are given for both the nu8 and the nu6 band. An estimate is given for the relative transition moments for the nu6 and nu7 bands.

Final rept.

. L. Barnes, and H. S. Peiser. 1986, 10p Pub. in Proceedings of Workshop and Symposium Na-tional Conference of Standards Laboratories, Gaith-ersburg, MD., October 6-9, 1986, p22-1-22-10.

Keywords: *Atomic mass, *Chemical elements, *Min-erals, *Accuracy, Isotopes, Abundance.

The atomic weights of the chemical elements in their natural terrestrial occurrences are among the most widely used measurement data affecting science, technology, and commerce. Uncertainties in these values arise not only from the remaining experimental imprecision and bias in determining these values, but also from variations between different sources of a given element. In the tables of the Standard Atomic Weights revised biennially by the International Union of Pure and Applied Chemistry, an attempt is made to publish a single value for each atomic weight with the largest number of significant figures that can be stated vith a single digit uncertainty. In this way users can, at a glance, perceive the atomic weight to the highest precision that is safely applicable to any source and corresponding to the best current knowledge as as-sessed by the Commission on Atomic Weights and Isotopic Abundances. In the paper the steps are traced by which this procedure has been developed.

High Temperature Thermal Conductivity Appara-tus for Fluids.

Hind rept. H. M. Roder. 1987, 8p Sponsored by Department of Energy, Washington, DC.

Sponsoreu by Department of Energy, Washington, DC. Engineering and Geosciences Div. Pub. in Proceedings of DOE (Department of Energy) Symposium on Energy Engineering Science (5th), Boulder, CO., p61-68 1987.

Keywords: *High temperature tests, *Thermal measur-ing instruments, *Thermal conductivity, *Thermal diffu-sion, "Fluids, Performance evaluation, Design criteria, Specific heat.

A new apparatus for measuring both thermal conduc-tivity and thermal diffusivity of fluids at high tempera-tures is described. The technique employed is that of the transient hot wire. Measurements are made with a 12.7 micrometer diameter platinum wire at times of up to 1 second. The data acquisition system is controlled by a microcomputer and includes several programmable digital voltmeters. The hot wire and a shorter com-pensating hot wire are arranged in different arms of a Wheatstone bridge. The cell containing the core of the Wheatstone bridge. The cell containing the core of the apparatus is designed to accommodate pressures from near zero to 70 MPa and temperatures form 0 to 500 C. For thermal conductivity, the precision of the new system is expected to be around 0.3% and the accuracy 1.0%. For thermal diffusivity the accuracy is estimated to be around 5%. From the two variables measured, the author can obtain values of the specific test. heat, Cp, of the fluid, provided that the density is either measured, or available through an equation of state.

900,367 PB89-174098

PB89-174098 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Time and Frequency Div. Study of Long-Term Stability of Atomic Clocks.

Final rept.

D. W. Allan. 1987, 5p Pub. in Proceedings of Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (19th), Redondo Beach, CA., December 1-3, 1987, 0275-027 p375-379.

Keywords: *Frequency standards, *Atomic clocks, Time measurement, Masers, Hydrogen, Cesium, Mercury(Metal), Beams(Radiation), Tracking(Position), Frequency stability, Pulsation, Spacecraft tracking, Pulsars.

The importance of long-term frequency stability has increased significantly in recent years because of the discovery of the millisecond pulsar, PSR 1937 + 21. In addition, long-term stability is extremely useful not only in evaluating primary frequency standards and the per-formance of national timing centers, but also in addressing questions regarding autonomy for the Global Positioning System (GPS) and syntonization for Jet Propulsion Laboratory's (JPL) Deep Space Tracking Network. Over the last year, NBS has carried out several studies addressing questions regarding the long-term frequency stability of different kinds of atomic clocks as well as of principal timing centers. These analyses cover commercial and primary cesium-beam frequency standards, active hydrogen master frequen-cy standards and the new commercial mercury-ion freguency standards at United States Naval Observatory (USNO). Fractional frequency stabilities of parts in 10 sup 14 down to parts in 10 sup 15 were observed for various of these standards. It is believed that frequency stabilities on the order of a part in 10 sup 15 will be necessary to measure the effects of gravity waves on frequency stability between millisecond pulsars and atomic clocks on or near the earth.

Thermophysics Div. Vapor-Liquid Equilibrium of Nitrogen-Oxygen Mix-tures and Air at High Pressure.

Final rept. J. C. Rainwater, and R. T. Jacobsen. 1988, 10p Pub. in Cryogenics 28, p22-31 Jan 88.

Keywords: *High pressure tests, *Nitrogen, *Oxygen, *Binary systems(Materials), *Mathematical models, *Thermodynamic equilibrium, *Phase diagrams, Phase transformations, Vapor phases, Liquid phases, critical paint Reprint, Vapor phases, Liquid phases, Critical point, Reprints.

The vapor-liquid equilibrium surface of the binary mixture nitrogen-oxygen is correlated over an extended critical region with the Leung-Griffiths model as modi-fied by Rainwater and Moldover. No single compre-hensive experimental measurement of the coexistence surface is available. However, several different experiments along isopleths, isotherms and isobars collectively provide enough data to make possible the development of a reasonable correlation. The model is optimized to modern data and is shown to be consistent with pioneering measurements done before 1930 to within experimental and temperature-scale unceraccurately modelled as a nitrogen-oxygen binary mixture by including the small argon component with oxygen. Ancillary equations for the saturation proper-ties of air as functions of temperature are also constructed.

Molecular Dynamics investigation of Expanded Water at Elevated Temperatures.

Final rept. R. D. Mountain. 1989, 5p Pub. In Jnl. of Chemical Physics 90, n3 p1866-1870, 1 Feb 89.

Keywords: *High temperature tests, *Water, *Dynamic structural analysis, Molecular structure, Hydrogen bonds, Density(Mass/volume), Thermodynamic propertles, Reprints, Expansion.

The structure of expanded states of TIP4P water has been examined over a range of densities running from 1000 to 100 kg/cu m and for a range of temperatures running from the coexistence temperature up to supercritical temperatures. The main result is that hydrogen bonding, as evidenced by the maximum in g(sub OH) (R) at 0.18 nm, persists to supercritical temperatures over the entire density range examined. For most liquid densities, the number of hydrogen bonds per molecule scales as a single function of the temperature but does not scale for dense vapor densities.

Decorated Lattice Gas Model for Supercritical Solubility. Final rept.

G. C. Nielson, and J. M. H. Levelt Sengers. 1987,

10p Pub. in Jnl. of Physical Chemistry 91, n15 p4078-4087 1987.

Keywords: *Solubility, *Thermodynamic equilibrium, *Supercritical flow, Phase diagrams, Solutes, Sol-vents, Temperature, Experimental design, Phase transformations, Solid phases, Liquid phases, Reprints.

The authors describe a self-consistent nonclassical model for supercritical solubility enhancement near the solvent's critical point. A Widom-Wheel-MermIn decorated lattice gas transformation is used to obtain prop-erties of a dilute supercritical solution from known properties of the pure solvent. Phase equilibria between the solution and the additional solid or liquid phase are described. A semiquantitative representa-tion of solubility data for three different solute-solvent pairs at several temperatures was obtained. Infinite-dilution partial molal volumes based on parameter sets obtained from fits to solubility data did not agree very well with experiment.

Low Range Flowmeters for Use with Vacuum and Leak Standards.

Final rept.

K. E. McCulloh, C. D. Ehrlich, F. G. Long, and C. R. Tilford. 1987, 6p Pub. in Jnl. of Vacuum Science and Technology A-

Vacuum Surfaces and Films 5, n3 p376-381 1987.

Keywords: *Flowmeters, *Standards, *Pressure sensors, "Gas flow, Calibrating, Comparison, Perform-ance evaluation, Leakage, Vacuum apparatus, Reprints.

Vacuum pressure standards of the orifice-flow type require known gas flows of .00001 mol/s (.01 std cc/s) and less. Known gas flows can also be used to cali-brate 'standard' leaks by comparing the pressures generated when flows from the leak and the flowmeter are alternately passed through a constant conduct-ance. Described here are two constant-pressure, piston displacement flowmeters developed at NBS that can generate flows between .000001 and 10 to the -10th power mol/s with an estimated uncertainty of 0.8 to 2%. Comparisons of the flowmeters with alter-nate calibration techniques, and repeated low range leak and vacuum gage calibrations, have been used to confirm the estimated uncertainty and random errors of the flowmeter.

Dynamics of Molecular Collisions with Surfaces: Excitation, Dissociation, and Diffraction.

Final rept. S. Holloway, M. Karikorpi, and J. W. Gadzuk. 1987,

18p Pub. in Nuclear Instruments and Methods in Physics

Research B27, n1 p37-54 1987.

Keywords: Excitation, Dissociation, Diffraction, Scattering, Reprints, *Molecular collisions, *Surface reac-tions, Charge transfer, EV range 01-10, Vibrational states

Aspects of molecular collisions with surfaces are dis-Aspects of molecular collisions with surfaces are dis-cussed which are important in the chemically relevant energy range of 1-10 eV. In particular, the role of charge transfer, potential energy surface topology and intra-molecular ground and excited-state potential curves are investigated as they pertain to internal vi-brational excitation, dissociative absorption or scatter-ing, and diffractive scattering. The modeling and analy-sis is based on classical trajectories and semi-classical wavepacket dynamics, both for, intra-molecular, and wavepacket dynamics, both for intra-molecular and translational motion.

One-Electron Transfer Reactions of the Couple SO2/SO2(1-) in Aqueous Solutions. Pulse Radioly-tic and Cycilc Voltammetric Studies. Final rept.

P. Neta, A. Harriman, and R. E. Hule. 1987, 6p Pub. In Jnl. of Physical Chemistry 91, n6 p1606-1611 1987.

Keywords: *Reaction kinetics, *Sulfur dioxide, *Free radicals, *Radiolysis, *Reduction(Chemistry), pH, Por-phyrins, Reprints, *Pulse techniques, *Voltammetry.

Rate constants for one-electron reduction of SO2 by several radicals and for reduction of several com-pounds by SO2(sup -1) radicals were determined by pulse radiolysis at pH 1. The reduction potentials for SO2 and for porphyrins were determined by cyclic voltammetry under identical conditions. These reduction potentials were used along with the rate constants and previously reported self-exchange rates to estimate the self-exchange rate for the couple SO2/SO2(sup -1) in acidic solutions. The calculated values were found to vary over many orders of magnitude, similar to the situation reported before for the O2/O2(sup -1) couple.

Defocus Modeling for Compositional Mapping with Wavelength-Dispersive X-ray Spectrometry. Final rept.

R. L. Myklebust, D. E. Newbury, R. B. Marinenko, and D. S. Bright. 1986, 3p

Pub. in Microbeam Analysis - 1986, p495-497 1986.

Keywords: *X ray spectroscopy, *Molecular structure, *Chemical composition, *Quantitative analysis, Spec-trochemical analysis, Numerical analysis, Reprints, *Electron microprobe analysis.

Quantitative compositional mapping by electron probe microanalysis requires the use of corrections for spectrometer defocusing when wavelength-dispersive is employed. A correction procedure has been devel-oped which is based on calculating a synthetic map of the standard from an angular scan across the peak. Equations have been developed which relate the dis-tance in a matrix scan from the line-of-best-focus of the spectrometer to the equivalent angular position in a peak scan. The transmission of the spectrometer can be directly determined from the peak scan and appropriate corrections can be applied to the intensity map of an unknown. The method is effective down to magnifications as low as 150x, where statistical considerations become limiting.

Physical & Theoretical Chemistry

Bate constants for reactions of NO3 radicals in neutral and acidic aqueous solutions were determined by pulse radiolysis. The values for hydrogen abstraction from several organic compounds were in the range of 10(5) - 10(7)/Ms and were dependent on the C-H bond strength. The rate constants for addition to double bonds ranged up to 5x10(7)/Ms. Rate constants for the one-electron oxidation of several organic comthe one-electron oxidation of several organic com-pounds and inorganic ions varied over a wide range. From these, it was possible to estimate the redox po-tential for the NO3/NO3 couple to be 2.3-2.6U. Sever-al rate constants for SO4(2-) were measured as well and the behavior of NO3, SO4(2-), and OH radicals are compared.

9. W. Ferry, A. W. Hoodmark, Laser Applications in Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Laser Applications in Chemistry and Biophysics, v620 p7-14 1986.

Keywords: *Raman spectra, *Coherent scattering, *Vi-brational spectra, *Carbon disulfide, *Benzene, *Lasers, Phases, Mixtures, Carbon tetrachloride, Ni-trobenzenes, Ethanols, Dilution, Polarization, Solvents, Mathematical models.

The vibrational dephasing of the 656 cm(-1) mode (nu1,a1g) of carbon disulfide and the 991 cm(-1) mode (nu2, a1g) of benzene have been studied as a function of concentration in mixtures with a number of solvents using a picosecond time-resolved coherent anti-Stokes Raman scattering (CARS) technique. The tech-nique employs two tunable synchronously-pumped model-locked dye lasers in a stimulated Raman pump, coherent anti-Stokes Raman probe time-resolved ex-periment. Results are obtained for CS2 in carbon tetrachloride, benzene, nitrobenzene and ethanol, and for benzene nu2 in CS2. The dephasing rates of CS2 nu1 increase on dilution with the polar solvents and de-crease or remain constant on dilution with the nonpolar solvents. The CS2/benzene solutions show a contrasting behavior with the CS2 nu1 dephasing rate being nearly independent of concentrations whereas the benzene nu2 dephasing rate decreases on dilution. These results are compared to theoretical models for vibrational dephasing of polyatomic molecules in solution.

Influence of Electronic and Geometric Structure on Desorption Kinetics of Isoelectronic Polar Molecules: NH3 and H2O. Final rept.

T. E. Madey, C. Benndorf, and S. Semancik. 1987,

Pub. in Springer Ser. Surf. Sci. 8, p175-181 1987.

Keywords: *Water, *Ammonia, *Reaction kinetics, *Desorption, Chemisorption, Surface chemistry, Chemical bonds, Adsorption, Polarity, Dipoles, Re-prints, *Electronic structure, Isoelectronic atoms.

The thermal desorption kinetics of isoelectronic NH3 and H2O from surfaces provide an interesting con-trast, due to geometrical and electronic structural effects in the adsorbed layers. Both NH3 and H2O are polar molecules bonded to the surface via lone pair orbitals on N and O, respectively. Hydrogen-bonding attractive interactions between neighboring H2O mole-cules lead to formation of 2-d and 3-d clusters; thermal desorption kinetics of H2O are characterized by sharp desorption peaks over narrow temperature ranges (delta T less than 10 K in some cases). In distinction, lateral interactions between neighboring NH3 molecules are largely repulsive (dipole-dipole interactions) and the thermal desorption spectra are considerably broader in temperature than for H2O (delta T approxi-mates 80 K to 180 K, depending on substrate).

Dehmer. 1988, 7p Sponsored by Department of Energy, Washington, DC.

Pub. in Physical Review A 37, n2 p437-443, 15 Jan 88.

Keywords: *Hydrogen, Far ultraviolet radiation, Re-prints, *Photoelectron spectroscopy, *Photoionization, Autoionization, eV range 10-100, Extreme ultraviolet radiation, Angular distribution.

Vibrationally resolved photoelectron angular distributions have been measured for photoionization of H2 over the range 17 eV = or < h(mu) = or < 39 eV using independent instrumentation at two synchrotron radiation facilities. The present data greatly extend and add vibrational resolution to earlier variable-wavelength measurements. The average magnitude of the asymmetry parameter continues to lie lower than the best independent-electron calculations. Broad structure is observed for the first time, possibly indicating the effects of channel interaction with dissociative. doubly excited states of H2. Neither the average magnitude nor the gross wavelength-dependent structure vary strongly with the final vibrational channel.

Vibrational Exchange upon Interconversion Tun-neling in (HF)2 and (HCCH)2. Final rept.

G. T. Fraser. 1989, 12p Pub. in Jnl. of Chemical Physics 90, n4 p2097-2108, 15 Feb 89.

Keywords: *Acetylene, *Hydrogen fluoride, Hydrogen bonds, Infrared spectra, Reprints, Vibrational states, Selection rules, Dimers.

Model calculations are presented to interpret the large H-F and C-H stretching vibrational dependencies of the interconversion tunneling splittings and the corre-sponding infrared vibrational-tunneling state selection rules in (HF)2 and (HCCH)2. The model consists of two potential curves in the tunneling coordinate, coupled by an interaction term that allows the vibrational excitation to be exchanged between the two monomer units, permitting tunneling to occur. The interaction term is approximated by resonant infrared transitiondipole coupling. The magnitudes of the calculated vi-brational dependencies, their isotopic shifts, and the predicted selection rules are in agreement with previous experimental observations.

Effects of Velocity and State Changing Collisions on Raman Q-Branch Spectra. Final rept.

G. J. Rosasco, and W. S. Hurst. 1987, 33p Sponsored by Army Research Office, Research Trian-

gle Park, NC. Pub. in Spectral Line Shapes, p535-567 1987.

Keywords: *Raman spectroscopy, *Molecular vibra-tion, *Line width, *Molecular energy levels, *Velocity, *Molecular rotation, Temperature, Pressure, Performance evaluation, Spectral lines, Reprints, *High resolution.

Recent progress in both the experimental character-ization and theoretical understanding of Raman vibra-tional Q-branch spectra is reviewed. Nonlinear Raman spectroscopy, in particular stimulated Raman gain/ loss spectroscopy, has produced high resolution (1-150 MHz) spectra for many systems over quite large ranges of temperature and pressure. The high resolution capability allows testing theoretical predictions to a previously unattainable level of accuracy. In turn, the use of nonlinear Raman spectroscopies for optical measurements of temperature, pressure, and species concentration in hostile environments requires very accurate prediction of spectra as functions of these variables. The level of current understanding and ability to predict these diagnostic spectra is reviewed. Emphasis is placed on the role of velocity and state changing collisions, since these primarily determine the shapes and widths of Raman Q-branch spectra.

Office of Industrial Programs. Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Optical Techniques for In-dustrial Inspection, v665 p298-305 1986.

Keywords: *Remote sensing, *Emission spectrosco-py, *Black liquors, *Combustion products, *Gas analy-sis, *Temperature measurement, Potassium, Boilers, Materials recover, Spectral lines.

A remote sensing technique, based on the principles of emission spectroscopy, is being developed for ap-plication to temperature measurement in black liquor recovery boilers. Thus far, several tests have been carried out, both in the laboratory and at a number of re-covery boilers, to characterize the emission spectra in the wavelength range of 300 micrometers to 800 micrometers. These tests pointed out the potential for the line intensity ratio technique based on a pair of emission lines at 404.4 micrometers and 766.5 micrometers observed in the recovery boiler combustion common constituent found in all the black liquors. Accordingly, a fiber optics based four-color system has been developed. The in-situ, nonintrusive technique together with some of the results obtained are described in the paper.

Keywords: *Argon, *Thermal conductivity, *High pres-sure tests, *Cryogenics, Gases, Liquids, Density(Mass/volume), Standards, Reprints.

The paper presents new experimental measurements of the thermal conductivity of liquid argon for four temperatures between 110 and 140 K with pressures to 70 MPa and densities between 23 and 36 mol/L. The measurements were made with a transient hot wire apparatus. A curve fit of each isotherm allows comparison of the present results to those of others and to correlations. The results are sufficiently detailed to illustrate several features of the liquid thermal conduc-tivity surface. If these details are taken into account, the comparisons show the accuracy of the present results to be 1%. The present results along with several other sets of data are recommended for selection as standard thermal conductivity data along the saturated liquid line of argon, extending the standards into the cryogenic temperature range. The results cover a fairly wide range of densities. A hard sphere model cannot represent the data within the estimated experimental accuracy.

1988, 5p See also PB87-233532.

Pub. in Gas Separation and Purification 2, p126-130 Sep 88.

Keywords: *Carbon dioxide, *Gases, *Swelling, *Ion exchange membrane electrolytes, *Separation, Glyc-erol, Hydration, Ethylenediamine, Transport properties, Hydrogen sulfide, Carriers, Diffusion, Permeability, Reprints.

pretreatment for perfluorosulphonic acid ion-exchange films, using glycerine and heating, causes the membranes to swell and imbibe greater (up to threefold) amounts of water than obtained using standard membrane hydration techniques. The permeation of CO, CO2 and H2S has been tested for these membranes in the diffusive transport mode and with carriermediated (facilitated) transport, using ethylenediamine (EDA). When compared to 'normally' hydrated mem-branes the results indicate that these membranes are up to 50% thicker; have four to six times higher flux in both diffusive and facilitated transport, maintain a high degree of facilitation for CO2 and H2S; and maintain similar selectivity versus non-carrier reactive gases as previously observed. Experimental results show the effects of pretreatment temperature on the CO2 flux.

energy, High resolution, Molecular dynamics, lonic conductivity, Clathrates, Milli EV range.

Some examples of recent applications of low energy and high resolution neutron spectroscopy in chemical physics are discussed. These include brief descriptions of research on translation-rotation coupling in solids, focused on alkali cyanides and alkali cyanide mixed salts a discussion of the problem of nonbonded potentials in molecular solids by a study of rotational modes and tunnel splittings, and the use of low energy neutrons to probe the mechanism of transla-tional diffusion and reorientation in molecular complexes, ionic conductors and intercalation compounds. The illustrative examples described demonstrate the application of modern neutron scattering methods to low energy spectroscopy over five orders of magnitude in time and energy (0.1-10,000 (micro)eV). The importance of future research using neutron methods to study molecular dynamics in dilute and low-dimensional systems is stressed.

Toluene at High Temperatures. Final rept.

D. Robaugh, and W. Tsang. 1986, 5p Pub. in Jnl. of Physical Chemistry 90, n17 p4159-4163 1986.

Keywords: *Reaction kinetics, *High temperature tests, *Decomposition reactions, Toluene, Methane, Ethane, Butenes, Reprints, *Chemical reaction mech-anisms, *Ethane/hexamethyl, *Hydrogen atoms.

Hexamethylethane has been decomposed in the presence of large excesses of toluene and methane/toluene mixtures in single pulse shock tube experiments in the temperature range of 950-1100K and at 2-5 atm. Methane, ethane, isobutene and benzene are the main light hydrocarbon reaction products. In the presence of sufficiently large excess of methane, benzene yields are reduced. This is due to the competitive process.

Quenching and Energy Transfer Processes of Single Rotational Levels of Br2 B triplet Pi(O(sub u)(+)) v'=24 with Ar under Single Collision Conditions.

Final rept.

K. Yamasaki, and S. R. Leone. 1989, 13p Grants NSF-CHE84-04803, NSF-CHE86-04504

Sponsored by National Science Foundation, Washington. DC.

Pub. in Jnl. of Chemical Physics 90, n2 p964-976, 15 Jan 89

Keywords: *Bromine, *Molecular energy levels, Argon, Energy transfer, Fluorescence, Reprints, Atom-mole-cule collisions, Rotational states, Vibrational states, Dve lasers, Quenching,

State-specific total quenching rate constants are measured for selected rotational levels of Br2 under single collision conditions with argon at 296 K. A strict criterion is used to obtain single collision conditions in a cell experiment. A 0.04/cm bandwidth, etalon-narrowed pulsed dye laser excites single rovibronic transi-tions of the B triplet Pi((O sub u)(+)) state. Fluorescence decay traces with and without the argon collision partner are analyzed at early times to extract total quenching rate constants.

5(sup 3)P(sub J)) Energy Transfer Collisions by Far Wing Laser Scattering. Final rept.

K. C. Lin, P. D. Kleiber, J. X. Wang, W. C. Stwalley, and S. R. Leone. 1988, 6p Grant NSF-CHE86-15118

Sponsored by National Science Foundation, Washington, DC.

Pub. in Jnl. of Chemical Physics 89, n8 p4771-4776, 15 Oct 88.

Keywords: *Calcium, Absorption spectra, Alignment, Energy transfer, Helium, Reprints, *Atom-atom collisions.

The far wing absorption profiles for excitation on the Ca(4s sup 2 singlet S sub 0-4s5p singlet p (sup 0, sub 1)) atomic transition, broadened in collisions with He are measured. Strong absorption was observed in both wings and a blue wing satellite was observed near the delta approx. 125/cm. This satellite was tentatively identified as due to a maximum in the CaHe(4s sup 2 singlet Sigma(+) - 4s5p singlet Sigma(+)) difference potential. These line-broadening techniques are used to study electronic energy transfer in the spin-changing collisions of Ca with He: Ca(5p singlet p(sup 0, sub 1)) + He yields Ca(5p triplet p(sup 0, sub J)) + He yields Ca(5p triplet p(sup 0, sub J)) + He + delta E.

and Dutch High-Pressure Science.

Final rept. J. M. H. Levelt Sengers, and J. V. Sengers. 1989,

Pub. in Physica A 156, p1-14 1989.

Keywords: Fluids, Light scattering, Molecular theory, Nuclear magnetic resonance, Phase transformations, Transport properties, Netherlands, Reprints, *Foreign technology, *Van der Waals Fund, *High pressure, technology, Calibration, Diamond anvils.

The history of the van der Waals Fund is traced from events in the late 19th century leading to its establish-ment in 1898 to the present time. The impact of the fund on the development of high-pressure science and industry in the Netherlands is discussed. The course of industry in the Netherlands is discussed. The course of high-pressure research at the University of Amsterdam is sketched in the period of van der Waals and Kohn-stamm, 1898 to 1920; that of Michels, 1920 to 1961; and that of Trappeniers, 1961 to 1987. The themes are: test of molecular theories at high pressures; quest for accuracy; high-pressure design; impact on Dutch industry; expanding the ranges of pressure and temperature; expanding the capabilities of property meas-urement; international recognition; and funding, including industrial support.

One Is Not Enough: Intra-Cavity Spectroscopy with Multi-Mode Lasers.

Final rept.

P. E. Toschek, and V. M. Baev. 1987, 89p

Pub. in Laser Spectroscopy and New Ideas, A Tribute to Arthur L. Shawlow, 89p Sep 87.

Keywords: *Spectrum analyses, Multiplexing, Design criteria, Performance evaluation, Quantum chemistry, Quantum interactions, Reprints, *Laser spectroscopy, *Intercavity spectroscopy, Mode selection.

The scope of the presentation is necessarily limited: the authors have not aspired to offer a complete ac-

count of work on or with intra-cavity spectroscopy (ICS). In particular, attempting to cover all the pertinent work that has been done in molecular spectroscopy and chemical kinetics would far exceed the limits of the spectroscopy and chemical kinetics would far exceed the limits of the article. Instead, the authors have tried to point out two facts that are, it seems, not munity. First, the considerable measure of understand-ing they now have of the fundamentals that underlie ICS, and second, the level of consistent rity the field has acquired recently. In adaptation of, but also challenging Arthur Schawlow's popular definition of a diatomic molecule, the authors claim that there indeed exist niches in physics where ONE is not enough. Eventually, what is lost in precious simplicity of the system under scrutiny is, perhaps, more than regained with inherent features that allow the spectroscopists to sometimes extend spectacularly the limits previously put on their techniques.

Quantum Physics Div. Structure and Dynamics of Molecular Clusters via High Resolution IR Absorption Spectroscopy. Final rept.

D. J. Nesbitt. 1987, 5p Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC

Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Laser Applications to Chemical Dynamics, Los Angeles, CA., January 13-14, 1987, v742 p16-20.

Keywords: *Infrared spectroscopy, *Absorption spec-tra, *Molecular structure, *Complex compounds, *Chemical dynamics, *Spectrum analysis, Molecular vibration, Molecular rotation, Hydrogen bonds, Van der Waals equation, Clustering, *High resolution, *Laser spectroscopy.

The combination of high resolution (.001/cm) cw tunable difference frequency generation (2.2-4.2 microme-ters) with high sensitivity .000001/((Hz))1/2) long path length absorption methods in pulsed slit supersonic jets has permitted spectroscopic investigation of many weakly bound molecular complexes. Discussion focuses on three complementary areas of experimenta-tion. Cluster formation in the molecular beam is probed tion. Cluster formation in the molecular beam is probed via sub-Doppler, velocity resolved absorption profiles of monometer species. Spatially dependent beam clustering is strongly manifested through loss of mo-nometer absorption intensity at line center. IR spectra of simple van der Waals molecules such as ArHF are obtained in the nu1 HF stretching region. Information on all modes in the complex is extracted. IR spectra of hydrogen bonded complexes such as HFCO2 are observed which exhibit large changes in average molecu-lar geometry as a function of vibrational state. Surpris-ingly low intermolecular bending frequencies are evidenced in the spectra via hot bands and provide dy-namical information on coupled vibrational-rotational motion in floppy molecular systems.

High Resolution Optical Multiplex Spectroscopy. Final rept.

K. P. Dinse, M. P. Winters, and J. L. Hall. 1987, 2p Pub. in Proceedings of International Conference on Laser Spectroscopy (8th), Are, Sweden, June 22-26, 1987, p388-389.

Keywords: *Spectrum analysis, *Doppler effect, *Opti-cal spectra, Calibrating, Excitation, Performance eval-uation, Multiplexing, *High resolution, *Laser spectros-CODV.

Cross correlation techniques using stochastic sources have been applied in many fields to determine the im-pulse response functions of a system. The work applies such noise-based techniques for the first time in the optical domain to obtain high resolution sub-Dopp-ler spectra. Interesting advantages of the method include a spectral multiplex advantage which can be a few powers of 10 relative to sequentially-scanned spectroscopy as well as absolute calibration of the fre-quency axis of the spectrum.

Pressure and Density Series Equations of State for Steam as Derived from the Haar-Gallagher-Kell Formulation.

Quarterly rept. R. A. Dobbins, K. Mohammed, and D. A. Sullivan. c1988, 8p

Included in Jnl. of Physical and Chemical Reference Data, v17 n1 p1-8 1988. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036

Keywords: *Vapor pressure, *Density(Mass/volume), *Steam, *Experimental data, Physical properties, Equations of state, Numerical analysis, Thermodynamic properties, Metastable state, Comparison, Virial coefficients.

Two equations of state for the properties of steam, which are in the form of power series in pressure and density, are developed from the HGK84 formulation. These equations are of high accuracy in the equilibri-um region where extensive measurements exist. They also accurately represent the extrapolated data in the metastable region between the vapor saturation and spinodal lines. The accuracy of the representations as a function of the number of terms of the series is presented. Their greatest utility is their use for high accuracy calculations that involve small to moderate depar-tures from ideal-gas behavior. Conversion relationships for the second through the tenth coefficients of the pressure and density series, which apply to the corresponding virial coefficients, are presented. The pressure and density expansions are advantageous for efficient numerical calculations of water vapor properties in the equilibrium and metastable regions.

A compilation is provided of absolute total photoab-A compliation is provided of absolute total photoab-sorption and partial-channel photoionization cross sections for the valence shells of selected molecules, including diatomics (H2, N2, O2, CO, NO) and triato-mics (CO2, N2O), simple hydrides (H2O, NH3, CH4), hydrogen halides (HF, HCI, HBr, HI), sulfur compounds (H2S, CS2, OCS, SO2, SF6), and chlorine compounds (Cl2, CCl4). The partial-channel cross sections pre-control rote to production of the individual electronic sented refer to production of the individual electronic states of molecular ions and also to production of parent and specific fragment ions, as functions of incident photon energy, typically from approximately 20 to 100 eV. Photoelectron anisotropy factors, which together with electronic partial cross sections provide cross sections differential in photon energy and in ejection angle, are also reported. There is generally good agreement between cross sections measured by

the physically distinct optical and dipole electron-impact methods. The cross sections and anisotropy factors also compare favorably with selection ab initio and model potential (X-alpha) calculations which provide a basis for interpretation of the measurements.

Standard Chemical Thermodynamic Properties of Polycyclic Aromatic Hydrocarbons and Their isomer Groups 1. Benzene Series.

Quarterly rept.

R. A. Alberty, and A. K. Reif. c1988, 13p Sponsored by National Bureau of Standards (ICST), Gaithersburg, MD.

Included in Jnl. of Physical and Chemical Reference Data, v17 n1 p241-253 1988. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Experimental data, *Standards, *Thermo-dynamic properties, *Aromatic polycyclic hydrocar-bons, *Benzene, *Isomerization, Chemical properties, Numerical analysis, Enthalpy, Specific heat, Entropy, Gibbs free energy, Tables(Data), Molecular structure.

The polycyclic aromatic hydrocarbons can be organized into an infinite number of series in each of which successive isomer groups differ by C4H2. The first series starts with benzene, and chemical thermodynamic tables are presented here for C6H6, C10H8, C14H10, C18H12, C22H14, and C26H16 in the ideal gas phase. Since chemical thermodynamic properties are known for only several polycyclic aromatic hydro-carbons, the properties of individual species have been estimated using Benson group values of Stein and Fahr for temperatures from 298.15 to 3000 K. Values of Cp, S, delta H, and delta G have been calculated in joules for a standard state pressure of 1 bar. The chemical thermodynamic properties of the isomer groups have also been calculated. This provides a basis for extrapolating to higher carbon numbers where it is not feasible to consider individual molecular species.

PB89-186746 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Chemical Thermodynamics Div. Water Structure in Crystalline Solids: ices to Pro-

teins. Final rept.

H. Savage. 1986, 82p

Sponsored by National Inst. of Arthritis, Diabetes, and Digestive and Kidney Diseases, Bethesda, MD. Pub. in Water Science Reviews 2, p67-148 1986.

Keywords: *Molecular structure, *Water, Hydrogen bonds, Crystal structure, Neutron diffraction, Reprints, *Crystalline hydrates, Non-bonded interactions.

The water structure in hydrate crystals ranging from the ice polymorphs to complicated macromolecular protein systems is reviewed with respect to analyzing the solvent using neutron and X-ray diffraction methods and understanding the resulting experimental structures. Detailed characteristics of water structure (ordered and disordered) are discussed with respect to

the more repulsive interactions that overall appear to control the actual geometries present within each system. The repulsive regularities may be used as a set of restraints in analyzing the possible water structure(s) around larger protein systems and also in computer simulations of water and aqueous systems.

900.414

Not available NTIS PB89-186753 National Bureau of Standards (NML), Gaithersburg, MD Chemical Thermodynamics Div. Repulsive Regularities of Water Structure in Ices

and Crystalline Hydrates.

Final rept. H. F. J. Savage, and J. L. Finney. 1986, 4p Pub. in Nature 322, n6081 p717-720 1986.

Keywords: *Water, *Liquids, *Neutron diffraction, *Hy-drogen bonds, *Crystal structure, Mathematical models, Solvents, Stereochemistry, Water of hydration, Reprints.

Hydrogen bonded structures display wide ranges of the various angles (e.g., O-H. . . O) and distances (e.g., H. . . O) used to describe their intermolecular geometry. For example, O. . O distances are found to vary be-tween -2.5 and 3.2A, while the hydrogen bond angles normally occur within the 120-180 range. Moreover, al-though many potential functions exist for describing water-water interactions, none of them are totally satisfactory in reproducing experimental results even for pure water. The initial results of an analysis of water structures in high resolution neutron crystal structures are presented and are dramatically more successful in rationalizing the stereochemistry of water interactions. Rather than considering the structures in terms of weak orientation-dependent attractions, a concentration on the repulsive interactions leads to a set of very much stronger stereochemical constraints which not only rationalize the structures but appear largely to control the orientational correlations in aqueous systems. Looked at in this way, water network structures in crystal hydrates and probably in the liquid itself become for the first time comprehensible. The ap-proach provides a much firmer base from which to build realistic potential functions to model and simulate solvent structure(s).

PB89-186779 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Chemical Thermodynamics Div. Biological Standard Reference Materials for the Calibration of Differential Scanning CalorImeters: Di-alkylohosphatidylcholine in Water Suspen-MD. Chemical Thermodynamics Div.

sions. Final rept.

F. Schwarz. 1986, 13p

Pub. in Thermochimica Acta 107, p37-49 1986.

Keywords: *Calibrating, *Heat measurement, Enthal-py, Thermodynamic properties, Reprints, *Phosphati-dylcholine/dialkyl, *Standard reference materials, Dif-ferential scanning calorimeters.

The temperatures and enthalpies of the phase transitions of suspensions of di-alkylphosphatidylcholines in water solutions, prepared and stored under a variety of experimental conditions, were determined in a differ-ential scanning calorimeter (DSC) to evaluate their po-tential as standard reference materials for the calibration of DSCs. The di-alkylphosphatidylcholine suspen-sions were 10 mass % 1,2-ditetradecanoyl-sn-glycero-3-phosphocholine (DTPC), and 1,2-dihexadecanoyl-sn-glycero-3-phosphocholine in aqueous buffered solutions at pH 7.0. A subtransition at 8.5 deg C with an enthalpy of 15.5 kJ/mole was observed in the DTPC suspensions after storage of the sample at -5.5 deg C for 2 days. The appearance and the temperature and enthalpy values of the subtransition, the pretransition, and the ice peaks of the suspensions depended on the preparation and storage conditions of the samples. An imprecision of 10% was observed for the values of the main transition and an imprecision of 0.03 deg C for the main transition temperature. Transition tempera-tures and enthalpies were also determined for suspensions of other di-alkylphosphatidylcholines in buffered water solutions.

Keywords: *Optical spectra, Metastable state, Quan-tum interactions, Performance evaluation, Calibrating, Iodine, Standards, *Laser spectroscopy, *High resolu-

It is indeed possible to lock to a reference cavity with a reproducibility 10 to the -15th power fringe widths and a stability a decade or so better producing a laser linewidth of 50 milliHertz. Heterodyne tests against an I2-stabilized reference show a frequency drift rate of +6100 Hz/hr stable to .001 per day and 1% for a week. Feed-forward compensation for the smooth drift then offers a source for spectroscopy with a frequency uncertainty 100 milliHertz for about one minute; as will be appropriate to scan over the 'quantum telegraph' optical resonances of single trapped ions with long metastable lifetimes.

PB89-189351 PC A05/MF A01 National Inst. of Standards and Technology (NML), Gaithersburg, MD. Chemical Thermodynamics Div. Logistic Function Data Analysis Program: LOGIT. W. H. Kirchhoff. Mar 89, 95p NISTIR-88/3803

Keywords: *Hyperbolic functions, *Statistical analysis, *Data Processing, Computer programs, Graphs(Charts), Tests, Data, Comparison, Experimen-tal data, Chronium, Nickel, Interfaces, *Logistic func-tions, *Autocatalysis, *Computer applications, Com-puter programs, Fortran programming language.

A FORTRAN program has been written for the statistical analysis of experimental data in terms of an ex-tended logistic function that includes non-horizontal asymptotes and asymmetry in the pre- and post-transition portions of growth and decay curves. The program is robust in that situations in which few or no data fall within the transition interval can be analyzed by the program. Individual weighting of the data is allowed for situations where the errors in experimental data are not uniform. The primary parameters describing the transition region include a location parameter, a width parameter, and an asymmetry parameter. Six more parameters describe the two quadratic asymptotic re-gions. Sufficient information is given to allow the devel-opment of companion subroutines for the graphing of the function and its standard deviations as well as for displaying the original data with error bars. The program provides a means for systematically parameteriz-ing sigmoidal profiles for the comparison of measure-ments made with different instruments on different systems and for the comparison of measurements with simulation models. The program is extensively documented.

Pub. in Jnl. of Chemical Physics 90, n3 p1677-1685, 1 Feb 89

Keywords: *Rotational spectra, *Nitrogen, Ground state, Fluorescence, Boltzmann equation, Charged particles, Reprints, *Argon ion, *Charge transfer.

The nascent rotational state distributions of N2(+) produced in the charge transfer reaction of Ar + (doublet P(sub 3/2)) with N2 at 0.28 and 0.40 are remeasured by laser-induced fluorescence. A supersonic expansion is used to reduce the initial rotational angular momentum of the N2. The N2(+) product ro-tational distributions, in both V=0 and V=1, have low and high energy components. For ease of reference, each distribution is described as a summation of two Boltzmann distributions . At a relative collision energy of 0.28 eV, the Boltzmann temperatures are 100 +or 20 K and 745 + or - 120 K for N2(+) (V=0) and 80 + or - 10 K and 680 + or - 30 K for N2(+) (V=1). Adiabatic potential energy curves for the lowest vibronic states are calculated and a simple curve hopping model is presented. Applying the model to the production of N2(+) (V = 1), for example, those reactants that charge transfer on the outgoing leg of a reactive trajectory interact with a deep potential well in the entrance channel for collinear geometry. It is postulated that rotationally excited products result. In comparison, reactants that charge transfer on the in-going leg (or in perpendicular geometry) do not sample the collinear potential well and the resulting products are less rotationally excited.

interaction of Water with Solid Surfaces: Fundamental Aspects. Final rept.

P. A. Thiel, and T. E. Madey. 1987, 175p Pub. in Surface Science Reports 7, n6-8 p211-385 1987

Keywords: *Surface chemistry, *Water, *Chemisorption, Adsorption, Surface properties, Reprints.

The review compares and discusses recent experimental and theoretical results in the field of H2O-solid interactions. The authors emphasize studies per-formed on well-characterized, single crystal surfaces of metals, semiconductors and oxides. The authors discuss the factors which influence dissociative vs. associative adsorption pathways. When H2O adsorbs molecularly, it tends to form three-dimensional hydro-gen-bonded clusters, even at fractional monolayer coverages, because the strength of the attractive interaction between two molecules is comparable to that of the substrate-H2O bond. The template effect of the substrate is important in determining both the local and long-range order of H2O molecules in these clusters. influence of surface additive atoms (e.g., O, Br Na, K) and also surface imperfections (e.g., steps and defects) on the surface structure and chemistry of H2O is examined in detail. Results on single crystal substrates are compared with earlier measurements of H2O adsorption on high-area materials, where available.

Keywords: *Adsorbates, *Ammonia, *Nitrogen oxide, *Platinum, Mass spectroscopy, Lasers, Fluorescence, Desorption, Dissociation, Reaction kinetics, Reprints.

The strongly interacting coadsorbate system of ammo-nia/nitric oxide on Pt(111) has been examined using both quadrupole mass spectrometer (QMS) and laser-induced fluorescence (LIF) detected temperature pro-grammed desorption (TPD) methods. The QMS/TPD experiments show simultaneous desorption of NQ and NH3 as reaction-limited products from the dissociation of an adsorbed NO-NH3 complex. Although NO TPD kinetics are altered by the formation of the complex, LIF/TPD results show that the rotational accommodation, spin-orbit temperature, lambda doublet popula-tions, and molecular alignment of desorbed NO are insensitive to the attractive interaction. It suggests that, following decomposition of the NO-NH3 species, NO resides on the surface sufficiently long that it has no memory of being complexed.

Pub. in Jnl. of the American Chemical Society 111, p3073-3074 1989.

Keywords: *Molecular structure, *Ethylene, *Ozone, Rotational spectra, Ground state, Excitation, Reprints, *Microwave spectra, Reaction kinetics, Dipole mo-ments, Van der Waals complex.

The rotational spectrum of CH2=CH2 ... 03 complex was observed using a pulsed beam Fabry-Perot cavity Fourier transform microwave spectrometer. Internal motions in the complex produced two components for each transition. The two sets of lines were independently fit to a Watson Hamiltonian to give the rotational constants (in MHZ): Ground State - A 8246.841 (2), B 2518.972 (4), C 2044.248 (5); Excited State - A 8241.897 (4), B 2518.941 (9), C 2044.872 (11). Dipole moment measurements determine mu sub c = mu sub total = 0.461 (2) D. The complex structure is described by two parallel planes containing ethylene and ozone in which the two centers of mass are connected by a 3.30 A line perpendicular to the planes. 1,3-dipolar cycloaddition theory and orbital symmetry rules are used in conjunction with ab initio calculations to argue that the CH2=CH2 ... 03 complex lies in a small minimum on the reaction coordinate prior to the transition state which produces ethylene primary ozonide.

Infrared Absorption Cross Section of Arsenic in Silicon in the Impurity Band Region of Concentration. Final rept.

J. Geist. 1989, 7p Pub. in Applied Optics 28, n6 p1193-1199, 15 Mar 89.

Keywords: *Arsenic, *Silicon, *Infrared spectra, Adsorption, Spectral lines, Reprints.

The spectral dependence of the infrared absorption cross section of As in Si near O K has been determined from infrared transmission measurements for three As concentrations (5.3, 8.4, and 15.9 X 10 to the 17th power cm sup -3) in the impurity band regime. The results demonstrate some features of physical interest. With increasing As concentration, the lines associated with the intra-atomic transitions broaden asymmetrically, while the integral of the total absorption cross section over photon energy is conserved as re-quired by the oscillator strength sum rule. It thus appears that the cross section of the intra-atomic transitions is conserved as the lines hybridize with the con-tinuum. Comparison of results with photoionization cross-sectional data suggests that the lines contribute to the cross section for photoionization through field and thermally assisted transitions when they are near the threshold for photoionization.

Physical & Theoretical Chemistry

CHEMISTRY

A new analysis is given of the roto-translational absorption spectrum of gaseous methane for which experimental data are available at different temperatures. The authors consider components of the induced dipole associated at long range with induction by the octopole and hexadecapole multipole moments together with components associated with the gradient of both the octopolar and hexadecapolar fields. A satisfactory description of experimental data is obtained only if short range anisotropic overlap is included with the octopolar and hexadecapolar induction. A better description of the experimental absorption bands is obtained if, in addition, the intensity of the double transitions is slightly increased with increasing temperature. This increase is attributed to anisotropic overlap effects on the double transition spectrum, which have not been explicitly taken into account.

Final rept. V. R. Weidner, J. J. Hsia, and K. L. Eckerle, 1986, 3p Pub. in Optics News 12, n11 p18-20 Nov 86.

Keywords: *Standards, *Spectrophotometry, Carbon black, Fluorescence, Reflectance, Reprints, Polytetrafluoroethylene.

The paper describes current research relating to the development of spectrophotometric standards of NBS. The results of some experimental work on the preparation and analysis of a gray scale for diffuse reflectance, and materials for possible use as fluorescence stand-ards are reviewed. The gray scale for diffuse reflec-tance was prepared by sintering mixtures of carbon black and polytetrafluoroethylene (PTFE) resin. These are durable solid disks that vary in reflectance from about 3% to over 90%, depending on the concentra-tion of carbon black. The fluorescent samples are prepared by sintering mixtures of inorganic phosphors in the same PTFE resin. These phosphors provide highly stable specimens with blue, green, yellow, and orange emission spectra.

DeVoe. 1986, 7p Pub. in Jnl. of Applied Spectroscopy 40, n8 p1146-1152 1986.

Keywords: *Atomic spectroscopy, Spectroscopic anal-ysis, Atomic spectra, Excitation, Reprints, Laser enhanced ionization.

Stepwise excitation laser-enhanced ionization spectroscopy utilizes two independently tunable dye lasers to populate high lying excited states of atoms in

Physical & Theoretical Chemistry

flames. Two atomic resonances are required, with the upper level of the first step transition coinciding with the lower level of the second step transition. Efficient population of a high lying atomic level is achieved from which a high rate of collisional ionization can take place. The double resonance aspect of such excitation adds an extra dimension of spectroscopic selectivity to the measurement. A computer controlled dual wavelength LEI spectrometer, including a Dizeau waveme-ter for wavelength verification, is used to record three-dimensional spectra-ionization signal as a function of both first and second step wavelengths. Examples illustrate the accuracy advantage accorded by the three-dimensional survey.

PB89-202139 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Chemical Kinetics Div. Pi-Electron Properties of Large Condensed Po-

Ivaromatic Hydrocarbons. Final rept.

S. E. Stein, and R. L. Brown. 1987, 9p

Pub. in Jnl. of the American Chemical Society 109, n12 p3721-3729 1987.

Keywords: *Aromatic polycyclic hydrocarbons, *Elec-tron density(Concentration), Electron distribution, Resonance, Energy levels, Heat of formation, Reprints, Bond orders, Hueckel theory.

Hueckel molecular orbital(HMO) theory has been used to calculate energy level density bond orders, electron distributions, free valence, resonance energies, and heats of formation for several homologous series of large, hexagonally symmetric benzenoid polyaromatic molecules with well-defined edge structures contain-ing up to 2300 carbon atoms. When extrapolated to the infinite limit, values for all properties converge to reasonable values. This is in contrast to several other pi-electron theories which do not yield correct graphite limits. Carbon atoms at the edges of such large mole-cules are predicted to behave like those in small polynuclear aromatic molecules, with properties strongly de-pendent on local structure. Regardless of edge struc-ture, interior carbons several bond lengths from an edge have properties similar to those in an infinite graphite sheet. Edge structure has a larger influence graphite sheet. Edge structure has a larger innuence on heats of formation than that predicted by group ad-ditivity methods. Only a weak correlation was found between the position of the highest occupied molecu-lar orbital and the reactivity of the most reactive position.

Nonadiabatic Theory of Fine-Structure Branching Cross-Sections for Sodium-Hellum, Sodium-Neon, and Sodium-Argon Optical Collisions. Final rept.

L. L. Vahala, P. S. Julienne, and M. D. Havey. 1986,

13p Pub. in Physical Review A: General Physics 34, n3

Keywords: *Collision cross sections, *Helium, *Neon, *Sodium, *Argon, Rare gases, Atomic energy levels, Quantum interactions, Electron transitions, Photons, Optical spectra, Reprints, Branching ratio, Fine structure.

The nonadiabatic close-coupled theory of atomic collisions in a radiation field is generalized to include elecstors in a radiation field is generalized to include electron spin and is used to consider the weak-field Na-rare gas (RG) optical collision. Na(doublet S(1/2)) +RG + nh(nu) yields Na(doublet P(j) + RG + (n-1)h(nu). The effects of detuning and incident energy on the branching into the atomic Na 3p doublet P(3/2) and 3p doublet(1/2) states are examined. The cross sections sigma(j) are found to have a strong asymme-tic between red and blue detuning as yould as a comtry between red and blue detuning as well as a complex threshold and resonance structure dependence on energy. A partial cross-section analysis of sigma(j) shows a significant difference between contributions from states of e and f molecular parity. The theoretical-ly calculated detuning dependence of the branching ratio into each fine structure state is in good agree-ment with available experimental data for NaAr, NaNe, and NaHe, as well as the total absorption coefficient for the production of Na 3p atoms. The fine structure branching ratio for thermal energy collisions shows considerable variation with rare gas collision partner, due to the different interaction potentials. For suffi-ciently high collision energy, the branching approach-es a recoil limit which is independent of collision partner.

Gas Solubility and Henry's Law Near the Solvent's Critical Point.

Final rept.

M. L. Japas, and J. M. H. Levelt Sengers. 1989, 9p Pub. in AIChE Jnl. 35, n5 p705-713 May 89.

Keywords: *Gases, *Henrys law, *Critical point, *Solvents, Solubility, High temperature tests, Thermody-namic properties, Water, Benzene, Mathematical models, Fugacity, Reprints.

It has been experimentally observed, for water and nonaqueous solvents alike, that Henry's constant passes through a maximum and then declines as the temperature is raised from the triple point to the critical point. Exact relations for the value of Henry's constant and its temperature dependence at the solvent's critical point are developed from classical and nonclassical models showing that the decline of the constant is a universal phenomenon. The limiting temperature dependence of Henry's constant can be predicted from the thermodynamic properties of the pure solvent and the initial slope of the critical line. The validity of the prediction is tested by comparing it with experimental solubility data for several gases in high-temperature water and benzene. The predictive model appears valid over a temperature range of at least 15% in temperature below the critical point of the solvent.

Temperature of H2O. Final rept.

A. H. Harvey, and J. M. H. Levelt Sengers. 1989, 3p Pub. in Chemical Physics Letters 156, n4 p415-417, 7 Apr 89.

Keywords: *Sodium chloride, *Water, *Solubility, Phase transformations, Concentration(Composition), Critical temperature, Reprints, Temperature dependence, Pressure dependences.

Recent high-temperature data on coexisting vapor-liquid compositions as a function of pressure in the CaC1-H2O system have been interpreted as implying a higher-than-expected value of the critical exponent beta. It is suggested that the observed behavior is a consequence of the fact that, as the solvent's critical point is approached, the coexistence curve in pres-sure-composition coordinates ceases to behave in the same manner as the pressure-density coexistence curve, which is always characterized by the exponent beta. At the critical temperature of the solvent, the pressure-composition coexistence curve is characterized by the much larger exponent beta \pm 1.

Pub. in Jnl. of Physical Chemistry 90, n25 p6684-6687 1986

Keywords: *Solvation, *Sulfur halides, *Thermoche-mistry, *Dissociation, Electron beams, Mass spectros-copy, Ligands, Complex ions, Kinetics, Reprints, Temperature dependence, Binding energy, Sulfur fluorides.

The stabilities of SF6(-).HR association ions, where HR is a simple aliphatic alcohol, H20, or Me2SO, have been investigated by the technique of pulsed electron beam high pressure mass spectrometry. Equilibrium constants were determined as a function of temperature in order to define delta H and delta S values for solvation. The binding energies are quite low, ranging from 10.5 kcal mol for SF6(-).H2O to 14.7 kcal/mol for SF6(-).Me2SO. For ligands in which the nature of the bonding is expected to be similar, the binding energies increase nonlinearly with increasing acid strength of the ligand. On the basis of additional measurements involving I(-).HR complexes, as well as existing literature values, the binding energies in SF6(-).HR ions are found to be slightly higher than those for I(-)HR. The SF6(-).HR complexes are less stable, however, due to their more positive dissociation entropies. Some comments are also included concerning the SF6(-).SF6 dimer ion.

MD. Electrosystems Div. Drift Tubes for Characterizing Atmospheric Ion Mobility Spectra Using AC, AC-Pulse, and Pulse Time-of-Flight Measurement Techniques.

Final rept.

M. Misakian, W. E. Anderson, and O. Laug. 1989, 10p

Pub. in Review of Scientific Instruments 60, n4 p720-729 Apr 89.

Keywords: *lonic mobility, *Atmospheric pressure, *Measurement, *Test equipment, Spectra, Time, Al-ternating current, Tubes, Drift(Instrumentation), Reprints.

Two drift tubes constructed of insulating cylinders with conductive guard rings on the inside walls are examined to determine their suitability for measuring ion mobility spectra at atmospheric pressure. One drift tube is of the pulse time-of-flight (TOF) type with adjustable drift distance, and the other is an ac-TOF drift tube similar in principle to devices reported by Tyndall and Powell. The latter drift tube is evaluated using sinusoidal and alternating-polarity pulse-voltage waveforms for gating the shutters. Methods for determining the drift velocity of an ion from theoretical fits of the TOF spectrum are described for drift tubes of fixed length exhibiting 'end effects.' Mobility values with uncertain-ties less than + or - 1% can be obtained with the pulse-TOF drift tube. Comparable results are obtained with the ac drift tube if an alternating-polarity pulsevoltage waveform is used for gating the shutter.

Pub. in Surface Science 176, p165-182 1986.

Keywords: *Surface chemistry, *Adsorption, *Water, *Lithium, *Ruthenium, Single crystals, Desorption, Spectroscopy, Auger electrons, Reprints.

The interactions between water and lithium have been studied on the surface of a Ru(001) crystal using ther-mal desorption spectroscopy electron stimulated desoption ion angular distributions (ESDIAD), Auger spectroscopy and LEED. The presence of Li was found to influence strongly the H+ ESD yield and the ESDIAD patterns from adsorbed water even at Li coverages of 0.02 monolayer; changes in the thermal desorption states for water were also observed at low Li coverages. For coadsorbed Li coverages above 0.05, ESDIAD measurements provided clear evidence of water decomposition, even at surface temperatures near 80 K; evidence for dissociation was also obtained from thermal desorption and Auger measurements. The present results are compared and contrasted to those reported previously for the H2O/Na/Ru(001) system.

Oxygen Chemisorption on Cr(110): 1. Dissociative Adsorption. Final rept.

N. D. Shinn, and T. E. Madey. 1986, 16p

See also PB89-202998.

Pub. in Surface Science 173, n2-3 p379-394 1986.

Keywords: *Chemisorption, *Chromium, *Oxygen, Electron diffraction, Auger electrons, Metals, Vibrational spectra, Reprints.

The initial stages of oxygen chemisorption on Cr(110) at 300K have been investigated using high resolution electron energy loss spectroscopy (HREELS), elec-tron stimulated desorption ion angular distributions (ESDIAD), low energy electron diffraction (LEED), and Auger electron spectroscopy (AES). Dissociative che-misorption occurs with near unit sticking probability, leading to an ordered p(4x2)O overlayer at theta(sub

0) approximately equals 1/8. A model with atomic oxygen located in the two-fold symmetric hollow sites is proposed. The previously reported c(3x1)0 overlayer was not observed in the study. A disordered oxygen adlayer is found as theta(sub 0) increases. ESDIAD and HREELS data suggest that chemisorbed oxygen atoms occupy inequivalent local binding sites for theta(sub 0)>0.25; subsurface oxygen is not found under these mild oxidation conditions

Oxygen chemisorption and dissociation on Cr(110) at 120K have been studied using high resolution electron energy loss spectroscopy (HREELS), electron stimu-lated desorption ion angular distribution (ESDIAD), low energy electron diffraction (LEED) and Auger electron spectroscopy (AES). Dissociative adsorption domi-nates although vibrational and stimulated desorption data provide evidence for a coexisting minority molecular binding state. An O2(ads) vibrational frequency of 1020/cm and a six beam ESDIAD pattern are suggestive of super-oxo O2(ads) bonding at six local sites each with the 0-0 molecular axis tilted away from the surface normal. These results are compared with data for chemisorbed oxygen on other transition metal surfaces.

Electron stimulated desorption (ESD) experiments using a time-of-flight pulse counting method are report-ed for molecular CO chemisorbed on the Cr(110) surface at 80K. Consistent with previous qualitative observations, negligible CO+ and O+ desorption signals were measured from the alpha(1)CO overlayer which saturates at 1/4 monolayer. For theta(CO) 0.25, a terminally-bonded (alpha(2)CO) binding mode is populated in addition to the existing alpha(1)CO bind ing mode and the ion yield sharply increases. For alpha(2)CO, both O and CO + ions are observed; the CO+ ions desorb with characteristically lower kinetic energies than O+ ions. Near saturation coverages of CO(ads), an observed decrease in the O+ yield is attributed to adsorbate-adsorbate interactions which reduce the ion desorption probability, as seen in ESD studies of terminally-bonded CO on other metals. These results are considered in the context of two possible models proposed for the alpha(1)CO binding state and related ESD observations for CO chemisorbed on potassium-promoted Ru(001) and Fe(001).

Physical & Theoretical Chemistry

The vibrational relaxation dynamics of CO chemis-orbed on small Pt and Rh particles supported on SiO2 has been investigated by picosecond time-resolved in-Tarse transient bleaching experiments. A vibrational T1 lifetime of 7 + or - 1 ps has been observed for several different samples, independent of polarization, pump intensity, and sample temperature from 100-400K. A 1:3 isotopic dilution has no effect upon T1. The T1 lifetime is a factor of 10-50 times shorter than T1 reported for metal carbonyl cluster compounds in solution and on SiO2 supports. Two possible mechanisms are considered to account for the rapid decay; redistribution of the energy throughout the broad CO vibrational band, and relaxation directly to electron-hole pairs in the metal particles.

Chemisorption of HF (Hydrofiuoric Acid) on Silicon Surfaces. Final rept.

S. A. Joyce, J. A. Yarmoff, A. L. Johnson, and T. E.

Madey. 1989, 6p Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of Materials Research Society Chaminal Parsnectives of Microelec-Symposium on Chemical Perspectives of Microelectronic Materials, Boston, MA., December 1988, v131 p185-190 1989.

Keywords: *Chemisorption, *Silicon, *Surface proper-ties, *Hydrogen fluoride, *Gases, *Chemical bonds, Single crystals, X ray analysis, Spectroscopy, Disso-ciation, Photoelectric emission, Microelectronics, Valence.

The interaction of gaseous hydrofluoric acid (HF) with single crystal silicon surfaces was investigated using Single dystal smooth surfaces that incomession soft x-ray photoemission spectroscopy and Electron Stimulated Desorption Ion Angular Distributions Stimulated Desorption Ion Angular Distributions (ESDIAD). Examination of the Si(2p) core level for surfaces saturated with HF shows the formation of siliconfluoride bonds indicating the dissociative chemisorp-tion of HF on both Si(111) and Si(100) surfaces. In-spection of the F(2s) and F(2p) valence levels at saturation coverage indicate that only one-half monolayer of fluorine bonds to the silicon. The primary ion desorbed by electron bombardment of these surfaces is F+ with only a minor contribution from H+ ESDIAD images from a saturation coverage of HF on stepped Si(100) surfaces reveal F+ desorption primarily along the direction of the terrace dimers. The ESDIAD patterns from HF adsorbed on Si(111) are characterized by strong normal F+ emission with a weak back-ground component of off-normal emission. The results are consistent with the dissociative chemisorption of HF where the ion emission direction is determined by the Si-F bond directions.

Measurement of Electrical Breakdown in Liquids. Final rept. R. E. Hebner, 1988, 19p

Pub. in NATO Advanced Study Institute on the Liquid State and Its Electrical Properties, Sintra, Portugal, July 5-17, 1987, p519-537 1988.

Keywords: *Liquids, *Electrical properties, *Electrical faults, Measuring instruments, Additives, Particle density(Concentration), Pressure, Viscosity, Voltage gain, Cathodes, Anodes, Reprints.

The continuing development of light sources, high speed cameras, and high speed electronic measuring systems have made it possible to study the breakdown process in increasing detail. The four measurements described are high speed photography of the break-down process, measurement of the voltage and cur-rent, optical spectroscopy, and the measurement of acoustic emission. Having developed a battery of acoustic emission. Having developed a battery of measurement techniques, understanding of the break-down process is gained by changing the system in known ways and determining the effect of these changes on the measured results. Parameters which have been investigated include types of liquids, chemi-cal additives, particle density, pressure, viscosity, and the rate of rise of the applied voltage. These investiga-tions have led to the identification of four modes of tions have led to the identification of four modes of growth when the streamer initiates at a cathode and three modes when it initiates at an anode.

Included in Jnl. of Physical and Chemical Reference Data, v18, n2 p583-638 1989.

Keywords: *Thermophysical properties, *Methane, Numerical analysis, Experimental design, Liquid phases, Equations of state, Specific heat, Graphs(Charts), Transport properties, Pressure, Thermal conductivity, Viscosity, Comparison, Virial coefficients.

New correlations for the thermophysical properties of fluid methane are presented. The correlations are based on a critical evaluation of the available experimental data and have been developed to represent these data over a broad range of the state variables. Estimates for the accuracy of the equations and com-parisons with measured properties are given. The reasons for the new study of methane include significant new and more accurate data, and improvements in the correlation functions which allow increased accuracy of the correlations especially in the extended critical region. For the thermodynamic properties, a classical equation for the molar Helmholtz energy, which con-tains terms multiplied by the exponential of the quadratic and quartic powers of the system density, is used. Tables of coefficients and equations are presented to allow the calculation of these and other thermodynamic quantities. (Copyright (c) by the U.S. Secretary of Commerce, 1989.)

Thermodynamic Properties of Argon from the Triple Point to 1200 K with Pressures to 1000 MPa.

A standard s

Data, v18 n2 p639-798 1989.

*Thermodynamic properties, Keywords: *Argon, Helmholtz free energy, Pressure, Equations of state, Enthalpy, Entropy, Specific heat, Tables(Data), Experi-mental design, Numerical analysis, Comparison, Liquid phases, Vapor phases, *Triple point.

A new thermodynamic property formulation for argon is presented. The formulation includes a fundamental equation explicit in Helmholtz energy, a vapor pressure equation, and estimating functions for the densities of saturated liquid and vapor states. The coefficients of the fundamental equation and ancillary functions were determined by a weighted least-squares fit of selected experimental data using a statistical procedure to select the terms for the equation most appropriate for the representation of the data. The fundamental equation is valid for liquid and vapor phases except near the critical point. Comparisons between the data used to determine the fundamental equation and values calculated from the formulation are given to verify the accu-racy of the fundamental equation. Tables of thermo-dyanmic properties of argon calculated with the formulation presented here are given for fluid states within the range of validity of the correlation. Keywords: *Thermodynamic properties, *Transport properties, *Pentoses, *Hexoses, *Carbohydrates, *Organic phosphates, Gibbs free energy, Specific heat, Viscosity, Phase diagrams, Enthalpy, Entropy, Tables(Data), Reviews, Transition temperature.

The review contains recommended values of the thermodynamic and transport properties of the five and six membered ring carbohydrates and their phosphates in both the condensed and aqueous phases. Equilibrium data, enthalpies, heat capacities, and entropies have been collected from the literature. The accuracy of these data have been assessed, adjusted to 298.15 K and to common standard state, and entered into a catalog of thermochemical reactions. The solution of the reaction catalog yields a set of recommended values for the formation properties of these sub-stances. The volumetric data have also been critically stances. The volumetric data have also been critically evaluated. Recommended values are presented for standard state molar volumes and the temperature and pressure derivatives of the molar volume, i.e., the expansivity and the compressibility. The excess prop-erty data of aqueous solutions of theses substances have been correlated to yield recommended values of the parameters of the virial expansion model used to represent the data. The transport data considered here includes both viscosity and diffusion data of aqueous solutions of the carbohydrates. The available phase diagram data and transition temperatures are summarized. Evaluated Kinetic and Photochemical Data for Atmospheric Chemistry. Supplement 3.

Ruarterly rept.
R. Atkinson, D. L. Baulch, R. A. Cox, R. F. Hampson, J. A. Kerr, and J. Troe. c1989, 217p
Prepared in cooperation with American Chemical Society, Washington, DC., American Inst. of Physics, New York, and Leeds Univ. (England). Sponsored by National Inst. of Strong Univ. tional Inst. of Standards and Technology, Gaithersburg, MD.

Included in Jnl. of Physical and Chemical Reference Data, v18 n2 p881-1097 1989.

Keywords: *Reaction kinetics, *Photochemical reac-tions, Tables(Data), Enthalpy, Thermodynamic proper-ties, Dissociation, *Atmospheric chemistry.

The paper updates and extends previous critical evaluations of the kinetics and photochemistry of gas phase chemical reactions of neutral species involved in atmosphere chemistry (J. Phys. Chem. Ref. Data 9, 295 (1980); 11, 327 (1982); 13, 1259 (1984)). The work has been carried out by the authors under the auspe-cies of the IUPAC Subcommittee on Gas Phase Kinetic Data Evaluation for Atmosphereic Chemistry. Data sheets have been prepared for 360 thermal and photochemical reactions, containing summaries of the avail-able experimental data with notes giving details of the experimental procedures. For each reaction, a preferred value of the rate coefficient at 298 K is given together with a temperature dependence where possible. The selection of the preferred value is discussed; and estimates of the accuracies of the rate coefficients and temperature coefficients have been made for each reaction. The data sheets are intended to provide the basic physical chemical data needed as input for calculations which model atmospheric chemistry. A table summarizing the preferred rate data is provided, together with an appendix listing the available data on enthalpies of formation of the reactant and product species. A great deal of solution chemistry can be summarized in a table of standard electrode potentials of the ele-

ments in the solvent of interest. In the work, standard electrode potentials and temperature coefficients in water at 298.15 K, based primarily on the 'NBS Tables of Chemical Thermodynamic Properties,' are given for nearly 1700 half-reactions at pH = 0.000 and pH =13.996. The data allow the calculation of the thermodynamic changes and equilibrium constants associated with approximately 1.4 million complete cell reac-tions over the normal temperature range of liquid water. Estimated values are clearly distinguished from experimental values, and half-reactions involving doubtful chemical species are duly noted. General and specific methods of estimation of thermodynamic quantities are summarized. (Copyright (c) by the U.S. Secretary of Commerce, 1989.)

20036.

Keywords: *Thermodynamic properties, *Aromatic po-Jycyclic hydrocarbons, *Isomers, *Pyrenes, Standards, Enthalpy, Specific heat, Gibbs free energy, Entropy, Tables(Data), *Coronenes.

The tables in our first paper on polycyclic aromatic hydrocarbons (J. Phys. Chem. Ref. Data 17, 241 (1988)) have been extended by calculating thermodynamic properties for the first four isomer groups in the pyrene series, the first three isomer groups in the naphthopyrene series, and the first three isomer groups in the coronene series. Successive isomer groups in each series differ by C4H2. Since chemical thermodynamic proper-ties are known for only a limited number of polycyclic aromatic hydrocarbons, the properties of individual species have been estimated using Benson group values of Stein and Fahr for temperatures from 298.15 to 3000 K. Values of C(sub p), S, delta(sub f), H, and delta(sub f)G have been calculated in joules for a standard state pressure of 1 bar. The chemical thermodynamic properties of the individual species have also been calculated. The isomer group values provide a basis for extrapolating to higher carbon numbers where it is not feasible to consider individual molecular species. Experimental cross sections for K-shell x-ray production by hydrogen and helium ions (Z1 = 1,2) in target atoms from beryllium to uranium (Z2 = 4.92) are tabulated as compiled 7418 cross sections) from the literature (161 references were found) with the search for the data terminated in January 1988. These cross sec-tions are compared with predictions of the first Born approximation and ECPSSR theory for inner-shell ionization. The ECPSSR accounts for the energy loss (E) and Coulomb deflection (C) of the projectile ion as well as for the perturbed stationary state (PSS) and relativistic (R) nature of the target's inner-shell electron. While the first Born approximation generally overestimates the data by orders of magnitude, the ECPSSR theory is confirmed to be, on the average, in agreement with the experiment to within 10%-20%. Included in Jnl. of Physical Chemical Reference Data, v18 n1 p219-543 1989. Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Reaction kinetics, *Metal complexes, Mo-lecular energy levels, Thermodynamic properties, Ex-citation, Solutions, Quenching media, Tables(Data).

The rate constants for the quenching of the excited states of metal ions and complexes in homogeneous fluid solution are reported in this compilation. Values of (sub q) for dynamic, collisional processes between excited species and quenchers have been critically evaluated, and are presented with the following information, among others, from the original publications, when available: description of the solution medium, temperature at which K(sub q) was determined, experi-mental method, range of quencher concentration used, lifetime of the exited state in the absence of quencher, activation parameters, quenching mecha-nism. Data collection is complete through the end of 1986, and covers the coordination compounds of 26 metals, including the ions and complexes of the innerand outer-transition metals, and porphyrin complexes of nontransition metals. The introduction to the work contains a discussion of the conceptual background to quenching, including a general treatment of the kinet-ics, an explanation of the tables, and a list of recent review articles. Uncommon kinetics mechanisms and equations, used to obtain the reported values of K(sub q) are discussed to defail as part of the notes to the tables. Indexes of excited states, quenchers, and authors are appended. (Copyright (c) by the U.S. Secretary of Commerce, 1989.)

D. G. Archer. 1989, 8p

Pub. in Jnl. of Physical Chemistry 93, n1 p5272-5279, 29 Jun 89.

Keywords: *Gibbs free energy, *Enthalpy, *Dilution, *Cyclohexanols, *Sugar alcohols, *Water, Heat meas-urement, Butanols, Propanols, Specific heat, Anti-freezes, High temperature tests, Gas laws, Reprints.

Enthalpies of dilution of cyclohexanol (aq) to 448 K and of myo-inositol (aq) and of cyclohexanol + myo-inositol (aq) to 398 K are reported. The results, along with enthalpies of dilution for 1-butanol (aq) to 448 K and for 2-methyl-2-propanol (aq) to 423 K, were combined with freezing point depression measurements and ambient-temperature enthalpy of dilution and heat capacity measurements in order to provide the excess Gibbs energy for the aqueous solutes from 273 to 523 K. The excess Gibbs energies were then used to pro-vide parameters for an additivity scheme that permits an approximation of the excess Gibbs energy, and thus the solute and solvent activity coefficients, for dilute aqueous alcohols for which high-temperature data do not exist. The excess Gibbs energies were also used to estimate the aqueous-solution second (aq), 1-butane (aq), and 2-methylpropane (aq) in the McMillan-Mayer convention. These virial coefficients for the aqueous hydrocarbons, when compared to gasphase virial coefficients for the hydrocarbons, suggest that the effect of low-temperature (298 K) water is to lessen the pairwise attraction of aqueous hydrocarbon over that found in the gas phase at the same temperature and that the lessening of the pairwise attraction diminishes at higher temperatures.

Keywords: *Dipole moments, Vibrational spectra, Dia-tomic molecules, Reprints, *Hydroxyl radicals, Infrared absorption, Herman Wallis effect.

A general approach to the determination of the dipole moment function and of the absolute vibrational transition moments for diatomic molecules is presented. The method utilizes the variation of intensity with J within a vibrational transition, together with permanent dipole moment information, to extract the absolute transition moments. An essential feature of the model is its use of algebraic expressions for calculating vibration-rotation line intensities. These expressions can be rapidly evaluated in a least squares fit which determines the dipole moment function. This approach is general in that it is not limited to (sup 1)Sigma state molecules, nor to the simplest of Hund's case couplings of spin, orbital and mechanical angular momen-tum. It is also not limited to molecules with essentially linear dipole moment functions. The model is successfully applied to the OH molecule which violates each of these restrictions. In the accompanying work the au-thors report experimental measurements of relative infrared absorption intensity measurements for OHmu = 1 <- 0 transitions and the extraction of an experi-mental mu(r) using the approach presented here.

Keywords: *Dipole moments, Vibrational spectra, Electron transitions, Infrared spectroscopy, Reprints, *Hydroxyl radicals, Infrared absorption, Flash kinetic spectroscopy.

The relative intensities of nine pairs of rovibrational transitions of OH in the nu = 1 < 0 fundamental have been measured by flash kinetic infrared absorption spectroscopy. Each pair of transitions originates from a common rotational and spin-orbit state, so that relative intensities are independent of the OH number den-sity and quantum state distribution. The relative intensities are strongly J dependent and this dependence provides detailed information about the shape of the OH dipole moment function, mu(f), and hence the ab-solute infrared transition strengths. In an accompany-ing paper, the authors present the theoretical basis for extracting mu(r) for an open shell diatomic like OH from relative infrared intensities and permanent dipole moment measurements and determine the OH dipole moment function.

ton, DC. Pub. in Jnl. of Chemical Physics 90, n9 p4855-4864, 1 May 89.

Keywords: *Infrared spectroscopy, *Potential energy, *Molecular rotation, *Hydrogen fluoride, *Argon, Mo-lecular energy levels, Intermolecular forces, Molecular vibration, Experimental design, Numerical analysis, Reprints, *Van der Waals forces, *Rydberg-Klein-Rees method, *Laser spectroscopy.

A method is described for extraction of two-dimension-al (angular and radial) potential energy surfaces for triatomic rare gas-hydrogen halide van der Waals complexes. The approach relies on extensive J rotational term values obtained by high resolution infrared laser jet spectroscopy for a family of bending vibrational states to deduce the radial and angular dependence of the intermolecular potential. First, effective 1D radial potentials for series of bend states are obtained by ro-tational RKR analysis of experimentally observed rotational progressions. These 1D potentials, which represent vibrational averages over different bending wave functions, are then inverted to determine the radially dependent coefficients of a Legendre expansion to the full surface. This relies on adiabatic angular motion with respect to radial degrees of freedom, the validity of which is discussed. This approach is tested with ex-perimental data. The accuracy of the resulting surface is verified by exact quantum bound state calculations which quantitatively reproduce the rovibrational input data, as well as predict the spectroscopic properties of five other vibrational states observed in the Ar+HF(v = 1) system but not used in the fitting procedure.

Three Dimensional Quantum Reactive Scattering Study of the I + HI Reaction and of the IHI(1-) Pho-todetachment Spectrum.

Final rept. G. C. Schatz. 1989, 8p Grant NSF-CHE87-15581

Sponsored by National Science Foundation, Washington, DC.

Pub. in Jnl. of Chemical Physics 90, n9 p4847-4854, 1 May 89.

Keywords: *Hydrogen iodide, *Iodine, Quantum inter-actions, Resonance, Reprints, *Reactive scattering, *Photodetachment, Coupled channel theory, Hyperspherical coordinates.

The author presents results of coupled channel hyperspherical reactive scattering calculations on the reaction I + HI -> IH + I using a semiempirical potential surface. Only the J = O partial wave is considered. Franck-Condon factors associated with photodetach-ment of IHI(1-) have also been calculated, and these show mainly direct scattering threshold behavior at low energies (E \leq 0.30 eV), with the (100) and (200) resonances contributing only slightly. Resonant behavior is dominant at higher energies (0.3-0.4 eV) where the (002) resonance especially contributes.

The challenge of correctly inferring even the qualita-tive features of the potential energy hypersurface from spectroscopic measurements is heightened dramatically in studies of weakly bound molecular complexes where large amplitude motion is present. This is especially true for data obtained from low temperature, supersonic expansions where Boltzmann distributions limit the range of internally excited states that can be investigated. To stress this point, the author presents simulated spectra for two model triatomic systems, a 'pinwheel' and a 'hinge,' with nearly flat potentials that support extremely large amplitude internal rotation and bending, respectively. The results indicate that simple eigenvalue analysis of jet cooled molecular spectra in the absence of hyperfine resolution may not be suffi-ciently sensitive to large amplitude angular motion, and that data from a variety of techniques may prove necessary to assess the degree of molecular rigidity.

Low-Q Neutron Diffraction from Supercooled D-Giycerol.

Final rept.

Final rept. H. J. M. Hanley, G. C. Straty, C. J. Glinka, and J. B. Hayter. 1987, 10p Sponsored by Department of Energy, Washington, DC. Div. of Materials Sciences, and Martin Marietta Energy Systems, inc., Oak Ridge, TN. Pub. in Molecular Physics 62, n5 p1165-1174 1987.

Keywords: *Glycerol, *Neutron diffraction, Supercooling, Scattering cross sections, Hydrogen bonds, Re-prints, *Structure factors, Vanadium fluorides.

Neutron diffraction measurements of the structure factor of supercooled liquid D-glycerol are reported for the range 0.03 approx = or < Q = or < 4.0/A at temperatures between 300 and 175 K. It was found that the structure is essentially unchanged over this entire range. The authors expected some evidence of increased hydrogen bonding at the lower tempera-tures, but no direct evidence for any strong oriented density correlation at low-Q due to a hydrogen bond is observed. To provide a contrast, the structure factor of vanadium pentafluoride is discussed briefly because vanadium pentafluoride is known to form fluorine-fluorine bridges in the dense state. The authors equate loosely this bridging with a hydrogen bond. In that compound there is evidence for F-F bonding at low-Q. Small angle Placzek corrections to the D-glycerol scattering cross section data are estimated.

Shear-Induced Angular Dependence of the Liquid Pair Correlation Function.

Final rept. H. J. M. Hanley, J. C. Rainwater, and S. Hess. 1987, 8p

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 36, n4 p1795-1802 Aug 87.

Keywords: *Liquids, Couette flow, Relaxation time, Spherical harmonics, Tensors, Simulation, Reprints, Correlation functions, Molecular dynamics.

A formal expansion in spherical harmonics or Cartesian tensors of the pair correlation function of a liquid subjected to a shear rate is discussed. Expressions for the coefficients to tensor rank 4 are evaluated via a nonequilibrium molecular-dynamics simulation of an inverse twelve soft-sphere liquid undergoing Couette flow. It is shown that the expansion converges slowly if the product tau gamma 0.05, where tau is the Maxwell relaxation time and gamma is the shear rate. Further, the fourth-rank coefficient that represents cubic symmetry is significant for the model system. The microstructure of a shear liquid is demonstrated by intensity plots of particles around a given central particle. Ex-pressions were derived for the expansion coefficients using a relaxation-time model, and the comparison between them and simulations is generally very good.

Pub. in Jnl. of Chemical Physics 90, n3 p1686-1693 Feb 89

Keywords: *Nitrogens, Reprints, *Change-exchange reactions, *Argon ions, Quantum mechanics, Rotational states, Born approximations.

Calculations of cross sections for the charge transfer reaction Ar(1+)(doublet P(3/2)) + N2(v=0,j) -> Ar+ N2+(1+)(v' = 1,j') are reported for thermal colli-sion energies. A three-dimensional quantum-mechanical method is used in which separate rotational closecoupling calculations are performed for the Ar(1+) + N2(v=0) -> Ar + N2(1+)(v' = 0) and Ar(2+) + N2(v=1) -> Ar + N2(1+)(v'=1) channels, and the cross sections for the v=0 -> v'=1 channel are computed using a coupled channel-distorted wave Born approximation. Potential energy surfaces and couplings are taken from ab initio data. The predicted rotational product distributions for N2(1+)(v'=1,j') agree fairly well with those measured in a molecular beam laser-induced fluorescence experiment.

*infrared spectroscopy, *Nitrogen Keywords: oxide(N2O), *Hydrogen fluoride, Dissociation, Complex compounds, Hydrogen binds, Molecular isomer-ism, Molecular vibration, Reprints, *Laser spectroscopy.

Two spectroscopically distinct isomers of a hydrogen bonded complex between nitrous oxide and hydrogen fluoride are observed by direct infrared laser absorp-tion detection in a slit supersonic expansion. The linear isomer FH-NNO contains a relatively rigid hydrogen bond to the nitrogen end of NNO. The bent isomer NNO-HF has a stronger hydrogen bond to the oxygen end of NNO, but this bond is characterized by a softer bending potential and thus the complex exhibits evidence of large amplitude bending motion. Rapid vibrational predissociation, as determined from the homo-geneous broadening of the rovibrational absorption structure, is evidenced in both isomers. The linear isomer exhibits predissociation lifetimes which show structure as a function of the upper J' rotational level. including narrow resonances which suggest excitation of NNO fragment vibrational modes.

Pub. in Jnl. of Applied Physics 65, n3 p1265-1269, 1 Feb 89.

Keywords: *Liquid metals, Surfaces, Simulation, Reprints, *Self sputtering, Molecular dynamics.

Molecular dynamics simulations of self-sputtering are performed using the recent picture of a stratified liquidmetal surface as a model. These results are compared to those obtained from a liquid model having uniformly distributed atoms and a crystalline solid model. The stratified liquid-metal model shows an enhanced lowenergy sputter yield, which falls below those of the other models for ion-impact energies above several hundred electron volts. These results are discussed in light of various published measurements of sputter yields of metals in their liquid and solid phases.

Calculations are described of spectra for the excitation of the bending and stretching vibrational-rotational energy levels in the van der Waals complexes of HCI with the rare gases Ne, Ar, Kr, and Xe. The calculations are performed using a basis set method, with dis-tributed Gaussian functions being employed for the co-ordinate associated with the stretching of the rare gas atom. Intensities of combination and fundamental transitions for each of the low frequency modes are calculated for total angular momentum up to $J=25,\,Sur$ prisingly large intensities are predicted for transitions to states with multiple vibrations excited in the bending mode. Promising comparisons are obtained with infrared spectra measured recently for the complexes of HCI with Ne and Ar at low temperatures.

Keywords: *Germanium halides, *Germanium hy-drides, *X-ray absorption, *Molecular structure, Gases, Electron scattering, Reprints.

X-ray absorption fine structure (XAFS) measurements of GeCl4, GeH3Cl, and GeH4 are reported. Since wide-angle multiple scattering involving H atoms is negligible, the single and multiple scattering (MS) are isolated. Components terms in the XAFS of GeCl4 by comparison of the spectra of the three compounds. It over single scattering (SS), although within 15 eV of the edge the two are comparable in size. However, the multiple scattering damps out very quickly with in-creasing energy above the absorption edge. Beyond 40 eV past the edge the MS/SS ratio is less than 0.06. The calculations are found to be in qualitative agreement with the experiment, but overestimate the size and energy range of the MS. The results suggest that SFS data in the range 1 < K < 3 A sup -1 can be analyzed in an SS picture in many cases, as long as good standard compounds are used, and calculations are used to estimate possible errors due to neglect of MS. The first evidence of single scattering observed from H atoms is also reported.

with Large Size Ratios. Final rept.

M. L. Huber, and J. F. Ely. 1987, 17p Sponsored by Department of Energy, Washington, DC. Pub. in Fluid Phase Equilibria 37, p105-121 1987.

Keywords: *Mixtures, *Perturbation theory, Statistics, Molecules, Potential theory, Reprints, *Lennard-Jones gas, Gas viscosity, Gas density.

Previous studies on model Lennard-Jones systems have shown that conformal solution theories tend to fall when mixtures contain molecules with large size differences. This failure can be attributed to deficien-cies in the underlying mean density approximation (MDA) for the mixture's radial distribution functions which was originally proposed by Leland and coworkers. An improved mean density approximation is pre-sented which is obtained from a straightforward application of statistical mechanical perturbation theory. Comparisons of the new theory with simulation PV data for systems with large size ratios show it to be far superior to van der Waals one-fluid and MDA n-fluid theories and an improvement upon hard sphere expansion and perturbation theories as well. Compari-sons are also made with chemical potential simulation data, and for these data the new theory is competitive with perturbation theory.

Keywords: *Thermochemistry, *Carbon dioxide, *Ethane, Mixtures, Temperature, Isotherms, Pressure, Keywords: Volume, Reprints.

Comprehensive isochoric PVT measurements have been obtained for the system (0.99 CO2 + 0.01 C2H6). The range of state points studied includes those with densities from 2 to 24 mol times dm(sup -3), temperatures from 245 to 400 K, and pressures to 35 MPa. Extensive comparisons have been made with two predictive conformal solution models, one which uses the 32-term BWR-type equation of Stewart and Jacobsen as a reference and the other using the newer Schmidt-Wagner functional form. Results ob-tained with the Schmidt-Wagner equation are better in the near-critical region owing to the flatter critical isotherm associated with this functional form.

Keywords: *Potassium chloride, *Solutions, *Resistance, *Primary standards, Electrolytes, Performance evaluation, Concentration(Composition), Reprints, Specificity.

A determination of the absolute specific conductance of KCI solutions is demonstrated. The measurement is based on the conductance cell with a well defined geometry, having a difference in the removable center tube of accurately measured dimensions. The specific conductance of the solution is obtained from the measured resistances of the cell with and without the center tube and the measured I/A ratio of the center tube. Specific conductances obtained using the cell agree with the previously accepted standards for 0.1 demal and 0.01 demal solutions within 0.02%. Results are also presented for solutions based on molality. The temperature control, bridge, and detector technology used to obtain results of this accuracy are described.

mentally Acceptable Halocarbon Refrigerants. Final rept

M. O. McLinden, and D. A. Didion. 1989, 14p Pub. in International Jnl. of Thermophysics 10, n3, p563-576, May 89.

Keywords: *Refrigerants, *Thermodynamic properties, *Halohydrocarbons, Transport properties, Mixtures, Environmental impacts, Reprints, *Working fluids.

The need for and uses of thermodynamic and transport properties in the selection of working fluids for the vapor compression cycle and in equipment design are reviewed. A list of hydrogen-containing halocarbons, as well as their mixtures, is presented as alternatives to the environmentally harmful, fully halogenated chlorofluorocarbons. These fluids range from wellcharacterized, widely available refrigerants to materials available only by custom synthesis about which very little is known. Data priorities for these fluids are presented; most essential are critical point, vapor pressure, liquid density, ideal-gas heat capacity, and vapor p-V-T data. A critical need exists for these data on a number of candidate working fluids in order not to lose the opportunity to select the best set of future refrigerants.

Pressure Fixed Points Based on the Carbon Dioxide Vapor Pressure at 273.16 K and the H2O(i) - H2O(ii) - H2O(L) Triple-Point. Final rept.

N. Bignell, and V. E. Bean. 1988, 10p Pub. in Proceedings of Seminar on High Pressure Standards, Paris, France, May 24-25, 1988, p175-184.

