This document compiles the existing North American Integrated Services Digital Network (ISDN) Users' Forum (NIUF) agreements for an ISDN developed and approved in the NIUF as of October 1992. New agreements superseded or added during 1992 cover Layer 1 BRI at the U, and S/T reference points. In addition, this document references the Conformance tests which have been completed by the NIUF. These include: Layer 3 BRI, Layer 2 BRI, PRI at the U reference point, and PRI at the U/S/T reference points. Finally, this document contains the Application Profiles for: Secure Voice Mail; Data Conferencing--Multi-Point; ISDN Telephone Workstation Integration; Engineering Workstation Interface; and the Remote Agent Application Profile.

Supplement to Stable Implementation Agreements for Open Systems Interconnection Protocols. Version 3, September 1990. Change Page Index, Version 3, June 1990 (Stable) Change Pages Issued December 1990; Output from September 1990 OSI Workshop (NIST Special Publication 500-177).
Dec 90, 108p.
See also PB90-269556.

Keywords: *Computer networks, *Communication networks, Standards, Agreements, Implementation, Protocols, *Open systems interconnections.

This document records, in replacement page format, all changes to stable material current (according to Version and Edition number) as of the end of the June Workshop. In this case, that would be NIST SP 500-177, Version 3, Edition 1 with previous Change Pages incorporated. By following the instructions and replacing or inserting the indicated pages, text will be created which reflects the current status of relevant stable material as of September 14, 1990.

North American ISDN Users' Forum, Gaithersburg, MD.
Catalog of National ISDN Solutions for Selected NIUF Applications.
Feb 94, 679p.
Supersedes PB93-162881.

Keywords: *Telecommunication, *Technology utilization, Decision making, Telephone systems, Work stations, Local area networks, Supercomputers, Facsimile communication, Voice communication, Screens(Displays), Computer networks, Computer software, Data transmission, Bibliographies, Dictionaries, Real property, Computer files, *ISDN(Integrated Services Digital Network), LAN(Local area networks), Videoconferencing systems, Teleconferencing, Telecommuting.

The NIUF is pleased to present the Second Edition of its ISDN Solutions Catalog. The purpose of the Second Edition remains the same as the first, to make it easier for vendors to develop and support ISDN applications and for users to understand and install them. In February of 1993, the NIUF authorized work on this Second Edition. It provides a more robust set of solutions in Section 3, and adds Section 2 for the 'decision maker', who must decide whether to use ISDN. Many other refinements were made. The scope is essentially the same as the First Edition, with additional coverage of National ISDN-2. New solutions in the Catalog cover National ISDN-2, especially Primary Rate. Of course, changes in products and services are tracked through an updated chapter of product information.

Videoconferencing Procurement and Usage Guide.
Rept. for Oct 93-Jul 94.
M. A. Wallace, and D. E. Rorrer. Aug 94, 54p, NISTIR-5485.
Sponsored by Internal Revenue Service, Washington, DC.

Keywords: *Teleconferencing, *Video communication, *Procurement, Interactive systems, Systems analysis, Integrated systems, Requirements, Personnel development, Training, Sites, Videoconferencing.

A brief history and technical discussion of videoconferencing is presented along with the processes that are required in order to evaluate the need for a videoconferencing system. Guidance is provided for the evaluation, selection, purchase, installation, and use of various options and system types. Communication and physical requirements are discussed with respect to each of the most common systems that are currently available. Personnel training and site preparation requirements are also developed.

ISDN Conformance Testing Guidelines: Guidelines for Implementors of ISDN Customer Premises Equipment to Conform to Both National ISDN-1 and North American ISDN Users' Forum Layer 3 Basic Rate Interface Basic Call Control Abstract Test Suites.
Special pub.
L. A. Collica, and D. M. Hoffman. Jul 94, 29p, NIST/SP-823/6.
Also available from Supt. of Docs as SN003-003-03278-6.

Keywords: *Tests, *Protocols, *Telecommunication, Interfaces, Guidelines, Communication networks, Communications management, Communication equipment, *ISDN(Integrated Services Digital Network), *Integrated Services Digital Network.

The document is intended to provide information, as a supplement to the abstract test suites, to allow conformance to both the Bellcore National ISDN-1 (NI-1) and North American ISDN Users' Forum (NIUF) NIU.301 specifications for the ISDN Layer 3 Basic Rate Interface for Basic Call Control (user-side). It was developed to guide implementors in the design of customer premises equipment in a manner which would allow them to pass both the NI-1 and NIUF conformance tests. It may also be useful to vendors of test equipment, government procurement agents, and testing laboratories.

Channel Coding for Code Excited Linear Prediction (CELP) Encoded Speech in Mobile Radio Applications.
E. Bracha, N. Farvardin, and Y. Yesha. Aug 94, 40p, NISTIR-5503.
See also PB93-173938.

Keywords: *Mobile communication systems, *Channels(Data transmission), *Coding, Radio communication, Error correction codes, Computerized simulation, Algorithms, *CELP(Code Excited Linear Prediction), *Code Excited Linear Prediction.

The National Wireless Performance Benchmarking Program seeks to provide tools, performance metrics, methodologies and testbed facilities to the wireless industry and users, so as to allow consistent and impartial performance measurement of wireless communication systems. As a part of this program, a research program is currently being undertaken, in which the mobile radio channel effects on Code Excited Linear Prediction (CELP) encodes speech data are studied. This research uses software simulations to test the various algorithms and evaluate their performance. This report provides a detailed description of the tests performed

in this study, including bit error and bit protection sensitivity tests as well as various error correction code tests. It also evaluates different error correction codes for use for channel coding of wireless communication systems.

Slant Path Atmospheric Refraction Calibrator: An Instrument to Measure the Microwave Propagation Delays Induced by Atmospheric Water Vapor.
Final rept.
S. Walter, and P. Bender. 1992, 10p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Geoscience and Remote Sensing 30, n3 p462-471 May 92.

Keywords: *Microwave transmission, *Water vapor, Tropospheric propagation, Light transmission, Radio transmission, Atmospheric composition, Atmospheric refraction, Microwave radiometers, Performance evaluation, Remote sensing, Travel time, Time delay, Measuring instruments, Reprints, *SPARC calibrator, Atmospheric transmissivity.

The Slant Path Atmospheric Refraction Calibrator, SPARC, has been developed to measure the water vapor induced propagation delay experienced by a radio signal traversing the atmosphere. SPARC measures the difference in the travel times between an optical and a microwave signal propagating along the same atmospheric path. Since the refractivity of dry air is similar for both the microwave and optical signals, the difference in arrival times is a sensitive measure of the water vapor induced microwave delay. The instrument is capable of measuring the difference in the optical and microwave travel times with an accuracy of 15 ps or better. SPARC was developed to provide an accurate, independent method for evaluating other techniques used to determine the atmospheric water vapor induced delay. The theoretical and experimental issues involved in making measurements of the delay induced by water vapor are discussed. Measurements along a 13.35-km ground-based path are presented, which will illustrate the instrument's stability, precision, and accuracy.

ISDN Conformance Testing.
Final rept.
D. H. Su, and L. A. Collica. 1991, 9p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers 79, n2 p190-198 1991.

Keywords: Protocols, Telecommunications, Communication networks, Digital communications, Interoperability, Interfaces, Tests, Standards, Reprints, *ISDN(Integrated Services Digital Networks), *Integrated Services Digital Networks, *Conformance testing.

Advances in communication networks have increased the complexity of communications protocols and interfaces significantly, and correct interpretation of standards has become a critical issue in ensuring interoperability of equipments from different vendors. The challenge to the telephony industry in providing high quality Integrated Services Digital Network (ISDN) service and interoperable ISDN products is unprecedented, as the ISDN protocols and interfaces are very complex and more open in terms of how services are to be provided. Conformance testing is a fundamental task in meeting this challenge.

Application Profile for ISDN.
Final rept.
S. Wakid, and K. Roberts. 1991, 6p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers 79, n2 p199-204 Feb 91.

Keywords: *Data processing, Standards, File management systems, Data transfer(Computers), Facsimile communication, Information retrieval, Electronic mail, Reprints, *ISDN(Integrated Services Digital Network), *Integrated Services Digital Network, EDI(Electronic Data Interchange).

This paper emphasizes some key data processing applications to be used in conjunction with the voice and facsimile services as a platform for deploying Integrated Services Digital Network (ISDN) in North America. Special emphasis is placed on the emerging standards of both ANSI T1 and X3 in an attempt to harmonize the computer and telecommunication industries towards providing the user with an integrated platform that is vendor transparent and ubiquitous. This generic platform, which spans a large sector of businesses, is only presented as a base context for defining user specific needs and incubating the applications that directly relate to businesses. Distributed Transaction Processing, Electronic Data Interchange, Information Retrieval, Electronic Mail, and File Transfer together with seven supplementary services for voice and G4 facsimile are proposed for ISDN deployment in the marketplace. This paper, therefore, describes how the relevant standards may be exercised via the various ISDN channels and emphasizes the value of the North American ISDN Users' Forum for commercializing this platform.

Keywords: *National security, *Emergency preparedness, *Telecommunication, *Security, Access control, Data processing security, Threats, Vulnerability, Computer networks, Communication networks, FCC(Federal Communications Commission), ONA(Open Network Architecture), PSN(Public Switched Network), NS/EP(National Security/Emergency Preparedness).

The Public Switched Network (PSN) provides National Security and Emergency Preparedness (NS/EP) telecommunications. Service vendors, equipment manufacturers, and the federal government are concerned that vulnerabilities in the PSN could be exploited and result in disruptions or degradation of service. The National Institute of Standards and Technology (NIST) is investigating the vulnerabilities and related security issues that result from use of the Federal Communications Commission's (FCC's) Open Network Architecture (ONA). This report provides an overview of ONA, describes NS/EP telecommunications security concerns, and describes NS/EP telecommunications security concerns that the FCC's ONA requirement introduces into the PSN.

Electronic Implementors' Workshop.
A. T. Landberg, R. H. Bagwill, and B. J. Gray. Mar 95, 19p, NISTIR-5623.
Presented at the RWS-CC Meeting (13th), Osaka, Japan, March 7-8, 1995.

Keywords: *Telecommunication, *Interoperability, *Information technology, Computer networks, Digital communications, Communication networks, Systems integration, Data access, User needs, Information dissemination, Standards, Protocols, *Electronic workshops, Internet.

The report has been prepared for the 13th RWS-CC Meeting held in Osaka, Japan, March 7-8, 1995. It describes the various elements of an electronic workshop and provides a list of capabilities needed to operate one. The primary elements of an electronic workshop include use of the Internet for basic communications such as electronic mail and public forums and publica-

tion and distribution of publications using computer based media such as Info Servers and CD ROM technology. The necessary prerequisites for establishing an electronic workshop are discussed along with policy and procedures that must be put into plane. Going electronic in the operation of the OSE Implementors Workshop has meant substantial cost savings while improving the timeliness and accessibility of information to the public and members.

NIST ATM Network Simulator: Operation and Programming, Version 1.0.
N. Golmie, A. Koenig, and D. Su. Aug 95, 63p, NISTIR-5703.

Keywords: *Communication networks, *Systems simulation, *Data transmission systems, *Manuals, Telecommunication, Computer graphics, Technology assessment, Models, Information systems, *ATM(Asynchronous Transfer Mode), *Asynchronous Transfer Mode, Graphical user interface, Network topology.

An Asynchronous Transfer Mode (ATM) network simulator has been developed to provide a means for researchers and network planners to analyze the behavior of ATM networks without the expense of building a real network. The simulator is a tool that gives the user an interactive modeling environment with a graphical user interface. With this tool, the user may create different network topologies, control computer parameters, measure network activity, and log data from simulation runs. Part 1 of this document is the user's manual for the simulator; it includes instructions for creating network configurations, specifying component parameters, manipulating the display, logging and saving measurements, and post-processing of data. Part 2 has been prepared as a guide for the user who wishes to modify the simulator software to accommodate network components not previously defined or to change the behavior of components already defined.

National Information Infrastructure and Advanced Digital Video.
Final rept.
C. Fenimore. 1994, 17p.
See also PB95-103677.
Pub. in International Symposium of Digital Imagery '94 'Digital Image and Interactive Services', Tokyo, Japan, October 17-24, 1994, p1-17.

Keywords: *Digital data, *Video data, *Information services, *Image processing, Video compression, Television systems, Telecommunication, Interactive systems, Communication networks, Information systems, Standards, Reprints, National Information Infrastructure.

The U.S. Administration regards the development of a National Information Infrastructure (NII) as a way of putting vast amounts of information at the fingertips of users in America and around the world. Digital video services are likely to be the most technically demanding NII service. Recognizing this, the National Institute of Standards and Technology (NIST), the Technology Policy Working Group of the Administration's Information Infrastructure Task Force and several industrial organizations sponsored a recent Workshop to: (1) define a vision of the role of digital video in the NII; (2) identify the architectural, scaling, and performance issues in realizing this vision; and (3) recommend the research, experiments, and other steps to taken to resolve these issues.

Perception of Clamp Noise in Television Receivers.
Final rept.
S. Herman, B. F. Field, P. Boynton, and G. de Haan. 1994, 4p.
Pub. in International Display Research Conference, Monterey, CA., October 10-13, 1994, p317-320.

Keywords: *Television systems, *Clamping circuits, *Signal-to-noise ratio, Clamps, Signal processing, Video signals, Scintillation, Time constants, Reprints.

Clamp circuits in television systems adjust the black level of each scan line to a reference voltage derived from the 'back porch' of the T.V signal. If the TV signal is noisy, then the derived black level can vary from scan line, resulting in a displayed streaking effect called 'clamp noise.' This paper reports on clamp noise research performed on a video processing supercomputer at the National Institute of Standards and Technology (NIST). This research measured the average input video signal-to-noise ratio (SNR) at which human observers can just begin to perceive clamp noise against a background of moving color pictures. This threshold was measured as a function of two parameters: two-dimensional scintillation noise due to broadband video noise, and the time constant of the clamp circuitry. These results may give TV system designers guidance in choosing tradeoffs between scintillation noise processing and clamp noise reduction.

Error Protecting Characteristics of CDMA and Impacts on Speech.
Final rept.
D. Cypher, S. Wakid, J. Bose, and D. Vaman. 1995, 6p.
Pub. in Institute of Electrical and Electronics Engineers Workshop (3rd) on the Architecture and Implementation of High Performance Communication Subsystems (HPCS '95), Mystic, CT., August 23-25, 1995, p141-146.

Keywords: *Code division multiple access, *Mobile communication systems, *Satellite communication, *Speech, Synchronism, Feedback control, Automatic control, Errors, Reprints.

A Code Division Multiple Access (CDMA) wireless network is simulated to analyze errors, determine impact on services, and provide an upper bound on the number of active channels. The simulation emphasizes the encoder, decoder/correlator, and a threshold detector; but assumes a resultant Gaussian Function for the 'air interface' noise. Since the characteristics of a wireless enviroment vary significantly, we examine, as a whole, the errors on the received signal without accounting for specific error contributions from power, fading, propagation, interference from other users, and other factors in such environment. The CDMA encoder uses the 64 Walsh codes that are specified in the draft Wideband CDMA Air Interface Compatibility Standard for 1.85 to 1.99 GHz PCS Applications (1). We use a digitized actual speech database to test for the intelligibility of the voice service over such a CDMA air interface. Therefore, we are able to learn about the nature of the errors inherent in such a frequency spreading technique and also determine an upper bound on the Simultaneous active channels that would preserve the quality of service (QOS).

Electronic Access to Standards on the Information Highway.
S. J. Laskowski, and V. V. Ramayya. Aug 95, 18p, NISTIR-5708.
See also PB95-103719. Prepared in cooperation with National Standards Systems Network Project, Arlington, VA.

Keywords: *Accessibility, *On-line systems, *Standards, Information systems, Computer networks, Technical assistance, User needs, Information needs, Information retrieval, Information technology, Telecommunication, *National Information Infrastructure, *Information highways, NSSN(National Standards Systems Network), Internet, World wide web, Virtual libraries, System architecture.

We discuss how the information highay can be used to support electronic access standards and standards information. We then show how a network of collections of standards and standards information based on an Internet architecture can be viewed as a 'virtual library of standards' by the users, while allowing standards providers to control and maintain the ownership of these collections on a set of heterogeneous databases. Next, we focus on how the needs of users and developers can be supported through search for standards via a common user interface. We conclude with some thoughts on support for standards development on the information highway and other related issues.

High Resolution Time Interval Counter.
Final rept.
V. S. Zhang, D. D. Davis, and M. A. Lombardi. 1994, 10p.
See also DE95009972, and N95-32331 (available as N95-32319).
Pub. in Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (26th), Reston, VA., December 6-8, 1995, p191-200 1994.

Keywords: *Time interval analyzers, *Modems, Time log, Frequency measurement, Frequency analysis, High resolution, Counters, Reprints.

In recent years, we have developed two types or high resolution, multi-channel time interval counters. In the NIST two-way time transfer MODEM application, the counter is designed for operating primarily in the interrupt-driven mode, with 3 start channels and 3 stop channels. The intended start and stop signals are 1 PPS, although other frequencies can also be applied to start and stop the count. The time interval counters used in the NIST Frequency Measurement and Analysis System are implemented with 7 start channels and 7 stop channels. Four of the 7 start channels are devoted to the frequencies of 1 MHz, 5 MHz or 10 MHz, while triggering signals to all other start and stop channels can arrange from 1 PPS to 100 kHz. Time interval interpolation plays a key role in achieving the high resolution time interval measurements for both counters.

Telecommunications Security Guidelines for Telecommunications Management Network. Computer Security.
Special pub.
J. Kimmins, C. Dinkel, and D. Walters. Oct 95, 46p, NIST/SP-800/13.
Also available from Supt. of Docs. as SN003-003-03376-6. See also PB95-189445.

Keywords: *Secure communications, *Voice communications, *Guidelines, Communication networks, Threats, Access control, Confidentiality, Vulnerability, Life cycles, Operation and maintenance, Integrity, Requirements, Telecommunication, *PSN(Public Switched Network), *Public Switched Network, Open systems architecture.

The Public Switched Network (PSN) provides critical commercial telecommunications services and National Security and Emergency Preparedness (NSEP). Telecommunication Service providers, equipment manufacturers, users, and the Federal Government are concerned that vulnerabilities in the PSN could be exploited and result in disruptions or degradation of service. This guideline focuses on two specific components of a Telecommunications Management Network (TMN) - Network Elements (NEs) and Mediation Devices (MDs) - with emphasis on the security features needed to protect the Operations, Administration, Maintenance, and Provisioning (OAM&P) of these components. This document is intended to provide a security baseline for NEs and MDs that is based on commercial security needs. In addition, some National Security and Emergency Preparedness (NS/EP) security requirements will be integrated into the baseline to address specific network security needs. The guideline should assist telecommunications vendors in developing systems and service providers in implementing systems with appropriate security for integration into the PSN.

The development of a National Information Infrastructure (NII) is a way of putting vast amounts of information at the fingertips of users in America and around the world. Digital video is likely to be the most technically demanding NII service. Recognizing this, several industrial and governmental organizations sponsored a recent workshop to define a vision of the role of digital video in the NII; identify the architectural, scaling, and performance issues in realizing this vision; and recommend the research, experiments, and other steps to be taken to resolve these issues. It was the sense of the participant in the workshop that the Grand Alliance proposal for HDTV is the best available alternative for terrestrial broadcast of HDTV in the U.S.

Comparison of FDDI Asynchronous Mode and DQDB Queue Arbitrated Mode Data Transmission for Metropolitan Area Network Applications.
Final rept.
W. E. Burr, S. Wakid, D. Vaman, and X. Qian. 1994, 12p.
Pub. in Institute of Electrical and Electronics Engineers Workshop on Metropolitan Area Networks (5th), Taormina, Italy, May 12, 1992, 12p Apr 94.

Keywords: *Wide area networks, *Computer networks, *Data transmission, Packet transmission, Network analysis, Communication traffic, Computer performance evaluation, Communication networks, Protocols, Mathematical models, Reprints, DQDB(Distributed Queve Dual Bus), FDDI(Fiber Distributed Data Interface).

The performance of the FDDI token ring and IEEE 802.6 DQDB protocols are compared using discrete event simulation models. A Metropolitan Aera Network (MAN) of 100 km and with 50 stations was moldeled. A 100 Mbps channel is used for both networks, with a traffic model with large (1 kbyte) low priority packets and smaller (100 byte) high priority packets. The delay and fairness characteristics of both networks are analyzed. The simulations show that FDDI has advantages in fairness and maximum capacity, while DQDB offers lower delay at all except very heavy loads and has a stronger priority mechanism.

Standardization for ATM and Related B-ISDN Technologies.
Final rept.
D. Cypher, and S. Wakid. 1993, 14p.
Pub. in Association for Computing Machinery (ACM) Standard Review, p1-14 Sep 93.

Keywords: *Computer networks, *Interfaces, *Standards, Communication networks, Protocols, User needs, Wide area networks, Local area networks, Operation and maintenance, Compatibility, Telecommunication, Reprints, ATM(Asychronous Trasfer Mode), B-ISDN(Broad Integrated Services Digital Network), Interconnections.

The Computer and Telecommunication industries are finally converging towards one single communication technology that permits transparency between the Local and Wide Area networks. This Asynchronous Transfer Mode (ATM) enables the remote interconnection of Local Area Networks (LANs) with compatibly switched telecommunication services rather than expensive private lines. ATM provides scalable high bandwidths, therefore promoting applications in imagery, visualization, video, and others; however, its key value is in shielding the dependency of protocols on media thus providing a seamless shell for interfacing and upgrading current communication gear. In, addition, users are able to dynamically allocate bandwidth on demand, use one unified addressing scheme, and obtain a spectrum of integrated services.

Hardware Measurement Techniques for High-Speed Networks.
Final rept.
A. Mink, Y. Fouquet, and S. Wakid. 1994, 21p.
Pub. in Institute of Electrical and Electronics Engineers Summer Topical Meeting, Santa Barbara, CA., July 28-30, 1993, Jnl. of High-Speed Networks, v3 p187-207 1994.

Keywords: *Computer performance evaluation, *Very large scale integration, *Data flow analysis, *Network analysis, Computer networks, Computer systems hardware, Computer architecture, High speed, Applications programs(Computers), Bandwidth, Standardization, Protocols, Kernel functions, Reprints, Ethernet.

The utilization of the inherent bandwidth in high-speed networks is often obstructed by implementation of the protocols. NIST and ARPA developed VLSI measurement components that permit researchers and product developers to better understand computing and communication bottlenecks by accurate measurement techniques. To illustrate and promote the use of such public domain components, this paper uses image transfer as an example application via a commercial UNIX (BSD 4.3.1 variant) implementation of the TCP/IP protocol over an Ethernet (10 Mbits/s), and a HIPPI (800 Mbits/s) medium. The only modification done to this commercially available kernel was to add the simple probe code necessary to interface to the NIST MultiKron measurement chip. The accurate data obtained for the various aspects of this protocol implementation clearly illustrate the major bottlenecks, provide insight with regard to scaling, and determine upper bounds on performance.

Ths paper concentrates on the provision of isochronous services to users via the existing IEEE 802.6 framework using q.931 as the signalling protocol for providing call control functions. We present possible scenarios of isochronous service provisioning via the IEEE 802.6 network. Real time performance for call setup procedures is simulated and analyzed with different priority schemes for transferring signalling messages. Call setup delays are determined using both Poisson-type and bursty type data traffic models.

S. Wakid, and D. Stokesberry. 1993, 13p.
Pub. in Institute of Electrical and Electronic Engineers Communications Magazine, 13p May 93.

Keywords: *Communication networks, *Standards, Digital communications, Agreements, Telecommunication, North America, Reprints, *ISDN(Integrated Services Digital Network), *Integrated Services Digital Network, FIPS(Federal Processing Standards).

This paper is an overview of the progression of Integrated Services Digital Networks (ISDN) in North America with a focus on the activities of the North American ISDN Users' Forum (NIUF), a consortium of users, service providers, network equipment manufacturers, customer premises equipment manufacturer, and applications software developers. This article discusses the role of the NIUF in the product development cycle, provides an overview of its activities and briefly discusses other important and complementary ISDN work. It outlines the beginning deployment of a natioanl ISDN and a major demonstration of ISDN capability within North America. Finally, it offers the perspective of ISDN as an enabling technology and not as a network that meets all communications requirements for all users.

Open Systems Interconnection (OSI) standards describe in a general way how data communications should take place in an open network, and include many options and undefined conditions. The development of products that implement OSI standards has been slow. It has been necessary to define the options, subsets, parameters and other conditions that are precisely specified in the standards, and to get agreements among the implementors to implement in a compatible way. Conformance and interoperability testing are needed to assure that different implementations work together, Different profiles, or groupings, of the OSI standards have been developed by different organizations to carry out similar functions. This condition also may be slowing down the development of OSI-compliant products.

Keywords: *Information systems, *Telecommunication, *Commerce, Standards, Procurement, Computer networks, Information exchange, Performance evaluation, Industries, *EDI(Electronic Data Interchange), *Electronic Data Exchange, Electronic commerce.

Electronic Data Interchange (EDI) is defined as the computer-to-computer exchange of standardized business information. As with most software products, EDI products can differ greatly. The host of options potentially present in an EDI product can make purchasing the 'right' one a difficult task. This document assists the reader in determining which EDI product, among many candidate products, best meets the reader's requirements. Specifically, this document addresses: (1) EDI product fuctionality, (2) EDI product performance, and (3) the integration of EDI products into the business process.

Strategy to Support Multipoint Communication Service Over Native ATM Service.
Final rept.
S. Y. Kim. 1996, 4p.
Pub. in Institute of Electrical and Electronics Engineers Southeastcon '96, Tampa, FL., April 11-14, 1996, p1-4.

Keywords: *Protocols, Communication networks, Telecommunication, Standards, Reprints, *Multipoint communication, *ATM(Asynchronous Transfer Mode), *Asynchronous Transfer Mode, Adaptation layer, Functionality.

This paper presents the simplified Multipoint Communication Service Protocol on the adaptation layer with multicast functionality over ATM. This protocol structure makes the adaptation layer take over the domain management function of the MCS protocol as the adaptation layer can do this function without difficulty by its own multicast functionality to support multimedia teleconferencing. As both the multicast functionality and the domain management function of the MCS layer combine into the adaptation layer over ATM, the authors can get more efficient multipoint communication without duplication of functions.

Distributed Communication Methods and Role-Based Access Control for Use in Health Care Applications.
J. Poole, J. Barkley, K. Brady, A. Cincotta, and W. Salamon. Apr 96, 66p, NISTIR-5820.

Keywords: *Software tools, *Access control, *Health care, Distributed, Security, CORBA, OLE, RBAC, Role-based.

The use of software in the health care industry is becoming of increasing importance. One of the major roadblocks to efficient health care is the fact that important information is distributed across many sites. These sites can be located across a significant area. The problem is to provide a uniform mechanism to integrate this information. This paper documents the results of an investigation into the suitability of several different distributed access mechanisms. Five methods were examined; the Common Object Request Broker (CORBA), Object Linking and Embedding (OLE), remote procedure call (RPC), remote database access (SQL/RDA) and Protocol Independent Interfaces (PII, the authors specifically examined sockets). These mechanisms were compared with regard for use in health care applications. In particular, the following capabilities were compared: Ease of use by the developer, Class of applications for which the technology is particularly effective in developing, Security capabilities.

Wavelet Variance, Allan Variance, and Leakage.
Final rept.
D. A. Howe, and D. B. Percival. 1995, 4p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers Transactions on Instrumentation, v44 n2 p94-97 Apr 95.

Keywords: *Clock, *Waves, *Time series analysis, Synchronism, Time measurement, Frequencies, Standards, Phase meters, Variance(Statistics), Reprints, Wavelet transform.

Wavelets have recently been a subject of great interest in geophysics, mathematics and signal processing. The discrete wavelet transform can be used to decompose a time series with respect to a set of basis functions, each one which is associated with a particular scale. The properties of a time series at different scales can then be summarized by the wavelet variance, which decomposes the variance corresponding to some of the recently discovered wavelets can provide a more accurate conversion between the time and frequency domains than can be accomplished using the Allan variance. This increase in accuracy is due to the fact that these wavelet variances give better protection against leakage than does the Allan variance.

Precise Laser-Based Measurements of Zero-Dispersion Wavelength in Single-Mode Fibers.
Final rept.
J. B. Schlager, S. E. Mechels, and D. L. Franzen. 1996, 2p.
Pub. in Conference on Optical Fiber Communication (OFC '96), San Jose, CA., February 25-March 1, 1996, Technical Digest Series, v2 p293-294.

Keywords: *Optical communication, *Optical fibers, *Optical detectors, *Standards, Infrared detectors, Wave dispersion, Frequency response, Fiber optics, Wavelengths, Tunable lasers, Reprints.

The transmission performance of ultralong-distance optical communication systems critically depends on fiber chromatic dispersion. To achieve desired performance, system designers require knowledge of the zero-dispersion wavelength, lambda sub 0 to within 0.1 nm. The authors have developed two laser-based systems to measure lambda sub 0 of long optical fibers. Both systems are based on tunable narrow-line laser sources with output wavelengths that can be accurately measured with an interferometric wavemeter. The first system uses the phase-shift method to measure group delay in the fiber sample as a function of wavelength. The second system directly measures the wavelength-averaged differential group delay or fiber chromatic dispersion by dithering the laser wavelength in a new implementation of the differential phase-shift technique. Both systems give lambda sub zero with a precision (repeatability) of 0.022 nm or less at the 99% confidence level.

Capacity of the Lp Norm-Constrained Poisson Channel.
Final rept.
M. R. Frey. 1992, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Information Theory 38, n2 p445-450 Mar 92.

Keywords: *Information capacity, *Channel capacity, Norms, Reprints, *Communication channels, Poisson channels, Coding capacity, Channels(Data transmission).

The information and coding capacities of the Poisson channel are derived with a constraint imposed on the L(sub p) norm (Norm chi (sub i))(sub p) of the encoder intensity chi; that is, we fix 1 = or < p = or < infinity and suppose (Norm chi (sub i))(sub p) = or < Q for all t (a member of) (in brackets:0,T) and some Q = or > 0. Formulae are given for the capacity which establish previously known results for p = 1, p = 2, and p = infinity to be part of a system of capacity problems with common form and solution. These formulae apply with or without causal feedback and whether or not the encoder intensity is OOK-constrained.

Procedures for Document Facsimile Transmission Issued by General Services Administration, April 14, 1982. Federal Standard 1063.
14 Apr 82, 30p, EIA-RS-466.
Sponsored by General Services Administration, Washington, DC.

Keywords: *Facsimile transmission, *Signals, *Interoperability, Facsimile communications, Data transmission, Signal processing, Pitch, Audio tones, Binary codes, Interfaces, Connectors, Terminals, Procedures, Documents, Federal Information Processing Standards, Calls.

This Standard is concerned with the procedures which are necessary for document transmission between two facsimile stations operating on voice band analog circuits. These procedures essentially comprise: call establishment and call release; compatibility checking, status and control command; checking and supervision of line conditions; control function and facsimile operator recall; and both recognized optional functions as well as other (non-standard) options. In this Standard two separate signalling systems are described; first a simple tonal system using single frequency tones, and second a binary-coded system offering a much wider range of signals for more complex procedures.

Standard of Attenuation for Microwave Measurements.
R. E. Grantham, and J. J. Freeman. 4 Oct 48, 8p, CRPL-9-8.
Pub. in Transactions of the American Institute of Electrical Engineers, V67 p1-7 1948.

Keywords: *Microwave equipment, *Standards, Reprints, Measurement, Specifications, Accuracy, Electrical properties, Consistency, Radiation attenuation, Calibration, Direct current, Attenuators.

In line with the program of the National Bureau of Standards for extending the standards of electrical quantities up through microwaves, the establishment of a standard of attenuation was undertaken. For such a standard to be useful, it must be readily adaptable to the calibration of commercial attenuators over the entire frequency range. Also, for self consistency, such a standard must be capable of being checked by d-c measurements, thus relating the radiofrequency (r-f) standard to the more accurate primary standards. A standard of any physical quantity consists not merely in the unique specification of that particular quantity but equally important, in the specification of the operations, or procedures, through which an unknown quantity is measured in terms of it. The purpose of this paper is to describe such a standard, and the preliminary experiments employed in its evaluation and development.

This article is from 'Proceedings of the Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (25th) Held in Marina Del Rey, California on 29 November - 2 December 1993', AD-A280 955, p293-306.

Keywords: *Ephemerides, Estimates, Perturbations, Phase modulation, Residuals, Time, Global positioning system, Navigation satellites, Kalman filtering, Component Reports, Satellite orbits.

We compare the broadcast ephemerides from Global Positioning Satellites (GPS) to the postprocessed ephemerides from the Defense Mapping Agency (DMA). We find significant energy in the spectrum of the residuals at 1 cycle/day and higher multiples. We estimate the time variance of the residuals and show that the short term residuals, from 15 min, exhibit power law processes with greater low frequency perturbations than white phase modulation. We discuss the significance of these results for the performance of the GPS Kalman filter which estimates the broadcast orbits.

This article is from 'Proceedings of the Annual Precise Time and Time Interval (PTTI) Applications and Plan-

ning Meeting (25th) Held in Marina Del Rey, California on 29 November - 2 December 1993', AD-A280 955, p505-511.

Keywords: *Time standards, Calibration, Clocks, Daylight, Formats, Communications networks, Uncertainty, Radio links, Synchronism, Component Reports, Internet, US NIST.

We will-describe the NIST Network Time Service which provides time and frequency information over the internet. Our first time server is located in Boulder, Colorado, a second backup server is under construction there, and we plan to install a third server on the East Coast later this year. The servers are synchronized to UTC(Universal Coordinated Time)(NIST) with an uncertainty of about 0.8 ms RMS and they will respond to time requests from any client on the internet in several different formats including the DAYTIME, TIME and NTP protocols. The DAYTIME and TIME protocols are the easiest to use and are suitable for providing time to PCs and other small computers. In addition to UTC(NIST), the DAYTIME message provides advance notice of leap seconds and of the transitions to and from Daylight Saving Time. The Daylight Saving Time notice is based on the US transition dates of the first Sunday in April and the last one in October. The NTP is a more complex protocol that is suitable for larger machines; it is normally run as a demon process in the background and can keep the time of the client to within a few milliseconds of UTC (NIST). We will describe the operating principles of various kinds of client software ranging from a simple program that queries the server once and sets the local clock to more complex 'demon processes (such as NTP) that continuously correct the time of the local clock based on periodic calibrations.

Future of Time and Frequency Dissemination.
J. Levine. 2 Dec 93, 6p.
This article is from 'Proceedings of the Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting (25th) Held in Marina Del Rey, California on 29 November - 2 December 1993', AD-A280 955, p573-578.

Keywords: *Frequency standards, *Time standards, Bandwidth, Computer networks, Technology forecasting, Communications traffic, *Time transfer, Component Reports.

I will try to extrapolate the changes in the dissemination of time and frequency information that have taken place during the last 25 years to predict the future developments both in the methods of disseminating time and frequency and in the kinds of customers we will be asked to serve. Two important developments are likely to play pivotal roles in driving the evolution of dissemination. The first is the commercial availability of very high quality clocks - devices whose performance may eventually rival that of the current generation of primary frequency standards. The widespread use of these devices may blur the traditional distinction between client and server, and may replace it with a more symmetrical interchange of data among peers. The second is the increasing demand for digital time and frequency information driven by the increasing sophistication of everything from traffic lights to electric power meters. The needs of these individual users may not tax the state of the art of primary frequency standards in principle, but their large numbers and wide geographical distribution present a technological challenge that is difficult to meet at a reasonable price using existing methods. Some of these problems may be solved (or at least addressed) using developments in communications and consumer electronics such as the increasing use of fiber-optic telephone circuits and the increasing bandwidth and sophistication of the cable network used to transmit television pictures. To be useful, these advances in hardware must stimulate parallel advances in software algorithms and methods. These advances are more difficult to predict with great confidence, but the developments of the last few years will be examined to provide some indications of the future.

The current definition of Coordinated Universal Time (UTC) dates from 1972. The duration of a UTC second is defined in terms of the frequency of a hyperfine transition in the ground state of cesium. This standard frequency is realized in a number of different laboratories using ensembles of commercial cesium clocks and a few primary frequency standards. The data from all of these devices are transmitted periodically to the Bureau International des Poids et Mesures (BIPM) in Sevres, France, where they are combined in a statistical procedure to produce International Atomic Time (TAI). The time of this scale is adjusted as needed ('coordinated') by adding or dropping integer seconds so as to keep it within plus or minus 0.9 s of UT1, a time scale based on the observation of the transit times of stars and corrected for the predicted seasonal variations in these observations. When the leap seconds are included into TAI, the result is called UTC. The difference between TAI and UTC is therefore an exact integer number of seconds. This difference is currently 29 s and will become 30 s at 0 UTC on 1 January 1996.

Keywords: *Time measurement, Kalman filters, Reprints, Frequency step detection, Time scale algorithms, Postprocessing.

There are some applications where the output of a time scale is not needed in real time. Such applications can make use of a post-processed time scale for improving long term performance. A post-processed scale can take advantage of improved characterizations of clocks in the scale and improved capability of frequency step detection. The authors study a particular time scale algorithm run in post-processed mode being studied at the National Institute of Standards and Technology. Results are reported based on both simulation and real data.

Using LORAN-C Broadcasts for Automated Frequency Calibrations.
Final rept.
M. Lombardi. 1992, 13p.
Pub. in Proceedings of National Conference of Standards Laboratories Workshop and Symposium Managing Worldwide Measurements, Washington, DC., August 2-6, 1992, p361-373.

Keywords: *Frequency measurement, *LORAN C, *Calibration, Ground wave propagation, Oscillators, Accuracy, Reprints, Path noise.

The LORAN-C (LOng RAnge Navigation) system is a radio navigation system maintained by the United States Coast Guard. LORAN-C signals are widely used as a navigation aid. Since the signals are extremely stable, they can also serve as an excellent reference for frequency calibrations. Any quartz, rubid-

ium, or cesium oscillator can be calibrated with LORAN-C. This paper tells how to use LORAN-C signals for frequency calibrations. It describes the LORAN-C system, lists the equipment that you need, shows the data you can obtain, and discusses the accuracy you can expect. It also discusses the NIST Frequency Measurement System, an automated calibration system that uses LORAN-C signals.

Pub. in Proceedings of Institute of Electrical and Electronics Engineers Frequency Control Symposium, Hershey, PA., May 27-29, 1992, p183-187.

Keywords: *Rubidium frequency standards, *Frequency standards, *Local oscillators, Frequency stability, Optical pumping, Room temperature, Design, Reprints, Laser diodes.

We describe the design of a synthesized local oscillator for a rubidium (Rb) passive frequency standard pumped by radiation from a diode laser. The design goals for this new oscillator are: (1) To operate at room temperature, (2) To have the ability to step quickly to different frequencies for measuring parameters such as magnetic fields, (3) To contribute less than 2 X 10(sup -14)/tau(sup 1/2) to the frequency stability of the Rb standard for measurement times between 30 and 200 seconds. Potential limits for obtaining these goals, as well as solutions to such problems, are discussed.

High-Order Harmonic Mixing with GaAs Schottky Diodes.
Final rept.
M. Prevedelli, F. L. Walls, and S. P. Beaton. 1990, 4p.
Pub. in Proceedings of the Annual Symposium on Frenquency Control (44th), Baltimore, MD., May 23-25, 1990, p555-558.

Keywords: *Frequency multipliers, Frequency synthesizers, Frequency control, Laser radiation, Schottky diodes, Planar structures, Extremely high frequency, Far infrared radiation, Gallium arsenides, Klystrons, Reprints, *Harmonic mixing.

In many areas of precision frequency metrology, it is useful to use a single nonlinear element to both multiply a source frequency and mix this harmonic with a higher frequency source. This process is commonly referred to as harmonic mixing. When the frequency span is great, it is advantageous to use large harmonic numbers to reduce the complexity, the number of local oscillators, and ultimately the cost. Planar GaAs Schottky diodes are good candidates for high order harmonic mixing because of their high cut-off frequency. Their robust construction should lead to excellent lifetime, reliability, and reproducibility. The authors have investigated the performance of one type of fast planar Schottky diode for harmonic mixing with harmonic numbers from 8 to 201. Their measurements indicate that, with optimum biasing and power, harmonic mixing with harmonic numbers of up to approximately 80 can be achieved with good signal-to-noise ratios. Detectable signals have been observed for harmonic numbers of 201. From the nonlinear characteristics of the diode and the signal-to-noise ratio obtained at lower frequencies, it looks as though we can multiply from 70 GHz to about 4.5 THz in one step.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 41, n6 p915-918 Dec 92.

Keywords: *Clocks, *Synchronism, *Calibration, Time measuring instruments, Reference standards, Time standards, Time signals, Random walk, Frequency stability, Accuracy, Reprints, *Smart Clock, *Time transfer.

The Smart Clock, opens up the possibility for any clock to be automatically synchronized to an external standard with a minimum of measurements. The Smart Clock enhances the accuracy or stability of a clock or oscillator by characterizing it against an external standard. The Smart Clock algorithm uses optimal estimation and prediction to apply a correction to the output of the oscillator, maintaining any combination of time or frequency accuracy or stability within specified limits. The algorithm decides when external measurements are necessary to maintain the desired accuracy or stability. The authors present here a tutorial description of the Smart Clock system and an example of how it could be used to maintain a simple clock to 1 s using measurements over the telephone lines.

Confidence on the Second Difference Estimation of Frequency Drift.
Final rept.
M. A. Weiss, D. W. Allan, and D. Howe. 1992, 6p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers Frequency Control Symposium, May 27-29, 1992, p300-305.

Keywords: *Frequency standards, *Frequency stability, Rubidium frequency standards, Frequency modulation, White noise, Simulation, Estimates, Reprints, Frequency drift.

We use simulation to compare the confidence in estimating frequency drift in the presence of stochastic noise between two different estimators: (1) a mean second difference using neighboring data, and (2) a single second difference over the entire data set. In each case we simulate 100 s data sampling and 10,000 samples (11 and 1/2 days of data). The two estimators show a similar confidence when the noise is purely random walk frequency modulation, but when there is also white frequency modulation, as is common in oscillators, method (2) is more efficient. An advantage of (1) is that it provides an internal confidence to an estimate on a single data set. As a practical example, when we simulate a typical rubidium gas cell frequency standard, the confidence of the drift estimate was ten times better for method (2) over method (1).

M. A. Weiss, and T. Weissert. 1991, 7p.
Pub. in Proceedings of European Frequency and Time Forum (5th), March 12-14, 1991, p442-448.

Keywords: Global positioning system, Kalman filters, Random walk, Stability, Clocks, Reprints, *Time scale algorithms, *TA2 algorithm, Postprocessors, US NIST.

TA2 is a time scale algorithm designed to run as a post-processor by smoothing, i.e. combining estimates from runs in both forward and backward temporal directions. It has been tested using the time-scale data at NIST from 1989 through the first half of 1990. We review the characterization parameters for clocks with white FM, and random-walk FM, and the dependence of these estimates on integration time. We also discuss the transformation of these parameters from their use as time deviations to frequency variances. We compare the scale generated by TA2 over 541 d starting at the beginning of 1989, with the two other scales at NIST, AT1 and TA.

Pub. in Proceedings of Precise Time and Time Interval Conference, Redondo Beach, CA., November 28-30, 1988, p117-128.

Keywords: *Synchronous satellites, *Ground stations, *Calibration, *Signal processing, Synchronism, Signal reception, Signal transmission, Time signals, Synchronous platforms, Time measurement, Time standards, Accuracy, Reprints, *Time transfer.

The authors discuss fundamental aspects of two-way timing and show an implementation of a satellite two-way time transfer system which has been used for two-years between USNO, Washington, D.C. and NIST, Boulder, CO. The raw data collection procedure will be discussed. The authors also outline the rationale for the choice of satellite uplink/downlink frequencies, signal structure, and reduction of data. Short-term noise in the time transfer limits the precision to about 300 ps in a 300 s average. Uncertainty in accuracy is due to uncertainty in the non-reciprocity of the two-way signal path. Accuracy limits due to the atmosphere, earth-satellite rotating system (Sagnac effect), and the equipment are discussed. The goal is to achieve an accuracy level of 1 ns after a suitable calibration of earth-station (differential) equipment delays.

Keywords: *Rubidium frequency standards, *Frequency standards, Semiconductor lasers, Frequency stability, Optical pumping, Reprints, Phase noise.

We report on our project to experimentally investigate the limits to the short-term stability achievable in optically pumped, rubidium cell frequency standards. Theory indicates that the atomic limited stability is several orders of magnitude better than what has actually been achieved. The difference is related to the complex spectral output of the lamps used in conventional standards as well as phase noise in the interrogating microwave radiation. Using a novel filter technique, we have built a microwave synthesis chain with phase noise capable of supporting a standard with (sigma(sub y))(tau) = or < 4 X 10(exp -14) tau(sup -1/2). With extended-cavity, diode lasers we have demonstrated measured line Q and signal-to-noise ratios commensurate with (sigma(sub y))(tau) = 4 X 10(exp -13) tau(sup -1/2) in a commercial, buffer gas type standard and (sigma(sub y))(tau) = 2 X 10(exp -13) tau(sup -1/2) in an evacuated, wall-coated cell. Both of these numbers can be improved significantly in a fully engineered and optimized standard.

Use of Ionospheric Data in GPS Time Transfer.
Final rept.
M. Weiss, T. Weissert, C. Thomas, M. Imae, and K. Davies. 1990, 7p.
Pub. in Proceedings of European Frequency and Time Forum (4th), Neuchatel, March 13-15, 1990, p327-333.

Keywords: *Ionospherics, *Global positioning system, *Error analysis, *Delay time, Synchronism, Data smoothing, Periodic variations, Electromagnetic noise, Time standards, Frequency standards, Time measuring instruments, Interlaboratory comparisons, Calibrating, Accuracy, Reprints, *Time transfer, Ionospheric delay.

With solar activity near maximum, the largest error in the use of the Global Positioning System (GPS) for common-view time transfer can be the correction for ionospheric delay. The paper describes the use of data from two different codeless ionospheric measurement systems to correct common-view time transfer measurements. The authors compare the measured ionospheric values with those from the ionospheric values with those from the ionspheric model parameters broadcast from the GPS satellites, computer time transfer values among three time standards laboratories: Observatoir de Paris, Paris, France; National Institute of Standards and Technology, Boulder, Colorado, USA; and Communications Research Laboratory, Tokyo, Japan. Combining these time transfers the authors can obtain closure around the world. The authors make another comparison between these results and ionospheric measurements using a Faraday rotation system.

Pub. in Proceedings of European Frequency and Time Forum (8th), Weihenstephan, Germany, March 9-11, 1994, p513-516.

Keywords: *Cesium frequency standards, *Frequency standards, Frequency stability, Microwave radiation, Instability, Reprints, Microwave leakage, Systematic errors.

We identify leakage from the microwave electronics in cesium atomic-beam frequency standards as a potential source of frequency error and instability in these standards. The problem arises when radiation that is phase coherent with the interrogating radiation finds its way to the atoms in regions outside the Ramsey cavity. We discuss techniques for evaluating and reducing the problem.

Velocity Distribution of Atomic Beams by Gated Optical Pumping.
Final rept.
W. D. Lee, J. H. Shirley, and R. E. Drullinger. 1994, 4p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Boston, MA., June 1-3, 1994, p658-661.

Keywords: *Cesium frequency standards, *Frequency standards, *Atomic beams, *Velocity distribution, Velocity measurement, Optical pumping, Doppler effect, Accuracy, Reprints, *NIST-7 frequency standard, US NIST.

In evaluating the accuracy of a cesium-beam frequency standard, accurate measurement of the atomic velocity distribution is important. In frequency standards which employ atoms with thermal velocities, the measured atomic resonance frequency differs from the true resonance by several parts in 10(exp 13) due to the second-order Doppler shift. To achieve the frequency accuracy goal for NIST-7 of 1 . 10(exp -14), an upper bound on the uncertainty of the mean-square atomic velocity of about 1 percent is needed. We present the results of experiments designed to measure the velocity distribution of NIST-7 using two independent techniques: gated optical pumping, and Ramsey fringe inversion. We show that these techniques yield velocity distributions and corresponding second-order Doppler shifts that agree within the stated tolerances.

Cross-Correlation Analysis Improves Time Domain Measurements.
Final rept.
A. Lepek, and F. L. Walls. 1993, 9p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Salt Lake City, UT., June 2-4, 1993, p312-320.

Keywords: Frequency stability, Cross correlation, Time domain, Reprints, *Allan variance.

We introduce cross correlation-based variances to estimate the Allan variance, the modified Allan variance, and the time variance in the presence of the measurement system noise. These variances substantially lower the short-term measurement noise floor; however, they require significantly more data. The cross correlation based variances are also used as a tool to analyze and improve the measurement system noise. The cross correlation based variances bear a precise relation to the 3-cornered-hat sigma. We have reduced the short-term noise floor for sigma(sub y) (1 s) by factor of 100 relative to our initial hardware and software configuration.

Hybrid Digital/Analog Servo for the NIST-7 Frequency Standard.
Final rept.
J. P. Lowe, W. D. Lee, F. L. Walls, and R. E. Drullinger. 1994, 4p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Boston, MA., June 1-3, 1994, p662-665.

Keywords: *Cesium frequency standards, *Frequency standards, Hybrid systems, Servomechanisms, Digital systems, Analog systems, Design, Stability, Reprints, *NIST-7 frequency standard, US NIST.

This paper describes a hybrid (analog/digital) approach to the servo electronics for the NIST-7 cesium-beam, frequency standard. A digital servo system has been added to the existing analog system to enhance the capabilities of both servos. The analog servo allows a 5 MHz oscillator to be frequency locked directly to the atomic transition frequency. The digital servo reduces the frequency perturbations due to changes in the ambient magnetic field. Also, the existence of separate servo systems allows independent measurements of systematic errors. Design specifications are given and stability measurement results are presented.

Reducing the Effect of Local Oscillator Phase Noise on the Frequency Stability of Passive Frequency Standards.
Final rept.
C. Szekely, F. L. Walls, J. P. Lowe, R. E. Drullinger, and A. Novick. 1993, 6p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Salt Lake City, UT., June 2-4, 1993, p81-86.

Keywords: *Frequency standards, *Frequency stability, Rubidium, Frequency standards, Notch filters, Local oscillators, Performance tests, Reduction, Reprints, Phase noise.

We report on the experimental test of a new concept for reducing limitation on short-term frequency stability of passive frequency standards due to local oscillator phase noise. Systems that use sinewave modulation to interrogate a stable resonance are limited in short-term frequency stability by phase noise at the second harmonic of the modulation, f(m). This effect limits the fractional frequency stability. This new concept uses notch filters at + or - 2f(m) from the carrier to reduce this effect. Tests on a modified passive rubidium standard demonstrate an improvement of approximately 18 in fractional frequency stability. The dual notch filters proved to be feasible and were obtained commercially.

Practical Standards for PM and AM Noise at 5, 10 and 100 MHz.
Final rept.
F. L. Walls. 1993, 10p.
Pub. in Proceedings of European Frequency and Time Forum (7th), Neuchatel, Switzerland, March 16-18, 1993, p189-198.

Keywords: *Amplitude modulation, *Phase modulation, *Standards, Very high frequency, High frequency, Carrier frequencies, Reprints, *Noise standards.

This paper describes a practical implementation of secondary standards for phase modulation noise (PM) and amplitude modulation noise (AM) at carrier frequencies of 5 MHz, and 100 MHz. In each case the standard simultaneously produces output signals at approximately + 15 + 17 dBm. The PM and AM noise between the two signals can be set to a calibrated level, which is constant to better than 0.2 dB for Fourier frequency offsets from nearly dc to 5% of the carrier, or set ot a minimum value. The calibrated level of PM and AM noise is used to evaluate the accuracy versus Fourier frequency.

M. A. Weiss, and T. P. Weissert. 1993, 12p.
Pub. in Proceedings of the European Frequency and Time Forum (7th), Neuchatel, Switzerland, March 16-19, 1993, p199-210.

Keywords: *Clocks, Optimization, Anomalies, Reprints, TA2 algorithm, Time scales, Stochastic noise, US NIST.

We have extended the new TA2 post-process time scale at NIST beyond our previous reports to include all of the period from January of 1984 to the present. Derived from the ensemble of clocks at NIST, this time scale includes the benefits of several recent refinements to the algorithm. By iteratively running the algorithm on the ensemble clock data and characterizing anomalous behavior in the dominant individual clocks of the ensemble between iterations, we obtain an optimized scale which benefits from the informed anticipation of that anomalous behavior and demonstrates an overall decrease in scale disruption. Herein we discuss: changes to the TA2 algorithm that we made while processing the eight-year run, our method of characterizing anomalous behavior in individual clocks, the way unanticipated anomalous behavior is dealt with by the algorithm, and our resulting nine-year time scale.

Local Oscillator Requirements and Strategies for the Next Generation of High-Stability Frequency Standards.
Final rept.
F. L. Walls. 1992, 4p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers Frequency Control Symposium, Hershey, PA., May 27-29, 1992, p2-5.

Keywords: *Oscillators, *Frequency stability, *Standards, Reprints, Meetings, Requirements, Strategies, *Foreign technology, Frequency synthesis.

This paper provides a brief introduction to the special session on high-stability frequency synthesis from rf to the visible. The special session is motivated by a number of proposals that have been made for developing frequency standards with frequency stabilities in the 10 to the minus 16th power to 10 to the minus 18th power range. Currently available local oscillators, frequency synthesis techniques, and the measurement methods are not, however, sufficient to support this level of stability. Some general approaches to solve these problems, such as the effect of interrogation type on local oscillator induced white frequency noise, are briefly introduced. The details are to be found in the individual presentations.

Secondary Standard for PM and AM Noise at 5, 10, and 100 MHz.
Final rept.
F. L. Walls. 1992, 10p.
Pub. in Special Issue of the Institute of Electrical and Electronics Engineers Instrumentation and Measurement Transactions of CPEM '92, p290-299.

Keywords: *Amplitude modulation, *Phase modulation, *Standards, *Electromagnetic noise, Frequency domain, Time domain, High frequency, Electrical measurement, Reprints, Phase noise.

This paper describes a practical implementation of a portable secondary standard for phase modulation (PM) and amplitude modulation (AM) noise at 5, 10, and 100 MHz. The accuracy of the standard for both PM and AM noise is + or - 0.14 dB, and the temperature coefficient is less than 0.02 dB/K. The noise floor of the standard for PM noise measurements, is less than -190 dBC, rel, to 1 sq rad/Hz at 5, 10, and 100 MHz. The noise floor for AM measurements depends on the configuration. A calibrated level of PM and AM noise of approximately -130 + or - 0.2 dB rel to 1 square rad/Hz (for Fourier frequencies from approximately 1 Hz to 10% of the carrier frequency) is used to evaluate the accuracy versus Fourier frequency. Similar PM/AM measurements. Some types of time-domain measurement equipment can also be calibrated.

Confidence on the Modified Allan Variance and the Time Variance.
Final rept.
M. A. Weiss, F. L. Walls, C. A. Greenhall, and T. Walter. 1995, 14p.
Pub. in Proceedings of the European Frequency and Time Forum, Besancon, France, March 8-10, 1995, 14p.

Keywords: *Degrees of freedom, *Confidence limits, Time domain, Overlap, White noise, Electromagnetic noise, Signal to poise ratio, Frequency stability, Time stability, Reprints, *Allan variance, Chi square distribution, Time variance.

The paper presents tabulated factors for calculating confidence intervals for the square root of the Modified Allan Variance and the related time Variance when the analysis uses full overlapping of the data. Confidence intervals are determined by multiplying factors from the appropriate table times sample deviations. These factors have been calculated from the equivalent degrees of freedom (EDF) for the five common power law noise types. Closed form expressions for calculating the EDF for these variances and noise types have only recently become available for fully overlapped data analysis. We compute the EDF using two different closed form expressions as well as simulations to ensure correctness of the results. We also show the relative advantage of using the modified Allan variance instead of the Allan variance to evaluate frequency or time stability in the presence of white phase modulated noise.

Wavelet Analysis for Synchronization and Timekeeping.
Final rept.
D. A. Howe, and D. B. Percival. 1994, 5p.
Pub. in Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Boston, MA., June 1-3, 1994, p567-571.

Keywords: *Wavelet analysis, *Synchronism, Frequency standards, Time functions, Frequency synchronization, Time measurement, Phase meters, Frequencies, Reprints, *Timekeeping, Wavelet transform, Wavelet variance.

We discuss the concept of the wavelet variance as a generalized formalism for representing variations in a time series on a scale by scale basis. In particular, we note that the wavelet variance corresponding to some of the recently discovered wavelets can provide a more accurate conversion between the time and frequency domains that can be accomplished using the Allan variance. The increase in accuracy is due to the fact that these wavelet variances give better protection against leakage than does the Allan variance.

The NIST Frequency Measurement Service (FMS) began operation in 1984 to assist users who needed to make high-level frequency calibrations traceable to NIST. The FMS provides a complete solution to all frequency calibration problems by providing a frequency measurement system that can be installed in the customer's lab. The system includes all hardware, software, and documentation needed to automate the frequency measurement process. NIST provides training and phone support and validates customer data through a modem hookup. Each lab receives a monthly report that certifies traceability to NIST.

General Order 'N' Analytic Correction of Probe-Position Errors in Planar Near-Field Measurements.
Final rept.
L. A. Muth. 1995, 10p.
Pub. in Annual Meeting and Symposium of 1995 Antenna Measurement Techniques Association (17th), Williamsburg, VA., November 13-17, 1995, p331-340.

Keywords: *Probes(Electromagnetic), *Antennas, Near field, Extremely high frequency, Reprints, Error correction.

An analytic technique recently developed at NIST (1)(2) to correct for probe position errors in planar near-field measurements has been implemented to arbitrary accuracy. The nth-order correction scheme is composed of an mth-order ordered expansion and an n - m higher-order approximation, where both n and m are arbitrary. The technique successfully removes very large probe position errors in the near-field, so the residual near-field probe position errors are substantially below levels that can be measured on a near-field range. Only the error-contaminated near-field measurements and an accurate probe position errors are substantially below levels that can be measured on a near-field range. Only the error-contaminated near-field measurements and an accurate probe position error function are needed for implementation of the correction technique. The method also requires the ability to obtain derivatives of the error-contaminated near field defined on an error-free regular grid with respect to the coordinates. In planar geometry the derivatives are obtained using FFTs (1), giving an approximate operation count of (3.2(m-1) -1+(n - m))N log N, where N is the number of data points. Efficient computer codes have been developed to demonstrate the technique. The results of simulations are more accurate than those obtained using the well-known k correction (3), which can correct for position errors in some direction in k space, but further contaminates the sidelobe levels.

Effect of Harmonic Distortion on Phase Errors in Frequency Distribution and Synthesis.
Final rept.
F. L. Walls, and F. G. Ascarrunz. 1995, 8p.
Pub. in Proceedings of the European Frequency and Time Forum (9th), Besancon, France, March 8-10, 1995, 8p.

Keywords: *Phase error, *Frequency distribution, *Frequency synthesizers, Frequency measurement, Frequency stability, Phase detectors, Radio frequencies, Roots of equations, Harmonics, Reprints, *Harmonic distortion, Timing errors.

The paper explores the effect of harmonic distortion on phase errors in frequency distribution and synthesis. Harmonic distortion gives rise to large timing errors in phase or zero crossing detectors. These large timing errors may cause unacceptable sensitivity to environmental conditions or signal fluctuations. Two types of phase detectors are considered in the paper. The timing errors in an ideal zero crossing detector is calculated as a function of harmonic number and the phase of the harmonic relative to the fundamental. Experimental data from several mixers at 5 MHz and different drive levels show that this model is a first-order approximation to real devices. The low sensitivity to the second harmonic is an important advantage over true zero-crossing detectors because it is difficult to significantly reduce the second harmonic without introducing large phase shifts due to filtering networks.

Heterodyne Mixing and Direct Detection in High Temperature Josephson Junctions.
Final rept.
E. N. Grossman, and L. R. Vale. 1994, 20p.
Pub. in International Symposium on Space Terahertz Technology (5th), Ann Arbor, MI., May 10-12, 1994, p244-263.

Keywords: *Lasers, *Heterodyne detection, Reprints, *Josephson junctions, Microwave noise temperature.

The authors have examined various properties of high characteristic frequency YBCO superconductor- normal-superconductor (SNS) Josephson junctions that are important to their performance as low-noise THz frequency mixers. Without far-infrared laser illumination, the microwavefrequency noise temperature to our lowest noise device shows good agreement with the predictions of the resistivity shunted Josephson model in applicable regions of bias. It has a maximum noise temperature of 36 plus or minus K at a physical temperature of 4 K. When illuminatedwith a 404 GHz far-IR laser local oscillator (LO) and a chopped 77 K blackbody signal, strong modulation of the 1 GHz IF noise power is observed. However, certain features of the modulated IF power signal strongly suggest that a larger fraction of it is not true heterodyne detection. The spurious component is probably due to direct detection ofthe broadband hot load/cold load signal. The authors believe that reliable measurement of heterodyne performance will require narrowband signal sources.

Keywords: *Computer security, *Cryptography, *Federal information processing standards, Telecommunication, Data processing security, Algorithms, Software engineering, Requirements.

The selective application of technological and related procedural safeguards is an important responsibility of every Federal organization in providing adequate security in its computer and telecommunications systems. The publication provides a standard to be used by Federal organizations when these organizations specify that cryptographic-based security systems are to be used to provide protection for sensitive or valuable data. Protection of accryptographic module within a security system is necessary to maintain the confidentiality and integrity of the information protected by the module. This standard specifies the security requirements that are to be satisfied by a cryptographic module. The standard provides four increasing, qualitative levels of security intended to cover a wide range of potential applications and environments. The security requirements cover areas related to the secure design and implementation of a cryptographic module. These areas include basic design and documentation, module interfaces, authorized roles and services, physical security, software security, operating system security, key management, cryptographic algorithms, electromagnetic interference/electromagnetic compatibility (EMI/EMC), and self-testing. This revision supersedes FIPS 140 in its entirety.

FIPS PUB 185 PC E03
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Escrowed Encryption Standard (EES); Category: Computer Security; Subcategory: Cryptography.
9 Feb 94, 11p.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Data encryption, *Federal information processing standards, Cryptography, Computer security, Telecommunication, Algorithms, Data processing security, LEAF(Law Enforcement Access Field).

The standard specifies an encryption/decryption algorithm and a Law Enforcement Access Field (LEAF) creation method which may be implemented in electronic devices and used for protecting government telecommunications when such protection is desired. The algorithm and the LEAF creation method are classified and are referenced, but not specified, in the standard. Electronic devices implementing the standard may be designed into cryptographic modules which are integrated into data security products and systems for use in data security applications. The LEAF is used in a key escrow system that provides for decryption of telecommunications when access to the telecommunications is lawfully authorized.

FIPS PUB 186 PC E04
National Inst. of Standards and Technology (NCSL), Gaithersburg, MD.
Digital Signature Standard (DSS). Category: Computer Security; Subcategory: Cryptography.
19 May 94, 24p.
Three ring vinyl binder also available; North American price $7.00; all others write for quote.

Keywords: *Cryptography, *Computer security, Algorithms, Access control, Data processing security, Data integrity, Data encryption, Message processing, Information security, Random number generators, Authentication, Verification, *Digital signatures, Federal Information Processing Standard, ADP(Automated Data Processing).

This standard specifies a Digital Signature Algorithm (DSA) which can be used to generate a digital signature. Digital signatures are used to detect unauthorized modifications to data and to authenticate the identity of the signatory. In addition, the recipient of signed data can use a digital signature in proving to a third party that the signature was in fact generated by the signatory. This is known as nonrepudiation since the signatory cannot, at a later time, repudiate the signature.

FIPS PUB 188 PC E04
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Standard Security Label for Information Transfer; Category: Computer Security; Subcategory: Security Labels.
6 Sep 94, 28p.
Also available from Supt. of Docs.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Computer information security, *Federal information processing standards, Computer security, Access control, Protocols, Computer communications, Syntax, Computer networks, Data processing security, *Security labels.

Information Transfer security labels convey information used by protocol entities to determine how to handle data communicated between open systems. Information on a security label can be used to control access, specify protective measures, and determine handling

restrictions required by a communications security policy. This standard defines a security label syntax for information exchanged over data networks and provides encodings of that syntax for use at the Application and Network Layers.

FIPS PUB 46-2 PC E04
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Data Encryption Standard (DES); Category: Computer Security; Subcategory: Cryptography.
30 Dec 93, 23p.
Supersedes FIPS PUB 46-1.
Three ring vinyl binder available; North American Continent price $7.00; all others write for quote.

Keywords: *Data encryption, *Federal information processing standards, Computer security, Algorithms, Cryptography, Data integrity, Data processing security.

The selective application of technological and related procedural safeguards is an important responsibility of every Federal organization in providing adequate security to its electronic data systems. The publication specifies a crypotographic algorithm which may be used by Federal organizations to protect sensitive data. Protection of data during transmission or while in storage may be necessary to maintain the confidentiality and integrity of the information represented by the data. The algorithm uniquely defines the mathematical steps required to transform data into a crypotographic cipher and also to transform the cipher back to the original form. The Data Encryption Standard is being made available for use by Federal agencies within the context of a total security program consisting of physical security procedures, good information management practices, and computer system/network access controls. The revision supersedes FIPS 46-1 in its entirety.

General Procedures for Registering Computer Security Objects.
N. A. Nazario. Dec 93, 23p, NISTIR-5308.

Keywords: *Computer security, *Standards, Services, Fees, Requirements, Labels, *CSOR(Computer Security Objects Register), Registration.

The document defines a Computer Security Objects Register (CSOR). It outlines the information required for the assignment of unique identifiers to the specifications of Computer Security Objects (CSOs). A CSO can be defined as a resource, tool, or mechanism used to maintain a condition of security in computerized environments. This broad definition covers many elements that are referred to in standards but that are either selected or defined by separate user communities (e.g., network security labels, cryptographic algorithm operation modes, authentication techniques). The CSOR services organizations and individuals seeking to further interoperability by using a common set of tools and techniques in the area of computer security.

Report of the NIST Workshop on Digital Signature Certificate Management. Held on December 10-11, 1992.
D. K. Branstad. Oct 93, 187p, NISTIR-5234.

Keywords: *Computer security, *Cryptography, *Meetings, Certification, Standards, Data processing security, *Digital signatures, National Institute of Standards and Technology.

This report summarizes the major topics of discussion held during a Workshop on Ditigal Signature Certificate Management held at the National Institute of Standards and Technology (NIST) on December 10-11, 1992. The purpose of the workshop was to review existing and required technologies for digital signature certification authorities and to develop recommendations for certificate contents, formats, generation, distribution and storage. The results of the workshop have been provided as input to a federally sponsored study of support infrastructures of a set of international and national signature certification authorities. A summary of the major issues discussed and the recommendations on several of them are presented.

Keywords: *Meetings, *Computer security, Access control, Data processing security, Computer privacy, Standards, North America, Europe, *Federal Criteria, National Institute of Standards and Technology, National Security Agency, Common Criteria Editorial Board, ISO(International Standards Organization).

The first draft of the Federal Criteria was made public in January 1993. Several thousand copies of the Federal Criteria were distributed and comments on this first draft were received. The purpose of the Federal Criteria Workshop was to address these comments. The purpose of these proceedings is to inform the Federal Criteria commentators and the workshop attendees of the outcome of the workshop. Also, these proceedings will be used as a blueprint for updating the Federal Criteria. These proceedings, and the revised portions of the draft Federal Criteria contents, will be the two principal National Institute of Standards and Technology (NIST)/National Security Agency (NSA) inputs to the Common Criteria Editorial Board (CCEB). Preliminary plans for dealing with the Federal Criteria comments are included in this document, and all revisions will be performed under the direction of NIST and the NSA.

Conformance Assessment of Transport Layer Security Implementations.
W. A. Jansen. Dec 93, 23p, NISTIR-5325.
See also AD-A207 905 and AD-A255 422.

Keywords: *Computer networks, *Protocols, *Computer security, Tests, Data integrity, Computer information security, Authentication, Access control, OSI(Open System Interconnection), TLSP(Transport Layer Security Protocol), SP4(Security Protocol at layer 4), SDNS(Secure Data Network System).

The paper presents a framework for evaluating conformance of a protocol implementation to the Security Protocol at layer 4 (SP4) standard. SP4 is one element of the Secure Data Network System (SDNS) architecture, used to provide security services at the Transport layer of the Open System Interconnection (OSI) reference model. SP4 also forms the basis of the International Organization for Standardization (ISO) standard for the OSI Transport Layer Security Protocol (TLSP). Therefore, with few exceptions, the findings of the paper are applicable to TLSP. The paper explores the relationship between conformance assessment, interoperability assessment, and security evaluation of security protocols. The OSI conformance testing methodology and framework is reviewed, and a strategy is given for applying this methodology to SP4 implementations.

Federal Certification Authority Liability and Policy: Law and Policy of Certificate-Based Public Key and Digital Signatures.
M. S. Baum. Jun 94, 485p, NIST/GCR-94/654.
Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD.

Keywords: *Computer security, *Cryptography, *Law(Jurisprudence), Computer information security, Government policies, Legal aspects, Data processing security, Electronic mail, Recommendations, Digital signatures, EDI(Electronic Data Interchange), National Institute of Standards and Technology, FCA(Federal Certification Authority), Infrastructure, PEM(Privacy Enhanced Mail).

The report identifies diverse technical, legal and policy issues affecting a certificate-based public key cryptographic infrastructure utilizing digital signatures supported by 'trusted entities.' It examines potential legal implications, surveys existing legal paradigms and the structures and roles of relevant governmental agencies and presents various institutional approaches to controlling liability. It considers the underpinnings of a legal and policy framework which might serve as a foundation for security policies and their implementation and concludes with a series of recommendations, both general and specific.

Hierarchical Interaction between Sensory Processing and World Modeling in Intelligent Systems.
Final rept.
J. S. Albus. 1990, 7p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Symposium on Intelligent Control (5th), Philadelphia, PA., September 5-7, 1990, v1 p53-59.

Keywords: *Artificial intelligence, *Machine vision, Learning machines, Robotics, Sensory perception, Models, Image processing, Pattern recognition, Reprints.

The role of the sensory processing system is to transform sensory maps into world model maps and to extract entity attributes and states. The role of the world modeling system is to store best estimates of the extracted values, and to generate from them, predicted inputs. There is a tight coupling between sensory proc-

essing and world modeling. The world model generates predicted sensory input from stored state estimates. The sensory processing system compares predictions with observations, and returns the difference signals to the world model for updating state estimators. The sensory processing system also performs spatial and temporal integration on various combinations of observed and predicted data, and compares the resulting correlation function against thresholds of recognition and detection.

Role of World Modeling and Value Judgment in Perception.
Final rept.
J. S. Albus. 1990, 10p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Symposium on Intelligent Control (5th), Philadelphia, PA., September 5-7, 1990, v1 p154-163.

Keywords: *Artificial intelligence, *Models, Machine learning, Knowledge representation, Robotics, Task planning(Robotics), Sensory perception, Interfaces, Reprints, *World models.

The world model is the intelligent system's best estimate of the external world. It provides an interface between sensory processing and task decomposition. A world model architecture is proposed that represents knowledge in terms of maps, entity frames, and state variables. The structure is hierarchically organized so as to provide multiple levels of resolution in space and time. Three types of map coordinates are important: egospheres, object coordinates, and world coordinates. Value judgments provided an evaluation of hypothesized plans, and perceived objects, events, and situations. Evaluations produce value state-variables that indicate cost, benefit, risk, priority, desirability, attractiveness, and uncertainty.

Theory of Intelligent Systems.
Final rept.
J. S. Albus. 1990, 10p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Symposium on Intelligent Control (5th), Philadelphia, PA., September 5-7, 1990, p866-875.

Keywords: *Artificial intelligence, Robotics, Learning machines, Machine vision, Feedback control, Models, Theories, Reprints.

A theoretical model is proposed consisting of seven basic elements: actuators, sensors, sensory processing, world modeling, task decomposition, value judgment, and global memory/communications. These elements are integrated into a hierarchical system architecture wherein: (1) control bandwidth decreases about an order of magnitude at each higher level, (2) perceptual resolution of spatial and temporal patterns contracts about an order-of-magnitude at each higher level, (3) goals expand in scope and planning horizons expand in space and time about an order-of-magnitude at each higher level, and (4) models of the world and memories of events expand in space and time by about an order-of-magnitude at each higher level. At each level, tightly coupled functional modules perform task decomposition, world modeling, sensory processing, and value judgments. Feedback control loops are closed at every level.

Keywords: *Data encryption, *Data processing security, Federal information processing standards, Algorithms, Computer software, Computer program integrity, Requirements, Industries, Computer security, *Key escrow encryption, EES(Escrowed Encryption Standard), US NIST.

The purpose of this workshop was to initiate a dialogue among representatives from industry, government and academia regarding issues of key escrow encryption. Workshop presentations and discussions included current progress in the planned usage of CAPSTONE/CLIPPER chips, the alternative of software key escrowing, multipurpose key escrowing methods, private key escrow management, integrity requirements of application systems, and international implications. The proposed plan of action, arising from this workshop, is to establish a joint industry/government working group to critically evaluate all known key escrowing proposals; examine the adequacy of existing (and possibly suggesting new) vehicles for collaborative industry/government research and development; identify and evaluate suitable algorithms for use in conjunction with key escrow along with criteria for determining acceptability; identify and address the issues of intellectual property which are inherent in any public royalty-free usage of algorithms, key escrow methodology, and supporting infrastructure; and create a key escrowing task force to manage and expedite the search for key escrow alternatives.

Formal Specification and Verification of Control Software for Cryptographic Equipment.
Final rept.
D. R. Kuhn, and J. F. Dray. 1990, 11p.
Pub. in Proceedings of Annual Computer Security Applications Conference (6th), Tucson, AZ., December 3-7, 1990, p32-43.

Keywords: *Cryptography, *Computer program verification, *Specifications, Access control, Software engineering, Computer security, Microprocessors, Workstations, Reprints, Smart cards, Formal methods, VDM(Vienna Development Method).

This paper describes the application of formal specification and verification methods to two microprocessor-based devices: a 'smart-token' system that controls access to a network of workstations, and a message authentication device implementing the ANSI X9.9 message authentication standard. A state-based specification for the smart token system was prepared and verified using the Unisys Formal Development Methodology. The message authentication device specification used the Vienna Development Method, which is based on denotational semantics. Formal specification and verification were found to be practical, cost-effective tools for detecting potential security weaknesses. The security of the access control system was strengthened as a result of the analysis. An unexpected result was the discovery of ambiguities in a published standard.

Keywords: *Meetings, *Computer security, Data processing security, Computer privacy, Computer information security, Data integrity, Government policies, Distributed computer systems, Operating systems(Computers).

The purpose of the Invitational Workshop on Information Technology (IT) Assurance and Trustworthiness was to identify crucial issues on assurance in IT systems and to provide input into the development of policy guidance on determining the type and level of assurance appropriate in a given environment. The readers of these proceedings include those who handle sensitive information involving national security, privacy, commercial value, integrity, and availability. Existing IT security policy guidance is based on computer and communications architectures of the early 1980s. Technological changes since that time mandate a review and revision of policy guidance on assurance and trustworthiness, especially since the changes encompass such technologies as distributed systems, local area networks, the worldwide Internet, policy-enforcing applications, and public key cryptography.

Adaptive, Predictive 2-D Feature Tracking Algorithm for Finding the Focus of Expansion.
S. Krishnan, and D. Raviv. Jun 94, 30p, NISTIR-5460.
Grant NSF-IRI-9115939
Prepared in cooperation with Florida Atlantic Univ., Boca Raton. Robotics Center. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *Motion, *Optical tracking, *Computer vision, *Two dimensional flow, Feature extraction, Pattern recognition, Image processing, Algorithms, Pixels, FOE(Focus of Expansion).

This paper describes a robust, pixel-based adaptive algorithm to track image features, both spatially and temporally, over a sequence of monocular images. The algorithm assumes no a priori knowledge about the features to be tracked, or the motion of the camera or the objects, in the 3-D scene. The features to be tracked are selected by the algorithm and these correspond to the peaks of a 'matching surface' constructed from the first image of the sequence to be analyzed. Any kind of motion can be tolerated keeping in mind the pixels-per-frame motion limitations. In our experiments, we have used the algorithm for tracking up to 3 pixels motion between frames with absolutely no subpixel calculations being necessary. Taking into account constraints of temporal continuity, the algorithm uses simple and efficient predictive tracking over multiple

frames. The algorithm accepts a slow, continuous change of brightness D.C. level in the pixels of the feature. Trajectories of features on multiple objects can be computed. As an application of the algorithm we show how the algorithm can be used to find the Focus of Expansion (FOE) using a sequence of real images.

Compensation of Markov Estimator Errors in Time-Jittered Sampling of Nonmonotonic Signals.
Final rept.
G. Tong, and T. M. Souders. 1993, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 42, n5 p931-935 Oct 93.

Keywords: Probability density functions, Sampling, Errors, Reprints, *Signal estimation, *Markov estimators, Sampling voltage trackers, Bias compensation, Time jitter.

The so-called Markov estimator is sometimes used to estimate signals from their time-jittered samples. The estimates are unbiased for monotonic signals, but exhibit errors in regions of nonmonotonicity. A method of compensation is presented to reduce this error. It requires a knowledge of the probability density functions (PDF) of the time jitter, and a proposed method for determining the PDF based on the generalized Markov estimator has been verified through simulations. The performance of the compensation approach is presented for four different nonmonotonic waveforms.

Visual Road Following without 3-D Reconstruction.
Final rept.
M. Herman, D. Raviv, H. Schneiderman, and M. Nashman. 1993, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers Applied Imagery Pattern Recognition Workshop (22nd), Washington, DC., October 1993, v2103 p1-11.

Keywords: *Robots, *Autonomous navigation, *Computer vision, Robotics, Robot dynamics, Ground vehicles, Two dimensional models, Optical flow(Image analysis), Cues, Algorithms, Real time, Reprints, *Road following.

The paper discusses an alternative approach to visual road following in which a minimal road model is generated. The model contains only task-relevant information and a minimum of vision processing is performed to extract this information. This approach leads to rapid and continuous update of the road model from the visual data. Road following is achieved by servoing on the visual cues in the 2-D model. In this paper, two specific examples of road following that use this approach are presented. In the first example, we show that road following commands can be generated from visual cues consisting of the projection into the image of the tangent point on the edge of the road, along with the optical flow of this point. Using this cue, the resulting servo loop is very simple and fast. In the second example, we show that lane markings can be robustly tracked in real time while confining all processing to the 2-D image plane. Neither knowledge of vehicle motion nor a calibrated camera is required.

Reconstruction during Camera Fixation.
Final rept.
D. Raviv. 1991, 8p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Intelligent Robots and Computer Vision IX: Neural, Biological and 3-D Methods, Boston, MA., November 7-9, 1990, v1382 p312-319 1991.

Keywords: *Autonomous navigation, *Robots, *Computer vision, Robot dynamics, Optical flow(Image analysis), Cameras, Reprints, *Camera fixation.

A fixation point is a point in 3-D space that projects to zero optical flow in an image over some period of time while the camera is moving. This paper deals with quantitative aspects of camera fixation for a static scene. In general, when the camera undergoes translation and rotation, there is an infinite number of points that produce equal optical flow for any instantaneous point in time. Using a camera-centered spherical coordinate system, it is shown how to find these points in space. If the elevation component of the optical flow is set to zero, then these points form a circle (called the Equal Flow Circle (EFC)) and a line. A special case of the EFCs is the Zero Flow Circle (ZFC) where both components of the optical flow are equal to zero. In a set of experiments using simulated as well as real data, we show how the concept of the EFC and ZFC can be used to explain the optical flow produced by points near the fixation point, and to explicitly map the space while fixating. It is also shown experimentally that points near the fixation point may change the sign of their optical flow as the camera moves.

Unified Approach to Camera Fixation and Vision-Based Road Following.
Final rept.
D. Raviv, and M. Herman. 1994, 53p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Systems, Man, and Cybernetics 24, n8 53p Aug 94.

Keywords: *Autonomous navigation, *Robotics, *Computer vision, Robots, Robot dynamics, Optical flow(Image analysis), Cameras, Reprints, *Camera fixation, *Road following.

Both camera fixation and vision-based road following are problems that involve tracking or fixating on 3-D points and features. These problems also require an analysis of depth and motion. We present a theoretical approach to analyzing optical flow and show the application of this unified approach to both problems. In general, when a camera undergoes translation and rotation, there is an infinite number of points in 3-D space that produce equal optical flow for any point in time. Using a camera-centered spherical coordinate system, we show how to find these points in space. If the elevation component of the optical flow is set to zero, then these points form a circle (called the Equal Flow Circle (EFC)) and a line. A special case of the EFCs is the Zero Flow Circle (ZFC) where both components of the optical flow are equal to zero. The fixation point is the intersection of all the ZFCs. Points inside and outside of the ZFC can be quantitatively mapped using the EFCs. Using the ZFCs approach, we suggest a new, quantitative, vision-based approach to road following. We show that motion commands can be generated from a visual feature, or cue, consisting of the projection into the image of the tangent point on the edge of the road, along with the optical flow of this point. Using this cue, we suggest a vision-based control approach.

Computer Security Management and Planning in the U.S. Federal Government.
Final rept.
E. F. Troy. 1990, 519p.
Pub. in Proceedings of Comsec International 1990, London, United Kingdom, October 10-12, 1990, 519p.

Keywords: *Federal government, *Computer information security, *Selective dissemination of information, *Data base administrators, *Access control, Data processing security, Electronic security, Classified information, Classified materials, Vulnerability, Privacy, Confidentiality, Risk assessment, Computer networks, Operating systems(Computers), Computer program integrity, Data management systems, Policies, Reprints, Computer security management, Computer security planning, Trusted systems, Computer Security Act.

The paper describes a number of activities sponsored by NIST to improve computer security management in the U.S. Federal government. The paper presents the results of the computer Security Act-mandated security plan review process and describes a number of procedural initiatives NIST has taken to help Federal computer security managers meet their computer security responsibilities. The paper also discusses new NIST technical initiatives in applying trusted systems technology concepts to sensitive systems, as a powerful new aid to assure better security protection. The paper asserts that a balanced combination of technical and non-technical security controls is needed to provide adequate computer security for Federal systems.

Configuration and Performance Evaluation of a Real-Time Robot Control System: A Skeleton Approach.
Final rept.
T. Wheatley, and J. Michaloski. 1990, 4p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Conference on Systems Engineering, Pittsburgh, PA., August 9-11, 1990, p268-271.

Keywords: *Robot control, *Systems analysis, *Performance evaluation, Real time, Computer system hardware, Operating systems(Computers), Multiprocessors, Concurrent processing, Hierarchies, Control systems, Reprints, Skeleton systems.

The use of a skeleton system to model a multi-processor robot control architecture offers the system designer a powerful tool to configure and evaluate system parameters. This paper describes the skeleton approach as applied to the NASREM robot control architecture. The skeleton approach creates the shell of a functioning real-time control system utilizing the actual hardware and operating system code without using actual application code. This is done by replacing the processing part of the application code with time delays. Parameterization of time delays, communication paths, message buffer lengths, and process allocation provides for rapid prototyping of alternative system architectures. Actual system performance is measured to provide realistic data on computation and communication loads. The skeleton reporting facility provides quantitative assessments of system activity. To illustrate the use of this technique, the servo level of the NASREM hierarchy will be modeled using a 5.0 msec cycle time on a multiprocessor system, and compared with the actual system.

Approaches Using Virtual Environments with Mosaic.
Final rept.
S. Ressler. 1994, 8p.
Pub. in Proceedings of International WWW Conference '94 Mosaic and the Web (2nd), Chicago, IL., October 17-20, 1994, p853-860.

Keywords: *Virtual reality, *Environment simulation, *Interactive graphics, Computer graphics, Interactive control, Computerized simulation, Man computer interfaces, Data transmission, Information technology, Reprints, *Mosaic, *Computer generated environments, User interfaces, World Wide Web, National Information Infrastructure.

The paper describes several ways to use a computer generated environment with Mosaic. The first is to allow the user to interact with an environment displayed as part of the Mosaic document, an in-line image. The second is to create an independent process with which the user can have high bandwidth interaction, i.e. real time manipulations, which can drive Mosaic remotely. These techniques demonstrate that the use and interaction with spatially oriented information spaces are practical. Both techniques have advantages and disadvantages which are discussed.

New Method to Calculate Looming for Autonomous Obstacle Avoidance.
K. Joarder, and D. Raviv. Nov 94, 32p, NISTIR-5512.
Grant NSF-IRI-9115939
Sponsored by National Inst. of Standards and Technology (MEL), Gaithersburg, MD. Intelligent Systems Div. and National Science Foundation, Arlington, VA. Div. of Information, Robotics and Intelligent Systems.