Keywords: *Pressure measurement, *Carbon dioxide, *Vapor pressure, *Water, *Ice, Metrology, *Triple point, Fixed points.

The vapor pressure of carbon dioxide in equilibrium with the liquid at 273.16 K has been measured and found to be 3.48608 + or - .00017 MPa. Results were found to depend upon the purity of the carbon dioxide. Samples prepared by heating analytical reagent quality sodium bicarbonate were of sufficient purity to be suitable for use as a pressure fixed point. The pressure of the H20(U)-H20(III)-H2(L) triple-point has also been measured and found to be 208.829 + or - 0.025 MPa.

Keywords: *Free radicals, Infrared spectra, Ultraviolet spectra, Stabilization, Photolysis, Spectroscopy, Re-prints, *Matrix isolation, Atom-molecule collisions.

Characteristics of the infrared and ultraviolet spectra of free radicals isolated in inert matrices are surveyed. Technique by which free radicals have been stabilized in matrices in concentration sufficient for optical spectroscopic detection are reviewed and are illustrated by recent studies. Emphasis is placed on the characteris-tics of atomic diffusion in rare gas matrices and on the consequences of the occurrence of cage recombination in the photolytic generation of free radicals in mat-nces. The stabilization of free radicals by matrix isola-tion sampling of discharge systems is discussed. The role of atom-molecule reactions in free radical stabilization is illustrated by specific consideration of reactions involving H, various metal atoms, C, Si, O, S, and

Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Vacuum Science and Technology A7, n3 p2221-2226 May/Jun 89.

Keywords: *Desorption, Nitrogen fluorides, Acetone, Ruthenium, Surfaces, Reprints, *Negative ions, Elec-tron stimulated desorption, Phosphorus fluorides, Time-of-flight method, Angular distribution, Hexafluoroacetone.

The electron stimulated desorption angular distributions technique has been extended to measure the angular distributions of negative ions desorbing from sur-faces. The apparatus is a modification of an existing display-type detector. Time-of-flight methods have been employed to separate the negative ions from the large background of electrons and to permit mass-re-solved measurements of both positive and negative ions. General trends in negative ion desorption from a series of fluorinated molecules (PF3, NF3, and hexa-fluoroacetone) adsorbed on Ru(0001) are presented. In these systems, negative ions arise primarily from molecularly intact adsorbates while positive ions can arise from both intact and dissociated species with similar probability.

Keywords: *Vibrational spectra, Infrared spectra, Ab-*Carbon dioxide ions, Neon atoms, Photoionization, Photodetachment, Matrix isolation, Molecular ions.

When a Ne:CO2 sample was codeposited at approximately 5 K with a beam of neon atoms that had been excited in a microwave discharge, an absorption appeared at 1421.7/cm very near the gas-phase band center for the antisymmetric stretching fundamental (nu sub 3) of CO2(1+). Detailed isotopic substitution studies support the assignment of this absorption to that fundamental of CO2(1+), as well as of an absorption at 1658.3/cm to nu sub 3 of CO2(1-). In earlier studies of the charge transfer interaction of an alkali metal with CO2, this vibration of CO2(1-) had been strongly perturbed by coordination with the alkali metal cation. In the present experiments, the threshold for electron photodetachment from CO2(1-) was ob-served in the visible spectral region. Evidence was also obtained for the stabilization of the O2C...OCO(1-) cluster anion.

Keywords: *Hydrocarbons, *Infrared spectroscopy, Reprints, *Propyne, Laser spectroscopy, High resolution, Vibrational states, Supersonic jet flow.

A direct absorption, difference frequency, infrared laser spectrometer with 0.0001/cm resolution combined with slit supersonic jet optical pathlengths is presented as a tool for the study of mode-mode vibrational coupling in laser-excited hydrocarbons. These weak mode-mode couplings are evidenced in frequency domain studies by virtue of transitions to isolated upper J states that are split into multiplets under sub-Doppler esolution. Instrument performance is demon-strated by investigating vibrational coupling in the 3000-3300/cm C-H stretch fundamental region of (12)C3 propyne, as well as the (12)C2(13)C propynes observed in natural isotopic abundance. The implica-tions of enhormonic coupling matrix elements of the tions of anharmonic coupling matrix elements of the magnitude found in the study, in overtone vibrational dynamics, are discussed.

Observation of Translationally Hot, Rotationally Cold NO Molecules Produced by 193-nm Laser Vaporization of Multilayer NO Films. Final rept.

L. M. Cousins, R. J. Levis, and S. R. Leone. 1989, 4p Sponsored by Army Research Office, Research Triangle Park, NC

ub. in Jnl. of Physical Chemistry 93, n14 p5325-5328 1989.

Keywords: *Nitrogen oxide(NO), Spin orbit interac-tions, Far ultraviolet radiation, Surfaces, Films, Cryogenics, Reprints, Rotational states, Laser heating, Vaporization, Multilayers.

Results are presented for the rotational and spin-orbit state excitation of NO molecules which are ejected at hyperthermal velocities by 193-nm laser vaporization of cryogenic multilayer NO films condensed on MgF2. For molecules with translational energies of 0.14 and 0.56 eV, the average rotational energies are 0.014 and 0.50 eV, the average rotational energies are 0.014 and 0.017 eV, corresponding to temperatures of 160 and 180 K, respectively. The spin-orbit population ratio for the 0.14-eV molecules is 0.35 (T approx = 170 K); however, the population ratio for the 0.56-eV molecules is higher, 0.7 (T approx = 500 K). The disequilib-rium between translation and rotation may be due in part to a collisional cooling mechanism (adiabatic ex-nansion) which occurs immediately following vaporizapansion) which occurs immediately following vaporization. Other dynamical ejection mechanisms are also discussed.

Reduced Dimensionality Quantum Reactive Scattering Study of the Insertion Reaction O(1D) + H2 - > OH + H. Final rept.

J. K. Badenhoop, H. Koizumi, and G. C. Schatz.

1989. 8p

Pub. in Jnl. of Chemical Physics 91, n1 p142-149, 1 Jul

Keywords: Hamiltonian furictions, Oxygen, Hydrogen, Reprints, *Insertion reactions, Quantum reactive scattering, Hyperspherical coordinates, Hydroxyl radicals, Two degrees of freedom.

The paper presents a two degree of freedom model for describing the quantum dynamics of the insertion reaction O(singlet D) + H2 in which bend motions are treat-ed with a sudden approximation. Comparison of prod-uct state vibrational distributions from a classical version of the model with three dimensional trajectory results indicates that the model is realistic. Quantum/ classical comparisons for the model Hamiltonian indicate that recrossing is more important in the quantum dynamics, and as a result, the quantum reaction probability from ground state reagents is lower by as much as 40%. In addition, the quantum vibrational state dis-tribution shows higher excitation than its classical counterpart. This difference in excitation is due to trajectories that produce vibrationally cold products, and it is found that these trajectories always cross the deepest part of the H20 well.

Properties of Lennard-Jones Mixtures at Various Temperatures and Energy Ratios with a Size Ratio of Two.

Technical note.

M. L. Huber, and J. F. Ely. May 89, 429p NIST/TN-1331

Also available from Supt. of Docs. as SN003-003-02952-1.

Keywords: *Mixtures, Computerized simulation, Distribution functions, Tables(Data), *Lennard-Jones fluids, Lennard-Jones potential, Molecular dynamics, Mean density approximation, Correlation functions.

Results are presented of molecular dynamics computer simulations for binary Lennard-Jones mixtures with a size ratio of two. A total of 84 state points were investigated at seven compositions ranging from 5% to 95% of the small molecule energy ratios from 0.5 to 3.0 and three reduced temperatures. In addition to the thermodynamic results, extensive tabular data are given for the radial distribution functions, local compositions and the direct correlation functions. The authors also discuss several theories of dense fluid mixtures and give a new approximation for the radial distribution function of a pair in a mixture, which they call the modified mean density approximation. The predictions of various thermodynamic quantities from the different liquid mixture models are compared with simula-tion results. For mixtures with large size differences, the modified mean density approximation was found to be competitive with first order, Lee-Levesque type statistical mechanical perturbation theory.

The authors report the detection of rotational transi-tions of the free radicals FeH, CoH, and NiH. The measurements were made in the far infrared (FIR) between 50-90/cm using laser magnetic resonance. Signal-to-noise ratios of over 1000 with a 1 s time constant were obtained on the strongest lines of all three species. These metal hydrides are expected to be abundant in the interstellar medium, and optical emission spectra of FeH have been detected in many stel-lar spectra. Precise ground state rotational transition frequencies are needed for radio and FIR astronomical searches and will be provided from an analysis of the authors' spectra.

The far-infrared laser magnetic resonance spectrum of the CD radical in the nu=0 level of the X doublet pi state has been studied in detail. Twelve transitions which are accessible with currently available laser lines have been recorded. The measurements have been analyzed and subjected to a single least-squares fit using an effective Hamiltonian. The data provide primary information on the rotational and fine-structure intervals between the lowest rotational intervals. They also yield values for the Lambda-type doubling and deuteron hyperfine splittings in the same levels. Com-bination of the measurements with the corresponding data for CH allows the two parameters, gamma and A sub D, to be determined separately.

Final rept.

P. P. Delsanto, R. B. Mignogna, and A. V. Clark. 1987, 8p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v6B p1533-1540 1987.

Keywords: *Aggregates, *Polycrystalline, *Determina-tion of stress, *Texture, Plates(Structural members), Rayleigh waves, Metal plates, Error analysis, Nonde-structive tests, Alloys, Reprints, *Ultrasonic testing.

The general perturbation formalism for the propagation of Rayleigh waves on the surface of initially deformed anisotropic material plates is applied to the problem of separation of material texture and stress. The preferential alignment of crystallographic axes in a polycrystalline material is described in terms of their orientation distribution function. The authors considered explicitly the case of an orthotropic distribution of cubic crystallites, which occurs, for example, in alumi-num and steel alloys. The measured values of the Rayleigh wave phase velocity at different angles on the material plate can be used for the determination, in a reference plate with similar texture, of the three coefficients W(400), W(420) and W(440), which characterize the orientation distribution. An extension of the formalism separates the acoustoelastic effects of the initial stresses. An error analysis and a comparison with similar techniques using grazing SH-waves complete the discussion.

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Molecular Spectroscopy Div. Photoacoustic Measurement of Differential Broadening of the Lambda Doublets in NO(X (2)Pi 1/2, \underline{v} =2-0) by Ar.

Final rept. A. S. Pine. 1989, 8p Sponsored by National Aeronautics and Space Admin-istration, Washington, DC. Pub. in Jnl. of Chemical Physics 91, n4 p2002-2009, 15

Aug 89.

Keywords: *Nitrogen oxide(NO), Ground state, Argon, Reprints, *Nitric oxide, Photoacoustic spectroscopy, Pressure broadening, Color center lasers, Tunable lasers.

A differential broadening of the Lambda doublets in the v=2-0 overtone band of the doublet Pi(1/2) ground electronic state of NO in an Ar buffer gas has been observed by photoacoustic spectroscopy using a tunable color-center laser. The broadening coeffi-cients for the f symmetry components are larger than for the e symmetry components by up to about 6% for J about 16.5. The differential depends on J and vanishes at low J, implicating the anisotropy of the unpaired electron Pi orbital in the plane of rotation. The doublet Pi(3/2) transitions are slightly broader than the doublet Pi(1/2) as a result of spin-flipping collisional relaxation. The observed line shapes also exhibit collisional or Dicke narrowing due to velocity-changing collisions.

L. R. Karam, and M. G. Simic. 1989, 5p Pub. in Environmental Health Perspectives 82, p37-41 1989.

Keywords: *Benzene, *Tyrosine, *Biochemistry, Gas chromatography, Mass spectroscopy, Muscles, Tissue(Biology), Laboratory animals, Reprints, *Chem-ical reaction mechanisms, *Hydroxyl radicals, *Biological indicators, Free radicals.

o-Tyrosine (o-Tyr) was used as a specific biomarker for OH radicals generated in biosystems. Specificity of o-Tyr as an OH biomarker was based on previous studies in systems exposed to ionizing radiations. Fresh muscle tissue incubated with benzene for 1 hr at 38 C exhibits formation of o-Tyr as seen in the cases of eth-anol- and carbon tetrachloride-exposed systems. Gas chromatography/mass spectrometry selective ion monitoring measurements of o-Tyr yields in chicken breast muscle incubated with water or benzene indi-cate levels of less than 0.1 ppm and 3.0 + or - 0.5 ppm of o-Tyr, respectively. Formation of OH is presumed to originate via a Haber-Weiss reaction of H2O2 with Fe(II) preceded by the formation of O2 and H2O2 from distorted mitochondria.

Grant N00014-88-F-0091 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Scripta Metallurgica 23, n7 p1043-1048 1989.

Keywords: *Electrodeposition, *Crystal structures, *Aluminum manganese alloys, Temperature, Fused salts, Diffusion, Metastable state, Reprints, *Icosahedrons, Amorphous state, Quasi-steady states.

Amorphous, quasicrystalline and metastable crystal-line structures have been observed in binary aluminum-manganese alloys electrodeposited from chlor-oaluminate electrolytes. During electrodeposition, the extent of the deviation from equilibrium as well as the degree of ordering is defined by the concurrent proc-esses of new layer formation and surface diffusion. The metastable amorphous phase can be formed quite easily by low temperature electrodeposition. The direct formation of quasicrystals, having a level of free energy between that of an amorphous and a stable crystalline phase, can be achieved by an increase in deposition temperature in a manner somewhat analo-gous to that which has been reported for sputter depo-sition. An increase in the temperature causes a gradual increase in the size of icosahedral regions.

J. W. Gadzuk, and C. W. Clark. 1989, 8p Pub. in Jnl. of Chemical Physics 91, n5 p3174-3181, 1 Sep 89.

Keywords: Resonance scattering, Palladium, Reprints, *Electron stimulated desorption, Oxygen atoms.

A theory is presented which accounts for giant enhancements in electron stimulated desorption (ESD) yields from adsorbate-covered surfaces if the incident electrons become trapped in a shape or Feshbach res-onance associated with the adsorbate. The resulting temporary negative ion is displaced inwards towards the surface as a result of the force provided by the image screening charge. Upon reneutralization, the desorbate can be returned high on the dissociative re-pulsive wall of the neutral-surface potential curve. The process has been modeled within the context of semi-classical Gaussian wave packet dynamics. Recent ob-servations of such giant enhancements in the ESD yields for the system O(alpha)/Pd(111) are explained in terms of the model, and an atomic physics basis for the resonance in atomic oxygen is proposed.

istration, Washington, DC. Pub. in Jnl. of Molecular Spectroscopy 135, p84-88 1989

Keywords: *Infrared spectroscopy, *Fourier transfor-mation, Demodulation, Calibrating, Molecular spectroscopy, Spectrum analysis, Microwave spectrosco-py, Reprints *Carbon oxysulfide, *Heterodyning.

Heterodyne frequency measurements are given for carbonyl sulfide in the 1700/cm region. The measure-ments were combined with Fourier transform spectros-copy measurements of the same bands and with other measurements in the literature (microwave, submillimeter wave, and other infrared measurements) in a least-squares fit. The combined data and fit result in improved frequency calibration values for the 1700/ cm region and also allow the determination of calibra-2550/cm from application of the Ritz principle.

N. Ohashi, S. Tsunekawa, K. Takagi, and J. T. Hougen. 1989, 14p Pub. in Jnl. of Molecular Spectroscopy 137, p33-46

1989.

Keywords: *Microwave spectroscopy, *Spectrum analysis, *Torsional strength, Molecular rotation, Elec-tron tunneling, Stark effect, Reprints, *Amine/methyl.

The microwave absorption spectrum of methyl amine has been reinvestigated in the range from 7 to 90 GHz, with the aim of analyzing the first torsional state in more detail. By combining the newly obtained micro-wave data with the far-infrared and microwave data already available, it was possible to make an analysis of the tunneling-rotational levels of the first torsional state in which three types of delta K = + or - 1 elements were introduced into the Hamiltonian matrix described in the group-theoretical formalism developed previously. Stark effect data, remeasured during the present study, are also examined in connection with the delta K = + or - 1 interaction.

Keywords: Microwave spectra, Deutenum compounds, Dipole moments, Stark effect, Molecular structure, Reprints, *Argon complexes, Fourier transform spectros-copy, Van der Waals forces, Electric dipoles, Methanol

Microwave spectra of Ar-CH3OH, Ar-CD3OH, and Ar-(13)CH3OH have been measured between 7 and 25 GHz using a pulsed-nozzle Fourier transform microwave spectrometer. Two tunneling states are ob-served which correlate to the A and E internal-rotor states of free methanol. The electric-dipole-moment components are determined. The structure of the complex is found to be T-shaped with an Ar to CH3OH center-of-mass separation of 3.684(14) A. A number of transitions are observed which do not appear to fit an asymmetrical-top Hamiltonian. These are assigned to an E tunneling state of the complex.

Final rept.

J. K. Olthoff, R. J. Van Brunt, and I. Sauers. 1989, 3p Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Physics D: Applied Physics 22, p1399-1441 (2014) 1401 1989.

Keywords: *Sulfur fluorides, *Mass spectra, Sulfur hexafluoride, Gas ionization, Detection, Reprints, Elec-tron impact, Positive ions, eV range 10-100.

Physical & Theoretical Chemistry

The positive-ion mass spectrum of S2F10 has been measured as a function of electron-impact energy in the range 20-70 eV using quadrupole mass spectrom-eter. Contrary to recent results from mass spectromet-ric analysis of arc-decomposed SF6 there was no evidence of S2F9(1+) or S2F10(1+) ion formation from S2F10 at any energy. The largest ion observed at all electron energies is SF5(1+). It was found, however, that the appearance potentials for SF5(1+) and SF3(1+), the two most prominent ions from S2F10, are significantly lower than the appearance potentials of the same ions from SF6. The differences between the mass spectra of S2F10 and SF6 are delineated and the implications for detection of S2F10 in the presence of SF6 are discussed.

PB90-117920 Not available NTIS National Inst. of Standards and Technology (NML), Gaithersburg, MD. Chemical Thermodynamics Div. Biological Thermodynamic Data for the Calibration of Differential Scanning Calorimeters: Heat Capac-Ity Data on the Unfolding Transition of Lysozyme in Solution.

Final rept. F. P. Schwarz. 1989, 21p Pub. in Thermochimica Acta 147, p71-91 1989.

Keywords: *Thermodynamics, Enthalpy, Chemical analysis, Reprints, *Differential scanning calorimetry, *Muramidase.

Differential scanning calorimetry measurements of the Unfolding transition of lysozyme in HCL-glycine buffer solutions were performed over a temperature range from 326 K at pH 2.3 to 349 K at pH 3.9. Van't Hoff transition enthalpies were calculated from the fit of a two-state transition model to the heat capacity measurements (Delta Hvf), from the van't Hoff plot of $\ln(1/K)$ vs. 1/T where K is the transition equilibrium constant, and from the ratio of the transition peak height to the area under the transition peak. The best linear fit of the van't Hoff enthalpies to the transition temperatures Tm was obtained with Delta Hvf and was Delta Hvf (kJ/mol)=432.7 + or - 1.7 + or - 5.81 + or - 0.24 (Tm-337.2). Calorimetric transition enthalpies were determined from the transition peak area using an extrapolated sigmoidal baseline (Delta Hs) and an extrapolat-ed straight linear baseline. The best linear dependence of the calorimetric enthalpy on Tm was obtained with Delta Hs (kJ/mol)=434.7 + or - 4.1 + 6.39 + or - 0.60 (Tm-337.2). Linear least-squares fits of Delta Hvf and Delta Hs to Tm were independent of the DSC scan rate, the source of the lysozyme, the buffer concentration from 0.1 to 0.2 M and the concentration of lyso-zyme from 0.26 to 2.8 mM. The transition temperature exhibited a linear dependence on pH and concentra-tion. Cooperativities of the transition ranged from $0.988 + \text{ or } \cdot 0.0007 \text{ at } 326 \text{ K to } 1.012 + \text{ or } \cdot 0.007 \text{ at }$ 349K.

Keywords: *Silicon, *Desorption, Resonance, Re-prints, Photon stimulated desorption, *Fluorine ions, Surface reactions.

Photon-stimulated desorption (PSD) of F(1+) was per-formed for silicon (111) surfaces terminated with fluo-rine atoms. The surfaces were prepared by exposure of clean silicon to XeF2. The onset for PSD at the Si 2p edge correlated with the transition from the 2p level of the bonding silicon atom to the conduction-band mini-num ond uses thus a function of the order to the conmum, and was thus a function of the oxidation state of the bonding atom. The ions originating from a SIF spe-cies described along the surface normal while the ions from a SiF3 group described in off-normal directions. from a SIF3 group desorbed in oft-normal directions. Localized 3s and 3p Rydberg-like resonances were observed in the quasimolecular SiF3 moieties. The ion kinetic-energy distributions were measured as an aid to elucidating the desorption mechanism. Measure-ments of the PSD of F(1+) at the Si 2s edge were used to confirm the 3s and 3p character of the meas-ured resonances ured resonances.

Measures of Effective Ergodic Convergence in Liquids. Final rept.

R. D. Mountain, and D. Thirumalai. 1989, 5p Grant NSF-CHE86-57356 Sponsored by National Science Foundation, Washington, DC.

Pub. in Jnl. of Physical Chemistry 93, n19 p6975-6979 1989

Keywords: *Liquids, Ergodic processes, Dielectric properties, Computenzed simulation, Water, Convergence, Diffusion, Reprints, Binary mixtures, Molecular dynamics.

The recently introduced measure for ergodic conver-gence is used to illustrate the time scales needed for effective ergadicity to be obtained in various liquids. The cases considered are binary mixtures of soft spheres, two-component Lennard-Jones systems, and liquid water. It is shown that various measures obey a dynamical scaling law which is characterized by a single parameter, namely, a novel diffusion constant. The time scales for ergodic behavior are found to be dependent on the particular observable being considered. For example, in water, the diffusion constants for the translational and rotational kinetic energies and for the laboratory frame dipole moments are very differ-ent. The implications of these results for the calcula-tion of the dielectric constant of polar liquids by computer simulations are discussed.

Second Second Research Control of Control of

Pub. in Jnl. of Chemical Physics 91, n2 p711-721, 15 Jul 89.

Keywords: *Hydrogen fluoride, Far infrared radiation, Infrared spectra, Deuterium compounds, Reprints, *Neon complexes, Van der Waals forces, Potential energy surfaces, Predissociation.

The authors have used ab initio methods to characterize the Ne-HF van der Waals complex. The interaction energy was determined using size consistent, correlat-ed CEPA wave functions expanded in a Gaussian basis chosen to represent both intraatomic effects and the low order multipole moments and polarizabilities of the low order multipole moments and polarizabilities of Ne and HF. Converged variational and close-coupling calculations using the ab initio potential surface reveal three bound levels of the Ne-HF stretch mode, and several metastable levels correlating asymptotically with rotationally excited HF(j=1). From the calculated line positions, widths, and intensities, the authors have synthesized far infrared and infrared spectra of Ne-HF and Ne-DF and Ne-DF.

Sponsored by National Science Foundation, Washington, DC.

Pub. in Jnl. of Chemical Physics 91, n2 p722-731, 15 Jul 89.

Keywords: *Hydrogen fluonde, Infrared spectroscopy, Reprints, *Neon complexes, Van der Waals forces, Potential energy surfaces, Supersonic jet flow, Predissociation

Direct absorption tunable difference frequency IR spectroscopy in a slit jet supersonic expansion has been used to observe complexes of Ne with HF for the first time. Spectra of both the weak HF stretch funda-mental and the 10-20 fold more intense bend and mental and the 10-20 fold more intense bend and stretch combination band transitions are observed, and illustrate several interesting dynamical features. The large ratio of combination band to fundamental in-tensity is evidence for a highly isotropic potential with respect to HF rotation. The HF bend vibration is thus better thought of as nearly free internal rotor motion with a nearly good space fixed quantum number.

Final rept. C. Benndorf, and T. E. Madey. 1988, 29p

Pub. in Surface Science 194, n1-2 p63-91 1988.

Keywords: *Adsorption, *Water, *Surface properties, *Nickel, Hydrogen bonds, Dissociation, Isotopic labeling, Desorption, Chemisorption, Oxygen, Dimerization, Reprints, Electron stimulated desorption ion angular distribution, Thermal desorption spectroscopy, Low energy electron diffraction.

The adsorption of H2O on both clean and modified Ni(110) surface has been studied using a variety of methods: electron stimulated desorption ion angular distribution (ESDIAD), thermal desorption spectroscopy (TDS), and low energy electron diffraction (LEED). Fractional monolayers, of H2O on clean Ni(110) are associated with a four-spot ESDIAD pattern suggesting that the HO ligands are in specific registry with the substrate. The authors postulate the formation of H2O dimers bound via oxygen lone pair orbitals to Ni sub-strate atoms and oriented with the O...H-O axis in 001 azimuthal directions. Upon heating to greater than or equal to 200K, a fraction of the H2O dissociates, form-ing OH(ad). TDS of H2O from clean Ni(110) reveals four binding states. They are related to multilayer de-sorption (155K), desorption from larger bilayer clusters (210K), desorption from H2C0 dimer clusters which might be stabilized by OH (245K), and recombination of OH to yield H2O (g) (370K). Isotopic exchange of H2(16)0 with (18)O(ad) is observed even for binding states in which dissociation is believed not to occur and is related to a proton exchange involving H2O(ad) hydrogen bonded to O(ad).

Final rept.

C. Benndorf, T. E. Madey, and A. L. Johnson. 1987,

Pub. in Surface Science 187, n2-3 p434-444 1987.

Keywords: *Ammonia, *Adsorption, *Dissociation, *Iron, *Surface properties, Single crystals, Desorption, Crystal structure, Chemisorption, Reprints, Electron stimulated desorption ion angular distribution.

The purpose of the present letter is to provide new information about the molecular structure and configuration of NH3 on Fe single crystal surfaces and to pro-vide insight into the influence of steps of NH3 orienta-tion and dissociation. Information about the NH3 oriensteps were gained in the present study from ESDIAD (Electron Stimulated Desorption Ion Angular Distribution). The results provide evidence that at low NH3 coverages adsorption takes place primarily at step sites. The adsorbed species stabilized at step sites are believed to include oriented NHx fragments as well as inclined' NH3. The molecular NH3 dipoles are believed to be tilted due to the electrostatic field at steps. For higher coverages NH3 adsorption sites on the Fe(100) terraces are populated; from ESDIAD data the authors conclude that NH3 is bonded mainly to terrace sites via the N atom and the H-atoms are pointed away from the surface, with no azimuthal ordering.

Quantitative Characterization of the Viscosity of a Microemulsion. Final rept.

R. F. Berg, M. R. Moldover, and J. S. Huang. 1987, 5p

Contract NASA-C-86129-D

Sponsored by National Aeronautics and Space Admin-istration, Cleveland, OH. Lewis Research Center. Pub. in Jnl. of Chemical Physics 87, n6 p3687-3691 1987

Keywords: *Quantitative analysis, *Viscosity, Temper-ature, Volume, Drops(Liquids), Critical point, Water, Decanes, Electrical resistivity, Reprints, *Microemulsions, *Ternary systems, AOT.

The authors measured the viscosity of the 3-compo-nent microemulsion water/decane/AOT as a function of temperature and droplet volume fraction. At tem-peratures well below the critical temperature the visspheres suspended in decane. Upon approaching the 2-phase region from low temperature, there is a large (as much a factor of 4) smooth increase of the viscosity which may be related to the percolation-like transition observed in the electrical conductivity. This in-crease in viscosity is not completely consistent with either a naive electroviscous model or a simple clustering model. The divergence of the viscosity near the critical point (39 C) is superimposed upon the smooth increase. The magnitude and temperature depend-ence of the critical divergence are similar to that seen near the critical points of binary liquid mixtures.

Pub. in Faraday Discussions of the Chemical Society 86, p13-20 1988.

Keywords: *Hydrogen chloride, Infrared spectroscopy, Far infrared radiation, Reprints, *Argon complexes, Van der Waals forces, Laser spectroscopy, Vibrational states, Supersonic jet flow, High resolution.

Direct absorption tunable difference frequency infrared radiation laser spectroscopy has been used to study the vibrational dynamics of ArHCI complexes cooled in a slit supersonic jet expansion. As a result of large-amplitude vibrational motion in these weakly bound complexes, transitions to each of the three van der Waals modes are observed as combination bands built on the fundamental HCl stretch, thus permitting detailed study of low-frequency, intermolecular modes with a near-infrared laser source. The molecular con-stants are in excellent agreement with both far-infrared radiation experimental results and semiempirical predictions for the Ar+HCI(v=0) surface, indicating only a small change in the intermolecular potential upon vi-brational excitation of the HCI.

Oct 89.

Keywords: Hydrogen bonds, Guantum theory, Hamil-tonian functions, Infrared spectroscopy, Reprints, *Complexes, Van der Waals forces, High resolution, Supersonic jet flow.

There has been a wealth of recent infrared experimenal data on van der Waals and hydrogen bonded com-plexes obtained under cooled, supersonic jet condi-tions where only a small fraction of the total bound quantum states can be elucidated. This partial set of data can often be well fit to a traditional Watson Hamiltonian derived from a rigid rotor perspective with low order centrifugal distortion effects included. In the paper, the authors show that even in extremely floppy molecular systems with wide amplitude vibrational motion, the quantum term values are very well fit by a rigid or semirigid rotor Hamiltonian over the limited range of energy states accessible in a cooled beam. The authors provide explicit examples of this behavior by full quantum solutions in two extremes of floppy motion: a symmetric triatonic with a square well bend-ing potential ('hinge') and a nearly free internal rotor ('pinwheel'). These results show that potentials with fundamentally different topologies can be consistent with same data, and indicate that even the limits of nearly rigid and floppy internal motion may be difficult to distinguish from a limited set of rovibrational eigenvalues.

Evaluation of Data on Solubility of Simple Apolar Gases in Light and Heavy Water at High Temperature.

Quarterly rept.

R. F. Prini, and R. Crovetto. c1989, 13p

H. F. Prini, and H. Crovetto. c1989, 13p Prepared in cooperation with Delaware Univ., Newark. Dept. of Chemistry, American Chemical Society, Washington, DC., and American Inst. of Physics, New York. Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD. Included in Jnl. of Physical and Chemical Reference Data, v18 n3 p1231-1243 1989. Available from Ameri-can Chemical Society, 1155 16th St., NW, Washing-ton, DC 20036. ton, DC 20036.

Keywords: *Solubility, *Heavy water, *Water, *Gases, Deuterium, Chemical properties, Thermodynamic properties, Henrys law, Data processing, Ethane, Ni-trogen, Oxygen, Hydrogen, Tables(Data), High tem-perature tests, Rare gases, Methane.

The solubility data of apolar gases in light and heavy water over the temperature range covered experimentally have been evaluated, laying particular emphasis to the region above the normal boiling points of the solvents. The systems that have been included in the solvents. The systems that have been included in the work are the inert gases and CH4 in light water and heavy water, H2, O2, N2 and C2H6 in light water and D2 in heavy water. Data in the original sources have been brought to the same footing by calculating from the raw experimental data P, T, and x when they were not reported by the author. The step is considered necessary to assess critically the available sets of data. The temperature dependence of Henry's constants for all the binary systems have been expressed in terms of two different polynomial equations. The formulations presented are discussed and the limits of application given.

Microwave Spectral Tables, 3. Hydrocarbons, CH to C10H10.

Quarterly rept. F. J. Lovas, and R. D. Suenram. c1989, 27p

Prepared in cooperation with American Chemical Society, Washington, DC., and American Inst. of Physics, New York.

Included in Jnl. of Physical and Chemical Reference Data, v18 n3 p1245-1524 1989. Available from Ameri-can Chemical Society, 1155 16th St., NW, Washington, DC 20036.

Keywords: *Microwave spectroscopy, *Hydrocarbons, *Molecular rotation, Physical properties, Tables(Data), Data processing, Dipole moments, Hyperfine struc-ture, Spectral lines, Isotopes.

All of the rotational spectral lines observed and reported in the open literature for 91 hydrocarbon molecules have been tabulated. The isotopic molecular species, assigned quantum numbers, observed frequency, esti-mated measurement uncertainty and reference are given for each transition reported. In addition to correcting a number of misprints and errors in the litera-ture cited, the spectral lines for many normal isotopic species have been refit to produce a comprehensive and consistent analysis of all the data extracted from various literature sources. The derived molecular prop-erties, such as rotational and centrifugal distortion constants, hyperfine structure constants, electric dipole moments, and rotational g-factors are listed.

Interaction of In Atom Spin-Orbit States with Si(100) Surfaces. Final rept.

D. J. Oostra, R. V. Smilgys, and S. R. Leone. 1989,

6p

Sponsored by Weapons Lab., Kirtland AFB, NM. Pub. in Materials Research Society Symposia Pro-ceedings Chemical Perspectives of Microelectronic Materials, v131 p239-244 1989.

Keywords: *Indium, *Silicon, *Desorption, Spin orbit interactions, Scattering, Reprints, Laser induced fluorescence, Auger electron spectroscopy, Surface reactions, Binding energy, Semiconductors.

Scattering and desorption of In from Si (100) is investi-gated. Laser induced fluorescence is used to probe the desorbing and or scattered species. Auger Elec-tron Spectroscopy is used to study the composition on the surface. The results show that at surface temperatures below 820 K atwo dimensional layer of In desorbs by a half order mechanism. This is explained by assuming two dimensional In islands on the surface. Above 820 K, desorption takes place by a first order mechanism. The desorption parameters appear to be spin-orbit state specific. The desorption energy for In doublet P(3/2) is 2.8 plus or minus 0.4 eV and for In doublet P(1/2) 2.5 plus or minus 0.2 eV. The difference is equal to the difference in the spin-orbit energy. So far no specular scattering of In is observed, suggesting that the sticking coefficients are unity.

Keywords: *Vibrational spectra, *Infrared spectra, Neon, Molecular structure, Photochemical reactions, Ionization, Absorption, Solids, Reprints, *Matrix isola-tion technique, *Oxygen ions, Chemical reaction mechanisms.

When a relatively concentrated Ne:O2 sample is code-When a relatively concentrated Ne:O2 sample is code-posited at approximately 5 K with a beam of excited neon atoms, prominent infrared absorptions appear which are assigned to O4(+) and O4(-). Absorptions of O3 and O3(-) are also present, and their product distributions in isotopic substitution experiments indi-exter the O atom exclusion and experiments indicate that O-atom production and reaction is a minor channel in this experimental system. Detailed isotopic substitution experiments require that both O4(+) and O4(-) possess two equivalent O2 units. Analysis of the isotopic shifts strongly favors a planar trans configura-tion (C(2h)) for both molecules. Several combination bands of O4(+) are observed, and give evidence regarding the position of Nu(sub 1)(a(sub g)), which is infrared inactive, and regarding perturbations by com-binations of low-frequency fundamentals. The mecha-nism of photodestruction of the ions in this system is also considered.

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Chemical Kinetics Div. Temperature Dependence of the Rate Constant for the Hydroperoxy + Methylperoxy Gas-Phase Reaction. Final rept.

P. Dagaut, T. J. Wallington, and M. J. Kurylo. 1988,

Pub. in Jnl. of Physical Chemistry 92, n13 p3833-3836 1988.

Keywords: *Reaction kinetics, *Photolysis, *Absorption spectra, Ultraviolet spectroscopy, Flash point, Temperature, Spectrum analysis, Vapor phases, Re-prints, *Hydroperoxy radicals, *Methylperoxy radicals, Arrhenius equation, Chemical reaction mechanisms, Peroxy radicals.

The temperature dependence of the reaction between hydroperoxy and methylperoxy radicals was measured in a flash photolysis ultraviolet absorption apparatus over the temperature range 228 - 380 K. (HO2 + CH3O2 -> products.) The data represented by the Arrhenius expression are compared to earlier results and discussed in terms of the reaction mechanism. Due to overlapping absorptions of the two radicals and deviations of the complex reaction system from both pseudo-first and second order behavior, the rate con-stants were determined from a detailed modeling of the radical decay curves. A sensitivity analysis of the rate constant determination procedure to the assumed radical absorption cross-sections and correlated changes in the rate constants for the HO2 and CH3O2 self-reactions was performed and the results are reported.

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Chemical Kinetics Div. Flash Photolysis Kinetic Absorption Spectroscopy Study of the Gas Phase Reaction HO2 + C2H5O2 Over the Temperature Range 228-380 K.

Final rept.

P. Dagaut, T. J. Wallington, and M. J. Kurylo. 1988,

Pub. in Jnl. of Physical Chemistry 92, n13 p3836-3839 1988.

Keywords: *Reaction kinetics, *Photolysis, *Absorp-tion spectra, Flash point, Temperature, Spectrum anal-ysis, Vapor phases, Reprints, *Hydroperoxy radicals, *Ethylperoxy radicals, Peroxy radicals, Arrhenius equation.

Flash photolysis kinetic absorption spectroscopy was used to investigate the gas phase reaction between hydroperoxy and ethylperoxy radicals between 228 and 380K in the pressure range 25-400 Torr. (HO2 + C2H502 -> products). Due to the large difference be-tween the self reactivities of the two radicals, first or second order kinetic conditions could not be maintained for either species. Thus, the rate constant was determined from computer modeled fits of the radical absorption decay curves recorded at wavelengths be-tween 230 and 280 nm. A reanalysis of earlier meas-urements of the C2H5O2 self-reaction (C2H5O2 + C2H5O2 -> products) using this expression for k1 re-sulting in the revised Arrhenius equation produced k2.

Triplet Dipoles in the Absorption Spectra by Dense Rare Gas Mixtures. 1. Short Range Interactions. Final rept.

B. Guillot, R. D. Mountain, and G. Birnbaum. 1989,

13p Pub. in Jnl. of Chemical Physics 90, n2 p650-662, 15 Jan 89

Keywords: *Rare gases, *Dipole moments, Far infra-red radiation, Absorption spectra, Liquefied gases, Mixtures, Argon, Krypton, Helium, Hydrogen, Reprints, Molecular dynamics.

A theory is proposed to evaluate the induced-dipole moment occurring when three dissimilar atoms are mutually interacting. Based on the one-effective electron model, the theory predicts that, at short and intermediate distances, the triatomic dipole moment origi-nates from three different processes, namely, overlap, quadrupole-induced, and dipole-induced. These threebody dipoles have then been implemented into a molecular dynamics simulation in order to generate the collision-induced absorption spectra by rare-gas mix-tures. For Ar-Kr liquid mixtures, the irreducible threebody contributions to the spectral density are found so important that they exceed two-body contributions. This is due to a profound cancellation between twobody dipoles which does not occur between irreducible three-body dipoles includes not occur between infeducible three-body dipoles. However, the comparison with ex-perimental data is poor because of a shortcoming of the model calculation which does not take into ac-count long-range dispersion interactions. On the contrary, a quantitative agreement is obtained for the fundamental vibration band of compressed H2-He mixtures, indicating that exchange overlap, three-body dipoles play the leading role for such light systems.

Laser Induced Vaporization Time Resolved Mass Spectrometry of Refractories. Final rept.

D. W. Bonnell, P. K. Schenck, and J. W. Hastie.

1988, 13p Pub. in Proceedings of the Electrochemical Society, v88-10 p82-94 1988.

Keywords: *Vaponzing, *Mass spectroscopy, *Spec-trum analysis, *Refractory materials, Chemical analy-sis, Boron nitrides, Graphite, High temperature tests, Thermodynamic equilibrium, Surface temperature, *Laser-radiation heating.

An experimental approach is described which can yield information about refractory surfaces by examin-ing the time history of the gas-dynamic process occur-ning during pulsed Nd/YAG laser induced vaporization. Specific examples consider BN and graphite vaporiza-tion. Time resolved mass spectrometric measure-ter to evolved mass spectrometric determination. tion. Time resolved mass spectrometric measure-ments of evolved species permit direct determination of gas species identities and concentration, independ-ent of mass spectral cracking problems. Of particular interest is the observation of local thermodynamic equilibrium for the observed laser vaporized gas spe-cies in both systems from surface temperatures of 2900 K (BN) and 4000 K (graphite). Indirect methods of determining surface temperatures a elternatives to of determining surface temperature as alternatives to direct measurement of radiance temperature are presented. Also, a preliminary analysis of the convolution problem to eliminate amplifier RC response delays and to extract true species velocity distributions is discussed.

Effect of Crosslinks on the Phase Separation Behavior of a Miscible Polymer Blend. Final rept.

R. M. Briber, and B. J. Bauer. 1988, 8p Pub. in Macromolecules 21, n11 p3296-3303 Nov 88.

Polymer Chemistry

Keywords: *Irradiation, *Crosslinking, *Polystyrene, *Vinyl ether resins, Phase diagrams, Neutron scattering, Solubility, Blending, Polymers, Reprints.

The effect of radiation cross-linking on the phase diagram and scattering function for a compatible polymer blend of deuterated polystyrene and poly(vinyl methyl ether) has been examined by small angle neutron scattering. The scattering curves for the cross-linked blends exhibit a maximum at a nonzero q vector, the position of which depends linearly on the square root of the radiation dose or inversely on the square root of the number of repeat units between cross-links. This dependence was predicted by de Gennes, but the measured position of the maximum is smaller than predicted. The spinodal temperature can be determined dicted. The spinodal temperature can be determined by plotting the inverse of the scattered intensity at the maximum, S(q sub *) sup minus one, versus inverse temperature and extrapolating to the point where S(q sub *) sup minus one = 0. The inverse of the meas-ured spinodal temperature depends linearly with radi-ation dose or with N sup minus one as predicted. This increases the size of the single phase region of the phase divergent with the outroplated spinodal temperaphase diagram with the extrapolated spinodal temperblack of the second se

900,547 **PB8**9**-14702**9 PB89-147029 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Ionizing Radiation Physics Div. Hydroxyl Radical Induced Cross-LinkIng between

Phenylalanine and 2-Deoxyribose.

Resonant Raman Scattering of Controlled Molecular Weight Polyacetylene.

Final rept.

M. A. Schen, J. C. W. Chien, E. Perrin, S. Lefrant, and E. Mulazzi. 1988, 6p Pub. in Jnl. of Chemical Physics 89, n12 p7615-7620, 15 Dec 88.

Keywords: *Acetylene, *Molecular weight, *Catalysts, *Polymers, Titanium, Synthesis, Organometallic com-pounds, Metal complexes, Aluminum, Raman spectra, Oxidation, Isomerization, Electrical resistivity, Reprints.

Polyacetylene, (CH) sub x, films of 500, 5300, 10,500, and 100,000 Daltons number average molecular weights (M sub n) were synthesized using the titanium tetra-n-butoxide/triethyl aluminum-catalyst/cocatalyst system and examined using resonant Raman scattering techniques. Before isomerization, trans segments are found to exist mainly as short, isolated sequences independent of M sub n. After thermal isomerization, theoretical analysis of the RRS spectra using the Brivio, Mulazzi model indicate the ratio of long trans conjugated segments (N is greater than or equal to 30) to short trans conjugated segments (N is less than or equal to 30) is significantly larger for 100,000 Dalton polymer in comparison to polymer of 10,500 M sub n and below. For samples below 10,500 Daltons, no clear relationship between actual polymer molecular

weight and G is observed. Optimization of the isomerization conditions for 100,000 Dalton polymer results in trans-(CH) sub x with a G = 0.80. These results suggest that not until very long molecular chains are ob-tained can samples composed principally of long con-jugated segments be obtained. It is proposed that defects which arise during and after the polymerization limit the content of long segments. Ambient, short term oxidation of 100,000 M sub n polymer shows a decrease in G from 0.80 to 0.70. Low-level chain oxidation or doping is shown to preferentially occur within long conjugated segments.

Thermal Degradation of Poly (methyl methacrylate) at 50 C to 125 C. Final rept.

Final rept. J. W. Martin, D. P. Bentz, W. E. Byrd, B. Dickens, E. Embree, W. E. Roberts, and D. Waksman. 1987, 17p Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Applied Polymer Science 34, n1 p377-393 1987

Keywords: *Chemical bonds, *Cleavage, *Polymers, *Polymethyl methacrylate, Thin films, Temperature, Free radicals, Oxidation, Reprints.

Small but significant numbers of chain scissions occur in a commercial poly (methyl methacrylate) film exposed to temperatures between 50 and 125 C. The scission rate is initially rapid and then slows down to a constant rate. The initial rate of chain scissions is temperature dependent, while the long-term rate of chain scissions appears to be temperature independent. Four modes of failure are proposed to explain the results: (1) the presence of unreacted initiators of polymerization; (2) free radicals generated from additives in the commercial film; (3) weak links in the polymer chain; and (4) free radicals generated in the thermal decomposition of an oxidation product of the monomer methyl methacrylate. The mode of failure which is most consistent with the experimental results is the one involving free radicals generated from an oxidation product of monomer.

Concentration Dependence of the Compression Modulus of Isotactic Polystyrene/Cis-Decalin Gels.

Final rept.

J. M. Guenet, and G. B. McKenna. 1986, 10p Pub. in Jnl. of Polymer Science 24, n11 p2499-2508

Nov 86

Keywords: *Polystyrene, *Decalin, *Gels, *Compress-ing, *Quenching(Cooling), *Micelles, Polymers, Modu-lus of elasticity, Phase diagrams, Reprints.

New results for isotactic polystyrene/cis-decalin gels are presented which suggest that a simple fringed mi-cellar model of the gel may not be appropriate. In measuring the room temperature compressive modu-lus of gels formed at -20C, it was found that, not only are the gels time decardent but she that the incenter are the gels time dependent but also that the isochro-nal modulus-concentration diagrams exhibit sharp features reminiscent of a phase diagram rather than the smooth curves (straight lines) typical of swollen rubber and fringed micellar gels.

Effects of Solvent Type on the Concentration Dependence of the Compression Modulus of Ther-moreversible Isotactic Polystyrene Gels. Final rept. G. B. McKenna, and J. M. Guenet. 1988, 10p

Pub. in Jnl. of Polymer Science B, Polymer Physics 26, n2 p267-276 Feb 88.

Keywords: *Polymers, *Polystyrene, *Decalin, *Gels, *Compression, Quenching(Cooling), Chlorohydrocar-bons, Modulus of elasticity, Relaxation(Mechanics), Stresses, Reprints

Solutions of isotactic polystyrene in either trans-decalin or 1-chlorodecane were transformed into gels by quenching from a high temperature (approximately 180 C) to -20 C. The relaxation modulus in compression of these gels was measured over a range of concentrations of from 0.04 g/g to 0.40 g/g. At 22 C the gels show a double logarithmic stress relaxation rate, m, which is higher than for polyvinylchloride and gelatin gel systems. 120s isochronal modulus concentration diagrams exhibit non-power law behavior, i.e., not only is the general trend such that the double logarith-mic slope decreases with increasing concentration, but there are also regions in which abrupt changes in modulus occur over narrow ranges in concentrations. These features in the concentration dependence of the modulus are less pronounced than those found previously in isotactic polystyrene/cis-decalin gels. The behavior is interpreted to be inconsistent with a fringed micelle picture of the gel structure.

Measurement of the Torque and Normal Force In Torsion in the Study of the Thermoviscoelastic Properties of Polymer Glasses. Final rept.

G. B. McKenna. 1985, 15p

Pub. in Relaxations in Complex Systems, p129-143 1985

Keywords: *Torsion tests, *Polymers, *Glass, *Aging tests(Materials), *Volume, *Polymethyl methacrylate, Torque, Viscoelasticity, Thermal properties, Normal strain, Strain measurement, Reprints.

The simultaneous measurement of the torque and normal force responses in torsion experiments on vis-coelastic materials provides multidimensional (multiaxial) data from a single simple test geometry. Data are presented which support the important theoretical prediction that in two step torsional deformations where the magnitude of the second step is one-half the magnitude of the first step, the normal stress response is predicted to be independent of the duration of the first

CHEMISTRY **Polymer Chemistry**

step and equal to the single step response to a deformation of the same magnitude as the second step. The second program involves a study of physical aging in a freshly quenched polymer glass of polymethyl methacrylate.

Viscosity of Blends of Linear and Cyclic Molecules of Similar Molecular Mass. Final rept.

G. B. McKenna, and D. J. Plazek. 1986, 3p

Pub. in Polymer Communications 27, n10 p304-306 Oct 86.

Keywords: *Polymers, *Molecular weight, *Polysty-rene, *Melt viscosity, Contamination, Chains, Rings, Linearity, Cyclization, Reprints, Reptation.

Narrow fractions of linear polystyrene were added to cyclic polystyrenes of similar molecular weights. For weight concentrations, theta sub c, of the cyclic poly-mers from 0.85 to 1.0, it is found that the zero shear viscosity varies as theta sub c sup (-5.6). These results suggest that discrepancies between reports in the literature for the molecular weight dependence of the melt viscosity of cyclic polymers can only be partially ac-counted for by contamination of the rings with linear chains.

MD. Building Materials Div. Preliminary Stochastic Model for Service Life Pre-diction of a Photolytically and Thermally Degraded Polymeric Cover Plate Material. Final rept.

Final rept. J. Martin, D. Waksman, D. Bentz, J. A. Lechner, and B. Dickens. 1984, 20p Pub. in Proceedings of International Conference on the Durability of Building Materials and Components Components 12015 1004 vigo 540 (3rd), Espoo, Finland, August 12-15, 1984, v3 p549-568

Keywords: *Plates(Structural members), *Durability, *Service life, *Thin films, *Polymethyl methacrylate, Stochastic processes, Mathematical model, Forecast-ing, Thermal degradation, Photodegradation, Failure, Polymers, Molecular weight, Oxidation.

A preliminary stochastic model has been developed and partially validated for predicting the service life of a polymeric film, such as poly(methyl methacrylate) (PMMA), which is subjected to both thermal and photolytic degradation. The exposure conditions under which degradation is induced simulate those expected for a polymeric cover plate material in an active solar collector. Service life for a population of films is defined as that time beyond which an unacceptable porure of a film is that its number average molecular weight has fallen below a specified threshold value.

Theory of Microphase Separation in Graft and Star Copolymers.

Final rept. M. O. de la Cruz, and I. C. Sanchez. 1986, 8p Pub. in Macromolecules 19, n10 p2501-2508 1986.

Keywords: *Polymers, *Graft polymerization, *Phases, *Separation, Radius of gyration, Critical point, Reprints.

Phase stability criteria and static structure factors have been calculated for simple AB graft copolymers, for star copolymers with equal number of A and B arms, and for n arm star diblock copolymers. The A-B interactions are characterized by the usual chi parameter. The fraction of A monomer in the graft copolymer is denoted as f and the fractional position along the A chain backbone at which the B graft is chemically linked is denoted as tan. When tan equals 0 or 1 the graft copolymer degenerates to a simple diblock co-polymer. Leibler previously calculated that the critical value, (chi N)c, at which a AB diblock copolymer containing N monomer units undergoes microphase separation is 10.5. The critical value occurs at f equals 0.5 and is the only composition for which the transition is second order. According to the present theory, a graft copolymer (0 < tau < 1) does not have a critical point for any f; i.e. all transitions are first order.

tanes. Effect of Chain Conformation. Final rept.

E. Perez, and D. L. VanderHart. 1987, 6p Pub. in Polymer 28, n5 p733-738 1987.

Keywords: *Polymers, *Nuclear magnetic resonance, *Carbon, Solids, Amorphous materials, Crystal struc-ture, Reprints, Carbon 13, Polyoxetanes, Conformational changes.

Carbon-13 nuclear magnetic resonance (NMR) in the solid state has been applied to the study of poly(oxetane) and poly(3,3-dimethyloxetane). Two different crystalline modifications, with T2G2 and T3G conformations, have been prepared for each of the polymers. The corresponding (13)C chemical shifts for each sample, both amorphous and crystalline, have been determined. Single resonances for the methylene carbons alpha to the oxygens, are observed for the crystal having T2G2 conformation. Two reson-ances are observed for these carbons in crystals having T3G conformation. The equivalence of these carbons in the T2G2 conformation and their inequivalence, within the same monomer unit, in the T3G con-formation is a property of the isolated chain.

Keywords: *Polymers, *Monte Carlo method, *Chains, *Impurities, *Molecular structure, Scalars, Surface chemistry, Electron distribution, Interactions, Random processes, Position(Location), Reprints.

Simple dimensional analysis is employed to discuss dimensional analysis is employed to discuss the relevance of impurity interactions on the molecular dimensions of flexible polymers in the limits of highand low-impurity densities. Scaling arguments account for the universal behavior of static properties observed by Baumgartner and Muthukumar in their recent Monte Carlo simulations. An approximate model of the random impurity interaction is introduced by considering the random impurities as being analogous to an effective surface with which the polymer interacts. Quali-tatively the same conclusions are obtained as in the scaling arguments except that the effective surface analogy provides closed form scaling functions de-scribing the variation of the molecular dimensions as a function of the dimensionless disorder interaction. The transition to a collapsed state is found to be characterized by a critical impurity density which is a function of the chain length.

Final rept. E. Perez, B. Crist, P. R. Howard, and D. L. Vanderhart. 1987, 10p

Pub. in Macromolecules 20, n1 p78-87 1987.

Keywords: *Proton magnetic resonance, *Polybutadiene, *Polyethylene, Carbon 13, Hydrogen, Alkanes, Crystallinity, Morphology, Polarization, Diffusion, Separation. Reprints.

A combination of (13)C and proton magnetic reso nance experiments has been performed on a model ethylene copolymer (hydrogenated polybutadiene) of about 100,000 molecular weight and 17 ethyl branches about 100,000 molecular weight and 17 ethyl branches per 1000 total carbons. The fraction of ethyl branches found in the crystal in this 41%-crystalline sample was 0.06 + or - 0.02, and the ratio of concentrations be-tween the crystalline and non-crystalline regions was correspondingly about 1:10. For reasons of best integrability, the methyl resonance of the ethyl branches was used to deduce the concentrations in each morphological phase. The same resonance is rather ill-behaved in cross-polarization experiments so that several auxiliary experiments were undertaken to deduce the true concentrations attributed to each phase. The experimental techniqiue utilizes cross-polarization as a probe of proton polarization levels; moreover, the success of the method relies on local proton spin diffusion.

M. O. de la Cruz, and I. C. Sanchez. 1987, 4p Pub. in Macromolecules 20, n2 p440-443 1987.

Keywords: *Phases, *Separation, *Polymerization, Scattering, Mixtures, Chemical analysis, Reprints.

Microphase separation in an A-B blockcopolymer with B homopolymer blend is analyzed. Let theta be the concentration of homopolymer, f the fraction component A along the blockcopolymer, N the degree of po-lymerization of the blockcopolymer and r the ratio of the blockcopolymer to homopolymer degree of polymerization. The scattering function for such a system is obtained. The variations of the spinodal temperature (chi N)s and the wave vector at which the scattering function diverges, q^* , are obtained as a function of f, theta, and r in the vicinity of the critical point of a pure blockcopolymer melt (q-o, f = 0.5). It is found that (chi N)s and q^* can increase or decrease with respect to the values at theta = zero.

Polymeric HumidIty Sensors for Industrial Process Applications.

Final rept.

P. H. Huang. 1988, 11p Pub. in Proceedings of Annual Sensors Expo Interna-tional (3rd), Chicago, IL., September 13-15, 1988, p106B-1-106B-16.

Keywords: *Detectors, *Humidity, *Polymers, Meas-urement, Moisture meters, Thermoplastic resins, Thermoset resins, Industrial engineering, Process control.

Humidity/moisture sensing and measurement tech-niques are summarized as an introduction. Various commercially available sensors for the on-line determination of humidity/moisture in gases, liquids and solids are described. The advantages and disadvantages of the individual sensor types are listed. Polymeric humidity sensors are now finding increasing use in industrial process applications. This is made possible by the recent advances in polymer science and technology. The paper deals with the current status of research in polymeric humidity sensors which are based on the use of thermoplastics and thermosets.

Influence of Molecular Weight on the Resonant Raman Scattering of Polyacetylene. Final rept.

M. A. Schen, S. Lefrant, E. Perrin, J. C. W. Chien, and E. Mulazzi. 1989. 8p

Pub. in Synthetic Metals 28, pD287-D294 1989

Keywords: *Polymers, *Acetylene, *Molecular weight, *Oxidation, *Raman spectra, Catalysis, Titanium, Aluminum, Mathematical models, Resonance, Reprints.

For the first time, polyacetylene, (CH)x, films of known number average molecular weights, Mn, have been ex-amined using Resonance Raman Scattering tech-niques. (CH)x samples of 500, 5300, 10500, and 100,000 Dattons were synthesized using the classical titanium tetra-n-butoxide/triethyl aluminum catalyst/ cocatalyst system. After thermal isomerization, model-ing of the RRS spectra using the Brivio, Mulazzi model indicate that the 100,000 Dalton polymer is composed principally of long transconjugated segments. In con-trast, polymers of 10500 Mn and below are seen to contain significantly larger fractions of short trans con-jugated segments. For samples below 10500, no clear relationship between actual polymer molecular weight relationship between actual polymer molecular weight and G, the ratio of long to short segments, is observed. These results suggest that not until very long chains are obtained can samples containing a large fraction of long conjugated segments be obtained. Ambient, short term oxidation of 100,000 Mn polymer shows an in-crease in satellite band intensities at omega (c-c) and correct (c-c) where opegae is fractionary which correormega (c=c), where omega is frequency, which corre-sponds to a decrease in G. Low level chain oxidation or doping is shown to preferentially occur within long conjugated segments.

Deuterium Magnetic Resonance Study of Orienta-tion and Poling in Poly(Vinylidene Fluoride) and Poly(Vinylidene Fluoride-Co-Tetrafluoroethylene). Final rept.

M. A. Doverspike, M. S. Conradi, A. S. DeReggi, and R. E. Cais. 1989, 7p

Pub. in Jnl. of Applied Physics 65, n2 p541-547, 15 Jan

Keywords: *Tetrafluoroethylene resins, *Nuclear magnetic resonance, Vinyl copolymers, Orientation, Deute-num, Molecular structure, Reprints, *Vinylidene fluoride polymers, Poling.

Deuteron nuclear magnetic resonance line shapes are reported for oriented samples of poly(vinylidene fluo-ride) and an (80-20) copolymer of vinylidene fluoride and tetrafluoroethylene. For stretched samples the orientation of the chain axes with respect to the stretch direction is given by a Gaussian distribution of width about 20 degrees. The width of the distribution was slightly smaller in the more highly stretched copolymer. Surprisingly, as the magnetic field is rotated in the plane perpendicular to the stretch direction, the deute-rium spectra of the poled copolymer sample do not change. The occurrence of electrical polarization in the absence of orientation dependence of the deuterium line shape indicates molecular reorientation through 180 degrees in the copolymer.

Dielectric Measurements for Cure Monitoring.

Final rept. F. I. Mopsik, S. S. Chang, and D. L. Hunston. 1989,

7p Pub. in Materials Evaluation 47, n4 p448-453, 465 Apr

Keywords: *Measurement, *Curing, *Epoxy resins, *Monitors, *Dielectric properties, Spectroscopy, Resistance, Viscosity, Ultrasonics, Reprints.

The use of dielectric measurements to monitor the cure of epoxy resins is investigated. Time-domain spectroscopy and an automated wide-dynamic-range AC-conductance measuring system show that dielec-tric loss and conductance measurements follow the entire cure cycle with good sensitivity and resolution. Comparisons with viscosity, differential scanning ca-lorimetry (DSC) exotherm, and shear-mode ultrasonic attenuation measurements made simultaneously on the same sample show that dielectric methods compare very favorably with the others. In addition, a limit to the validity of a direct, simple relation between vis-cosity and dielectric loss is discussed. The conditions necessary for meaningful measurements are considered along with possible implementations of the method.

MD. Polymers Div. 13C NMR Method for Determining the Partitioning of End Groups and Side Branches between the Crystalline and Non-Crystalline Regions in Polyethylene.

Final rept. D. L. VanderHart, and E. Perez. 1986, 8p Pub. in Macromolecules 19, n7 p1902-1909 1986.

Keywords: *Carbon 13, *Nuclear magnetic resonance, *Crystal defects, *Polyethylene, Polymers, Butenes, Ethylene, Morphology, Separation, Spin lattice relax-ation, Molecular structure, Reprints.

A butene-ethylene linear copolymer (BELC) is shown to give rise to a solid-state 13C spectrum, which con-tains resolvable resonances from vinyl and methyl end groups as well as ethyl side-branches. In contrast to the backbone methylene resonance which shows shifted, separable signals arising from the crystalline and non-crystalline regions, these weak 'defect' reson-ances show corresponding shifts too small to be defin-itive. Therefore, the problem of determining the partitioning of defects between the crystalline and noncrystalline regions of polyethylene must be ap-proached indirectly. The method for identifying the morphological origin of defect signals is based on the concept that 13C CP signals are proportional to the local spin polarization levels, which, in turn, are kept

guite uniform over distances of nearest neighbors because of proton spin diffusion. Thus, defect signal intensities are argued to be proportional to backbone signal intensities within a given morphological region. By isolating the backbone resonances corresponding to the pure crystalline and non-crystalline compo-nents, one thereby isolates the defect resonances.

Final rept.

I. C. Sanchez. 1987, 18p Pub. in Encyclopedia of Physical Science and Technol-ogy, v11 p1-18 1987.

Keywords: *Polymers, *Liquid phases, Thermodynamics, Separation, Agglomeration, Entropy, Reaction ki-netics, Reprints.

A homogeneous polymer solution or mixture under certain thermodynamic conditions will separate into two or more liquid phases that differ in composition. Polymer solutions as a rule are very viscous and the time scales required to effect phase separation are much longer than for analogous mixtures involving only small molecules. In addition to kinetic differences, phase separation in polymer solutions differs qualita-tively in other important respects. In particular, polymer solutions are more susceptible, especially at elevated temperatures, to phase separation. The propensity for phase separation is related to the small entropy of mixing intrinsic to polymer solutions and a concomitant instability with respect to volume fluctuations. In a so-lution very dilute in polymer, phase separation can pro-ceed by the development of a polymer rich phase formed by intermolecular aggregation of the polymer chains. However, intramolecular aggregation will pre-cede the intermolecular aggregation process and cause a partial collapse of a coiling polymer chain. The latter process represents phase separation of isolated polymer chains.

Surface-Interacting Polymers: An Integral Equa-tion and Fractional Calculus Approach. Final rept.

J. F. Douglas. 1989, 12p

Pub. in Macromolecules 22, n4 p1786-1797 Apr 89.

Keywords: *Polymers, *Surface properties, Integral calculus, Friction, Eigenvalues, Reprints.

A method due to Feynman and Kac is used to convert the path integral formulation of surface (variable sur-face dimension) interacting polymers into an equiva-lent integral equation approach. The integral equation for the surface-interacting chain partition function is determined to be the Volterra analogue of the Fred-holm integral equation describing the friction coefficient in the preaveraged Kirkwood-Riseman theory. The approach to surface interacting polymers thus clarifies the close interconnection between the surface interaction and Kirkwood-Riseman theories noted in previous renormalization group calculations. An exact solution of the surface-interacting chain partition func-tion is obtained by using the Riemann-Liouville frac-tional calculus. Finally, the integral equation and fractional calculus methods are combined to explain some of the most conspicuous features of the renormaliza-tion group theory--the mathematical significance of the 'crossover exponent,' infrared fixed point,' nontrivial 'critical exponents,' and the pole structure found in the interaction perturbation theory. The integral equation-fractional calculus formalism is also used to examine a point of 'critical instability' defining the adsorption threshold and to examine the failure of the renormali-zation group and eigenfunction expansion methods to describe scaling functions for values of the interaction near the instability point. The critical instability is read-ily understood on the basis of the Fredholm alterna-tive. tional calculus methods are combined to explain some tive.

Effects of Materiai Characteristics on Fiame Spreading. Final rept.

T. Kashiwagi, A. Omori, and J. Brown. 1989, 11p Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1989, p107-117.

Keywords: *Polystyrene, *Polymethyl methacrylate, *Flame propagation, Molecular weight, Thermal stability, Melt viscosity, Spreading, Polymers.

Effects of initial molecular weight and thermal stability of polymer samples on horizontal flame spreading behavior and spread rate were studied by comparing re-sults between two polystyrene (PS) samples with different initial molecular weights and between two poly(methylmethacrylate) (PMMA) samples with differ-ent thermal stability and initial molecular weights. The flame spread rate of the higher molecular weight PS sample was about 25% larger than that for the low mo-lecular weight PS sample and the flame spread rate of the higher molecular weight PMMA sample was about four times larger than that for the low molecular weight four times larger than that for the low molecular weight does not form molten polymer near the flame front and the flame spreads steadily. However, the sample with low initial molecular weight forms molten polymer and the opposed slow fluid motion of molten polymer along the inclined vaporizing surface against the traveling flame significantly affects flame spreading behavior and its expression. and its rate.

Gaithersburg, MD. Ceramics Div. Recvaluation of Forces Measured Across Thin Polymer Films: Nonequilibrium and Pinning Effects. Final rept.

Final rept.
R. G. Horn, S. J. Hirz, G. Hadziioannou, C. W. Frank, and J. M. Catala. 1989, 8p
Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Chemical Physics 90, n11 p6767-6774, 1 Jun 89.

Keywords: *Polymers, *Fluid friction, *Thin films, *Si-loxanes, *Interfacial tension, Measurement, Surface properties, Drag, Viscosity, Molecular structure, Liquid phases, Reprints, *Pinning.

Forces between molecularly smooth solid surfaces separated by thin films of molten polydimethylsiloxane have been measured. A long-range repulsion reported in earlier work is not an equilibrium force, but can be attributed to viscous drag effects. Consistent with pre-vious results, the viscosity of the film can be modeled by assuming that a layer of polymer molecules is im-mobilized or pinned at each surface for a time longer than the time scale of the measurements. The pinning is a result of entanglement-like effects in the vicinity of a wall.

Gaithersburg, MD. Polymers Div. Shear Effects on the Phase Separation Behaviour of a Polymer Blend in Solution by Small Angle Neutron Scattering.

Final rept. A. I. Nakatani, H. Kim, Y. Takahashi, and C. C. Han.

1989, 4p Pub. in Polymer Communications 30, p143-146 May 80

Keywords: *Polymers, *Blends, *Boundary layer sepa-ration, *Neutron scattering, Polystyrene, Poly butadi-ene, Plastics, Elastomers, Phthalates, Shear rate, Phase, Settling, Reprints.

The phase separation behavior of polystyrene and polybutatiene in dioctyl phthalate has been examined as a function of shear rate by small angle neutrons scat-tering. A couette geometry shear cell was used to apply a shear field to the solution at various temperatures. Differences in the correlation lengths parallel and perpendicular to the flow direction were observed by assuming mean field behavior of the solution. Dramatic decreases in the spinodal temperature were ob-served as a function of shear rate in the direction of flow. The results are consistent with the notion of shear stabilization and decoupling of the flow field in orthogonal directions.

Final rept.

D. Eichinger, D. Kranbuehl, and P. Verdier. 1989, 2p Pub. in Polymer Preprints 30, p45-46 1989.

Keywords: *Polymers, *Computerized simulation, *Lattice parameters, Mathematical models, Monte Carlo method, Coils, Molecular structure, Reprints.

The use of lattice model chains and Monte Carlo techniques has been the basis of numerous studies on the dynamics of random coil polymer chains. The majority of papers have focused on the effect of excluded volume and its associated effects of chain connectivity-entanglement on the dynamic properties of poly-mer chains as a function of chain length and segment density. At the same time, the increasing use of lattice models and the disagreement generated by the predictions have heightened concern about the possibility of anomalous effects due to the lattice constraints and the choices of bead movement rules. In order to study the effects of both the lattice constraints and the bead movement rules on chain dynamics, simulations in which no lattice constraints are present have been carried out. Overall the off lattice results, as did the recent SC, BCC and FCC simulations show with remarkable consistency that excluded volume can cause an additional lengthening of a single chain's longest relaxation time well beyond the value observed for equilibrium properties.

Phase interpenetrating Polymer Networks. Final rept.

B. J. Bauer, R. M. Briber, and C. C. Han. 1987, 2p Pub. in Polymer Preprints 28, n2 p169-170 1987.

Keywords: *Polymers, *Networks, *Neutron scatter-ing, Vinyl ether resins, Polystyrene, Crosslinking, Deu-teration, Phase transformations, Deformation, Stabili-ty, Compressing, Solubility, Reprints, ty, Compressing Synthesis(Chemistry).

Compatible semi-interpenetrating polymer networks (IPN) have been synthesized from linear poly(vinylmethylether) and deuterated poly(styrene) crosslinked with divinyl benzene. The phase separa-tion behavior of the IPNs has been studied by small angle neutron scattering. At the temperature of syn-thesis increasing the PSD crosslink density decreases

the miscibility of the system. However, once a compatible IPN has been formed, the presence of the crosslinks increases the single phase stability as the tem-perature is raised. The influence of deformation on phase separation behavior of the samples was also studied. A sample was deformed to 2.5 times the origiall length by compressing the sample and constrain-ing it to elongate in one direction only. The scattering data indicate that the miscibility is decreased signifi-cantly along the deformation direction when compared to the undeformed sample.

Charging Behavior of Polyethylene and ionomers. Final rept.

M. G. Broadhurst, A. S. DeReggi, G. T. Davis, and F. I. Mopsik. 1987, 6p

Pub. in Proceedings of Conference on Electrical Insulation and Dielectric Phenomena, Gaithersburg, MD., October 18-22, 1987, p313-318.

Keywords: *Charging, *Polyethylene, *Ions, Electric charge, Polymeric films, Plastics, Zinc, Methacrylic acid, Coppolymers, Dielectric properties, Electrical insulation, Temperature.

The charging behaviors of films of polyethylene and zinc ionomers of polyethylene methacrylic acid copoly-mers are reported. Charge distributions across the thickness were measured with the thermal pulse method. Charging variables included applied fields from 0 to 50 V/micro, temperatures from 20 to 80 C, times up to one week and electrode metal. Initial differences in the signs and distributions of charge between nominally similar films were related to differences in the mechanical and thermal histories. At long charging times all films approach a steady state, nearly uniform distribution of negative charge. In the steady state the field due to the space charge was found to be a signifi-cant fraction of the applied charging field. The results are compatible with a model of homopolar injection of the construction contraction and the contraction of the negative charge at the cathode and conduction of the injected charge through the film.

interpretation of the Effects of Retarding Admix-tures on Pastes of C3S, C3A pius Gypsum, and Portiand Cement. Final rept.

H. M. Jennings, H. Taleb, G. Frohnsdorff, and J. R. Clifton. 1986, 5p

Pub. in Proceedings of International Congress on the Chemistry of Cement (8th), Rio de Janeiro, Brazil, September 22-27, 1986, p239-243.

Keywords: *Cements, *Hydration, *Retardants, Port-land cements, Gypsum cements, Coagulation, Setting time, Reprints, Induction period, Tricalcium aluminate, Tricalcium silicate hydration.

From studies of the effects of a range of organic re-tarders on pastes of C3S and of C3A-gypsum, it may be concluded that the two systems have different, possibly independent, influences on the concentrations of retarders in the aqueous phase of a portland cement paste. In the case of C3S, some of the retarder is in-corporated into the layer of product which forms around the grains during the early stages of reaction. It appears that a process which controls the induction period occurs within this C-S-H layer and that the incorporation of a retarder in it somehow slows the proccorporation or a retarder in it somenow slows the proc-ess. It may be that a phase change, or other reaction which ends the induction period by making the layer more permeable, is poisoned by the retarder which is incorporated into the layer. The C3A-gypsum-water system removes a large amount of retarder from the aqueous phase during the early stages of hydration, with the rate of removal falling with time. Delaying re-tarder addition, therefore decreases the amount of retarder addition, therefore, decreases the amount of re-tarder which can be incorporated into a C-S-H layer. Thus these systems affect, in separate ways, a retarder's ability to extend the induction period of a portland cement. There is a delay time after initial mixing, when it is most efficient to add a retarder. It seems probable that, at least for some organic retarders, the effects on the portland cement reaction may be considered to be a combination of separate processes occuring in the C3S-water and C3A-gypsum-water subsystems.

Implications of Computer-Based Simulation Models, Expert Systems, Databases, and Net-works for Cement Research. Final rept.

G. Frohnsdorff, J. Clifton, H. Jennings, P. Brown, L. Struble, and J. Pommershein. 1986, 5p Pub. in Proceedings of International Congress on the Chemistry of Cement (8th), Rio de Janeiro, Brazil, Sep-tember 22-27, 1986, p598-602.

Keywords: *Cements, *Computer networks, *Re-search management, Chemical properties, Concretes, Hydration, Mathematical models, Decision making, Ex-penses, Physical management, *Data bases.

The simulation models, expert systems, and data-bases will complement each other to make possible improved predictions of performance of cements and concretes under diverse conditions, and improved decisions on selection of concrete materials; they will also facilitate identification of research needed to fill gaps in the knowledge base. More sharply focused statements of research needs should help improve decisions on research expenditures and lead to accelerated progress in cement research. Also, cooperative research efforts should become easier to carry out, thereby further contributing to the rate of progress. Ex-amples from the authors' laboratory are used to illustrate some areas where computers are changing the direction of research related to cement hydration. They are: (1) modeling of microstructure development, (2) use of knowledge-based expert systems, and (3) storage, retrieval and transmission of knowledge needed for modeling and for expert system develop-ment. The implications of the growing ease of collec-tion, storage, retrieval, and sharing of knowledge, and the possible use of knowledge, probably by teams, in the development of interconnected computer-based knowledge systems are discussed. It is concluded that these developments provide new opportunities for collaboration among cement researchers. If exploited, these opportunities will accelerate progress in cement and concrete science and technology.

PB90-124306 PC A03/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Building Technology. Adsorption of High-Range Water-Reducing Agents on Selected Portland Cement Phases and Related Materials.

D. R. Rossington, and L. J. Struble. Sep 89, 27p NISTIR-89/4172

Prepared in cooperation with New York State Coll. of Ceramics, Alfred.

Keywords: *Portland cements, *Plasticizers, *Water reducing agents, *Adsorption, Concretes, Silicate ce-ments, Chemical reactions, Silica materials, Slumping, Hydration, Chemical analysis.

The quantities of high-range water-reducing agents (superplasticizer) absorbed from their aqueous solu-tions by portland cement, tricalcium silicate, silica fume, wollastonite, and calcium silicate hydrate gel were determined using an ultraviolet spectrophoto-meter. The two superplasticizers (sulfonated melamine formaldehyde and sulfonated naphthalene formaldehyde) produced generally similar results. Wollas-tonite, a calcium silicate that does not react with water, produced no measurable adsorption of superplasticizer. The adsorption of superplasticizer by tricalcium silicate was similar to the adsorption by portland cement. From these results, it appears that superplas-ticizer is not absorbed by anhydrous silica or anhydrous calcium silicate, but rather by calcium silicate hydrate gel. Additional studies are recommended for im-proving the understanding of the absorption of superplasticizer by portland cement.

Also available from Supt. of Docs. as SN003-003-2925-4. Library of Congress catalog card no. 88-600600. Errata sheet inserted. on National Science Foundation, Washington, DC., Federal Highway Ad-ministration, Washington, DC., and California State Dept. of Transportation, Sacramento.

Keywords: *Bridges(Structures), *Columns(Supports), Cyclic loads, *Concrete structures, Elastic properties, Energy absorption, Failure, Dynamic structural analy-sis, Loading rate, Mechanical tests.

Circular, spirally reinforced concrete bridge columns were subjected to cyclic loading (representing seismic loads) in the laboratory. The test articles were proto-type columns designed in accordance with recent (1983) California Department of Transportation (CAL-TRANS) specifications. Two full-scale columns, each measuring 5 feet (1.52 m) in diameter with aspect ratios (height/width) of 3 and 6, were subjected to slow reversed cyclic lateral load with constant axial load to simulate the gravity weight of the bridge superstruc-ture. Details are presented concerning the design of the special test apparatus required to conduct the project as well as recommendations for future improvements in test procedures. Results from the tests are presented in the form of energy absorption graphs and bar charts, load-displacement hysteresis curves, Iongitudinal and confining steel strains, and curvature profiles. Comparisons of the ultimate moment capac-ities, measured displacement ductilities, plastic hinge lengths, cyclic energy absorption capacity and the fail-ure modes of the full-scale specimens are made with those observed from 1/6-scale model tests.

Prediction of Tensile Behavior of Strain Softened Composites by Flexural Test Methods. Final rept.

T. J. Chuang, and Y. W. Mai. 1987, 11p Contract DE-Al05-80OR20679

Sponsored by Department of Energy, Oak Ridge, TN. Oak Ridge Operations Office. Pub. in Advanced Composite Materials and Structures,

p647-657 1987.

Keywords: *Composite materials, *Tensile properties, *Fiber reinforced concretes, Bend test, Flexural strength, Loads(Forces), Tensile strength, Bending, Fiber composites, Reprints, Polymer concrete, Strain softening.

A simple scheme of predicting tensile properties of a composite exhibiting strain-softening behavior from flexural tests is developed based on establishment of a relationship between bending and tensile properties. It is shown that strain-softening materials give higher bending strengths than tensile strengths, a result con-sistent with experimental observation. Also, given the load-displacement diagram obtained from a flexural test, it is possible to predict the entire tensile response. Bending data of polymer concrete are used to demonstrate the principles.

Pub. in Proceedings of Fall Technical Meeting--Chemi-cal and Physical Processes in Combustion, San Juan, PR., December 15-17, 1986, p52.1-52.4 1987.

Keywords: *Combustion, *Soot, *Aerodynamic forces, Agglomeration, Kinetic theory, Numerical analysis, Particles.

Most studies of the effects of soot particles on combustion phenomena assume that the aerodynamic forces on an individual particle can be calculated as if torces on an individual particle can be calculated as if the particle were a sphere. However, for particles of sizes significantly larger than 10(sup -2) microM, most of the growth comes from agglomoration of individual spheres of approximately this diameter into long irreg-ular chains. These chains of reasonably distinct spheres form the characteristic open shapes of large soot particles which range up to several microns in overall length. Under combustion conditions it is ap-arent that any realistic analysis mutric recognize the parent that any realistic analysis must recognize the

chainlike shapes of the soot particles, and must be based on the kinetic theory of gases. The present study describes an analysis which satisfies these reauirements.

The report contains the results of measurements per-formed on both 0.4 m and 0.6 m diameter pool fires produced by burning a layer of Prudhoe Bay crude oil supported by a thermally deep layer of water. Both steady and vigorous burning deep layer of water. Both water sublayer were observed. The measured energy release rate for steady burning was about 640 kW/sq m. The emission rate, the size distribution, and specific extinction coefficient were measured for the smoke aerosol produced by the fires. Data were also obtained on the structure of the smoke aerosol by electron mi-croscopy and on emission of CO and CO2. Analysis of the crude oil burn residue indicated selected depletion of the short chain alkanes and cycloalkanes when compared to the fresh oil. Mono-ring aromatics includ-ing benzene, toluene, and xylenes present in the fresh crude were absent in the burn residue. Calculations of the induced air flow into a stimulated distribution of 20 fires over a 100 m x 100 m area showed that the maximum inflow velocity near the largest size fire (2.5 m diameter, 3.2 MW) was 1.1 m/s.

Light Scattering from Simulated Smoke Agglomerates.

Final rept.

R. D. Mountain, and G. W. Mulholland. 1988, 6p

Pub. in Langmuir 4, n6 p1321-1326 Nov/Dec 88.

Keywords: *Smoke, *Light scattering, Agglomerates, Computerized simulation, Reprints, Langevin formula, Fractal dimensions.

The computer simulation technique of Langevin dy-namics is used to simulate the growth of smoke ag-glomerates. Clusters consisting of between 10 and 700 primary particles are generated, and the light scat-tering from these clusters is calculated in the Rayleigh-Debye limit. The results of these calculations are then used to infer the concentration, the size, the radius of gyration (R sub g), and the fractal dimension of the agglomerates. The pair distribution function for these agglomerates is shown to be a scaled function of r/R sub g, and the cutoff function describing large separations of particles in the clusters has the form exp(-c(r/R sub g) to the 2.5 power).

Natural Gas/Air Diffusion Flames.

Final rept.

J. P. Gore, G. M. Faeth, D. Evans, and D. B. Pfenning. 1986, 9p Pub. in Fire and Materials 10, n3-4 p161-169 Sep-Dec 86.

Keywords: *Diffusion flames, Mathematical models, Natural gas, Heat flux, Heat transfer, Combustion, Temperature, Thermal measurements, Soot, Reprints, *Flame radiation, *Flame structure, Radiative heat transfer.

Recent data from large-scale turbulent natural gas/air diffusion flames (135-210 MW) were used to evaluate analysis of flame structure and radiation properties.

The conserved-scalar formalism, in conjunction with the laminar flamelet concept, was used to estimate flame structure. The discrete-transfer method, in conjunction with a narrow-band radiations model, was used to predict radiative heat fluxes. The narrow-band model considered the nonluminous gas bands of water vapor, carbon dioxide, methane and carbon monoxide in the 1000 - 6000 nm wavelength range. Structure predictions were encouraging, with discrepancies for mean temperatures comparable to experimental un-certainties (ca. 200 K in the hottest portions of the flames). Radiative heat flux predictions were also reasonably good, e.g., predictions based on mean scalar properties were generally 15% lower than the meas-urements. The findings also suggest that continuum radiation from soot is negligible for these flames.

J. H. Miller, and K. C. Smyth. 1986, 7p Pub. in Preprints of Papers, American Chemical Socie-ty, Division of Fuel Chemistry 31, n2 p105-111 1986.

Keywords: *Molecular structure, *Combustion prod-ucts, *Diffusion flames, *Methane, Aromatic polycyclic hydrocarbons. Concentration(Composition), Public hydrocarbons, Concentration(Composition), Public health, Acetylene, Hydrocarbons, Soot, Benzene, *Air pollution effects(Humans).

The production of intermediate and large hydrocarbon species is common to most combustion systems. These products range in size from acetylene, benzene and polynuclear aromatic hydrocarbons (PAH) to very large soot particles. Radiation from particles is the dominant mode of heat transfer in large fires. In addi-tion, sampled particles often have PAH adsorbed onto them. Many of these molecules are known carcino-gens and their presence on inhalable soot particles poses an obvious long-term health hazard. Despite the important role that such species play in flames and the danger they present as combustion byproducts, the mechanism for their formation is as yet unknown.

National Bureau of Standards (NEL), Gaithersburg, MD. Fire Measurement and Research Div. Methyl Radical Concentrations and Production Rates in a Laminar Methane/Air Diffusion Flame. Final rept. J. H. Miller, and P. M. Taylor. 1987, 11p Pub. in Combustion Science and Technology 52, n1-3

p139-149 1987.

Keywords: *Diffusion flames, *Reaction kinetics, *Combustion products, *Concentration(Composition), Combustion, Mass spectroscopy, Temperature, Veloc-ity, Ionization, Reprints, *Methyl radicals.

Methyl radicals have been observed in a laminar methane/air diffusion flame via an application of the scav-enger probe technique. In these experiments, a quartz microprobe was modified such that iodine vapor was pumped from a storage side arm into the inside tip of the probe. Sampled methyl radicals react quantitatively with iodine to product methyl iodide which was de-tected by an on-line mass spectrometer. These quanti-tative profiles are compared to profiles of stable intermediate hydrocarbons which have been observed in this flame, as well as profile signals which are due to methyl radical ionization by laser radiation. The con-centration of methyl is combined with velocity and temperature data to calculate the net rates of chemical reactions of methyl in the flame. The use of methyl concentration and rate data to estimate the concentra-tions of other reactive species is discussed.

Combustion & Ignition

Pub. in Flammability and Sensitivity of Materials in Oxygen-Enriched Atmospheres, ASTM STP 986, v3 p146-157 1988.

Keywords: *Iron alloys, *Combustion, Ignition, Exothermic reactions, Endothermic reactions, Temperature, Carbon dioxide lasers, Ignition temperature, Oxidation, Reprints.

The development of ignition and subsequent combustion from quasi-stable temperatures was studied for several iron, nickel, and cobalt-based alloys. The quasi-stable temperature was produced by heating a specimen with a continuous wave carbon dioxide laser. Endothermic and exothermic transitions appear to play an important role in the development of thermal to play an important role in the development of thermal runaway, ignition, and combustion. The apparent effect of the endothermic transitions was to accelerate the rate of oxidation of the alloy, which produced abrupt changes in surface temperature as well as increasing the rate of increase in surface temperature. In the final stages of the thermal runaway phase, endothermic and exothermic events forced the alloy surface rapidly into combustion. Total destruction of the specimen followed immediately. The results for the iron-based alloy UNS S66286, which represent the phenomena observed, are presented. A spontaneous igni-tion temperature, enhanced oxidation temperature and ignition temperature for the solid alloy have been defined. Data are presented for the oxygen pressure range of 1.7 to 13.8 MPa.

Final rept.

B. J. McCaffrey, and D. D. Evans. 1988, 7p Pub. in Proceedings of International Symposium on Combustion 21, p25-31 1988.

Keywords: *Diffusion flames, *Methane, *Jet flow, Combustion, Flame propagation, Subsonic flow, Tem-perature, Radiation, Heat transfer.

Methane jet diffusion flames with heat release approaching to 350 MW in both subsonic and supercriti-cal configurations have been studied regarding lift-off height and flame height, absolute flame stability, radi-ative characteristics, and for an evaluation of their propensity for extinguishment using water sprays. Flames from orifices up to 38 mmD could be blown off with sufficient gas pressure. For D = 51 mm the flame could not be blown off even for stagnation pressures to 2300 kPa. The data point at 38 mm allows a more accurate extrapolation, in the manner of Kalghatgi, leading to a predicted critical orifice size of 48 mm for absolute flame stability for CH4. Failure to ignite gas from a 1 mm diameter aperture in a reservoir at 12,000 kPa is consistent with the shape of the upper portion of the locus of the derived stability curve. Wide-band radi-ation measurements coupled with flame temperature measurements confirm small scale absorptivity determinations for use in simple flame radiation models.

Solution for Diffusion-Controlled Reaction in a Vortex Field.

Final rept.

R. G. Rehm, H. R. Baum, and D. W. Lozier. 1987, 4p Pub. in Chemical and Physical Processes in Combus-tion 1986, p3.1-3.4 1987.

Keywords: *Combustion, *Diffusion, *Vortices, Con-vection, Mixing, Mathematical models, Reaction kinet-ics, Turbulence, Navier-Stokes equations, Reprints.

A mathematical model of local, transient, constant-density diffusion-controlled reaction between unmixed species initially occupying adjacent half-spaces is ana-lyzed. An axisymmetric viscous vortex field satisfying the Navier-Stokes equations winds up the interface be-tween the species as they diffuse together and react. A flame-sheet approximation of the rapid reaction is made using Shvab-Zeldovich dependent variables. The model was originally proposed by F. Marble, who performed a local analysis of consumption rates along the flame sheet. The present paper describes a global similarity solution to the problem which is Fourier analyzed in a Lagrangian coordinate system.

Keywords: *Flame propagation, *Fire tests, Air flow, Combustion, Fuels, Flow rate, Gas flow, Ignition, Tur-bulence, Diffusion, Pyrolysis, Numerical analysis, *Flame spread.

The research tasks completed during the reporting period include an experimental study of the effect on the spread of flames of the turbulence intensity of an opposed air flow, and a theoretical analysis of the concurrent spread of flames over thin fuels. Both studies are, in the author's opinion, important contributions in the study of the flame spread process. The results of the experimental study show that the flame spread process is significantly affected by the flow turbulence intensity for flames spreading over both thin and thick fuels. The results of the theoretical analysis, which are in good agreement with previous experimental meas-urements, give detailed information about the flame structure and mechanisms of flame spread.

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. Pub. in Combustion and Flame 76, p197-212 1989.

Keywords: *Diffusion flames, *Jet flow, *Fuel sprays, *Turbulent flow, *Mixing, Two phase flow, Flame propagation, Reprints.

Many different theoretical analyses have been devel-oped to predict the lift-off and blowout behaviors of axisymmetric, turbulent jet diffusion flames. Past theoretical and experimental work is summarized. It is then shown that these flame stability properties can be pre-dicted using the known time-averaged concentration and velocity profiles of the corresponding nonreacting ict flows of the fuels into air. In contrast to past theoret-ical treatments of these processes, it is not necessary to consider interactions of the turbulent concentration and/or velocity fluctuations with the combustion process. Possible physical mechanisms that can lead to such a finding are discussed.

K. C. Smyth, and J. H. Miller. 1987, 13p Pub. in Chemical and Physical Processes in Combus-tion 1986, pC.1-C.13 1987.

Keywords: *Diffusion flames, *Soot, *Hydrocarbons, Combustion, Spectrometers, Chemical reactions, Re-action kinetics, Flame propagation, Combustion products, Reprints.

In the last two years detailed species concentration measurements have been made in hydrocarbon diffu-sion flames for the first time. Far from being hopelessly complex (as many had thought), the interplay between chemical and transport processes can now be unrav-elled. In addition, questions about the chemical growth processes leading to polycyclic aromatic hydrocarbon and soot formation can be addressed. The results thus far reveal striking parallels with premixed flame studies.

Semerijan. 1988, 9p

Pub. in Proceedings on International Symposium of Combustion (21st), p1763-1771 1988.

Keywords: *Combustion products, Infrared spectros-copy, Temperature, Soot, Optical measurement, Particles, Diffusion flames, Gases, Emission, Transmission, *Fourier transform spectrometers, *In-situ combustion.

An infrared emission/transmission (E/T) technique (a method previously used as an in-situ diagnostic for gases and soot using dispersive infrared) has been implemented with a Fourier Transform Infrared (FT-IR) spectrometer and extended to include measurements on particles, as well as gases and soot. The method on particles, as well as gases and soot. The method can measure both the concentration and temperature of each of the phases. The paper presents the applica-tions of FT-IR E/T spectroscopy to gases, soot and particles in reacting flows. Several examples are pre-sented including a coannular laminar diffusion flame. The results for soot temperature and concentration in the flame are in good arrement with measurements. this flame are in good agreement with measurements reported by other investigators.

continuing effort at developing a chemical kinetic data base for the computer simulation of hydrocarbon combustion is described. Because of the complexity of the problem present efforts are directed towards providing data related to the initial stages of methane combustion are considered. The reactions are a key subset of all hydrocarbon combustion processes and the rate expressions form the basis for predictive methods for larger compounds. A key factor in the work is the necessity of interpolating and extrapolating experimental data so as to derive rate constant expressions valid over temperature and pressure ranges of 300-2500K and 10(sup 16)-10(sup21) particles/cu cm, respectively. Unimolecular reactions pose special problems, and the methodology for treating and presenting the data is discussed.

Technical Reference Gulde for FAST (Fire and Smoke Transport) Version 18. Technical note

W. W. Jones, and R. D. Peacock. May 89, 130p NIST/TN-1262

Also available from Supt. of Docs. as SN003-003-02944-1.

Keywords: *Mathematical models, *Computer pro-grams, *Fires, Algorithms, Differential equations, Com-partment analysis, Heating, Radiation, Convection, Conduction, Venting, Smoke, Plumes.

FAST is a model to describe fire growth and smoke transport in multi-compartment structures. The imple-mentation consists of a set of programs to describe the structure to be modeled, run the model and produce usable output. The reference guide describes the equations which constitute the model, data which are used by the model and explains how to operate the model. The physical basis of zone models, their limitations, and development of the predictive equations are described elsewhere and therefore are only summa-rized in the reference guide. The intent of the guide is to provide a complete description of the way the model is structured. In particular the relationship between the equations and the numerical implementation of the equations is laid out. It is intended as a complete description of the parameters and key words available to control various aspects of a simulation. It is hoped that there is sufficient information provided to adapt the model for specialized applications.

Assessment of Theories for the Behavior and Blowout of Lifted Turbulent Jet Diffusion Flames. Final rept.

W. M. Pitts, 1989, 8p

Pub. in Proceedings of International Symposium on Combustion (22nd), Seattle, WA., August 14-19, 1988, p809-816 1989.

Keywords: *Diffusion flames, *Turbulent flow, *Jet flow, Mixing, Combustion stability, Flame photometry.

Many competing theories have been published to describe the characteristics and blowout of lifted turbu-lent jet diffusion flames. The assumptions which are made as to the physical processes responsible for these behaviors vary widely. In the paper these as-sumptions are summarized for each model and com-pared with the actual turbulent behaviors of unignited fuel jets. As part of this discussion, recent unpublished measurements of real-time concentration fluctuations along a line in a turbulent fuel jet are introduced. To the extent possible, each theory is also assessed as to its capabilities to accurately predict experimentally ob-served lift off and blowout behaviors. The conclusion of these analyses is that none of the currently available theories for flame stabilization are satisfactory. Further experimentation is required before the actual physical processes responsible for flame stabilization can be identified and models which are capable of accurate prediction of lift off heights and blowout velocities developed.

Combustion Efficiency, Radiation, CO and Soot Yield from a Variety of Gaseous, Liquid, and Solid Fueled Buoyant Diffusion Flames.

Final rept. B. J. McCaffrey, and M. F. Harkleroad. 1988, 11p Sponsored by Defense Nuclear Agency, Washington, DC., and Department of the Interior, Washington, DC. Pub. in Proceedings of International Symposium on Combustion (22nd), Seattle, WA., August 14-19, 1988, p1251-1261 1989.

Keywords: *Combustion efficiency, *Diffusion flames, *Combustion products, *Radiation, Carbon monoxide, Soot, Thermal measurements, Heptane, Propane, Wood, Crude oil.

The following compilation of data describes combus-tion conditions for the free burning of propane, hep-tane, 3 crude oils, wood and polyurethane cribs in fuel package sizes less than a meter, having heat release rates up to 1/2 MW. Measurements include heat re-lease rate from O2 depletion calorimetry, mass loss rate, incident radiative flux to nearby targets, flame and liquid interface temperatures and overall major gase-ous species yield including soot. The information con-tained herein provides a data base for buoyant diffu-sion flame modelling regarding radiation and elementary chemical characterization. There appears to be a one-to-one correspondence between a fuels radiative behavior and its soot and CO vield. Urethanes and crude oil have significantly higher values for all these parameters as compared to propane, heptane and wood. No correlation was found between these measurements and time-averaged thermocouple readings of temperature.

Final rept. K. G. Kreider. 1986, 6p Contract DE-Al05-83OR21375

Sponsored by Oak Ridge National Lab., TN. Pub. in Jnl. of Vacuum Science and Technology A 4, n6 p2618-2623 Nov/Dec 86.

Keywords: *Thermocouples, *Internal combustion en-gines, *Fabrication, *Measurement, *Temperature, *Coatings, Thin films, Valves, Cylinders, Pistons, Com-bustion chambers, Aluminum oxide, Iron alloys, Sput-tering, Adhesion, Platinum alloys, Aluminum alloys, Chromium alloys, Microscopy, Stainless steels, Electri-cal properties, Reprints.

The feasibility of fabricating thin film thermocouples on internal combustion engine hardware was investigated. The goal was to find a procedure that would be useful for the measurement of the metal temperature of valve, valve seats, combustion chamber surface, cylinder walls, and piston heads during engine operation. The approach pursued was to coat the engine hardware material with an aluminum-containing, oxida-tion-resistance ferrous alloy (FeCrAIY) which forms an oxide layer with good electrical resistance. This thermal oxide was coated with a thin layer of reactively sputtered aluminum oxide and sputtered thin film type S thermocouple legs of platinum and platinum plus rhodium. This project was used to investigate the materials problems related to obtaining good adhesion in the metal metal-oxide-oxide-metal laminate and the electrical insulating properties of the oxide. Thermal oxidation, reactive sputtering of Al2O3 and platinum alloy sputtering were investigated using optical micros-copy, x-ray photoemission spectroscopy (XPS), lam-inar adhesion testing, and the evaluation of high tem-perature electrical properties.

Flow Velocities. Rept. for 1984-86.

J. D. Siegwarth. 1986, 15p

Sponsored by National Aeronautics and Space Administration, Huntsville, AL. George C. Marshall Space Flight Center.

Pub. in Advanced Earth-to-Orbit Propulsion Technology, NASA Conference Publication 2437, v2 p139-153 1986.

Keywords: *Flowmeters, Liquid oxygen, Hydrogen, Reprints, *Space shuttle main engine, Vortex shedding, Cryogenic fluids.

Vortex shedding flowmeter designs developed for this project are capable of measuring water flowrates at velocities above the liquid oxygen (LOX) flow velocities (SSME). These meters have been tested in two sec-tions of actual SSME ducts with high velocity water flow. The results show that a meter vane fitted through a pair of appropriately located standard 11.2 mm diameter instrument ports can be used to measure flow without any upstream conditioning. The vortex shed-ding flowmeter with a 41 mm (1.61 in) bore has under-gone preliminary testing with air at SSME fuel-flow densities. In spite of the much lower sound velocity of air, a strong vortex-generated spectrum line has been observed up to 180 m/s (590 ft/s). Successful meter designs suitable for high-pressure cryogenic flow measurement have been built and tested.

In Situ Fiuorescence Monitoring of the Viscosities of Particie-Filled Polymers In Flow. Annual rept.

A. J. Bur, F. W. Wang, A. Lee, R. E. Lowry, S. C. Roth, and T. K. Trout. Nov 88, 37p NISTIR-88/3892 Grant N00014-86-F-0115 See also FY 87, PB88-157698. Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Laminar flow, *Propellants, *Binders, *Polymers, Fluorometers, *Fluorescence, Monitoring, Spectroscopy, Mixing, Rheology, Viscosity, Polybuta-diene, Aluminum oxide, Measuring instruments, Synthesis(Chemistry).

Work during FY 88 has focused on three areas: the chemical synthesis of a polymeric chromophore; the design of experiments to measure fluorescence anisotropy and non-Newtonian viscosity as a function of shear rate; and, measuring the quality-of-mix of a two component material using a fluorescence microscope. Significant results from these areas of work are: (a) a polymeric chromophore, consisting of anthracene co-valently bonded to polybutadiene, has been synthevalency bolided to polydualene, has been synthe-sized and characterized by gel permeation chromatog-raphy and infrared observations. The number average molecular weight is 12,000 which is above the entan-glement molecular weight for polybutadiene; (b) ex-periments using the polymeric chromophore as a depart in a Newtonian fluid your low redevide weight dopant in a Newtonian fluid, very low molecular weight polybutadiene, show that fluorescence anisotropy cor-relates with the viscosity, i.e., it remains constant as a function of shear rate; and (c) using a fluorescence microscope, the authors have measured optical transmittance and near neighbor distances between particles in a matrix/particle mixing experiment and correlated these data with fluorescence intensity fluctuations.

A five-layer simulation model of OSI protocols is described and applied to predict transport user perform-ance on a local area network (LAN). Emphasis is placed on time-critical applications typical of a small, flexible manufacturing system. The results suggest that, with current technology, OSI protocols can pro-vide 1.5 Mbps throughputs, one-way delays between 6 and 10 ms, and response time between 15 and 25 ms. The results also demonstrate that CSMA/CD is a reasonable access method for time-critical applications on small factory LANS.

The Clock Evaluation and Time Keeping Experiment was the cooperative effort of Applied Research Lab-oratories, the National Bureau of Standards, and the United States Naval Observatory. It was designed to collect a dense Global Positioning System (GPS) data set for evaluating methods of monitoring a ground-based atomic clock with on-site data alone, and of investigating improved methods of time setting and time transfer using GPS data. The experiment collected two-frequency, P-code, pseudorange and Doppler data for five weeks at three sites: Austin, Texas; Boul-der, Colorado; and Washington, D.C. All sites used two-frequency receivers on cesium oscillators. A time history of the cesium oscillators against hydrogen

masters also was recorded at two of the sites. The be-havior of the cesium oscillators was well tracked by the range residuals over the five weeks of the experiment. Residuals of Doppler data were strongly correlated across stations. This implies that time transfer with accuracy approaching 1 ns looks promising over the time period of one satellite pass. With a full GPS constella-tion, continuous use of phase data could significantly improve time transfer via GPS.

Keywords: *Computerized simulation, Semantics, Models, Documentation, *Computer communications, *Protocols, Wise system, Estelle, Software tools.

The Wise software system provides a simulation envi-ronment for Estelle, which is a formal description tech-nique for specifying computer communication proto-cols. The Wise tool is based on a model of Estelle semantics that is implemented as a collection of classes in the object-oriented language Smalltalk. The report describes the model and the Smalltalk implementation in some detail, which is useful background for extending or modifying the Wise tool. A companion report, the User Guide for Wise, describes how to use the tool.

Time and Frequency Div. Comparison of Time Scales Generated with the NBS (National Bureau of Standards) Ensembling Algorithm.

Final rept. F. B. Varnum, D. R. Brown, D. W. Allan, and T. K.

Peppler. 1987, 11p Pub. in Proceedings of Annual Precise Time and Time 192. Interval (PTTI) Applications and Planning Meeting (19th), Redondo Beach, CA., December 1-3, 1987, p13-23.

Keywords: *Time standards, *Algorithms, Time meas-urement, Time measuring instruments, Clocks, Cesium, Weighting functions.

The National Bureau of Standards (NBS), Boulder, Colorado, uses an algorithm which generates UTC(NBS) from its ensemble of clocks and automatically, optimally, and dynamically weights each clock in the ensemble. The same algorithm was used at the Master Control Station (MCS) of the Global Positioning System (GPS) to generate a time scale from a small ensemble of cesium clocks. Time transfer employing the GPS common view technique between NBS (Boul-der) and MCS (Colorado Springs) was used to evalu-ate the stability of the MCS ensemble relative to UTC(NBS). The results demonstrate the power of the NBS algorithm in providing a stable time scale from a small ensemble of clocks. The resulting scale is, in principle, more stable than the best clock and a poor clock need not degrade the ensemble.

PB89-185722 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Time and Frequency Div. Millisecond Pulsar Rivals Best Atomic Clock Stabil-

ity.

Final rept.

D. W. Allan. 1987, 10p See also PB88-138821. Pub. in Proceedings of Annual Symposium on Fre-quency Control (41st), Philadelphia, PA., May 27-29, 1987, p2-11.

Keywords: *Atomic clocks, *Stability, Comparison, Orbits, Time measuring instruments, Signal to noise ratios, Dispersions, Ephemerides, Interplanetary medium, Interstellar matter, Gravity waves, *Millisecond pulsar.

The measurement time residuals between the millisecond pulsar PSR 1937+21 and atomic time have been significantly reduced. Analysis of data for the most recent 865 period indicates a fractional frequency stability (square root of the modified Allan variance) of less than 2 x 10 to the (-14) power for integration times of about 1/3 year. Analysis of the measurements taken in two frequency bands revealed a random walk behavior for dispersion along the 12,000 to 15,000 light year path from the pulsar to the earth. The random walk accumulates to about 1,000 nanose-conds (ns) over 265 days. The final residuals are nominally characterized by a white phase noise at a level of 369 ns. Following improvement of the signal-to-noise ratio, evidence was found for a residual modulation. Possible explanations for the modulation include: a binary companion to the pulsar with approximate period(s) of 120 days and with a mass of the order of 1 10 to the (0) power that of the pulsar irregular man x 10 to the (-9) power that of the pulsar; irregular mag-netic drag in the pulsar; unaccounted delay variations in the interstellar medium; modeling errors in the earth's ephemeris; reference atomic clock variations in excess of what are estimated; or gravity waves. For gravity waves, the amplitude of the length modulation would be about 5 parts in 10 to the (19) power. Further study is needed to determine which is the most probable explanation.

Pub. in Proceedings of Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (20th), Vienna, VA., November 29-December 1, 1988, p101-110.

Keywords: *Calibrating, *Time standards, *Frequency standards, Japan, Telecommunication, Time measure ment, Frequency measurement, Receivers, Synchronism, *Global positioning systems, Time transfer.

With the development of common view time compari-sons using Global Positioning System (GPS) satellites the Japanese time and frequency standards laborato-ries have been able to contribute with more weight to the international unification of time under the coordina-tion of the Bureau International de Poids et Measures. During the period from June 1 through June 11, 1988, the differential delays of time transfer receivers of the GPS were calibrated at three different laboratories in Japan, linking them for absolute time transfer with previously calibrated labs of Europe and North America. The differential delay between two receivers was first calibrated at the National Institute of Standards and Technology (NIST)(formerly the National Bureau of Standards) in Boulder, Colorado, USA. Then one of Standards) in Boulder, Colorado, USA. Then one of these receivers was carried to each of the three lab-oratories: the Tokyo Astronomical Observatory, the Communications Research Laboratory, both in Tokyo, and the National Research Laboratory of Metrology in Tsukuba City. At each lab data was taken comparing receivers. Finally the traveling receiver was taken back to NIST for closure of the calibration. On the way back the GPS receiver at the WWVH radio station of NIST in Hawaii was also calibrated. The results of the calibra-Hawaii was also calibrated. The results of the calibra-tion trip are reported, along with some interesting prob-lems that developed concerning the technique.

gineers) Transactions on Instrumentation and Meas-urement 38, n2 p624-630 Apr 89.

Keywords: *Atomic clocks, *Stability, Time standards, Frequency meters, Time measuring instruments, Fre-quency standards, Time measurement, Chronometers, Timing devices, Gravitational fields, Reprints.

There is an increased need for better clock performance than is currently available. Past work has focused on developing better clocks to meet the increased need. Significant gains have been and can be obtained through the algorithms which optimize the clock readings and through international comparisons now avail-able via satellite. Algorithms for processing are more important than the proportionate attention generally given them. In fact, to date, one of the main ways to investigate some of the long-term performance aspects of the millisecond pulsar, PSR 1937 + 21, is by using such optimization algorithms. Since there are indications in the pulsar data of variations which could be explained as arising from the influence of gravita-tional waves, these long-term stability studies take on a new importance. Improved long-term stability of earth-bound clock systems will significantly assist the study of the incredibly stable spin rates of these neutron stars.

J. L. Hieronymus, and W. J. Majurski. 1986, 4p Pub. in Proceedings of ICASSP, IEEE (Institute of Electrical and Electronics Engineers) International Conference on Acoustics, Speech and Signal Processing, Tokyo, Japan, April 7-11, 1986, p2787-2790.

Keywords: *Speech recognition, Speech articulation, Vowels, Formants.

Seven English monothong vowels were studied in con-tinuous sentences. The study determined what methods are likely to be successful in compensating for coarticulation in all vowel and consonantal contexts. A method by Kuwahara is examined in detail. The Kuwahara compensation improves the separation of the vowel regions in a space composed of the first and second formant. Important issues are where to meas-ure the formant target frequencies, how to obtain good formant tracks, measuring speaking rate accurately, and how to label vowels accurately.

ance Estimates. G. E. Lyon. Mar 89, 25p NISTIR-89/4063

G. E. Lyon, Mar 89, 25p NISTIR-89/4063 Sponsored by Defense Advanced Research Projects Agency, Arlington, VA., Bureau of Export Administra-tion, Washington, DC, and Department of Energy, Washington, DC.

Keywords: Computer systems hardware, Computer components, *Computer architecture, *Computer performance evaluation, Computer applications.

Even the coarsest performance estimators for a modern computer must account for architectural dependencies and variabilities. For example, average execution rate is rather sensitive to the match between machine and application workload. Computing can be viewed as computational components that are loaded by demands of an application, or alternately, as an apbication workload partitioned by system components. Models based upon these simple perspectives help organize simple performance measurements. Several examples demonstrate strengths of a straight-forward flexible partitioning scheme based upon tree and graphs. Quite explicit, the graphs promote a more critical view of measurements and support multiple interpretations.

PC A03/ME A01 National Inst. of Standards and Technology (NCSL), Gaithersburg, MD. Advanced Systems Div. Architecturally-Focused Benchmarks with a Com-

munication Example. G. E. Lyon, and R. D. Snelick. Mar 89, 39p NISTIR-89/4053

Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Performance evaluation, Performance tests, Measurement, Computer systems hardware, Comparison, *Computer architecture, Computer communications, Parallel processing, Vector processing.

The discussion first sketches a framework of modalities for an architecturally-focused performance evaluation. The result is a hybrid of benchmarking and model-ing: elements of capacity-and-use trees (CUTs) are ex-plored as a simplified notation. There follows a description of the structure and preliminary results from a practical benchmark set for process communication. Argument is given that performance within a class of architecture is often dominated by unavoidable com-petitions within distinct machine modalities, such as scalar-vector. A k-alternative, forced choice defines a dimension of comparison equally well in SI- or MIMD architectures. Performance estimators are interpolations between values from basis benchmarks for modes; ideally in the two-alternative forced choice only two benchmark measurements are needed. Re-finements in basis benchmarks support CUT-based estimates of performance.

Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Matrices(Mathematics), *Multiplication, Algorithms, *Multiprocessors, Distributed computer systems, Computer networks.

The report considers the problem of efficiently multiplying matrices on distributed-memory, messagepassing computers. Block decomposition and wavefront computing are employed to yield a communica-tion-efficient solution. It also explores interconnections between distributed data structures, physical networks of nodes and virtual networks of nodes and processes. The notion of wavefront computing is extended to include pipelining of data between nodes of networks of processes as well as physical networks of nodes. Algorithms are developed in layers to facilitate porting between topologies and programming environments. The authors show how different topologies can be em-ployed in a single application. A mathematical characterization of data-routing for efficient matrix multiplication on distributed-memory machines is developed, which exhibits a wavefront version of the Dekel/Nassimi/Sahni algorithm as a special case. The authors discuss the notion of granularity in this context and use it to distinguish between algorithms on grounds of communication complexity.

*Computer software management, *Computer pro-gram reliability, Reusable software, Computer soft-ware maintenance, Computer program verification, Software tools, Life cycles.

The guide provides an overview of software configuration management, a support function dedicated to making both the technical and managerial software ac-tivities more effective. It addresses the problems associated with managing software changes; the importance of implementing software configuration manage-ment (SCM) procedures early; and the application of those procedures throughout the software lifecycle. A brief summary of SCM tools and their applicable func-tionality is provided. SCM extends to more than just the code (source, relocatable, executable) and docu-mentation (e.g., system and software requirements and design specifications). It also covers control files, test data, test suites, support tools, and other compo-nents used to develop and maintain the software product.

Application of Formal Description Techniques to Conformance Evaluation. Final rept.

J. P. Favreau, R. J. Linn, and P. Gaudette. 1988, 15p Pub. in Proceedings of International Conference on Formal Description Techniques (1st), Stirling, Scotland, September 6-9, 1988, p295-309.

Keywords: Tests, Systems engineering, *Protocols, *Communication networks, Software tools, Estelle, Abstract Syntax Notation One, Electronic mail

Formal description techniques, and software tools based on them, are applied successfully in the development of test systems for OSI protocols. The test system architecture uses reference implementations augmented with test features in a manner that facilitates multi-layer testing and minimizes the effort necessary to develop test cases. The designs for test sys-tems in general and for a specific gateway are de-scribed, focusing on the use of Estelle and ASN.1.

Object-Orlented Model for Estelle.

Final rept.

R. Sijelmassi, and P. Gaudette. 1988, 15p See also PB89-196190.

Pub. in Proceedings of International Conference on Formal Description Techniques (1st), Stirling, Scot-land, September 6-9, 1988, p91-105.

Keywords: Models, *Protocols, *Communication net-works, Protocol(Computers), Estelle, Translators, Dis-tributed computer systems, Finite state machines.

Estelle is a formal description technique for specifying OSI communication protocols. An object-oriented model for Estelle is presented that is concrete enough to allow execution but abstract enough to remain concise and workable. A synchronization protocol cap-tures the subtleties of parallelism in the semantics of Estelle and allows module instances to execute as if they were asynchronous. The remainder of the basic model defines objects that are very close to the enti-ties defined by Estelle semantics. The model consti-tutes an excellent specification of the output of a translator. It has been extended to allow appropriate obser-vation and user control of the objects that simulate an Estelle formal description of a protocol. The combinaprovides a powerful tool for specifying, studying, and debugging distributed systems.

Also available from Supt. of Docs. as SN003-003-02955-6. Library of Congress catalog card no. 89-600750

Keywords: *Computer security, *Instructions, Computer software management, Computer networks, Contin-gency, Copyrights, Vulnerability, Trojan horses, Per-sonal computers, *Computer viruses.

The document contains guidance for managing the threats of computer viruses and related software and unauthorized use. The document emphasizes that organizations cannot effectively reduce their vulnerabili-ties to viruses and related threats unless the organiza-tion commits to a virus prevention program, involving the mutual cooperation of all computer managers and users. The guidance is aimed at helping managers pre-vent and deter virus attacks, detect when they occur or are likely to occur, and then to contain and recover from any damage caused by the attack. The document contains an overview of viruses and related software, and several chapters of guidance for managers of multi-user computers, managers and users of personal computers, managers of wide and local area networks including personal computer networks, and managers of end-user groups.

Software Verification and Validation: Its Role in Computer Assurance and Its Relationship with Software Project Management Standards.

Special pub. Jul 88-May 89. D. R. Wallace, and R. U. Fujii. Sep 89, 40p NIST/SP-500/165

Also available from Supt. of Docs. as SN003-003-02959-9. Library of Congress catalog card no. 89-600754. Prepared in cooperation with Logicon, Inc., San Pedro, CA.

Keywords: *Computer software management, *Software engineering, Computer software maintenance, Computer program verification, Computer security, Computer performance evaluation, Software validation.

The report describes how the software verification and validation methodology and V&V standards provide a strong framework for developing quality software. First, the report describes software V&V, its objectives, recommended tasks, and guidance for selecting tech-niques to perform V&V, it explains the difference between V&V and quality assurance, development system engineering, and user organization functions. The report explains that V&V produces maximum benefits when it is performed independent of development functions and provides a brief discussion of how V&V benefits change when embedded in quality assurance, development systems engineering, and user organizations. An analysis of two studies of V&V's cost-effec-tiveness concludes that cost benefits of V&V's early error detection outweigh the cost of performing V&V.

Final rept. E. J. Vanzura. 1988, 18p Pub. in Proceedings of Conference on HP Technical Computer Users, Orlando, FL., August 7-12, 1988, p1-18.

*Subroutines, Keywords: Operating systems(Computers), Computer programming, "Basic programming language, *Fortran programming lan-guage, Pascal programming language.

CSUBs are compiled subprograms created using the Pascal operating system and which run in the BASIC environment. A new technique in which programs writ-ten in FORTRAN can be turned into CSUBs is described. Thus, powerful, well-documented FORTRAN routines become accessible to the BASIC-language programmer. I/O and variable interfacing are discussed, and a comprehensive example is provided.

T. R. Kramer. 1986, 27p

Pub. in Jnl. of Autom. Reasoning 2, n2 p127-153 1986.

which is required to support the tiling scheme.

Keywords: *Search structuring, *Searching, *Artificial intelligence, Selection, Tables(Data), Objectives, Operators(Mathematics), Reprints.

In one approach to the artificial intelligence problem of searching, the current situation is represented by a state table which gives the set of current conditions. Changes in the situation are brought about by opera-tors which create a new state by adding some condi-tions to the table and deleting others. The search pro-ceeds by applying operators one after another to the current state until the current state is identical to the goal state. The paper describes a technique for help-ing select operators. The technique is based on the fact that, during a search in which a partial sequence of operators has been selected, if the last operator or two are known, only a limited group of operators will be sensible to try next, and this group may be selected without prior knowledge of operators most recently tried. The output of the technique is a table that gives, for each feasible partial sequence of one or two operators, a list of operators that might be tried next.

Acoustic Detection

900.678

PB89-173488 Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Automated Production Technology Div. Higher-Order Crossings: A New Acoustic Emission Signai Processing Method.

Final rept.

N. N. Hsu, and D. G. Eitzen. 1988, 8p Pub. in Proceedings of International Acoustic Emission Symposium (9th), Kobe, Japan, November 14-17, p59-66 1988.

Keywords: Acoustic measurement, Signal processing, Spectrum analysis, Data reduction, Data smoothing, Fatigue tests, Crack propagation, *High order cross-ing, *Acoustic emission, Failure analysis, Stress waves.

A new signal processing technique has been developed called the higher-order crossings (HOC) technique. It is intuitively simple yet efficient and useful in many spectral analysis and data reduction applica-tions. Some feasibility studies of the adaptation of HOC for acoustic emission (AE) signal discrimination are reported. First introduced are the mathematical concept and the physical significance of HOC, and then the experience on using the HOC technique to classify some simulated AE, AE during fatigue testing of pre-cracked aluminum specimens, impact-echo sig-nals, and signals from machine tool monitoring is reported. It was found that the first few order crossings are sufficient to distinguish different types of AE, but specific pattern recognition schemes must be devised based on specific applications. To encourage others to experiment with these techniques, a scheme of modifying a conventional multi-channel AE system to do real time AE signal processing using higher-order crossings is presented.

900,679 PB89-211809

Not available NTIS National Bureau of Standards (NEL), Gaithersburg, MD. Automated Production Technology Div. Ultrasonic Sensor for Measuring Surface Rough-

ness.

Ress. Final rept. G. V. Blessing, and D. G. Eitzen. 1988, 9p Pub. in Proceedings of SPiE (Society of Photo-Optical Instrumentation Engineers): Surface Measurement

and Characterization, Hamburg, FRG, September 19-21, 1988, v1009 p281-289.

Keywords: *Ultrasonic frequencies, *Detectors, *Surface roughness, Acoustics, Sound ranging, Surface properties, Topography, Metal plates, Measurement, Process control, Quality control.

Ultrasonic reflectance/scattering measurements have been made on metal samples possessing a large range of surface roughness values. The root-mean-square roughnesses R(q) ranged from 0.3 to nearly 40 incrometers on the mostly periodic surfaces. The echo amplitude from short incident pulses of ultra-sound in the frequency range of 1 to 30 MHz was used, in the manner of a comparator, to measure relative roughnesses with an area-averaging approach defined by the ultrasonic beam spot size. Ultrasonic wave-lengths ranged from about 50 to 300 micrometers at from 0.2 to 5 mm in diameter. Both air and fluid coupling techniques were used between the sensor (transducer) and surface, on both static and rapidly (in excess of 5 m/sec surface speed) moving parts. On static surfaces, a resolution of better than 1.0 micrometers R(q) was achieved at the higher ultrasonic frequencies. By focusing the ultrasonic beam at 30 MHz, a profilometry capability was demonstrated on a 1 micrometer R(q) sinusoidal specimen of 800 micrometers wavelength.

Shielding effectiveness relates to the ability of a material to reduce the transmission of propagating fields in order to electromagnetically isolate one region from another. Because the shielding capability of a complex material is difficult to predict, it often must be measured. A number of approaches to simulating a far-field source are studied, including the use of coaxial trans-mission-line holders and a time-domain system. In each case the authors consider the system frequency range, test sample requirements, test field type, dynamic range, measurement time required, and analytical background, and present data taken on a common set of materials.

Photonic Electric Field Probe for Frequencies up to 2 GHz.

Final rept.

K. Masterson. 1987, 5p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), High Bandwidth Analog Applications of Photonics, September 23-24, 1986, Cambridge, MA., v720 p100-104 1987.

Keywords: *Electric fields, Electromagnetic radiation, Frequencies, Birefringence, Electrooptics, Measurement, Electromagnetic properties, Optical properties, Photonic probes.

A photonic electric field probe using the Pockel's effect in bulk LINbO3 is described. It was used to measure electromagnetic fields from 10 to 100 V/m. The observed frequency response was flat up to 1.6 GHz and extended beyond 2 GHz. Over the majority of the frequency range field strengths down to about 6 V/ m would be detectable above the noise floor when using a 10 kHz detection bandwidth. Present experimental results indicate a linear dynamic range for the probe of approximately 30 dB. Increasing the optical carrier power and lowering the system noise floor is expected to improve the dynamic range to above 50 dB

Keywords: *Electric fields, *Electron probes, Field strength, Measurement, Electromagnetic fields, De-tectors, Isotropy, Field emission, Fiber optics, Elec-trooptics, Crystals, Dipoles.

An isotropic, photonic electric-field meter (PEFM-15) having 15 cm resistively tapered dipole elements and Pockels effect electro-optic modulators is used to measure electric fields of 10 to 100 V/m from 10 kHz to beyond 1 GHz. The probe's frequency response is flat within +1-dB from 30 kHz to 100 MHz except for a region between 1 and 10 MHz where acoustic resonances occur in the LiNbO3 modulator crystals. For a 3 kHz detection bandwidth, the noise equivalent field is approximately 7 V/m, thereby giving a calculated linear dynamic range of 68 dB in field power density. The probe's isotropic response is flat within +1 dB, and the response of each dipole closely follows the curve predicted by theory. An optical-beam switch that connects the individual dipoles to a laser source and optical receiver is also described.

Keywords: *Subsurface investigations, *Tunnel detection, Magnetic dipoles, Remote sensing, Clutter, Electric dipoles, Born approximation.

Clutter models for subsurface electromagnetic applications are discussed with emphasis on tunnel detection applications. Random medium models are more versatile and require less detailed information than deterministic models. The Born approximation is used to derive expressions for the incoherent field, and electric and magnetic dipoles are treated in detail. When random inhomogeneities are located in the near field of the dipole source, an electric dipole radiates a larger incoherent field than a magnetic dipole because of its larger reactive electric field.

Standard Format for the Exchange of Fingerprint information.

Final rept.

R. T. Moore, and R. M. McCabe. 1986, 4p

Pub. in Proceedings of Carnahan Conference on Security Technology, Lexington, KY., May 14-16, 1986, p13-16.

Keywords: *Identification systems, *Standards, Data, Images, *Fingerprints, Format.

There are a number of automatic or semiautomatic identification systems which may be used to extract information from fingerprint images. The information extracted generally relates to discrete features, such as minutiae (ridge endings and bifurcations), cores, deltas, and ridge features, such as tracings or counts, and to their spatial and/or topological relationships with each other. The details of these features and the way that information about them is measured, de-scribed, and presented varies from system to system. As a consequence, fingerprint information read on one system cannot be searched directly against the files of fingerprint information read on another system. To cope with this problem, an American National Standard is being developed to define a format that the fingerprint information can be converted into, or from, to provide a mechanism for the exchange of data. This requires that each system have only a single set of data conversion programs to exchange data with any other system rather than a separate set of data conversion routines for each different system. An overview of the standard and the development process is presented.

Calibrating Antenna Standards Using CW and Pulsed-CW Measurements and the Planar Near-Field Method.

Final rept.

Pub. in Proceedings of Annual Antenna Measurement Techniques Association (10th), Atlanta, GA., Septem-ber 12-16, 1988, p13-21-13-29.

Keywords: *Antennas, *Continuous radiation, Coher-ent radiation, Near fields, Measurements, Gain, Cali-brating, Cross polarization, Sidelobes.

The National Bureau of Standards (NBS) has calibrated an antenna to be used to evaluate both a near-field range and a compact range. These ranges are to be used to measure an electronically-steerable antenna which transmits only pulsed-CW signals. The antenna calibrated by NBS was chosen to be similar in physical size and frequency of operation to the array and was also calibrated with the antenna transmitting pulsed-CW. The calibration included determining the effects of using different power levels at the mixer, the accuracy of the receiver in making the amplitude and phase measurements, and the effective dynamic range of the receiver. Comparisons were made with calibration results obtained for the antenna transmitting CW and for the antenna receiving CW. The parameters compared include gain, sidelobe and cross polarization levels. The measurements are described and some results are presented.

Pub. in Proceedings of Annual Antenna Measurement Techniques Association (10th), Atlanta, GA., September 12-16, 1988, p13-13-17.

Keywords: *Antennas, *Millimeter waves, *Error anal-ysis, Amplification, Insertion loss, Extremely high fre-quencies, Polarized electromagnetic radiation, Power loss, Waveguides, Near fields, Radiation patterns.

For the past two years the National Bureau of Standards (NBS) has been developing the capability to perform on-axis gain and polarization measurements at millimeter wave frequencies from 33-65 GHz. The paper discusses the error analysis of antenna meas-urements at these frequencies. The largest source of error is insertion loss measurements. In order to make accurate insertion loss measurements, flanges on antennas need to be flat and perpendicular to the wave-guide axis to within approximately 0.001 cm (0.0005 in). In addition, waveguide screws need to be tightened with a device that supplies constant torque. NBS is continuing development of its measurement capabili-tica including measuring proficients. ties, including measuring probe correction coefficients required in planar near-field processing, in order to provide accurate pattern measurements at these frequencies.

Keywords: *Antennas, *Electrostatic probes, *Electromagnetic fields, Correction, Taylors series, Integral equations, Analysis(Mathematics), Electromagnetic radiation, Field strength, Measurement, *Position errors.

The authors have developed a general theoretical procedure to take into account probe position errors when planar near-field data are transformed to the far field. If the probe position errors are known, measured data can be represented as a Taylor series, whose terms contain the error function and the ideal spectrum of the antenna. Then the ideal spectrum can be solved in terms of the measured data and the measured position errors by inverting the Taylor series. This is complicat-ed by the fact that the derivatives of the ideal data are unknown; that is, they can only be approximated by the derivatives of the measured data. This introduces additional computational errors, which must be properly taken into account. The authors have shown that the first few terms of the inversion can be easily obtained by simple approximation techniques, where the order of the approximation is easily specified. A more general solution can also be written by formulating the prob-lem as an integral equation and using the method of successive approximations to obtain a general solution. An important criterion that emerges from the condition of convergence of the solution to the integral equation is that the total averaged position error must be less than some fraction of the sampling criterion for the antenna under test.

Spherical-Wave Source-Scattering Matrix Analysis of Coupled Antennas: A General System Two-Port Solution.

Final rept.

R. L. Lewis. 1987, 6p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Antennas and Propagation AP-35, n12 p1375-1380 Dec 87.

Keywords: *Coupled antennas, *S matrix theory, Spherical waves, Elastic waves, Wave propagation, Backscattering, Waveguides, Reprints.

Expressions are given for the coupling between two antennas in terms of each antenna's spherical-wave source-scattering matrix. A comparison with the 'classical' scattering matrix representation is given in sufficient detail to permit conversion back and forth between the source-scattering matrix and the classical scattering matrix. Expressions for the transmission formulas, showing two different expressions corresponding to reversing the direction of propagation are given. However, if both antennas are reciprocal with equal characteristic waveguide impedances, then the twoport scattering matrix is a symmetric matrix.

Accurate Determination of Planar Near-Field Cor-rection Parameters for Linearly Polarized Probes. Final rept. A. G. Repjar, A. C. Newell, and M. H. Francis. 1988,

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Antennas and Propagation 36, n6 p855-868 Jun 88.

Keywords: *Antenna radiation patterns, *Electromag-netic fields, *Electrostatic probes, Plane waves, Far field, Correction, Accuracy, Measurements, Reprints.

The receiving patterns (both amplitude and phase) of two probes must be known and utilized to determine accurately the complete far field of an antenna under test from near-field measurements. The process is called probe correction. When the antenna to be tested is nominally linearly polarized, the measure-ments are more accurate and efficient if nominally linearly polarized probes are used. Further efficiency is obtained if only one probe which is dual polarized is used instead of two probes to allow for simultaneous measurements of both components. It should be noted, however, that a single-port probe can be rotat-ed by 90 deg (in effect, the second probe) to obtain the second component. A procedure used by the National Bureau of Standards (NBS) for accurately determining the plane-wave receiving parameters of both single-and dual-port linearly polarized probes is described. Examples are presented, and the effect of these probe receiving characteristics in the calculation of the pa-rameters for the antenna under test is demonstrated using the required planar near-field theory.

Pub. in International Jnl. of Infrared and Millimeter Waves 9, n2 p101-133 1988.

Keywords: *Biconical antennas, Elementary excitations, Antenna couplers, Gain, Electromagnetic noise, Reprints, *Quasiparticle mixers, Microstrip transmission lines.

The authors have designed and evaluated planar litho-graphed W-band SIS mixers with bow-tie antennas and several different RF coupling structures. Both Pb-In-Au/Pb-Bi and Nb/Pb-In-Au junctions were used, each with omega times (R sub N) times C>>1. Single junctions and series arrays of five junctions directly at-tached to bow-tie antennas with no additional coupling structure gave poor performance, as expected. Single junctions with inductive microstrips and five-junction arrays with parallel wire inductors gave good coupling over bandwidths of approximately 5 and 25% respec-tively. Good agreement was found between design calculations based on a simple equivalent circuit and measurements of the frequency dependence of the mixer gain. When good coupling was achieved, typical values of mixer gain G sub M(DSB) approximately equal to 0 dB, noise T sub M(DSB) approximately equal to 150 K, and receiver noise approximately 200 K were observed.

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. Pub. in International Jnl. of Infrared and Millimeter Waves 9, n4 p303-320 1988.

Keywords: *Biconical antennas, *Spectrometers, *Mixing circuits, *Tuners, Optical measuring instru-ments, Antenna couplers, Lithography, Reprints, Fast fourier transforms.

Planar lithographed guasioptical mixers can profit from the use of integrated tuning elements to improve the coupling between the antenna and the SIS mixer junctions. The authors have used a Fourier transform spec-trometer with an Hg-arc lamp source as an RF sweep-er to measure the frequency response of such inte-grated tuning elements. The SIS junction connected to the tuning element served as the direct detector for the spectrometer. This relatively quick, easy experiment can give enough information over a broad range of millimeter and submillimeter wavelengths to test both design concepts and success in fabrication. One type of tuning element, an inductive wire connected in parallel with a series array of 5 SIS junctions across the terminals of a bow-tie antenna, shows a resonant response peak at 100 GHz with a 30% bandwidth.

R. L. Lewis, and A. C. Newell. 1988, 12p See also PB86-181963. Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Antennas and Propagation 36, n6 p890-901 Jun 88.

Keywords: *Microwave antennas, Electromagnetic fields, Plane waves, Traveling waves, Wave diffraction, *Fresnel integrals, Power density, Fast fourier transforms.

An efficient and reliable method has been developed for computing and exhibiting Fresnel-region fields radiated by microwave antennas using plane-wave scat-tering matrix analysis. That is, near fields are calculated by numerically integrating the complex far-field an-tenna pattern. The predicted near-fields are exhibited as relative power-density contours lying in a longitudi-nal plane bisecting the antenna's aperture. The crux of the analysis consists of handling a numerical instability which arises from integrating discrete data. A criterion is developed for excluding highly oscillatory regions of the integrand. In turn, this leads to restricting the output domain where the near field computations are valid. With the numerical instability problem resolved valid. With the numerical instability problem resolved, the fast Fourier transform is used for efficient numeri-cal integration. The predicted near fields have been compared against both measured and theoretical data, confirming that the authors' near-field computa-tion algorithm is capable of extremely high accuracy.

Effect of Random Errors In Planar Near-Field Measurement.

Pinal rept. A. C. Newell, and C. F. Stubenrauch. 1988, 5p See also PB87-233896. Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Antennas and Propagation 36, n6 p769-773 Jun 88.

Keywords: *Antenna radiation patterns, *Electromag-netic fields, *Signal to noise ratio, Far field, Attenu-ation, Electromagnetic interference, Electromagnetic noise, Transmitter characteristics, Random error, Reprints.

Expressions which relate the signal-to-noise ratio in the near field to the signal-to-noise ratio in the far field are developed. The expressions are then used to pre-dict errors in far-field patterns obtained from near-field data. A technique to measure the noise in the far-field pattern is also given.

Experimental Study of Interpanel Interactions at 3.3 GHz.

Final rept. . A. Muth. 1987, 5p

Sponsored by Rome Air Development Center, Hans-com AFB, MA. Electromagnetics Directorate. Pub. in Proceedings of Antenna Measurement Tech-nique Association (AMTA) Annual Meeting and Sym-posium (9th), Seattle, WA., September 28-October 2, 1997 - 25 - 20 1987. p25-29.

Keywords: *Antenna arrays, *Electric fields, *Electro-magnetic scattering, Reflections, Strip transmission lines, Backscattering, Scattering loss, Deflection, Electromagnetic radiation.

A general theoretical approach is formulated to de-scribe the complex electromagnetic environment of an N-element array. The theory reveals the element-to-element interactions and multiple reflections within the element interactions and multiple renections within the array. To experimentally verify some features of the theory, measurements on experimental array panels in various configurations were made. The array panels consisted of 256 microstrip radiating elements. In each of the configurations both the near-field and portside signals were measured to study the interactions be-tween these panels. In particular, the effects of open-circuited array panels on the radiation pattern of a circuited array panels on the radiation pattern of a single panel are observed both in the near field and in the far field. It is found that internal scattering is the main mechanism of interaction between panels, rather than reradiation of signals received from adjacent panels. The effects of scattering are observable at the -50 dB level.

The book chapter is one of approximately forty chap-ters which will appear in the handbook. It is in the sec-tion on Applications, and the other handbook sections are Fundamentals, Antenna Theory, and Related Topics. The chapter discusses a number of antennas which are used for subsurface probing of the earth. The two most commonly used antennas are grounded wires and loops, and they are covered in detail for both time-harmonic and transient excitations. Emphasis is placed on the extremely low frequency (ELF) portion of the spectrum where it is possible to probe the earth to depths of several hundred meters.

unique, single-element antenna measurement scheme that can simultaneously measure the electric, scheme that can simultaneously measure the electric, magnetic, and time-dependent Poynting vectors of electromagnetic (EM) fields is described. The electric and magnetic responses of the antenna sensor are separated by a 0 degree/180 degree hybrid junction. The resulting two radio frequency (RF) voltages, along with relative phase and frequency information, are transmitted to a remotely located vector analyzer by a pair of well-matched fiber optic downlinks. The remote receiver measures and displays the electric dipole response, the magnetic loop response, and the time phase difference between the two. The information is sufficient to determine the time-dependent Poynting vector. Both a theoretical analysis and a discussion of experimental measurements performed, which de-scribe the capabilities and performance of a working prototype of the antenna measurement scheme, are presented. The results demonstrate that a three-axis (isotropic) version of the system could be used to measure the near fields of EM sources, as well as to completely describe the resultant flow of energy.

PB90-128208 Not available NTIS National Inst. of Standards and Technology (NEL), Boulder, CO. Electromagnetic Fields Div. Near-Fleid Detection of Buried Dielectric Objects.

Final rept. D. A. Hill. 1989, 5p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Geoscience and Remote Sensing 27, n4 p364-368 Jul 89. Keywords: *Antennas, *Electromagnetic fields, *Dielectrics, * Detection, Electric fields, Lossy materials, Di-poles, S matrix theory, Scattering cross sections, Sub-surface investigations, Reprints.

The plane-wave scattering-matrix method is used to compute the response of a detector to a buned dielec-tric scatterer. The Born approximation is used to derive the scattering matrix for scatterers of small dielectric contrast, but the general theory is not limited to such cases. Specific numerical results are generated for a UHF dipole detector swept over a buried dielectric cube. The maximum response is obtained when the detector is located at the air-earth interface, and the response decays rapidly with detector height. The sweep curves are symmetrical in the horizontal direc-tion and have a null when the detector is directly over the object. An experimental curve for a free-space environment has the same qualitative features.

New Cavity Configuration for Cesium Beam Pri-mary Frequency Standards.

Final rept. A. DeMarchi, J. Shirley, D. Glaze, and R. Drullinger.

1988, 6p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Meas-urement 37, n2 p185-190 Jun 88.

Keywords: *Cesium frequency standards, *Cavity res-onators, Oscillators, Resonant frequency, Micro-waves, Waveguides, Mathematical models, Reprints.

In the design of cesium beam frequency standards, the with residual running waves) in the microwave cavity, due to the small losses in the cavity walls, can become a significant source of error. To minimize such errors in future standards, it has been proposed that the long Ramsey excitation structure be terminated with nig-shaped cavities in place of the conventional shorted waveguide. The nig cavity will minimize distributed cavity-phase-variations at the position of the atomic beam, provided only that the two sides of the ing and the T-junction feeding the ing are symmetric. In the paper, a model is developed to investigate the validity of the concept in the presence of the small asymme-tries that inevitably accompany the fabrication of such a cavity. The model, partially verified by laboratory tests, predicts that normal tolerances will allow the frequency shifts due to distributed cavity-phase-vari-ations to be held at the 10 to the negative 15th power level for a beam tube with a Q of 10 to the 8th power.

ANA (Automatic Network Analyzer) Measurement Results on the ARFTG (Automatic RF Techniques Group) Traveling Experiment. Final rept.

L. F. Saulsbery, and R. T. Adair. 1987, 14p Pub. in ARFTG (Automatic RF Techniques Group) Conference Digest (28th), St. Petersburg, FL., December 4-5, 1986, p65-78 1987.

Keywords: *Measuring instruments, Reflectivity, At-tenuation, Standing wave ratios, Assessments, Phase shift, *Automatic network analyzers.

The Automatic RF Techniques Group (ARFTG) Executive Committee has assembled two traveling measure-ment assessment kits. Each of these kits consists of: 1-dB, 20-dB, 40-dB, and 60-dB attenuators; a 50-ohm termination; a 10-centimeter air line; 1.2-VSWR and 2.0-VSWR mismatched terminations; and a short cir-cuit termination. These devices are equipped with pre-cision 7-mm coaxial connectors. The traveling kits are being circulated among measurement laboratories that wish to assess their ability to measure reflection coefficient, attenuation, and phase shift from 300 MHz to 17 GHz. The results obtained on ten different automated measurement systems are presented.

Pub. in Proceedings of Annual Symposium on Fre-quency Control (41st), Philadelphia, PA., May 27-29, 1987, p512-518.

Keywords: *Frequency synthesizers, *Electromagnet-ic noise, Microwave oscillators, Crystal oscillators, Signal generators, Frequency converters, Frequency multipliers, Frequency dividers.

The paper reviews the various definitions of phase noise and changes in the phase noise of a signal under noiseless multiplication, division, and translation. Next the phase noise in selected noncryogenic rf and microwave oscillators is reviewed. Using a systems ap-proach one can synthesize a microwave signal where the close in phase noise is controlled by a low frequency crystal oscillator while the high frequency phase noise is controlled by a microwave source. The ap-proach yields a phase noise performance that is supe-nor to that possible with a single source. Finally the phase noise of various amplifiers, multipliers, and dividers is compared. The phase noise of dividers while generally inferior to that of the best multipliers, is often sufficient for most applications.

Keywords: *Sensitivity, *Tests, Analog systems, Per-formance evaluation, Precision, Transient response, Acuity, Accuracy, Reprints, *Circuit analysis.

An efficient method has been developed for determining component ambiguity groups which arise in analog

circuit testing. The method makes use of the sensitivity model of the circuit. The ambiguity groupings are shown to depend on the test points selected and the measurement accuracy, and is, therefore, a useful tool for determining where to add or delete test points. The concept of ambiguity groups can be used to refine the testability measure of a circuit.

Final rept.

J. Geist, and H. Baltes. 1989, 11p Pub. in Applied Optics 28, n18 p3929-3939, 15 Sep 89.

*Quantum efficiency, *Photodiodes, Keywords: Mathematical models, Diffusion theory, Silicon, Accuracy, Reprints.

A new silicon photodiode model is proposed which is optimized for high-accuracy measurement usage. The new model differs from previous models in that the contribution to the quantum efficiency from the diode front region is described by an integral transform of the equilibrium minority carrier concentration. The description is accurate as long as the recombination of excess minority carriers in the front region occurs only at the front surface and the diode is operating linearly.

J. C. Geist. 1988, 18p Pub. in Theory and Practice of Radiation Thermome-try, Chapter 14, p821-838 1988.

Keywords: *Photodiodes, *Calibrating, *Silicon, Thermal radiation, Temperature measurement, Blackbody radiation, Reprints.

A new and rapidly evolving technique for radiometric calibrations that is of considerable potential interest to radiation thermometry is considered. Although the method is not yet fully developed, it has already dem-onstrated an accuracy that is superior to that of all other methods in the spectral region traditionally used for high-precision radiation thermometry (650 nm). Through a simple experimental procedure using rela-tively inexpensive equipment that is widely available. the quantum efficiency and the spectral reflectance of a high-quality shallow-junction silicon photodiode can be readily determined.

Stability and Quantum Efficiency Performance of Silicon Photodiode Detectors in the Far Ultraviolet. Final rept.

. R. Canfield, J. Kerner, and R. Korde. 1989, 4p Pub. in Applied Optics 28, n18 p3940-3943, 15 Sep 89.

Keywords: *Ultraviolet detectors, *Photodiodes, Far ultraviolet radiation, Quantum efficiency, Silicon diox-ide, Radiometry, Stability, Reprints.

Recent improvements in silicon photodiode fabrication technology have resulted in the production of photo-diodes which are stable after prolonged exposure to short wavelength radiation and which have efficiencies in the far ultraviolet close to those predicted using a value of 3.63 eV for electron-hole pair production in Si. Quantum efficiency and stability data are presented in the 6-124-eV region for several variations on the basic successful design and on devices with extremely thin silicon dioxide antireflecting/passivating layers. The

ELECTROTECHNOLOGY **Optoelectronic Devices & Systems**

results indicate that the oxide is dominant in determining many of the performance parameters and that a stable efficient far ultraviolet diode can be fabricated by careful control of the Si-SiO2 interface quality.

diode Transfer Standards at 1.064 Micrometers. A. L. Rasmussen, P. A. Simpson, and A. A. Sanders. Aug 89, 40p NISTIR-89/3917

Sponsored by Aerospace Guidance and Metrology Center, Newark AFS, OH.

Keywords: *Photodiodes, *Avalanche diodes, *Standards, Semiconductor devices, Voltage regulators, De tectors, Lasers, Numerical analysis, Calibrating, Im pulse response.

Three silicon-avalanche-photodiode (APD) transfer standards were calibrated from approximately 10(-8) to approximately 10(-5) W/sq cm peak power density at approximately 10 percent uncertainty. The calibra-tions are for 1.064 micrometer wavelength pulses of 10 to 100 ns duration. For the calibration, an acoustooptically modulated laser beam generated alternately equal levels of pulsed power and cw power into a lowlevel beam splitter. The cw power measured by a transfer standard in the transmitted beam of the splitter was used to determine the pulsed power into the APD transfer standard in one of the low-level reflected beams of the splitter. To increase the sensitivity, one or two 20 dB, 500 MHz bandwidth amplifiers followed the preamplifier. With very low pulsed power, a 30 MHz low-pass filter with Gaussian roll-off was attached to the amplifier output to reduce the noise. A transient digitizer recorded the impulse responses of the APD detectors at 1.064 micrometer. The data were read into computer programs that convolved the unit-area impulse response with unit-height Gaussian pulses. From the data, correction factors of the pulse peak for observed pulse durations from 10 to 100 ns were determined. Instructions, calibrations, error budgets, and system descriptions are included.

Mode-Stirred Chamber for Measuring Shielding Effectiveness of Cables and Connectors: An Assessment of MIL-STD-1344A Method 3008.

Final rept. M. L. Crawford, and J. M. Ladbury. 1988, 7p

Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) International Symposium on Electromagnetic Compatibility, Seattle, WA., August 2-4, 1988, p30-36.

Keywords: *Electromagnetic shielding, *Communica-tion cables, Standing wave ratios, Measurements, Specifications, Electric wire, Electric connectors, Antennas.

The mode-stirred method for measuring the shielding effectiveness (SE) of cables and connectors as specified in MIL-STD-1344A Method 3008 is examined. Problems encountered in applying the method are identified and recommendations to improve the measurement results are provided. These include chamber design, type and placement of transmitting and reference receiving antenna, determination and correction for VSWR of the reference antenna and equipment under test (EUT), and the measurement approach to use at specified test frequencies. Design and measurement setups for a small mode-stirred chamber suitable for performing SE measurements in the frequency range 1 - 18 GHz with dynamic ranges up to 130 dB are given along with SE measurement results of some sample EUTs.

mal Deflection. Final rept.

R. K. Hickernell, D. R. Larson, R. J. Phelan, and L. E. Larson. 1988, 3p

Pub. in Applied Optics 27, n13 p2636-2638, 1 Jul 88.

Keywords: *Optical communication, *Transmission loss, *Waveguides, Transmission lines, Backscatter-ing, Telecommunication, Lasers, Refractivity, Reprints, *Photothermal deflection.

Photothermal deflection (PTD) is introduced as a technique for measuring propagation loss in optical chan-nei waveguides. A probe laser beam is deflected by the thermally-induced refractive-index gradient due to the absorption of guided pump light. The technique is non-contact and is applicable to a wide range of chan-nel waveguide geometries and materials, including buried guides. Scattering centers and unguided back ground light affect the measurement only indirectly, since the PTD signal depends on the gradient of the local temperature and not the light intensity directly. Scans of the PTD signal as a function of distance along the waveguide yielded propagation loss meas-urements with lower uncertainty than scans of the scattered light intensity. The PTD technique should be useful in the study of waveguide loss mechanisms.

Tiger Tempering Tampers Transmissions.

Final rept.

F. D. Martzloff. 1988, 2p

Pub. in BICSI Newsletter, p3 and p10 Dec 88.

Keywords: *Surges, *Wire lines, *Transmission lines, Buildings, Overcurrent, Overvoltage, Retarding, Reprints.

The article is the second of a two-part update on progress at the National Institute of Standards and Technology in a study on the propagation of surges in building wiring systems. In the first part, the problems associated with surge propagation in building wiring systems were described and classified as pussycats (they can just purr or they can scratch you and make you bleed) or tigers (they can eat you alive). Fast transients were shown to be pussycats. In the article, tests on the propagation of slower surges are cited; an im-portant finding is that attempts at suppressing surges (tempering or taming tigers) on the power lines can have unexpected effects on the data transmission lines of an electronic data processing system.

Using the Cone Calorimeter. E. Braun, J. R. Shields, and R. H. Harris. Jan 89, 63p NISTIR-88/4003

Sponsored by Naval Sea Systems Command, Washington, DC.

Keywords: *Electric wire, *Flammability testing, Ignition, Combustion, Fire safety, Fire tests, Ignition delay, Smoking, Thermal measurements, *Cone calori-Smoking, Thermal mea meters, Heat release rate.

Cone calorimeter tests were performed on eight multi-conductor electrical cables. Measurements of ignition delay time, heat release rate, mass loss rate, and gas and smoke generation rates were made in the vertical (2 irradiance levels) and horizontal (3 irradiance levels) (2) Infadiance levels) and nonzontal (3) Infadiance levels) orientations. It was found that comparable ignition delay times were observed for all of the cross-linked polyolefin jacketed cables. The PVC jacketed cable had a substantially lower ignition delay time. All of the cables exhibited an ignition delay time dependence on external irradiance proportional to 1/q2. Sample orien-tation did not significantly affect the ignition delay time. Heat release rate measurements showed that cables burned in multiple stages. Each stage of burning was of the cable assembly. For some cables, at low exter-nal irradiances (25 kW/m2) only the outer jacket burst open exposing the interior cable materials and secondary heat release rate peaks resulted. Changes in the cable components actually burning were reflected in variations in mass loss, gas, and smoke generation rates as well as small changes in the effective heat of combustion.

Magnetic Dipole Excitation of a Long Conductor in Magnetic Dipole Excitation of a Lossy Medium. a Lossy Medium. Final rept. D. A. Hill. 1988, 6p Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Geoscience and Remote Sensing 26, n6 p720-725 Nov 88.

Keywords: *Transmission lines, *Magnetic dipoles, *Excitation, Electric current, Polarized electromagnetic radiation, Stimulation, Emission, Electric discharges, Reprints, *Electric dipoles.

Formulations for the excitation of currents on an infinitely long conductor by electric or magnetic dipoles of arbitrary orientation are presented. The conductor can be either insulated or bare to model ungrounded or grounded conductors. Specific calculations are presented for a vertical magnetic dipole source because the source produces the appropriate horizontal polar-ization and could be used in a borehole-to-borehole configuration. Numerical results for the induced current and secondary magnetic field indicate that long conductors produce a strong anomaly over a broad frequency range. The secondary magnetic field decays slowly in the direction of the conductor and eventually becomes larger than the dipole source field.

Some Questions and Answers Concerning Air Lines as Impedance Standards.

Final rept. C. A. Hoer. 1987, 13p Pub. in Proceedings of ARFTG (Automatic RF Tech-niques Group) Conference (29th), Las Vegas, NV., June 12-13, 1987, p161-173.

Keywords: *Characteristic impedance, *Transmission lines, Calibrating, Standards, Electric conductors, Re-flection, Measurement, *Automatic network analyzers, Scattering parameters.

The paper attempts to answer a number of questions that arise when using one or more lengths of precision coaxial transmission line to calibrate a dual 6-port

automatic network analyzer, questions such as: how important is the quality of the test port relative to that of the line; what type connectors should the line standards have; what are the advantages of using two lines instead of one line and a through connection when test port imperfections are considered; and how many lines are optimum from a quality control point of view and what should the lengths be. The answers to these questions appear to be: (1) The quality of the line is much more important than that of the test port. A perfect line will calibrate out most imperfections in the test port. An example is given where 75-omega test ports are calibrated with 50-omega lines, and then used to measure reflection coefficient relative to 50 omega with very little error. (2) Greatest accuracy is achieved with line standards having male connectors. (3) Two lines get rid of many test port imperfections that one line cannot. Three lines will show up a problem if one line is bad. Five lines will identify which line is bad. Five is probably optimum. (4) There may not be an optimum for the actual lengths of a set of lines, but there does appear to be an optimum difference in the lengths.

Meters Using Thermistor Detectors.

Final rept. F. R. Clague, and N. T. Larsen. 1987, 11p Pub. in ARFTG (Automatic RF Techniques Group) Conference Digest (28th), St. Petersburg, FL., Decem-ber 4-5, 1986, p79-89 1987.

Keywords: *Thermistors, *Transient response, Dynamic response, Amplification, Power measurement, Semiconductor devices, Variable resistors, Microwave frequencies, Bolometers, Electric power meters.

Broadband coaxial thermistor mounts are commonly used in automated precision microwave measurement systems such as six-port networks. To reduce the effect of temperature drift and to decrease the total measurement time, it is desirable to measure the DC bias voltage on the thermistor mount very quickly after turning the rf on or off. However, investigation has re-vealed that a coaxial mount may take much longer to settle to a stable DC bias voltage than the thermistor element time constant or the associated power meter servo bandwidth would indicate. If the bias voltage is measured before this transient ends, the error in the calculated of power can be very large; as much as 1.4% has been observed. The paper describes these transients and gives measured durations and maxi-mum error for a number of different bolometer mounts.

Pub. in Proceedings of Zurich International EMC (Elec-tromagnetic Compatibility) Symposium, Zurich, Swit-zerland, March 7-9, 1989, p137-142.

Keywords: *Protectors, *Varistors, *Surges, Overcur-rent, Semiconductor devices, Thermistors, Variable re-sistors, Overvoltage, Power lines, Clamping circuits, Electric potential, Premature aging.

Surge protective devices, such as varistors, are ap-plied to protect sensitive load equipment against power-line surges. The need to provide low clamping

voltage for protection of equipment with low inherent immunity must be balanced against the risk of premature aging of the protective device. Lower clamping voltage causes more frequent interventions of the pro-tective device, accelerating its aging. The paper de-scribes four possible causes of such premature aging, calling for a more careful and thus more reliable application of protective devices.

Using a TEM (Transverse Electromagnetic) Celi.

Technical note. G. H. Koepke, M. T. Ma, and W. D. Bensema. Jan 89, 40p NIST/TN-1326

Also available from Supt. of Docs. as SN003-003-02932-1.

Keywords: *Electromagnetic radiation, Measurement, Antennas, Emission, Test equipment, *Transverse *Transverse electromagnetic cells.

The transverse electromagnetic cell is widely used to evaluate the electromagnetic characteristics of electrically small devices. The paper reviews the theoretical basis for a technique to quantify the radiated emis-sions from any such device in the cell. The technique is well suited to an automated test system provided that the mechanical motions required can be controlled by a computer. The difficulties associated with these me-chanical motions are discussed and possible solutions are proposed. The measurement technique is also expanded to include multiple-frequency sources in addition to single-frequency sources.

Not available NTIS National Inst. of Standards and Technology (NEL), Boulder, CO. Electromagnetic Technology Div. Superconducting Kinetic Inductance Bolometer. Final rept.

J. E. Sauvageau, and D. G. McDonald. 1989, 4p Sponsored by Redstone Arsenal, AL., and Aerospace Guidance and Metrology Center, Newark AFS, OH. Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 25, n2 p1331-1334 Mar 89.

Keywords: *Bolometers, Temperature measuring in-struments, Inductance, Niobium, Silicon, Substrates, Reprints, *Superconducting devices, *Thermometers, SQUID (Detectors).

The authors are developing a bolometer with a temper-ature sensor based on the temperature dependence of the inductance of a superconducting microstrip line. As a first step in exploring this idea, they have designed experiments to test only the temperature sensor. The experimental devices are all-niobium inductance thermometers fabricated on silicon substrates which have been deeply etched to provide areas of relative ther-mal isolation. The ground plane superconductor is thin enough that its kinetic inductance dominates the audio frequency impedance of the stripline near its critical temperature, at 0.09(T sub c). This differential thermometer uses a commercial SQUID as the preamplifier. Preliminary results demonstrate a proof-of-principle for the thermometer design.

son Junctions.

Final rept. M. W. Cromar, J. A. Beall, D. Go, K. A. Masarie, and R. H. Ono. 1989, 3p Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Magnetics 25, n2 p1005-1007 Mar 89.

Keywords: *Electromagnetic noise, Josephson junc-tions, Direct current, Aluminum oxide, Niobium, Re-prints, *SQUID devices.

The authors have developed a process which incorpo-rates very high quality Nb/Al-oxide/Nb Josephson junctions. The junctions had low subgap conductance yielding (V sub m) greater than 50 mV for critical cur-rent densities of 1000 A/sq cm. Low inductance SQUIDs made with these junctions were apparently free from junction conductance fluctuations, at least

for frequencies above 1 Hz. The SQUIDs exhibited flux noise of currently unknown origin.

Final rept.

R. J. Soulen, and D. Van Vechten. 1987, 27p Pub. in Physical Review B-Condensed Matter 36, n1 p239-265 1987.

Keywords: *Electrical impedance, Josephson junctions, Electrical measurement, Radio frequencies, Re-prints, *SQUID devices, Noise thermometers.

The authors have measured with high accuracy (100 ppm) and high precision (5-10 ppm) the impedance of an rf-driven resistive SQUID as a function of the amplitude and frequency of the radio-frequency (rf) bias, as a function of the current bias, and as a function of sev-eral other circuit parameters. They have developed the coupled differential equations for the resistive SQUID and for the rf tank circuit. The fit of the solutions of these equations to the data for non-hysteretic junctions is excellent. The authors were unable to develop solutions for the hysteretic case and thus compare them to the data obtained. The relationship of the study to noise thermometry using resistive SQUIDs is indicated.

burg, MD. Callbration of Voitage Transformers and High-Woltage Capacitors at NIST. W. E. Anderson. 1989, 17p Included in Jnl. of Research of the National Institute of

Standards and Technology, v94 n34 p179-195 May-Jun 89.

Keywords: *Calibration, Capacitors, Dissipation factor, Electric power, Electrical standards, NIST services, Voltage transformers.

The National Institute of Standards and Technology (NIST) calibration service for voltage transformers and (NIST) calibration service for voltage transformers and high-voltage capacitors is described. The service for voltage transformers provides measurements of ratio correction factors and phase angles at primary vol-tages up to 170 kV and secondary voltages as low as 10 V at 60 Hz. Calibrations at frequencies from 50-400 Hz are available over a more limited voltage range. The service for high-voltage capacitors provides measurements of capacitance and dissipation factor at applied voltages ranging from 100 V to 170 kV at 60 Hz depending on the nominal capacitance. Calibra-tions over a reduced voltage range at other frequentions over a reduced voltage range at other frequen-cies are also available. As in the case with voltage transformers, these voltage constraints are deter-mined by the facilities at NIST.

Keywords: *Field effect transistors, *Models, Wave-forms, Electric potential, Unsteady flow, Steady state, Electric current, Reprints, Ambipolar MOSFET. diffusion.

An analytical model for the power Insulated-Gate Bipolar Transistor (IGBT) is developed. The model consistently describes the IGBT steady-state current-voltage characteristics and switching transient current and voltage waveforms for all loading conditions. The model is based on the equivalent circuit of a MOSFET which supplies the base current to a low-gain, highlevel injection, bipolar transistor with its base virtual contact at the collector end of the base. The basic element of the model is a detailed analysis of the bipolar transistor which uses ambipolar transport theory and does not assume the quasi-static condition for the transient analysis. This analysis differs from the previ-ous bipolar transistor theory in that (1) the relatively large base current which flows from the collector end of the base is properly accounted for, and (2) the component of current due to the changing carrier distribution under the condition of a moving collector-base de-pletion edge during anode voltage transitions is ac-counted for. Experimental verification of the model using devices with different base lifetimes is presented for the on-state current-voltage characteristics, the steady-state saturation current, and the current and voltage waveforms for the constant voltage transient, the inductive load transient, and the series resistor-inductor load transient.

Use of Artificial Intelligence and Microelectronic Test Structures for Evaluation and Yield Enhancement of Microelectronic Interconnect Systems. Final rept.

M. W. Cresswell, N. Pessall, L. W. Linholm, and D. J.

Radack. 1986, 10p Pub. in Proceedings of International IEEE (Institute of Electrical and Electronics Engineers) VLSI (Very Large Scale Integration) Multilevel Interconnection Conference (3rd), Santa Clara, CA., June 9-10, 1986, p331-340.

Keywords: *Circuit interconnections, *Integrated cir-cuits, *Test equipment, Tests, Artificial intelligence, Very large scale integration, Expert systems.

A major factor limiting the production and performance of high-density VLSI integrated circuits is the fabrica-tion of reliable interconnect systems. Properly de-signed microelectronic test structures and appropriate test methods can be used to characterize the processes used to fabricate these systems. However, the computer-controlled testing of comprehensive process evaluation and diagnosis structures often results in large quantities of data which cannot be readily or effectively interpreted by the user. As a result, important features of the data are often overlooked or not considered in the evaluation of the fabrication processes. The paper describes an expert system for assisting the user to interpret test results associated with fabricating selected aspects of VLSI interconnect systems.

Stress Effects on III-V Solid-Liquid Equilibria.

Final rept. F. C. Larche, and J. W. Cahn. 1987, 8p

Pub. in Jnl. of Applied Physics 62, n4, p1232-1239, 15 Aug 87.

Keywords: *Epitaxy, *Thermodynamic equilibrium, Phase diagrams, Compositions, Stresses, Reprints, *III-V compounds.

The equilibrium of an epitaxial layer grown from the melt is analyzed in detail. The stresses produced by lattice mismatch with the substrate interact with the chemistry of the process. The general equilibrium equations are derived for 3-5 compounds. The stress field, and its approximations for thin layers are obtained. An expression for the composition of the epilayer as a function of liquid composition, valid in the vicinity of the lattice matching composition, is derived. Very good agreement is found between calculated values and measured results from LPE growth. Properties of systems that would present lattice latching phenomena are quantitatively discussed. It is shown that epitaxial equilibrium also affects the results of several methods of phase diagram determination, which are discussed in light of the preceeding results.

Keywords: *Standards, *Metrology, *Optical measure-ments, *Line width, *Integrated circuits, Performance evaluation, Pitch(Inclination), Critical dimensions.

The National Bureau of Standards (NBS) has devel-oped optical linewidth standards for the integrated circuit industry for over 10 years. The past work has concentrated on the development and the certification of photomask linewidth and pitch standards. The recent work is directed at extending the feature sizes on these standards to cover the range from 0.5 to 30 micrometers, and at doubling the certification accuracy to 0.025 micrometers. Features with heights larger than approximately 1/4 wavelength of light cannot be modeled as zero-thickness layers as is done for photo-masks. The development of models to handle this thick-layer case and to develop practical edge-detection criteria are currently under development at NBS. It is generally not possible to interpret the image profiles of thick features and thereby measure an accurate linewidth. The basic obstacles that must be overcome to achieve accurate submicron feature size measurements are reviewed and the prospects for future NBS optical standards for features such as photoresist lines on silicon wafers are assessed. Some suggestions about what to do until these standards become available are given.

sulated Gate Bipolar Transistor (IGBT). Final rept.

A. R. Hefner, D. L. Blackburn, and K. F. Galloway. 1986, 7p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science NS-33, n6 p1428-1434 Dec 86.

Keywords: *Neutron irradiation, Mathematical models, Field effect transistors, Reprints, *Bipolar transistors, *Insulated gate bipolar transistors, *Physical radiation effects, MOSFET, Carrier lifetime.

The effects of neutrons on the operating characteristics of Insulated Gate Bipolar Transistors (IGBT) are described. Experimental results are presented for devices that have been irradiated up to a fluence of 10 to the 13th power neutrons/c sq cm, and an analytical model is presented which explains the observed effects. The effects of neutrons on the IGBT are compared with the known effects on power MOSFETs, and it is shown that the IGBT characteristics begin to degrade at a fluence that is an order of magnitude less than the fluence at which the power MOSFET begins to degrade. At high fluences, the IGBT takes on the characteristics of a power MOSFET.

Keywords: *Semiconductors(Materials), *Standards, Integrated circuits, Specifications, Tests, Standardiza-tion, Reprints, *Very large scale integration.

Standard measurement methods and specifications for the semiconductor industry will be reviewed and discussed with emphasis on applications to VLSI processes. These standards are well accepted in the U.S. and in Europe, but are not so well known in Japan. The standards development process is an excellent way for material producers and users to develop good working relations and to solve their shared measurement problems; this process will be described in some detail. Because the semiconductor industry is an international one, serious efforts have been made for a number of years to rationalize the technical differences between test method standards in Europe and the U.S. with considerable success. The present state of such cooperative activity with Japan, which as a more recent origin, will also be reported.

Keywords: *Field effect transistors, *Mathematical models, Simulation, Semiconductor devices, Transient response, Impedance, Surges, Protection, Ratings, Performance standards, *Bipolar transistors, Snub-

The device-circuit interactions of the power Insulated Gate Bipolar Transistor (IGBT) for a series resistor-inductor load, both with and without a snubber, are simulated. An analytical model for the transient operation of the IGBT is used in conjunction with the load circuit state equations for the simulations. The simulated results are compared with experimental results for all conditions. Devices with a variety of base lifetimes are studied. For the fastest devices studied, the voltage overshoot of the series resistor-inductor load circuit approaches the device voltage rating for load inductances greater than 1 microHenrys. For slower devices, the voltage overshoot is much less and a larger induct-ance can therefore be switched without a snubber circuit. In the study, the simulations are used to determine the conditions for which the different devices can be switched safely without a snubber protection circuit. Simulations are also used to determine the required values and ratings for protection circuit components when protection circuits are necessary.

80, 82, 83 Nov 87.

Keywords: *Electromagnetic fields, *Field strength, *Feedback amplifiers, Electromagnetic shielding, Ra-diation shielding, Feedback control, Automatic control, Electromagnetic interference, Cybernetics, Magnetic permeability, Reprints, *Shielded rooms.

The paper describes a computer-controlled feedback system that can maintain field strength levels within moderate bounds inside a partially-loaded shielded room. The levels are relatively uniform over a large enough volume to allow radiated immunity testing of moderate-sized objects. The frequency range depends on the characteristics of the transmit antenna; 50 to 200 MHz was used, which is a difficult range to cover because of limitations of other EMC susceptibili-ty test facilities. The measurement system consists of a computer, signal generator, amplifier, biconical an-tenna and an isotropic probe system.

Dosed Tin Oxide. Final rept.

S. Semancik, and D. F. Cox. 1987, 6p

Pub. in Sensors and Actuators 12, n2 p101-106 1987.

Keywords: *Tin oxides, *Single crystals, *Water, *Oxygen, *Adsorption, Surface chemistry, High pres-sure tests, Semiconductors(Materials), Defects, Sensors, Photoelectric emission, Reprints.

The chemical, electronic and structural properties of a SnO2(110) crystal have been studied before and after exposure to H2O and O2. The results show that the initial stages of water adsorption on SnO2(110) can be influenced by structural factors and/or the concentration level of surface defects. The degree of surface ox-idation has also been demonstrated to have an observable effect on the nature of water adsorption at higher pressures. These results relate both to basic gas sensing mechanisms for SnO2 and to the influence of humidity on tin oxide.

Neural Network Approach for Classifying Test Structure Results. Final rept.

D. Khera, M. E. Zaghloul, L. W. Linholm, and C. L.

Wilson, 1989, 4p Pub, in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) International Conference on Microelectronic Test Structures, Edinburgh, Scotland, March 13-14, 1989, v2 n1 p201-204.

Keywords: *Integrated circuits, *Manufacturing, *Neural nets, Artificial intelligence, Algorithms, Learn-Tests, *Semiconductors, ing machines, Chips(Electronics).

The paper describes a new approach for identifying and classifying semiconductor manufacturing process variations using test structure data. The technique described employs a machine-learning algorithm based on neural networks to train computers to detect pat-terns associated with test structure results. The objective of the work is to develop more reliable machinelearning classification procedures using test structure data from a semiconductor manufacturing environ-ment. An example based on characterizing the per-formance of a 1 micro m lithography process is pre-sented as well as description of the test chip.

PB89-228530 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Semiconductor Electronics Div. Machine-Learning Classification Approach for IC Manufacturing Control Based on Test Structure Measurements.

Final rept. M. E. Zaghloul, D. Khera, L. W. Linholm, and C. P. Reeve. 1989, 7p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Semiconductor Manufactur-ing 2, n2 p47-53 May 89.

Keywords: *Integrated circuits, *Manufacturing, Semiconductor devices, Learning machines, Classifying, Artificial intelligence, Reprints, *Chips(Electronics), Expert systems.

The paper describes the use of a machine-learning method for classifying electrical measurement results from a custom-designed test chip. The techniques are used for characterizing the performance of a 1 mi-crometer integrated circuit lithographic process. The focus of the work is to develop a method for producing reliable classification rules from data bases containing large samples of measurement data. The paper describes a test chip, data-handling methods, rule gen-eration techniques, and statistical data reduction and parameter extraction techniques. An analysis of error introduced by noise in the rule formation process is presented.

PB89-230460 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Mfg. Engineering. High-Mobility CMOS (Complementary Metai Oxide Semiconductor) Transistors Fabricated on Very Thin SOS Films. Final rept.

D. J. Dumin, S. Dabral, M. Freytag, P. J. Robertson, G. P. Carver, and D. B. Novotny. 1989, 3p Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Electron Devices 36, n3, p596-598, Mar 89.

Keywords: *Metal oxide transistors, *Thin films, Semi-conducting films, Semiconductor devices, Carrier mo-bility, Reprints, *CMOS, *Complementary metal oxide semiconductors, Silicon films.

The increased emphasis on submicrometer geometry CMOS/SOI devices has created a need for high mobility CMOS transistors fabricated on high-quality SOI films with thicknesses of the order of 0.1 to 0.2 micro m. To date, the only demonstrated way of producing high-mobility transistors on very thin high-quality SOS films in this thickness range has been to apply recrys-tallizations and regrowths to the films prior to transistor fabrication. It has been found that the mobility of CMOS transistors fabricated on very thin SOS films is a function of the film growth rate. Transistors with mobilities nearly as high as those obtained on 1.0-micro m-thick films have been fabricated on SOS films 0.2 micro m thick that have been grown at growth rates above 4 micro m/min.

PB89-231195 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Semiconductor Electronics Div. **IEEE** (Institute of Electrical and Electronics Engineers) IRPS (International Reliability Physics Symposium) Tutorial Thermai Resistance Measurements, 1989.

Final rept. F. F. Octtinger. 1989, 33p Pub. in Proceedings of International Reliability Physics Deceire 47 April 10, 1989, p7.1-7.33.

Keywords: *Thermal resistance, *Integrated circuits, *Transistors, Thermal conductivity, Thermal stability, Temperature, Thermal measuring instruments, Junctions, Measurement.

The tutorial reviews the thermal properties of power transistors and to discuss methods for characterizing these properties. The devices discussed include bipolar transistors and metal-oxide-semi-conductor field-effect-transistors (MOSFETs). Measurement problems common to these devices, such as deciding the reason a particular measurement is required, adequate reference temperature control, selection of a temperature-sensitive electrical parameter, and separation of electrical and thermal effects during measurement are addressed. The thermal characterization of the packaged integrated circuit chip surface/junction for the new generation of VLSI devices generally takes one of three forms: indirect (i.e., electrical) measurements, direct (e.g., infrared), or computer simulations of the surface/junction temperatures. Due to the inherent difficulties in measuring and analyzing the thermal properties of active integrated circuits, an approach using specifically designed thermal test chips for evaluation of new die attachment and packaging schemes is finding wide acceptance in the industry.

urements of Sliicon.

Final rept. W. R. Thurber, J. R. Lowney, R. D. Larrabee, P. Talwar, and J. R. Ehrstein. 1989, 2p

Sponsored by Air Force Systems Command, Washington, DC.

Pub. in Proceedings of Electrochemical Society Meet-ing, Los Angeles, CA., May 7-12, 1989, p365-366.

Keywords: *Impedance, *Alternating current, *Silicon, Semiconductors(Materials), Electrical resistance, Electron probes, Frequencies.

An AC impedance method for measuring the average bulk resistivity of ingots and slices of high-resistivity sil-icon is described. Easily removable contacts, such as silver paste, are applied to the end faces of the sample and the impedance of the resulting capacitive sandwich is measured as a function of frequency. The resis-

Semiconductor Devices

tivity can be calculated from the frequency of the nega-tive peak in the imaginary part of the impedance and model consistency can be checked by comparison of values of resistance obtained from real and imaginary parts at this peak. Comparisons with van der Pauw and four-probe measurements are consistent with the impedance method.

900,794 PB89-231211 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Semiconductor Electronics Div. Experimental Verification of the Relation between Two-Probe and Four-Probe Resistances. Final rept.

J. J. Kopanski, J. H. Albers, and G. P. Carver. 1989,

Pub. in Proceedings of Electrochemical Society Meeting, Los Angeles, CA., May 7-12, 1989, p367-368.

Keywords: *Electron probes, *Electrical resistance, Measurement, Wafers, Test equipment, Measurement, equipment, Semiconductors(Materials).

Recent innovations in the measurement of two-probe (spreading) resistance and four-probe resistance using an array of lithographically fabricated, geometrically well-defined contacts have enabled the measurement of the quantities with high accuracy and reproducibility. It has permitted experimental verification of the rela-tionship between the two-probe resistances and the four-probe resistance. Verification was also made of the predicted dependence of the four-probe resistance on the ratio of wafer thickness to probe spacing for inline and square probe configurations.

Final rept. A. R. Hefner. 1989, 11p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) Power Electronics Specialists Conference (20th) - PESC '89, Milwaukee, WI., June 26-29, 1989, p303-313.

Keywords: *Field effect transistors, *Electric current, *Waveforms, Models, Comparison, Capacitance, Electric potential, Analyzing.

It is shown that a non-quasi-static analysis must be used to describe the transient current and voltage (IGBT). The non-quasi-static analysis is necessary because the transport of electrons and holes are coupled for the low-gain, high-level injection conditions, and because the quasi-neutral base width changes faster than the base transit speed for typical load circuit con-ditions. To verify that both of these non-quasi-static effects must be included, the predictions of the quasistatic and non-quasi-static models are compared with measured current and voltage switching waveforms. The comparisons are performed for different load circuit conditions and for different device base lifetimes.

PB89-231237 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Semiconductor Electronics Div. Power MOSFET Failure RevIsited.

Final rept.

D. L. Blackburn. 1988, 8p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Power Electronics Specialists Conference -PESC '88, Kyoto, Japan, April 11-14, 1988, p681-688.

Keywords: *Field effect transistors, *Failure, Ava-lanche breakdown, Electrical faults, Nondestructive tests, Energy dissipation, *MOSFET semiconductors.

The failure of power MOSFETs during avalanche breakdown is discussed. A theory is presented that relates the failure to the temperature rise of the chip during the avalanche breakdown and to a critical current for failure. It is shown that the energy that can be safely dissipated during avalanche breakdown de-creases as the starting current increases or as the case temperature increases. Thus, if power MOSFETs are to be rated for their energy dissipation capability during avalanche breakdown, both the starting current and temperature must be specified as it is these two parameters that determine the failure limits and not the energy.

Final rept.

Final rept. M. E. Cage, R. F. Dziuba, and B. F. Field. 1982, 15p Sponsored by Naval Research Lab., Washington, DC., and Department of Defense, Washington, DC. Pub. in Proceedings of NCSL Workshop and Symposi-um Metrology Management and Technology-A Scien-tific Approach, Gaithersburg, MD., October 4-7, 1982, 081.1 B 1.15. pB1-1-B1-15.

Keywords: *Hall effect, *Standards, Semiconductor devices, Metrology, Fundamental constants, Cryogen-ics, *Quantum Hall effect, *Resistance standards.

The discovery of the quantum Hall effect by K. v. Klitz-ing, using semiconductor devices that are cryogenical-ly cooled in large applied magnetic fields, has opened up the exciting possibility that this effect could stimu-late the discipline of electrical metrology to an extent analogous to that of the Josephson effect. The paper describes the quantum Hall effect, and explains how it is being used in experiments at NBS in an attempt to achieve a new resistance standard accurate to a few parts in 100 million, in which the resistance is defined in terms of fundamental constants of nature.

MD. Electrosystems Div. Thermal-Expansive Growth of Prebreakdown Streamers in Liquids.

Final rept. C. Fenimore. 1988, 4p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of Conference Record IEEE (Institute of Electrical and Electronics Engineers) Interna-tional Symposium on Electrical Insulation, Boston, MA., June 5-8, 1988, p27-30.

Keywords: *Dielectric breakdown, *Electric dis-charges, *Liquids, Electrical insulation, Mathematical models, Bubbles, Pressure effects.

The growth of electrically conductive, low-density re-gions has been observed in dielectric breakdown in a variety of liquids. This phenomenon motivates the development of the present theory for coupling thermal effects with fluid mechanical effects in the dynamics of elongated, impulsively-driven bubbles. The model explicitly describes the time-dependent dimensions of a growing ellipsoidal bubble. In previous work, a model for such effects associated with the growth of a bubble about an arc in a liquid was developed. In the case of the prebreakdown streamer, the geometry is not as simple as for an arc, and the evolution of the bubble is found in ellipsoidal coordinates. The effect of pressure is to shorten the time scale of the bubble dynamics.

PB89-170872 PC A04/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Electronics and Electri-

cal Engineering. High-Current Measurement Techniques. Part II. 100-kA Source Characteristics and Preliminary Shunt and Rogowski Coll Evaluations.

J. D. Ramboz, Mar 89, 52p NISTIR-89/4040 See also PB85-100444. Sponsored by Sandia National Labs., Albuquerque, NM.

Keywords: *Electrical measurement, Electric current, Calibrating, Bypasses, Circuits, Alternating currents, Electric coils, Rogowski coils.