Keywords: *Autonomous navigation, *Obstacle avoidance, Computer vision, Cameras, Ocular fixation, Textures, Motion, Image processing, *Visual looming.

The idea of visual looming, i.e., the expansion of an object's size on the retina due to its decreasing distance from the observer, can be used as a powerful visual cue for autonomous obstacle avoidance. In this paper we describe a method of measuring looming quantitatively by fixating a camera at a point on the surface of an object and studying the texture near this point. A reduced distance of the camera from the surface results in a decline in the density of the texture primitives in the image. We show analytically how looming can be calculated from the relative change in this density and from the local orientation of the surface. The method is applicable for both stationary and moving obstacles and does not require calculation of range. Results of looming are presented for various textural surfaces, in different orientations.

Taxonomy for Security Standards.
Final rept.
W. A. Jansen. 1994, 10p.
Pub. in Proceedings of National Computer Security Conference (17th), Baltimore, MD., October 11-14, 1994, p165-174.

Keywords: *Computer security, *Standards, *Taxonomy, US DoD, Standardization, Classifications, Reprints.

This paper presents a taxonomy of security standards developed to ensure a systematic review of security standardization areas appropriate to the Department of Defense (DoD) Goal Security Architecture. The taxonomy relies on a simple paradigm based on the notions of uniformity and quality. This approach attempts to provide full coverage of all relevant security standards, yet be simple to understand and apply. The taxonomy is also open to further refinements and adjustments. Because of the flexibility and simplicity of the taxonomy, other initiatives involving the classification of standards may benefit from its use.

Casual Regularizing Deconvolution Filter for Optimal Waveform Reconstruction.
Final rept.
N. G. Paulter. 1994, 8p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 43, n5 p740-747 Oct 94.

Keywords: Iterative methods, Optimization, Convergence, Reprints, *Signal reconstruction, *Waveform reconstruction, Deconvolution filters.

A causal regularizing filter is described for selecting an optimal reconstruction of a signal from a deconvolution of its measured data and the measurement instrument's impulse response. Measurement noise and uncertainties in the instrument's response can cause the deconvolution (or inverse problem) to be ill-posed, thereby precluding accurate signal restoration. Nevertheless, close approximations to the signal may be obtained by using reconstruction techniques that alter the problem so that it becomes numerically solvable. A regularizing reconstruction technique is implemented that automatically selects the optimal reconstruction via an adjustable parameter and a specific stopping criterion, which is also described. Waveforms reconstructed using this filter do not exhibit large oscillations near transients as observed in other regularized reconstructions. Furthermore, convergence to the optimal solution is rapid.

Calculating Time-to-Contact Using Real-Time Quantized Optical Flow.
T. A. Camus. Mar 95, 18p, NISTIR-5609.

Keywords: *Computer vision, *Optical flow(Image analysis), Robotics, Autonomous navigation, Collision avoidance, Real time, Algorithms, Correlation, Measurement, *Time-to-contact, Time-to-collision.

Recently it has been demonstrated that robust, real-time optical flow is possible using standard computing hardware. One limitation of this correlation-based algorithm is that it does not give truly real-valued image velocity measurements. Therefore, it is not obvious that it can be used for a wide range of robotic vision tasks. One particular application for optical flow is time-to-contact: based on the equations for the expansion of the optical flow field it is possible to compute the number of frames remaining before contact with an observed object. Although the individual motion measurements of this algorithm are of limited precision, they can be combined to produce remarkably accurate time-to-contact measurements, which can be produced in real-time on standard computing hardware.

Keywords: *Electronic security, *Data encryption, *Cryptography, *Standards, Electronic funds transfer, Data processing security, Computer security, Risk management, Authentication, Confidentiality, Specifications, Reprints, Electronic data interchange.

The use of electronic rather than paper-based transactions has reduced costs and improved efficiency for many organizations. However, the use of this technology also exposes the business community and its customers to potential/severe risks from the accidental or deliberate alteration of data. In response to this increased risk, several standards-setting bodies have developed or are developing standards to protect information transferred electronically. This chapter discusses two computer-based technologies--electronic funds transfer (EFT) and electronic data interchange (EDI)--and several of the standards that have been developed specifically for them including message authentication, encryption, and key management.

The National Security Agency (NSA) with the cooperation of the National Institute of Standards and Technology (NIST) formed a technical group to create security requirements for distributed systems. These include requirements for data confidentiality, data integrity, cryptography, distributed identification and authentication, as well as for access control, auditing, system management, trusted path, and trusted recovery for distributed systems. These requirements are being reviewed for incorporation within the Common Criteria, which is a joint effort of the United States (NSA and NIST), Canada, France, Great Britain, and Germany to come up with a single criteria for security requirements.

Bounds on Least-Squares Four-Parameter Sine-Fit Errors Due to Harmonic Distortion and Noise.
Final rept.
J. P. Deyst, T. M. Souders, and O. M. Solomon. 1995, 6p.
See also DE94007859.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement, v44 n3 p637-642 Jun 95.

Keywords: *Least square fit, *Signal conditioning, Algorithms, Reprints, Errors, Harmonics, Noise.

Least-squares sine-fit algorithms are used extensively in signal-processing applications. The parameter estimates produced by such algorithms are subject to both random and systematic errors when the record of input samples consists of a fundamental sine wave corrupted by harmonic distortion or noise. The errors occur because, in general, such sine-fits will incorporate a portion of the harmonic distortion or noise into their estimate of the fundamental. Bounds are developed for these errors for least-squares four-parameter (amplitude, frequently, phase, and offset) sine-fit algorithms. The errors are functions of the number of periods in the records, the number of samples in the record, the number of samples in the record, the harmonic order, and fundamental and harmonic amplitudes and phases. The bound do not apply to cases in which harmonic components become aliased.

Point Probe Decision Trees for Geometric Concept Classes.
Final rept.
E. M. Arkin, M. T. Goodrich, J. S. B. Mitchell, S. S. Skiena, D. Mount, and C. D. Piatko. 1993, 12p.
Pub. in Workshop on Algorithms and Data Structures (WADS '93) (3rd), Montreal, Canada, Spring 1993, v709 p95-106.

Keywords: *Computer vision, *Decision tree analysis, Image resolution, Geometric accuracy, Computational geometry, Reprints, Probing.

A fundamental problem in model-based computer vision is that of identifying to which of a given set of concept classes of geometric models an observed model belongs. Considering a 'probe' to be an oracle that tells whether or not the observed model present at a given point in an image, we study the problem of computing efficient strategies ('decision trees') for probing an image, with the goal to minimize the number of probes necessary (in the worst case) to determine in which class the observed model belongs. We prove a hardness result and give strategies that obtain decision trees whose height is within a log factor of optimal.

Prepared in cooperation with National Inst. of Standards and Technology, Gaithersburg, MD. and Naval Academy, Annapolis, MD.
Included in Jnl. of Research of the National Institute of Standards and Technology, v101 n2 p165-174 Mar/Apr 96.

Keywords: *Computer arithmetics, Fixed-point, Floating-point, Logarithmic, Level-index, Reprints, Residue number system, Serial simulation, Parallel simulation.

The paper is a blueprint for the use of a massively parallel SIMD computer architecture for the simulation of various forms of computer arithmetic. The particular system used is a DEC/MasPar MP-1 with 4096 processors in a square array. This architecture has many advantages for such simulations due largely to the simplicity of the individual processors. Arithmetic operations can be spread across the processor array to simulate a hardware chip. Alternatively they may be performed on individual processors to allow simulation of a massively parallel implementation of the arithmetic.

Keywords: *Federal agencies, *Computer security, *Access control, *European communities, Data processing security, Electronic security, Privacy, Confidentiality, Computer networks, Data management systems, Operating systems(Computers), Policies, Standards, Performance evaluation, Criteria, *Trusted systems, Commercial Licensed Evaluation Facilities.

In November 1990, James Burrows, then Director of the Computer Systems Laboratory of the National Institute of Standards and Technology (NIST), met with European officials and Steve Walker of Trusted Information Systems to discuss initiating a preliminary developmental evaluation of the trusted Mach (Tmach) system against the European developed Inforamtion Security Evaluation Criteria (ITSEC). As a result, NIST finalized an agreement with the Advanced Research Projects Agency (ARPA) to coordinate and oversee the TMach evaluation work to be done by Germany and the United Kingdom. The document describes the multi-national evaluation experiment of the Trusted Mach system. The report focuses on Phase I - The Development Evaluation Phase. The objective is to provide a historical journal discussing the experiment, and providing insight into what has been learned and accomplished thus far. Discussed are the objectives of the effort, the participants, how the evaluation has proceeded, and the benefit. It is in the interest of the U.S. Government to understand how these two criteria differ in practice and how evaluations done under each may be compared.

Keywords: *Computer security, Information systems, Federal agencies, Local area networks, Risk, Computer viruses, Computer prevacy, Data integrity, Management, Personal computers, Principles, Computer networks, Data encryption, *Generally Accepted Principles and Practices.

As more organizations share information electronically, a common understanding of what is needed and expected in securing information technology (IT) resources is required. This document provides a baseline that organizations can use to establish and review their IT security programs. The document gives foundation that organizations can reference when conducting multi-organizational business as well as internal business. Management, internal auditors, users, system developers and security practioners can use the guideline to gain an understanding of the basic security requirements most IT systems should contain. The foundation begins with generally accepted system security principles and continues with common practices that are used in securing IT systems.

Keywords: *Data storage, *Error correcting codes, *Optical disks, *Optical memory (Data storage), *Quality control, Degradation, Error analysis, Information systems, On-line systems.

Optical disk-based information systems are being used in private industry and many Federal Government agencies for on-line and long-term storage of large quantities of data. The storage devices that are part of these systems are designed with powerful, but not unlimited, media error correction capacities. The integrity of data stored on optical disks does not only depend on the life expectancy specifications for the medium. Different factors, including handling and storage conditions, may result in an increase of medium errors in size and frequency. Monitoring the potential data degradation is crucial, especially for long term applications. Efforts are being made by the Association for Information and Image Management Technical Committee C21, Storage Devices and Applications, to specify methods for monitoring and reporting to the user medium errors detected by the storage device while writing, reading or verifying the data stored in that medium. The Computer Systems Laboratory (CSL) of the National Institute of Standard and Technology (NIST) has a leadership role in the development of these standard techniques. In addition, CSL is researching other data integrity issues, including the investigation of error-resilient compression algorithms. NIST has conducted care and handling experiments on optical disk media with the objective of identifying possible causes of degradation. NIST work in data integrity and related standards activities is described.

Keywords: *Local area networks, *Standards, Fiber optics, Workstations, Protocols, Wiring, *FDDI, *Fiber Distributed Data Interface, GOSIP(Government Open Systems Interconnection Profile), Token rings.

The Fiber Distributed Data Interface (FDDI) is an emerging Standard fiber optic Local Area Network (LAN) technology suitable for backbone and high performance workstation applications. FDDI will be widely used by federal agencies in the 1990's. This report describes FDDI standards and the media that FDDI uses, and provides information about writing for FDDI LANs and about effectively configuring FDDI LANs. It also describes the relationship of FDDI to the Government Open Systems Interconnection Profile (GOSIP) and discusses connecting FDDI to other networks.

Standardization of Testing Methods for Optical Disk Media Characteristics and Related Activities at NIST.
Final rept.
F. L. Podio, R. Onyshczak, and E. S. Villagran. 1990, 5p.
Pub. in Optical Information Systems 10, n4 p174-178 Jul/Aug 90.

Keywords: *Optical disks, *Tests, *Standardization, Media, Standards, Optical storage materials, Service life, Reprints, US NIST.

Standard testing methods for measuring the characteristics of optical disks are needed to verify conformance to the related industry media interchange standards. Technical Committee (TC) X3B11 is addressing the standardization of those testing methods. Through its optical disk computer storage media research program, the National Institute of Standards and Technology, National Computer Systems Laboratory (NIST/NCSL) is involved in the research of testing methods for media characteristics and is participating in the development of optical media standards in TC X3B11 and other standard committees. Standard testing methods for predicting the life expectancy of the media are also needed. NIST is designed a methodology for predicting life expectancy of optical media and is also contributing to those standardization efforts and data permanence studies.

NIST Workshop on the Computer Interface to Flat Panel Displays. Held in San Jose, California on January 13-14, 1994.
Special pub.
M. P. Williamson, W. E. Burr, and J. W. Roberts. Aug 94, 231p, NIST/SP-500/219.
Also available from Supt. of Docs. as SN003-003-03289-1.

Keywords: *Display devices, *Standards, *Meetings, Liquid crystal display systems, Cathode ray tubes, Electric connectors, Personal computers, Flat surfaces, Workstations, *Flat panel displays, *Computer interface, Interface standards, US NIST.

On January 13 and 14, 1994, the NIST Workshop on the Computer Interface to Flat Panel Displays was held at the San Jose Hilton and Towers in San Jose, California. The meeting was attended by representatives from computer, flat panel display, and graphics controller companies. The objectives of this workshop were: to determine the need for a standard or a series of standards for the computer interface to flat panel displays; to identify what types of standards are needed; to identify approaches for developing flat panel display interface standards; and to obtain a consensus on a coordinated plan for standards development. The workshop attendees agreed that a standard flat panel display interface for integrated devices is needed. A special interest group was formed under the Video Electronics Standards Association (VESA) to undertake the development of a standard or a series of standards for the interface between a flat panel display and its controller. This interface standard will address both active and passive flat panel displays in integrated devices. It will cover both the electrical and the mechanical (connector) specifications. The interface for remote flat panel displays requires additional technical discussions before a standard can be written. Additional workshops on display interfaces and/or technical sessions at the SID (Society for Information Display) Symposium should be explored. In addition, the VESA Monitor Committee invited interested parties to participate in their committee which will be considering interfaces and connectors to desktop and remote flat panel displays in addition to their CRT interface work.

Guide on Open System Environment (OSE) Procurements.
Special pub.
G. E. Fisher. Oct 94, 161p, NIST/SP-500/220.
Also available from Supt. of Docs. as SN-003-003-03302-2. See also PB95-166260.

Keywords: *Government procurement, Requirements, Guidelines, Specifications, Operating systems(Computers), Man computer interface, Software engineering, Data management, Data transfer(Computers), Computer graphics, Computer networks, Management, Computer systems hardware, *OSE(Open System Environment), *Open System Environment, RFPs(Requests for proposals).

The guide provides program managers and senior system engineers with much-needed information for developing plans and requirements to establish an Open System Environment (OSE). U.S. Government procurements that have already taken place have provided numerous lessons-learned which have been incorporated in this report. A decision model is defined in the introductory material to provide a mechansim for making choices concerning the applicability of standards. Side-bars in the text provide associated information about the use of specific standards in order to more clearly describe the effects of relationships among different standards. Additional information includes text that can be included in requests for proposals (RFPs), a sample statement of work based on the guidance contained in the report, a glossary, and methods for evaluating individual proposals made in response to OSE requirements.

MasPar MP-1 as a Computer Arithmetic Laboratory.
M. A. Anuta, D. W. Lozier, and P. R. Turner. Jan 95, 24p, NISTIR-5569.
Prepared in cooperation with Cray Research, Inc., Calverton, MD. and Naval Academy, Annapolis, MD. Dept. of Mathematics.

Keywords: *Arithmetic units, *SIMD(Computers), Algorithms, Computer architecture, Computer systems hardware, Massively parallel processors, Very large scale integration, Computer software, Array processors, *DEC/MasPar MP-1 computer systems, LI(Level-index) arithmetic, SLI(Symmetric level-index) arithmetic.

This paper describes the use of a massively parallel SIMD computer architecture for the simulation of various forms of computer arithmetic. The particular system used is a DEC/MasPar MP-1 with 4096 processors in a square array. This architecture has many advantages for such simulations due largely to the simplicity of the individual processors. Arithmetic operations can be spread across the processor array to simulate a hardware chip. Alternatively, they may be performed on individual processors to allow simulation of a massively parallel implementation of the arithmetic. Compromises between these extremes permit speed-area trade-offs to be examined. The paper includes a description of the architecture and its features. It then summarizes some of the arithmetic systems which have been, or are to be implemented. The implementation of the level-index (LI) and symmetric level-index (SLI) systems is described in some detail. An extensive bibliography is included.

Operating Principles of MultiKron II Performance Instrumentation for MIMD Computers.
A. Mink. Dec 94, 32p, NISTIR-5571.
See also PB92-181072. Sponsored by Advanced Research Projects Agency, Arlington, VA.

Keywords: *MIMD(Computers), *Very large scale integration, Chips(Electronics), Multiprocessors, Computer performance evaluation, Parallel processors, *MultiKron II.

The MultiKron II design is an enhanced version of our earlier MultiKron performance instrumentation chip. They are both 179 pin chips, and although pin compatibility is close they are not 100% compatible. The MultiKron II has a longer TRACE sample, 20 bytes vs 16, to allow a larger user data and Timestamp fields. The 16 counters for resource utilization measurements are now writable, to allow for 'virtual' use, and their programming interface has changed to allow more options. Although designed for a 64-bit processor bus interface, an internal holding register provides for 32-bit mode operation.

Keywords: *Computer systems hardware, *Circuit boards, *Very large scale integration, Printed circuits, MIMD(Computers), Multiprocessors, Computer architecture, Data acquisition, SIB(SBus MultiKron Interface Board), US NIST.

The MultiKron Experimenter's Toolkit contains an SBus MultiKron interface board (SIB) or alternatively a VME MultiKron interface board (MIB), installation software, data logging software, and analysis software; all of the software supplied is written in C. The Toolkit allows users to take advantage of the National Institute of Standards and Technology (NIST) MultiKron performance measurement chip in systems that do not already have a MultiKron designed into them. The SIB is applicable to both multiprocessor systems and single-processor systems. The Experimenter's Toolkit allows researchers to obtain hands-on experience with the MultiKron performance measurement chip, without the engineering effort required to design and build a hardware interface between the MultiKron and their computer. Over 800,000 Trace Samples can be collected during an experiment to the SIB on-board memory; a practically-unlimited number of Samples can be collected if an optional external data-collection computer is used.

Conformance Testing for OSI Protocols.
Final rept.
R. J. Linn. 1990, 17p.
Pub. in Computer Networks and ISDN Systems 18, p203-219 1989/90.

Keywords: *Computer communications, *ISO, *Protocols, Computer architecture, Communication networks, Conformity, Tests, Test methods, Specifications, Standards, Reprints, *OSI(Open Systems Interconnection), *Open Systems Interconnection, Test systems, ANC1(Abstract Syntax Notation 1), TICN(Tree and Tabular Combined Notation), Estelle.

In the early 1980's, research and development was initiated on methods to test the developing International Standards Organinzation's Open Systems Interconnection (ISO/OSI) communications protocols. A tutorial overview of the test methods and test notation named TTCN which were developed within ISO are presented. Issues regarding multilayer test methods are still not completely resolved. These issues are identified and alternatives to ISO's methods are explored. Application of the formal description techniques named ASN.1 and Estelle to multi-layer test systems

is illustrated. Concluding remarks summarize the status of current practice in conformance testing and status of evolving OSI testing standards.

See also PB93-234730, PB95-189486 and PB95-231783. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Computer systems hardware, *Multiprocessors, *Circuit boards, Very large scale integration, MIMD(Computers), Printed circuits, Computer architecture, Performance tests, Multikron Performance Instrumentation.

The MultiKron* and MultiKron II performance instrumentation provided both Trace sampling and Resource Counters, but required a separate measurement data collection facility for collecting sample data. Although providing a large amount of measurement detail, trace sampling has the disadvantage of requiring additional investment in logic, wires and space to provide for the collection facilities. An alternative measurement approach that would eliminate the need for a collection facility, and its associated cost, is to eliminate Trace sampling and only provide for a very large number of Resource Counters, at the cost of some loss of measurement detail. The MultiKron virtual counter (MultiKron vc) performance instrumentation chip provides such a feature. Similar in concept to virtual memory, thousands of virtual counters are available but only a small number are real counters that can be active at any one time. Unlike virtual memory, where swapping is transparent to the programmer, due to extra hardware and kernel software support, swapping of counter blocks must currently be handled by the programmer.

Research on Methods for Determining Optical Disk Media Life Expectancy Estimates.
Final rept.
F. L. Podio. 1992, 9p.
Pub. in Society of Photo-Optical Instrumentation Engineers, v1663 p447-455 Feb 92.

Keywords: *Optical data storage materials, *Life(Durability), *Aging tests(Materials), Optical disks, Service life, Stress testing, Test methods, Error analysis, Quality control, Standards, Reprints, Arrhenius model, Byte error rate.

Methodologies for determining extrapolated life expectancy values for optical disk media were investigated at the National Institute of Standards and Technology (NIST). These investigations showed that the life expectancy values of optical disk media vary greatly due to several factors, including the method used to derive the value of the quality parameter (the byte error rate), the areas measured in the disks, the written patterns used, and the criteria for data analysis. Vendor's life expectancy claims can be properly assessed by prospective users if standard methods for calculating and reporting extrapolated life expectancy values are implemented.

Pub. in National Space Science Data Center Conference on Mass Storage Systems and Technologies for Space and Earth Science Applications, Greenbelt, MD., July 23-25, 1991, NASA Conference Publication 3165, v3 p163-187.

Keywords: *Computer storage devices, *Data storage, *Digital data, Magnetic tapes, Optical disks, Optical memory(Data storage), Optical data (Storage materials), Interchangeability, Error detection codes, Life (Durability), Service life, Error analysis, Standards, Reprints, Standard reference materials.

Standards for removable computer storage media are needed so that users may reliably interchange data both within and among various computer installations. Industry standards for digital magnetic tapes require the use of Standard Reference Materials (SRMs) developed and maintained by NIST. In addition, NIST has been studying Care and handling procedures for optical digital data disks and is involved in a program to investigate error reporting capabilities of optical disk drives. NIST has developed a methodology for determining the life expectancy of optical disks. NIST is developing care and handling procedures for optical digital data disks and is involved in a program to investigate error reporting capabilities of optical disk drives.

NIST Program for Investigating Error Reporting Capabilities of Optical Disk Drives.
Final rept.
F. L. Podio. 1991, 8p.
Pub. in Proceedings of a Workshop held in Colorado Springs, CO., August 5, 1991, p1-8.

Keywords: *Error detection codes, *Optical disks, *Research programs, Computer storage devices, Optical data storage materials, Optical memory(Data storage), Quality control, Error correcting codes, Life(Durability), Service life, Error analysis, Reprints.

Optical disk drives are designed with strong but unlimited error corrections capabilities. If the level of errors overcome the error detection and corrections mechanisms implemented in the optical disk drive controllers, incorrectable errors may occur. Federal Government data managers are interested in being able to monitor error rate activity in optical disk drive systems. This could be achieved through the interface, if the drives would provide information on correctable error rate activity, such as maximum number of correctable errors, maximum number of errors per interleave, and the location of those errors. Reports on errors encountered while reading header information is also necessary. This information would provide data managers with a better understanding of the status of their data and would allow them to design more efficient recopying policies to copy the data to similar or different media in a timely and economic fashion.

Information technology (IT) standards are an important part of Federal Government strategies for managing information resources. Standards help to promote the interoperability of different manufactures' systems, the portability of applications, and the sharing of ideas, data, and training. But while the abstract concept of standards is acceptable and easily understood, it is not always easy for managers and users to put standards to work for their organizations. This paper discusses some of the activities of the National Institute of Standards and Technology (NIST) that support the implementation of standards in products that organizations can buy.

Ada Compiler Validation Summary Report: Certificate Number: 931217S1.11336 Control Data Systems, Inc. NOS/VE Ada, Version 1.4 Cyber 180-930-31 => Cyber 180-930-31.
17 Dec 93, 48p.

Keywords: *Compilers, *Ada programming language, Validation, Data processing, Standards, *Validation summary reports, Computer program verification.

This Validation Summary Report describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports

the results of testing this compiler using the Ada Compiler Validation Capability. An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard. Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results.

Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results.

Ada Compiler Validation Summary Report: Certificate Number: 940325S1.11349 DDC-I, DACS Sun SPARC/Solaris to 80386 PM Bare Ada Cross Compiler System with Rate Monotonic Scheduling, Version 4.6.4 Sun SPARCclassic => Intel iSBC 386/116 (Bare Machine).
25 Mar 94, 119p.

Keywords: *Compilers, *Ada programming language, Standards, *Validation summary reports, Computer program verification.

This Validation Summary Report describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability. An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard. Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results.

Measuring Performance of Parallel Computers. Final Report.
F. Sullivan. 1994, 23p, DOE/ER/25046-T1.
Contract AI05-87ER25046
Sponsored by Department of Energy, Washington, DC.

Keywords: *Parallel Processing, Algorithms, Benchmarks, Performance Testing, EDB/990200.

Performance Measurement - the authors have developed a taxonomy of parallel algorithms based on data motion and example applications have been coded for each class of the taxonomy. Computational benchmark kernels have been extracted for several applications, and detailed measurements have been performed. Algorithms for Massively Parallel SIMD machines - measurement results and computational experiences indicate that top performance will be achieved by 'iteration' type algorithms running on massively parallel SIMD machines. Reformulation as iteration may entail unorthodox approaches based on probabilistic methods. The authors have developed such methods for some applications. Here they discuss their approach to performance measurement, describe the taxonomy and measurements which have been made, and report on some general conclusions which can be drawn from the results of the measurements.

FIPS PUB 119-1 PC$278.00
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
ADA; Category: Software Standard; Subcategory: Programming Language.
13 Mar 95, 546p, ANSI/ISO/IEC-8652-1995.
Supersedes FIPS PUB 119. Prepared in cooperation with American National Standards Inst., New York.
Three ring binder also available. North American Continent price $6.25; all others write for quote.

Keywords: *Ada programming language, *Standards, *Data processing, Computer program portability, Compilers, Decoding, Semantics, Syntax, High level languages, Conformance, Software standards, Programming languages, Federal Information Processing Standards.

The purpose of the standard is to promote portability of Ada programs for use on a variety of data processing systems. The standard is for use by implementors as the reference authority in developing compilers, interpreters, or other forms of high level language processors; and by other computer professionals who need to now the precise syntactic and semantic rules of the standard.

01,668
FIPS PUB 153-1 PC E99
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Programmer's Hierarchical Interactive Graphics System (PHIGS). Category: Software Standard; Subcategory: Graphics.
27 Jan 95, 199p.
Supersedes FIPS PUB 153.
Three ring vinyl binder available; North American Continent price $7.00; all others write for quote.

Keywords: *Interactive graphics, *Computer software, *Federal information processing standards, Computer program portability, Computer graphics, Computer animation, Computer aided design, Data structures, Specifications, PHIGS(Programmers Hierarchical Interactive Graphics Systems), PLUS(Plus Lumiere and Surfaces).

The publication is a revision of FIPS PUB 153 and supersedes that document in its entirety. This revision provides a substantial, upward-compatible enhancement of the basic Programmer's Hierarchical Interactive Graphics System (PHIGS) functionality known as Plus Lumiere and Surfaces, (PHIGS PLUS) (ANSI/ISO 9592.1a,2a,3a,4:1992). PHIGS PLUS adds facilities for the specification of curved lines, curved and facetted surfaces, lighting and shading, and adds a mechanism for color specification to allow non-indexed color specification. Amendments to each part of the PHIGS specification details revisions required by PHIGS PLUS. Also, each language binding of PHIGS has been amended as a result of PHIGS PLUS. The specifications and amendments that comprise the complete PHIGS standard as a result of this revision are detailed in the Specification section of this document.

FIPS PUB 194 PC E04
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Open Document Architecture (ODA) Raster Document Application Profile (DAP). Category: Software Standard; Subcategory: Graphics.
13 Mar 95, 54p.
Three ring vinyl binder available; North American Continent price $7.00; all others write for quote.

Keywords: *Federal information processing standards, *Computer graphics, *Documents, Raster scanning, Format, Data transfer(Computers), Image processing, Text processing, DAP(Documents Application Profile), ISP(International Standardized Profile), ODA(Open Document Architecture).

This Federal Information Processing Standard (FIPS) adopts the International Organization for Standardization (ISO)/International Electrotechnical Commission (IEC) 12064-1 International Standard Profile (ISP) FOD112, which specifies the use of subset of the Open Document Architecture (ODA) standard. It facilitates the interchange of raster documents among different raster graphics applications by specifying the constraints on document structure and content according to the rules of the ODA standard. The documents supported by this standard are based on a paradigm of an electronic engineering drawing, illustration, or other electronic image. The FIPS PUB specifies the structure and parameters for describing and interchanging bilevel untiled compressed images as well as tiled raster images.

COBOL. Category: Software Standard; Subcategory: Programming Language. Includes ANSI'S X3.23-1985, X3.23A-1989 and X3.23B-1993.
23 Jan 95, 975p.
Supersedes FIPS PUB 21-3. Also available from Supt. of Docs. Also pub. as American National Standards Committee, New York rept no. ANSI-X3.23-1985, ANSI-X3.23A-1989 and ANSI-X3.23B-1993. Prepared in cooperation with American National Standards Committee, New York.
Three ring vinyl binder also available; North American Continent price $7.00, all others write for quote.

Keywords: *COBOL, *Standards, *Programming languages, Memory(Computers), ANSI(American National Standards Institute).

This standard is a revision of American National Standard for Programming Language COBOL, ANSI X3.23-1974. The language specifications contained in this standard were drawn from both ANSI X3.23-1974 and the CODASYL COBOL Journal of Development. Like its prodecessors, this document provides specifications for both the form and interpretation of programs expressed in COBOL. It is intended to provide a high degree of machine independence in such programs in order to permit their use on a variety of automatic data processing systems.

FIPS PUB 21-4A PC E99
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
COBOL. Category: Software Standard; Subcategory: Programming Language. Part A.
23 Jan 95, 94p.
Supersedes FIPS PUB 21-3A. Also available from Supt. of Docs. Also pub. as American National Standards Committee, New York rept no. ANSI-X3.23A-1989. Prepared in cooperation with American National Standards Committee, New York.
Three ring vinyl binder also available; North American Continent price $7.00, all others write for quote.

Keywords: *COBOL, *Standards, *Programming languages, Memory(Computers), ANSI(American National Standards Institute).

This supplement, the first to the document entitled 'American National Standard for Information Systems - Programming Language - COBOL, ANSI X3.23-1985, ISO 1989-1985,' presents a new COBOL module, the Intrinsic Function module. This module provides the capability of referencing a data item whose value is derived automatically during the execution of a program.

Integration Definition for Information Modeling (IDEF1X); Category: Software Standard; Subcategory: Modeling Techniques.
21 Dec 93, 163p.
Also available from Supt. of Docs. See also AD-A266 176.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Data models, *Systems engineering, Data base management systems, Information systems, Data management, Semantics, Syntax, Computer models, *IDEF1X(Information Definition for Information Modeling), Software standards, Modeling techniques, Graphical languages, Data definition.

This standard is based on the Integration Information Support System (IISS), Volume V - Common Data Model Subsystem, Part 4 - Information Modeling Manual - IDEF1 Extended, 1 (IDEF1X) November 1985 (AD-A181 952). This standard describes the IDEF1X modeling language (semantics and syntax) and associated rules and techniques, for developing a logical

model of data. IDEF1X is used to produce a graphical information model which represents the structure and semantics of information within an environment or system. Use of this standard permits the construction of semantic data models which may serve to support the management of data as a resource, the integration of information systems, and the building of computer databases.

Open System Environments.
F. Schulz. Aug 94, 31p.
In National Aeronautics and Space Administration, NASA Sti Program Coordinating Council Twelfth Meeting: Standards p 85-115.

Keywords: *Distributed processing, *Information systems, *Standards, *Applications programs (Computers), Computer networks, Internets, Protocol (Computers), Systems compatibility, Systems engineering, User requirements.

An open system is defined as a system that implements open specifications for interfaces, services, and supporting formats to enable properly engineered applications software to be ported with minimal changes across a wide range of systems; and to interact with users in a style which facilitates user portability. Based on that definition, a reference model for an open system environment is presented.

Computing Effects and Error for Large Synthetic Perturbation Screenings.
N. Drouin, R. Kacker, and G. Lyon. Dec 93, 15p, NISTIR-5296.
See also PB93-161339, PB93-178572 and PB93-189835. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Parallel programming, *Statistical analysis, Analysis of variance, Standard error, Experimental design, Computation, *Synthetic Perturbation Screening, Hadamard matrices.

Synthetic Perturbation Screening (SPS) is a powerful, statistically-based method of performance improvement for parallel computer programs. SPS uses statistically designed experiments to identify segments of code that consume significant computing resources or otherwise impede a parallel application. Analysis typically starts with a preliminary screening of a large number of code segments; SPS does this via fractional factorial designs based upon Hadamard matrices. Since Hadamard matrix designs are not commonly discussed in introductory texts, there is a need to survey briefly the calculation of their effects and especially, their standard error. The result is a practical, supplementary sketch that should help users of SPS automatic tools understand how investigations and analyses are being performed.

Keywords: *Software engineering, *Evaluation, Software tools, Methodology, Requirements, User needs, *SEE(Software Engineering Environment), CASE(Computer Aided Software Engineering).

This guide outlines general approaches to software engineering environment (SEE) assessment and evaluation. This guide defines SEE assessment as the process of accurately describing the capabilities of a software engineering environment to support and integrate a range of computer aided software engineering (CASE) tools. The guide defines SEE evaluation as the process of determining how well a SEE matches the customer's requirements. The assessment and evaluation approaches presented here focus on accurately defining the integration and functional capabilities of candidate SEEs and the requirements of the customer.

The Parallel Virtual Machine (PVM) is a general purpose distributed system developed by researchers at the Oak Ridge National Laboratory and Emory University. The PVM system consists of a portable suite of software specifically designed for use by parallel and supercomputing application engineers. The National Institute of Standards and Technology (NIST) researchers are studying PVM to assist them in defining the system service requirements needed to support parallel programming and supercomputing activities in the general purpose distributed setting. The report focuses on defining the profile requirements culminating from our PVM assessment; therefore, the document will also provide reference material for those involved in evaluating distributed system software for the supercomputing domain.

Time-Perturbation Tuning of MIMD Programs.
G. Lyon, R. Snelick, and R. Kacker. Jun 82, 22p, NISTIR-4859.
See also PB93-161339. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Parallel programming, Experimental design, Distributed computer systems, Optimization, Performance evaluation, Response time(Computers), *Time-perturbation tuning, *MIMD, *Multiple-instruction Multiple-data, Code perturbation, DEX(Design experiments).

Time-perturbation tuning (TPT) is a novel technique for assaying and improving the performance of programs on Multiple-instruction Multiple-data (MIMD) systems. Small, synthetic program delays are combined with statistically designed experiments (DEX). Claims for TPT are two: (1) Conceptually, it brings the powerful, mathematical perspective of experiment design to interdependent, sometimes refractory aspects of MIMD program tuning; (2) Practically, it provides a needed speedup mechanism, synthetic time delays for what otherwise would be ad-hoc, hand tailored program setups for DEX. Overall, the technique identifies bottlenecks in programs directly, as quantitative effects upon response time. TPT works on programs for both shared and distributed-memory, and it scales well with increasing system size.

Pub. in Proceedings of Institute of Electrical and Electronics Engineers Global Telecommunications Conference and Exhibition, San Diego, CA., December 2-5, 1990, p579-583.

Keywords: *Routing, *Protocols, *Computerized simulation, *Software tools, Performance evaluation, Reprints, ECMA(European Computer Manufacturers Association), OSI(Open Systems Interconnection), IS-IS(Intermediate System to Intermediate System), Interdomain.

Three classes of Open Systems Interconnection (OSI) routing protocols have been defined by the International Organization for Standardization (ISO): End System to Intermediate System (ES-IS), intra-domain Intermediate System to Intermediate System (IS-IS), and inter-domain IS-IS. The paper addresses a simulation tool developed at the National Institute of Standards and Technology (NIST) to aid in the design and performance evaluation of the European Computer Manufacturers Association (ECMA) inter-domain IS-IS protocol proposal. The paper discusses the inner-workings of the simulation tool and how it models the ECMA protocol. Finally, a set of experiments are defined that test the performance of the routing algorithm defined by ECMA.

Using Synthetic-Perturbation Techniques for Tuning Shared Memory Programs (Extended Abstract).
Final rept.
R. Snelick, J. JaJa, R. Kacker, and G. Lyon. 1993, 9p.
Pub. in Proceedings of 1993 Int. Conf. on Parallel Processing, St. Charles, IL, Aug. 16-20, 1993, pII-2-II-10. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Parallel programming, Software engineering, Computer program portability, Memory(Computers), Multiprocessors, Case studies, Image processing, Sorting routines, Parallel processing, Reprints, *SPI, *Synthetic Perturbation Tuning, *MIMD, *Multiple Instruction Multiple Data.

The Synthetic-Perturbation Tuning (SPT) methodology is based on an empirical approach that introduces artificial delays into the Multiple Instruction Multiple Data (MIMD) program and captures the effects of such delays by using the modern branch of statistics called design of experiments. SPT provides the basis of a powerful tool for tuning MIMD programs that is portable across machines and architectures. The purpose of this paper is to explain the general approach and to extend it to address specific features that are the main source of poor performance on the shared memory programming model. These include performance degradation due to load imbalance and insufficient parallelism, overhead introduced by synchronizations and by accessing shared data structures, and compute time bottlenecks. The authors illustrate the practicality of SPT by demonstrating its use on two very different case studies: a large image processing benchmark and a parallel quicksort.

Keywords: *Meetings, *Information retrieval, *Text processing, Thesauri, Automation, Natural language processing, Pattern recognition, Routing, Probability theory, Documents, Approximation, Search structuring, Knowledge bases(Artificial intelligence), Machine learning, Algorithms, Semantics, Vector processing.

The second Text REtrieval Conference (TREC-2) was held in August 1993 and was attended by about 150 people involved in the 31 participating groups. The goal of the Conference was to bring research groups together to discuss their work on a new large test collection. There was a large variation of retrieval techniques reported on, including methods using automatic thesauri, sophisticated term weighting, natural language techniques, relevance feedback, and advanced pattern matching. As results had been run through a common evaluation package, groups were able to compare the effectiveness of different techniques, and discuss how differences between the systems affected performance.

Simple Scalability Test for MIMD Code.
G. Lyon, and R. Kacker. Jun 94, 21p, NISTIR-5417.
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Parallel programming, *Scaling, *Computer program portability, Parallel processors, Computer performance evaluation, Tests, Computer program verification, Coding, Taylors series, *MIMD(Multiple Instruction Multiple Data), Code scalability, DEX(Designed experiments).

Code scalability, crucial on any parallel system, determines how well parallel code avoids becoming a bottleneck as its host computer is made larger. Scalability of computer code can be estimated by statistically designed experiments that empirically approximate a multivariate Taylor expansion of the code's execution response function. Each suspected code bottleneck corresponds to a first-order term in the expansion, the coefficient for that term indicating how sensitive execution is to changes in the suspect location. However, it is the coefficients for second-order interactions between code segments and the number of processors that are fundamental in discovering which program elements limit parallel speedup. Extending an earlier formulation, a new unified view via these second-order terms yields an informal scaling test of high utility in code development.

Graphical Conceptual Navigation as a Presentation Technique for a Graphics Standard.
Final rept.
J. V. Cugini. 1989, 10p.
Pub. in Proceedings of Annual Conference and Exposition Dedicated to Computer Graphics (10th), Philadelphia, PA., April 17-20, 1989, v1 p87-96.

Keywords: *Computer graphics, *Standards, Knowledge representation, Knowledge bases(Artificial intelligence), Object-oriented programming, Reprints, *Conceptual navigation, COOL(COncept Oriented Language), Prolog programming language, Conceptual networks.

Conceptual navigation can serve as a powerful tool to help users understand and explore a given domain. COOL (COncept Oriented Language) is a system, implemented with Prolog and GKS, which gives the knowledge engineer a high level language in which to express the conceptual relations among objects within a domain. The facilities for inspecting the Knowledge base (KB) support the metaphore of a complex graph of related concepts. Thus, a close conceptual relationship among objects is expressed as spatial proximity. Although not mandatory, the system is set up to allow the conceptual graph to be grounded in some authoritative reference text explaining or defining the domain. The system also has the ability to express relations among the concepts of the domain intensionally, as well as extensionally. The GKS standard is a suitable domain for the COOL system.

Pub. in Operating Systems Review 24, n4 p34-51 Oct 90.

Keywords: *Distributed computer systems, *Applications programs(Computers), *Object programs, Models, Distributed processing, Operating systems(Computers), Reprints.

A model for supporting distributed applications, called the Associated Object Model, is described. In this model, multi-objects (different distributed application objects) can join in an association, making it possible for application objects to cooperate in wider degree than possible under other models. A mechanism supporting associations is introduced in this paper. By the mechanism, many associations between cooperating application objects can be established and maintained. The paper also includes some discussions about the description and implementation of the model and the mechanism.

Debugger for Tcl Applications.
Final rept.
D. Libes. 1993, 16p.
Pub. in Proceedings of Tcl/Tk Workshop, Berkeley, CA., June 10-11, 1993, p3-18.

Keywords: *Debugging(Computers), Applications programs(Computers), Interpreters, Software tools, Reprints, *Tcl(Tool Command Language) programming language, *Tool Command Language, *Tcl programming language, C programming language.

This paper describes an implementation of a debugger for Tcl applications. The debugger has a typical front-end but with some extremely unusual commands, in part because of the features and limitations of Tcl. The debugger is modeless, allowing users to issue Tcl and application commands along with debugger commands. Each type of command may invoke the other, allowing debugging to be programmed, dynamically or in advance. The debugger is written in C and is very fast. When linked in but not used, it does not slow applications at all. The debugger requires no modifications to the Tcl core, and can be plugged into applications with little effort.

Kibitz-Connecting Multiple Interactive Programs Together.
Final rept.
D. Libes. 1993, 11p.
Pub. in Software-Practice and Experience 23, n5 p465-475 May 93.

Keywords: *Interactive systems, *Computer software, *Interprocessor communication, Automation, Software reuse, Computer program portability, Debugging(Computers), Reprints, *Expert programming language, Kibitz.

Expect is a programming language for automating interactive programs. Recently, people have begun using Expect to connect multiple interactive programs together, allowing for new classes of applications. With some basic building blocks and a little scripting, it is possible to build such applications quickly. This paper discusses the general technique, while focusing on a particular example: Kibitz. Kibitz connects multiple sessions and applications together, providing a means for consulting, group editing, or other cooperative tasks. Kibitz in turn, can be used as a module in building additional programs of this type. Using Kibitz, we demonstrate how to enable cron or background processes to call upon and interact with users, e.g. for guidance or debugging. Owing to program reuse, our approach avoids many portability issues already addressed and solved by existing programs. Kibitz has no special coding for byte swapping, structure encoding, or job control, and requires neither kernel modifications nor setuid or other permissions even though it runs over a network and deals with multiple users, job control, and sophisticated programs such as shells and full screen editors.

Using Expect to Automate System Administration Tasks.
Final rept.
D. Libes. 1990, 8p.
Pub. in Proceedings of Large Installation System Administrator's Conference (4th), Colorado Springs, CO., October 17-19, 1990, p107-114.

Keywords: *UNIX(Operating system), *Computer systems programs, *Systems management, Interactive systems, Interprocessor communication, Computer software management, Automation, Reprints, Systems administration.

UNIX system administration often involves programs designed only for interactive use. 'Expect' is a program which can 'talk' to interactive programs. A script is used to guide the dialogue. Scripts are written in a high-level language and provide flexibility for arbitrarily complex dialogues. By writing an 'Expect' script, one can run interactive programs non-interactively. Shell scripts are incapable of managing these system administration tasks, but 'Expect' scripts can control them and many others. 'Expect' is similar in style to the shell, and can easily be mastered by any system administrator who can program in the shell already. This paper presents real examples of using 'Expect' to automate system administration tasks such as passwd and fsck. Also discussed are a number of other systems administration tasks that can be automated.

FORTRAN Compiler Validation System, Version 2.1.
Software.
1 Jan 94, mag tape, NIST/SW/MT-93/008.
Language: FORTRAN. Supersedes PB85-226736.
Available in 9-track, ASCII character set tape, 1600 bpi, 6250 bpi, or 3480 cartridge. Documentation included; may be ordered separately as PB94-114055.

Keywords: *Software, *Compilers, *Computer program verification, Federal information processing standards, Error detection codes, Validation, Magnetic tapes, *Fortran programming language, Conformance testing.

This Version of the Fortran Compiler Validation System (FCVS) has been revised to include all of the Temporary Program Files (TPFs) that were used with Version 2.0. The tests are progressively complex exercises of statement combinations representing typical language usage. They can be used to evaluate compiler usability and conformance to the 1978 FORTRAN Standard, and can aid in precise identification of compiler flaws. The test case outputs are tailored to each of the tests involved in order to aid in the specific diagnosis of instances of non-conformance or of compiler errors. For each test, the output indicates whether the test passes; if a test fails, the correct results and the compiler produced results are displayed on the output report. The test cases are so designed that the user can quickly and easily locate the source code which caused the failure for further analysis. The FCVS architecture supports thorough quality testing of the compiler; at the same time, with no loss of efficiency or increase in complexity, the system also provides for the auditability of the testing operation. The system was produced to be used in support of the procurement of 1978 FORTRAN Standard compilers, but it is also designed for the general user.

PB94-502077 Diskette $250.00
National Inst. of Standards and Technology, Gaithersburg, MD.
M (also known as MUMPS) Validation Test Suite, Version 8.3 (for Microcomputers).
Software.
c1 Jul 94, diskette.
System: MS DOS 3.0 or higher operating system. Language: MUMPS. Supersedes PB91-507699, PB91-507707, PB91-507715, PB91-507723.
The software is on one 3 1/2 inch DOS diskette, 1.4M high density. The diskette is in ASCII format. Documentation included; may be ordered separately as PB94-180486.

Keywords: *Software, *Compilers, *Tests, Federal information processing standards, Precompilers, Validation summary reports, Interpreters, Computer systems programs, Computer program verification, Microcomputers, Diskettes, *M programming language, *MUMPS programming language.

The M (also known as MUMPS) Validation Test Suite, Version 8.3 was developed to assess conformance to the FIPS PUB 125-1. This test suite contains 3,592 tests and incorporates features such as (1) pass/fail conditions for individual tests, (2) imbedded instructions and warnings, and (3) fully automated tabulation of the test results. This test suite can be used by Federal Agencies, M programming language developers,

physicians, hospital administrators, large group medical practices, and other industries which have requirements for M to assess the technical correctness of one or more M programming language processors. This test suite is approximately 99% self driven.

Validated Products List (Cobol, Fortran, ADA, Pascal, MUMPS, SQL).
1994, 1p.
Supersedes PB93-937300.
Paper copy available on Standing Order, deposit account required (U.S., Canada, and Mexico $100; all others $200). Single copies also available in paper copy only.

Keywords: *Cobol programming language, *Fortran programming language, Language programming, *Federal Information Processing Standards, *Validation summary reports, *Pascal programming language, *Ada programming language, SQL programming language.

The Validated Processor List identifies those COBOL, Fortran, Ada and Pascal programming language processors that have a current validation certificate and those SQL language processors that have a registered test report, referencing the applicable Federal Information processing Standard (FIPS) as of the date of the publication. The list also includes GOSIP Conformance Testing Registers. The testing of language processors to determine the degree to which they conform to the Federal Standards is required by Government agencies in accordance with Federal Information Resources Management regulation (FIRMR) Parts 201.13 and 201.39, and the associated Federal ADP and Telecommunications Standards Index. The list is updated and published quarterly.

Making Sense of Software Engineering Environment Framework Standards.
B. Cuthill. May 94, 35p, NISTIR-5487.
Sponsored by Assistant Secretary of Defense, Washington, DC. Director of Defense Information.

Keywords: *Softwear engineering, *Standards, Specifications, Operating systems(Computers), Software tools, Data base management systems, Man computer interface, *SEEs(Software Engineering Environments), *Software Engineering Environments, POSIX(Portable Operating System Interface), PCTE(Portable Common Tool Environment), CORBA(Common Object Request Broker Architecture), ODBMS(Object Database Management Standard), CDIF(Computer Aided Software Engineering (CASE) Data Interchange Format), X3H6 Draft Messaging Standard, X Windows, Motif.

The purpose of software environment framework standards and specifications is to enhance tool portability, interoperability, and integration by creating public interfaces to functionality incorporated into the framework. If tools can access framework services in predictable ways, tool vendors can take advantage of these services to avoid duplicating services and concentrate on the unique functionality of the tool. This describes the functionality and integration support supplied by a selected set of software environment framework standards and specifications with respect to common models.

Software Safety and Program Slicing.
Final rept.
K. B. Gallagher, and J. R. Lyle. 1993, 10p.
Pub. in Proceedings of the Annual Conference on Computer Assurance (8th), COMPASS '93, Gaithersburg, MD., June 14-17, 1993, p71-80.

Keywords: *Computer program reliability, *Safety, *Quality assurance, Software engineering, Computer program verification, Functional integration, Prototypes, Reprints, *Program slicing, US NIST.

Software quality assurance auditors are faced with a myriad of difficulties. One particular problem is the localization of safety critical code that may be interleaved throughout the entire system. Moreover, once this code is located, its effects throughout the system are difficult to ascertain. We present a method that uses program slicing to mitigate these difficulties in two ways. First, we show how program slicing can be used to locate all code that contributes to the value of variables that might be part of a safety critical component. Second, we show how slicing-based techniques can be used to validate functional diversity, i.e., that there are no interactions of one critical component with another critical component and that there are no interactions of non critical components with the safety critical components.

Object SQL: Language Extensions for Object Data Management.
Final rept.
L. J. Gallagher. 1992, 10p.
Pub. in Proceedings of ISMM International Conference on Information and Knowledge Management, Baltimore, MD., November 8-11, 1992, p17-26.

Keywords: *Query languages, *Object-oriented programming, *Data management, Data bases, Data base management systems, Standards, Specifications, Standardization, Reprints, *SQL database language, ISO(International Organization for Standardization), RDA(Remote Database Access).

Database Language SQL is enjoying success as an effective International Standard for the definition and management of relationally structured data. National and international SQL standardization committees are now focusing on development of future extensions for meeting the stated requirements of managing complex objects in engineering and multimedia environments. These extensions include object identifiers, abstract data types, inheritance hierarchies, and all of the other features normally associated with object data management. This paper presents the object management features contained in the draft specification for the next SQL standard, discusses problems and alternatives, and addresses planned future standardization activities.

Domain Analysis of the Alarm Surveillance Domain. Version 1.0. Conducted as Part of the Domain Analysis Case Study Project.
C. Dabrowski, and J. Watkins. Sep 94, 210p, NISTIR-5494.

Keywords: *Software reuse, *Communications networks, *Management, Fault detection, Information systems, Models, Domain analysis, Alarm surveillance, FODA(Feature Oriented Domain Analysis).

The Domain Analysis Case Study was created to examine the potential use of domain analysis methods in supporting software reuse. To this end, the Domain Analysis Case Study has investigated the use of a particular domain analysis method, called the Feature Oriented Domain Analysis (FODA) method. This report describes the results of the application of the second phase of the FODA method--the domain modeling phase--to the alarm surveillance domain. During this phase, a domain model of alarm surveillance systems was created. This model captured commonalities and variabilities of the alarm surveillance domain with respect to the features of systems in the domain, the functions system perform, and the underlying structure of data used by systems. The domain model is intended to be reused to derive functional requirements for new software systems in this domain.

Faster BKL Monte Carlo Simulations.
J. L. Blue, I. Beichl, and F. Sullivan. 20 Sep 94, 11p, NISTIR-5489.

Keywords: *Computerized simulation, *Monte Carlo method, *Run time(Computers), Algorithms, Crystal growth.

For Monte Carlo simulations of systems of size M that use the method of Bortz, Kalos, and Liebowitz (BKL), the best computer time per event has been O(M to the 1/2 power). We present two new methods whose computer time per event is O(M to the 1/K power) or O(log M). In practice, for typical simulation sizes, K = 4 or K = 5 is fastest, requiring even less computer time than the O(log M) method. For typical simulation sizes, we are able to achieve speedup factors of 5 to **7.**

Analysis of Selected Software Safety Standards.
Final rept.
D. R. Wallace, D. R. Kuhn, and L. M. Ippolito. 1992, 14p.
Pub. in Proceedings of COMPASS '92 Conference, Gaithersburg, MD., June 15-18, 1992, p1-14.

Keywords: *Computer software, *Software reliability, *Data processing security, *Standards, Computer program integrity, Software engineering, Computer security, Quality assurance, Requirements, Guidelines, Reprints, Software safety.

The study examines standards, draft standards, and guidelines that provide requirements for the assurance of high integrity software. The study focuses on identifying the attributes necessary in a document for providing reasonable assurance for high integrity software, and on identifying the relative strengths and weaknesses of the documents. The documents vary widely in their requirements and the precision with which the requirements are expressed. Overall there is little relationship between the degree of risk and the rigor of applicable standards. Recommendations are provided for a base standard for the assurance of high integrity software.

Underflow-Induced Graphics Failure Solved by SLI Arithmetic.
Final rept.
D. W. Lozier. 1993, 8p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers Symposium on Computer Arithmetic (11th), Windsor, Ontario, Canada, June 29-July 2, 1993, p10-17.

Keywords: *Computer graphics, *Floating point arithmetic, Computation, Algorithms, Errors, Scaling, Accuracy, Reprints, SLI(Symmetric level-index) arithmetic.

Floating-point underflow is often regarded as either harmless or as an indication that the computational algorithm is in need of scaling. A counter example to this view is given of a function for which contour plotting is difficult due to floating-point underflow. The function arose as an asymptotic solution to a model problem in turbulent combustion in which two chemical species (fuel and oxidizer) mix and react in a vortex field. Scaling is not a viable option because of extreme sensitivity to a small physical parameter. Standard graphics software packages produce erroneous contours without any indication of difficulty. This example provides support for considering symmetric level-index (SLI) arithmetic, a new form of computer arithmetic which is immune to underflow and overflow.

Data-Parallel Algorithm for Three-Dimensional Delaunay Triangulation and Its Implementation.
Final rept.
Y. A. Teng, F. Sullivan, I. Beichl, and E. Puppo. 1993, 10p.
Pub. in Proceedings of Supercomputing '93, Portland, OR., November 15-19, 1993, p112-121.

Keywords: *Triangulation, *Computational geometry, *Three dimensional models, Parallel processing, Algorithms, Run time(Computers), Computer program reliability, Connection machine, Reprints.

In this paper, we present a parallel algorithm for constructing the Delaunay triangulation of a set of vertices in three-dimensional space. The algorithm achieves a high degree of parallelism by starting the construction from every vertex and expanding over all open faces thereafter. In the expansion of open faces, the search is made faster by using a bucketing technique. The algorithm is designed under a data-parallel paradigm. It uses segmented list structures and virtual processing for load-balancing. As a result, the algorithm achieves a fast running time and good scalability over a wide range of problem sizes and machine sizes. We also incorporate a topological check to eliminate inconsistencies due to degeneracies and numerical errors. The algorithm is implemented on Connection Machines CM-2 and CM-5, and experimental results are presented.

Glossary of Software Reuse Terms.
S. Katz, C. Dabrowski, K. Miles, and M. Law. Dec 94, 37p, NIST/SP-500/222.
Also available from Supt. of Docs.

Keywords: *Software reuse, *Dictionaries, Software engineering, Computer programming, Software tools.

One method proposed for increasing the efficiency of software production in the development of large, reliable software applications is the systematic reuse of existing software products. Effective software reuse will require new techniques to supplement traditional software engineering practices. Preliminary research has already produced new methods and reports. As a result, new terminology has emerged. This report provides a baseline set of recommended definitions for terms commonly used in the software reuse community. The glossary will be expanded as further research results become available and are evaluated for use in software reuse programs.

Handling Passwords with Security and Reliability in Background Processes.
Final rept.
D. Libes. 1994, 8p.
Pub. in Proceedings of Systems Administration Conference (8th), (LISA VIII), San Diego, CA., September 19-23, 1994, 8p.

Keywords: *Interactive systems, *Computer security, Data processing security, Computer program reliability, Automation, Access control, Reprints, Passwords, Expect computer program, Background processes.

Traditionally, background automation of interactive processes meant giving up security and reliability. With the advent of software such as Expect for controlling interactive processes, it has become possible to improve reliability and security with relative ease. This paper reviews the reliability aspects but focuses primarily on the security aspects, presenting several non-obvious techniques for dealing with passwords and other sensitive information in background processes. These techniques require no changes to existing programs and no new security systems are necessary. With the appropriate tools and examples, these techniques can be applied with surprisingly little effort to a wide variety of problems.

Performance Characteristics of Fast Elliptic Solvers on Parallel Platforms.
Final rept.
R. Pozo. 1994, 5p.
Pub. in Proceedings of the European Parallel Virtual Machine Users Group Meeting (1st), Rome, Italy, October 9-11, 1994, p1-5.

Keywords: *Elliptic differential equations, *Computation, Connection machine, Computer calculations, Computer software, Computer networks, Partial differential equations, Interprocessor communication, Run time(Computers), Performance evaluation, Reprints, *PVM(Parallel Virtual Machine), *Parallel Virtual Machine, OSC(Orthogonal spline collocation).

We present performance analyses of a fast three-dimensional elliptic orthogonal spline collocation (OSC) method on the Connection Machine CM-5, and various network clusters using the Parallel Virtual Machine (PVM) software package. While the OSC method is an efficient approach for solving Poisson, Helmholtz, and other separable partial differential equation (PDE) problems, it poses serious challenges for parallel architectures because of its high communication to computation ratio: O(N cubed) data movement to O(N cubed log N) computation. Furthermore, the communication pattern is one of the most expensive: personalized all-to-all. Results show that communication time occupies roughly 5% of total execution time in native message-passing systems (such as NX and CMMD), 10% with PVM layer on MPP's and roughly 50% for Ethernet networks.

Comparing Remote Procedure Calls: Open Network Computing, Distributed Computing Environment and International Organization for Standardization.
J. F. Barkley. Oct 93, 23p, NISTIR-5277.
Sponsored by Defense Information Systems Agency, Arlington, VA. and Department of the Army, Fort Belvoir, VA. Sustaining Base Information Services.

Keywords: *Computer networks, *Computer communications, *Protocols, Applications programs(Computers), Compilers, Semantics, Programming languages, Computer program portability, Run time(Computers), *RPC(Remote procedure calls), *Remote procedure calls, ONC(Open Network Computing), DCE(Distributed Computing Environment), ISO(International Organization for Standardization).

Almost all computer systems are connected to a network supporting data communications. As a result, many techniques have evolved to support the development of applications which require processes on different systems to communicate and coordinate their activities. One such technique is remote procedure call (RPC). RPC is a mature method with several specifications and implementations. Among these are: Open Network Computing (ONC) RPC, Distributed Computing Environment (DCE) RPC, and the RPC specification from the International Organization for Standardization (ISO). This report describes the RPC concept, how this concept is commonly implemented, and compares the features and capabilities of these three RPCs. The RPC language, semantics, and protocol of ONC RPC, DCE RPC, and ISO RPC are compared. Since ONC RPC and DCE RPC have implementations, the output of their RPC language compiler and the support provided by their runtime libraries are also compared.

Study on Hazard Analysis in High Integrity Software Standards and Guidelines.
L. M. Ippolito, and D. R. Wallace. Jan 95, 65p, NISTIR-5589.
See also PB92-112267.

Keywords: *Computer software, *Hazards, *Computer program integrity, Standards, Guidelines, Safety, Quality assurance, Software engineering, Computer program reliability, Systems analysis.

This report presents the results of a study on hazard analysis, especially software hazard analysis, in high integrity software standards and guidelines. It describes types of system hazard analysis (that influence software), types of software hazard analysis, techniques for conducting hazard analysis (along with some of their advantages and disadvantages), and other practices and processes that should be employed in order to ensure the safety of software.

Keywords: *Object-oriented programming, *Technology assessment, Distributed computer systems, Distributed processing, Software engineering, Computer program verification, Technology innovation, Research projects, *Object-oriented technology, US NIST.

This paper discusses some of the issues surrounding object technology. The topics which are discussed are object-oriented (OO) development methodologies, measuring the quality of OO software, testing, the use of OO technology in high-integrity systems, and distributed object computing. The purpose of this report is to identify research topics in OO technology for the National Institute of Standards and Technology (NIST) Computer Systems Laboratory. A bibliography is included to assist the reader in selecting material for further reading.

PET and DINGO Tools for Deriving Distributed Implementations from Estelle.
Final rept.
R. Sijelmassi, and B. Strausser. 1993, 18p.
Pub. in Computer Networks and ISDN Systems 25, p841-851 1993.

Keywords: *Software tools, *Distributed computer systems, Operating systems(Computers), Compilers, Finite state machines, Specifications, Translators, Computer networks, Reprints, *Estelle translator, OSI(Open systems interconnection).

The combination of the Portable Estelle Translator (PET) and the Distributed ImplementatioN GeneratOr (DINGO) tools produces distributed implementations from Estelle specifications. The resulting implementations run as one or more operating system processes distributed over several sites of a target distributed system. In addition, the tools generate elements of an X-Window interface which allows centralized or distributed monitoring of some or all of the running modules.

Overview of the Text REtrieval Conference (3rd) (TREC-3). Held in Gaithersburg, Maryland on November 2-4, 1994.
Special pub.
D. K. Harman. Apr 95, 595p, NIST/SP-500/225.
Also available from Supt. of Docs. as SN003-003-03328-6. Sponsored by Advanced Research Projects Agency, Arlington, VA.

Keywords: *Meetings, *Information retrieval, *Text processing, Thesauri, Automation, Natural language processing, Pattern recognition, Routing, Probability theory, Documents, Search structuring, Knowledge bases(Artificial intelligence), Vector processing, Semantics, Evaluation.

The third Text REtrieval Conference (TREC-3) was held in Gaithersburg, Maryland, November 2-4, 1994 and was attended by 150 people involved in the 33 participating groups. The goal of the Conference was to bring research groups together to discuss their work on a new large text collection. There was a large variation of retrieval techniques reported on, including

methods using automatic thesauri, sophisticated term weighting, natural language techniques, relevance feedback, and advanced pattern matching. As results were run through a common evaluation package, groups were able to compare the effectiveness of different techniques, and discuss how differences between the systems affected performance.

Analysis of ANSI ASC X12 and UN/EDIFACT Electronic Data Interchange (EDI) Standards.
R. Aronoff, and K. Hsing. Apr 95, 35p, NISTIR-5631.

Keywords: *Information systems, *Message processing, *Software engineering, *Standards, Data processing, Electronic commerce, Health insurance, EDI(Electronic Data Interchange), EDI, American National Standards Institute ASC X12, UN/EDIFACT(United Nations Electronic Data Exchange for Information), UN/EDIFACT.

The report discusses the two Electronic Data Interchange (EDI) standards that are being developed by the ANSI ASC X12 and the UN/EDIFACT committees, respectively. Discussion is focused on the basic EDI data structures, syntax rules, and functionality. In order to illustrate the concepts and issues involved, a particular application, health care claim submission, is examined. An example scenario is presented which demonstrates how EDI can be used to support this traditional business process. An analysis is then presented which compares these two standards in detail. This analysis look at functionality, efficiency, and existing levels of standards development. To investigate issues of relative efficiency, a comparison is made of record lengths for the basic control/service elements for both standards.

Testability of Object-Oriented Systems.
Final rept. on Phase 1.
Jun 95, 83p, NIST/GCR-95/675.
Contract NIST-50DKNA-Y-00119
Sponsored by National Inst. of Standards and Technology (CSL), Gaithersburg, MD.

Keywords: *Object-oriented programming, *Tests, *Improvements, Software reuse, Fault tolerant computing, Computer software.

We have studied the feasibility of building an object-oriented software testability improvement tool that can be sued in conjuction with RST Corporation's C++ Softwre Testability Analysis (TM) or as a standalone assertion injection tool. We have also produced a set of recommended validation and design techniques that will improve testability, and as a side benefit, the testing of OO systems. If awarded a Phase II effort, RST will provide NIST with a means of improving the testability of C++ systems; to do so within the Phase II cost limit, RST will leverage knowledge gained from building next-generation software assessment tools. Here, RST will rely on experience gained during the building of RST's C and Fortran-77 testability tools, as well as the experimental results from the Phase I effect (which required our building a prototype C++ front-end for PiSCES Software Analysis Toolkit(TM)). Such a Phase II innovation can also be used by NIST or other US Government agencies to empirically research the fault masking ability provided between procedural and object-oriented languages.

Keywords: *Software engineering, *Computer program reliability, *Software tools, Computer program verification, Computer software maintenance, Debugging(Computers), Safety, Algorithms, Requirements, *Program slicing, CASE(Computer Aided Software Engineering), ANSI C programming language.

This report describes a Computer Aided Software Engineering (CASE) tool, unravel, that can assist evaluation of high integrity software by using program slices to extract computations for examinations. The tool can currently be used to evaluate software written ANSI C and is designed such that other languages can be added. Program slicing is a static analysis technique that extracts all statements relevant to the computation of a given variable. Program slicing is useful in program debugging, software maintenance and program understanding. Application of program slicing is evaluation high integrity software reduces the effort in examining software by allowing a software reviewer to focus attention on one computation at a time. Once a software reviewer has identified a variable for further investigation, the reviewer directs unravel to compute a program slice on the variable. Instead of examining the entire program, only the statements in the slice need to be examined by the reviewer. By speeding up the process of locating relevant code for examination by the reviewer, a larger sample of the software can be inspected with greater confidence that some relevant section of source code has not been missed. Volume 1 of this report describes the requirements, design and evaluation of unravel.

Using Synthetic Perturbations and Statistical Screening to Assay Shared-Memory Programs.
Final rept.
R. Snelick, J. JaJa, R. Kacker, and G. Lyon. 1995, 7p.
Pub. in Information Processing Letters, v54 p147-153 1995.

Keywords: *Parallel processing, MIMD(Computers), Response time(Computers), Computer performance evaluation, Computer systems performance, Distributed computer systems, Statistical analysis, Reprints, *Shared memory programs, *Synthetic perturbation screening.

Synthetic-perturbation screening (SPS, hereafter, for brevity) is a diagnostic technique employing artifical code-in discussion to follow, delays-placed within segments of an MIMD program. These insertions simulate code changes in suspected program bottlenecks. Screening techniques based upon statistical experimental design then flag those program segments that are most sensitive to perturbation (delay). A subset of program segments so flagged can be candidates for improvement. The results are sensitivity analyses of specimen programs in terms of their questionable sections of code.

Mapping Integration Definition for Function Modeling (IDEFO) Model into CASE Data Interchange Format (CDIF) Transfer File.
I. V. Simakhodskiy. Sep 95, 128p, NISTIR-5719.
See also PB95-154670.

Keywords: *Data transfer(Computers), *Standards, *Models, Software tools, *IDEFQ(Integration Definition for Function Modeling), *Integration Definition for Function Modeling, *CDIF(Case Data Interchange Format), *Case Data Interchange Format, CASE(Computer Aided Software Engineering), Computer Aided Software Engineering.

The Integration Definition for Function Modeling (IDEFO) is a standard modeling technique used in the logical definition of an organization's data resources. Qne serious limitation to the standard is the lack of a formal standard mechanism for transferring information between different IDEF tools and between IDEF tools and other tools supporting different modeling techniques. This leaves the users of IDEF tools at a great disadvantage. A user is restricted to using a particular tool provided by a particular vendor thus seriously hindering the reusability of the information represented in a model. Qne solution is the use of a standard method to exchange data between tools. The CASE Data Interchange Format (CDIF) Family of Standards is primarily designed to be used as a description of a mechanism for transferring information between CASE tools. This document will describe a conceptual mapping of an IDEF0 model into the CDIF transfer tile. The document will cover both syntax and semantics of the model. This work will demonstrate that it is possible to use the standard exchange for moving information between different tools.

SQA Standards and Total Quality Management.
Final rept.
C. E. Wardle, D. R. Wallace, R. Khorramshahgol, E. G. McGuire, and B. Kaplan. 1991, 19p.
Pub. in Annual Pacific Northwest Software Quality Conference (9th), Portland, QR., Qctober 7-8, 1991, v9 p1-19.

Keywords: *Total quality management, *Computer program integrity, Computer software, Software engineering, Software reliability, Program verification(Computers), Computer architecture, Quality control, Reprints, *SQA(Software Quality Assurance), *Software Quality Assurance, Software standards, Process improvement.

Total Quality Management (TQM) programs, which focus on continuous process improvement, are becoming increasingly popular in corporations today and may, in fact, be superceding quality assurance activities. Quality assurance has been used by corporations to ensure the quality of released products. What we are finding now is the thrust of management attention is on process improvement rather than on quality assurance. This paper examines some major standards and programs in SQA and TQM. Because few companies are using SQA standards, the difficulties in implementing SQA standards are addressed. Results from an on-going research project studying SQA standards and the interrelationships between TQM and SQA are presented.

Distributed Systems: Survey of Open Management Approaches.
J. Hungate, and G. Fernandes. 21 Sep 95, 34p, NISTIR-5735.

Keywords: *Distributed computer systems, *Management, System engineering, Computer networks, Computer communications, Integrated systems, Interoperability, Models.

Networks and distributed systems are becoming critical for the working of many enterprises. Traditionally,

tools necessary to perform effective system management were inherent to proprietary operating systems and dealt with user and resource allocation and administration. With the introduction of local area networks (LANs), distributed computing environments started to develop. System management tools were enhanced with network management facilities, but rarely in an integrated fashion. Management services, providing mechanisms to monitor and control a great diversity of components and user interactions with these components, and an integrated approach to assure consistency are just now being addressed by standard development organizations and user consortia. The report gives an overview of some existing approaches proposed by differnet organizations: IEEE POSIX Working Group P1003.0, X/Open, ISO/IEC, and the Network Management Forum (NMF).

Method to Determine a Basis Set of Paths to Perform Program Testing.
J. Poole. Nov 95, 18p, NISTIR-5737.

Keywords: *Computer program verification, *Software tools, Algorithms, Computer software, *Debugging(Computers), *Flowgraphs, Software testing.

A major problem in unit testing of programs is to determine which test cases to use. One technique that is in widespread use is to take the control flowgraph from each of the program functions and calculate a basis set of test paths. A basis set is a set of paths through the functions that are linearly independent and the paths in the basis set can be used to construct any path through the program flowgraph. Path construction is defined as adding or subtracting the number of times each edge is traversed. While this is not a total solution for test case generation, it does provide a good starting set of test cases. This paper gives an algorithm for taking a function's flowgraph and determining a basis set of paths. Proofs that the algorithm generates a set of paths that fulfill the above requirements are provided. A prototype tool, STest, is also discussed. Some general ideas for further improvement are also provided.

Scalability Test for Parallel Code.
Final rept.
G. Lyon, R. Kacker, and A. Linz. 1995, 17p.
See also PB94-193638.
Pub. in Institute of Electrical and Electronics Engineers International Software Metrics Symposium (2nd), Lond, United Kingdom, October 24-26, 1994, Software: Practice and Experience, v25 n12 p1299-1314 Dec 95.

Keywords: *Parallel processing(Computers), *MIMD(Computers), *Response time(Computers), Computer performance evaluation, Computer systems performance, Computer program verification, Coding, Distributed computer systems, Sensitivity analysis, Optimization, Experimental design, Reprints, *Code scalability.

Code scalability, crucial on any parallel system, determines how well parallel code avoids becoming a bottleneck as its host computer is made larger. Each suspected code bottleneck corresponds to a first-order term in the expansion, the coefficient for that term indicating how sensitive execution is to changes in the suspect location. However, it is the expansion coefficients for second-order interactions between code segments and the number of processors that are fundamental to discovering which program elements impede parallel speedup. A new, unified view of these second-order coefficients yields an informal relative scalability test of high utility in code development. Discussion proceeds through actual examples, including a straightforward illustration of the test applied to SLALOM, a complex, multiphase benchmark.

NIST has been tasked by the CALS Project Office to organize an SGML Conformance Testing Service. The first step in producing a conformance testing service was to produce a thorough test suite. The goal of this project was to evaluate existing test suites for use as the basis within an SGML conformance testing service. This document describes the methodology used in analyzing Exoterica Corporation's SGML Test Suite and the different types of tests run with the various SGML products at NIST's disposal.

Application Portability Profile (APP): The U.S. Government's Open System Environment Profile Version 3.0.
Special pub.
G. E. Fisher. Feb 96, 112p, NIST/SP-500/230.
Supersedes PB93-216943. Also available from Supt. of Docs. as SN003-003-03389-8.

Keywords: *Computer program portability, *Interoperability, *Distributed processing, Computer program transferability, Federal agencies, Computer networks, Computer communications, Software engineering, Operating systems(Computers), Applications programs(Computers), Network analysis, Data transfer(Computers), Data flow, Data management, Computer graphics, Graphical user interface, Human-computer interface, Standardization, Specifications, Recommendations, *Open System Environment, *Application Portability Profile, Federal Information Processing Standards.

The report is designed to provide recommendations on a variety of specifications that will generally fit the requirements of U.S. government information systems. As the U.S. Government's Open System Environment (OSE) profile, the guidance is provided to assist Federal agencies in making informed choices regarding the selection and use of OSE specifications, and in the development of more selective application profiles based on the APP. It is directed toward managers and project leaders who have the responsibilities of acquiring, developing, and maintaining information systems supported by heterogeneous application platform environments.

Slicing in the Presence of Parameter Aliasing.
Final rept.
D. Binkley. 1993, 8p.
Pub. in Proceedings of the Software Engineering Research Forum (3rd), Orlando, FL., November 1993, p261-268.

Keywords: *Software engineering, *Computer program integrity, Algorithms, Debugging(Computers), Computer software maintenance, Software reliability, Computer programming, Parameterization, Functional integration, Reprints, *Program slicing, Aliasing, Data dependence, Program dependence graph.

The notion of a program slice, originally introduced by Mark Weiser, is useful in program debugging, automatic parallelization, program integration, and software maintenance. A slice of a program is taken with respect to a point p and a variable x; the slice consists of all

statements of the program that might affect the value of x at point p. This paper presents an algorithm for interprocedural slicing in the presence of parameter aliases: two formal parameters that refer to the same memory location. The algorithm is parameterized by a set of parameter aliasing information.

Computer-aided Acquisition and Logistic Support (CALS) is a major initiative by the U.S. Department of Defense to enable the use of shared digital technical information in support of weapon systems. CALS is reducing the use of paper-based technical information, improving the information systems supporting weapon systems, and improving work processes. CALS is based on broad support nationally and internationally, particularly from the CALS/Concurrent Engineering Industry Steering Group and the Natioanl Institute of Standards and Technology within the U.S. Department of Commerce. CALS is based on Open Systems and has actively supported the development of standards, Application Protocols/Profiles, and conformance tests and test services.

As the circuit design drew near, the pace became more frantic by the hour, elevating the project leader's anxiety level and his blood pressure. And for good reason - all the users of DEC workstations, where the computer-aided design software resided, were out at a seminar. To be sure, IBM, Sun, and other workstations were available that would have allowed other engineers to complete the job on time. Only a DEC version was obtainable in house; in no way could it be ported to the IBM or Sun on time to beat the deadline - even though the project leader had received assurances from the software vendor that such versions 'were forthcoming.'

Pub. in Concurrent Engineering Techniques and Applications, Control and Dynamics Systems, v62 p59-88 Feb 94.

Keywords: *Operating systems(Computers), *Computer program portability, *Concurrent engineering, Software development, Software tools, Platforms, Interoperability, Interfaces, Application programs(Computers), Standards, Reprints, POSIX(Portable Operating Systems Interface for Computer Environments), OST(Open Systems Interconnection).

The movement toward concurrent engineering comes at a time when the computer industry is undergoing a fundamental change in the way computers and software are developed and used. Products based on 'open systems' standards - particularly the ISO Open System Interconnection (OSI), and IEEE POSIX - are beginning to replace reliance on proprietary computing platforms. Engineers who develop products that incorporate embedded computer and software are thus faced with the challenge of understanding two technological developments that will change the way they do their jobs: concurrent engineering and open systems.

Technique for Analyzing the Effects of Changes in Formal Specifications.
Final rept.
D. R. Kuhn. 1992, 5p.
Pub. in the Computer Jnl., v35 n6 p574-578 1992.

Keywords: *Predicate logic, *Computer software, *Specifications, *Electronic security, Mathematical logic, Boolean functions, Software engineering, Software reliability, Computer program integrity, Computer program verification, Standards, Computer information security, Reprints.

This paper defines the notion of predicate differences and shows how predicate differences may be used to analyze the effects of changes in formal specifications. Predicate differences have both theoretical and practical applications. As a theoretical tool, predicate differences may be used to define a meaning for the 'size' of a change to a formal specification. Practical applications include analyzing the effect of design changes on a previously verified design; defining an affinity function for reusable software components; computing slices of formal specifications, similar to program slices; investigating the conditions under which invalid assumptions will render a system non-secure; and formalizing the database inference problem.

Pub. in Encyclopedia of Software Engineering, v2 p873-878 Feb 94.

Keywords: *Debugging(Computers), *Software engineering, *Computer software maintenance, Computer programming, Computer program vertification, Computer program reliability, Computer program integrity, Software reliability, Mathematical calculations, Algorithms, Functional integration, Reprints, *Program slicing.

Program slicing is a family of program decomposition techniques based on extracting statements relevant to a computation in a program. This is advantageous because the slice can collect an algorithm for a given calculation that may be scattered throughout a program excluding irrelevant statements. It should be easier for a programmer interested in a subset of the program's behavior to understand the corresponding slice than to deal with the entire program. The utility and power of program slicing comes from the potential automation of tedious and error-prone tasks. Program slicing has applications in program debugging, program testing, program integration, parallel program execution, and software maintenance. Several variations on this theme have been developed, including program dicing, dynamic slicing, and decomposition slicing.

This chapter describes how the software verification and validation (V&V) methodology and software provide a strong framework for developing quality software. First, the chapter describes software V&V, its objectives, recommended tasks, and guidance for selecting V&V techniques to perform V&V. An analysis of two studies of V&V's cost-effectiveness concludes that cost benefits of V&V early error detection outweigh the cost of performing V&V. The chapter describes several software engineering standards for V&V, project management, and quality assurance. The chapter describes each V&V standard according to its V&V requirements and techniques. The chapter provides insights on how to use management, quality, and V&V techniques to structure a quality software development.

Many Federal agencies are currently examining their inventories of software systems to identify those which are suitable for reuse. Reuse of software may range from conversion of code from one language to another, adaption of the system for another platform, or the use of an existing system in a new system with additional requirements. To accomplish these and other forms of reuse, the agencies are finding that reengineeringing is often necessary.

S-Check is a tool for detecting performance bottlenecks in programs on computer systems with multiple processors. S-Check automates the techniques of Synthetic Perturbation Screnning. Synthetic Perturbation Screening systematically perturbs selected program code segments and determines performance sensitivities of these selected segments by using the statistical techniques of Design of Experiments. The resulting sensitivity analysis serves as a basis for performance evaluations. This document serves as a user's guide for S-Check.

Application of the Pointer State Subgraph to Static Program Slicing.
D. W. Binkley, and J. R. Lyle. Mar 96, 22p, NISTIR-5799.
Contract DISA-DNR046115
Sponsored by Defense Information Systems Agency, Arlington, VA.

Keywords: *Static analysis, *Computer programs, Software engineering, Data flow analysis, Interface slicing, Pointers.

A new technique for performing static analysis of programs that contain unconstrained pointers is presented. The technique is based on the pointer state subgraph: a reduced control flow graph that takes advantage of the fact that in any program there exists a smaller program that computes only the values of pointer variables. The pointer state subgraph is useful in building static analysis tools. As an example the application of the pointer state subgraph to program slicing is considered. Finally, some experimental results, obtained using the ANSI-C slicer Unravel, are reported. These results show a clear reduction in the time taken to compute data-flow information from programs that contain pointers. They also show a substantial reduction in the space needed to store this information.

Application of Metadata Standards.
Final rept.
J. Newton. 1996, 14p.
Pub. in Institute of Electrical and Electronics Engineers Metadata Conference Proceedings (1st), Silver Spring, MD., April 16-18, 1996, p1-14.

Keywords: *Standards, Data transfer(Computers), Data management, Interoperability, Formats, Data bases, Standardization, Specifications, Procedures, Reprints, *Metadata, *Data elements, Attributes.

Application of metadata standards in the development of data elements assures a consistent, sharable set of data described and named in a predictable way. National and international efforts are underway to produce this metadata standardization. Classification of the components of data elements into a taxonomic structure facilitates the selection of appropriate components for particular elements. In this way, sets of complete and discrete data elements can be developed in to coherent descriptions of subject areas. A set of standardized attributes, some with sample values, prescribe the base set of information to be recorded about each data element. Finally, procedures for registration of standard data elements provide a facility for sharing the benefits of standardization among organizations.

SparseLib++ v. 1.5 Sparse Matrix Class Library. Reference Guide.
R. Pozo, K. A. Remington, and A. Lumsdaine. Jun 96, 25p, NISTIR-5861.
Prepared in cooperation with Notre Dame Univ., IN.

Keywords: *Linear systems, *Matrices(Mathematics), Algebra, Distributed data processing, Array processors, Parallel processing, Computer architecture, Object oriented programming, Computer codes, Subroutine libraries, Data storage systems, Computatuion, Iterations, Sparse matrix, SparseLib plus plus, C plus plus programming language, Kernel functions.

SparseLib++ is a C++ class library for efficient sparse matrix computations across various computational platforms. The software package consists of matrix objects representing several sparse storage format currently in use (in the release: compressed row, compressed column and coordinate formats), providing basic functionality for managing sparse matrices, together with efficient kernel mathematical operations (e.g. sparse matrix-vector multiply). The Sparse BLAS Toolkit(1) is used to enhance portability and performance across a wide range of computer architectures. Included in the package are various preconditioners commonly used in iterative solvers for linear systems of equations. The focus here is on computational support for iterative methods (see IML++(5)), but the sparse matrix objects presented here can be used in their own right.

IML++ v.1.2 Iterative Methods Library Reference Guide.
J. Dongarra, A. Lumsdaine, R. Pozo, and K. A. Remington. Jun 96, 43p, NISTIR-5860.
Prepared in cooperation with Notre Dame Univ., IN. and Oak Ridge National Lab., TN.

Keywords: *Algorithms, *Computer program documentation, Iterative methods, Object oriented computing, Linear algebra, Matrices(Mathematics), Vector fields.

The Iterative Methods Library, IML++, is a collection of algorithms implemented in C++ for solving both symmetric and nonsymmetric linear systems of equations by using iterative techniques. The goal of the package is to provide working code which separates the numerical algorithm from the details of the matrix/vector implementation. The separation allows the same algorithm to be used without modification, regardless of the specific data representation.

MV++ v. 1.5a Matrix/Vector Class Reference Guide.
R. Pozo. 27 Jun 96, 18p, NISTIR-5859.
See also DE95017458.

Keywords: *Matrix algebra, *Vector fields, *User guide, Algorithms, Compute program documentation, MV++ v 1.5a computer program.

MV++ is a small, efficient set of concrete vector and matrix classes specifically designed for high performance numerical computing. The MV++ package includes interfaces to the computational kernels found in the Basic Linear Algebra Subprograms (BLAS), such as scalar updates, vector sums, and dot products. The idea behind MV++ is to leverage vendor-supplied or optimized BLAS routines that are fine-tuned for particular plantforms. The various MV++ classes form the building blocks of larger user-level libraries such as SparseLib++(2) and LAPACK++(1). The MV++ library was built to supply simple, concrete, numerical vector and column oriented dense matrix classes.

Experimental Evaluation of Specification Techniques for Improving Functional Testing.
Final rept.
K. L. Mills. 1996, 13p.
Pub. in Jnl. of Software and Systems Engineering, n32 p83-95 Jan 96.

Keywords: *Computer programming, *Specifications, *Man-computer interface, Computer software, Natural language(Computers), Performance tests, Graphical user interface, Real time, Reprints, *Functional testing, Structured analysis, Program execution.

The article reports results from one experiment to compare the effectiveness of functional testing given three different sets of software specifications. Three groups of experienced programmers independently developed functional test cases for the same automated cruise control software. One group worked solely from a natural language description, one was given a graphical real-time structured analysis (RTSA) specification to augment the natural langauge description, and a third was given, in addition to the English language description and the RTSA specification, an executable specification. Two measures of performance were evaluated: the degree of statement coverage achieved by the test cases created by each group, and the amount of time taken to create the test cases. No significant difference in performance was found among any of the groups for either of the measures.

Knowledge-Based Approach for Automating a Design Method for Concurrent and Real-Time Systems.
Final rept.
K. L. Mills, and H. Gomaa. 1996, 8p.
Pub. in International Conference on Software Engineering and Knowledge Engineering, SEKE '96 (8th), Lake Tahoe, NV., June 10-12, 1996, p529-536.