The characterization of a 100-kA current source is dis-cussed. The source is intended for use in the calibra-tion of high-current sensors such as shunts and Rogowski coils commonly employed in resistance weldschedule control of the source is derived from SCR-gated signals in the form of bursts of 'chopped' 60-Hz sinsusoidal waveforms. These waveforms and their spectral content were investigated. The near-field magnetic field strength was mapped. Initial calibrations were performed on a 30-kA, 10 microohms shunt. Pre-liminary results indicate a temperature coefficient of about 130 ppm/deg which is thought to be related to a thermally induced strain. Several Rogowski coil type current sensors were evaluated and calibrated. Each of the coils measured had outputs which were sensi-tive to the rotational position about the current carrying conductor. The calibration philosophy and approach is discussed and estimates of measurement uncertainty are given. Suggested improvements for the measure-ment process are offered, Planned efforts are outlined.

Power Quality Site Surveys: Facts, Fiction, and Fallacies.

Final rept.

F. D. Martzloff, and T. M. Gruzs. 1988, 14p

See also PB87-201679. Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Industry Applications 24, n6 p1005-1018 Nov/Dec 88.

Keywords: *Site surveys, *Power supplies, Quality as-surance, Reliability, Reprints, *Electronic equipment, Power losses.

The quality of the power supplied to sensitive electron-ic equipment is an important issue. Monitoring disturbances of the power supply has been the objective of various site surveys, but results often appear to be instrument-dependent or site-dependent, making com-parisons difficult. After a review of the origins and types of disturbances, the types of monitoring instru-ments are described. A summary of nine published surveys reported in the last 20 years is presented, and a close examination of underlying assumptions allows meaningful comparisons which can reconcile some of the differences. Finally, the paper makes an appeal for improved definitions and applications in the use of monitoring instruments.

Pub. in Proceedings of Measurement Science Confer-ence, Anaheim, CA., January 26-27, 1989, p1C-1-1C-14.

Keywords: *Microwaves, *Frequency standards, *Ca-lorimeters, *Bolometers, Measuring instruments, Per-formance standards, Automatic control, Electrical measurement, Adaptive systems, Electronic control.

The national microwave power standards consist of two parts: a microcalorimeter and a bolometer mount used as the transfer standard. In the past, operation of the microcalorimeter has been slow and complicated, and required skilled personnel. The paper details the automation of the 0.1 to 18 GHz coaxial microcalorimeter and the design of a new coaxial transfer standard. Together, these have reduced measurement time by a factor of 10. A highly skilled operator is no longer required and largely unattended operation 24 hours a day is possible. The basic theory of operation of both devices, design considerations, some error evaluation problems, and performance results are included.

New Internationally Adopted Reference Standards of Voltage and Resistance.

Bi-monthly rept. B. N. Taylor. 1989, 9p

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n2 p95-103 Mar-Apr 89.

Keywords: *Electrical measurement, *Standards, Voltage measurement, Electrical resistance, Voltmeters, Ohmmeters, Hall effect, Units of measurement, Calibrating, Consultative Committee on Electricity(CCE), International Committee of Weights and Measures(CIPM), International System of Units(SI).

The report provides the background for and summa-rizes the main results of the 18th meeting of the Con-sultative Committee on Electricity (CCE) of the International Committee of Weights and Measures (CIPM) held in September 1988. The principal recommendations originating from the meeting, which were subse-quently adopted by the CIPM, establish new interna-tional reference standards of voltage and resistance based on the Josephson effect and the quantum Hall effect, respectively. The new standards, which are to come into effect starting January 1, 1990, will result in improved uniformity of electrical measurements world-wide and their consistency with the International System of Units or SI. The CCE also recommended a particular method, affirmed by the CIPM, of reporting calibration results obtained with the new reference standards that is to be used by all national standards laboratories.

The report is the twenty-fifth issue of a quarterly publication providing information on the technical work of the National Institute of Standards and Technology (formerly The National Bureau of Standards) Center for Electronics and Elecrical Engineering. The issue of the CEEE Technical Progress Bulletin covers the fourth quarter of calendar year 1988. Abstracts are provided by technical area for both published papers and papers approved by NIST for publication.

Microwave, and Millimeter Wave Power Meters. Technical note.

E. M. Livingston, and R. T. Adair. Dec 88, 149p NIST/TN-1310

Also available from Supt. of Docs. as SN003-003-02931-9.

Keywords: *Power measurement, *Electrical meas-urement, *Power meters, Thermistors, Wattmeters, Measuring instruments, Radio waves, Performance evaluation, Microwaves, Millimeter waves, Electro-magnetic radiation, Calibrating, Temperature.

Measurement techniques are described for the evaluation of the electrical performance of commercially available radiofrequency (rf), microwave (mw), and mil-limeter wave (mmw) power meters which use bolometric power sensors and typically operate from 10 MHz to 26.5 GHz for an average power range of 10 microW to 10 mW with appropriate attenuation for higher power ranges. Techniques are described for analysis of: ranges of frequency and power, operating tempera-ture, stability, response time, calibration factor, ex-tended power measurement, overload protection, and characteristics of the internal power reference source. Some automated methods are discussed. Block dia-grams of test setups are presented. Sources of uncer-tainty in the bolometric method are analyzed.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Meas-urement 38, n2 p451-456 Apr 89.

Keywords: *Electrical measurement, *Electric poten-tial, Electrical properties, Voltmeters, Calibrating, Radio frequencies, Step response, Ramp response, Reprints.

The RF voltage measurement capability of an equivalent-time sampling system has been investigated over the frequency range of 1-100 MHz. The system is easily calibrated from step response measurements, independent of thermal transfer standards. Comparison measurements made with NBS-calibrated thermal converters show agreement generally within the stated uncertainties presently provided by NBS for such cali-brations. The system offers several advantages over conventional thermal transfer techniques; ac/dc transfers are not required, loading and transmission line problems are reduced, and direct measurement of vol-tages from 2 V to as low as 10 mV are possible. In addition, other waveform characteristics are readily obtained, e.g., average and peak values, harmonic distortion, etc.

AC-DC Difference Calibrations at NBS (National Bureau of Standards).

Final rept. J. R. Kinard. 1986, 6p

Pub. in Proceedings of Measurement Science Confer-ence, Irvine, CA., January 23-24, 1986, p3-8.

Keywords: *Calibrating, *AC to DC converters, Electric potential, Electric current, Electric converters, Rectifiers, Standards, National Institute of Standards and Technology.

The NBS calibration service for thermal voltage and current converters relies on a group of primary multi-junction thermal converters and sets of reference and working standards for extending their ranges and fre-quencies. The converter sets which constitute the NBS standards--primary, reference and working--as well as the build-up and bootstrap techniques used in their characterization over the full ranges of voltage, current, and frequency are described briefly. Routine NBS uncertainties for ac-dc difference calibrations are given as well as a summary of current activities and plans.

The document provides general guidelines and de-tailed instructions on how to bring laboratory reference standards of voltage and resistance and related instrumentation into conformity with newly established and internationally adopted representations of the volt and ohm. Based on the Josephson and quantum Hall effects, respectively, the new representations are to come into effect worldwide starting on January 1, 1990. Their implementation in the U.S. will result in in-1990. Their implementation in the U.Š. will result in increases in the values of the national volt and ohm representations maintained at the National Institute of Standards and Technology (NIST, formerly the National Bureau of Standards or NBS) of 9.264 parts per million (ppm) and 1.69 ppm, respectively. The resulting increase in the value of the U.S. representation of the ampere will be 7.57 ppm and in the U.S. electrical representation of the watt, 16.84 ppm. Also discussed are the effects on electrical standards of the January 1, 1990, replacement of the International Tractical Temperature Scale of 1968 by the International Temperature 0.14 ppm decrease in the U.S. representation of the farad. the farad.

Determination of the Time-Dependence of ohm NBS (National Bureau of Standards) Using the Quantized Hall Resistance.

Final rept. M. E. Cage, R. F. Dziuba, C. T. Van Degrift, and D.

Yu. 1989, 7p Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Instrumentation and Meas-urement 38, n2, p263-269, Apr 89.

Keywords: *Electrical resistance, *Standards, Electri-cal measurement, Precision, Reprints, *Resistance standards, *Quantum Hall effect, *Ohm, Temperature dependence.

The Quantum Hall effect is being used to monitor the U.S. legal representation of the ohm, or as-maintained ohm, ohm(NBS). Measurements have been made on a regular basis since August 1983. Individual transfers between the quantized Hall resistance, R(H) and the five 1-ohm resistors which comprise ohm(NBS) can five 1-ohm resistors which comprise ohm(NBS) can now be made with a total one standard deviation (1 sigma) uncertainty of + or - 0.014 ppm. This uncertainty is the root-sum-square of 32 individual components. The time-dependent expression for T(H) in terms of ohm(NBS) is: R(H) = 25 812.8 (1 + (1.842 + or - 0.012) x 10 to the -6th power + (0.0529 + or - 0.0040) (t - 0.7785) x 10 to the -6th power/year) ohm(NBS), where t is measured in years from January 1, 1987. The value of ohm(NBS) is, therefore, decreasing at the rate of (0.0529 + or - 0.0040) ppm/year.

MD. Electricity Div. Measurement of the NBS (National Bureau of Standards) Electrical Watt in SI Units.

Final rept. P. T. Olsen, R. E. Elmquist, W. D. Phillips, E. R. Williams, G. R. Jones, and V. E. Bower, 1989, 7p. Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Instrumentation and Measurement 38, n2, p238-244, Apr 89.

Keywords: *Electric power, *Standards, Reprints, *Watt, Ampere, Josephson effect.

The authors have measured the NBS electric watt in SI units to be: $W(NBS)/W = K(w) = 1 \cdot (16.69 + or - 1.33)$ ppm. The uncertainty of 1.33 ppm has the significance of a standard deviation and includes their best estimate of random and known or suspected systematic uncertainties. The mean time of the measurement is May 15, 1988. Combined with the recent measure-ment of the NBS ohm in SI units: ohm(NBS)/ohm = K(ohm) = 1 - (1.593 + or - 0.022) ppm, this leads to a Josephson frequency/voltage quotient of E(J) =((0)(1 + (7.94 + or - 0.67) ppm) where E(0) = 483594 GHz/V.

Discharges. Final rept.

Final rept. I. Sauers, M. C. Siddagangappa, G. Harman, R. J. Van Brunt, and J. T. Herron. 1989, 4p Sponsored by Department of Energy, Washington, DC. Office of Energy Storage and Distribution. Pub. in Proceedings of International Symposium on High Voltage Engineering (6th), New Orleans, LA., August 28-September 1, 1989, p1-4.

Keywords: *Sulfur hexafluoride, Decomposition reac-tions, Gas chromatography, Mass spectroscopy, Water vapor, Production, Stability, *Corona discharges.

The authors report the yield of S2F10 produced in corona discharges in SF6 and the dependence of the S2F10 yield on various parameters. The data were obtained from two experimental systems, both employing point-to-plane geometry, a small corona cell (200-ml in volume) with a gas chromatograph-thermal conductivi-ty analyzer (GC-TCD) at ORNL and a large (3.7-1) corona cell with a gas chromatograph-mass spectrom-eter (GC-MS) analyzer at NIST (formerly NBS). The GC-MS technique was found to be quite sensitive to S2F10 when the mass analyzer was tuned to mass 86 (SOF2(1+)).

Final rept. G. W. Day, and A. H. Rose. 1988, 13p Sponsored by Department of Energy, Washington, DC., Electric Power Research Inst., Palo Alto, CA., Empire State Electric Energy Research Corp., New York, and Department of Defense, Washington, DC. Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers), Fiber Optic and Laser Sensors VI, v985, p138-150 1988.

Keywords: *Faraday effect, Electric current, Magnetic fields, Electrical measurement, Magnetic measure-ment, Optical measurement, Sensitivity, Stability, De-tectors, Reviews, Reprints, State of the art, Sensors.

The Faraday effect is becoming widely used as an optical method of measuring electric current or magnetic cal method of measuring electric current or magnetic field. It is particularly advantageous where the meas-urements must be made at high voltage or in the pres-ence of electromagnetic interference, and where speed or stability are considerations. The paper re-views the development of the technology over the last twenty years, with an emphasis on the basic principles, design considerations, and performance capabilities of senears that proceent the latest achievements. Fare sensors that represent the latest achievements. Faraday effect current sensors are now used routinely in the measurement of large current pulses and are start-ing to become available for ac current measurements in the power industry. Recent developments include their extension to the measurement of currents in the milliampere range and substantial reductions in size.

Similar devices, in slightly different configurations, can be used for magnetic field measurements. Further improvements, based on new fiber types and new materials, are projected.

Keywords: *Calibrating, *Network analyzers, Trans-mission lines, Test equipment, Frequency analyzers, Electric analyzers, Measuring instruments, Test sets, Reprints, *Test ports.

The test ports on automatic network analyzers are generally built with an impedance that matches the impedance of the calibration standards. The paper gives experimental evidence that substantial impedance discontinuities can be tolerated at the test port interface if proper calibration procedures are observed. The 50-Omega test port on one of the six-ports in a dual six-port network analyzer was replaced with a 75-Omega test port. The test port was then calibrated to look like a 50-Omega test port. Measurements on various de-vices showed that indeed it was possible to make a 75-Omega test port indistinguishable from a 50-Omega test port.

Final rept.

D. I. Wu, and D. C. Chang. 1988, 9p Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Microwave Theory and Techniques 36, n9 p1334-1342 Sep 88.

Keywords: *Electromagnetic waves, *Greens function, Cavities, Computation, Reprints, Point sources, Rec-tangular configuration, Numerical solution, Modes.

A hybrid ray-mode representation of the Green's function in a rectangular cavity is developed using the finite Poisson summation formula. In order to obtain a numerically efficient scheme for computing the field generated by a point source in a large rectangular cavity, the conventional modal representation of the Green's function is modified in such a way that all the modes near resonance are retained while the truncated remainder of the mode series is expressed in terms of a weighted contribution of rays. For an electrically large cavity, the contribution of rays from distant images becomes small; therefore the ray sum can be approxi-mated by one or two dominant terms without a loss of

numerical accuracy. To illustrate the accuracy and the computational simplification of this ray-mode representation, numerical examples are included with the conventional mode series (summed at the expense of long computation time) serving as a reference.

Tunnels.

Final rept.

D. A. Hill. 1988, 20p Pub. in Proceedings of Technical Symposium on Tunnel Detection (3rd), Golden, CO., January 12-15, 1988, p518-537.

Keywords: *Tunnel detection, *Electromagnetic induc-tion, Magnetic dipoles, Magnetic fields, Transmission lines, Electric dipoles.

Formulations for the excitation of currents on an infinitely long conductor by electric or magnetic dipoles of arbitrary orientation are presented. The conductor can be either insulated or bare to model ungrounded or grounded conductors. Specific calculations are presented for a vertical magnetic dipole source because this source produces the appropriate horizontal polar-ization and could be used in a borehole-to-borehole configuration. Numerical results for the induced current and secondary magnetic field indicate that long conductors produce a strong anomaly over a broad frequency range. The secondary magnetic field decays slowly in the direction of the conductor and eventually becomes larger than the dipole source field.

Hebner, 1988, 6p Pub. in Annual Report of Conference on Electrical In-sulation and Dielectric Phenomena, Ottawa, Canada, October 16-20, 1988, p263-268.

Keywords: Liquids, *Breakdown(Electronic threshold), *Prebreakdown, Pressure effects.

The initiation of streamers in a liquid under the application of negative impulse voltages applied to a needle-sphere gap is investigated. A square pulse is applied so that the prebreakdown streamer will not grow to breakdown. With the application of pressure the initial streamer is observed to collapse and disappear while the voltage remains on the tip. When the voltage is chopped, a new streamer appears which resembles the structure of the anode streamers. The branches of the new streamer do not strictly follow the previous branches of the cathode streamer which injected the charge in the liquid. Using a simple model, approxi-mately 11 nC is estimated to be injected into the liquid producing a charge density of 49 microC/cc.

Keywords: *Electric corona, *Gas discharges, Electri-cal measurement, Stochastic processes, Nitrogen, Oxygen, Mixtures, Pulse height analyzers, Markov processes, Reprints.

A new method is described for measuring the stochas-tic behavior of corona and partial-discharge pulses which uses a pulse selection and sorting circuit in con-junction with a computer-controlled multichannel analyzer to directly measure various conditional and un-conditional pulse-height and pulse-time-separation distributions. From these measured distributions it is possible to determine the degree of correlation be-tween successive discharge pulses. Examples are

General

given of results obtained from measurements on negative, point-to-plane (Trichel-type) corona pulses in a N2/O2 gas mixture which clearly demonstrate that the phenomenon is inherently stochastic in the sense that development of a discharge pulse is significantly af-fected by the amplitude of and time separation from the preceding pulse. It is found, for example, that corona discharge pulse amplitude and time separation from an earlier pulse are not independent random vari-ables. Discussions are given about the limitations of the method, sources of error, and data analysis proce-dures required to determine self-consistency of the various measured distributions.

Final rept. Y. X. Zhang, R. H. McKnight, and C. Fenimore. 1989, 4p

Pub. in Proceedings of International Symposium on High Voltage Engineering (6th), New Orleans, LA., August 28-September 1, 1989, p1-4.

Keywords: *Lightning, *Digital systems, *Data smoothing, *Splines, Cubic equations, Data process-ing, Data reduction, Numerical analysis, Electric discharges, Static electricity, Step response.

Measurements of the full-lightning or chopped-lightning waveforms or of the step response are confound-ed by noise, radiated electro-magnetic interference, and high frequency oscillations. Before the advent of digitizers, these effects were minimized by filtering in hardware and fitting photographic data by hand. Unfor-tunately, unacceptably large errors may be introduced by the process. A method has been developed and evaluated to fit and smooth digital data using cubic splines. These are piecewise cubic polynomials. Their advantage is that the spline and its first two derivatives are continuous, including at the knots (where two polynomials are joined). It is important because the first derivative is used in calculating the unit-step response-time. The location of the knots may be freely chosen. In the case of oscillatory data the choice is critical. A selection criterion is given and evaluated.

Keywords: *High voltage, *Power transmission lines, *Electric fields, *Magnetic fields, Measuring instru-ments, Ion currents, Ion density(Concentration), Charge density.

In the mid-1970s there were no standards which provided guidance for the measurement of fields near power lines or for the calibration of instrumentation used for such measurements. Today an ANSI/IEEE standard exists for measurements of electric and mag-netic fields near AC power lines. An IEC standard exists for measuring power-frequency electric fields. In addition, an IEEE standard is currently being prepared for the measurement of DC electric fields and ion related parameters near DC power lines. The paper briefly surveys the instrumentation currently in use for characterizing fields near AC power lines and the electric field, and ion current density and monopolar charge density near DC power lines.

Effect of Slag Penetration on the Mechanical Properties of Refractories: Final Report. S. M. Wiederhorn, and R. F. Krause. Jun 87, 145p

NBSIR-87/3584

Contract DE-AI05-83OR21349

Sponsored by Oak Ridge National Lab., TN.

Keywords: *Refractories, *Slags, *Coal gasification, *Corrosion, Ceramics, Mechanical properties.

The problem of selecting refractory insulation is the result of refractory lining exposure to the gasifier environment and to slag present in that environment. The ronment and to slag present in that environment. The lifetime of the refractory depends on the temperature of operation and the composition of slag at the hot face of the refractory. Higher temperatures (1500 C to 1700 C) and more corrosive slags (high alkali; high Fe) reduce the lifetime of refractories. Since slag is a uni-versal solvent for refractories, all refractories eventual-by dispetive in each lage Mouver by correspondent mate ly dissolve in coal slag. However, by appropriate materials design, the resistance of the refractory to dissolu-tion (and hence lifetime) can be increased.

Development of Standard Measurement Tech-niques and Standard Reference Materials for Heat Capacity and Heat of Vaporization of Jet Fuels. Final rept. Aug 87-May 88. J. E. Callanan. Aug 88, 33p NBSIR-88/3093 Contract F33615-85-C-2508 Sponsored by Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH. Aero-Propulsion Lab.

Keywords: *Jet engine fuels, *Specific heat, *Heat of vaporization, Measurement, Standards, Thermogravi-metry, Temperature, Heat measurement, Calori-meters, JP-4, JP-7, JP-8x.

Procedures developed in the NBS-Boulder Laboratory for heat capacity measurements of solids have been adapted successfully for the determination of liquid heat capacities. Heptane was used as a standard in the measurement of the heat capacity of three jet fuels, JP-4, JP-7, and JP-8x, from 220 to 360 K. Transi-

tions were observed in these fuels as follows (fuel, temperature): JP-4, 320 K; JP-7, 220-230 K; JP-8x, 220-240 K. Combined thermogravimetric and scanning calorimetric techniques were used successfully to measure heats of vaporization of cyclohexane, cisdecalin, and heptane. The precision of these measure-ments was better than 0.9 percent; agreement with lit-erature values was satisfactory in view of small differences between the measuring temperature and the literature values for the boiling points.

Enthalples of Desorption of Water from Coal Surfaces. Final rept.

J. E. Callanan, B. J. Filla, K. M. McDermott, and S.

A. Sullivan. 1987, 4p Pub. in Proceedings of ACS (American Chemical Soci-ety) Symposium, Division of Fuel Chemistry, Denver, CO., April 5-10, 1987, p185-188.

Keywords: *Enthalpy, *Desorption, *Water, *Coal, *Calorimeters, Surface properties, Exothermic reac-tions, Oxidizers, Porosity, Measurement, Outgassing.

An exotherm observed on the initial heating of coal, but not on subsequent heating, has been attributed to the interaction of moisture with the oxidized coal surface. This enthalpy difference has been evaluated as a function of specimen size, coal oxidation, and atmosphere within the cell. A simple procedure has been de-vised which uses a commercially available calorimeter, for measurement of enthalpies of desorption of water on coal. The method is useful, not only for coal-water interactions, but also for solvent-porous solid interactions in general.

Specific Heat Measurements of Two Premium Coals. Final rept.

J. E. Callanan, and K. M. McDermott. 1988, 6p

Pub. in Proceedings of ACS (American Chemical Soci-ety) National Meeting (194th), New Orleans, LA., August 31-September 4, 1987, p237-242 1988.

Keywords: *Coal, *Specific heat, Volatility, Thermo-physical properties, Exothermic reactions, Measurement.

Specific heats of high volatile and medium volatile coals from the Argonne Premium Coal Sample Pro-gram were measured from 300 to 520 K. The results for the premium coals did not manifest the exothermic behavior on initial runs shown by weathered coals. Qualitative and quantitative differences in the behavior of the premium coals, by comparison with oxidized coals, will be presented.

Thermophysics Div. Speed of Sound in Natural Gas Mixtures.

Final rept.

R. D. McCarty. 1986, 7p

Sponsored by Gas Research Inst., Chicago, IL. Pub. in Proceedings of International Symposium on

Fluid Flow Measurement, November 16-19, 1986, 7p. Keywords: *Natural gas, *Acoustic velocity, *Sound

Mathematical models, Density (Mass/volume), Pres-sure, Temperature, Sound waves, Mixtures.

Accurate values for the speed of sound in natural gas mixtures are important in the application of sonic me-tering devices and in many design applications. In the case of mixtures, it is not possible to obtain experimentally determined speed of sound data for all possible compositions of the pure components found in natural gases. The alternative is a mathematical model of acceptable accuracy which allows the prediction of the speed of sound at an arbitrary state point and compo-sition. The paper describes the 'state of the art' for the prediction of the speed of sound for natural gases.

Comprehensive Study of Methane + Ethane System. Final rept.

W. M. Haynes, and R. D. McCarty. 1986, 16p Pub. in Proceedings of International Symposium on Fluid Flow Measurement, Washington, DC., November 16-19, 1986, p14-27.

Keywords: *Methane, *Ethane, Mixtures, Thermody-namic properties, Transport properties, Thermal conductivity Specific heat, Viscosity, Acoustic velocity.

The paper reports on the use of the methane-ethane system as a model for developing and testing predictive techniques for mixtures. Comprehensive data have been obtained for both thermodynamic (PVT, heat capacity, sound velocity) and transport (viscosity, thermal conductivity) properties of three mixtures of methane and ethane, as well as for both components. The sound velocity and heat capacity data serve as extremely stringent tests for evaluating the performance of calculational techniques, as well as providing key information essential for optimizing the models. A critical enhancement in the thermal conductivity was observed for the system; current theory does not predict such behavior for mixtures.

The Proceedings of the Alaska Arctic Offshore Oil Spill Response Technology Workshop contains papers by keynote speakers on the following topics: Mechanical Containment and Recovery; Chemical Treatment; In-Situ Burning; Readiness; the Technology Assessment and Research Program and the OHMSETT Program; the Arctic and Marine Oil Spill Program; the Canadian Environmental Science Revolving Fund; the Alaskan Clean Seas Research and Development Program; the NOFO Program. These papers served as a stimulus to the discussions that followed in the various Panel sessions. The Panels were organized into broad research areas: Mechanical Containment; Mechanical Recov-ery; Chemical Treatment; In-Situ Burning; Readiness. Each Panel summary is included in the Proceedings and these recommendations reflect the combined input from experts in the field. The Proceedings will serve as a working document to the Minerals Manage-ment Service (MMS) to identify their future research program.

ane.

Technical note. D. G. Friend, J. F. Ely, and H. Ingham. Apr 89, 489p NIST/TN-1325

Also available from Supt. of Docs. as SN003-003-02947-5.

Keywords: *Methane, *High pressure tests, *Low tem-perature tests, *Equations of state, Thermodynamic properties, Tables(Data), Specific heat, Viscosity, Thermal conductivity, Computer programs.

The thermophysical properties of methane are tabulat-ed for a large range of fluid states based on recently formulated correlations. For the thermodynamic properties, temperatures from 91 to 600 K at pressures less than 100 MPa are included. For the viscosity, the corresponding range is 91 - 400 K with pressures to 55MPa, while for the thermal conductivity the range is 91 - 600 K with pressures to 100 MPa. In addition to the tables of properties, algebraic expressions and as-sociated tables of coefficients are given to allow addi-

tional property calculations. Tables of comparisons between experimental property determinations and the correlations are also given both for primary data used in the formulation of the correlations and for additional data. A listing of a FORTRAN program for the evaluation of methane thermophysical properties using the Schmidt-Wagner equation of state is included.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Thermophysics Div. Measurements of Molar Heat Capacity at Constant Volume: Cv,m(xCH4+(1-x)C2H6' T = 100 to 320 K,

Final rept. J. E. Mayrath, and J. W. Magee. 1989, 15p Sponsored by Gas Research Inst., Chicago, IL Pub. in Jnl. of Chemical Thermodynamics 21, p499-513 1989.

Keywords: *Specific heat, *Thermal measurement, *Thermophysical properties, *Methane, *Ethane, Mix-tures, Temperature, Density, Volume, Calorimeters, Reprints.

Measurements of the molar heat capacity at constant volume Cv,m(XCH4+(1-X)C2H6, X=0.35, 0.50, 0.68) at temperatures from 100 K to 320 K and at pressures to 35 MPa are reported. Heat capacities have been measured for 626 state conditions and these measure-ments complement thermodynamic and transport-property measurements previously reported for the same mixtures. The measurements were made on samples of constant mass contained by a calorimeter vessel of nearly constant volume. Uncertainties of the heat-capacity measurements are estimated to be less than 2.0%. Critical enhancement of heat capacity for each mixture is apparent in the critical-temperature region for constant density and similarly in the critical-density region for constant temperature. Liquid heat capacities at saturation, obtained by extrapolation at constant density, have a minimum for each composition occurring at twice the estimated critical density.

National Bureau of Standards (NML), Gaithersburg, MD. Chemical Thermodynamics Div. Evaluation of Data on Higher Heating Values and Elemental Analysis for Refuse-Derived Fuels.

Final rept.

T. J. Buckley, and E. S. Domalski. 1988, 8p Sponsored by Department of Energy, Washington, DC. Biofuels and Municipal Waste Technology Div.

Pub. in Proceedings of National Waste Processing Conference, Philadelphia, PA., May 1-4, 1988, p77-84.

Keywords: Experimental design, Numerical analysis, Error analysis, *Refuse derived fuels, *Heating rate, *Multi-element analysis, Waste utilization, Data bases, Interlaboratory comparisons.

Elemental analyses and higher heating values taken from ASTM Round Robin Testing of RDF-3 have been evaluated. The data base was composed of five rounds of tests with eight to twelve laboratories performing four tests each. The authors found that established formulas can be used to calculate higher heat-ing values on a moisture free basis (HHV2) from elemental analysis. A comparison is made between sev-eral methods of calculating HHV2. The Dulong formula and Institute of Gas Technology formula can predict HHV2 to within 3%.

Final rept.

E. R. Kweller. 1986, 19p Sponsored by Department of Energy, Washington, DC. Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Transactions, v92 pt2B p239-257 1986.

ENERGY

Heating & Cooling Systems

Keywords: *Test facilities, Natural gas, Propane, Fuel consumption, Standards, Tests, Thermal efficiency, Reprints, *Catalytic heaters, *Combustion tests, Appliance Efficiency Test Procedures.

Both vented and unvented designs of catalytic heaters using natural gas and propane as the fuel were tested by three test methods. The objective of the study was to determine an appropriate laboratory test method for determining the percentage of unreacted fuel during typical heater use. Results of the study are expected to be useful for manufacturers who are currently developing an ANSI standard for catalytic heaters and by the Department of Energy for their Appliance Efficiency Test Procedures. Results showed that an analytical approach of calculating unreacted fuel using a carbon balance was equivalent to an empirical method. Re-sults of tests in two open-room test methods and one closed room test method showed that the methods to use will depend on whether the heater is vented or un-vented. A closed room method was shown to yield results consistent with those obtained by open-room methods for the unvented heater, and may be used in place of an open-room method if the room oxygen is not depleted below 19% as an end-point of the test. A completely sealed test room was found to be unnecessary for this closed room test.

Thermal and Economic Analysis of Three HVAC (Heating, Ventilating, and Air Conditioning) System Types in a Typical VA (Veterans Administration) Patient Facility.

G. N. Walton, and S. R. Petersen. Aug 87, 59p NBSIR-87/3619

Sponsored by Veterans Administration, Washington, DC. Office of Facilities.

Keywords: *Thermal analysis, *Economic analysis, *Hospitals, *Military facilities, Computerized simulation, Radiant heating, Environmental engineering, Tables(Data), *Energy analysis, *HVAC systems, Energy demand, Variable air volume systems, Fan coil systems, Life cycle costs.

Thermal and economic analyses were performed for three different types of heating, ventilating, and cool-ing systems for a patient room in a typical VA patient facility in each of four locations. Thermal analysis was done with the U.S. Army's Building Loads Analysis and System Thermodynamics (BLAST) energy analysis program. Radiant panel, variable air volume (VAV), and fan coil systems were simulated. Some subrou-tines were developed and added to the BLAST pro-gram in order to simulate the radiant panel system. The predicted energy requirements, energy cost pro-inctione and existence activity were then outputted uping jections, and system costs were then evaluated using the NBS Federal Building Life-Cycle Cost (FBLCC) program to determine the 20-year life-cycle cost of each system in each location.

MD. Building Equipment Div. Part Load, Seasonal Efficiency Test Procedure Evaluation of Furnace Cycle Controllers. Final rept.

R. A. Wise, and E. R. Kweller. 1986, 11p

Sponsored by Department of Energy, Washington, DC. Pub. in ASHRAE (American Society of Heating, Refrig-erating and Air-Conditioning Engineers) Transactions, v92 pt2B p674-684 1986.

Keywords: *Furnaces, *Performance standards, Thermostats, Thermal efficiency, Heating load, Tests, Tem-perature control, Reprints, Energy consumption, Energy conservation.

Claims of energy savings of 20 to 40% for space heating have been made by marketers of rapid cycling furnace controllers (cyclers). The present testing method of ANSI/ASHRAE 103-1982 can not be used to evaluate the heating seasonal efficiency of furnaces or boilers should they be installed using cyclers. To develop a test method that will reflect possible changes in effi-ciency, NBS has tested a furnace under various cycling conditions. A supply air temperature based cycler was tested, time based unit was simulated, and the test results were compared to results using simulated standard thermostat control. The comparisons were made using cycles corresponding to the average outdoor air temperatures of four weather condition bins of

approximately the same total heating hours. A test method has been developed which can evaluate the effect of cyclers on furnace efficiency. No proposal is made to use this method because: the test is more difficult to perform and replicate, change would require retesting of all furnaces and destroy the present data base of past test results, and changes in furnace efficiency attributable to cyclers were too small to justify a change.

F. D. Martzloff. Jun 89, 78p NISTIR-89/4113 Sponsored by Sandia National Labs., Albuquerque, NM.

Keywords: *Photovoltaic cells, *Lightning, *Surges, *Circuit protection, Overvoltage, Overcurrent, Light-ning protection, *Solar cell arrays.

Two installations of photovoltaic systems were damaged during lightning storms. The two sites were vis-ited and the damaged equipment that was still available on the site was examined for analysis of the suspected occurrence. The evidence, however, is insufficient to conclude that all the observed damage was caused by the direct effect of a lightning flash. A possi-ble scenario may be that lightning-induced overvoltages caused insulation breakdown at the edges of the photovoltaic modules, with subsequent damage done by the dc current of the array. Other surge protection considerations are also addressed, and suggestions presented for further investigations.

Final rept.

M. E. McCabe. 1986, 9p Sponsored by Department of Energy, Washington, DC. Office of Solar Heat Technologies. Pub. in Proceedings of Joint AIAA/ASME (American Detitute American

Institute of Aeronautics and Astronautics/American Society of Mechanical Engineers) Thermophysics and Heat Transfer Conference, Boston, MA., June 2-4, 1986, 9p

Keywords: *Conduction, *Heat transmission, *Phase transformations, *Cylinders, Flux(Rate), Thermophysical properties, Heat of fusion, Diurnal variations, Enthalpy, Specific heat, Solar heating, *Thermal energy storage equipment.

The thermal performance of an energy storage system subjected to a time dependent flux representing the 24-hour diurnal cycle of the sun is discussed. The gov-erning mathematical equations are presented for a cy-lindrical configuration and a numerical solution based on the enthalpy model is used to obtain the temperature distribution and phase interface location in a phase change energy storage system. The steady-periodic solution is investigated to determine the effects of cylinder size, fusion temperature and thermophysical properties on the thermal performance of a radiatively charged/convectively discharged energy storage system in a passive solar heated building. The relationship between fusion temperature and the mean surface temperature is shown to be critical for storage of energy. The numerical results show that maximum energy storage and minimum surface temperature variation occur when the cyclic mean surface temperature equals the fusion temperature.

Keywords: *Potential energy, *Ions, Research projects, Electric fields, Activity coefficients, Charged particles, Transmission lines, Atmospheric pressure, Measurements, Charge density, Gas cylinders, Sto-chastic processes, Dielectrics, Hydrostatic pressure, Transients.

Reported is technical progress in four investigations conducted at NIST and supported by the U.S. Depart-ment of Energy under Task Order Number 137. The first investigation is concerned with the measurements of electric fields and ions in the vicinity of high-voltage transmission lines and biological exposure facilities. Results are reported on evaluations of two methods for measuring monopolar charge densities in air. The second investigation is concerned with development of advanced diagnostics for compressed gas-insulated power systems. Results are reported on measure-ments of collisional electron detachment and negative ion conversion reactions in SF6 and on a new techlique for measuring the stochastic behavior of partial discharges. The third investigation is concerned with

measurement of prebreakdown phenomena at solidliquid dielectric interfaces. Results are presented here from optical observations of the influence of hydrostatic pressure on prebreakdown partial discharge devel-opment and measurement of nano-second impulse breakdown at liquid-solid interfaces. The fourth area of research is concerned with electrical measurement of fast transient phenomena. Results are presented from an investigation into the interactions between two dividers used simultaneously to measure fast impulse voltages.

Carbon Dioxide Following Acute Inhalation Exposures In Rats.

B. C. Levin, M. Paabo, L. Highbarger, and N. Eller. May 89, 45p NISTIR-89/4105 Sponsored by Society of the Plastics Industry, Inc.,

New York.

Keywords: *Air pollution, *Carbon dioxide, *Nitrogen dioxide, *Rats, Toxicology, Respiratory diseases, Oxi-dizers, Hemoglobins, Exposure, Blood, Mortality, Air pollution control, Standards, Methemoglobins, Fire dases.

All fires occurring in air produce carbon dioxide (CO2). Fire involving nitrogen-containing products will also generate nitrogen dioxide (NO2), a pulmonary irritant. In Fischer 344 male rats, the LC50 (30 minute exposure plus 14 day post-exposure observation period) for NO2 was 200 ppm (with 95% confidence limits of 43 to 51%); whereas, the LC50 for NO2 in the presence of 5% CO2 was 90 ppm (with 90% confidence limits ranging from 70-120 ppm). Exposure to NO2 in-creased the methemoglobin (MetHb) levels in the arte-rial blood. At the end of the 30 minute exposures, the MetHb levels were 2-3 times higher in the animatic exposures, the posed to the combination of NO2 (200 ppm) and CO2 (5%) than in those exposed to NO2 only. Deaths from NO2 were all post-exposure and occurred earlier in the presence of NO2 plus 5% CO2 than in the absence of the CO2. The time of death was concentration-dependent when both gases were present. At death, evi-dence of hemorrage and extensive edema was observed in the lungs. The mean lung wet weight/body weight ratio from rats exposed to 200 ppm NO2 with and without 5% CO2 was 3-4 times that of non-exposed rats. More edema was noted with NO2 and CO2 than with NO2 alone.

Suspended particulate matter samples were collected by high-volume samplers in a heavily traveled roadway tunnel to characterize the mobile source emissions (diesel- and gasoline-fueled vehicles) for polycyclic aromatic hydrocarbons (PAHs). Liquid and gas chromatographic techniques were employed to isolate and quantify individual PAHs in dichloromethane extracts of Teflon and glass-fiber filters. Mobile-source PAH emission estimates were generated from the particleand vapor-phase samples collected in the tunnel and agree with emission estimates reported previously for roadway tunnels in Japan. Factor analysis of PAH concentrations from 47 filter samples yielded two factors; one which possibly represented the diesel-fueled vehicles (heavy-duty trucks) and the other, either gasolinefueled vehicles or a composite of the gasoline and diesel sources.

Pub. in Jnl. of High Resolution Chromatography and Chromatography Communications 11, p761-766 Nov 88

Keywords: *Aromatic polycyclic hydrocarbons, *Parti-cles, *Combustion products, *Stoves, Sources, Resi-dential building, Exhaust emissions, Automobiles, Chemical analysis, Chromatographic analysis, Atmos-pheric composition, Reprints, *Air pollution detection, *Air pollution sampling, *Wood burning appliances, Coal combustion, Fairbanks(Alaska).

Samples were taken of the atmospheric particulate matter over Fairbanks Alaska in the winter of 1985, and from wood stoves burning the major wood types locally available. These samples were then analyzed for polycyclic aromatic hydrocarbon (PAH). A PAH emission profile was determined from the wood stove samples and applied to the atmospheric samples to determine the residential wood combustion contribution to the local atmospheric particulate burden. Emission profiles for coal burning and automobile emis-sions for PAH were also used to estimate their relative contributions.

Fundamental Aspects of Key Issues In Hazardous Waste Incineration. Final rept.

W. Tsang. 1986, 6p Pub. in Proceedings of ASME (American Society of Mechanical Engineers) Winter Annual Meeting, Ana-heim, CA., December 7-12, 1986, 6p.

Keywords: *Hazardous materials, *Waste disposal, *Incineration, *Pyrolysis, Reaction kinetics, Oxidation, Chemical reactions, Performance evaluation.

The incineration of hazardous waste is considered from the point of view of its important chemical reac-tions. The authors begin with a brief review of the earlier work on destruction mechanisms and expand it by allowing for regions where pyrolytic reactions are im-portant. The authors then discuss the quantitative rela-tionship between destruction efficiency and the appro-priate rate constants for hazardous waste destruction. This leads into considerations of the products of in-complete combustion and the author describe in qualitative terms the type of compounds that can be expected. The concept of surrogates is discussed. The authors consider recent results on OH attack on or-ganics near levels of CO usually observed in various types of incinerators, and conclude that there is a high probability that the organics in the incineration effluent stream are formed by pyrolysis mechanism. Finally the authors suggest a number of measures for validating proper incinerator operation.

Not available NTIS PB89-173827 National Bureau of Standards (NEL), Gaithersburg, MD. Statistical Engineering Div. Designs for Assessment of Measurement Uncer-

tainty: Experience in the Eastern Lake Survey.

W. S. Liggett. 1986, 15p Sponsored by Corvallis Environmental Research Lab.,

Pub. in Proceedings of International Biometric Conference: Invited Papers (13th), Seattle, WA., July 27-August 1, 1986, p1-15.

Keywords: *Lakes, *Error analysis, *Environmental surveys, Quality assurance, Statistical analysis, As-sessments, Probability theory, Chromatographic anal-ysis, Inorganic nitrates, Sulfates, Performance evalua-tion, United States, *Water pollution sampling.

As is typical of environmental studies, the Eastern Lake Survey generated data that reflect both properties of the environment and properties of the sampling and measurement procedures. Thus, environmental conclusions cannot be drawn from these data without assessment of the sampling and measurement error. The paper shows how the properties of ion chromatog-raphy affect the nitrate and sulfate measurements in the survey. The investigation, which is based on measurements of routine-duplicate samples, field blanks, and field audit samples, is interesting because of its complexity. The measurement error has a within-day component and a day-to-day component. The variance of the within-day component increases linearly with concentration except near zero where the algorithm used to interpret the chromatographs seems to behave poorly. The day-to-day component depends on the calibration procedure. As an example, this in-vestigation illustrates the strengths and weaknesses of some common designs for uncertainty assessment.

Keywords: *Fuel oil, *Combustion products, *Water pollution, *Fires, *Aerosols, Tanker ships, Measure-ment, Smoke, Aromatic hydrocarbons, Air flow, Off-shore drilling, Graphs(Charts).

The report contains the results of measurements per-formed on both 0.4 m and 0.6 m diameter pool fires

produced by burning a layer of Prudhoe Bay crude oil supported by a thermally deep layer of water. Both steady and vigorous burning caused by boiling of the water sublayer were observed. The measured energy release rate for steady burning was about 640 kW per sq meter. The emission rate, the size distribution, and specific extinction coefficient were measured for the smoke aerosol produced by the fires. Data were also obtained on the structure of the smoke aerosol by electron microscopy and on emission of CO and CO2. Analysis of the crude oil burn residue indicated selected depletion of the short chain alkanes and cycloalkanes when compared to the fresh oil. Mono-ring aro-matics including benzene, toluene, and xylenes present in the fresh crude were absent in the burn residue. Calculations of the induced air flow into a simulat-ed distribution of 20 fires over a 100 m x 100 m area showed that the maximum inflow velocity near the largest size fire (2.5 m diameter, 3.2 MW) was 1.1 m/s.

PB89-229280 Not available NTIS National Inst. of Standards and Technology (IMSE), Gaithersburg, MD. Polymers Div. Biotransformation of Mercury by Bacteria Isolated from a River Collecting Cinnabar Mine Waters. Final rent Final rept.

F. Baldi, M. Filippelli, and G. J. Olson. 1989, 12p Pub. in Microbial Ecology 17, p263-274 1989.

Keywords: *Aerobic bacteria, *Mercury inorganic com-pounds, *Water pollution, Mercury ore deposits, Rivers, Reprints, *Mine waters, *Biotransformation, Resistance(Biology).

One hundred six strains of aerobic bacteria were isolated from the Fiora River which drains an area of cinnabar deposits in southern Tuscany, Italy. Thirty-seven of the strains grew on an agar medium containing 10 microg/ml Hg (as HgCl2) with all of these strains pro-ducing elemental mercury. Seven of the 37 strains also degraded methylmercury. None of 106 sensitive and resistant strains produced detectable monomethyl-mercury although 15 strains produced a benzene-solu-ble mercury. ble mercury species. Two strains of alkylmercury (methyl-, ethyl- and phenylmercury) degrading bactena were tested for the ability to degrade several other analogous organometals and organic compounds, but Mercury methylation is not a mechanism of Hg resist-ance in aerobic bacteria from this environment. Growth of bacteria on the agar medium containing 10 microg/ml HgCl2 was diagnostic for Hg detoxification based on reduction.

Environmental Standard Reference Materials -Present and Future Issues. Final rept.

S. D. Rasberry. 1988, 9p

Pub. in Proceedings of International Symposium on Trace Analysis in Environmental Samples and Stand-ard Reference Materials, Honolulu, HI., January 6-8, 1988, p62-66-4.

Keywords: *Environmental surveys, *Chemical analy-sis, Measurement, Chemical properties, Physical prop-erties, Quality assurance, Forecasting, *Standard ref-erence materials, Certified reference materials.

Accurate measurements are an important consider-ation in environmental analysis. The National Bureau of Standards (NBS) provides several types of services or Standards (NBS) provides several types of services to aid analysts in obtaining accurate measurements and in validating the accuracy of measurement meth-ods and measurement systems. The most well known of these services is Standard Reference Materials (SRMs), which are well-characterized, homogeneous materials or simple artifacts with specific chemical or physical properties certified by NBS. There are several hundred SRMs in support of environmental chemists covering inormanic constituents in water covering inorganic and organic constituents in water, air, sediments, rocks, plant and animal materials. At tention is given to providing SRMs which closely ap-proximate the matrix being analyzed in a specific envi-ronmental application. The extremely wide range of environmental matrices makes it economically unfeaenvironmental matrices makes it economically unfea-sible for the NBS to offer nearly exact matches the every matrix. For this reason, analysts frequently should use more than one SRM in a 'benchmark-bracketing' way to validate their analytical methods. Non-matrix specific SRMs, such as single element spectrometric solutions, are also available for instru-ment calibration or validation.

For the past 10 years, the National Institute of Standards and Technology has been involved in environ-mental specimen banking activities. These activities have resulted in the development of collection, storage, processing, and analysis procedures for long-term archiving of a variety of environmental specimens including human liver, fish muscle and liver, oysters, mussels, sediment, and seal tissues. In the paper, the authors describe some of the experiences and results from these efforts as related to environmental trend monitoring and the potential value of a specimen bank for future retrospective analyses.

Fire Propagation in Concurrent Flows.

Final rept. A. C. Fernandez-Pello. Jan 89, 67p NIST/GCR-89/ 557

Grant NANB-7-D0737

See also PB86-181849. Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Air flow, *Flame propagation, *Fire tests, Flames, Heat transfer, Combustion, Turbulence, Fuels, Gases, Flammability, *Rooms.

The research tasks completed during this reporting period include an experimental study of the effect on the spread of flames of the turbulence intensity of an opposed air flow, and a theoretical analysis of the con-current spread of flames over thin fuels. Both studies are in the authors opinion important contributions in the study of the flame spread process. The results of the experimental study show that the flame spread process is significantly affected by the flow turbulence intensity for flames spreading over both thin and thick fuels. For a fixed flow velocity, the spread rate de-creases as the turbulent intensity is increased. This appears to be due to the turbulent convective cooling of the fuel surface and gas in the vicinity of the flame front. Also observed is that extinction of the flames occurs at lower velocities as the turbulent intensity increases. The results of the theoretical analysis, which are in good agreement with previous experimental measurements, give detailed information about the flame structure and mechanisms of flame spread. It is shown that the flame length and consequently the rate

of flame spread, are strongly dependent on the interaction between the pyrolysis and burn-out fronts.

Smoke and Gas Evolution Rate Measurements on Fire-Retarded Plastics with the Cone Calorimeter. Final rept.

V. Babrauskas. 1989, 8p Pub. in Fire Safety Jnl. 14, p135-142 1989.

Keywords: *Plastics, *Flammability testing, *Fire re-sistant materials, Smoke, Reprints, *Cone calorimeter.

The cone calorimeter was developed originally for making improved rate of heat release measurements. The basic design has proved to be highly versatile, al-lowing it to become a suitable test bed for making smoke and gas evolution studies. The smoke measurement procedures with the cone calorimeter have recently been published by ASTM as a proposed method. Gas evolution measurements are still at the research laboratory stage, but are being actively developed, with a strong role being seen in the near future for both fire modeling and combustion toxicity. The techniques evolved are seen to be especially useful for comparing fire-retarded materials to non-retarded ones.

B. C. Levin, M. Paabo, J. L. Gurman, and S. E. Harris. 1986, 18p Sponsored by Army Medical Research Inst. of Chemi-cal Defense, Aberdeen Proving Ground, MD., and So-ciety of the Plastics Industry, Washington, DC. Pub. in Proceedings of SPI and FRCA Joint Meeting, Washington, DC., March 19-21, 1986, p71-88.

Keywords: *Toxicity, *Fires, *Gases, Fire hazards, Carbon dioxide, Carbon monoxide, Hydrogen cyanide, Concentration(Composition), Lethal dose 50.

The Center for Fire Research is developing a computer model to predict the toxic hazard that people will experience under various fire scenarios. The toxicity of single and multiple fire gases is being studied to deter-mine whether the toxic effects of a material's combustion products can be explained by the biological interactions of the primary fire gases or, if minor, more ob-scure gases need to be considered. LC50 values for Fisher 344 rats have been calculated for carbon monvside (CO) in air for 2, 5, 10, 30, and 60 minute expo-sures using the NBS Toxicity Test Method. LC50 values have also been calculated for hydrogen cya-nide (HCN) in air for similar time periods, plus one minute exposures. Combination experiments with CO and HCN indicate that they act in an addictive manner. A preliminary comparison of the concentrations of the major combustion products generated from some ma-terials tested at their LC50 values with the combined gas results indicates that the observed toxicity for these materials appear to be explained by the biologi-cal interactions of the primary toxic fire gases.

Interpretation of a between-Time Component of Error in Mass Measurements. Final rept.

R. S. Davis. 1987, 7p

Pub. in Proceedings of Measurement Science Conference, Irvine, CA., January 29-30, 1987, plll-B(1)-III-B(7) 1987.

Keywords: *Error analysis, *Reliability, Measuring instruments, Metrology, Random error, Mathematical models, *Between-time error, *Calibration errors, Mass measurement.

Detection of a between-time component of error in a calibration process involves analysis of a lengthy record of data. An individual object or device which is being calibrated must be returned to the customer in a timely way. Therefore, evidence of a between-time component of error can only be inferred from studies of standards which are internal to the calibration facility. If study of internal standards reveals such an error component, it then becomes necessary to propagate this error to the reported calibration uncertainty. Because sophisticated calibrations usually involve measurement designs which are solved by least squares techniques, the propagation of a between-time error component is obscured. In order to examine such propagation it is necessary to choose a mathematical model which can account for the observed effects. Since choice of this model has a profound effect on the analysis, the metrologist must be aware of its implications. These considerations are illustrated by a real example from precision mass metrology.

Special Calibration Systems for Reactive Gases and Other Difficult Measurements. Final rept.

W. D. Dorko, and E. E. Hughes. 1987, 6p Pub. in ASTM (American Society for Testing and Mate-rials) Special Technical Publication 957, p132-137 1987

Keywords: *Measuring instruments, *Gas analysis, Gas chromatography, Measurement, Reliability, *Reactive gases, *Calibration standards.

The most popular method for analyzing a component of interest in a gas mixture is to use a detector which responds to the analyte and is calibrated directly with a cylinder gas mixture containing the analyte at the ap-proximate concentration of interest. In many in-stances, however, this cannot be achieved; cylinder calibration mixtures may be unstable or the direct response detector may not be sensitive enough. The unstable cylinder mixture can be replaced by a dynamic dilution gas calibration system where the analyte can be introduced to any one of several means including permeation devices, or a higher concentration gas mixture which can be more easily stabilized. If the detector for the analyte is insensitive or difficult to calibrate then the analyte can be converted to another compound for which there is a detector which is sufficiently sensitive and easy to calibrate. Any system which will produce a mixture of the required concentra-

Keywords: *Calibrating, *Measuring instruments, Standardization, X rays, Gamma rays, Quality control, *Instrument compensation, Computer software.

To provide the quality assurance necessary for secondary-level laboratories, a computer program has been developed for use by state-sector laboratories calibrating instruments used in x-ray and gamma-ray fields. Although specific to the equipment in statesector laboratories, the basic procedures are also applicable to secondary-level laboratories in the private and federal sectors. The program is written in a com-piled BASIC. After the initial program selection, options are menu driven. There are specific programs for each of the classes of instruments calibrated by these lab-oratories. They perform the routine quality control on all of the pertinent equipment used for calibrations and make the measurements to characterize the laborato-ry, which are necessary for the uncertainty analysis and generation of the final report.

MD. Building Physics Div. Circular and Square Edge Effect Study for Guarded-Hot-Plate and Heat-Flow-Meter Apparatuses. Final rept.

B. Peavy, and B. Rennex. 1986, 7p Pub. in Jnl. of Thermal Insulation 9, p254-300 Apr 86.

Keywords: *Heat flow meters, *Size determination, *Shape, *Heat transmission, Circles(Geometry), Squares(Geometry), Thermal insulation, Thermal re-sistance, Thermal conductivity, Mathematical models, Reprints, *Edge effect, *Guarded hot plate.

The guarded-hot-plate apparatus measures thermal resistance across thermal insulation specimens. The measurement of very thick specimens results in an edge error due to the loss of some of the centrally metered heat to the peripheral ambient surrounding the specimen. To choose the appropriately sized appara-tus for a particular test, it is important to know the order of magnitude of this edge error as a function of specimen thickness. The report defines the edge effect, derives a model for its calculation for both circular and square geometries, and indicates graphically the sensitivity of the edge-effect curves (as a function of thickness) with respect to the following parameters: the ratio of the guard to metered sizes, the metered size itself, the ratio of the surface heat transfer coefficient to the specimen apparent conductivity, and the apparent-thermal-conductivity anisotropy. The results of the square metered area are compared with those of the circular metered area, and the theoretical results are compared with experimental results for a circular geometry (using a 1-m guarded hot plate).

Laboratory Accreditation Systems in the United States, 1984. Final rept.

W. Locke. 1984, 13p
 Pub. in Proceedings of Workshop and Symposium of the National Conference of Standards Laboratories, Gaithersburg, MD., October 1-4, 1984, p29-1-29-13.

Keywords: *Laboratories, *Test facilities, Measure-ment, Standards, *Accreditation, Calibration.

Laboratory accreditation in the United States is grow-ing as is demonstrated by the comparison of the newest survey conducted for the NBS Office of Prod-uct Standards Policy by the Marley Organization with the original study completed in 1979. The largest inter-est in accreditation comes from administrators of gov-ernment funded programs (e.g. health care and de-tance) hear accurate masurement is peeded to jusfense) where accurate measurement is needed to justify payment of fees or contracts. There is a growing interest in accreditation by some product marketeers since the use of test data from accredited testing laboratories in specific areas can help sell products. There is little thrust toward developing a coordinated accreditation system to serve all users, although the continuing increase in the number of accreditation systems and laboratories seeking accreditation and the

expansion of export markets will tend to encourage such coordination. Verification of calibrations is important in most accreditation systems and is emphasized in defense systems, but in no case is the identification of uncertainties throughout the chain of measurement required.

Keywords: *Heat flow meters, *Size determination, *Shape, *Thermal measuring instruments, *Heat transmission, Circles(Geometry), Squares(Geometry), Thermal insulation, Thermal resistance, Thermal con-ductivity, Mathematical models, Reprints, *Edge effect.

The report provides the information necessary to choose the appropriate apparatus size for a measurement of thermal resistance of a specimen of insulation material of a particular thickness. The information con-sists of the order of magnitude of apparatus edge error as a function of specimen thickness. The report defines the edge effect; derives a model for its calculation for both circular and square geometries, and indi-cates graphically the sensitivity of the edge-effect curves (as a function of thickness) with respect to the following parameters: the ratio of the guard to metered sizes, the metered size itself, the ratio of the surface heat transfer coefficient to the specimen apparent conductivity, and the apparent thermal-conductivity anisotropy. The results of the square metered area are compared with those of the circular metered area, and the theoretical results are compared with the expenmental results for a circular geometry (using a 1-m guarded hot plate).

Final rept.

B. F. Payne. 1986, 7p Pub. in Proceedings of International Instrumentation Symposium on Instrumentation in the Aerospace Industry (32nd), Seattle, WA., May 5-8, 1986, p1-7.

Keywords: *Accelerometers, *Vibration meters, *Transducers, Automation, *Laser interferometers, *Calibration, Computerized control systems.

Low frequency accelerometers and velocity transduc-ers are widely used for vibration investigations on structures such as buildings, bridges, aircraft, ships, power plant equipment, and seismic applications. Pre-vious work in this area has focused on the development of accurate calibration methods for transducers by optical methods in the frequency range of 2-100 Hz. The paper describes a computer-controlled fringe counting system for transducer calibration. The calibration system uses digital signal analysis for accurate

low frequency voltage measurements. The measure-ment procedures are fully automated, with menu driven programs using the computer soft keys for controlling the test frequencies, acceleration levels, set-ting test parameters, collecting and storing data and producing reports and graphs. An error analysis is given and experimental data are presented for transducer calibrated on this system.

Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Gas and Particulate Science Div. Precision and Accuracy Assessment Derived from

Calibration Data. Final rept.

H. L. Rook. 1987, 6p Pub. in ASTM (American Society for Testing and Mate-rials) Special Technical Publication 957, p81-86 1987.

Keywords: *Precision, *Accuracy, *Assessments, Data processing, Error analysis, Bias, Standards, Re-prints, *Calibration.

During the past ten years, the importance of assessing the precision and the accuracy of data derived from standard methods has become recognized. Both ASTM and EPA have developed policies requiring pre-cision and accuracy assessment for methods before they are designated as standard methods or reference methods. The difficulty in implementing these policies is not in developing a meaningful error estimate for a given method, it is in separating the random from the systematic components of the error. In the paper, a method of separating error components into precision and bias is given. The method uses calibration data taken repeatedly at a fixed point using a standard whose total uncertainty is small compared to the uncertainty of the measurement method.

Calibration with Randomly Changing Standard Curves.

Final rept. D. F. Vecchia, H. K. Iyer, and P. L. Chapman. 1989, 8p

Pub. in Technometrics 31, n1 p83-90 Feb 89.

Keywords: *Measuring instruments, Statistical sam-ples, Regression analysis, Calibrating, ples, Regression analysis, Calibra Curves(Graphs), Reprints, *Calibration standards.

Changes in calibration curves from one time to the next caused by drift often require measuring devices to be recalibrated at frequent intervals. In such situations. the usual practice is to estimate the unknown values of test samples using only data from the corresponding calibration period. Under a random coefficient regres-sion model for the different calibration curves, howev-er, it can be shown that it is more efficient to combine the data from all calibration periods to estimate the unknowns. The authors consider a particular class of point estimators obtained by inverting suitable predic-tion functions and show that the estimator obtained from a best prediction function is optimal in a sense defined by Godambe and Durbin in the context of unbiased estimating equations. The small sample performance of the estimator is compared with the usual estimator using the Pitman closeness criterion.

Sponsored by Gas Research Inst., Chicago, IL. Pub. in American Gas Association Operating Section Proceedings, Toronto, Canada, May 16-18, 1988, p492-495

Keywords: *Gas flow, *Test facilities, *Flow measure-ment, Performance, Efficiency, Gas pipelines, Temper-ature, Flowmeters, Precision, Reprints.

Major modifications have been made to the gas flow facility at the National Bureau of Standards in Boulder, Colorado. Significant improvements in steady state operation and overall efficiency have resulted. Variability in the gas temperature has been decreased by a factor of five and the precision of performance data on flowmeters has increased by a factor of two. The massbased facility provides the gas industry with an accu-rate, efficient, and precise research facility operating at pipeline conditions.

Stability of the SI (International System) Unit of Mass as Determined from Electrical Measurements.

Final rept. R. S. Davis. 1989, 2p

Pub. in Metrologia 26, p75-76 1989.

Keywords: *Mass, *Standards, *Electrical measurement, Precision, Test facilities, Stability, Reprints, Calibration standards.

The apparatus developed by Kibble at the National Physical Laboratory has recently achieved an uncer-tainty smaller than 1 x 10 to the minus seventh power in measuring the ratio between the electrical watt as maintained and the watt as defined in the International System (SI). Since there is reason to anticipate further experimental improvements, the possibility of monitor-ing the stability of the SI unit of mass (the kilogram) through such an apparatus is being seriously discussed. The kilogram is the only remaining base unit of the SI still defined by an artifact. The letter points out that electrical measurements even now provide the most critical test of the long-term stability of the SI unit of mass.

Keywords: *Temperature measuring instruments, *Thermistors, *Thermal conductivity, Thermal resist-ance, Thermophysical properties, Liquids, Thermal measurements, Mathematical models, Calibrating.

A transient technique was validated for making thermal conductivity measurements. The technique incor-porated a small, effectively spherical, heat source and temperature sensing probe. The actual thermal conductivity measurements lasted 30 seconds. After ap-proximately 15 minutes of data reduction, a value for thermal conductivity was obtained. The probe yielded local thermal conductivity measurements. Spherical sample volumes less than 8 cu cm were required for the materials tested. Thermal conductivity (and moisture) distributors can be measured for relatively dry or wetted samples.

The document describes the calibration services for thermocouples and thermocouple materials presently thermocouples and thermocouple materials presently provided by the NIST at temperatures from -210 to 2100 C. Three general calibration methods used at NIST, which provide traceability to the International Practical Temperature Scale of 1968, are outlined in detail. Consideration is given primarily to the calibra-tion of type S (platinum-10% rhodium versus platinum) thermocouples at defining fived points of the JPTS-68 thermocouples at defining fixed points of the IPTS-68 as standard instruments, and to the calibration of other letter-designated type thermocouples (types B, R, S, E, J, K, N, and T) by comparison with a calibrated reference thermocouple and by comparison with a standard platinum resistance thermometer. The procedures followed to maintain internal quality control of appara-tus and standards in the NIST thermocouple calibration laboratories are covered, and statistical assess-ments of the uncertainties involved in the calibrations of type S thermocouples by the fixed-point method and by the comparison method are presented.

Final rept. C. R. Tilford, R. W. Hyland, and S. Yi-Tang. 1988, 9p Pub. in Proceedings of Seminar on High Pressure Me-trology, Paris, France, May 24-25, 1988, p105-113.

Keywords: *Pressure measurement, Manometers, Standards, Gases, *Piston gages, Effective area.

Using a mercury manometer, the authors determined the effective areas of different gas-operated piston gages as a function of pressure, mode of operation (absolute or differential), and gas species. They have observed changes in the effective area of individual gages that vary from zero to 25 ppm as these param-eters are changed. Over the 5-160 kPa range of these experiments, changes in the geometry of the pistons and cylinders cannot explain these effects. These re-sults demonstrate the need for a more refined theory of the interaction of the pressure fluid and the piston? of the interaction of the pressure fluid and the piston/ cylinder. Until that is available, effective areas of primary standard piston gages calculated on the basis of geometric factors alone can have significant uncertainties.

Final rept. B. E. Weich, R. E. Edsinger, V. E. Bean, and C. D. Ehrlich. 1988, 14p Pub. in Proceedings of Seminar on High Pressure Standards, Paris, France, May 24-25, 1988, p81-94.

Keywords: *Pressure measurement, Helium, Neon, Ni-trogen, Argon, Krypton, Carbon dioxide, *Piston gages, Effective area.

The effective areas of four gas-operated piston gages have been determined by the pressure calibration technique with a state-of-the-art manometer using both helium and nitrogen in the absolute mode. For all four gages, the effective areas with nitrogen are great-er than the effective areas using helium. The differer than the effective areas using helium. The differ-ences range from 4 to 28 parts-per-million. Pairs of these gages have been cross-floated in both the gage and the absolute modes with helium, neon, nitrogen, argon, carbon dioxide, and krypton. For a given gas, the effective area in the absolute mode is greater than that for the gage mode. The magnitude of the differ-ence is dependent upon the species of gas.

intercomparison of Load Ceil Verlfication Tests Performed by National Laboratorles of Five Countries. Final rept.

R. A. Mitchell, S. L. Yaniv, K. Yee, and O. K. Warnlof. Aug 89, 124p NISTIR-89/4101

Keywords: *Load cells, *Verifying, Measuring instru-ments, Temperature, Weight indicators, Mass, Test fa-cilities, Metrology, *Calibration standards, International cooperation.

A round-robin intercomparison of OILM IR 60 load cell verification tests, as performed by national laborato-nes of five countries, is reported. The five participating countries were Australia, the Federal Republic of Ger-many, the Netherlands, the United Kingdom, and the United States. Six OIML Class C load cells, ranging in Comparability of the results from any one laboratory rise caucity from 18 kg to 25000 kg, were tested by the five laboratories. The objective was to determine the comparability of the results from the verification test processes of the five laboratories, so that the laboratory rise could accept the results from any one laboratory and avoid the cost of retesting. Overall, the test results indicate reasonably good agreement among the five laboratories in the measurement of most of the char-acteristics of the six load cells. The degree and pattern of the differences in the results can serve as a guide to making refinements in the verification test processes.

The objective of the research program is to produce improved flowmeter performance when meters are in-stalled in 'non-ideal' conditions. This objective is being attained via a strategy to measure, understand, and quantify the 'non-ideal' pipeline flows from such pipeline elements as elbows, reducers, valves, or combinations of these; for selected types of flowmeters, correlate meter factor 'shifts' relative to the features of these 'non-ideal' installations; and disseminate the resulting technology through appropriate channels such as publishing results in pertinent journals and upgrading paper standards for flow measurement.

Two orifice flow measurement standards are presently used, one in the United States (ANSI/API 2530) and another in Europe (ISO 5167). These two standards have significantly different specifications for installations. One important specification is the location of the flow conditioner relative to the orifice plate.

iyzers. Final rept.

J. J. McClelland, M. R. Scheinfein, and D. T. Pierce. 1989, 5p

Sponsored by Department of Energy, Washington, DC. Pub. in Review of Scientific Instruments 60, n4 p683-687 Apr 89.

Keywords: *Electron spin, *Analyzers, Electron scat-tering, Gold, Thin films, Reprints, *Thorium 230 target, Mott scattering, Sherman tables.

Measurements of the effective Sherman function have been carried out for 10-100-keV spin-polarized elecing Mott analyzer. At 20 and 100 keV the dependence on the maximum energy loss accepted by the detector has been measured. Comparison is made with scattering from a 1250 A gold film. Thorium is seen to have a S(eff) up to 30% higher than gold. The higher S(eff) can not only improve the figure of merit of a spin detector, but also lessen its sensitivity to instrumental asymmetries. Comparison is also made with preliminary theoretical results. Good agreement between theory and experiment is seen in the thorium Sherman function relative to that of gold.

The physical measurement services of the National Institute of Standards and Technology are designed to help the makers and users of precision instruments achieve the highest possible levels of measurement quality and productivity. The hundreds of individual services listed in the Fee Schedule constitute the highest-order calibration services available in the United States. They directly link a customer's precision equipment or transfer standards to national measurement standards. These services are offered to public and private organizations and individuals alike.

W. Liggett. 1988, 6p Pub. in Computing Science and Statistics, Proceedings of Symposium on the Interface (20th), Fairfax, VA., p68-73 Apr 88.

Laboratory & Test Facility Design & Operation

Keywords: *Experimental design, *Replicating, *Sta-tistical inference, Error analysis, Estimating, Robustness(Mathematics).

Inference methods valid for nonnormal error are proposed for experiments in which each design point is replicated three or more times. Differences between the replicates provide the data needed for a pooled estimate of the error density, and the density forms the basis for the bootstrap. The density estimator is specifield for symmetric error, and the symmetric estimator has been generalized to asymmetric error. In the paper, the application of the density estimator to de-signed experiments is considered. The lack-of-fit test is of particular interest. The extension of the density estimator to data requiring a blocking variable and to data with dispersion effects is discussed. The boot-strap based on the density estimator is shown to be valid for smaller sample sizes when the test statistics are robust. Estimation of the error density is illustrated with measurements replicated at different laboratories.

Not available NTIS Not available NTIS National Bureau of Standards (ICST), Gaithersburg, MD. Advanced Systems Div. Notion of Granularity.

Final rept. C. P. Kruskal, and C. H. Smith. 1988, 14p

Pub. in Jnl. of Superconducting 1, p395-408 1988.

Keywords: *Grain size, Definitions, Fineness, Comparison, Metal industry, Reprints, Parallel processing.

Granularity is a well known concept in parallel processing. While intuitively, the distinction between coarse-grain and fine-grain paralellism is clear, there is no rigorous definition. The paper develops two notions of granularity, each defined formally and represented by a single rational number. The two notions are com-pared and contrasted with each other and with previously proposed definitions of granularity.

Final rept.

T. R. Scott. 1989, 11p Pub. in Proceedings of Measurement Science Confer-ence, Anaheim, CA., January 26-27, 1989, p3C-19-3C-

Keywords: *Fiber optics, *Power measurement, *Calorimeters, Lasers, Thermal measurements, Stand-ards, Detectors, Calibrating, Telecommunications, Light transmission, Optical communication.

The measurement of optical power (that is, laser power or energy at wavelengths and power levels of interest to the fiber optic community) at NIST is based upon a standard reference calorimeter called the Cseries calorimeter. The C-series calorimeter is a na-tional reference standard for measuring absolute energy and power levels of cw laser sources over a wide range of wavelengths. Various infrared laser sources and a calibrated beamsplitter measurement system are used to compare an electrically calibrated pyroelectric radiometer (ECPR) to the C-series calo-rimeter. The calibrated ECPR is then used as a laboratory standard for the calibration of measurement of op-tical power. The measurement of optical power at NIST is reviewed starting with a discussion of the primary reference standard and the associated measurement system. The system used for calibrating optical power detectors is discussed and the associated uncertainties are identified.

Keywords: *Thermal insulation, *Acoustic measurement, Thermal resistance, Sound transmission, Heat transfer, Evaluation, Cellulose, Houses, Thermal effi-ciency, Fiberglass, Rockwool, Blown-in-place attic insulation

A laboratory apparatus has been constructed that en-ables rapid measurement of the sound insertion loss of a sample of insulation as a function of frequency. An extensive series of measurements of the sound inser-tion losses associated with blown samples of fiberglass, rockwool, and cellulose has been completed. The results of these acoustical measurements are highly correlated with coverage (mass per unit area) and thermal resistance (R-value). An investigation is planned to extend the acoustical techniques used in the laboratory apparatus to in-situ determination of the sound transmission loss through thermal insulation installed in attics. Two possible approaches to such field measurements are described.

Nondestructive Testing

Keywords: *Radiology, *Standards, Questionnaires, Nondestructive tests, Fracture tests, Deformation methods, *Real-time radioscopy.

Standards developed to measure the quality of film radiographs are unable to evaluate all the features of real-time systems. Particularly, problems exist when the specimen is rotated to a degree where the image quality indicators are no longer orthogonal to the beam or when the evaluation is performed while the specimen is in motion. The report describes the develop-ment of new standards that will allow quantitative evaluation of real-time systems under these conditions. Other NBS activities, such as a survey of real-time usage and the development of a 150 kV radiation transfer standard, will also be presented.

System) Standard In CALS (Computer-Alded Ac-quisition and Logistic Support). D. K. Jefferson, and C. M. Furlani. Sep 89, 16p

NISTIR-89/4169

Keywords: *Information systems, *Data management systems, Dictionaties, Architecture(Computers), Dis-tributed data bases, Standards, Models, Information processing languages, *Computer-aided Acquisition and Logistic Support.

The objective of the point paper is to show how the Information Resource Dictionary System (IRDS) can fulfill critical design and operational requirements for CALS Phase II. First, a series of assumptions are made about the data management services which are needed by CALS Phase II. Next, these assumptions are used to develop a series of requirements for a dic-tionary system. The structure of the IRDS family of standards is then described. Examples are provided to illustrate how the IRDS could meet the requirements. A schedule is presented to show that the IRDS and other data management standards will be available when needed to meet the immediate requirements of CALS. An architecture is presented to illustrate additional standards required to achieve longer-range goals of distributed database. Finally, development tasks are recommended.

The purpose of the report is to assist managers and users in making informed decisions on which systems are best for them. The report presents the technical and managerial choices and implications associated with selecting and using electronic publishing systems. A matrix of publishing capabilities and features is presented in the appendix to illustrate one method of comparing and selecting a publishing system.

Computer Aided Design (CAD)

900.936

PB89-151799 PC A06/MF A01 Catholic Univ. of America, Washington, DC. Design Protocol, Part Design Editor, and Geometry Library of the Vertical Workstation of the Automat-ed Manufacturing Research Facility at the National Bureau of Standards.

T. R. Kramer, and J. S. Jun. 28 Jan 88, 113p NISTIR-88/3717

Grant NANB-5-D0522

Sponsored by National Bureau of Standards, Gaithersburg, MD.

Keywords: Design, Machining, Planning, *Computer aided design, *Computer aided manufacturing, Inter-active systems, Workstations, Automated Manufacturing Research Facility.

In the Vertical Workstation (VWS) of the NBS Automat-ed Manufacturing Research Facility, metal parts are machined automatically from a feature-based design. A simple two-and-a-half dimensional part may be designed and machined within an hour, allowing half the time for design input. Workstation activity may be divided into design, process planning, data execution, and physical execution stages. The design of a part is ex-pressed as a list of features on a block-shaped workpiece. Each feature is a removed volume. A feature is expressed by giving the name of the feature type and values for several parameters appropriate to that feature type. The design editor is an interactive system that runs on a Sun computer which is used to create or change designs. The system engages the user in a dialog to determine what the user wants to do, and prepares a design according to the user's instructions. The editor draws a three-view picture of the part being edited. The geometry library is a set of LISP functions that do geometric calculations to support the operation of the design editor and other modules of the VWS software.

PB89-166102 PC A06/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Building Technology. Guidelines for the Specification and Validation of IGES (Initial Graphics Exchange Specification) Application Protocols. R. J. Harrison, and M. E. Palmer. Jan 89, 111p

NISTIR-88/3846

Prepared in cooperation with Sandia National Labs., Albuquerque, NM.

Keywords: *Data converters, *Standards, Proving, *Computer aided design, *Initial Graphics Exchange Specification, Data management, Computer applications

The document provides a background discussion of product data, describes the concept of IGES (Initial Graphics Exchange Specification) application proto-cols, specifies the technical content of an IGES application protocol, describes a validation methodology for these application protocols, and provides guide-lines for the implementation of an IGES application protocol. A key conclusion of the background discus-sion of product data is that IGES application protocols must be developed in order to achieve consistent and reliable exchanges of product data within specified ap-plication areas. The technical content of an IGES application protocol includes a conceptual information model for the application area with its supporting documentation, an application protocol format specification with a protocol usage guide, and a set of application protocol format test cases. These test cases must be used in concert with a well-defined testing methodolo-gy. Since no complete IGES application protocols cur-rently exist, the document describes a current implementation of an application protocol process that is based on a partially complete application protocol.

B. M. Smith. Sep 89, 11p NISTIR-89/4166

Keywords: *Data, *Standards, Standardization, Prod-uct development, *Computer aided design, Computer aided manufacturing, International Organization for Standardization.

The ability to exchange product data files among a va-riety of different vendor CAD/CAM systems is critical to both a company's internal plans for integration and its external relationships with contractors and customers. Therefore, several national projects are being co-ordinated through the International Organization for Standardization (ISO) to develop a single world standand for data exchange. In addition to geometry, the standard will support a wide range of non-geometry data such as features, tolerance specifications, materi-al properties and surface finish specifications. The geometry model will include solid representations for both boundary and constructive solid geometry forms. The geometry model coupled with the non-geometric data and the relationship information preserved from the sending system will enable the standard to com-municate a complete product model. The paper details the strategy behind the development of the ISO project, identifies the various technical resources that have been brought together to develop, standardizes and uses product data technology, gives the status of the effort as of early 1989 and enumerates project plans for the balance of 1989.

Automated Documentation System for a Large Scale Manufacturing Engineering Research Project. Final rept.

H. M. Bloom, and C. E. Wenger. 1983, 10p Pub. in Proceedings of International Conference on Systems Documentation (2nd), Seattle, WA., April 29-30, 1983, 10p.

Keywords: Data storage, *Automated Manufacturing Research Facility, *Computer aided manufacturing, *Software engineering, Information processing, Computer communications, Data management systems.

The Automated Manufacturing Research Facility (AMRF) being implemented at the National Bureau of Standards (NBS) will involve the development of a software manufacturing system integrating the various information processing, communications and data storage functions required in a totally automated environment. For such a research environment, there exists a need to develop an automated system for gen-erating documentation for the software life cycle that could be used for the following purposes: (1) tracking progress of individual module development; (2) allowing for the availability of up-to-date information on module description to other members of the project who need to interface to a given module; (3) develop-ing a cross reference of module and data element relationships; and (4) generating working level documenta-tion that can be easily modified and serve as information to be given to any one with interest in the project. The paper describes the structure of a software development system that will function in a research environment.

Intelligent processing of materials has been established as a major new program area in the Institute for Materials Science and Engineering, National Institute of Standards and Technology (NIST). The goal of the program is to develop some of the generic scientific and technological bases for intelligent processing and, by means of selected pilot or demonstration projects, to encourage American industry to pursue and to adopt this powerful new approach to materials procadopt this powerful new approach to materials proc-essing. In developing the new program, NIST cooper-ated in organizing two national workshops in 1985-86 to help identify the principal industrial needs in this field of technology and to solicit guidance for program planning activities. On August 30 and September 1, 1988, NIST convened a third workshop in this series. This one was comprised primarily of selected industrial specialists and was designed to define the specific materials processes upon which the NIST program materials processes upon which the NIST program should focus, and to discuss suitable approaches for accomplishing the work. The report documents the results of that workshop.

PB89-159636 PC A04/MF A01 National Bureau of Standards, Gaithersburg, MD. Data Handling In the Vertical Workstation of the Automated Manufacturing Research Facility at the National Bureau of Standards.

T. R. Kramer. 21 Apr 88, 70p NBSIR-88/3763 Grants NANB-5-D0522, NANB-7-H0716 Sponsored by Catholic Univ. of America, Washington, DC.

Keywords: Machining, Tooling, Tables(Data), *Auto-mated Manufacturing Research Facility, *Data man-agement systems, Computer aided manufacturing, Workstations, Data base management, Automatic programming.

In the Vertical Workstation (VWS) of the NBS Automat-ed Manufacturing Research Facility, metal parts are machined automatically from a feature-based design. A simple two-and-a-half dimensional part may be de-

signed and machined within an hour, allowing half the time for design input. Workstation activity may be divided into design, process planning, data execution, and physical execution stages. The VWS requires data for: features, machining operations, tooling, fixturing, work-pieces, trays and other items. Hierarchical LISP property lists are used to store most of this data. The VWS also exchanges data with a global database. A local database manager is used to handle all exchanges with the global database and also to emulate the global database. Data exchanges take place through structured reports. The VWS system includes a sub-system which automatically writes LISP functions to read and write reports.

Into a Features Representation. T. R. Kramer. Feb 89, 22p NISTIR 88/3864 Grant NANB7H0716

Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Mfg. Engineerina

Keywords: Pattern recognition, Boundaries, *Automated Manufacturing Research Facility, *Computer aided manufacturing, Parsing algorithms, Computer aided design, Workstations, Feature extraction.

The VWS2 B-rep Parser is a computer program written In LISP that takes a file giving the boundary represen-tation of a part as input and produces a file giving a feature-based representation of the part as output. The format of the input file is a Product Data Exchange Specification (PDES)/Standard for The Exchange of Product data (STEP) boundary representation, and the format of the output file is that required by the VWS2 system of the National Institute of Standards and Technology (NIST) Automated Manufacturing Re-search Facility (AMRF). The parser deals with a limited range of two-and-a-half dimensional parts. The general approach to parsing is to expect that the part is parsable and look for arrangements of faces which are of the signatures of features. The initial implementation of the approach recognizes five feature types. The ap-proach is extendible to a wider range of feature and subfeature types, and to parts which have features made from several sides. Parts having features which intersect in a complex manner are likely to test the limits of this approach, or be beyond the limits. With the addition of this parser, the AMRF Vertical Workstation is capable of making a part from a PDES/STEP file without human intervention.

MANUFACTURING TECHNOLOGY Computer Aided Manufacturing (CAM)

Developing effective CIM architecture is hampered by automation and integration problems. The key to resolving these problems lies in a better understanding of each manufacturing function and how it is related to other manufacturing functions. The authors view is that mathematical models can provide this under-standing. The paper presents the results of their initial efforts to develop such models. They can be used to guide the development of the technology needed for automation. They also specify the inputs, outputs, and interrelations needed for integration, regardless of the specific CIM architecture used.

Prepared in cooperation with Illinois Univ. at Urbana-Champaign. Dept. of General Engineering.

Keywords: *Scheduling, *Routing, *Hierarchical con-trol, Optimization, *Factory automation, *Automated Manufacturing Research Facility, *Flexible manufacturing, Real time.

A major manufacturing research facility has been es-tablished at the National Institute of Standards and Technology. The Automated Manufacturing Research Facility has been designed to address the standards and measurement needs for the factory of the future. A five-layer hierarchical planning/control architecture is under development to manage production and support activities. A three layer architecture is being developed to manage the data requirements of the modules within that hierarchy. Each of these architectures contain functions that require the solution to one or more optimization problems. The paper describes both the production planning/control and the data manage-ment architectures being developed at NBS. It empha-sizes the optimization problems contained within those architectures. It also discusses the work underway at NBS to address some of those problems.

Flexible manufacturing systems (FMS) have been in-stalled in many factories around the world. Production scheduling is the function responsible for assigning FMS resources to various manufacturing tasks. On-line simulation is being used as an analysis tool to choose among several candidate scheduling rules. The paper defines on-line simulation, and describes the inputs to and outputs from the on-line simulation trails. It also addresses the statistical analysis of those outputs to determine the 'best' compromise scheduling rule. Finally, it presents results from some preliminary scheduling experiments on the Automated Manu-facturing Research Facility (AMRF) at the National Bureau of Standards.

MANUFACTURING TECHNOLOGY Computer Aided Manufacturing (CAM)

tegrated manufacturing, *Hierarchies, Organizational structure.

In the recent past, several hierchies have been pro-posed as candidate models for the integration of decision and control functions within a Computer-Integrated Manufacturing environment. A common theme in the definition of these models is to construct an analog to managerial hierarchies that are currently employed in many corporate settings. The paper will adopt an alternate approach. Rather than defining a hierarchy, the paper will discuss the manufacturing functions that a CIM hierarchy must address. Whenever possible, mathematical formulations for the functions will be given with consideration for the stochastic environ-ment in which they will function. The conclusion outlines several concerns arising in the definition of a ge-neric CIM hierarchy and associated research topics that must be addressed.

L. S. Haynes, and A. J. Wavering. 1986, 12p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) International Conference on Robotics and Automation, San Francisco, CA., p1705-1716 1986

Keywords: Computer systems programs, Robots, *Automated Manufacturing Research Facility, *Com-puter aided control systems, *Computer software, Real time systems, Robotics, Software engineering.

The Automated Manufacturing Research Facility (AMRF) is currently composed of six workstations, six robots, an automated material handling system, buffer storage, a networking system for communication, a database system to support the needs of the facility and over 100 sensors throughout the facility to provide continued monitoring of all processes. One of the major challenges of the facility is to implement a realtime control system which continually reads the sensors within portions of the facility, interprets those readings, makes decisions as to required actions or changes, and then effects the required change via commands to actuators, manipulators, or subsystems. During development of the AMRF it became clear that real-time control software is fundamentally different, and more complex than scientific or business type systems. The paper discusses the reasons why this is true and describes the NBS Real-Time Control System, a system designed to help deal with these problems.

The document specifies the addition of ellipses, hyperbolas, parabolas, and b-splines to the AMRF Part Model Report Format. The reports are used through-out the AMRF to communicate part model data be-tween application processes and the global AMRF database. Part model data consists of geometry, topolo-gy, features, and tolerances. The document is intend-ed to be used by programmers implementing systems that make use of AMRF part model data. While the report is a complete description of the extensions, the document 'AMRF Database Report Format: Part Model' by T.H. Hopp is also required to complete the grammar.

Measuring in-Plane Elastic Moduli of Composites with Arrays of Phase-insensitive Ultrasound Receivers.

Final rept

D. W. Fitting, R. D. Kriz, and A. V. Clark. 1989, 8p Sponsored by National Research Council, Washington, DC.

Pub. in Review of Progress in Quantitative Nonde-structive Evaluation, v8B p1497-1504 1989.

Keywords: *Composite materials, *Phased arrays, *Modulus of elasticity, *Ultrasonic tests, Nondestruc-tive tests, Measurement, Wave phases, Oriented fiber composites, Velocity, Anisotropy, Reprints, Graphiteepoxy composites.

Ultrasonic measurements of elastic moduli of composite materials have traditionally been made on either small specimens cut from a larger component or by using a scanning technique with the specimen im-mersed in a water bath. A phase-insensitive array has been developed for rapid nondestructive measure-ment of in-plane elastic moduli. The array characteristics allow for determination of energy flux deviation angle in the composite, as well as measurement of group and phase velocity. Techniques for computing the phase velocity from array measurements are de-scribed. Energy flux deviation in unidirectional graphite-epoxy specimens has been determined with the array. Comparisons are made herein of results with analytical (bulk wave) predictions.

The report describes the research performed during the period March 1987 - July 1988 under a joint re-search program between the Mechanical Engineering Department of the University of Maryland and the Center for Fire Research of the National Bureau of Standards. The formulation of a model for the prediction of the cooling induced by an evaporating droplet impinging a semi-infinite solid is the subject of the report. The thermal interactions during the evaporation of a liquid droplet deposited on a low conductivity semi-infinite solid are complex because the evaporative process is coupled to the solid intense local cool-Numerical techniques based on finite difference ina. methods have failed to provide meaningful results. This is due to the sharp temperature gradients in the proximity of the droplet edge which cause instabilities in the solution for reasonable time steps due to the explicit coupling of the liquid-vapor regions. An integral method was proposed by Dr. Baum (CFR-NBS) in order to overcome difficulties. The methodology and the application to the specific perblem is described in its application to this specific problem is described in detail.

Real-Time Simulation and Production Scheduling Systems.

J. Davis, and A. T. Jones, Apr 89, 20p NISTIR-89/4070

Prepared in cooperation with Illinois Univ. at Urbana-Champaign.

Keywords: *Production control, *Scheduling, *Simula-tion, *Real time operations, Production planning, Auto-mation, Manufacturing, Statistical analysis, Flexible manufacturing systems, Concurrent processing.

The efficient scheduling of resources in a flexible man-ufacturing system (FMS) has a direct impact on the company's goal of increased profits. Many techniques, including mathematical programming, expert systems, and discrete event simulation have been used to solve these scheduling problems. However, they have all been ineffective in dealing with the unexpected delays that occur on the shop floor. The paper deals with a new approach to address production scheduling prob-lems in an FMS - real-time, concurrent simulations. These simulations can be initialized to the current system state and run any time a new schedule is needed.

Necking Phenomena and Cold Drawing.

Final rept. L. J. Zapas, and J. M. Crissman. 1985, 23p Pub. in Viscoelasticity and Rheology, Chapter 4, p81-103 1985.

Keywords: *Cold drawing, *Necking, *Tensile proper-ties, Stresses, Strains, Loading rate, Elastic properties, Reprints.