Keywords: *Concurrent engineering, *Real time operation, *Computer-aided design, Knowledge bases(Artificial intelligence), Design analysis, Software engineering, Automation, Software tools, Specifications, Semantics, Reprints.

The paper describes a knowledge-based approach to automate CODARTS, a software design method for concurrent and real-time systems. The approach uses multiple paradigms to represent knowledge embedded within CODARTS. Semantic data modeling provides the means to model specifications and related designs. Production rules form the basis for modeling a set of heuristics that can generate concurrent designs based upon semantic concepts from the specification and design meta-models. Together, the semantic data models and production rules, encoded using an expert-system shell, compose CODA, an automated designer's assistant.

Measurement of Process Complexity.
Final rept.
R. Tesoriero, and M. V. Zelkowitz. 1996, 12p.
Pub. in Proceedings of the European Control and Metrics Conference (7th), Wilmslow, United Kingdom, May 15-17, 1996, p304-315.

Keywords: *Software engineering, *Technology transfer, *Complexity, Computer program reliability, Computer programming, Design analysis, Scheduling, Specifications, Measurement, Requirements, Reprints, Process models.

The ability to quantitatively assess a given project has meant one of two different approaches: (1) a study of the complexity of the software being produced, (2) or a study of the process being used to develop that software. In the apper, the authors try to indicate that neither approach is sufficient. They are developing a model that evolved from an earlier study on software engineering technology transfer. In it, the authors look at the evolving nature of the software development to develop a process model that keeps up with these changes. The paper presents an initial overview of the process model.

Representation of Axes for Geometric Fitting.
T. H. Hopp. Sep 96, 18p, NISTIR-5897.

Keywords: *Dimensional measurement, *Algorithms, Metrology, Geometry, Estimates, *Geometric fitting software, Coordinates measuring systems.

The authors review methods for representing geometric axes in three dimensions and discuss why these methods have undesirable properties for geometric fitting applications. The authors then describe a new representation that seems better suited for use in problems of fitting geometric elements to data points. This representation was developed in the course of the authors' work on testing of data analysis software in coordinate measurement systems. The new representation has allowed us to lower significantly the estimated uncertainty of the authors' test results. Details and properties of the representation are discussed.

Experimental Models for Software Diagnosis.
M. V. Zelkowitz, and D. R. Wallace. Aug 96, 39p, NISTIR-5889.
Prepared in cooperation with Maryland Univ., College Park. Dept. of Computer Science.

Computer Software

Keywords: *Software engineering, *Information systems, *Computer program validation, Computer systems design, Distributed data processing, Data collection, Experimental data, Models.

Experimentation and data collection are becoming accepted practices within the software engineering community to determine the effectiveness of various software development practices. However, there is wide disagreement as to exactly what the term 'experimentation' means in this domain. It is important that we be able to understand this concept and identify how we can best collect data needed to validate software methods that seem to be effective. This understanding will provide a basis for improved technical exchange of information between scientists and engineers within the software community.

Structured Testing: A Testing Methodology Using the Cyclomatic Complexity Metric.
Special pub.
D. R. Wallace, A. H. Watson, and T. J. McCabe. Aug 96, 124p, NIST/SP-500/235.
Portions of this document are not fully legible. Also available from Supt. of Docs. as SN003-003-03426-6.

Keywords: *Computer programs, *Test methods, Integration, Object oriented programs, Life cycles, Quality assurance, Measurement, Software engineering, Cyclomatic complexity.

The purpose of this document is to describe the structured testing methodology for software testing, also known as basis path testing. Based on the cyclomatic measure of McCabe, structured testing uses the control flow structure of software to establish path coverage criteria. The resultant test sets provide more through testing than statement and branch coverage. Extensions of the fundamental structured testing techniques for integration testing and object-oriented systems are also presented. Several related software complexity metrics are described. Summaries of technical papers, case studies, and empirical results are presented in the appendices.

Text REtrieval Conference (4th) (TREC-4). Held in Gaithersburg, Maryland on November 1-3, 1995.
Special pub.
D. K. Harman. Oct 96, 776p, NIST/SP-500-236.
Also available from Supt. of Docs. as SN003-003-03430-4.

Keywords: *Meetings, *Information retrieval, *Text processing, Thesauri, Automation, Natural language processing, Pattern recognition, Routing, Probability theory, Documents, Search structuring, Knowledge bases(Artificial intellegience), Vector processing, Semantics, Evaluation.

This report constitutes the proceedings of the fourth Text REtrival Conference (TREC-4) held in Gaithersburg, Maryland, November 1-3, 1995. The conference was co-sponsored by the National Institute of Standards and Technology (NIST) and the Defense Advanced Research Agency (DARPA), and was attached by 140 people involved in the 36 participating groups. The goal of the conference was to bring research groups together to discuss their work on a large test collection. There was a wide variation of retrieval techniques reported on, including methods using automatic thesaurii, sophisticated term weighting, natural language techniques, relevance feedback, and advanced pattern matching. As results had been run through a common evaluation package, groups were able to compare the effectiveness of different techniques, and discuss how differences between the systems affected performance. In addition to the main evaluation, 5 more focussed evaluations, called 'tracks' were run. The conference included paper sessions and discussion groups. This proceeding includes papers from most of the participants (several poster groups did not submit papers), tables of the system results, and brief system descriptions including timing and storage information.

Three Dimensional Position Determination from Motion.
Final rept.
M. Nashman, and K. Chaconas. 1991, 10p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Sensor Fusion III: 3-D Perception and Recognition, Boston, MA., November 5-8, 1990, v1383 p166-175 1991.

Keywords: *Manipulators, *Control systems, *Position finding, *Motion, Algorithms, Image processing, Three dimensional motion, Real time, Sensory feedback, Trajectory planning, Reprints.

The analysis of sequences of images over time provides a means of extracting meaningful information which is used to compute and track the three-dimensional position of a moving object. This paper describes an application in which sensory feedback based on time-varying camera images is used to provide position information to a manipulator control system. The system operates in a real-time environment and provides updated information at a rate which permits intelligent trajectory planning by the control system.

Reference Model Architecture for Intelligent Systems Design.
J. S. Albus. Sep 94, 48p, NISTIR-5502.

Keywords: *Control systems design, *Real time systems, *Artificial intelligence, Autonomy, Self adaptive control systems, Hierarchies, Task planning(Robotics), Canonical forms, Data bases, Robots, Manufacturing, Workstations, Models, RCS(Real-time Control System).

A reference model architecture based on the Real-time Control System (RCS) is proposed for real-time intelligent control systems. RCS partitions the control problem into four basic elements: behavior generation (or task decomposition), world modeling, sensory processing, and value judgment. It clusters these elements into computational nodes that have responsibility for specific subsystems, and arranges these nodes in hierarchical layers such that each layer has characteristic functionality and timing. The RCS reference model architecture has a systematic regularity, and recursive structure that suggests a canonical form. Control systems based on the RCS have been built for a number of applications. Examples of a control system architecture and a world model database for an intelligent robot in a manufacturing work-station are described. Each level of the control architecture performs real-time planning and sensory interactive execution. Each level of the world model knowledge database contains state variables, system parameters, entity frames, and maps.

Expert Control System Shell Version 1.0 User's Guide.
S. A. Osella. Feb 95, 44p, NISTIR-5601.

Keywords: *Control systems design, *Expert systems, *Software tools, Prototypes, Systems engineering, Real time systems, Controllers, Graphical user interface, Control equipment, Software engineering, User manuals(Computer programs).

The Expert Control System Shell (ECSS) is a software tool for rapidly prototyping and deploying control systems of arbitrary complexity. With the ECSS, a control system designer creates a controller which consists of a graphical user interface (called the operator front panel) and, optionally, a collection of expert system rule-based programs. A controller can be operated in manual mode where an operator interacts directly with the system to be controlled without using the expert system, in automatic mode where the expert system is used to perform most, if not all, system interactions, or in a combination of the two modes. The User's Guide is discussed in the following order: (1) a tutorial on how to create a controller, (2) creating controllers, (3) creating and importing device interface functions, (4) creating rule-based programs, (5) importing expert system functions, and (6) operating controllers.

This document is one of two reports on the Integrated ISIS protocol. Required by the IAB/IESG in order for an Internet routing protocol to advance to Draft Standard Status. Integrated ISIS is an Interior Gateway Protocol and is designed to carry both IP and ISO CLNP routing information. Integrated ISIS is currently designated as a Proposed Standard. The protocol was first published in RFC 1195. Internet Draft was published subsequently to RFC 1195 and documents the current version of the protocol. This report documents experience with Integrated ISIS. This includes reports on interoperability testing, field experience and the current state of Integrated ISIS implementations. It also presents a summary of the Integrated ISIS Management Information Base (MIB), and a summary of the Integrated ISIS authentication mechanism.

Graphical Kernel System (GKS). Category: Software Standard. Subcategory: Graphics. International Standard: Information Technology; Computer Graphics; Graphical Kernel System (GKS) Language Bindings. Part 4: C.
8 Jan 91, 113p.
Also available from Supt. of Docs. Also pub. as American National Standards Inst., New York rept. no. ISO/IEC-8651-4.1991E. Supersedes FIPS PUB 120. Prepared in cooperation with American National Standards Inst., New York.

Keywords: *Federal information processing standards, *Computer graphics, *Computer software, Applications programs(Computers), Computer program portability, GKS(Graphical Kernel System), ANSI(American National Standard Institute), ISO(International Organization for Standardization), C programming language.

This revision supersedes Federal Information Processing Standard (FIPS) PUB 120 and modifies the standard by adding a requirement for validation of GKS implementations that are acquired by Federal agencies. FIPS 120-1 adopts American National Standard Graphical Kernel System (ANS GKS), ANSI X3.124-1985, Functional Description, which consists of four parts (X3.124.1-1985 FORTRAN Binding, X3.124.2-1988 Pascal Binding, X3.124.3-1989 Ada Binding), as a FIPS.ANS GKS specifies a library (or toolbox package) of subroutines for an application programmer to incorporate within a program in order to produce and manipulate two-dimensional pictures. The purpose of the standard is to promote portability of graphics application programs between different installations. The standard is for use by implementors as the reference authority in developing graphics software systems; and by other computer professionals who need to know the precise syntactic and semantic rules of the standard.

User Interface Component of the Applications Portability Profile Category: Software Standard; Subcategory: Application Program Interface.
Federal information processing standards.
c8 Oct 93, 5p.
Supersedes FIPS PUB 158. Also available from Supt. of Docs.
Three ring binder also available. North American Continent price $7.00; all other write for quote.

Keywords: *Standards, *Windowing, Interfaces, Computer graphics, *Federal information processing standards, *Man computer interface, *Application programs(Computers), *Software engineering, Portable Operating System Interface (POSIX), Computer program portability, Application program interface, Open systems interconnections.

This publication announces the adoption of the X Protocol, Xlib Interface, Xt Intrinsics and Bitmap Distribution Format specifications of the X Window System, Version 11, Release 5 (X Window System is a trademark of the Massachusetts Institute of Technology (MIT) as a Federal Information Processing Standard). This FIPS is identical to FIPS PUB 158, except that the specification is updated from Release 3 to Release 5 of the X Window System, Version 11. The standard is for use by computing professionals involved in system and application software development and implementation. The standard is part of a series of specifications needed for application portability. The standard covers the Data Stream Encoding, Data Stream Interface, and Subroutine Foundation layers of the reference model. It is the intention of NIST to provide standards for other layers of the reference model as consensus develops within industry. This standard addresses the user interface functional area of the Applications Portability Profile (NIST SP 500-87).

Guideline for the Use of Advanced Authentication Technology Alternatives. Category: Computer Security. Subcategory: Access Control.
Final rept.
J. F. Dray. 28 Sep 94, 66p.
Also available from Supt. of Docs.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Computer security, *Authentication, *Federal information processing standards; Cryptography, Telecommunication, Data processing security, Data encryption, Biometrics, Access control, Passwords.

This Guideline describes the primary alternative methods for verifying the identities of computer system users, and provides recommendations to Federal agencies and departments for the acquisition and use of technology which supports these methods. Although the traditional approach to authentication relies primarily on passwords, it is clear that password-only authentication often fails to provide an adequate level of protection. Stronger authentication techniques become increasingly more important as information processing evolves toward an open systems environment. Modern technology has produced authentication tokens and biometric devices which are reliable, practical, and cost-effective. Passwords, tokens, and biometrics can be used in various combinations to provide far greater assurance in the authentication process than can be attained with password alone.

Guideline for the Analysis of Local Area Network Security. Category: Computer Security; Subcategory: Risk Analysis and Contingency Planning.
Final rept.
L. J. Carnahan. 9 Nov 94, 62p.
Also available from Supt. of Docs.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Local area networks, *Computer security, *Federal information processing standards, Risk assessment, Vulnerability, Distributed computer systems, Data processing security, Protocols, Message processing, Access control, Authentication, Data integrity, Personal computers, Training.

Local area networks (LANs) that are used to store, process or transmit sensitive information must provide appropriate protection to prevent undesirable events such as compromise of information or denial of service. This document can be used as a tool to help improve the security of a local area network. A LAN security architecture is described that discusses threats and vulnerabilities that should be examined, as well as security services and mechanisms that should be explored. A five step process is defined that helps the reader to determine LAN assets, environment-specific threats and vulnerabilities, the risk of those threats to the LAN, and possible security services and mechanisms that can be used to help reduce the risk to the LAN. A discussion concerning LAN security policy, contingency planning, and training issues is also included.

SQL Environments. Category: Software Standard; Subcategory: Database.
3 Feb 95, 72p.
Also available from Supt. of Docs.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Federal information processing standards, *Programming environments, *Data processing, Data bases, Multimedia, Integrated systems, Tests, Procurement, Specifications, *SQL(Structured Query Language), *Structured Query Language, Internet, ERI(External repository interface), CLI(Call Level Interface).

AN SQL environment is an integrated data processing environment in which heterogeneous products, all supporting some aspect of the FIPS SQL standard (FIPS PUB 127), are able to communicate with one another and provide shared access to data and data operations and methods under appropriate security, integrity, and access control mechanisms. This Federal Information Processing Standards Publication (FIPS PUB) is the beginning of a continuing effort to define appropriate conformance profiles that can be used by both vendors and users to specify exact requirements for how various products fit into an SQL environment. The emphasis in this first publication is to specify general purpose, SQL external repository interface (SQL/ERI) server profiles for non-SQL data repositories. Two major SQL/ERI Server Profiles are specified: read-only and read-write. To make it easier to specify integration among heterogeneous, non-SQL data models, this specification defines a new minimal level of the SQL language that can be supported by various non-SQL implementations.

Federal Building Grounding and Bonding Requirements for Telecommunications. Category: Telecommunications Standard; Subcategory: Grounding and Bonding.
15 Aug 95, 46p.
Also pub. as Telecommunications Industry Association, Washington, DC. Standards and Technology Dept. rept. no. ANSI/TIA/EIA-607-1994. Prepared in cooperation with Telecommunications Industry Association, Washington, DC. Standards and Technology Dept.
Three ring vinyl binder also available; North American Continent price $7.00, all others write for quote.

Keywords: *Telecommunication, *Public buildings, Communication cables, Electrical grounding, Wires, Communication equipment, National government, Passageways, Electrical circuits, Safety engineering, Fire prevention, *Federal information processing standards.

This standard, by adoption of ANSI/TIA/EIA-607-1994, Commercial Building Grounding and Bonding Requirements for Telecommunications, specifies the requirements for a uniform telecommunications grounding and bonding infrastructure for Federal buildings where telecommunications equipment is installed. The standard provides the requirements for a ground reference for telecommunications systems within the telecommunications entrance facility, the telecommunications closet, and equipment room; it also provides the requirements for bonding and connecting pathways, cable shields, conductors, and hardware at telecommunications closets, equipment rooms, and entrance facilities. The grounding and bonding approach described in this standard is consistent with the cabling topology specified in FIPS PUB 174, Federal Building Telecommunications Wiring Standard (ANSI/EIA/TIA-568-1991), and installed in accordance with FIPS PUB 175, Federal Building Standard for Telecommunications Pathways and Spaces (ANSI/EIA/TIA-569-1990).

Computer Graphics Metafile (CGM): Procedures for NIST CGM Validation Test Service.
L. S. Rosenthal, and J. A. Schneider. Feb 94, 29p, NISTIR-5372.
See also FIPS PUB 128-1E and PB93-198273.

Keywords: *Computer graphics, *Standards, Federal information processing standards, Conformity, Tests, Verifying, Interpreters, *Computer Graphics Metafile, *CALS, Continuous Acquisition and Life-Cycle Support, Computer-aided Acquisition and Logistics Support, Application Protocols, National Institute of Standards and Technology.

This document provides general procedures for the National Institute of Standards and Technology's (NIST) Computer Graphics Metafile (CGM) Validation Test Service. The NIST CGM Validation Test Service provides a way of determining the degree to which an implementation conforms to the CGM standard (Federal Information Processing Standard 128-1, Computer Graphics Metafile, and the Continuous Acquisition and Life-Cycle Support Application Profile, MIL-D-28003A). The goal of the NIST Test Service is to maximize the probability of successful interchange of CGMs between conforming systems. The document is divided into three testing programs: metafile testing, generator testing, and interpreter testing. In order to take into account the differences among the three testing programs, many procedures have been tailored to the specific testing program. The policies and procedures presented in this document are organized into five sections: an introduction, general procedures, and specific procedures for each of the three testing programs.

Compatibility Analysis of the ANSI and ISO IRDS Services Interfaces.
J. Berube, and A. Goldfine. Sep 92, 104p, NISTIR-4904.
See also PB88-163779.

Keywords: *Data management, *Dictionaries, *Standards, Compatibility, IRDS(Information Resource Dictionary System), ANSI(American National Standards Institute), ISO(International Organization for Standardization).

The primary purpose of the report is to compare: the ANSI IRDS standards (ANSI 1992), (IRDS 1988); and the ISO IRDS standards (FRAMEWORK 1990), (ISO 1992). The following are also part of the context of the report and will be surveyed: the IBM Repository Manager Interface (RM 1990); the ATIS IRDS proposal (ATIS 1990); and the PCTE standard (PCTE 1988). The principal objective of the report is to establish the level of compatibility and interoperability possible between an ANSI IRDS environment and an ISO IRDS environment. This is done by attempting to establish if these environments can be reconciled: in definition. That is, can they share data. in operation. That is, could a single product offer the two types of services.

IGOSS-Industry/Government Open Systems Specification.
Special pub.
G. Mulvenna. May 94, 131p, NIST/SP-500/217.
Also available from Supt. of Docs as SN003-003-03269-7. See also FIPS PUB-107, FIPS PUB 100-1 and PB93-166809.

Keywords: *Computer networks, *Standards, Protocols, Government/industry relations, Computer architecture, File management systems, Message processing, Communication networks, *OSI(Open Systems Interconnection), *Open Systems Interconnection, GOSIP(Government Open Systems Interconnection Profile), IGOSS(Industry/Government Open Systems Specification).

The IGOSS is a standard reference to use when acquiring and operating computer networking products and services intended to conform to the Open Systems Interconnection (OSI) protocols. The IGOSS is jointly authored by the U.S. Government, the Canadian Government, Manufacturing Automation Protocol (MAP) group, the Technical and Office Protocol (TOP) group, and the electric power group. Each of these organizations has previously issued their own procurement profiles and are now consolidating their procurement requirements into a single domain.

U.S. GOSIP Testing Program.
Final rept.
J. P. Favreau, K. L. Mills, and J. S. Nightingale. 1990, 5p.
Pub. in Proceedings of International Conference on the Applications of Standards for Open Systems (6th), Falls Church, VA., October 2-4, 1990, p125-129.

Keywords: *Tests, Protocols, Federal information processing standards, Federal agencies, Government procurement, Reprints, *GOSIP(Government Open Systems Interconnection Profile), *Government Open Systems Interconnection Profile, OSI(Open Systems Interconnection).

This paper discusses progress to date in the development and deployment of a Testing Policy for U.S. Government Open Systems Interconnection Profile (GOSIP) protocol implementations. The policy itself is fully discussed in the Federal Information Processing Standards (FIPS): 'GOSIP Conformance and Interoperation Testing and Registration.' Realization of the policy has included solicitation and assessment of abstract test suites, means of testing, conformance test laboratories and interoperability test suites and facilities. Public registers of all of these items are compiled and published so that Federal Agencies may make informed procurement decisions for GOSIP products.

This editorial is a clarification of the National Institute of Standards and Technology's (NIST's) role in the de-

velopment of the American National Standards Institute (ANSI) standard ANSI/NIST-CSL 1-1993 entitled 'Data Format for the Interchange of Fingerprint Information.' Several misrepresentations of the NIST role appeared in an editorial published in the May/June 1993 issue of the Journal of Forensic Identification.

Industry/Government Open Systems Specification Testing Framework. Version 1.0.
J. P. Favreau. Jun 94, 124p, NISTIR-5438.
Supersedes PB92-110105.

Keywords: *Tests, Quality control, Data transmission, Data transfer(Computers), Protocols, Computer networks, Message processing, Commodities, Procurement, Government/industry relations, Standards, *IGOSS(Industry/Government Open Systems Specification), *Industry/Government Open Systems Specification, US NIST, OSI(Open Systems Interconnection).

The development of National Institute of Standards and Technology (NIST) Special Publication 500-217 which specifies the Industry/Government Open Systems Specification (IGOSS), resulted in the need to establish policy and procedures aimed at ensuring that the IGOSS Partners' data communications products adhere to the technical documents referenced by IGOSS and that they interoperate. The goal of this document is to aid an Industry/Government Acquisition Authority in procurement of IGOSS products by employing publicly accessible registers verifying supplier claims of conformance and documenting instances of interoperability of IGOSS CONFORMANT PRODUCTS. This document supersedes NISTIR 4594.

Federal Government and Information Technology Standards: Building the National Information Infrastructure.
Final rept.
S. M. Radack. 1994, 13p.
Pub. in Government Information Quarterly 11, n4 p373-385 1994.

Keywords: *Standards, *Information processing, Government policies, National government, Federal information processing standards, Computers, Information systems, Telecommunication, Reprints, NII(National Information Infrastructure), NPR(National Performance Review), US NIST.

For many years, standards have been important considerations in the Federal government's policies for the use of information technology. The Computer Systems Laboratory (CSL) at the National Institute of Standards and Technology develops and issues technical standards that are used by the Federal government in its information technology systems. The new Federal initiative for the National Information Infrastructure (NII) and the National Performance Review (NPR) make information technology an agent for change and emphasize standards as a means for achieving connectivity of computer and telecommunications technologies and for easy access to information. The Federal government will be challenged to address the technical, organizational and policy issues that affect the development of the standards needed for future information systems.

Lessons from the Establishment of the U.S. GOSIP Testing Program.
Final rept.
J. P. Favreau, and J. S. Nightingale. 1991, 16p.
See also PB94-211455.
Pub. in Proceedings of the International Workshop on Protocol Test Systems (4th), Leidschendam, The Netherlands, October 15-17, 1991, 16p.

Keywords: *Computer communications, *Protocols, Computer networks, Communication networks, Interfaces, Interoperability, Message processing, Computer architecture, Systems engineering, Standardization, Specifications, Requirements, Reprints, *OSI(Open Systems Interconnection), *Open Systems Interconnection, *GOSIP(Government Open Systems Interconnection Profile), *Government Open Systems Interconnection Profile, Conformance.

Currently, the U.S. Government mandates use of Open Systems Interconnection (OSI) protocols in procurement of new networks and major upgrades to existing networks. Vendors strive to meet the challenge of making OSI products available. Users are confused by this new technology. In order to respond to this problem the National Institute of Standards and Technology has set up a comprehensive testing program. An overview of the U.S. GOSIP Testing Program is presented with some of the issues in OSI protocol conformance and interoperability testing raised during its design and implementation.

Open Issues in OSI Protocol Development and Conformance Testing.
Final rept.
J. P. Favreau, G. V. Bochmann, and P. Mondain-Monval. 1991, 19p.
Pub. in Computer Networks '91, Wroclaw, Poland, 19p 1991.

Keywords: *Protocols, *Conformance, *Interoperability, Standards, Testing, Computer networks, Computer software, Computer equipment, Procurement, Communications, Reprints, *OSI(Open Systems Interconnection), *Open Systems Interconnection.

As of August 15, 1990 the U.S. Government mandated use of Open Systems Interconnection (OSI) in procurement of new networks and major upgrades to existing networks. The goal of OSI is to allow interworking of separately developed pieces of software and equipment. However, it is not easy to allow interworking of separately developed pieces of software and equipment. However, it is not easy to insure that OSI products provided by different vendors will properly interoperate. This paper presents some unresolved issues in OSI protocol development and conformance testing, and proposes an approach for the protocol development and testing cycle that would alleviate some of the present problems.

Reliable Optical Flow Algorithm Using 3-D Hermite Polynomials.
H. Liu, T. H. Hong, M. Herman, and R. Chellappa.
Dec 93, 35p, NISTIR-5333.
Prepared in cooperation with Maryland Univ. Coll., College Park.

Keywords: *Image analysis, Image reconstruction, Scene analysis, Computer vision, Hermite polynomials, Three dimensional, Matrices, Algorithms, Theorems, *Optical flow.

Algorithms that attempt to accurately compute optical flow must cope with occlusion, brightness changes, irregular motion, and the aperture problem. Most optical flow algorithms have tried to overcome one or more of the problems mentioned above. Yet, claims about the reliability of computed flow are still based on ad hoc evaluation schemes. While a perfect algorithm that is free of all the problems is not yet available, we present a reliable algorithm, which despite all the difficulties, generates the output flow field wherever possible, and associates with the output evaluation metrics that reflect the reliability of the output. The evaluation metrics are complete in the sense that they are theoretically related to the physical phenomena that cause the inherent problems noted above. Our approach to computing optical flow expands the spatio-temporal image in terms of Hermite polynomials and then derives multiple Gaussian smoothed gradient constraint equations, which constitute an overdetermined linear system that can be solved for image flow with a least square method.

Evaluating Form Designs for Optical Character Recognition.
M. D. Garris, and D. L. Dimmick. Feb 94, 117p, NISTIR-5364.

Keywords: *Optical character recognition, *Human factors engineering, *Forms(Paper), *Taxes, Errors, Performance evaluation, Data bases, NIST(National Institute of Standards and Technology), IRS(Internal Revenue Service).

The National Institute of Standards and Technology (NIST), under the sponsorship of the Internal Revenue Service, has conducted an extensive study of three different redesigned tax forms. The NIST Model Recognition System was used in conjunction with the NIST Scoring Package to generate performance measures at the form, field, and character levels. The analyses of these measures conclude that factors introduced onto forms by the writer are the primary cause of segmentation errors, which are the major source of errors within the recognition system. Analysis shows that 97% of these segmentation errors can be attributed to factors introduced by the writer. The paper cites three ways in which these types of human factors can be handled so as to increase recognition performance. First, the algorithms and techniques deployed within the system can be improved. Second, the instances of human factors leading to system errors can be detected. Third, writers can be influenced by the design of the form including the layout and structure of the fields. By applying a combination of these three approaches, human factors can be dealt with, and the errors made by a form processing system can be effectively reduced to classification errors.

See also PB94-118213.

Keywords: *Word recognition, *Handwriting, Character recognition, Pattern recognition, Neural nets, Automation, Classification, Lexicography, NIST(National Institute of Standards and Technology).

A word recognition system has been developed at the National Institute of Standards and Technology (NIST) to read free-formatted text paragraphs containing handprinted characters. The system has been developed and tested using samples of handprint from NIST Special Database 1. This database of binary images contains 2,100 different writers' printings of the Preamble to the U.S. Constitution. Each writer was asked to print these sentences in an empty 70mm by 175mm box. The Constitution box contains no guidelines for the placement and spacing of the handprinted text, nor are there guidelines to instruct the writer where to stop printing one line and to begin the next. This paper discusses the word recognition system in detail.

See also PB92-238542.

Keywords: *Meetings, *Optical character recognition, *Handwriting, Character recognition, Image processing, Dictionaries, Scoring, Voting, Tests, US Bureau of the Census, NIST(National Institute of Standards and Technology).

The results of the Second Census Optical Character Recognition (OCR) Systems Conference are described. There were two conference tests, one scanned from microfilm, the other from paper. Each test consisted of three thousand miniforms with three answer fields per form. The answers consisted of phases associated with the respondant's occupation. Twenty-five organizations participated in the conference, but only ten submitted results for scoring by the National Institute of Standards and Technology (NIST). The results from one organization were good enough to suggest that OCR may now be sufficiently well developed to be used in a future Census.

Object Finder for Digital Images Based on Multiple Thresholds, Connectivity, and Internal Structures.
Final rept.
D. S. Bright. 1989, 120p.
Pub. in Jnl. of Computer Assisted Microscopy 1, n4 p307-329 Dec 89.

Keywords: *Image processing, Transmission electron microscopy, Ion microscopy, Electron diffraction, Reprints, *Feature extraction, Blob Splitting Algorithm, Image segmentation, Digital images.

The Blob Splitting Algorithm (BSA), developed for segmenting digital images (Bright 1987a), finds simple objects in micrographs that have troublesome backgrounds. Locating objects can be difficult when they have a wide range of sizes or shapes, when they have fuzzy edges, when they are not clearly separated, or when they do not stand out well from the background. The algorithm works without any preprocessing, filtering, or transforming of the images. It is not sensitive to object width or even to object size or shape, but rather to intensities relative to a local surround. Although computationally expensive, it is robust and is used routinely in our laboratory for locating particles in TEM and ion microscope images, locating spots in electron diffraction patterns, and finding regions of interest in complex particles.

Pub. in Parallel Architectures and Algorithms for Image Understanding, p3-26 1991. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *Image processing, *Templates, *Blocks, *Computer architecture, Pattern recognition, Parallel processing, Very large scale integration, Systolic arrays, Chips (Electronics), Input output processing, Reprints.

Image template matching and block matching are representative of many window based tasks in image processing. While the existing architectures for template matching and block matching consist of a systolic array of processors, most of them either ignore the I/O issues or employ schemes involving frequent off-chip memory accesses. We propose a systolic architecture consisting of a linear array of processors which handles the I/O bandwidth problem efficiently.

Certainty Grid to Object Boundary Algorithm.
J. A. Horst, H. M. Huang, and T. M. Tsai. Jun 94, 16p, NISTIR-5447.

Keywords: *Image processing, *Robotics, Algorithms, Edge detection, Curve fitting, Approximation, Mapping, *CGOB(Certainty grid to object boundary), *Certainty grid to object boundary.

An edge linking algorithm is modified for a mobile robot map representation application. Certainty grid 'images' are transformed to an appropriate set of object boundary curves. The latter are expressed as oriented piecewise linear segments. Image processing techniques, such as edge detection, thinning, curve tracing, and linear approximation are employed with various modifications. The most significant modification is a new method for linear curve approximation that is simple, accurate, and efficient. The method monitors chord and arc length, and its excellent performance is demonstrated against similar algorithms. The certainty grid to object boundary algorithm is tested against simulated noisy certainty grid maps.

Grant NSF-IRI-9115939
See also PB92-133016. Prepared in cooperation with Florida Atlantic Univ., Boca Raton. Sponsored by National Science Foundation, Washington, DC. Directorate for Engineering.

Keywords: *Computer vision, *Three dimensional motion, *Optical flow(Image analysis), Invariance, Three dimensional bodies, Cameras, Rotation, Fixation.

The paper deals with a visual-motion fixation invariant. The authors show that during fixation there is a measurable nonlinear function of optical flow that produces the same value for all points of a stationary environment regardless of the 3-D shape of the environment. During fixated camera motion relative to a rigid object, e.g., a stationary environment, the projection of the fixated point remains (by definition) at the same location in the image, and all other points located on the 3-D rigid object can only rotate relative to the 3-D fixation point. This rotation rate of the points is invariant for all points that lie on the particular environment, and it is measurable from a sequence of images. This new invariant is obtained from a set of monocular images, and is expressed explicitly as a closed form solution. In the paper the authors show how to extract this invariant analytically from a sequence of images using optical flow information, and they present results obtained from real data experiments.

Face Recognition Technology for Law Enforcement Applications.
C. L. Wilson, C. S. Barnes, R. Chellappa, and S. A. Sirohey. Jul 94, 77p, NISTIR-5465.

Keywords: *Face(Anatomy), *Law enforcement, *Pattern recognition, Neural networks, Character recognition, Image processing, Computer aided analysis, Psychophysics, Photographic images, Feature extraction, Segmented elements, Eigenvectors, Technology transfer, *Forensic sciences, *Face recognition, National Institute of Standards and Technology.

The goal of the report is to relate existing face recognition technology to law enforcement applications. These applications range from static matching of controlled photographs as in mugshot matching to surveillance video images and have different constraints in terms of complexity of processing requirements and thus present a wide range of different technical challenges. The ongoing research activities have been given a renewed emphasis over the last five years. The existing techniques and systems have been tested on different sets of images of varying complexities. Also, very little synergism exists between studies in psychophysics and the engineering literature. Most importantly, there exist no evaluation or benchmarking studies using large databases with the image quality that arises in law enforcement applications.

Keywords: *Optical character recognition, *Handwriting, Data structures, Utility routines, Computer software, Feature extraction, UNIX(Operating system), *Handprint, US NIST, CD-ROM, C programming language.

The National Institute of Standards and Technology (NIST) has developed a standard reference form-based handprint recognition system for evaluating optical character recognition. NIST is making this recognition system freely available to the general public on CD-ROM. This is a source code distribution written primarily in C with two additional utilities having FORTRAN components. Library utilities are provided with the recognition system for conducting form registration, form removal, field isolation, field segmentation, character normalization, feature extraction, character classification, and dictionary-based postprocessing. A host of data structures and low-level utilities are also provided. The recognition system has been successfully compiled and tested on a host of UNIX workstations. This report documents the system in terms of its installation, organization, and functionality.

R. Rangachar, T. Hong, M. Herman, and J. Lupo. 1990, 12p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Real Time Image Processing II, Orlando, FL., April 16-18, 1990, v1295 p211-222.

Keywords: *Optical range finders, *Optical flow(Image analysis), *Real time, Edge detection, Spatial distribution, Temporal distribution, Algorithms, Gradients, Cameras, Motion, Reprints, *Differential range, PIPE(Pipelined Image Processing Engine).

A scheme to estimate differential range using optical flow along a known direction is described. The factors affecting the accuracy of results, and various spatial and temporal smoothing algorithms used to increase the accuracy of the method are described. The effect of using edge detectors and a prior knowledge of the environment is considered next. While the former reduces the noise, the latter improves the range discriminability of the method. The authors have implemented the method on a real time, high speed, Pipelined Image Processing Engine (PIPE), which processes sixty frames per second. For the PIPE implementation, a horizontally moving camera is used, which produces optical flow along a scan line.

See also PB92-213339 and PB93-184273. Sponsored by Federal Bureau of Investigation, Washington, DC.

Keywords: *Fast Fourier transformations, *Neural nets, Data bases, Image enhancement, Pattern recognition, Karhunen-Loeve expansion, Errors, Feature extraction, *Fingerprint classification.

Two types of Fourier Transform based filters are presented and used to enhance fingerprint images for use with a neural network fingerprint classification system developed at the National Institute of Standards and Technology (NIST). With image enhancement the system is capable of achieving classification error rates of 8.65% with 10% rejects, a 2 percentage point improvement in error rate versus using no fingerprint enhancement. Speed of the filters range from 2 to 9 seconds. Classification tests were performed using ridge-valley based feature extraction, Karhunen Loeve transform, and a Probabilistic Neural Network (PNN) classifier. The testing method used differs from past reports because no rolling of the same print is allowed to appear in both the training and testing set used by the Neural Network classifier.

Keywords: *Computer vision, *Optical tracking, Systems analysis, Predictions, Bandwidth, Image processing, Algorithms, Kinematics, *Visual pursuit systems, TRICLOPS system.

Visual pursuit systems are reviewed using a generalized form with the principal delay in the visual feedback pathway. The performance of several different control methods are compared through analysis of the tracking error. A high-performance active vision system, called TRICLOPS, is used to obtain experimental data on the tracking performance of the various methods, some of which had previously only been tested through simulation. Image processing delay is shown to be the primary limiting factor in performing high-speed tracking. Prediction is necessary to achieve high performance tracking, and the effectiveness of prediction depends on several factors, including the coordinate system used for motion modeling and the noise content of the target motion signal. It is demonstrated that, using relatively simple tracking algorithms which incorporate prediction with an advanced robotic device like TRICLOPS, it is now possible to outperform humans in the domain of visual pursuit of simple targets.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Mathematical Methods in Medical Imaging, San Diego, CA., July 15-16, 1993, v2035 p255-266.

Keywords: *Image restoration, *Image reconstruction, Noise reduction, Diffusion theory, Reprints, Tikhonov-Miller restoration, SEB restoration, Ill posed problems, Image deblurring.

A new supplementary a priori constraint, the slow evolution from the boundary constraint, (SEB) sharply reduces noise contamination in a large class of space-invariant image deblurring problems that occur in medical, industrial, surveillance, environmental, and astronomical applications. The noise suppressing properties of SEB restoration can be proved mathematically, on the basis of rigorous error bounds for the reconstruction, as a function of the noise level in the blurred image data. This analysis proceeds by reformulating the image deblurring problem into an equivalent ill-posed problem for a time-reversed diffusion equation. The SEB constraint does not require smoothness of the image. An effective, fast, non-iterative procedure, based on FFT algorithms, may be used to compute SEB restorations. For a 512 X 512 image, the procedure requires about 45 seconds of cpu time on a Sun/sparc2. A documented deblurring experiment, on an image with significant high frequency content, illustrates the computational significance of the SEB constraint by comparing SEB and Tikhonov-Miller reconstructions using optimal values of the regularization parameters.

Keywords: *Optical flow(Image analysis), *Image processing, Spatial resolution, Temporal resolution, Pipelining(Computers), Edge detection, Gradients, Reprints, PIPE(Pipelined Image Processing Engine).

The paper examines spatio-temporal methods of image flow and shows how differential range can be estimated from time-space imagery. We consider one scan line of the image obtained from a camera moving in the horizontal direction. At the next instant of time, we shift the previous line up by one pixel, and obtain another line from the image. We continue the procedure to obtain a time-space image, where each horizontal line represents the spatial relationship of the pixels, and each vertical line the temporal relationship. Each feature along the horizontal scan line will generate an edge in the time-space image, the slope of which depends upon the distance of the feature from the camera. We apply two mutually perpendicular edge operators to the time-space image, and determine the slope of each edge. We show that this corresponds to optical flow. We use the result to obtain the differential range, and show how this can be implemented on the Pipelined Image Processing Engine (PIPE). We discuss several kinds of edge operators, show how using the zero crossings reduces the noise, and demonstrate how better discrimination can be achieved by knowing the range we are interested in.

Pub. in Proceedings of International Joint Conference on Neural Networks, San Diego, CA., June 17-21, 1990, p325-329.

Keywords: *Neural nets, *Character recognition, *Massively parallel processors, Array processors, Image processing, Self organizing systems, Algorithms, Accuracy, Reprints.

Two neural network based methods are combined to develop font independent character recognition on a distributed array processor. Feature localization and noise reduction are achieved using least squares optimized Gabor filtering. The filtered images are then presented to an ART-1 based learning algorithm which produces self-organizing sets of neural network weights used for character recognition. Implementation of these algorithms on a highly parallel computer with 1,024 processors allows high speed character recognition to be achieved in 8ms/image with greater than 99% accuracy on machine print and 80% accuracy on unconstrained hand printed characters.

General Motion Model and Spatio-Temporal Filters for Computing Optical Flow.
H. Liu, T. H. Hong, M. Herman, and R. Chellappa. Nov 94, 50p, NISTIR-5539.
Prepared in cooperation with Maryland Univ., College Park.

Keywords: Image motion compensation, Image filters, Image analysis, Mathematical models, Three dimensional, Hermite polynomials, Matrices, Algorithms, *Image motion analysis, *Optical flow.

Traditional optical flow algorithms assume local image translational motion and apply simple image filtering. Recent studies have taken two separate approaches toward improving the accuracy of computed flow: the application of spatio-temporal filtering schemes and the use of generalized motion models such as the affine model. Each has achieved some improvement over traditional algorithms in specialized situations. In this paper, we analyze the interdependency between them and propose a unifed approach. The general motion model we adopt characterizes arbitrary 3-D steady motion. Under perspective projection, we derive an image motion equation that describes the spatio-temporal relation of gray-scale intensity in an image sequence, thus making the utilization of 3-D filtering possible. However, to accommodate this complex motion, we need to extend the filter design to derive additional motion constraint equations. Using Hermite polynominals, we design differentiation filters, whose orthogonality and Gaussian derivative properties insure numerical stability. The resulting algorithm produces accurate optical flow and other useful motion parameters. It is evaluated quantitatively using the scheme established by Barron, et al. and qualitatively with real images.

Keywords: *Optical character recognition, *Neural nets, *Handwriting, Pattern recognition, Dynamical systems, Image processing, Karhunen-Loeve expansion, Errors, BDMs(Binary Decision Machines).

A multiple neural network system for handprinted character recognition is presented. It consists of a set of input networks which discriminate between all two class pairs, and an output network which takes the signals from the input networks and yields a digit recognition decision. For a ten digit classification problem this requires forty-five binary decision machines in the input network. The output stage is typically a single trained network. The neural network paradigms adopted in these input and output networks are the multi-layer perceptron, the radial basis function network, and the probabilistic neural network. A simple majority vote rule was also tested in place of the output network.

Motion-Model-Based Boundary Extraction.
H. Liu, T. H. Hong, M. Herman, and R. Chellappa. Jan 95, 29p, NISTIR-5587.
Presented at International Conference on Computer Vision, Cambridge, MA., June 20-23, 1995. Prepared in cooperation with Maryland Univ., College Park.

Keywords: *Computer vision, *Motion, *Edge detection, Algorithms, Flow, Iteration, Mathematical models, Pattern recognition, Three dimensional models, Segmentation.

Motion boundary extraction and optical flow computation are two subproblems of the motion recovery problem that cannot be solved independently of each other. They represent the most common dilemma in motion research. A popular approach uses an iterative scheme that consists of motion boundary extraction and optical flow computation components and refines each result through iteration. This approach is typically time-consuming and sometimes does not converge. We present a local, noniterative algorithm that extracts motion boundaries and computes optical flow simultaneously. This is achieved by modeling a 3-D image intensity block with a general motion model that presumes locally coherent motion. Local motion coherence, which is measured by the fitness of the motion model, is the criterion we use to determine whether motion should be estimated, or otherwise motion boundaries should be located. The motion boundary extraction algorithm is evaluated quantitatively and qualitatively against other existing algorithms in a scheme originally developed for edge detection. The results show that our algorithm is accurate in locating boundaries.

Method and Evaluation of Character Stroke Preservation on Handprint Recognition.
M. D. Garris. Jul 95, 32p, NISTIR-5687.

Keywords: *Optical character recognition, *Handwriting, Artificial intelligence, Image processing, Performance evaluation, Statistical analysis, Algorithms, Edge detection, Automation, Matrices(Mathematics), *Form removal.

A new technique for intelligent form removal has been developed along with a new method for evaluating its impact on optical character recognition (OCR). The form removal technique automatically detects the dominant lines in an image and erases them while preserving as much of the overlapping character strokes as possible. This method of form removal relaxes the recognition systems dependence on rigid form design, printing, and reproduction by automatically detecting and removing some of the physical structures (lines) on the form. The line detection and removal technique operates on loosely defined zones in which no image deskewing is performed. The technique was tested on a large number of randomly-ordered handprinted lowercase alphabet fields, as these letters (especially those with descenders) frequently touch and extend through the line along which they are written. It is shown that intelligent form removal can improve lowercase recognition by as much as 3%, but this net increase in performance is insufficient to understand the inpact on the recognition. There is expected to be trade-offs with the introduction of any new technique into a complex recognition system. A new statistical analysis was designed to evaluate the impact of intelligent line removal on OCR. The evaluation method compares the statistical distributions of individual confusion pairs between two systems and automatically determines the significant improvements and the significant losses in performance. In order for system developers to continue to reduce error rates, sophisticated analyses like this become necessary to understand the real impact a modification has on recognition performance. The statistical analysis presented in the paper was used to evaluate the new line removal technique, and the results are reported.

Keywords: *Optical character recognition, *Neural nets, Self organizing systems, Optimization, Conjugate gradient method, Iteration, Handwriting, Performance evaluation, Machine learning, Image processing, Pattern recognition, Reprints, *Fingerprint classification, PNN(Probabilistic Neural Network), MLPs(Multilayer Perceptrons).

The paper shows that performance equal to or better than the Probabilistic Neural Network (PNN) can be achieved with a single three-layer Multilayer Perceptron (MLP) by making fundamental changes in the network optimization strategy. These changes are: (1) Neuron activation functions are used which reduce the probability of singular Jacobians; (2) Successive regularization is used to constrain volume of the weight space being minimized; (3) Boltzmann pruning is used to constrain the dimension of the weight space; and (4) Prior class probabilities are used to normalize all error calculations so that statistically significant samples of rare but important classes can be included without distortion of the error surface. All four of these changes are made in the inner loop of a conjugate gradient optimization iteration and are intended to simplify

the training dynamics of the optimization. On handprinted digits and fingerprint classification problems these modifications improve error-reject performance by factors between 2 and 4 and reduce network size by 40% to 60%.

PCASYS: A Pattern-Level Classification Automation System for Fingerprints.
G. T. Candela, P. J. Grother, C. I. Watson, R. A. Wilkinson, and C. L. Wilson. Aug 95, 46p, NISTIR-5647.

Keywords: *Pattern recognition, *Automation, Image processing, Data base management, Image classification, Image enhancement, Feature extraction, Neural nets, Algorithms, Machine learning, Accuracy, *Fingerprint classification, PNN(Probabilistic Neutral Network), AFIS(Automated Fingerprint Identification System).

This report describes a system we have developed that automatically classifies images of fingerprints into six pattern-level classes. Our program takes gray-level images of fingerprints as input, and for each fingerprint it produces a hypothesized classification as arch, left loop, right loop, scar, tented arch, or whorl, as well as a number indicating how much confidence should be assigned to its classification decision. The system performs these processing steps: image segmentation; image enhancement; feature extraction; registration; application of a linear transform that both applies a pattern of regional weights and reduces dimensionality; running of a main classifier, which is a Probabilistic Neural Net, and of an auxiliary whorl-detecting classifier that traces and analyzes pseudoridges (approximate trajectories through the ridge flow); and finally, the combining of the outputs of the main and auxiliary classifiers so as to decide on a hypothesized class and a confidence level.

Neural network methods show great promise for providing highly accurate, noise resistant, parallel algorithms, and data organization of image recognition. One specific area of image recognition, the conversion of images of hand written and machine print characters to computer representation, has been studied in detail in the past. Both special purpose hardware and software approaches have been used on the character recognition problem with promising results. The present work addresses the problem of using a specific class of computer architecture, an array of 1024 processors arranged in a 32 x 32 grid and operated in a parallel mode, as a neural network character recognition device.

Keywords: *Optical character recognition, *Neural nets, Self organizing systems, Optimization, Conjugate gradient method, Heration, Handwriting, Performance evaluation, Machine learning, Image processing, Pattern recognition, Reprints, *Fingerprint classification, PNN(Probabilistic Neural Network), MLPs(Multilayer Perceptions).

In this paper, the authors will show that performance equal to or better than PNN can be achieved with a single three-layer MLP by making fundamental changes in the network optimization strategy. These changes are: (1) Neuron activation functions are used which reduce the probability of singular Jacobians; (2) Successive regularization is used to constrain volume of the weight space being minimized; (3) Boltzmann pruning is used (4) to constrain the dimension of the weight space; and (4) Prior class probabilities are used to normalize all error calculations so that statistically significant samples of rare but important classes can be included without distortion of the error surface. All four of these changes are made in the inner loop of a conjugate gradient optimization iteration (5) and are intended to simplify the training dynamics of the optimization.

Pub. in Pattern Recognition, v29 n3 p425-437 Jul 96.

Keywords: *Optical character recognition, *Neural nets, *Handwriting, Pattern recognition, Dynamical systems, Image processing, Karhunen-Loeve expansion, Errors, Reprints, BDMs(Binary Decision Machines).

A multiple neural network system for handprinted character recognition is presented. It consists of a set of input networks which discriminate between all-two-class pairs, for example '1' from '7' and an output network which takes the signals from the input networks and yields a digit recognition decision. For a ten-digit classification problem this requires 45 binary decision machines in the input network. The output stage is typically a single trained network. The neural network paradigms adopted in these input and output networks are the multi-layer perceptron, the radial-bias function network and the probabilistic neural network. A simple majority vote rule was also tested in place of the output network. The various resulting digit classifiers were trained on 7480 isolated images and tested on a disjoint set of size 32140. The Karhunen-Loeve transforms of the images of each pair of two classes formed the training set for each BDM. Several different combinations of neural network input and output structures gave similar classification performance. The minimum error rate achieved was 2.5% with no rejection obtained by comining a PNN input array with an RBF output stage. This combined network has an error rate of 0.7% with 10% rejection.

Generalized Form Registration Using Structure-Based Techniques.
M. D. Garris, and P. J. Grother. Apr 96, 16p, NISTIR-5726.
See also PB94-217106.

Keywords: *Forms(Paper), *Optical character recognition, *Handwriting, Data structures, Utility routines, Computer software, Databases, Image processing, Automation, Registration, Feature extraction, US NIST.

A new method for registering forms has been developed at the National Institute of Standards and Technology. This method automatically estimates the amount of rotation and translation in the image without any detailed knowledge of the form. This is accomplished through the automatic detection of dominant vertical and horizontal structures (lines) commonly found in forms. A general method for rotation estimation and a robust method for translation estimation are presented. Results demonstrate that this technique is extremely tolerant to spurious annotations on the form and scanner noise in the image, and the computational requirements of the utility can be tuned by optionally choosing to process and analyze downsampled versions of the image. All 3,669 Handwriting Sample Forms distributed with NIST Special Database 19 were successfully registered with the new technique, and using the same code, 255 uniformly laid out IRS tax forms and 500 Census miniforms were also tested and registered. Every type of form contained in the numerous NIST (public) form databases can be registered using this technique. These results also demonstrate how easy it is to set up the computer to register new types of forms, introducing a set-up interface that is much more automated and less tedious than what is currently required to specify new forms for the NIST public domain Form-Based Handprint Recognition System.

Component-Based Handprint Segmentation Using Adaptive Writing Style Model.
M. D. Garris. Jun 96, 29p, NISTIR-5843.

Keywords: *Optical character recognition, *Handwriting, *Data structures, Feature extraction, Image processing, Forms(Paper), Statistical analysis, Classifying, Databases, Expert systems, *Handprint, Character segmentation.

Building upon the utility of connected components, NIST has designed a new character segmentor based on statistically modeling the style of a person's handwriting. Simple spatial features (the thickness of the pen stroke and the height of the handwriting) capture the characteristics of a particular writer's style of handprint, enabling the new method to maintain a traditional character-level segmentation philosophy without the integration of recognition or the use of oversegmentation and linguistic postprocessing. Estimates for stroke width and character height are used to compute aspect ratio and standard stroke count features that adapt to the writer's style at the field level. The new method has been developed with a predetermined set of fuzzy rules making the segmentor much less fragile and much more adaptive, and the new method successfully reconstructs fragmented characters as well as splits touching characters. The new segmentor was integrated into the NIST public domain Form-Based Handprint Recognition System and then tested on a set of 490 Handwriting Sample Forms found in NIST Special Database 19. When compared to a simple component-based segmentor, the new adaptable method improved the overall recognition of handprinted digits by 3.4% and field level recognition by 6.9%, while effectively reducing deletion errors by 82%. The same program code and set of parameters successfully segments sequences of uppercase and lowercase characters without any context-based tuning. While not as dramatic as digits, the recognition of uppercase and lowercase characters improved by 1.7% and 1.3% respectively. The segmentor maintains a relatively straightforward and logical process flow avoiding convolutions of encoded exceptions as is common in expert systems. As a result, the new segmentor operates very efficiently, and throughout as high as 362 characters per second can be achieved. Letters and numbers are constructed from a predetermined configuration of a relatively small number of strokes. Results in the paper show that capitalizing on this knowledge through the use of simple adaptable features can significantly improve segmentation, whereas recognition-based and oversegmentation methods fail to take advantage of these intrinsic quality of handprinted characters.

To facilitate interoperability between existing ballistic imaging systems, the Office of National Drug Control Policy (ONDCP), the Federal Bureau of Investigation (FBI), and the Bureau of Alcohol, Tobacco, and Firearms (ATF) executed a Memorandum of Understanding that recognized, in part, that it is imperative that the Drugfire and IBIS Ballistic Imaging Systems are interoperable. Further, the National Institute of Standards and Technology (NIST) was asked to provide technical assistance in this effort. This document is the first of a series of planned documents that will specify the hardware and software requirements to permit interoperability between the Drugfire and IBIS systems as specified in the MOU. This specific document provides a complete specification of hardware requirements for capture of cartridge image and ancillary data for each system, and the data exchange formats required for transmitting and processing information requests.

Motion cues are a rich source of visual information. Object boundaries due to motion parallax, perception of collision, and transparency provide crucial information to any mobile vision system, biological or robotic. This report presents the formulation, design, evaluation and implementation of a motion algorithm which accurately and efficiently interprets the above motion cues.

Sponsored by Army Belvoir Research Development and Engineering Center, Fort Belvoir, VA.
Pub. in Jnl. of Electromagnetic Waves and Applications 8, n2 p237-248 1994.

Keywords: *Gradiometers, *Magnetic detection, *Electromagnetic measurement, Electrical impedance, Antennas, Boreholes, Magnetic dipoles, Magnetic fields, Tunnels, Electromagnetic wave transmission, Reprints, *Subsurface conductors.

The use of gradiometer antennas for detection of long conductors in tunnels is analyzed. For reception in vertical boreholes, the gradiometer consists of two vertical magnetic dipoles with a vertical separation. The source is a vertical magnetic dipole located in an adjacent vertical borehole. Both sum and difference responses are useful, but the difference response has the potential advantage of suppressing the primary field and making the scattered field easier to detect. The difference response is most effective in suppressing the primary field for a parallel scan where the transmitting antenna and receiving gradiometer are always at the same height.

Keywords: *Calibration, *Candela, Illuminance, Lumen, Luminous intensity, Lux, Measurement, Photometers, Scale, Standards, Units, Reprints.

The Systeme International des Unites (SI) base unit for photometry, the candela, has been realized by using absolute detectors rather than absolute sources. This change in method permits luminous intensity calibrations of standard lamps to be carried out with a relative expanded uncertainty (coverage factor k=2, and thus a 2 standard deviation estimate) of 0.46%, almost a factor-of-two improvement. A group of eight reference photometers has been constructed with silicon photodiodes, matched with filters to mimic the spectral luminous efficiency function for photopic vision. The wide dynamic range of the photometers aid in their calibration. The components of the photometers were carefully measured and selected to reduce the sources of error and to provide baseline data for aging studies. Periodic remeasurement of the photometers indicate that a yearly recalibration is required. The design, characterization, calibration, evaluation, and application of the photometers are discussed.

The authors describe how the National Institute of Standards and Technology obtains a scale of absolute spectral response from 406 nm to 920 nm. This scale of absolute spectral response is based solely on detector measurements traceable to the NIST High Accuracy Cryogenic Radiometer (HACR). Silicon photodiode light-trapping detectors are used to transfer optical power measurements from the HACR to a monochromator-based facility where routine measurements are performed. The transfer also involves modeling the quantum efficiency (QE) of the silicon photodiode light-trapping detectors. The authors describe their planned quality system for these measurements that follows ANSI/NCSL Z540-1-1994. A summary of current NIST capabilities based on these measurements is also given.

Keywords: *Color temperature, *Lamp orientation, *Quartz-halogen lamps, Spectral irradiance, Standard lamps, Ultraviolet, Reprints.

Spectral irradiance calibration often require that irradiance standard lamps be oriented differently than the normal calibration orientation used at the National Institute of Standards and Technology and at other standards laboratories. For example, in solar measurements the instruments are generally upward viewing, requiring horizontal working standards for minimization of irradiance calibration uncertainties. To develop a working standard for use in a solar ultraviolet intercomparison. NIST determined the irradiance of quartz-halogen lamps operating in the horizontal position, rather than in the customary vertical position. An experimental technique was developed which relied upon equivalent lamps with independent mounts for each orientation and a spectroradiometer with an integrating sphere whose entrance port could be rotated 90 degrees to view either lamp position.

Keywords: *Breakdown, *Quantized dissipation, Resistance states, Voltage states, Hall effect, Level scattering, Electron gas, Reprints.

Quantized longitudinal voltage drops are observed along a length of a GaAs/AlGaAs heterostructure quantum Hall effect device at applied currents large enough for the device to be in the breakdown regime. The range of currents is extensive enough to demonstrate that it is the longitudinal voltage that is quantized, rather than the longitudinal resistance. A black-box and a quasi-elastic inter-Landau level scattering (QUILLS) model are then employed to calculate the fraction of electrons making transitions into higher Landau levels, the transition rates, and the maximum electric field across the device.

RangeCAD and the NIST RCS Uncertainty Analysis.
R. L. Lewis, L. A. Muth, and R. C. Wittmann. Aug 94, 18p, NISTIR-5022.

Keywords: *Uncertainty, *Error analysis, *Radar cross sections, Calibration, Radar signals, Noise(Radar), Amplitude, Estimation, Mathematical models, Range CAD computer program.

We discuss the salient features of a computer program, RangeCAD, and then translate the program's output into a catalogue of radar cross section (RCS) uncertainties. This specific catalogue was developed by the National Institute of Standards and Technology (NIST) to standardize RCS uncertainty computations at the various RCS measurement sites. We check uncertainty estimates generated by RangeCAD against alternative formulations that approximate equivalent uncertainty specifications. Based on this comparison, we conclude that the uncertainty estimates generated by RangeCAD provide realistic values for the NIST RCS uncertainty analysis.

Polarimetric Calibration of Reciprocal-Antenna Radars.
R. L. Lewis, L. A. Muth, and R. C. Wittmann. Mar 95, 24p, NISTIR-5033.

Keywords: *Radar cross sections, Radar antennas, Radar targets, Error analysis, Depolarization, Calibration, *Radar polarimetry, Measurement uncertainty, Reciprocity.

We discussed how radar target depolarization enhances a radar's cross polarization contamination, and we dramatize the effect by presenting a graphical study of radar cross section (RCS) measurement error due to depolarization by an inclined dihedral reflector. Since error mitigation requires full polarimetric RCS measurements, we recommend upgrading singly polarized radars to full polarimetric capability. We present a novel polarimetric calibration technique that is applicable to reciprocal antenna radars, saves calibration time by requiring a single calibration target, uses simple mathematical expressions, and smoothes measured calibration data to reduce clutter.

The U.S. electronics and electrical-equipment industries are outstripping available measurement capability with adverse effects on their international competitiveness. Improved measurement support is an essential part of any successful strategy for improving their competitiveness. Among U.S. manufacturing industries, the electronics industry is the largest employer with 1.8 million employees and is virtually tied with the chemical industry for largest shipments of nearly $300 billion (1992). The electrical-equipment industry is also quite large, with shipments of nearly $50 billion (1990). U.S. competitiveness in many fields of electronic and elec-

trical products has been declining. Improved competitiveness will require outstanding performance from manufacturers in every step required to realize a competitive product in the marketplace: research and development, manufacturing, marketplace exchange, and after-sales support. All of these steps are highly measurement intensive. The Electronics and Electrical Engineering Laboratory (EEEL), within the National Institute of Standards and Technology, has identified the principal needs for improved measurement capability and other supporting technology in several important fields: semiconductors, magnetics, superconductors, low frequency, microwaves, lightwaves, power, video, electromagnetic compatibility, electronic data exchange, and national electrical standards. The document describes EEEL's strategic plan for a response to these needs. The plan was developed in consultation with U.S. industry and other NIST Laboratories.

Reproducibility of JEDEC Standard Current and Voltage Ramp Test Procedures for Thin-Dielectric Breakdown Characterization.
Final rept.
J. S. Suehle. 1993, 13p.
Pub. in Proceedings of the International Integrated Reliability Workshop, Lake Tahoe, CA., October 24-27, 1993, p22-34.

Keywords: *Dielectric breakdown, *Electrical measurement, Interlaboratory comparisons, Integrated circuits, Electric fields, Charge density, Reproducibility, Test methods, Reprints, JEDEC.

Six laboratories and a reference laboratory participated in an interlaboratory experiment that was conducted to determine the reproducibility of breakdown electric field, E(BR), and breakdown charge density, q(bd), measurements using the JEDEC standard voltage and current ramp dielectric test procedures. The results indicate that the measurement of E(BR) is much more reproducible than q(bd). Much of the variability in the q(bd) measurements was found to be due to an allowed range of values that could be chosen for a parameter in the current ramp procedure. When this source of variability is accounted for, the results indicate that the standard test procedures can be implemented to obtain critical dielectric integrity parameters with good reproducibility for a large variety of test equipment.

Coaxial Reference Standard for Microwave Power.
Technical note.
F. R. Clague, and P. G. Voris. Apr 93, 54p, NIST/TN-1357.
Also available from Supt. of Docs. as SN003-003-03213-1.

Keywords: *Power measurement, *Microwaves, *Standards, Coaxial cables, Calibration, Performance, Design, *Reference standards, *Bolometer mounts, *Thermistor mounts.

Design and construction details are given for the bolometer (thermistor) mounts used by NIST as working reference standards for microwave power calibrations in coaxial transmission line. The effective efficiency of these reference standards can be measured directly in the NIST coaxial microcalorimeters. The standards are then used to calibrate other microwave power sensors. Two versions are described: one with a Type N connector and one with an APC-7 connector. The operating frequency range is 0.05 to 18 GHz with either connector. Detailed drawings and performance measurements are included.

Realizing Suspended Structures on Chips Fabricated by CMOS Foundry Processes Through the MOSIS Service.
J. Marshall, M. Gaitan, M. Zaghloul, J. I. Pi, C. Pina, W. Hansford, D. Novotny, and V. Tyree. Jun 94, 60p, NISTIR-5402.
Prepared in cooperation with George Washington Univ., Washington, DC. School of Engineering and Applied Science. and University of Southern California, Marina del Rey. Information Sciences Inst.

Keywords: Chips(Electronics), Etching, Wafers, Tiles, Design, Silicon, CMOS, Hazards, *Micromachining, Microelectromechanics, MOSIS.

Chips can be inexpensively fabricated at Complementary Metal-Oxide Semiconductor (CMOS) foundries through the MOSIS (MOSIS is an acronym for 'MOS Implementation System') Service at the University of Southern California's Information Sciences Institute. MOSIS now supports CMOS-compatible micromachining to realize microelectromechanical systems (MEMS) and devices such as suspended corners, cantilevers, and pixels. The MEMS designs are fabricated through MOSIS on a multi-project wafer, and the user performs a post-processing maskless anisotropic etch. Two new design tiles called 'open' and 'pstop' have been added to support these designs.

Keywords: *Microelectronics, *Metrology, *Bibliographies, Electrical measurement, Integrated circuits, Millimeter waves, Microwaves, Optical fibers, Integrated optics, Semiconductor devices, Electric power, High temperature superconductors, Electromagnetic interference, Magnetic measurement, Abstracts.

This is the fortieth issue of a quarterly publication providing information on the technical work of the National Institute of Standards and Technology Electronics and Electrical Engineering Laboratory (EEEL). This issue of the EEEL Technical Publication Announcements covers the first quarter of calendar year 1994. This issue contains citations and abstracts for Laboratory publications published in the quarter. Main topic areas include: Fundamental Electrical Measurements; Semiconductor Microelectronics; Signal Acquisition, Processing, and Transmission; Electrical Systems; Electromagnetic Interference; Additional Information.

General

Sources of Uncertainty in a DVM-Based Measurement System for a Quantized Hall Resistance Standard.
K. C. Lee, M. E. Cage, and P. S. Rowe. 1994, 14p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n3 p227-240 May/Jun 94.

Keywords: *Resistors, *Standards, *Calibrating, Voltmeters, Electrical resistance meters, Hall effect, Drift(Instrumentation).

The paper describes a simple automated measurement system that uses a single, high accuracy, commercially available digital voltmeter (DVM) to compare the voltages developed across a 10 kilohm standard resistor and a quantized Hall resistor when the same current is passed through the two devices. From these measurements, the value of the 10 kilohm standard resistor is determined. The sources of uncertainty in this system are analyzed in detail and it is shown that it is possible to perform calibrations with relative combined standard uncertainties less than 0.1 ppm.

Three-Axis Coil Probe Dimensions and Uncertainties during Measurement of Magnetic Fields from Appliances.
M. Misakian, and C. Fenimore. 1994, 7p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n3 p247-253 May/Jun 94.

Keywords: *Electric appliances, *Magnetic fields, *Probability theory, Coils, Computation.

Comparisons are made between the average magnetic flux density for a three-axis circular coil probe and the flux density at the center of the probe. The results, which are determined assuming a dipole magnetic field, provide information on the uncertainty associated with measurements of magnetic fields from some electrical appliances and other electrical equipment. The present investigation extends an earlier treatment of the problem, which did not consider all orientations of the probe. A more comprehensive examination of the problem leaves unchanged the conclusions reached previously.

Performance Evaluation of a New Digital Partial Discharge Recording and Analysis System.
Final rept.
P. von Glahn, and R. J. VanBrunt. 1994, 5p.
Pub. in Proceedings of Conference Record of the 1994 Institute of Electrical and Electronics Engineers International Symposium on Electrical Insulation, Pittsburgh, PA., June 5-8, 1994, p12-16.

Keywords: *Digital recording systems, *Electrical insulation, Epoxy matrix composites, Performance evaluation, Personal computers, Stochastic processes, Real time, Digitizers, Reprints, *Partial discharges.

We describe the design and performance evaluation of a new digital partial discharge (PD) recording system capable of real-time recording of PD pulse trains for later off-line computerized stochastic analysis. By way of illustration, measurements were made of the time-varying stochastic behavior of ac-generated PDs in point-to-dielectric gaps in air where the insulation material was cast epoxy with aluminum oxide filler, extending the work reported previously. Sample analysis results are presented, demonstrating that the new system provides analysis results comparable with the results achieved by the existing NIST analog PD stochastic analysis system. Sample stochastic analysis results are presented demonstrating the additional insights possible with the new system.

Electrical Breakdown in Transformer Oil in Large Gaps.
Final rept.
K. L. Stricklett, D. M. Weidenheimer, N. R. Pereira, and D. C. Judy. 1992, 7p.
Sponsored by Defense Nuclear Agency, Washington, DC. and Department of Energy, Washington, DC.
Pub. in Proceedings of Annual Report Conference on Electrical Insulation and Dielectric Phenomena, Victoria, British Columbia, Canada, October 18-21, 1992, p248-254.

Keywords: *Electric discharges, *Dielectric breakdown, *Pulse transformers, *Spark gaps, Shadowgraph photography, Electric fields, High speed photography, Pulses, Switches, Reprints.

The Aurora accelerator uses four parallel Blumlein pulse-forming lines to provide an intense flash x-ray pulse. Proper timing of the pulses generated by each Blumlein is important to the quality of the radiation. The pulse on each Blumlein, and the synchronization between the Blumleins are affected by the closure of high-voltage triggered oil switches in each line. The triggered oil switch utilizes a uniform field geometry with a gap spacing between 40 and 50 cm, a unique environment for observation of arc development in transformer oil. High-speed photography of switch closure shows timing to be influenced by the initiation and spatial development of prebreakdown streamers.

Effective Medium Theory for Ferrite-Loaded Materials.
Technical note.
R. G. Geyer, J. Mantese, and J. Baker-Jarvis. Oct 94, 26p, NIST/TN-1371.
Also available from Supt. of Docs. as SN003-003-03304-9. See also PB92-205376. Prepared in cooperation with General Motors Research Labs., Warren, MI.

Keywords: *Electromagnetic theory, Binary systems(Materials), Composite materials, Barium titanates, Very high frequency, Ultrahigh frequency, Dielectric properties, Magnetic properties, Permeability, Permittivity, Inclusions, Integral equations, Spheres, Maxwell-Garnett formulae, Magnesium copper zinc ferrites, Two phase systems.

A ferrite-loaded composite medium is modeled by spherical inclusions spaced equally on a cubic lattice

within a host matrix. Both the inclusions and host matrix may be magnetically permeable and possess dielectric and magnetic loss. The ferrite-loaded medium may be considered to consist of excited Hertzian electric and magnetic dipole sources. Effective medium rules of a modified Maxwell-Garnett form can be derived by analysis of plane-wave propagation through the composite. These rules do not yield symmetric characterization of two-phase media. They are compared with other effective medium theories (Lorentz-Lorenz, Maxwell-Garnett, and Bruggeman) and broadband coaxial transmission line data measured on ferrite-loaded titanates of known composition. The modified Maxwell-Garnett rules give both lower and upper bounds for the effective permittivities and permeabilities of the composite and yield accurate estimates of bulk electric and magnetic properties for low volumetric inclusion loading. The Bruggeman formalism yields the best predicitive permittivity and permeability values when volumetric percentages of the inclusions and host matrix are approximately equal. Generally, maximal magnetic loss factors occur at a frequency where the static initial permeability decreases by a factor of one-half, and the relaxation fequency for ferrite composites increases with decreasing static initial permeability.

A. D. Koffman, and H. L. Stott. 1993, 12p.
Pub. in Proceedings of National Computer Systems Laboratory Workshop and Symposium, Albuquerque, NM., July 25-29, 1993, p299-310.

Keywords: Case studies, Calibration, Selection, Frequency, Voltage, Reprints, *Thermal transfer standards, *Multirange instruments, Test points.

Full calibration support for multirange instruments can be costly and time consuming. This paper presents a case study in which a new empirical-model-based approach was used to substantially reduce the number of tests required to fully characterize an instrument. The Fluke 792A Thermal Transfer Standard was the subject instrument for the study. Test results showed that measurements made at 50 test points were sufficient to allow accurate predictions of the instrument's performance at all 255 test points specified by the manufacturer. An accurate model relating ac/dc difference to voltage and frequency for the instrument was formulated using complete test data for many devices collected by the manufacturer over several production runs. An empirical test point selection procedure was used to select an optimal set of test points and subsequently to predict the ac/dc differences of other 792As based on the limited set of measurements taken at the selected test points.

Characterization of Unknown Linear Systems Based on Measured CW Amplitude.
Final rept.
M. T. Ma, and J. W. Adams. 1993, 5p.
Pub. in Proceedings of International Symposium on Electromagnetic Compatibility, Dallas, TX., August 9-13, 1993, p78-82.

Keywords: *Linear systems, Electromagnetic compatibility, Continuous radiation, Laplace transformation, Transfer functions, Approximation, Characteristics, Reprints, Impulse response.

An approximate squared-magnitude function is derived from a given measured cw amplitude response to characterize an unknown linear system. Various possible system transfer functions (both amplitude and phase) and the corresponding impulse responses are then deduced. These transfer functions may or may not be minimum phase. The first impulse maximum and accumulated energy content are the greatest when the transfer function is at minimum phase.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Antennas and Propagation 41, n3 p387-389 Mar 93.

Keywords: *Electromagnetic scattering, Electric fields, Magnetic fields, Integral equations, Computation, Reprints.

This letter discusses a recently-published paper which presents an approach to the problem of internal resonances of the electric field integral equation. This method, which requires the determination of the smallest singular value of the associated integral operator, may fail due to the accumulation of singular values at the origin. In contrast, another method, already in the literature, applies the magnetic field integral equation, which does not suffer from this problem.

Importance of Unraveling Memory Propagation Effects in Interpreting Data on Partial Discharge Statistics.
Final rept.
R. J. Van Brunt, E. W. Cernyar, and P. von Glahn. 1993, 12p.
Sponsored by Department of Energy, Washington, DC. Office of Energy Storage and Distribution.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electrical Insulation 28, n6 p905-916 Dec 93.

Keywords: *Electric discharges, *Electrical insulation, Monte Carlo method, Static electricity, Pulse amplitude, Stochastic processes, Pattern recognition, Dielectrics, Simulation, Reprints, *Partial discharges.

The significance of memory propagation in controlling the stochastic behavior of partial-discharge phenomena is demonstrated by determination of various conditional amplitude and phase-of-occurrence distributions for both measured and simulated discharge pulses. A system that can be used to measure directly a set of both conditional and unconditional pulse amplitude and phase distributions needed to reveal memory effects and quantify the phase-resolved stochastic properties of partial-discharge pulses, is briefly described. It is argued that not only is an unraveling of memory effects essential in any attempt to understand the physical basis for the observed stochastic behavior of partial-discharge phenomena, but also that the data on conditional distributions provide additional statistical information that may be needed to optimize the reliability of partial-discharge pattern recognition schemes now being considered for use in insulation testing.

Nonstationary Behavior of Partial Discharge during Insulation Aging.
Final rept.
R. J. Van Brunt, P. von Glahn, and T. Las. 1993, 2p.
See also PB95-163598. Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.
Pub. in Proceedings of the International Conference on Partial Discharges, Canterbury, United Kingdom, September 28-30, 1993, p29-30.

Keywords: *Electrical insulation, *Aging(Materials), *Electric discharges, Surface resistivity, Alternating current, Aluminum oxides, Epoxy resins, Stochastic processes, Dielectrics, Fillers, Reprints, *Partial discharges.

The statistical properties of pulsating partial discharges (PD) generated by applying an alternating voltage to a point-dielectric gap were measured with a stochastic analyzer under conditions where the PD induced changes in the dielectric surface conductivity. The

epoxy materials with and without Al203 filler were considered in this investigation. In the case of epoxy with filler, dramatic changes in the statistical behavior of the PD were observed to be correlated with changes in surface conductivity. These results illustrate the difficulties to be encountered in defining meaningful PD pulse patterns that can be used for reliable defect site identification. An analysis of the positive and negative integrated-charge distribution also reveal problems of relating PD pulse-height data to average current measured by standard techniques.

See also PB95-163580. Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.
Pub. in 1993 Annual Report, Conference on Electrical Insulation and Electric Phenomena, Pocono Manor, PA., October 17-20, 1993, p455-461.

Keywords: *Electric discharges, *Electrical insulation, *Epoxy resins, *Aging(Materials), Time dependence, Alternating current, Stochastic processes, Monte Carlo method, Electrical measurement, Aluminum oxides, Dielectrics, Simulation, Surface resistivity, Fillers, Reprints, *Partial discharges.

Measurements were made of the time dependences of positive and negative integrated-charge distributions for ac-generated pulsating partial discharge (PD) in point-to-dielectric gaps where the dielectric material was cast epoxy either with or without an aluminum oxide filler. Other statistical characteristics of the PD were measured such as pulse-phase distributions. The dielectric surface resistivity was measured before and after exposure to PD. For epoxy with filler, the PD statistical characteristics changed significantly during times when there was a corresponding decrease in local surface resistivity. For example, the positive PD pulses were observed to cease after a time that is inversely proportional to the frequency of the applied voltage. Partial discharge from epoxy without filler exhibited a much more stationary behavior. The connection between changes in surface resistivity and changes in stochastic behavior are explained using a Monte Carlo simulation.

Revised Uncertainty Analysis for the NIST 30-MHz Attenuation Calibration System.
Final rept.
J. A. Jargon. 1994, 6p.
Pub. in Proceedings of Measurement Science Conference Symposium and Workshop, Pasadena, CA., January 27-28, 1994, 6p.

Keywords: Very high frequency, Electrical measurement, Phase shift, Modification, Revisions, Attenuators, Uncertainty, Reprints, *Attenuation Calibration System, US NIST.

Although the 30-MHz Attenuation Calibration System has been in operation for many years at the National Institute of Standards and Technology, several modifications have been made to the system since the last published uncertainty analysis. The linear displacement of the standard attenuator's receiving coil is now measured with a laser interferometer instead of a steel ruled scale and optical projector, and a new comparison receiver has been installed in the system. The expanded uncertainty is on the order of + or - 0.003 dB per 10 dB step. Type A uncertainties depend upon the repeatability and resettability of the system and the device under test. Type B uncertainties are due to the standard waveguide below-cutoff (WBCO) attenuator, the resolution of the comparison receiver, the change in level of the precision phase shift standard, the level set attenuator, rf leakage, and mismatch uncertainty.

Electronic Mode Stirring for Reverberation Chambers.
Final rept.
D. A. Hill. 1994, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 36, n4 p294-199 Nov 94.

Keywords: *Reverberation chambers, Electromagnetic theory, Rectangular configuration, Two dimensional, Superhigh frequency, Modal response, Numerical solution, Bandwidth, Reprints.

A modal analysis and a uniform-field approximation are presented for the fields in an idealized two-dimensional, rectangular cavity excited by an electric line source. The model is used to evaluate the effectiveness of frequency stirring, an alternative to mechanical stirring in reverberation chamber immunity measurements. Numerical results indicate that good field uniformity (standard deviation less than 1 dB) can be obtained with a bandwidth of 10 MHz at a center frequency of 4 GHz. The bandwidth requirement is determined primarily by the number of modes excited, and higher frequencies can achieve the same field uniformity with a smaller bandwidth because of the higher mode density. Cavity excitation by two single-frequency sources is also analyzed.

NIST Strategies for Reducing Testing Requirements.
Final rept.
A. D. Koffman, T. M. Souders, and G. N. Stenbakken. 1994, 7p.
Pub. in Proceedings of Conference Test and Calibration Symposium, Arlington, VA., November 30-December 2, 1994, p267-273.

Keywords: *Electronic equipment, *Test methods, Mathematical models, Standard deviation, Analog systems, Calibration, Optimation, Reduction, Strategy, Reprints, Singular value decomposition, US NIST.

For the past several years, research has been carried out in the Electricity Division at the National Institute of Standards and Technology (NIST) to reduce the testing requirements for analog and mixed-signal devices. The most significant testing technique to result has been a model-based approach to the testing and calibration of such devices. The model is developed from empirical data, physical information, a priori information, or a combination of the three. Algebraic operations are performed on these data to create a model. The model approximately spans the vector space within which the device behavior can be described. With this model, the device can be characterized using significantly fewer measurements than is possible with traditional methods. A brief description of the techniques will be presented, along with a summary of the results achieved in testing analog and mixed-signal devices.

Physics and Chemistry of Partial Discharge and Corona: Recent Advances and Future Challenges.
Final rept.
R. J. Van Brunt. 1994, 24p.
Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Dielectrics and Electrical Insulation 1, n5 p761-784 Oct 94.

Keywords: *Electric discharges, Electrical insulation, Dielectric breakdown, Electric corona, Aging(Materials), Stochastic processes, Reprints, *Partial discharges.

Results of recent research on physical and chemical processes in partial discharge (PD) phenomena are reviewed. The terminology used to specify different types or modes of PD are discussed in light of a general theory of electrical discharges. The limitations and assumptions inherent to present theoretical models are examined. The influence of memory propagation effects in controlling the stochastic behavior of PD is shown. Examples of experimental results are presented that demonstrate the nonstationary characteristics of PD which can be related to permanent or quasi-permanent discharge-induced modifications (aging) of the site where the PD occur. Recommendations for future research are proposed.

Electromagnetic Shielding Characterization of Gaskets.
D. A. Hill. Feb 95, 29p, NISTIR-5032.

Keywords: *Electromagnetic shielding, *Gaskets, Two dimensional models, Mathematical models, Reverberation chambers, Transfer impedance, Time domain, Slots, Shielding effectiveness, Coaxial fixtures.

Numerous measurement methods are used for determining the shielding performance of rf gaskets, but different methods give significantly different results for

the same gasket. Various measurement methods and the reasons for the discrepancies are reviewed. Simple models and theories are used to explain the meaning of transfer impedance and shielding effectiveness for gaskets and to determine the frequency range of validity. Transfer impedance should be a valid characterization at low frequencies, and shielding effectiveness is more appropriate at high frequencies. The precise frequency limitations of these characterizations and current measurement methods are not well known, but a time-domain method is proposed for determining gasket properties over a broad frequency range.

Method to Determine the Calorimetric Equivalence Correction for a Coaxial Microwave Microcalorimeter.
Final rept.
F. R. Clague. 1994, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 43, n3 p421-425 Jun 94.

Keywords: *Power measurement, *Calorimeters, *Standards, Coaxial cables, Microcalorimetry, Reprints, *Microwave power standards, *Microcalorimeters, Reference standards, Thermistor mounts.

A way is presented to obtain the microcalorimeter correction factor by direct measurement rather than by an indirect estimate or modeling. The microcalorimeter is used to measure the effective efficiency of a reference standard thermistor mount. The correction factor accounts for the different thermal paths and losses in the microcalorimeter reference standard combination. The uncertainty in the measurement depends primarily on an accurate determination of the correction factor. This has been an especially difficult problem in the coaxial case because of the center conductor. The method requires the fabrication of components that duplicate the thermal and RF loss in the microcalorimeter and reference standard. Using the technique with the new National Institute of Standards and Technology (NIST) type N coaxial microcalorimeter has substantially reduced the systematic uncertainty. The total uncertainty is about one-half the uncertainty of the prior NIST standard at frequencies above 1 GHz.

Developing a NIST Coaxial Microwave Power Standard at 1 mW.
Final rept.
F. R. Clague, and J. D. Splett. 1994, 8p.
Pub. in Proceedings of National Conference of Standards Laboratories 1994 Workshop and Symposium, Chicago, IL., July 31-August 4, 1994, p291-298.

Keywords: *Power measurement, *Standards, Coaxial configurations, Calibration, Thermistors, Uncertainty, Error analysis, Reprints, *Microwave power standards, Reference standards, Thermistor mounts, US NIST.

Some customers of the NIST microwave power calibration service report that they are using their calibrated reference standard at a power of about 1 mW, rather than 10 mW where the NIST measurement is made. Since the coaxial reference standards accepted by NIST for calibration are dual-element thermistor mounts, they are subject to a dual-element substitution error if not used at the calibration power level. The error differs for each mount. The error is not easily measured, nor is it possible to readily estimate an additional uncertainty for using the mount at a different power. Initial measurements indicate the error can be up to 50 percent of the quoted calibration uncertainty. If the calibration uncertainty does not increase too much, a reasonable solution is to extend the NIST calibration service to powers under 10 mW. This paper briefly describes the present standard and the approach being taken to add the 1 mW capability. Preliminary uncertainty estimates are included.

Compensation for Substrate Permittivity in Probe-Tip Calibration.
Final rept.
D. F. Williams, and R. B. Marks. 1994, 11p.
Pub. in Proceedings of Automatic Radio Frequency Techniques Group Conference Digest (44th), Boulder, CO., December 1-2, 1994, p20-30.

Keywords: Capacitance, Compensation, Permittivity, Substrates, Reprints, *Probe tip calibration, Multiline TRL method, On wafer measurement, Coplanar waveguides, Scattering parameters.

We demonstrate a method of compensation for the effect of substrate permittivity on coplanar waveguide probe-tip scattering parameter calibrations, modeling the effect as a capacitance at the probe tip. Comparison to on-wafer multiline TRL (through-reflect-line) calibration verifies its accuracy. The method allows calibration to the probe tip using generic off-wafer standards with accuracy comparable to that of on-wafer calibration.

Pub. in Concise Encyclopedia of Magnetic and Superconducting Materials, p621-624 1992.

Keywords: *Electrical measurement, *Standards, Measuring instruments, Volt-ampere characteristics, Electric current, Ohms Law, Electric equipment, Reprints.

The International Systems of Units, abbreviated SI, has been developed to meet the need for a uniform and consistent set of units. One of the most important and widely used of these units is the volt. The SI definition of the volt is that electromotive force between two points on a conductor carrying a constant current of 1 A when the power dissipated between the two points is 1 W. The realization of the SI volt, therefore depends on experiment that relate the primary electrical units to mechanical units of length, force and power. Precise modern instrumentation requires voltage measurements with a reproducibility exceeding the accuracy with which the SI volt can be realized. To meet this need, realizations of the volt that are stable and reproducible at a level near 0.01 ppm have been developed even though their value relative to the SI volt is uncertain within about 0.4 ppm.

Pub. in Institute of Electrical and Electronics Engineers Proceedings: Science, Measurement and Technology, v142 n1 p37-45 Jan 95.

Keywords: *Dielectric materials, *Electric discharges, *Aging(Materials), Monte Carlo method, Simulation, Pattern recognition, Stochastic processes, Surface properties, Electric conductivity, Reprints, Nonstationary behavior, Partial discharges, Point-dielectric gaps.

Changes in the stochastic behavior of pulsating partial discharge with time have been observed when an alternative voltage is applied to point-dielectric gaps in which the dielectric is a cast epoxy resin either with, or without, Al2O3 filler. The changes in discharge behavior are shown, with the help of a Monte-Carlo simulation, to be consistent with discharge induced increases in the surface conductivity of the epoxy. This 'ageing' effect is shown to be accelerated as the frequency of applied voltage is increased from 50 to 800 Hz. The implications of the results on accelerated aging tests and definition of partial discharge 'signatures' for possible pattern recognition are discussed.

P. von Glahn, and R. J. Van Brunt. 1995, 12p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Dielectrics and Electrical Insulation, v2 n4 p590-601 Aug 95.

Keywords: *Digital recording systems, *Stochastic analysis, Reprints, Design, Personal computers, Digitizers, Real time, *Partial discharges.

We describe the design and use of a digital partial discharge (PD) data recording system capable of continuous real-time recording of PD pulse trains. The recording system consists of a custom two-channel PD digitizer coupled to a personal computer via a 16-bit parallel interface. The digitizer is under software control with the resulting data being stored in binary files on the computer's hard disk. The stored data subsequently are subjected to stochastic analysis using appropriate computer software. Because all data are retained and the computer provides the desired stochastic analysis of data files, the new system is well suited to investigate non-stationary PD behavior such as encountered in aging studies. The results confirm and extend previous measurements made with an analog stochastic analyzer. With these sample results, we demonstrate how the system allows detailed stochastic analyzes not possible with data obtained from existing conventional PD measurement systems.

Pub. in Proceedings of the International Conference on Space Charge in Solid Dielectrics (2nd), Antibes - Juan-las-Pins, France, April 2-7, 1995, p439-446.

Keywords: *Surface properties, *Charge distribution, *Dielectrics, *Stochastic processes, Pulse duration, Electrical pulses, Aluminum oxides, Impurities, Statistical analysis, Electric discharges, Reprints, PD(Partial discharge), Surface charge.

Experimental techniques have been developed in recent years that enable a complete stochastic characterization of pulsating partial-discharge (PD) phenomena in terms of a set of conditional and unconditional discharge pulse phase (or time), amplitude, and integrated-charge distributions and related correlation coefficients. Investigations using these techniques have shown the importance of pulse-to-pulse memory propagation on the statistical behavior of PD. It has been shown that the observed stochastic behavior of PD can be simulated using a theoretical model that invokes surface Charging and considers the effect of surface charge on the probability of discharge pulse initiation.

Methods for Aligning the NIST Watt-Balance.
Final rept.
G. N. Stenbakken, R. Steiner, P. T. Olsen, and E. R. Williams. 1995, 5p.
Pub. in Proceedings of Instrumentation and Measurement Technology Conference, Waltham, MA., April 24-26, 1995, p247-251.

Keywords: *Magnetic forces, Electrical measurement, Simulation, Reprints, *Watt measurement, Induced voltage, Mass stability.

The NIST watt-balance has been developed to explore the possibility of monitoring the stability of the mass standard by means of electrical quantum standards. The mass standard is the last basic standard that is kept as an artifact. The watt-balance uses a movable coil in a radial magnetic field to compare the mechanical energy required to lift a kilogram mass in earth's gravity with the electrical energy required to move the coil the same distance in a magnetic field. The electrical energy is monitored in terms of quantized Hall resistance and Josephson's junction voltage standards. The accuracy of this experiment depends on a large number of factors. Among them are the ability to align the apparatus so that the movable coil and magnet are coaxial and aligned to the local vertical. Misalignment of the coil and magnet results in forces and torques on the coil. The coil is suspended like a pendulum, so responds easily to these torques and horizontal forces. This paper describes a computer program that was written to calculate the shape of the magnetic field and the torques and forces on the movable coil that result from any misalignments. This information is being used to develop an alignment procedures that minimizes misalignments and the errors they cause. This program has enhanced our understanding of the cause of torques about the vertical axis on the coil and the dependence of this torques on the magnetic field gradient.

Influence of Electrode Material on Measured Ion Kinetic-Energy Distributions in Radio-Frequency Discharges.
Final rept.
R. J. Van Brunt, J. K. Olthoff, and S. B. Radovanov. 1995, 2p.
Pub. in Proceedings of the International Conference on Phenomena in Ionized Gases (22nd), Hoboken, NJ., July 31-August 4, 1995.

Keywords: *Gas discharges, *Radio frequency discharges, Mass spectrometry, Plasma, Surface charging, Reprints, Ion kinetic energy, Ion sampling.

Evidence is presented for a significant influence of electrode surface material and condition on the measurement of the kinetic energies of ions samples from discharges through an orifice in the electrode. Significant differences in ion energy shifts and/or discrimination of low-energy ions are found using aluminum and stainless-steel electrodes in a radio-frequency (rf) discharge cell. It is argued that the observed differences in energy shifts may be attributable in part to differences in charging of oxide layers on the electrode surface around the sampling orifice.

Physics and Chemistry of Partial Discharge and Corona - Recent Advances and Future Challenges.
Final rept.
R. J. Van Brunt. 1995, 42p.
Pub. in 1994 Annual Report - Conference on Electrical Insulation and Dielectric Phenomena, Arlington, TX., October 23-26, 1994, p29-70 1995.

Keywords: *Electric discharges, Electrical insulation, Dielectric breakdown, Electric corona, Aging(Materials), Stochastic processes, Reprints, *Partial discharges.

Results of recent research on physical and chemical processes on partial-discharge (PD) phenomena are reviewed. The terminology used to specify different types of modes of PD are discussed in the light of the general theory of discharges. The limitations and assumptions inherent to present theoretical models of PD are examined. The influence of memory propagation effects in controlling the stochastic behavior of PD is shown. Examples of experimental results are presented which demonstrate the nonstationary characteristics of PD which can be related to PD-induced aging of insulating materials. Recommendations for future research are proposed.

Behavior of Surface Partial Discharge on Aluminum Oxide Dielectrics.
Final rept.
P. von Glahn, and R. J. Van Brunt. 1995, 7p.
Pub. in 1995 Annual Report: Conference on Electrical Insulation and Dielectric Phenomena, Virginia Beach, VA., October 22-25, 1995, p365-371.

Keywords: *Dielectrics, *Partial discharge, Aluminum oxide, Data recording, Behavior, Phase distributions, Purity effect, Statistical parameters, Reprints.

Partial discharge (PD) was generated with alternating voltage applied to a point electrode touching the surfaces of aluminum oxide (Al2O3) dielectrics of different purity in air. The amplitudes and phases of all pulsating PD events that occured during voltage application periods up to 35 minutes were recorded and the results were analyzed to reveal details of the characteristics of PD exhibit rapid changes with time that depend significantly on voltage and the purity of the Al2O3 sample. Example are shown of statistical data for individual positive and negative pulses in a voltage cycle that are much more refined than data that can be obtained from conventional Pd measurment systems. The results presented here illustrate the advantages of using continuous data records in the investigation and characterization of pulsating PD phenomena.

Metrology for Electromagnetic Technology: A Bibliography of NIST Publications, September 1995.
A. G. Bradford. Sep 95, 81p, NISTIR-5040.
See also PB95-135588 and PB96-128210.

Keywords: *Metrology, *Bibliographies, Superconductor devices, Magnetic measurements, Cryogenics, Josephson junctions, High temperature superconductors, US NIST, Cryoelectronics, Electromagnetic metrology.

This bibliography lists the publications of the personnel of the Electromagnetic Technology Division of NIST during the period from January 1970 through the publication of this report. A few earlier references that are directly related to the present work of the Division are also included. This edition of the bibliography is the first since the Electromagnetic Technology Division split into two Divisions, and it includes publications in cryoelectronic metrology and superconductor and magnetic measurements. The optical electronic metrology section found in earlier editions is now being produced seperately by the new Optoelectronics Division of NIST. That companion bibliography to this publication is NISTIR 5041.

Metrology Issues in Terahertz Physics and Technology.
R. U. Datla, E. Grossman, and M. K. Hobish. 13 Dec 94, 164p, NISTIR-5701.
Proceedings of a workshop held in Gaithersburg, MD. on December 13, 1994.

Keywords: *Metrology, *Physics, *Meetings, Technology utilization, Infrared radiation, Research and development, Radiation measuring instruments, Accuracy, Calibrating, Standards, Infrared equipment, *Terahertz physics, THz technology.

Tremendous progress has been made in recent years in the development of new sources, detectors, antennas, and materials for the terahertz (THz) spectral region, i.e., from 100 GHz (3 mm wavelength) to 10 THz (30 micro m wavelength). However, very little attention

has been paid to questions of accurate measurement techniques, calibration, and standards at THz frequencies. In order to discuss metrology issues and the role NIST might play in the rapidly advancing field of THz technology, the staff in various divisions of NIST's Physics Laboratory, in collaboration with the staff in the Electronics and Electrical Engineering Laboratory (EEEL), convened a Workshop on Metrology Issues in THz Physics and Technology. The workshop was held at NIST on December 13, 1994, and was attended by 50 representatives from industry, academia, and federal agencies.

Analysis of an Open-Ended Coaxial Probe with Lift-Off for Nondestructive Testing.
Final rept.
J. Baker-Jarvis, M. D. Janezic, P. D. Domich, and R. G. Geyer. 1994, 8p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement, v43 n5 p711-718 Oct 94.

Keywords: *Calibration, *Dielectric constants, Reprints, Loss factor, Microwaves, Nondestructive, Permeability, Measurement, *Coaxial probes, Open ended probe.

The open-ended coaxial probe with lift-off is studied using a full-wave analysis, and an uncertainty analysis is presented. The field equations for the following terminations are worked out: (1) the sample extends to infinity in the positive axial direction, (2) the sample is backed by a well-characterized material, and (3) the sample is backed by a short-circuit termination. The equations are valid for both dielectric and magnetic materials. The model allows the study of the open-ended coaxial probe as a nondestructive testing tool. The analysis allows a study of the effects of air gaps on the probe measurements. The reflection coefficient and phase are studied as a function of lift-off, coaxial line size, permittivity, permeability, and frequency. Numerical results indicate the probe is very sensitive to lift-off. For medium to high permittivity values and electrically small probes, gaps on the order of fractions of a millimeter strongly influence the reflection coefficient.

Applicability of Effective Medium Theory to Ferroelectric/Ferrimagnetic Composites with Composition and Frequency-Dependent Complex Permittivities and Permeabilities.
Final rept.
R. G. Geyer, J. V. Mantese, A. L. Micheli, J. Grosvenor, D. F. Dungan, and J. Baker-Jarvis. 1996, 6p.
Pub. in Jnl. of Applied Physics, v79 n3 p1655-1660 Feb 96.

Keywords: *Composites, *Ferrites, Microwaves, Permeability, Permittivity, Reprints, Effective medium, Mixing rules.

High-frequency (1 MHz-1 GHz) transmission line measurements were used to determine the composition and frequency-dependent complex permitivities and complex permeabilities of ferroelectric/ferrimagnetic (barium titanate and a magnesium-copper-zinc ferrite) composites. The effective medium rules of Maxwell-Garnett give both lower and upper bounds for the effective permittivities and permeabilities and yield accurate estimates of the bulk electric and magnetic properties at low volume fill fraction of either component provided the proper host matrix is chosen. Bruggeman theory yielded the best predictive values for the permittivity and permeability over the entire composition range. In all cases these complex quantities were shown to be constrained by Bergman-Milton bounds.

Influence of Films' Thickness and Air Gaps in Surface Impedance Measurements of High Temperature Superconductors Using the Dielectric Resonator Technique.
Final rept.
R. G. Geyer, J. Ceremuga, J. Krupka, and J. Modelski. 1995, 5p.
Pub. in Institute of Electronics, Information and Communications Engineers Transactions on Electronics, Japan, vE78-C n8 p1106-1110 Aug 95.

Keywords: *Dielectric resonators, *Surface resistance, Reprints, *Foreign technology, *High temperature superconductors.

The dielectric resonator technique is commonly used for microwave surface resistance measurements of High Temperature superconducting (HTS) films. Thickness of superconductors and its impact on measurement results has not been taken into consideration so far. A theoretical mode-match solution analysis of a TE011 10 GHz sapphire resonator was performed. The results of this analysis demonstrate that the thickness of the films under test can significantly affect the resonant frequencies (Fres) and quality factor Q of the resonant system, particularly when the thickness is less than three times the penetration depth lambda of the films at the operating temperature.

Two-Tier Multiline TRL for Calibration of Low-Cost Network Analyzers.
Final rept.
J. A. Jargon, and R. B. Marks. 1995, 8p.
Pub. in Automatic RF Techniques Group Meeting (ARFTG), Scottsdale, AZ., November 30-December 1, 1995, p1-8.

Keywords: *Network analyzers, *Scattering parameters, Wireless, Calibration, Measurement, Multiline, Reprints, TRL, Two-tier.

We compare calibrations for use on three-sampler vector network analyzers (VNAs) which do not allow the direct application of some advanced error-correction schemes such as TRL (thru-reflect-line). Here we compare various alternatives, including an approximate version of TRL that has been introduced commercially and two-tier multiline TRL using external software. We consider both coaxial and coplanar open-short-load-thru (OSLT) calibrations for the first tier, showing that the latter can lead to inaccuracies. Finally, we investigate the stability of the load reflection terms to show that the first tier calibration need not be frequently repeated.

Keywords: *Calibration standards, *Metrology, *Electret, Emanation, Environment, Ionization chamber, Measurement, Radium-226, Radon-222.

The recently developed 222Rn emanation standards that are based on polythylene-encapsulated 226Ra solutions were employed for a first field-measurement application test to demonstrate their efficacy in calibrating passive integral radon monitors. The performance of the capsules was evaluated with respect to the calibration needs of electret ionization chambers (E-PERM, Rad Elec Inc.). The encapsulated standards emanate well-characterized and known quanties of 222Rn, and were used in two different-sized, relatively-small, accumulation vessels (about 3.6 L and 10 L) which also contained the deployed electret monitors under test.

Microstructural Characterization of Cobalt-Tungsten Coated Graphite Fibers.
N. S. Wheeler. 1995, 18p.
Prepared in cooperation with Virginia Univ., Charlottesville. Dept. of Materials Science and Engineering.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n6 p641-659 Nov/Dec 95.

Keywords: *Carbon, *Cobalt, *Tungsten, Composite, Graphite, TEM, XRD.

The research concerns an electrodeposited cobalt-tungsten alloy coating on graphite fibers. Annealed and unannealed coated fibers were analyzed by scanning electron microscopy/energy dispersive x-ray spectroscopy (SEM/EDS), x-ray diffraction (XRD), and transmission electron microscopy (TEM). The mole fraction of tungsten in the as-deposited cobalt-tungsten coating was found to be (7.10 plus or minus 0.82) %, and the crystalline lattice was determined to be hexagonal closepacked. Note: The uncertainties reported here are expanded uncertainties (i.e., 2 standard deviation estimates).

Faraday Constant.
Final rept.
W. F. Koch. 1991, 6p.
Pub. in Units and Fundamental Constants, Subvolume b: Fundamental Constants, Chapter 3.2.13, p3-213-3-218.

Keywords: *Faraday constant, *Electrochemistry, Coulomb, Reprints, Coulometry, Electricity, Silver, *Foreign technology, Fundamental physical constant.

The discovery of the quantitative relationship among electric current, time, and the amount of chemical change effected by the electric current was the first announced by Michael Faraday in the 1830's (1839 F). Because of religious convictions, Faraday, himself, never derived a mathematical expression for these laws of nature. However, these laws may be simply expressed in summary as: mole = (1/F)fIdt, where mole is the amount of substance, I is the current in amperes, and t is the time in seconds. The proportionality factor F has been appropriately named the Faraday constant (or just Faraday), and has units of coulombs per mole of univalent substance, C/mol. (A mole of univalent substance is synonymous with the term 'equivalent'.)

Pub. in Institute of Electrical and Electronics Engineers Transactions on Nuclear Science, v39 n6 p2086-2097 Dec 92.

Keywords: *Buried oxides, *Electron traps, Reprints, *RESOI, Silicon on insulator, SIMOX, ZMR.

Shallow electron and deep hole trapping in the buried oxides of SIMOX, ZMR and BESOI material are examined. By irradiating the oxides with x-rays at cryogenic temperatures, 40 - 50 K, hole motion is frozen and electrons are trapped. The oxide charge is determined by C-V measurements. Following the cryogenic irradiation, the electrons are detrapped by field stressing (tunneling) or by annealing (thermal excitation). Hole trapping is examined by annealing after the trapped electrons are removed by field stressing. Substantial shallow electron and deep hole trapping distributed uniformly through the oxide is observed for all buried oxides that are processed above about 1100 degrees C. A comparison to thermal oxides grown at 850 degress C and annealed at 1300 degress C with and without a polysilicon capping layer shows that the top silicon layer significantly increases trap formation.

Effect of Single versus Multiple Implant Processing on Defect Types and Densities in SIMOX.
Final rept.
D. Venables, S. J. Krause, J. C. Park, J. D. Lee, and P. Roitman. 1993, 2p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers SOI Conference, Palm Springs, CA., October 1993, p48-49.

Keywords: *Silicon, Defects, Reprints, *SIMOX, TEM, Silicon on insulator, Stacking faults.

Silicon-on-insulator material fabricated by high-dose oxygen implantation (SIMOX) has applications for high speed, radiation hard and low power devices. However, a continuing problem has been crystalline defects in the top silicon layer. SIMOX is fabricated by two distinct methods: a single oxygen implant to a dose of 1.8x10 to the 18th power cm to the minus 2 power followed by a high-temperature anneal (equal to or greater than 1300 degress C, 4-6 hr) or by multiple lower dose implants (approx. 6x10 to the 17th power cm to the minus 2 power) with high-temperature anneals after each implant. To data, there has been no systematic comparison of the defect structures produced by these two fabrication methods. Therefore, we have compared the defect structure and densities on multiple vs. single implant wafers produced on a high current implanter. In this paper we describe the origin and characteristics of the defect structures in contemporary SIMOX and show how their densities are controlled by the processing method and conditions.

Keywords: *Microwaves, *Power measurement, *Coaxial configurations, *Calibration standards, Calorimeters, Thermistors, Error analysis, Uncertainty, Frequencies, NIST(National Institute of Standards and Technology), Microwave power standards, Thermistor mounts.

A calibration service at the National Institute of Standards and Technology (NIST) for coaxial microwave power reference standards is described. The service provides measurements of the reference standard effective efficiency from 50 MHz to 18 GHz at a power level of 10 mW. In the Report of Calibration, the effective efficiency is reported in percent. The NIST microwave power standards consist of both a microcalorimeter and an associated reference standard. The reference standard is a bolometric type power detector (a thermistor mount). The only thermistor mounts accepted for measurement are those constructed to NIST specifications which are compatible with the coaxial microcalorimeter. These thermistor mounts and the automated microcalorimeter are described. A detailed error analysis with an estimate of the calibration uncertainties and their sources is included.

Band-Limited, White Gaussian Noise Excitation for Reverberation Chambers and Applications to Radiated Susceptibility Testing.
Technical note.
M. L. Crawford, T. A. Loughry, M. O. Hatfield, and G. J. Freyer. Jan 96, 112p, NIST/TN-1375.
Also available from Supt. of Docs. as SN003-003-03392-8.

Keywords: *Reverberation chambers, *Electromagnetic shielding, *Electromagnetic susceptibility, Bandwidth, Shielding effectiveness, Mode stirred chambers, Frequency stirring.

The report gives the results of demonstration tests conducted to (1) evaluate the electromagnetic environment (EME) produced by band-limited, white gaussian noise (BLWGN) excitation of a reverberation chamber and to verify its applications to susceptibility and shielding effectiveness (SE) testing. Data were collected to compare the EME produced in a reverberation chamber by CW and swept frequency excitation using both mechanical stirring and BLWGN to excite the cavity mode structure. The feasibility of using the BLWGN technique for radiated susceptibility testing was evaluated by comparison with mechanical stirring in a reverberation chamber and with anechoic chamber results. Within normal measurement uncertainties, the response of both types of systems were the same for mechanical stirring and for BLWGN excitation and were consistent with the results obtained in the anechoic chamber.

Beyond the Technology Roadmaps: An Assessment of Electronic Materials Research and Development.
M. A. Schen, T. J. Russell, R. F. Leheny, G. Borsuk, A. Yang, H. Simon, and V. Hess. Mar 96, 60p, NISTIR-5777.
Prepared in cooperation with Defense Advanced Research Projects Agency, Arlington, VA., Department of Commerce, Washington, DC. Technology Administration., National Science Foundation, Arlington, VA. and Naval Research Lab., Washington, DC.

Keywords: *Electronic equipment, *Microelectronics, *Materials, Photonics, Research management, Microwaves, Radiofrequency, Electronic industry, Modules(Electronics), Mass storage.

This report, produced by the National Science and Technology Council, Electronic Materials Working Group, captures the findings of the December 6-7, 1994 industry-government-university Workshop on Electronic Materials held in Dallas, TX. It provides summary of the dominant electronics materials issues facing U.S. industry and contains recommendations critical to the advancement and competitiveness of the U.S. electronics and materials industries. The technologies encompassed within this report are microelectronics, radio frequency and microwave electronics, photonics, mass storage, and module interconnection. In addition, materials characterization and materials research, two areas essential to the understanding, discovery and utilization of materials, are included.

The Electronics and Electrical Engineering Laboratory (EEEL), working in concert with other NIST Laboratories, is providing measurement capability and other generic technology critical to the competitiveness of the U.S. electronics industry and the U.S. electrical-equipment industry. This 1996 Program Plan describes the technical projects that EEEL plans to conduct in fiscal year 1996 to provide metrological support to U.S. industry.

Electromagnetic Coupling Character of (001) Twist Boundaries in Sintered Bi2Sr2CaCu2O8+x Bicrystals.
Final rept.
J. L. Wang, X. Y. Cai, R. J. Kelley, D. C. Larbalestier, M. D. Vaudin, and S. E. Babcock. 1994, 10p.
Pub. in Physica C, v230 p189-198 1994.

Keywords: *Bicrystals, *Electromagnetic coupling, Reprints, *Critical current density, Grain boundaries, Weak coupling, Weak links.

The electromagnetic characteristics of (001) twist grain boundaries in Bi2Sr2CaCu2O8+x (BSCCO-2212) have been deduced from measurements of the resistive transitions, voltage-current (V-I) characteristics, and field-dependent transport critical current densities (Jct(H)) of single- and bicrystalline samples. The bicrystals were prepared by solid-state sintering of (001) faces of freshly-cleaved, bulk-scale single crystals placed at a pre-determined misorientation angle, O. A low-angle 2 degrees bicrystal was strongly coupled with V-I and Jct(H) characteristics that were indistinguishable from those of the single crystals, indicating that the sintering process itself does not produce weak coupling. 30 degrees and 36 degrees (001) bicrystals were weakly coupled. 23 degrees and 88 degrees twist bicrystals were strongly coupled, even though their boundary Tc values were reduced. This behavior contrast starkly with that of (001) tilt boundaries in YBa2Cu3O7-, where a reduced boundary Tc is always associated with weak coupling.

Pub. in Jnl. of Vacuum Science and Technology B, v14 n1 p242-247 Jan/Feb 96.

Keywords: *Capacitance imaging, Modeling, Collocation, Reprints, *Scanning capacitance microscopy, *Poisson's equation.

A scanning capacitance microscope (SCM) has been implemented by interfacing a commercial contact-mode atomic force microscope with a high-sensitivity capacitance sensor. The SCM has promise as a next-generation dopant-profiling technique because the measurement in inherently two dimensional, has a potential spatial resolution limited by tip diameter of at least 20 nm, and requires no current carrying metal-semiconductor contact. Differential capacitance images have been made with the SCM of a variety of bulk-doped samples and in the vicinity of pn junctions and homojunctions. Also, a computer code has been written that can numerically solve Poisson's equation for a model SCM geometry by using the method of collocation of Gaussian points. Measured data and model output for similar structures are presented. How data and model output can be combined to achieve an experimental determination of dopant profile is discussed.

Surface Transverse Wave Oscillators with Extremely Low Thermal Noise Floors.
Final rept.
I. D. Avramov, F. L. Walls, T. E. Parker, and G. K. Montress. 1994, 16p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Boston, MA., June 1-3, 1994, p379-394.

Keywords: *Phase noise, *Power oscillator, Reprints, *Surface transverse wave resonators, Line discriminator, A-B class power amplifier.

This paper presents state-of-the-art results on 1 Ghz surface transverse wave (STW) power oscillators running at extremely high loop power levels. High-O single-mode STW resonators used in these designs have an insertion loss of 3.6 dB, an unloaded O of 8000, a residual phase noise of -142 dBc/Hz at 1 Hz intercept and operate at an incident power of up to 31 dBm in the loop. Other low-Q STW resonators and coupled resonator filters (CRF) with an insertion loss in the 5-9 dB range can conveniently handle power level in escess of 2 W. These devices were implemented in voltage controlled oscillators (VCO's) running from a 9.6 V source at an output power of 23 dBm and a RF/dc efficiency of 28%. Their tuning range was 750 kHz and the noise floor - 180 dBc/Hz. The oscillators, stabilized with the high-O devices, use specially designed AB-class power amplifiers, deliver an output power of 29 dBm and demonstrate a noise floor of -184 dBc/Hz and a 1 Hz intercept of -17 dBc/Hz. The 1 Hz intercept was improved to -33 dBc/Hz using the UTO-1023 as a loop amplifier. In this case the output power was 22 dBm. In all cases the loop amplifier was the limiting factor for the close-to-carrier oscillator phase noise performance.

Models of Granualr Giant Magnetoresistance Multilayer Thin Films.
Final rept.
J. O. Oti, S. E. Russek, S. C. Sanders, and R. W. Cross. 1996, 9p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics, v32 n2 p590-598 Mar 96.

Keywords: *Thin films, *Magnetoresistance, Models, Anisotropy, Exchange, Multilayers, Spin-valves, Micromagnetic, Reprints.

Phenomenological micromagnetic and large-scale magnetization-dependent models of resistivity that produce giant magnetoresistance in granular multilayer magnetic thin films are described. Included in the models are intralayer and interlayer scattering components formulated explicitly in terms of the microstructural properties and characteristic transport lengths of the medium. The micromagnetic model provides insight into the influence of the magnetization distribution on the giant magnetoresistance response of the medium. The large-scale model which is derived from the micromagnetic model, is useful for obtaining media transport parameters from experimental data. Both models are used to study a set of annealed NiFe/Ag multilayer films.

Data Evaluation of a Linear System by a Second-Order Transfer Function.
Final rept.
D. G. Camell, and M. T. Ma. 1995, 5p.
See also PB95-182390.
Pub. in Institute of Electrical and Electronics Engineers EMC Symposium Conference Record, August 14-18, 1995, p511-515.

Keywords: *Electromagnetic interference, *Convolution integrals, Electromagnetic pulses, Transfer functions, Continuous radiation, Resonant frequency, Linear systems, Magnitude, Reprints, Impulse response.

A recently developed technique for predicting the response of a linear system to an electromagnetic pulse, based only on the measured sontinuous-wave magnitude, is applied to a particular system as a case study. The measured magnitude representing the system's transfer function is deduced first from the measured response to a known cw source. The authors next derive an analytic expression for the magnitude square of the transfer function to approximate the measured data and obtain a system transfer function in terms of the complex frequency. Finally, the authors predict the system's cw phase characteristics and its multiple solutions due to a given impulse source.

Observation of the Transverse Second Harmonic Magneto-Optic Kerr Effect from Ni81Fe19 Thin Film Structures.
Final rept.
T. M. Crawford, C. T. Rogers, T. J. Silva, and Y. K. Kim. 1996, 3p.
Pub. in Applied Physics Letters, v68 n11 p1573-1575 Mar 96.

Keywords: *Thin films, *Multiple reflection theory, Magnetic interfaces, Second harmonics, Reprints, *Kerr effect, MOKE, Non-linear optics, Second order susceptibility, SH conversion efficiency.

We report second-harmonic magneto-optic Kerr measurements on air-exposed, polycrystalline Ni81Fe19 thin films, ranging in thickness from 1 nm to 2 micro m, on Al2O3 coated Si (001). For samples thicker than 20 nm, in the tranverse Kerr geometry, we observe a factor of 4 change in second-harmonic intensity upon magnetization reversal. For thin samples, we observe interference between second-harmonic fields from the various interfaces and deterioration of ferromagnetism in the 1 and 2 nm films. Modeling suggests that the Ni81Fe19/Al2O3 interface has a larger second-order susceptibility than the air/Ni81Fe19 surface.

Keywords: *Magnetic field sensors, *Iron garnets, Faraday effect, Flux concentration, Waveguides, Magneto-optics, Reprints, Electric current sensors, Radiation-induced darkening.

Sensors based on the Faraday effect can be configured to measure either magnetic fields or electric currents. Such sensors can be constructed without introducing conducting materials which are often undesirable. Presently, the most sensitive Faraday effect sensors employ ferrimagnetic iron garnets as the sensing elements. With these materials, we have demonstrated minimum detectable fields as low as 1 pT/Hz1/2 and currents as low as 200 nA/Hz1/2. The paper reviews these and other recent research results obtained at NIST and considers prospects for still further improvements in sensitivity and frequency response.

Pub. in Physica B, v194-196 p109-110 1994.

Keywords: *Infrared detectors, *Bolometers, *Antennas, Superconducting junctions, Electron tunneling, Microbolometers, Hot electrons.

The authors present measurements of a novel power detector which can be used as an ultra-sensitive detector of millimeter and sub-millimeter radiation. The absorbing element consists of a thin film resistor with submicrometer dimensions, which is connected to superconducting electrodes. This device exploits the Andreev reflection of electrons, and the weak interaction between electrons and phonons at low temperatures, in order to produce a large temperature rise for a small input power (approximately 10 mK/fW). The temperature rise of the electrons is measured from the temperature dependence of the current-voltage characteristic of a superconductor-insulator-normal metal tunnel junction, where part of the resistor strip forms the normal electrode. The authors have measured a voltage responsivity approximately 10 to the ninth power V/W, and an amplifier-limited electrical NEP approximately 3x 10 to the minus 18th power WHz to the minus one half power at an operating temperature of 100 mK. If infrared radiation were coupled to the absorbing element by using superconducting planar anntennas, then the sensitivity of this detector would be at least a factor of 10 higher than the best available direct detectors and thus may become the detector of choice for important astrophysics investigations.

Also available from Supt. of Docs. as SN003-003-03417-7.

Keywords: *Reverberation, *Electromagnetic compatibility, Electromagnetic fields, Electromagnetic noise.

In this paper, the authors present an experimental technique for the rapid evaluation of mode-stirred (or reverberation) chambers. The measurement provides an estimate of the average chamber quality factor (Q) by measuring the chamber impulse response and observing the decay of the spectral components of the response. The results show good agreement with those obtained using conventional CW techniques. The measurement is well suited for low-frequency analysis of a chamber, where costly and time consuming mode-tuned approaches are generally employed. Since this technique does not use paddle stirring, the time savings can be considered.

Proposed Tests to Evaluate the Frequency-Dependent Capacitor Ratio for Single Electron Tunneling Experiment.
Final rept.
S. Avramov-Zamurovic, N. M. Zimmerman, A. F. Clark, and A. Jeffery. 1996, 2p.
Pub. in Conference on Precision Electromagnetic Measurements, Braunschweig, Germany, June 17-20, 1996, p265-266.

Keywords: *Capacitor ratio, *Single electron tunneling, Voltage divider, Frequency dependence, Capacitance, Reprints, *Foreign technology.

A precise measurement of the ratio of two cryogenic capacitors is needed for a capacitor charging experiment using Single Electron Tunneling (SET) phenomena. To support the capacitor charging metrology a frequency characterization of the capacitors is required. To cover the frequency range from 1 Hz to 1 kHz, resistive and inductive voltage divider bridges are proposed. Preliminary tests suggest that the uncertainty with which the capacitor ratio can be evaluated is less than one part per 10 to the sixth power.

Transient Errors in a Precision Resistive Divider.
Final rept.
S. A. Boggs, G. J. FitzPatrick, and J. Kuang. 1996, 4p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Symposium on Electrical Insulation, Montreal, Quebec, Canada, June 16-19, 1996, p482-485.

Keywords: *Resistive dividers, *Transient errors, Heating effects, High voltage, Impulse measurements, Reprints.

Resistive dividers have the advantages of dc response and stability. However unlike capacitive dividers, they inevitably involve power dissipation and also generally involve an appreciable inductance. These aspects of a resistive divider result in transient errors, i.e., errors which are a function of the applied waveform. The paper discusses transient measurement errors of precision high voltage resistive dividers such as the one recently developed by NIST.

Uncertainties of Frequency Response Estimates Derived from Responses to Uncertain Step-Like Inputs.
Final rept.
J. P. Deyst, T. M. Souders, and J. J. Blair. 1996, 4p.
Pub. in Institute of Electrical and Electronics Engineers Instrumentation and Measurement Technology Conference, Brussels, Belgium, June 4-6, 1996, p151-154.

Keywords: *Frequency response, *Step response, Electrical measurement, Signal conditioning, Algorithms, Errors, Test methods, Mathematical models, Estimates, Reprints.

The frequency response of a linear time-invariant system can be estimated from the measurement of its response to an ideal step input. However, an ideal step is unrealizable, and various other error sources affect the accuracy of such estimates. The paper investigates the effect of using an uncertain (inexactly known), step-like test signal. An approach is developed here for determining the systematic uncertainties of the frequency response estimate of a device under test (DUT), when it is estimated from the response, are converted to the frequency domain and processed, resulting in uncertainties for the frequency response of the DUT. Also, a mathematical proof is provided for the 'envelope-modulation' method of calculating the systematic uncertainties of a frequency response estimate of a device, as derived from the uncertain response of the device to an ideal step.

Optical and Mass Spectrometric Investigations of Ions and Neutral Species in SF6 Radio-Frequency Discharges.
Final rept.
R. Foest, J. K. Olthoff, R. J. Van Brunt, E. C. Benck, and J. R. Roberts. 1996, 12p.
Pub. in Physical Review E, v54 n2 p1876-1887 Aug 96.

Keywords: *Radio frequency discharges, *Electrode surface effects, Ion kinetic energy, Laser induced fluorescence, Electric characteristics, Degree of dissociation, Reprints.

Radio-frequency (rf) discharges at 13.56 MHz were generated in pure SF6 using a capacitively coupled, parallel-plate GEC reference cell for gas pressures in the range of 4-33.3 Pa (30-250 mTorr) and for peak-to-peak applied rf voltages in the range of 100-300 V. The following measurements were made during operation of the discharge: (1) electrical characteristics which included power dissipation, voltage-current phase angle, and the dc self-bias; (2) time-averaged vertical and horizontal profiles of the optical emissions from neutral atomic fluorine for the 2p(4)3p' 2F(0)7/2 -> 2p(4)3s' 2D5/2 and 2p(4)3p(2)p(0)3.2 -> 2p(4)3s(2)P3/2 transitions; (3) spatially resolved, laser-induced fluorescence (LIF) utilizing the 2p(4)3s(4)p5/2 metastable level of atomic fluorine; (4) mass spectra of neutral species in the plasma; and (5) kinetic-energy distributions and relative fluxes of mass-selected positive ions extracted from the plasma through a 0.1 mm diameter orifice in the grounded electrode. The dependence of the electrical characteristics on gas pressure confirms previous observations and model predictions which indicate, for example, that the plasma becomes more resistive as pressure increases.

The effects of uncertainties in the alignment of the NIST watt balance with local gravity and the magnetic field of the balance have been analyzed, and techniques for measuring all misalignment parameters have been developed. The systematic uncertainty in the watt measurement due to alignment has been reduced to 0.04 micrometers W/W.

Observation of Hot-Electron Shot Noise in a Metallic Resistor.
Final rept.
A. H. Steinbach, J. M. Martinis, and M. H. Devoret. 1996, 4p.
Pub. in Physical Review Letters, v76 n20 p3806-3809 May 96.

Keywords: *Mesoscopics, *Noise, *Shot noise, *Resistors, Reprints.

The authors have measured the current noise of silver thin-film resistors as a function of current and temperature and for resistor lengths of 7000, 100, 30 and 1 micrometers. As the resistor becomes shorter than the electron-phonon interaction length, the current noise of large current increases from a nearly current independent value to the interacting hot-electron value (square root 3/4)2el. However, further reduction in length below the electron-electron interaction length decreases the noise to a value approaching the independent hot-electron value (1/3)2el first predicted for mesoscopic resistors.

Keywords: *Sampling, *Wideband, *Voltmeters, Error sources, RMS voltage, Time-base, Reprints, *Foreign technology, Quasi-equivalent-time.

A high accuracy sampling voltmeter, designed to span the frequency range of 10 Hz to 200 MHz is described. The instrument operates autonomously, at a measurement update rate of at least one per second. A novel quasi-equivalent time sampling process is sued, with a custom strobed comparator as the sampling device and decision element. The architecture and control are presented, along with the time-base design principles. Major error sources associated with the time-base are also discussed.

Effect of Beam Voltage on the Properties of Aluminum Nitride Prepared by Ion Beam Assisted Deposition.
Final rept.
J. H. Edgar, C. A. Carosella, C. R. Eddy, and D. T. Smith. 1996, 7p.
Pub. in Jnl. of Materials Science: Materials in Electronics, v7 p247-253 1996.

Keywords: *Aluminum nitride, *Beam voltage, Mechanical properties, Reprints, *Ion beam assisted deposition.

The effects of nitrogen-beam voltage on the structure, stress, energy band gap and hardness of AIN thin films deposited on Si(111), Si(100) and sapphire (0001) by ion beam assisted deposition (IBAD) are reported. As the nitrogen-bean voltage was increased from 50 to 200 V, the stress and disorder in the AIN films increased as determined by X-ray diffraction, FTIR and Raman spectroscopy. The preferred orientation of the film's c-axis changed from completely normal to the film at 100 V, to a mixture of normal and in the plane of the film at 200 V. For AIN films deposited under the same conditions, the films were more highly oriented on sapphire (0001) than in SI(111). The hardness of the films increased from 18.2 to 23.7 GPa with the nitrogen-beam voltage, and possible reasons for this change in hardness are considered.

Pub. in Zeitschrift fur Physikalische Chemie, Bd., v95 S p195-215 1995.

Keywords: *Electron attachment, *Thermal electrons, *Energy positions, Gases, Liquids, Constants, Reprints, *Foreign technology.

Thermal electron attachment rate constants for halocarbons in the gaseous phase, (ka)th, and thermal electron attachment rate constants for a number of molecules in liquid cyclohexane, (ka)L, are summarized in an effort to discern the dependence of the thermal electron attachment rate constant for molecules embedded in gases and in liquids on the energy position, E(NIS), of the electron attaching state. For these molecules the (ka)th varies only slightly with E(NIS) as long as E(NIS) is less than 0.0 eV (i.e., as long as the electron affinity of the molecule is positive), but it de-

General

creases precipitously with increasing E(NIS) when E(NIS) greater than 0.0 eV (i.e., when the electron affinity of the molecule becomes negative). The (ka)L exhibits a similar behavior except that it remains virtually constant well above 0.0 eV, up to E(NIS) approximately 0.9 eV, and thereafter decreases precipitously. This energy shift between the gaseous and the liquid phase correlations is consistent with the magnitude of the polarization energy of the anions in liquid cyclohexane and its effect on E(NIS).

Keywords: *Calibration standards, *Magnetic field, *Voltage, *Mass, Interlaboratory comparisons, Electrical measurement, Weight measurement, Fundamental constants, Mechanical measurement, Metrology, Precision, Monitoring, Reprints, *Kilograms, Current loops.

An apparatus has been constructed which measures both the force on a current loop in a magnetic field and the voltage induced around that loop when it moves at some velocity through that same magnetic field. By comparing the force times the velocity to the current times the voltage, mechanical power is compared to electrical power, and a value for the watt which is consistent in both electrical mechanical units can be derived. The kilogram is defined in terms of a physical artifact, and intercomparisons among various kilogram masses suggest that the kilogram mass standard changes over time. Present research on the watt experiment aims to improve the precision of the measurement so that a defined value of the watt can be used to monitor the drift of the kilogram mass standard in terms of fundamental natural constant.

Pub. in Proceedings of the Annual Meeting and Symposium of Antenna Measurement Techniques Association (15th), Dallas, TX., October 4-8, 1993, p198-204.

Keywords: Alignment, Reprints, *Antenna measurements, Planar near field technique.

This paper discusses one method of characterizing the scan plane for planar near-field measurements. The method uses a theodolite autocollimator, a laser interferometer, an electronic level and an optical square. The data obtained using these techniques are first used to make alignment corrections to the scan plane; then new data are used to determine the best fit for the realigned scan plane. The normal to this plane is referenced using a permanently placed mirror. In addition, the final data obtained can be used in probe position-correction techniques, developed for planar near-field measurements.

This tutorial paper discusses various standard antennas for measuring radio-frequency electric and magnetic fields. A theoretical analysis of each antenna's receiving characteristics is summarized and referenced. The standard probes described are an electrically short dipole, a resistively-loaded dipole, a half-wave dipole, an electrically small loop, and a resistively-loaded loop. A single-turn loop designed for simultaneous measurement of the electric and magnetic components of near-fields and other complex electromagnetic environments is also described. Each type of antenna demonstrates a different compromise between broadband frequency response and sensitivity.

The planar near-field measurement technique is a proven technology for measuring ordinary antennas operating in the microwave region. The development of very low-sidelobe antennas raises the question whether this technique can be used to accurately measure these antennas. The authors show that data taken with an open-end waveguide probe and processed with the planar near-field methodology, including probe correction, can be used to accurately measure the sidelobes of very low-side-lobe antennas to levels of -55 dB to -60 dB relative to the main beam peak. A special probe with a null in the direction of the main beam was also used for some of these measurements. This special probe reduced some of the measurement uncertainties but increased the uncertainties due to probe-antenna interactions. The authors discuss the major sources of uncertainty and show that the probe-antenna interaction is one of the limiting factors in making accurate measurements. The test antenna for this study was a slotted-waveguide array whose low sidelobes were known.

Correction Factor for Nonplanar Incident Field in Monopole Calibrations.
Final rept.
J. Randa. 1993, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 35, n1 p94-96, 1 Feb 93.

Keywords: *Antenna radiation patterns, *Calibration, *Monopole antennas, Antenna design, Electromagnetic properties, Monopoles, Incidence, Electromagnetic fields, Electromagnetic compatibility, Reprints.

In calibrating monopole antennas, the length of the antenna can be comparable to the separation distance. In that case, there is a significant variation in both the magnitude and the phase of the incident field along the length of the antenna under test. This paper presents an expression for a correction factor to account for this effect. We evaluate the correction factor for some representative cases and present some guidelines for when this factor should be taken into account. The effect can exceed 1 dB in some practical cases.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 35, n3 p339-346 Aug 93.

Keywords: *Broadband antennas, Horn antennas, Time domain, Frequency domain, Characteristics, Directivity, Comparison, Reprints.

A set of time-domain characterizations that can efficiently describe wide bank antennas is proposed in this paper. The experimentally measured responses of transverse electromagnetic horn antennas are used to evaluate the utility of these characterizations. Comparisons are made between the antennas' frequency-domain response and their time-domain characterizations. The comparisons show that the time-domain characterizations can provide significant insight into an antenna's behavior as well as providing a means to accurately compare two or more different antennas.

Also available from Supt. of Docs. as SN003-003-03358-8.

Keywords: *Autennas, *Near field, Spherical waves, Algorithms, Antenna coupling, Antenna measurements, Probes(Electromagnetic).

Expressions are presented for describing incoming and outgoing fields about an antenna in terms of a series of exciting and emergent vector spherical-wave functions. The exciting and emergent fields around the antenna's exterior are related to the field in the antenna feed via a source-scattering matrix representation. A series of so called spherical-wave source-scattering matrix coefficients are then related to more conventional parameters such as antenna gain and receiving cross section. An overview of rotation and translation theorems for transforming vector spherical-wave functions between two distinct coordinate systems is given, followed by a general solution to the problem of expressing the coupling between two coupled antennas in terms of each antenna's spherical-wave source-scattering matrix representation. The authors go on to consider special results to substantiate their formulation, such as showing equivalence between the coupling equations for transmission in opposite directions when the antennas are reciprocal, showing uniform convergence of some series representations for antenna coupling and simultaneously obtaining a coordinate-system translation theorem for the dyadic Green's function, and lastly showing that the authors' two-antenna coupling equations reduce to expressions for the incident and emergent fields about a single antenna when the other antenna is an elementary dipole. Efficient probe-corrected spherical and hemispherical scanning algorithms are then developed for processing measured near-field data to obtain antenna's far-field pattern. Finally, the authors describe a number of self-consistency tests and theoretical-data simulations that were developed to validate their spherical-scanning algorithm, and they describe an independent experimental verification.

R. T. Johnk, and M. Kanda. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Antennas and Propagation, v42 n5 p747-749 May 94.

Keywords: *Dipole antennas, *Length, *Galerkin method, Convergence, Current density, Electric potential, Open circuit density, Charge density, Scattering, Electrostatics, Reprints.

The scattering of a plane wave broadside incident to a dipole antenna with a symmetrically placed, open-circuited gap is treated. The induced currents on the antenna are found by solving the electric-field integral equation by means of a Galerkin moment method. The resulting current distribution is then used to compute line integrals of the scattered electric field along appropriate paths. The line integral is first evaluated directly across the dipole gap in order to compute the effective length, but severe convergence problems are encountered. This problem is due to the presence of charge singularities at the gap edges. Instead of incorporating the singular charge behavior into the basis functions, a line integral is evaluated along a path that alleviates the convergence difficulties. This remedy is developed first for an electrostatic case and then for the dynamic scattering problem.

M. H. Francis. 1995, 7p.
Pub. in Annual Meeting and Symposium Antenna Measurement Techniques 1995 Assoc. (17th), Williamsburg, VA., November 13-17, 1995, p341-347.

Keywords: *Antennas, *Extremely high frequencies, Antenna arrays, Phased arrays, Near fields, Far fields, Planar structures, Antenna radiation patterns, Response functions, Error analysis, Taylor series, Reprints, *Probe-position errors.

The authors investigated two methods of probe-position error correction to determine how well the corrected results compare to the uncorrupted far field: the k-correction method and the Taylor-series method. For this investigation, the authors measured a 1.2 m dish at 4 GHz and a 1.2 m by 0.9 m phased array at 2.2 GHz. Measurements were made first without position errors and then with deliberate z-position errors. The authors performed probe-position error correction using both methods and compared the results to the error-free far field.

Antennas

Standard Source Method for Reducing Antenna Factor Errors in Shielded Room Measurements.
Technical note.
D. Camell, G. Koepke, R. Smith, and B. Rakoski.
Mar 96, 43p, NIST/TN-1382.
Also available from Supt. of Docs. as SN003-003-03405-3.

Keywords: *Antennas, *Electromagnetic fields, *Calibration, *Shields, Test facilities, Errors.

In this report the authors will examine the use of a well characterized standard source of electromagnetic radiation as a means to calibrate the effects of the shielded room on a receiving antenna used for MILSTD 461/462 RE102 emissions measurement. The goal was to compensate for the shielded room environment so that radiated emissions measurements can be more accurately compared from one room to another. This was accomplished by using a characterized spherical dipole source to calibrate an antenna's response in the location that it was used. An interlaboratory comparison was made of the detected emissions from a simulated equipment-under-test at three sites to see how this in-situ calibration of the receive antenna helped the shielded room test repeatability.

Pub. in Handbook of Electromagnetic Compatibility, Chapter 15, p599-625 1995.

Keywords: *Electromagnetic interference, *Antennas, *Measurement, Standards, Radio frequency interference, Radio reception, Electric fields, Magnetic fields, Radio receptor, Reprints.

Establishing standards for electromagnetic (EM) field measurements is a multifacted endeavor which requires measurements made (1) in anechoic chambers, (2) at open sites, and (3) within guided-wave structures and the means of transferring these measurements from one situation to another. The underlying principles of these standard measurements and transfer standards fall into one of two categories: measurements and theoretical modeling. That is, either a parameter or a set of parameters is measured, or a parameter is calculated by established physical and mathematical principles. In the following, the three measurement topics and field transfer standards will be discussed, with the guided-wave structures restricted to the transverse electromagnetic (TEM) cell and the waveguide chamber. Throughout the discussion the interplay between measured quantitites and predicted (modeled) quantities will be seen. The frequencies considered here range from 10 kHz to 40 Ghz (and upward) and are determined by our ability to made an actual measurement and the restrictions imposed by rigorous theoretical analysis of a given model.

Comparison of Ultralow-Sidelobe-Antenna Far-Field Patterns Using the Planar-Near-Field Method and the Far-Field Method.
Final rept.
M. H. Francis, A. C. Newell, K. R. Grimm, J. Hoffman, and H. E. Schrank. 1995, 9p.
Pub. in Institute of Electrical and Electronics Engineers Antennas and Propagation Magazine, v37 n6 p7-15 Dec 95.

Keywords: *Antennas, *Sidelobes, *Measurement, Far fields, Near fields, Measuring instruments, Reprints, Planar near field.

The development of very-low-sidelobe antennas raises the question of whether or not the planar-near-field method can be used to accurately measure these antennas. Recently, scientists at several organizations showed that data taken and processed with the planar-near-field methodology, including probe correction, can be used to accurately measure the sidelobes of ver-low-sidelobe antennas. This can be done to levels of -55 dB to -60 dB, relative to the mainbeam peak (1). This paper highlights these results, including a comparison of the far field, from the planar-near-field method, with the far field, found on a far-field range. The test antenna for this study was slotted-waveguide array, the low sidelobes for which were known. The near-field measurements were conducted on the NIST planar-near-field facility.

Pub. in Annual Meeting and Symposium of the 1995 Antenna Measurement Techniques Association (17th), Williamsburg, VA., November 13-17, 1995, p3-8.

Keywords: *Radar cross sections, *Depolarization, *Polarimetry, Radar antennas, Radar targets, Cross polarization, Error analysis, Calibration standards, Reprints, Reciprocal antenna radars.

We discuss how RCS targer depolarization enhances cross-polarization contamination, and we present a graphical study of measurement error due to depolarization by an inclined dihedral reflector. Error correction requires complete polarimetric RCS measurements. We present a simple polarimetric calibration scheme that is applicable to reciprocal antenna radars. This method uses a dihedral calibration target mounted on a rotator. Because the calibration standard can be rotated, there is no need to mount and align multiple separate standards, and clutter and noise may be rejected by averaging over rotation angle.

Numerical Evaluation of Hypersingular Integrals for Scattering by a Dielectric Wedge.
Final rept.
E. Marx. 1993, 4p.
Pub. in Institute of Electrical and Electronics Engineers Antennas and Propagation Society of International Symposium, Ann Arbor, MI., June 28-July 2, 1993, 1993 Digest, v2 p906-909.

Keywords: *Dielectric wedges, *Electromagnetic scattering, Hypersingular integral, Numerical integration, Reprints, Neighboring-patch contributions.

Some components of the electromagnetic field near the edge of a dielectric wedge diverge. The computation of the fields scattered by the wedge can be done by solving a singular integral equation (SIE) or a hypersingular integral equation (HIE) (2) - (4). The unknown boundary function diverges near the edge for the SIE and tends to a constant for the HIE. Thus, the method using the HIE does not require the computation of the boundary function closer to the edge that the closest field point, since this function can be approximated by a constant and the remainder of the integral can be evaluated numerically. Nevertheless, the integrand varies rapidly, like l/R2, over the patch and a number of special precautions have to be taken. The authors need to verify the expected behavior of fields near sharp edges because the theory is not rigorous. If the unknown function is constant near the edge of the wedge, the behavior of the fields is determined by the remainder of the integrand. The neighboring-patch contributions were previously examined under the assumption taht the small-argument approximation of the Hankel functions could be used. Here the authors relax this assumption. Similar corrections are required in the computation of the field components when the distance between the field point and the patch is small compared to the wavelength. Although the field integrals are finite, the behavior of the integrand is the same as that for the neighboring-patch contributions.

NIST Model PM2 Power Measurement System for 1 mW at 1 GHz.
F. R. Clague. Dec 93, 46p, NISTIR-5016.

Keywords: *Microwave equipment, *Power measurement, Computerized control systems, Electric power meters, GHz range 01-100, Ultrahigh frequency, Computer programs, Automation, Uncertainty.

The design and operation of an automated measurement system designed to measure power accurately at the level of 1 mW and at the frequency of 1 GHz are described. The system consists of commercial IEEE Std-488 bus-controlled instruments, a computer controller, and software. The results of a series of measurements are output to the computer display and, optionally, to a printer. The results are the mean of the measurement series and an estimate of the Type A (here random) and Type B (here systematic) uncertainty. The estimated total expanded uncertainty for the average of six consecutive measurements of a nominal 1 mW, 1 GHz source is typically less than 1 percent. The system can measure any power for 0.1 to 10 mW at any microwave frequency by making appropriate changes to the software and, possibly, the hardware.

NIST 30 MHz Linear Measurement System.
J. A. Jargon, R. A. Ginley, and D. D. Sutton. 1994, 12p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p19-30 Jan/Feb 94.

Keywords: *Electric measuring instruments, Power measurement, High frequency, Linear systems, Nonlinearity, Automation, Calibration, Thermistors, Attenuators, Uncertainty, Reprints, Reference standards, US NIST.

There has been a recent interest in and demand for a calibration service at NIST to support rf attenuators and voltage doublers that operate specifically at 30 MHz. The first step required to offer such a service is to develop a reference standard. For the best possible accuracy, a tuned single-element thermistor mount was chosen. A linear measurement system was designed and constructed at NIST to calibrate the nonlinearity of this mount. The paper contains a description of the LMS, an explanation of the measurement scheme, calibration results, and an uncertainty analysis.

Null-Balanced Total-Power Radiometer System NCS1.
S. P. Pucic. 1994, 9p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p45-53 Jan/Feb 94.

Keywords: *Thermal noise, *Calibration, Noise temperature, GHz range 01-100, Cryogenic temperature, Radiometers, Reprints, *Noise calibration system, *NCS1 system, Noise standards.

A recently developed radiometer system NCS1 is used to calibrate thermal noise temperature at any frequency between 1.0 GHz and 12.0 GHz. Any cryogenic noise source can be measured; the upper limit of noise temperatures measured without a loss of accuracy is estimated to be about 100,000 K. For a typical hot noise source with the noise temperature of 8400 K and a reflection coefficient magnitude of 0.1, the expanded uncertainty is about 1.8%, and the system sensitivity about 2 K. Implemented in Type N connector, it can be easily modified to calibrate noise sources with other coaxial connectors or waveguide flanges.

Derivation of the System Equation for Null-Balanced Total-Power Radiometer System NCS1.
S. P. Pucic. 1994, 9p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p55-63 Jan/Feb 94.

Keywords: Noise temperature, Mathematical models, Calibration, Broadband, Radiometers, Reprints, *Noise calibration system, *NCS1 system.

A system equation of a recently developed null-balanced, total-power radiometer system is rigorously derived. Delivered noise power and temperature is related to available power (temperature) through an extension of the mismatch factor to broadband systems. The available power ratio, the available gain, and the delivered power ratio (efficiency) are defined. Properties of idealized, but in principal realizable components such as an infinitely directive isolator and a lossless matched waveguide-below-cutoff attenuator are used. A cascading technique is repeatedly applied to the fundamental noise equation. Mathematically modeling the experimental procedure of sequentially attaching the two noise standards and the unknown source to the system input, the authors obtain the system of three equations that can be solved for the noise temperature of the unknown noise source.

Evaluation of Uncertainties of the Null-Balanced Total-Power Radiometer System NCS1.
S. P. Pucic. 1994, 11p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p65-75 Jan/Feb 94.

Keywords: Noise temperature, GHz range 01-100, Thermal noise, Radiometers, Uncertainty, Calibration, Reprints, *Noise calibration system, *NCS1 system, Noise standards.

Standard uncertainties are evaluated for the null-balanced, total-power, heterodyned radiometer system with a switched input that was recently developed at NIST to calibrate thermal noise sources. Eight significant sources of uncertainty due to systematic effects are identified, two, attributable to the two noise standards, and one each to connectors, the input mismatch, the input switch asymmetry, the isolator, the broadband mismatch and the attenuator. The combined standard uncertainty of a typical coaxial noise source calibration at the representative frequency of 2 GHz is about 1%. A strategy for reducing uncertainties is discussed.

Leakage Current Detection in Cryogenic Current Comparator Bridges.
Final rept.
R. E. Elmquist. 1993, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 42, n2 p167-169 Apr 93.

Keywords: *Resistance bridges, *Comparator circuits, *Leakage current, Electrical measurement, Error analysis, Cryogenic equipment, Ratios, Tests, Reprints, Cryogenic current comparators, Quantum Hall effect.

Several tests have been developed to locate leakage currents in cryogenic current comparator (CCC) resistance ratio bridges used at NIST to measure ratios of 1,000 ohms/100 ohms, 6,453.2 ohms/100 ohms, and 10 k(ohms)/100 ohms. The major advantage of the tests is that they can be performed in situ using the sensitivity of the CCC bridge. These test procedures have been used to reduce the leakage error uncertainty of CCC ratio measurements linking working standards to the quantized Hall resistance (QHR) and to the NIST calculable capacitor experiment. CCC bridges require that the current which passes through a standard resistor must equal the current through the appropriate CCC winding to very high precision. This can be difficult to verify at or below 1 pA because a large number of possible leakage paths exist. Errors due to six important leakage current paths are given.

G. J. FitzPatrick, and T. R. McComb. 1993, 4p.
Pub. in Proceedings of International Symposium on High Voltage Engineering (8th), Yokohama, Japan, August 23-27, 1993, p387-390.

Keywords: *High voltage, *Kerr cells, *Calibration, Aging(Materials), Electrical measurement, Electric pulses, Precision, Impulses, Reprints, Reference standards, Transfer standards.

Kerr-cell measuring systems can be used for high-voltage measurements from direct voltage up to impulses with a few nanoseconds risetime. In principle, this allows a measuring system for impulses to be calibrated at high-voltage using direct or alternating voltage which can be measured with a smaller uncertainty than is needed for impulse measurements. Unfortunately, the liquid normally used in such systems, nitrobenzene, degrades with time. This paper reports on an investigation into methods of calibrating an aged Kerr-cell so that a measuring system based on a Kerr-cell could be used as a Reference Measuring System. The repeatability of measurements using a fixed geometry to determine the voltage scale factor was also investigated.

Keywords: Electrical measurement, kHz range 100-1000, Interlaboratory comparisons, Reprints, *Thermal voltage converters, *Thermal converters, Intercomparison.

Coaxial, thermal voltage converters were hand-carried among NIST, NPL, PTB, and VSL for intercomparison of ac-dc difference from 100 kHz to 1 MHz. This paper briefly describes the highly varied methods and underlying principles on which ac-dc difference determinations are based in each laboratory, the transport standards used, and the results of the intercomparisons. The ac-dc differences reported by the participating laboratories are in very good agreement. It has been concluded that representative values of ac-dc difference in the 100 kHz to 1 MHz frequency range have been established with 2(Sigma) uncertainties of 4-8 ppm.

Keywords: *Circuit boards, *X-ray inspection, Calibration standards, Qualifications, Resolution, Reprints, *X-ray laminography, *Laminography, Image quality.

X-ray laminography, a tomographic technique that can examine individual planes of focus within a three-dimensional structure, promises to be an excellent method of inspecting complicated circuit boards. The system has accuracy and reproducibility that are appropriate for circuit board inspection, however its application has been limited by a lack of physical standards to verify machine performance. The report describes the development of devices to measure the resolution of a laminography system and reports the system resolution measured with these devices. The system which the authors evaluated uses a scanned beam technique to select a plane of focus (slice) within a three-dimensional structure. The scanned beam technique provides very good z-dimension resolution. It is able to minimize the contribution from out-of-plane objects to the image. However, the authors noted one example of an incorrect height (measurement artifact due to ge-

ometry), when used with a hollow sphere image quality indicator design (not representative of solder joint shapes).

Keywords: *Oscillators, *Frequency stability, Temperature dependence, Pressure dependence, Test methods, Specifications, Guidelines, Precision, Humidity, Reprints.

The purpose of the research is to arrive at tractable (non-burdensome) guidelines, standards, and precautions for test methods used in determining the dependence of the output frequency of precision oscillators on temperature, humidity, and pressure. Over specification, under specification, or the lack of proper specification will miscommunicate. We offer a perspective for the manufacturer and the designer, as well as the user so that clear understanding and communication can occur. The guidelines, standards and precautions encourage consistency and repeatability for measurement and specification of environmental sensitivities. We believe very large cost savings will be appreciated if these guidelines, standards and precautions are followed.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 40, n2 p301-304 1991.

Keywords: *Standards, Superhigh frequency, Reprints, *Voltage standards, Josephson arrays.

A Josephson array voltage standard that operates at 24 GHz has been designed and fabricated. Optimum selection of junction parameters makes possible step stability times of 20 minutes, which is more than adequate for calibrations at the 1-V level. Designs using both probe and finline microwave couplers were tested. The probe coupler was about 3 dB more efficient and allowed a smaller chip and a less expensive mount. The reduced operating frequency allows substantial advantages in cost and reliability over more conventional devices that operate at 70-100 GHz.

Keywords: *Electrical networks, *Analog circuits, *Circuit analysis, Sensitivity analysis, Nonlinear systems, Reprints.

An approach to the analysis of large circuits based on the use of the large change sensitivity technique applied to decomposed networks is presented. As a result of this approach, a simple, compact notation for the solution vector is derived. The method is applicable to nonlinear analogue networks with hierarchical decomposition simulated by inserted ideal switches. A simple illustrative example is given.

Flux-Locked Current Source Reference.
Final rept.
W. L. Tew, and E. R. Williams. 1993, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 42, n2 p186-190 Apr 93.

Keywords: Temperature range 0000-0013 K, SQUID devices, Quantization, Stability, Reprints, *Current sources, Flux transformers, Voltage references.

The quantization of flux in a closed superconducting circuit is used to provide a stable reference current. A 10 mA current source is coupled through a toroidal transformer to a dc SQUID input, and the resulting signal is fed back as an error current. The result is a net flux linkage that exhibits short-term stability of 1 part in 10(exp 9)/h. The net current is quantized with a step size of 59.4 nA, and it will exhibit the same stability as the flux provided the mutual inductance of the transformer remains constant. This current is passed through a precise 100 ohm resistor and compared against Zener diode references. The observed temperature coefficient for the flux transformer is 28.5 + or - 3 ppm/K at 4.2 K. Possible sources for the temperature dependence are discussed.

R. N. Ghosh, E. R. Williams, A. F. Clark, and R. J. Soulen. 1994, 2p.
Pub. in Physica B 194-196, p1007-1008 1994.

Keywords: *Capacitance bridges, Cryogenic temperature, Cryogenic equipment, Electrometers, Precision, Reprints, Single electron tunneling, Electron charge, Dilution refrigerators.

The electronic charge can be determined by placing a known number of electrons on a calibrated capacitor and measuring the resulting voltage. Single electron tunneling (SET) electrometers with sufficient sensitivity for this application have been fabricated. We report on the design and preliminary results of a capacitance bridge experiment using an SET electrometer to measure two capacitors in a dilution refrigerator. This includes discussion of issues such as the leakage rate of a capacitor at cryogenic temperatures and the optimum coupling of the electrometer to the bridge circuit.

Pub. in Review of Scientific Instruments 64, n9 p2676-2678 Sep 93.

Keywords: *Voltage dividers, *Calibration, Temperature control, Temperature measurement, Automation, Linearity, Hz range, Reprints, Inductive voltage dividers, Zeno experiment.

Two inductive voltage dividers (IVDs) used for temperature measurements in NASA's Zeno experiment were tested. In order to obtain the required resolution of 10 parts-per-billion, a 30-bit binary inductive voltage divider developed at the National Institute of Standards and Technology was used to measure the differential linearity of the Zeno IVDs. Automatic measurements were performed on the dividers in the Zeno engineering model at frequencies of 266 and 351 Hz over a ratio range of 0.55-0.56. The measured differential linearity limits of temperature resolution of 5 microK.

Pub. in Proceedings of National Computer Systems Laboratory Workshop and Symposium, Albuquerque, NM., July 25-29, 1993, p225-232.

Keywords: *Voltage dividers, *Calibration, Temperature control, Thermostats, Automation, Impedance bridges, Hz range, Linearity, Tests, Reprints, Inductive voltage dividers, Zeno experiment.

The inductive voltage dividers (IVDs) used in the thermostat of NASA's Zeno experiment were tested using an automatic IVD bridge developed at the National Institute of Standards and Technology (NIST). To achieve + or -10 microK temperature control, the thermostat must be able to measure resistance ratios with a differential linearity of + or -0.1 parts-per-million (ppm). The test results show that within a ratio range of O.5 to 0.6 at frequencies between 200 Hz and 400 Hz, the thermostat IVDs were linear to + or -0.07 ppm.

Pub. in Proceedings of the Annual Symposium on Frequency Control (44th), Baltimore, MD., May 23-25, 1990, p542-548.

Keywords: *Frequency synthesizers, *X band, Frequency discriminators, Microwave oscillators, Superhigh frequency, Sources, Reprints, Phase noise.

We have developed a X-band frequency source that has very high spectral purity and is suitable for frequency synthesis and many kinds of high-resolution spectroscopy. A commercial dielectric resonator oscillator (DRO) is frequency locked to a high-Q cavity used as a frequency discriminator. Many systems have been developed in the past for locking a source to a reference cavity. The distinguishing features of our approach are given. We describe the design of the discriminator cavity, the phase compensated frequency-locked loop, and the phase and amplitude noise performance. We also discuss vibration sensitivity, techniques for automatically locking to the low frequency reference, and the reduction of 60 Hz sidebands.

Keywords: *Resonators, High temperature superconductors, Ferroelectric materials, Superconducting devices, Microstrip devices, Tuning devices, Microwave equipment, YBCO superconductors, Strontium titanates, Thin films, Reprints, Yttrium barium cuprates.

We have fabricated and characterized electrically tunable high temperature superconductor microstrip resonators incorporating YBa2Cu3O(7-x) superconductor and SrTiO3 ferroelectric films. Early versions of these and similar devices were described previously. The resonators consist of two co-linear microstrip line-sections separated by a 5 micrometer gap. The capacitance of the gap influences the frequencies of the odd-order coupled resonances. Inductively choked dc bias lines are attached to each line section so that a bias voltage can be applied to the gap. When the gap is filled with a ferroelectric material, the odd resonances can be tuned. Frequency shifts of 300 MHz have been observed with a bias voltage of 50 V for resonances at 5.6 GHz and 11.6 GHz. The tunability is independent of temperature from 4 K to 80 K.

Pub. in Physical Review B 50, n5 p3158-3164, 1 Aug 94.

Keywords: *Josephson junctions, Scanning electron microscopy, Two dimensional, Aluminum oxides, Niobium, Reprints, Josephson arrays, Vortex dynamics.

Spatially resolved images of the dynamic states of current-biased two-dimensional arrays of Nb/AlO(x)/Nb Josephson junctions were obtained using low-temperature scanning electron microscopy. The arrays were square or rectangular and the maximum size was 20 junctions X 20 junctions. In overdamped arrays, our images at zero or small applied perpendicular magnetic field, together with model calculations, confirm the nucleation of a vortex at one sample edge (or an antivortex at the opposite edge) and its subsequent motion into the array interior. Vortex annihilation due to vortex-antivortex collision was observed to take place in the middle of the array or at the edge opposite to the nucleation edge. These dynamics and the underlying model considerations are similar to that for Abrikosov vortices in the current-induced resistive state of thin film type-II superconductors. The phenomenon of 'row switching' is directly confirmed in images of underdamped arrays. The specific rows experiencing this process change randomly when the same bias point on the current-voltage characteristic is established many times, starting each time from zero current.

A commercial microwave electron cyclotron resonance (ECR) reactor has been optimized for plasma enhanced chemical vapor deposition of silicon dioxide films at deposition temperatures lower than 150 C. A spool piece was added to the system resulting in improved deposition uniformity and lower deposition temperatures. Response surface methodology was used in the ECR system optimization before and after the modification. The response variables were deposition rate, uniformity, index of refraction, film stress, and wet-etch rate. As a result of the studies, several oxide deposition processes have been developed at ambient temperatures. These processes are presently being used in the superconducting-integrated-circuit fabrication facility at NIST. The optimization process and results are discussed.

Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Jnl. of Applied Physics 76, n6 p3835-3846, 15 Sep 94.

Keywords: *Josephson junctions, Phase locked systems, Two dimensional, Frequency standards, Design criteria, Stability, Reprints, *Josephson oscillators, Josephson arrays.

An overview of phase locking in two-dimensional (2D) arrays of identical Josephson junctions is presented. General design criteria are discussed for optimization of power and linewidth. A harmonic balance technique is used to derive an analytic expression for the fundamental power as a function of bias voltage for a single shunted tunnel junction with an external shunt resistor having parasitic inductance. A linear stability analysis is performed on the in-phase state of 2D arrays in the absence of any external load. Most excitation modes in the 2D array are damped, leading to stable phase locking between parallel junctions within each row; however, within the theoretical model, no mechanisms intrinsic to the array were found to induce phase locking between rows of junctions. The results of these calculations and their impact on and relevance to the design of phase-locked Josephson oscillators are discussed.

Keywords: *Superconducting devices, *Logic devices, Josephson junctions, SQUID devices, Design, Reprints, Single flux quantum.

We have optimized the design and calculated the margins for a number of single flux quantum (SFQ) logic elements including AND, OR, XOR, Splitter, DC-to-SFQ converter, and SFQ-to-DC converter. These are the fundamental building blocks necessary to construct more complex logic functions such as the half adder, and full adder. Experimental tests of the primary gates, the AND, OR, XOR, and splitter, were made by imbedding each test gate between DC-to-SFQ converters at the inputs and SFQ-to-DC converters at the outputs. Automated testing of each circuit was used to determine functionality, optimum bias levels, and margins. The experimental bias current margins for each gate are consistent with the simulations. This is the first experimental functional confirmation of these SFQ logic gates.

Pub. in Proceedings of International Symposium on Space Terahertz Technology (5th), Ann Arbor, MI., May 10-12, 1994, p234-243.

Keywords: *Josephson junctions, Phase locked systems, Experimental data, Two dimensional, Noise temperature, Line width, Emission, Reprints, *Josephson oscillators, Josephson arrays.

We present experimental results on the emission from phase-locked two-dimensional arrays of Josephson junctions. We have coupled the emission from 10 x 10 arrays to a room-temperature mixer through a fin-line antenna and WR-12 waveguide. A single voltage-tunable peak was detected up to 230 GHz. A stripline resonance in the antenna reduced the array's dynamic resistance and thereby the emission linewidth to as low as 10 kHz. We extract an effective noise temperature of 14 K from the linewidth data. When the array's emission was coupled to an on-chip detector junction through a dc blocking capacitor, we detected voltage-tunable emission from 75 GHz up to 300 GHz, and in some circuits emission above 400 GHz. The coherent power spectrum depends primarily on internal resonances.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity 3, n1 p2493-2495 Mar 93.

Keywords: *Josephson junctions, Phase locked systems, Frequency dependence, Two dimensional, Coherent radiation, Standing waves, Emission, Reprints, *Josephson oscillators, Josephson arrays.

Coherent emission from two-dimensional arrays of Josephson junctions, coupled to a detector junction through a dc blocking stripline capacitor, was detected over a frequency range from 50 to 210 GHz. A power of 0.26 (micro)W which is larger than the 0.1 (micro)W expected from the RSJ model was detected in a range from 140 to 150 GHz. Frequencies where no emission was detected correspond to standing waves in the capacitor when multiples of the half-wavelength match the capacitor length. Low temperature scanning electron microscopy confirmed the presence of standing waves at these frequencies, but also revealed standing waves at other frequencies indicating an impedance mismatch and a possible extension of the standing waves into the array.

Final rept.
C. A. Hamilton. 1992, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity 2, n3 p139-142 Sep 92.

Keywords: *Josephson junctions, Frequency multipliers, Design, Reprints, *Voltage standards, Single flux quantum.

A Josephson single-flux-quantum voltage/frequency multiplier circuit is proposed as the basic building block

for a new generation of voltage standards. The circuit uses magnetic coupling to synchronize a series array of independent junction oscillators to the flux flow in a Josephson transmission line. A cascade of these circuits can multiply an arbitrarily low input frequency up to the frequency limit of the circuit (approx. 250 GHz) and then add the voltages across approximately 30,000 oscillators to generate precise voltages up to 10 V. Because the oscillators can be switched on and off with a bias current, the output voltage is rapidly programmable. A complete design for a voltage standard programmable in 1.2 (micro)V increments to a maximum of 10 V is proposed. Using existing fabrication technology, the circuit would cover a substrate area of about 1 sq cm and use 67,210 junctions.

Keywords: *Transformers, Superconducting devices, High temperature superconductors, YBCO superconductors, Strontium titanates, Magnetometers, Fabrication, Reprints, *Flux transformers, Yttrium barium cuprates, Multilayers.

We describe an improved interconnect technology for the fabrication of multiturn flux transformers from YBa2Cu3O(7-x)-SrTiO3-YBa2Cu3O(7-x) multilayers. The essential improvements are reductions in the thicknesses of the trilayer films, typically to 100 nm, 250 nm, and 250 nm respectively, and in the deposition rate, to 0.07 nm/laser pulse. This process yields crossovers in which the critical current density in the upper YBa2Cu3O(7-x) film at 77 K is (2-3) x 10(sup 6) A/sq cm. In situ trilayers exhibited 1/f flux noise levels at 1 Hz below the measurement sensitivity of 15 (mu)(Phi)(sub 0) Hz(sup -1/2), where Phi(sub 0) is the flux quantum. However, the flux noise of trilayers in which each layer had been patterned was significantly higher. The best flip-chip magnetometer had a white noise of 40 fT Hz(sup -1/2), increasing to 340 fT Hz(sup -1/2) at 1 Hz; the corresponding flux noise levels were 9 (mu)(Phi)(sub 0) Hz(sup -1/2) and 75 (mu)(Phi)(sub 0) Hz(sup -1/2).

Mutual phase locking between two high-temperature step-edge superconducting-normal metal-superconducting junctions has been investigated using a two-junction circuit with a nonsuperconducting feedback path. The strength of the phase-locked state has been characterized as a function of locking frequency and temperature. Results are presented for a planar circuit as well as for a multilayer circuit incorporating a superconducting ground plane. The observed behavior was significantly enhanced for the circuit over a ground plane. Characterization of the phase locked state at 4 K yielded locking strengths as large as (absolute value of I(sub L))/(I bar)(sub c) = 9%, and maximum locking frequencies to 1.06 THz. The magnitude of the locking strength decreased rapidly with increasing temperature with complete loss of coherence occurring at temperatures greater than 35 K.

F. G. Ascarunz, E. S. Ferre, and F. L. Walls. 1993, 9p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Salt Lake City, UT., June 2-4, 1993, p303-311.

Keywords: *Microwave amplifiers, *Microwave oscillators, *Mixers(Electronics), *Electromagnetic noise, *Amplitude modulation, *Phase modulation, Electrical measurement, Superhigh frequency, X band, White noise, Reprints.

In this paper we report on measurements of phase modulation (PM) and amplitude modulation (AM) noise in a variety of amplifiers, dielectric resonator oscillator (DRO) sources and mixers at 10.6 GHz. There is little information on AM noise and only limited information on PM noise in microwave devices. Two channel measurement systems and cross-correlation analysis were used in these noise measurements. In amplifiers there are at least two random noise processes that generate equal levels of PM and AM noise when the amplifier is in the linear operating range. The noise processes correspond to a flicker noise process and a white noise process. In the DRO sources we show that these noise mechanisms are present in the active components and determine the AM and PM characteristics of the oscillator. We report on noise residuals in mixers from three different companies.

10 kV DC Resistive Divider Calibration.
R. S. Turgel. Jan 95, 57p, NISTIR-5566.

Keywords: *Voltage dividers, *Calibration, Electrical networks, Direct current, Temperature control, High voltage, Computer programs, Voltmeters, Resistors, Kilovolts.

A calibration method for a 10 kV dc ratio divider was developed. The method uses a high-precision digital voltmeter, at the 10 V level, to establish a 10:1 voltage ratio for each decade of the resistive divider and combines these results to obtain an overall voltage ratio of 10,000:1. The linearity of the voltmeter was checked using a Josephson-array voltage standard. The overall ratio agreed with measurements made at 10 kV using a Park-type divider to within the uncertainty limits.

Accuracy and Repeatability in Time Domain Network Analysis.
Final rept.
L. A. Hayden, R. B. Marks, and J. B. Rettig. 1994, 8p.
Pub. in Proceedings of Automatic Radio Frequency Techniques Group Conference Digest, Boulder, CO., December 1-2, 1994, p39-46.

Keywords: *Network analysis, *Electrical measurement, Electrical networks, Electromagnetic noise, Time domain, Reproducibility, Reflectometers, Attenuation, Accuracy, Reprints.

This paper examines the importance of measurement repeatability in time domain network analysis and includes an analysis of the limitations imposed on theoretical accuracy by measurement noise. A closed-loop correction algorithm implemented in a fast, equivalent-time sampling, time domain reflectometer improves source timing accuracy, the dominant cause of nonrepeatability. An example measurement of attenuation in a 3.5 mm coaxial air-line demonstrates performance approaching this theoretical noise limit and the limits imposed by connector repeatability.

Time Domain Network Analysis Using the Multiline TRL Calibration.
Final rept.
R. B. Marks, L. A. Hayden, J. A. Jargon, and F. Williams. 1994, 9p.
Pub. in Proceedings of Automatic Radio Frequency Techniques Group Conference Digest (44th), Boulder, CO., December 1-2, 1994, p47-55.

Keywords: *Network analyzers, *Calibration, Time domain, Reprints, Multiline TRL method, On wafer measurement, Scattering parameters.

We apply the multiline TRL (through-reflect-line) method to the calibration of a time domain network analyzer (TDNA). The calibration removes the effects of cables and connectors, nonideal source and sampler responses, source and sampler mismatch, and frequency-dependent characteristic impedance of the transmission lines. Multiline TRL is especially well suited to TDNA and provides not only a complete calibration but also a full characterization of the transmission lines, information useful in the study of interconnections.

Resonances in Two-Dimensional Array Oscillator Circuits.
Final rept.
P. A. A. Booi, and S. P. Benz. 1995, 4p.
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2899-2902 Jun 95.

Keywords: *Josephson junctions, *Resonance, *Emission, Antennas, Waveguides, Resonance lines, Spectra line width, Oscillators, Circuits, Reprints.

The authors present experimental results on the emission from phase-locked two-dimensional arrays of Josephson junctions. The authors have coupled the emission from 10 x 10 arrays to a room-temperature mixer through a fin-line antenna and WR-12 waveguide. A single voltage-tunable peak was detected up to 230 GHz. A stripline resonance in the antenna reduced the array's dynamic resistance and thereby the emission linewidth to as low as 10 kHz. The authors extract an effective noise temperature of 14 K from the linewidth data.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2723-2726 Jun 95.

Keywords: *Josephson junctions, *Arrays, *Vortices, Absolute zero, Magnetic fields, Electric current, Nucleation, Bias, Reprints, Two dimensional array, SEM(Scanning electron microscopy), Vortex dynamics, LTSEM.

Spatially resolved images of the dynamic states of current-biased overdamped two-dimensional arrays of

Nb/AlOx/Nb Josephson junctions were obtained using low-temperature scanning electron microscopy. The authors present two-dimensional imaging results describing various vortex dynamic regimes in zero applied magnetic field. The nucleation of current-induced vortices at the array boundaries and their subsequent motion into the array interior are observed for bias currents slightly above the array critical current. With increasing bias current, vortex-vortex interaction becomes important. Discussions on the coherent microwave radiation emission are presented.

100 Ampere, 100 kHZ Transconductance Amplifier.
Final rept.
O. B. Laug. 1995, 6p.
Pub. in Institute of Electrical and Electronics Engineers Instrumentation and Measurement Technology Conference (IMTC), Waltham, MA., April 24-26, 1995, p506-511 1995.

Keywords: *Power amplifiers, *Voltage amplifiers, Reprints, Transconductance, Electric power meters.

A high-current, wide-band transconductance amplifier is described that provides an unprecedented level of output current at high frequencies with exceptional stability. It is capable of converting a signal voltage applied to its input into a ground-referenced output current up to 100 amperes rms over a frequency range from dc to 100 kHz with a useable frequency extending to 1 MHz. The amplifier has a 1000 watt output capability, + or - 10 volts of compliance, and can deliver up to 400 amperes peak-to-peak of pulsed current. The amplifier design is based on the principle of paralleling a number of precision bipolar voltage-to-current converters. The design incorporates a unique ranging system controlled by opto-isolated switches, which permit a full-scale range from 5 to 100 amperes. The design considerations for maintaining wide bandwidth, high output impedance, and unconditional stability for all loads are discussed.

Reducing Errors, Complexity, and Measurement Time of PM Noise Measurements.
Final rept.
F. L. Walls. 1993, 9p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Frequency Control Symposium, Salt Lake City, UT., June 2-4, 1993, p289-297.

Keywords: *Signal generators, *Frequency synthesizers, *Oscillators, Reprints, Standards, *Phase noise.

This paper shows that a new measurement technique based on the two-oscillator technique and the addition of a noise source in series with the reference oscillator can significantly reduce calibration time for accurate PM measurements in oscillators and other components as compared to the traditional two-oscillator technique. This technique also significantly reduces the measurement time and improves the accuracy of 3-corner-hat measurements. Measurement complexity is greatly reduced. The noise source is used to generate a known level of PM noise (PMCAL) for calibrating the product of mixer sensitivity and amplifier gain with Fourier frequency. This can be used to correct for PLL effects whem PMCAL is larger than the residual phase noise in the oscillator under test. PMCAL is typically constant to equal to or greater than 0.1 dB for Fourier frequencies from 0 to 5% of the carrier (maximum width typically less than 500 MHz). When the PMCAL is off, the noise added to the reference signal is typically less than -150 dBc/Hz at 1 Hz and -190 dBc/Hz at 10 kHz for carrier frequencies of 5 to 100 MHz. A similar system also works in the microwave range.

Pub. in Proceedings of Materials Research Society, April 4-8, 1994, San Francisco, CA., v347 p215-220.

Keywords: *Circuit boards, *Coaxial cables, *Nondestructive tests, Substrates, Probes, Dielectrics, Wave equations, Mathematical models, Numerical analysis, Sensitivity, Low frequencies, Reprints, *Open-ended probes.

The results of the full-wave model theory for the open-ended coaxial probe with lift-off are presented and are applied to mesurements of thin materials. The model allows the study of the open-ended coaxial prode as a nondestructive testing tool. The equations presented are valid for both dielectric and magnetic materials. The analysis yields insight into the effects of air gaps on probe measurements. Numerical results indicate that the probe is very sensitive to lift-off at low frequencies. This sensitivity decreases somewhat as frequency increases.

G. G. Harman. 1995, 10p.
Pub. in Proceedings of the International Conference on Multichip Modules, Denver, CO., April 19-21, 1995, p292-301.

Keywords: *Multichip modules, *Microwave substrates, *Material modules, Skin(Anatomy), Reprints, *Wire bonding, Soft substrates.

Several classes of 'soft substrates' can be difficult to wire bond. These include MCM-Ds, MCM-Ls, flex substrates, some complex IC chips with multilevel polymer-insulated metallization, and microwave hybrids made on PTFE substrates. The bonding solutions include: increasing the bond-pad metal thickness and area and applying a hard metal under-layer, a hard metal top-layer, or some combination of these, -capped with a highly-bondable metal. A summary is given of the bond-pad metallurgy and bonding machine parameters that have produced successful wire bonding to a wide variety of MCMs and other 'soft substrates.' Wire-bonding yield is also generally correlated to the elastic modulus and Tg of the polymer or laminate, and to the yield strength of the metal pads. Thus, the choice of material properties for the substrate and bond pads is at least as important as the actual bonding machine setup in achieving high-yield wire bonding. Other considerations, such as the possible use of high-frequency ultrasonic bonding and high-clock-rate skin-effect losses on the multilayer bond pads, are discussed.

Keywords: *SQUID devices, *Noise reduction, *Low frequency, *Switches, Optical switching, Niobium, Laser radiation, Superconducting devices, Circuits, Modulation, Frequency dependence, Reprints, SQUID(Superconducting Quantum Interference Device), Microbridges.

The authors have developed a technique to modulate the input to a superconducting quantum interference device (SQUID) using a very low noise double-pole, double-throw switching network. This network is composed of four niobium microbridges that are driven normal in pairs by pulses of laser light. An input signal is modulated at a frequency above the 1/frequency noise regime, amplified by the SQUID, and subsequently demodulated to obtain an output in which the excess low-frequency SQUID noise has been removed. With this technique, the authors have reduced the low-frequency noise by an order of magnitude in energy over measurements made without this technique.