The various experimental results presented suggest strongly that the instability leading to neck formation is associated with the nonlinearity of the mechanical behavior coupled with the time dependence. In experiments involving constant rate of clamp separation, necking occurs well beyond the point where the stress-strain curve goes through a maximum, and the amount beyond depends on the rate of strain. For polypropylene, at the lowest rate of clamp separation shown, the strain at which the neck became visible was about three times the value at which the maximum in the stress occurred. At constant rate of loading, the stress-strain behavior is monotonically increasing up to the point of necking where immediately thereafter the specimens break. To describe the instability behavior in a hard device one might in some way use elastic behavior. However for a soft device it becomes very clear that one needs to consider the viscoelastic behavior of the material.

Keywords: *Mathematical models, *Machine tools, *Errors, Accuracy, Compensation, Turning(Machining), Deflections, Wear, Positioning error, Coordinate transformations, Turning center, Thermally-induced errors.

In the paper, the authors describe a general mathe-matical model, which is able to incorporate the error sources to determine the positional error vector of the cutting tool with respect to the workpiece. In the process of the development of the model, the authors first represent individual elements in the machine tool-fixrepresent individual elements in the machine tool-lik-ture-workpiece system by assigning a homogeneous coordinate transformation matrix to each element. This matrix describes the position and orientation of a body in space, and can incorporate the error motions of the body in six degrees of freedom. The machine heal fittee underlangementer in the appridded as a tool-fixture-workpiece system is then considered as a chain of linkages, and the relationships between these linkages are determined by matrix multiplications. Based on this idea, a matrix equation corresponding to the structural loop of the machine tool-fixture-workpiece system is constructed, and solved for the error vector. Although this model is applied to a turning center, it can easily be modified for any type of ma-chine tools, coordinate measuring machines, and robots.

Scire, and E. C. Teague. 1986, 9p
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Optical Techniques for In-dustrial Inspection, Quebec City, Canada, June 4-6, 1986, p8-16.

Keywords: *Optical measurement, *Surface rough-ness, *Nondestructive tests, Optical measuring instru-ments, Light scattering, Diffraction, Mathematical models.

The paper reviews the effort to develop the theory and instrumentation needed to measure surface roughness of manufactured surfaces by optical scattering methods. Three key problems are addressed: developing a valid and sufficient optical scattering theory for the roughness range; applying appropriate mathemati-cal inversion techniques so that practical roughness parameters can be calculated from scattering distributions; and evaluating a compact commercial instru-ment that is easy to align on a wide variety of part ge-ometries. Recent results suggest that the simple phase screen approximation model of optical scatter-ing theory validly describes light scattering from ma-chined metal surfaces with a predominant surface lay in the 0.01 Ra to 3.0 Ra range. New measurements of light scattered out of the plane-of-incidence are discussed. A model for scattering in the entire far-field hemisphere and observations on the inverse problem is given.

CAD (Computer Alded Design)-Directed Inspection. Final rept.

T. H. Hopp. 1984, 15p Pub. in Annals of the CIRP 33, n1 p1-15 1984.

Keywords: *Inspection, Automation, Measuring instru-ments, Artificial intelligence, Quality assurance, Re-prints, *Computer aided design, *Computer aided manufacturing, Control systems.

The paper describes a control system architecture, based on hierarchical task-decomposition techniques, for multi-axis coordinate measuring machines. An in-spection program consists of a series of high level goals to be satisfied. Goals are satisfied when speci-fied information has been obtained regarding the part. There is a decision hierarchy, each level of which provides logic for partially decomposing goals into simpler goals. The control system executes the inspection program by interpreting the decision hierarchy logic. A world model hierarchy executing in parallel with the task decomposition hierarchy provides information which aids in the decomposition decisions at each level. Artificial intelligence techniques will allow the convenient incorporation of quality assurance standards into inspection tasks.

Prepared in cooperation with Department of the Navy, Washington, DC., and Department of Energy, Wash-ington, DC.

MANUFACTURING TECHNOLOGY

Quality Control & Reliability

Keywords: *In-process quality control, *Automation, Verification inspection, Process control, Monitors, Sensors.

The document describes a quality control architecture that uses real-time sensing, deterministic metrology methods, machine tool characterization, process-intermittent gauging, and process certification to control the machining process with the objective of reducing the reliance on traditional post-process inspections methods and moving toward greater reliance on in-process verification. The 'Quality In Automation' project is developing a computer-based system that includes real-time sensors, a quality database, quality monitors, guality controllers, an inspection station, and a communication network which allows data to flow among components of the quality system. The quality architecture includes control loops such as post-proc-essing characterization, pre-processing characteriza-tion, process intermittent gauging, and real-time sensing. The sensors for temperature, force and ultrasonic may result in a command signal to the machine tool controller to alter its pre-programmed positions, to change its manipulative variables (speed and feed), and to modify the NC code. The corrective action will depend on the time varying nature of the errors and the predictions derived from the analysis models.

Building Representations from Fusions of Multiple Views. Final rept.

E. W. Kent, M. O. Shneier, and T. H. Hong. 1986, 6p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) International Conference on Robotics and Automation, San Francisco, CA., April 7-10, 1986, p1634-1639.

Keywords: *Robots, Pattern recognition, Models, *Computer vision, Position sensing, Spatial resolution, Sensors.

A robot sensing system is described that uses multiple sources of information to construct an internal representation of its environment. Initially, object models are used to form the basic representations. These are modified by processes that operate on sequences of sensory information which is obtained from sensors that move about in the environment. Two representations are constructed. One is a description of the spatial layout of the environment, represented as an octree. The other is an object- and feature-based rep-resentation. The system handles both expected and unexpected objects, and attempts to register its internal representation with the external world using a variety of predictive, sensory-processing, and matching procedures.

Supersedes PB87-218384. Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD. This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Hydraulic equipment, *Rotary valves, *Ac-tuators, *Patents, Control equipment, Fluidic control devices, Creep strength, Phased arrays, PAT-CL-91-536.

The present invention provides a rotary hydraulic valve and a multiple hydraulic actuator system which, together, offer a truly practical solution to the problem of automating machine-tool parts fixtures. The control valve of the invention is capable of carrying out the complex logic required for multiple actuator control but is nonetheless both simple and compact. The actuator system is designed to incorporate a rotary valve but avoids the problem of creep which is characteristic of prior rotary-valve controlled actuators. The valve design of the invention also prevents thrust loads on the rotary valve member and thus avoids the need for heavy duty thrust bearings even in high pressure applications.

and M. M. Barash. 1986, 10p Pub. in Precision Engineering 8, n4 p187-196 Oct 86.

Keywords: *Machine tools, *Accuracy, Calibrating, Tolerances(Mechanics), Temperature, Errors, Least squares method, Compensation, Reprints.

The methodology introduces a general mathematical model, which relates the error in the position of the cutting tool with respect to the workpiece to the errors of the individual machine elements are then decom-posed into geometric and thermally-induced compo-nents. A predictive machine calibration procedure to predict the geometric and thermally-induced errors of the machine slides is described. Based on the calibration data, empirical models for the error components are generated and valves for the parameters in these models are obtained using least-squares curve fitting techniques. A flexible, modular, and structured soft-ware system compensates for the predicted errors in real-time. The compensation system monitors the tem-peratures on the machine tool structure and the nominal axes positions, and then uses this information to predict the errors. The software is written in high level language and implemented in a dedicated, low cost, single-board microcomputer. The cutting tests carried out under transient thermal conditions have shown that the accuracy enhancement of up to 20 times is achievable using the methodology described in the paper, without a machine warm-up period.

P. J. Blau, and E. D. Doyle. 1987, 7p Pub. in Wear 117, n3 p381-387 1987.

Keywords: *Wear, *Crack propagation, Sliding, Crack initiation, Nucleation, Coalescing, Metallography, Reprints.

The location, surface or subsurface, for nucleation and propagation of microcracks during sliding wear has been a continuing source of discussion and controversy in the tribology community. Rather than to suggest that there is only one correct answer to this question, the authors propose that depending on the contract conditions and materials involved, several preferred sites for microcrack nucleation can exist. The present paper provides metallographic evidence in support of a model which involves nucleation ahead of the slider, crack closure, and reopening after the slider passes. Once microcracks nucleate, subsequent slider passes can cause crack propagation, coalescence, and the eventual formation of wear debris particles. Observations of uplifted flakes are similar to those of the 'delamination theory of wear,' but the mechanism proposed for crack nucleation differs from that originally proposed based on the subsurface stress analysis from the 'delamination theory.'

K Temperature Range.

Final rept.

R. Radebaugh. 1987, 19p Sponsored by Air Force Flight Dynamics Lab., Wright-Patterson AFB, OH.

Pub. in Proceedings of Interagency Meeting on Cryo-coolers (2nd), Easton, MD., September 24, 1986, p145-163 1987.

Keywords: *Regenerators, *Low temperature tests, *Effectiveness, Mechanical refrigeration, Cryogenics, Performance tests, Powder(Particles), Specific heat, Phase angle, Test facilities, Measurement.

Regenerators for temperatures around 10 K usually have rather high values of ineffectiveness because of a lack of matrix heat capacity. The paper describes various models used to predict regenerator perform-ance and shows how the pressure oscillation and flow through a temperature gradient affect the overall heat transfer in the regenerator. These two effects can par-tially cancel each other and reduce the regenerator

MANUFACTURING TECHNOLOGY

General

loss when the phase angle between the displacer and compressor is less than 90 degrees. The paper also describes an apparatus used to measure the ineffectiveness under realistic operating conditions and gives results of measurements on two powder materials with different heat capacities - Pb and GdRh. The effect of the phase angle between mass flow rate and pressure are examined and are shown to have a strong effect.

Low Temperatures. Final rept.

R. Radebaugh, B. Louie, and D. Linenberger. 1987, 25p

Sponsored by Air Force Flight Dynamics Lab., Wright-Patterson AFB, OH. Pub. in Proceedings of Interagency Meeting on Cryo-coolers (2nd), Easton, MD., September 24, 1986, p69-

93 1987.

Keywords: *Regenerators, *Low temperature tests, *Measurement, *Effectiveness, Heat exchangers, Cry-ogenics, Helium, Test facilities, Pressure, Tempera-ture, Phase angle, Flow rate, Mass flow.

The low temperature limit of regenerative-cycle cryocoolers is usually determined by the ineffectiveness of the regenerator for temperatures below approximately the regenerator for temperatures below approximately 20 K. It is also this temperature range that the energy stored in the void volume gas becomes significant, which makes regenerator modeling much more diffi-cult compared with regenerators operating at higher temperatures. The paper describes an experimental apparatus for measuring the ineffectiveness of regen-erators in the temperature range 4-40 K. All operating personetice, such as mass flow, pressure temperatures. parameters, such as mass flow, pressure, tempera-ture, and phase angle can be measured and controlled independently of each other. A discussion of materials and geometries to be tested in the apparatus is given and estimates of performance of refrigerators with im-proved regenerators are made.

Defect Intergrowths in Barium Polytitanates. 1. Ba2Ti9O20.

Final rept. P. K. Davies, and R. S. Roth. 1987, 13p See also PB89-146831.

Pub. in Jnl. of Solid State Chemistry 71, n2 p490-502 1987.

Keywords: *Barium titanates, *Defects, *Electron mi-croscopy, Microwaves, Dielectrics, Crystal structure, Stoichiometry, Reprints.

Using high-resolution transmission electron microsco-py, the mechanisms of defect formation in samples of the microwave dielectric material, Ba(sub 2)Ti(sub 9)O(sub 20) were investigated. Materials prepared by a variety of different techniques show considerable structural disorder. The most prevalent intergrowth involved formation of a new triclinic polytype with an ionic arrangement closely related to that in the accept-ed structure. Defects also resulted from considerable

microtwinning and were observed mainly in the samples prepared from a vanadate flux. The degree of nonstoichiometric defect formation was small in comparison to the stoichiometric intergrowths. In this case defects appeared to result from the incorporation of excess vacancies into the close-packed layers of the structure. Barium-deficient surface phases were also formed via a similar mechanism.

See also PB89-146823. Pub. in Jnl. of Solid State Chemistry 71, n2 p503-512 1987.

Keywords: *Barium titanates, *Defects, *Electron mi-croscopy, Crystal lattices, Diffraction, Reprints.

High resolution electron microscopy has been used to investigate the structure of BaTi(sub 5)O(sub 11). Single phase materials were prepared from alkoxide precursors and studied using lattice imaging and microdiffraction techniques. Considerable structural disorder was observed in all the samples investigated. In general, isolated defects were observed. These resulted from a displacement of the close-packed layers of the structure giving some face-sharing of the Ti octahedra. However, in several regions of the samples, systematic stacking faults lead to the formation of a new polytypic structure. The paper describes the defect mechanisms, and relates these to the structure of the new polytype.

Critical Assessment of Requirements for Ceramic Powder Characterization.

Final rept.

A. L. Dragoo, C. R. Robbins, and S. M. Hsu. 1987,

4p Pub. in Advances in Ceramics 21, p711-720 1987.

Keywords: *Ceramics, *Powder(Particles), *Micros-tructure, *Particle size distribution, *Quality control, Measurement, Standards, Sampling, Reprints.

The detailed characterization of ceramic powders is very important for the reproducible manufacture of advanced ceramics which will perform reliably in service. The basic issues are: what to measure, how to measments by all laboratories. 'What to measure' involves understanding the relationship between powder char-acteristics and ceramic microstructures. 'How to measure it' requires the development of measurement methods and the determination of repeatability and reproducibility. Standard Reference Materials (SRMs) are required to assure the quality of measurements and the comparability of measurements between different laboratories and techniques. From considerations of the distributed nature of powder and ceramic properties, new SRMs are proposed which will certify distributed properties. As an example of such SRMs, technical requirements are developed for the production of an SRM with a certified particle size distribution for ceramic powders. Factors which enter the certifica-tion of a particle size distribution for a ceramic powder include the approximate mathematical representation of the distribution, weighting of the distribution by the measurement technique, the particle shape distribu-tion, and statistical variances introduced by the powder, the sampling methods, and the methods of measurement.

Not available NTIS National Bureau of Standards (IMSE), Gaithersburg, MD. Ceramics Div. Application of SANS (Small Angle Neutron Scatter-

Ing) to Ceramic Characterization. Final rept.

K. G. Frase, K. A. Hardman-Rhyne, and N. F. Berk.

1986, 8p Pub. in Materials Research Society Symposia Pro-ceedings Better Ceram. Chem. 73, n2 p179-186 1986.

Keywords: *Neutron scattering, *Ceramics, *Defects, *Nondestructive tests, Spinel, Porosity, Particle size,

Agglomeration, Sintering, Precipitation(Chemistry), Microstructure, Reprints.

Traditionally, small angle neutron scattering (SANS) has been used to study dilute concentrations of defects 1 - 100 nm in size. Recent extensions of the scattering theory have allowed the expansion of the technique to include larger sizes through the use of multiple scattering. With multiple small angle neutron scat-tering, defects (pores, microcracks, precipitates) up to 10 micro rain size can be studied. SANS is inherently a non-destructive, bulk probe of microstructure, with wide applications in the characterization of materials. A number of studies of ceramic materials using multiple and traditional (single particle diffraction) small angle neutron scattering will be discussed. The emphasis will be on the strength of the technique in the characterization of materials. Particular examples will include: the assessment of pore size distributions in spinel compacts as a function of sintering and agglomeration, the characterization of primary and secondary particle sizes in precipitated aggregates, and the de-termination of microporosity in MDF cements.

MATERIALS SCIENCES Ceramics, Refractories, & Glass

The Abstract reports new observations on the laserexcited visible fluorescence in the micro-Raman spectra of erbium oxide and erbium-bearing silicate glasses. These results relate to the unusual optical behavior of rare-earth ions in solid phase matrices attributed to certain energy transfer reactions, proceeding by various upconversion mechanisms, when stimulated by infrared or visible radiation. The results reported here include the observation of anti-Stokes fluorescence from Er3 + when excited with 568.2 nm laser light.

MD. Building Materials Div. Standard Specifications for Cements and the Role In Their Development of Quality Assurance Systems for Laboratories.

Final rept.

G. Frohnsdorff, P. W. Brown, and J. H. Pielert. 1986, 5n

Pub. in Proceedings of International Congress on the Chemistry of Cement (8th), Rio de Janeiro, Brazil, Sep-tember 22-27, 1986, p316-320.

Keywords: *Cements, *Specifications, *Standards, Portland cements, Quality assurance, Performance standards, Durability, Laboratories, Test facilities, Performance evaluation.

Standard specifications for portland and related cements contain both prescriptive and performance cri-teria. Prescriptive criteria may hinder innovation by placing unnecessary limits on composition. Perform-ance specifications define the performance required of a cement in terms which are closely related to the performance characteristics required in service. Performance tests may take too long to carry out to be suitable as acceptance tests. For this reason cement specifica-tions must continue to include both prescriptive and performance components. It should be practical for a specification to be structured to consist of a complete performance specification supplemented by prescriptive criteria to be developed by the manufacturer according to specified rules. New factors affecting cement specifications may include computer-aided checks for logical consistency, and the needs for precise chemical and physical information for use in math-ematical models of cement performance and in integrated project information systems.

The mechanisms and kinetics of hydration in the C3S-H2O and C3A-gypsum-H2O systems are discussed within the context of the relevant phase equilibria. The development of a layer of C-S-H of variable composition results in the onset of the induction period. The composition gradient in this layer causes a morphological transformation leading to the onset of the acceleratory period. The first-formed aluminate-containing phase in the C3A-gypsum-H2O system may be AH3 or ettringite, depending on the initial solution composition. The rate of early C3A hydration is lowest when ettringite is the first-formed phase. This suggests that initial AH3 formation does not have a major influence on retardation.

The achievement of higher efficiency heat engines and heat recovery systems requires the availability of high-temperature, high-performance structural materials. Structural ceramics, and more recently, ceramic matrix composites have received particular attention for these applications due to their high strength and resistance to corrosion and thermal shock. Even with these positive attributes, improved reliability and extended lifetime under service conditions are necessary for structural ceramics to gain industrial acceptance. The problems with these materials are mechanical and chemical in nature and are enhanced by the fact that they are subjected to high temperatures, reactive envi-ronments and extreme thermal gradients. With an objective of improved performance for heat engine/heat recovery applications, the NBS program on structural ceramics and ceramic composites addresses these problems through the determination of critical factors that influence mechanical and microstructural behavior. The activities of the program are grouped under two major subtasks, each designed to develop key data, associated test methods and companion predictive models. The status of the subtasks for the period ending September 30, 1987 are provided.

Keywords: *Superconductors, *Oxygen, *Isotopic la-beling, *Copper oxides, Bismuth, Strontium, Calcium, Electrical resistivity, Magnetic permeability, Phonons, Reprints.

An oxygen isotope effect is observed in mixed-phase Bi-Sr-Ca-Cu-O superconductors when O18 is substi-tuted for O16. The superconducting transition temper-ature Tc, measured by electrical resistivity and mag-netic susceptibility, is lowered by about 0.32 K for the higher-Tc (110 K) phase and by about 0.34 K for the lower Tc (75 K) phase. These results suggest a meas-urable contribution to the superconductivity from phonurable contribution to the superconductivity from phonons.

Small Angle Neutron Scattering from Porosity in Sintered Alumina. Final rept.

K. A. Hardman-Rhyne, and N. F. Berk. 1986, 3p Pub. in Jnl. of the American Ceramic Society 69, n11 pC.285-C.287 Nov 86.

Keywords: *Aluminum oxide, *Neutron scattering, *Sintering, *Porosity, Microstructure, Nondestructive tests, Ceramics, Voids, Reprints.

Large voids (approximately 0.2 micrometers and larger) can remain in the ceramic material after the sintering process is over. Often sintered ceramic materials are quite thick as well. Larger volume fraction and pore sizes are not seen with traditional single particle diffraction techniques in small angle neutron scattering. Multiple scattering methods were employed to elu-cidate microstructural information relating to pore size and porosity.

Effect of Coal Slag on the Microstructure and Creep Behavior of a Magnesium-Chromite Refractory

Final rept.

S. M. Wiederhorn, R. F. Krause, and J. Sun. 1988, 10p

Sponsored by Department of Energy, Washington, DC. Pub. in American Ceramic Society Bulletin 67, n7 p1201-1210 Jul 88.

Keywords: *Slags, *Refractory materials, *Ceramics, Microstructure, Creep tests, Magnesium, Chromites, Bricks, Aggregates, Viscosity, Penetration, Reprints.

As slag penetrates magnesium chromite refractory, ion As slag penetrates magnesium chromite refractory, ion exchange between the refractory and the slag changes the composition of the slag from anorthite-like to diopside-like. This modification of the slag com-position is believed to reduce its viscosity and enhance its reactivity. The creep rate of the refractory brick is increased by a factor of about 3 when slag penetrates into the brick. Creep behavior is rationalized in terms of the secret end to be secret to be secret with a secret secret with the secret the spacing and size of the aggregate particles within the refractory, and the structure and composition of the material bonding the aggregate particles together. It is suggested that refractory disintegration involves creep deformation at the hot face of the brick caused by mechanical loading and stresses due to ion ex-change within the brick. The results of the present paper suggest that refractory performance can be im-proved by chemical modification of the brick to prevent a reduction slag viscosity during penetration.

A fracture mechanics specimen known as the doublecleavage drilled-compression (DCDC) specimen has been used to study crack-fiber interactions and tough-ening increments in a model composite system of SiC monofilaments in a borosilicate glass matrix. The toughening increments were measured from changes in applied stress intensity factor as a function of crack length and number of monofilament fibers. Both the fiber-matrix debond strength and the interfacial fric-tional shear resistance, which influence these tough-ening increments, were measured independently by a single fiber pull-out test and were correlated with the toughness increases measured by the DCDC speci-men. A ceramic composite material that has received much attention because of its increased toughness and creep resistance compared with alumina is alumi-num order scietored with alumina is aluminum oxide reinforced with silicon carbide whiskers. In the study, the creep and creep rupture behavior of a 25 wt% SiC whisker-reinforced alumina ceramic with 4.9% porosity were measured at temperature between 100 deg C and 1300 deg C and at applied stresses between 55 and 306 MPa, although the applied stresses at each temperature varied over a much narrower range. Creep strains were determined from loading-point displacement measurements in four-point flexure.

Crystal Chemistry of Superconductors: A Guide to the Tailoring of New Compounds. Final rept.

A. Santoro, F. Beech, M. Marezio, and R. J. Cava.

1988, 8p Pub. in Physica C 156, p693-700 1988.

Keywords: *Superconductivity, *Copper oxides, *Crys-tal defects, Perovskites, Lanthanum, Calcium, Thalli-um, Bismuth, Barium, Strontium, Yttrium, Shearing, Reprints

The crystal structures of the known superconducting copper oxides can be described in terms of two basic copper oxides can be described in terms of two basic structural types. The series La2Ca(n-1)CunO(2n+2), (T1,Bi)2(Ba,Sr)2Ca(n-1)CunO(2n+4) and TIBa2Ca(n-1)CunO(2n+3) can be viewed as made of alternating slices having the rock salt and perovskite structure. The compounds Ba2YCu4O8 and Ba4Y2Cu7O(14+x), on the other hand, are comprised of perovskite blocks alternating with blocks in which a crystallographic shear is present. The effect of this shear is that of forming double chains of edge sharing squares with oxygen atoms at the corners and copper atoms at the center. The superconductor Ba2YCu3O7 can be described in terms of both structural types and may be considered as an intermediate type between the other two. The basic building blocks of these su-perconducting materials can be further broken down into constituent nets (or meshes). This description allows one to envisage new structures built from these meshes containing the key structural elements present in the currently known superconductors. As such, the structural schemes used in this description may be used as a guide in the preparation of new materials with interesting electronic properties.

MD. Ceramics Div. RIsing Fracture Toughness from the Bending Strength of Indented Alumina Beams.

Final rept. R. F. Krause. 1988, 6p

Pub. in Jnl. of the American Ceramic Society 71, n5 p338-343 May 88.

Keywords: *Crack propagation, *Ceramics, *Fractur-ing, *Aluminum oxide, *Indentation, Defects, Tensile properties, Optical microscopes, Surface properties, Vickers hardness, Impact tests, Loads(Forces), Bend-ing, Toughness, Annealing, Residual stress, Polishing, Beams(Supports), Reprints.

The analytical function of crack extension to a fractional power is used to represent the fracture resistance of a vitreous-bonded 96% alumina ceramic. A varying flaw size, controlled by Vickers indentation loading between 3 and 300 N, was placed on the prospective tensile surfaces of four-point bend specimens, previ-ously polished and annealed. The lengths of surface cracks were measured by optical microscopy. Straight lines were fitted to the logarithmic functions of observed bending strength versus indentation load in two series of experiments, including the residual stress due to indentation and having the residual stress annealed out at an elevated temperature. Within the precision of measurement these lines have the same slope, being about 32% less than the slope which a fracture toughness independent of crack extension would indicate.

Phase Relations between the Polytitanates of Barium and the Barium Borates, Vanadates and Molybdates.

J. M. Millet, R. S. Roth, and H. S. Parker. 1986, 4p Pub. in Jnl. of the American Ceramic Society 69, n11 p811-814 Nov 86.

Keywords: *Ceramics, *Barium oxides, *Phase dia-grams, Barium titanates, Vanadates, Molybdates, Chemical equilibrium, Borates, Ternary systems, X ray diffraction, Liquids, Melting, Reprints.

Phase equilibria in ternary systems involving Ba0, Ti02, and the low melting oxides B203, V205 and Mo03 are reported. Alternative ways to synthesize BaTi409 have been found. These compounds can be obtained by heating at relatively low temperature appropriate com-positions in the system Ba0-Ti02-V205 or Ba0-Ti02-M03 and dissolving the excess phases in dilute HC1. Ba2Ti9020 can also be prepared at low temperature in the Bao-Ti02-B203 system, in which it may show a lim-ited solid solution, offering the possibility of obtaining dense ceramics at low temperature. The low temperature phase BaTi5011 has not been obtained in equilibtium in any of the studied systems. It has been found that the compound reported with the composition Ba3Ti3V4015 has in fact the composition Ba3Ti3V4014, It decomposes at 995 + or - 5 C (Ba3TiV4013 yields liq + Ba2V207). A ternary compound Ba2Ti2B209 which decomposes into BaTi03 and a liquid at approxi-mately 950 C was also found.

MD. Ceramics Div. Effect of Lateral Crack Growth on the Strength of Contact Flaws in Brittle Materials.

Final rept.

R. F. Cook, and D. H. Roach. 1986, 12p Sponsored by IBM Thomas J. Watson Research Center, Yorktown Heights, NY. Pub. in Jnl. of Materials Research 1, n4 p589-600 Jul/ Aug 86.

Keywords: *Ceramics, *Glass, *Brittle fracturing, *Crack propagation, *Impact tests, Defects, Single crystals, Contacting, Elastic properties, Plastic proper-ties, Residual stress, Indentation, Radial stress, Later-al pressure, Failure, Fatigue(Materials), Strength, Loads(Forces), Reprints, Fracture mechanics.

The effect of lateral cracks on strength controlling contact flaws in brittle materials is examined. Inert strength studies using controlled indentation flaws on a range of ceramic, glass and single crystal materials reveal significant increases in strength at large contact loads, above the predicted load dependence extrapo-lated from strength measurements at low indentation loads. The increases are explained by the growth of loads. The increases are explained by the growth of lateral cracks decohesing the plastic deformation zone associated with the contact from the elastically re-straining matrix, thereby reducing the residual stress field driving the strength controlling radial cracks. A strength formulation is developed from indentation fracture mechanics which permits inert strengths to be, described over the full range of contact loads. The for-mulation takes account of the decreased constraint of the plastic deformation zone by lateral crack arouth as the plastic deformation zone by lateral crack growth as well as post-contact non-equilibrium growth of the radial cracks. Simple extensions permit the strengths of specimens controlled by impact flaws to be de-scribed, as well as those failing under non-equilibrium (fatigue) conditions. The work reinforces the conclu-sion that a full understanding of the residual stress field at dominant contact flaws is necessary to describe the strength of brittle materials.

Densification, Susceptibility and MIcrostructure of Ba2YCu3O(6+x).

Final rept.

J. E. Blendell, and L. C. Stearns. 1988, 10p
 Pub. in Ceramic Transactions 1, ptB p1146-1155 1988.

Keywords: *Ceramics, *Microstructure, *Densification, *Magnetic permeability, *Sintering, *Superconducti-vity, Measurement, Pressure, Temperature, Porosity, Chemical composition, Grain boundaries, Barium oxides, Yttrium, Copper, Compacting, Atmospheres, Poprinte Reprints.

The densification of Ba2YCu30(6+x) for different sin-tering conditions has been measured. The effects of compaction pressure, atmosphere and temperature have been investigated. Measurements of the AC magnetic susceptibility have been used to determine magnetic susceptionity have been used to determine the superconducting properties. Dense samples were found to have less superconducting material as com-pared to porous samples. Compositional mapping of the samples showed variations in composition in the samples, corresponding to Cu-rich regions and Y-poor regions. Sinter-forging was done in order to align the grains grains.

Bi-monthly rept. R. G. Munro, F. Y. Hwang, and C. R. Hubbard. 1989, 11p

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n1 p37-46 Jan-Feb 89

Keywords: *Ceramics, Thermodynamic properties, Materials specifications, Thermal expansion, Thermal conductivity, Thermal diffusivity, Specific heat, Shock resistance, Thermal resistance, Bibliographics, Sys-tems engineering, *Numerical data bases, Structural ceramics data base system, User requirements.

The development of a computerized database on advanced structural ceramics can play a critical role in fostering the widespread use of ceramics in industry and in advanced technologies. A preliminary system has been completed as phase one of an ongoing pro-gram to establish the Structural Ceramics Database system. The system is designed to be used on personal computers. Developed in a modular design, the pre-liminary system is focused on the thermal properties of monolithic ceramics. The initial modules consist of materials specification, thermal expansion, thermal con-ductivity, thermal diffusivity, specific heat, thermal shock resistance, and a bibliography of data refer-ences. Query and output programs also have been de-veloped for use with these modules. Three primary considerations provide the guidelines to the system's development: (1) The user's needs; (2) The nature of materials properties; and (3) The requirements of the programming language. The report discusses the manner and rationale by which each of these considerations leads to specific features in the design of the system.

Pore Morphology Analysis Using Small Angle Neu-tron Scattering Techniques.

Final rept.

K. A. Hardman-Rhyne. 1987, 12p

Pub. in Advanced Ceramics 21, p767-778 1987.

Keywords: *Ceramics, *Porosity, *Compacting, *Powder(Particles), *Neutron scattering, Aluminum oxide, Microstructure, Green strength, Reprints.

Unfired ceramics are very difficult to characterize due to the often fragile nature of the compacted powder and the high concentration of pores. Furthermore, these pores can have a wide distribution in sizes de-pending on the size and nature of the particles and the compaction procedure used to form the compacts. Small angle neutron scattering techniques are used to study alumina compacts. Various microstructural phe-nomena, generally in the size range of 1 to 10,000 nm, are discussed including pore size and distribution, pore fraction and surface area.

Creep Cavitation in Liquid-Phase Sintered Alumina.

Final rept.

R. A. Page, K. S. Chan, K. Hardman-Rhyne, J. Lankford, and S. Spooner. 1987, 9p Pub. in Jnl. of the American Ceramic Society 70, n3 p137-145 1987.

Keywords: *Aluminum oxide, *Ceramics, *Creep tests, *Cavitation, *Grain boundaries, *Sintering, Phases, Liquids, Neutron scattering, Stress analysis, Strain rate, Nucleation, Reprints.

The early stages of creep cavitation in a liquid-phase sintered alumina have been characterized using small-angle neutron scattering. Grain boundary cavities were found to nucleate throughout creep, although at a steadily decreasing rate. The cavities were located on two-grain junctions as well as triple points and were spaced approximately 100 to 200 nm apart. Cavity nu-cleation was also found to be relatively independent of the applied stress. The behavior has been rationalized based on the decreasing ratio of epsilon(gbs)/

MATERIALS SCIENCES Ceramics, Refractories, & Glass

epsilon(t), where epsilon(gbs) is the strain due to grain boundary sliding and epsilon(t) is the total strain, at in-creasing stresses. Cavity growth, on the other hand, was highly stress dependent. Above a certain 'threshold' stress cavity growth was observed. In all cases, however, the observed growth was transient, i.e., the cavity growth rate decreased with time. Lowering the stress below the 'threshold' resulted in a condition in which cavities nucleated but continued growth of the cavities did not occur. In all cases the cavities nucleat-ed and grew, when growth did occur, with relatively equiaxed shapes.

Dynamic Polsson's Ratio of a Ceramic Powder during Compaction. Final rept.

M. P. Jones, and G. V. Blessing. 1987, 4p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) Ultrasonics Symposium, Denver, CO., October 14-16, 1987 p587-590.

Keywords: *Ceramics, *Powder testing, *Elastic prop-erties, *Ultrasonic tests, Compacting, Poisson ratio, Pressure, Secondary waves, Longitudinal waves, Green strength.

Shear and longitudinal wave transit times were measured in a ceramic powder during its compaction. These transit times were used to calculate the dynamic Pois-son's ratio of the powder. The goal of the work was to better understand the particles' interaction and rear-rangement under pressure. It was shown that Pois-son's ratio depended upon the type of powder evaluated and the loading path. Information obtained from this technique could be used as real-time feedback to control and monitor the quality of ceramic parts.

Keywords: *Ceramics, *Synthesis(Chemistry), *Barium oxides, *Titanates, *Phase transformations, Niobium, Tin, Zirconium, Stability, Triclinic lattices, Orthorhombic lattices, X ray diffraction, Single crystals, Metastable state, Reprints.

A metastable phase corresponding to the previously reported Ba2Ti5O12 was found to form between 650-675 C from hydrolized ethoxide precursors. The stabili-

ty was increased to approximately 850 C by the addi-tion of 1-2 mole% Nb2O5 to the precursor solutions. Addition of 5 mole% SnO2 failed to yield any sign of Addition of 5 moles ShO2 failed to yield any sign of this phase in solid state preparations, contrary to the previous report. Addition of 8 mole% ZrO2, however, did produce the desired phase as reported, both with and without additional Nb2O5, apparently stable to greater than 1300 C. Small single crystals, picked from 2700 thillibed on single crystals, picked from greater than 1300 C. Small single crystals, picked from a ZrO2 stabilized specimen with one mole% Nb2O5, showed the compound BaZTi(5-x)ZrXO12 to be a 10-layer structure, triclinic, pseudo-orthorhombic with A-centered symmetry and a = 9.941(5), b = 11.482(4), c = 23.528(10) nm x 10. The corresponding reduced triclinic unit cell has a equal 9.941, b = 11.482, c = 13.090 nm x 10, alpha = 116.01 degrees, beta = 90.0 degrees, gamma = 90.0 degrees.

901,042 PB89-185573 PC A03/MF A01 National Bureau of Standards (NEL), Gaithersburg, MD. Center for Building Technology. Epoxy Impregnation of Hardened Cement Pastes for Characterization of Microstructure.

Interim rept.

L. Struble, and E. Byrd. Nov 86, 22p NBSIR-87/3504 Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Cements, *Hardening(Materials), *Polish-ing, *Impregnating, *Epoxy resins, *Ethanols, Tests, Microstructure, Crack propagation, Drying, Methodology, Electron microscopy.

Methods were explored for drying of hardened cement paste prior to impregnation with epoxy, in order to polish for microscopic examination. All were shown to cause microcracking of the paste. An alternative method involves replacing pore water with ethanol, then replacing ethanol with epoxy. The method ap-pears to minimize the occurrence of microcracks associated with drying.

Computer Graphics for Ceramic Phase Diagrams.

Final rept. P. K. Schenck, and J. R. Dennis. 1987, 5p

Pub. in Computer Handling and Dissemination of Data, p184-188 1987.

Keywords: *Ceramics, *Phase diagrams, Reprints, *Interactive graphics, Computer graphics, Computer applications, Data bases, Computer software.

Specialized graphics software has been written in sup-port of the NBS-ACerS Phase Diagrams for Ceramists Data Base Program. The software runs on a stand alone desk top computer and allows both binary and ternary ceramic phase diagrams to be entered into a graphics data base. The phase diagrams may be en-tered by keyboard, direct digitization of a published diagram, or from properly formatted data files. The software allows for dynamic on-screen editing of the diagrams and includes many special features to en-hance the appearance and the accuracy of the figures. The rapid generation of uniform, camera-ready copy for inclusion in subsequent volumes of Phase Diagrams for Ceramists has allowed the Data Center to accelerate publication of critically evaluated phase diagrams. In addition, the graphics data base will eventu-ally be integrated with other data bases under development in the Data Center.

Phase Diagrams for High Tech Ceramics. Final rept.

S. J. Schneider, J. W. Hastie, and W. P. Holbrook. 1987, 16p

Pub. in Mater. Sci. Monogr. 38A, p59-74 1987.

Keywords: *Ceramics, *Phase diagrams, *Data proc-essing, Mathematical models, Reprints.

Chemical behavior is the foundation from which advanced ceramics are designed, processed and used; it sets properties, dictates reliable manufacture and ultimately determines performance and lifetimes. Predictive and descriptive chemistry is required and the basis for this is phase equilibria and its graphical expression -- the phase diagram. Ceramic phase equilibria re-search is literally exploding with literature growth out-

stripping the capacity of any single company, or even nation, to compile, evaluate and disseminate the available phase diagram information. Cooperative efforts able phase diagram information. Cooperative efforts worldwide are needed and in recognition of this, the American Ceramic Society (ACerS) and the National Bureau of Standards (NBS) have initiated a program to expand their previous data effort to develop a compre-hensive Phase Diagram Data System. The paper sum-marizes the status of the development program to achieve more forguent and up to dath completing of achieve more frequent and up-to-date compilations of critically evaluated phase diagrams, expanded cover-age for high technology ceramics and computer serv-ices for data base management, graphics and phase diagram modeling.

A critical assessment of the state of the art of the tribo-A critical assessment of the state of the art of the tribo-logy of ceramics is made. To identify the critical techni-cal barriers confronting the utilization of advanced gas-fired engines, data were gathered specifically on the tribology of materials for gas-fired engine applications. Site visits and discussions with a number of GRI con-tractors in industry were conducted as the first step in identifying critical issues. Then, an extensive review of the tophaged literature were made to determine what the technical literature was made to determine what information was available to resolve those issues, and, more importantly, what critical information was not yet available. These data were used to examine the issues for each of the principal engine types (rotary, recipro-cating, and turbine). Materials property data for ceram-ics were then reviewed in the context of the operating environments and conditions for these engines. There mal, mechanical, and tribological properties were ex-amined, along with the important considerations for luof these data considered the important considerations for up-bricating ceramics in engine applications. The analysis of these data considered the impact and relative merits of using various advanced materials and result-ed in recommendations for research activities that could have a significant impact on the development of gas-fired prime movers.

Keywords: *Alkali aggregate reactions, *Silicon oxides, *Expansion, *Concretes, Cements, Mortars(Materials), Opal, Quartzites, Rhyolite, Flint glass, Limestone, Graphs(Charts).

Preliminary studies have been carried out to identify candidate materials for use as a standard reactive ag-gregate in alkali-silica investigations. The materials studied included several commercial glasses, an opal, a quartzite, a rhyolite and a calcined flint. Candidate materials were tested for their expansion in mortars prepared using either a high-alkali or a low-alkali cement, a nonreactive limestone sand, and some pro-portion of reactive material. Tests were carried out ac-cording to ASTM C441-81, Standard Test Method for Effectiveness of Mineral Admixtures in Preventing Ex-cording to Expansion of Congreto Duo to the Alkal Adcessive Expansion of Concrete Due to the Alkali-Ag-gregate Reaction, and ASTM C227-87, Standard Test Method for Potential Alkali Reactivity of Cement-Ag-gregate Combinations (Mortar-Bar Method). The pro-portion of limestone replaced by each reactive materi-al was varied so as to bracket the pessimum proporthe highest level of expansion). Mortar-bar expansion levels were measured throughout reaction periods of approximately 6 months to 1 year. Expansion results are presented and discussed. Based on the studies,

the Vycor, fused quartz, fused silica, and calcined flint appear suitable as standard reactive materials; the cal-cined flint appears especially promising.

Commercial Advanced Ceramics.

Final rept. S. J. Schneider. 1986, 4p

Pub. in ASTM (American Society for Testing and Materials) Standardization News, p36-39 Oct 86.

Keywords: *Ceramics, Standards, Construction materials, Electronics, Engine blocks, Reprints.

Advanced ceramics represent a newer generation of high-performance materials that collectively are viewed as an enabling technology, development and exploitation of which are critical to advances in a host of high-technology applications ranging between modern microelectronic components to futuristic auto engines. New products are in the offing that could impact whole industrial segments including transportation, communications, computers, energy conversion and major defense systems. Even though products are being developed, diffusion to the marketplace is severely inhibited by the lack of commercial standards the test methods, the classification system, the standard reference materials and the like. The standards needs have been identified and include requirements in the areas of: processing, characterization, proper-ties, performance, statistical procedures and terminology.

Electron Microscopy Studies of Diffusion-Induced Grain Boundary Migration in Ceramics. Final rept.

M. D. Vaudin, C. A. Handwerker, and J. E. Blendell.

1988, 6p Pub. in Jnl. de Physique 49, n10 pC5-687-C5-692 Oct

Keywords: *Ceramics, *Grain boundaries, Electron mi-croscopy, Diffusion, Sintering, Crystal structure, Mag-nesium oxides, Annealing, Nickel oxides, Microstruc-ture, Temperature, Surface properties, Interfaces, Strains, Reprints.

The stability of grain boundaries during the uptake of solute into polycrystalline MgO has been investigated by exposing sintered, well-annealed MgO specimens to NiO at various temperatures for different times, and observing their microstructure both before and after this exposure. Electron and optical microscopy techniques have been used to characterize the specimen surface morphology, and the variation in composition and elastic and plastic strains in the interface regions. The spatial distribution of nickel at various depths below the original specimen surface was determined

using electron microprobe analysis. The observations are discussed in terms of the coherency strain theory.

MD. Ceramics Div. Green Function Method for Calculation of Atomis-tic Structure of Grain Boundary Interfaces in Ionic Crystals. Final rept.

V. K. Tewary, E. R. Fuller, and R. M. Thomson. 1986,

10p Pub, in Ceramic Microstructures '86 Role of Interfaces, p167-176.

Keywords: *Atomic structure, *Crystal lattices, *Ce-ramics, Greens function, Microstructure, Grain boundaries, Interfaces, Ions, Polarity, Coulomb interactions, Crystal defects, Reprints.

A lattice statics Green function method is described for calculating the atomistic structure of grain boundary interfaces in ionic crystals. The grain boundary is taken along coincidence lattice sites of the two crystallites. The periodicity of the coincidence lattice is exploited by taking a partial Fourier transform of the Green function. It is also shown that the Coulomb interaction between ions across the grain boundary line can be rep-resented in terms of effective dipolar and higher order polar interactions which makes them relatively short range.

MD. Ceramics Div. Crack-Interface Traction: A Fracture-Resistance Mechanism In Brittle Polycrystals.

Final rept.

P. L. Swanson. 1988, 21p Pub. in Proceedings of Conference on the Fractogra-phy of Glasses and Ceramics, Alfred, NY., August 3-6,

1986, p135-155 1988.

Keywords: *Ceramics, *Glass, *Interfaces, *Crack propagation, Fractures(Materials), Microscopy, Traction, Aluminum oxide, Resistance.

Crack-interface tractions have been identified as a source of increasing resistance to fracture with crack extension, or rising R-curve behavior, in previous stud-ies on coarse-grained alumina. Real time in situ mi-croscopy observations are used in the present study to investigate the generality of crack-interface tractions as a crack-resistance mechanism in three alumina and three glass-ceramics with varying R-curve characteris-tics. Interface tractions are found to operate to varying degrees in each material. Ligamentary-bridge formation is compared with the development of twist hackle, inclusion/wake hackle and cleavage hackle in simple material systems. Both sources of interface traction remain active as far as 100 particle dimensions behind the primary crack tip and, with sufficient crack-opening displacement, are eventually overcome by interface-localized microfracturing. Simple analytical fracture mechanics concepts are used to assess the influence of interface tractions on macroscopic fracture behavior. Because of the observed crack-history dependence of the interface-traction crack-tip shielding, it is suggested that neither R-curve behavior nor applied-K(sub I)/subcritical crack velocity relationships are unique properties of these and similar materials.

Design Criteria for High Temperature Structural Applications.

Final rept. S. M. Wiederhorn, and E. R. Fuller. 1986, 19p Sponsored by Department of Energy, Oak Ridge, TN. Pub. in Proceedings of International Symposium on

Ceramic Materials and Components for Éngines (2nd), Luebeck-Travemuende, West Germany, April 14-17, 1986, p911-929.

Keywords: *Structural forms, *High temperature tests, *Fractures(Materials), *Crack propagation, *Ceramics, Creep rupture tests, Nucleation, Initiation, Damage, Engines.

Current methods of assessing high temperature, structural reliability of ceramics are fracture mechanics based, in the sense that failure is assumed to originate

Ceramics, Refractories, & Glass

from pre-existing flaws that grow until they reach a critical size for rupture. Recent data on structural ceramics at elevated temperatures suggest that the view may be over-simplified and that flaw initiation and damage accumulation may be important factors to consider in the design of ceramic materials for high temperature applications. The techniques that are cur-rently being used for structural design are summarized and the limits of their application at elevated temperatures are defined. The need for incorporating information on flaw nucleation and damage accumulation into methods of structural design is emphasized.

PC-Access to Ceramic Phase Diagrams.

Final rept.

P. K. Schenck, and J. R. Dennis, 1989, 12p Pub. in ASTM (American Society for Testing and Mate-rials) Special Technical Publication 1017, p292-303 1989.

Keywords: *Phase diagrams, *Ceramics, Computer systems programs, Data retrieval, Reprints, Computer graphics.

A personal computer (PC)-based version of Phase Diagrams for Ceramists has been demonstrated by the joint National Bureau of Standards/American Ceramic Society Phase Diagrams for the Ceramists Data Center. A selection of phase diagrams from the nearly 1100 diagrams of Volume 6 has been transferred from the Data Center's graphics workstations to a PC. Demonstration software has been developed for retrieving and plotting the phase diagrams on the PC's monitor from the PC-based Phase Diagram Data Base. In addition, the software allows the operator to retrieve data from the diagram by means of an interactive graphics cursor whose location is displayed digitally on the monitor in a choice of user units (for example, C, F, K). Areas of the phase diagram can be magnified and replotted to clarify features. The operator can also overlay a second diagram for comparison purposes, re-verse the diagram, magnify or rescale the diagram, and apply an electronic lever rule or curve-tracking mode. Future refinements include conversions between weight and mole percent and retrieval of ternary or higher-order phase diagrams.

Semiconductor Measurement Technology: Database for and Statistical Analysis of the Interlaboratory Determination of the Conversion Coefficient for the Measurement of the Interstitial Oxygen Content of Silicon by Infrared Absorption.

Special pub. (Final). A. Baghdadi, R. I. Scace, and E. J. Walters. Jul 89, 183p NIST/SP-400/82 Also available from Supt. of Docs. as SN003-003-02943-2. Library of Congress catalog card no. 89-congroup. 600739

Keywords: *Semiconductors(Materials), *Oxygen, *In-terstitials, *Silicon, *Infrared radiation, Quantitative analysis, Statistical analysis, Radioactivation analysis, Charged particles, Photons, Conversion, Tables(Data), Graphs(Charts), Electromagnetic absorption, Round robin tests.

The Special Publication contains the data collected for the worldwide, double-round-robin determination of the conversion coefficient used to calculate the interstitial oxygen content of silicon from infrared absorption measurements. It also contains detailed statistical analyses of the data. The approach taken to determine the conversion coefficient was to conduct inter-laboratory round robins for both the infrared measurements and the absolute measurements. The infrared measurements were carried out at 18 laboratories in China, Europe, Japan, and the United States, using either dis-persive infrared or Fourier transform infrared spectrometers. The absolute measurements were carried out at eight laboratories in Europe, Japan, and the United States, using either charged-particle activation analysis, photon activation analysis, or inert gas fusion analysis.

dvanced ceramics offer many advantages that other materials do not possess. They have high strength, dimensional stability, are chemically inert, lightweight, wear resistant, and have desirable properties in electri-cal, optical, and thermal applications. At high temperatures, they are the only class of material with reasona-ble properties. Worldwide production of advanced ce-ramics is growing rapidly. Since ceramics are based on alumina and silica, the most abundant minerals on earth, effective utilization of ceramics carries implications into the next several centuries. One of the major technical barriers to widespread use of ceramics is the inability of industry to manufacture reliable ceramics reproducibly and economically. Advanced ceramics are sensitive to small defects introduced during proc-essing and generated during use. The symposium pro-vides timely exchange of technical information on a very significant subject area of achieving reliable manufacturing through standards.

Gaithersburg, MD. Ceramics Div. Effect of Heat Treatment on Crack-Resistance Curves in a Liquid-Phase-SIntered Alumina. Final rept.

S. J. Bennison, H. M. Chan, and B. R. Lawn. 1989, 3p

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Jnl. of the American Ceramic Society 72, n4 p677-679 Apr 89.

Keywords: *Aluminum oxide, *Crack propagation, *Heat treatment, *Liquid phases, *Sintering, *Indenta-tion hardness tests, Microstructure, Defects, Design criteria, Ceramics, Reprints.

The effects of heat treatment on the R-curve (crackresistance) behavior of a commercial liquid-phase-sin-tered (LPS) alumina have been studied using the in-dentation-strength test. An enhancement of the R-curve characteristic of this LPS alumina is obtained by a treatment that increases the scale of the microstruc-ture. The enhanced R-curve characteristics leads to the desirable property of flaw tolerance, albeit at the expense of a diminished strength at small crack sizes The implications of the findings are discussed with ref-erence to processing and design strategy.

Keywords: *Concretes, *Polymers, *Setting time, Polyurethane resins, Temperature, Catalysts, Water, Pilot plants, Flexural strength, Mathematical models.

Set time data were obtained for polymer concrete made with a proprietary polyurethane resin for a wide range of aggregate and resin temperatures. Catalyst value of aggregate and resin temperatures. Catalyst concentrations were adjusted so that setting occurred within a required time range. The effects of the pres-ence of water and ice on set time were also studied. Set time data were also obtained from pilot tests using another polyurethane and catalyst for various aggregate and resin temperatures and moisture conditions. Considerably more catalyst was required in the pilot tests to obtain comparable set times. The impact of temperature variations on flexural strength was investi-

gated. The flexural strength and failure mechanism at early ages depended on the temperature of aggregate and resin at the time of casting the polymer concrete. Using the model, a series of design charts were prepared which can be used to predict set time when cat-alyst concentration and initial aggregate and resin tem-peratures are given, or to determine the catalyst con-centration needed to assure set time corresponding to specified aggregate and resin temperatures.

Final rept. S. J. Cho, B. J. Hockey, B. R. Lawn, and S. J.

Bennison. 1989, 4p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC., Gas Research Inst., Chicago, IL., and Korea Science and Engineering Foundation. Pub. in Jnl. of the American Ceramic Society 72, n7 p1249-1252 1989.

Keywords: *Ceramics, *Aluminum oxides, *Wear, *Ab-rasion tests, *Grain size, Crack propagation, Brittle-ness, Sliding friction, Fracture strength, Microstructure, Reprints.

Results of sliding wear tests on three alumina ceramics with different grain sizes are discussed in the light of crack-resistance (R-curve, or T-curve) characteristics. The degree of wear increases abruptly after a criti-cal sliding period, reflecting a transition from deforma-tion-controlled to fracture-controlled surface removal. The transition occurs at earlier sliding times for the alu-minas with the coarser-grained microstructures, indic-ative of an inherent size effect in the wear process. A simplistic fracture mechanics model, incorporating the role of internal thermal expansion mismatch stresses in the crack-resistance characteristic, is developed. The results suggest an inverse relation between wear resistance and large-crack toughness for ceramics with pronounced R-curve behavior.

Tribochemical Mechanism of Alumina with Water.

Final rept. R. S. Gates, S. M. Hsu, and E. E. Klaus. 1989, 7p Sponsored by Department of Energy, Washington, DC. Pub. in Tribology Transactions 32, n3 p357-363 1989.

Keywords: *Aluminum oxide, *Water, Reaction kinetics, Wear tests, X ray diffraction, Thermal analysis, Surface chemistry, Phase transformations, Aluminum hydroxides, Rubbing, Reprints, *Tribology.

Water has been found to exhibit significant effects on the tribological behavior of alumina. A film-like sub-stance was found on the surfaces of water lubricated alumina wear surfaces, suggesting the possibility of tribochemical reaction between water and alumina in the contact junction. The paper describes an investigation of the alumina/water tribosystem to determine the chemical interaction between the two materials under rubbing conditions. A combination of x-ray powder diffraction and thermogravimetric analysis (TGA) has been used to investigate the kinetics of aluminal/water reactions. The experiments have determined that transition (gamma) alumina reacts with water to form hydroxides of aluminum. At high temperature (approxi-mately 200 C) aluminum oxide hydroxide (boehmite -AIO(OH) is formed, while at lower temperature (approximately 100 C) the formation of aluminum trihy-droxide (bayerite-AI(OH)3) is favored. A mechanism for lubrication of alumina with water is proposed whereby stresses and temperatures in the contact junction case phase transformation from alpha alumi-na to a transition alumina. The transition alumina sub-sequently reacts with water to form a lubricious hydroxide layer and reduce friction and wear.

Not available NTIS National Inst. of Standards and Technology (IMSE), Gaithersburg, MD. Ceramics Div. Flaw Tolerance in Ceramics with Rising Crack Re-

sistance Characteristics. Final rept.

S. J. Bennison, and B. R. Lawn. 1989, 7p Sponsored by Air Force Office of Scientific Research, Washington, DC.

Pub. in Jnl. of Materials Science 24, p3169-3175 1989.

Keywords: *Ceramics, *Crack propagation, *Defects, Toughness, Aluminum oxide, Polycrystalline, Brittle-ness, Stresses, Reprints, Closures.

The stabilizing influence of increasing toughness with crack size associated with a cumulative closure-stress process (R-curve, or T-curve) on the strength proper-ties of brittle ceramic materials is analyzed. Three strength-controlling flaw types are examined in quantitative detail: microcracks with closure-stress history through both the initial formation and the extension in subsequent strength testing; microcracks with closure stresses active only during the subsequent extension; stresses active only during the subsequent extension; spherical pores. Using a polycrystalline alumina with pronounced T-curve behavior as a case study, it is demonstrated that the strength is insensitive to a greater or lesser extent on the initial size of the flaw i.e. the material exhibits the quality of 'flaw tolerance'. The insensitivity is particularly striking for the flaws with full closure-stress history, with virtually total inde-pendence on initial size up to some 100 microns, for the flaws with only post-evolutionary exposure to the closure elements the effect is less dramatic, but the strength characteristics are nevertheless significantly more insensitive to initial flaw size than the counterparts for materials with single-value toughnesses. The implications of the results to engineering design meth-odologies, as expressed in conventional R-curve constructions, and to processing strategies for tailoring materials with optimal crack resistance properties, are discussed.

Low Temperature Mechanical Property Measure-ments of Silica Aerogel Foam. Final rept.

. L. Scull, and J. M. Arvidson. 1988, 6p Sponsored by Lawrence Livermore National Lab., CA. Pub. in Advances in Cryogenic Engineering Materials, v34 p413-418 1988.

Keywords: *Cryogenics, *Mechanical properties, *Sili-con oxides, *Aerogels, *Foam, *Measurement, Col-loids, Ultimate strength, Thermal conductivity, Insulation, Reprints.

Silica aerogel is a low-density foam material produced by supercritically extracting the solvent from a colloidal suspension of silica in solution. The process produces a transparent, open-cell foam structure that possesses a transparent, open-cell foam structure that possesses an extremely small cell size (approximately 60 nm) with a total porosity in excess of 90% by volume. The mor-phology gives the aerogel a large strength to density ratio with excellent insulating properties (thermal con-ductivity of 0.02 - 0.05 w/m/k in N2 gas). Also, the material has refractive index less than 1.10. The prop-erties measured in the study include Young's modulus, proportional limit, yield strength and strain in compres-tion. Other properties measured were Poisson's ratio sion. Other properties measured were Poisson's ratio and ultimate tensile strength.

Relationship between Appearance and Protective Durability of Coatings: A Literature Review.

T. Nguyen, B. Collins, L. Kaetzel, J. Martin, and M. McKnight. Dec 88, 57p NISTIR-88/4010 Sponsored by Civil Engineering Lab. (Navy), Port Hueneme. CA.

Keywords: *Protective coatings, *Forecasting, *Serv-ice life, *Discoloration, *Paints, Reviews, Construction materials, Fading, Weathenng.

For coatings, improved service life prediction aids in the effective selection and use of materials and in the development of cost-effective maintenance strategies. However, quantitative measures of degradation are essential in predicting service life. Standard proceessential in predicting service life. Standard proce-dures are available to quantitatively measure small changes in the appearance properties of coatings, one of the two primary functions of coatings, the other being protection. However, quantitative measure-ments of early changes associated with the protective function usually are not possible. Hence, the objective of the report is to ascertain, based upon the literature, whether changes in appearance properties of coatings can be used to predict changes in the protective prop-erties of the film. It was concluded, that for the most part, changes in the protective properties are not related to changes in the protective properties of a coating film.

PB89-209290 PC A03/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Chemical Process Metrology Div. Thin Film Thermocouples for High Temperature Measurement.

K. G. Kreider. May 89, 26p NISTIR-89/4087

Keywords: *Thin films, *Thermocouples, *Vacuum de-posited coatings, High temperature tests, Graphs(Charts), Platinum, Rhodium, Measurement, Engines, Turbines.

Thin film thermocouples have unique capabilities for measuring surface temperatures at high temperatures (above 800K) under harsh conditions. Their low mass, approximately 2x10(sup-5) g/mm permits very rapid response and very little disturbance of heat transfer to the surface being measured. This has led to applica-tions inside gas turbine engines and diesel engines measuring the surface temperature of first stage turbine blades and vanes and ceramic liners in diesel cyl-inders. The most successful high temperature (up to 1300K) thin film thermocouples are sputter deposited from platinum and platinum-10% rhodium targets although results using base metal alloys, gold, and platinel will also be presented. The paper reviews the fab-rication techniques used to form the thermocouples,

approaches used to solve the high temperature insulation and adherence problems, current applications, and test results using the thin film thermocouples. In addition a discussion will be presented on the current problems and future trends related to applications of thin film thermocouples at higher temperatures up to 1900K.

MD. Building Materials Div. Quantitative Studies of Coatings on Steel Using Reflection/Absorption Fourier Transform infrared Spectroscopy. Final rept.

T. Nguyen, D. Bentz, and E. Byrd. 1986, 1p Pub. in Abstracts of Papers, 1p 1986.

Keywords: *Infrared spectroscopy, *Thin films, *Steels, *Absorption, Reflection, Epoxy resins, Coat-ings, Quantitative analysis, Nondestructive tests, Re-prints.

Reflection/absorption infrared spectroscopy (RAS), commonly referred to as external reflection infrared spectroscopy, has become a powerful, nondestructive technique for studies of thin and thick films on metal surfaces. The intensity and shape of the absorption bands obtained by the technique are different from those obtained by the conventional transmission technique and are a complex function of numerous param-eters. The theory of RAS is valid only for very thin films and for a particular substrate/film system; for thick films, the theory deviates from experimental data. In the paper, the relationships between band intensities, angles of incidence, and film thicknesses of an aminecured epoxy coating on cold-rolled steel are examined using reflection/absorption Fourier transform infrared oped to describe the relationships for thick films of a steel/epoxy system.

Final rept.

D. C. Cranmer. 1989, 5p Sponsored by Strategic Defense Initiative Organiza-tion, Washington, DC. Innovative Science and Tech-

nology. Pub. in American Ceramic Society Bulletin 68, n2 p415-419 Feb 89.

Keywords: *Coatings, *Ceramic fibers, *Carbon fibers, *Thickness, Monitors, Dimensional measurement, Reprints

A variety of techniques exist for depositing coatings on ceramic and carbon fibers. The paper reviews several of the techniques and discusses the advantages and disadvantages. It also points out several deficiencies in the ability to uniformly and reproducibly coat fibers, especially multifilament tows. One of the most significant problems is the inability to monitor the coating composition and thickness in real-time, i.e., as it is deposited. Characterization techniques are currently limted to the examination of small amounts of fiber at a time and can not readily be adapted to continuous processing.

Gaithersburg, MD. Polymers Div. Design and Synthesis of Prototype Air-Dry Resins for Use in BEP (Bureau of Engraving and Printing) Intaglio Ink Vehicles.

Annual rept. B. Dickens, B. J. Bauer, W. R. Blair, and E. J. Parks. Sep 89, 44p NISTIR-89/4110 Sponsored by Bureau of Engraving and Printing, Washington, DC.

Keywords: *Alkyd resins, *Synthesis(Chemistry), *Inks, Polymers, Drying oils, Pentaerythritol esters, Air, Dispersing, Water, Oxidation, *Synthetic resins, *Intaglio.

Over 60 air-dry resins were designed and synthesized to provide prototype resins for intaglio inks used in the Bureau of Engraving and Printing for printing currency. Most of the resins contain linseed oil fatty acids as the air-dry part. The polysols used are trimethylol propane, pentaerythritol, dipentaerythritol, and tripentaerythritol. In other cases, 'super drying oil' resins were synthe-sized from tripentaerythritol and linseed oil fatty acids. Inks made from the resins must disperse in 1% aque-ous alkali. Acids groups were introduced into the resins using trimellitic anhydride, phthalic anhydride or succinic anhydride. The inks must pass two preliminary tests, one for dispersion in aqueous alkali before curing and one for resistance to the same solution after curing. Two resins, one a super-drying-oil type molecule based on tripentaerythritol and one a more typical alkyd based on pentaerythritol, passed these tests.

Films and Particles Grown by Hot-Filament Chemicai-Vapor Deposition.

Final rept. L. H. Robins, L. P. Cook, E. N. Farabaugh, and A. Feldman. 1989, 11p

Pub. in Physical Review B 39, n18 p13 367-13 377, 15 Jun 89.

Keywords: *Cathodoluminescence, *Diamonds, *Thin films, *Defects, Crystal structure, Surface properties, Microstructure, Reprints, *Chemical vapor deposition, Scanning electron microscopy.

Point defects, impurities, and defect-impurity complexes in diamond particles and polycrystalline films were investigated by cathodoluminescence (CL) imaging and spectroscopy in a scanning electron microscope. The diamond films and particles were grown by hotfilament methane-hydrogen chemical-vapor deposi-tion at several different temperatures; the nominal deposition temperature (Td) ranged from 600 to 850 C. Electron-beam energies used to excite the CL were 10-30 keV. By comparing the CL spectra to spectra of known defects in natural and synthetic diamond, the following luminescence centers were identified: 2.156-eV center attributed to a nitrogen-vacancy complex; 2.326-eV center, also thought to be a nitrogen-vacancy complex; violet-emitting center (observed peak position at 2.82 eV), associated with dislocation line defects, whose atomic structure is uncertain; 3.188-eV center, attributed to interstitial nitrogen or a nitrogen-(carbon-interstitial) complex; isolated neutral vacancy (denoted the general radiation center) with principal zero-phonon line at 1.673 eV. The luminescence from each center displayed a different dependence on Td and film morphology.

Straps. Final rept.

R. D. Kriz, and L. L. Sparks. 1988, 8p Sponsored by Ball Aerospace Systems Div., Boulder,

Pub. in Advances in Cryogenic Engineering, v34 p107-114 1988

Keywords: *Composite materials, *Aluminum oxide, *Epoxy resins, *Straps, *Mechanical properties, Keywords. Competence *Epoxy resins, *Straps, *Mechanical Pro-Fibers, Reinforced plastics, Glass fibers, Thermal conductivity, Loads(Forces), Fatigue(Materials), conductivity, Loads(Forces) Fractures(Materials), Reprints.

A study of advanced fiber-reinforced composites indicates improved thermal-mechanical performance for straps fabricated with alumina fiber over conventional fiber/epoxy systems. In particular, the study compared identical thermal-isolation strap configurations but with different fiber-reinforcement: S2-glass and alumina. Static and cyclic mechanical tests and thermal conductivity measurements indicate superior performance of straps with alumina fibers. Here a popular cryogenic grade resin was used in both configurations. Results of the study indicate that failure initiates in a region where the load is transferred by shear and compression.

Sponsoled by Harar Conference on Ad-ington, DC. Pub. in Proceedings of Annual Conference on Ad-vanced Composites 'How to Apply Advanced Com-posites Technology' (4th), Dearborn, MI., September 13-15, 1988, p141-150.

Keywords: *Composite materials, *Calorimeters, *Flammability testing, Heat measurement, Ignition, Radiance, Fiberglass reinforced plastics, Epoxy resins, Combustion, Sensitivity, Phenylene sulfide resins.

A study was undertaken to evaluate the fire performance of composite materials using the cone calonime-ter as the bench-scale method of test simulating the thermal irradiance from fires of various magnitudes. Parameters were derived from the calonimetry measurements to characterize the ignitability and flammability of the composite materials. The parameters are, to some extent, empirical since radiative heat losses from the samples were unknown. These parameters are: (1) minimum external radiant flux (MERF) required are: (1) minimum external radiant flux (MERF) required to produce pilot ignition in a predetermined exposure time; (2) thermal sensitivity index (TSI) which indicates the burning intensity dependence on external heat flux; and (3) extinction sensitivity index (ESI) which in-dicates the propensity for continued flaming combus-tion without an external heat flux. MERF values at 300 s for 3 mm composite panels of a FR epoxy resin and of a poly(phenylene sulfide) (PS) resin were about 18 and 28 kW/sq m, respectively. The TSI of the PPS resin composite revealed that it had the greatest de-pendency on external flux Additionally the FSI of the resin composite revealed that it had the greatest de-pendency on external flux. Additionally, the ESI of the PPS composites was the only one to indicate an exter-nal flux requirement to sustain combustion during the first 60 s after ignition.

Computer-Alded Imaging: Quantitative Composi-tional Mapping with the Electron Probe Microanalyzer. Final rept.

D. E. Newbury, R. B. Marinenko, D. S. Bright, and R. L. Myklebust. 1988, 13p Pub. in Scanning 10, p213-225 1988.

Keywords: *Electron probes, *Microanalysis, Compos-ite materials, Quantitative analysis, Mapping, Reprints, Image processing

X-ray area scanning ('dot mapping') is a technique widely used in electron probe microanalysis for deter-mining the spatial distribution of elemental constitu-ents. Although powerful, this technique is subject to significant limitations on concentration sensitivity and significant limitations on concentration sensitivity and flexibility for subsequent processing. The new tech-nique of compositional mapping overcomes these limi-tations. In compositional mapping, a complete quanti-tative electron probe analysis is carried out at each point of a matrix scan. The resulting matrices of con-centration values can be assembled into images in a digital image processor by assigning gray or color in-tensities to the actual concentrations rather than the raw spectral intensities. Dirital compositional maps raw spectral intensities. Digital compositional maps can be readily manipulated by a wide variety of image processing techniques to improve the visibility of features of interest.

The creep rupture behavior of a ceramic particulate composite system was studied under tensile and flexural loading. The rupture process commences from the heterogeneous formation of cavities at particle interfaces in the tensile stress field. As deformation proceeds, a critical strain is reached whereupon cavity proceeds, a critical strain is reached whereupon cavity coalescence takes place forming large microcracks. Ultimately, rupture occurs when one of these micro-cracks reaches a critical length and the remaining liga-ment cannot sustain the applied load. On the assump-tion that microcracks grow to a critical size through the coalescence of cavities, a new rupture criterion is pro-posed based upon a critical strain concept of failure. Using the criterion for fracture, together with a detailed creap mechanics analysis: theoretical predictions are creep mechanics analysis; theoretical predictions are made of lifetime under both bending and simple ten-sion. Creep and creep rupture data for a grade of sili-conized silicon carbide tested at 1300 C are collected and compared with the proposed theory. Reasonable agreement between theory and experiment were obtained in both modes of loading.

Keywords: *Composite materials, *Thermal conductivity, *Thermal cycling tests, Plastics, Polymers, Alumi-num oxide, Epoxy resins, Ceramic fibers, Orientation, Low temperature tests, Graphs(Charts), Tables(Data), Fiber laminates, Polyetheretherketone.

The thermal conductivities of poly-ether-ether-ketone (PEEK), of alumina fiber in a matrix of PEEK, and of alumina fiber in a matrix of epoxy, were determined along with the effects of fiber orientation and thermal cycling. Thermal conductivity was measured over the temperature range of 4.2 to 310 K using a steady-state apparatus. Data are presented and discussed relative to specimen characteristics. It appears that after accounting for different fiber fractions in the specimens, the thermal conductivity of the PEEK composite mate-rial is less than that of the epoxy composite material in particular temperature ranges.

Pub. in Dental Materials 5, p241-243 Jul 89.

Keywords: *Dentistry, *Dental materials, *Bonding, *Composites, Cavities, Leakage, Aluminum oxide, Ferric compounds, Reprints, Permanent dental restorations

The study observed microleakages of composite restorations bonded with two commercial and two experimental systems. A high-viscosity condensable com-posite and a low-viscosity composite were used as the restorative materials. The bonding systems used were two widely accepted commercial brands and two experimental systems, one containing ferric oxalate and the other aluminum oxalate. Restorations were placed in cavities prepared in extracted human teeth, then stored in 37 C water for 24 hours and then polished. The restored teeth were subjected to seven days of thermocycling (5 C-55 C for 540 cycles per day). Micro-leakage was detected and scored from 0-4 according to the degree of stain penetration. The experimental systems had lower scores than the commercial systems. The high-viscosity composite restorations had microleakage scores higher than those of the lower-viscosity composite restorations.

A silicon carbide fiber used as reinforcement in a borosilicate glass matrix has been shown to enhance the fracture toughness of the glass by as much as 22%. A ductile nickel coating on the fiber was found to reduce the interfacial shear strength and the frictional sliding between the fibers and the glass matrix, but any influ-ence that the thickness of the nickel coating has on toughening was not conclusive. Time functions of creep strain and creep times to failure were measured for a 25 wt% SiC whisker-reinforced Al203 composite with 4.9% porosity. Beam specimens were used in four-point flexure with variously fixed bending moments and fixed temperatures between 1100 and 1300 C. The secondary creep-strain rates of specimens tested at lower stresses did not follow a power-law function of stress which was fitted to the high stress data. The microstructure of as-received specimens and specimens crept to failure were studied using optical and electron microscopy to determine the mecha-nisms of creep in the two stress regimes. Both kind of specimens contained cavitation at the whisker/Al203 grain boundary intersections to varying degrees. How-ever, high stress specimens contained broken whisk-ers whereas those from the low stress regime did not.

ASTM STP 1012, p150-161 1989.

Keywords: *Laminates, *Woven fiber composites, *Stress analysis, Epoxy resins, Composites, Thermonucle-ar energy, Reprints, *Edges, Glass fiber reinforced plastics.

Woven glass-epoxy laminates are used as nonmetallic components at low temperatures in magnetic fusion energy structures. Previous damage studies on G-10CR and G-11CR cryogenic grade woven laminates revealed that most of the damage occurred in the laminated interior. An existing, generalized plane strain, finite element model was modified to predict stress states at the laminate interior and free edges. Finite element results demonstrated that the weave geometry reduces edge stresses at low temperatures. Delamination edge stresses in woven laminates are more sensitive to small changes in temperature than those in nonwoven laminates.

Keywords: *Tensile strength, *Fatigue(Materials), *Creep strength, *Copper, *Stainless steels, *Lami-nates, Composite materials, Electrical resistivity, Thermal conductivity, Magnets, Reprints.

The design of compact ignition magnets uses a highconductivity copper alloy. However, the large magnetic fields cause large stresses in the coil. The application may require a conductor with higher strength than that of the copper alloys and equally high electrical and thermal conductivity. A candidate material was produced by reinforcing the copper alloy with a stainless-steel alloy. The steel is roll-bonded as the midplane between two copper sheets. The material has the high thermal and electrical conductivity of the copper alloy and, possibly, sufficient strength to be used in compact ignition magnets. Tests were conducted at 295 and 76 K to characterize the tensile and creep-fatigue behav-ior of the laminated composite material in three rollbonded conditions. The conditions correspond to a bulk reduction of 40, 50, and 60% cold work in the laminate as a whole. A mixing rule was used to predict the tensile behavior of the composite on the basis of the individual tensile properties of copper and stainless steel.

Corrosion induced Degradation of Amine-Cured Epoxy Coatings on Steel. Final rept.

T. Nguyen, and E. Byrd. 1987, 1p Pub. in Abstracts of Papers of the American Chemical Society 193, p133 Apr 87.

Keywords: *Protective coatings, *Degradation, *Epoxy resins, *Amines, *Corrosion, *Curing agents, Inter-faces, Steels, Aging tests(Materials), Oxidation, Alkalinity, Infrared spectroscopy, Reprints.

Organic protective coatings on metal can undergo physical and chemical changes under service condi-tions. The paper differentiates the interfacial degradation due to corrosion processes from that due to thermal oxidative reactions of an amine-cured epoxy coating on steel substrate exposed to corrosive environ-ment. Relatively thin films of 40 and 400 nm of an amine cured-epoxy coating on well-prepared cold-rolled steel substrate aged in corrosive and thermal oxidative environments were studied by reflection/absorption Fourier Transform Infrared Spectroscopy. The results obtained showed degradation of the coating exposed to corrosive environment but not that exposed to thermal oxidative environment, suggesting that the corrosion reaction products, which are highly alkaline, are responsible for the degradation of the coating.

Keywords: *Chlorides, *Coatings, *Metals, *Corro-sion, *Blistering, *Electrodes, Methodology, Inter-faces, Electric potential, Microelectronics, Measure-ment, Graphs(Charts).

One of the main reasons for the lack of a complete understanding of corrosion and adhesion failures of a coated metal is the lack of analytical instrumentation to probe the behaviors of corrosive agents at the coating/steel interface. A procedure has been developed based in microelectrodes for studying in situ the be-haviors of potential and chloride ions in blister and at a coating/metal interface. The procedure requires an at-tachment of a double-barred Cl(-1) selective microe-lectrode at the coating/metal interface, thus allowing direct measurements of Cl(-1) concentration and cor-rosion potential changes at localized areas under a coating. Although it is intricate to prepare the microelectrodes, the procedure provided very useful informa-tion for mechanistic studies of corrosion under coatings, as well as for transport studies of C(-1) ions through a coating on metal. The procedure should also be very useful for studying the roles of Cl(-1) in local-ized corrosion. The utility of an inverted electrode mi-crosampling method for studies of Cl(-1) in very small volumes such as blisters was also demonstrated.

Flow of Molecules Through Condoms. Annual rept. 1 Mar-1 May 87 (Final). C. M. Guttman. Oct 87, 47p NBSIR-88/3721

Contract FDA-224-79-5023

Sponsored by Food and Drug Administration, Rock-ville, MD. Office of Science and Technology.

Keywords: *Elastomers, *Contraceptives, *Diffusion, Latex, Pin holes, Molecular flow, *Condoms.

An apparatus for the measurement of flux of small molecules through whole condoms has been developed. It is shown that the experiment can measure diffusion constants as low as 10(sup -13) cm(sup 2)/s or a single pinhole as small as .4 micrometers in the condom. For pinhole measurements this is shown to be a factor of 10 better than current ASTM testing methods on the basis of flow considerations only. Analysis of the experimental data show the difficulties in making unambiguous determinations on the mecha-nisms of flow. Further experiments are necessary to distinguish between large holes and small holes and fluxes due to diffusion and those due to pinholes. The results suggest a more careful study of fluxes through condoms is necessary to assure that a particle about 1 micrometer cannot pass through the condom.

. Small angle neutron scattering (SANS) measurements were performed on poly(isoprene) networks at differ-ent uniaxial strains, i.e., 1.0 less than lambda (exten-sion ratio) less than 2.1. The networks were prepared from anionically polymerized, alpha, mu-dihydroxy-poly(isoprene) precursors (H-chains) and the corre-sponding poly(isoprene-d8) isotopic counterparts (D-chaine). Two molecular weights of Dechains 26 000 chains). Two molecular weights of D-chains, 26,000 and 64,000, crosslinked with approximately the same molecular weight H-chains (29,000 and 68,000 respectively) were examined for the deformation behaviors. The chain extensive deformation is found to follow a behavior intermediate between the junction affine model and the phantom network model which allows unrestricted fluctuations of network junctions. The chain contractive deformation follows closely the chain affine model, indicating an asymmetry between extensive and contractive chain deformation. In either case, the deformation behavior is found to be the same for the two molecular weights.

Doctoral thesis.

Y. Chen. Jun 89, 147p NIST/GCR-89/566 Grants NANB-8-D0851, NANB-6-D0629 Sponsored by National Inst. of Standards and Tech-nology (NEL), Gaithersburg, MD. Center for Fire Research

Keywords: *Pyrolysis, *Cellulose, *Fire resistant coatings, *Sodium hydroxide, Catalysts, Combustion prod-ucts, Heat of vaporization, Nitrogen, Graphs(Charts), Vapors, Volatility, Theses.

The pyrolysis of pure and fire retarded bulk cellulose samples in a nitrogen atmosphere is studied. The study is directed toward determining the effects of the solid phase fire retardant (sodium hydroxide) on the burning of cellulose. The material property of pure and fire retarded cellulose which most directly affects its burning behavior, the heat of gasification, is measured by using a specially designed pyrolyzing chamber. Theoretical results are obtained for a one-dimensional pyrolysis wave propagating into cellulose by using a finite-difference calculation. The experimental data show that sodium hydroxide acts as a catalyst in the pyrolysis of cellulose. Its addition leads to decreases in the heat of gasification and the mass fraction of non-combustible volatiles in the total volatiles and to increases in stoichiometric ratio and the heat of combustion of combustible volatiles, and thereby has a dual effect on cellulose burning.

Flammability Tests for Industrial Fabrics: Relevance and Limitations.

Final rept. K. M. Villa, and J. F. Krasny. 1988, 16p

Pub. in Proceedings of Annual Conference of the Industrial Fabrics Association International (76th), Chicago, IL., November 9-12, 1988, p119-134.

Keywords: *Flammability testing, *Industrial fabrics, *Fire resistant textiles, Criteria.

Flammability tests applicable to industrial fabrics, in-cluding tents and other outdoor equipment, inflatable structures, etc., are discussed briefly. These tests were designed to assure self-extinguishment after ex-posure to small flames. The specimens are generally held vertically in a U-shaped steel frame and ignited at the bottom. Most of these tests were developed when only char-forming materials like flame retardant cotton were available. The criteria chosen for the tests were char length, and afterflame and afterglow time. The applicability of these tests and criteria to both charforming and thermoplastic fabrics is critically reviewed.

Local Brittle Zones in Steel Weldments: An Assessment of Test Methods. Final rept.

R. Denys, and H. I. McHenry. 1988, 7p Pub. in Proceedings of International Conference on Offshore Mechanics and Arctic Engineering (7th), Houston, TX., February 7-12, 1988, p379-385.

Keywords: *Steels, *Weldments, *Fractures(Materials), *Offshore structures, *Plates(Structural member), *Nondestructive tests, Brittleness, Microstructure, Heating, Quality control, Toughness, Structural analysis.

Local brittle zones (LBZs) are regions of brittle microstructure within the heat affected zones (HAZs) of steel weldments that can initiate brittle fracture at low toughness levels. The paper describes the metallurgical nature of LBZs, reviews the various test methods used to detect and evaluate LBZs, and recommends test methods for controlling LBZs in offshore structures. The recommended tests and their specific functions are: (1) For pre-production qualification of steel plates, CTOD tests evaluate the susceptibility of steels to the formation of LBZs; (2) For quality control of steel plates, drop weight NDT tests evaluate the tolerance for LBZs of the steels used for offshore structures; (3) For qualification of welding materials and proceedures, Charpy V-notch tests verify that the HAZ toughness exceeds the minimum toughness specified for the steel; (4) For fitness for purpose evaluations, wide plate tests assess the significance of LBZs in existing structures.

J-Integral Values for Small Cracks in Steel Panels.

D. T. Read. 1988, 13p Sponsored by Naval Sea Systems Command, Wash-ington, DC., and David W. Taylor Naval Ship Research and Development Center, Annapolis, MD. Pub. in Fracture Mechanics: Eighteenth Symposium, ASTM STP 945, p151-163 1988.

Keywords: *Steels, *Fractures(Materials), Toughness, Defects, Loads(Forces), Strains, Crack propagation, Plates(Structural members), Tearing, Reprints, *J-integral, Steel A710.

For a quantitative relationship between fracture toughness, flaw size, and applied loading for small flaws, be used for fitness-for-service assessment, applied J-integral was measured as a function of applied strain in eight 14-mm-thick specimens of ASTM A710 Grade A Class 3 steel plate. All the edge cracks had lengths less than 3% of the specimen width of 82 mm. Six specimens were tested in tension; two were loaded by four-point-bending in the plane of the plate. One single-edge-cracked, transversely oriented specimen was tested at -30 deg C. Electrical resistance strain gage and clip-gage crack mouth opening displacement measurements were used to obtain quantities inside the J-integral. The J-integral was calculated by trape-zoidal rule integration. Unloading crack mouth compliance measurements were used to obtain crack length values so that tearing effects could be observed. Lueder's strains occurring right after yield caused rapid increases in the applied J-integral values for the ten-sion specimens. Except for the Lueder's strain effect, the behavior of the applied J-integral in bending was similar to that in tension. Tearing caused a smooth ex-ponential rise in applied J as strain increased beyond the point of initiation. The initiation toughness and tearing resistance of the panels with short cracks were equal to or greater than those of conventional threepoint-bend specimens of the same thickness.

Iron & Iron Alloys

Cracking(Fracturing), Toughness, Residual stress, Strain gages, Pressure vessels, Hydrostatics, Chromium, Molybdenum.

Wide-plate and standard-size specimens cut from repair welds in 2-1/4Cr-1Mo plate were tested as-welded and after post-weld heat treatment (PWHT). Three-point-bend specimens with cracks oriented in the TS direction were used to measure weld-metal and heat-affected-zone (HAZ) toughness values. Results of direct measurements of the applied J-integral on the wide plates were compared with critical J-value measurements of three-point-bend specimens. The com-parison indicated that PWHT was highly beneficial, be-cause it reduced the crack-driving force from residual stresses and increased the weld-metal and HAZ toughness. In the as-welded condition, very low tough-ness values were measured at the HAZ. These low toughness values, together with the measured crackdriving forces, indicated critical crack depths of a few a new approach to the problem of the applied J-inte-gral produced by residual stresses is being explored: strain-gage measurements made during notching are analyzed to obtain an applied J-integral as a function of crack depth. The preliminary results are encourag-ing. The residual-stress-produced J-value is roughly equivalent to that produced by a remote elastic loading to the same stress level.

Fractal-Based Description of the Roughness of **Blasted Steel Panels.**

Final rept.

J. W. Martin, and D. P. Bentz. 1987, 7p Sponsored by Federal Highway Administration, Wash-

ington, DC. Pub. in Jnl. of Coatings Technology 59, n745 p35-41 1987.

Keywords: *Steels, *Roughness, *Thermography, *Images, Panels, Blasting, Fractography, Cameras, Surface properties, Reprints.

The fractal dimensions of a standard series of blasted steel panels are shown to correlate very well with their perceived roughness. This occurs because the roughness of a blasted panel dictates the roughness of its image, and hence, its fractal dimension. The blasted steel panels are imaged with a thermographic camera, as opposed to a visual camera, because a thermo-graphic image better delineates the peak-to-valley heights of the crater-like structures; it minimizes imag-ing problems due to light reflectance; and it eliminates most of the imaging problems associated with surface discoloration. It is concluded that the fractal dimension of a blasted steel surface captures most of the perceptually relevant shape structures on an abraded sur-face, and thus, provides a good quantitative representation of surface roughness.

Loading Rate Effects on Discontinuous Deformation In Load-Control Tensile Tests. Final rept.

Ogata, K. Ishikawa, R. P. Reed, and R. P. Walsh. 1988, 8p

Sponsored by Department of Energy, Washington, DC.

Office of Fusion Energy. Pub. in Advances in Cryogenic Engineering Materials, v34 p233-240 1988.

Keywords: *Tension tests, *Loading rate, *Load con-trol, *Austenitic steels, *Deformation, Tensile proper-ties, Strains, Ultimate strength, Low temperature tests, Cryogenics, Loads(Forces), Reprints.

In load-control tensile tests at liquid helium tempera-ture, an abrupt and large discontinuous deformation occurs, which differs from the discontinuous deformation obtained from displacement-control tests. We investigated the effects of loading rate, varied from 0.5 to 5000 N/s, on the tensile properties of AISI 304L, 310, and 316LN steels at 4 K. A large deformation, near 40% strain, occurred in AISI 310. At the high loading rates, the ultimate strength of these materials was 65% of the strength obtained in displacement-control tests; the initiation strength of discontinuous deformation was also less.

ton, DC.

Keywords: *High temperature tests, *Creep tests, *Tensile strength, *Computation, *Deformation, *Con-struction materials, *Steels, Elastic properties, Plastic properties, Equations, Graphs(Charts), Steel ASTM A36

The results of tensile and creep tests on steels close to the American specification for ASTM A36 have been used to formulate an equation from which elastic, plastic, creep and total strains can be calculated. Correlations between measured and predicted strains for Australian AS A149 and Japanese SS41 steels, both close to the A36 specification, are shown and good agreement is found. The above mentioned equation is also used to construct deformation mechanism (i.e., elastic, plastic, or creep) maps for times of 2 minutes to 4 hours at temperature. From these maps the defor-mation mechanisms operating at a given temperature and stress can be seen. The dominant mechanism for each set of conditions is given. In addition the maps show contours of total strain values 1, 2, and 5%.

901,099 PB89-173504 Not available NTIS National Bureau of Standards (IMSE), Boulder, CO. Fracture and Deformation Div. Role of Inclusions in the Fracture of Austenitic

Stainless Steel Welds at 4 K.

T. A. Siewert, and C. N. McCowan. 1987, 11p Sponsored by Department of Energy, Washington, DC. Pub. in Welding Metallurgy of Structural Steels, p415-425 1987.

Keywords: *Inclusions, *Austenitic stainless steels, *Weldments, *Impact tests, *Toughness, *Cryogen-ics, Yield strength, Shielded metal arc welding, Gas metal arc welding, Fractures(Materials), Surface prop-erties, Morphology, Ductility, Reprints.

Inclusion densities were measured for three types of austenitic stainless steel welds and compared to the 4-K yield strengths, 76-K Charpy V-notch absorbed energies, and the ductile dimple densities on the respective fracture surfaces. The welds included shielded metal arc (SMA) welds and gas metal arc (GMA) welds. The arc (SMA) welds and gas metal arc (GMA) welds. The inclusion density was consistently a factor of 8 to 10 less than the fracture surface dimple density. Inclusion and dimple densities ranged from 3.9×10 sup 4 inclusions per sq mm and 3.2×10 sup 5 dimples per sq mm for one SMA specimen to 1.1×10 sup 4 inclusions per sq mm and 1.2×10 sup 5 dimples per sq mm for the fully austentitic GMA specimen. Both ductile dimple density and dimple morphology varied with specimen type. The inclusion data for the welds agreed with a linear relationship between fracture touchness and inlinear relationship between fracture toughness and in-clusion spacing that had been developed for base metals.

Fracture and Deformation Div. Influence of Molybdenum on the Strength and Toughness of Stainless Steel Welds for Cryogenic Service.

Final rept. C. N. McCowan, T. A. Siewert, and E. Kivineva. 1987, 12p

Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of International Symposium on Welding Metallurgy of Structural Steels, Denver, CO., February 22-26, 1987, p427-438.

Keywords: *Molybdenum, *Austenitic stainless steels, *Additives, *Toughness, *Impact tests, *Cryogenics, Yield strength, Chromium alloys, Nickel, Manganese, Nitrogen, Weldments, Inclusions.

Molybdenum additions to austenitic stainless welds were found to increase the 4-K yield strength by apadditions had little effect on the 76-k Charpy V-Notch impact energy, with one exception: when the molybde-num content was raised from 1.7 to 3.8 wt. % in an otherwise equivalent stainless steel composition of apotherwise equivalent stainless steel composition of ap-proximately 17Cr-9Ni-6.6Mn-0.17N, the absorbed energy decreased from 33 to 16 J. At a nickel content of 14 wt. %, the higher molybdenum contents did not reduce the impact toughness. The loss in impact toughness for the 9 wt.% nickel, 3.8 wt. % molybde-num composition was linked to an increased number of both small and large inclusion sizes in the weld. The effects of pickel and managese on the correction effects of nickel and manganese on the cryogenic strength and toughness are also reported.

Failure Analysis of an Amine-Absorber Pressure Vessel.

Final rept.

H. I. McHenry, and D. T. Read. 1986, 17p See also PB89-126783. Sponsored by Occupational Safety and Health Administration, Chicago, IL. Pub. in Proceedings of International Conference on Structural Failure, Product Liability and Technical In-surance (2nd), Vienna, Austria, July 1-3, 1986, p141-157

Keywords: *Pressure vessels, *Bursting, *Refineries, *Stress corrosion tests, Failure, Fractures(Materials), Microstructure, Hydrogen, Crack propagation, Pres-sure, Embrittlement, Petroleum products, Toughness, Weldments, Maintenance, Structural forms, Steels, Reprints.

In 1984, a pressure vessel ruptured at a petroleum refinery causing an explosion and fire. It fractured along a path that was weakened by extensive cracking adja-cent to a repair weld joining a replacement section to the vessel. These pre-existing cracks initiated in areas the vessel. These pre-existing cracks initiated in areas of a hard microstructure due to hydrogen stress crack-ing. The cracks grew through the vessel wall due to hydrogen pressure cracking. When the depth of the largest of these cracks exceeded 90% of the wall thickness, the remaining ligament ruptured resulting in a through crack about 800 mm long. This crack trig-gered final fracture at the operating stress level of 35 MPa because the toughness of the vessel steel was reduced nearly 3-fold by hydrogen embrittlement. reduced nearly 3-fold by hydrogen embrittlement.

Tensile Strain-Rate Effects in Liquid Hellum.

Final rept.

R. P. Reed, and R. P. Walsh. 1988, 10p Pub. in Advances in Cryogenic Engineering: Materials, v34 p199-208 1988.

Keywords: *Tensile strength, *Strain rate, *Liquids, *Helium, *Austenitic stainless steels, Cryogenics, Heat transfer, Dislocations(Materials), Surface properties, Adiabatic conditions, Reprints.

The effects of strain rate on tensile properties of three austenitic stainless steels at 4 K were examined. Strain rates ranged from 4.4 x 10 sup(-6) s sup(-1) to 8.8 x 10 sup(-3) s sup(-1). Strain rates less than 2.2 x 10 sup(-3) s sup(-1) had no effect on tensile properties. Strain

Iron & Iron Alloys

rates of 4.4 x 10 sup(-3) s sup(-1) or larger reduced the ultimate tensile strength, and stress-strain curves and temperature measurements indicated specimen warming to 100 K. Calculations are presented to estimate the work put into the specimen during deformation, stored energy in terms of dislocations and dislocation interactions, and dissipated heat. The reduction of tensile strength was associated with specimen warming which was caused by the transition from nucleate to film-boiling heat transfer on the specimen surface.

Fracture Behavior of a Pressure Vessel Steel in the Ductile-to-Brittle Transition Region. J. Heerens, and D. T. Read. Dec 88, 44p NISTIR-88/

3099

Prepared in cooperation with GKSS - Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.).

Keywords: *Fractures(Materials), *Steels, *Pressure vessels, *Ductile brittle transition, *Cleavage, Manga-nese, Initiation, Crack propagation, Nickel, Molybdenum. Metal allovs.

The reasons for the scatter of fracture toughness in the ductile-to-brittle transition region, as well as the mechanisms leading to cleavage fracture, have been investigated for a quenched and tempered pressure vessel steel, DIN 20 MnMoNi 55. The fracture surfaces indicate that cleavage fracture starts at one small area in the ligament, the cleavage initiation site. Cleavage initiation occurs ahead of the crack tip at the location of the maximum normal stresses. Fractography and metallography show four different types of initiation sites. The mechanisms which may trigger cleavage fracture at these initiation sites are discussed. The results indicate that the scatter of fracture toughness is due to the scatter in the distance between the cleavage initiation site and the fatigue crack tip.

The development of ignition and combustion in pressurized oxygen atmospheres was studied for the iron based alloy UNS S66286. Ignition of the alloy was achieved by heating the top surface of a cylindrical specimen with a continuous-wave CO2 laser. Two heating procedures were used. In the first, laser power was adjusted to maintain an approximately linear in-crease in surface temperature. In the second, laser power was periodically increased until autoheating (self-heating) was established. It was found that the alloy would autoheat to destruction from temperatures below the celidue temperature. In addition, and that below the solidus temperature. In addition, endothermic events occurred as the alloy was heated, many at reproducible temperatures. Many endothermic events occurred prior to abrupt increases in surface temperature and appeared to accelerate the rate of increase in specimen temperature to rates greater than what would be expected from increased temperature alone. It is suggested that the source of these endotherms may increase the oxidation rate of the alloy. Ignition parameters are defined and the temperatures at which these parameters occur are given for the oxygen pres-sure range of 1.72 to 13.8 MPa (25 to 2000 psia).

Ferrite Number Prediction to 100 FN in Stainless **Steel Weld Metal.**

Final rept. T. A. Siewert, C. N. McCowan, and D. L. Olson.

1988, 10p Pub. in Welding Research Supplement, p289-s-298-s Dec 88.

Keywords: *Weldments, *Stainless steels, *Ferrite, Manganese, Molybdenum, Nitrogen, Silicon, Solidifica-tion, Surveys, Reprints, Stainless steel 309, Data hases

To improve the accuracy of ferrite number (FN) prediction in stainless steel weld metal, a new diagram has been developed using a database containing more than 950 alloy compositions from worldwide sources. In accuracy, the diagram surpasses the DeLong dia-gram for the low-FN austenitic stainless steel composi-tions of the 300 series, and it corrects a 2 FN bias de-tected for Type 309 stainless steel. The diagram is more accurate than the Schaeffler diagram for duplex stainless steel alloys and ferrite contents to 100 FN. It is most accurate when the Mn content is restricted to 10 wt-%, Mo content is restricted to 3 wt-%, N content is restricted to 0.2 wt-%, and Si content is restricted to 1 wt-%. Changes in the primary solidification mode are indicated on the diagram, and they appear to affect the FN response. Transitions in iso-FN line spacings may be caused by these mode changes.

Linear-Elastic Fracture of High-Nitrogen Austenitic Stainless Steels at Liquid Hellum Temperature. Final rept.

R. L. Tobler, R. P. Reed, and P. T. Purtscher, 1989. 6p

Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy. Pub. in Jnl. of Testing and Evaluation 17, n1 p54-59

Jan 89

Keywords: *Austenitic stainless steels, *Chromium nickel alloys, *Cryogenics, *Fractography, Fracture strength, Brittleness, Reprints, *Nitrogen additions, Manganese additions, Thermonuclear reactors

Four commercial Fe-Cr-Ni-Mn austenitic stainless steels containing 0.14, 0.26, and 0.37 wt% N were fractured in liquid helium at 4 K, and measurements of the linear-elastic plane-strain stress-intensity factor, K(sub 1c), were made. Interstitial nitrogen significantly strengthens these steels at low temperatures so that brittle fractures occur under plane strain conditions at 4 K despite moderate ductility in uniaxial tension. The brittle fracture mechanism at 4 K involves a form of cleavage or slip-band cracking as evidenced by the formation of transgranular facets on (111) planes

Final rept.

P. T. Purtscher, R. P. Walsh, and R. P. Reed. 1988, 80

Pub. in Advances in Cryogenic Engineering Materials, v34 p191-198 1988.

Keywords: *Chemical composition, *Cryogenics, *Me-chanical properties, *Austenitic stainless steels, Liquid helium, Toughness, Yield strength, Crack propagation, Molybdenum containing alloys, Nickel containing alloys, Microstructure, Annealing, Reprints, *Stainless-steel-316LN, Molybdenum additions, Nickel additions.

A series of eight austenitic stainless steels was tested in liquid helium to determine the effect of Mo and Ni variations on the strength and toughness. The Mo content ranged from 0 to 4 wt.%; the Ni content varied from 11 and 14 wt.%. The microstructure of the alloys depended upon the composition and annealing tem-perature. Higher alloy content and lower annealing temperatures, 1000 to 1050 C, resulted in a nonuni-form circular. form structure. The higher temperature, 1150 C. pro-duced a uniform austenitic structure. The mechanical test results showed that Mo additions increased the yield strength (to a maximum at 3 wt.%) and de-creased the K sub (Ic)(J) values, so that there was no improvement in the strength-toughness relationship. Increasing the Ni content decreased the strengthening effect of Mo and increased K sub (Ic)(J). It supports earlier work that showed that Ni does improve the strength-toughness relationship.

Iron & Iron Allovs

Pub. in Advances in Cryogenic Engineering Materials, v34 p379-386 1988.

Keywords: *Fractures(Materials), *Cryogenics, *Aus-tenitic stainless steels, *Tension tests, Axial stress, In-clusions, Surface properties, Microstructure, Nuclea-tion, Reprints, *Stainless- steel-316LN, Maganese sulfides

The fracture behavior of an austenitic stainless steel, commercial-grade 316LN alloy, at cryogenic temperatures is studied by careful examination of the fracture surfaces and polished cross-sections through the frac-ture surfaces of round tensile specimens. The fracture is ductile (a dimpled rupture process) and is controlled by inclusions in the structure, MnS stringers and smaller spherical particles. The main effect of the MnS stringers was to decrease the percent reduction in area in the tensile test at 4K. The true stress and strain at fracture vary as a function of test temperature and are shown to be related to the nucleation of microvoids around the spherical particles.

Keywords: *Tension tests, *Minesweepers(Ships), *Wire rope, Graphs(Charts), Tensile stress, Naval mine detection, *Stainless steel-305.

The Naval Coastal Systems Center submitted to the The Naval Coastal Systems Center submitted to the National Institute of Standards and Technology (NIST) approximately 360 feet of each of two different AISI 305 stainless steel wire ropes for testing. Both wire ropes were nominally 5/8 inch in diameter. One was stated as having a 6 x 19 configuration and the other a 7 x 7 configuration. The first number in such a designation indicates the number of strands in the wire rope different wire rope. and the second number indicates how many wires there are per strand. For example, the wire rope with a 6 x 19 configuration consists of six strands of 19 wires each. As shown later, the wire rope stated to have a 7 x 7 configuration actually had a 6 x 7 configuration actually had a 6 x 7 configuration actually had a 6 x 7 configuration with an independent wire rope core (IWRC). The core is one of the three basic parts of a wire rope. The other two are the wires and the strands. The core may be comprised of steel or fiber. In the case of both of the submitted wire rope samples, the core consisted of an independent wire rope.

Preparative Liquid Chromatographic Method for the Characterization of Minor Constituents of Lubricating Base Olls.

Final rept. P. Pei, and S. M. Hsu. 1986, 35p

Pub. in Jnl. of Liquid Chromatography 9, n15 p3311-3345 Nov 86.

Keywords: *Lubricating oils, *Chromatography, *Po-larity, *Hydrocarbons, Methodology, Liquids, Separa-tion, Synthesis(Chemistry), Friction, Wear, Oxidation, Molecular structure, Reprints.

In an effort to isolate, identify, and measure the proper-ties of the active ingredients in a lubricating base oil, a high performance liquid chromatography (HPLC) sepa-ration scheme has been developed. The preparative mode of production is necessary to yield sufficient amounts of minor constituents for property measure-ments in terms of friction, wear, and oxidation charac-teriotion briotics and wear control the polority of the teristics. In friction and wear control, the polarity of the molecular species is more important than the function-al groups in the species. Therefore the design of the separation scheme is based on the relative polarity of various functional groupings. Because the effort is di-rected towards identifying key components rather than analysis of the major compositions, mass recovery re-quirement is critical. The separation scheme is divided into two stages. The base oil first undergoes a clay-get separation to yield the saturates, aromatics, and the polar fractions. The polar fraction then is separated further using a neutral alumina column and the sequential solvent extractions into molecular compound classes of varying polarity. The paper describes the separation scheme and the detailed chemical characterization of the fractions.

Nondestructive techniques are required for the in-process characterization of rapidly solidified and sur-face modified layers to fulfill the role of sensors in emerging intelligent materials processing technol-ogies. In steels, where surface modification via direct-ed high energy sources is being investigated for sur-face hardening, it has been found that a difference race nardening, it has been found that a difference exists in the Rayleigh wave velocity of martensite and pearlite. The difference in velocity can be used to char-acterize the hardness of a surface modified layer on a pearlite substrate. By varying the Rayleigh wave fre-quency (and thus the depth of wave penetration) and measuring velocity dispersion, it has also been possi-ble to non-destructively determine the depth of modi-fied surface layers on both AISI 1053 and 1044 steels produced by electron beam meltion. produced by electron beam melting.

Keywords: *Surface properties, *Solids, *Radiation damage, *Molecular structure, Photons, Quantitative analysis, Simulation, Chemical bonds, Sorption, Reprints.

Techniques for analyzing the structure and composition of solid surfaces using electron and photon beams often suffer from interferences due to radiation damage. Damage-producing processes compete with information-producing events during measurements, and beam damage can be a serious perturbation in and beam damage can be a serious perturbation in quantitative surface analysis. However, there are also substantial benefits of electron and photon stimulated damage processes for studying molecules on sur-faces. Direct information about the geometrical struc-ture of adsorbed species can be obtained from meas-urements of the angular distributions of ions released by electron or photon stimulated desorption. The di-cotione of ion or photon stimulated desorption. rections of ion emission are determined by orientations of the surface bonds which are ruptured by beam irra-diation. The method of Electron Simulated Desorption Ion Angular Distributions (ESDIAD) has proven particularly useful as a direct tool for characterizing local molecular structure at surfaces. Moreover, photon stimulated desorption studies using synchrotron radiation are revealing the fundamental electronic excitations which lead to bond-breaking processes at surfaces.

Experimental Determination of Forced Convection Evaporative Heat Transfer Coefficients for Non-Azeotropic Refrigerant Mixtures.

Rinal rept. R. Radermacher, H. Ross, and D. Didion. 1983, 7p Pub. in Proceedings of Winter Annual Meeting of the American Society of Mechanical Engineers, Boston, MA., November 13-18, 1983, p1-7.

Keywords: *Refrigerants, *Test facilities, *Heat trans-fer coefficient, Convection, Mixtures, Evaporators, Two phase flow.

Recently energy conservation requirements spurred interest in nonazeotropic refrigerant mixtures, because such mixtures can improve theoretically the COP of certain refrigerant cycles. The two phase heat transfer coefficient of such mixtures under forced convection conditions is virtually unknown. An experimental rig has been constructed to investigate whether it is possible to predict the heat transfer coefficient of the mixture based on the coefficients of the components. Ini-tially data was taken on R-22 and compared to literaagreement was found with the literature's data on forced convection, single phase heat transfer correlations, and some two phase evaporative correlations.

Keywords: *Chromium, *Coatings, *Patents, Electro-deposition, Electrodes, Electrolytes.

An electrodeposition process and a bath therefore are disclosed for performing the electrodeposition of hard smooth coatings of trivalent chromium. The electrodeposition process is accomplished energy efficiently. The bath includes chromium chloride as a source of chromium, citric acid to complex the chromium, and a wetting agent which is preferably Triton x-100. Prefer-ably, bromide is also provided in the solution to maintain the hexavalent chromium production at the anode at a low level. Ammonium chloride is also preferably provided to improve the conductivity and also the curprovided to improve the conductivity and also the cur-rent distribution in the bath. Boric acid is provided to advance the reaction kinetics. The pH of the bath is maintained at approximately 4.0 and the temperature is maintained at approximately 35 C. Either a direct current or pulsed current is used for the deposition process. Hard smooth coatings of trivalent chromium are deposited through use of the process and the bath of the claimed invention.

Studies of phase formation in rapidly solidified Al-Mn alloys (composition range 18-22 at % Mn) show that an icosahedral phase is replaced by another noncrys-tallographic phase, a decagonal phase. The deca-gonal phase is another example of quasicrystal: It has a noncrystallographic point group (10/m or 10/mmm) together with long-range orientational order and one-dimensional symmetry. The decagonal phase is an in-termediate phase between an icosahedral phase and a crystal both from the symmetry and from the solidifia crystal both from the symmetry and from the solidifi-cation condition points of view.

Ultrasonic Determination of Absolute Stresses in Aluminum and Steel Alloys.

Alumination of the second seco

ington, DC.

Pub. in Residual Stresses in Science and Technology, Garmisch-Partenkirchen, Federal Republic of Germa-ny, v1 p207-214 1986.

Keywords: *Ultrasonic tests, *Weldments, *Aluminum, *Steels, *Plates(Structural members), *Residual stress, Strain gages, Piezoelectricity, Electromagnetic fields, Transducers, Measurement, Acoustics, Reprints.

Components of plane stress have been measured with ultrasonic techniques for welded aluminum and steel alloy plates. Measurements of the difference of princi-pal stresses were performed using both a piezoelectric transducer and an electromagnetic acoustic transducer (EMAT) with good agreement. The EMAT was used to measure arrival times of ultrasonic shear waves along the centerline of baseplates before and after welding. Subject to certain assumptions, changes in arrival times, at a given location, are due to principal stresses at that location. For the aluminum alloy plates these EMAT measurements of principal stresses were within 20 MPa of strain gage values. For the steel plates, the difference between EMAT and strain gage results was about 20%. A second technique used to obtain the normal stress in welded aluminum alloy plates is described.

Nov 88.

Keywords: *Lead alloys, *Tin, *Particle size distribu-tion, *Sintering, Kinetics, Eutectics, Liquid phases, Re-prints, Ostwald ripening.

Experiments on the coarsening behavior of two-phase mixtures in a model Pb-Sn system are reported. This system fulfills most of the assumptions of theory and has the particular advantage that all the materials parameters necessary for a comparison between the ex-perimentally measured and theoretically predicted coarsening kinetics are known. The coarsening of Snrich and Pb-rich solid phases was examined in contact with eutectic liquid in the volume fraction solid range above approximately 0.6 where the development of a solid skeletal structure inhibits sedimentation. Particle intercept distributions are measured and found to be time independent when scaled by the average inter-cept. This invariance is interpreted as evidence that scale factor coarsening is present. The intercept distri-butions are in good agreement with the predictions of

Observations on Crystal Defects Associated with Diffusion induced Grain Boundary Migration in Cu-Zn. Final rept.

S. A. Hackney, F. S. Biancaniello, D. N. Yoon, and C. A. Handwerker, 1986, 6p

Pub. in Scripta Metallurgica 20, n6 p937-942 Jun 86. Keywords: *Copper, *Crystal defects, *Zinc, *Electron microscopy, Diffusion, Grain boundaries, Brasses, Transmission, Migrations, Dislocations(Materials), Gases, Reprints.

High purity copper foils (.025 mm thick) have been exposed to zinc vapor from an 11 at% zinc brass at 360 deg C. Standard transmission electron microscopy re-veals that diffusion induced grain boundary migration (DIGM) has occurred at an average rate of 1.85 x 10(sup -11) m/s over the first 30 hours. The grain boundary structure, grain boundary morphology, and matrix dislocations associated with the DIGM phenomena have been studied in detail. The following general observations have been made: (1) the region over which the grain boundary has migrated is alloyed with zinc; (2) a 'wall' of dislocations marks the original position of the grain boundary; (3) the grain boundary structure includes a high density of defects with a step character having a maximum height of 3 nm; and (4) the matrix dislocation density is highest directly in front of the migrated grain boundary.

MD. Metallurgy Div. Migration of Liquid Film and Grain Boundary in Mo-Ni Induced by W Diffusion.

Final rept. Hinai rept. H. K. Kang, S. Hackney, and D. N. Yoon. 1988, 5p Pub. in Acta Metallurgica 36, n3 p695-699 1988.

Keywords: *Liquids, *Migrations, *Grain boundaries, *Nickel alloys, Molybdenum, Diffusion, Heat treat-ment, Sintenng, Tungsten, Solid solutions, Coherence, Reprints.

The liquid films and grain boundaries in liquid phase sintered Mo-Ni alloy are observed to migrate during heat-treatment after adding W to the liquid matrix. Behind the migrating boundaries form Mo-Ni-W solid solution with the W concentration decreasing with the migration distance because of W depletion in the liquid matrix. The migration rate during the heat-treatment at 1540 deg C after adding W decreases with the de-creasing pretreatment sintering temperature. When the sintering temperature is 1420 deg C, the migration rate is almost reduced to 0. Under this condition, the coherency strain due to the simultaneous diffusion of W and Ni into the grain surfaces is estimated to be almost 0. The results thus lead to the conclusion that the coherency strain due to lattice diffusion is the driving force for the liquid film and grain boundary migration.

Diffusion induced grain boundary migration (DIGM) is now a well recognized phenomena which occurs during multi-component diffusion in many systems. Kiwill have to be modified to include the contributions of DIGM and the related process of diffusion induced recrystallization. The underlying driving force for this important process has been the topic of a great deal of speculation. The theoretical approach to the process has far outstripped the necessary experimental observations. One critical area of experimentation which has been neglected is the microstructural observations of the physical processes involved in the initiation of DIGM. The early observations from a study of DIGM initiation are presented for the Cu-Zn system.

Final rept. Y. Ma, E. A. Stern, and C. E. Bouldin. 1986, 4p Pub. in Physical Review Letters 57, n13 p1611-1614, 29 Sep 86.

Keywords: *X ray analysis, *Manganese, *Aluminum alloys, *Silicon, *Crystallization, Orthorhombic lattices, Quenching(Cooling), Reprints.

EXAFS measurements were made on icosahedral MAI and MnSiAI, and on the standards alpha-phase of MnSiAI and orthorhombic phase of MnAi6. Exper-mental evidence is presented that a cage of Mn atoms at the vertices of an icosahedron is the structural unit in the icosahedral MnSiAl and MnAl phases. The connections among these icosahedral units and between them and the Al atoms are different in the icosahedral phases and in the alpha-phase. As in the alpha-phase, the Mn icosahedra do not share vertices in the icosahedral phases; i.e., they are separated from one an-other. It is suggested that the i-phase grows by ran-domly nucleating together Mn icosahedra along their 20 threefold directions, as allowed by local steric constraints.

Keywords: *Modulus of elasticity, *Test facilities, *Nickel alloys, Metals, Measurement, Comparison, Reprints.

The results of a round-robin testing study are present-ed for measurements of dynamic Young's modulus in two nickel-based alloys. The Interlaboratory Testing Program involved six types of apparatus, six different

MATERIALS SCIENCES

Nonferrous Metals & Allovs

organizations, and specimens from a well-documented source. All the techniques yielded values of dynamic Young's modulus that agreed within 1.6% of each other. For Inconel alloy 600 the dynamic modulus was 213.5 GPa with a standard deviation of 3.6 GPa; for Incoloy alloy 907 the corresponding values were 158.6 and 2.2 GPa, respectively. No significant effect of frequency over the range 780 Hz to 15 MHz was found.

The cellular dissolution process in Pb-5.5% Sn first studied by Tu and Turnbull has been reexamined using instrumental techniques. It has been determined that cell dissolution by grain boundary migration does not cell dissolution by grain boundary migration does not recreate a homogeneous solid solution. This observa-tion has been interpreted in terms of a thermodynamic hysteresis. The driving force for dissolution first pro-posed by Tu and Turnbull has been modified to include the macroscopic grain boundary curvature term. This allows a direct contrast between the forced oscillation of the grain boundary in the cellular transformation and that studied in DIGM. A simple thermodynamic evolu-tion criteria reveals, that the difference in behavior tion criteria reveals that the difference in behavior during dissolution between the two phenomena may be due to the presence of the precipitate phase rather than a difference in migration mechanism.

Keywords: *Aluminum, *Manganese, *Phase dia-grams, Thermodynamics, Mathematical models, Equi-librium, Stoichiometry, Liquidus, Quenching(Cooling), Stability, Metastable state, Thermal analysis, Reprints.

The aim of the present investigation was resolution of certain obscure features of the Al4Mn phase diagram. The experimental approach was guided by assessment of the previous literature and modeling of the thermodynamics of the system. It has been shown that two phases of approximate stoichiometry Al4Mn (lambda and mu) are present in stable equilibrium, lambda forming by a peritectoid reaction at 693 + or C. The liquidus and invariant reactions as proposed by Goedecke and Koester have been verified. A map has been made of the successive non-equilibrium phase transformations of as-splat-quenched alloys. Finally, the thermodynamic calculation of the phase diagram allows interpretation of complex reaction sequences during cooling in terms of a catalog of all the metasta-ble invariant reactions involving (Al), Al6Mn, Iambda, mu, theta, and Al11Mn4 phases.

Nov/Dec 87.

Keywords: *Aluminum, *Manganese, *Powder(Particles), *Quenching(Cooling), Phase Dia-grams, Metastable state, Nucleation, Temperature, Crystallization, Reprints.

The solidification behavior of Al-Mn powders was studied as a function of cooling rate and Mn content. It was found that the phases present in the powder differed from those expected at equilibrium. The Al6Mn phase was absent due to its failure to nucleate, and in the more concentrated and rapidly cooled powders the metastable quasicrystal phases were present. Nuclea-tion temperatures measured in alloys cooled at 25 C/ sec are believed to represent formation of the icosahedral phase, which subsequently transforms to the decagonal phase.

Keywords: *Solidification, *Kinetics, *Surface finish-ing, *Metal alloys, *Lasers, *Ion beams, *Electron beams, *Microstructure, Solubility, Metastable state, Free energy, Morphology, Heat transfer, Phase diaarams.

While ion, laser and electron beam surface treatments involve a variety of experimental conditions, they share some important common kinetic and thermodynamic features. The alloy additions that are incorporated into the surface modified solid region by the various processes are often in metastable states of relatively high free energy. An examination of the metastable equilibrium features of phase diagrams can identify the possi-ble choice of product structures depending on the particular constraints imposed on the system and the controlling phase selection kinetics during nucleation.

Under rapid rates the analysis of resolidification involves the use of response functions to treat the liquidsolid interface conditions during solute trapping. These functions, when combined with solute redistribution and heat flow analysis, provide a basis for the prediction and analysis of microstructural evolution in sur-face treated layers in terms of size scale and morphol-ogy. The application of metastable equilibria and kinetics analysis offers an effective strategy for the genera-tion of tailored microstructures to optimize the results of surface treatments.

The G phase of Al-Mn, which has until now been considered to be metastable, is demonstrated to actually be a stable phase forming by a pentectoid reaction be-tween 490 and 550 C. The growth of the G phase is extremely slow, but by rapid solidification the rate of nucleation of the G phase is greatly increased so that the transformation is almost complete after 1000 hours at 400 C. The G phase contains icosahedral clusters of atoms similar to those proposed in some models of the Al-Mn icosahedral phase.

Aluminum Alloys. Final rept. R. J. Schaefer, L. A. Bendersky, and F. S. Biancaniello. 1986, 10p Pub. in Jnl. de Physique 47, nC-3 p311-320 1986.

Keywords: *Aluminum alloys, *Manganese, *Nuclea-tion, *Solidification, Microstructure, Eutectics, Silicon, Crystal structure, Dendritic crystals, Phase transforma-tion, Quenching(Cooling), Reprints.

The icosahedral and decagonal aperiodic phases dominate the microstructures of rapidly solidified Al-Mn alloys because of their nucleation and growth behavior, which differs substantially from that of the equilibrium phases. Electron beam surface melting can be used to produce a wide range of solidification condi-tions, in which the different stages of the nucleation and growth processes can be observed. It is found that the icosahedral phase nucleates abundantly in supercooled AI-Mn melts, and that the decagonal phase is subsequently nucleated by the icosahedral phase. Addition of Si to the AI-Mn alloys suppresses formation of the decagonal phase, but in these alloys the hexagonal beta phase can grow rapidly.

Replacement of Icosahedral Al-Mn by Decagonal Phase.

Final rept.

R. J. Schaefer, and L. Bendersky. 1986, 6p Pub. in Scripta Metallurgica 20, n5 p745-750 May 86.

Keywords: *Aluminum alloys, *Manganese, *Micros-tructure, *Solidification, *Crystal structure, Phase transformation, Nucleation, Quenching(Cooling), Reprints.

It is concluded from microstructural evidence that the decagonal T phase is nucleated epitaxially by the ico-sahedral phase. At low cooling rates, the T phase grows and completely replaces the icosahedral phase. while at high cooling rates the icosahedral phase is preserved. Even in samples where none of the icosa-hedral phase is found, its presence at an early stage of solidification is revealed by the specific geometrical arrangement and orientational variants of the T phase crystals.

Magnetic Correlations in an Amorphous Gd-Al Spin Glass. Final rept.

M. L. Spano, R. J. Gambino, S. K. Hasanain, T. R. McGuire, S. J. Pickart, and J. J. Rhyne. 1987, 3p Pub. in Jnl. of Applied Physics 61, n8 p3639-3641 1987

Keywords: *Neutron scattering, *Thin films, *Gadolinium, *Aluminum alloys, Sputtering, Lorentz transforma-tions, Ferromagnetism, Spin orbit interactions, Temperature, Rare earth elements, Reprints.

Small angle neutron scattering (SANS) as well as mag-netization measurements have been made on a sput-tered film of Gd43Al57. The low field susceptibility

peaks at a freezing temperature, T sub f, of 33 K. It agrees well with the SANS data, which shows a peak in the intensity at this temperature for the lowest Qs measured. The SANS lineshapes are unusual in that they can be fitted with a Lorentzian-squared cross section with dissimilar correlation lengths. The Lorentzian correlation length peaks near 35 K at a value of approximately 14 angstroms, while the Lorentziansquared correlation length exhibits a large, essentially resolution-limited value up to temperatures several times T sub f. These results are consistent with the coexistence of finite static spin clusters with relatively long range ferromagnetic correlations.

Final rept.

M. L. Spano, and J. J. Rhyne. 1987, 3p Pub. in Jnl. of Applied Physics 61, n8 p4100-4102 1987.

Keywords: "Neutron scattering, *Spin orbit interac-tions, *Terbium, *Iron, *Ferromagnetism, Glass, Metal alloys, Temperature, Lorentz transformations, Rare earth elements, Phase transformations, Reprints.

Small angle neutron scattering measurements (SANS) have been made on Tb45Fe55 and Tb25Fe75 as a function of temperature. The SANS results show that long range ferromagnetic order is quenched in the alloys and is replaced by a spin glass-like state. For T greater than T(c), where T(c) is the transition tempera-ture, both samples exhibit a conventional Lorentzian lineshape (in q), but they depart from the form below T(c). The low temperature lineshapes have been fitted with the Lorentzian plus Lorentzian-squared form appropriate for random field systems. As the temperature of the Tb45Fe55 alloy is lowered, the correlation length rises to a rounded maximum of 80 angstroms at 250 K (T(c) = 298 K) and decreases to about 60 ang-stroms at low T. In both alloys the coefficient of the Lorentzian term rises sharply as T approaches 0, whereas the Lorentzian-squared coefficient follows approximately the square of the order parameter divided by the correlation length. Both systems thus lend support to the suppression of long range order by the random anisotropy field.

Final rept. P. W. Voorhees, and R. J. Schaefer. 1987, 13p Pub. in Acta Metallurgica 35, n2 p327-339 1987.

Keywords: *Metals, *Phase transformations, Drops(Liquids), Diffusion, Particles, Reprints, *Ostwald ripening, Coarsening. *Phase

In situ observation of the growth and Ostwald ripening of spherical second phase domains in a solid is reported. It was found that at relatively low (3%) volume fractions of coarsening phase, diffusional interactions be-tween particles were sufficiently strong to alter significantly the individual particle coarsening rates from the theoretical predictions of Lifshitz and Slyozov and Wagner (LSW). As a result, the LSE theory was found to be an inadequate description of the coarsening behavior of the low volume fraction system. In addition, particle migration in the solid matrix during coarsening was observed. The experimental results were found to be qualitatively consistent with a theoretical analysis of particle migration due to interparticle diffusional interactions or nonuniform matrix concentration fields. The generality of the mechanism responsible for the particle migration implies that particle motion, and thus a time dependent spatial correlation function, during coarsening will occur to some extent in all systems undergoing first order phase transformations.

Numerical Simulation of Morphological Develop-ment during Ostwald Ripening. Final rept.

P. W. Voorhees, G. B. McFadden, R. F. Boisvert, and D. Meiron. 1988, 16p

Pub. in Acta Metallurgica 36, n1 p207-222 1988.

Keywords: *Metals, *Microstructure, *Particles, *Spa-tial distribution, Diffusion, Separation, Interfaces, Sin-tering, Liquids, Reprints, *Ostwald ripening, Coarsening.

A boundary integral technique is employed to determine the morphological evolution of small number of particles during Ostwald ripening in two dimensions. The approach specifically allows the bodies to change shape consistent with interparticle diffusional interactions and the interfacial concentrations as given by the Gibbs-Thomson equation. It is shown that the strong interparticle diffusional interactions which occur at small interparticle separations can induce significant motions of the centers of mass of the particles. Such motion is shown to be a strong function of the spatial distribution of particles. The generality of the mecha-nism responsible for the particle migration suggests that particle motion is a generic aspect of the ripening process at high volume fractions of coarsening phase. It was found that significant shape distortions of parti-cles during ripening requires particle arrangements which induce significant diffusional screening of regions of interface. Through particle arrangements simi-lar to those found in solid-liquid systems during liquid phase sintering, it is shown that the formation regions of flat interface between particles is completely consistent with an Ostwald ripening mechanism.

Unition Characteristics of the Nickel-Based Alloy UNS N07718 in Pressurized Oxygen. J. W. Bransford, P. A. Billiard, J. A. Hurley, K. M. McDermott, and I. Vazquez. Apr 89, 50p NISTIR-89/

3911 Sponsored by National Aeronautics and Space Admin-istration, Huntsville, AL. George C. Marshall Space Flight Center.

Keywords: *Nickel alloys, *Combustion, *Ignition, Criti-cal temperature, Flammability tests, Graphs(Charts), Tables(Data), UNS NO7718, Pressurized oxygen.

The development of ignition and combustion in pressurized oxygen atmospheres was studied for the nickel-based alloy UNS N07718. Ignition of the alloy was achieved by heating the top. It was found that the alloy would autoheat to destruction from temperatures below the solidus temperature. In addition, endothermic events occurred as the alloy was heated, many at reproducible temperatures. Many endothermic events occurred prior to abrupt increases in surface temperature and appeared to accelerate the rate of increase in specimen temperature. It appeared that the source of some endotherms may increase the oxidation rate of the alloy. Ignition parameters are defined and the temfor the oxygen pressure range of 1.72 to 13.8 MPa (250 to 2000 psia).

Aug 89, 24p NISTIR-89/4143

Prepared in cooperation with Carnegie-Mellon Univ.,

Pittsburgh, PA.

Keywords: *Bismuth alloys, *Tin alloys, *Anisotropy, *Thermal conductivity, *Crystal growth, *Solidification, Microstructure, Dispersions, Stability, Orientation, Oscillations, Graphs(Charts), Equations.

A linear morphological stability analysis of a planar interface during unidirectional solidification of a binary alloy was performed for the case of a crystal having an anisotropic thermal conductivity. A dispersion relation was calculated which shows that the onset of instability depends on the orientation of the growth direction with respect to crystallographic axes and on the orien-tation of the wave vector of the perturbation. The onset of instability can be either oscillatory (travelling waves) or non-oscillatory in time. For growth along a principal axis of the crystal there is an exchange of stabilities, and the onset of instability is non-oscillatory. The dispersion relation for a uniaxial crystal was explored in detail. Numerical results for the case of an alloy of 0.78 at % bismuth in tin are given.

Keywords: *Nickel alloys, *Intermetallics, *Boron, *Additives, *Grain boundaries, *Electron microscopy, Polycrystals, Bicrystals, Aluminum, Crystal disloca-tions, Nickel aluminides.

Grain boundaries in both pure and boron doped Ni3AI have been studied using a variety of electron micros-copy techniques. Small angle boundary structures were examined in both bicrystal and polycrystalline specimens. Dislocations with Burgers vector a/

2<110> are observed in the presence of boron, while dislocations with Burgers vector a<100> are observed in the absence of boron. A possible explanation for the behavior is the presence of a disordered layer at the interface in boron doped Ni3AI. The addition of boron to Ni3AI was seen to induce faceting of grain boundaries, and to afford the boundaries some protection from etching. Using electron backscatter diffrac-tion patterns, the frequency of occurrence of grain boundary types was found to be unchanged by the ad-dition of boron.

Keywords: *Nickel alloys, *Intermetallics, *Boron, *Ductility, *Bicrystals, *Aluminum, Intergranular corro-sion, Transgranular corrosion, Polycrystals, Grain boundaries, Additives, Nickel aluminides, Flat surfaces.

Ni3Alk is a potentially useful high temperature alloy. In its single crystal form it exhibits good ductility; however in polycrystalline form the pure alloy is highly prone to intergranular failure. It has been seen that in slightly nickel-rich alloys the addition of small amounts of boron has the effect of dramatically increasing the material ductility and of changing the failure mode from intergranular to transgranular. In alloys which have been ductilitized by boron addition, atom probe investigation has shown the boron to be segregated to grain boundaries. The segregation may induce a change in the boundary structure as has been seen by Sickafus and Sass in gold doped iron bicrystals.

Keywords: *Tungsten, *Platinum, *Adsorption, *Oxygen, *Thin films, *Annealing, Desorption, Elec-tron diffraction, Auger electrons, Spectroscopy, Mono-molecular films, Reprints.

Low-energy electron diffraction (LEED) and Auger spectroscopy have been used to characterize Pt over-layers coadsorbed with oxygen on W(110). Previous work has shown that multilayers of Pt alone will cluster into three-dimensional crystallites of bulk Pt when annealed, leaving a pseudomorphic monolayer of Pt cov-ering the W(110) surface. When oxygen is present on the surface, the monolayer of Pt is no longer stable. Annealing a W(110) surface on which both Pt and oxygen are adsorbed causes nearly all of the Pt to agglomerate into clusters as the oxygen largely replaces the monolayer on the surface. The presence of the Pt the monolayer on the surface. The presence of the Pt clusters reduces the temperature required for desorp-tion of oxygen, however, and the Pt spreads across the W surface as the oxygen is removed. The complex LEED patterns observed when coadsorbed oxygen and Pt are annealed and the changes in the tempera-ture required for desorption of oxygen suggest that there is an interaction between the two adsorbates and there is an interaction between the two adsorbates and that there is not complete phase separation; i.e., some Pt remains dispersed on the W surface within the oxygen phase.

Texture Monitoring In AlumInum Alloys: A Compar-ison of Ultrasonic and Neutron Diffraction Measurements.

Final rept. A. V. Clark, R. C. Reno, R. B. Thompson, J. F. Smith, G. V. Blessing, R. J. Fields, P. P. Delsanto, and R. B. Mignogna. 1988, 9p Sponsored by Office of Naval Research, Arlington, VA.

Pub. in Ultrasonics 26, p189-197 Jul 88.

Keywords: *Aluminum alloys, *Texture, *Monitors, Ul-trasonic tests, Neutron diffraction, Metal sheets, Re-prints, Piezoelectric transducers, Electroacoustic transducers.

Theories have been developed by several authors to calculate velocities of bulk, guided and surface waves in polycrystalline aggregates of cubic metals. The theories can be used to predict the effect of texture on ultrasonic velocity in rolled aluminum and steel sheet, provided that the effects of dislocations, secondprovided that the effects of dislocations, second-phase particles, inclusions, etc. can be ignored. The theories predict that ultrasonic velocities will be influ-enced by three orientation distribution coefficients (ODCs). The ODCs are quantitative measures of the texture in the material. In the work, the texture of thin sheets of a commercial grade aluminum alloy was measured with both ultrasonics and neutron diffrac-tion. Several ultrasonics and neutron diffraction. Several ultrasonic techniques were employed, using bulk, guided and surface waves. Both piezoelec-tric and electromagnetic-acoustic transducers (EMATs) were used. Quantitative measurements of texture made with different ultrasonic techniques were a good agreement. The ultrasonic techniques were in good agreement. The ultrasonic measurements also agreed with neutron diffraction measurements, indicating that the dominant features of the effect of texture on wave propagation have been modelled with sufficient accuracy.

Final rept.

R. R. Rao, and H. Ledbetter. 1989, 4p Pub. in International Jnl. of Thermophysics 10, n4 p899-902 Jul 89.

Keywords: *Brasses, *Elastic properties, Strains, Cauchy problem, Partial differential equations, Elastic theory, Crystal structure, Reprints, *Brass-beta.

Combinations of the fourth-order elastic constants of beta-brass were calculated using the measured second-order and third-order elastic constants and the expressions for the effective elastic constants of a cubic crystal obtained from finite-strain theory. The present calculations show that the Cauchy relations for the fourth-order elastic constants in beta-brass are not satisfied. This implies that noncentral or many-body forces occur in this material. The authors considered two alloys. The higher-Zn alloy shows lower mag-nitudes of the fourth-order elastic constants and a larger Cauchy discrepancy.

Equilibrium Crystal Shapes and Surface Phase Diagrams at Surfaces in Ceramics. Final rept.

C. A. Handwerker, M. D. Vaudin, and J. E. Blendell. 1988, 7p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. de Physique 49, n10 pC5-367-C5-373 Oct 88.

Keywords: *Ceramics, *Surface properties, *Crystal structure, *Shape, *Thermodynamic equilibrium, Free energy, Phase transformations, Magnesium oxides, Nickel oxides, Reprints.

The equilibrium shape of a crystal is the shape that minimizes the total surface free energy of the crystal and may contain any or all of the following: facets, sharp edges, smoothly curved surfaces, and corners. The relationship between the surface free energy per unit area, gamma, and the equilibrium crystal shape is seen straightforwardly from the Wulff plot, the polar left of common are of function of orientation of the seen straightforwardly from the Wulff plot, the polar plot of gamma as a function of orientation of the normal vectors, n. The boundaries between surfaces on the equilibrium crystal (for example, between adja-cent facet planes) have been described as surface phase transitions. If gamma(n) changes with tempera-ture, pressure, or chemical potentials of the compo-nents, the equilibrium shape of the crystal may change. The change in equilibrium shape can be rep-resented by a surface phase diagram with axes of sur-face orientation, in terms of angle from an arbitrary ori-entation, and temperature pressure or chemical comentation, and temperature, pressure, or chemical com-position. The surface phase transitions of MgO have been determined as a function of NiO solute concentration and surface phase diagrams have been constructed.

Since the discovery of an icosahedral phase in rapidly Since the discovery of an icosaneural phase in rapidly solidified AI-Mn alloys, similar phases have been found in many other systems. Generally, a successful ap-proach was to rapidly solidify alloys known to form equilibrium intermetallic compounds with structure ex-hibiting extensive icosahedral (or polytetrahedral) clus-tering. For example, Frank-Kasper phases have entire-ly tetrahedral bonding of atoms with coordination num-bers 12, 14, 15 and 16. According to the criteria the Cd-Cu system seems to be appropriate for forming the Cd-Cu system seems to be appropriate for forming the icosahedral phase. The central portion of the Cd-Cu phase diagram consists of three intermetallic phases with unit cells containing the icosahedral clusters. In the present work the microstructure of the rapidly so-lidified Cu-Cd alloys was studied by means of transmission electron microscopy. The purpose was to explore: (1) a possibility of the icosahedral and other metastable phase formation; and (2) solidification of complex crystal structures under conditions of rapid freezing.

Alloy. Final rept.

L. A. Bendersky, F. S. Biancaniello, and R. J. Schaefer. 1987, 4p

Pub. in Jnl. of Materials Research 2, n4 p427-430 Jul/ Aug 87.

Keywords: *Aluminum alloys, *Phase transformations, *Silicon containing alloys, *Iron containing alloys, Mi-crostructure, Solidification, Reprints, *Amorphous state, *Rapid quenching(Metallurgy).

The alloy AI70Si17Fe13 was subjected to a range of rapid solidification conditions and the resulting micros-tructures were evaluated. It was found that when solidification was sufficiently rapid to bypass the formation of primary intermetallic phases, the alloy consisted of spherical regions of amorphous (or micro-quasicrys-talline) material surrounded by a crystalline phase(s). The microstructure is interpreted as the result of solidification of the amorphous phase from the melt by a first-order transformation. The structure of the amor-phous phase is different from that of a liquid (or usual metallic glass).

Keywords: *Solidification, *Aluminum alloys, *Iron containing alloys, *Silicon containing alloys, Crystal structure, Phase transformations, Microstructure, Met-astable state, Reprints, *Amorphous state, *Rapid quenching(Metallurgy).

The focus of the work is the amorphous phase formation in AI-Fe-Si alloys. Depending on the concentration of Fe and Si, the phase appears either as an intercellular constituent or as primary phase with globular mor-phology. Thus the amorphous phase acts like a normal crystalline phase. The globular morphology of the amorphous phase suggests the possibility of a metastable liquid miscibility gap. However there is no ther-modynamic evidence to support a positive heat of

mixing for the liquid phase. Another possibility sug-gests crystallization of a phase structurally different from liquid but at the same time being neither crystal-line nor quasicrystalline. A possible structural relationship among the amorphous phase, the cubic alpha(AIFeSi) and te quasicrystalline phases is discussed.

Keywords: *Aluminum manganese alloys, *Crystal structure, *Phase transformations, Electron diffraction, Reprints, Icosahedrons, Amorphous state.

The Al-Mn system is very rich in phases with composi-tion close to Al4Mn. As solidification conditions change from very slow (casting) to extremely fast (atomized submicron size droplets) the following phases will form: hexagonal mu phase (a = 1.995 nm, c = 2.452 nm), hexagonal lambda phase (a = 2.841 nm, c = 1.238 nm), decagonal quasicrystal, icosahedral quasicrystal, and microquasicrystalline or 'amorphous' phase. In the present work, the potential interrelationship between the structures of the crystalline, quasicrystalline and amorphous Al4Mn phases is in-vestigated by a systematic study of electron diffraction intensities. Analysis of electron diffraction intensity modulations and the spatial relationships suggests that the phases have a structural skeleton of icosahe-dral units, possibly of Mackay icosahedron type. Differ-ent crystalline and quasiperiodic phases can be formed by different stackings of the same icosahedral clusters and they are not necessarily in a single orien-tation. The amorphous structure can be described as a network of randomly oriented clusters.

Keywords: *Dispersions, *Aluminum alloys, *Iron con-taining alloys, *Nickel containing alloys, *Solidification, Microstructure, Eutectics, Cells, Velocity, Reprints, *Rapid quenching(Metallurgy).

Examination of the effect of rapid solidification velocity on the microstructure of AI-3.7 wt% Ni-1.5 wt% Fe has revealed a new mechanism for the formation of dis-crete second phase particles in rapidly solidified alloys. Cellular growth of alpha-Al occurs with the intercellular phase, Al9(Fe,Ni)2 in two distinct morphologies. At low velocity (<50 cm) the phase is continuous in the growth direction while at higher velocity discrete rounded particles are observed. Analysis of the orientation relationship and the number of variants that exists between phases leads to a mechanism where liquid droplets are deposited by the moving cellular interface. The droplets solidified subsequently to form the rounded second phase particles.

C. Handwerker. 1989, 4p Pub. in McGraw-Hill Yearbook of Science and Tech-nology, p155-158 1989.

Keywords: *Diffusion, *Grain boundaries, *Alloying, Metals, Solid solutions, Phase diagrams, Solutes, Poly-crystalline, Thin films, Reprints.

When large grain-sized, well-annealed polycrystalline materials are exposed to a solute source and the solute diffuses down the grain boundaries, it is fre-quently observed that grain boundaries migrate, some-times away from the centers of curvature, and alloys form in the regions swept by the moving grain boundaries. This newly recognized phenomenon is known as diffusion-induced grain boundary migration (DIGM) since the solute diffusion induces otherwise stable grain boundaries to move. Grain boundaries are placed in contact with solute sources in most engi-neering systems, for example, in thin_film multi-layer contacts on computer circuit boards. The technologi-cal and economic impact of the unexpected break-down of the systems by DIGM is enormous.

Keywords: *Cryogenics, *Copper, *Grain size, *Cold rolling, Electrical resistivity, Yield strength, Tensile stress, Ultimate strength, Microstructure, Reprints.

The effects of grain size and cold rolling on the tensile properties and electrical resistivity at 295, 76 and 4 K were studied for oxygen-free, high-conductivity copper. Tensile-yield and ultimate strengths increase linearly with increasing 1/sq rt d (d = grain diameter), following the Hall-Petch relationship. At low tempera-tures the dependence on grain size increases in tures, the dependence on grain size increases. In-creasing grain size lowers resistivity slightly at all tem-peratures. Cold rolling to 10 percent reduction of area significantly increases the yield strength at all temperatures; subsequent rolling produces smaller strength increases. Resistivity increases with cold rolling.

The Arthur M. Sackler Collection of works of art con-The Arthur M. Sackier Collection of works of art con-tains several hundred fine early ritual bronze vessels. Among the vessels, 106 attributed to the Shang Dy-nasty, 127 attributed to the Western Zhou and 94 at-tributed to the Eastern Zhou Dynasty have been given a thorough technical examination. The examination has included x-ray radiography viewing under ultravio-let light, overall visual examination and examination of data words a binary large technical examination of the east of the ea details under a binocular microscope. The metal of most of the vessels also has been analyzed for lead isotope ratios by means of mass spectrometry, for the major component by atomic absorption spectrometry, major component by atomic absorption spectrometry, and for some minor and trace elemental concentra-tions by instrumental neutron activation analysis. The vessels may be divided into 11 groups by one particu-lar statistical analysis of the data. The division may in-dicate the use of different sources of raw materials, although the locations of the different sources is not known at the present time. Data analysis using both chemical and isotopic information is continuing as is the search for samples from sources of ores which might have been used in ancient times.

Effects of Space Charge on the Poling of Ferro-electric Polymers.

Final rept.

A. S. DeReggi, and M. G. Broadhurst. 1987, 11p Pub. in Ferroelectrics 73, n3-4 p351-361 Jun 87.

Keywords: *Ferroelectric materials, *Polymers, *Ther-mal measurements, *Polarization, Poles, Electrical re-sistivity, Lasers, Charge density, Reprints, Vinylidene fluoride resins.

Thermal pulse measurements of the polarization distribution in ferroelectric polymers and copolymers after poling give distributions concentrated to one side poling give distributions concentrated to one side when the electrical conductivity under poling condi-tions is significantly different from zero. These results could be explained if net charge were present in the material during poling. The direct observation of dis-tributed charge in nonpolar polymers after exposure to poling conditions support this explanation. However, high resolution laser thermal pulse measurements on present described explace of polymoldance diversion nominally well poled samples of polyvinylidene fluoride reveal a sharp drop of polarization to near zero value at a depth of about 1 micrometer from the surfaces which is not explained.

Epoxy impregnation Procedure for Hardened Cement Samples.

Progress rept. L. Struble, and P. Stutzman. May 88, 19p NBSIR-88/ 3702

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Epoxy resins, *Impregnating, *Cements, *Ethanols, *Curing, Viscosity, Cracks, Microscopy, Po-rosity, Crosslinking, Plastics processing.

A method was previously developed for epoxy impregnation of hydrated cementitious materials for micronation or nydrated cementitious materials for micro-scopical examination without drying the samples, by sequentially replacing pore solution with ethanol, then the ethanol with epoxy. During subsequent application of the procedure, many specimens were cured. Stud-ies were carried out to identify the cause of these prob-lems and to modify the procedure for more reliable im-pregnation. Contamination with low levels (4%) of water or ethanol was found to prevent proper cured. water or ethanol was found to prevent proper curing. Modifications in the procedure to prevent contamina-tion, including monitoring the replacement of pore so-lution by ethanol, were shown to provide consistent and reliable impregnation.

MD. Polymers Div. Polymers Bearing Intramolecular Photodimeriza ble Probes for Mass Diffusion Measurements by the Forced Rayleigh Scattering Technique: Syn-thesis and Characterization.

Final rept.

Q. Tran-Cong, T. Chang, and C. C. Han. 1988, 10p Pub. in Polymer 29, p2261-2270 Dec 88.

Keywords: *Anthracene, *Photochemical reactions, *Synthesis, *Photochromism, *Probes, *Rayleigh scattering, *Polystyrene, Irradiation, Ultraviolet radi-ation, Solvents, Carbon tetrachloride, Temperature, Refractivity, Polymers, Mixtures, Diffusion, Dyes, Reprints.

A new photochromic probe, bis(9-anthryl methyl)ether(BAME) derivative, was synthesized and introduced as an effective probe for forced Rayleigh scattering (FRS) measurement. It is shown that BAME and polystyrene labelled with BAME exhibit a large change in refractive index under irradiation of u.v. light (363.8 nm). The self-diffusion of BAME and polysty-(doi:3 nm). The self-diffusion of BAME and polysty-rene labelled with BAME (PSA) were measured in vari-ous solvents. Results of PSA in good, marginal and poor solvents are consistent with those obtained from quasi-elastic light scattering (QELS). Since the photo-dimerization reaction of anthracene has been extensively studied in solution and crystal as well as in polymer matrix, unfavorable multistep photochemical reac-tions can be avoided. One such unfavorable case, which involves a fluorescence quenching solvent CCI4, is demonstrated. A temperature dependence study of polystyrene in semi-dilute theta solution by FRS has suggested that the non-exponential intensity decay is due to large concentration fluctuations in the solution. The well known photochemistry, large refrac-tive index change and temperature stability have made BAME a very promising probe for FRS measurements.

MD. Polymers Div. Phase Contrast Matching in Lamellar Structures Composed of Mixtures of Labeled and Unlabeled Biock Copolymer for Small-Angle Neutron Scatter-

Ing. Final rept. Y. Matsushita, Y. Nakao, R. Saguchi, K. Mori, H. Choshi, Y. Muroga, I. Noda, M. Nagasawa, T. Chang, C. J. Glinka, and C. C. Han. 1988, 5p Pub. in Macromolecules 21, n6 p1802-1806 1988.

Keywords: *Polystyrene, *Mixtures, *Neutron scatter-ing, *Lamellar structure, Isotopic labelling, Polymers, Deuterium, Molecular weight, Vinyl resins, Phase, Pyridines, Reprints.

To extract the single-chain scattering function of poly-styrene block chain in lamellar structures of styrene-2-vinylpyridine diblock copolymers, the method of 'phase contrast matching' was studied for small-angle neu-tron scattering from blends of the deuterium-labeled and unlabeled block copolymers. The phase contract matching is successfully applied for the samples with

the lowest molecular weights (3.4 x 10 sup 4 for the labeled portions) but not for the samples with the higher molecular weights (9.2 and 16.2 x 10 sup 4). It is concluded that the mismatching may be caused by concentration fluctuation in the mixture of hydrogenated and deuteriated polystyrenes in domains, as well as by nonuniform distribution of deuteriated species along the direction perpendicular to the lamellae due to the difference in lengths of the labeled and unlabeled blocks.

Lignin Concentrations in Pulping Liquors.

J. J. Horvath, H. G. Semerjian, K. L. Biasca, and R. Attala. 1988, 10p Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Industrial Optical Sensing, Dearborn, MI., June 29-30, 1988, v961 p68-77.

Keywords: *Fluorescence, *Lasers, *Lignin, *Process control, Pulping, Dyes, Absorption spectra.

Laser excited fluorescence of pulping liquors was investigated for use in the pulp and paper industry for process measurement and control applications. A Nd-YAG pumped dye laser was used to generate the exci-tation wavelength of 280 nm; measurements were also performed using a commercially available fluorometer. Measurements on mill pulping liquors gave strong sig-nals and showed changes in the fluorescence intensity during the cook. Absorption spectra of diluted mill liquor samples showed large changes during the cook. Samples from well controlled and characterized labo-ratory cooks showed fluorescence to be linear with concentration over two decades with an upper limit of approximately 1000 ppm dissolved lignin. At the end of these cooks, a possible chemical change was indicat-ed by an increase in the observed fluorescence intensity. Results indicate that lignin concentrations in pulping liquors can be accurately determined with fluorescence in the linear optical region over a greater dy-namic range than absorption spectroscopy.

Plastics

Keywords: *Douglas fir wood, *Thermal diffusivity, *Fire tests, Heat of combustion, Heat flux, Specific heat, Thermochemical properties, Combustion.

Measurements have been made on the thermal diffusivity of Douglas fir and its char up to 550 deg C. Its char contraction factors have also been determined. Intercontraction factors have also been determined. Inter-pretation of some data in the literature has resulted in the establishment of the specific heat as a function of temperature over this range. These thermophysical property data along with some data reported separate-ly on the thermochemical properties of cellulose, mannan, xylan and lignin were used as input to a model for the heat release rate of wood in order to exclusion the heat release rate of wood in order to calculate the heat release rate and heat of combustion of Douglas fir exposed to an external radiant flux of 25 kW/sq m. These calculations were compared with measurements made in the Cone calorimeter. The agreement is reasonable at this stage of the model development.

A computer model has been set up to represent a A computer model has been set up to represent a porous medium. The basis for this model is a two-dimensional square network (100 x 100) of channels that have randomly assigned widths between the value of zero (closed) and the value of one (open, unrestricted flow). of zero (closed) and the value of one (open, unrestricted flow). The channel width assignments have been made by a random selection from five different distributions: f(q)=q, f(q)=si q, f(q)=erf(q), f(q)=1 - sin q, and f(q)=1-erf(q). Diffusion of particles in the network has been studied by a random-walk procedure for each realization of the channel width assignments. The diffusivity is quite sensitive to the distribution of bacedure for the constitue remediate of the part channel widths. The percolation properties of the networks obtained from the three most restrictive distributions have been investigated and the independent, linked clusters within the network have been determined. For clusters sizes that are less than the full width of the network, the network does not percolate and either the flow is not diffusive or the diffusivity is severely reduced. An approximate value for the percolation threshold has been determined in each case and the fractal dimension has been calculated also.

Final rept.

M. Roche, and W. Li. 1988, 9p Pub. in ACCESS 7, n6 p23-31 Nov/Dec 88.

Keywords: *Curve fitting, *Real time operations, Algo-rithms, Interpolation, Coordinates, Reprints, Spline functions.

Computer listings of coded curve fitting algorithms for interpolation of coordinate points as they are generat-ed are presented. As coordinate values are deter-mined, they are added to an array and an interpolation procedure is applied to the new coordinate values of the array. In particular, as the sequence is being in-creased, it will be interpolated by a local cubic fitting procedure. The report exhibits a procedure which limits the cubic construction to be one segment behind the last segment of the sequence. The last input co-ordinate values are not the end points for the cubic segment being constructed. Another procedure will include these last input coordinate values as end coordinate values for the last cubic segment being generat-ed. As will be seen, these methods lend themselves to real time curve generation.

Algebra, Analysis, Geometry, & Mathematical Logic

The purpose is to describe a new class of methods for computing the 'capacity dimension' and related quanti-ties for point-sets. The techniques presented here build on existing work which has been described in the literature. The novelty of the methods lies first in the approach taken to the definition of computation of dimension (namely, via Monte Carlo calculation of the volume of an epsilon-cover of the point-set), and second in the use of data structures which result in extremely efficient codes for vector computers such as the Cyber 205 (the computation is reduced to the sorting and searching of one-dimensional arrays so that a calculation employing one million points requires less than 2 minutes).

Shortest Paths in Simply Connected Regions in R2. Final rept.

R.D. Bourgin, and P. L. Renz. 1989, 36p Pub. in Advances in Mathematics 76, n2 p260-295 1989.

Keywords: Topology, Reprints, *Jordan regions, Shortest paths.

Let R be a Jordan region in R2. A number of questions are settled concerning shortest paths in such regions: If there is a rectifiable path in R joining given points p and g then there is a unique shortest path in R joining these points. This path may be characterized by local geometric conditions. If another path joins p and q within R, a quantitative bound determined solely by the arclengths of this path and of the shortest path is presented which determines a tube about the shorlest path guaranteed to contain the other path. When no rectifiable path in R exists joining p and q, there is, nevertheless, a unique locally shortest path in R joining them. Finally, the pathology-free nature of shortest paths is explicitly demonstrated by characterizing their connected sections within the boundary of R as well as within its interior.

901,204 PB89-174049 Not available NTIS National Bureau of Standards (NML), Boulder, CO. Time and Frequency Div. Variances Based on Data with Dead Time between

the Measurements. Final rept.

J. A. Barnes, and D. W. Allan. 1987, 8p Pub. in Proceedings of Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (19th), Redondo Beach, CA., December 1-3, 1987, D227-234

Keywords: *Variance(Statistics), *Dead time, Bias, Displacement, Errors, Damping, Delay time, Resolu-tion, Sensitivity, Data sampling, Frequency stability.

In 1974 a table of bias functions which related variance estimates with various configurations of number of samples and dead time to the two-sample (or Allan) variance was published. The tables were based on noises with pure power-law power spectral densities. Often situations recur which unavoidably have distributed dead time between measurements, but still the conventional variances are not convergent. Some of these applications are outside of the time and frequency field. Also, the dead times are often distributed throughout a given average, and this distributed dead time is not treated in the 1974 tables. The paper re-views the bias functions B1(k²,r,mu), and B2(r,mu) and introduces a new bias function B3(2,r,mu), to handle the commonly occurring cases of the effect of distrib-uted dead time or the parameters. uted dead time on the computed variances. Some convenient and easy ways to interpret asymptotic limits are reported.

Electronic Mail and the 'Locator's' Dilemma. Final rept.

C. Witzgall, and P. B. Saunders. 1988, 20p Pub. in Applications of Discrete Mathematics, p65-84 1988

Keywords: *Linear programming, *Optimization, Telecommunication, Benefit cost analysis, Return on in-vestment, Reprints, Electronic mail, Communication networks, Cost benefit analysis.

A general methodology for optimally selecting subconfigurations from a given universal configuration is dis-cussed. It is based on a method for assessing the ef-fects of shared fixed costs developed by J. M. W. Rhys and M. L. Balinski. A parametric minimum cost network flow algorithm for solving the resulting optimization problems is described. The problem arose in connection with a cost-benefit model called PAREC whose purpose was to analyze particular configurations of a contemplated electronic mail or message service system.

PB90-112335 PC A03/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Factory Automation Systems Div. Modeling Dynamic Surfaces with Octrees. D. Libes. Sep 89, 14p NISTIR-89/4055

Keywords: *Mathematical models, Monte Carlo method, *Three dimensional models, *Octrees, Data structures, Dynamic models, Systems simulation.

Octrees in the past have been used to represent static objects. The paper discusses the extensions neces-sary to model dynamic surfaces. One particularly im-portant aspect is the ability to represent expanding surfaces that grow to be arbitrarily large. The ability to represent dynamic surfaces allows one to apply octrees to new problems which could not previously have been modeled with static octrees. One such problem is the 'entropy of random surfaces.' Using dynamic octrees, a simulation of self-avoiding random surfaces using Monte Carlo techniques is produced.

Keywords: *Nonlinear programming, Functions(Mathematics), Optimization, Constraints, Mathematical models, Regression analysis. Keywords: *Nonlinear

FACTUNC is a system for solving unconstrained mini-mization problems based on the concept of factorable programming. The concept enables the user to pro-vide the problem function and data in a user friendly way and does not require user-supplied derivatives. system utilizes the factorable function concept to obtain the first and second derivatives required for unconstrained optimization. As a system for nonlinear minimization, FACTUNG allows several options. First the user can solve regression (nonlinear least squares) problems by providing the regression equation and the data for the dependent and independent variables. The second option allows for the minimization of the sum of an indexed function. The user provides the function, and the indexed data. The third option is simply to minimize a function supplied by the user. Uti-lizing barrier function methodology, the third option can sometimes be used to solve constrained problems.

Problems with interval Estimation When Data Are Adjusted via Calibration. Final rept.

J. M. Mulrow, D. F. Vecchia, J. P. Buonaccorsi, and H. K. Iyer. 1988, 15p Pub. in Jnl. of Quality Technology 20, n4 p233-247 Oct

88.

Keywords: *Confidence limits, Error analysis, Esti-mates, Measurement, Reprints, *Tolerance limits, mates, Measurement, Reprints, Calibration.

The analysis of adjusted data arising from a linear calibration curve is considered. Although it is obvious that adjusted values contain errors due to estimation of the calibration curve, some investigators may be tempted to analyze such data as if one applies 'naive' analyses to calibrated data. In particular, it is shown that stand-ard one-sample confidence intervals have actual confidence levels that are always less than the nominal value. The authors also propose and evaluate two other methods for constructing confidence intervals. Tolerance intervals derived from adjusted data also may yield deceiving results, having actual probability levels that are usually greater than the desired level but smaller in some cases.

tistical Engineering Div. Estimation of the Error Probability Density from Repilcate Measurements on Several items.

Final rept.

W. Liggett. 1988, 11p Pub. in Biometrika 75, n3 p557-567 1988.

Keywords: *Error analysis, Orthogonal functions, Monte Carlo method, Variance(Statistics), Probability density functions, Measurement, Computation, Esti-mates, Reprints, Robustness (Mathematics), Hermite polynomials.

Estimation of the measurement error probability densi-ty from data that consist of a few measurements on each of several dissimilar items is investigated. An estimator is proposed for independent and identically distributed measurement error with a symmetric density function. This estimator is based on an orthogonal function expansion. Computation begins with the difand makes use of the fact that the characteristic func-tion of these differences equals the square of the characteristic function of the measurement error. Application to robust inference for items measured in triplicate is considered. The M-estimates of the values of the items are compared on the basis of an estimated standard error computed from the density estimated. The circumstances under which this standard error estimator provides nearly valid inferences are delimited by Monte Carlo experiments.

Minimax Approach to Combining Means, with Practicai Examples.

Final rept. K. R. Eberhardt, C. P. Reeve, and C. H. Spiegelman. 1989, 20p

Grant N00014-86-F-0025 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Chemometrics and Intelligent Laboratory Systems 5, p129-148 1989.

Keywords: *Minimax technique, *Mean, Comparison, Estimating, Confidence limits, Statistics, Reprints.

The paper describes a method for combining sample means that accounts for bias in those means. It compares the unweighted mean, the weighted mean using reciprocal estimated variances for weights, and a mini-max weighted mean. When the individual means are subject to nontrivial biases, the authors show that the minimax estimator can lead to important decreases in mean squared error and confidence interval width. The recommendations are based on statistical theory and on simulations based on three Standard Reference Material data sets.

Estimation of an Asymmetrical Density from Severai Small Samples.

Final rept. W. Liggett. 1989, 9p Pub. in Biometrika 76, n1 p13-21 1989.

Keywords: *Skewed density functions, *Estimating, Probability density functions, Orthogonal functions, Statistical samples, Monte Carlo method, Least squares method, Reprints, Hermitian polynomial.

A method for estimation of the measurement error probability density from three or more measurements on each of several dissimilar items is presented. Differences between measurements on the same item pro-vide estimates of the densities of the first and second differences between error realizations. The relations between these densities and the error density, ex-pressed in terms of characteristic functions and Her-mite function expansions, are the basis for a nonlinear least-squares algorithm. Estimated percentiles of the error density are investigated by Monte Carlo experi-ments. The method is applied to measurements by several laboratories on an inhomogeneous reference material with asymmetric variability.

Consensus Values, Regressions, and Weighting Factors.

Bi-monthly rept. R. C. Paule, and J. Mandel. 1989, 7p Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n3 p197-203 May-Jun 89.

Keywords: Variance(Statistics), Regression analysis, Taylor series, Computation, Convergence, *Consensus values, Weighted average, Iterative methods.

An extension to the theory of consensus values is presented. Consensus values are calculated from averages obtained from different sources of measurement. Each source may have its own variability. For each av-erage a weighting factor is calculated, consisting of contributions from both the within- and the betweensource variability. An iteration procedure is used and calculational details are presented. An outline of a proof for the convergence of the procedure is given. Consensus values are described for both the case of the weighted average and the weighted regression.

Computation and Use of the Asymptotic Covarlance Matrix for Measurement Error Models. P. T. Boggs, and J. R. Donaldson. 26 Jun 89, 30p NISTIR-89/4102

Keywords: *Measurement, *Error analysis, Simultane-ous equations, Covariance, Regression analysis, Con-fidence limits, Monte Carlo method, Matrices(Mathematics), Optimization.

The measurement error model assumes that errors occur in both the response variables and the predictor variables. In using this model, it is of interest to compute confidence regions and intervals for the estima-tors of the model parameters. An asymptotic form for the covariance matrix is used to construct approximate confidence regions and intervals. The solution of the minimization problem resulting from the use of the measurement error model is discussed, and a procedure for accurately computing the covariance matrix is developed. Then the quality of the confidence regions and intervals constructed from this matrix is assessed via a Monte Carlo study.

User's Reference Guide for ODRPACK: Software for Weighted Orthogonal Distance Regression Version 1.7. Internal rept.

P. T. Boggs, R. H. Byrd, J. R. Donaldson, and R. B. Schnabel. Aug 89, 79p NISTIR-89/4103 Prepared in cooperation with Colorado Univ. at Boulder. Dept. of Computer Science.

Keywords: *Curve fitting, *Data smoothing, Orthogon-ality, Regression analysis, Algorithms, Mathematical models, Errors, Least squares method, Data, *User manuals(Computer programs), Computer applications, Independent variables, Dependent variables.

ORDPACK is a portable collection of NASI 77 Fortran subroutines for fitting a model to data. It is designed primarily for instances when the independent as well as the dependent variables have significant errors, implementing a high efficient algorithm for solving the weighted orthogonal distance regression problem, i.e., for minimizing the sum of the squares of the weighted orthogonal distances between each data point and the curve described by the model equation. It can also be used to solve the ordinary least squares problem where all of the errors are attributed to the observations of the dependent variable. A complete description of the orthogonal distance regression problem and the algorithm and implemented in ORDPACK is given by Boggs et al. ORDPACK is designed to handle many levels of user sophistication and problem difficulty.

Pub. in Jnl. of Forensic Identification 39, n4, p231-238, Jul/Aug 89.

Keywords: Females, Males, Distance, Reprints, *Forensic medicine, *Fingerprints.

The distance from the center of one friction skin ridge to the center of the ridge next to it is quite variable in different regions of a given fingerprint. This distance has been measured on a small sample of fingerprints. The measured value ranged from 0.2 mm to 0.85 mm on fingerprints from male subjects, and from 0.2 mm to 0.75 mm on fingerprints from female subjects. The mean ridge-to-ridge distance for 731 measurements on the fingerprints of ten male subjects was 0.46 mm. For 1,046 measurements on the fingerprints of ten female subjects the mean value was 0.41 mm. A method is described for using these values to calculate ridge counts between near neighboring minutiae. Esti-mates are made of the errors likely to result from the use of calculated ridge counts.

Keywords: *In vivo analysis, *Quantitative analysis, *Metals, *Absorption spectra, Bioaccumulation, Chemical analysis, Fluorescence, *Epifluorescence microscopy, Fluorescence spectroscopy

Quantitative measurement of metal ion uptake in living cells is accomplished via staining the biota with an appropriate fluorogenic ligand, determining the emission photon flux by epilluorescence microscopy imaging (EMI), and relating the latter quantity to absolute metal ion concentration by atomic absorption analysis. By thus combining the techniques of element-specific fluorimetry and EMI, it is possible to observe the chemistry occurring during redox transformations of ele-ments by colonies of living cells in reactions that have significant economic potential. The strengths, weaknesses, and future directions to be taken in improving this analytical method are discussed.

The disordered solvent distribution in crystals of vitamin B12 coenzyme was examined using the methods

of high resolution neutron and X-ray diffraction. One set of neutron (0.95A) and two sets of X-ray (0.94A and 1.1A) data were collected and the resulting models were extensively refined using least squares and Fourier syntheses. The solvent regions were ana-hyped in two charges firstly, "point of the ware extended to be other set." lysed in two stages: firstly, 'main' sites were assigned to the well defined regions of solvent density and re-fined using least squares; secondly, 'continuous' sites were assigned representing the more disordered diffuse and elongated regions of solvent density around and between the main sites. Water networks were for-mulated from the assigned sites in the above three models and also from those assigned in the original structure determination. The well established networks extend throughout all the solvent regions of the crystal with interesting orientational arrangements of the individual waters around both polar and apolar groups of the coenzyme molecule. The networks were seen to be consistent among each of the four models in terms of occupying relatively similar positions, however, the occupancy values of the individual networks varied between the models.

Water Structure In Vitamin B12 Coenzyme Crystals. 2. Structural Characteristics of the Solvent Networks.

Final rept.

H. Savage. 1986, 14p See also PB89-186803.

Pub. in Biophysical Jnl. 50, n5 p967-980 1986.

Keywords: *Water, *Molecular structure, Crystal struc-ture, Vitamin B12, Reprints, *Vitamin B 12 coenzymes, Biomolecules, Hydrogen bonding.

The geometrical details of the solvent structure in vita-min B12 coenzyme crystals with respect to hydrogen bonding and non-bonded contacts are described. The individual H-bond geometries varied over wide ranges, similar to those observed in small molecule structures. Large deviations from tetrahedral coordination were found around a majority of the waters. The mutual po-sitions and orientations of the water molecules could not be adequately explained in terms of the H-bonding relationships present in the structure. However, additional investigations which focused on the short range non-bonded contacts around water positions in a variety of crystal hydrates, revealed several structural regularities. These features relate to the non-bonded O...O, H...O and H...H interactions and give rise to a set of repulsive restrictions that are seen to be very much stronger stereochemical restraints than those associated with H-bonding. The repulsive restrictions can be used as stereochemical restraints in the interpretation and refinement of solvent structures within larger hydrate systems such as protein crystals. They may also be included in potential functions used to simulate solvent structures in aqueous solutions and hydrate systems.

The paper reviews the use of liposomes as synthetic models for studying various biophysical aspects of matrix vesicle calcification, especially the involvement of acidic phospholipids in the nucleation and growth processes which occur during the initial stages of min-eral formation in and around these membrane-bound structures. Recent results showed that acidic phospholipids incorporated into phosphatidylcholine-rich anionic liposome membranes were ineffective in initiat-ing extraliposomal calcium phosphate precipitation from metastable solutions at physiological pH. On the contrary, certain acidic phospholipids such as phos-phatidic acid and phosphatidylserine retarded the de-velopment of such precipitation when the latter was endogenously induced. The extent of inhibition correlated with the strength of the electrostatic interaction between the polar head group of the acidic phospholi-pid and the surface of the mineral phase. The results suggest that acidic phospholipids may play an important role in controlling the rate of early mineral devel-opment in matrix vesicle calcification.

Keywords: *Biochemistry, *Antibodies, Lipids, Vitamin B complex, Antigens, Reprints, *Liposomes, *Immun-oassay, Cell membranes, Fluorescence spectrometry, Cross-linking reagents, Avidin.

The report discusses the derivatization of liposomes with antibodies by using avidin to crosslink biotinylated phospholipid molecules in the liposome membranes with biotinylated antibody molecules. A comparison of the biotin binding activity of avidin in solution and avidin associated with liposomes shows that avidin bound to biotinylated phospholipid in liposome membranes retains full binding activity for additional biotin molecules. Changes in the fluorescence spectrum of avidin have been used to characterize the binding capacity of avidin for biotin in solution, and change in intensity of light scattered due to aggregation of lipo-somes was used to measure the biotin binding activity of avidin associated with liposomes. Relative amounts of the biotinylated phospholipid, avidin, and biotinylatof the biotinylated phospholipid, avoin, and biotinylated ed antibody have been optimized to produce stable li-posomes which are derivatized with up to 1.7 nmol of antibody/micromol of lipid. These derivatized lipo-somes are highly reactive to immunospecific aggrega-tion in the presence of multivalent antigen. A linear in-crease in light scattering was recorded between 1 and 10 pmol of antigen. The work shows that liposomes contained biotinglated phospholipid can be successful containing biotinylated phospholipid can be successful generic reagent for immunoassays.

Pub. in New Biotechnology in Oral Research, Chapter 4, p54-75 1989.

Keywords: *Calcification, Calcium phosphate, Precipitation(Chemistry), Reprints, *Liposomes, *Min-eralization, Membrane lipids, Lipid bilayers.

The chapter reviews the preparation and use of artificial lipid vesicles (liposomes) as synthetic models for studying membrane controlled precipitation of calcium phosphate salts in aqueous solutions. The impetus behind the development of liposomes for this purpose is the recognition that naturally occuring bilayer counterparts known as matrix vesicles have a primary role in initiating mineralization in many skeletal and dental tissues. Reviewed in the chapter are some of the lipid combinations, preparation procedures, and methods for characterizing liposomes that are currently used in mineralization studies. Also described is an endogenous reaction procedure which allows precipitations to be carried out in liposomal suspensions which parallel those postulated to occur during matrix visicle calcifiveloped, liposomes have proved to be a useful tool for elucidating in vitro the role membrane lipids possibly play in biocalcification processes.

The paper reviews important aspects of the field of bioorganometallic chemistry opened over 50 years ago by Professor Frederick Challenger. Considered are the scope and rate of organometallic biogenesis, mechanistic implications for environmental (chemical and biogenesis), which are assessed in the set and biological) processes involving organometals and the prospects for control and manipulation of these processes for new biotechnical approaches to materials acquisition and environmental protection. Methylmetal(loid) species are microbially generated endo- and exocellularly by a variety of enzymatic and non-enzymatic processes. Large quantities of microbi-al metabolites which can act as metal methylating agents are generated in the global environment. Examples include methyl halides, methyl corrinoids and methylated sulfur compounds. Interesting prospects for materials processing arise in considering bioorgan-ometallic chemistry with novel routes to metal dissolution precipitation and reduction being possible.

Described is the application of Raman microprobe spectroscopy to the characterization of the mineral phase present in atherosclerotic and bioprosthetic calcified deposits. Examined are human aortic plaque and calcific deposits removed from a heart assist device implanted in sheep. The vibrational Raman spectra of these mineralized deposits are interpreted relative to the various types of calcium phosphates known to par-ticipate in the formation of the biological mineral. A specific goal is the spatial tracking, in the microscopic domain, of carbonate species associated with the mineral phosphate to determine the type of carbonate substitution (Type A or Type B sites) in the biological apatite. Results are presented from the quantitation of carbonate contents based on an empirical procedure using relative scattering intensities of carbonate and phosphate species. These studies are part of a larger research program on the comprehensive physico-chemical characterization of these pathologic, calcified deposits in animals and in man.

The report reviews the application of the capillary gas chromatography-mass spectrometry (GC-MS) tech-nique to chemical characterization of radiation-induced damage to DNA. Damage to both sugar and base moieties of DNA exposed to ionizing radiation in aqueous solution can be unequivocally characterized by GC-MS. Sugar products released from DNA are re-duced by NaBD, to corresponding polyalcohols and analyzed by GC-MS following trimethylsilylation. For those sugar products still bound to the DNA backbone, an additional step, alkaline treatment, following NaBDreduction is required to release them. Incorporation of deuterium atoms into the polyalcohols permits the assessment of the presence and the position of the carbonyl and deoxy groups in the precursor sugar mole-cules. The t-butyldimethylsilyl derivatives provide a typical (M-57) plus ion, which appears in most in-stances as the base peak in the mass spectra, and is very useful for diagnostic purposes. The technique of selected-ion monitoring (SIM) permits the unequivocal characterization of the products at very low radiation doses that are considered biologically relevant. The SIM is also used for quantitative measurement of the products at low radiation doses.

Radiochemical and Instrumental Neutron Activation Analysis Procedures for the Determination of Low Level Trace Elements In Human Livers. Final rept.

R. Zeisler, R. R. Greenberg, and S. F. Stone. 1988, 17p

Sponsored by Environmental Protection Agency, Washington, DC. Pub. in Jnl. of Radioanalytical and Nuclear Chemistry

124, n1 p47-63 1988.

Keywords: *Trace elements, *Neutron activation analysis, *Liver, Humans, Compton effect, Spectrochemi-cal analysis, Tissues(Biology), Nuclear chemistry, Radiochemistry, Reprints.

A comprehensive approach to the analysis of human livers was developed in a pilot program for the National Environmental Specimen Bank that employed a combination of four analytical techniques. Refinements in this approach were needed for improvement in detection limits, for more effective sample usage, and to reduce the number of analytical steps that were involved. Since neutron activation analysis (NAA) deter-mined most of the elements, expansion of NAA was chosen to achieve these goals. Modifications in the instrumental NAA procedures, including the use of a Compton Suppressor System, gave increased sensi-tivity for some low level elements, such as arsenic and chromium. Radiochemical procedures that followed the instrumental counts increased the sensitivity for the elements chromium, selenium, arsenic, molybdenum, silver, antimony, and tin. Results are given for two radiochemical procedures that were applied following the modified procedure, either the use of an inorganic ion exchange column or a liquid/liquid extraction, and these are compared to instrumental results.

S. A. Margolis, and T. P. Davis. 1988, 7p Pub. in Clinical Chemistry 34, n11 p2217-2223 1988.

Keywords: *Ascorbic acid, *Stabilization, Chromato-graphic analysis, Standards, Reprints, *Human plasma, *Clinical analysis, High pressure liquid chromatography, Reference materials.

Two independent HPLC procedures are described for the rapid and accurate analysis of ascorbic acid in human plasma. No sample extraction or phase separation is required. The development of a human plasma reference material for clinical laboratory analysis of ascorbic acid is described. The plasma ascorbic acid content can be determined with as little as 50 uL of sample in 15 min. Analytical recoveries are 100% with direct injection of deprotiented plasma. Extensive stability data under several conditions using dithiothreitol as a preservative (antioxidant) indicate that ascorbic acid remains stable for up to 57 weeks. Round robin analysis of 11 normal human blood samples by two independent methods showed a % CV between 0.1 and 5.3. These clinical samples appear to be stable for no less than 60 days under the described conditions of stabilization and sample treatment. By using these methods, a laboratory can easily automate the analysis for up to 24 hours of injections at room temperature (21 deg C).

New International Temperature Scale of 1990 (ITS-90). Final rept. B. W. Mangum. 1989, 3p

Pub. in Clinical Chemistry 35, n3 p503-505 1989.

Keywords: *Temperature measurement, Calibrating, Reprints, *Temperature scales.

A new international temperature scale, the ITS-90, will replace the International Practical Temperature Scale of 1968 (amended edition of 1975), IPTS-68(75), on 1 January 1990. Temperatures on the ITS-90 will agree more closely with thermodynamic temperatures; there-fore, the ITS-90 represents a substantial improvement over the IPTS-68(75). Fortunately for the clinical laboratory community, the change in the scale will be at most only 0.05 C or less in the range from 0 to 60 C, but corrections in primary calibrations should be made so that the calibrations are based on the ITS-9C.

Welch, and E. White. 1989, 6p Pub. in Analytical Chemistry 61, n15 p1718-1723, 1 Aug 89.

Keywords: *Cholesterol, *Blood, *Carbon 13, *Isotop-ic labeling, *Mass spectroscopy, *Dilution, Measure-ment, Standards, Methodology, Gas chromatography, Reprints.

An isotope dilution mass spectrometric (ID/MS) method for cholesterol is described that uses capillary gas chromatography with cholesterol-(13)C3 as the la-beled internal standard. Labeled and unlabeled cholesterol are converted to the trimethylsilyl ether. Combined capillary column gas chromatography and elec-tron impact mass spectrometry are used to obtain the abundance ratio of the unlabeled and labeled ions from the derivative. Quantitation is achieved by measurement of each sample between measurements of two standards whose unlabeled/labeled ratios bracket that of the sample. Seven pools were analyzed by the method. The method is a modification of the original definitive method for cholesterol.

See also PB88-175237.

Pub. in AIP (American Institute of Physics) Conference Proceedings, n146 p694-697 1986.

Keywords: *Photosensitivity, *Neoplasms, *Fluores-cent dyes, *Drug therapy, Porphyrins, Photons, Excita-tion, Beams(Radiation), Lasers, Spectra, Emissivity, Tissues(Biology), Penetration, Free radicals. Position(Location).

The tumor localizing photosensitizer hematoporphyrin derivative (HPD) is shown to undergo simultaneous two-photon excitations upon intense laser irradiation at 750 or 1064 nm, a spectral region where there is no significant HPD one-photon absorbance in aqueous solution. Evidence for the two-photon excitation consists in the observation both of the HPD fluorescence spectrum in the region of 615 nm as a result of 750 or 1064 nm excitations and the guadratic dependence of this fluorescence emission intensity upon the excitation laser intensity. Since the penetration depth of ul-traviolet and visible light into tissue varies logarithmi-cally with wavelength (red penetrating more deeply than blue), these studies suggest the possibility that two-photon induced localization of tumor-bound HPD

Clinical Medicine

might facilitate the detection of deeper lying tumors than allowed by the current one-photon photolocalization method.

Keywords: *Mossbauer *Diagnosis, effect. *Tissues(Biology), Gamma rays, Images, Doppler effect, Absorption, Rotation, Electromagnetic noise, Spectroscopy analysis, Reprints, *Tomography.

Recoilless gamma-ray resonance, or the Mossbauer effect, is a well-established spectroscopic tool in materials science. Mossbauer spectroscopy shares some of the fundamental characteristics of nuclear magnetic of the fundamental Characteristics of nuclear magnetic resonance (NMR) spectroscopy, since both rely on nu-clear resonance phenomena. A significant recent ad-vance in the latter field is NMR imaging in biomedicine. In Mossbauer spectroscopy, a quantity analogous to the NMR magnetic field is the relative velocity between the score and entry of the above. gests that an analogous approach to Mossbauer imaging is possible by imposing a velocity gradient on the absorber. This can be achieved simply by rotating the absorbing object relative to the source, generating line integrals of constant Doppler shift, or equivalently, of constant gamma-energy. From such measurements, a spatial map of the gamma-ray absorption coefficient can, in principle, be tomographically reconstructed. Spatial resolution is directly related to the rate of rotation of the absorber, but ultimately is signal-to-noise limited.

The calibration of small radioactive sources used for interstitial radiation therapy, short distance therapy (brachytherapy), is performed in terms of the physical quantities exposure or air kerma. (60)Co and (137)Cs sources are calibrated by comparison with NBS work ing standard sources of the same type, while (192)Ir

and (125)I sources are calibrated by measurement in a reentrant ionization chamber that was calibrated using NBS working standard sources of the same type. The working standard sources were calibrated using the NBS graphite cavity ionization chambers except for (125)I, for which the NBS measurement standard was a free-air chamber. The working standard sources of the two iong-lived sources have been measured a number of times over the years; the reliability of the reentrant chamber for the two short-lived sources is assured by use cf sealed radium sources as a constancy check. The overall uncertainty (considered to have the approximate significance of a 95% confi-dence limit) is given as 2% for all the sources except for (125)I seeds, for which it is given as 5%, 6%, and 7%, depending on the type of sect. The stated uncer-tainty for (125) seeds does not include possible errors due to low-energy X rays not recognized at the time the standards were established.

diobiology, Microanalysis, Ionizing radiation, Molecular structure, Deoxyribonucleic acids, Alpha amino car-boxylic acids, Uracils, Radiation effects, Reprints, *Thymine, *DNA, *Hydroxyl radicals, Hydroxy compounds.