D. C. DeGroot, and R. B. Marks. 1995, 10p.
Pub. in Automatic RF Techniques Group Meeting (ARFTG), Scottsdale, AZ., November 30-December 1, 1995, p19-28.

Keywords: Automation, Calibration, Reprints, *Time domain network analysis, *Instrument settings.

In this work, we demonstrate how changes in sample density, time-window size, and waveform averaging affect the accuracy and acquisition time of calibrated time-domain network analysis. One of the key results from this study is that accuracy can be enhanced by eliminating the incident step-edge signal from the time-domain reflection waveform before maximizing the instrument's vertical scale. This study identifies the trade offs between accuracy and measurement speed and examines other trands to provide general guidance in establishing reliable and efficient time-domain network analysis measurements for a variety of rf and microwave applications.

Direct Comparison Transfer of Microwave Power Sensor Calibrations.
Technical note.
M. P. Weidman. Jan 96, 20p, NIST/TN-1379.
Also available from Supt. of Docs. as SN003-003-03385-5.

Keywords: *Power measurement, *Microwave equipment, *Calibration, Electrical measurement, *Microwave power standards.

This report describes a basic, but potentially accurate, transfer technique for comparing microwave power sensors. The technique is not new, but the specific applications are. This report is written to supplement the existing literature. The method transfer the effective efficiency of a standard power sensor to an unknown (uncalibrated) power sensor. The power sensors may be bolometric (thermistor mounts), thermoelectric, or

diode types, and each type will have inherent limitations. The technique can be implemented with a variety of commercial coaxial and rectangular waveguide components. Measurement uncertainty is discussed in this report so that a potential user can quantify transfer uncertainties.

The current amplitudes of Shapiro steps in large-area metallic-barrier Josephson junctions, both with and without a ground plane, are investigated with the goal of optimizing junction parameters for programmable voltage standards. Using the resistively shunted junction model without capacitance, the authors calculate maximum step amplitudes as a function of reduced frequency and junction dimension for both one- and two-dimensional junctions. For junctions without a ground plane, the authors conclude that step amplitudes of order 10 mA are practical, but significantly larger amplitudes require excessive microwave power.

Novel Vortex Dynamics in Two-Dimensional Josephson Arrays.
Final rept.
S. G. Lachenmann, T. Doderer, R. P. Huebener, P. A. A. Booi, and S. P. Benz. 1994, 8p.
Pub. in Proceedings of the International Conference on Nonlinear Superconducting Devices and High-Tc Materials, Capri, Italy, October 8-13, 1994, p365-372.

Keywords: *Josephson junctions, *Arrays, *Vortices, Superconductivity, Reprints, Two dimensional array, Vortex dynamics.

The authors present spatially resolved studies of vortex dynamics in two-dimensional Josephson-junction arrays. For bias currents smaller than the array critical current, a small local thermal perturbation at the array boundaries lowers the vortex entry barrier and the array switches to the resistive state. For bias currents slightly above the array critical current vortices and antivortices are nucleated at opposite edges of the array. An alternating crossing vortex motion (ACVM) is observed experimentally.

Series arrays of Nb-PdAu-Nb Josephson junctions have been fabricated with characteristics ideally suited for application in programmable voltage standards and digital/analog convertors. Large arrays of junction with applied microwave power showed constant voltage steps with current amplitudes as large as 7 mA. A novel coplanar waveguide design has enabled uniform microwave power coupling to a 5-segment array of 8192 total junctions so that each array segment has constant voltage steps over the same bias current range. The 8192-junction device generated 1.1 mA steps at 186 mV with 11 GHz power and a maximum constant voltage step of 260 mV at 15.34 GHz.

The authors analyze the limitations imposed by junction capacitance and the parasitic inductance associated with shunt resistors on the performance of Nb/Al-AlOx/Nb-junction-array oscillators. The authors use wide junctions that are in situ deposited on top of PdAu resistor films (to minimize inductance) and are situated about Nb ground planes to ensure uniform current injection. From the measured parasitics, the authors infer that maximum power and frequency that can be obtained for critical-current densities Jc less than or equal to 100 kA/cm squared. The authors illustrate these findings with experimental results of a 1.968 junction array have Jc=10 Ka/cm squarted that was found to couple 0.1 - 0.8 mW to a 56-ohm load in the range 100-300 GHz.

Keywords: *Microwave amplifiers, *Amplitude modulation, *Phase modulation, *Electromagnetic noise, Frequency domain, Standards, Electrical measurement, Very high frequency, High frequency, Reprints.

In the paper, the authors report the results of extensive research on phase modulation (PM) and amplitude modulation (AM) noise in linear bipolar junction transis-

tor (BJT) amplifiers. BJT amplifiers exhibit 1/f PM and AM noise about a carrier signal that is much larger than the amplifier's thermal noise at those frequencies in the absence of the carrier signal. The authors work whows that the 1/f PM noise of a BJT based amplifier is accompanied by 1/f AM nose which can be higher, lower, or nearly equal depending on the circuit implementation. The 1/fAM and PM noise in BJT's is primarily the result of the 1/f fluctuations in transistor, current, transistor capacitance, circuit supply voltages, circuit impedances, and circuit configuration. The author discuss the theory and present experimental data in reference to common emitter emplifiers, but the analysis can be applied to other configurations as well. The study provides the functional dependence of 1/f AM and PM noise on transistor parameters, circuit parameters, and signal frequency, thereby laying the groundwork for a comprehensive theory of 1/f AM and PM noise in BJT amplifiers. The authors show that in many cases the 1/f PM and AM noise can be reduced below the thermal noise of the amplifier.

Quest to Understand and Reduce l/f Noise in Amplifiers and Baw Quartz Oscillators.
Final rept.
F. L. Walls. 1995, 18p.
Pub. in Proceedings of the European Frequency and Time Forum (9th), Besancon, France, March 8-10, 1995, p227-244.

Keywords: *Microwave amplifiers, *Microwave oscillators, *Quartz resonators, Amplitude modulation, Phase modulation, Electromagnetic noise, Frequency measurement, Reprints, Phase noise.

The paper attempts to trace the highlights in the development of precision oscillators from a historical point of view and speculates on further improvements in their 1/f performance. Using Leeson's model the closed loop phase modulation (PM) noise and frequency stability can be estimated from the stability of the quartz resonator, the resonator quality factor, and the noise of the sustaining amplifier coupled with the stability of the oven and various environmental parameters. The inherent frequency stability of the oscillator is primarily limited by the 1/f PM noise of the BAW quartz resonator and the sustaining amplifier. The paper, therefore, focuses on describing the quest to characterize, understand, and reduce the 1/f PM noise of amplifiers and BAW resonators.

Pub. in Institute of Electrical and Electronics Engineers Transacations on Instrumentation and Measurement, v45 n3 p440-444 Jun 96.

Keywords: *Power amplifiers, *Voltage amplifiers, Transconductance, Electric power meters, Reprints.

A high-current, wide-band transconductance amplifier is described that provides an unprecedented level of output current at high frequencies with exceptional stability. It is capable of converting a signal voltage applied to its input into a ground-referenced output rms current up to 100 A over a frequency range from dc to 100 kHz with a useable frquency extending to 1 MHz. The amplifier has a 1000-W output capability plus or minus 10 V of compliance, and can deliver up to 400 A of pulsed peak-to-peak current. The amplifier design is based on the principle of paralleling a number of precision bipolar voltage-to-current converters. The design incorporates a unique ranging system controlled by optoisolated switches, which permit a full-scale range from 5 A to 100 A. The design considerations for maintaining wide bandwidth, high output inpedance, and unconditional stability for all loads are discussed.

Pub. in Applied Physics Letters, v68 n26 p3799-3801 Jun 96.

Keywords: *Josephson junctions, *Arrays, Phase locked systems, Current, Power, Reprints, *Josephson oscillators.

The authors have experimentally coupled emission from a distributed series array of 1968 wide Josephson junctions to an on-chip 10.8 omega load and detected 0.16 mW at 240 HGz. The result is achieved by reducing the parasitic inductance associated with shunt resistors so that functions with critical currents of 23 mA are effectively shunted at the operating frequency. The power is less than the 1.3 mW expected from theory due to the presence of a large impedance mismatch. Optimization of the load design will allow the detection of mW power.

Keywords: *Voltage dividers, Electrical networks, Capacitors, Circuitry, Feedback amplifiers, Reprints.

A voltage divider has been designed which consists of a group of solid dielectric capacitors maintained in a temperature-controlled environment, an external compressed-gas capacitor, and special electronic circuitry. The prototype divider has been constructed and preliminary results obtained to validate the operating principle and accuracy target. The principal innovative part is a feedback amplifier, complemented with an 'open-loop' voltage source controlled from the high voltage. This enables achievement of a voltage ratio that is equal to the reciprocal of the capacitance ratio to well within one ppm without encountering dynamic instability problems.

Electromechanical Devices

We present two test structures for establishing design rules for minimum spacing of a new class of microelectromechanical-based sensors and actuators fabricated through commercial complementary metal-oxide-semiconductor (CMOS) foundries. The microelectromechanical devices are suspended membranes of passivation glass that encapsulates polysilicon and aluminum layers in the CMOS process. The membranes are suspended by anisotropically etching the silicon substrate through openings in the passivation glass. These test structures measure the lateral undercutting and the rotational misalignment of openings in passivation oxide that are used to make the microelectromechanical devices, and give information for the layout, and proximity to circuits of the microelectromechanical devices. Two test structures are discussed, one optical and one electrical, and results for a 2 micrometer n- and p-well CMOS process run are presented.

Programmable Guarded Coaxial Connector Panel.
Final rept.
L. L. Kile. 1995, 5p.
Pub. in National Conference of Standards Laboratories, Dallas, TX., July 16-20, 1995, p285-289.

Keywords: *Coaxial cables, *Connectors, *Automated systems, Programmable switch, Resistance measurements, Reprints.

A programmable guarded connector panel using coaxial connectors has been specifically designed for an automated measurement system for the comparison of four-terminal resistors. A computer controlled XYZ positioning system is used to move a 4-connector Z arm over a panel of 72 coaxial connectors mounted in the XY plane. This provides for 30 four-terminal channels. The outer shields of the connectors are electrically isolated from one another to allow the shields to be driven at guard voltages to supress errors caused by leakage currents. The resistance repeatability of the plug-socket connections including resistance variations of 12 m of AWG 12 connecting cable is typically 10 microohms. Variations of thermoelectric voltages over a 10-minute measurement period of the plug-socket connections are typically less than 10 nV. This automatic switching system may be useful for other types of precision measurements where guarding, contact resistances, and thermoelectric voltages are critical factors.

Pub. in Jnl. of Vacuum Science and Technology B, v13 n2 p571-575 Mar/Apr 95.

Keywords: *Electron beams, *Field emission, *Planar structures, *Lenses, Collimation, Focusing, Electrodes, Gates(Circuits), Experimental data, Cathodes, Reprints, *Field emitter arrays, *Spindt cathodes.

Experimental data is analyzed for a method of collimating and focusing electron beams emitted from field-emitter arrays (FEAs) where the focusing electrode is co-planar of nearly co-planar or nearly co-planar with the gate electrode. The focusing mechanism is provided by the fringe field formed along the edge of the gate electrode due to the potential difference between grid and the substrate or the gate and another lens electrode. The concept is verified by EGUN2 simulations. Experiments performed to verify the theory and focusing of electron beams emitted from FEAs were observed. Elongated emission patterns were consistently observed, indicative of one-dimensional focusing.

Cryogenic Blackbody Calibrations at the National Institute of Standards and Technology Low Background Infrared Calibration Facility.
R. U. Datla, M. C. Croarkin, and A. C. Parr. 1994, 43p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p77-119 Jan/Feb 94.

Keywords: *Blackbody radiation, *Calibration, Intermediate infrared radiation, Near infrared radiation, Infrared radiometers, Cryogenic equipment, Light sources, Measurement, Uncertainty, Sensors, Reprints, Low Background Infrared Calibration Facility, LBIR facility, US NIST.

The Low Background Infrared Calibration Facility (LBIR) at the National Institute of Standards and Technology has been in operation for calibration measurements of the radiant power emitted from infrared radiation (IR) sources, such as cryogenic blackbodies, for more than 2 years. The IR sources are sent to NIST by customers from industry, government, and university laboratories. An absolute cryogenic radiometer is used as the standard detector to measure the total radiant power at its aperture. The low background is provided by a closed cycle helium refrigeration system that maintains the inner parts of the calibration chamber at 20 K. The radiance temperature of the blackbody is deduced from the measured power and compared with the blackbody temperature sensor data. The calibration procedures and data analysis are illustrated using the measurements of a typical blackbody.

Interface Roughness-Induced Changes in the Near-E(sub 0) Spectroscopic Behavior of Short-Period AlAs/GaAs Superlattices.
Final rept.
D. Chandler-Horowitz, J. G. Pellegrino, N. V. Nguyen, and S. B. Qadri. 1994, 5p.
Pub. in Materials Research Society Symposium Proceedings, v326 p145-149 1994.

Keywords: *Superlattices, Aluminum gallium arsenides, Aluminum arsenides, Optical properties, Perturbations, Ellipsometry, Reprints, *Interface roughness, Photoreflectance.

The perturbations on the optical properties introduced by increased interface roughness in 3x3 short-period AlAs/GaAs superlattices (SLs) were investigated through an examination of the position and line shape of the E(o) (direct gap) feature in photoreflectance (PR) and spectroscopic ellipsometry (SE). The degree of interface roughness in the SLs was controlled by a choice of the growth conditions and the buffer layer thickness. The structural behavior was characterized by X-ray diffraction. The measured spectra from PR and SE were compared to those from an Al(x)Ga(1-x)As (x=0.5) alloy reference specimen grown under nearly identical conditions.

One Gigarad Passivating Nitrided Oxides for 100% Internal Quantum Efficiency Silicon Photodiodes.
Final rept.
R. Korde, J. S. Cable, and L. R. Canfield. 1993, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Nuclear Science 40, n6 p1655-1659 Dec 93.

Keywords: *Ultraviolet detectors, *Silicon diodes, *Photodiodes, Vacuum ultraviolet radiation, Radiation resistance, Quantum efficiency, Silicon dioxide, Reprints.

100% internal quantum efficiency silicon photodiodes with 4 to 8 nm passivating silicon dioxide have been fabricated by rapid thermal nitridation in nitrous oxide and ammonia ambients with the aim of increasing their radiation hardness. The fabricated diodes were exposed to 10.2 eV photons using a hydrogen plasma light source and a normal incidence monochromator. The measured quantum efficiency degradation indicates that the interface trap area density increases sublinearly with dose up to a measured dose of one Gigarad. No noticeable change in quantum efficiency over the range of 50 to 250 nm was observed after exposure to 100% relative humidity. This suggests that the nitrided SiSiO2 interface is practically insensitive to moisture.

Modified Airy Function Method for the Analysis of Tunneling Problems in Optical Waveguides and Quantum Well Structures.
Final rept.
R. Sukhdev, A. K. Ghatak, I. C. Goyal, and R. L. Gallawa. 1993, 6p.
Pub. in Institute of Electrical and Electronics Engineers Jnl. of Quantum Electronics 29, n2 p340-345 Feb 93.

Keywords: *Optical waveguides, *Quantum wells, *Electron tunneling, One dimensional, Airy function, WKB approximation, Potentials, Reprints.

We present a simple method for the analysis of tunneling through an arbitrary one-dimensional potential barrier, based on the modified Airy function approach. We have considered truncated step-linear, step-exponential, parabolic, and quartic potential barriers. The results have been compared with those obtained by the conventional WKBJ, modified WKBJ, and the matrix method. The effect of the truncation level on the tunneling coefficient has also been investigated. The tunneling coefficient is sensitive to the truncation level. For the step-linear potential, the tunneling coefficient is a monotonically decreasing function of the truncation level, while for the parabolic potential, it oscillates before saturating to a constant value.

Optical current transducers (OCTs) are well-suited for current measurements in high voltage applications because they offer advantages over conventional oil-filled current transformers such as greater immunity from electromagnetic interference (EMI), intrinsic safety, and wide dynamic range. This paper describes an OCT designed and built at the National Institute of Standards and Technology (NIST) for in the development of calibration methods for OCTs for power system applications. The design and operating characteristics of the NIST OCT are described, and the results of tests for sensitivity, linearity, and dynamic range are reported. Some of the sources of measurement error are discussed.

Keywords: *Satellite instruments, *Infrared detectors, *TIROS satellites, *GOES satellites, Mercury cadmium tellurides, Intermediate infrared radiation, Shubnikovde Haas effect, Meteorological satellites, Photoconductive cells, Magnetoresistivity, Metallizing, Packaging, Bonding, Calibration, Scanning capacitance microscopy, Test structures.

An extensive study was carried out to improve the characterization and evaluation methods used for HgCdTe (mercury cadmium telluride) photoconductive infrared detectors used in GOES and TIROS satellites. High-field magnetotransport techniques were used to determine the electrical properties of the detector accumulation layers, which partially control their detectivities. Assessments were made of the quality of the bonding and packaging used in detector fabrication, and a list of recommended practices was produced. The applicability of scanning capacitance microscopy and test structures to detector-array evaluation is discussed, and finally recommendations are made for standardized detector calibration. The results of this work have provided new and more refined measurement methods that can be adapted by the detector manufacturers to improve performance and yield.

Electro-Optical Sensor for Surface Displacement Measurements of Compliant Coatings.
Final rept.
D. Adair, W. M. Madigosky, and N. E. Mease. 1991, 2p.
Pub. in Review of Scientific Instruments 62, n6 p1652-1653 1991. Sponsored by Admiralty Research Establishment, Portland (England). and Naval Research Lab., Washington, DC.

Keywords: *Displacement measurement, *Vibration measurement, Light emitting diodes, Phototransistors, Hydroelasticity, Hydrodynamics, Gallium arsenides, Silicon, Sensors, Reprints, Compliant coatings.

A method has been developed primarily to quantify the characteristics of hydroelastic instability waves on an elastic surface but which may also be applied to vibration measurements in general. The instability waves to be investigated result from the reaction of a compliant coating to the hydrodynamic forces of the boundary layer flowing over it. The present displacement sensor comprises a gallium arsenide infrared emitting diode in conjunction with a spectrally matched silicon phototransistor. It was found that this conbination could be designed to give an analog linear response in the region 4.5mm < d < 6.5mm, where is the distance from the reflecting surface to the phototransistor. Variation in voltage to change in d was found to be approximately 1.5mV/m when using polished aluminum as the reflecting surface and 0.5mV/(mu)m when using silicon gel impregnated with calcium carbonate.

Silicon Photodiodes Optimized for EUV and Soft X-Ray Regions.
Final rept.
L. R. Canfield, J. Kerner, and R. Korde. 1990, 6p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Extreme Ultraviolet, X-ray, and Gamma-ray Instrumentation for Astronomy, San Diego, CA., July 11-13, 1990, v1344 p372-377.

Keywords: *X-ray detection, *Ultraviolet detectors, *Silicon diodes, *Photodiodes, Extreme ultraviolet radiation, Soft x rays, Radiometry, Reprints.

Silicon photodiode detectors are now being routinely fabricated with almost no internal loss mechanisms. Such detectors have also been optimized in a windowless configuration for use in the extreme ultraviolet/soft X-ray region. These photodiodes have stable efficiencies (electrons per incident photon) which are essentially linear with photon energy (in this region), and which exceed 1 electron per incident photon for photon energies of about 10eV and beyond. In addition to reporting the most recent performance parameters of devices with active areas of 1 sq cm and 3 sq cm, the temporal stability of devices with measurements spanning more than a year will be shown to be quite acceptable for photon energies > 25eV. Silicon photodiodes of this type have numerous applications in the extreme ultraviolet and soft X-ray regions where their relative ease of use, low cost, stability, extremely high efficiency, and ability to operate in the presence of gases can be profitably exploited. Although silicon detectors are by nature very wide band detectors, narrow bandpass characteristics may be easily developed by directly overcoating the silicon dioxide outer surface of the basic photodiode with one or more thin films of appropriate materials. Examples of photodiodes whose responses have been thus tailored for use in the extreme ultraviolet are presented.

Keywords: *Surface emitting lasers, Electron microscopy, Photoluminescence, Gallium arsenides, Metrology, Wafers, Reprints, Double crystal x-ray diffractometry, Photoreflectance.

Several analytical tools are applied to characterize vertical-cavity surface-emitting laser structures grown on GaAs wafers. These epitaxial structures are amenable to x-ray, electron-beam, and optical metrologies. Cross-sectional scanning electron microscopy and transmission electron microscopy were used to measure layer thicknesses and uniformity. Photoluminescence wafer mapping was used to determine alloy composition uniformity across the wafer. Photoreflectance was also used to determine alloy composition. Cross-sectional microphotoluminescence was used to measure average alloy compositions in the top and bottom mirrors. Reflectance spectroscopy was used to characterize the cavity resonances and mirror layers. Double-crystal x-ray diffractometry (DCXRD) was used to characterize mirror layer dimensions, uniformity, and average alloy composition. Excellent agreement was found among these measurement techniques and between simulations and measurements. The results demonstrate the accuracy of the device simulation tools and the applicability of DCXRD in analyzing these structures.

Keywords: *Electric current, *Magnetic fields, *Magnetometers, Reprints, Magnetic measurement, Faraday effect, Thermal stability, Optical fibers, Birefringence, Reviews, *Fiber optic sensors, *Current sensors.

The last few years have seen dramatic progress in the development of Faraday effect sensors for measuring both magnetic fields and electric current. In the case of magnetic field sensors, the most significant advances have resulted from an investigation of new materials, especially the ferrimagnetic iron garnets. Minimum detectable magnetic fields have been reduced by several orders of magnitude to about 100 pT/Hz(sup 1/2) at 500 Hz and bandwidths of hundreds of megahertz have been obtained. In the case of electric current sensors, new methods of avoiding the effects of linear birefringence in optical fiber have resulted in much smaller and more stable sensors. One of those approaches, annealing of the fiber to reduce birefringence, has yielded sensors with temperature stabilities near that of the material limit, < 10(sup -4)/K. These topics and other developments that have occurred since a previous summary (Proc. SPIE 985 138-150 (1988)) are discussed in the review.

Optically Sensed EM-Field Probes for Pulsed Fields.
Final rept.
M. Kanda, and K. D. Masterson. 1992, 7p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers 80, n1 p209-215 Jan 92.

Keywords: *Probes(Electromagnetic), *Photonics, Electromagnetic fields, Electromagnetic pulses, Transfer functions, Electrooptics, Modulators, Reprints.

We discuss the characteristics of photonic probes that give them the potential to measure pulsed electromagnetic fields more accurately than has been possible in the past. An overview of system design is presented with particular emphasis placed on the transfer functions of appropriate antennas and electro-optic modulators. Noise sources which limit the sensitivity to low level signals are discussed and used to determine the noise equivalent field (NEF). The characteristics of some sensors developed by NIST are presented, and their performances relative to estimated practical limits for the NEF are indicated. Optical guided wave technology appears to hold considerable promise for fabricating modulators with a wide variety of operating parameters that can improve probe performance and extend their applications to a wider region of the electromagnetic spectrum.

Keywords: *Mercury cadmium tellurides, *Electrical resistivity, Liquid phase epitaxy, High resolution, Bulk semiconductors, Room temperature, Electric contacts, Recrystallization, Thin films, Reprints, *Resistivity mapping, Contact resistivity.

The fine-scale resistivity variations of slices of bulk, n-type Hg(1-x)Cd(x)Te (HgCdTe) grown by the solid-

state recrystallization (SSR) process and thin-film epitaxial layers of HgCdTe grown by liquid phase epitaxy (LPE) on SSR substrates were mapped at room temperature (297 K). An automatic probe station was used to make four-probe resistance measurements, spaced 80 micrometers apart, on lithographically defined metal-to-HgCdTe contacts. Most slices of SSR HgCdTe were found to have resistivities that increased from the center to the outside edge, and some SSR material also showed small inclusions with resistivity either higher or lower than the surrounding material. LPE material was found to have a more random variation in resistivity than SSR HgCdTe material. Also, the metal-semiconductor contact resistivity of In/Pb/In/Ni contacts to n-type HgCdTe was measured to be in the range of 0.3 to 20 X 10(-5) ohm cm for HgCdTe resistivities varying from 0.01 to 0.1 ohm cm.

Keywords: *Mercury cadmium tellurides, *Infrared detectors, Integrated circuits, Process control, Gallium arsenides, Microelectronics, Silicon, Reviews, Reprints, *Test structures.

The impact of microelectronic test structures, as they have been applied to silicon integrated circuits (ICS) and gallium arsenide monolithic microwave integrated circuits (MMICS), is reviewed. General principles for the use of test structures with possible applications to infrared (IR) detector technology based on HgCdTe and other materials are emphasized. The uses of test structures for Si and GaAs, test chip design methodology and some examples of how test structures have been applied for process control and to increase yield are discussed. Specific test structures and techniques that have been applied to IR detectors are also reviewed. The basic design considerations and measurements possible with each class of test structure are discussed. The important experience of the Si and GaAs industries, applicable to IR detectors, is that significant yield improvement is possible with improved process control using test structures. Increased research efforts to expand the applications of test structures to IR detector manufacture are indicated.

Keywords: *Mercury cadmium tellurides, Activation energy, Electron traps, Hole traps, Interstitials, Impurities, Reprints, Resonance ionization spectroscopy.

A technique for studying low concentrations of trap levels in narrow-gap Hg(1-x)Cd(x)Te has been combined with the deliberate introduction of defects to determine the activation energies of these impurities in this ternary material. In this investigation, mercury (Hg) interstitials, believed to be responsible for dark current in metal-insulator-semiconductor devices, were deliberately introduced into samples with x approx = 0.22 and x approx = 0.24. Each sample was divided into two parts with the second part of each slice used as a control. The results from these samples provide direct evidence that Hg interstitials create trap levels near 45 and 60 meV above the valence-band edge for these x-value samples.

Pub. in Jnl. of Electronic Materials 22, n8 p985-991 1993.

Keywords: *Mercury cadmium tellurides, *Infrared detectors, *Passivation, Shubnikov-de Haas effect, Photoconductive cells, Two dimensional, Electron gas, Surfaces, Reprints.

Some processes used to passivate n-type mercury cadmium telluride photoconductive infrared detectors produce electron accumulation layers at the surfaces, which result in 2D electron gases. The dispersion relations for the electric subbands that occur in these layers have been calculated from first principles. Poisson's equation for the built-in potential and Schroedinger's equation for the eigenstates have been solved self-consistently. The cyclotron effective masses and Fermi energies have been computed for each subband density for 12 total densities between 0.1 to 5.0 X 10(sup 12)/sq cm. Results are discussed. These results provide a basis for characterizing the passivation processes, which greatly affect device performance.

Interface Roughness of Short-Period AlAs/GaAs Superlattices Studied by Spectroscopic Ellipsometry.
Final rept.
N. V. Nguyen, J. G. Pellegrino, P. M. Amirtharaj, D. G. Seiler, and S. B. Qadri. 1993, 8p.
Pub. in Jnl. of Applied Physics 73, n11 p7739-7746, 1 Jun 93.

Keywords: *Superlattices, *Interfaces, Molecular beam epitaxy, Gallium arsenides, Aluminum arsenides, Thin films, Optical properties, Ellipsometry, Roughness, Reprints.

Spectroscopic ellipsometry (SE) has been used to study the effects of interface roughness on the optical properties of ultrathin short-period 3x3 GaAs/AlAs superlattices grown by molecular-beam epitaxy (MBE). The complex dielectric function and thickness of the whole superlattice and the thickness of the native oxide overlayer were simultaneously determined by an inversion technique from data in the 1.5-5.0 eV region. The main optical critical points E(0), E(0) + Delta(0), E(1), E(1) + Delta(1), and E(2) were deduced by line-shape fitting of the second derivative of the complex dielectric function of the superlattice to the analytical line-shape expression. The interface roughness is found to shift the optical transitions, except E(2), to higher energy and broaden their line shapes. A simple interpretation of the shift and broadening is given. The interface roughness and layer thicknesses obtained by SE are found to be consistent with the results of x-ray diffraction and Raman scattering studies previously reported. The results in the study demonstrate the capability of the post-growth nondestructive characterization by SE to provide useful information about the interface quality of superlattice structures, and consequently to optimize the MBE growth conditions in order to achieve the desired structural parameters.

Pub. in Thin Solid Films 220, p176-183 1992.

Keywords: *Superlattices, *Interfaces, Molecular beam epitaxy, Surface emitting lasers, Aluminum arsenides, Gallium arsenides, Thin films, X-ray diffraction, Roughness, Reprints, Edge emitting lasers.

Superlattices composed of aluminum, gallium and indium are currently employed in a variety of device-related applications. Among these are edge-emitting GRINSCH lasers and vertical cavity surface emitting laser diodes. As the individual layer thickness is reduced, the role of interface sharpness becomes more critical in ensuring good two-dimensional growth. This work addresses the relationship between interface roughness and superlattice crystallinity for short-period AlAs/GaAs superlattices. Thin short-period superlattices with active layer thicknesses of 30 nm or less were also investigated to help determine the interface sharpness in the initial stages of growth. X-ray diffraction was used to assess interface roughness and to calculate superlattice periodicity. These results are compared with those obtained by reflection high energy electron diffraction (RHEED), Raman spectroscopy, and spectroscopic ellipsometry. The results indicate that interface roughness is promoted by a reduced arsenic flux growth condition at normal growth temperatures for short-period superlattices. The results also suggest that, for thin superlattices, a 10 nm buffer layer enhances interface roughness in the initial stages of growth and compromises the subsequent epilayer crystallinity. An analysis of these results in the light of structural, dynamical, and optical data is presented.

Pub. in Jnl. of Vacuum Science and Technology A 11, n4 p917-922, Jul/Aug 93.

Keywords: *Superlattices, *Interfaces, Molecular beam epitaxy, X-ray diffraction, Gallium arsenides, Roughness, Thin films, Reprints, Heterostructures.

Superlattices composed of III-V heterostructures have established applications in high-speed electronic and optoelectronic devices. As layer thicknesses are reduced, the role of heterostructure interface sharpness becomes more critical to ensuring high quality two-dimensional growth. In this work, short-period (less than 1 nm) superlattices with active layer thicknesses of 31 nm were investigated to assess interface roughness in the initial stages of growth. X-ray diffraction was used to evaluate interface roughness and to calculate superlattice periodicity. Results suggest that surface roughening by islanding may be promoted by GaAs buffer layers that are 10-100 nm thick. Smoother inter-

faces were obtained in samples with buffer layers 250 nm and greater.

Pub. in Applied Optics 31, n34 p7226-7231, 1 Dec 92.

Keywords: *Ge semiconductor detectors, *Infrared detectors, *Photodiodes, Interlaboratory comparisons, Near infrared radiation, Optical communication, Radiometry, Reprints, Intercomparison.

An intercomparison of spectral responsivity measurements has been carried out among the national laboratories of 13 countries. Measurements were made at wavelengths of 1300 and 1550 nm, which are important in optical communication systems. Three germanium photodiodes were circulated in each of three separate paths, beginning and ending at the National Institute of Standards and Technology as the coordinating laboratory. The results show agreement within 1%.

Far-Infrared Kinetic Inductance Detector.
Final rept.
E. N. Grossman, D. G. McDonald, and J. E. Sauvageau. 1991, 4p.
Sponsored by Strategic Defense Initiative Organization, Washington, DC. Innovative Science and Technology.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p2677-2680 Mar 91.

Keywords: *Superconducting devices, *Infrared bolometers, *Infrared detectors, Superconducting films, Far infrared radiation, SQUID devices, Mixers(Electronics), Temperature range 0000-0013 K, Thin films, Inductance, Inductors, Heterodyning, Reprints, Niobium titanium, Photoinductors.

Extremely sensitive far-infrared detectors suitable for both direct detection and heterodyne applications are possible, based on micrometer-sized thin films with thickness less than a superconducting penetration depth. The penetration depth of such a film, and therefore its inductance, varies with temperature and with quasiparticle population (described by an effective temperature T*), resulting in both bolometric and non-equilibrium 'photoinductive' responses. Common magnet alloys such as NbTi are the natural choice for liquid-He temperature operation. A detailed analysis predicts a (phonon-limited) NEP of about 4 x 10 (exp -17) W/Hz(sup 1/2) for a bolometer with an iridium kinetic inductor operated at 0.1 K. A heterodyne noise temperature of 2250 K (SSB) at 3 THz, with 200 MHz bandwidth is predicted for a NbTi mixer operated at 4 K.

Metrology for Electromagnetic Technology: A Bibliography of NIST Publications.
A. J. Smith. Sep 94, 93p, NISTIR-5029.
Supersedes PB94-108776.

Keywords: *Optoelectronic devices, *Superconductor devices, *Magnetic measurement, *Metrology, *Bibliographies, Optical communication, Optical fibers, Optical waveguides, Fiber optics, Solid state lasers, YBCO superconductors, High temperature superconductors, Josephson junctions, SQUID devices, Cryogenics, *Electromagnetic metrology, *Cryoelectronics, US NIST.

This bibliography lists the publications of the personnel of the Electromagnetic Technology Division of the National Institute of Standards and Technology (NIST) during the period from January 1970 through publication of this report. A few earlier references that are directly related to the present work of the Division are also included. Keywords include cryoelectronics, electromagnetic metrology, lasers, optical fibers, and superconducting materials. This bibliography is expected to be the last from the Electromagnetic Technology Division since the Division is in the process of being split into two Divisions. Each will produce its own bibliography in future editions.

Superconducting Kinetic Inductance Radiometer.
Final rept.
J. E. Sauvageau, D. G. McDonald, and E. N. Grossman. 1991, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p2757-2760 1991.

Keywords: *Superconducting devices, *Infrared radiometers, *Infrared bolometers, Superconducting films, Impedance bridges, Integrated circuits, Temperature measurement, SQUID devices, Thermometers, Inductors, Prototypes, Silicon, Reprints, Inductance bridges, Photoinductors.

We are developing a bolometer based on a differential thermometer that senses temperature changes through changes in the kinetic inductance of a superconducting thin film. The composite bolometer is the sensor for a prototype radiometer that will provide an absolute measure IR power. The radiometer is intended to measure the spectrally dispersed power of a 300 K black body. This absolute radiometer is being developed for use at the Low Background Infrared (LBIR) Facility at NIST, Gaithersburg. The noise floor of the temperature transducer for the radiometer has been measured to be 0.75 pW for a 100 sec. integration time. This is 150 times lower noise level than that of the commercial absolute radiometer currently used at the LBIR Facility in Gaithersburg.

Retinal-Protein Complexes as Optoelectronic Components.
Final rept.
N. N. Vsevolodov, and T. V. Dyukova. 1994, 8p.
Pub. in Trends in Biotechnology 12, n3 p81-88 Mar 94.

Keywords: *Eye pigments, *Eye proteins, *Optical storage, *Rhodopsin, *Biosensors, Photosensitivity(Biological), Biotechnology, Complexes, Reprints, *Bacteriorhodopsin.

Naturally occurring retinal-protein complexes (RPCs) have recently received much attention with regard to their potential use as light-sensitive elements for optical recording. The best-known RPC is bacteriorhodopsin (BR), a photosensitive protein from the membrane of extreme halophilic bacteria, which has been studied in great detail. The remarkably robust nature of BR, coupled with its ability to reversibly change color upon illumination and its high cyclicity of ground-to-photoinduced state transitions, makes BR a promising material for optical information processing.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Laser Diode Technology and Applications V, Los Angeles, CA., January 18-20, 1993, v1850 p115-121.

Keywords: *Distributed feedback lasers, *Semiconductor lasers, *Computer aided design, Scanning electron microscopy, Transmission electron microscopy, Near infrared radiation, Laser materials, Materials tests, X-ray diffraction, Computerized simulation, Software tools, Laser arrays, Photoluminescence, Characteristics, Reflectance, Reprints, Nondestructive evaluation, Double crystal x-ray diffractometry.

One of the key technologies required for manufacturing vertical-cavity laser arrays at a production scale is rapid and nondestructive evaluation of the laser material. A brief review of methods for materials characterization of vertical-cavity semiconductor lasers is presented. Techniques based on reflectance spectroscopy, photoluminescence, photoreflectance, double crystal x-ray diffractometry, scanning electron microscopy, and transmission electron microscopy are used to determine alloy composition, cavity spacer thickness, and Bragg mirror layer thickness. Critical aspects of data gathering, analysis, interpretation, and simulation are highlighted. The optical simulation software used for computer aided device design and simulation of reflectance spectra is also briefly discussed. The usefulness of the software is demonstrated by applying it to the design of a novel distributed-feedback vertical-cavity laser with a vertically integrated pump reflector. The characterization techniques are applicable to all types of vertical-cavity devices: lasers, detectors, light emitting diodes, Bragg mirrors, modulators, micro-cavities, and vertically integrated devices.

High Speed, High Sensitivity Magnetic Field Sensors Based on the Faraday Effect in Iron Garnets.
Final rept.
M. N. Deeter. 1993, 6p.
Pub. in Proceedings of Optical Fiber Sensors Conference (9th), Firenze, Italy, May 4-6, 1993, p409-414.

Keywords: Faraday effect, Optical measurement, Magnetic measurement, Magnetic anisotropy, Yttrium iron garnets, Optical waveguides, High sensitivity, High speed, Reprints, *Magnetic field sensors, *Fiber optic sensors, Garnet films.

Recent research demonstrating greater performance of Faraday effect sensors based on iron garnet crystals is described. Bulk crystals are coupled to high-permeability flux concentrators, resulting in an increase in sensitivity of at least two orders of magnitude. Iron garnet films with perpendicular magnetic anisotropy and exploited in an optical waveguide geometry exhibit greater frequency response than bulk crystals. These films also exhibit larger values of saturation Faraday rotation and ideally should exhibit no hysteresis.

Magneto-Optic Magnetic Field Sensors Based on Uniaxial Iron Garnet Films in Optical Waveguide Geometry.
Final rept.
M. N. Deeter, G. W. Day, R. Wolfe, and V. Fratello. 1993, 1p.
Pub. in Digests of International Magnetics Conference INTERMAG'93, Stockholm, Sweden, April 13-16, 1993, pEF-09.

Keywords: Yttrium iron garnets, Magnetic anisotropy, Magnetic hysteresis, Magnetic measurement, Optical waveguides, Optical measurement, Magnetooptics, Barkhausen effect, Faraday effect, Ferrimagnetism, Reprints, *Magnetic field sensors, Uniaxial anisotropy, Garnet films.

The properties of iron garnet films exhibiting uniaxial (perpendicular) magnetic anisotropy are investigated as they relate to magneto-optic magnetic field sensors. When configured in an optical waveguide geometry, such films are expected to magnetize by the mechanism of domain rotation rather than domain wall motion. This distinction should result in magnetic field sensors which exhibit improved linearity and frequency response in comparison to garnet-based magneto-optic magnetic field sensors that rely on domain wall motion. We present data which show the predicted purely linear response function as well as data which exhibit hysteresis at higher driving fields.

Polarization Dependence of Response Functions in 3x3 Sagnac Optical Fiber Current Sensors.
Final rept.
K. B. Rochford, G. W. Day, and P. R. Forman. 1993, 4p.
Sponsored by Los Alamos National Lab., NM.
Pub. in Proceedings of Optical Fiber Sensors Conference (9th), Firenze, Italy, May 4-6, 1993, 4p.

Keywords: Response functions, Optical coupling, Polarized light, Sagnac effect, Complexity, Reprints, *Electric current sensors, *Fiber optic sensors, *Optical fiber sensors, Polarization dependence, Optical couplers, Sagnac interferometers.

The response functions of an ideal Sagnac optical fiber current sensor, based on a 3x3 coupler, fundamentally depend on the polarization state of light entering the coupler, even for a zero birefringence system. The desired response functions, sinusoids separated by 120 deg phase shifts, are obtained only for circularly polarized light. The response functions for linearly polarized and depolarized inputs are sinusoids separated by 180 deg, and yield only zero-slope small-signal responses; in addition, two outputs are degenerate, so the response is similar to that observed in 2x2 systems. Thus, 3x3 couplers offer no advantage over 2x2 systems for linearly polarized light. This result increases system complexity in that polarization control optics are required to supply the proper polarization, even for an ideal, zero-birefringence system.

Magneto-Optic Magnetic Field Sensors Based on Uniaxial Iron Garnet Films in Optical Waveguide Geometry.
Final rept.
M. N. Deeter, G. W. Day, R. Wolfe, and V. J. Fratello. 1993, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 29, n6 p3402-3404 Nov 93.

Keywords: *Ferrite garnets, Ferrimagnetic resonance, Magnetic hysteresis, Magnetic anisotropy, Magnetic films, Yttrium iron garnets, Domain walls, Optical waveguides, Faraday effect, Magnetooptics, Reprints, *Magnetic field sensors, Uniaxial anisotropy, Garnet films.

Iron garnet films which exhibit perpendicular uniaxial magnetic anisotropy are promising materials for magneto-optic magnetic field sensing. In an optical waveguide geometry, these materials exhibit large values of saturation Faraday rotation which in turn produce high sensitivity. The domain structure of these films favors magnetization rotation as the primary magnetization process. This process is significantly faster than domain wall motion, which is the primary magnetization process in bulk iron garnet crystals. We present data which confirm the high sensitivity and wideband frequency response to these materials. One film exhibits a virtually flat frequency response from dc to at least 1 GHz. Potential problems with waveguide sensors, such as birefringence and optical coupling efficiency appear to be soluble.

Terahertz Detectors Based on Superconducting Kinetic Inductance.
Final rept.
E. N. Grossman, D. G. McDonald, and J. E. Sauvageau. 1991, 16p.
Pub. in Proceedings of International Symposium on Space Terahertz Technology, Pasadena, CA., February 1991, p407-422.

Keywords: *Infrared radiometers, *Infrared detectors, *Bolometers, *Superconducting devices, Optical heterodyning, Antenna couplers, Far infrared radiation, Reprints, *Heterodyne mixers, SIS(Superconductors), Mixers(Optics), Kinetic inductance, Photoinductive detectors.

The inductance of a superconducting stripline varies with the concentration of Cooper pairs in the superconductor. This inductance variation may be used as the basis for highly sensitive radiometers, bolometers, and heterodyne mixers. We describe recent progress on three kinetic inductance devices: a large-area, absolute radiometer intended for use in the NIST Low-Background Infrared Calibration Facility, and small, antenna-coupled devices used either in a bolometric mode as direct detectors, or in a non-equilibrium, 'photoinductive' mode as heterodyne mixtures. The photoinductive mixers of a particular interest because their frequency coverage starts at approximately the energy gap, 2Delta, and extends upward. The impedance matching concerns which make extension of SIS mixers to high frequencies so difficult in practice are greatly relaxed for photoinductors because they lack the large parasitic capacitances inherent in a junction-like geometry.

Optical Performance of Photoinductive Mixers at Terahertz Frequencies.
Final rept.
E. N. Grossman, J. E. Sauvageau, and D. G. McDonald. 1993, 17p.
Pub. in Proceedings of International Symposium on Space Terahertz Technology (4th), Los Angeles, CA., February 1993, p588-604.

Keywords: *Infrared detectors, *Bolometers, *Superconducting devices, Superconducting films, Far infrared radiation, Temperature dependence, Electrical properties, Optical properties, SQUID devices, Niobium, Reprints, Kinetic inductance, Photoinductive detectors, Heterodyne mixers, Mixers(Optics).

We have investigated the electrical and optical properties of detectors based on the change in kinetic inductance of a superconducting film with incident terahertz-frequency radiation. Two different geometric configurations, stripline and slotline, of these photoinductive detectors have been explored. Both include a loop of thin niobium coupled to the incident radiation through a lithographic antenna; the loop inductance is read out via an integrated D.C. SQUID. The slotline geometry is substantially simpler to fabricate, but electrically, the two geometries have very similar properties. The loop inductance varies with temperature in good agreement with the 2-fluid model, while the critical current varies with temperature in agreement with Ginzburg-Landau theory.

Ultrasensitive-Hot-Electron Microbolometer.
Final rept.
M. Nahum, and J. M. Martinis. 1993, 3p.
Pub. in Applied Physics Letters 63, n22 p3075-3077, 29 Nov 93.

Keywords: *Infrared detectors, *Bolometers, *Superconducting devices, Submillimeter waves, Millimeter waves, Far infrared radiation, Electron-phonon coupling, Superconducting junctions, Tunnel junctions, Hot electrons, Reprints, *Microbolometers, Millikelvin temperature.

We present measurements on a novel power detector which can be used as an ultrasensitive detector of millimeter and submillimeter radiation. The absorbing element consists of a thin film resistor strip which is connected to superconducting electrodes. This device exploits the Andreev reflection of electrons and the weak electron-phonon coupling at low temperatures to produce a large temperature rise for a small input power (approx = 10 mK/fW). The temperature rise of the electrons is detected by a tunnel junction where part of the metal strip forms the normal electrode. We have measured a voltage responsivity of approximately 10(exp 9) V/W and an amplifier-limited electrical noise equivalent approx = 3 X 10(exp -18) W/sq root of Hz at an operating temperature of 100 mK. If infrared radiation were efficiently coupled to the absorbing element with an antenna or a waveguide, then the sensitivity of this detector would be at least a factor of 10 better than the best available direct detector operating at the same temperature.

Keywords: *Pyroelectric detectors, *Photodetectors, *Optical measurement, Power measurement, Variability, Accuracy, Reprints, *Optical power.

This paper describes the present efforts at NIST to improve the accuracy of the electrically calibrated pyroelectric detector for measuring optical power by an order of magnitude. The principal limitation, the uniformity of the responsivity over the receiving aperature, has been significantly improved.

High-Tc Superconducting Antenna-Coupled Microbolometer on Silicon.
Final rept.
J. P. Rice, Grossman, L. J. Borcherdt, and D. A. Rudman. 1994, 12p.
Pub. in Society of Photo-Optical Instrumentation Engineers 2159, p98-109 1994.

Keywords: *Bolometers, High temperature superconductors, Superconducting devices, Yttrium oxides, Zirconium oxides, YBCO superconductors, Silicon, Epitaxial growth, Micromachining, Fabrication, Substrates, Reprints, *Microbolometers, Yttrium barium cuprates.

A process is described for fabricating antenna-coupled resistive-edge microbolometers based on the high T(c) superconductor YBa2Cu3O7 (YBCO) on silicon. The YBCO and a buffer layer of yttria-stabilized zirconia (YSZ) were grown epitaxially on silicon to minimize excess electrical noise. A silicon-micromachined YBCO/YSZ air-bridge was incorporated to minimize the thermal conductance and the heat capacity. The thermal conductance of the air-bridge was measured to be 3 X 10(exp -6) W/K at a temperature of 100 K. At an operating temperature of 89 K, the detector is estimated to have a response time of 2 microseconds, a responsivity in the 1000 V/W range, and a noise-equivalent power (NEP) in the 10(exp -12) W/Hz(sup 1/2) range at 1000 Hz.

Effect of Semiconductor Laser Characteristics on Optical Fiber Sensor Performance.
Final rept.
K. B. Rochford, A. H. Rose, I. Clarke, and G. W. Day. 1994, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Laser Diode Technology and Applications VI, Los Angeles, CA., January 25-27, 1994, v2148 p269-279.

Keywords: *Semiconductor lasers, Frequency stability, Noise spectra, Error analysis, Calibration, Performance, Reprints, *Optical fiber sensors, *Fiber optic sensors.

Optical sensor systems have source requirements that can be significantly different from those of optical com-

munications and other technologies that have generally driven the development of semiconductor sources. In this paper, we examine basic interferometric, polarimetric, and other sensors. Relevant semiconductor source data is reviewed to illustrate the impact of source characteristics on sensor performance. The effect of low-frequency amplitude and frequency noise on sensor precision is described. Errors in sensor calibration due to amplitude and wavelength drifts are discussed. Examples of sensor performance using typical source data illustrate these issues.

Terahertz Shapiro Steps in High Temperature SNS Josephson Junctions.
Final rept.
P. A. Rosenthal, and E. N. Grossman. 1994, 8p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Microwave Theory and Techniques 42, n4 p707-714 Apr 94.

Keywords: *Josephson junctions, Far infrared radiation, High temperature superconductors, Temperature dependence, Laser radiation, Infrared lasers, Reprints, *Shapiro steps, Microfabrication, Microbridges, Josephson oscillators.

We have studied the far infrared behavior of high-T(c) superconductor-normal metal-superconductor (SNS) microbridges with T(c) > 85 K and critical current-resistance products (I(c)R(N)) as high as 10 mV at 4K. These are the highest I(c)R(N) products reported to date for microfabricated Josephson junctions of any material. The junctions were integrated at the feeds of planar log-periodic antennas made from Au thin films. The junctions had dc normal state resistances R(N) between 6 and 38 ohms, reasonably well matched to the antenna's estimated RF impedance of 53 ohms. Far infrared laser radiation at 404, 760, and 992 GHz induced distinct Shapiro steps (i.e. constant voltage steps at voltages n(hf/2e), n = 1, 2, ...) in the current voltage characteristics as well as modulation of the critical current. Steps were observed at voltages up to 17 mV and 6 mV, at temperatures of 9 K and 57 K, respectively. This corresponds to maximum Josephson oscillation frequencies of 8 and 3 THz at these temperatures.

Pub. in Materials Research Society Symposia Proceedings, v326 p483-488 1994.

Keywords: *Quantum well lasers, *Surface emitting lasers, *Photoluminescence, Optical measurement, Dielectric properties, Epitaxy, Simulation, Comparison, Reprints, Distributed systems.

We present comparisons of photoluminescence (PL) data for various vertical-cavity surface-emitting laser (VCSEL) and distributed quantum well structures taken with the pump beam (and the collection path) in two different configurations: normal to the surface of the sample; and perpendicular to a cross-section of the epitaxial layers. We demonstrate that the cross-sectional PL (XPL) technique can resolve individual features in the structures, and that the surface-normal PL (NPL) spectra are perturbed by the multilayer mirrors in the VCSELs. We elucidate a potential method for transforming between the NPL spectra and the non-perturbed XPL spectra and evaluate the sensitivity of this method to various measurement as well as material parameters. This simulation technique is well-suited to wide parametric variations of the dispersion curves for the complex dielectric constant of the materials, the pump field distribution, and the depth profile of the gain medium.

Measurement and Simulation of Photoluminescence Spectra from Vertical-Cavity Quantum-Well Laser Structures.
Final rept.
D. T. Schaafsma, R. K. Hickernell, and D. H. Christensen. 1994, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Quantum Well and Superlattice Physics V, Los Angeles, CA., January 24-25, 1994, v2139 p92-102.

Keywords: *Quantum well lasers, *Surface emitting lasers, *Photoluminescence, Optical measurement, Dielectric properties, Spatial resolution, Quantum electrodynamics, Superlattices, Simulation, Epitaxy, Reprints, Distributed systems, Multilayers.

We compare photoluminescence data collected in either a surface-normal configuration (NPL) or with the pump and collection paths perpendicular to a cross-section of the epitaxial layers (XPL) for various vertical-cavity surface-emitting lasers and distributed quantum well structures. We report the spatial resolution of the XPL technique, particularly as it applies to distinguishing features in complex multilayer structures. We assess a potential simulation method for transforming the perturbed NPL spectra into the unperturbed XPL spectra, taking into account a number of experimental and material parameters which may influence the lineshape. These factors include the pump field distribution and its influence on the weighting of the emitters, the collection optics, and the changes in the dispersive complex dielectric constant of the quantum wells. This information is of import not only to optimizing device manufacture, but to basic physical and materials research as well. Thereas the XPL technique is a relatively simple but destructive characterization tool, a complete understanding of NPL emission could be made to yield the same information via rapid, non-destructive means.

Waveguide Polarizers Processed by Localized Plasma Etching.
Final rept.
D. L. Veasey, D. R. Larson, and I. Veigl. 1994, 3p.
Pub. in Applied Optics 33, n7 p1242-1244, 1 Mar 94.

Keywords: *Optical waveguides, *Plasma etching, *Polarizers, Chemical vapor deposition, Polarization(Waves), Amorphous silicon, Silicon films, Reprints, *Waveguide polarizers, In situ monitoring, Claddings.

We develop a downstream localized plasma-etching process that permits in situ monitoring of light throughput in a semiconductor-clad channel waveguide as the semiconductor thickness is trimmed. Hydrogenated amorphous silicon films are deposited on ion-exchanged channel waveguides by plasma-enhanced chemical vapor deposition. We then employ the localized plasma-etching process to maximize accurately the extinction ratio between TE and TM polarizations propagating in the clad waveguide. We achieve polarization extinction ratios of greater than 30 dB for both TE-pass and TM-pass polarizers.

H. K. Whitesel, G. W. Day, A. H. Rose, and C. A. Miller. 1993, 42p.
Pub. in Naval Surface Warfare Center Technical Report CARDIVNSWC-TR-80-92/15, 42p May 93.

Keywords: *Self tests, *Calibration, Self repairing devices, Redundant components, Temperature sensors, Military applications, Naval equipment, Reprints, *Optical fiber sensors, *Fiber optic sensors, *Self calibration.

Potential applications of optical fiber sensors in the Navy and elsewhere involve networks of hundreds of thousands of sensors. Routine maintenance and calibration of these sensor networks, if undertaken manually, would involve unacceptable commitments of ship personnel and time. This has led to the present investigation into methods that can be used to produce sensor systems that can be self testing and/or self calibrating. A self testing sensor is one in which one or more internal tests are used to verify the performance of the sensor. Self calibration extends the self testing concept to the point where when defects are identified, calibration corrections can be made automatically. Three design concepts can be considered for optical fiber sensors: substitution, redundancy, and internal diagnostics. Examples of how diagnostics of these types can be used to test and recalibrate various types of sensors are described in this report; a more detailed study of potential designs for a self calibration polarimetric temperature sensor is also included.

Pub. in Proceedings of International Symposium on Spectral Sensing Research, Maui, HI., November 15-20, 1992, v1 p324-341 1993.

Keywords: *Self tests, *Calibration, Self repairing devices, Redundant components, Military applications, Naval equipment, Reprints, *Optical fiber sensors, *Fiber optic sensors, *Self calibration.

Potential applications of optical fiber sensor networks in the Navy include environmental and equipment monitoring and control. Such systems may involve hundreds if not thousands of sensors. Conventional methods of performing routine maintenance and calibration would require unacceptable amounts of manpower and time. This has led to the present investigation into methods that can be utilized to produce sensor systems that can be self-testing and/or self-calibrating. A self testing sensor is one in which internal tests are used to verify the performance of the sensor. Self calibration extends the self testing concept to a point where, when changes in system operational characteristics are measured, calibration corrections can be made automatically. Three general design concepts were considered: substitution, redundancy, and internal diagnostics. Substitution involves applying a measurand of known value to the sensor in a manner similar to most laboratory calibrations. Redundancy involves using multiple sensors in such a way that the failure of a single sensor can be detected: Correct values are then attributed to sensors giving consistent results. Internal diagnostics can take many forms, but involves the use of various optical tests to insure the proper performance of the sensor.

Keywords: *Semiconductor devices, Electron microscopy, Optical microscopy, X ray microscopy, Aluminum gallium arsenides, Photoluminescence, Refractive index, Quantum wells, Reflectance, Correlation, Simulation, Epitaxy, Reprints, Bragg mirrors, Multilayers.

Techniques based on optical, X-ray, and electron microscopy measurements are applied to characterize a wide variety of semiconductor multilayer structures. Bragg mirrors serve as valuable test structures for evaluating the epitaxial uniformity of crystal growth systems. Careful characterization of half-wave spaced single quantum wells provides a method for determining their complex refractive indices using reflectance spectroscopy. Comparison of cross-sectional microphotoluminescence to surface-normal photoluminescence, combined with these characterization techniques, allows studies of spontaneous emission in microcavities and elucidates the difficulties with using surface-normal photoluminescence to determine the alloy composition of the mirror layers. The application of these characterization methods to visible-wavelength AlGaAs mirrors, 485-720nm, enables the

development of these mirrors for uses such as optically tailored substrates and visible surface-emitter or detector arrays.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Technologies for Optical Fiber Communications, Los Angeles, CA., January 25, 1994, v2149 p345-356.

Keywords: *Photodiodes, *Photodetectors, *Frequency response, Near infrared radiation, Frequency measurement, Interlaboratory comparisons, Infrared detectors, Heterodyning, Neodymium lasers, YAG lasers, Reprints, Mach-Zehnder modulators, Intercomparison.

We report the first comparison of high speed photodiode frequency response measurements up to 40 GHz between NIST and NPL in the 1.3 and 1.5 micrometer wavelength regions. This comparison is an important step in establishing international agreement on photodiode response measurements, with traceability to international microwave power and DC current standards. Measurements at NIST used a Nd:YAG heterodyne system. NPL used DFB heterodyne and integrated-optical modulator-based techniques. Measurements of a photodiode with nominally 20 GHz optical bandwidth show good agreement with average scatter of + or - 0.15 dB (2 sigma) below 20 GHz, and + or - 0.30 dB from 20 to 33 GHz. The results diverge systematically above 33 GHz, due to calibration of the RF power sensors. Scatter in the data is well represented by the combined uncertainties of the measurement systems up to 33 GHz.

R. K. Hickernell, D. H. Christensen, J. G. Pellegrino, J. Wang, and J. P. Leburton. 1994, 4p.
Pub. in Applied Physics Letters 75, n6 p3056-3059, 15 Mar 94.

Keywords: *Quantum wells, *Refractive index, Aluminum gallium arsenides, Optical measurement, Reflectance, Absorption, Reprints, Bragg reflectors, Distributed systems.

We investigate the measurement of the complex refractive index of individual quantum wells by reflectance spectroscopy. Placing the wells at half-wavelength spacing to cause resonant feedback produces an order-of-magnitude increase in measurement sensitivity over that of nonresonant structures. Ouantum well dispersive and absorptive effects on reflectance can be differentiated in certain spectral regions. Experimental data confirm a theoretical model of refractive index and absorption for quantum wells of GaAs in Al(0.2)Ga(0.8)As in the region of the well band gap.

Electrical Characterization of Liquid-Phase Epitaxially Grown Single-Crystal Films of Mercury Cadmium Telluride by Variable-Magnetic-Field Hall Measurements.
Final rept.
J. S. Kim, D. G. Seiler, L. Colombo, and M. C. Chen. 1994, 10p.
Pub. in Semiconductor Science and Technology 9, p1696-1705 1994.

Keywords: *Mercury cadmium tellurides, Liquid phase epitaxy, Temperature dependence, Semiconducting films, Infrared detectors, Magnetic fields, Single crystals, Hall effect, Magnetoresistivity, Classification, Reprints.

We report a method for a new classification procedure for liquid-phase epitaxially grown mercury cadmium telluride single crystals. Variable-magnetic-field hall measurements are performed on nine liquid-phase epitaxially grown Hg(0.78)Cd(0.22)Te single-crystal films for magnetic fields from 0 to 1.4 T and in the temperature range from 10 K to 300 K. The data from these measurements are analyzed in the context of the reduced-conductivity-tensor scheme proposed by Kim and co-workers. Based on the degree of deviation from an ideal one-carrier behavior, these experimental samples are classified into several types to emphasize the transition in the behavior of the normal to anomalous n-type samples, finally leading to p-type samples. Our classification is also based on a general trend in the temperature dependence of the mobility and density of the majority carriers, which were extracted from the magnetoresistivity data. The classification provides a useful benchmark for materials characterization in the infrared detector industry.

Accurate Measurement of Optical Detector Nonlinearity.
Final rept.
S. Yang, I. Vayshenker, X. Li, and T. R. Scott. 1994, 10p.
Pub. in Proceedings of National Computer Systems Laboratory Workshop and Symposium 'Role of Metrology in a Changing World', Chicago, IL., July 31-August 4, 1994, p353-362.

Keywords: *Optical detectors, Optical measurement, Comparative evaluations, Computerized simulation, Nonlinearity, Accuracy, Reprints.

In this paper we describe the results of our efforts to analyze and compare by computer simulation three common methods of measuring detector nonlinearity: (1) superposition method, (2) attenuation method, and (3) differential or ac-dc method. We describe a definition and expressions which we used to intercompare the data analyses of these methods. Issues that are common to these methods or specific to one individual method and have an impact on the measurement accuracy were studied. We conclude that superposition and differential methods are better choices than the attenuation method. Suggestions about the choice of polynomial order of the fitting curve with regard to the data accuracy and detector nonlinearity are also given.

Scaling of the Nonlinear Optical Cross Sections of GaAs-AlGaAs Multiple Quantum-Well Hetero n-i-p-i's.
Final rept.
D. S. McCallum, A. N. Cartwright, A. L. Smirl, J. Comas, W. F. Tseng, and J. G. Pellegrino. 1994, 8p.
Pub. in Institute of Electrical and Electronics Engineers Jnl. of Ouantum Electronics, v30 n12 p2790-2797 Dec 94.

Keywords: *Absorption cross sections, *Nonlinear optics, *Ouantum wells, *Heterojunctions, Gallium arsenides, Aluminum gallium arsenides, Carrier density(Solid state), Semiconducters(Materials), Reprints.

The authors study the dependence of the Stark shift optical nonlinearity of GaAs-AlGaAs multiple quantum-well hetero n-i-p-i's on the number of quantum wells per intrinsic region in otherwise identical hetero n-i-p-i's. The authors determine that sigma (sub eh), the

nonlinear absorption cross section, is proportional to the number of quantum wells per intrinsic region. A study of the fluence dependence of sigma(sub eh) shows that the saturation carrier density is inversely proportional to the number of wells per intrinsic region. The authors find that the turn-on time of the nonlinear abosrption change in their samples is independent of the number of quantum wells per intrinsic region. All of these results are consistent with the absence of retrapping of photogenerated carriers.

Niobium Microbolometers for Far-Infrared Detection.
Final rept.
M. E. MacDonald, and E. N. Grossman. 1995, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Microwave Theory and Techniques, v43 n4 p893-896 Apr 95.

Keywords: *Bolometers, *Far infrared radiation, *Niobium, Thin films, Temperature measurement, Room temperature, Bias, Noise, Detectors, Reprints, *Microbolometer.

Microbolometers have been fabricated using a thin niobium film as the detector element. These detectors operate at room temperature, are impedance matched to planar antennas, and are suitable for broadband use at far-infrared wavelengths. The authors have achieved responsitivities of up to 21 V/W at a bias of 6.4 mA, and electrical noise equivalent powers (NEP) of as low as 1.1 x 10(exp -10)W/(square root of H2) at 1 kHz at a bias of 3.6 mA. At this bias, the detectors are 1/f-noise limited below 1 kHz and are Johnson noise limited above 10 kHz. The 1/f noise in nV/(square root of Hz) increases approximately linearly with bias with a typical level of 0.39 I(MA)/(square root of f(kHz)). This level of 1/f noise is approximately a factor of 7 below the best reported for bismuth microbolometers.

The response functions of previously reported 3x3 Sagnac current sensors are strongly dependent on input polarization, so systems require careful control of the input polarization state. In this paper, the authors describe a simple method for eliminating this polarization dependence so that stable response functions are obtained. The authors demonstrate the existence of a wavelength range over which spun high-birefringence fiber guides only one elliptically polarized mode, thus preserving a single polarization state. Using this effect, the authors show that 3x3 Sagnac current sensor response functions can exhibit current sensing without the need for polarization control.

Pub. in Jnl. of Lightwave Technology, v12 n8 p1504-1509 Aug 94.

Keywords: *Fiber optics, *Sagnac effect, *Functions(Mathematics), Interferometers, Birefringence, Electric current, Polarization(Waves), Phase shift, Optical coupling, Reprints, *Electric current sensors, *Optical fiber sensors, Sagnac interferometer.

We show theoretically that the response functions of a lossless Sagnac optical fiber current sensor based on a 3 x 3 coupler fundamentally depend on the polarization state of light entering the coupler, even for systems with no linear birefringence. Thus, 3 x 3 Sagnac systems offer no advantage over 2 x 2 systems for linearly polarized input light. The predicted polarization dependence of 3 x 3 Sagnac response functions is experimentally confirmed. This result establishes the need for increased system complexity in 3 x 3 Sagnac current sensors since polarization control optics are required to provide the proper input polarization.

We report on optical time-domain reflectometer that employs an ultrafast optical switch based on nondegenerate four-wave mixing in a semiconductor laser amplifier. Two-point spatial resolution on the order of 1 mm over 2 m is demonstrated; Fresnel reflections with optical return losses greater than 53 dB are detected. Submillimeter-resoluton optical time-domain reflectometery over a 100-m range should be possible with modifications to the pulse sources.

Refraction of Light by Graded Birefringent Media.
Final rept.
K. L. Stricklett, and C. Sununu. 1994, 5p.
Pub. in Conference of Electrical Insulation and Dielectric Phenomena, Pocono Manor, PA., October 17-20, 1993, Institute of Electrical and Electronics Engineers 1993 Annual Report, p444-448 1994.

Keywords: *Light refraction, *Birefringent media, Reprints, Kerr effect, Electric field mapping, Graded refractive index.

To date, proposals to use the Kerr effect to map divergent electric fields have not considered refraction of light in the graded potential. Spatial variation of the strength or direction of the field will produce non-uniform refractive indices, and significant refraction of light in regions of high divergence may disort the final image and introduce an error in the field measurement. Experimental evidence for this effect is presented and its implications to optical field mapping are discussed.

Pub. in Extended Abstracts of the 1994 U.S. Workshop on the Physics and Chemistry of Mercury Cadmium Telluride and Other IR Materials, San Antonio, TX., October 4-6, 1994, p167-168.

Keywords: *Mercury cadmium tellurides, *Electrical resistivity, Liquid phase epitaxy, High resolution, Reprints, *Reduced conductivity tensor.

Magnetoresistance has been shown in the past to be a valuable tool for studying complex energy bands of semiconductors. In this paper, we demonstrate that magnetoresistance can be used as an extremely useful physical quantity to electrically characterize HgCdTe materials, structures, or devices which are of a multicarrier conduction nature. We take advantage of simple relationships between the magnetoresistance. The applied magnetic field, the lattice temperature, and relevant physical quantities in the reduced conductivity tensor (RCT) scheme. We have performed variable-magnetic-field and variable-temperature Hall measurements (0 to 1.5 T and 10 K 300 K) on LPE HgCdTe films and a GaAs-based HEMT structure. Magnetoresistance data obtained from these measurements are analyzed in the context of the RCT scheme.

Keywords: *Infrared radiometers, *Calibration standards, Temperature control, Superconductors, High temperature, Infrared detectors, Electrical-substitution, NIST(National Institute of Standards and Technology).

A requirement exists for broadband radiometers that can be used to transfer NIST infrared radiometric scales to calibration laboratories elsewhere. The authors discuss the design of a liquid-nitrogen-cooled transfer standard radiometer that represents a practical tradeoff between room-temperature and liquid-helium-cooled radiometers. The detector utilizes high-Tc superconductors as temperature sensors for increased sensitivity. Such sensors have already been shown to enable temperature regulation of 100 microK peak-to-peak at 85 K, and have the potential for further improvements by three orders of magnitude. Electrical substitution is used to linearize the response over the dynamic range and to remove susceptibility to sensor aging effects.

The Optics Division, one of the first divisions formed after NBS was established in 1901, was initially charged with work on radiometry, spectroscopy, and polarimetry. Over the next five or six decades optics remained a significant topic of research. Within a year of Maiman's first demonstration of the ruby laser in 1960, a similar laser was constructed at the NBS-Boulder Laboratories. Demands for assistance in measuring the power or energy produced by such lasers led to the establishment of laser calibration services beginning in 1967. Another early program was aimed at developing techniques for laser frequency stabilization and absolute frequency and wavelength measurements. That effort culminated in 1972 with the determination of a much improved value for the speed of light, which led ultimately to a redefinition of the meter.

Improving Color Measurements of Displays.
Final rept.
J. E. Hardis. 1996, 10p.
Pub. in Color Imaging: Device-Independent Color, Color Hard Copy, and Graphic Arts, San Jose, CA., January 29-February 1, 1996, v2658 p182-191.

Keywords: *Calibration, *Cathode ray tubes, *Matrix transformation, Colorimeters, Reprints, Measurement, Standards, Tristimulus, Chromaticity.

It is generally believed that the most accurate means of measuring the CIE tristimulus values X, Y, Z or chromaticity coordinates x,y from a display is by using a spectroradiometer. Nevertheless, tristimulus colorimeters employing three or four colored filters find wide use because of their simplicity and lower cost. These devices cannot be calibrated to give accurate results in all situations because the spectral responsivities of their filtered detectors are not exactly the CIE color-matching functions. However, for a display that produces a linear superposition of three primary colored lights of fixed spectra, a tristimulus colorimeter can be correctly calibrated to measure all colors on that display. Signals from all of the filtered detectors are used to compute each of the X,Y,Z values. The calibration matrix is computed by data fitting to a reference colorimeter.. An improvement to the previously published method is reported, and a numerical example is shown. This technique is more tractable with today's digital instrumentation than it was when it was discovered, yet it remains underused. The American Society for Testing and Materials (ASTM), through its Committee on Color and Appearance, is revising its standard on display measurements using tristimulus colorimeters to encourage the adoption of the technique.

The ATP Workshop on Optoelectronics and Optomechanics Manufacturing was held at the National Institute of Standards and Technology in Gaithersburg, MD on February 15, 1995. The purpose of the Workshop was to respond to industry interest and provide an open forum for the exchange of ideas among interested members of the optics/photonics community concerning the strategic importance of optoelectronics (OE) and optomechanics (OM) technologies to U.S. economic growth. The Workshop brought together over 160 experts in OE/OM for the purpose of addressing the issues and requirements of U.S. industry in the area of OE/OM manufacturing. Input gained from the morning presentations and the breakout sessions will be used to help formulate the scope and range of a proposed ATP Focused Program in OE/OM manufacturing.

Keywords: *Receivers, *Glass, *Polarization, Waveguides, Cladding, Hybrid, Integrated, Optical, Polarizers, Semiconductors, Splitter, Reprints.

The authors have successfully demonstrated an integrated optical TE-TM mode discriminator using waveguide polarizers and guided-wave photodetectors for use in polarimetric optical sensor and positioning systems. The photonic integrated circuit consists of a Y-branch waveguide splitter formed by potassium-sodium ion exchange in silicate glass. Hydrogenated amorphous silicon claddings were deposited on each branch of the splitter to act as polarizers. One output cladding was trimmed to a thickness which attenuated the TE polarization, while the other cladding was trimmed to attenuate light having TM polarization. The thickness trimming is accomplished using a process of localized plasma etching which allows in situ extinction optimization by monitoring transmitted light. Optical extinction ratios of up to 27 dB were demonstrated on Y-branch waveguides for polarizers with claddings 1.2 mm in length. The integrated receiver was completed with the deposition of metal-semiconductor-metal photodetectors on each of the output waveguide branches following the polarizers. Amorphous silicon claddings were contacted with chrome-gold interdigitated Schottky contacts to form the waveguide detectors.

Crosstalk between Microstrip Transmission Lines.
D. A. Hill, K. H. Cavcey, and R. T. Johnk. Dec 93, 38p, NISTIR-5015.

Keywords: *Microstrip transmission lines, *Crosstalk, Characteristic impedance, Mutual inductance, Scale models, Permittivity, Predictions, Mutual capacitance, Scalar potentials, Vector potentials.

Methods for prediction of crosstalk between microstrip transmission lines are reviewed and simplified for the weak coupling case. Classical coupled transmission line theory is used for uniform lines, and potential and induced EMF methods are used for crosstalk between nonuniform lines. It is shown that the potential method is equivalent to classical coupled transmission line theory for the case of uniform lines. An experiment was performed for uniform coupled microstrip lines for frequencies from 50 MHz to 5 GHz, and good agreement between theory and measurement was obtained for both near-end and far-end crosstalk.

Also available from Supt. of Docs. as SN003-003-03258-1. See also PB92-205376.

Keywords: *Transmission lines, *Magnetic permeability, *Permittivity, *Electrical measurement, Coaxial cables, Waveguides, Dielectric properties, Calibrating, Short circuits, Reflection, Algorithms, Optimization, Mathematical models, Frequency stability, Uncertainty analysis.

The transimission/reflection and short-circuit line methods for measuring complex permittivity and permeability of materials in waveguides and coaxial lines are examined. Equations for complex permittivity and permeability are developed from first principles. In addition, new formulations for the determination of complex permittivity and permeability independent of reference plane position are derived. For the one-sample transmission/reflection method and two-position short-circuit line measurements, the solutions are unstable at frequencies corresponding to integral multiples of one-half wavelength in the sample. For two-sample methods the solutions are unstable for frequencies where both samples resonate simultaneously. Criteria are given for sample lengths to maintain stability. An optimized solution is also presented for the scattering parameters. This solution is stable over all frequencies and is capable of reducing scattering parameter data on materials with higher dielectric constant. An uncertainty analysis for the various techniques is developed and the results are compared. The errors incurred due to the uncertainty in scattering parameters, length measurement, and reference plane position are used as inputs to the uncertainty models.

Effect of DC Tests on Induced Space Charge.
Final rept.
N. Hozumi, J. Tanaka, A. DeReggi, B. Dickens, and N. Nagusrinivas. 1990, 3p.
Pub. in Proceedings Conference Record of the 1990 Institute of Electrical and Electronics Engineers International Symposium on Electrical Insulation, Toronto, Canada, June 3-6, 1990, p332-334.

Keywords: *Electric cables, *Space charge, Aging(Materials), Direct current, Polyethylenes, Tests, Reprints.

Poling-induced space charges in peeled samples of ac aged/dc tested cables were studied using the thermal pulse technique. Samples were poled at about 0.12 MV/cm for 3.5 hours at 70 C using the same polarity as that used for the dc tests. Previous work seemed to indicate that dc testing could have permanent effects which could be detected by the amount of poling-induced charge. An attempt was made to examine this by using three samples with about the same length of ac aging but with different amounts of dc testing. The sample with one dc test and the sample with 23 dc tests were appreciably oxidized whereas the sample with 11 dc tests was not oxidized. Other interesting observations were made.

Reciprocity Relations in Waveguide Junctions.
Final rept.
D. F. Williams, and R. B. Marks. 1993, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Microwave Theory and Techniques 41, n6/7 p1105-1110 Jun/Jul 93.

Keywords: Characteristic impedance, Reprints, *Waveguide junctions, Microwave metrology, Reference impedance, Scattering parameters, Reciprocity.

The Lorentz reciprocity condition is applied to junctions composed of reciprocal media which connect uniform but otherwise arbitrary waveguides. An expression relating the forward and reverse transmission coefficients is derived and factored into two terms: the first involving the phase of the reference impedance in the guide, and the second a new reciprocity factor. The usual condition equating the forward and reverse transmission coefficients is shown not to hold in the general case. Experimental evidence supporting the theoretical results is presented.

M. G. Broadhurst, A. S. DeReggi, B. Dickens, and R. M. Eichhorn. 1990, 5p.
Pub. in Conference of Record of the Institute of Electrical and Electronics Engineers International Symposium on Electrical Insulation, Toronto, Canada, June 3-6, 1990, p405-409.

Keywords: *Electrical insulation, *Dielectrics, *Electric wire, *Space charge, *Electric fields, Reprints, Polyethylenes, Electrical properties, Electric charge, Electrical measurement.

The authors measured the electric fields due to space charge within film samples of several commercial polyolefins used as medium voltage power cable insulation. They charged the films at 60 deg. C with DC voltages applied for several hours. For dry charged films, vacuum deposited gold or aluminum provided the electrodes. For wet charged films, one or both surfaces of the film were bare and in contact with an aqueous 0.05 molar solution of NaCl. They measured the fields using the thermal pulse (TP) method. To use this method with the wet charged films, they painted colloidal graphite electrodes onto the films after they were charged. The results show that thermoplastic polyethylene (PE) charges negatively for both wet and dry charging. Crosslinked polyethylene (XLPE) charges negatively when dry charged, but small amounts of either positive or negative charge were found after wet charging.

Currents Induced on Multiconductor Transmission LInes by Radiation and Injection.
Final rept.
D. A. Hill. 1992, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 34, n4 p445-450 Nov 92.

Keywords: *Transmission lines, Excitation, Tests, Reprints, *Induced current, Wire assemblies.

Multiconductor transmission line theory is used to compare currents induced on individual wires within a bundle by injection and radiated excitation. Calculations show that the two types of excitation generally induce significantly different current distributions, but the differences are much smaller for electrically short lines. The results are relevant to the validity of using current injection testing to replace radiated immunity testing.

Aperture Coupling to a Coaxial Air Line: Theory and Experiment.
Final rept.
D. A. Hill, M. L. Crawford, M. Kanda, and D. I. Wu. 1993, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 35, n1 p69-74, 1 Feb 93.

Keywords: *Electromagnetic shielding, Reverberation chambers, Polarization(Waves), Circular configuration, Dipole moments, Apertures, Reprints, *Coaxial air lines.

Coupling through a circular aperture in the shield of a coaxial air line is studied theoretically and experimentally. Polarizability theory is used to compute the effective dipole moments that excite the coaxial line in the internal region. Measurements of shielding effectiveness were made in a reverberation chamber over wide-frequency ranges. Agreement between theory and measurements is generally within + or - 10 dB. Recommendations for improvements in the measurements and theory are made for achieving closer agreement that would be desirable for an artifact standard for shielding effectiveness measurements.

Accurate Experimental Characterization of Interconnects: A Discussion of 'Experimental Electrical Characterization of Interconnects and Discontinuities in High-Speed Digital Systems'.
Final rept.
R. B. Marks, and D. F. Williams. 1992, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Components, Hybrids, Manufacturing Technology 15, n4 p601-604 Aug 92.

Keywords: *Circuit interconnections, *Transmission lines, Characteristic impedance, Electrical measurement, Digital circuits, Permittivity, Capacitance, High speed, Accuracy, Reprints.

This paper discusses two issues concerning the accuracy of electrical characterizations of interconnect transmission lines, particularly in regard to a recently published paper. The error in the characteristic impedance may be reduced through an alternative approximation to the capacitance of the transmission line. Furthermore, measurements of both the propagation constant and characteristic impedance, which are the two primary parameters characterizing the line, may be improved by the use of a well conditioned algorithm.

Important Link in Entire-House Protection: Surge Reference Equalizers.
Final rept.
F. D. Martzloff, and M. Samotyj. 1993, 4p.
Pub. in Proceedings of Zurich EMC Symposium, Zurich, Switzerland, March 9-12, 1993, p395-398.

Keywords: *Electronic equipment, *Circuit protection, *Surges, Households, Residential buildings, Cable television, Telephones, Communication equipment, Voltage regulators, Reprints.

The increasing use of electronics in residential applications has been paralleled by a realization that surge protection may be necessary for this type of equipment. Installing a surge-protective device on the power-line port as well as on the communications-line port of a piece of equipment might appear sufficient to ensure this protection. However, the normal operation of one of the protective devices during a surge event can create differences in the voltages of the references of the two ports. This difference in voltages, applied across the equipment or across a communication link between two pieces of equipment, can result in permanent damage as well as upset. Equalizing these voltages can be achieved by proper routing of the two lines through a single device, called Surge Reference Equalizer, and thus avoid the risk of damage.

Measurements of the Characteristic Impedance of Coaxial Air Line Standards.
Final rept.
J. R. Juroshek, and G. M. Free. 1994, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Microwave Theory and Techniques 42, n2 p186-191 Feb 94.

Keywords: *Characteristic impedance, *Standards, *Impedance measurement, Electrical measurement, Network analyzers, Transmission lines, Capacitance, Electric connectors, Reprints, *Coaxial air lines, Scattering parameters.

A method for electrically measuring the characteristic impedance of coaxial air line standards is described. This method, called the gamma method, determines the characteristic impedance of a coaxial air line from measurements of its propagation constant and capacitance per unit length. The propagation constant is measured on a network analyzer, and the capacitance per unit length. The propagation constant is measured on a network analyzer, and the capacitance per unit length is measured on a capacitance bridge at 1 kHz.

The measurements of characteristic impedance with the gamma method are independent of any dimensional measurements. Measurements of the characteristic impedance using the gamma method are compared to theoretical predictions from dimensional measurements. Test results are shown for 14 mm, 7 mm, and 3.5 mm coaxial air lines.

Keywords: *Thermonuclear reactor materials, *Superconducting wires, *Niobium stannides, *Critical current, *Electrical measurement, Interlaboratory comparisons, Fusion reactors, Homogeneity, Standards, Mandrels, Niobium intermetallics, Titanium intermetallics, ITER tokamak, Tables(Data), Graphs(Charts), Titanium alloy 6Al 4V, Reference materials, Reference wires, Intercomparison, Niobium titanides.

This report describes research conducted to help establish a standard critical current measurement technique for Nb3Sn wires that may be used in fusion applications. The main part of this report is a detailed presentation of results of the first ITER international interlaboratory comparison of Nb3Sn critical current measurements. A common procedure and a common reaction and measurement mandrel was used by US laboratories in this comparison, whereas there was no common procedure followed by other international laboratories. The largest difference in I(c) measurements of two laboratories that did not use a common procedure was 23%. The largest difference in I(c) measurements of two laboratories that did use a common procedure was 6.5%. There may still be room for improvement, but this indicates the strong need for a common detailed procedure. Results on the homogeneity of one of the Nb3Sn wires used in this study and a commentary on creating a Nb3Sn Reference Wire are also presented.

Reduction of Interfilament Contact Loss in Nb3Sn Superconductor Wires.
Final rept.
R. B. Goldfarb, and K. Itoh. 1994, 4p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Jnl. of Applied Physics 75, n4 p2115-2118, 15 Feb 94.

Keywords: *Superconducting wires, *Niobium stannides, Proximity effect, Eddy currents, AC losses, Magnetization, Reduction, Reprints, Hysteresis losses, Twisted filaments, Length dependence.

Interfilament contact in Nb3Sn wires made by the internal-tin-diffusion process causes excess hysteresis loss beyond the intrinsic magnetic hysteresis loss of the filaments. In analogy with eddy-current and proximity-effect coupling losses, the excess contact loss can be reduced by decreasing the twist-pitch length of the filaments in the wire. One consequence of interfilament contact is that volume magnetization measurements are strongly dependent on sample length below about one twist pitch. We define a characteristic length whose reciprocal is equal to the sum of the reciprocals of the sample length and the twist pitch. Hysteresis loss is a universal function of characteristic length for different sample lengths and twist pitches. We discuss several experimental parameters for the magnetic determination of hysteresis loss.

Micromagnetic Scanning Microprobe System.
Final rept.
C. A. Thompson, R. W. Cross, and A. B. Kos. 1994, 7p.
Pub. in Review of Scientific Instrumentation 65, n2 p383-389 Feb 94.

Keywords: *Magnetoresistance, *Thin films, *Scanning electron microscopy, *Microanalysis, Magnetic tapes, Magnetic recordings, Instrumentation, Data acquisition, Domains, Apparatus, Barkhausen noise, Reprints, Read heads.

The authors describe the apparatus, instrumentation, and data acquisition techniques which make up the micromagnetic scanning microprobe system (MSMS). The system was developed to study magnetoresistive (MR) thin films used in magnetic recording read heads. It uses a dc, four-probe resistance measurement coupled with two pairs of orthogonal field sources. Results from magnetoresistance measurements of the dynamic response of a MR read head film are shown to demonstrate system operation and performance. Significant variations in MR responses were seen across the width of the device because of local domain formation. The MSMS is an effective tool for characterizing the effects of domain formation on the output of a MR read head.

Crosstalk between Microstrip Transmission Lines. (NIST Reprint).
Final rept.
D. A. Hill, K. H. Cavcey, and R. Johnk. 1994, 8p.
See also PB94-135639.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Electromagnetic Compatibility 36, n4 p314-321 Nov 94.

Keywords: *Microstrip transmission lines, *Crosstalk, Characteristic impedance, Mutual inductance, Permittivity, Reprints, Mutual capacitance, Scalar potentials, Vector potentials.

Methods for prediction of crosstalk between microstrip transmission lines are reviewed and simplified for the weak-coupling case. Classical coupled transmission line theory is used for uniform lines, and potential and induced EMF methods are used for crosstalk between nonuniform lines. It is shown that the potential method is equivalent to classical coupled transmission line theory for the case of uniform lines. An experiment was performed for uniform coupled microstrip lines for frequencies from 50 MHz to 5 GHz, and good agreement between theory and measurement was obtained for both near- and far-end crosstalk.

Critical-Current Degradation in Nb3 Al Wires Due to Axial and Transverse Stress.
Final rept.
T. Kuroda, H. Wada, S. L. Bray, and J. W. Ekin. 1993, 5p.
See also PB93-153211.

Keywords: *Superconducting wires, *Critical current, *Stress analysis, Axial stress, Microstructure, Strains, Reprints, Transverse stress, Niobium aluminides, Multifilaments.