DNA-protein cross-links are formed when living cells or isolated chromatin is exposed to ionizing radiation. Little is known about the actual cross-linked products of DNA and proteins. In the work, a novel hydroxyl radical induced cross-link of thymine and tyrosine has been isolated along with a tyrosine dimer by high-performance liquid chromatography of aqueous mixtures of tyrosine and thymine that had been exposed to hydroxyl radicals generated by ionizing radiation. The iso-lated compounds have been examined by gas chromatography-mass spectrometry, high-resolution mass spectrometry, and (1)H and (13)C nuclear magnetic resonance spectroscopy. The structure of the thy-mine-tyrosine cross-link has been identified as the product from the formation of a covalent bond between the methyl group of the thymine and carbon 3 of the tyrosine ring. In addition, the 3,3' tyrosine dimer was isolated and characterized. The mechanism of the formation of these compounds is discussed. The work presents the first complete chemical characterization of a hydroxyl radical-induced DNA base-amino acid cross-link.

Development of automated methods to sequence DNA, RNA, proteins, and other macromolecules have yielded oceans of cryptic symbols, for which there is an absolute dependence upon computerized factual databases to acquire, store, retrieve, and analyze data. The Human Genome Project has focused attention on the information science aspects of nucleic acid data, yet for the practicing scientist nucleic acids and

other sequence data are just one piece of an increasingly complex biological puzzle whose solution will be expressed in terms of structure and function. Access to and integration of information across multiple related biological databases is a major challenge facing information system builders, a challenge which holds the promise of creating knowledge synergy from what are today disconnected, stand-alone information sources.

Use of Structural Templates in Protein Backbone

Modeling. Bi-monthly rept. L. S. Reid. 1989, 8p Included in Jnl. of Research of the National Institute of Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n1 p65-72 Jan-Feb

Keywords: *Proteins, Conformation, Data bases, Templates.

Many proteins of interest have low (i.e. less than 50%) sequence similarity to any known structure. In these cases new approaches to prediction of structure are required. The use of sequence profiles which relate se-quence to known structure has been proposed as one method to assign local regions of structure. As a first stage, templates or icons' of the many relevant sub-structural motifs found in proteins must be defined. The sequences which gave rise to these structures are then aligned and a weighted profile obtained. Average structures of the 8 and 12 residue helix-turn and turnhelix motifs have been prepared. These coordinate templates were then used to scan through the Brookhaven protein structural database for similar, superimposable fragments. A composite template of 100 similar fragments for each element was found to be internally consistent. All of the sequences, from these structures, were then used to create an overall se-quence profile.

Bi-monthly rept. J. Moult. 1989, 6p Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n1 p79-84 Jan-Feb 89

Keywords: *Proteins, *Molecular structure, Amino acids, Models, Electrostatics, Crystallography, Reli-ability, *Protein conformation, Databases.

Comparative modeling of protein structure is a process which determines the three-dimensional structure of protein molecules on the basis of amino acid sequence similarity to experimentally known structures. The procedure is facilitated by the growing database of protein structures obtained from crystallography. In the review a series of stages in the modeling process are identified and discussed. These are (i) obtaining a reliable amino acid sequence of the structure of interest, (ii) producing a structurally correct sequence of the structure of interest, (ii) producing a structurally correct sequence alignment, (iii) identifying which structural features are conserved between target and parent structures, (iv) modeling the new pieces of structure, and (v) tests of reliability.

The high resolution structures of bovine pancreatic trypsin inhibitor refined in two distinct crystal forms

Cytology, Genetics, & Molecular Biology

have been compared. One of the structures was a result of new least squares x-ray refinement of data from crystal form I, while the other was the joint x-ray/ neutron structure of crystal form II. After superposition, the molecules show an overall root-mean-squares deviation of 0.40A for the atoms in the main chain, while the deviations for the side chain atoms are 1.53A. The latter number decreases to 0.61A when those side chains which adopted drastically different conforma-tions are excluded from comparison. The discrepancy between atomic temperature factors in the two models was 6.7 sq A, while their general trends are highly correlated. About half of the solvent molecules occupy similar positions in the two models, while the others are different. As expected, solvent molecules with the lowest temperature factors are most likely to be common in the two crystal forms. While the two models are clearly similar, the differences are significantly larger than the errors inherent in the structure determination.

Final rept.

R. D. Astumian, and B. Robertson. 1989, 11p Pub. in Jnl. of Chemical Physics 91, n8 p4891-4901, 15 Oct 89.

Keywords: *Electric fields, *Nonlinear systems, Catal-ysis, Electrochemistry, Relaxation, Kinetics, Reprints, *Membrane proteins, Biological transport.

The nonlinear response of a two-state chemical transi-tion to an oscillating electric field is examined. A reaction for which the analysis is particularly relevant is a conformational transition of a membrane protein exposed to an ac electric field. Even a modest externally applied field leads to a very large local field within the membrane. This gives rise to nonlinear behavior. The applied ac field causes harmonics in the polarization and can cause a dc shift in the state occupancy, both of which can be observed and used to determine kinetic parameters. Fourier coefficients are calculated for the enzyme state probability in the ac field, exactly for infinite frequency, and in powers of the field for finite frequency. Kramers-Kronig relations are proved and response functions are given for the leading terms of the harmonics. The results are extended to the spherical symmetry relevant to suspensions of spherical cells, vesicles, or colloidal particles. If the protein catalyzes a reaction, free energy is transduced from the electric field to the output reaction, even if that reaction is electrically silent. Many transport enzymes are ideal examples. The ac field can cause the enzyme to against an (electro) chemical potential. The efficiency of the energy transduction can be as high as 25%.

A crystallization database, the Biological Macromole-Crystallization Database, containing crystal data cule and the crystallization conditions for more than 1000 crystal forms of over 600 biological macromolecules, has been compiled from the scientific literature. Data for proteins, protein:protein complexes, nucleic acids, nucleic-acid:nucleic-acid complexes, protein:nucleicacid complexes and viruses have been included. The general information cataloged for each macromolecule includes the macromolecular name(s), the molecular weight, the subunit composition, the presence of prosthetic group(s), and the source of the macromolecule. The crystal data include the unit cell parameter, space group, crystal density, crystal habit and size, and diffraction limit and lifetime. The crystallization data consist of the crystallization method, chemical additions to the crystal growth medium, macromole-cule concentration, temperature, pH, and growth time. A result of the compilation of the crystallization data was the development of a general strategy for the crystallization of soluble proteins.

Comparison of Fluoride Uptake Produced by Tray and Flossing Methods In vitro. Final rept.

M. K. Guo, L. C. Chow, C. T. Schreiber, and W. E. Brown. 1989, 3p

Sponsored by American Dental Association Health Foundation, Chicago, IL., and National Taiwan Univ., Taipei. Coll. of Medicine.

Pub. in Jnl. of Dental Research 68, n3 p496-498 Mar 89.

Keywords: *Fluoride, Trays, Adsorption, Reprints, *Dental enamel, Dicalcium phosphate dihydrate, Dental floss, Fluoroapatite.

The study compares: (i) the fluoride (F) uptake by enamel in approximal areas of teeth when the F agent was applied in vitro via a tray or a flossing technique; and (ii) the effectiveness of two treatments -- acidulat-ed phosphate fluoride (APF) alone and CaHPO4-2H20 (DCPD)-forming pre-treatment followed by APF. Groups of three teeth (one premolar and two molars) were mounted in impression compounds simulating their oral configuration. In the tray group, teeth received one four-minute treatment by means of customformed trays. In the flossing group, the approximal areas of teeth were flossed for 40 sec twice daily for three days with an absorbent floss wetted with the treatment solution. The F uptake was calculated from biopsy data obtained before and after the treatment. The results showed that (i) DCPD-APF produced siginficantly greater F uptake than APF alone in both the tray and flossing methods, and (ii) that the flossing technique produced significantly greater F uptake in the approximal areas than the tray method for either treatment.

Micro-Analysis of Mineral Saturation Within Enamel During Lactic Acid Demineralization. Final rept.

G. L. Vogel, C. M. Carey, L. C. Chow, T. M. Gregory, and W. E. Brown. 1988, 9p

Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Jnl. of Dental Research 67, n9 p1172-1180 Sep

88.

Keywords: *Microanalysis, *Lactic acid, Dental caries, Concentration(Composition), Calcium, Phosphate, Re-prints, *Dental enamel, Demineralization, Hydroxyapatite, Enamel solubility, Tooth permeability.

In this study, the physicochemical factors responsible for caries-like lesion propagation were investigated by

means of a micro-analytical system used to study the fluid within a lesion during a simulation of the decay process. Four 500-micrometer-thick serial sections prepared from a single human molar were mounted between glass plates with only the natural surface of the tooth exposed. The concentrations of calcium, phosphate, and hydrogen ions of the fluid in the wells were then followed as a function of time as the lesion advanced. The results of this study, in which lactic acid was used to demineralize enamel, were consistent with those previously reported (Vogel et al, 1987a). The solution within the lesion remained saturated during the acid attack. Differences in initial mobilities of the calcium and phosphate and other ions increased the concentrations within the lesion and permanently changed the ratio of these ions in the lesion solution. Based on these results, the authors suggest that the ionic permselectivity of tooth enamel can have a profound effect on the transport of mineral from a caries lesion.

Mechanism of Hydrolysis of Octacalcium Phosphate. Final rept.

B. B. Tomazic, M. S. Tung, T. M. Gregory, and W. E. Brown. 1989, 9p

Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Scanning Microscopy 3, n1 p119-127 1989.

Keywords: *Hydrolysis, Chemical reactions, Solubility, Transformations, Reprints, *Octacalcium phosphate, Hydroxyapatite.

The chemical and structural properties of hydrolyzed octacalcium phosphate (OCP) appear to be of high rel-evance to tooth, bone and pathological bioapatites. Hydrolysis of synthetic well-crystallized OCP was studied at constant pH by using the pH stat method over the 6.1 to 8.6 range at 50 C and to a lesser extent at 37 C. Hydrolytic transformation proceeds according to thermodynamic requirements except for some retardation at the highest pH value as a consequence of decreased solubility of OCP which may be rate determin-ing. The product of hydrolysis, OCP-hydrolyzate (OCPH), was characterized by chemical analysis, scanning electron microscopy, x-ray diffraction, electron microprobe (x-ray microanalysis, EDX) and solubility measurement under static and dynamic condi-tions. Overall findings provide new evidence that OCP may be a precursor phase in the formation of pathologic calcified deposits and normal biomineral, which appear to be complex hydrolyzates of OCP.

Formation of Hydroxyapatite in Hydrogels from Tetracalcium Phosphate/Dicalcium Phosphate Mixtures.

A. Sugawara, J. M. Antonucci, S. Takagi, L. C. Chow, and M. Ohashi. 1989, 10p

Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Jnl. of the Nihon University School of Dentistry

31, n1 p372-381 Mar 89.

Keywords: Dental materials, Reprints, *Hydroxyapatite, *Apatitic calcium phosphate cements, *Dental cements.

Apatitic calcium phosphate cements, formed by the ambient reaction of tetracalcium phosphate (TTCP) with dicalcium phosphates (DCP), have been recently reported. H20 or dilute aq. H3PO4 (0.2%) is used as the liquid vehicle for this reaction. The study ascertained if hydroxyapatite (HAp) can form in self-cured hydrogel composites containing TTCP/DCP mixes. The setting times (ST) and diametral tensile strengths (DTS) of these hydrogel composites were also deter-mined. The hydrogels were of two types: vinyl thermosets derived from the copolymerization of HEMA (2hydroxyethyl methacrylate) and cross-linking mon-omers, and polyelectrolyte-based hydrogels formed from aq. poly(alkenoic acids), e.g., poly(acrylic acid). Cylindrical specimens 6 mm D x 3 mm H were prepared and stored in H20 for up to 30 days. The HEMA composites were hardened in 7-15 min by free radical initiation (benzoyl peroxide/tertiary aromatic amine).

Final rept.

MEDICINE & BIOLOGY

Dentistry

After various periods of storage in H20 at 37 C, some of the specimens were examined by X-ray spectroscofor HAp. HAp formation was not observed in the py for HAp. HAp formation was not observed in the HEMA composites even after 30 days of H20 storage but was detected in the polyacid cements. Both the H20 content and pH may thus be factors controlling the rate and extent of HAp formation in hydrogel com-posites containing TTCP/DCP mixtures.

Detection of Lead in Human Teeth by Exposure to Aqueous Sulfide Solutions.

Final rept.

A. Sugawara, J. M. Antonucci, G. C. Paffenbarger, and M. Ohashi. 1989, 15p Sponsored by American Dental Association Health Foundation, Chicago, IL. Pub. in Jnl. of the Ninon University School of Dentistry

31, n1 p382-396 Mar 89.

Keywords: *Lead(Metal), *Exposure, *Teeth, *Humans, *Detection, Discoloration, Reprints, Dental cements, Sodium sulfide, Aqueous solutions.

A recent study has shown that the presence of lead (Pb) as well as other base metals in esthetic restorative materials, especially dental cements, is detectable by color shifts induced by exposure of hardened speci-mens to a 0.1% (w/v) aqueous solution of sodium sulfide, Na2S. The present study was initiated to deter-mine the applicability of this simple exposure test to the detection of Pb in human teeth. Extracted whole the detection of PD in numan teeth. Extracted whole teeth as well as sectioned, thin specimens were ex-posed first to either a 0.01% or a 0.001% (w/v) aque-ous solution of lead nitrate, Pb(NO3)2 at 37 C for 24 h. After rinsing with distilled H20 and a subsequent 24 h exposure to the 0.1% Na2S solution at 37 C, the tooth specimens were examined visually and by a dental color analyzer for color changes. Neither control speci-mens exposed to distilled H20 only or to 0.1% Na2S only exhibited any significant change in appearance after 24 h of storage at 37 C. However, specimens ex-posed first to the Pb(NO3)2 solutions showed discerni-ble delta E values after exposure to the Na2S solution. Delta E was greatest for specimens exposed to the more concentrated Pb(NO3)2 solution. Most of the discoloration in both thin and intact tooth specimens was confined to the outermost layers of the tooth structure. For the intact specimens, the greatest degree of discoloration occurred in the cementum, the most permeable part of the tooth structure.

High-Temperature Dental Investments.

Final rept.

J. A. Tesk. 1989, 11p Pub. in Dental Materials: Properties and Selection, Chapter 18, p351-361 1989.

Keywords: *Dental materials, Polymers, Castings, High temperature tests, Reprints, *Dental investments.

High-temperature dental investments are materials used primarily for the casting of high-temperature dental alloys, that is, alloys with casting temperatures greater than 1,300 C. While the casting of these alloys into crowns, inlays, partial dentures (fixed or removable), and other restorative devices is certainly the primary use for the investments, they have other dental applications as well. One such use is as fixtures for holding dental prostheses during soldering operations. Another use is for making dies for the fabrication of porcelain facial tooth veneers. Until recently there have been two basic compositional types: phosphate-bonded and ethyl silicate-bonded. However, due to interest in the casting of titanium prostheses, other sys-tems are now being explored and used. This is neces-sary because the conventional phosphate and ethyl silicate investments react with molten titanium and contaminate the casting. Commercial dental invest-ments used in Japan for titanium are based primarily on magnesium oxide. Investments under development in the United States are based on zirconia. They have been used to make titanium castings for limited clinical evaluations by the Paffenbarger Research Unit at the National Bureau of Standards.

Pulpal and Micro-organism Responses to Two Ex-perimental Dental Bonding Systems. Final rept.

R. L. Blosser, N. W. Rupp, H. R. Stanley, and R. L.

Bowen, 1989, 5p Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Dental Materials 5, p140-144 Mar 89.

*Dental materials, *Dentin, *Bonding, Keywords: Teeth, Reprints, *Biocompatibility, Dental pulp, Microleakage.

Several new bonding systems have been reported that promote strong adhesion. This in vivo study involves treatment with two experimental bonding systems of Class V cavity preparations in the teeth of three Macaca fascicularis primates and reports the pulpal re-sponses and degree of micro-organism invasion associated with each treatment. The upper and lower left quadrants were treated with clinical materials to estab-lish positive and negative controls. After 4, 25, and 59 days, the teeth were removed and underwent routine histological and bacteriological evaluation. Slight pathological conditions were noted for superficial and deep responses, but all value approached 0.0 by the 59th day. Micro-organisms were seen under only 12% of the restorations. Both experimental systems appear to be safe for human clinical trials.

Gaithersburg, MD. Polymers Div. Quasi-Constant Composition Method for Studying the Formation of Artificial Caries-Like Lesions. Final rept.

L.C. Chow, and S. Takagi. 1989, 6p Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Caries Research 23, p129-134 1989.

Keywords: Demineralizing, Volumetric analysis, Reprints, *Dental caries, *Tooth diseases, Dental enamel solubility.

Caries-like lesions were formed in human tooth enamel in a quasi-constant composition titration system without the use of surface dissolution inhibitors or weak acids. The titration system maintained the composition of the demineralizing solution constant to within 6% on the average. Thus, the rate of lesion formation may be quantitatively assessed from the rate of titration. The system has sufficient sensitivity for measuring the rate of lesion formation in a small area, e.g., 15 sq mm, of a single human enamel specimen.

Keywords: *Crystal structure, *Glutaminase, Reprints, *Asparaginase, *Acinetobacter glutaminasificans, Protein conformation, Amino acid sequence.

The preliminary structure of a glutaminase-asparagi-nase from Acinetobacter glutaminasificans (AgGA) is reported. The structure was determined at 3.0 A resolution with a combination of phase information from multiple isomorphous replacement at 4 - 5 A resolu-tion, and phase improvement and extension by density modification techniques. Initially polyalanine was fit to the electron density map and was subsequently re-placed by a polypeptide with an amino acid sequence in agreement with the sizes and shapes of the side chain electron densities. The crystallographic R-factor is 0.300 following constrained least-squares refine-ment with data to 2.9 A resolution. The AgGA subunit folds into two domains: the amino-terminal domain

contains a five-stranded beta sheet surrounded by five alpha helices, and the carboxy-terminal domain con-tains three helices and less regular structure. The connectivity is not fully determined at present, due in part to the lack of a complete amino acid sequence. The AgGA structure has been used successfully to deterand of Vibrio succinogenes asparaginase (space group and of Vibrio succinogenes asparaginase, and in a new crystal form of E, coli asparaginase (space group 1222, one subunit per asymmetric unit).

Skokie, IL. Pub. in Jnl. of Agricultural and Food Chemistry 37, n4 p954-957 1989.

Keywords: *Cholesterol, *Human nutrition, Mass spectroscopy, Plant oils, Blood, Fats, Nutrients, Gas chro-matography, Reprints, *Coconut oil, Standard Refer-ence Materials.

A new Standard Reference Material (SRM) consisting of coconut oil with various nutrients added has been developed at the National Institute of Standards and Technology in response to the needs of the food measurement community. SRM 1563 consists of ampules of a coconut oil with added cholesterol and selected fat-soluble vitamins and ampules of the natural coconut oil. Cholesterol has been measured in the material by a modification of the definitive method based on isotope dilution mass spectrometry coupled with gas chromatography, originally developed for the measurement of cholesterol in serum. The cholesterol concentration, as total cholesterol, in the fortified oil was determined to be 64.2 + or - 0.6 mg/100 g of oil. This value, with its precision, complies with the request of the food nutrient measurement community for a standard with an uncertainty within + or -5% of the certified value at 95% confidence limits. The natural oil was found to contain 0.344 + or -0.014 mg/100 g of oil.

Intramolecular H Atom Abstraction from the Sugar Molety by Thymine Radicals in Oligo- and Poly-deoxynucleotides. Final rept.

L. R. Karam, M. Dizdaroglu, and M. G. Simic. 1988,

Sponsored by Armed Forces Radiobiology Research Inst., Bethesda, MD. Pub. in Radiation Research 116, p210-216 1988.

Keywords: *Uracils, *Free radicals, *Hydrogen, *Sugars, Chemical reactions, Hydroxides, Thymidines, Ribose, Gas chromatography, Mass spectroscopy, Reprints.

Hydroxyl radical addition to uracil (U) has been sug-gested to lead to strand breaks in polyundylic acid, an gésted to lead to strand breaks in polyuridylic acid, an occurrence attributed in part to H atom abstraction by U-OH free radicals from the ribose moiety. The particu-lar reaction is investigated by means of the hydroxyl radical-induced products of thymine (T), pT, TpT, TpTpT, polythymidylic acid (poly-T), (T+dR) poly-dA center dot poly-T, and a mixture of T and 2-deoxyri-bose (dR). The major monomeric product of T-OH radi-cal in TpT, TpTpT, poly-T, and poly-dA center dot poly-T was found to be 5-hydroxy-6-hydrothymine (H-T-OH), while that in T, pT, and T plus dR was thymine glycol (HO-T-OH). These results indicated that the intra-molecular H atom abstraction from a nearby sugar (in this case, deoxyribose) moiety by base radisugar (in this case, deoxyribose) moiety by base radi cals, i.e., T-OH, occurs in oligo- and polydeoxynucleo-tides of T. In poly-T, the yield of H-T-OH is not much greater than in TpT or TpTpT, indicating that the ab-straction of an H atom from the sugar molety of a nucleotide subunit further than two nucleotides along the chain may not be significant. Additionally, a corre-sponding decrease in the yield of HO-T-OH with an in-crease in the yield of H-T-OH suggests that the formations of these two types of thymine products are competitive.

crodosimetry Calculations.

Final rept. R. S. Caswell, J. J. Coyne, H. M. Gerstenberg, and R. B. Schwartz. 1986, 13p Sponsored by Department of Energy, Washington, DC. Office of Health and Environmental Research.

Pub. in Proceedings of International Conference on Fast Neutron Physics, Dubrovnik, Yugoslavia, May 26-31, 1986, p122-134.

Keywords: Monte Carlo method, Energy absorption, Computation, *Microdosimetry, Tissue-equivalent materials.

Calculations describing the deposition of energy by neutrons in tissue-like materials are usually carried out by the 'analytic method' or the 'Monte-Carlo method.' Extensions of the equations of the analytic method to include thin walls as well as thick walls are now available. Furthermore, inclusion of straggling effects in the analytic method is relatively simple and has been pro-grammed for computer calculations. The first step in the analytic method is the calculation of the 'initial' spectra of secondary charged particles generated by the neutrons. The authors are preparing tables of initial spectra below 20 MeV. The calculation of 'lineal energy' or 'y' spectra for neutrons is of interest for mi-crodosimetry. The possibility of carrying out microdosi-netric calculations on a narmator scale usion track metric calculations on a nanometer scale using track structure information generated by Wilson and Par-etzke is being pursued. A Monte-Carlo code is being generated using the same data base as the authors' analytic method codes. The chief advantage of the Monte-Carlo code is in the correct handling of events where two or three correlated charged particles are emitted. Some results of microdosimetric calculations including straggling are given.

Initial Spectra of Neutron-Induced Secondary Charged Particles. Final rept.

H. M. Gerstenberg, R. S. Caswell, and J. J. Coyne. 1988, 4p

Sponsored by Department of Energy, Washington, DC. Office of Health and Environmental Research. Pub. in Radiation Protection Dosimetry 23, n1/4 p41-44 1988.

Keywords: *Nuclear cross sections, *Neutron reac-tions, *Computation, *Carbon, *Tissues(Biology), *Charged particles, Spectra, Hydrogen, Helium, Deu-terium, Boron, Nitrogen, Oxygen, Beryllium, Radioactive decay, lons, Reprints.

Calculations have been made of the initial spectra of secondary charged particles which result from neutron interactions with materials such as tissue. These secondary particles are ions of H, D, He and the heavier recoil ions of Be, B, C, N and O. The spectra of the ions have been determined in 200 keV neutron energy bin sizes between 0 and 20 MeV as well as for 76 almostlogarithmic bins extending from thermal energy to 2 MeV. The primary input for these calculations is the ENDF/B-V nuclear data file from the National Nuclear Data Center at Brookhaven. Additional supplementary information is also needed on the angular distribution of neutron reactions leading to charged particles and on the final excitation of residual nuclei. Recently measured kerma factors in carbon disagree with those calculated using the nuclear cross section data from ENDF/B-V by as much as 25% in the region between 14 MeV and 18 MeV. A recently made evaluation of the carbon cross sections in the energy region be-tween 5 MeV and 32 MeV is used here to calculate kerma and initial spectra at neutron energies of 16.9, 14.9, and 13.9 MeV; the results are then compared with that obtained using the ENDF/B-V data.

Keywords: Quartz, Bioinstrumentation, Silane, Reprints, *T-2 toxin, *Monoclonal antibodies, *Optical prints, *T-2 toxin, *M sensors, Binding sites.

Several methods for immobilizing anti-T2 mycotoxin monoclonal antibodies on guartz fibers, for use in optical sensor development, have been evaluated with respect to the surface density and stability of the immo-bilized proteins. The first method activates matrix hy-droxyl groups using p-toluenesulfonyl chloride (TSC). The second method activates these groups using pnitrophenyl chloroformate (NPCF). The third method requires an initial silanization using 3-aminopropyl-triethoxysilane (APTES) followed by carrier activation

MEDICINE & BIOLOGY Pharmacology & Pharmacological Chemistry

with glutaraldehyde. The activated carrier in all three methods is then reacted with the amino groups of the protein. The first two non-silanizing coupling methods are simple, inexpensive and non-hazardous compared to the third, more complex method in which an initial silanization step is required. The active antibody surface densities and stabilities were monitored at 4 and 50C. Each of these methods produced active antibody surface densities in the range of 181 - 297 ng/sq cm with half lives ranging from 30 to 80 hours at 50C to several months at 4C.

The report presents antenna factors determined in a screenroom which was partially loaded with radio fre-quency (rf) absorbing material, using the two-antenna insertion-loss technique. These antenna factors are compared with the antenna factors obtained in an unloaded screenroom, a fully loaded screenroom (an-echoic chamber), and at an open field site. In addition, measurements at the eight corners of a cube were made in the partially loaded and fully loaded screen-

room to determine the field deviation at the eight corners of the cube with respect to its center. Also, measurement improvements are quantified for the electric-field strength beneath a single-wire transmission line, in a partially loaded screenroom. Finally, electric-field measurements were made on top of the grounded table in a partially loaded screenroom to determine the field strength variation above the table.

Sponsored by Federal Emergency Management

Agency, Washington, DC. Pub. in Proceedings of Institute of Cost Analysis Na-tional Conference on Cost Analysis Applications of Ec-onomics and Operations Research, Washington, DC., July 5-7, 1989, p353-386.

Keywords: *Military mobilizing, *Economic analysis, Economic mobilization, Readiness, National defense, Command and control, Mathematical models.

A military mobilization is a complex series of events, which if modeled adequately, can specify how a na-tional economy makes the transition from a peace-time to a war-time footing. Problems in modeling such situations have highlighted the importance of evaluating large-scale, policy-oriented models prior to their use by decision makers. The current study outlines a generic procedure for conducting such an evaluation. Specifically, macro-economic modeling and a struc-tured sensitivity analysis can be combined to measure and evaluate the economic impacts of a military mobilization.

Secure Milltary Communications Can Benefit from Accurate Time.

Final rept. D. W. Hanson, and J. L. Jespersen. 1986, 12p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) Military Communications Conference, Monterey, CA., October 5-9, 1986, 12p.

Keywords: *Secure communication, *Military communication, Security, Coding, Countermeasures, Detec-tion, Time division multiplexing, Pulse modulation, Interception, Deception, National defense.

Some military communications systems have require-ments quite different from civilian systems. Among others there are the necessities to protect military communications from detection, interception, exploitation, or disruption by adversaries particularly during times of hostilities. There are a number of techniques available to protect communications against these threats -- some of them can benefit from unambiguous time information. A hypothetical military communica-tions system is used in the paper to discuss these pro-tection techniques and to illustrate how time may assume a useful role in their operation. The paper will also cover sources external to the communications system from which the necessary time information may be obtained.

DCTDOS: Neutron and Gamma Penetration In Composite Duct Systems.

L. V. Spencer. Feb 87, 93p NBSIR-87/3534 Sponsored by Federal Emergency Mar Agency, Washington, DC. Emergency Management

Keywords: *Radiation shielding, *Neutron absorption, *Nuclear weapons, Neutron albedo, Ducts, Computer programs, *Computer applications, *Gamma ray absorption.

The paper describes computer methods for estimating neutron and gamma ray fluence rate, dose, and even spectral features due to penetration through a series of duct segments. The procedure links together data for individual segments -- straight sections and bends -- in arbitrary combinations; and the resulting composite can include computations for a room at the end, if there is one. This particular method was developed for rapid estimates in the protection problems against nuclear weapons, but the concepts which are employed are more broadly applicable.

PC A10/MF A01 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research. Assessment of Need for and Design Requirements of a Wind Tunnel Facility to Study Fire Effects of Interest to DNA. W. M. Pitts. May 89, 209p NISTIR-89/4049

Sponsored by Defense Nuclear Agency, Washington, D'C

Keywords: *Fires, *Wind, Spreading, Dispersing, Urban areas, Nuclear explosions, Nuclear weapons, Wind tunnels.

The objective of the study is to recommend whether or not a new wind tunnel facility should be designed and constructed for the investigation of wind-aided fire spread. The focus is on the types of mass fire which can be expected following a nuclear detonation above an urban environment. The final conclusions of the report are (1) the need for an improved understanding of urban fire spread as it relates to nuclear weapon effects is overwhelming, (2) the authors currently have essentially zero predictive capability for fire damage in an urban environment following a nuclear attack, (3) wind tunnel experiments will not provide all of the required information, but offer the opportunity to substantially improve the understanding of the problem, (4) most existing wind tunnels were designed decades ago and are not well-suited for the required experimentation, and (5) some progress can be and is being made in existing facilities, but substantial improve-ments in understanding require a new facility and a sustained commitment for support.

Keywords: *Microanalysis, *Minerals, Borate minerals, Carbonate minerals, Electron probes, Chemical ele-ments, Raman spectroscopy, Classifications, Yttrium, Reprints, Light elements, Ion probes.

Complementary microanalysis techniques, including electron probe, ion microprobe and laser-Raman microanalysis, are applied to the compositional and structural characterization of a candidate new mineral

Geology & Geophysics

containing light elements. The findings from ion probe analysis (SIMS) indicate the presence of boron and carbon as major constituents in addition to yttrium as the chief rare-earth element. The application of Raman microprobe analysis is explored to substantiate the results of optical measurements and x-ray structure determinations concerning the existence of carbonate and borate species. A series of synthetic components and natural minerals are studied by micro-Raman spectroscopy to obtain a spectral data base for structurally complex carbonates, borates, and minerals containing both species. These data are used in the interpretation of the Raman spectrum of the unknown Y/B/C-mineral and its classification as an yttrium carbonborate containing hydrogen-bonded borate groupings.

B. P. Burton, and P. M. Davidson. 1988, 31p Pub. in Structural and Magnetic Phase Transitions in Minerals, Chapter 4, p60-90 1988.

Keywords: *Crystallization, *Phase diagrams, *Carbonate minerals, Mathematical models, Hematite, Il-menite, Heat of mixing, Critical point, Topology, Reprints, Diopside, Jadeite.

Models of multicritical phase relations are reviewed and theoretical results pertaining to the rhombohedral carbonates, hematite-ilmenite, and diopside-jadeite systems are discussed. The microscopic interactions that cause ordering and phase separation in these systems are highly anisotropic, such that ordering is fa-vored in one crystallographic direction but clustering is favored in another. Model calculations which incorporate such interactions predict appropriate phase diagram topologies and appreciate composition and temperature dependence for excess heats of mixing.

Relationships between Fault Zone Deformation and Segment Obliquity on the San Andreas Fault, California.

Final rept.

R. Bilham, and K. Hurst. 1988, 15p Pub. in Proceedings of China-U.S. Symposium on Crustal Deformation and Earthquakes, Wuhan, Peo-ple's Republic of China, October 29, 1985, p510-524 1988.

Keywords: *San Andreas Fault, *Geological faults, *Earthquakes, *Creep rate, Earth movements, California, Numerical analysis, *Geologic structures.

Faults of the San Andreas system are considered as a sequence of contiguous straight segments with lengths from 2-30 km. A dominant length of approximately 12 km appears to exist. The segments are not parallel to each other nor to the plate slip vector calcu-lated from global plate motions. Although it is possible to choose a regional slip vector that will approximate the local strike of the fault by invoking slip on adjacent faults, it is not possible to eliminate oblique slip on all segments simultaneously. The detailed consequences of oblique slip on fault segments are described in terms of their impedance, a measure of the resistance of segment to fault motion. Impedance is defined to be the change of area resulting from slip on the fault. Cir-cumstantial evidence suggests that segments with anomalously large or small impedance may play a role in terminating or initiating earthquake rupture. The inferred instantaneous compression rate of creeping sections of the fault is calculated. It is shown that the present creep rate is insufficient to create the observed transpressive features on the southern San Andreas Fault and that much of the observed deformation must occur during earthquakes.

ple's Republic of China, October 29, 1985, p264-275 1988

Keywords: *Indicating instruments, *Water distribu-tion, *Earthquakes, *Earth surface, Design criteria, Performance evaluation, Transducers, *Tiltmeters.

A Michelson tiltmeter consists of a horizontal pipe in which a continuous water surface extends from end to end. Tilt of the Earth's surface causes an increase in water depth at one end and a corresponding decrease in water depth at the other. Methods to detect these changes in water level to 0.001 mm accuracy are reviewed and several new methods are discussed. A new transducer is described that senses movements of the image position of a light emitting diode (LED) after it has been reflected from the water surface. The projected image of the LED is followed by a null-seeking servo system based on a silicon photodiode bi-cell whose vertical position is monitored by an LVDT transducer. The absolute depth of the water may be meas-ured directly by the LED follower transducer to ap-proximately 1 micrometers accuracy. In a 1km tillmeter this is equivalent to a long term measurement accura-cy of 1 nanoradian/year. System accuracy, however, is only as good as the accuracy with which the water level transducer is indexed to the Earth's surface. The method uses an array of vertical extensioneters to identify locally generated signals that are typically of non-tectonic origin.

Baseline from a Translocation Analysis of LAGEOS Laser Range Data. Final rept.

A. Stolz, M. A. Vincent, P. L. Bender, R. J. Eanes, M. M. Watkins, and B. D. Tapley. 1989, 4p Pub. in Geophysical Research Letters 16, n6 p539-542

Jun 89.

Keywords: *Geological faults, Geodynamics, Earth-quakes, California, Motion, Reprints, *Plate tectonics, *San Andreas Fault, Laser range finders, Lageos(Satellite).

Translocation studies of LAGEOS laser range data from Quincy and Monument Peak in California observed during 1984-1987 suggest that plate tectonic motion across the San Andreas fault system in the di-rection of the baseline between the two stations is uniform at a rate of -30(+ or - 3) mm/a. Changes in the components of the baseline vector were inferred from repeat determinations using the solutions from suc-cessive half-year intervals. The changes in the vertical and transverse components of the Quincy-Monument and transverse components of the Quincy-Monument Peak baseline are $-0.4(+ \text{ or } -5) \text{ mm/a and } +14(+ \text{ or } -5) \text{ mm/a respectively. The vertical component deter-$ minations attest to the height stability of the laser rang-ing method. LAGEOS measurements made fromQuincy and Monument Peak before 1984 are inaccurate enough to limit their usefulness for plate tectonic studies.

Keywords: *Boreholes, *Site surveys, Colorado, Wyoming, Yellowstone National Park, Oceans, Topogra-phy, Reprints, *Tiltmeters, *Earth tides, phy, Reprints, *Tiltmeters, Earn uos *Attitude(Inclination), Erie(Colorado), Secular vai ations.

The authors have designed a worehole tiltmeter using two horizontal pendulums which have periods of 1 s. They have installed the instruments at seven sites in Colorado and Wyoming to evaluate the secular tilt, the tides, and the coherence between nearby instruments. Using 28 days of data from Boulder, Colorado, the estimates agree with models that include the body tide, the ocean load, and the topographic correction to better than the estimated uncertainty. Tidal measurements at Erie, Colorado, have larger, possibly nonrandom variability that may be caused by a coupling between the tides and long-period tilts. Measurements at Erie, Colorado and in Yellowstone National Park, Wyoming exhibit an annual or biannual periodicity.

Keywords: *Microbiology, *Metals, *Bioengineering, *Mineral deposits, *Copper, *Uranium, Catalysis, Stra-tegic materials, Materials recovery, Hydrometallurgy, Solution mining, Reprints.

The article reviews the recent literature on biological and engineering aspects of biotechnological metals and engineering aspects of biotecrinological metalo-recovery. Microorganisms catalyze many transforma-tions of metals including solubilization, precipitation and volatilization reactions, often associated with metal reduction, oxidation, alkylation or dealkylation reactions. There is a growing awareness in the microbiological, engineering, and mining fields that such re-actions are of importance in metal recovery operations. Currently, copper and uranium are being commercially recovered from ores via biohydrometallurgy, and extension of the technology to other metals, especially precious and strategic, is underway. Efforts to commercialize such activities are hampered by a number of biological and engineering considerations, in part relating to inadequate knowledge of mechanisms of metal solubilization on surfaces by microorganisms and engineering problems related to heteroge-neous systems in bioprocessing of solid materials. Various potential process engineering designs are discussed.

NATURAL RESOURCES & EARTH SCIENCES

Mineral Industries

A novel process for bulk metal and metal ore solubilization by aqueous methyl iodide is described. A flow bioreactor system was developed and used in connection with a graphite furnace atomic absorption spectrometer for continuous, on-line quantitation of dis-solved metals. Dissolution of binary and ternary metal ores as well as bulk metals was enhanced 5-145x by aqueous methyl iodide in the flow system. Repeated alternating cycles of water and aqueous methyl iodide resulted in increasing enhancement of bulk from dissolution apparently due to a uncovering of fresh new reactive surfaces. Films of copper on circuit boards were also dissolved by methyl iodide. The process has many possible uses in mining and metallurgy especial-ly for recovery of precious and/or strategic metals from difficult to reach locations in ores or wastes.

The Mining Automation Real-Time Control System Ar-chitecture Standards Reference Model (MASREM) defines a logical hierarchical architecture for mining auto-mation. The MASREM architecture defines a set of standard modules and interfaces which facilitates software design, development, validation, and test, and makes possible the integration of software from a wide variety of sources. Standard interfaces also provide the software hooks necessary to incrementally upgrade future mining automation systems as new capa-bilities develop in computer science, robotics, and autonomous system control.

Keywords: *Economic analysis, *Environmental surveys, Data acquisition, Remote sensing, Economic surveys, Land surveys, Commerce, Observation, Examination, Regulations, Reprints, *Satellite surveys, Landsat.

Satellite remote sensing is being used to obtain a wide range of information about the land, the oceans, the atmosphere and man-made objects. The information, or environmental intelligence, is used to help solve problems that affect the general population, such as the greenhouse effect, the depletion of the ozone layer and land use planning, as well as for specialized com-mercial activities such as agriculture and forestry evaluations, mineral and petroleum exploration. The level of commercial involvement in the use of satellite remote-sensing data is increasing, due to technologi-cal and economic factors. However, commercial involvement in satellite system operations is plagued with economic impediments, is running into conflict with international obligations that regard this activity as a public good, and is being chilled by ambiguous domestic laws and regulations. The paper identifies the trends in commercial development; the legal, political, technical and economic factors that will affect the rate of the development; and the impact that such development will have on the overall conduct of satellite remote sensing activity.

Radon source potential characterization of sites in terms of soil index properties which do not vary with transient conditions such as moisture content, barometric pressure, temperature and wind speed is stud-ied. The invariant index properties which were found to be critical for site characterization are radium activity concentration in the soil, in-place dry density, porosity, and dry gas permeability. These properties can be measured in situ or in the laboratory or estimated on

the basis of other soil index properties such as grainsize distribution and Atterberg limits. Various expres-sions for radon source potential are reviewed and a new expression is formulated on the basis of data from areas of deep glacial terrace deposits. Site exploration methods proposed include use of the Standard Penetration Test together with a laboratory determination of radium activity concentration, and a rapid field measurement procedure using a portable gamma ray spectrometer, a portable nuclear moisture-density meter and retrieval of a soil sample for laboratory determination of particle-size distribution. A plan to develop ex-ploration protocols, test the effectiveness of the source potential prediction, and prepare a draft exploration standard is proposed.

Time and Frequency Div. Apparent Diurnal Effects in the Global Positioning System.

Final rept.

M. Weiss. 1987, 16p

Pub. in Proceedings of Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (19th), Redondo Beach, CA., December 1-3, 1987, p33-48

Keywords: *Diurnal variations, Bias, Displacement, Errors, Delay time, Resolution, Sensitivity, Damping, Periodic variations, *Global positioning system, *Time transfer.

Since the Global Positioning System (GPS) has been used for common view time and frequency transfer between remote locations various systematic effects have been observed. These effects have been discussed on various occasions appearing as biases between different daily measurements as well as ob-structing closure in around-the-world time transfer. GPS satellites are examined from several locations around the world, after linking the ground station clocks GPS. The results are that there are apparent diurnal variations in many of the SV clocks. These sys-tematic effects are studied, the biases in common view time transfer, the lack of closure in around-the-world time transfer, and the diurnal variations in the SV clocks. The diurnal effects are primarily due to errors in the transmitted satellite ephemeris and ionospheric model.

Using Multiple Reference Stations to Separate the Variances of Noise Components in the Global Positioning System. Final rept.

M. A. Weiss, and D. W. Allan. 1986, 11p Pub. in Proceedings of Annual Symposium on Fre-quency Control (40th), Philadelphia, PA., May 28-30, 1986, p394-404.

Keywords: *Periodic variations, *Electromagnetic noise, Space surveillance(Spaceborne), Divergence, Atmospherics, Natural radio frequency interference, Clocks, Correlation, Variability, *Global positioning systems.

The separation of variance technique has been ap-plied to measurements of a clock against received signals from Global Positioning System (GPS) satellites to separate out various noise components in the system. First, the authors show how measurements can be taken from several different locations to obtain estimates of more components of GPS system and to obtain better estimates of the components previously studied. It is shown how to estimate the variances of the GPS system clock, the error in the transmitted cor-rection term between the satellite clock and the GPS system clock, propagation noise in the measurement including ionospheric and tropospheric modelling errors, error in the transmitted ephemeris for the satel-lite, and the local reference clock. The authors consider the effects of correlations between elements of the data and analyze the confidence one may have in the estimates in light of those correlations. Finally, the multi-station separation of variance technique is ap-plied to recent GPS data. New insights into the GPS system that have been learned using the technique are discussed.

Keywords: *Neutron irradiation, *Depth detectors, Iso-topes, Probes, Nondestructive tests, Metals, Ceramics. Reprints.

Using a low-energy neutron beam as an isotopic probe, neutron depth profiling (NDP) provides quanti-tative depth profiles in nearly all solid matrix materials. Several of the light elements, such as He, Li, B, and N can be non-destructively analyzed by NDP. The infor-mation obtained using NDP is difficult if not impossible to determine by non-nuclear techniques. As a result, NDP is used collaboratively with techniques as SIMS, RBS, FTIR, PGAA, and AES. Profiles measured by NDP are given for semiconductor and optical processing materials, and light weight alloys. Improvements in the technique are discussed with emphasis on the use of intense cold neutron beams.

NBS (National Bureau of Standards) Radon-in-Water Standard Generator.

Final rept. J. M. R. Hutchinson, P. A. Mullen, and R. Colle.

1986, 5p Pub. in Nuclear Instruments and Methods in Physics Research A247, n2 p385-389, 15 Jun 86.

Keywords: *Radioactivity, *Standards, Water, Reprints, *Radon 222, Radium 226.

NBS has completed the development of a transfer standard for radon-in-water measurements. This standard can be used to generate and accurately dis-pense radium-free (222)Rn solutions of known con-centration. The present finalized version is based on an earlier and previously described prototype. The (226)Ra solution source in a small-volume accumulation chamber and an ancillary mixing and dispensing system which is partially automated with motor-driven syringes. The revised source configuration is more stable than the original prototype and the mixing and dispensing system is more compact, rugged, and con-venient. The standard generator was calibrated and certified in terms of the (222)Rn concentration or total activity in an aliquot dispensed from the generator when a detailed operating procedure is adequately fol-lowed. The overall uncertainty of the calibration was estimated to be approximately + or - 4%.

Single Particle Standards for Isotopic Measure-ments of Uranium by Secondary Ion Mass Spectrometry.

Final rept.

D. S. Simons. 1986, 11p Pub. in Jnl. of Trace Microprobe Tech. 4, n3 p185-195 1986.

Keywords: *Uranium, *Radioactive isotopes, *Mass spectroscopy, Glass, Standards, Quantitative analysis, Ions, Reprints.

The isotopic abundance ratios of uranium have been determined from individual glass microparticles using secondary ion mass spectrometry (SIMS). Synthetic glasses were prepared using oxides of known isotopic composition as starting materials. Relative precisions and accuracies of better than 1% could be attained for (235)U/(238)U ratios between 0.0020 and 0.0072. These were primarily limited by counting statistics. Even the abundances of the minor isotopes (234)U and (236)U could be determined since molecular ion interferences were not present at measurable levels.

Nuclear Instrumentation

PB89-147508 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Ionizing Radiation Physics Div. Measurement Quality Assurance. Final rept. E. H. Eisenhower. 1988, 7p Pub. in Health Physics 55, n2 p207-213 1988.

Keywords: *Quality assurance, *Measurement stand-ards, *Ionizing radiation, Measurement, Radiation pro-

tection, Health physics, Quality control, Laboratories, Reprints.

The quality of a radiation protection program can be no better than the quality of the measurements made to support it. In many cases that quality is unknown, and is merely assumed on the basis of a calibration of a measuring instrument. If that calibration is inappropri-ate or is performed improperly, the measurement result will be inaccurate and misleading. Assurance of measurement quality can be achieved if appropriate precedures are followed, including overlotic quality. procedures are followed, including periodic quality control actions that demonstrate adequate performance. Several national measurement quality assurance (MQA) programs are operational or under devel-opment in specific areas. They employ secondary standards laboratories that provide a high-quality link between the National Bureau of Standards and measurements made at the field use level. The procedures followed by these secondary laboratories to achieve MQA will be described, as well as plans for similar future programs. A growing general national interest in quality assurance, combined with strong specific moti-vations for MQA in the area of ionizing radiation, will provide continued demand for appropriate national , programs.

MD. Ionizing Radiation Physics Div. Monte Carlo Calculated Response of the Dual Thin Scintillation Detector in the Sum Coincidence Mode. Final rept.

K. C. Duvall, and R. G. Johnson. 1988, 3p

Pub. in Proceedings of International Conference on Nuclear Data for Science and Technology, Mito, Japan, May 30-June 3, 1988, p419-421.

Keywords: *Scintillation counters, *Neutron counters, Spectra, Mathematical models, Pulse height analyz-ers, Monte Carlo method, Neutron flux, Reaction time, Efficiency, Coincidence circuits.

The Dual Thin Scintillator is a unique neutron detector that is being developed for improved fluence and spec-trum measurement. Current attention has been directed towards understanding some details of the detector response in the sum coincidence mode of operation where a peaked pulse-height response is exhibited throughout the energy region of interest. As a result of the peaked distribution, the detector efficiency is a weak function of the pulse-height bias, allowing the number of recorded events above the bias to be deternumber of recorded events above the bias to be deter-mined with greater certainty. A Monte Carlo code has been used to calculate the sum coincidence pulse-height response at several energies within the 1 to 15 MeV region. The detector efficiency as a function of neutron energy has also been calculated. The results of the Monte Carlo calculations, which include the effect of multiple createring on the chara of the re effect of multiple scattering on the shape of the response function and efficiency curve are presented.

Pub. in Radiation Protection Dosimetry 27, n2 p103-110 1989.

Keywords: Reprints, *Neutron monitors, *Survey mon-itors, Interlaboratory comparisons, Calibration, International separation.

An informal intercomparison of the methods of calibration of neutron area survey meters has been undertak-en by NIST, NPL, PTB and ETCA-CEA. The measurement programming was based upon the calibration of two different types of survey instrument in the neutron fields emitted by bare and by heavy water moderated californium spontaneous fission neutron sources. One of the transfer devices was a conventional spherical survey meter and the other was a new type of monitor which attempts to take the neutron spectral distribu-tion into account through the ratio of responses of two different sized moderating spheres. The results are compared and demonstrate that agreement among the various institutions can be obtained within + or - 3% for conventional instruments, but larger differ-

try. Final rept.

M. Ehrlich. 1989, 7p Pub. in Radiation Protection Dosimetry 28, n1-2 p89-95 1989.

Keywords: *Radiation protection, Reprints, *Kerma, *Dose equivalents, *Personnel dosimetry, *Dosemeters.

A method is outlined for estimating air kerma and di-rectional dose equivalent from indications on multi-element dosemeters having energy and angle response functions that are different for at least two of the dose-meter's radiation-sensitive elements. The method em-ploys dosemeter calibrations relating response of each element and the corresponding indication ratio(s) to radiation energy and angle of radiation incidence. Indications are measured in the usual way on the elements of each dosemeter irradiated under unknown conditions, and the ratio is formed of the indications of any two elements known to have different response any two elements known to have different response functions. Using the calibration curves, energy-angle pairs are found that correspond to these indication ratios, and are then used to determine the correspond-ing response values of which there are several per energy-angle pair. Finally, the response values corre-sponding to any given energy-angle pair are averaged, and air kerma or directional dose equivalent is comput-ed from average response and the measured indica-tions. The method is illustrated for a dosemeter for which photon calibration data were available which photon calibration data were available.

The workshop on Cement Stabilization of Low-Level Radioactive Waste was co-sponsored by the U.S. Nu-clear Regulatory Commission and National Institute of Standards and Technology and held in Gaithersburg, Maryland on May 31-June 2, 1989. The workshop provided a forum for exchanging information on the solidi-fication and stabilization of low-level radioactive waste in cement among federal and state regulators, nuclear in cement among federal and state regulators, nuclear power station operators, cement vendors, national lab-oratory researchers and consultants. The workshop was structured into a 'Plenary' and four 'Working Group' sessions. Each working group session dis-cussed specific issues: Lessons learned from small-and full-scale waste forms and observations at nuclear power stations; Laboratory test experience and appli-cation to problem waste streams; Stabilized waste form testing guidance; and Waste characterization, so-lidification, and process control programs.

Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Concretes, Degradation, Service life, Mathematical models, Corrosion mechanisms, Accel-erated tests, Durability, Permeability, *Radioactive waste management, Underground disposal, Low-level radioactive wastes.

The U.S. Nuclear Regulatory Commission (NRC) has the responsibility for developing a strategy for the dis-posal of low-level radioactive waste (LLW). An approach being considered for their disposal is to place the waste forms in concrete vaults buried in th earth. A service life of 500 years is required for the concrete vaults as they may be left unattended for much of their lives. The report examines the basis for making service life predictions based on accelerated testing and mathematical modeling of factors controlling the dura-bility of concrete buned in the ground. Degradation processes are analyzed based on considerations of their occurrence, extent of potential damage, and mechanisms. A recommended research plan for developing methods for predicting the service life of con-crete is presented. Concepts of quality and factors af-fecting quality of concrete are discussed. Permeability is discussed in terms of the water-to-cement ratio, the pore structure of concrete, and the effects of cracks.

Section at the National Bureau of Standards.

Section at the National Bureau of Standards. Final rept. R. G. Johnson, A. D. Carlson, O. A. Wasson, K. C. Duvall, J. W. Behrens, M. M. Meier, B. D. Patrick, and M. S. Dias. 1988, 4p Pub. in Proceedings of International Conference on Nuclear Data for Science and Technology, Mito, Japan, May 30-June 3, 1988, p1037-1040.

Keywords: *Fissionable materials, *Standards, *Neu-tron cross sections, *Uranium 235, Nuclear fuels, Linear accelerators, Measurement.

The Neutron Interactions and Dosimetry Group at the National Bureau of Standards (NBS) has had a long-term program for the measurement of standard neutron cross sections. The group has maintained a significant effort on the measurement of one of the most important of these cross sections -- the neutron-in-duced fission cross section of 235U. Since the ENDF/ B-VI evaluation has been recently released, it is appro-priate to review the measurements of the (235)U(n,f) cross section which have been made at the NBS using accelerator-based neutron sources. In the 0.1 to 20 MeV region where the cross section is a standard, six separate measurements of the differential cross section, using a variety of techniques have been made.

Both the NBS 150-MeV Electron Linac and the 3-MV Positive Ion Accelerator have been used as neutron sources. Two of the measurements are relative to the H(n,p) cross section while the remainder are absolute. These measurements will be reviewed and compared to ENDF/B-VI. The current status of the program and possible future improvements will be discussed.

Keywords: *Aquatic animals, *Trace elements, *Chemical analysis, *Organic compounds, Sampling, Performance evaluation, Fishes, Mussels, *Environmental monitoring, *Baseline studies, *Water pollution detection.

The National Oceanic and Atmospheric Administration has initiated a Specimen Bank for estuarine and coastal samples as part of its National Status and Trends Program. During the first year, sample collection proto-cols were developed for the collection of benthic fish, bivalve molluscs, and associated sediments. Specimens from over 40 sites nationwide have now been submitted for inclusion in the Specimen Bank which is housed at the National Bureau of Standards in Gaithersburg, Maryland. Specimens are preserved at liquid nitrogen temperature with degradation expected to be minimal for decades. Retrospective analysis of specivalues for new environmental contaminants and make historical marine samples available for analysis when new and improved analytical procedures become available. Preliminary analyses of selected samples collected during the first year are presently under way for organic and trace element contaminants.

MD. Ceramics Div. Biodegradation of Tributyitin by Chesapeake Bay Microorganisms.

Final rept. G. J. Olson, and F. E. Brinckman. 1986, 6p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of Oceans 86, Conference Record, Washington, DC., September 23-25, 1986, p1196-1201.

Keywords: *Chesapeake Bay, *Biodeterioration, *Marine microorganisms, *Water analysis, Gas chro-matography, Chemical analysis, *Tin/tributyl, Flame photometry.

The authors have been studying microbial resistance to butyltin compounds and the degradation of tributyl-tin spiked into samples of Chesapeake Bay waters. Butyltin species were identified and quantified using a gas chromatograph equipped with a tin-selective flame photometric detector (GC-FPD), providing micro-grams/1 detection limits. Incubation of these samples under incandescent lamps accelerated biodegradation, suggesting the involvement of photosynthetic microorganisms. At certain times in these degradation experiments, tetrabutyltin was detected by GC-FPD and confirmed by gas chromatography-mass spectrometry.

Gravity Tide Measurements with a Feedback Gravity Meter. Final rept.

J. Levine, J. C. Harrison, and W. Dewhurst. 1986, 7p Pub. in Jnl. of Geophysical Research 91, nB12 p12835-12841, 10 Nov 86.

Keywords: *Tides, *Gravimeters, *Measurement, Sur-face waves, Gravity waves, Tidal currents, Ocean waves, Atmospheric pressure, Amplitude, Reprints.

Gravity-tide data obtained using a calibrated LaCoste and Romberg gravity meter with electrostatic feedback has been analyzed. There is agreement between the measured amplitude and phase of the major semi-diurnal components and the corresponding values to be

expected using current earth models and ocean-load calculations. Both local and global barometric pressure changes make significant contributions to the power in the tidal bands and are included in the fitting function. The admittance estimates at diurnal frequencies can be used to determine the frequency and to set a lower bound on the dissipation of the nearly-diurnal resonance in the tidal response by fitting a resonance function to the observations. These estimates are in reasonable agreement with results obtained by other methods, but are somewhat different from the values to be expected on the basis of more elaborate theoretical estimates.

Keywords: *Marine engineering, *Materials specifica-tions, Offshore structures, Mechanical properties, Structural design, Corrosion, Failure, *Data bases.

Because of the harshness of the marine environment, the selection of materials for structural and other purposes has always been a demanding task, complicated by the enhancement of mechanical failures by corrosion. Not only are data such as corrosion fatigue scarce, locating the available data can be very difficult. The computer offers an opportunity to allow easy and efficient access to technical data. Over the last few years, a comprehensive materials data system has been started to meet the needs of industrial and other materials data users. One result has been to establish the National Materials Property Data Network. Recog-nizing that databases will be built by the same wide variety of groups that now use only one kind of computer system, the Network plans to offer a gateway service that features a common user interface, a convenient catalog of existing data, and coverage of all types of engineering materials and their properties. Progress towards these goals will be described as well as efforts to make available high-quality data of interest to marine environments.

Sponsored by Army Aviation Systems Command, St. Louis, MO., and Naval Surface Weapons Center, Silver Spring, MD.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electromagnetic Compatibility 30, n4, p484-494 Nov 88.

Keywords: *Initiators(Explosives), *Electromagnetic compatibility, Electromagnetic interference, Measurement, Mathematical models, Statistical theory, Vulnerability, Electromagnetic fields, Electromagnetic pulses, Nuclear explosion effects, Reprints.

Electroexplosive devices (EEDs) are electrically fired explosive initiators used in a wide variety of applica-tions. The nature of most of these applications requires that the devices function with near certainty when required and otherwise remain inactive. Recent concern with pulsed electromagnetic interference (EMI) and the nuclear electromagnetic pulse (EMP) made apparent the lack of methodology for assessing EED vulnerability. A new and rigorous approach for characterizing EED firing levels is developed in the context of statistical linear models and is demonstrated in the paper. The authors combine statistical theory and methodology with thermodynamic modeling to determine the probability that an EED of a particular type fires when excited by a pulse of a given width and amplitude. The results can be applied to any type of EED for which the hot wire explosive binder does not melt below the firing temperature of the primary explosive.

Measurement of Adapter Loss, Mismatch, and Effi-ciency Using the Duai Six-Port. G. J. Counas, and B. C. Yates. Jul 88, 209p NBSIR-

88/3096

Sponsored by Aerospace Guidance and Metrology Center, Newark AFS, OH. Metrology Engineering Section.

Keywords: *Acoustic measurement. Measuring instruments, Noise, Standards, Efficiency, Accuracy, Adapters, Temperature, *Dual six-port measurement system.

A noise measurement system is being developed for the U.S. Air Force which uses coaxial cryogenic and ambient noise temperature standards to determine the noise temperature of the device under test. When the device under test has a different connector than those on the noise standards, an adapter has to be used. Adapter loss and complex reflection coefficient must be compensated for or noise measurement accuracy is affected. A technique has been developed which uses a dual six-port measurement system to determine the mismatch, loss, and ultimately the efficiency of the adapter used. This enables correction of measurement results and allows measurements to be made with an adapter with no degradation of accuracy.

Measuring the Gas Constant and the Thermodynamic Temperature.

Final rept. M. R. Moldover. 1989, 8p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 38, n2 p217-224 Apr 89.

Keywords: *Ideal gas law, *Temperature measure-ment, *Acoustic resonance, *Microwaves, Thermody-namic properties, Resonant frequency, Resonance, Acoustic velocity, Reprints.

Techniques are being developed for simultaneously measuring the frequencies of microwave and acoustic

resonances in a spherical cavity. They will permit the determination of the thermodynamic temperature with determination of the thermodynamic temperature with unprecedented accuracy. Progress to date includes: a new value for the universal gas constant: R = 8.314471 + or - 0.000 014 J/(mol times K) (1.7 ppm) with a five-fold reduction in its standard error, a new value of the thermodynamic temperature of the triple point of gallium (302.9169 + or - 0.0005 K), and a microwave measurement of the volumetric thermal expansion of an acoustic responder with an error of about + or 1.5 In acoustic resonator with an error of about + or -1.5 ppm. Improved values of the Boltzmann constant, (1.38 065 13 + or - 0.000 002 5) x 10(-23) J/K, and the Stefan-Boltzmann constant, (5.670 399 + or - 0.000 038) x 10(-8) W/(m sup 2 times K sup 4), were obtained from R, and further studies of the temperature scale are in progress.

901,321 PB90-128505 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Thermophysics Div. Sphericai Acoustic Resonators.

Final rept. J. B. Mehl, and M. R. Moldover. 1989, 23p Pub. in Topics of Current Physics: Photoacoustic, Photothermal and Photochemical Processes in Gases, Chapter 4, p61-83 1989.

Keywords: *Acoustic resonators, *Acoustic velocity, *Thermophysical properties, *Gases, Mathematical models, Acoustic measurement, Reprints, Spherical configuration.

Gas-filled spherical resonators are excellent tools for measurements of the speed of sound. The radially symmetric gas resonances are nondegenerate and have high quality factors (typically 2,000-10,000). These resonances can be used with very simple instrumentation and unsophisticated analysis to measure the speed of sound in a gas with an accuracy on the order of 0.01%. With data analysis based on a complete theoretical model of the acoustical system, the accuracy can be increased to better than one part per million. The model includes the effects of the coupling between acoustic and thermal waves, thermal and vis cous effects at the shell boundary, shell motion, and imperfect shell geometry. Other boundary effects, in-cluding the effects of holes in the resonator wall and precondensation effects, have also been considered. The results of the theoretical model are described in detail and compared with experimental results in the chapter. There is also a brief review of the thermophy-sical importance of acoustic measurements, including a discussion of the determination of ideal-gas specific heats and information about intermolecular interactions.

Solutal Convection during Directional Solidification.

Final rept

G. B. McFadden, and S. R. Coriell, 1988, 7p

Sponsored by National Aeronautics and Space Administration, Washington, DC. Pub. in Proceedings of National Fluid Dynamics Con-

gress (1st), Cincinnati, OH., July 25-28, 1988, p1572-1578.

Keywords: *Alloys, *Metals, *Solidification, *Crystalli-zation, *Convection, *Fluid dynamics, Buoyancy, Com-putation, Gravitation, Mathematical models, Melts, Bifurcation.

During directional solidification of a binary alloy at constant velocity, buoyancy-driven fluid flow may occur due to the solute gradients generated by the solidifica-tion process. Numerical calculations of the solute and fluid flow fields in the melt have been carried out using finite differences in a two-dimensional, time-dependent model that assumes a planar crystal-melt interface and allows time-dependent gravitational accelerations. The container walls are rigid and perfectly insulating for solute. For constant vertical gravitational accelera-tions, as the solutal Rayleigh number is varied, multiple tready action of the dependent states are supported. steady states and time-dependent states may occur. The bifurcation from the quiescent state may be sub-

critical or transcritical, depending on the aspect ratio of the container. The maximum variation in the solute concentration at the crystal-melt interface was also calculated for various values of the rotation rate of the gravitational acceleration.

MD. Chemical Process Metrology Div. Numerical Computation of Particle Trajectories: A Model Problem.

Final rept.

E. F. Moore, and R. W. Davis. 1986, 6p Pub. in Gas-Solid Flows, p111-116 1986.

Keywords: *Particle trajectories, *Numerical analysis, Mathematical models, Stokes law(Fluid mechanics), Unsteady flow, Incompressible flow, Computenzed simulation, Reprints, *Gas-particle flow.

Computer simulations are useful in gas-solid particle systems where experimental measurements are often difficult. The relative accuracy of various numerical methods becomes important in assessing the significance of results obtained. The note presents a model problem for trajectories of solid particles in a quasi-steady, incompressible axisymmetric flowfield and nu-merical results obtained from three different methods for tracking particles through this flow. The character-istics of the trajectories, with sudden changes in direc-tion, are reminiscent of particle tracks seen in the wake of a bluff body. Thus, this model problem is highly pertinent to numerical simulations of realistic gas-particle flows. The basic parameter involved here is particle Stokes number. Trajectories of a particle are presented for three values of Stokes number. The relative accuracy of the three particle-tracking methods when the flow is either steady or suddenly reversing direction is discussed.

Llaulds.

Final rept.

H. J. M. Hanley, G. P. Morriss, T. R. Welberry, and D. J. Evans. 1988, 26p Sponsored by Department of Energy, Washington, DC. Pub. in Physica 149A, p406-431 1988.

Keywords: *Liquids, Shear tests, Photographic tech-niques, Light scattering, Anisotropy, Reprints, Two di-mensional.

The behavior of a dense two-dimensional soft disc liquid under shear is studied via nonequilibrium molecular dynamics. The structure factor for the liquid at a given shear rate is evaluated directly by plotting the particle positions, taken at random from the NEMD simulation at that shear, onto photographic film and using light scattering to obtain a diffraction pattern. The pair correlation function of this system is also extracted directly by histogramming the particle positions with respect to a given central particle as a function of separation and angle. The pair correlation function is compared to that approximated by a Fourier series ex-pansion to rank ten. Results are reported as a function

of shear rate from a shear rate of 0.1 (when the fluid is essentially Newtonian) to 10 (when the fluid can dis-play a string phase). The appearance of the string phase is discussed and shown to be a consequence of the definition of temperature in the simulation algonthm. A modification of the algorithm is proposed. Comparisons between this work and previous work with three-dimensional liquids are given. The two-dimensional structure factor is compared with that ob-tained from a real colloidal suspension via light scatterina.

PB89-161871 PC A03/MF A01 National Inst. of Standards and Technology (NML), Gaithersburg, MD. Center for Chemical Technology. Mixing Motions Produced by Pipe Elbows. T. T. Yeh, and G. E. Mattingly. Jan 89, 41p NISTIR-89/4029

Keywords: *Pipe flow, *Mixing, *Elbows(Pipe), Pipes(Tubes), Velocity measurement, Swirling, Vortex flow, Pressure distribution, Turbulent flow, Laser anemometers.

Experimental measurements have been made, using laser Doppler velocimetry (LDV) of the pipeflows produced by a range of pipe-elbow configurations. The secondary flow characteristics of these pipeflows are described qualitatively and quantitatively together with their decay rates in the downstream piping. The poten-tial these flows have as mixing environments is de-scribed on the basis of the profiles of the mean and schoed on the basis of the profiles of the mean and turbulent velocity components, the change of these with downstream distance, and the pressure losses. Parameters characterizing these flow fields are de-fined from the measured velocity profiles. It is shown that double elbow 'out-of-plane' combinations where minimal pipelengths separate the elbows can produce verv energetic long-lasting, swirling flows that can very energetic, long-lasting, swining flows that can serve as effective mixers. Such effectiveness suggests that process designers might consider adding an additional elbow (and the slight increase in pressure loss) to pipe turns so as to take advantage of the enhanced mixedness that can be achieved via closecoupled elbows-out-of-plane.

Shear Dilatancy and Finite Compressibility in a Dense Non-Newtonian Liquid.

Final rept. H. J. M. Hanley, J. C. Rainwater, D. J. Evans, and L. Hood. 1988, 3p

Pub. in Proceedings of International Congress on Rhe-ology (10th), Sydney, Australia, August 14-19, 1988, v1 p386-388.

Keywords: *Non-Newtonian fluids, *Compressible flow, *Shear tests, Rheological properties, Dilatancy, Density(Mass/volume), Viscosity, Dynamic pressure, Cylinders.

Nonequilibrium molecular dynamic (NEMD) simula-tions of model systems indicate that liquids of spherical particles are non-Newtonian. The authors illustrate here that the shear viscosity coefficient, Eta(sub +) of a liquid of soft spheres is a function of the shear rate, gamma; they show that the liquid is shear dilatant, i.e., that the density, rho, is a decreasing function of gamma at constant pressure, p; they also indicate that the liquid exhibits normal pressure differences. The re-sults are used to analyze fluid behavior in a typical flow problem, namely flow between vertical rotating concentric cylinders.

Pub. in Nuclear Technology 84, p113-118 Jan 89.

Keywords: *Flow visualization, *Water flow, Porous materials, Aluminum oxide, Bentonite, Kaolin, Absorp-tion, Reprints, *Magnetic resonance imaging.

The flow of water in porous materials has been visual ized using nuclear magnetic resonance imaging (MRI). For flow in an initially dry bed, the water gives a large signal that can be detected directly. Flow in a wet bed is visualized indirectly by displacing the pure water with a dilute solution of paramagnetic ions. The solution does not give an MRI signal and so can be contrasted with pure water. Another use of MRI is to observe the absorption of water by a solid. The MRI technique is sensitive and can give accurate and quantitative re-sults for flow with low Peclet number.

Elimination of Spurious Eigenvalues in the Chebyshev Tau Spectral Method.

G. B. McFadden, B. T. Murray, and R. F. Boisvert. May 89, 19p NISTIR-89/4090

Keywords: *Chebyshev inequality, *Hydrodynamics, *Eigenvalues, Spectrum analysis, Models, *Cheby-shev approximation, *Spectral methods, Computation-al fluid dynamics, Chebyshev tau method, Chebyshev Galerkin method, Orr-Sommerfeld equations, Vorticity equations.

Spectral methods have been used to great advantage in hydrodynamic stability calculations; the concepts are described in Orszag's seminal application of the Chebyshev tau method to the Orr-Sommerfeld equa-tion for plane Poiseulle flow in 1971. Orszag discusses both the Chebyshev Galerkin and the Chebyshev tau which is easier to implement than the Galerkin method. The tau method has the disadvantage that two unstable eigenvalues are produced that are artifacts of the discretization. The authors present an ex-tremely simple modification to the Chebyshev tau method which eliminates the spunous eigenvalues. They first study a simplified model of the Orr-Sommer-feld equation discussed by Gottlieb and Orszag. They consider the Chebyshev tau method, which has two spurious eigenvalues, and then describe a modifica-tion which eliminates them. Finally, they consider re-sults for the Orr-Sommerfeld equation, where the modified tau method also eliminates the spurious eigenvalues. The simplicity of the modification makes it a convenient alternative to other approaches to the problem.

Keywords: *Fluids, *Mixtures, *Phase transformation, Pressure, Temperature, Equations of state, Van der Waals equation, Thermodynamics, Reprints.

Fluid Mechanics

A field-space corresponding-states transformation is one in which the properties of a fluid, or fluid mixture, are related to the properties of a reference fluid, or fluid mixture, by equations which are analytic in the field variables (i.e., the pressure, temperature and chemical potentials). Such transformations are radically different from traditional corresponding states methods. The most useful of these differences is that the presence of phase coexistence in the target system is a direct reflection of phase coexistence in the refer-ence system and never the result of the transformation itself. An immediate consequence of technical interest is that, if the phase transitions of the reference system are tabulated or known analytically, transforming these states maps all of the phase transitions of the target system directly.

Keywords: *Orifice flow, *Flow measurement, *Pipes(Tubes), *Roughness, Orifice meters, Surface roughness, Gases, Water, Experimental data.

Flow measurement with orifice flowmeters is simple in concept and can be accurate, but, as demonstrated in flow measurement test facilities, can also result in large errors if any of the significant parameters are not controlled. Many of these parameters are well known and particular care is taken to ensure that they do not cause measurement errors. Others are more subtle and not so easily detected or controlled. One such parameter is the surface finish of the pipe immediately upstream of the orifice plate. Results of an experimental investigation into the effects of this pipe roughness on the orifice discharge coefficient are presented, along with a review of some of the pertinent literature. Measurement errors of approximately 1% can result from using meter tubes that are too rough but still within the specification of the standards.

Keywords: *Microscopy, Dielectrics, Mie scattering, Electromagnetic scattering, Diameters, Reprints, *Resonance light scattering, *Microspheres.

Resonance light scattering (RLS) spectra have been obtained from a liquid suspension of dielectric micros-pheres having a narrow size distribution in order to deduce the mean size and distribution width of the spheres. Comparison with single-particle spectra shows that most peaks in the size-distributed spectra are due to several resonances in the a sub n or b sub n Mie scattering coefficients. A mean diameter for the microspheres, obtained by matching experimental res-onance wavelengths with those calculated using a vectorized Mie scattering algorithm, is in excellent agreement with optical microscopy and scanning electron microscopy results. However, the measured width of the size distribution is significantly smaller than those from optical microscopy and transmission electron microscopy. Several sources of experimental error which affect the RLS spectra, including angle

Optics & Lasers

misalignment and oversized collection apertures, are discussed.

Keywords: Light scattering, Reprints, *Laser noise, Resonance fluorescence.

Significant fluctuations, above the shot-noise limit, have been observed in the intensity of fluorescent light scattered from atoms excited by an intense noisy laser, where a central role is played by the nonlinearity laser, where a central role is played by the nonlinearity of the atom-field interaction. By considering the vari-ance of the atomic populations, the authors show that noise spectroscopy is sensitive to the field statistics of the laser. They specifically consider the cases of reso-nance fluorescence (analogous in the weak-field limit to analysis by a Fabry-Perot interferometer), two-photon excitation, and double optical resonance for variable laser intensity and bandwidth. It is shown that large differences in the noise spectra can occur be-ween lasers characterized by a phase-diffusion or a tween lasers characterized by a phase-diffusion or a phase-jump model, although these models would give the same values for the mean atomic populations. The authors believe that observation of population fluctua-tions can become a useful method for characterizing laser noise.

Scattering of Polarized Light in Spectral Lines with Partlal Frequency Redistribution: General Redistribution Matrix. Final rept.

H. Domke, and I. Hubeny. 1988, 12p Pub. in Astrophysical Jnl. 334, p527-538, 1 Nov 88.

Keywords: *Spectral lines, Resonance scattering, Le-gendre functions, Reprints, *Polarized light, Radiative transfer

The redistribution matrix for resonance scattering of arbitrarily polarized light, described by a vector of Stokes parameters, is derived assuming that the ground state is isotropic (i.e., assuming negligible optical pumping). When specified in the atomic rest frame, the redistribution matrix is found to be composed of several terms with individually separate frequency and angular dependence. The laboratory frame (velocity averaged) redistribution matrix exhibits an analogous structure, but the angular and frequency dependences are intermingled. The authors consider two possibili-ties for treating the angular dependence in practical applications, namely, an expansion in a series of Legendre polynomials, and an azimuthal expansion. Fition matrix is examined, and explicit expressions for resonance lines are given.

PB89-171672 Not available NTIS National Bureau of Standards (NEL), Boulder, CO. Electromagnetic Technology Div. Stability of Birefringent Linear Retarders (Waveplates).

Final rept. P. D. Hale, and G. W. Day. 1988, 8p Sponsored by Optical Society of America, Washington,

Pub. in Applied Optics 27, n24 p5146-5153, 15 Dec 88.

Keywords: *Retarders(Devices), Birefringence, Stabili-ty, Reprints, *Waveplates.

The effects of changes in temperature, wavelength, and direction of propagation (angle of incidence) on the retardance of zero-order, multiple-order, compound zero-order, and temperature-compensated wa-veplates are described in detail. A disagreement in the literature regarding the properties of a compound zeroorder waveplate is resolved by showing that with re-spect to temperature and wavelength, it behaves like a true zero-order waveplate, but with respect to angle of incidence it behaves like a multiple-order waveplate. A previously proposed temperature-compensated design is shown to suffer from the same directional imitations. A new design for a retarder consisting of one element of a positive uniaxial crystal and one element of a negative uniaxial crystal is proposed. The retardance of such a waveplate would be much less sensitive to the direction of propagation, but somewhat more sensitive to temperature than a typical com-pound zero-order waveplate.

Keywords: *Calorimeters, *Laser beams, *Power meters, Measuring instruments, Standards, Calibrat-ing, Optical communications, Power measurement, Thermal measurements.

The National Bureau of Standards (NBS) maintains a set of electrically calibrated calorimeters designed and built specifically for laser energy measurements. These calorimeters are used as national reference standards for the calibration of optical power and energy meters. NBS offers laser measurement services based on the standard calorimeter to the public at a variety of laser wavelengths and power ranges. The uncertainties associated with these measurements have recently been re-evaluated.

A free electron laser is being built at the National Bureau of Standards as a joint project with the Naval Research Laboratory. The electron beam source is the 185 MeV CW racetrack microtron (RTM) presently nearing completion. The accelerator is characterized by extremely good emittance and small energy spread. A new photocathode injector operating on the 32nd subharmonic of the 2380 MHz rf frequency is being developed to increase the peak current to approx = or > 2 A in 3 ps micropulses. The wiggler design has 130 periods of (lambda sub w) = 28 mm with rms wiggler parameter K approx = or < 1. Three-dimensional calculations indicated that power gains of 10-30% per pass can be achieved for optical wavelengths in the range 200 nm to 10.0 micrometers. The design of the RTM and FEL will be described. The FEL is intended for use in a broad program of research applications in biomedicine and materials science.

A Solution to the Ray-Linking Problem. Final rept.

S. J. Norton. 1987, 4p Pub. in Jnl. of the Optical Society of America A-Optics and Image Science 4, n10 p1919-1922 1987.

Keywords: *Ray tracing, *Light transmission, Integral equations, Iteration, Perturbation, Convergence, Reprints, Refractive index, Successive approximations method, Imaging techniques.

The problem of computing the ray trajectory between points a and b, when given the refractive index (or sound velocity) distribution, is complicated by the ignorance of the initial ray direction at the point a, which is needed in defining the path intercepting the end point b when numerically integrating the ray equation. It is shown that this ray-linking problem can be avoided by transforming the ray equation into an implicit integral equation for the true ray path that satisfies the given boundary conditions. The integral equation can be solved for the true path by the method of successive approximations. Simulations suggest that this iterative scheme often converges rapidly to the true path. An explicit expression for a ray path, obeying the bounda-ry conditions, is also derived which is correct to first order in the refractive index perturbation. This path provides an excellent approximation to the true path when the refractive index perturbation is small, and be-comes increasingly good as the perturbation goes to zero.

Apparatus Function of a Prism-Grating Double Monochromator.

Final rept.

R. D. Saunders, and J. B. Shumaker. 1986, 5p Pub. in Applied Optics 25, n20 p3710-3714 1986.

Keywords: *Monochromators, Spectroradiometers, Spectrometers, Reprints, Slit functions.

The slit function of a double monochromator has been studied using a dye laser and a few ion laser lines. The value of the slit function is roughly nine orders of magnitude below the peak at 300 nm from the line center. The difference between the slit function obtained by monochromator scanning over a fixed spectral line and that obtained by tuning a spectral line through a fixed monochromator setting is illustrated. Also reported is a prominent structure in the slit function which is attributed to the intermediate slit of the instrument.

Heuristic Analysis of von Kries Color Constancy. Final rept.

J. A. Worthey, and M. H. Brill. 1986, 5p Pub. in Jnl. of the Optical Society of America A 3, n10 p1708-1712 Oct 86.

Keywords: Reflectance, Reprints, *Color constancy, Von Kries adaptation, Robot vision.

The properties of a constancy model based on the proportionality rule of von Kries are examined in a series of simplified examples. It is found that the breadth of receptor sensitivity functions causes metamerism, thwarting color constancy. Overlap of these functions limits the accuracy of von Kries adaptation, for a more subtle reason: it causes non-zero off-diagonal ele-ments in the transformation matrix relating object re-flectance to receptor stimuli. Such off-diagonal elements make von Kries adaptation incorrect even when the illuminant is restricted so as to prevent metamerism.

Keywords: *Light scattering, *Hydrogen, *Helium, *Deuterium, Molecular spectroscopy, Infrared spec-troscopy, Absorption spectra, Planetary atmospheres, *Molecule collisions, Line shape.

The survey deals with collision (or interaction) induced absorption (CIA) and light scattering (CILS) primarily in gases at low densities where bimolecular collisions predominate. The advances in these fields that have occurred primarily in the last five years are empha-sized. In the area of CIA, these topics include: H2-H2 and H2-He spectra in the far infrared (FIR) and in the fundamental IR bands; dimer features in these spectra; and the role of anisotropic interactions. The effects of the vibrational dependence of the potential function of the H2IR spectra are presented. The interesting line shapes and intensity problems in the FIR and IR spec-tra of HD due to interference between the collision induced and allowed transitions is discussed in some detail. Collision induced light scattering from simple isotropic and anisotropic molecules, including H2, is discussed. Another section deals with the onset of three-body collisions in both CIA and CILS.

Keywords: *Optical materials, *Radiation damage, *Meetings, Optical coatings, Optical measurement, Thin films, Surfaces, Mirrors, Substrates, *High power lasers, *Laser damage, Laser radiation.

The Nineteenth Annual Symposium on Optical Materials for High-Power Lasers (Boulder Damage Symposium) was divided into sessions concerning Materials and Measurements, Mirrors and Surfaces, Thin Films, and, finally, Fundamental Mechanisms. As in previous years, the emphasis of the papers presented at the Symposium was directed toward new frontiers and new developments. Particular emphasis was given to materials for high power systems. The wavelength range of prime interest was from 10.6 micrometers to the uv region. Highlights included surface character-ization, thin film substrate boundaries, and advances in fundamental laser-matter threshold interactions and mechanisms. The scaling of damage thresholds with pulse duration, focal area, and wavelength was discussed in detail.

Final rept.

D. Z. Anderson, and J. Feinberg. 1989, 13p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Jnl. of Quantum Electronics 25, n3 p635-647 Mar 89.

Keywords: *Optical filters, High-pass filters, Low-pass filters, Bandpass filters, Characteristics, Quantum electronics, Reprints.

A novelty filter detects what is new in a scene and may be likened to a temporal high-pass filter. The report reviews the current status of optical novelty filters and related devices that use four-wave mixing or two-beam coupling in photorefractive media. A detector that shows only what is not new is called a monotony filter and may be likened to a temporal low-pass filter. Dem-onstrations of high- and low-pass and bandpass tem-poral image filters are discussed. An analytical treatment of the two-beam coupling devices is given in a Laplace transform framework in the undepleted pump approximation assuming plane wave inputs. This allows a unified treatment of the various filter characteristics.

Final rept.

M. Young. 1989, 7p

Pub. in Applied Optics 28, n8 p1467-1473, 15 Apr 89.

Keywords: *Optical microscopes, *Optical measure-ment, *Line width, High pass filters, Reprints, Integrat-ed optics, Optical waveguides, Spatial filtering.

High pass filtering has been relatively little used in microscopy, yet it may have application to linewidth measurement and visualization of phase objects. The author has designed and built a spatial filtering microscope entirely of conventional microscope objectives. For linewidth measurement, the spatial filter has an optimum width that allows linewidths to be measured within a few percent. Phase lines can also be examined, but phase contrast microscopy may be more suited to weak phase objects such as integrated-optical waveguides.

MAIN1 is a software program for aiding the analysis of ellipsometric measurements. MAIN1 consists of a suite of routines written in FORTRAN that are used to invert the standard reflection ellipsometric equations for simple systems. Here a system is said to be simple if the solid material sample may be adequately charac-terized by models which assume at least the following: materials are nonmagnetic; samples exhibit depth-dependent optical properties, such as one with layered or laminar structure atop a substrate that behaves like a semi-infinite half-space; layers are flat and of uniform thickness; and the dielectric function within each layer/substrate is isotropic, homogeneous, local, and linear. Each layer is characterized in part by a thick-ness, while the optical properties for a given material and wavelength are expressed in terms of a refractive index and extinction coefficient. The ellipsometric equations are formulated as a standard damped nonlinear least-squares problem and then solved by an it-erative method when possible. Estimates of the uncer-

Optics & Lasers

tainties associated with assigning numerical values to the model parameters are calculated as well.

burg, MD. Search for Optical Molasses in a Vapor Celi: General Analysis and Experimental Attempt.

A. L. Migdall. 1989, 6p Office of Naval Research, Arlington, VA.

Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n6 p373-378.

Keywords: *Lasers, *Cooling, Viscosity, *Optical mo-lasses, *Vapor cells, Cold atoms.

The authors analyze the application of optical molasses to a thermal vapor cell to make and collect cold atoms. Such as arrangement would simplify the production of cold atoms by eliminating the difficulty of first having to produce and slow an atomic beam. The authors present the results of our calculations, computer models, and experimental work.

Wavelengths and Energy Levels of the K i isoelec-tronic Sequence from Copper to Molybdenum. Final rept

V. Kaufman, J. Sugar, and W. L. Rowan. 1989, 4p Pub. in Jul. of the Optical Society of America B 6, n2 p142-145 Feb 89.

Keywords: *Molecular orbitals, *Rubidium, *Strontium, Copper, Molybdenum, Plasmas(Physics), Spectra, Wavelengths, Energy levels, Arsenic, Bromine, Gal-lium, Germanium, Krypton, Niobium, Potassium, Sele-nium, Yttrium, Zinc, Zirconium, Reprints.

Seven lines in the K-like transition array 3p63d-3p53d2 were observed for each of the spectra Cu XI to Mo XXIV (except for Rb and Sr) in radiation from impurity-ANY (except to Hb and Sr) in radiation from impuny-doped tokamak and laser-generated plasmas. Wave-lengths in the range of 70-112 angstroms, measured with an uncertainty of + or - 0.005 angstroms, are given. These are compared with calculations obtained with the relativistic Hartree-Fock code of Cowan. From these comparisons, predicted values for the wave-lengths of Rb and Sr were obtained, with an uncertain-ty of + or - 0.01 angstroms ty of + or - 0.01 angstroms.

Final rept. D. G. Hummer. 1988, 14p

Contract NAGW-766

Sponsored by National Aeronautics and Space Admin-

istration, Washington, DC. Pub. in Proceedings of Conference on Atomic Proc-esses in Plasmas, Santa Fe, NM., October 1987, p1-14 1988

Keywords: *Atomic energy levels, Equations of state, Thermodynamic equilibrium, *Plasma, Partition functions, Stellar opacity.

Recent work on the evaluation of the atomic internal partition function at densities less than about 0.02 gm/ cc is discussed, in which an attempt is made to identify the physical mechanism responsible for determining the level populations of atoms and ions in dense LTE plasmas. Level populations predicted by a phenomenological theory based on the identification are compared with those obtained by the activity expansion method.

M. Schneider, K. M. Evenson, M. D. Vanek, D. A. Jennings, J. S. Wells, A. Stahns, and W. Urban.

1989. 10p Pub. in Jnl. of Molecular Spectroscopy 135, p197-206

1989.

Keywords: *Lasers, *Carbon monoxide, *Frequency measurements, Demodulation, Lamb wave tests, Carbon dioxide, Vibrational spectra, Doppler effect, Reprints.

The paper reports the first frequency measurements of a Lamb-dip-stabilized (12)C(16)O laser. The laser was stabilized to the optogalvanic Lamb dip of the CO molecule excited in a low-pressure dc discharge. The region of study was for transitions with lower state vibrational quantum numbers ranging from nu = 6 to nu = 16. Supplementary Doppler limited measurements are also reported for the range nu = 16 to nu = 34. The frequencies were directly measured in a hetero-dyne experiment in which two saturation-stabilized CO2 lasers were used as references. By fitting the transition frequencies to the Dunham expression, new coefficients have been determined which fit the new sub-Doppler data with over an order of magnitude more accuracy than previous coefficients.

Finite Element Studies of Transient Wave Propagation. Final rept.

M. Sansalone, N. J. Carino, and N. N. Hsu. 1987, 9p Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v6A p125-133 1987.

Keywords: *Stress waves, *Elastic shells, Strains, Dis-placement, Greens function, Differential equations, Impact, Transducers, Reprints, *Finite element method.

The paper shows the versatility and power of the finite element method for solving stress wave propagation problems and provides background information about the finite element program that was used to carry out wave propagation studies at the National Bureau of Standards. The paper illustrates the use of the method to solve the following three problems: stress and dis-placement fields produced by transient point impact on the surface of an elastic plate; the interaction of transient stress waves produced by point impact with a planar disk-shaped void and a flat-bottom hole within

elastic plates; stress and displacement fields produced by an ultrasonic transducer radiating into an elastic solid. The finite element results are compared to exact Green's function solutions for a point source on an infinite plate, experimentally obtained displacement wave-forms for point impact on a plate contain-ing a planar flaw, and photoelastic pictures of the stress fields produced by an ultrasonic transducer radiating into silica.

Final rept.

G. H. Koepke, M. T. Ma, and W. D. Bensema. 1989,

Pub. in IEEE (Institute of Electrical and Electronics En-gineers) Transactions on Instrumentation and Meas-urement 38, n2 p473-479 Apr 8 9.

Keywords: *Transverse waves, *Electromagnetic radiation, *Measurement, Electric fields, Automatic control equipment, Electronic test equipment, Electric analyzers, Frequency analyzers, Measuring instruments, Net-work analyzers, Reprints.

The transverse electromagnetic (TEM) cell is widely used to evaluate the electromagnetic characteristics of electrically small devices. The paper reviews the theoretical basis for a technique to quantify the radiat-ed emissions from any such device in the cell. The technique is well suited to an automated test system provided that the mechanical motions required can be controlled by a computer. The difficulties associated with these mechanical motions are discussed and possible solutions are proposed. The measurement tech-nique is also expanded to include multiple-frequency sources in addition to single-frequency sources.

Boulder, CO. Electromagnetic Fields Div. Effect of an Electrically Large Stirrer in a Mode-Stirred Chamber.

Final rept.

D. I. Wu, and D. C. Chang. 1989, 6p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electromagnetic Compatibility 31, n2 p164-169 May 89.

Keywords: *Electric fields, *Cavity resonators, *Stir-rers, *Frequency shift, Apertures, Eigenvectors, Wave dispersion, Oscillations, Pulsation, Frequency stability, Reprints

In a mode-stirred chamber, the field in the cavity is perturbed with a stirrer or rotating scatterer so that the time-averaged field is constant. The paper investigates the key factor that governs the effectiveness of a stirrer. By examining the fundamental properties associated with a perturbing the full after the hope thes associate ed with a perturbing body in a cavity, the key to effec-tive field perturbation is found in shifting the eigen-mode frequencies. The phenomenon is illustrated by examining a 2-D cavity with a 1-D perturbing body. Using the Transmission-Line-Matrix method, the shifting of eigenfrequencies is computed and the variation on the magnitude of the fields is examined for different stirrer sizes. From the analysis, insights one draws in-

Standards and Metrology (4th), Ancona, Italy, September 5-9, 1988, p319-325 1989.

Keywords: *Frequency standards, *Microwaves, *Hyperfine structures, Radiowaves, Atomic spectra, Spectrum analysis, Experimental data, *Penning traps.

lons in a Penning trap provide a promising candidate for a microwave frequency standard. The performance of a frequency standard based on a hyperfine transition in the ground state of a few thousand 9Be 4 ions stored in a Penning trap is discussed. An inaccuracy of less than 2x10(-13) and fractional frequency stability of 2x10-11 tou(-1/2) were obtained in a first experimental setup. With the use of sympathetic cooling, a 0.9 mHz linewidth and a second order Doppler shift less than $1 \times 10(-14)$ were obtained on the Be+ clock transition. This should enable an order of magnitude improvement in the frequency standard.

P. F. Wilson, M. T. Ma, and A. R. Ondrejka. 1988, 5p Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) International Symposium on Electromagnetic Compatibility, Seattle, WA., August 2-4, 1988, p179-183.

Keywords: *Electric fields, *Mathematical models, *Dipoles, Electromagnetic theory, Static electricity, Elec-trostatic charge, Polarity, Electrostatics, Field emis-sion, Field strength, *Electrostatic discharge.

Electrostatic discharge (ESD) can be a serious threat to electronic equipment. To date, metrology efforts have focused primarily on ESD-associated currents in order to develop test simulators. Significantly less work has been done on the ESD radiated fields. The paper examines the fields problem both theoretically and experimentally. Measurements indicate that the electric fields can be quite significant (greater than 150 V/m at a distance of 1.5 m), particularly, for relatively low voltage sparks (less than 6 kV). A theoretical dipole model for the ESD spark is developed to com-pute the radiated fields. The agreement between theory and experiment is good. The model may be used to predict the fields for a wide range of possible discharge configurations.

Surface Structure and Growth Mechanism of Ga on Si(100).

Final rept.

B. Bourguignon, and S. R. Leone. 1988, 6p Grants AFOSR-84-0272, NSF-CHE84-08403

Sponsored by Air Force Geophysics Lab., Hanscom AFB, MA., and National Science Foundation, Washington, DC.

Pub. in Proceedings of Symposium on Atomic and Sur-face Physics, LaPlagne, France, January 17-23, 1988, p228-233.

Keywords: *Semiconductors, *Gallium, *Silicon, Crys-tallization, Surface properties, Spectroscopy, Bonding, Locors, Eluorescence, Auger electrons, *Molecular beam epitaxy.

The surface structures and growth mechanism of Ga overlayers on Si(100) are important data for the molec-ular beam epitaxy (MBE) of GaAs on Si(100). Some experimental results are discussed. It is found that Ga forms a well-ordered first layer with a large binding energy to Si(100). Surface structures are proposed where Ga is dimerized below 0.5 ML, while the Si(100) 2 x 1 reconstruction is removed above 0.5 ML. These structures account for an observed change in desorption energy and preexponential factor at 0.5 ML. (In the paper, 1 ML refers to Ga:Si = 1:1, or 6.8 x 10(sup 14)cm(sup -2).) From these surface structures, covalent bonding as opposed to metallic bonding between the metal atoms and the semiconductor, and bonding to the substrate as opposed to lateral bonding be-tween adatoms, are inferred to be dominant. Islands start to grow at coverages above 1 ML, which depends on the surface temperature T(sub s). These results are contrasted with other recent results on similar systems, namely In and As on Si(100).

troscopy) of the Epitaxial Growth of Cu on Ni(100). Final rept. W. F. Egelhoff. 1985, 5p

Pub. in Structure of Surfaces, p199-203 1985.

Keywords: *X-ray analysis, *Photoelectrons, *Copper, *Nickel, *Epitaxy, Spectroscopy, Single crystals, Lat-tice parameters, Reprints.

In angle resolved x-ray photoelectron spectroscopy (XPS) of single crystals the core level peaks exhibit enhanced intensities along major crystal axes. This phenomenon is often referred to as electron channeling (or Kikuchi beams) due to an apparent analogy with effects found in electron microscopy. The present analysis of this phenomenon for epitaxial Cu on Ni(100) demonstrates that the electron channeling (or Kikuchi beams) approach fails completely to describe the data. The actual physical basis for this phenome-non is forward scattering of photoelectrons by overlying atoms in the lattice.

The manual describes a new Standard Reference Ma-terial (SRM 1965). The SRM consists of two single-layer groupings of contacting monosize 10-micrometer polystyrene spheres that have been permanently sealed in an air chamber on a microscope slide. One sphere grouping consists of hexagonally ordered arrays, while the other grouping is unordered. The di-ameter distribution of the sphere material (SRM 1960), ameter distribution of the sphere material (SHM 1960), which was made under microgravity conditions on a Space Shuttle, is accurately known. SRM 1965 has a dual function: supporting measurements involving mi-croscopy and supporting teachings and experiments in micrometrology. The manual describes how to meas-ure microscope magnification and image distortion at levels below 0.5% and describes micrometrology experiments at the 0.05 micrometer level.

Refinement of the Substructure and Superstructure of Romanechite. Final rept.

S. Turner, and J. E. Post. 1988, 7p

Pub. in American Mineralogist 73, p1155-1161 1988.

Keywords: *Crystal structure, *Electron transitions, Banum oxides, Manganese, Minerals, Cells, Anisotro-py, Reprints, *Romanechite.

The substructure and superstructure of romanechite, (Ba,H2O)2Mn5O10, were refined using a crystal from Schneeburg, Germany. The subcell is monoclinic, space group C2/m, with a = 13.929(1) Angstroms, b = 2.8459(4) Angstroms, c = 9.678(1) Angstroms, beta = 92.39(1) degrees, Z = 2, and it refined to R = 0.036 for anisotropic temperature factors using 598 reflections. The Mn(2) octahedra of the structure show significant distortion consistent with the concentration of Mn sup 3+ on the Mn(2) site. The supercell consist-ing of a tripling along b (i.e., the tunnel axis), results from ordering Ba and H2O along the tunnel lengths. Further, long-exposure diffraction patterns show mod-ulated streaks along (201)*, implying only short-range ordering between the tunnels in one direction. A simplest monoclinic unit cell was chosen with space group C2/m and Z = 6. It was refined to R = 0.041 for aniso-tropic temperature factors using 954 reflections. Ba preferentially occupies the Ba(1) site, and correspond-ingly the closest framework octahedra (Mn(2) site) are preferentially occupied by Mn sup 3+.

Final rept.

D. T. Pierce. 1988, 6p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Physica Scripta 38, p291-296 1988.

Keywords: Magnetic domains, Microstructure, Re-prints, *Electron spin polarization, Scanning electron microscopy, Scanning tunneling microscopy, Secondary electrons, High resolution.

The measurement of the spin polarization of second-ary electrons generated by a finely focused (unpolar-ized) scanning electron microscope (SEM) beam to obtain high-resolution magnetization images is presented. An alternative measurement, using a spin-po-larized incident beam in an SEM, has many difficulties which are discussed. To measure spin configurations with higher spatial resolution, the possibility of intro-ducing electron spin polarization in scanning field-emission and tunneling microscopy is considered. The measurement of the spin polarization of secondary electrons generated by a specially prepared single-atom scanning field-emission tip looks promising. The potential advantages and unsolved problems involved in using a ferromagnetic tip or an optically pumped semiconductor tip are described.

Pub. in Jnl. of Applied Crystallography 19, pt6 p427-439, 1 Dec 86.

Keywords: *Neutron spectrometers, Neutron scattering, Magnetic domains, Crystal structure, Reprints, Small angle scattering, Position sensitive detectors, Neutron detectors, NBSR reactor.

A small angle neutron scattering spectrometer, suita-ble for the study of structural and magnetic inhomgen-eities in materials in the 10 to 1000 A range, has been constructed at the National Bureau of Standards Research Reactor. The instrument is 8 m long and uses a mechanical velocity selector and pinhole collimation to provide a continuous incident beam whose wavelength is variable from 5 to 10 A. The neutron detector is a 65 x 65 sq cm position sensitive proportional counter which pivots about the sample position to extend the angular range of the spectrometer. Fea-tures unique to this instrument include a multibeam converging collimation system for high resolution measurements and an interactive color graphics termi-nal with specialized software for the rapid imaging and analysis of data from the two dimensional detector. The design and characteristics of the spectrometer and data acquisition system are described in detail, and examples of data are presented which illustrate its performance.

Surface Structures and Growth Mechanism of Ga on Si(100) Determined by LEED (Low Energy Elec-tron Diffraction) and Auger Electron Spectrosco-

py. Final rept. B. Bourguignon, K. L. Carleton, and S. R. Leone.

1988, 18p Grant AFOSR-84-0272

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. Pub. in Surface Science 204, p455-472 1988.

Keywords: *Gallium arsenides, *Gallium, *Silicon, *Surfaces, Substrates, Reprints, *Epitaxial growth, Low energy electron diffraction, Auger electron spec-troscopy, Temperature dependence, Binding energy.

The surface structures of gallium overlayers on Si(100) are studied using LEED and Auger electron spectros-copy (AES). At 300 K, Ga grows epitaxially up to at least 5 ML. In the range of low surface temperature least 5 ML. In the range of low surface temperature T(s) = 330-600 L, the growth obeys a Stranski-Kras-tanov mechanism, and the coverage at which island growth begins depends on T(s). Structures are pro-posed for the observed LEED patterns of Ga on Si(100)(3x2, 5x2, 2x2, 8x1 and 2x1). The existence of well-ordered structures suggests that Ga terminated Si(100) surfaces are suitable for epitaxy of GaAs on Si.

MD. Surface Science Div. Progress in Understanding Atomic Structure of the icosahedrai Phase. Final rept.

A. J. Melmed, M. J. Kaufman, and H. A. Fowler.

1986, 6p Pub. in Jnl. of Physics Colloquium 47, nC-7 p35-40 Nov 86

Keywords: *Aluminum-manganese alloys, Electron dif-fraction, Atomic structure, Reprints, *Icosahedral fraction, Atomic structure, Reprints, * phase, Quasicrystals, Field ion microscopy.

Electron diffraction analysis of the icosahedral phase (1-phase) in AIMn alloys (1-AIMn) is presented which shows clearly that, in addition to the sharp diffraction maxima from the i-phase, there is a considerable amount of diffuse intensity indicating the presence of a certain amount of disorder interspersed within this phase. This result correlates well with previous results from both neutron diffraction and field ion microscopy studies and helps to reduce the number of possible structural models of the i-phase. Analysis of FIM images indicates the presence of a hierarchy of cluster sizes with numerous features which appear to agree qualitatively with recently proposed models. A com-plete quantitative description of the structure of the iphase is being pursued by comparing experimentally observed atomic motifs with computer-simulated model surfaces, and preliminary results are presented.

AES and LEED Studies Correlating Desorption Energles with Surface Structures and Coverages for Ga on Si(100). Final rept.

B. Bourguignon, R. V. Smilgys, and S. R. Leone. 1988, 12p Grant AFOSR-84-0272

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC Pub. in Surface Science 204, p473-484 1988.

Keywords: *Gallium, *Silicon, *Auger electrons, *Semiconductors(Materials), *Desorption, *Monomo-lecular films, Chemical bonds, Temperature, Surface properties, Kinetics, Heat of vaporization, Electrodeposition, Spectroscopy, Energy bands, Reprints.

Gallium interactions with silicon (100) are studied with Auger electron spectroscopy and LEED to correlate the desorption energies with surface coverages and structures in isothermal desorption experiments. Some evidence for a temperature-induced change from a Stranski-Karstanov to a Volmer-Weber growth mode between 600 and 700 K is presented. In the temperature range 800-900 K, three different kinetic regimes are observed. Between 0 and 0.5 monolayers (ML), first-order desorption is observed from a well-ordered Ga overlayer (Si:Ga 2x2), with a desorption energy of 2.9 plus or minus 0.2 eV and a pre-exponential factor of 3x10(sup 16 plus or minus 1)s. Between 0.5 and 1 ML, first-order desorption is also observed from a wellordered Ga layer (Si:Ga 8x1), but the desorption energy decreases to 2.3 plus or minus 0.2 eV with a pre-exponential factor of 8x10(sup 12 plus or minus .2)/s. Above 1 ML, zeroth-order desorption from Ga islands on top of an ordered Ga monolayer is ob-served, and the desorption energy of the combination of surface species is 2.61 plus or minus 0.07 eV with a pre-exponential factor equal to (4 plus or minus 3)x10(sup 13) ML/s. It is suggested that atoms from the islands and the ordered layer are kinetically cou-pled, and that the islands cover too little of the surface to exhibit the bulk heat of vaporization of liquid Ga, 2.9 eV. The observed kinetic regimes are correlated with the surface structures proposed in the preceding paper.

Superiattice Magnetoroton Bands

Final rept

H. C. A. Oji, S. M. Girvin, and A. H. MacDonald. 1987. 4p

Pub. in Physical Review Letters 58, n8 p824-827 1987.

Keywords: Electron gas, Magnetic fields, Gallium arse-Hall effect, Superlattices, Wigner crystallization.

A theory is given for the effect of interlayer coupling in a superlattice on the magnetoroton modes of a two-dimensional electron gas in a strong magnetic field. It was found that for typical fields and layer spacings, the modes broaden into bands. For sufficiently small layer spacings, the gap necessary for the occurrence of the fractional quantum Hall effect vanishes. The authors argue that the vanishing of the gap should be associated with an instability toward the state with a two-dimensional Wigner crystal in each layer and that this state is favored by interlayer coupling.

MD. Radiation Physics Div. Magnetic Properties of Surfaces Investigated by Spin Polarized Electron Beams. Final rept.

D. T. Pierce. 1986, 12p

Pub. in Proceedings of International Workshop on Magnetic Properties of Low-Dimensional Systems, Taxco, Mexico, January 6-9, 1986, p58-69.

Keywords: Electron scattering, Chemisorption, Carbon monoxide, Oxygen, Nickel, Magnetic moments, *Sur-face magnetism, *Magnetic surfaces, Electron spin polarization, Electronic structure.

A spin polarized electron beam incident on a ferromagnetic surface results in elastically and inelastically scattered electrons and in photons via radiative transi-tions. The spin dependent intensities of each of these provide a sensitive measure of surface magnetization. comparison between low temperature spin deviations at the surface and in the bulk is given; the varia-tion follows the same power law with temperature but with a larger pre-factor for the surface. The connection between surface electronic structure and surface magnetism and the changes in each induced by chemisorption have been studied by spin polarized inverse photoemission. For oxygen and carbon monoxide on Ni(110), a reduction of the Ni magnetic moment is found, rather than a decrease in exchange coupling and corresponding randomization of the alignment of the moments. Further, in the case of CO, the chemis-orption interaction is non-local with one CO molecule eliminating on the average the magnetic moment of two Ni atoms.

Electromagnetic Technology Div. Josephson-Junction Model of Critical Current in Granular Y1Ba2Cu3O(7-delta) Superconductors. Final rept.

R. L. Peterson, and J. W. Ekin. 1988, 4p

Pub. in Physical Review B 37, n16 p9848-9851, 1 Jun 88.

Keywords: *Superconductors, *Josephson junctions, Magnetic fields, Grain boundaries, Reprints, *High temperature superconductors, *Critical current, *Yttri-um barium cuprates, *Barium yttrium cuprates.

The authors calculate the transport critical-current density in a granular superconductor in magnetic fields below about 0.005 T. The field dependence in this region is assumed to be controlled by intragranular or intergranular Josephson junctions. Various model calculations are fitted to transport critical-current data on bulk Y1Ba2Cu3O(7-delta) ceramic superconductors, whose average grain size somewhat exceeds 10 mi-crometers. The results yield an average junction cross-

Solid State Physics

sectional area (thickness x length) of 4-6 sq micrometers. If the junctions are at the grain boundaries, a London penetration depth of about 150-300 nm is in-ferred, consistent with other estimates. The authors conclude that Josephson junctions are limiting the transport critical current in the samples and that they lie at the grain boundaries. The parameters of the fit are not consistent with Josephson junctions at twinning boundaries.

Final rept. R. L. Peterson. 1988, 4p Pub. in Physics Letters A 131, n2 p131-134, 8 Aug 88.

Keywords: *Superconductors, Flux jumping, Magnetization, Reprints, *High temperature superconductors, Bean model.

The author extends the phenomenological Bean model of magnetization in hard superconductors to include the trains of magnetization jumps seen at low temperature in moderate-to-high magnetic fields. As in the original Bean model, no particular mechanisms for flux pinning are invoked. The extended model correctly accounts for the general dependence of the size of the magnetization jumps on sample size and critical cur-rent density. The data together with the model show that the shielding fields are approximately equal after each jump.

Temperature-Dependent Radiation-Enhanced Diffusion In Ion-Bombarded Solids. Final rept.

D. Marton, J. Fine, and G. P. Chambers. 1988, 4p Pub. in Physical Review Letters 61, n23 p2697-2700, 5 Dec 88.

Keywords: *Silver, *Nickel, *Diffusion, Crystal defects, Reprints, Ion bombardment, Physical radiation effects, Temperature dependence.

Temperature-dependence radiation-enhanced-diffusion rates for Ag in Ni have been found to decrease at elevated temperatures. The observed narrowing of interface interdiffusion regions with increasing temper-ature depends on both defect concentration and mi-gration processes which occur in ion-bombarded solids. These findings can be interpreted in terms of a general model of radiation-enhanced diffusion that in-volves long-lived complex defects which can migrate for large distances and which are themselves subject to annealing.

Final rept

J. R. D. Copley. 1988, 6p Pub. in Jnl. of Appl. Cryst. 21, p639-644 1988.

Keywords: *Neutron scattering, Monte Carlo method, *Computerized simulation, Vacuum, Embedding, Dis-persing, Spheres, Wavelengths, Water, Reprints.

The multiple scattering of neutrons in small-angle neutron scattering experiments has been studied using the technique of Monte Carlo simulation. As a test of the approach, investigations have been performed on strongly scattering samples of a system of monodisperse spheres in vacuo: the results are in excellent agreement with semianalytic calculations by Schelten and Schmatz. The scattering by systems of monodisperse spheres embedded in a medium has also been studied: the standard procedure for subtraction of the scattering by the medium slightly oversubtracts the multiple scattering due to the medium alone. The wavelength dependence of the single and multiple scattering in light water has been estimated and com-pared with experimental measurements by groups at the Institut Laue-Langevin, Grenoble, France.

Occurrence of Long-Hange Hencal Spin Gruen in Dy-Y Muitilayers. Final rept. J. J. Rhyne, J. Borchers, R. Du, R. W. Erwin, C. P. Flynn, M. B. Salamon, and S. Sinha. 1987, 6p See also PB89-179642.

Pub. in Jnl. of Applied Physics 61, n8 p4043-4048 1987.

Keywords: *Dysprosium, *Yttrium, Neutron diffraction, Metal films, Single crystals, Magnetic fields, Magnons, Ferromagnetism, Reprints, *Magnetic ordering, Mag-netic films, Molecular beam epitaxy, Multilayers, Tem-perature dependence, Band theory, Spin waves.

The magnetic ordering of highly perfect single crystal multilayer films of alternate layers of magnetic Dy and non-magnetic Y prepared by molecular beam epitaxy has been studied by neutron diffraction. Results on a series of films with Dy thicknesses of approximately 16 atomic planes (about 45 A) and Y thicknesses ranging from 10 to 22 planes have confirmed the existence of long-range helimagnetic ordering of the Dy 4f spins which is propagated through the intervening Y layers in phase coherence. The propagated in ough the intervening r layers in both Dy and Y layers have been calculated from the wave vector of the magnetic satellites and the intensity of the bilayer harmonics. The application of a field along basal plane directions destroys the helical order and produces a ferromagnetic state with all spins aligned along the field direction.

Pub. in Jnl. of the Less Common Metals 126, p53-62 Dec 86.

Keywords: *Dysprosium, *Yttrium, Ferromagnetism, Neutron diffraction, Metal films, Magnetic fields, Re-prints, *Magnetic ordering, Superlattices, Molecular beam epitaxy, Temperature dependence, Multilayers.

Neutron diffraction studies have demonstrated the existence of helical magnetic order in a metallic superlat-tice of Dy and Y produced by molecular beam epitaxy. Analysis of the magnetic satellite peak widths indicates that phase coherence of the helix exists over at least five bilayer cells, each consisting of 14 atomic planes of Dy and of non-magnetic Y. The multilayer comprises 64 bilayer cells. Results are given for the temperature dependence of the magnetic intensity and for the effect of an applied magnetic field which continuously converts the helical ordering to ferromagnetism.

Keywords: *Superconductors, *Electric contacts, Gold, Silver, Indium, Comparison, Electrical resistivity, Reprints, *High temperature superconductors, *Yttn-um banum cuprates, *Barium yttrium cuprates.

Contact surface resistivities (product of contact resist-Contact surface resistivities (product of contact resist-ance and area) have been obtained for both silver and gold contacts to high T(sub C) superconductors. This is a reduction by about eight orders of magnitude from the contact resistivity of indium solder connections. The contact resistivity is low enough to be considered for both on-chip and package interconnect applica-tions. The contacts were formed by sputter depositing either silver at call of they temperature (c 100 C) as either silver or gold at low temperatures (< 100 C) on a clean surface of Y1Ba2Cu3O(T-delta) (YBCO) and later annealing the contacts in oxygen. Auger micro-probe analysis shows that indium/YBCO contacts contain a significant concentration of oxygen in the indium layer adjacent to the YBCO interface. Silver and gold contacts, on the other hand, contain almost no oxygen and have favorable interfacial chemistry with low oxygen affinity. Silver also acts as a 'switcha-ble' passivation buffer, allowing oxygen to penetrate to the YBCO interface at elevated temperatures, but protecting the YBCO surface at room temperature.

Pub. in Jnl. of Applied Physics 65, n2 p684-687, 15 Jan

89

Keywords: Stresses, Strains, Comparison, Reprints, *Superconducting wires, *Niobium titanium, *Critical current, Room temperature, Temperature dependence.

The effect of axial tensile stress, applied at room tem-perature, on the critical current of NbTi superconduct-ing wire was measured and compared with the effect of tensile stress applied at liquid-helium temperature (about 4 K). The results of these measurements indi-cate that the effect on the critical current is independ-ent of the temperature at which the stress is applied. Thus, the existing 4-K data base can be used to deter-mine I(sub c) degradation from room-temperature fab-nication stress, cool-down stress introduced by differential contraction, as well as 4-K stress generated by the Lorentz force when the magnetic is energized. To generalize these results for arbitrary matrix-to-super-conductor volume ratios, the data are presented in terms of the stress on the NbTi portion of the composite conductor. Methods for determining the stress on the NbTi from the total composite load are presented.

Keywords: Fourier series, Crystal structure, Reprints, *Structure factors, Electron density, Maximum entropy method. Iterative methods.

It is shown that an electron density distribution of the form the sub k = exp (Sigma (f sub y)(r sub k)(x sub y)) has maximum entropy under the constraint that the ex-pected values of a set of functions, f sub j(r), are con-stant. For a Fourier map the functions f sub j(r) are the magnitudes of the structure factors for a set of reflec-tions h sub j including F(000). Maximum entropy is an efficient way of expressing the phase implications of a large set of structure amplitudes.

prints, *High temperature superconductors, *Band theory, Yttrium barium cuprates, Barium yttrium cuprates

A semi-phenomenological analysis is given of the effects of certain band structure features on the gap ratios 2 Delta/(k sub B)(T sub c) for high (T sub c) superconductors, including multigap systems. In addition to phonons, other intermediate bosons (IB) mediating the superconducting interaction are considered. Interthe superconducting interaction are considered. Inter-esting results emerge when the IB energy exceeds the widths of possible narrow peaks in the density of states associated with subbands presumably belong-ing to substructures such as stacked Cu-O planes. Comparison with experiment is made. In particular, data obtained by Warren et al. via nuclear-spin relax-ation on Ba2YCu3O(7-delta) can be interpreted within the present framework in terms of a metal having an the present framework in terms of a model having an IB of energy approx = $\sigma r > 1 \text{ eV}$, which exceeds the predicted width (approx = $\sigma r < 0.3 \text{ eV}$) of a peak in the density of states containing the normal-state Fermi level. This suggests that the IB is not a phonon.

Keywords: *Superconductors, Emission spectra, Oxygen, Reprints, *High temperature superconduc-

tors, *Yttrium barium cuprates, *Barium yttrium cuprates, Soft x rays, Density of states, Band theory.

Oxygen K soft x-ray emission spectra are presented for the YBa2Cu3Ox compounds with x nominally equal to 6, 6.5, and 7, and are compared with x-ray emission spectra determined from recent band-structure calculations. The K emission spectrum of O provides a measure of the p-type local partial density of states (p-LPDOS) at the oxygen sites. As x decreases from 7 delta to about 6.5, a chemical shift of the entire spectrum to lower energy indicates that screening is modified for all oxygen sites. The integrated intensity of the spectra is nearly unchanged by oxygen removal, indi-cating an increase in p-LPDOS per oxygen site. These results and changes in the spectral shape suggest that itinerant electron density near the O atoms is reduced and bound electron density is increased as oxygen is removed.

Dynamical Diffraction of X-rays at Grazing Angle. Final rept. T. Jach, P. L. Cowan, Q. Shen, and M. J. Bedzyk.

1989, 9p Pub. in Physical Review B 39, n9 p5739-5747, 15 Mar 89.

Keywords: *X ray diffraction, Germanium, Standing waves, Reprints, *Grazing incidence, KeV range 01-10.

Details are presented of the theory and experimental observation of dynamical diffraction of X rays at graz-ing angle from crystal planes normal to a surface. The authors are able to associate different features of the specularly reflected and diffracted-reflected beam fluxes with the contributions from the alpha and beta branches of the dispersion surfaces. The theory pre-dicts surface propagation modes to which internal and external beams can couple only through the diffraction process. An experiment is described in which the spe-cularly reflected and reflected-diffracted beams were simultaneously observed for 8-keV X rays incident on germanium. The agreement with first-order theory is good, but systematic deviations were observed. Calcu-lations are presented that illustrate how eigenstates of the wave fields, which are X ray standing waves with nodal planes normal to the surface of the crystal, can be used to obtain atomic registration at a surface or interface.

Keywords: *Gallium, *Silicon, *Kinetics, *Desorption, *Epitaxy, *Semiconducting films, Lasers, Probes, Fluorescence, Auger electrons, Surface properties, Elec-tron diffraction, Monomolecular films, Temperature, Growth, Gallium arsenides.

The kinetics of desorption and scattering of Ga atoms on Si(100) surfaces are probed by laser-induced fluorescence detection of the gas phase species and by Auger analysis of the surface composition. The kinetic parameters are correlated with the structures deduced by Low Energy Electron Diffraction (LEED) and the by Low Energy Electron Diffraction (LEED) and the coverages determined by Auger spectroscopy. The binding energy of Ga on Si(100) is found to be a func-tion of coverage, starting out at 2.9 eV at low cover-ages and decreasing to 2.3 eV for coverages between 0.5 and 1 monolayer (ML). Ordered growth is always observed for coverages below 1 ML, but above one monolayer the growth of islands occurs on the well-ordered monolayer. The onset of island formation is a strong function of temperature. A model is proposed for the structures and energetics involved in the growth of Ga on Si(100). The results are discussed in terms of the implications for epitaxial growth of GaAs on Si.

Ag Screen Contacts to Sintered YBa2Cu3Ox Powder for Rapid Superconductor Characterization.

Final rept.

J. Moreland, and L. F. Goodrich. 1989, 4p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 25, n2 p2056-2059 Mar 89.

Keywords: *Superconductors, *Electric contacts, Sintering, Silver, Powder(Particles), Electric contacts, Sin-tering, Silver, Powder(Particles), Electrical resistivity, Electrical measurement, Reprints, *High temperature superconductors, *Yttrium barium cuprates, *Barium yttrium cuprates, Critical current.

A new method was developed for making current con-tacts and voltage taps to YBa2Cu3Ox sintered pellets for rapid superconductor characterization. Ag wire screens are interleaved between calcined powder sec-tions and then fired at 930 C to form a composite pellet for resistivity and critical current measurements. The Ag diffuses into the powder during the sintering process forming a proximity contact that is permeable to O2. In this configuration, current can be uniformly in-jected into the ends of the pellet through the bonded Ag screen electrodes. Also, Ag screen voltage con-tacts, which span a cross section of the pellet, may provide an ideal geometry for detecting voltage drops along the pellet, minimizing current transfer effects.

Keywords: *Josephson junctions, *Electric potential, *Plasma frequency, Bessel functions, Cusps(Mathematics), Superconductivity, Bias, Reprints, Chaos, Catastrophe theory.

At bias frequencies much higher than the plasma frequency, the zero-voltage state of the rf-biased Joseph-son junction is known to span a range of dc bias pro-portional to the zero-order Bessel function of the rf amplitude. This pattern is modified at frequencies near the plasma frequency by the onset of chaotic instabilities and by the presence of cusp catastrophes.

Intermittent switching in the voltage-current character-istics (VIC) of thin film bridges of YBa2Cu3Ox have been observed. At a fixed bias point there are multiple metastable voltage states with lifetimes which depend the state of the sta on the bias current and applied magnetic field. The mi-crobridges are made of thin (<500nm), polycrystalline films of YBa2Cu3Ox which are patterned by liftoff into structures with dimensions ranging from less than 1 micro m to 100 micro m. Details of the fabrication proc-ess and the measurements are presented. The results are discussed in the context of fluctuations in the effective resistance of the bridge due to motion of trapped flux.

Keywords: *Desorption, *Ionization, *Surface proper-ties, Photons, Electron impact, X ray spectroscopy, Radiation damage, Silicon, Ruthenium, Reprints, Auger electron spectroscopy, Transmission electron microscopy.

Some of the benefits and pitfalls of electron and photon stimulated (ESD/PSD) processes at surfaces are described. The benefits include useful information about the local structure of surface molecules, provided by electron stimulated desorption ion angular distri-butions (ESDIAD). ESDIAD is an effective surface structural tool because the directions of ion desorption are determined by the orientation of the surface bonds ruptured by electron or photon bombardment. Other benefits of electron and photon-stimulated damage processes at surfaces include electron and photon beam lithography in microelectronics. The pitfalls of ESD/PSD include beam damage in surface analysis (by Auger electron spectroscopy, X-ray photoelectron spectroscopy and high resolution transmission electron microscopy and high resolution transmission elec-tron microscopy), the PSD of gases from vacuum walls in fusion reactors and synchrotron radiation sources, and inaccurate pressure readings due to ESD effects in ionization gauges.

MD. Ceramics Div. Electron Diffraction Study of the Faceting of Tilt Grain Boundaries in NiO.

J. A. Eastman, M. D. Vaudin, K. L. Merkle, and S. L.

Sponsored by Department of Energy, Washington, DC. Pub. in Philosophical Magazine A 59, n3 p465-477 1989.

Keywords: *Diffraction, *Grain boundaries, *Crystal dislocations, *Nickel oxides, Crystal lattices, Electron microscopy, Reprints.

The diffraction effects expected from a periodically faceted boundary containing a periodic array of dislo-cations in the long facet have been analyzed. The characteristic manifestation in reciprocal space of peri-

odic faceting was identified as the occurrence of bundles of reciprocal lattice rods; within each bundle the rods are displaced with respect to each other parallel to their length in a manner related to the facet geometry. Electron diffraction and microscopy were used to study the facet structure of tilt boundaries in NiO, and the boundary structure deduced from the observed diffraction effects was in good agreement with the imagfraction effects was in good agreement with the imag-ing observations. In those cases where there was only one type of dislocation present in the long facet, it was possible to determine the average boundary plane, the dislocation spacing in the long facet, the facet period and the facet height from electron diffraction observa-tions. The technique is especially useful for large-angle boundaries having high-index rotation axes, where little datailed information acet using where little detailed information can be obtained using imaging techniques.

Spin-Density-Wave Transition in Dilute YGd Single Crystals.

Final rept.

L. E. Wenger, G. W. Hunter, J. A. Mydosh, J. A. Gotaas, and J. J. Rhyne. 1986, 4p Pub. in Physical Review Letters 56, n10 p1090-1093 1986.

Keywords: *Yttrium alloys, *Magnons, Gadolinium containing alloys, Neutron diffraction, Specific heat, Single crystals, Phase transformations, Antiferromag-netism, Reprints, *Spin waves, Magnetic susceptibility, Magnetic ordering.

Neutron diffraction, heat capacity, and susceptibility measurements on dilute YGd single crystals with 1.5 to 4.4 at .% Gd show long-range helical magnetic order-ing at low temperatures. The neutron data reveal a periodic incommensurate spin structure with the Gd moments in the basal plane and a propagation wave-vector of 0.28c. A semicusp-like behavior is observed in the magnetic specific heats with the maxima occurring at similar temperatures as the susceptibility peaks (H perpendicular to c axis) and the onset of Bragg scattering. These results are quantitatively interpreted within a helical spin-density-wave stabilization of the conduction electrons.

Ergodic Behavior in Supercooled Liquids and In Glasses Final rept

D. Thirumalai, R. D. Mountain, and T. R. Kirkpatrick. 1989, 12p

Grants MSF-CHE86-09722, NSF-DMR86-07605 Sponsored by National Science Foundation, Washing-

ton, DC

Pub. in Physical Review A 39, n7 p3563-3574, 1 Apr 89.

Keywords: *Ergodic processes, *Glass, *Liquids, *Phase transformations, Supercooling, Statistical me-chanics, Correlation, Mathematical models, Symmetry, Vitreous state, Molecular relaxation, Reprints.

Ergodic behavior in liquids, supercooled liquids, and glasses is examined with a focus on the time scale needed to obtain ergodicity. In addition to broken ergodicity, the possibility that a subtle symmetry is broken as the liquid-to-glass transition takes place is exam-ined. It is suggested that a 'discrete' symmetry, to be referred to as the statistical symmetry, is broken in the glassy phase. This is illustrated by analyzing the distri-bution of the energy of the particles. Based on this, long-time dynamics and structural relaxation in glasses will be dominated by fluctuations in domains of finite length within which the particles are highly correlated. This is in accord with the ideas of Adams and Gibbs. All of the above arguments are illustrated with the aid of molecular-dynamics simulations of soft-sphere mixtures.

Liquid, Crystalline and Glassy States of Binary Charged Colloidal Suspensions. Final rept.

R. O. Rosenberg, D. Thirumalai, and R. D. Mountain. 1989, 6p Grant NSF-CHE86-57396

Sponsored by National Science Foundation, Washington, DC. Pub. in Jnl. of Physics: Condens. Matter 1, p2109-2114 1989.

Keywords: *Suspending(Mixing), *Colloids, Polysty-rene, Spheres, Liquids, Vitreous state, Crystallization, Computerized simulation, Reprints.

The formation of the liquid, crystalline, and glassy states in binary mixtures of aqueous suspensions of charged polystyrene spheres of different sizes is investigated. It is shown that on merely mixing the particles, crystalline (a substitutional body-centered cubic) and glassy states are readily formed for a 1:1 mixture at appropriate values of the density. These results are in agreement with recent experimental studies. The ease of formation of the crystal and the glassy phases is rationalized by an analysis of the local potential energy profiles calculated using the Hessian (dynami-cal matrix). It is suggested that the eigenvalues of such a Hessian can be used to define a preferred length in any glassy system.

88.

Keywords: *Antiferromagnetism, *Holmium compounds, *Erbium compounds, Crystal lattices, Electric fields, Neutron diffraction, Low temperature research, Reprints, *Heusler alloys.

Neutron scattering techniques have been employed to investigate the magnetic properties of the cubic Heusler alloys HoPd2Sn and ErPd2Sn. Both materials exhibit an fcc type-II antiferromagnetic order, with T(sub N)=5.0 and 1.0 K for Ho and Er materials, respectively. However, there is an additional modulation of this basic structure. Inelastic neutron scattering measurements have been performed by time-of-flight techniques to determine the crystal field levels of the rare-earth ions. The (cubic) Lea, Leask, and Wolf crystal field parameters were determined to be $W=0.0287(4)\,\text{meV},x=0.3248(8)$ for HoPd2Sn, and $W=-0.0450(4)\,\text{meV},x=0.3022(6)$ for ErPd2Sn.

Exchange and Magnetostrictive Effects in Rare Earth Superlattices.

Final rept.

J. J. Rhyne, R. W. Erwin, J. Borchers, M. B. Salamon, R. Du, and C. P. Flynn, 1989, 17p

Pub. in Jnl. of the Less-Common Metals 148, p17-33 1989.

Keywords: *Single crystals, *Rare earth elements, *Thin films, *Yttrium, *Neutron diffraction, *Ferromag-netism, Magnetic properties, Dysprosium, Erbium, Crystal structure, Crystal lattices, Reprints.

Single-crystal multilayer films with alternate heavy rare earth and yttrium layers have been shown by neutron diffraction to exhibit long-range magnetic order. Analy-sis of the neutron results on Dy/Y and Er/Y super-lat-tices shows that the phase of the modulated magnetic structures in the dysprosium and erbium is preserved across the intervening yttrium non-magnetic layer and corresponds to a 'pseudo turn-angle' near 51 degrees in the yttrium, which is in accord with theoretical calculations from the band structure. The ferromagnetic transitions occurring in the pure elements are com-pletely suppressed in the multilayers as a result of epitaxial 'clamping' by the yttrium layers, which inhibits the development of sufficient magnetostrictive strain to induce the phase transition. The temperature of the intermediate transitions in Er/Y multilayers is also modified by magnetostriction, and evidence is found for different turn-angles for c axis and basal plane moment components.

PB89-228076 Not available NTIS National Inst. of Standards and Technology (NEL), Boulder, CO. Thermophysics Div. Torsional Plezoelectric Crystal Viscometer for Compressed Gases and Liquids.

D. E. Diller, and N. V. Frederick. 1989, 13p Sponsored by Department of Energy, Washington, DC. Pub. in International Jnl. of Thermophysics 10, n1 p145-157 Jan 89.

Keywords: *Piezoelectric crystals, *Viscometers, *Gases, *Liquids, Pressure, Temperature, Impedance, Argon, Methane, Resonance, Reprints.

A torsional piezoelectric crystal viscometer for compressed gases and liquids at temperatures to 600 K and at pressures to 70 MPa has been developed. Several torsional crystals were prepared from swept (electrolyzed) quartz to obtain a good performance at high temperatures. Measurements of the bandwidth of the crystal resonance curve were automated using an impedance analyzer. The viscometer was tested on compressed gaseous argon and methane at temperatures to 500 K and at pressures to 50 MPa. The measure-ments differ from accurate wide-range correlating equations by less than 2%.

Resistance Measurements of High T(sub c) Super-conductors Using a Novel 'Bathysphere' Cryostat. Final rept.

J. Moreland, Y. Li, R. M. Folsom, and T. E. Capobianco. 1989, 3p Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Magnetics 25, n2 p2560-2562 Mar 89.

Keywords: *Superconductors, *Electrical resistance, *Cryostats, Magnetic fields, Critical temperature, Defi-nitions, Thermodynamics, Reprints, *High temperature superconductors, Temperature dependence, Cryogen-is any interact Rethingtheraperature ic equipment, Bathyspheres.

The authors have developed a novel cryostat for variable temperature testing of high temperature super-conductors. The cryostat is a bathysphere consisting of an overturned stainless steel Dewar suspended in liquid helium. Results for resistance versus temperature of some high temperature superconductors in a magnetic field are presented. Also, vanous definitions for thermodynamic and practical T sub c derived from transport resistance measurements are suggested and discussed. These definitions are based on T sub c midpoint, various relative resistance criteria, or absolute resistivity criteria.

The authors have used the squeezable electron tunneling junction technique for testing the electrical properties of the surfaces of YBa2Cu3Ox (YBCO) thin-film electrodes. As deposited and annealed, the sur-faces of the electrodes were insulating at 4 K. Several methods were used to improve the electrical proper-ties of the electrodes' surfaces including rapid thermal annealing, oxygen sputter etching, and thin Ag coating treatments. The greatest improvement occurred after a deposition of a 5 nm Ag coating and subsequent rapid thermal anneal of one set of YBCO films. Under these conditions it was possible to make a supercon-

ducting Josephson point contact between the surfaces of the electrodes. The authors think that the Ag acts as a normal-metal proximity layer effectively shunting the degraded electrodes' surfaces.

 J. R. Lowney, and H. S. Bennett. 1989, 5p
 Pub. in Jnl. of Applied Physics 65, n12 p4823-4827, 15 Jun 89.

Keywords: *Semiconductor devices, *Gallium arsen-ides, *Silicon, *Energy gap, Semiconductor doping, Reprints, Quantum wells.

The limitations of the theory for band-gap narrowing, which is based on uniform material, are considered in devices that have steep doping gradients. Validity cri-teria are derived that place upper bounds on the dopant and carrier density gradients for the application of the results from uniform theory. The existence of wave-function tailing beyond the potential barriers that occur in devices is studied. At room temperature the effects due to these tails are usually small, but at low effects due to these tails are usually small, but at low temperatures they can become very significant.

perconductors. Final rept.

H. M. Ledbetter, and S. A. Kim. 1988, 4p Pub. in Physical Review B 38, n16 p11857-11860, 1 Dec 88.

Keywords: *Superconductors, *Phase transforma-tions, Barium titanates, Hysteresis, Elastic properties, Ultrasonic radiation, Acoustic velocity, Reprints, *High temperature superconductors, *Yttrium barium cuprates, *Barium yttrium cuprates, Holmium barium cu-prates, Europium barium cuprates.

The authors studied ultrasonic-wave velocities, both longitudinal and shear, in YBa2Cu3O7-x between 5 and 295 K, during both cooling and warming. Both waves, especially the longitudinal, show thermal hys-teresis. The results suggest a hysteretic phase change that occurs between 160 and 170 K during cooling, and between 170 and 260 K during warming. This phase-change hypothesis explains anomalies in sev-eral physical properties. The phase change agrees with thermodynamic instability predictions. The auwith thermodynamic instability predictions. The au-thors confirmed the hysteresis in Ho-Ba-Cu-O, where it is smaller than in Y-Ba-Cu-O, and in Eu-Ba-Cu-O, where it is larger. In a comparison perovskite, BaTiO3 they observed zero hysteresis. At T(c), 91 K, sound velocities show no measurable change in either magnitude or slope. This continuity disputes the current pop-ular view that, contrary to thermodynamics, elastic stiffness increases upon cooling through T(c) into the superconducting state. The authors believe that stiffening results from the usual thermal effects after a phase transformation from a stiffer phase.

The critical temperature T sub c(n) of systems, such as the TI and Bi compounds, containing n CuO2 planes per cluster is discussed theoretically within semi-phe-nomenological models which are based upon the exchange of (unspecified) high-energy bosons (omega > > omega(phonon)) between different CuO2 planes. Applied to representative data for the TI2 com-pounds, the models predict rapid saturation of T sub c(n) at relatively low n, with the possibility of a diminu-tion beyond n = 3. Within the theoretical framework, these qualitative features appear to be quite general for this class of materials.

Final rept.

M. Nikolo, and R. B. Goldfarb. 1989, 4p Pub. in Physical Review B 39, n10 p6615-6618, 1 Apr 89.

Keywords: *Superconductors, *Flux, *Creep proper-ties, *Activation energy, *Grain boundaries, Magnetic hysteresis, Temperature, Reprints.

The ac susceptibility of sintered YBa2CuO7-delta pellets as a function of temperature and ac magnetic-field amplitude and frequency was measured. The imagi-nary part of the susceptibility chi double prime exhibits two peaks. A narrow peak is located at the critical temperature of the grains. A broad peak at lower tempera-ture is attributed to hysteresis losses at the grain boundaries. There is a small shift in this coupling peak to higher temperature as the frequency increases from 10 to 1000 Hz. The shift is explained in terms of Ander-son flux creep on a time scale of milliseconds. The shift depends on the amplitude of the measuring field. The activation energy for flux creep ranges from 11.9 The activation energy for hits cleap ranges form 1.5+ or - 1.0 eV in the zero-field limit (0.8 Am(sup -1) (0.01 Oe)) to 1.2 + or - 0.3 eV at 800 Am(sup -1) (10 Oe). The data is extrapolated to find the value for an intergrain decoupling field of 1-2 kAm(sup -1) (13-25 Oe), above which flux creep presumably becomes flux flow of the strip houndaries flow at the grain boundaries.

p2445-2448 May/Jun 89.

Keywords: *Surfaces, Fluorine, Silicon, Adsorption, Reprints, *Photon stimulated desorption, *Electronic structure.

The yield of ions desorbed via excitation of the Si 2p and F 1s levels was measured for fluorine adsorbed on Si(111). These photon-stimulated desorption (PSD) spectra were compared with the absorption measured via secondary or Auger electrons. It was seen that the PSD is dominated by direct excitations, and that the PSD spectra are sensitive to the final-state density at the local atomic site associated with the initial excita-tion. At the Si 2p edge, the PSD is sensitive to the oxidation state of the bonding silicon atom. At the F 1s edge, it is sensitive to the correspondence between the polarization vector of the incident light and the bond direction. Measurements of the kinetic energies of the desorbed ions were used to ascertain details of the desorption mechanism.

Final rept. W. L. Morgan. 1989, 3p Pub. in Applied Physics Letters 55, n2 p106-108, 10 Jul 89.

Keywords: *Sputtering, Monte Carlo method, Deposi-tion, Simulation, Substrates, Reprints, *Resputtering, Universal curves.

The process of resputtering material being sputter de-posited onto a substrate is investigated via Monte Carlo simulations and simple analytical models. This resputtering comprises contributions from self-sputter-ing and from neutralized ions reflected from the target being sputtered. The results of these models are in reasonable agreement with recent measurements over a wide variety of gases and metal targets. When plotted versus a dimensionless mass parameter, the intrinsic resputtered fraction lies on a seemingly universal curve. The reason for this becomes clear through the development of simple analytical models.

Directional Solidification of a Planar Interface in the Presence of a Time-Dependent Electric Current.

L. N. Brush, S. R. Coriell, and G. B. McFadden. Sep 89, 53p NISTIR-89/4161

Keywords: *Crystal growth, *Electric current, Peltier effect, Thermoelectricity, Ohmic dissipation, Resist-ance heating, Bismuth, Mathematical models, Indium antimonides, Germanium containing alloys, Tin alloys, *Directional solidification(Crystals), Numerical solu-tion, Electromigration.

The paper develops a numerical method to study the motion of a planar crystal-melt interface during the directional solidification of a binary alloy in the presence of a time-dependent electric current. The model in-cludes the Thomson effect, the Peltier effect, Joule heating and electromigration of solute in the coupled set of equations governing heat flow in the crystal and melt, and solute diffusion in the melt. For a variety of time dependent currents, the temperature fields and interface velocity are calculated as functions of time for indium antimonide and bismuth, and for the binary alloys, germanium-gallium and tin-bismuth. For the

Solid State Physics

alloys, it also calculates the solid composition of a function of position, and thus makes quantitative pre-dictions of the effect of an electrical pulse on the solute distribution in the solidified material. In addition, for a sinusoidal current of small amplitude, it compares the numerical solutions with approximate analytical solutions valid to first order in the current amplitude. By using the numerical approach the specific mechanisms which play dominant roles in interface demarcation by current pulsing can be identified.

Final rept. R. C. Casella. 1989, 3p

Pub. in Applied Physics Letters 55, n9 p908-910, 28 Aug 89.

Keywords: *Superconductivity, Bismuth inorganic compounds, Thallium inorganic compounds, Copper oxides, Comparison, Reprints, *High temperature su-perconductors, *Boson-exchange models, Cuprates.

Semiquantitative tests are considered of models in which high T(c) superconductivity follows from the ex-change of unspecified intermediate bosons (IB) with omega >> omega(phonon) between fermionic pairs in different CuO(2) layers. Earlier predictions of the dependence of T(c)(n) on the number n of layers per cluster and extended to include the possibility that T(c)(n = 1) < about 10K in the T11201 and 2201 compounds. In common with other authors rapid saturation of T(c)(n) with increasing n is found here. Nonetheless, the experimental value of T(c)(n = 1) in the TI and Bi systems can play an important role in discriminating between the various models empirically.

of Er/Y Superlattices. Final rept.

J. Borchers, M. B. Salamon, R. Du, C. P. Flynn, R. W. Erwin, and J. J. Rhyne. 1988, 4p Pub. in Superlattices and Microstructures 4, n4 pt5 p439-442 1988.

Keywords: *Erbium, *Ytterbium, Phase transforma-tions, Neutron diffraction, Reprints, *Superlattices, Molecular beam epitaxy, Magnetic ordening, Multilavers.

Coherent, crystalline superlattices of erbium and yttnium have been prepared by molecular beam epitaxy techniques. Magnetometer measurements indicate that the transition temperatures for the superlattices are significantly lower than those for pure erbium. The ferromagnetic phase observed in erbium is completely supressed. Neutron diffraction studies show that the periodic magnetic order of Er propagates through the Y layers, but has a temperature independent magnetic wavelength. These results suggest that the erbium magneto-elastic energy has been altered in the superlattice samples.

Solid State Physics

Magnetic Order of Pr in PrBa2Cu307.

Wight rept. W. H. Li, J. W. Lynn, S. Skanthakumar, T. W. Clinton, A. Kebede, C. S. Jee, J. E. Crow, and T. Mihalisin. 1989. 4p

Pub. in Physical Review B 40, n7 p5300-5303, 1 Sep

Keywords: Specific heat, Neutron diffraction, Magnetic moments, Reprints, *Praseodymium banum cuprates, *Barium praseodymium cuprates, *Magnetic ordering, *Praseodymium ions, Magnetic susceptibility, Antiferromagnetic materials.

The magnetic order of Pr in nonsuperconducting PrBa2CuO7 has been studied by specific-heat, susceptibility, and neutron-diffraction measurements. The basic ordering consists of a simple antiferromagnetic arrangement, with a saturated moment of 0.74 (mu sub s) and a Neel temperature T(N) of about 17 K, which is two orders of magnitude higher than expected from either dipolar or Rudeman-Kittel-Kasuya-Yosida interactions alone. The small moment, along with the large value of the low-temperature electronic specific-heat coefficient gamma of 196 mJ/mole(K squared), sug-gests that there is substantial f-electron character at the Fermi level.

Pub. in Physical Review B 40, n7 p5172-5175, 1 Sep

Keywords: Neutron diffraction, Neel temperature, Re-prints, *Neodymium banum cuprates, *Barium neo-dymium cuprates, *Magnetic ordering, *Copper ions, Pressure dependence, Antiferromagnetic materials, High temperature superconductors.

Neutron-diffraction measurements have been carried out as a function of hydrostatic pressure to study the magnetic order of the Cu spins in NdBa2Cu3O(6.35) and NdBa2Cu3O6.1). In the high-temperature phase, where the Cu planes order antiferromagnetically, it is found that the Neel temperature T(N1) is very strongly dependent on pressure, increasing at the rate of about 23 K/kbar. The authors attribute this phenomenal sensitivity to the two-dimensional-like behavior of this magnetic system. In the low-temperature phase, which is associated with magnetic ordering of the chains, only a small change in the ordering temperature T(N2)is observed.

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. Pub. in Applied Physics Letters 55, n13 p1333-1335, 25 Sep 89.

Keywords: *Indium arsenides, Silicon, Substrates, Ad-sorption, Desorption, Reprints, *Epitaxial growth, Auger electron spectroscopy, Laser induced fluorescence, Semiconductor materials.

Adsorption and desorption of In on partially and fully As-terminated Si(100) are investigated by laser-in-duced fluorescence detection and Auger electron spectroscopy using the methods of temperature pro-grammed desorption and isothermal desorption. Desorption measurements show that As is bound to the surface more strongly than In. For In, a 2/3 order kinet-ic desorption mechanism is observed. This and Si auger intensity attenuation measurements indicate a strong tendency for In to form three-dimensional is-lands on the As-terminated surface. The activation energy for In diffusion from the islands ranges from 1.5 to 1.9 eV, depending on the As coverage. The results have important implications for growth of InAs on Si(100).

National Inst. of Standards and Technology (NEL), Boulder, CO. Electromagnetic Technology Div. Offset Criterion for Determining Superconductor Critical Current.

Final rept. J. W. Ekin. 1989, 3p

Pub. in Applied Physics Letters 55, n9 p905-907, 28 Aug 89.

Keywords: *Superconductors, Standards, Criteria, Reprints, *Critical current, High temperature superconductors.

Critical-current criteria based on electric field or resistivity can present a number of problems in defining crit-ical current, especially for high T(c) superconductors in the vicinity of the critical temperature or upper critical field. The resulting critical-current density J(c) can be quite arbitrary, since it depends strongly on criterion level at high fields and temperatures. These J(c) defini-tions also create problems in distinguishing between superconductors and high-conductivity normal metals such as copper. They can also bias J(c) data when superconductors are compared that have different values of normal-state resistivity. To minimize these problems, an intrinsic J(c) criterion is proposed, which effectively separates superconducting and normalstate properties. Based on the long-standing concept of a flux-flow resistivity, J(c) is defined as the current where the tangent to the E-J curve at a given electric field level extrapolates to zero electric field. This determines an offset J(c) that minimizes the above problems. The criterion is particularly useful near T(c) or near the effective upper critical field where the E-J characteristic starts to approach ohmic behavior.

Direct Observation of Surface-Trapped Diffracted Waves.

Final rept T. Jach, D. B. Novotny, M. J. Bedzyk, and Q. Shen.

1989, 4p Pub. in Physical Review B 40, n8 p5557-5560, 15 Sep

Keywords: *X ray diffraction, Surface roughness, Germanium, Interfaces, Reprints, Grazing incidence.

The authors have made the first direct observation of a diffracted x-ray beam that occurs only at an interface in the grazing-angle diffraction geometry. The beam, which is unable to propagate into the bulk of either component of the interface, was detected at the surface of a Ge crystal. A roughened area etched into the surface permitted phase matching to a beam in the vacuum. The diffracted beam that is observed to escape in this configuration shows a wave-vector dependence that cannot be qualitatively explained by purely kinematic models of scattering from rough surfaces.

Keywords: *Magnetic domains, Whiskers(Single crystals), Microstructure, Polarization(Spin alignment), Cobalt, Iron, Reprints, *Imaging techniques, Electron spin polarization.

An ability to study the properties of microscopic mag-netic structures and to investigate magnetic properties with submicron spatial resolution is important both for its fundamental scientific value and its usefulness in applied magnetic technology. Many current tech-niques for the investigation of magnetic structures suffer either from poor spatial resolution or from the inability clearly to separate contrast due to magnetic structures from that due to topographic or other physi-cal features. The authors describe a method of magnetic imaging that overcomes many of the difficulties of other current techniques and that allows quantitative analysis at high spatial resolution of the vectorial properties of sample magnetization.

Effect of a Crystal-Melt Interface on Taylor-Vortex Flow.

G. B. McFadden, S. R. Coriell, B. T. Murray, M. E. Glicksman, and M. E. Selleck. Oct 89, 22p NISTIR-89/4192

Prepared in cooperation with Rensselaer Polytechnic Inst., Troy, NY. Dept. of Materials Engineering.

Keywords: *Crystal growth, *Hydrodynamics, Solidifi-cation, Morphology, Stability, Couette flow, Taylor instability

The linear stability of circular Couette flow between concentric infinite cylinders is considered for the case that the stationary outer cylinder is a crystal-melt inter-face rather than a rigid surface. A radial temperature difference is maintained across the liquid gap, and equations for heat transport in the crystal and melt phases are included to extend the ordinary formulation of the problem. The stability of the two-phase system depends on the Prandtl number. For small Prandtl number the linear stability of the two-phase system is given by the classical results for a rigid-walled system. For increasing values of the Prandtl number, convective heat transport becomes significant and the system becomes increasingly less stable. Previous results in a narrow-gap approximation are extended to the case of a finite gap, and both axisymmetric and non-axisymmetric disturbance modes are considered. The twohave system becomes less stable as the finite gap tends to the narrow-gap limit. The two-phase system is more stable to non-axisymmetric modes with azimuthal wavenumber n = 1; the stability of these n = 1 modes is sensitive to the latent heat of fusion.

Linear Elastic Fracture Mechanics.

Pinal rept. P. R. Heyliger. 1988, 15p Pub. in Engineering Fracture Mechanics 31, n1 p157-

Keywords: *Finite element analysis, Displacement, Stress analysis, Numerical analysis, Stiffness meth-ods, Elastic analysis, Reprints, *Elastic fracture me-chanics, Quarter-point element, Stress intensity factor, J-integral technique.

The numerical performance of conventionally configured and quarter-point mixed elements is examined for planar problems in linear elastic fracture mechanics. Because of the independent approximations of the displacement and stress components characteristic of the mixed formulation, the shifting of a mid-side node of an element to the quarter-point results in a singular strain but a finite stress at the corner node. For the example problems considered, the conventional and quarter-point mixed elements provide lower and upper bounds, respectively, for the strain energy of a cracked body. Mode I stress intensity factors are computed for several representative geometries using the crack extension, stiffness derivative and J-integral techniques. The quarter-point elements yield superior results only for the J-integral technique, with each of the three techniques giving excellent results for very coarse mesh configurations.

Elastic Interaction and Stability of Misfitting Cuboldal Inhomogeneities. Final rept.

W. C. Johnson, and P. W. Voorhees. 1987, 10p Pub. in Jnl. of Applied Physics 61, n4 p1610-1619 1987

Keywords: *Elastic analysis, *Stability, Energy meth-ods, Matrix methods, Elastic properties, ods, Matrix methods, Elastic properties, Plates(Structural members), Precipitates, Heterogeneity, Reprints.

The elastic interaction energy between several rectan-gular parallel-epipeds and the elastic self energy of a cuboid are calculated to first-order in the difference in elastic constants between the precipitate and matrix. The system is assumed to be isotropic and the precipitates to possess a dilatational misfit. The functionality and magnitude of the interaction energy per precipitate is extremely sensitive to the precipitate morphology and number of precipitates considered. The interaction energy between three or more precipitates cannot be accurately estimated by summing the pairwise interac-tions. The influence of the interaction energy on the stability of precipitate arrays is discussed.

Sponsored by Air Force Weapons Lab., Kirtland AFB, NM

Keywords: *Bonding strength, *Sands, *Tension tests, Adhesive strength, Bonding, Cements, Grain structure, Tensile strength, Breaking load, Tensile stress.

A method to measure the tensile bond strength between two weakly-cemented sand grains was developed. Special microloading testing equipment was de-veloped to measure the force required to pull apart two sand grains. To illustrate the method, bond strengths were measured in tension for six pairs of cemented sand grains. A wide range in the bond failure stress occurred and was attributed primarily to (a) difficulties in identifying and measuring the actual bond failure surface area and, (b) eccentricity in the specimens during loading. The method developed is seen as a starting point and can be used as a basis for further development. Improved techniques need to be devel-oped to identify and measure the actual bond failure surface area and to reduce, or at least measure and account for, the eccentricity introduced.

Higher Order Beam Finite Element for Bending and Vibration Problems.

Final rept.

P. R. Heyliger, and J. N. Reddy. 1988, 18p

Pub. in Jnl. of Sound and Vibration 126, n2 p309-326 1988

Keywords: *Beams (Supports), *Finite element analy-sis, Vibration, Bending, Shear properties, Deformation, Reprints, Timoshenko beams, Rectangular configuration, Numerical solution.

The finite element equations for a variationally consistent higher order beam theory are presented for the static and dynamic behavior of rectangular beams. The higher order theory correctly accounts for the stress-free conditions on the upper and lower surfaces of the beam while retaining the parabolic shear strain distribution. The need for a shear correction coefficient is therefore eliminated. Full integration of the shear stiffness terms is shown to result in the recovery of the Kirchoff constraint for thin beams without introducing spurious locking constraints. The accuracy of this for-mulation is demonstrated by using several numerical examples for the cases of small and large displacements. For a hinged-hinged beam, the linear thickness-shear mode frequency can be matched with the Timoshenko frequency to yield a shear coefficient of 0.824. Matching the bending frequencies between the two theories indicates a shear coefficient for the Timoshenko theory that changes with mode number and slenderness ratio. The influence of in-plane inertia and slenderness ratio on the non-linear frequency is examined for beams with a number of different support conditions.

MD. Reactor Radiation Div. Use of Multiple-Slot Multiple Disk Chopper Assemblies to Pulse Thermal Neutron Beams.

J. R. D. Copley. 1988, 10p Pub. in Nuclear Instruments and Methods in Physics Research A273, p67-76 1988.

Keywords: *Neutron beams, *Thermal neutrons, Neu-tron scattering, Reprints, *Neutron choppers, Time-of-flight method, High resolution.

Single-slot disk choppers are commonly used to pulse thermal neutron beams, but their use in high resolution applications is limited because the maximum transmit-ted beam intensity, given that the chopper is rotating at its maximum possible speed, is proportional to the square of the burst time of the chopper, which is itself proportional to the width of the incident beam. The transmitted intensity can be doubled, with no associattransmitted intensity can be doubled, with no associat-ed increase in the burst time, by doubling the beam width and using counter-rotating choppers to double the effective chopping speed. In order to increase the intensity still further, without degrading the resolution, the author proposes the use of multiply-slotted chop-pers in combination with a multiply-slotted beam mask. With two slots in each of two choppers and a mask, the intensity is four times that of the single-slot single chopper arrangement. A further doubling is achieved if a system of three choppers and a mask, each fitted with four slots, is employed. The effects of relative phasing errors in multiple chopper systems are examphasing errors in multiple chopper systems are examined in detail, and the implications of nonzero chopper separation and nonzero radial slot extent are briefly discussed.

A model is presented that predicts major features of the evaporation of water droplets deposited on a hot non-porous solid surface. In the temperature range of interest, nucleate boiling heat transfer is fully sup-pressed, hence the model is only concerned with the evaporative process. In the model, the solid material is assumed to have high thermal conductivity and diffusi-vity, so that the surface temperature under the water droplet can be considered uniform. The temperature of this portion of a larger solid surface covered by the

General

liquid is calculated from the classic solution for contact temperature between two semi-infinite bodies. The liquid-vapor interfacial temperature and the watervapor molar fraction in the air at the exposed surface of the water droplet are deduced from the coupled heat and mass transfer energy balance at the inter-face. Spatial and temporal integration of the overall droplet energy equation is used to predict the droplet evaporation time and the instantaneous evaporation rate. Model predictions for the total evaporation time and temporal variation of the droplet volume agree well with experiments performed using a heated aluminum block.

Final rept.

L. F. Goodrich, and S. L. Bray. 1988, 7p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in Cryogenics 28, p737-743 Nov 88.

Keywords: *Superconductors, Titanium alloys, Direct current, Alternating current, Power supplies, Electro-magnetic noise, Reprints, *Critical current, Niobium alloys, Ripples.

The effect of current ripple or noise on d.c. critical current measurements was systematically studied. Measurements were made on multifilamentary Nb-Ti supersupply was required in the study in order to make the pure d.c. critical current measurements. Also, an elec-tronic circuit that stimulates a superconductor's gener-al current-voltage characteristic was developed and used as an analysis tool. In order to make critical current measurements in which current ripple was present, the battery supply was modified to allow the introduction of controlled amounts of a.c. npple. The results of this work are general and quantitatively applicable to the evaluation of critical current data and measurement systems. A theoretical model was developed to further support and explain the ripple effect. An unexpected benefit of this work was a more precise method for general critical current data acquisition. Problems common to all large conductor critical current measurements are discussed.

Time and Frequency Div. Perpendicular Laser Cooling of a Rotating ion Plasma in a Penning Trap.

Final rept.

W. M. Itano, L. R. Brewer, D. J. Larson, and D. J.

Wineland, 1988, 9p Sponsored by Office of Naval Research, Arlington, VA., Air Force Office of Scientific Research, Washing-ton, DC., and National Science Foundation, Washington, DC.

Pub. in Physical Review A 38, n11 p5698-5706, 1 Dec 88.

Keywords: Temperature measurement, Reprints, *Beryllium ions, Beryllium 9, Laser cooling, Penning traps, Ion storage.

The steady-state temperature of an ion plasma in a Penning trap, cooled by a laser beam perpendicular to the trap axis, has been calculated and measured. The rotation of the plasma, due to crossed E and B fields, strongly affects the minimum attainable temperature. This is because the velocity distribution of the ions, as seen by a laser beam intersecting the plasma at some distance from the axis of rotation, is skewed, and this leads to a change in the velocity distribution (and hence temperature) at which a steady state is attained. The calculated temperature is a function of the intensi-

ty, frequency, and position of the laser beam, and of the rotation frequency of the plasma. Temperatures of (9)Be(1+) plasmas were measured for a wide range of experimental parameters. The lowest and highest tem-peratures were approximately 40 mK and 2 K. The measured and calculated temperatures are in agreement.

Atomic-Ion Coulomb Clusters in an Ion Trap. Final rept. D. J. Wineland, J. C. Bergquist, W. M. Itano, J. J. Bollinger, and C. H. Manney. 1987, 4p Sponsored by Office of Naval Research, Arlington, VA., and Air Force Office of Scientific Research, Washington, DC. Pub. in Physical Review Letters 59, n26 p2935-2938, 28 Dec 87.

28 Dec 87.

Keywords: Atomic spectroscopy, Reprints, *Mercury ions, Ion traps, Laser cooling, Ion storage, Wigner crystallization.

Small numbers of laser-cooled Hg(1+) ions, which are confined in a Pual radio-frequency ion trap, to crystallize into regular arrays or clusters were observed. The structure of these clusters was investigated by direct structure of these clusters was investigated by direct imaging, optical spectroscopy, and numerical calcula-tions. The spectroscopy of such 'pseudomolecules' is unique in that individual atoms of the molecule can be probed separately. The ratio of Coulomb potential energy per ion to k(B)T in these clusters is observed to be achieve as 100 be as high as 120.

National Bureau of Standards (NEL), Gaithersburg, MD. Precision Engineering Div. Electromagnetic Pulse Scattered by a Sphere.

Final rept.

E. Marx. 1987, 6p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Antennas and Propagation 35, n4 p412-417 1987.

Keywords: *Electromagnetic pulses, *Electromagnetic scattering, Integral equations, Magnetic fields, Spheres, Reprints, Transient radiation effects.

The magnetic field integral equation for transient elecsphere is solved by the stepping-in-time procedure. The contribution of the self-patch, where the integrand is singular, and of the neighboring patches to the sur-face current density are computed separately from the contributions of other patches to correct for inaccuracies. The term of the integrand with the time-derivative of the current density is shown to make a contribution to these corrections that cannot be neglected in calcu-lating the initial (small) values of the surface current density. The improvement in the values of the scat-tered fields due to these corrections is significant but not dramatic.

Calculation of Tighter Error Bounds for Theoreti-cal Atomic-Oscillator Strengths.

Final rept.

D. V. I. Roginsky, and A. W. Weiss. 1988, 7p Pub. in Physical Review A 38, n4 p1760-1766, 15 Aug 88

Keywords: Hartree-Fock approximation, Electron tran-sitions, Transition probabilities, Lithium, Sodium, Re-prints, *Oscillator strengths, Beryllium ions, Magnesium ions.

The authors report a series of calculations of error bounds to the Hartree-Fock approximation for the 2s-2p and 3s-3p transitions in lithium and sodium, and the singly ionized ions Be(1 +) and Mg(1 +). The purpose is to test the efficacy of various modifications of Wein-hold's effective-bounds formula for several simple but realistic examples of multielectron systems. The authors therefore assume the overlap error epsilon to be known, adopting overlap values from extensive vari-ational calculations. The authors find angular momentum projection of the transition operator to be effective in tightening the bounds, while the variational optimiza-

PHYSICS

General

tion of a mixture of length and velocity operators is not. The authors also found a wave-function projection based on Brillouin's theorem to be especially effective. When used in conjunction with angular momentum projection, this last procedure has yielded bounds for lithium very close to the known Hartree-Fock error.

MD. Thermophysics Div. Thermodynamic Values Near the Critical Point of Water.

Final rept. L. Haar, and J. S. Gallagher. 1986, 3p Pub. in Proceedings of International Conference on Properties of Steam (10th), Moscow, USSR, Septem-ber 3-7, 1984, p167-169 1986.

Keywords: *Thermodynamic properties, *Water, *Criti-cal point, Steam, Equations of state, Specific heat, Temperature, Pressure, Volume, Measurement.

In the immediate neighborhood of the critical point the thermodynamic consistency between very accurate measurements for the heat capacities, the speed of measurements for the heat capacities, the speed of sound, and pressure-volume-temperature values is ex-amined. For this purpose several thermodynamic for-mulations are employed, including: the Haar, Galla-gher, and Kell (HGK) formulation and the Pollak formu-lation, which everywhere are analytic, and the scaled equation for the critical region reported by Levelt Sengers, and co-workers, which is an expansion about a non-analytic critical point. It is shown that HGK and the scaled equation are in accord with the measurethe scaled equation are in accord with the measurements for the different thermodynamic properties; also, the recent PVT measurements by Hanafusa and co-workers are the most accurate yet made close to the critical point. A description is provided of the HGK formulation and specification of the liquid-vapor co-existence curve.

Systems Driven by Colored Squeezed Noise: The Atomic Absorption Spectrum.

Final rept.

H. Ritsch, and P. Zoller. 1988, 12p Pub. in Physical Review A 38, n9 p4657-4668, 1 Nov

Keywords: *Atomic spectra, *Absorption spectra, Sto-chastic processes, Reprints, *Squeezed light, chastic processes, Reprints, *Squeezed light, Squeezed states (Quantum theory), Bloch equations, Matrices.

Stochastic density-matrix equations are derived for an atom strongly driven by finite-bandwidth squeezed light. The quantum properties of the light are account-ed for by a doubling of dimensions of the stochastic process for c-number electric field amplitudes. Satura-tion properties and the weak-field absorption spectrum of a two-level atom embedded in finite-bandwidth squeezed light and driven by a coherent field are calculated. The effect of finite bandwidth of the squeezed light in obtaining subnatural linewidth in the atomic ab-sorption spectra is discussed, based on nonperturbative solutions of the stochastic optical Bloch equations.

Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of Applied Physics 64, n9 p4269-4277, 1 Nov 88

Keywords: *Sulfur hexafluoride, Collision cross sec-tions, Mixtures, Nitrogen, Oxygen, Neon, Gas ioniza-tion, Dissociation, Reprints, Electron-molecule collisions.

An improved set of electron-collision cross sections is derived for SF6 and used to calculate transport, ionization, attachment, and dissociation coefficients for pure SF6 and mixtures of SF6 with N2, O2, and Ne. Elec-tron kinetic energy distributions computed from numer-ical solutions of the electron-transport (Boltzmann) equation using the two-term, spherical harmonic ex-pansion approximation were used to obtain electron-transport and reaction coefficients as functions of E/N and the fractional concentration of SF6. Here E is the electric field strength and N is the gas number density. Attachment rate data for low concentrations of SF6 in N2 are used to test the attachment cross sections. Particular attention is given to the calculation of transport and reaction coefficients at the critical E/N = (E/P)N) sub c at which the ionization and attachment rates are equal.

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 38, n7 p3339-3350.

Keywords: Electron irradiation, Perturbation theory, Excitation, Reprints, *Calcium ions, *Electron-ion collisions.

Detailed calculations of the electron-impact excitation of Ca(1+) are performed using both perturbation theory and the close-coupling approach. Particular attention is focused on the resonance (4s-4p) excitation since experimental emission-cross-section data are available for this transition. The results of the most sophisticated model, a six-state (4s, 3d, 4p, 5s, 4d, 5p) close-coupling calculation with semiempirical Hartree-Fock target wave functions and including one- and two-body core-polarization potentials are in better agreement with the experimental cross section and resonance-fluorescence polarization data than any other calculation. At incident electron energies below

the 5s, 4d, and 5p thresholds, the six-state calcula-tions are essentially in agreement with the experimen-tal data, although rich resonance structures predicted by theory are not seen experimentally due to the finite energy resolution. At energies above the 5s, 4d, and 5p thresholds the six-state emission cross sections exceed the experimental cross sections by about 20% once ellowreaps in media for engaged for the 20%, once allowance is made for cascades from the 5s, 4d, and 5p levels.

Electron-Impact Excitation of Al(2+).

Final rept.

J. Mitroy, and D. W. Norcross. 1989, 8p Contract DOE-EA-77-A-01-6010

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 39, n2 p537-544, 15 Jan 89.

Keywords: Electron irradiation, Approximation, Excita-tion, Reprints, *Aluminum ions, *Electron-ion colli-sions, Bound state, Oscillator strengths.

Detailed calculations of the electron-impact excitation of the sodiumlike ion Al(2+) were performed using both the unitarized Coulomb-Born approximation and the close-coupling approach. Calculations were under-taken at both the five-state (3s, 3p, 3d, 4s, and 4p) and nine-state levels of approximation. Calculations using Hamiltonians both with and without (semiempirical) core-polarization potentials were completed. Particular attention was paid to the resonance (3s-3p) excitation. The inclusion of core-polarization potentials resulted in cross sections for the resonance excitation that are 10% smaller in magnitude. As an additional check on the calculations, binding energies of Al(1+) bound states and oscillator strengths for Al(2+) transitions, were also computed and compared with the results of measurements and other calculations.

Mathematical Analysis Div. Classical Chaos, the Geometry of Phase Space, and Semiclassical Quantization. Final rept.

W. P. Reinhardt. 1985, 77p Grants NSF-CHE80-11442, NSF-PHY82-00805 Sponsored by National Science Foundation, Washing-

ton. DC. Pub. in Mathematical Analysis of Physical Systems, Chapter 8, p169-245 1985.

Keywords: Hamiltonian functions, Schrodinger equa-tion, Reprints, *Chaos, *Phase space, *Quantization, Two degrees of freedom.

Basic concepts relating to the onset of chaos in deter-ministic dynamics are illustrated using conservative Hamiltonian dynamics in two degrees of freedom--that is, dynamics in a four-dimensional phase space. The correspondence between regular and chaotic dynam-ics and concepts of integrability and nonintegrability are established, and semiclassical quantization (i.e., determination of estimates of energy eigenvalues of the corresponding Schrodinger operator using only classical dynamical information as input) is carried out utilizing the invariant tori of integrable (regular) classical dynamics. The origins of classical chaos are briefly discussed in terms of orbit bifurcation and in terms of the Painleve analysis of the complex time singularities of the orbits themselves. Expectations of quantum correspondence principle ramifications of classical chaos are discussed in terms of Percival's 'irregular spectrum' and in terms of the statistics of nearest-neighbor level spacings.

MD. Metallurgy Div. Fast Magnetic Resonance Imaging with Simulta-neously Oscillating and Rotating Field Gradients. Final rept.

S. J. Norton. 1987, 11p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Medical Imaging 6, n1 p21-31 1987.

Keywords: *Nuclear magnetic resonance, Gradients, Magnetic fields, Oscillations, Reprints, *Image reconstruction, Tomography.

The report presents an approach to magnetic resonance imaging employing a magnetic field gradient that rotates 180 degrees in the image plane while the gradient magnitude oscillates rapidly during the rota-tion. A single free induction decay recorded during this rotation contains all information needed to reconstruct a two-dimensional image. In effect, each sinusoidal oscillation of the gradient provides information corresponding to one projection in more conventional Fouri-er-projection approaches. Since the data acquisition can be achieved in a period less than T2, the method offers the potential of great speed, which is limited only by the gradient modulation frequency. An explicit image reconstruction formula is derived that gives, when evaluated, a reconstruction of the magnetization equal to the true magnetization convolved with a space-invariant point spread function. This point spread function is derived and characterizes the resolving power and sidelobe response of the technique. Moreover, it derives a similar reconstruction formula which is valid when known inhomogeneities in the static field H0 and T2 are present. Finally, it shows how the general approach can be extended to three dimensions

Algebraic Representation for the Topology of Multicomponent Phase Diagrams.

Final rept. D. J. Orser. 1986, 30p

Pub. in Proceedings of Computer Modeling of Phase Diagrams Symposium, Toronto, Ontario, Canada, Oc-tober 13-17, 1985, p301-330 1986.

Keywords: *Phase diagrams, *Tcpology, Models, Thermodynamics, Incidence matrices, Algebra, Equilibrium, Data bases.

The paper describes a methodology based on treating phase diagrams as topological structures and devel-ops a representation along the following lines: for each topologically distinct phase diagram there exists a finite incidence algebra whose elements correspond to the invariant (vertices), monovariant (edges), bivariant (surfaces), etc., transition equilibria of the diagram. The elements of the incidence algebra are sets for which a relation and two binary operations are defined. This defines a calculus of phase diagram equilibria and provides an efficient method for a computer to retrieve the topological relationships between an equilibrium and the rest of the diagram or between any two equilib-ria. Its application to a multicomponent data base and its potential for qualitative thermodynamic modeling are discussed.

Magnetic Resonance of (160)Tb Oriented in a Terblum Single Crystal at Low Temperatures. Final rept.

P. Roman, W. D. Brewer, E. Klein, H. Marshak, K. Freitag, and P. Herzog. 1986, 4p Pub. in Physical Review Letters 56, n18 p1976-1979, 5 May 86.

Keywords: *Nuclear magnetic resonance, Quadrupole moment, Single crystals, Garma rays, Reprints, * Ter-bium 160, *Oriented nuclei, Ion implantation, Ther-mometers, Terbium 159, Rare earth nuclei.

The first observation of magnetic resonance of orient-ed rare earth nuclei in a rare earth host is reported. Radioactive 160Tb implanted in a single crystal of ferromagnetic terbium was subjected to magnetic reso-nance detected by perturbation of the gamma-ray ani-sotropy. The open Tb 4f shell gives rise to a strong electric quadrupole interaction in addition to the magnetic interaction; the resulting resonance signal has 6 components, of which the first was detected at 480.0(4) MHz. The derived quadrupole interaction frequency is 167.7(2.6) MHz, giving Q=3.56(10) b.

Relation between Wire Resistance and Fluid Pressure in the Translent Hot-Wire Method. Bi-monthly rept.

I. M. Roder, and R. A. Perkins. 1989, 4p Included in Jnl. of Research of the National Institute of Standards and Technology, v94 n2 p113-116 Mar-Apr 89.

Keywords: *Thermal conductivity, *Fluids, Plantinum, Electrical resistance, Pressure, Calibrating, Measure-ment, *Hot wire flowmeters.

The resistance of metals is a function of applied pres-sure, and the dependence is large enough to be signifi-cant in the calibration of transient hot-wire thermal conductivity instruments. For the highest possible ac-curacy, the instrument's hot wires should be calibrated in situ. If this is not possible, the author recommended that a value of campa the relative resistance change that a value of gamma, the relative resistance change with pressure, of -2x10 sup (-5) MPa(-1) be used to account for the pressure dependence of the platinum wire's resistance.

Current Research Efforts at JILA (Joint Institute for Laboratory Astrophysics) to Test the Equiva-lence Principle at Short Ranges.

Final rept. J. E. Faller, T. M. Niebauer, M. P. McHugh, and D. A. Van Baak. 1988, 14p Sponsored by Air Force Geophysics Lab., Hanscom

AFB. MA.

Pub. in Proceedings of Moriond Conference 5th Force Neutrino Physics (23rd), Les Arcs, Savoie, France, January 23-30, 1988, p457-470.

Keywords: *Gravitation, Gravity, *Equivalence principle, Fifth force, Free fall.

The authors are presently engaged in three different experiments to search for a possible breakdown of the equivalence principle at short ranges. The first of these experiments, which has been completed, is the socalled Galilean test in which the differential free-fall of two objects of differing composition was measured using laser interferometry. The authors observed that the differential acceleration of two test bodies was less than 5 parts in 10 billion. The experiment set new limits ranges longer than 1 km. With a second experiment, the authors are investigating substance dependent a fluid supported torsion balance; the apparatus has been built and is now undergoing laboratory tests. A proposal has been made to measure the gravitational signal associated with the changing water level at a large pumped storage facility in Ludington, Michigan. Measuring the gravitational signal above and below the pond will yield the value of the gravitational constant, G, at ranges from 10-100 m.

Final rept. S. A. Lee, L. U. Andersen, N. Bjerre, O. Poulsen, E. Riis, and J. L. Hall. 1987, 4p Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC

Pub. in Proceedings of International Conference on Laser Spectroscopy (8th), Are, Sweden, June 22-26, 1987, p52-55.

Keywords: *Special relativity, Atomic beams, Frequen-cy shift, Anisotropy, Tests, *Two photon absorption, Light speed, Neon atoms, Spectral shift, 1sotropy.

A two-photon absorption experiment was performed using a fast Ne* atom beam merged to be coaxial with a standing wave laser field. Intermediate state resonance was achieved by controlling the accelerator-de-termined Doppler shift. A diurnal optical frequency shift would be expected if the speed of light were anisotrop-ic. Preliminary measurements relative to an I2 refer-ence line yield a diurnal frequency shift <2 kHz, corre-sponding to a '1-way' speed of light anisotropy epsilon $<3 \times 10$ to the -9 power.

MD. Center for Radiation Research. Quasifree Electron Scattering on Nucleons In a Momentum-Dependent Potential. Final rept.

J. S. O'Connell, and B. Schroder. 1988, 3p Pub. in Physical Review C 38, n5 p2447-2449 Nov 88.

Keywords: *Electron scattering, Momentum transfer, Carbon, Reprints, *Electron-nucleon interactions, Carbon, Reprints, *Electror Energy losses, Effective mass.

Systematics on the location of the quasifree peak observed in electron-nucleus scattering as a function of momentum transfer are related to the momentum-dependent mean field in which the struck nucleon moves. Data on carbon are used as an example.

ductor Measurements.

Final rept. S. L. Bray, L. F. Goodrich, and W. P. Dube. 1989, 4p Sponsored by Department of Energy, Washington, DC. Pub. in Review of Scientific Instruments 60, n2 p261-264 Feb 89

Keywords: *Superconductors, *Power supplies, Elec-trical measurement, Reprints, *Critical current, Circuit diagrams, Battery operated.

General

To measure the critical current of superconductors, a high output current supply is required. In addition to high current capability, the supply should be designed to reduce ground loop problems, respond linearly to an input control signal, and minimize output noise. A current supply with these qualifications has been con-structed and tested. Although the supply was originally designed for testing conventional superconductors at high current levels, it has also been successfully used in measurements on the high-critical-temperature ceramic superconductors where the maximum current output was less than 1 A. The supply can produce 1000 A output current with a noise level of approxi-mately 0.05 A peak-to-peak. The specifics of the current supply's design and performance are given.

Cable Strands. Final rept.

L.F. Goodrich, and S. L. Bray. 1989, 4p Sponsored by Department of Energy, Washington, DC. Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 25, n2 p1949-1952 Mar 89.

Keywords: Superconducting magnets, Deformation, Degradation, Reprints, *Superconducting cables, Criti-cal current, Superconducting super collider, Niobium titanium, Aspect ratio.

The electromagnetic properties of NbTi strands ex-tracted from Rutherford cables were studied to clarify the effect of mechanical deformation, caused by the cabling process, on the current capacity of the strands. Three different cables were studied, all of which are prototypes for the Superconducting Super Collider's dipole magnets. The extracted cable strands were inacross several key regions of mechanical deformation as a function of current and the orientation of the applied magnetic field. The resulting data are presented in terms of the strand's voltage profile as well as its critical current in order to more thoroughly characterize the conductor's electromagnetic properties.

Nb3Sn Critical-Current Measurements Using Tubular Fiberglass-Epoxy Mandrels. Final rept.

L. F. Goodrich, S. L. Bray, and T. C. Stauffer. 1989, 4p

Sponsored by Department of Energy, Washington, DC. Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 25, n2 p2375-2378 Mar 89.

Keywords: Superconductors, Strains, Thermal expan-sion, Contraction, Electrical measurement, Reprints, *Superconducting wires, *Niobium stannides, *Critical current, Fiberglass epoxy composites, Niobium tin.

A systematic study of the effect of sample mounting techniques on the superconducting critical-current measurement was made in conjunction with the VAMAS (Versailles Agreement on Advanced Materials and Standards) interlaboratory comparison (round robin) measurements. A seemingly small change in mandrel geometry can result in a 40% change in the measured critical current of a Nb3Sn sample at 12 T. This is a result of a change in the conductor pre-strain at 4 K caused by variation in thermal contraction be-tween thick- and thin-walled fiberglass-epoxy composite (G-10) tubes.

Final rept.

U. Litzen, and J. Reader. 1989, 6p See also PB87-109666. Sponsored by Department of Energy, Washington, DC. Pub. in Physica Scripta 39, n468-473 1989.

Keywords: *Atomic energy levels, *Ultraviolet spectra, Far ultraviolet radiation, Reprints, *Rubidium ions,

*Strontium ions, *Zirconium ions, *Niobium ions, *Mo-lybdenum ions, *Yttrium ions, Multicharged ions.

Spectra of the germanium-like ions Rb VI, Sr VII, Y VIII, Zr IX, Nb X, and Mo XI have been investigated in the region 280-790 A. Identification of lines of the transition array 4s(2) 4p(2)-4s4p(3) has yielded all levels of the two configurations except 4s 4p(3) quintet S. The level structure has been studied by means of ab initio and parametric calculations.