Effects of axial and transverse stress on the critical current of Nb-tube processed multifilamentary Nb3Al wires have been studied. The degradations of the critical current due to axial or transverse stress for these Nb3Al wires are much smaller than those for Nb3Sn wires. The microstructures and stress states of the Nb3Al wires have been investigated to understand the stress dependences of the critical current through the microscopic observations and the elastic theory. From an engineering standpoint, the importance of mechanical strength of the matrix material where superconducting filaments are embedded has been found especially for transverse stress effects.

Sulfur hexafluoride (SF6) is currently the most common insulating gas used in enclosed electrical systems. It is, however a potent greenhouse gas and, thus, its use could impart fears of environmental costs, regulations, and restrictions, in spite of its current low levels in the environment. An aspect of this potential problem, namely the search for alternative high-voltage insulants, such as high-pressure gaseous dielectrics (e.g., N2 and N2/SF6 mixtures), is addressed in this paper.

Simple and Repeatable Technique for Measuring the Critical Current of Nb3Sn Wires.
Final rept.
L. F. Goodrich, and A. N. Srivastava. 1994, 4p.
Pub. in Proceedings of the International Workshop on Critical Currents in Superconductors (7th), Alpbach, Austria, January 24-27, 1994, p609-612.

Keywords: *Critical current, *Niobium stannides, *Superconductors, *Wire, Interlaboratory comparisons, Mandrels, Strains, Titanium alloys, Variations, Reproducibility, Reprints.

We evaluated an alternative approach for measuring the critical current (Ic) of Nb3Sn wire which uses a standard mandrel geometry and apparatus interface. Preliminary data indicate that the tension in the conductor before reaction and measurement may affect the repeatability. We show preliminary summary statistics for measurements of conductors performed by five US laboratories. The reaction and measurement mandrel used was fabricated using a Ti-6 Al-4V alloy. This high temperature alloy was used to avoid transferring the specimen between mandrels, thus reducing the likelihood of inadvertent mechanical damage of the specimen. The U.S. International Thermonuclear Experimental Reactor (US ITER) Home Team adopted this approach in a recent test because it was expected to be easily implemented and yield consistent results.

SF6/N2 Mixtures: Basic and High-Voltage-Insulation Properties.
Final rept.
L. G. Christophorou, and R. J. Van Brunt. 1995, 52p.
Pub. in Institute of Electrical and Electronics Engineers Transaction on Dielectrics and Electrical Insulation, Virginia Beach, VA., October 23-26, 1995, p952-1003.

Keywords: *Dielectrics, *Electrical insulation, Collision cross sections, Electron transport, Gas mixtures, Global warming, Reprints, High-voltage insulation.

The widespreed use of SF6 by the electric power and other industries has led to increased concentrations of SF6 in the atmosphere. This causes concern as to pos-

sible effects on global warming, because SF6 is a potent greenhouse gas. This paper first touches on this issue and then documents the behavior of high pressure gases such as N2 and SF6/N2 mixtures that can be realistically considered as acceptable intermediate or long-term replacements for pure SF6 in some HV applications. The possible use of dilute SF6/N2 mixtures as an alternative to pure SF6 for some of industry's insulation needs (albeit at higher pressure) is documented, and existing knowledge on these mixtures and on the individual components (N2 and SF6), both basic and applied, is compiled. A guide to existing literature is provided.

Keeping Up with the Reality of Today's Surge Environment.
Final rept.
F. D. Martzloff. 1995, 7p.
Pub. in Proceedings of the Power Quality Solutions, Long Beach, CA., September 9-15, 1995, p246-252.

Keywords: *Surges, *Electric faults, *Overvoltage, Electrical equipment, Electric power distribution, Electric power failures, Overcurrent, Power measurement, Electromagnetic compatibility, Circuit protection, Voltage regulators, Reprints.

The paper proposes to establish a program for characterizing surge events by the capability of a surge event to deliver a surge current through the power system in end-user facilities. This characterization would complement or even supersede the conventional monitoring of surge voltages. Two approaches are suggested: (1) using a metal-oxide varistor with the lowest possible voltage to 'attract' surges away from other SPDs connected in the facility, and then recording the surge current waveform in the varitor; (2) gathering data on field failure attributable to surges or swells for all types of electrical appliances, then attempting to replicate the failure mode in the laboratory.

Anomalous Switching Phenomenon in Critical-Current Measurements When Using Conductive Mandrels.
Final rept.
L. F. Goodrich, J. A. Wiejaczka, and A. N. Srivastava. 1995, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n3 p3442-3444 Sep 95.

Keywords: *Critical current, *Superconducting wires, Switiching, Voltage-current, Reprints, Bypass current, Conductive mandrel, Multivalued, Nb-Ti.

NIST and other laboratories have observred an anomalous switching phenomenon that can occur in critical-current measurement of coiled Nb-Ti and Nb3Sn superconductors when mounted on an electrically-conductive measurement mandrel. During aquistion of the voltage-current (V-I) characteristic, large voltage discontinuities are observed. This switching phenomenon results in a multivalued V-I curve, and apparently multiple 'critical-current' values. An explanation of this phenomenon, some necessary conditions for switching to occur, as well as methods of detecting the phenomenon are given.

Size Effects in Submicron NiFe/Ag GMR Devices.
Final rept.
S. E. Russek, R. W. Cross, S. C. Sanders, and J. O. Oti. 1995, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics, v31 n6 p3939-3942 Nov 95.

Keywords: *Magnetoresistance, Barkhausen noise, Reprints, Submicrons, *GMR.

The authors measured the magnetoresistive response of submicron NIFe/Ag giant magnetoresistive (GMR) devices as a function of current density and field angle. In addition to magnetostatic broadening, the authors observe large jumps in the magnetoresistive response (Barkhausen jumps) due to domain switching. These effects lead to irregular device-specific magnetoresistive response curves. The large Barkhausen jumps are more pronounced at low current density while at high current densities the response is smoother due to self field stabilization. The detailed structure of the Barkhausen jumps is very sensitive to the angle of the applied magnetic field. These effects are general properties of wide class of GMR materials that rely on incoherent reversal of many small magnetic domains.

Keywords: *Microstrip transmission lines, *Irradiation, *Directivity, Emission, Immunity, Measurement, Power, Efficiency, Reverberation, Test chambers, NIST(National Institute of Standards and Technology), Mode stirring, Radiated power, Radia efficiency.

The authors analyze radiation from a microstrip transmission line and calculate total radiated power by numerical integration. Reverberation chamber methods for measuring radiated emissions and immunity are reviewed and applied to three microstrip configurations. Measurements from 200 to 2000 MHz are compared with theory, and excellent agreement is obtained for two configurations that minimize feed cable and finite ground plane effects. Emissions measurements are found to be more accurate than immunity measurements because the impedance mismatch of the receiving antenna cancels when the ratio of the microstrip and reference radiated power measurements is taken.

Pub. in PQA '95, International Conference on Power Quality (4th): Applications and Perspectives, New York, NY., May 9-11, 1995, 17p Aug 95.

Keywords: *Electrical equipment, *Residential buildings, *Surges, *Overcurrent, *Electromagnetic compatibility, Electromagnetic equipment, Circuit protection, Voltage regulation, Surge suppressors, Communication equipment, Wiring, Voltage regulators, Cascaded elements, Reprints.

To demonstrate real-world scenarios, a replica of the wiring system in a typical residence was installed in the laboratory. This paper reports selected results from many measurements, and presents the corresponding numerical modeling, thereby leading to mutual validation of the two processes. Two exposure scenarios for producing differences of voltages between the power and data ports of appliances are illustrated. Additional measurements and parametric variations are reported here to characterize the impedance of the various components of the wiring system and the source impendance of the resulting overvoltages appearing between the ports.

Electrohydrodynamic Instability and Electrical Discharge Initiation in Hexane.
Final rept.
K. L. Stricklett, and R. A. C. Altafim. 1995, 4p.
Pub. in Annual Report, Conference on Electrical Insulation and Dielectric Phenomena, Virginia Beach, VA., October 22-25, 1995, p163-165.

Keywords: *Electrohydrodynamics, *Hexanes, Dielectric fluids, Surface instability, Reprints, *Laser triggered breakdown, Prebreakdown.

An experimental technique is described that tests the hydrodynamic stability of the fluid boundary in a fluid-insulated system: a quasi-uniform field configuration is used and a pulsed, Nd:YAG laser is employed to create a micro-bubble at the surface of one electrode. The gap is pulse-charged and the laser is synchronized with the time-of-application of the voltage pulse. Under appropriate experimental conditions of voltage and laser pulse energy, the bubble evolves to produce full electrical breakdown by the onset and propagation of instabilities in the bubble surface. Experimental data obtained in hexane are presented.

Dielectric and Magnetic Measurements from -50C to 200C and in the Frequency Band 50 MHz to 2 GHz.
J. Baker-Jarvis, and J. H. Grosvenor. Mar 96, 20p, NISTIR-5045.

Keywords: *Dielectric properties, *Magnetic properties, *Electrical measurement, *Transmission lines, Cavity resonators, Coaxial cables, Calibrating, Waveguides, High temperatures, Microwave measurements.

This is an overview of techniques for dielectric and magnetic measurements of low-loss through high-loss materials in the frequency range from 50 MHz to 2 GHz and over a temperature range of -50 deg C to 200 deg C. The authors conclude that a single fixture is not adequate to satisfy the measurement objectives. The necessary measurements can be met using a combination of reentrant cavity, coaxial line, and dielectric resonator fixtures. In order to minimize heat loss, the coaxial line fixture should be milled from stainless steel stock and then gold plated. The reentrant cavity and split post resonator fixtures should be fitted with high temperature coaxial cables and temperature control obtained from an environmental furnace.

The authors describe a coaxial line-reflect-match calibration that corrects for imperfections in the load used as a match standard. The method provides a practical means of obtaining accurate, wideband calibrations with compact coaxial standard sets. When the load model is valid, the load may be characterized using an additional line of moderate length.

Alternative EMC Compliance Test Facilities.
Final rept.
M. L. Crawford. 1995, 30p.
Pub. in Handbook of Electromagnetic Compatibility, Chapter 18, p681-710 1995.

Keywords: *Electromagnetic capability, *Test facilities, Electrical measurement, Performance, Electromagnetic shielding, Transmission lines, Reprints, Mode stirred method.

Chapter 15 described conventional electromagnetic compatibility compliance test facilities which consist of open-field or shielded enclosures. Shielded enclosures have low residual noise levels and electrical isolation or shielding. Presumably, open-field sites provide both a reference and a perturbation-free environment in which actual operating conditions of the equipment can be simulated. However, open-field sites do not provide isolation from the environment and hence they can be used only under special circumstances.

Correlations between Electrical and Acoustic Detection of Partial Discharge in Liquids and Implications for Continuous Data Recording.
Final rept.
P. von Glahn, K. L. Stricklett, R. J. Van Brunt, and L. A. V. Cheim. 1996, 6p.
Pub. in Conference Record of the Institute of Electrical and Electronics Engineers International Symposium on Electrical Insulation, Montreal, Quebec, Canada, June 16-19, 1996, v1 p67-74.

Keywords: *Acoustic detection, *Continuous recording, *Electrical detection, Reprints, Partial discharge, Signal analysis, Statistical properties, Correlation analysis.

Simultaneous measurements were made of electrical and acoustic signals from partial discharge (PD) produced by applying an alternative voltage at a frequency of 70 Hz to a point-plane electrode gap immersed in transformer oil. Both internally and externally mounted acoustic sensors were tested, and in all cases the intensity of the acoustic PD signal was found, on average, to increase with the amplitude of the electrical PD signal. The correlation between acoustic and electrical PD signal was found to be consistent with results reported from previous investigations. It is shown here that, because of this strong correlation, it is possible to extract statistical information from continuously recorded acoustic PD data, such as pulse phase (time) and amplitude distributions that are in agreement with those obtained from electrical data. It is demonstrated that by having continuous records of all PD events that occur during a test, it is possible to uncover new statistical information that is useful in attempts to understand the physical basis for the phenomenon.

Electromechanical Properties of Superconductors for DOE Fusion Applications.
J. W. Ekin, S. L. Bray, C. L. Lutgen, and W. L. Bahn. Jan 94, 116p, NISTIR-5013.

Keywords: *Thermonuclear reactor materials, *Superconducting magnets, *Superconductors, *Niobium stannides, *Electromechanics, Superconducting wires, Stress analysis, Axial stress, Critical current, Fusion reactors, US DOE, Niobium aluminides, Vanadium gallides.

The electrical performance of many superconducting materials is strongly dependent on mechanical load. This report presents electromechanical data on a broad range of high-magnetic-field superconductors. The conductors that were studied fall into three general categories: candidate conductors, experimental conductors, and reference conductors. Research on candidate conductors for fusion applications provides screening data for superconductor selection as well as engineering data for magnet design and performance analysis. The effect of axial tensile strain on critical-current density was measured for several Nb3Sn candidate conductors including the US-DPC (United States Demonstration Poloidal Coil) cable strand and an ITER (International Thermonuclear Experimental Reactor) candidate conductor. Also, data are presented on promising experimental superconductors that have strong potential for fusion applications. Axial strain measurements were made on a V3Ga tape conductor that has good performance at magnetic fields up to 20 T. Axial strain data is also presented for three experimental Nb3Sn conductors that contain dispersion hardened copper reinforcement for increased tensile strength. Finally, electromechanical characteristics were measured for three different Nb3Sn reference conductors from the first and second VAMAS (Versailles Project on Advanced Materials and Standards) international Nb3Sn critical-current round robins. Published papers containing key results, including the first measurement of the transverse stress effect in Nb3Sn, the effect of stress concentration at cable-strand crossovers, and electromechanical characteristics of Nb3Al, are included throughout the report.

Keywords: *Cavity resonators, Cylindrical configuration, Dielectric materials, Performance evaluation, Computer programs, X band, Uncertainty, Superhigh frequency, *Permittivity measurements, Dielectric measurements, MEAS-RES computer program, CAVITYPROG computer program.

Uncertainty estimates are developed for dielectric permittivity calculations made using the NIST 60-mm diameter cylindrical resonator. A mode-filtering helical waveguide makes up the cavity's cylindrical wall, which permits the generation of high-purity TE(01p) resonant modes for high accuracy permittivity measurements. The cavity's length can be varied from 408 to 433 mm. Fixed-length and fixed-frequency measurements in the X-band frequency range are evaluated with particular emphasis on 10 GHz. Resonator theory and design, measurement tolerances, and software are included.

High Temperature Silicide Thin-Film Thermocouples.
Final rept.
K. G. Kreider. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v322 p285-290 1994.

Keywords: *Thermocouples, Temperature measuring instruments, High temperature, Seebeck effect, Thin films, Molybdenum silicides, Rhenium silicides, Tantalum silicides, Titanium silicides, Tungsten silicides, Sputtering, Reprints.

High-temperature silicides have been used in mechanical structures, heating elements, and electronic, CMOS applications. Their stability in high temperature oxidizing environments and excellent electrical conductivity may also make them useful as high temperature thin-film sensors in harsh environments. We have investigated sputter deposited MoSi2, ReSi2, TaSi2, TiSi2, and WSi2 thin films and characterized their performance as thermoelements and stability up to 1200 C. A multilayer technique was developed to ensure constant silicide stoichiometry during oxidation thereby maintaining a constant Seebeck coefficient. In addition, techniques were developed to suppress the formation of metal oxides from the silicides. The results indicated excellent stability of Seebeck coefficient up to 1200 C. These results are compared with the problems of thin film instability in the Seebeck coefficient found in noble metal thermocouples. Potential applications for temperature and heat transfer measurements will be discussed.

Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., January 21-22, 1993, p1-10.

Keywords: *Capacitance, Calibration, Reprints, Measurement Assurance Program, MAP program, Reference standards, US NIST.

This paper describes the recently developed capacitance Measurement Assurance Program (MAP) service at the National Institute of Standards and Technology (NIST). Using a commercial digital capacitance meter as the transport standard, two separate pilot programs for the capacitance MAP have been carried out for standards at both the 1,000 pF and 100 pF levels. The first was carried out as a single transfer with a government standards laboratory, and the second was designed for round-robin measurements as a multiple transfer by three industrial standards laboratories. In contrast to the normal MAP, where the transport standards are measured by the client laboratory, the capacitance MAP involves measurements performed on 'dummy' standards by both the meter (transport standard) and the laboratory capacitance measuring systems. Results from these two pilot programs are presented. Also included are requirements and procedures for laboratories interested in participating in the capacitance MAP service.

R. F. Dziuba. 1993, 7p.
Pub. in Proceedings of National Computer Systems Laboratory Workshop and Symposium, Albuquerque, NM., July 25-29, 1993, p363-369.

Keywords: *Resistors, *Pressure, *Electrical resistance, Electrical measurement, Standards, Reprints.

The U.S. representation of the ohm is based on the quantized Hall resistance of 6453.20175 ohms with a combined standard uncertainty of 0.02 ppm. To maintain the ohm at this resistance or other resistances at this uncertainty level requires well characterized standard resistors. A sometimes overlooked parameter affecting standard resistors is pressure. A variety of standard resistors are examined for pressure dependencies over the range 250 hectopascals (hPa) above and below a standard atmosphere. Results indicate that the pressure coefficients of resistance for some standards are significant.

Sputtered High Temperature Thin Film Thermocouples.
Final rept.
K. G. Kreider. 1993, 5p.
Pub. in Jnl. of Vacuum Science and Technology A 11, n4 p1401-1405 Jul/Aug 93.

Keywords: *Thermocouples, Temperature measuring instruments, Temperature range 0400-1000 K, Rhodium containing alloys, Rhodium oxides, Platinum alloys, Thin films, Seebeck effect, Aluminum oxides, Annealing, Reprints.

Thin film thermocouples have the advantage of extremely fast response (< 1 ms), low cost, and very fine spatial resolution. These capabilities have permitted measurements never before possible, such as the instantaneous temperature measurements of the inside surfaces of a diesel engine cylinder during operation. Although these type S platinum plus platinum 10% rhodium thermocouples are stable at the 900-1100 C range, oxidation of rhodium can take place in the 600-800 C range in air which lessens the thermoelectric potential of the positive element. We evaluated the effect of air exposures to high temperature thin film thermocouples and attempted to find solutions to the problem. We found that after 50 h at 750 C the Seebeck coefficient of a platinum 10% rhodium element was reduced 50% compared to the as-sputtered condition. The reduction of Seeback coefficient at 700 and 800 C was also substantial. This reduction in Seeback coefficient could be recovered by annealing the thin film at 900 C. The degradation after 750 C could be suppressed using a 1 micrometer sputtered aluminum oxide coating. The reversible behavior suggests the formation of Rh2O3 at 700-800 C and its subsequent reduction at temperatures at which the free energy of formation is zero or positive. Microstructural evidence confirm these conclusions.

Pub. in Proceedings of European Frequency and Time Forum, Besancon, France, March 12-14, 1991, p461-464.

Keywords: *Quartz resonators, Phase modulation, Frequency response, Electric fields, Direct current, Linear systems, Reprints, *Phase modulators, Polarizing effect.

A dc electric field applied to a quartz plate resonator causes changes in the elastic constants which can lead to a change in the frequency of the resonator. This effect, known as the polarizing effect, has been shown to be extremely linear. We have used this effect to build a phase modulator with 2nd-harmonic distortion that is at least 117 dB below the fundamental modulation and low added phase noise. A description of the modulator as well as methods of measurement are discussed.

Relationship of AM to PM Noise in Selected RF Oscillators.
Final rept.
L. M. Nelson, C. W. Nelson, and F. L. Walls. 1994, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Ultrasonics, Ferroelectrics, and Frequency Control 41, n5 p680-684 Sep 94.

Keywords: *Radiofrequency oscillators, *Quartz resonators, *Electromagnetic noise, Amplitude modulation, Phase modulation, Cross correlation, Very high frequency, High frequency, Reprints, Flicker noise, Phase noise.

We have studied the amplitude modulation (AM) and phase modulation (PM) noise in a number of 5 MHz and 100 MHz oscillators to provide a basis for developing models of the origin of AM noise. To adequately characterize the AM noise in high performance quartz oscillators, we found it necessary to use two-channel cross-correlation AM detection. In the quartz oscillators studied, the power spectral density (PSD) of the f(sup -1) and f(sup 0) regions of AM noise is closely related to that of the PM noise. The major difference between different oscillators of the same design depends on the flicker noise performance of the resonator. We therefore propose that the f(sup -1) and f(sup 0) regions of AM and PM noise arise from the same physical processes, probably originating in the sustaining amplifier.

Design Challenges in a Commercial Quantum Hall Effect-Based Resistance Standard.
K. C. Lee, and M. E. Cage. Nov 94, 42p, NISTIR-5533.

Keywords: *Electrical resistance, *Primary standards, *Standards, Temperature range 0000-0013 K, Cryogenic temperature, Cryogenic cooling, Temperature dependence, Electrical measurement, Commercial equipment, Wire wound resistors, Calibration, Closed-cycle cooling systems, Design criteria, *Resistance standards, *Quantum Hall effect.

Of the electrical measurements that underpin the broad spectrum of modern industry, measurements of voltage, resistance, and impedance are among the most important. National Standards laboratories have developed intrinsic standards based on quantum effects, such as Josephson's Effect and the quantum Hall effect that can be used to realize standards of voltage and resistance. The equipment necessary to observe these phenomena is very complex and expensive, and these standards have not yet found wide application in industrial laboratories. This paper assesses the possibility of developing a commercially viable quantum Hall effect-based resistance standards system. The capabilities of resistance calibration systems currently in use are summarized, and specifications for a competitive quantum Hall effect-based system are described. The realization of such a system presents numerous challenges, from making suitable samples, to developing high accuracy, automated measurement systems, to developing low cost, reliable cryogenic systems. These technical challenges are discussed in detail, and several possible commercial systems are described.

Sponsored by International Copper Research Association, Inc., New York.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4560-4562 Nov 94.

Keywords: *Electrical resistivity, *Electrical measurement, *Eddy currents, Low temperature, Curve fitting, Metals, Copper, Reprints.

Eddy-current decay is a unique, nondestructive method for determining the low-temperature resistivity of large samples of pure metal. Furthermore, it is the only means available for measurement of the residual resistivity ratio (RRR), rho(273 K)/rho(4 K), of samples with shapes that do not lend themselves to conventional four-wire resistance measurement techniques. An improvement to an earlier implementation of the eddy-current decay method of resistivity characterization is presented. It involves modernizing the earlier apparatus by the use of a digitizing oscilloscope, commercial curve-fitting software, digital averaging techniques, and modern electronics. Data are shown for high-purity copper cylinders.

A dielectric resonator technique has been used for measurements of the permittivity and dielectric loss tangent of single-crystal dielectric substrates in the temperature range 20-300 K at microwave frequencies. Application of superconducting films made it possible to determine dielectric loss tangents of about 5 X 10(exp -7) at 20 K. Two permittivity tensor components for uniaxially anisotropic samples were measured. Generally, single-crystal samples made of the same material by different manufacturers or by different processes have significantly different losses, although they have essentially the same permittivities. The permittivity of one crystalline ferroelectric substrate, SrTiO3, strongly depends on temperature. This temperature dependence can affect the performance of ferroelectric thin-film microwave devices, such as electronically tunable phase shifters, mixers, delay lines and filters.

Keywords: *Strontium titanates, *Dielectric properties, High-Tc superconductors, Temperature dependence, Microwave frequencies, Microstrip devices, YBCO superconductors, AC losses, Thin films, Capacitance, Capacitors, Substrates, Reprints, Yttrium barium cuprates, Lanthanum aluminates, Microstrip resonators.

We have fabricated and characterized YBCO (YBa2Cu3O(7-x)) microstrip resonators on LAO(LaAlO3) substrates that include thin film STO(SrTiO3) coplanar capacitors to study the dielectric properties of thin film STO. The low frequency capacitance of the STO/LAO capacitor is measured as a function of temperature and dc bias. We use the observed resonant frequencies to extract the microwave frequency capacitance of the structure and the Q's to determine the microwave losses. A conformal map is developed and used to transform the observed capacitances into dielectric constant values for the thin film STO.

Domain Effects in Faraday Effect Sensors Based on Iron Garnets.
Final rept.
M. N. Deeter. 1995, 4p.
See also PB92-197482.
Pub. in Applied Optics 34, n4 p655-658, 1 Feb 95.

Keywords: *Magnetic measurement, *Ferrite garnets, Yttrium iron garnets, Magnetic anisotropy, Magnetic domains, Magnetic films, Faraday effect, Thick films, Comparative evaluations, Magnetooptics, Diffraction, Reprints, *Magnetic field sensors.

Domain-induced diffraction effects produced by two iron garnet thick films and two bulk crystals are compared. The thick films, characterized by a serpentine magnetic domain structure, produced nonlinear response functions; this is in qualitative agreement with a one-dimensional diffraction model. Bulk iron garnet crystals, which exhibited a complex three-dimensional domain structure, produced qualitatively similar effects that diminished with increasing crystal length. Differential signal processing resulted in a linear signal for the thick films and a primarily sinusoidal response for the bulk crystals.

SF6 Insulation: Possible Greenhouse Problems and Solutions.
L. G. Christophorou, and R. J. Van Brunt. Jul 95, 28p, NISTIR-5685.

Keywords: *Sulfur hexafluoride, *Electrical insulation, Dielectric materials, Gas-insulated substations, Gas-insulated cables, Gas-insulated transformers, Physical properties, Chemical properties, Dielectric properties, Recycling, Alternatives, Environmental chemical substitutes, Nitrogen, Mixtures, Greenhouse gases, Ozone depletion, Air pollution abatement, *Insulating gas.

Sulfur hexafluoride (SF6) is the most commonly used insulating gas in electrical systems to date. It is however, a potent greenhouse gas and, thus, its use entails fears of environmental costs, regulations, and restrictions, in spite of its current low levels in the environment. This potential problem and current efforts in the search for short-term and long-term solutions are briefly outlines and discussed in this report. Limiting the release of SF6 in the environment, recycling SF6, and using it where it is needed the most, are among the elements of an emerging consensus effort for the short run. A long-term solution may include the search for alternative high-voltage insulants such as high-pressure gaseous dielectrics (e.g., N2 and N2/SF6 mixtures).

Ferroelectric Thin Film Characterization Using Superconducting Microstrip Resonators.
Final rept.
D. Galt, J. C. Price, J. A. Beall, and T. E. Harvey. 1995, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2575-2578 Jun 95.

Keywords: *Ferroelectricity, *Thin films, *Resonators, *Microwave frequencies, Superconductors, Dielectric properties, Capacitors, Bias, Solid state devices, Reprints, YBCO film, Microstrip devices.

The authors describe a novel technique for characterizing the dielectric response of ferroelectric thin films at microwave frequencies. The method involves a microstrip resonator which incorporates a ferroelectric capacitor at its center. To demonstrate this method the authors have fabricated a superconducting microstrip resonator from a laser ablated Yba2Cu3O(7-delta) (YBCO) film on a LaAlO3(LAO) subsrate with a SrTiO3(STO) capacitor at its center. The authors report the observed dielectric behavior of the STO laser ablated film as a function of bias at liquid He and N2 temperatures and at high and low frequencies. It is observed that the electrically tunable dielectric constant of the STO film is roughly independent of frequency up to 20 GHz (especially at high bias). The loss tangent of the STO/LAO capacitor decreases with increasing bias and is apparently independent of frequency between 6 and 20 GHz.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Ultrasonics, Ferroelectrics, and Frequency Control, v39 n2 p241-249 Mar 92.

Keywords: *Oscillators, *Quartz, *Environmental effects, *Sensitivity, Frequency analysis, Amplitudes, Mechanical vibrations, Noise, Magnetic fields, Electric fields, Irradiation, Temperature, Humidity, Pressure, Acceleration, Reprints.

The frequency, amplitude, and noise of the output signal of a quartz oscillator are affected by a large number of environmental effects. The paper examines the physical bases for the sensitivity of precision oscillators to temperature, humidity, pressure, acceleration and vibration, magnetic field, electric field, load, and radiation. The sensitivity of quartz oscillators to radiaton is a very complex topic and poorly understood. Therefore only a few general results are mentioned. The senstivity to most external influences often varies significantly both from one oscillator type to another and from one unit of a given type to another. For a given unit, the sensitivity to one parameter often depends on the value of other parameters and on history.

Keywords: *Impedence measurement, *Digital systems, *Electric bridges, Electrical impedance, Circuits, Standards, Comparative evaluations, Inductance, Resistors, Reprints.

An impedance bridge that compares two-terminal standard inductors to characterized ac resistors in the frequency range of 10 Hz to 100 kHz is described. A dual-channel, digitally-synthesized source and sampling digital multimeter are used to generate and measure relevant bridge signals. A linear interpolation algorithm is used to autocalibrate the bridge to a 1 nF gas dielectric capacitor. An intercomparison of the new bridge with existing measurement standards conducted in the low audio frequency range shows agreement of 50 to 200 parts in 10(exp 6) for inductors for 1 mH to 10 H.

Measurements of Permittivity and the Dielectric Loss Tangent of Low Loss Dielectric Materials with a Dielectric Resonator Operating on the Higher Order Te(sub 0 gamma delta) Modes.
Final rept.
J. Krupka, R. G. Geyer, and D. Cros. 1994, 6p.
Pub. in International Microwave Conference (10th), MIKON - 94, Ksiaz Castle, Poland, May 30-June 2, 1994, v2 p567-572.

Keywords: *Resonators, *Dielectric resonators, Reprints, Microwaves, Permittivity, Metrology, Modes, *Foreign technology.

Dielectric resonator techniques are commonly used for permittivity and the dielectric loss tangent measurements of low-loss materials. Usually, the TE mode (1-2) or TE mode (3-5) is used. In this case, if dielectric characterization is required at various frequencies, more than one sample of the material under test must be provided. These samples must have differing physical dimensions. In order to perform dielectric measurements on a single sample at several contiguous frequency subbands, higher-order TE modes may be utilized. These higher-order modes are tuned by changing the distance between the conductor ground planes of the dielectric resonator. Identification of higher-order TE resonant modes in several cylindrical samples of the material under test allows properties to be determined over a broad frequency spectrum.

Keywords: *Resistors, *Automation, *Calibration, *US NBS, Measurements, Quality assurance, Standards, Reprints, Standard resistors, NIST(National Institute of Standards and Technology).

The National Institute of Standards and Technology (NIST) provides a calibration service for dc standard resistors over 17 decades of resistance from 10(exp -4) Ohms to 10(exp 12) Ohms using seven independent measurement systems. Four measurement systems are completely automated for calibrating resistors from 1 Ohms to 1 M Ohms. A fifth system for high resistance measurements is semiautomated. Plans are underway to fully automate this system, along with the remaining two measurements is semiautomated. Plans are underway to fully automate this system, along with the remaining two measurement systems. The primary consideration to automate a measurement system is to improve the quality of measurements, and not simply to relieve the operator from tedious repetitive measurements. This paper describes the extent and future plans of resistance measurement automation at NIST.

Also available from Supt. of Docs. as SN003-003-03393-6. See also PB94-200060.

Keywords: *Capacitance, *Calibration, Measuring instruments, *Measurement Assurance Program, MAP program, Reference Standards, US NIST.

The document describes the capacitance Measurement Assurance Program (MAP) service at the National Institute of Standards and Technology (NIST). This service, which uses a commercial digital capacitance meter as the transport standard, provides calibration for capacitance standards at both the 1000 pF and 100 pF levels, at a frequency of 1 kHz. In contrast to the normal MAP, where the transport standards are measured by the client laboratory, the capacitance MAP involves measurements performed on 'dummy' standards by both the Meter (transport standard) and the laboratory capacitance measuring system. Measurement procedures and requirements for client laboratories are included. Also presented are error analysis, assigned values, and equations to estimate the combined uncertainties of the assigned values.

Fundamental Limits on the Frequency Stabilities of Crystal Oscillators.
Final rept.
F. L. Walls, and J. R. Vig. 1995, 14p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Ultrasonics, Ferroelectrics, and Frequency Control, v42 n4 p576-589, 13 Jul 95.

Keywords: *Frequency stability, *Crystal oscillators, Environmental effects, Quartz oscillators, Quartz resonators, Reprints, BAW resonators, Flicker FM.

The frequency instabilities of precision bulk acoustic wave (BAW) quartz crystal oscillators are reviewed. The fundamental limits on the achievable frequency stabilities, and the degree to which the fundamental limits have been approached to data are examined. Included are the instabilities as a function of time, temperature, acceleration, ionizing radiation, electromagnetic fields, humidity, atmospheric pressure, power supply, and load impedance. Most of the fundamental limits are zero or negligibly small, a few are finite. We speculate about progress which may be achievable in the future with respect to approaching the fundamental limits. Suggestions are provided about the paths that may lead to significant stability improvements.

Complicated Cases and Shielded Rooms: Audiometric Booths Shielded to Attenuate Electromagnetic Interference.
Final rept.
V. Nedzelnitsky. 1996, 2p.
Pub. in Jnl. of the Acoustical Society of America, v97 n5 pt2 p3321-3322 May 95.

Keywords: *Electromagnetic shielding, *Electroacoustics, *Test chambers, Electromagnetic interference, Radiofrequency, Hearing aids, Electromagnetic compatibility, Standards, Reprints, Audiometric equipment.

Electromagnetic compatibility (EMC) issues involving acoustical instruments, especially their susceptibility and immunity to electromagnetic interference (EMI), are increasing in importance. Of particular significance is the impact on commercial practice and international trade of two Councils of the European Communities directives regarding generic apparatus and medical devices. Directive 93/42/EED is being interpreted to include hearing aids and audiometric instruments. In the U.S.A., at least, existing standards for measuring such shielded-room performance were not specifically developed for audiometric booths. Methods in some of these standards have been adapted and applied to that purpose. Selected standards, methods, and some considerations regarding their application to measuring the shielding performance of audiometric booths in hospital/clinical environments are discussed.

Pub. in Research in Nondestructive Evaluation, v4 n3 p165-182 1992.

Keywords: *Formability, *Acoustics, *Sheet metal, Resonance, Reprints, *Electromagnetic acoustic transducers, R-value.

An electromagnetic-acoustic transducer (EMAT) system was used in conjunction with a 'sample' CW signal-processing method to generate, receive, and process longitudinal and shear waves in thin steel sheets. Using the system, swept-frequency measurements were made up to 7.5 MHz., To relate the measurements to sheet steel formability, a dimensionless frequency ratio, K, was computed from the resonant frequencies. From theoretical considerations, K should be related to a measure of steel sheet formability, r. This parameter is traditionally measured by plastically deforming uniaxial tension specimens. Good correlation was found between K and r for a set of steel sheet represenative of those typically used to produce automobile body parts.

Effect of Liftoff on Accuracu of Phase Velocity Measurements Made with Electromagnetic-Acoustic Transducers.
Final rept.
A. V. Clark, and Y. Berlinsky. 1992, 41p.
Pub. in Research in Nondestructive Evaluation, 41p 1992.

Keywords: *Acoustics, Liftoff, Reprints, *Electromagnetic acoustic transducers, *Phase velocity.

Electromagnetic-acoustic transducers (EMATs) work on transduction principles which allow them to operate with a clearance (liftoff) between them and a conducting specimen. They have the potential for on-line ultrasonic measurements of rapidly moving materials. Liftoff causes changes in the effective inductance and resistance of the EMAT. Consequently, it causes a phase shift in the output voltage of a receiving EMAT. This can cause errors when the EMAT is used for velocity measurements. In this paper, the authors develop a model for the effect of liftoff. The model gives good agreement with measured liftoff-induced arrival time changes. The model can be extended to the case of an EMAT used with a voltage stepup transformer. The maximum signal is obtained for EMATs operating at resonance; however, the maximum sensitivity to liftoff also occurs then. Thus, a tradeoff must be made between optimum signal and supressing liftoff artifacts. The authors' model, and experimental results, can be used to make these tradeoffs.

Pub. in Jnl. of Nondestructive Evaluation, 36p 1992.

Keywords: *Formability, *Steel sheet, Nondestructive tests, Reprints, *Electromangetic acoustic transducers, Ultrasonic velocity, R value.

Ultrasonics offers a potential means to measure sheet steel formability nondestructively. The formability can be characterized by the plastic strain ratio, or r-value. To be practical, an ultrasonic system should resolve r-value accurately, on rapidly moving material. The authors report here on research which quantifies factors which could degrade this resolution. The authors also present means to suppress these artifacts. They have developed a moving sheet device (MSD) to be used as a test bed to demonstrate the feasibility of on-line measurement of r-value in a steel mill. The device can move specimens at speeds comparable to those in industrial practice. An automated velocity measurement system has also been developed and integrated with the MSD. This allows ultrasonic measurements to be made with an array of transducers. Measurements were made in both static and dynamic mode. Artifacts due to sheet motion were found to be small, and should not significantly degrade 4-value resolution.

Pub. in Applied Physics Letters, v60 n17 p2048-2050 Apr 92.

Keywords: *Magnetic measurement, Magnetic anistropy, Magnetooptics, Faraday effect, Epitaxial films, Reprints, *Fiber optic sensors, *Magnetic field sensors, Stripe domains.

The Faraday effect in the thick epitaxial films of magnetic garnets of the type used in magnetooptic isolators can be used as the basis for a fiber-optic magnetic field sensor. These films have uniaxial anisotropy perpendicular to the surface and they contain bismuth to enhance the Faraday rotation. The typical magnetic domain pattern of meandering stripes changes in response to an applied field perpendicular to the film and this changes the polarization of infrared light propagating perpendicular to the film. Theory and experiment show that the speed of operation is limited by relaxation or resonance effects to upper frequencies between 10(6) and 10(9) Hz. Maximum sensitivity requires low magnetic moment and large thickness, in conflict with the requirements for high speed.

Keywords: *Thin films, *Thermocouples, *Indium oxides, *Tin oxides, Sputtering, Ceramics, Transparence, Platinum, Calibrating, Reprints.

Thin Film thermocouples have unique capabilities for measuring surface temperatures at high temperatures (above 800K) under harsh conditions. Their low mass, approximately 2 x ten to the minus 5 power g/mm permits very rapid response and very little disturbance of heat transfer to the surface being measured. This has led to applications inside gas turbine blades and vanes and ceramic liners in diesel cylinders. The most successful high temperature (up to 1300/K) thin film thermocouples are sputter deposited from platinum and platinum 10% rhodium targets although results using base metal alloys, gold, and platinel will also be presented. The paper reviews the fabrication techniques used to form the thermocouples, approaches used to solve the high temperature insulation and adherence problems, current applications, and test results using the thin film thermocouples. In addition, a discussion will be presented on the recent research on thin film transparent thermocouples.

Resistors are inportant components in electrical and electronic circuits. The article begins with a brief historical account of the evolution of the different types of resistors starting with wirewounds and proceeding to carbon composition and the various film-type resistors. The concept of resistance is briefly described along with Ohm's Law and the unit of resistance. By international agreement, since, January 1, 1990, the unit of resistance has been expressed in terms of the quantum Hall effect which occurs in suitable semiconductors operating at high magnetic fields and low temperatures and is based on fundamental constants. The importance of resistors in the measurement of current, voltage ratios, temperature, and displacement is also discussed. The article describes, in more detail, resistor fabrication including the main constructural elements of base material, resistive element, terminations, and protective enclosure. Then separate categories of carbon composition, wirewound, metal foil, thin film, and thick film resistors are characterized. The article next discusses the key characteristics of the different types of resistors, including accuracy, stability, power rating, temperature coefficient, load coefficient, voltage coefficient, humidity effects, pressure effects, and freqency effects. Finally, the common classification of resistors, according to their intended use and inherent performence, is described. The classification includes standard resistors, resistors in electronic circuits, integrated circuit resistors, high current resistors, and high voltage resistors.

Pub. in Proceedings of the National Conference of Standards Laboratories Workshop and Symposium, Monterey, CA., August 25-29, 1996, p207-212.

Keywords: *Calibration, *Electronic equipment, Test methods, Mathematical models, Linear systems, Predictions, Reprints, Thermal transfer standards.

Empirical linear prediction, developed at NIST, has recently been applied to the NIST calibration of a commercial multi-range ac-dc thermal transfer standard. This approach reduced the number of required test points by 62 percent, resulting in significant cost savings. The calibration model was developed using extensive test data obtained from the instrument manufacturer. Calibration measurements for the instrument under test were made at the reduced set of test points enabling subsequent predictions of the response at all unmeasured points using the model. Uncertainties for the unmeasured points were developed by testing the goodness of fit of the calibration measurements to the model. These uncertainty intervals depend on the quality of the model as well as on the number of points actually measured. The ability of the model to characterize the instrument under test is key to achieving low uncertainties. A brief mathematical description of the modeling and prediction process is presented along with measurement results.

Capacitors with Very Low Loss: Cryogenic Vacuum-Gap Capacitors.
Final rept.
N. M. Zimmerman. 1996, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement, v45 n5 p841-846 Oct 96.

Keywords: *Capacitors, Measurements, Resistance, Reprints, *Vacuum-gap capacitors, *Low-loss capacitors.

The authors report on measurements of capacitors with about 1 pF of capacitance, which have unmeasurably small leakage at very low frequencies, placing a lower bound of about 10 to the 19th power omega on the parallel resistance at an effective frequency of 1 mHz. These measurements are made possible by two themes: the use of vacuum-gap capacitors

(i.e., no dielectric material, operated in vacuum), and detection of leakage using single electron tunneling (SET) electrometers, which have very high input impedance. The authors also report on good achieved results in time stability and lack of frequency and voltage dependence.

Contract AC36-83CH10093
Sponsored by Department of Energy, Washington, DC.

Keywords: *Silicon Solar Cells, Amorphous State, Electrical Properties, Hydrogenation, Progress Report, Thin Films, EDB/140501.

Properties of the hydrogenated amorphous silicon (a-Si:H) films used in photovoltaic (PV) panels are reported. The atomic-scale topology of the surface of intrinsic a-Si:H films, measured by scanning tunneling microscopy (STM) as a function of film thickness, are reported and diagnosed. For 1-500-nm-thick films deposited under normal device-quality conditions from silane discharges, most portions of these surfaces are uniformly hilly without indications of void regions. However, the STM images indicate that 2-6-nm silicon particulates are continuously deposited into the growing film from the discharge and fill approximately 0.01% of the film volume. Although the STM data are not sensitive to the local electronic properties near these particulates, it is very likely that the void regions grow around them and have a deleterious effect on a-Si:H photovoltaics. Preliminary observations of particulates in the discharge, based on light scattering, confirm that particulates are present in the discharge and that many collect and agglomerate immediately downstream of the electrodes. Progress toward STM measurements of the electronic properties of cross-sectioned a-Si:H PV cells is also reported.

Keywords: *Silicon carbides, *Capacitors, *Semiconductor devices, *Vapor deposition, Cubic lattices, Electrical properties, Semiconductor traps, MIS(Semiconductors), Capacitance-voltage characteristics, Metal oxide semiconductors, Multilayer insulation, Oxide coatings, Silicon inorganic compounds, *MIS capacitors, *MOS capacitors, *Compound semiconductors.

Processes to fabricate metal-insulator-semiconductor (MIS) capacitors on the cubic (3C) form of silicon carbide (SiC) were studied. The insulating layers were formed from either thermally grown oxide or chemical-vapor-deposited (CVD) silicon dioxide. The effects of wet or dry oxygen and of oxidation temperatures between 1050 and 1200 C on the electrical properties of devices with thermal oxides were determined. Electrical characterization techniques appropriate for these devices on SiC were developed and applied to the fabricated capacitors. The capacitors were characterized from multiple-frequency capacitance-voltage (C-V) measurements as a function of temperature from room temperature to 300 C. The apparent interface trap level densities were estimated from the high-frequency C-V curves.

Keywords: *Very large scale integration, *Integrated circuits, *Computer aided design, Chips(Electronics), Computer programs, Gallium arsenides, Silicon, Transistors, Guidelines, Manuals, MOSFET, CMOS, Test structures, Test chips, SOI(Semiconductors), SIMOX.

The design guidelines for test chips NIST3 and NIST4 are specified in this manual. These chips were designed for process monitoring and device parameter extraction for a CMOS (Complementary Metal-Oxide-Semiconductor)-on-SOI (Silicon-On-Insulator) process. The chips contain structures which are common to a standard CMOS process as well as structures specifically designed for a SIMOX (Separation by the IMplantation of OXygen) process. In order to facilitate the CAD process, a unique 'technology file' was created for the Magic VLSI layout editor used on a Sun-3/280 system running Sun Version 3.5. This SIMOX technology file is very general and can be used to build CMOS as well as SIMOX chips. NIST3 is 6380 micrometers x 4780 micrometers and contains several large-geometry MOSFETs, resistors, and capacitors. NIST4 is 1 cm x 1 cm and contains approximately 300 small-geometry test structures. The SIMOX specific structures found on these chips include MOSFETs, capacitors, interconnects, and pads to be discussed in more detail. The test guide for the test structures on NIST3 and NIST4 is included in a separate manual (PB93-152106).

Efficient Method to Compute the Maximum Transient Drain Current Overshoot in Silicon on Insulator Devices.
Final rept.
C. Korman, I. Mayergoyz, M. Gaitan, and G. Tai. 1993, 6p.
Pub. in Jnl. of Applied Physics 73, n6 p2611-2626, 15 Mar 93.

Keywords: *Field effect transistors, Transport theory, Poisson equation, Computation, Silicon, MOSFET, Reprints, *SOI(Semiconductors), Drain current overshoot.

The authors present an efficient method to compute the maximum transient drain current overshoot in silicon-on-insulator metal-oxide-silicon field effect transistors. The method is based on the physical idea that the number of majority carriers remains unchanged immediately after a change in the applied gate bias. The maximum overshoot is computed by solving the Poisson and the stationary minority carrier transport equations under the constraint that the number of majority carriers is conserved. Hence, the novel aspect of the method is that it allows one to compute the maximum drain current overshoot without resorting to a computationally costly transient simulation. The accuracy of the method is verified by comparing the value of the drain current computed by the method with the maximum value of the drain current computed by transient simulations. The comparisons show that, with this method, the maximum transient drain current overshoot can be computed quite accurately for fast changes in the gate bias.

Semiconductor Measurement Technology: Design and Testing Guides for the CMOS and Lateral Bipolar-on-SOI Test Library.
J. C. Marshall, and M. E. Zaghloul. Mar 94, 142p, NIST/SP-400-93.
Also available from Supt. of Docs. as SN003-003-03262-0. See also PB93-152106 and PB94-163458. Prepared in cooperation with George Washington Univ., Washington, DC. School of Engineering and Applied Science.

Keywords: *Very large scale integration, *Computer aided design, *Integrated circuits, Chips(Electronics), Bipolar transistors, Electronic modules, Computer programs, Wafers, MOSFET, CMOS, Tests, SOI(Semiconductors), Test structures, Test chips, SIMOX, NIST8, NIST9.

Design and testing guides have been developed for the test library from which test chip NIST8 and test wafer NIST9 were derived. They were designed for use in process monitoring and device parameter extraction to evaluate and compare CMOS (Complementary Metal-Oxide-Semiconductor) test structures, including devices and circuits, fabricated on both bulk silicon and SOI (Silicon-on-Insulator), specifically SIMOX (Separation by the IMplantation of OXygen), wafers. The test library consists of both CMOS-on-SOI and lateral bipolar-on-SOI modules. From it, 20 modules were assembled to create CMOS test chip NIST8 that was fabricated using a standard bulk CMOS foundry through the MOSIS service. SOI/SIMOX test wafer NIST9 contains approximately 1000 modules and was also assembled from modules in this test library. Fourteen processing masks are used to fabricate depletion-mode MOSFETs, lateral bipolar devices, and CMOS MOSFETs with source-to-channel ties. The SOI/SIMOX technology file used with the Magic VLSI layout editor was modified to include the layers necessary to generate these 14 processing masks. This modification is discussed, and unique test structure designs are presented.

The measurement of layer-to-layer feature overlay will, in the foreseeable future, continue to be a critical metrological requirement for the semiconductor industry. Meeting the image placement metrology demands of accuracy, precision, and measurement speed favors the use of electrical test structures. In this paper, a two-dimensional, modified voltage-dividing potentiometer is applied to a short-loop VLSI process to measure image placement. The contributions of feature placement on the reticle and registration on the wafer to the overall measurement are analyzed and separated. Additional sources of uncertainty are identified, and methods developed to monitor and reduce them are described.

Electro-Thermal Simulation of an IGBT PWM Inverter.
Final rept.
H. A. Mantooth, and A. R. Hefner. 1993, 10p.
Pub. in Proceedings of the Power Electronics Specialists Conference, Seattle, WA., June 20-24, 1993, p75-84.

Keywords: *Inverters, Chips(Electronics), Computerized simulation, Thermal analysis, Silicon, Reprints, Insulated gate bipolar transistors, Circuit simulators.

A recently developed electro-thermal network simulation methodology is used to analyze the behavior of a full-bridge, pulse-width-modulated, voltage-source inverter which uses IGBTs (Insulated Gate Bipolar Transistors) as the switching devices. The electro-thermal simulations are performed using the Saber Circuit simulator and include the control logic circuitry, the IGBT gate drivers, the physics-based IGBT electro-thermal model, and the thermal network component models for the power device silicon chips, packages, and heat sinks. It is shown that the thermal response of the silicon chip determines the IGBT temperature rise during the device switching cycle. It is also shown that the full electro-thermal analysis is required to accurately describe the power losses and circuit efficiency.

Keywords: *Semiconductor junctions, *P-n junctions, *Gallium arsenides, Molecular beam epitaxy, Scanning tunneling microscopy, Aluminum arsenides, Passivation, Cleavage, Reprints, Atomic force microscopy.

Scanning tunneling microscopy (STM) and atomic force microscopy operating in air have been used to investigate locations of molecular-beam epitaxially grown GaAs multiple pn junctions cleaved and passivated with P2S5. Symmetrically and asymmetrically doped junctions were prepared within topographically delineated AlAs/GaAs marker regions for this in-air study of electronic junction contrast. Our results indicate that the STM-delineated junction locations do not coincide with the electrical junction locations, but rather shift into the p-type regions.

Majority and Minority Mobilities in Heavily Doped Silicon for Device Simulations.
Final rept.
H. S. Bennett, and J. R. Lowney. 1992, 6p.
Pub. in Proceedings of International Workshop on Numerical Modeling of Processes and Devices for Integrated Circuits, Seattle, WA., May 31-June 1, 1992, p123-128.

Keywords: *Electron mobility, *Hole mobility, Carrier mobility, Doped materials, Simulation, Silicon, Reprints.

As silicon devices approach 0.2 micrometer in size, it will be essential to have accurate values for the majority and minority mobilities of electrons and holes. These mobilities have been calculated in silicon for donor and acceptor densities between 10(sup 17)/cc and 10(sup 20)/cc. All the important scattering mechanisms have been included. The ionized impurity scattering has been treated with a quantum-mechanical phase-shift analysis. The results are in good agreement with experiment. In addition, the ionized impurity scattering rates calculated from the quantum-mechanical phase shifts and those rates calculated from the Born approximation are shown to differ by more than factors of three. The commonly used Born approximation is not valid for low energy carriers near band extrema.

Pub. in Extended Abstract, Proceedings of Institute of Electrical and Electronics Engineers International SOI Conference, Ponte Vedra Beach, FL., October 6-8, 1992, p26-27. Sponsored by Office of Naval Research, Arlington, VA. and Defense Nuclear Agency, Washington, DC.

Keywords: Electron spin resonance, Vacuum ultraviolet radiation, Crystal defects, Electron traps, Hydrogen, Reprints, *SOI(Semiconductors), *SIMOX, Buried oxides.

Evidence for structural changes in SIMOX buried oxides is presented. We show that deep electron traps may be created in SIMOX buried oxides; these electron traps could compensate for some positively charged E' centers. In addition, we report observation of relatively high densities of hydrogen-related defects in VUV illuminated oxides. We suggest that this short range disorder may be responsible for the differences between the response of ordinary thermal oxide and SIMOX buried oxides.

Keywords: *Microelectronics, *Lithography, Metrology, Substrates, Masks, Reprints, Test structures, Coordinate measurement systems, Traceability.

A new test structure has been designed to measure the positions of the images of an array of fiducial marks projected from a mask into a resist film on a substrate. The resist film on the substrate covers a nominally matching array of partially formed versions of the test structure prepatterned in a conducting film. Instances of the finished structure are formed on the substrate by further selective removal of conducting material from the partially formed test structures where they are overlaid by images of the fiducial marks on the mask. At each array point, the feature of the completed test structure that is defined by the overlay of the image of the fiducial marks on the mask is called the pointer. The part of the partially formed test structure that is unaffected by the overlay of the images of the fiducial marks on the mask serves as a ruler. Electrical testing accurately provides the precise location of the pointer relative to the ruler within each test structure. The paper describes the test structure and provides examples of measurements that indicate precision to within less than 2 nm and accuracy of better than 7 nm.

We have successfully made low resistance contacts between high-quality films of YBa2Cu3O(7-x) (YBCO) and single-crystal Si substrates through Ag-Au interconnections. The YBCO films were deposited by laser ablation on an epitaxial yttria-stabilized zirconia buffer layer on Si and had zero-resistance critical temperatures of 83-85 K after patterning into lines. Specific contact resistivities (resistance-area products) of the YBCO to Si interconnection, limited by the Au to Si interface, of 10(sup -6) ohm (cm squared) were achieved on heavily doped Si after deposition and patterning of the YBCO film. This demonstrates the use of high-temperature superconductors as a wiring layer compatible with conventional Si metal-oxide semiconductor processing.

Investigation of the Drive Circuit Requirements for the Power Insulated Gate Bipolar Transistor (IGBT).
Final rept.
A. R. Hefner. 1991, 12p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Power Electronics 6, n2 p208-219 Apr 91.

Keywords: *Bipolar transistors, Requirements, Reprints, *Insulated gate bipolar transistors, Drive circuits, Power transistors.

The drive circuit requirements of the insulated gate bipolar transistor (IGBT) are explained with the aid of an analytical model. It is shown that non-quasi-static effects limit the influence of the drive circuit on the time rate-of-change of anode voltage. Model results are compared with measured turn-on and turn-off waveforms for different drive, load, and feedback circuits and for different IGBT base lifetimes.

Multicarrier Characterization Method for Extracting Mobilities and Carrier Densities of Semiconductors from Variable Magnetic Field Measurements.
Final rept.
J. S. Kim, D. G. Seiler, and W. F. Tseng. 1993, 12p.
Pub. in Jnl. of Applied Physics 73, n12 p8324-8335, 15 Jun 93.

Keywords: *High electron mobility transistors, *Carrier mobility, *Carrier density, Indium gallium arsenides, Electrical conductivity, Magnetic fields, Tensors, Reprints, Multilayers.

A simple, practical method is described to extract the carrier concentration and mobility of each component of a multicarrier semiconductor system (which may be either a homogeneous or multilayered structure) from variable magnetic field measurements. Advantages of the present method are mainly due to the inclusion of both the longitudinal and transverse components of the conductivity tensor and normalization of these quantities with respect to the zero-field longitudinal component of the conductivity tensor. This method also provides a simple, direct criterion by which one can easily determine whether the material under test is associated with a one-carrier or multicarrier conduction. The method is demonstrated for a simple one-carrier system (GaAs single-channel high-electron-mobility-transistor (HEMT) structure) and two multicarrier systems (an InGaAs-GaAs double-channel HEMT-structure and two types of carriers present in an InGaAs single-channel HEMT structure). The analysis of the experimental data obtained on these samples demonstrates the utility of the method presented here for extracting carrier concentrations and mobilities in advanced semiconductor structures.

Pub. in Extended Abstract, Proceedings of Institute of Electrical and Electronics Engineers International SOI Conference, Ponte Vedra Beach, FL., October 6-8, 1992, p80-81.

Keywords: *Crystal defects, *CMOS, Integrated circuits, Ion implantation, Stacking faults, Annealing, Silicon, Oxides, Reprints, *SOI(Semiconductors), Thermal ramping, SIMOX.

SIMOX (Separation by IMplantation of OXygen) is a leading technology for providing SOI material for complementary metal-oxide-semiconductor (CMOS) circuits which have increased radiation hardness and higher operating speed. Defects in the top Si layer affect CMOS device yield, operation, and reliability. Defects in annealed SIMOX form from oxide precipitation and dissolution during thermal ramping and annealing. These defects include dislocations, stacking faults, stacking fault pairs, and stacking fault tetrahedra. Multiple cycles of implantation and annealing and higher temperature implantation, above 600 C, have been used to reduce the defect density. Thermal ramping rate and annealing ambient can significantly affect precipitation processes and defect formation during thermal ramping. In this work, the effect of thermal ramping conditions, including oxide capping, on defect formation was studied.

The terms in the title of this paper are often used to characterize the quality of any measurement result. However, these terms (particularly accuracy and traceability) are very often confused (and abused) in practice. They often do not have the same meaning to the seller, buyer, and user of metrology instruments. Each of these terms has a very specific meaning and definition and each should be fully understood and quantified properly before being used to convey metrological information for any purpose. This paper summarizes the generally-accepted generic metrological meaning and significance of these terms for the purpose of clarifying any misunderstanding that might otherwise arise between the metrologist and the user of metrological data. These meanings are illustrated by discussing their application to dimensional standards presently available to the semiconductor industry from NIST.

O. B. Laug, T. M. Souders, and D. R. Flach. 1992, 5p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers Instrumentation and Measurement Technology Conference, Secaucus, NJ., May 12-14, 1992, p437-441.

Keywords: *Application specific integrated circuits, *Comparator circuits, Frequency domain, Time domain, Electrical measurement, Electric pulses, Voltage, Performance, Design, Silicon, Reprints, Waveform sampling.

This paper reports on the design and performance of an application specific integrated circuit (ASIC) comparator that has been optimized for equivalent-time waveform sampling applications. The comparator, which has been fabricated with an 8.5 GHz f(sub tau), bipolar silicon process, features a bandwidth of >2 GHz, a settling-time accuracy of 0.1% in 2 ns, and almost total elimination of 'thermal tails' in the settling response. Several novel design features that have been used to achieve this level of performance are presented. The comparator can be used in a sampling system for both frequency domain measurements, e.g. wideband rms voltage measurements, and high accuracy time domain pulse measurements.

Pub. in Institute of Electrical and Electronics Engineers Circuits and Devices 8, n6 p10-17 Nov 92.

Keywords: *Computer aided design, *CMOS, Chips(Electronics), Etching, Silicon, Reprints, *Micromachining, MOSIS service.

The methodology for implementing the design of silicon micromachined devices in a standard CMOS foundry process is discussed, and a modified Magic technology file is introduced. The modified technology file is used to design silicon micromachined devices that are fabricated using a standard CMOS foundry through the MOSIS service. An additional maskless etch in EDP is required to realize the micromechanical structures once devices are delivered. The modified technology file implements a layer that we call 'open' that consists of a combination of vias and contact cuts. This open area exposes the silicon surface for an anisotropic etch procedure that creates suspended bridges of polysilicon or metal encapsulated in SiO2. Results from fabricated chips are included.

Defects in ungated n- or p-type and gated p-type resistors have been characterized by photoinduced transient spectroscopy (PITS). These resistors were fabricated with p-type separation by implanted oxygen (SIMOX) wafers with a single-energy 200-keV oxygen implant to a total fluence of 1.8 X 10(sup 18)/sq cm. One wafer, used for gated resistor fabrication was implanted at 595 C and sequentially annealed at 1,325 C for 4 h in argon (plus 0.5% oxygen) followed by 4 h in nitrogen (plus 0.5% oxygen). Another wafer, used for ungated resistor fabrication, was implanted at 650 C and annealed at 1,275 C for 2 h in nitrogen (plus 0.5% oxygen). Our results indicate that more damage is present in the wafer annealed at 1,275 C than in the one annealed at 1,325 C. We estimate the average trap density at the back interface to be in the 10(sup 11)/sq cm range.

Keywords: *Breakdown(Electronic threshold), *Dielectric breakdown, Electron traps, Hole traps, Capacitors, Reprints, *SIMOX, SIMOX(Separation by IMplanted OXygen), Buried oxides, SOI(Semiconductors).

We have studied the charge build-up mechanism in SIMOX (Separation by IMplanted OXygen) capacitors injected with electrons from the gate or substrate. The breakdown voltage corresponds to electric fields of 10(sup 7)V/cm for electron injection from the gate, or 7.5 X 10(sup 6)V/cm for electron injection from the substrate. These field values, comparable to breakdown fields in capacitors fabricated with thermally grown oxides, are reported here for the first time in SIMOX buried oxides. The breakdown voltage asymmetry in the SIMOX structure is determined by differences in interface morphology at the gate or substrate. Injection from the substrate yields higher current under equal bias and results in lower breakdown fields.

Practical Photomask Linewidth Measurements.
Final rept.
J. Potzick. 1990, 9p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Integrated Circuit Metrology, Inspection and Process Control IV, San Jose, CA., March 5-6, 1990, v1261, p114-122.

Keywords: *Dimensional measurement, *Integrated circuits, *Line width, *Photomasks, *Lithography, Process control, Comparison, Accuracy, Reprints, Microlithography, Micrometrology.

The measurement cycle for practical accurate photomask linewidth measurement is analyzed as a differential measurement--the linewidth to be measured is compared to a known linewidth on a standard photomask. The linewidth measuring instrument is thus a comparator. The conditions necessary for a valid measurement are discussed with regard to both the instrument and the comparison process. The principles discussed here apply to many other types of measurement as well.

Standard Reference Materials: Certification of a Standard Reference Material for the Determination of Interstitial Oxygen Concentration in Semiconductor Silicon by Infrared Spectrophotometry.
Special pub.
B. Rennex. Aug 94, 85p, NIST/SP-260/121.
Also available from Supt. of Docs. as SN003-003-03281-6.

Keywords: *Silicon, Concentration(Composition), Infrared spectrophotometers, Certification, Calibration, Interstitials, Semiconductors, Uncertainty, Tables(Data), Graphs(Charts), *Standard reference materials, *Oxygen concentration, Infrared spectrophotometry, Number fraction.

A Standard Reference Material, SRM-2551, has been prepared, measured, and certified for the determination of interstitial oxygen number fraction (commonly referred to as the oxygen concentration) in semiconductor silicon. This SRM is intended for calibration of infrared spectrophotometers used to measure the 1107/cm interstitial oxygen peak in silicon. Its purpose

is to enable its users to improve their measurement agreement. The expanded SRM uncertainty is 0.17% for the low-oxygen specimens, 0.13% for the medium-oxygen specimens, and 0.12% for the high-oxygen specimens. The certifying instrument was a Fourier-transform infrared spectrophotometer which measured the oxygen peak height. Specimens from an earlier international Grand Round Robin (GRR) were used to convert these infrared values to oxygen number fraction (concentration) values. A major source of uncertainty had been measurement drift; this was largely compensated using a control specimen. The remaining sources of uncertainty were instrument reproducibility, nonuniformity in oxygen concentration and thickness over the specimen area, and variation in residual oxygen in the SRM float-zone specimens, each of which float-zone specimens served as the zero-oxygen reference for a measurement. These sources were combined in quadrature to arrive at the above-quoted 2 sigma estimate of expanded SRM uncertainty.

Physics for Device Simulations and Its Verification by Measurements.
Final rept.
H. S. Bennett, and J. R. Lowney. 1994, 41p.
Pub. in Semiconductors, v59 pt2 p33-73 1994.

Keywords: *Semiconductor devices, *Computerized simulation, Quantum mechanics, Carrier mobility, Bipolar transistors, Space charge, Doped materials, Band theory, Gallium arsenides, Silicon, Plasmons, Phonons, Reprints.

The motivations for using computers to simulate the electrical characteristics of transistors are discussed. Our work and that of others in the area of device physics and modeling are described. We compare conventional device physics with an alternative approach to device physics that is more directly traceable to quantum-mechanical concepts. We then apply this new approach to quasi-neutral regions, space-charge regions, and regions with high levels of carrier injection. Examples of applying quantum-mechanically-based device physics to energy band diagrams for bipolar transistors are given. The limits for using theoretical results from uniform media in numerical simulations of devices with large concentration gradients are discussed. We conclude with a discussion of the requirements for verifying and calibrating device simulators for the submicrometer domain.

This NISTIR documents the results of a joint Industry - University - Government workshop on 'Materials Metrology and Data for Commercial Electrical and Optical Packaging and Interconnection Technologies' conducted on May 5-6, 1994 at the Hilton Hotel in Gaithersburg, MD and was cosponsored by the National Institute of Standards and Technology, the Institute for Interconnecting and Packaging Electronic Circuits, the Optoelectronics Industry Development Association, and the Semiconductor Research Corporation. The workshop consisted of eight separate working groups. Four technology-focused working groups met to address the challenges and priorities in materials measurement and data to support the design, manufacture, and reliability assessment of critical electrical and optical packaging and interconnection materials, structures, and processes. Four performance-focused working groups also met to address the status, challenges, and gaps in metrology and data to describe the properties of materials utilized in the critical packaging and interconnection materials, structures, and processes identified earlier.

Monte Carlo Model for SEM Linewidth Metrology.
Final rept.
J. R. Lowney, M. T. Postek, and A. E. Vladar. 1994, 12p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Integrated Circuit Metrology, Inspection, and Process Control VIII, San Jose, CA., February 28-March 2, 1994, v2196 p85-96.

Keywords: *Scanning electron microscopy, *Dimensional measurement, *Integrated circuits, *Line width, *Edge detection, Mathematical models, Monte Carlo method, Computerized simulation, Electron transport, Electron scattering, Backscattering, Metrology, Substrates, Silicon, Gold, Reprints, X-ray lithography, Microlithography.

A scanning electron microscope (SEM) can be used to measure the dimensions of the microlithographic features of integrated circuits. However, without a good model of the electron-beam/specimen interaction, accurate edge location cannot be obtained. A Monte Carlo code has been developed to model the interaction of an electron beam with a line lithographically produced on a multi-layer substrate. The purpose of the code is to enable one to extract the edge position of a line from SEM measurements. It is based on prior codes developed at NIST, but with a new formulation for the atomic scattering cross sections and the inclusion of a method to simulate edge roughness or rounding. The code is currently able to model the transmitted and backscattered electrons, and the results from the code have been applied to the analysis of electron transmission through a gold line on a thin silicon substrate, such as used in an X-ray lithographic mask. By comparing the predictions of the code with measured data, it is possible to obtain edge positions to the order of + or - 10 nm, which is needed for the advanced lithography projected for the year 2000. The uncertainty of this measurement is limited by the sample geometry and surface roughness and not by the measurement process.

Transverse Magnetoresistance: A Novel Two-Terminal Method for Measuring the Carrier Density and Mobility of a Semiconductor Layer.
Final rept.
J. R. Lowney, W. R. Thurber, and D. G. Seiler. 1994, 3p.
Pub. in Applied Physics Letters 64, n22 p3015-3017, 30 May 94.

Keywords: *Carrier density, *Carrier mobility, *Magnetoresistance, Semiconductor devices, Semiconductors(Materials), Mercury cadmium tellurides, Infrared detectors, Electrical measurement, Cryogenic temperature, Reprints, Magnetic field dependence, Transverse magnetoresistance.

The magnetic-field dependence of the two-terminal magnetoresistance that occurs in rectangularly shaped samples can be used to determine both the free-carrier density and the mobility of a semiconductor layer. An approximate equation for the magnetoresistance was derived for variable length-to-width ratio. This technique was used to determine the electron density and mobility of accumulation layers in n-type Hg(0.8)Cd(0.2)Te photoconductive infrared detectors at 6 and 77 K. It should be applicable to a wide variety of fabricated devices and allow significant improvements in processing methods and quality control.

High Temperature Reliability of Thin Film SiO2.
Final rept.
J. S. Suehle, P. Chaparala, and C. Messick. 1994, 9p.
Pub. in Proceedings of International High Temperature Electronics Conference (2nd), Charlotte, NC., June 5-10, 1994, pVIII 15-VIII 23.

Keywords: *Silicon dioxide, *Dielectric breakdown, Temperature range 0400-1000 K, Time dependence, Reliability(Electronics), High temperature, Dielectric films, Reprints.

We present Time-Dependent Dielectric Breakdown (TDDB) test results for thin SiO2 gate oxides at stress temperatures up to 400 C. The data were collected at the wafer level using a specially designed probe station that uses a water-cooled probe card and text fixture. It is demonstrated that these oxides exhibit extrapolated lifetimes in excess of 6.3 x 10(exp 10) s (2000 years) at 2.0 MV/cm for a stress temperature of 350 C under positive or negative bias. Our results indicate that the physical mechanism of TDDB does not change significantly up to stress temperatures of 400 C. It is necessary to obtain data over a wide range of electric fields and temperatures to distinguish between field acceleration models and to quantify the electric field and temperature dependencies of the thermal activation energy and the field acceleration factor, respectively.

Effects of Heavy Doping on Numerical Simulations of Gallium Arsenide Bipolar Transistors.
Final rept.
M. Tomizawa, T. Ishibashi, H. S. Bennett, and J. R. Lowney. 1992, 10p.
Pub. in Solid-State Electronics 35, n6 p865-874 1992.

Keywords: *Bipolar transistors, Molecular beam epitaxy, Mathematical models, Numerical solution, Sensitivity analysis, Doped materials, Carrier mobility, Carrier density, Carrier lifetime, Gain, Reprints, *Gallium arsenide transistors.

Using the best available physical models is essential for predictive numerical simulations of advanced, high performance GaAs transistors. Among the many input parameters for numerical simulations, the effective intrinsic carrier concentrations, n(ie) minority carrier mobilities, mu, and recombination lifetimes, tau, are very critical parameters. The results from recent theoretical calculations for n(ie) were implemented into a two-dimensional, drift-diffusion simulator for GaAs transistors. In order to compare predicted and measured d.c. common emitter gains, NPN GaAs homojunction bipolar transistors with different but heavily doped bases and similarly doped emitters that have widths between 0.1 and 0.45 micrometer were fabricated by molecular beam epitaxy. The predicted gains of 8, 25, 46, 72 for these transistors agreed very well with their measured gains of 9, 22, 42 and 70 at high current, respectively. Without using the new theoretical data for n(ie) but setting n(ie) equal everywhere to the intrinsic carrier concentration, n(i), the predicted gains became 4, 14, 27 and 35, respectively. Sensitivity analyses on mobilities, lifetimes, and n(ie) showed that physically correct n(ie) values are quantitatively very important for predictive simulations of GaAs bipolar transistors.

Electrical Test Structure for Overlay Metrology Referenced to Absolute Length Standards.
Final rept.
M. W. Cresswell, W. B. Penzes, R. A. Allen, E. C. Teague, L. W. Linholm, and C. H. Ellenwood. 1994, 10p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Integrated Circuit Metrology, Inspection, and Process Control VIII, San Jose, CA., February 28-March 2, 1994, p512-520.

Keywords: *Very large scale integration, *Integrated circuits, *Overlays, Potentiometers(Resistors), Microelectronics, Positioning, Alignment, Metrology, Lithography, Reprints, *Test structures, Coordinate measurement systems, Length standards, Traceability.

This test structure is based on the voltage-dividing potentiometer principle and was originally replicated in a single lithography cycle to evaluate feature placement by a primary pattern generator. A new test structure has now been developed from the single-cycle version and has been used for measuring the overlay of features defined by two different exposures with a stepping projection aligner. The as-measured overlay values are processed by an algorithm which minimizes the effects of nominal random pattern imperfections. The algorithm further partitions measurements of overlay into contributions which derive, respectively, from misregisteration of the image fields projected by the two masks and from the drawn misplacement of features on the masks. The numerical estimates of these contributions so obtained from the electrical measurements were compared with those extracted from the same features by the NIST Line Scale Interferometer, providing traceability to absolute length standards. The two sets of measurements were found to agree to within the several-nanometer uncertainty cited for the line scale interferometer's readings alone. The motivation for this work was to compare the nanometer-level distortions, produced by alternative chucking arrangements, of proximity X-ray masks having various support-ring architectures. However, the techniques may also be used to evaluate optical aligner tools and to determine image placement quality on optical reticles with traceability to the International Standard of length, the meter.

Exact Solution of the Steady-State Surface Temperature for a General Multilayer Structure.
Final rept.
J. Albers. 1994, 9p.
Pub. in Proceedings of Annual Institute of Electrical and Electronics Engineers Semiconductor Thermal Measurement and Management Symposium (10th), San Jose, CA., February 1-3, 1994, p129-137.

Keywords: *Semiconductor devices, *Surface temperature, Thermal conductivity, Fourier analysis, Steady state, Heat flow, Microelectronics, Silicon, Reprints, SOI(Semiconductors), Multilayers, SIMOX.

A recursive technique is developed and is shown to provide the surface temperature of the multilayer steady-state heat flow equation. This recursive technique can be used with any number of layers while incurring only a small increase in computation time for each added layer. For the case of complete, uniform top surface coverage by a heat source, the technique gives rise to the generalized one-dimensional thermal resistance result. An example of the use of the new recursive method is provided by the preliminary calculations of the surface temperature of a buried oxide (SOI, SIMOX) structure containing several thicknesses of the surface silicon layers. This new technique should prove useful in the investigation and understanding of the steady-state thermal response of modern multilayer microelectronic structures.

Comparisons of Measured Linewidths of Sub-Micrometer Lines Using Optical, Electrical, and SEM Metrologies.
Final rept.
R. A. Allen, P. Troccolo, J. C. Owen, J. Potzick, and L. W. Linholm. 1993, 10p.
Pub. in Proceeding of Society of Photo-Optical Instrumentation Engineers: Integrated Circuit Metrology, Inspection, and Process Control VII, San Jose, CA., March 2-4, 1993, v1926 p34-43.

Keywords: *Very large scale integration, *Integrated circuits, *Dimensional measurement, *Line width, Scanning electron microscopy, Optical microscopy, Comparative evaluations, Metal films, Lithography, Substrates, Metrology, Titanium, Quartz, Wafers, Reprints, Test structures.

An investigation is being carried out to determine the ability of three methods of linewidth metrology to measure the dimensions of features to less than 0.5 micrometer. The three methods are transmitted-light optical microscopy, electrical test structure, and scanning electron microscopy (SEM). Electrical, SEM, and reflected-light microscopy techniques are widely used for linewidth metrology in VLSI fabrication. However, none of these widely-used techniques currently permits traceability to international standards of length. Transmitted-light optical microscopy allows traceability; however, this technique is applicable only to transparent substrates. To permit the inclusion of transmitted-light optical microscopy in this investigation, 100-nm thick Ti films were patterned using normal VLSI processing techniques on a 150-mm diameter quartz wafer. The cross-bridge resistor test structure was used as this structure has been widely used in industry and it allows the results from all three metrological techniques to be compared. The design bridge widths of the test structures range from 0.4 micrometer to 1.0 micrometer. The results of these measurements show systematic and uniform offsets between the different techniques. In this paper we discuss the different techniques and describe the observed results.

Physics for Device Simulations and Its Verification by Measurements.
Final rept.
H. S. Bennett, and J. R. Lowney. 1994, 41p.
Pub. in Semiconductors, v59 pt2 p33-73 1994.

Keywords: *Computerized simulation, *Transistors, Silicon transistors, Bipolar transistors, Quantum mechanics, Energy bands, Gallium arsenides, Carrier mobility, Calibration, Phonons, Plasmons, Reprints.

The motivations for using computers to simulate the electrical characteristics of transistors are discussed. Our work and that of others in the area of device physics and modeling are described. We compare conventional device physics with an alternative approach to device physics that is more directly traceable to quantum-mechanical concepts. We then apply this new approach to quasi-neutral regions, space-charge regions, and regions with high levels of carrier injection. Examples of applying quantum-mechanically-based device physics to energy band diagrams for bipolar transistors are given. The limits for using theoretical results from uniform media in numerical simulations of devices with large concentration gradients are discussed. Calculations of the effective intrinsic carrier concentrations for gallium arsenide and silicon are also given, along with published data. In addition, calculations of the mobilities for GaAs that are based in part on quantum-mechanical phase shifts are compared with published data. We then conclude with a discussion of the requirements for verifying and calibrating device simulators for the submicrometer domain.

Experimental Study of Reverse-Bias Failure Mechanisms in Bipolar Mode JFET (BMFET).
Final rept.
G. Busatto. 1993, 7p.
Pub. in Proceedings of Power Electronics Specialists Conference, Seattle, WA., June 20-24, 1993, p482-488.

Keywords: *Field effect transistors, *Bipolar transistors, *Breakdown(Electronic threshold), *Avalanche breakdown, Nondestructive tests, Failure(Electronics), Integrated circuits, Layout, Reprints, Power transistors, Second breakdown, Reverse bias.

A systematic, non-destructive, experimental study of the bipolar mode FET (BMFET) behavior during its failure is presented. The variation of the reverse bias safe operating area (RBSOA) for an inductive load with different bias conditions is described. It is shown that the device breakdown is strongly dependent on the reverse current gain. On the basis of the experimental results, insight into the physics of the failure mechanisms is given, and it is shown that most of the RBSOA limitations appear to result from device lay-out problems.

The emerging field of nanoelectronics demands innovative methods to fabricate nanometer-scale structures. Such structures will play a critical role in the quantum-effect device physics of future highly integrated circuit architectures. An integrated approach to compound semiconductor nanostructure fabrication based on scanning tunneling microscope (STM) nanolithography, molecular-beam epitaxy, and reactive ion etching techniques is described. The critical elements of this approach, which have been demonstrated recently, are reviewed. Prospects for the coevolutionary development of nanoelectronics and STM-based fabrication and characterization are considered.

We report on the performance of multijunction thermal converters (MJTCs) fabricated using commercial CMOS integrated circuit (IC) foundries through MOSIS. Calibration testing shows that the devices are suitable for the measurement of ac voltage, current, and power for frequencies above audio using conventional thermal transfer techniques. These devices show promise for applications as low-cost, high-precision RF and microwave power sensors with integrated electronics. The fabrication methodology allows easy integration with VLSI microcircuits using standard design libraries leading to low-cost, foundry-independent products.

Modeling Buffer Layer IGBTs for Circuit Simulation.
Final rept.
A. R. Hefner. 1993, 10p.
Pub. in Proceedings of Power Electronics Specialists Conference, Seattle, WA., June 20-24, 1993, p60-69.

Keywords: *Bipolar transistors, Application specific integrated circuits, Mathematical models, Dynamic properties, Reprints, *Insulated gate bipolar transistors, Circuit simulators, Buffer layers.

The dynamic behavior of commercially available buffer layer IGBTs is described. It is shown that buffer layer IGBTs become much faster at high voltages than nonbuffer layer IGBTs with similar low voltage characteristics. Because the fall times specified in manufacturers' data sheets do not reflect the voltage dependence of switching speed, a new method of selecting devices for different circuit applications is suggested. A buffer layer IGBT model is developed and implemented into the Saber circuit simulator, and a procedure is developed to extract the model parameters for buffer layer IGBTs. It is shown that the new buffer layer IGBT model can be used to describe the dynamic behavior and power dissipation of buffer layer IGBTs in user-defined application circuits.

Simulating the Dynamic Electro Thermal Behavior of Power Electronic Circuits and Systems.
Final rept.
A. R. Hefner, and D. L. Blackburn. 1993, 10p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Power Electronics 8, n4 p376-385 Oct 93.

Keywords: *Electronic circuits, *Electrical networks, *Thermal analysis, Temperature distribution, Mathematical models, Semiconductor devices, Chips(Electronics), Heat sinks, Integrated circuits, Electric current, Voltage, Reprints, *Circuit simulators, Thermal networks.

A methodology is presented for simulating the dynamic electrothermal behavior of power electronic circuits and systems. In the approach described, the simulator solves for the temperature distribution within the semiconductor devices, packages, and heat sinks (thermal network) as well as the currents and voltages within the electrical network. The thermal network is coupled to the electrical network through the electrothermal models for the semiconductor devices. The electrothermal semiconductor device models calculate the electrical characteristics based upon the instantaneous value of the device silicon chip surface temperature and calculate the instantaneous power dissipated as heat within the device. The thermal network describes the flow of heat from the chip surface through the package and heat sink and thus determines the evolution of the chip surface temperature used by the semiconductor device models.

X-ray Mask Metrology: The Development of Linewidth Standards for X-ray Lithography.
Final rept.
M. T. Postek, J. R. Lowney, A. E. Viadar, R. D. Larrabee, W. J. Keery, and E. Marx. 1993, 15p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Electron-Beam, X-ray, and Ion-Beam Submicrometer Lithographies for Manufacturing III, San Jose, CA., March 1-2, 1993, v1924 p435-449.

Keywords: *Integrated circuits, *Dimensional measurement, *Line width, *Lithography, *Standards, Scanning electron microscopy, Monte Carlo method, Electron beams, Metrology, Reprints, *X ray lithography, *X ray masks, Transmitted electrons, Secondary electrons.

The calibration of masks used in X-ray lithography has been successfully accomplished in the scanning electron microscope (SEM) by using the transmitted scanning electron detection technique. This has been made possible because these masks present a measurement subject different from most (if not all) other objects used in semiconductor processing because the support membrane is, by design, X-ray transparent. This characteristic can be used as an advantage in electron beam-based mask metrology because, depending upon the incident electron beam energies, substrate composition and substrate thickness, the membrane can also be essentially electron transparent. The areas of the mask where the absorber structures are located are essentially X-ray opaque as well as electron opaque. Viewing the sample from a perspective below an X-ray mask (by placing the detector beneath the mask) provides excellent electron signal contrast between the absorber structure and the base membrane. Thus, the mask can be viewed in the transmitted electron detection mode of the SEM and precise, potentially accurate dimensional measurements can be made. Monte Carlo modeling of the transmitted electron signal was used to support this work in order to determine the optimum electron detector position and characteristics. This work represents the potential for the first accurate linewidth measurement standard measured at NIST in the SEM as well as the potential for linewidth standards for the X-ray lithography community.

D. K. Walker, D. F. Williams, and N. Morgan. 1992, 9p.
Pub. in ARFTG Conference Digest (40th), Orlando, FL., December 3-4, 1992, p1-9.

Keywords: *Film resistors, Electrical impedance, Planar structures, Equivalent circuits, Photoresist coatings, Nickel chromium alloys, Integrated circuits, Residues, Reprints, *Wafer probe stations, On wafer probes, On wafer calibration.

This paper investigates the effects of variations in sheet resistance, geometry, distance from the probe tip, and fabrication processes on the impedance of planar nickel-chromium resistors. Resistor reactance is a strong function of film resistance, but depends only weakly on geometry and distance from the probe tip. Photoresist contamination in the resistive film induces more complicated impedance behavior, even at low frequencies. The impact on circuit design and time- and frequency-domain calibrations is considered in light of these results.

Anomalous Behavior of a Quantized Hall Plateau in a High-Mobility Si Metal-Oxide-Semiconductor Field-Effect Transistor.
Final rept.
K. Yoshihiro, C. T. Van Degrift, M. E. Cage, and D. Yu. 1992, 11p.
Pub. in Physical Review B 45, n24 p14 204-14 214, 15 Jun 92.

Keywords: *Field effect transistors, *MOSFET, *Electrical resistance, High electron mobility transistors, Silicon transistors, Metastable state, Electrical measurement, Anomalies, Reprints, *Quantum Hall effect, Millikelvin temperature.

Measurements at 14 T and 340 mK of the quantized Hall resistance of the i = 4 plateau of a Si metal-oxide-semiconductor field-effect transistor (Si-MOSFET) made with a precision of 0.005 ppm and an accuracy of 0.015 ppm revealed unexpected irregularities. Smooth variations of + or - 0.04 ppm were observed across the plateau even though the Si-MOSFET had a mobility of 1.2 m(squared)/V s and a diagonal resistivity less than 0.002 ppm of the plateau resistivity. Furthermore, measurements over a period of several months indicated that the plateau shape is metastable. A variety of possible causes for these phenomena are discussed, but none provides a satisfactory explanation.

Sponsored by National Science Foundation, Washington, DC.
Pub. in Applied Physics Letters 59, n23 p3003-3005, 2 Dec 91.

Keywords: Ion implantation, Oxygen additions, Oxynitrides, Annealing, Ambience, Reprints, *Oxide removal, *SIMOX, Oxide precipitates.

The effect of annealing ambient on the precipitate removal processes in high-dose oxygen implanted silicon (separation by implantation of oxygen (SIMOX)) has been studied with transmission electron microscopy, electron energy-loss spectroscopy, and secondary ion mass spectroscopy. The rate of removal of oxide precipitates from the top silicon layer in SIMOX is higher during annealing in argon than in nitrogen. The removal is reduced in nitrogen due to the formation of an oxynitride complex at the precipitate surfaces which inhibits oxygen diffusion across the interfaces. Similar effects have been observed for oxide precipitation during nitrogen ambient annealing in bulk silicon.

B. Steiner, J. Comas, W. Tseng, and U. Laor. 1993, 6p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Materials Research Society Symposia Proceedings, v281 p127-132 1993.

Keywords: *High electron mobility transistors, *Crystal defects, Molecular beam epitaxy, Synchrotron radiation, Monochromatic radiation, X-ray diffraction, High resolution, Indium phosphides, Substrates, Reprints, *Lattice mismatch.

The formation of mismatch dislocations in layered semiconductor structures was found recently in high resolution monochromatic synchrotron x-radiation diffraction images to be correlated with characteristics of the substrate as well as with the layer thickness and degree of lattice mismatch of nonpseudomorphic layers. We have now extended these studies to examine the accommodation to strain as a function of lattice mismatch in a series of high electron mobility transistor (HEMT) structures grown by molecular beam epitaxy (MBE) on indium phosphide substrates. Five distinct types of irregularity are observed: (1) lattice warping, (2) the formation of a nonpseudomorphic layer, (3) the formation of extended arrays of linear mismatch dislocations at the interface between the substrates and nonpseudomorphic layer, (4) the formation of oval regions of tweed-like local lattice variation imbedded among these arrays, (5) extended tweed-like local lattice variation over large peripheral areas in which the formation of straight mismatch dislocation arrays is not observed.

During the manufacturing of present-day integrated circuits, certain measurements must be made of the submicrometer structures composing the device with a high degree of repeatability. Optical microscopy, scanning electron miscroscopy, and the various forms of scanning probe microscopies are major microscopical techniques used for this submicrometer metrology. New techniques applied to scanning electron microscopy have improved some of the limitations of this technique and time will permit even further improvements. The paper reviews the current state of scanning electron microscope (SEM) metrology in light of many of these recent improvements.

Keywords: *Electron traps, Electron spin resonance, Ion implantation, Oxygen additions, Reprints, *SOI(Semiconductors), *SIMOX.

We present direct evidence for the creation of deep electron traps in Separation by IMplantation of OXygen buried oxides. In addition, we present combined electrical and electron spin resonance evidence which demonstrate that at least some positively charged paramagnetic E' centers are compensated by negatively charged centers. Finally, we present evidence which strongly suggests that a substantial fraction of the deep electron traps are coupled to E' centers.

New Test Structure for Nanometer-Level Overlay and Feature-Placement Metrology.
Final rept.
M. W. Cresswell, R. A. Allen, L. W. Linholm, E. C. Teague, C. H. Ellenwood, and W. B. Penzes. 1994, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Semiconductor Manufacturing 7, n3 p266-271 Aug 94.

Keywords: *Microelectronics, *Overlays, *Lithography, Semiconductor devices, Integrated circuits, Process control, Measurement, Photomasks, Metrology, Reprints, Test structures.

A new electrical test structure for overlay measurement has been evaluated by replicating arrays of its complementary components from two different photomasks into a conducting film on a quartz substrate. The features resulting from images projected from the first mask were used as a reference grid which was calibrated by the NIST line-scale interferometer. A first subset of the relative placements of the images projected from the second mask, which were derived from the electrical overlay measurements and the reference grid, agreed to within 13 nm with corresponding measurements made directly by the line-scale interferometer over distances up to 13.5 mm. A second comparison made at another substrate location indicated that gradients of projected feature linewidths across the exposure site may need to be measured, and corrected for, in the electrical extraction of overlay.

Defect Pair Formation by Implantation-Induced Stresses in High-Dose Oxygen Implanted Silicon-on-Insulator Material.
Final rept.
J. D. Lee, J. C. Park, D. Venables, S. J. Krause, and P. Roitman. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v316 p753-758 1994.

Keywords: *Crystal dislocations, Transmission electron microscopy, X ray diffraction, Crystal dislocations, Ion implantation, Temperature dependence, Integrated circuits, Oxygen additions, Doped materials, Microstructure, Annealing, Strains, Silicon, Stresses, Reprints, *SOI(semiconductors), *SIMOX.

Defect microstructure and the near-surface strain of high-dose oxygen implanted silicon-on-insulator material (SIMOX) were investigated as a function of dose, implant temperature, and annealing temperature by transmission electron microscopy and high resolution x-ray diffraction. Dislocation half loops (DHLs) begin to form by stress assisted climb at a critical stress level due to implantation-induced damage. DHLs evolve into through-thickness defect (TTD) pairs by expansion during annealing. Both DHL and TTD-pair density increase with higher implant dose and lower implant temperature. Possible methods for defect density reduction are suggested based on the results of this study.

On-Wafer Impedance Measurement on Lossy Substrates.
Final rept.
D. F. Williams, and R. B. Marks. 1994, 2p.
Pub. in Institute of Electrical and Electronics Engineers Microwave and Guided Wave Letters 4, n6 p175-176 Jun 94.

Keywords: *Electrical impedance, *Impedance measurement, Characteristic impedance, Transmission lines, Planar structures, Resistors, Wafers, Reprints, Silicon substrates, Scattering parameters.

This paper introduces a new method for measuring impedance parameters in transmission lines fabricated on lossy or dispersive dielectrics. The method, which uses an independent calibration to provide an impedance reference, compares well with conventional techniques when applied to lossless substrates. The effectiveness of the technique is illustrated for resistors fabricated on lossy silicon substrates.

Interaction of Stoichiometry, Mechanical Stress, and Interface Trap Density in LPCVD Si-rich SiNx-Si Structures.
Final rept.
S. C. Witczak, M. Gaitan, J. S. Suehle, M. C. Peckerar, and D. I. Ma. 1994, 10p.
Pub. in Solid-State Electronics 37, n10 p1695-1704 1994.

Keywords: *Silicon nitrides, Chemical vapor deposition, X ray diffraction, Rutherford scattering, Dielectric films, Electron traps, Hole traps, Backscattering, Stoichiometry, Interfaces, Capacitors, Stresses, Wafers, Reprints.

Mechanical and electrical properties were correlated in LPCVD SiN(x)-Si structures through the characterization of six wafers patterned with MNS capacitors whose insulator films were deposited rich in Si under various processing conditions. The samples were measured for mechanical stress at the Si-SiN(x) interface with X-ray diffraction. The deposited SiN(x) films were measured for stoichiometry by Rutherford backscattering spectroscopy. Low-temperature C-V measurements were used for the first time to estimate Si-SiN(x) interface trap densities in the capacitors. The interface trap densities were confirmed with the aid of a model based on a numerical analysis of the capacitor small-single response. The measurement results indicate that an increase in the Si/N ratio in the insulating films was accompanied by a decrease in the film tensile stress. Those SiN(x) films made sufficiently rich in Si were successfully deposited under compressive stress. Furthermore, a decrease in the magnitude of the stress was accompanied by a decrease in interface trap densities, suggesting that interfacial mechanical stress may be influential in the formation of Si-SiN(x) interface traps. Interface trap densities were lowest in those structures whose insulating films were deposited under compression.

Microelectronic Test Structures for Feature Placement and Electrical Linewidth Metrology.
Final rept.
L. W. Linholm, R. A. Allen, and M. W. Cresswell. 1994, 28p.
Pub. in Handbook of Critical Dimension Metrology and Process Control, vCR52 p91-118 1994.

Keywords: *Integrated circuits, *Microelectronics, *Line width, *Lithography, Overlays, Reviews, Reprints, *Test structures, Registration.

This paper presents a critical review of electrical test methods for determining feature placement with total measurement uncertainties below 10 nm and electrical linewidth for sub-half micrometer design linewidths with measurement precision below 1 nm. Microelectronic test structures are electrical devices that are used to determine selected tool, process, device, material, or circuit parameters by means of electrical tests. They are supported by a variety of commercial test equipment often found in semiconductor manufacturing facilities. They provide low-cost, post-patterning metrology for determining both feature placement and electrical linewidth. Properly characterized test structures and measurement methods provide an economic means of determining the critical parameters needed to develop, control, and operate the next generation of patterning tools.

Accuracy in Integrated Circuit Dimensional Measurements.
Final rept.
J. E. Potzick. 1993, 10p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Critical Review of IC Metrology

and Process Control, Monterey, CA., September 28-29, 1993, p1-10.

Keywords: *Integrated circuits, *Photomasks, *Dimensional measurement, Calibration, Metrology, Length, Accuracy, Reprints.

The measurement of critical dimensions of features on integrated circuits and photomasks is modeled as the comparison of the images of the test object and of a standard object in a measuring device. A length measuring instrument is then a comparator. The calibration of the standard and the conditions necessary for a valid comparison are discussed. The principles discussed here apply to many other types of measurement as well.

Dielectric Properties of Materials at Cryogenic Temperatures and Microwave Frequencies.
Final rept.
R. G. Geyer. 1994, 2p.
Pub. in Proceedings of Conference on Precision Electromagnetic Measurements Digest, Boulder, CO., June 27-July 1, 1994, p350-351.

Keywords: *Tetrafluoroethylene resins, *Polystyrene, *Quartz, *Teflon, Dielectric properties, Dielectric materials, Microwave frequencies, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Room temperature, Single crystals, Permittivity, Microelectronics, Substrates, Reprints, Dielectric measurements, Rexolite.

The permittivity and dielectric loss tangent of single-crystal quartz, cross-linked polystyrene (Rexolite), and polytetrafluoroethylene (Teflon) were measured at microwave frequencies and at temperatures of 77 K and 300 K using a dielectric resonator technique. Application of high-temperature superconducting (HTS) films at the endplates of the dielectric resonator made it possible to determine dielectric loss tangents of about 7 X 10(exp -6) at 77 K. Two permittivity tensor components for uniaxially anisotropic crystalline quartz were measured. Although the permittivities at 77 K changed very little from their room temperature values at 300 K, large changes in dielectric losses were observed. The decreased loss characteristics of these microelectronic substrates can markedly improve the performance of many microwave devices at cryogenic temperatures.

Pub. in Proceedings of the Integrated Reliability Workshop, Lake Tahoe, CA., October 16-19, 1994, p5-11.

Keywords: *Integrated circuits, *Metal films, *Film thickness, *Dimensional measurement, Circuit interconnections, Reliability(Electronics), Aluminum alloys, Test methods, Microelectronics, Electromigration, Metallizing, Reprints, Thickness measurement, Resistance measurement, Test structures.

The electrical thickness of an aluminum-alloy metallization can be determined from resistance measurements of a van der Pauw cross structure at two temperatures, with corrections for the deviation from Matthiessen's rule and for thermal expansion. Thickness determinations, made in this way, agree with those made with a calibrated scanning electron microscope (SEM) to within the uncertainty of the instrument. The electrical cross-sectional area of metal lines can be determined by making resistance measurements at two temperatures.

Keywords: *Semiconductor devices, *Integrated circuits, *Thermal analysis, *Computer programs, Models, Heat transmission, Steady flow, Steady state, Thermal conductivity, Temperature, Area, Surface temperature, Average, Semiconductor(Materials), TXYZ3.0, TXYZ computer program, HOTPAC software package, Line averaging, Area averaging.

This report presents and discusses a number of recent developments in the steady-state thermal analysis of multiple-layer structures. These include: (1) analytical evaluation of line and area average temperatures, and (2) a recursion relation technique for calculating the steady-state surface temperature of a multilayer structure with an arbitrary number of layers. The application of the analytic averaging to the TXYZ code is incorporated in the updated code, TXYZ30, while the multilayer recursion relation solution along with analytic averaging are included in the Thermal Multilayer code, TML. Both of these are contained in the HOTPAC software package. The first part of this report contains a discussion of the general elements of the multiple-layer thermal model. This is presented in some detail for the case of the Kokkas three-layer problem and the associated TXYZ code. The previous update of the code, TXYZ20, is also discussed.

Using Quantized Breakdown Voltage Signals to Determine the Maximum Electric Fields in a Quantum Hall Effect Sample.
M. E. Cage, and C. F. Lavine. 1995, 8p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n3 p269-276 May/Jun 95.

Keywords: *Quantum electronics, *Hall effect, *Electrical faults, *Electric fields, Electrical measurement, Electron plasma, Landau damping, Two dimensional flow, Dissipation, Quantum Hall Effect, National Institute of Standards and Technology, Quantized voltage states, Quasi-elastic inter-Landau level scattering.

We estimate the maximum values of the electric field across the width of a GaAs/AlGaAs heterostructure quantum Hall effect sample at several currents when the sample is in the breakdown regime. This estimate is accomplished by measuring the quantized longitudinal voltage drops along a length of the sample and then employing a quasi-elastic inter-Landau level scattering (QUILLS) model to calculate the electric field. We also present a pictorial description of how QUILLS transitions occuring between states distributed across the sample width can be detected as voltage signals along the sample length.

Exact Recursion Relation Solution for the Steady-State Surface Temperature of a General Multilayer Structure.
Final rept.
J. Albers. 1995, 8p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Components, Packaging, and Manufacturing Technology, ptA18 n1 p31-38 Mar 95.

Keywords: *Semiconductor devices, *Fourier analysis, *Laplace equation, Electric conductivity, Surfaces, Thermal conductivity, Temperature, Steady state, Heat flow, Layers, Reprints, Multiple layers.

A recursion relation technique has been used in the past to determine the surface potential from the multilayer electrical Laplace equation. This has provided for a vastly simplified evaluation of the electrical spreading resistance and four-probe resistance. The isomorphism of the multilayer Laplace equation and the multilayer steady-state heat flow equation suggests the possibility of developing a recursion relation applicable to the multilayer thermal problem. This recursive technique is developed and is shown to provide the surface temperature of the multilayer steady-state heat flow equation.

Model for Determining the Density and Mobility of Carriers in Thin Semiconducting Layers with Only Two Contacts.
Final rept.
J. R. Lowney. 1995, 5p.
Pub. in Jnl. of Applied Physics 78, n2 p1008-1012, 15 Jul 95.

Keywords: *Carriers, *Magnetoresistance, Reprints, Density, Mobility, Semiconductors, Electrical measurement, Coallocation, Hall effect.

A new method for determining the carrier densities and mobilities in a thin semiconducting layer was recently described. It is based on fitting the transverse magnetoresistance of the layers as a function of magnetic field, and it requires only two contacts. To improve the accuracy and generalize the procedure to multicarrier systems, a computer code was written to solve for the magnetoresistance as a function of magnetic field and the length-to-width ratio of a rectangular sample. A nonlinear-least-squares fit was made to the results of the computer model for a single-carrier system. The results for multicarrier systems are discussed. This method is especially useful as a monitor for improving the quality control of the electrical characteristics of thin conducting layers in finished devices. The code is also useful for interpreting standard four-terminal measurements as well.

Pub. in Jnl. of Vacuum Science and Technology A 13, n3 p787-791 May/Jun 95.

Keywords: *Electron transport, Superlattices, X ray diffraction, Mobility, Reprints, *Field effect transistors, *Molecular beam epitaxy, MODFET(Modulation Doped Field Effect Transistors).

The correlation between the structural and transport properties for a series of high-quality modulation-doped field-effect transistor (MODFET) structures was made for various growth temperatures. X-ray reflectivity, x-ray diffraction, and magnetotransport measures were used to assess structural quality and transport parameters. Four samples with growth temperatures in the range 500-630 degrees C were examined. The results show a correlation exists between the measured electron mobility and the quality of the interface width, as measured from satellite peaks of the buffer layer. In addition, these results show, for the first time to the best of our knowledge, that a direct correlation can be made between x-ray reflectivity structural measurements and measured electron mobility of high-quality gallium-arsenide-based MODFETs. Both x-ray and transport results suggest a higher-quality structure was obtained at higher growth temperatures.

Pub. in Proceedings of the International Reliability Physics Symposium, Las Vegas, NV., April 4-6, 1995. p124-130.

Keywords: *Silicon dioxide, *Dielectric breakdown, Reprints, Time dependence, Reliability(Electronics), Dielectric films, Field acceleration models.

For many years Time Dependent Dielectric Breakdown (TDDB) has been the subject of much controversy. Two different field dependencies have been observed and several acceleration models have been suggested. Of the two most popular models one predicts that the log t50% is proportional to the electric field (E) (1 - 3) while the other predicts that it is proportional to the reciprocal of the electrical field (1/E) (4-6). This paper will help to explain the discrepancies in the electric field dependence observed and demonstrate distinct differences in the TDDB behavior between extrinsic dielectric breakdown.

Effect of Anneal Temperature on Si/Buried Oxide Interface Roughness on SIMOX.
Final rept.
G. Jacobs, A. Genis, and L. P. Allen. 1995, 2p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers SOI Conference, Nantucket Island, MA., October 3-6, 1994, p49-50.

Keywords: *Temperature dependence, *Silicon, Reprints, Roughness, *SIMOX, Atomic force microscopy, SOI(Semiconductors).

Fully depleted, thin film silicon-on-insulator SIMOX devices are attractive for their short channel characteristics and high speed compared with bulk silicon. Their potential for applications in low power devices and circuitry places extreme demands upon the starting SIMOX substrate material. Threshold voltage control for fully depleted SOI devices has been recognized as a key issue for realization of fully depleted SOI technology. To that end, examination of the interface roughness between the device silicon layer and the buried oxide of the SOI structure is an active area of materials research and development. In this work, we have used atomic force microscopy (AFM) to measure the interface roughness of SIMOX SOI substrates as a function of anneal parameters. This study has shown that the silicon/buried oxide interface roughness is a strong function of the post implant annealing temperature.

New Model of 1/F Noise in Baw Quartz Resonators.
Final rept.
F. L. Walls, P. H. Handel, R. Besson, and J. J. Gagnepain. 1992, 7p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers Frequency Control Symposium, Hershey, PA., May 27-29, 1992, p327-333.

Keywords: *Quartz resonators, *Resonators, *Noise, Reprints, Models, Bulk acoustic wave devices, 1/f noise, Electronic noise, Quantum 1/f effect.

The paper presents a new model for predicting the 1/f (flicker) frequency noise in quartz resonators as a function of the unloaded resonator quality factor Q and volume under the electrodes for bulk acoustic wave (BAW) resonators. The functional form of this model originates from a quantum 1/f theory for scattering of phonons from the primary oscillator mode. Using this new model, we are able to match the 1/f frequency noise observed in the best quartz controlled oscillators and resonators. Quite unexpectedly, this model indicates that the amplitude of 1/f frequency noise might be improved by making resonators with smaller electrodes. BVA resonators show approximately a factor of 3 improvements in 1/f frequency noise (Sy(f)) over electroded resonators with the same unloaded Q-factor and electrode volume.

Keywords: *Microelectronics, *Gases, *Standards, *Cells, *Meetings, Electric current, Diagnostic techniques, Electric discharges, Plasmas(Physics), Radio frequencies, Electrical impedance, Electrical measurement, Comparison, *Gaseous electronics, Reference cell, NIST(National Institute of Standards and Technology).

Measurements of the electrical characteristics of discharges in the Gaseous Electronics Conference Radio-Frequency Reference Cell are reviewed here. Topics include: common sources of error in the measurements; comparisons of current and voltage data among GEC cells; the effects of gas impurities, surface conditions and the external circuitry on the reproducibility of the electrical characteristics; and comparisons of current and voltage data with results of other measurements.

Keywords: *Microelectronics, *Gases, *Standards, *Cells, *Meetings, Light emission, Plasmas(Physics), Radio frequency discharge, Spectroscopy, Calibrating, *Gaseous electronics, Reference cell, NIST(National Institute of Standards and Technology).

A summary of the experimental observations of the optical emission from the Gaseous Electronics Conference (GEC) rf Reference Cell plasma will be discussed. Spatially and temporally resolved results are provided for various reference and nonreference conditions, including etching type plasmas. These measurements provide a detailed description of the temporal evolution of optical emission from different excited atomic states within different atomic and ionic species, as well as their radial and axial distributions. Some of the measurements have been placed on a absolute radiometric scale to provide comparisons to model calculations.

Keywords: *Microelectronics, *Gases, *Standards, *Cells, *Meetings, Plasmas(Physics), Absorption, Argon, Electric discharges, Radio frequencies, Electric fields, Helium, Fluorescence, Metastable state, Diagnostic techniques, Plasma processing, NIST(National Institute of Standards and Technology).

A number of laser-induced fluorescence and absorption spectroscopy studies have been conducted using Gaseous Electronics Conference Reference Cells. Laser-induced fluorescence has been used to measure hydrogen atom densities, to measure argon metastable spatial profiles, to determine the sheath electric field, and to infer the electron density and temperature. Absorption spectroscopy, using lamp sources and diode lasers, has been used to measure metastable atom densities in helium and argon discharges and fluorocarbon densities in silicon etching discharges. The experimental techniques and sample results of these investigations are reviewed.

A review is presented of kinetic-energy distribution measurements for ions striking grounded surfaces in a gaseous Electronics Conference (GEC) rf Reference Cell. Two experimental arrangements that have been used to measure ion energies in the GEC Cell are described, and a comparison of their performance under different operating conditions is presented. Significant results from ion-energy analysis in the Reference Cell are highlighted, including evidence of effects due to surface conditions on ion sampling, verification of electrical behavior of the cell, inferences about ion-molecule reactions indicated by the shapes of measured ion kinetic-energy distributions (IEDs), and the use of measured IEDs for the validation of theoretical models. The paper concludes with a detailed study of IEDs measured for rf plasmas generated in mixtures of argon and oxygen, using both experimental arrangements.

Keywords: *Microwave transmission, *Microelectronics, *Gases, *Cells, *Meetings, Electron density, Electric discharges, Microwave interferometers, Reactors, Diagnostic techniques, Plasmas(Physics), Time dependence, *Gaseous electronics, Reference cell, NIST(National Institute of Standards and Technology).

Three groups have published electron density data taken in the Gaseous Electronics Conference (GEC) reference reactor using microwave interferometry. The agreement in the data from these groups at higher pressures is excellent especially when one considers that the GEC reactors involved have some key differences. The electron densities compare favorably in argon, helium, and nitrogen above 33.3 Pa (250 mTorr); but, the measurements tend to diverge some at 13.3 Pa (100 mTorr) and in 133 Pa helium above approximately 200 mA. It is speculated that the latter difference occurs as the discharges change from a bulk ionization or a-mode to a secondary electron emission or y-mode, and that this transition occurs at lower voltages and currents for reactors with aluminum electrodes than it does for those with stainless steel electrodes. In addition, time resolved electron densities are presented.

Langmuir Probe Measurements in the Gaseous Electronics Conference RF Reference Cell.
M. B. Hopkins. 1995, 11p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n4 p415-425 Jul/ Aug 95.

Keywords: *Microelectronics, *Gases, *Standards, *Cells, *Meetings, Electrostatic probes, Plasma diagnostics, Reactors, Radio frequencies, *Gaseous electronics, Reference cell, NIST(National Institute of Standards and Technology).

The use of a Langmuir probe system in two GEC cells is reviewed. The major problems associated with probe diagnostics and GEC cell are outlined and discussed. While the data base is still insufficient to give definitive values for many parametes, a number of standard measurements are put forward. The plasma density in argon is 9 x 10(exp 9)/cubic cm (plus or minus 20%) at an applied rf voltage of 250 V (500 V peak to peak) and a gas pressure of 13.3 Pa (100 mTorr). The electron density scales linearly with applied voltage. The plasma to ground sheath resistance is shown to be very important with a value of 810 Ohms in argon at a pressure of 13.3 Pa (100 mTorr) and discharge current of 0.1 A. The value of plasma to ground resistance scales inversely with discharge current and sublinear with pressure.

Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n4 p427-439 Jul/ Aug 95.

Keywords: *Microelectronics, *Gases, *Standards, *Cells, *Meetings, Plasma density, Electrostatic probes, Coupling, Plasmas(Physics), Plasma potential, *Gaseous electronics, Reference cell, NIST(National Institute of Standards and Technology).

In order to extend the operating range of the GEC RF Reference Cell, we developed an inductively coupled plasma source that replaced the standard parallel-plate upper-electrode assembly. Voltage and current probes, Langmuir probes, and an 80 GHz interferometer provided information on plasmas formed in argon, chlorine, and nitrogen at pressures from 0.1 Pa to 3 Pa. For powers deposited in the plasma from 20 W to 300 W, the source produced peak electron densities between 10(exp 10)/cubic cm and 10(exp 12)/cubic cm and electron temperatures near 4eV. The electron density peaked on axis with typical full-width at half maximum of 7 cm to 9 cm. Discharges in chlorine and nitro-

gen had biomodal operation that was clearly evident from optical emission intensity. A dim mode occurred at low power and a bright mode at high power. The transition between modes had hysteresis.

This paper describes the results of using the GEC reference cell as a reactive ion etcher. Silicon wafers with layers of polysilicon and silicon dioxide on crystalline silicon patterns with photoresist have been investigated with fluorine and chlorine chemistries. Scanning electron microscopy (SEM), profilometry, and refraction techniques were used to determine the etch parameters such as etch rate, uniformity and selectivity. The discharges are in general monitored by measuring the optical emission spectroscopy and the bias voltages. Depending upon the discharge and chemistry conditions, similar etch rates and etch patterns of different GEC cells were obtained.

A number of important investigations into the formation, growth, charging, transport and consequences of particulate due in plasmas have been made using the Gaseous Electronics Conference Reference Cell as the reactor test-bed. The greatest amount of work to data has been directed toward a better understanding of the role that electrostatic, ion drag, neutral fluid drag and gravitational forces play in governing the dynamic behavior of particles cloud motion. Also, statistical correlation's in the fluctuation of scattered laser light intensity (dynamic laser light scattering (DLLS)) can be used to determine information about particle size, motion, and growth dynamics. New results from DLSS experiments performed in the Reference Cell are presented that show process-induced dust particles confined in an electrostatic trap exhibit low-frequency oscillatory motion consistent with charge density wave (CDW) motion predicted for strongly coupled Coulomb liquids.

Over the past few years multidimensional self-consistent plasma simulations including complex chemistry have been developed which are promising tools for furthering our understanding of reactive gas plasmas and for reactor design and optimization. These simulations must be benchmarked against experimental data obtained in well-characterized systems such as the Gaseous Electronics Conference (GEC) reference cell. Two-dimensional simulations relevant to the GEC Cell are reviewed in this paper with emphasis on fluid simulation.

Keywords: *Integrated circuits, *Semiconductor devices, *Microwave circuits, *Metrology, Gallium arsenides, Microelectronics, Fabrication, Expert systems, Microwave frequency converters, Communication equipment, Millimeter waves, Test methods, Test structures, MMIC, Monolithic Microwave Integrated circuits.

This document describes a set of microelectronic test structure designs for manufacturers of GaAs MMIC devices. These designs enable the dc measurement of process and device parameters that can be used to diagnose, monitor, compare, and predict the performance of the fabrication process or the devices produced. The test structure designs are embodied in a computer-aided design library known as NISTGAAS, which contains 8 types of test structures, implemented in 125 combinations of process layer and size and based on a 2 x 6 probe-pad array. Any design, once fabricated on a wafer, can be probed using commonly available commercial parametric test system equipment. This document specifies how to implement and test each type of test structure and how to analyze the results. It also provides guidance on how to apply the set of test structures at the wafer level. Although NISTGAAS was designed for the process described in this document, it was also designed and demonstrated to be adaptable for other MMIC processes. Since NISTGAAS contains cell designs rather than a chip design, it provides a flexible test structure methodology that also provides the MMIC community with a common reference point for assessing process and device performance.

Process and device simulators are being used for the technology computer-aided design (TCAD) of 0.25-micrometers gate-length transistors predicted to begin manufacture in 1998. This paper compares and reviews the status of inverse modeling and direct physical analysis methods to obtain two-dimensional dopant profiles for verification and calibration of these TCAD simulators. Spatial resolution, dopant accuracy, and concentration range requirements are discussed. Direct characterization methods include scanning probe microscopies (scanning capacitance microscopy, scanning tunneling microscopy combined with 'spectroscopy,' Mu-spreading resistance probe, scanning Kelvin probe microscopy, and scanning potential microscopy), electron holography, and tomographic secondary ion mass tomographic spectroscopy.

J. J. Kopanski. 1992, 9p.
Pub. in Properties of Silicon Carbide, Book Chapter 5.2, p121-129.

Keywords: *Oxidation, *Silicon carbides, Metal oxide semiconductors, Mis(Semiconductors), Chemical vapor deposition, Epitaxy, Wafers, Vacuum deposition, Sublimation, Electrical properties, Semiconductors(Materials), Ceramics, Reprints, Thermal oxidation.

Thermal oxidation of the two most common forms of single-crystal silicon carbide with potential for semiconductor electronics applications is discussed: 3C-SiC formed by heteroepitaxial growth by chemical vapor deposition on silicon, and 6H-SiC wafers grown in bulk by vacuum sublimation or the Lely method. SiC is also an important ceramic and abrasive that exists in many different forms. Its oxidation has been studied under a wide variety of conditions. Thermal oxidation of SiC for semiconductor electronic applications is discussed in the following section. Insulating layers on SiC, other than thermal oxide, are discussed in Section C, and the electrical properties of the thermal oxide and metal-oxide-semiconductor capacitors formed on SiC are discussed in Section D.

Defect Formation Mechanism Causing Increasing Defect Density during Decreasing Implant Dose in Low-Dose Simox.
Final rept.
J. D. Lee, J. C. Park, S. Krause, and P. Roitman. 1994, 2p.
Pub. in Proceedings of the International IEEE SOI Conference, Nantucket Island, Massachusetts, October 3-6, 1994, p69-70.

Keywords: *Large scale integration, *Defects, *Quality control, Oxygen, Ion implantation, Dosage, Crystal dislocations, Production costs, Wafers, Reprints, SIMOX wafers, Defect density, Defect formation mechanisms.

Silicon-on-insulator material synthesized by oxygen implantation (SIMOX) is a leading candidate for advanced large scale integrated circuit applications due to thickness uniformity and moderate defect density. In the past few years, there has been a significant reduction of the defect density by optimizing processing conditions. Today, commercial SIMOX wafers are available by single implant at a high dose of 1.8 x 10(exp 18)/square cm (defect density about 10(exp 6)/square cm), single implant at a low-dose of -0.5 x 10(exp 18)/square cm (defect density less than 10(exp 3)/square cm), and multiple implants/anneals (defect density less than 10(exp 4)/square cm). Studies on defect formation mechanisns may suggest further modification of the processing conditions for both production cost and material quality.

Pub. in National Conference on Standards Laboratories, Dallas, TX., July 16-20, 1995, p647-653.

Keywords: *Electrical resistance, *Device characterization, Fundamental constant, Electron gas, Reprints, *Quantum Hall effect.

The quantized Hall resistance (QHR) standard requires characterization test which determine if and how a particular QHR device should be used as an intrinsic standard. The initial characterization at a qualified QHR laboratory would provide the following: (1) Verification that the device resistance was approximately equal to that of other QHR devices under prescribed conditions; (2) Assurance that the QHR device meets recognized quality construction standards; (3) Determination of the effect of temperature in the range below 1.5k; (4) Determination of the approximate magnetic flux density which must be applied to measure the QHR standard. The device could than be used as a standard in another laboratory, which would be expected to characterize the device using procedures which are given in the Recommended Instrinsic/Derived Standards Practice. Some of the laboratory procedures are described.

Keywords: *High temperature superconducting, *Superconductors, *Wafer bonding, *Micromachining, Thin films, Silicon, Reprints, Thermal isolation, Micromachining.

Using a new micromachining technology, thermally isolated thin films of high-temperature superconductor have been microfabricated. The intended application for these structures is in infrared bolometers. A silicon wafer bonding process produces a low thermal mass island of single-crystal silicon on a silicon nitride membrane which provides thermal isolation. The silicon can act as a seed for the epitaxial growth of YBa2Cu3O7 on a yttria-stabilized zirconia buffer layer. This paper describes the overall concept of the thermally isolated device, and demonstrates that the micromachined structure can be fabricated with high-quality superconducting films.

Growth of Epitaxial KNbO3 Thin Films.
Final rept.
T. M. Graettinger, P. A. Morris, A. Roshko, D. J. Lichtenwalner, A. F. Chow, A. I. Kingon, and O. Auciello. 1994, 12p.
Pub. in Materials Research Society Symposium Proceedings, San Francisco, CA., April 5-7, 1994, v341 p265-276.

Keywords: *Epitaxial growth, *Ion beams, *Thin films, Reprints, Morphology, Sputtering, MOCVD.

KNbO3 possesses high nonlinear optical coefficients making it a promising material for frequency conversion of infrared light into the visible wavelength range using integrated optical devices. While epitaxial thin films of KNbO3 have previously been grown using ion beam sputtering, defects (i.e. grain boundaries, domains, surface roughness) in these films resulted in high optical losses and no measurable in-plane birefringence. Previous films were grown on MgO substrates, which have a greater than 4% lattice mismatch with KNbO3. In the work reported here, the authors have grown films on MgO, MgAl2O4, NdGaO3, and KTaO3 to investigate the role of lattice mismatch on the resulting film quality. Films have also been grown with and without oxygen ion assistance. The orientations, morphologies, and defects in the films were examined using x-ray diffraction and AFM to determine their relationships to the growth conditions and substrate lattice mismatch.

Keywords: *Yttrium oxides, *Thin films, Reprints, Microwaves, *Atomic force microscopy, YBCO, RHEED, HTS.

The changes in surface morphology and surface resistance of sputtered and laser ablated YBa2Cu3O7-sigma films both before and after etching have been examined. Six different etchants were used: citric acid, nitric acid, Br-methanol, EDTA, disodium EDTA, and ion milling. The surface morphologies of the films were examined by reflection high energy electron diffraction (RHEED) and atomic force microscopy (AFM), both before and after etching. The surface resistance (Rs) was measured at 94 GHz using a confocal resonator. An amorphous layer was found on the film surfaces after exposure to air. A few of the etches restored some of the surface crystallinity, but most caused increases in the overall surface roughness. Several of

the wet etches attacked dislocations. Ion milling caused the largest degradation of surface crystallinity and a corresponding increase in (Rs). Some of the chemical etches increased R, by less than 15%.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Microwave Theory and Techniques, v43 n2 p466-469 Feb 95.

Keywords: *Integrated circuits, *Electric probes, *Calibration, Electrical measurement, Reprints, Microwave circuits, Broadband, *Probe tip calibration, *Wafer probe stations.

The line-reflect-match calibration is enhanced to accommodate imperfect match standards and lossy lines typical of monolithic microwave integrated circuits. The authors characterize the match and line standards using an additional line standard of moderate length. The new method provides a practical means of obtaining accurate, wideband calibrations with compact standard sets. Without the enhancement, calibration errors due to imperfection in typical standards can be severe.

Microwave Dielectric Properties of Anisotropic Materials at Cryogenic Temperatures.
Final rept.
R. G. Geyer, and J. Krupka. 1995, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement, v44 n2 p329-331 Apr 95.

Keywords: *Cryogenics, Dielectric properties, Microwave frequencies, Permittivity, Reprints, Crystals, Superconductors, *Anisotropic materials, Dielectric resonators.

The permittivity and dielectric loss tangent of crosslinked polystyrene (Rexolite), polytetrafluoroethylene (Teflon), and single-crystal quartz were measured at microwave frequencies and at temperatures of 77 K and 300 K using a dielectric resonator technique. Dielectric loss tangents as low as 7 x 10 to the minus 6th power at 77 K were determined by applying high-temperature superconducting (HTS) films as the endplates of the dielectric resonator. Two permittivity tensor components for uniaxially anisotropic crystalline quartz were measured. Although the permittivities at 77 K changed very little from their room temperature values at 300 K, large changes in dielectric losses were observed. The decreased losses of these microelectronic substrates can markedly improve the performance of many microwave devices at cryogenic temperatures.

Use of Monte Carlo Modeling for Interpreting Scanning Electron Microscope Linewidth Measurements.
Final rept.
J. R. Lowney. 1995, 6p.
Pub. in Scanning, v17 p281-286 1995.

Keywords: *Line width, *Lithography, Monte Carlo method, Electron beams, Metrology, Reprints, *X ray lithography, *Scanning electron microscopy.

A scanning electron microscope (SEM) can be used to measure the dimensions of the microlithographic features of integrated circuits. However, without a good model of the electron-beam/specimen interaction, accurate edge location cannot be obtained. A Monte Carlo code has been developed to model the interaction of an electron beam with one or two lines lithographically produced on a multilayer substrate. The purpose of the code is to enable one to extract the edge position of a line from SEM measurements. It is based on prior codes developed at the National Institute of Standards and Technology, but with a new formulation for the atomic scattering cross sections and the inclusion of a method to simulate edge roughness or rounding. The code is currently able to model the transmitted and backscattered electrons, and the results from the code have been applied to the analysis of electron transmission through gold lines on a thin silicon subtrate, such as is used in an x-ray lithographic mask. Significant reductions in backscattering occur because of the proximity of a neighboring line.

Electrical Characterization of Integrated Circuit Metal Line Thickness.
Final rept.
S. Mayo, and H. A. Schafft. 1995, 8p.
Pub. in Solid-State Electronics, v38 n12 p1993-2000 1995.

Keywords: *Aluminum, *Film thickness, *Integrated circuits, Interconnect lines, Metallization, Reprints, Matthiessen's rule.

Resistance measurements of thin aluminum-silicon alloy lines, 10 and 30 microm wide, were made at various temperatures in the 9.2-295.5 K range. Deviations from Matthiessen's rule were observed over the whole temperature range. At temperatures near room ambient data for these lines are in good agreement with those reported for aluminum-copper alloy wires. A formalism was developed to calculate line thickness and cross-sectional area from electrical resistance data. Line thickness calculations are in good agreement with thickness data measured via scanning electron microscopy. The stress distributions in these lines were modeled by using finite element stress analysis. The results show large stress gradients localized at the line edge region, whereas at the central part of the line there is a high stress value and a low stress gradient. In submicrometer lines the whole line body is under large stress gradients.

Cross-Sectional Photoluminescence and Its Application to Buried-Layer Semiconductor Structures.
Final rept.
D. T. Schaafsma, and D. H. Christensen. 1995, 6p.
Pub. in Jnl. of Applied Physics, v78 n2 p694-699 Jul 95.

Keywords: *Semiconductors, *Photoluminescence, Quantum wells, Lasers, Emission spectra, Reprints, Burried-layers, VCSEL.

We present an overview of a cross-sectional scanning microphotoluminescence technique that is used to examine various buried-layer semiconductor structures for which traditional surface-normal techniques cannot yield sufficient information or must be coupled with time-consuming and painstaking processes such as wet etching. This technique has a wide range of application; two-- defect-driven interdiffusion in quantum wells and the modificaton of spontaneous emission from quantum wells in vertical-cavity surface-emitting lasers (VCCSELs)-are discussed here. The data obtained using this method can be used to distinguish emission spectra from quantum wells as little as one micrometer apart in depth and a few nanometers different in wavelength. The comparison of normal incidence with cross-sectional data from VCSELs can be used to more effectively optimize the match between cavity resonance and quantum well emission in high-Q devices.

Pub. in Proceedings of International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p549-554 1996.

Keywords: *Molecular beam epitaxy, *Neutron sources, *Reflectivity, Crystal growth, Semiconductor devices, Quantitative analysis, Isotopic labeling, Composition(Property), Xray analysis, Comparative evaluations, Reprints, MBE(Molecular beam epitaxy), In situ neutron reflectivity.

Several properties make neutron reflectivity particularly suited to investigations of semiconductor structures produced by both molecular beam epitaxy (MBE) and chemical means. Reflectivity can provide quantitative information about composition, layer thickness and interface width. Since the scattering length for neutrons depends upon nuclear interactions, in contrast to x-rays, a large difference in scattering length can occur between systems of similar atomic number and one can employ isotope tagging at a particular fabrication step to determine its effect in the finished structure. In this paper we describe a new facility for in-situ neutron reflectivity and related measurements within a MBE chamber, review the principles underlying reflectivity and grazing angle diffraction, discuss the unique capabilities of neutrons in comparison with X-rays, and give some examples of applications in which neutron reflectivity can be uniquely utilized.

Pub. in Semiconductor Characterization Present Status and Future Needs, p313-317 1996.

Keywords: *Metrology, *Accuracy, *Microscopy, Semiconductors(Materials), Roughness, Microstructure, Calibration standards, Reprints, AFM(Atomic force microscopy), Critical dimension.

Accurate metrology using atomic force microscopy (AFM) requires accurate control of the tip position, an estimate of the tip geometry and an understanding of the tip-surface interaction forces. We describe recent progress at National Institute of Standards and Technology (NIST) towards accurate AFM metrology. We begin with a brief introduction to the potential applications of accurate AFM metrology within the semiconductor industry. Next, we describe the technological infrastructure required before industry personnel can successfully use AFM for repeatable, reproducible, and accurate measurements. NIST's programmatic response to the identified needs is then outlined. We give particular attention to the development of a calibrated atomic force microscope (C-AFM), since the development of this instrument is essential to the successful completion of most of our specific projects.

Methodology for the Certification of Reference Specimens for Determination of Oxygen Concentration in Semiconductor Silicon by Infrared Spectrophotometry.
Final rept.
B. G. Rennex, J. R. Ehrstein, and R. I. Scace. 1996, 6p.
Pub. in Jnl. of the Electrochemical Society, v143 n1 p258-263 1996.

Keywords: *Silicon, *Semiconductors, Fourier transform spectrometers, Interstitial, Oxygen, Reprints, Standards, FTIR.

The methodology and experiment for certification of reference specimens for determining interstitial oxygen concentration in semiconductor silicon are reported. These reference specimens are intended for calibration of infrared spectrophotometers which measure the 1107 cm to the minus 1 power oxygen peak in silicon to enable users to improve their measurement agreement. Based on an earlier international Grand Round Robin study, this measurement agreement is at best 5.4% (2(sigma)). Industry requirements for measurement comparison are much more demanding, and a methodology to satisfy those requirements is described. The most important aspect of this methodology is to reduce interlaboratory variation by the use of a single infrared instrument for certification. The certification uncertainty depends primarily on the improved repeatability of this instrument. Other sources of uncertainty were nonuniformity in both oxygen concentration and thickness over the specimen area, and variations in residual oxygen among the float-zone specimens which provided zero-oxygen reference for the reference sets. These various sources were combined in quadrature to arrive at 2(sigma) estimates of uncertainty under 0.2% at three oxygen levels.

Nanometrology.
Final rept.
E. C. Teague. 1991, 37p.
Pub. in AIP Conference Proceedings 241, Scanned Probe Microscopy, Santa Barbara, CA., January 1-11, 1991, p1-37 Feb 91.

Keywords: *Metrology, Heterodyning, Transducers, Flexing, Bearings, Microscopy, Interferometry, Reprints, Nanometrology, Probe geometry, Scanning tunneling microscopy.

Nanometrology is defined here as the science of measuring the dimensions of objects or object features to uncertainties of one nanometer or less. Four major tasks of nanometrology are examined: realizing a metric in the measurement space; establishing the metric in a coordinate reference frame; generating and measuring repeatable motion relative to the coordinate reference frame; and linking the testpiece to the coordinate reference frame/metric by a probe. Optical scales, x-ray interferometry, heterodyne interferometry, Fabry-Perot etalons, impedance-based transducers, and STM scales are evaluated as possible means to realize a metric.

Scanned Probe Microscopies: Opportunities and Issues in Metrology.
Final rept.
E. C. Teague. 1991, 4p.
Pub. in Scanning Probe Microscopies: STM and Beyond, Proceedings 241, Santa Barbara, CA., January 1-11, 1991, 4p Feb 91.

Keywords: *Metrology, *Integrated circuits, *Trends, Electronics industry, Microelectronics, Surfaces, Geometry, Microscopy, Scanning, Requirements, Reprints, Frequency metrology, Atomically-flat surfaces, Scanned probe microscopy.

Projections about manufacturing trends in the integrated circuit industry are made which indicate that by 2001 uncertainty requirements for dimensional metrology will be less than 1 nanometer. Brief arguments are presented that new scanning probe microscopes offer many opportunities to meet this need because they have the potential of reducing the uncertainty of locating a feature on a testpiece and because they provide new access to the highly ordered atomic structure of crystal surfaces. Such access has much potential for giving greatly increased accuracy for generating reference lines and geometry against which motion of machine elements can be measured and characterized. The need for large-area, atomically-flat surfaces is discussed.

High-Accuracy Principal-Angle Scanning Spectroscopic Ellipsometry of Semiconductor Interfaces.
Final rept.
N. V. Nguyen, D. Chandler-Horowitz, J. G. Pellegrino, and P. M. Amirtharaj. 1996, 5p.
Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p438-442 1996.

Keywords: *Semiconductor interfaces, *Principal angle, Reprints, Interfaces, *Spectroscopic ellipsometry, Strain roughness.

A high-performance spectroscopic ellipsometer has been custom built, in house at NIST, based on the commonly used rotating-analyzer configuration. The data accuracy was highly enhanced by using the principal-angle scanning technique. This technique requires an accurate setting of the angle of incidence which is accomplished by an interferomter and high-precision goniometers for the sample stage and the polarizer. For each wavelength, the principal angle of incidence was automatically searched to obtain a 90s phase shift of the polarized light upon reflection, i.e., delta = 90 degrees, and the polarizer azimuth was set to psi. At this condition, the ac component of detected intensity is near a null. With zone averaging, systematic errors such as the detector nonlinearity, and the

analyzer and polarizer calibration constants, are minimized. To illustrate the use and capability of this system, the authors use the results of a recent study of the optical properties of SiO2/Si system and, in particlar, the transitional region, defined as an interlayer between the thermally grown SiO2/Si system and, in particular, the transitional region, defined as an interlayer between the thermally grown SiO2 film and the Si substrate. In this study, the complex dielectric function and the thickness of the interlayer were determined.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Power Electronics, v10 n2 p111-123 Mar 95.

Keywords: *Bipolar transistors, Application specific integrated circuits, Mathematical models, Dynamic properties, Reprints, *Insulated gate bipolar transistors, Circuit simulators, Buffer layers.

The dynamic behavior of commercially available buffer layer IGBT's described. It is shown that buffer layer IGBT's become much faster at high voltages than nonbuffer layer IGBT's with similar low voltage characteristics. Because the fall times specified in manufactures' data sheets do not reflect the voltage dependence of switching speed, a new method of selecting devices for different circuit applications is suggested. A buffer layer IGBT model is developed and implemented into the Saber circuit simulator, and a procedure is developed to extract the model parameters for buffer layer IGBT's. It is shown that the new buffer layer IGBT model can be used to describe the dynamic behavior and power dissipation of buffer layer IGBT's in user-defined application circuits. The results of the buffer layer IGBT model are verified using commercially available IGBT's.

Keywords: *Semiconductors, *Magnetic fields, Reprints, *Foreign technology, *Magnetoresistance, 2D electron gas, Magnetophonon effect, Universal conductance fluctuations, Shubnikov-de Haas oscillations.

Quantum-mechanical effects observed in the magnetoresistance of semiconductor devices and materials give important information such as carrier density, scattering rates, and band structure parameters. However, the small size of these effects often limits their observation and subsequently their practical use. The purpose of this paper is to show how these quantum mechanical effects can be more easily observed and used as characterization tools by modulating the applied magnetic field, which can increase the sensitivity of magnetotransport measurements.

Theory for Quantum-Dot Quantum Wells: Pair Correlation and Internal Quantum Confinement in Nanoheterostructures.
Final rept.
G. W. Bryant. 1995, 4p.
Pub. in Physical Review B, v52 n24 pR16997-17000, 15 Dec 95.

Keywords: *Binding energy, *Quantum wells, *Oscillator strength, Quantum dots, Correlation, Exciton, HgS, Reprints.

Spherical quantum-dot-quantum-well nanocrystallites, with internal radial quantum-well band profiles, can now be fabricated. Pair states in these nanoheterostructures are determined by electron-hole attraction, global confinement in the dot, and local confinement within the well. Configuration-interaction calculations using effective-mass models with screened pair interaction give accurate exciton energies for CDs/HgS quantum-dot quantum wells. Binding energy and pair correlation are suppressed but pair-oscillator strengths are enhanced by adding a HgS quantum well to a CDs quantum dot.

Keywords: *Dielectric breakdown, *Silicon dioxide, Temperature dependence, High temperature, Integrated circuits, Reprints, Electric fields, Dielectric files, Thin films, Field acceleration models.

The authors present time-dependet dielectric breakdown (TDDB) characteristics for 9, 15, and 22 nm silicon dioxide films stressed under dc, unipolar, and bipolar pulsed bias conditions. The authors' results indicate that the increased lifetime observed under pulsed stress conditions diminishes as the stress electric field and oxide thickness are reduced. TDDB data under pulse bias conditions exhibit similar field and temperature dependencies as under static stress. C-V measurements indicate that lifetime enhancement only occurs for electric fields and thickness where charge trapping is significant.

Maintaining critical dimensions (CDs) in optical lithography requires careful control over the UV/DUV dose applied to a photoresist, especially as CDs become smaller. To meet the growing need for a UV-measurement infrastructure in the semiconductor industry, the National Institute of Standards and Technology (NIST) is improving its primary radiometric standards by an order of magnitude, reducing the absolute uncertainty in irradiance measurements to about 0.5% in the 100-400 nm range. Parallel improvements in transfer standards and source calibrations will allow the dissemination of highly accurate radiometric scales directly to industry.

Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Integrated Reliability Workshop Final Report, Lake Tahoe, CA., October 22-25, 1995, p72-80.

Keywords: *Silcon dioxide, Reliability(Electronics), Reprints, Dielectric films, Time dependence, *Time-Dependent Dielectric Breakdown, *Thin dielectric reliability.

A new, physics based model for time dependent dielectric breakdown has been developed, and is presented along with test data obtained by NIST on oxides provided by National Semiconductor. Testing included Fields from 5.6 MV/cm to 12.7 MV/cm, and temperatures ranging from 60 degrees C to 400 degrees C. The physics, mathematical model and test data, all confirm a linear, rather than an inverse field dependence. The primary influence on oxide breakdown was determined to be due to the dipole interaction energy of the field with the orientation of the molecular dipoles in the dielectric. The resultant failure mechanism is shown to be the formation and coalescence of vacancy defects, similar to that proposed by Dumin et al.

Keywords: *Lithography, *Microstructures, *Metastable atoms, Gold, Etching, Surfaces, Aqueous solutions, Argon, Reprints, *Atom lithography, Microlithography, SAMs(Self-assembled monolayers).

Lithography can be performed with beams of neutral atoms in metastable excited states to pattern self-assembled monolayers (SAMs) of alkanethiolates on gold. An estimated exposure of a SAM of dodecanethiolate (DDT) to 15 to 20 metastable argon per DDT molecule damaged the SAM sufficiently to allow penetration of an aqueous solution of ferricyanide to the surface of the gold. This solution etched the gold and transformed the patterns in the SAMs into structures of gold; these structures had edge resolution of less than 100 nanometers. Regions of SAMs as large as 2 square centimeters were patterned by exposure to a beam of metastable argon atoms. These observations suggest that this system may be useful in new forms of micro- and nanolithography.

Pub. in Institute of Electrical and Electronics Engineers International Frequency Control Symposium, San Francisco, CA., May 31-June 2, 1995, p305-314.

Keywords: *Bipolar transistors, *Amplifiers, Design criteria, Junction transistors, Electric circuits, Noise, Reprints.

In this paper, the authors discuss guidelines for designing linear bipolar junction transistor (BJT) amplifiers with low 1/f amplitude modulation (AM) and phase modulation (PM) noise. These guidelines are derived from a new theory that relates AM and PM noise to transconductance fluctuations, junction capacitance fluctuations, and circuit architecture. The authors analyze the noise equations of each process for a common emitter (CE) amplifier and use the results to suggest amplifier designs that minimize the 1/f noise while providing other required attributes such as high gain. Although the authors use a CE amplifier as an example, the procedure applies to other configurations as well. Experimental noise results for several amplifier configurations are presented.

Two computer codes for simulating the backscattered, transmitted, and secondary-electron signals for targets in a scanning electron microscope are described. The frist code, MONSEL-II, has a model target consisting of three parallel lines on a three-layer substrate, while the second, MONSEL-III, has a model target consisting of a two-by-two array of finite lines on a three-layer substrate. Elastic electron scattering is determined by published fits to the Mott cross section. Both plasmon-generated electrons and ionized valence electrons are included in the secondary production. An adjustable quantity, called the residual energy loss rate, is added to the formula of Joy and Luo to obtain the measured secondary yield. The codes show the effects of signal enhancement due to edge transmission, known as blooming, as well as signal reduction due to neighboring lines, known as the 'black-hole' effect.

NIST is in the process of developing a new scanning electron microscope (SEM) magnification calibration reference standard useful at both high and low accelerating voltages. This standard will be useful for all applications to which the SEM is currently being used, but it has been specifically tailored to meet many of the particular needs of the semiconductor industry. A small number of test samples with the pattern were prepared on silicon substrates using electron beam lithography at the National Nanofabrication Facility at Cornell University. The structures were patterned in titanium/palladium with maximum nominal pitch structures of approximately 3000 micrometers scaling down to structures with minimum nominal pitch of 0.4 micrometer. Eighteen of these samples were sent out to a total of 35 university, research, semiconductor and other industrial laboratories in an interlaboratory study. The purpose of the study was to test the SEM instrumentation and to review the suitability of the sample

design. The laboratories were asked to take a series of micrographs at various magnifications and accelerating voltages designed to test several of the aspects of instrument performance related to general SEM operation and metrology. If the instrument in the laboratory was used for metrology, the laboratory was also asked to make specific measurements of the sample. In the first round of the study (representing 18 laboratories), data from 35 instruments from several manufacturers were obtained and the second round yielded information from 14 more instruments. The results of the analysis of the data obtained in the study are presented in the paper.

During the manufacturing of present-day integrated circuits, certain meausrements must be made of the submicrometer structures composing the device with a high degree of precision. Optical microscopy, scanning electron microscopy and the various forms of scanning probe microscopies are major microscopical techniques used for submicrometer metrology. New techniques applied to scanning electron microscopy have improved some of the limitations of this technique and time will permit even further improvements. This presentation will review the current state of scanning electron microscope (SEM) metrology in light of many of these recent improvements.

Pub. in American Society of Mechanical Engineers, v8 p78-82 1993.

Keywords: *Scanning electron microscopy, *Metrology, *Lithography masks, X rays, Measurements, Reprints.

Accurate dimensional metrology of the submicrometer gold absorber structures of x-ray masks can be accomplished in the scanning electron microscope (SEM). This is possible because the x-ray masks present a measurement object that is unique from most other objects viewed in the SEM. This is because the silicon support membrane is, by design, x-ray transparent. The characteristic can be used as a distinct advantage in electron beam-based mask metrology since, depending upon the incident electron beam energies, substrate composition and substrate thickness, the membrane can also be essentially electron transparent. The area of the mask where the absorber structures are located are essentially x-ray opaque, as well as, electron opaque. Viewing the sample from a perspective below the mask, by placing an electron detector beneath the mask, provides excellent electron signal contrast between the absorber structure and the base membrane.

Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Reliability Physics Conference, Dallas, TX., April 30-May 2, 1996, p61-66.

Keywords: *Dielectric breakdown, *Silicon dioxide, Temperature dependence, Reprints, High temperature, Integrated circuits, Electric fields, Thin films, Oxides, Time-dependent.

Time-dependent dielectric breakdown (TDDB) characteristics are reported for 6.5 nm,, 9nm, 15 nm, and 22 nm intrinsic silicon dioxide films stressed under dc and bipolar pulsed stress conditions for a wide range of electric fields and temperatures. The authors results show that the increased ifetime observed under bipolar pulsed stress conditions diminishes as the stress electric field and oxide thickness are reduced. Similar electric field and temperature dependencies of TDDB are observed under both static and dynamic stress conditions. It is observed that lifetime enhancement only occurs for electric fields and thicknesses where charge trapping is significant. Contradictory to the convention notion, TDDB tests on intrinsic thin oxides indicate that static stress testing cannot be considered as a conservative test of bipolar stressing for estimating oxide reliability. These results also confirm the existence of two separate failure mechanisms for TDDB that are function of electric field and oxide thickness.

The purpose of this work is to explore the use of electrical test structures for calibrating optical overlay instruments with respect to certain application-dependent errors which are otherwise expected to become a serious impediment to realization of the goals of the National Technology Roadmap for Semiconductors over the next decade. A new hybrid test structure, from which overlay measurements can be extracted electricallty, as well as by optical instruments used for inspecting production wafers, has been designed and fabricated with built-in overlay values ranging from -60 to +60 nm. Structures patterned in a single conducting film and having critical-dimension (CD) design-rules ranging from 1.0 to 2.0 micrometers have been tested. Electrical overlay parameters, derived from multiple step-and-repeat exposure-site measurements, generally match the corresponding optical parameters to within several nanometers, subject to nominal quality of the pattern-replication process. The paper focuses on the analysis of electrical measurements, their dependence on CD design rules, and their comparison with the corresponding measurements made both by a commercial optical-overlay instrument and by a coordinate-measurement system having measurements traceable to absolute dimensional standards.

Keywords: *Double-modulation, *Lasers, *Photoreflectance, *Semiconductors, Quantum-well, Selective-excitation, Reprints.

Photoreflectance (PR) is a powerful, contactless, and nondestructive technique capable of probing interband electronic transitions and built-in electric-fields at the surface and in interface regions in semiconductor materials and microstructures. It has been widely used as a characterization too. Howevr, its application to highly luminscent systems, such as quantum-well (QW) lasers and samples with poor surface morphology has been limited because of the difficulty in minimizing the interference from the luminescence and the pump beam that is scattered from the surface. The authors present a double modulation procedure where both the probe and pump beams are modulated which allows the PR component to be completely separated from the luminescence and scattered contributions. The separation is achieved through the appropriate choice of modulation frequencies and specially designed tuned amplifiers. A complete PR system, along with the necessary circuits, is presented. In addition, the authors have also exploited the freedom provided by the system to choose any pump wavelength to selectively modulate specific regions of the multilayer structure (QW, barrier, and cladding layer) and extract detailed information regarding the properties of each layer.

S. Bagchi, J. D. Lee, S. J. Krause, and P. Roitman. 1996, 6p.
Pub. in Jnl. of Electronic Materials, v25 n1 p7-12 1996.

Keywords: *Silicon islands, *Defect formation, Dislocation half-loop, Stacking fault pyramide, Threading dislocation, Reprints, SIMOX.

The defects and microsructure of low-dose (less than 0.7 x 10 to the 18th power cm to the minus 2 power), oxygen-implanted silicon-on-insulator (SIMOX) material were investigated as a function of implant dose and

annealing temperature by plan-view and cross-sectional transmission electron microscopy. The threading-dislocations in low-dose (0.2 approximately 0.3 x 10 to the 18 power cm to the minus 2 power), annealed SIMOX originate from unfaulting of long (approximately 10 micrometer), shallow (0.3 micrometer), extrinsic stacking faults generated during the ramping stage of annealing. As dose increases, the defect density is reduced and the structure of the buried oxide layer evolves dramatically. It was found that there is a dose window which gives a lower defect density and a continuous buried oxide with a reduced density of Si islands and the buried oxide.

Keywords: *Silicon, *Electrical measurement, *Calibration, Semiconductors(Materials), Integrated circuits, Line width, Test equipment, Standards, Microelectronics, Reprints, MEMS(Microelectromechanical systems), Microelectromechanical systems.

Measurements of the linewidths of submicrometer features made by different metrology techniques have frequently been characterized by differences of up to 90 nm. The purpose of the work reported here is to address the special difficulties that this phenomenon presents to the certification of reference materials for the calibration of linewidth-measurement instruments. Accordingly, a new test structure has been designed and fabricated, and has undergone preliminary tests. Its distinguishing characteristics are assured cross-sectional profile geometries with known side-wall slopes, surface planarity, and compositional uniformity when it is formed in mono-crystalline material at selected orientations to the crystal lattice. To allow the extraction of electrical linewidth, the structure is replicated in a silicon film of uniform conductivity which is separated from the silicon substrate by a buried oxide layer. The utilization of a silicon-on-insulator (SOI) substrate further allows the selective removal of substrate material from local regions below the reference features, thus facilitating measurements by optical and electron-beam transmission microscopy. The combination of planar feature surfaces having known side-wall slopes is anticipated to eliminate factors which are believed to be responsible for methods divergence in linewidth measurements, a capability which is a prerequisite for reliable certification of the linewidths of features on reference materials.

Pub. in International Jnl. for Numerical Methods in Engineering, v39 p1029-1040 1996.

Keywords: *Semiconductors, *Collocation, Mathematical models, Three dimensional, Boundary value problems, Reprints, Poisson's equation.

A research code has been written to solve an elliptic system of coupled non-linear partial differential equations of conservation form on a rectangularly shaped three-dimensional domain. The code uses the method of collocation of Gauss points with tricubic Hermite piecewise continuous polynomial basis functions. The system of equations is solved by iteration. The system of non-linear equations is linearized, and the system of linear equations is solved by iterative methods. When the matrix of the collocation equations is duly modified by using a scaled block-limited partial pivoting procedure of Gauss elimination, it is found that the rate of convergence of the iterative method is significantly improved and that a solution becomes possible. The code is used to solve Poisson's equation for a model semiconductor problem. The electric potential distribution is calculated in a metal-oxide-semiconductor structure that is important to the fabrication of electron devices.

Characterization of Time-Dependent Dielectric Breakdown in Intrinsic Thin SiO2.
Final rept.
J. S. Suehle, and P. Chaparala. 1996, 9p.
See also PB96-179478.
Pub. in Microelectronics Jnl., v27 p657-665 1996.

Keywords: *Dielectric breakdown, *Silicon dioxide, Temperature dependence, High temperature, Integrated circuits, Electric fields, Dielectric files, Thin films, Reprints, *Foreign technology.

Time-dependent dielectric breakdown data collected from 6.5-, 9-, 15-, 20-, and 22.5-nm-thick SiO2 films are presented. The failure distributions are of single mode with no apparent extrinsic population. The logarithm of the median-test-time-to-failure, log(t50) is described by a linear electric-field dependence. Contrary to reports in earlier studies, the field-acceleration parameter is observed to be insensitive to temperature and has a value to approximately 1.0 decade/Mv/cm for the range of oxide thicknesses studied. Capacitance-voltage studies indicate that there is no strong correlation between oxide trapped charges and time-to-failure under constant voltage stress conditions.

Earthquake Resistant Construction of Electric Transmission and Telecommunication Facilities Serving the Federal Government Report.
F. Y. Yokel. Feb 90, 48p, NISTIR-89/4213, FEMA-202.
Sponsored by Federal Emergency Management Agency, Washington, DC.

Keywords: *Telecommunication, *Electric power generation, *Earthquake resistant structures, Seismic design, Design standards, Building codes, Telephone systems, Television systems, Radio communication, Computer networks, Transmission lines, Power transmission, Soil-structure interactions, Earthquake engineering, Lifeline systems.

The vulnerability of electrical transmission and telecommunication facilities to damage in past earthquakes, as well as available standards and technologies to protect these facilities against earthquake damage are reviewed. An overview is presented of measures taken by various Federal agencies to protect electrical transmission and telecommunication facilities against earthquake hazards. It is concluded that while most new facilities which are owned and operated by Federal agencies are presently designed to provide some, though not necessarily adequate, earthquake resistance, there generally is no effort to retrofit existing facilities. No evidence was found of requirements to protect electrical transmission and communication facilities which have major contractual obligations to serve the Federal Government and only limited seismic design requirements are stipulated for electrical transmission systems constructed with Federal funding.

Evaluation of the Economic Impacts Associated with the NIST Power and Energy Calibration Services.
A. N. Link. Jan 95, 27p, NISTIR-5565.
See also DE94010428. Prepared in cooperation with North Carolina Univ. at Greensboro. Dept. of Economics.

Keywords: *Electric power, *Calibration, *Economic impacts, Benefit cost analysis, Government policies, Watt hour meters, Electric utilities, Evaluation, Power and Energy Calibration Project, Federal laboratories, US NIST.

It is well established in the economics literature that investments in measurement-related technology research by Federal laboratories represents an important resource commitment to the innovation process, and that these investments have a significant impact on economic growth. The purpose of this study is to identify, and quantify where possible, the net economic benefits associated with the NIST Power and Energy Calibration Project. The NIST services from the project that are considered in this report are: (1) maintenance of the national standard for the watthour; (2) research to lower the level of uncertainty associated with watthour revenue meters; (3) general technical support to industry associated with measurement activities. For this particular study, the calculation of a benefit-to-cost ratio is believed to be the most reliable evaluation metric. This ratio is computed as the ratio of benefits (received by economic units directly dependent on the activities of the NIST power and energy calibration services) to the costs to society to generate those benefits, namely the cost to operate the Power and Energy Calibration Project. An alternative metric, an internal rate of return measure, is also presented in this report in order to facilitate a comparison of the benefit-to-cost result to the results from similar studies.

Technical Impact of the NIST Calibration Service for Electrical Power and Energy.
J. D. Ramboz, and F. D. Martzloff. Dec 95, 68p, NISTIR-5564.
See also PB95-188850.

Keywords: *Electric power meters, *Electrical measurement, *Calibration, Economic analysis, Watt hour meters, Standards, Power measurement, Electric utilities, NIST(National Institute of Standards and Technology).

A survey was conducted to assess the economic impact of the NIST Power and Energy Calibration service. Information was sought from electric utilities, manufacturers, testing laboratories, and Public Utilities Commissions on the structure of their operations and the economic aspects of the existence of traceability to National Standards by NIST. The information returned by the respondents was not sufficiently comprehensive and consistent to allow broad generalization leading to reliable assessment of the economic impact of the NIST services. However, the technical impact of these services was sufficiently documented to present this report describing the infrastructure and the relationships among the stakeholders.

Coordinating Cascaded Surge Protection Devices: High-Low versus Low-High.
Final rept.
J. S. Lai, and F. D. Martzloff. 1993, 8p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Industry Applications 29, n4 p680-687 Jul/Aug 93. See also PB92-159664.

Keywords: *Cascaded elements, *Circuit protection, *Surges, Reliability(Electronics), Varistors, Standards, Electric fuses, Coordination, Reprints.

Cascading surge protection devices located at the service entrance of a building and near the sensitive equipment is intended to ensure that each device shares the surge stress in an optimum manner to achieve reliable protection of equipment against surges impinging from the utility supply. However, depending on the relative clamping voltages of the two devices, their separation distance, and the waveform of the impinging surges, the coordination may or may not be effective. The paper provides computations with experimental verification of the energy deposited in the devices for a matrix of combinations of these three parameters. Results show coordination to be effective for some combinations and ineffective for some others, which is a finding that should reconcile contradictory conclusions reported by different authors making different assumptions. From these results, improved coordination can be developed by application standards writers and system designers.

Cascading Surge-Protective Devices: Options for Effective Implementation.
Final rept.
F. D. Martzloff, and J. S. Lai. 1992, 8p.
Sponsored by Electric Power Research Inst., Palo Alto, CA.
Pub. in Proceedings of International Conference on Power Quality (2nd): End-Use Applications and Perspectives, Atlanta, GA., September 28-30, 1992, pC-11:1-C-11:8.

Keywords: *Cascaded elements, *Circuit protection, *Surges, Arresters, Computerized simulation, Standards, Overvoltage, Reprints.

The basic and critical parameters for a successful coordination of cascaded surge-protective devices include the relative voltage clamping of the two devices, their electrical separation through wiring inductance, and the actual waveform of the impinging surge. The authors examine in detail the implications of the situation resulting from the present uncoordinated application of devices with low clamping voltage at the end of branch circuits and devices with higher clamping voltage at the service entrance. As an alternative, several options are offered for discussion, that might result in effective, reliable implementation of the cascaded protection concept.

Coordinating Cascaded Surge-Protective Devices: An Elusive Goal.
Final rept.
F. D. Martzloff, and J. S. Lai. 1992, 4p.
Pub. in Electrical Business, p1-4 Sep 92.

Keywords: *Cascaded elements, *Circuit protection, *Surges, Reliability(Electronics), Overvoltage, Lightning protection, Standards, Reprints.

Cascading two or more surge-protective devices located at the service entrance of a building and near sensitive load equipment is done to ensure that each device shares the surge stress in a manner commensurate with its rating. The final purpose is to achieve reliable protection of equipment against surges impinging from the utility supply, as well as internally generated surges. Coordination may or may not be effective, depending upon the relative clamping voltages of the two devices, their separation distance, and the waveform of the impinging surge. The article presents the results of computations, confirmed by measurements of the energy deposited in the devices for combinations of these three parameters. From these results, a suggestion is made on a possible approach to a coordinated scheme. However, without consensus among interested parties, some questions remain on the likelihood of ensuring coordination for all possible circumstances.

This project is directed at the reduction of valve recession in natural gas-fueled engines. Ceramic valve seat inserts have been procured, installed in a Caterpillar G3516 natural gas generator set, and tested for 1000 hours. Two different silicon nitride materials are being utilized for the valve seats in addition to stock Eatonite metallic inserts. Three valve face materials are being tested. These include stock Caterpillar stellite 1 faced, stellite 6 faced, and unfaced valves. A test matrix was used to allow comparison of all three valve face materials in combination with all three insert materials. The testing is scheduled to continue for an additional 7000 hours. No problems have been encountered with the test materials. In general, it has been shown that two types of silicon nitride materials have at least short term durability in engine operation. Neither material has exhibited any deficiencies thus far. An economic analysis spreadsheet has been created to calculate potential cost savings potential using ceramic valve seat inserts. Valve recession data for the first 1000 hours shows expected trends. Exhaust valve positions are wearing more than intake valve positions. If the intake positions and all positions with unfaced valve are ignored, then ceramic inserts paired with Stellite 1 valves show the most wear.

A Cooperative Research and Development Agreement (CRADA) has been established to study the production and mitigation of S2F10 (disulfur decafluoride), one of a number of toxic by-products formed in electrical discharges in the insulating gas SF6. The particular concern for S2F10 is due to its highly toxic nature, the Ceiling Limit Value being 10 parts per billion (ppb, or 1 part in 10 to the 8th power) and the need for development of sensitive detection techniques down to this level. There are a large number of SF6 gas-insulated electric power systems already in service in North America, particularly circuit breakers. SF6 is extensively used as an insulation and current interruption medium in power circuit breakers, compressed gas transmission lines and various components in substations. Ensuring the safe operation and maintenance of this equipment is an important issue for utilities, government agencies, and manufacturers.

Pub. in Oak Ridge National Laboratory, Oak Ridge, Tennessee Report No. ORNL/M-4314, v1 27p Oct 95.

Keywords: *Sulfur fluorides, *Electric power distribution, *Insulation, Toxic substances, Circuit breakers, Reprints, Air pollution, Electrical insulation.

A Cooperative Research and Development Agreement (CRADA) was established in 1991 to study the production and mitigation of S2F10 (disulfur decafluoride), one of a number of toxic by-products formed by electrical discharges in the insulating gas SF6. Since compressed SF6 is extensively used as an insulation and current interruption medium in electric power equipment, ensuring the safe operation and maintenance of this equipment is an important issue for utilities, government agencies, and manufacturers. The particular concern for S2F is due to (1) its highly toxic nature: the Threshold Limit Value - Ceiling (TLV-C) is 10 ppbv (1 ppbv = 1 part in 10 to the 9th power by volume = 1nL/L), the level which can not be exceeded during any part of the working exposure; and (2) the lack of sensitive detection techniques down to the TLV-C.

The objectives of this project are to develop state-of-the-art experimental apparatus that can be used to measure the thermophysical properties of a wide range of fluids and fluid mixtures important to the energy, chemical, and energy-related industries and to carry out carefully selected benchmark measurements on key systems. The measurement capabilities to be developed include new apparatus for transport properties, thermodynamic properties, phase equilibria properties, and dielectric properties. The specific measurement capabilities to be developed are: thermal conductivity apparatus; vibrating wire viscometer; dual-sinker densimeter; high-temperature vibrating tube densimeter; dynamic phase equilibria apparatus; apparatus for dilute solutions; total-enthalpy flow calorimeter; and dielectric constant apparatus. The research also includes benchmark experimental measurements on pure and mixed alternative refrigerants and their mixtures with lubricants, on aqueous solutions, and on carefully selected systems consisting of species of diverse size (methane + neopentane) and polarity (methane + ammonia) that are important for the development of predictive models for energy-related fluids.

Fuels Technology Contractors' Review Meeting, Morgantown, WV (United States), 16-18 Nov 1993. Sponsored by Department of Energy, Washington, DC.

Keywords: *Chemical Reactors, *Desulfurization, *Natural Gas, *Separation Processes, Hydrogen sulfides, Catalysts, Design, Membranes, Oxidation, Sodium Hydroxides, *Gas pipelines, EDB/030300.

A low temperature redox catalyst is combined with an H(sub 2)S selective membrane to create a composite-catalytic-membrane-reactor (CCMR) to help reach pipeline-quality natural gas H(sub 2)S levels of below 4 ppM. The goal of this program is to identify the apparent kinetic and mass transfer parameters for the CCMR. Using these kinetic and mass transfer parameters a preliminary process design can be made to ascertain the potential of this technology for replacement of conventional amine scrubbing and Claus sulfur recovery processes. In pursuit of this goal the project contains the following activities: construction of reactor and mass transfer equipment suitable for accurate measurements and safe handling of pure H(sub 2)S; initial proof-of-concept experiments with a prototype CCMR; obtain literature data and develop thermodynamic models for multicomponent natural gas components' solubility in electrolyte solutions; make physical and chemical measurements on the catalyst; obtain kinetic data using a 3-phase slurry reactor; obtain kinetic data for a catalytic membrane under varying mass transfer conditions; develop mathematical models to guide experimental work and for interpretation of results; optimize the permselective membrane part of the CCMR using commercially available materials; further proof-of-concept experiments with an optimized CCMR; and develop preliminary process design and economic analysis for the use of a CCMR in gas clean-up.

Keywords: *Radiative heat transfer, *Fuels, Burning rate, Combustion, Data analysis, Spectral emission, Burners, Heat flux, Soot, Heat measurement, *Pool fires.

An experimental and theoretical study of radiative feedback, burning rates, radiative heat loss fractions, and flame heights for pool fires with diameters ranging from 4.6 cm to 100 cm was completed. Transient measurements of soot and temperature distributions were obtained in 7.1 cm and 30 cm heptane and toluene fires using a three-wavelength emission/absorption probe. The heat release rates of the fires varied from 0.6 kW to 2,166 kW allowing a study over a wide range. A variety of fuels were tried but most of the measurements were restricted to methanol, heptane, and toluene as representatives of the alcohols, paraffins and aromatics. Radiative feedback was measured using a new in situ purged optical probe inserted at the level of the fuel surface. Measurements of reflection of energy from the fuel surface were also obtained.

Calculation of Higher Heating Values of Biomass Materials and Waste Components from Elemental Analyses.
Final rept.
T. J. Buckley. 1991, 13p.
Pub. in Resources, Conservation and Recycling 5, n4 p329-341 Aug 91.

Keywords: *Biomass, *Waste utilization, *Calorific value, *Hazardous materials, Comparison, Performance evaluation, Chemical analysis, Numerical analysis, Experimental design, Fuels, Reprints, Standard reference materials, Vondracek formula.

Higher heating values on a dry basis (HHV2) measured and those calculated from elemental analyses of over 140 biomass and waste component materials have been compared. The data was evaluated by six higher heating value formulas. The Vondracek formula was found to give the best agreement between calculated and measured heating values over a wide range (10 to 47 MJ/kg). This was evident by the good linear correlation between measured and calculated HHV2's. Standard reference materials also have been evaluated and shown generally to give good agreement. The calculation of higher heating values from elemental analyses is a good check for the reliability of a material's composition and heating value measurements in most cases. Materials with differences between calculated and measured higher heating values in excess of 6 percent should be considered suspect and examined closely.

Keywords: *Nondestructive tests, *Natural gas pipelines, *Stress corrosion, Cracking(Fracturing), Wipers, Inspection, Technology assessment, Electromagnetic waves, ILI(In-line inspection), Smart pigs.

The objective of the project was to assess the nondestructive evaluation (NDE) technology that may be applied to natural gas steel pipelines for the detection of stress corrosion cracking (SCC). In particular, the application of such technology would be from the inside of the pipe while the pipeline is in service, and inspection commonly called in-line inspection (ILI). The assessment focused on two basic NDE methods, ultrasonics and electromagnetics (including magnetic flux leakage). A third technology was data acquisition/analysis systems. Based on the experience of British Gas (BG) and others doing SCC inspections in different industries, crack discrimination is the important challenge for any such inspection system.

A method for estimating the radiative heat loss fraction is developed for non-premixed flames in a poor fire configuration. An experimental investigation of small to intermediate pool flames shows that a particular location can be determined such that a single radiance measurement yields an adequate estimate of the radiative heat loss fraction. The procedure is tested on a variety of fuels which yield flames over a wide range of luminosities and values of radiative heat loss fraction.

Combustion of Methanol and Methanol/Dodecanol Spray Flames.
Final rept.
C. Presser, A. K. Gupta, C. T. Avedisian, and H. G. Semerjian. 1992, 7p.
Pub. in Jnl. of Propulsion and Power 8, n3 p553-559 May/Jun 92.

Keywords: *Methanol, *Combustion, *Spraying, *Flame propagation, Lasers, Velocity distribution, Drops(Liquids), Interferometry, Mixtures, Size determination, Reprints.

The structure of methanol and methanol/dodecanol mixture spray flames has been examined. The mixture was studied in order to obtain evidence for the occurrence of microexplosions. Droplet size and velocity measurements were carried out under burning conditions using phase/Doppler interferometry. Laser sheet beam photography was used to observe the global features of the spray within the nonluminous portion of the flames. Droplet size and velocity distributions near the nozzle exit were found to be similar and monomodal for both fuels. Further downstream in the mixture flame the velocity distribution became bimodal near the spray boundary along with a change in size distribution to smaller droplets and an increase in number density. These results suggest that microexplosions may occur in 50/50 mixtures of methanol/dodecanol spray flames.

C. Presser, A. K. Gupta, C. T. Avedisian, and H. G. Semerjian. 1990, 5p.
Pub. in Proceedings of Annual Conference Extended Abstracts ILASS-Americas (4th), Hartford, CT., May 21-23, 1990, p243-247 1990.

Keywords: *Alcohol fuels, *Atomization, *Spraying, *Transport, *Flame propagation, Vaporization, Combustion, Combustion products, Particulates, Inteferometry, Reprints.

Studies with alternative fuels (i.e., methanol and ethanol) are of particular interest because of the current initiative to gradually replace the limited supply of conventional fossil fuels (i.e., gasoline, heating oils, etc.). Alcohol-based fuels are attractive, since they burn more cleanly and represent a potential to reduce the environmental impact of combustion processes. Investigation of the effect of alcohol fuels on spray and flame characteristics (i.e., droplet size and velocity) is important since chemical and physical properties of the fuel have a significant influence upon droplet atomization, vaporization, transport, combustion, and pollutant and particulate formation processes. The paper examines the effects of physical and chemical properties of two alcohol fuels on droplet transport processes of swirling spray flames. Experiments were carried out with methanol and a miscible mixture of methanol/1-dodecanol. The mixture fuel was selected to investigate the possibility of microexplosions in spray flames. Droplet size and velocity distributions were obtained using a phase/Doppler system. Laser sheet beam photography was also used to observe the internal features of pressure-atomized spray flames.

Keywords: *Kerosene, *Swirling, *Spraying, *Flames, Velocity distribution, Atomization, Drops(Liquids), Laser doppler velocimeters, Combustion, Reprints.

The interaction of the fuel spray with the surrounding combustion air, in particular near the spray boundary, affects its combustion and emission characteristics. Near the spray boundary, droplets of many different sizes, traveling at different velocities, are expected to be found. In addition, combustion air swirl affects fuel/air mixing and modifies the entire spray pattern. Therefore, spatially and temporally resolved information about the effect of swirl on droplet properties, especially near the spray boundary, is important for understanding the structure of sprays and spray flames. The results presented demonstrate the strong interaction between the spray droplets and the combustion air flow, which significantly modifies the flame structure. They also demonstrate the need to assess the effect of instrument characteristics, such as dynamic range and system gain, on the measurements for determination of accurate mean flow properties.

On January 2, 1988, a four million gallon capacity oil storage tank at the Ashland Petroleum Company Floreffe Terminal near West Elizabeth, Pennsylvania, collapsed as it was being filled to capacity for the first time since its reconstruction. The tank had been dismantled in Cleveland, Ohio, after more than 40 years of service and reconstructed at the Floreffe site in 1986. The National Institute of Standards and Technology (NIST) conducted an independent investigation into the physical cause of the Ashland tank collapse. It was determined that the failure was caused by a brittle fracture of the tank shell that initiated from a defect which existed prior to reconstruction of the tank. Complete rupture of the tank shell occurred because the steel did not possess adequate toughness at the operating temperature to prevent brittle fracture propagation. The collapse shows the importance of using steel with sufficient fracture toughness to prevent propagation of a brittle fracture in tanks whose sudden failure would mean unacceptable human, environmental or economic losses.

Keywords: *Natural gas, *Chemical composition, *Physical properties, Data bases, Gas chromatography, Chemical analysis, Quality assurance, Thermophysical properties, Hydrocarbons, Thermodynamics, Odorants, Treatment compounds.

The U.S. gas industry relies upon gas chromatographic analysis to obtain detailed gas compositional information needed for determining phase equilibrium behavior, thermophysical properties, and compliance with gas quality and safety engineering specifications. Analysis of the C(6+) fraction constituents of natural gas is technically complex and expensive. The assembly of a physical properties database for known C(6+) fraction constituents is needed to facilitate the development of improved chromatographic separation procedures for analyzing raw and processed natural gas streams for compliance with gas quality and end use specifications. The report provides a critically reviewed compilation of physical properties data for 132 hydrocarbon compounds identified as being native constituents of natural gas, 21 gas treatment compounds, and 23 gas odorant compounds.

Pub. in Resources, Conservation and Recycling 5, n2-3 p183-193 Apr 91.

Keywords: *Coal, *Desulfurization, *Biological treatment, *Air pollution abatement, *Sulfur inorganic compounds, *Sulfur organic compounds, Microorganisms, Microbiology, Biochemistry, Chemistry, Removal, Thermophiles, Reprints.

The study of microbial processes for the removal of organic and inorganic sulfur from coals is complicated by the lack of direct methods of measurement for organic sulfur content and the related incomplete understanding of the specific forms of organic sulfur in coal. In addition, the accessibility of specific chemical groups in the coal matrix to microorganisms and their enzymes is uncertain, raising questions about the nature and validity of model compound studies. Thus, interpretation of data from numerous efforts focused on the microbial removal of inorganic and organic sulfur from coals remains controversial. The discussion here reviews recent developments in the chemical characterization of coal sulfur related to bioprocessing research and describes some of our recent efforts in involving sulfur transformations by hyperthermophilic archaebacteria.

Keywords: *Thermopiles, *Gas chromatography, *Catalytic cracking, *Hydrocarbons, *Detectors, Fuels, Temperature measurement, Thermocouples, Catalysis, Reprints, *Hydrocarbon detectors.

A detector has been designed and built for the gas chromatographic detection of hydrocarbon species, especially in plant or on-line applications. Detection of the temperature change that occurs as a result of the catalytic cracking of hydrocarbons is the functional basis of the detector. The main component of this detector is a thermopile bundle constructed with type-K thermocouple wire. The sensing junctions of the thermopile are coated with a catalyst made up of a silicon dioxide-aluminum oxide-zeolite mixture. The temperature change associated with catalytic cracking occurs predominantly on the catalyst surface and is measured by the thermopile. The thermopile is directly connected to an electronic integrator, and provides a signal as a result of the temperature change. The tests that were performed to characterize the performance capabilities of the detector are reported. In addition, variable parameters were studied to determine the optimal conditions for obtaining the greatest sensitivity of the detector. The catalytic cracking detector is a very simple, inexpensive, and rugged device and is proposed as a potential alternative to other detectors for use in field or plant environments.

The effect of fire size on radiative heat loss fraction kappa(sub r) and combustion efficiency kappa(sub a) was examined by an analysis of scale for pool flames with varying diameter (D). Correlations between D and kappa(sub r) or kappa(sub a) were obtained. For 0.1m < D < 1m, kappa(sub r) and kappa(sub a) are relatively constant and independent of D. For larger pool diameters, kappa(sub r) decreases with increasing D.

Microbial Degradation of Polysulfides and Insights into Their Possible Occurrence in Coal.
Final rept.
L. Tilstra, G. J. Olson, G. Eng, and R. M. Kelly. 1990, 16p.
Pub. in Proceedings of International Symposium on the Biological Processing of Coal (1st), Orlando, FL., May 1-3, 1990, p3.27-3.42.

Keywords: *Microbial degradation, *Biodeterioration, *Polysulfides, *Coal, *Air pollution abatement, Desulfurization, Sulfur-oxidizing bacteria, Thiobacillus oxidans, Reduction(Chemistry), Oxidation, Biological treatment, Microorganisms, Reprints, Sulfur reducing bacteria.

Sulfur-oxidizing mesophilic (Thiobacillus thiooxidans) and sulfur-reducing hyperthermophilic (pyrococcus, Pyrodictium and others) bacteria are used as probes of specific forms of sulfur coal. When these bacteria are grown in medium with elemental sulfur or simple polysulfides (e.g., methyl trisulfide, cystine), easily measured products which are diagnostic of desulfurization are produced. As part of this research, we have synthesized model compounds which might more closely approximate some of the forms in which sulfur occurs in coal. These include: (1) organic sulfur model compounds which have bulky chemical groups surrounding the sulfur atoms and (2) polymeric polysulfides. Tests on these polysulfides will clarify the ability of the above bacteria to oxidize or reduce various forms of sulfur. The studies are also providing information as to the potential for these microorganisms to serve as probes of specific functional groups in coal and for the microbiological removal of sulfur from coal. Our approach could be extended to studies of large model compounds containing sulfur in other types of linkages such as heterocyclic rings.

Pub. in Jnl. of Thermophysics and Heat Transfer 8, n2 p329-333 1994.

Keywords: *Diffusion coefficient, *Aviation fuels, *Supercritical fluids, *Chromatography, Thermophysical properties, Diffusion, Concentration(Composition), Solubility, Binary mixtures, Chemical analysis, Nuclear magnetic resonance, Light scattering, Reprints.

In this article, the experimental procedures that are applicable to the measurement of diffusion in supercritical fluid solutions will be reviewed. This topic is of great importance to the proper design of advanced aircraft and turbine fuels, since the fuels on these aircraft may sometimes operate under supercritical fluid conditions. More specifically, we will consider measurements of the binary interaction diffusion coefficient D(sub 12) of a solute (species 1) and the solvent (species 2). In this discussion the supercritical fluid will be species 2, and the solute, species 1, will be at a relatively low concentration, sometimes approaching infinite dilution. After a brief introduction to the concept of diffusion, we will discuss in detail the use of chromatographic methods, and then briefly treat light scattering, nuclear magnetic resonance spectra, and physical methods.

Fugacity Coefficients of Hydrogen in (Hydrogen + Butane).
Final rept.
T. J. Bruno, and S. L. Outcalt. 1993, 10p.
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in Jnl. of Chemical Thermodynamics 25, p1061-1070 1993.

Keywords: *Evanescence, *Hydrogen, *Butanes, *Fugacity, Thermodynamic properties, Permeability, Membranes, Gas flow, Transpiration, Binary mixtures, Reprints, *Fugacity coefficients.

The fugacity coefficients of hydrogen in (hydrogen + butane) were measured as a function of composition with a physical-equilibrium technique at (temperature, pressure) pairs of (433.15 K, 3.39 MPa), (473.15 K, 3.38 MPa), (473.15 K, 22.65 MPa), and (523.15 K, 3.42 MPa). The physical-equilibrium technique involved the use of an experimental chamber that was divided into two separate regions by a semipermeable membrane through which hydrogen, but not butane, could permeate. Measurement of the gas pressures on each side of the membrane, in addition to a measurement of the composition and the system temperature, allowed the calculation of the fugacity and fugacity coefficient of hydrogen in the mixture. The qualitative features of the measurements are discussed, and comparisons are made with predictions obtained from the Redlich-Kwong and Peng-Robinson models.

Pub. in Gas Research Institute Annual Report, Jan-Dec 92, 12p.

Keywords: *Fluids, *Thermophysical properties, *Natural gas, Gas industry, Equations of state, Experimental design, Mathematical models, Hydrocarbons, Detectors, Reprints.

The U.S. gas industry standard for computing thermophysical properties is the A.G.A. Transmisson Measurement Committee Report No. 8 equation of state (AGA 8). This report summarized the results from several experimental, theoretical, and modeling programs directed at the extensive evaluation of the accuracy with which various types of natural gas physical properties can be calculated using AGA 8 and related methods. The most important results were the assembly of benchmark data sets for speed of sound, viscocity, fugacity, heat capacity, critical region PVT, mixture compressibilities, and vapor pressure measurements for natural gas fluids. When tested against these benchmark properties data, the AGA 8 equation of state model was found to be generally accurate within plus or minus 0.1% for sound speeds (and densities) and within plus or minus 0.03% for compressibilities over the ranges of pressure, temperature, and composition that encompass the major region of custody transfer or natural gas. Work was also completed on the fabrication and testing of a prototype catalytic cracking detector for the selective detection of hydrocarbons; a U.S. patent was awarded for this invention with the assignment to GRI.

Keywords: *Fossil fuels, *Sulfur, *Chemical composition, Coal, Petroleum products, Kerosene, Chemical analysis, Mass spectroscopy, Isotope dilution, Ionization potential, Reprints, Standard reference materials.

Total sulfur has been measured in 13 petroleum and 14 coal Standard Reference Materials (SRMs) by isotope dilution thermal ionization mass spectrometry. Samples were spiked with enriched stable S-34 and conbusted in sealed Carius tubes using nitric and hydrochloric acids. The oxidized sulfur was reduced to H2S, precipitated as As2S3, and then dissolved in an ammoniacal solution of As2O3. A portion of this solution, equivalent to 1.5 micrograms of sulfur, was added to a single Re filament coated wth silica gel. The amount of sulfur in the samples was determined from the S-32/S-34 ratio by mesuring the As(75)S(32)/As(75)S(34) molecular ions in a Faraday detector. The total uncertainty (95 percent confidence interval) for homogeneous materials such as oils is about 0.5 percent, and for less homogeneous materials such as coals is 1 - 4 percent.

Development of Gas Standards from Solid 1,4-dichlorobenzene.
Final rept.
G. C. Rhoderick. 1995, 7p.
Pub. in Jnl. of Chromatography A, v710 p229-235 1995.

Keywords: *Natural gas, Liquified, Recrystalize, Response factor, Solid, Reprints, *Foreign technology, *Gas standards.

For over fifteen years the National Institute of Standards and Technology (NIST) has been preparing gas standards containing volatile organic compounds at sub micro mol/mol (ppm) concentrations. These standards have been prepared using organic compounds that are either gases or liquids at room temperature. A microgravimetric technique was developed previously to prepare standards containing these compounds in treated aluminum gas cylinders using a one step dilution. Requests were received to prepare gas standards containing the compound 1.4-dichlorobenzene. These requests posed a major problem in that 1.4-dichlorobenzene is a solid at room temperature. Research was undertaken using the microgravimetric procedure to determine if it was feasible to prepare gas standards from solid phase compounds. In the first stage of research the liquid phase compound 1.2-dichlorobenzene previously studied at NIST in gas mixtures was used as an internal standard. Results from analyses of a pepared gas standard showed that the response factor on a gas chromatograph flame-ionization detector for 1.3-dichlorobenzene was 3% less than that for 1.2-dichlorobenzene.

Measurement of Atmospheric Methyl Bromide Using Gravimetric Gas Standards.
Final rept.
G. C. Rhoderick. 1995, 4p.
Pub. in Environmental Science and Technology, v29 n11 p2797-2800 Nov 95.

Keywords: *Methyl bromide, Samples, Calibration, Regression analysis, Reprints, *Gravimetric standards, Ozone layer.

Methyl bromide (CH3Br) is the largest source of gaseous bromine in the atmosphere. Methyl bromide is, therefore, environmentally important due to its potential to contribute to the loss of the stratospheric ozone layer through catalytic destruction. Several sets of atmospheric bethyl bromide measurements have been reported, but little has been reported on the calibration standards used to determine those values. For years, the National Institute of Standards and Technology (NIST) has prepared gravimetric gas standards containing methyl bromide at the low parts per billion (ppb; 10 to the minus 9th power mol/mol) level. These standards have been used by federal and state governments in urban air monitoring programs.

This report presents new experimental density measurements and density prediction models for natural gas liquids. Experimentally, vibrating tube densimeters have been used to measure coexisting densities for ethane, propane, n-butane, isopentane, n-pentane, and isohexane and for binary mixtures of ethane+propane, propane+n-butane, and n-butaine+n-pentane. The density measurements were combined with simultaneous vapor-liquid equilibrium measurements using a vapor and liquid recirculation phase-equilibrium apparatus at temperatures from 240 K to either 410 K or the critical temperature of the system, whichever is less. Isothermal data were obtained for the binary mixtures over the entire composition range for each of the systems. Also, an isochoric gas expansion technique has been used to carry out (p,p,T) measurements on two binary mixtures of ethane + propane with mol fractions of 0.35 and 0.65 and one binary mixture of propane+n-butane with a propane mol fraction of 0.61.

Pub. in International Jnl. of Heat and Fluid Flow, v15 n5 p364-377 Oct 94.

Keywords: *Droplets, *Rotation, *Liquid circulation, Circulation, Numerical models, Fluid transport, Spherical liquid volume, Rotation, Reprints.

The paper presents a combined theoretical/experimental study of internal liquid circulation induced by droplet surface rotation. A numerical model is presented first, examining the fluid transport within a spherical liquid volume whose surface is subjected to rotation about a central axis. The model predicts that the steady-state motion established from spatially nonuniform surface rotation has a helical character and bears little resemblance to the toroidal internal flows developed within droplets under axisymmetric conditions. Similar internal flow patterns are predicted for temporally varying surface rotation occuring during droplet spin-up or spin-down. Planar laser-induced fluorescence is employed to provide high-resolution images of fluid flow developed within millimeter-sized suspended droplets that are exposed to steady laminar air streams to induce repeatable surface rotation. The predicted spiral flow patterns are corroborated by the pendant droplet visualization experiments, and suggest that nonuniform rotation or transient spinning may significantly alter internal droplet dynamics.

Computer Programs for Simulation of Lighting/HVAC Interactions.
G. N. Walton. Dec 93, 156p, NISTIR-5322.
See also PB91-144386. Sponsored by Department of Energy, Washington, DC., and Electric Power Research Inst., Palo Alto, CA.

Keywords: *Space HVAC systems, *Lighting systems, *Computerized simulation, *Buildings, Coefficients, Algorithms, Interactions, Heat transfer, Cooling load, Energy audits, Thermal measurements, HLITE computer program, VLITE computer program, National Institute of Standards and Technology.

The report describes two computer programs developed for the analysis of lighting/HVAC interactions: HLITE and VLITE. VLITE is used to compute the coefficients (view factors) describing radiation interchange between surfaces. These coefficients are used in a thermal network model which is solved by HLITE for

transient temperatures and cooling loads. These programs are research tools. HLITE is based on a simple finite volume model for heat transfer combined with sufficiently short time steps to permit explicit time integration in most of the simulation. Controls are modeled in a manner emulating the operation of controls in real buildings. The accuracy of the mathematical solution is appropriate to the models used and data available resulting in a fast, flexible simulation tool.

Evaluation of GSA Maintenance Practices of Large Centrifugal Chillers and Review of GSA Refrigerant Management Practices.
J. Y. Kao. Jan 94, 51p, NISTIR-5336.
Sponsored by Public Buildings Service, Washington, DC.

Keywords: *Centrifugal pumps, *Refrigerating machinery, *Refrigerants, US GSA, Maintenance, Inspection, Nondestructive tests, Air pollution control, CFC(Chlorofluorocarbons).

The study contains two major subjects involving maintenance of large centrifugal chillers in the General Services Administration (GSA) facilities. The first part is to use nondestructive testing (NDT) techniques for chiller testing and maintenance. NDT techniques investigated are visual inspection, leak testing, vibration analysis, infrared thermal testing, eddy current testing, oil analysis, and acoustic emission testing. With the exception of acoustic emission testing, all other techniques are recommended for GSA chiller maintenance. The second part of the study is about refrigerant management.

Study of Heat Pump Performance Using Mixtures of R32/R134a and R32/R125/R134a as 'Drop-In' Working Fluids for R22 with and Without a Liquid-Suction Heat Exchanger.
P. I. Rothfleisch, and D. A. Didion. Dec 93, 65p, NISTIR-5321.

Keywords: *Heat pumps, *Refrigerants, *Working fluids, Heat exchangers, Performance(Engineering), Heat transfer, Uncertainty, Mathematical models, Thermodynamic cycles, Residential buildings.

A ductless mini-split residential heat pump with a modified indoor coil was utilized to compare the performance of R22 and a mixture of 34% R32/66% R134a by weight. This test was intended to serve as an indicator of 'drop-in' performance so the system was optimized for each refrigerant by varying only the charge mass and expansion valve setting. At the 27.8 C (82 F) cooling test condition the capacity and COP of the mixture were 94% and 90% of the values for R22, respectively. Additional tests were conducted with a liquid-suction intracycle heat exchanger. The modified system was operated with both single-phase and two-phase refrigerant entering the low pressure side of the liquid-suction heat exchanger. The addition of the liquid-suction heat exchanger showed a minimal performance improvement with the performance of the two-phase variation being slightly higher. The best performing liquid-suction heat exchanger variant (two-phase refrigerant on the low pressure side) was also run with a ternary mixture of 30% R32/10% R125/60% R134a, by weight. The results for this mixture were similar to the binary mixture.

Predicting the Energy Performance Ratings of a Family of Type I Combination Appliances.
S. T. Liu, and G. E. Kelly. Aug 93, 30p, NISTIR-5250.
Sponsored by Department of Energy, Washington, DC. Office of Codes and Standards.

Keywords: *Housing(Dwellings), *Space heaters, *Water heaters, *Energy efficiency, Water heating, Boilers, Thermal efficiency, Space heating, Comuterized simulation, *ANSI/ASHRAE Standard 124-1991, *Combination appliances.

ANSI/ASHRAE Standard 124-1991 specifies the laboratory tests and the calculation procedure for estimating seasonal and annual performance of combination appliances which are designed to provide both space heating and water heating. A boiler that includes a tankless coil for water heating is covered by those sections in ASHRAE Standard 124 that pertain to Type I combination appliances. In an effort to minimize the test burdens on manufacturers, a computer simulation study was conducted to determine if a subset of a family series of Type I combination appliances could be tested and used to predict the performance of the rest of the appliances in the family. Computer simulation was conducted on a family of five different size boilers with an identical tankless coil to calculate their Combined Annual Efficiency (CAE) as specified in ASHRAE Standard 124. To this end, the Energy Factor (EF) for water heating and the Annual Fuel Utilization Efficiency (AFUE) for space heating were calculated. For the water heating test that was simulated, daily hot water draw volumes of 243.4 liters (64.3 gal.) and 454.2 liters (120 gal.) were used. The results showed that for the five boilers, the AFUE for space heating differed by less than 1 percent.

Shape of the Temperature-Entropy Saturation Boundary.
Final rept.
G. Morrison. 1994, 10p.
Pub. in International Jnl. of Refrigeration, v17 n7 p494-503 1994.

Keywords: *Compression, *Diagrams, *Entropy, Reprints, Refrigerants, Saturation, Substitute, Temperature.

The phase diagram in temperature-entropy space plays an important role in the visualization, design and analysis of operating cycles in refrigerators and heat pumps. The shape of the phase boundary in this space varies dramatically from one material to another. The origin of these differences is shown to be a consequence of molecular structure. Relationships of varying accuracy are developed to estimate the slope of the vapour branch of the T-S diagram.

Composite Struts for SMES Plants.
Rept. for May 91-Nov 92.
R. P. Reed, and J. D. McColskey. Oct 94, 624p, NISTIR-5024.
Contract DNA-IACRO-91-854
Prepared in cooperation with Cryogenic Materials, Inc., Boulder, CO. Sponsored by Defense Nuclear Agency, Washington, DC.

Keywords: *Epoxy matrix composites, *Glass fiber reinforced plastics, *Struts, *Composite structures, *Magnetic energy storage equipment, Structural components, Stress analysis, Strains, Tensile properties, Modulus of elasticity, Composite materials, Displacement, Fatigue tests, Mechanical properties, Thermal conductivity, *Superconducting Magnetic Energy Storage Plants.

This report summarizes NIST research efforts in the development of composite struts for Superconducting Magnetic Energy Storage plants (SMES). Large SMES plants require radial structural support from the superconducting coils to the outer walls to assist in restraining the coil cool-down and Lorentz forces. The struts proposed for this structural support must have good axial compressive strength and low axial thermal conductivity, as well as low cost. A variety of E-glass fibers, resins, lay-up angles and manufacturing methods were evaluated in the course of this program, at temperatures ranging from 295 to 76K. Analysis methods are presented that describe the response of fiber-reinforced cylinders and end fitting designs to axially varying mechanical and thermal loads. Finally, failure-mode and tube design studies were conducted in order to optimize support tube-design based on minimum cross-sectional area with allowable strain values input as design constraints.

Procedure for Measuring Trace Quantities of S2F10, S2OF10, and S2O2F10 in SF6 Using a Gas Chromatograph-Mass Spectrometer.
Final rept.
R. J. Van Brunt, J. K. Olthoff, K. L. Stricklett, and D. J. Wheeler. 1995, 8p.
Pub. in Proceedings of the International Symposium on Gaseous Dielectrics (7th), Knoxville, TN., April 24-28, 1994, p441-448 1995.

Keywords: *Gas chromotography, *Mass spectrometers, *Trace quantities, Reprints, Procedures.

The compounds S2F10, S2OF10, and S2O2F10 are formed by decomposition of gaseous sulfur hexafluoride (SF6) in electrical discharges. The species S2F10 is known to be highly toxic to humans, and there is recent evidence that S2O2F10 may also be very toxic. There is, therefore, an interest in having analytical methods to detect these compounds in compressed SF6 at trace levels down to 10 parts in 10 to the 9th power by volume (10 ppbv). Two chromatographic methods have been used to direct these compounds at the 10 ppbv level or lower. The first method developed by Sauers and coworkers is based on a cryogenic enrichment procedure first proposed by Janssen, and uses a gas chromatograph with an electron-capture detector. The second method, which is the focus of the present work, utilizes a gas chromatograph-mass spectrometer (GC/MS) with a thermal-chemical converter. The purposes of the present work are: (1) to define a procedure for using the CC/MS method to make fast, reliable measurement of trace S2F10, S2OF10, and S2O2F10 in pressurized SF6; (2) to discuss the major sources of error that can be encountered in using the method; and (3) to discuss the factors that limit the sensitivity such as interference from other compounds.

Plasma Chemistry in Disilane Discharges.
Final rept.
J. R. Doyle, D. A. Doughty, and A. Gallagher. 1992, 10p.
Contract SERI-XG-1-1216
Pub. in Jnl. of Applied Physics 71, n10 p4771-4780, 15 May 92. Sponsored by Solar Energy Research Inst., Golden, CO.

Keywords: *Silanes, *Radio frequency discharge, *Plasma chemistry, *Amorphous silicon, Silicon solar cells, Semiconducting films, Reprints, Disilanes.

We have measured the initial silane and polysilane product yields from disilane decomposition in rf and dc discharges, at 25 and 250 C and 20 Pa (0.15 Torr) pressure as typically used for alpha-Si:H film deposition. From analyses of these yields we conclude that the initial Si2H6 fragmentation pattern is SiH3 + SiH2 + H (91 + or - 9%) and H3SiSiH + 2H (9 + or - 9%), that the primary product of the H + Si2H6 reaction is SiH4 + SiH3, and that SiH3 is the dominant radical causing film growth. We have measured a radical-surface reaction probability of 0.34 + or - 0.03, very similar to that observed for SiH3 in SiH4 discharges. We report a spatial distribution of emission indicative of a gamma-regime discharge. From deposition on glass fibers strung between the electrodes, we find that highly strained alpha-Si:H film is produced everywhere except on or near the electrodes, suggesting that energetic ion impact is necessary to yield useful films in disilane discharges.

Pub. in Handbook of Statistics, v12 p71-102 1994.

Keywords: *Environmental research, *Mathematical models, *Replicating, Statistical analysis, Multivariate analysis, Experimental design, Measurement, Reprints, *Data quality.

Replicate measurements can be used to improve sampling and measurement procedures and thereby data quality and to select an environmental model that agrees reasonably with the data. The implications for study design of these uses of replicates and corresponding statistical analysis methods are presented. The statistical analysis methods presented for quality improvement and model selection are especially appropriate for environmental studies. The quality improvement method discussed is a multivariate method generalized to include estimation of a power transformation for each constituent measurement. The model selection method discussed employs a bootstrap based on replicates that is applicable to models fit by robust estimation.

Scientific Protocols in Statistical Standards for Environmental Studies.
Final rept.
W. Liggett. 1993, 6p.
Pub. in Proceedings of American Statistical Association Conference on Quality and Product, San Francisco, CA., p38-43, 1993.

Keywords: *Environmental surveys, *Mathematical models, *Statistical inference, *Protocols, Statistical analysis, Randomization, Measurement, Errors, Experimental design, Reprints.

In environmental studies, the validity of the probability model that underlies statistical inference often depends on the operation of physical mechanisms. Deliberate randomization, although important, often cannot remove this dependence. Traditionally, statisticians have considered the impact of physical mechanisms on study conclusions to be the responsibility of scientific collaborators. Because scientists are guided by values other than the validity of probability models, statisticians must take responsibility themselves. Thus, statisticians must understand the relevant physical mechanisms so that they can develop scientific protocols that result in statistically-tractable probability models. As a practical approach, statisticians can become involved in the design and execution of pilot studies with the aim of resolving probability-model issues. Pilot studies adequate in this regard are necessary as a basis for environmental statistical standards.

Standard Reference Materials for Dioxins and Other Environmental Pollutants.
Final rept.
R. Alvarez. 1991, 7p.
Pub. in Science of the Total Environment 104, n1-2 p1-7 1991.

Keywords: *Dioxins, *Chemical analysis, *Environmental pollution, *Pollutants, Chemical composition, Certification, Concentration(Composition), Calibrating, Analytical techniques, Pesticides, Isotopic labeling, Physical properties, Chlorine organic compounds, Reprints, *Standard reference materials, National Intitute of Standards and Technology.

The National Institute of Standards and Technology issues approximately 1100 Standard Reference Materials (SRMs) certified for chemical composition or physical properties. A number of these SRMs have been developed to assist chemists in analyzing environmental samples more reliably for chlorinated dioxins and other organic pollutants. Certification of the pollutant concentration in a natural matrix SRM is based on concordant analyses by the NIST Organic Analytical Research Division using at least two independent methods. For a calibration solution, such as SRM 1614, Dioxin (2,3,7,8-TCDD) in Isooctane, certification is based on agreement of the calculated concentration based on the gravimetric preparation and the concentration as determined experimentally. SRM 1614 also includes a (13)C-labeled 2,3,7,8-TCDD for use as an internal standard in methods based on gas chromatography/mass spectrometry. The certified concentrations, in ng/g, are 98.3 + 3.3 for the unlabeled dioxin and 95.6 + or - 1.5 for the labeled dioxin. The certificates for SRM 1588, Organics in Cod Liver Oil, and SRM 1589, Polychlorinated Biphenyls (As Aroclor 1260) in Human Serum, provide noncertified concentrations of dioxins. Concentrations of chlorinated dioxins in two urban particulate SRMs have been reported in the literature.

Opportunities for Innovation: Pollution Prevention.
D. E. Edgerly. Aug 94, 181p, NIST/GCR-93/659.
Grant 50SBNB3C7626

Keywords: *Pollution abatement, *Waste recycling, *Small businesses, *Waste disposal, *Industrial wastes, Automotive industry, Chemical industry, Paper industry, Textile industry, Paints, Coatings, Degreasing, Dyes, Dyeing, Printing, Office equipment, *Medium-sized businesses, Opportunities for innovation, Waste minimization, Pollution prevention, Waste reduction.

The objective was to identify technological opportunities within a number of selected industries and/or manufacturing/finishing processes, to reduce pollution. These industries/processes were selected as representative of and applicable to the broad range of U.S. manufacturing businesses. These include: metals coating (i.e., painting) which is widely done in a number of major industries, including the automotive industry; metals degreasing; recyclability of office equipment; chemical manufacturing; printing; textiles dye and dyeing; and the pulp and paper industry. Additionally, the promulgation of new regulations, requiring companies to change their historical manufacturing and waste generating/disposal practices, will continue to create technological needs and opportunities for savvy businesses to develop solutions.

Liquid Chromatographic Determination of Polycyclic Aromatic Hydrocarbon Isomers of Molecular Weight 278 and 302 in Environmental Standard Reference Materials.
Final rept.
S. A. Wise, A. Deissler, and L. C. Sander. 1993, 16p.
Pub. in Polycyclic Aromatic Compounds 3, p169-184 1993.

Keywords: *Liquid column chromatography, *Polycyclic aromatic hydrocarbons, *Reference standards, *Quantitative chemical analysis, Isomers, Chromatographic analysis, Fluorescence spectroscopy, Extraction columns, Pollution sampling, Particulates, Sediments, Coal tar, Reprints, *Environmental samples, Standard reference materials, Dibenzopyrenes, Dibenzoanthracenes, Dibenzofluoranthenes.

Polycyclic aromatic hydrocarbons (PAHs) of molecular weight (MW) 278 (dibenzanthracene isomers) and 302 (dibenzopyrene/dibenzofluoranthene isomers) are seldom measured in environmental samples. A multidimensional liquid chromatography (LC) procedure was developed for the quantification of isomers of MW 278 and 302. Using the multidimensional LC procedure, six isomers of MW 278 and nine isomers of MW 302 were quantified in four environmental Standard Reference Materials (SRMs): coal tar (SRM 1597), air particulate matter (SRMs 1648 and 1649), and marine sediment (SRM 1941).

Considerations in the Design of an Environmental Specimen Bank: Experiences of the National Biomonitoring Specimen Bank Program.
Final rept.
S. A. Wise, and B. J. Koster. 1995, 7p.
Pub. in Environmental Health Perspectives, v103 sup3 p61-67 Apr 95.

Keywords: *Tissue banks, *Reference standards, *Environmental monitoring, *Bioassay, Chemical analysis, Inorganic chemistry, Organic chemistry, Sampling, Bioaccumulation, Marine mammals, Fishes, Animal tissues, Humans, Biological effects, Cryogenic storage, Quality assurance, Reprints, National Biomonitoring Specimen Bank.

Since 1979 the National Institute of Standards and Technology (NIST) have been involved in environmental specimen banking activities as part of the National Biomonitoring Specimen Bank (NBSB). These activities have focused on the development of procedures for the collection, processing, analysis, and long-term storage of a variety of environmental specimens including: human liver, mussels and oysters, fish tissue (liver and muscle), marine mammal tissues (blubber, liver, and kidney), and marine sediments. The experiences of the NBSB, the issues that should be addressed in the design and operation of a valid specimen bank program are presented.

ISO Environmental Management Standardization Efforts.
Technical note.
M. H. Saunders. Feb 96, 25p, NISTIR-5638-1.
Supersedes PB95-220513.

Keywords: *ISO, *Standardization, *Environmental protection, Environment management, Product development, Process control(Industry), Design criteria, Design analysis, Life cycle costs, Labeling, Auditing, Performance evaluation, Recommendations, *Life cycle analysis, Process management, Product standards.

The International Ogranization for Standardization (ISO) is currently developing a family of 'environmental management' standards which address management systems and the environmental aspects of products in the areas of life cycle assessment and labelling. These standards have the potential to exert a significant influence on the design, manufacture and marketing of products. They are also likely to affect the type of environmental data gathered by businesses and how those data are communicated internally and externally. The report outlines the current state of development of these planned ISO standards and also covers developments relating to third party certification of environmental management systems.

Pilot Studies for Improving Sampling Protocols.
Final rept.
W. S. Liggett, and K. G. W. Inn. 1996, 18p.
Pub. in Principles of Environmental Sampling, p185-202 1996.

Keywords: *Environmental research, *Sampling, *Measurement, Experimental design, Protocols, Selectivity, Optimization, Sensitivity, Specificity, Statistical analysis, Statistical inference, Reprints.

Development of an environmental sampling and measurement protocol by means of experiments is feasible. The experiments require dissimilar plots, each of which is large enough for execution of a set of alternative protocols, but the experiments do not require that the property of interest be known for the plots. This chapter discusses the statistical framework for such experiments: what constitutes a proper set of alternative protocols, how the protocol responses can be used to estimate relative performance, and how the best protocol can be determined.

Ground-Based Smoke Sampling Techniques Training Course and Collaborative Local Smoke Sampling in Saudi Arabia.
Final rept. Aug 92-Aug 93.
N. P. Bryner, and B. A. Benner. Jan 94, 94p, NISTIR-5306.

Keywords: *Air pollution sampling, *Smoke, *Oil wells, *Fires, Particulates, Saudi Arabia, Health, Kuwait.

Smoke and gaseous emissions such as those generated by multiple oil-well fires can significantly impact the health of the local population. To assess the immediate risk to public health, the chemical and physical properties of the smoke and gaseous emissions must be quickly characterized. Local sampling via portable gas analyzers, filters and pumps, and particle sizing instrumentation provides real-time characterization of pollutant levels. These analyses provide a snapshot of the physical and chemical properties of the aerosols sampled in Saudi Arabia, but due to the very limited number of samples, they do not provide a reasonable basis for estimating the short- or long-term health risk due to exposure to smoke and gaseous emissions.

Modulation of Fossil Fuel Production by Global Temperature Variations, 2.
B. W. Rust, and F. J. Crosby. Jan 94, 64p, NISTIR-5332.
See also PB83-182592.

Keywords: *Fossil fuels, *Atmospheric temperature, *Northern Hemisphere, *Air pollution, Production, Climatic changes, Global warming, Variations, Mathematical models, Graphs(Charts), Gaia hypothesis, Rust-Kirk model.

The report includes the inverse modulation of global fossil production by variations in Northern Hemispheric temperatures. The present study incorporates recent revisions and extensions of the fuel production record and uses a much improved temperature record. The authors show that the new data are consistent with the predictions of the original Rust-Kirk model which they then extend to allow for time lag between variations in the temperature and the corresponding responses in fuel production. The modulation enters the new model through the convolution of a lagged averaging function with the temperature time-series. The authors also include explicit terms to account for the perturbations caused by the Great Depression and World War II. The final model accounts for 99.84% of the total variance in the production record. This modulation represents a feedback which is consistent with the carbon dioxide problem; climate change; fossil fuel production; global warming Gaia hypothesis; temperature variations.

Sulfur Dioxide Capture in the Combustion of Mixtures of Lime, Refuse-Derived Fuel, and Coal.
Final rept.
K. L. Churney, and T. J. Buckley. Nov 90, 59p, NISTIR-4443.
Sponsored by Department of Energy, Washington, DC. Biofuels and Municipal Waste Technology Div.

Keywords: *Refuse derived fuels, *Sulfur dioxide, *High sulfur coal, *Cocombustion, *Air pollution control, Calcium oxides, Fly ash, Chlorine, Manganese oxides, Sorbents, Tests, Combustion chambers.

Chlorine and sulfur mass balance studies have been carried out in the combustion of mixtures of lime, refuse-derived fuel, and coal in the NIST multikilogram capacity batch combustor. The catalytic effect of manganese dioxide on the trapping of sulfur dioxide by lime was examined. Under the authors conditions, only 4% of the chlorine was trapped in the ash and no effect of manganese dioxide was observed. Between 42 and 14% of the total sulfur was trapped in the ash, depending upon the lime concentration. The effect of manganese dioxide on sulfur capture was not detectable. The temperature of the ash was estimated to be near 1200 deg C, which was in agreement with that calculated from sulfur dioxide capture thermodynamics.

Rare-Earth Isotopes as Tracers of Particulate Emissions: An Urban Scale Test.
Final rept.
J. M. Ondov, W. R. Kelly, J. Z. Holland, P. J. Paulsen, Z. C. Lin, and S. A. Wight. Jan 91, 43p, CBRM-TR-91-2.
See also PB91-195347. Prepared in cooperation with National Inst. of Standards and Technology (NML), Gaithersburg, MD. Center for Analytical Chemistry. Sponsored by Maryland Dept. of Natural Resources, Annapolis. Chesapeake Bay Research and Monitoring Div. and Maryland Power Plant Research Program, Annapolis.

Keywords: *Tracer techniques, *Isotopic labeling, *Particulates, *Rare earth elements, *Air pollution, Urban areas, Feasibility studies, Coal fired power plants, Fly ash, Flue gases, Concentration(Composition), Neodymium 148, Field tests.

The particulate emissions of a 100 MW(e) coal-fired power plant were successfully tagged with enriched rare-earth isotopes on three occasions during the month of August, 1988. On 28 August, an 8-hour release was made using 94% isotopically pure 148Nd injected at a rate of 61 mg/hr and 14 ambient aerosol samples collected along a 72 degree arc 20-km distant from the plant were analyzed by pulse-counting thermal-ionization mass spectrometry for excess 148Nd and naturally-occurring (total) Nd background. The results were in good agreement with Gaussian plume model predictions. We conclude that the experiment and preliminary results successfully demonstrate the feasibility of using an enriched rare-earth isotopes as tracers of emissions from coal-fired power plants. The large signal-to-noise ratios achieved here are sufficient for tracing particles over much larger distances.

CONTAM93 User Manual.
G. N. Walton. Mar 94, 80p, NISTIR-5385.

Keywords: *User manuals (Computer programs), *Indoor air pollution, *Air flow, *Buildings, Environmental transport, Spatial distribution, Ventilation, Contaminants, Algorithms, Requirements, Air quality, Environmental engineering, *CONTAM93 computer program, CONTAM computer program, CONTAMX computer program, Multizone analysis.

This manual describes the use of two computer programs for analyzing the air movement and indoor air quality in multizone buildings. The first program CONTAM is used to create and edit the building description including data for all features relating to airflow or to the generation and removal of contaminants. It uses a graphic interface to establish the spatial relationship of these features. These data along with weather data are used by the program CONTAMX to calculate the airflows and dynamic levels of indoor contaminants. The results of the calculation may be reviewed graphically in CONTAM and printable files may be generated. Together these two programs are called CONTAM93.

CONTAM88 Building Input Files for Multi-Zone Airflow and Contaminant Dispersal Modeling.
J. B. Fang, and A. K. Persily. Jun 94, 53p, NISTIR-5440.

Keywords: *Indoor air pollution, *Air flow, *Buildings, Computerized simulation, Algorithms, Ventilation, Contaminants, Computer files, Dispersants, Data bases, Infiltration(Fluids), *CONTAM88 computer program, *Multi-zone air flow, *Contaminant dispersal modeling.

Input files for the multi-zone airflow and contaminant dispersal computer program CONTAM88 are described for four large buildings. The files were developed for a twelve-story multi-family residential building, a five-story mechanically-ventilated office building with an atrium, a seven-story mechanically-ventilated office building with an underground parking garage, and a one-story school building. The physical characteristics of each building and its idealization as a multi-zone airflow system are described. These input files enable a user to employ CONTAM88 to study airflow and contaminant dispersal in these large buildings without developing building idealizations and inputting them into CONTAM88. Results of selected computer simulations are presented to demonstrate the effects of wind speed, indoor-outdoor temperature difference, and the percentage of outdoor air intake in the supply air on air change rates and interzonal airflows for these four buildings. Appendices are also included that contain a building component leakage database useful in multizone airflow modeling and updated information on the use of CONTAM88.

Pub. in Proceedings of IAQ 92 Environments for People Conference, San Francisco, CA., October 19-21, 1992, p85-93. Sponsored by General Services Administration, Washington, DC.

Keywords: *Indoor air pollution, *Office buildings, *Air pollution monitoring, *Federal buildings, *Air quality, Environmental engineering, Ventilation, Concentration(Composition), Carbon dioxide, Carbon monoxide, Radon, Formaldehyde, Volatile organic compounds, Performance evaluation, Reprints, Overland(Missouri).

A study of the environmental performance of three new office buildings is being conducted, involving long-term monitoring of building ventilation rates and indoor levels of selected pollutants, both before occupancy and during early occupancy. This paper describes the effort in a seven-story office building in Overland, Missouri. The measurement results discussed in this paper include tracer gas decay measurements of ventilation rates and the concentrations of carbon dioxide, carbon monoxide, radon, formaldehyde, and volatile organic compounds (VOCs).

Ventilation Rates in Office Buildings.
Final rept.
A. Persily. 1989, 9p.
Sponsored by Geological Survey, Reston, VA., General Services Administration, Washington, DC., and Department of Energy, Washington, DC.
Pub. in Proceedings of the ASHRAE/SOEH Conference on IAQ 89 The Human Equation: Health and Comfort, San Diego, CA., April 17-20, 1989, p128-136.

Keywords: *Ventilation, *Office buildings, *Air quality, *Thermal confort, *Indoor air pollution, *Flow measurement, Design criteria, Air flow, Performance evaluation, Standards, Tracer techniques, Reprints.

The ventilation rate of an office building impacts the building air quality in terms of both thermal comfort and pollutant levels. The National Institute of Standards and Technology has been studing ventilation in office buildings for several years. The research has included the measurement of ventilation rates in 14 office buildings for periods on the order of one year, and has produced a data set of about 3000 ventilation measurements under a range of weather and building operation conditions. These data are a unique source of actual ventilation rate measurements in office buildings, and are the subject of the paper. The data provides an indication of current practice. Although the ventilation rates vary considerably among the buildings and for each individual structure, many of the buildings have ventilation rates below recommended levels and/or design values during significant portions of the year.

Dispersion and Deposition of Smoke Plumes Generated in Massive Fires.
Final rept.
A. F. Ghoniem, X. Zhang, O. M. Knio, H. Baum, and R. Rehm. 1993, 19p.
Sponsored by Minerals Management Service, Herndon, VA.
Pub. in Jnl. of Hazardous Materials 33, p275-293 1993.

Keywords: *Plumes, *Fires, *Smoke, *Environment effects, *Trajectories, *Computational fluid dynamics, Deposition, Buoyancy, Environmental pollution, Dispersion, Pollution transport, Equations of motion, Wind direction, Air pollution, Reprints, *Buoyant smoke plumes.

Massive fires resulting from the uncontrolled burning of crude oil from spills or industrial accidents produce large smoke-laden buoyant plumes which rise in the wind direction before they equilibrate within a stably stratified atmosphere. Beyond this point, the plume material cools by entrainment and the plume becomes negatively buoyant due to the heavy smoke loading. The trajectory of the descending plume, which determines the ground distribution of smoke, is the subject of this paper. A computational model for the simulation of large-scale smoke plumes resulting from such fires is developed and applied to investigate the effects of the plume initial properties on its trajectory and smoke deposition patterns. Attention is focused on the descent and dispersion of wind-driven plumes in a homogeneous atmosphere, and the smoke deposition on flat terrain. Results show that the plume dynamics in the cross-wind direction are dominated by two buoyantly generated, coherent, streamwise vortices which distort the plume cross section into a kidney-shaped structure. The strength of the two vortices and their separation increases as the plume falls. The plume width grows under the action of these vortices at a rate which increases as the plume settles on the ground, leading to a smoke footprint which does not resemble the prediction of Gaussian dispersion models.

Sponsored by Public Buildings Service, Washington, DC.
Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transactions 100, pt2 10p 1994.

Keywords: *Office buildings, *Ventilation, *Carbon dioxide, *Indoor air quality, Air flow rates, Air circulation, Air infiltration, Flow measurement, Tracer techniques, Air pollution monitoring, Indoor air pollution, Space HVAC systems, Reprints, Air exchange rates.

Ventilation rates and indoor carbon dioxide levels were monitored for two years in a new office building near St. Louis, Missouri. These measurements were made to assess the operation and performance of the ventilation system in this building and to investigate the relationship between indoor carbon dioxide levels and air change rates. Ventilation rates were measured with the tracer gas decay technique using an automated measuring system. Indoor carbon dioxide concentrations were also measured with an automated system. The relationship between the indoor carbon dioxide levels and the building air change rates was similar to that seen in other office buildings. This discussion points out limitations in the use of equilibrium analysis of carbon dioxide concentrations in office buildings.

Guidelines for Refractive Index Measurements of Asbestos.
Final rept.
J. R. Verkouteren, J. M. Phelps, and E. B. Steel. 1989, 5p.
Pub. in Microbeam Anal. 24, p429-433 1989.

Keywords: *Asbestos, *Refractive index, *Optical measurement, *Guidelines, Chrysotile, Amosite, Crocidolite, Polarized light, Microscopy, Calibration standards, Reference standards, Reprints, Standard reference materials, Focal screening, Dispersion staining, Becke line technique.

Refractive index is one of the primary optical properties used to identify minerals using polarized light microscopy. Through the association with the Bulk Asbestos Laboratory Accreditation Program, the authors have received requests from hundreds of Laboratories for technical assistance in the area of bulk asbestos analysis. Many of these requests are for information on the measurement of refractive index, specifically using the focal screening (dispersion staining) and Becke line techniques. The authors have developed Standard Reference Materials (SRMs) of chrysotile, amosite, and crocidolite (SRM1866) to serve laboratories as primary calibration standards for the measurement of the optical properties of asbestos, including refractive index. These materials will be discussed and used as examples to explain the application of focal screening and the Becke line technique to refractive index measurement.

Ventilation, Carbon Dioxide and ASHRAE Standard 62-1989.
Final rept.
A. K. Persily. 1993, 4p.
Pub. in American Society of Heating, Refrigeration and Air-Conditioning Engineers Jnl. 35, n7 p40-44 Jul 93.

Keywords: *Ventilation, *Carbon dioxide, *Air quality standards, *Indoor air quality, Commercial buildings, Office buildings, Indoor air pollution, Air flow, Flow rates, Flow measurement, Air infiltration, Air circulation, Air pollution monitoring, Space HVAC systems, Reprints, *ASHRAE Standard 62-1989.

The article is an attempt to reduce some of the confusion concerning the issues of ventilation, carbon dioxide and ASHRAE Standard 62-1989 that has been evident in numerous discussions of indoor air quality. The article presents a brief discussion of how indoor carbon dioxide levels are related to ventilation rates, including the potential for using these indoor concentrations to determine outdoor airflow rates. The role of carbon dioxide is Standard 62, specifically the significance of the 1000 ppm guideline is also discussed. Much of the discussion in the article is specific to mechanically-ventilated office buildings, but many of the conclusions are relevant to other building types.

Stability/Instability of Gas Mixtures Containing 1,3-Butadiene in Treated Aluminum Gas Cylinders.
Final rept.
G. C. Rhoderick. 1990, 9p.
Pub. in Proceedings of 1990 EPA/A&WMA International Symposium on Measurement of Toxic and Related Air Pollutants, Raleigh, NC., May 1990, p709-717.

Keywords: *Butadienes, *Stability, *Gas cylinders, *Binary mixtures, *Calibration standards, Nitrogen, Air pollution, Chemical analysis, Quantity ratio, Concentration(Composition), Reprints, *Aluminum gas cylinders, *1,3-Butadiene.

The Gas Metrology Research Group of the National Institute of Standards and Technology (NIST), has been involved in research and development of gas standards of volatile toxic organic compounds for many years. Over thirty toxic organic compounds have been studied in gas mixtures contained in high pressure aluminum gas cylinders with specially treated interior surfaces. Almost all compounds studied to date have shown very good long term stability at the parts-per-billion (ppb, nanomole/mole) to parts-per-million (ppm, micromole/mole) range. One exception, 1,3-butadiene, is a compound that many scientists and policy makers are very interested in measuring in the environment. The author discusses data obtained over several years for gas mixtures of 1,3-butadiene in nitrogen, at concentrations of 2 ppm, 100 ppb, and 10 ppb. The data demonstrate that mixtures of 1,3-butadiene at the 2 ppm level have remained stable for over three years. However, gas mixtures of 1,3-butadiene at the 10 ppb level have shown decreases in concentration of more than 70% over a two-year period. Decreases in the concentration of 1,3-butadiene have been observed immediately after the preparation of the gas mixture in several cylinders. This indicates that gas mixtures of 1,3-butadiene are not stable at the ppb levels and therefore are not reliable as accurate calibration standards.

Atmospheric Reactivity of alpha-Methyl-Tetrahydrofuran.
Final rept.
T. J. Wallington, W. O. Siegal, R. Liu, M. J. Kurylo, Z. Zhang, and R. E. Huie. 1990, 4p.
Pub. in Environmental Science and Technology 24, n10 p1596-1599 1990.

Keywords: *Atmospheric chemistry, *Air pollution, *Fuel additives, Biomass, Volatile organic compounds, Environmental impact, Hydroxyl radicals, Reaction kinetics, Exhaust emissions, Reprints, *Furan/methyltetrahydro.

Biomass derived alpha-methyl-tetrahydrofuran, MTHF, has been proposed as an automotive fuel additive. Since MTHF is a volatile organic compound, the environmental impact of evaporation to the atmosphere needs to be considered if this compound is to be used in substantial quantities in such applications. The major loss process of MTHF in the atmosphere is expected to occur via reaction with hydroxyl radicals (OH), hence we have conducted a study of the kinetics of the reaction of OH radicals with MTHF using both absolute (flash photolysis resonance fluorescence) and relative rate techniques. The absolute rate experiments were performed over the temperature range 240-400 K at total pressures of 35 torr of argon; the relative rate experiments were conducted at 295 K in 740 torr of synthetic air. The results from both techniques were in good agreement.

Keywords: *Hazardous materials, *Low level radioactive wastes, *Incinerators, *Air pollution control, Fluidized beds, Membranes, Separation processes, Permeability, Combustion products, Carbon dioxide, Oxygen, Nitrogen, Water, Reprints, Gas permeation.

For their proposed fluidized-bed incineration process, EG&G Rocky Flats' technical staff are considering the possible scenario of placing a 'molecular filter' (a gas separation membrane) system on their stack gases. The permeate through the membrane would principally be the products of combustion: CO2 and H2O, and the retentate is circulated back to the incinerator as the fluidizing gas. Data were obtained for cellulose acetate and polyamide membranes using a CO2-rich stream with N2 and O2. Additional measurements were made to provide some basis for estimating the fate and effect of contaminants. Gas permeation measurements, with both types of membranes, were made on streams that contained trace C(sub 1)-C(sub 3) contaminants. These latter measurements were also made with cellulose acetate samples which had been exposed to saturated organic solvent vapors for extended periods.

Sources of Urban Contemporary Carbon Aerosol.
Final rept.
L. M. Hildemann, D. Klinedinst, G. A. Klouda, L. A. Currie, and G. R. Cass. 1994, 12p.
Pub. in Environmental Science and Technology 28, n9 p1565-1576 1994.

Keywords: *Aerosols, *Carbonaceous materials, *Air pollution sources, *Urban areas, Carbon, Carbon 12, Carbon 14, Fossil fuels, Particulates, Exhaust emissions, Anthropogenic sources, Air pollution sampling, Air pollutants, Los Angeles, Reprints, Emission inventories.

Emissions from the major sources of fine carbonaceous aerosol in the Los Angeles basin atmosphere have been analyzed to determine the amounts of the C-12 and C-14 isotopes present. From these measurements, an inventory of the fossil carbon and contemporary carbon particle emissions to the Los Angeles atmosphere has been created. Using a mathematical model for atmospheric transport, predictions are made of the atmospheric fine particulate fossil carbon and contemporary carbon concentrations expected due to primary source emissions. It is concluded that the high fraction of contemporary carbon measured historically in Los Angeles is not due to local emission sources of biogenic material; rather, it is due to a combination of local anthropogenic pollution sources and background marine aerosol advected into the city.

Limits of CO2 Monitoring in Determining Ventilation Rates.
Final rept.
A. K. Persily. 1994, 4p.
Pub. in TAB Jnl., p19-22 1994.

Keywords: *Carbon dioxide, *Ventilation, *Indoor air pollution, *Air pollution monitoring, Air infiltration, Air flow, Flow rates, Concentration(Composition), Concentration rates, Buildings, Reprints, ASHRAE Standard 62-1989.

The article is an attempt to reduce some of the confusion concerning the issues of ventilation, carbon dioxide (CO2), and ASHRAE Standard 62-1989 that has been evident in recent discussions of indoor air quality. The article presents a brief discussion of how indoor CO2 levels are related to ventilation rates, including the use of indoor concentration measurements to determine outdoor air flow rates. The role of carbon dioxide in Standard 62, specifically the significance of the 1,000 ppm guideline, is also discussed. The article primarily addresses mechanically ventilated office buildings, but many of the statements are also relevant to other building types.

Contract DE-AI01-91CE21042
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Indoor Air '93, Helsinki, Finland, July 4-8, 1993, p195-200.

Keywords: *Office buildings, *Ventilation, *Indoor air pollution, *Air infiltration, Air flow, Flow rates, Flow measurement, Air quality, Air intakes, Space HVAC systems, Reprints, Air change effectiveness.

Ventilation effectiveness measurements were made in two office buildings employing the age-of-air approach. The objective of these tests was to study the applicability of the associated tracer gas procedures in mechanically ventilated office buildings. Experimental issues were investigated including the ability to establish a uniform tracer concentration at the start of the test and the relationship of ventilation system configuration and system operation on the test procedure. The test results indicate good mixing of the ventilation air within the occupied space. In addition, experience was obtained with the measurement procedures that will assist the development of a standardized approach to measuring ventilation effectiveness in the field.

Keywords: *Air pollution monitoring, *Indoor air pollution, *Space HVAC systems, *Baseline measurements, Residential buildings, Air pollutants, Air intakes, Air infiltration, Air flow, Flow measurement, Ventilation, Air pollution control, Mathematical models, Computerized simulation.

NIST is performing whole building airflow and contaminant dispersal computer simulations with the program CONTAM93 to assess the ability of modifications of central forced-air heating and cooling systems to control pollutant sources relevant to the residential environment. The report summarizes the results of Phase II.A of this project, which consisted of three major efforts: baseline simulations of contaminant levels without indoor air quality (IAQ) controls, design of the IAQ control retrofits, and preliminary simulations of contaminant levels with the IAQ control retrofits. In Phase II.B of the study, all of the baseline cases will be modified to incorporate the IAQ control retrofits. The retrofit results will then be compared to the baseline results to evaluate the effectiveness of the retrofits.

Application of a Multizone Airflow and Contaminant Dispersal Model to Indoor Air Quality Control in Residential Buildings.
Final rept.
S. J. Emmerich, A. K. Persily, and G. N. Walton. 1994, 15p.
Pub. in Proceedings of the AIVC Conference (15th): The Role of Ventilation, Buxton, Great Britian, September 27-30, 1994, p493-507 1994.

Keywords: *Air flow, *Indoor air pollution, *Residential buildings, *Air quality, *Computerized simulation, Ventilation, HVAC systems, Air circulation, Air pollution control, Tracer studies, Contaminants, Reprints, *CONTAM93 model, Contaminant dispersal models, Multi-zone air flow.

A new multizone airflow and contaminant dispersal model CONTAM93 is described, along with a demonstration of its application in a study of ventilation and contaminant control in single-family residential buildings. While CONTAM93 is based on existing theory of network airflow analysis and contaminant dispersal, the model employs a unique graphic interface for data input and display. The interface uses a sketchpad to describe the connections between zones and icons to represent zones, openings, ventilation system components, and contaminant sources and sinks. The model, its graphic interface and plans for its further development are described. As a demonstration of the capabilities of CONTAM93, the paper describes a study of ventilation and contaminant control in eight single-family residential buildings. The overall objective of the effort is to study the impact of residential HVAC systems on indoor air quality (IAQ). This paper describes the study and the use of CONTAM93 to calculate whole building air change rates for a range of weather conditions and to simulate fan pressurization and tracer gas decay tests in the houses.

Measurements of Indoor Pollutant Emissions from EPA Phase II Wood Stoves.
S. J. Nabinger, A. K. Persily, K. S. Sharpless, and S. A. Wise. Feb 95, 68p, NISTIR-5575.
Sponsored by Consumer Product Safety Commission, Washington, DC. Directorate for Health Sciences.

Keywords: *Stoves, *Air pollution sampling, *Indoor air pollution, *Residential buildings, Polycyclic aromatic hydrocarbons, Particulates, Emission factors, Waste gases, Particle size, Air pollution monitoring, *Wood burning appliances.

Measurements of indoor pollutant emissions were made for four wood stoves meeting the U.S. Environmental Protection Agency (EPA) Phase II emission requirements in a 37 sq. m (400 sq. ft) test house at National Institute of Standards and Technology (NIST). The stoves were operated in a manner consistent with typical residential use and in accordance with the manufacturers' instructions. Three tests were conducted for each stove, with each test lasting approximately ten hours. During the tests some of the following quantities monitored included: combined gaseous and particulate phase concentrations of individual polycyclic aromatic hydrocarbons (PAH) averaged over the test period, including benzo(a)pyrene (BAP); and, indoor and outdoor air temperature and relative humidity. Based on these measurements, emission rates of the individual PAH compounds were determined for each test.

Computer Simulations of Airflow and Radon Transport in Four Large Buildings.
J. B. Fang, and A. K. Persily. Apr 95, 50p, NISTIR-5611.
Sponsored by Environmental Protection Agency, Washington, DC. Office of Air and Radiation.

Keywords: *Air flow, *Radon, *Indoor air quality, *Computerized simulation, Ventilation, Air infiltration, Air circulation, Radionuclide migration, Leakage, Flow rates, Air intakes, Space HVAC systems, Temperature measurement, Spatial distribution, Flow models.

Computer simulations of airflow and radon transport in four large buildings are performed using the multi-zone airflow and pollutant transport model CONTAM88. These buildings include a twelve-story multi-family residential building, a five-story mechanically ventilated office building with an atrium, a seven-story mechanically ventilated office building with an underground parking garage, and a one-story mechanically ventilated school building. Interzone airflow rates and radon concentrations are predicted in these buildings as a function of wind speed and direction, indoor-outdoor temperature difference, and ventilation system operation. Ventilation system factors that are studied include the operation of exhaust fans in the apartment

building and variations in the percent outdoor air intake in the office buildings. Simulations in the office buildings are also made with the ventilation systems off and with variations in the balance of the supply and return airflow rates.

New Mass Transport Elements and Components for the NIST IAQ Model.
J. W. Axley. Jul 95, 90p, NIST/GCR-95/676.
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD. Building Environment Div.

Keywords: *Indoor air pollution, *Air flow, *Air pollution dispersion, *Mathematical models, Aerosols, Particles, Air circulation, Environmental transport, Mass transport, Flow measurement, Contaminants, Filtration, Ventilation, Computerized simulation, Contaminant dispersal models.

This report presents new mass transport elements for the next generation of the NIST IAQ Model that may be used to model (1) homogenous (bulk-air) chemistry within well-mixed chamber, (2) aerosol mass transport within well-mixed chambers and fractional particle filtration in building filtration devices, and (3) heterogeneous (surface-related) physical processes and chemical transformations including those governing the behavior of gas-phase air cleaning devices. In an effort to maintain rigor, generality, and flexibility, each transport process is formulated in terms of the elemental mass transport step that together govern the overall process. In this way, the more complex processes may be represented as component equations that are assembled from fundamental element equations.

Indoor Air Quality Impacts of Residential HVAC Systems Phase II.B Report: IAQ Control Retrofit Simulations and Analysis.
S. J. Emmerich, and A. K. Persily. Sep 95, 94p, NISTIR-5712.
Sponsored by Consumer Product Safety Commission, Bethesda, MD.

Keywords: *Indoor air pollution, *Air pollution monitoring, *Air flow, *Space HVAC systems, Air infiltration, Air intakes, Flow measurement, Retrofitting, Residential buildings, Vents, Ambient air quality, Air pollutants, Ventilation systems, Heating systems, Computerized simulation, Graphs(Charts).

The National Institute of Standards and Technology (NIST) performed a preliminary study of the potential for using central forced-air heating and cooling system modifications to control indoor air quality (IAQ) in residential buildings. The objective of this effort was to provide insight into the use of state-of-the-art IAQ models to evaluate such modifications, the potential of these modifications to mitigate residential IAQ problems, the pollutant sources they are most likely to impact, and their potential limitations. This study was not intended to determine definitively whether the IAQ control options studied are reliable and cost-effective. The report summarizes the results on Phase II.B of this project, which consisted of three main efforts: computer simulations of contaminant levels with IAQ control retrofits, evaluation of the effectiveness of the IAQ control retrofits, and development of recommendations for future research.

EMISS: A Program for Estimating Local Air Pollution Emission Factors Related to Energy Use in Buildings: User's Guide and Reference Manual.
Final rept.
S. R. Petersen. Oct 95, 36p, NISTIR-5704.
Sponsored by Federal Energy Management Program, Washington, DC.

Keywords: *Emission factors, *Energy use, *Air pollution monitoring, Buildings, Energy consumption, Energy conservation, Heating systems, Regional analysis, Life cycle costs, Nitrous oxide, Sulfur dioxide, Carbon dioxide, Electric power, Distillates, Natural gas, Coal, Liquified natural gas, Residual fuels, Fossil fuels, Combustion, Sulfur content, User guides, EMISS computer program, End users.

EMISS is a computer program used to generate data files with regional or local air pollution emission factors for use with the Nist BLCC (Building Life-Cycle Cost) program. BLCC uses these emission factors to calculate air pollution emissions associated with energy use in buildings and reductions in those emissions attributable to energy conservation measures. Emission factors for fossil fuels can be regionalized or localized by specifying the percentage of sulfur in the fuel, the heating content of the fuel, and the end-use combustion process at the building site. A data base with state-specific electricity emission factors and U.S. average sulfur content of fossil fuels provides default data for use in setting up a regional emission factors file.

Analysis by a Combination of Gas Chromatography and Tandem Mass Spectrometry: Development of Quantitative Tandem-in-Time Ion Trap Mass Spectrometry: Isotope Dilution Quantification of 11-Nor-Delta-9-Tetrahydro cannabinol-9-Carboxylic Acid.
Final rept.
C. S. Phinney, and M. J. Welch. 1995, 5p.
Pub. in Rapid Communications in Mass Spectrometry, v9 p1056-1060 1995.

Keywords: *Toxic substances, *Mass spectrometers, Reprints, Sampling, Organic compounds, Quantitative analysis, *Drug analysis, Tandem Mass Spectrometry.

Collision-induced dissociation (CID) was performed in an ion-trap mass spectrometer to investigate quantification by isotope dilution and gas chromatography coupled with tandem mass spectrometry (GC/MS/MS). The operating system software was modified to allow simultaneous CID of two ions differing only slightly in mass/charge ratios. Simultaneous excitation of the base peaks of the parent compound and its deuterated analog in a co-eluting GC peak leads to quantitative and reproducible formation of daughter ions. Changing conditions in the mass analyzer as the GC peak elutes required broadening of the CID excitation frequency pattern. This had to be done so that relatively uniform dissociation energy would be imparted to both parent ions during the concentration changes associated with the elution of a GC peak. A commonly measured human metabolite of marijuana, 11-nor-delta-9-tetrahydro cannabinol-9-carboxylic acid, was analyzed in freeze-dried urine. The mean value, 14.0 equal to or greater than 0.61 (1 standard deviation) ng/mL, agrees very well with the GC/MS mean measured value of 14.1 equal to or greater than 0.45 ng/mL. The overall coefficient of variation for the individual ion-trap MS/MS sample measurements is 4.3%.

Few Caveats on Carbon Dioxide Monitoring.
Final rept.
A. P. Persily. 1994, 4p.
Pub. in Indoor Air Quality Jnl., v1 n4 p22-25 1994.

Keywords: *Carbon dioxide, *Air pollution monitoring, *Indoor air pollution, Commercial buildings, Ecological concentration, Air flow, Air circulation, Ventilation systems, Space HVAC systems, Tracer techniques, Errors, Reprints.

While techniques exist to relate indoor carbon dioxide concentrations to building ventilation, they are not as simple as sometimes suggested. Some of the techniques can yield reliable results when used correctly, while others can result in serious errors. Using any of these approaches requires that one understands the technique and the following factors are considered: the outdoor carbon dioxide concentration; the number of people in the building and the rate at which they generate carbon dioxide; variations in the number of occupants within the building and over time; variations in the carbon dioxide concentration within the building; the measurement uncertainty of the carbon dioxide monitor being used; ventilation system operation prior to and during the measurements; and, indoor sources of carbon dioxide other than the occupants.

As part of the United States Environmental Protection Agency's Integrated Air Cancer Project, air particulate matter samples collected in Boise, ID, were analyzed by gas chromatography with mass spectrometric detection (GC-MS) and apportioned between their two main sources: residential wood combustion (RWC) and motor vehicle (MV) emissions. The technique used for distinguishing the source contributions involved comparison of the concentration of 1,7-dimethylphenanthrene (1,7-DMP), a polycyclic aromatic hydrocarbon (PAH) emitted primarily by burning soft woods (e.g., pines), with that of a PAH emitted in modest concentrations by both RWC and MV sources, 2,6-dimethylphenanthrene (2,6-DMP). These results were then compared with the mean 1,7-DMP/2,6-DMP ratio of 48 samples collected in a roadway tunnel, with any enrichment in the Boise sample ratios over the mean tunnel ratio attributable to the RWC source. These resulting RWC contributios were compared with fraction RWC results obtained by radiocarbon measurements (C-14/C-13) of the same extracts from Boise, with generally good correlations between the two techniques observed, suggesting that the methods are comparable when used to distinguish emissions of MVs from RWC of soft woods.

precipitators, Filters, Heat recovery, Ventilators, Air intakes, Dampers, Reprints.

The impact of central forced-air heating and cooling system modifications on the levels of selected pollutants in single-family houses was evaluated by simulating pollutant concentrations due to a variety of sources in eight houses with typical HVAC systems. Simulations were performed with a multizone airflow and pollutant transport model and were repeated with the systems modified to include an electrostatic particulate filter, a heat recovery ventilator, and an outdoor air intake damper. The system modification reduced the pollutant levels in the houses for some cases; however, the results also demonstrated potential limitations in both the simulation method and the performance of the devices.

The reduction in chlorofluorocarbon (CFC) and hydrochlorofluorocarbon (HCFC) production and the scheduled phase-out of these ozone depleting refrigerants requires the development and determination of environmentally safe refrigerants for use in heat pumps, water chillers, air conditioners, and refrigerators. Azeotropic mixtures are attractive as alternative refrigerants because they behave very nearly as pure materials. A simple correlative scheme that allows one to judge whether or not an azeotrope is likely in a binary refrigerant mixture is discussed. This paper presents laboratory and computer simulation model evaluation of two of the azeotropic refrigerant mixtures which are identified, HFC-134a (1,1,1,2-tetrafluoroethane) with R-C290 (Propane) and HFC-134a with R-600a (Isobutane), in a generic heat pump apparatus. A third azeotropes mixture, HFC-134a with R-C290 (Cyclopropane) is examined by computer simulation only.

The paper describes the relationship of indoor CO2 concentrations to building air quality and ventilation, with a focus on how CO2 can be used to evaluate air quality and ventilation performance. While CO2 concentrations do not provide a comprehensive indication of indoor air quality, they can be used to assess the acceptability of a space in terms of human body odor. Also, under some circumstances, CO2 can be used to evaluate building ventilation, specifically air change rates and percent outdoor air intake.

Sponsored by National Fire Protection Association, Quincy, MA.

Keywords: *Carbon monoxide, *Air pollution dispersion, *Residential building, *Indoor air pollution, Air circulation, Ventilation, Air flow, Flow rates, Diffusion models, Rooms, Air pollution monitoring, Tracer techniques, Detection, Exposure, Environmental engineering, Computerized simulation, Literature surveys.

While the use of CO detectors can decrease the likelihood of exposure to such CO levels, questions exist concerning the installation of these devices in residential buildings, primarily with regards to the location and number of detectors. A literature review and technical analysis was conducted to assess information on CO dispersion in residential buildings that could support the development of guidance on detector installation. The review covered a number of issues including CO concentration measurements in residential buildings, sources of indoor CO, mixing within and between rooms, tracer gas techniques for assessing building airflow, and computer models of air movement and contaminant dispersal in buildings. The material obtained in the literature review is discussed, and a technical analysis of the issues related to CO dispersion in residential buildings is presented.

Pub. in Indoor Air '96, International Conference on Indoor Air Quality and Climate (7th), Nagoya, Japan, July 21-26, 1996, v2 p109-114.

Keywords: *Office buildings, *Phenols, *Floors, *Indoor air pollution, Epoxy resins, Emissions, Building materials, Chemical analysis, Physical properties, Reprints, Volatile organic compounds.

It was hypothesized that phenol emissions from an epoxy floor-leveling material were the source of the complaints. A materials-science based study was performed to ascertain whether phenol, or any other volatile organic compounds, was being emitted from the floor-leveling material. The chemical composition and physical properties of the leveling material were determined using a variety of analytical procedures typical of a materials-science based approach. It was concluded that the floor-leveling material contained phenol, and that the measured concentrations ranged from 0.25% to 0.52% of the material's mass.

Issues in the Field Measurement of VOC Emission Rates.
Final rept.
A. K. Persily. 1996, 6p.
Pub. in Indoor Air '96, International Conference on Indoor Air Quality and Climate (7th), Nagoya, Japan, July 21-26, 1996, v2 p49-54.

Keywords: *Emissions, *Indoor air pollution, *Air pollution monitoring, Ecological concentration, Mass balance, Absorption, Desorption, Design analysis, Computerized simulation, Reprints, *Volatile organic compounds.

The measurement of VOC emission rates in the field can be valuable in indoor air quality research, in evaluations of the indoor air quality impacts of design, and in the diagnosis of indoor air quality problems. The paper reviews the mass balance theory employed in field measurements of VOC emission rates. Some concerns associated with these measurements are dis-

cussed including the assumption of equilibrium VOC concentrations and the neglect of adsorption and desorption of VOC on building surfaces. Computer simulations are described that provide an order-of-magnitude assessment of the impacts of these issues.

Pub. in Environmental Science and Technology, v30 n4 p1098-1105 Jun 96.

Keywords: *Carbon 14, *Natural emissions, *Air pollution sampling, *Biomass, Air pollution sources, Ozone, Precursors, Ecological concentration, Atmospheric chemistry, Photochemistry, Urban areas, Photochemical reactions, Data quality, Quality control, Reprints, *Volatile organic compounds, Atlanta(Georgia).

The radiocarbon C-14 abundance of atmospheric volatile organic compounds (VOC) gives a quantitative estimate of contributions from biomass and fossil-mass sources, important information for effective regulation of ozone precursors. The authors report the details of a methodology to perform such measurements and the first exploratory C-14 results on VOC fractions separated from two composited urban tropospheric air samples, collected during the summer (1992) in Atlanta, GA. The results of these experiments, designed to (1) evaluate the entire C-14 VOC measurement process and (2) obtain reliable estimates of biogenic contributions to atmospheric VOC, emphasize how important controls are throughout this multi-step chemical process to ensure quality data.

Sponsored by Navy Health Sciences Education and Training Command, Bethesda, MD.
Pub. in Health Physics 65, n2 p131-140 1993.

Keywords: *Radiation accidents, *Occupational safety and health, *Radiation injuries, *Industrial medicine, *Accident investigations, Industrial accidents, Occupational exposure, Radiation dosage, Partial body irradiation, Accelerators, Biological radiation effects, Radiation heating, Materials processing reactors, Reprints.

On 11 December 1991, a radiation overexposure occurred at an industrial radiation facility in Maryland. The radiation source was a 3-MV potential drop accelerator designed to produce high electron beam currents for materials-processing applications. During maintenance on the lower window pressure plate, an operator placed his hands, head, and feet in the beam. This was done with the filament voltage of the electron source turned 'off,' but with the full accelerating potential on the high voltage terminal. The operator's body, especially his extremities and head, were exposed to electron dark current. In an attempt to reconstruct the accident, radiochromic film and alanine measurements were made with the accelerator operated at two beam currents. Electron paramagnetic resonance spectrometry, which measures the concentration of radiation-induced paramagnetic centers in calcified tissues, was used to estimate the dose to the victim's extremities.

Measurement and Determination of Radon Source Potential: A Literature Review.
A. B. Tanner. Apr 94, 199p, NISTIR-5399.

Keywords: *Radon, *Air pollution sources, *Indoor air pollution, Natural radioactivity, Radium, Soil gases, Soil-structure interactions, Radionuclide migration, Mapping, Buildings, Diffusion, Permeability, Flow rates, Site characterization, Foundations, Construction materials, Regional analysis, Soil tests, Activity levels.

Radon source potential may be estimated for areas of a nation, state, county, housing development, or building lot. The critical characteristics of the soil are its radium concentration, emanation coefficient, permeability to gas, and diffusion coefficient for radon under typical conditions. This report summarizes and evaluates available information on radon potential mapping and site-specific characterization. More than 100 reports have been found that bear on radon potential mapping, and indicate fair to good agreement with indoor radon results where correlations have been possible.

Expansion of Cementitious Materials Exposed to Sulfate Solutions.
Final rept.
J. R. Pommersheim, and J. R. Clifton. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v333 p363-368 1994. Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Cements, *Concretes, *Radioactive waste disposal, *Environmental effects, *Sulfates, *Low-level radioactive wastes, Underground storage, Construction materials, Environmental protection, Degradation, Exposure, Diffusion, Crack propagation, Reprints.

Disposal of low-level radioactive waste in concrete vaults buried underground is being considered in the United States and a potentially significant degradation process is sulfate attack. The results of experimental studies and of modeling of the kinetics of sulfate attack of cement-based materials are given. It was concluded that the expansion process involves a two-stage mechanism. The first stage is likely to be diffusion controlled and the second stage appears to be acceleratory due to the development and spread of cracks.

Pub. in Radiation Protection Dosimetry, v63 n3 p181-188 1996.

Keywords: *Dosimeters, *Electrets, *Environmental monitoring, Ionization chambers, Radiation measuring instruments, Dielectrics, Thermoluminescent, Reprints.

During each quarter of 1991 electret ion chambers, (nai)LiF(6)LiF, and (7)LiF thermoluminescence dosimeters, all integrating ionizing radiation monitors, were placed at a location in the grounds of the National Institute of Standards and Technology. One group was exposed to the total ambient field, while a second group was sealed for testing a method of protection against radon gas instrusion. A high-pressure ion chamber at the same location provided another measure of the field. Simultaneously with the environmental response test, other sealed and unsealed groups of electret ion chambers and thermoluminescence dosemeters were exposed during each quarter to discrete exposures from calibrated sources of (60)Co and (137)Cs. All responses were evaluated at the end of each quarter. The results indicated that the electret ion chamber gave results comparable to thermoluminescence dosemeters for routine environmental monitoring. No significant difference was found for any monitor type when sealed results were compared with unsealed results.

This report, prepared for the U. S. Department of Transportation, contains background information useful in evaluating the performance of plastic packagings for hazardous materials transportation, insofar as mechanical properties are concerned. Current DoT regulations and test methods are reviewed, as well as testing procedures from other organizations and countries. Also included are recommendations to modify current DoT regulations to make test methods more quantitative Finally, experimental data are presented which represent the initial stage of a study it is hoped will ultimately lead to the establishment of criteria upon which the long time behavior of plastic containers can be predicted based on short time tests. Pub. in Pure and Applied Chemistry 63, n10 p1415-1418 1991.

Keywords: *Municipal wastes, *Calorific value, *Heat of combustion, *Heat measurement, Solid wastes, Calorimeters, Performance evaluation, Sample preparation, Reprints.

A study has been carried out to establish the limits of reliability of the calorific content of municipal solid waste (MSW) by the bomb calorimetric procedure currently used in commercial test laboratories. This procedure involves using gram-size samples derived from MSW that have been processed down to a particle size of 2 mm or less. Critics argue that one cannot sample a multi-ton quantity of MSW and extract gram-size samples which are representative of the entire gross sample. They argue further that processing down to 2 mm or less significantly alters the composition of the sample. In order to test the bomb calorimetric procedure, a multi-kg capacity combustion flow calorimeter was designed and constructed for the determination of the enthalpies of combustion of kilogram-size samples of MSW in flowing oxygen near atmospheric pressure.

Bioleaching of Cobalt from Smelter Wastes by 'Thiobacillus ferrooxidans'.
Final rept.
G. J. Olson, C. K. Sakai, E. J. Parks, and F. E. Brinckman. 1990, 4p.
Pub. in Jnl. of Industrial Microbiology 6, n1 p49-52 Sep 90.

Keywords: *Waste treatment, *Materials recovery, *Cobalt, *Biological treatment, *Leaching, Microorganisms, Smelting, Mattes, Solubility, Reprints, Thiobacillus ferrooxidans.

The bioleaching of cobalt from domestic, industrial smelter wastes was studied. Thiobacillus ferrooxidans solubilized Co from sulfidic dross furnace mattes. At pulp densities of 4%, up to 600 mg of Co per liter of leaching solution was released from nickel matte, corresponding to removal of about two-thirds of the original amount of Co in the matte. Bioleaching methods may be useful as a component of a process for solubilization and recovery of Co from sulfidic smelter mattes.

NIST Standard Reference Materials (SRMs) for Polychlorinated Biphenyl (PCB) Determinations and Their Applicability to Toxaphene Measurements.
Final rept.
M. M. Schantz, R. M. Parris, and S. A. Wise. 1993, 8p.
Pub. in Chemosphere 27, n10 p1915-1922 1993.

Keywords: *Polychlorinated biphenyls, *Pesticides, *Environmental surveys, *Chemical analysis, *Toxaphene, *Water pollution detection, Chlorine organic compounds, Water pollution effects, Marine environments, Rivers, Sediments, Air pollution detection, Dust, Interlaboratory comparisons, Marine biology, Reprints, *Standard reference materials, SRM 1588, SRM 1939, SRM 1941, SRM 1974, SRM 1945, SRM 1649.

In the past five years the National Institute of Standards and Technology (NIST) has developed several Standard Reference Materials (SRMs) to assist in the validation of measurements of polychlorinated biphenyl (PCB) congeners and chlorinated pesticides in environmental samples. The following natural matrix SRMs have been issued: SRM 1588, Organics in Code Liver Oil; SRM 1939, PCB Congeners in River Sediment; SRM 1941, Organics in Marine Sediment; SRM 1974, Organics in Mussel Tissue (Mytilus edulis); and SRM 1945, Whale Blubber. Recently, SRM 1649 has been analyzed for selected PCB congeners and chlorinated pesticides. Toxaphene measurements have not been made at NIST for these SRMs; however, these SRMs represent the environmental matrices that are typically analyzed for toxaphene. Recommended values for toxaphene concentrations could be established on any of these materials through interlaboratory comparison exercises involving laboratories experienced in making toxaphene measurements. In this paper we describe these SRMs and discuss their suitability as potential reference materials for toxaphene measurements.

Keywords: *Oil spills, *Fire tests, *In situ combustion, *Burning rate, Crude oil, Combustion properties, Combustion kinetics, Oil-water interfaces, Plumes, Particulates, Oil pollution control, Water pollution control, Reprints, Smoke yield.

A series of six mesoscale and one large laboratory fire experiments were performed to measure the burning characteristics of Louisiana crude oil on water in a pan. Results of the measurements for burning rate and smoke emissions are compared to those from previous burns of various scales. Predictions of smoke plume trajectory and particulate deposition at ground level from the Large Eddy Simulation (LES) model developed as part of this research effort are presented. LES is a steady-state three-dimensional calculation of smoke plume trajectory and smoke particulate deposition based on a mixed finite difference and Langrangian particle tracking method.

A novel p,p-cyanobiphenyl stationary phase (p-cyanobiphenyl, p-allyloxy methlpolysiloxane) has been evaluated for the GC investigation of polychlorinated biphenyls (PCBs). Several PCB congeners which coelute on the phases typically used for PCB analysis (e.g. 5% phenyl methylpolysiloxane) are separated on the p,p-cyanobiphenyl phase, including the hexachlorobiphenyl congers PCB 163, PCB 164, and PCB 138. In this work, a p,p-cyanobiphenyl stationary phase was used to measure selected PCB congeners in two Standard Reference Materials (SRMs) available from the National Institute of Standards and Technology (NIST), and two Certified Reference Materials (CRMs) available from the Community Bureau of Reference (BCR). The materials analyzed were SRM 1588, Organics in Cod Liver Oil; SRM 1945, Organics in Whale Blubber; CRM 349, Chlorobiphenyls in Cod Liver Oil; and CRM 350, Chlorobiphenyls in Macherel Oil. Concentrations are reported for several PCB congeners which coelute on the 5% phenyl methylpolysiloxane, including PCB 163 and PCB 164.

Four different analytical techniques were used for the determination of polycyclic aromatic hydrocarbons (PAHs) in a new marine sediment reference material, SRM 1941 a, Organics in Marine Sediment. These procedures were based on reversed-phase liquid chromatography (LC) with fluorescence detection, a multidimensional LC procedure, and gas chromatography/mass spectrometry on two stationary phases with different selectivity for the separation of PAH isomers. The results from these four aproaches were in good agreement and were combined to provide certified concentrations for 23 PAHs, which represents the largest number of certified concentrations for PAHs in any natural matrix SRM.

Keywords: *Oil spills, *In situ combustion, *Smoke, *Plumes, Atmospheric diffusion, Burning rate, Emulsions, Particulates, Combustion kinetics, Combustion properties, Crude oil, Oil pollution control, Water pollution control, Field tests, Fire tests, Comparison, LES(Large Eddy Simulation).

In the present report, experimental data collected at two sets of mesoscale burns are compared with the results of the LES model run using the recorded meteorological and physical conditions. The two experiments are the Newfoundland Offshore Burn Experiment (NOBE), Aug. 1993, and the Alaska Clean Seas Burning of Emulsions, Sept. 1994. Each series of burns was conducted under different conditions, and different data collection techniques were employed at each. The results show that the predictions of the LES model are in good agreement with the experimental measurements, given the uncertainty if the input parameters.

The National Biomonitoring Specimen Bank (NBSB), a collaborative project of several U.S. government agencies, includes marine mammal tissues collected for the Alaska Marine Mammal Tissue Archival Project (AMMTAP) and the National Marine Mammal Tissue Bank (NMMTB). Tissues were collected from 139 animals representing 13 species of marine mammals from around the U.S. Recently, concentrations for up to 30 elements in liver tissues of nine long-finned pilot whales (Globicephala melas), six harbors porpoises (Phocoena phocoena), and four white-sided dolphins (Lagenorhyunchus acutus) from the NMMTB were measured using instrumental neutron activation analysis. Results from analysis of these tissues are presented, compared with results for liver tissues from other marine mammals from the AMMTAP, and compared with published values.

Relationship of Silver with Selenium and Mercury in the Liver of Two Species of Toothed Whales (Odontocetes).
Final rept.
P. R. Becker, E. A. Mackey, R. Demiralp, B. J. Koster, S. A. Wise, R. Suydam, and G. Early. 1995, 10p.
Pub. in Marine Pollution Bulletin, v30 n4 p262-271 1995.

Keywords: *Bioaccumulation, *Marine mammals, *Water pollution effects(Animals), Liver, Mercury, Selenium, Silver, Reprints, *Foreign technology, *Instrumental neutron activation analysis, Pilot whale, Beluga whale.

Liver specimens archived in the National Biomonitoring Specimen Bank from beluga whales, Delphinapterus leucas, and from Alaska and pilot whales, Globicephala melas, from the North Atlantic were analysed for silver, selenium and total mercury. Silver concentrations in beluga whales were one to three orders of magnitude higher than the concentrations in pilot whales and those reported elsewhere for the other marine mammals. The concentrations of silver in the livers of beluga whales were the same or in some instances higher than the concentrations of selenium or mercury. Like mercury, silver was positively correlated with selenium in both pilot and beluga whales. This suggests a possible role for selenium in the accumulation and storage of silver in both species of whales, and raises questions about the potential for silver at such high concentrations to affect radical-scavenging enzyme systems in these marine mammals.

Keywords: *Oil spills, *In situ combustion, *Atmospheric diffusion, *Combustion products, Smoke, Plumes, Particulates, Atmospheric transport, Burning rate, Combustion kinetics, Oil pollution control, Fire tests, Reprints.

There is growing interest in the environmental consequences of large fires, since the transport of combustion products by a windblown fire plume can distribute potentially hazardous materials over a wide area. Pools of burning oil and other petroleum products are of particular concern due to the vast flow of these materials through the global economy and because of the fragility of the environment in many regions where oil is extracted or transported. The present work is part of a larger study of a closely related issue, the feasibility of cleaning up oil spills on water through burning.

The National Oceanic and Atmospheric Administration's (NOAA) National Status and Trends (NS&T) Program monitoring components, the National Benthic Surveillance and Mussel Watch Projects, have archived tissues and sediments in a specimen bank since 1985 and 1986, respectively. Additional samples were archived after the Exxon Valdez oil spill in Prince Williams Sound, Alaska. Samples from the Environmental Protection Agency's Mussel Watch Program, collected from 1976 to 1978, were added to the NS&T Specimen Bank in 1992. Contaminant analyses were performed to provide additional data on environmental quality and to ensure that data existed for sample stability studies. Samples in the NS&T Specimen Bank are available for retrospective analyses should a contaminant or group of contaminants be identified that was introduced into the environment during the years of the NS&T Program or during the EPA's Mussel Watch Program but that were not previously measured.

Laser Doppler Velocimeter Studies of the Pipeflow Produced by a Generic Header.
Technical note.
T. T. Yeh, and G. E. Mattingly. Apr 95, 79p, NIST/TN-1409.
Also available from Supt. of Docs.

Keywords: *Flow measurement, *Flow meters, Fluid flow, Installation effects, LDV, Header flow.

The report presents recent results obtained in a consortium-sponsored research program on flowmeter installation effects being conducted at NIST-Gaithersburg, MD. The piping element tested and reported here is generic header which has a specific arrangement of one inlet and two outlets. LDV velocity measurements are reported for the pipeflows produced downstream of the header with and without a conventional 19-tube concentric tube bundle flow conditioner. The results indicate that the secondary flow produced by the generic header is very similar to that produced by the closely-coupled double elbows out-of-plane piping configuration. The axial velocities are slower than the ideal flow near the pipe center and higher near the walls. Transverse velocity distributions show a very strong swirl eddy flow pattern produced by this header. This swirl eddy is relatively stable and organized and its dissipation is slower than that observed for the double elbows out-of-plane. The 19-tube tube bundle is quite effective in reducing the transverse velocities associated with the energetic, swirl flow from this header. Several profile indexes are introduced and presented for the header flow to characterize its swirl, profile peakness and flow displacements. These indexes can also be used to develop criteria for improving flow meter performance in the outlet piping from this header.

Simple Method of Composition Shifting with a Distillation Column for a Heat Pump Employing a Zeotropic Refrigerant Mixture.
P. I. Rothfleisch. Jul 95, 30p, NISTIR-5689.
Sponsored by Department of Energy, Washington, DC. Building Equipment Div. and Environmental Protection Agency, Research Triangle Park, NC. Air and Energy Engineering Research Lab.

Keywords: *Refrigerants, *Air conditioning equipment, *Heat pumps, Refrigerating, Chemical composition, Distillation, Columns(Process engineering), Zeotropic mixtures.

The work presents a simplified method of controlling heat pump capacity by shifting the composition of a zeotropic refrigerant mixture with a distillation column. Simplicity is achieved by incorporating the distillation column into the typical suction accumulator used by residential heat pumps. A U.S. patent has been applied for under the title Accumulator Distillation Insert for Zeotropic Mixtures. An experimental system employing this distillation concept has been evaluated in the laboratory for zeotropic mixtures of R32/134a (30/70) and R32/125/134a (23/25/52). For the binary mixture the circulating refrigerant composition was shifted to R32/134a (54/46). For the ternary mixture the circulating refrigerant composition was shifted to R32/125/134a (36/36/28).

Effects of Nonmodel Errors on Model-Based Testing.
Final rept.
G. N. Stenbakken. 1995, 5p.
Pub. in Proceedings of Instrumentation and Measurement Technology Conference, Waltham, MA., April 24-26, 1995, p38-42.

Keywords: *Confidence intervals, Simulation, Testing, Empirical modeling, Reprints, *Nonmodel errors, Prediction intervals.

In previous work, methods have been developed for efficient testing of components and instruments that are based on models of these units. These methods allow for the full behavior of these units to be predicted from a small but efficient set of test measurements. Such methods can significantly reduce the testing cost of such units by reducing the amount of testing required. But these methods are valid only as long as the model accurately represents the behavior of the unit. Previous papers on this subject described many methods for developing accurate models and using them to develop efficient test methods. However, they gave little consideration to the problem of testing units which change their behavior after the model has been developed, for example, as a result of changes in the manufacturing process. Such changed behavior is referred to as nonmodel behavior or nonmodel error. When units with this new behavior are tested with these more efficient methods, their predicted behavior can show significant deviations from their true behavior. This paper describes how to analyze the data taken at the reduced set of measurements to estimate the uncertainty in the model predictions, even when the device has significant nonmodel error. Results of simulation are used to verify the accuracy of the estimates and to show the expected.

Enhancement of R123 Pool Boiling by the Addition of N-Hexane.
M. A. Kedzierski. Mar 96, 45p, NISTIR-5780.
See also PB96-128129. Sponsored by Department of Energy, Washington, DC.

Keywords: *Pool boiling, Hexanes, Heat transfer, Thermal conductivity, Surface treatment, Heat flux, Mixtures, Natural convection, Thermodynamic properties, Performance tests, *N-hexane, *R-123 refrigerant.

The paper presents the heat transfer data used to file international patent WO 94/18282. The data consisted of pool boiling performance of a GEWA-T(trademark) surface for three fluids: (1) pure R123, (2) R123/n-hexane (99/1), and (3) R123/n-hexane (98/2). The heat flux and the wall superheat were measured for each fluid at 277.6 K. The observations were used to describe various boiling modes on the GEWA-T(trademark) surface. The addition of hexane to pure R123 caused a simultaneous reduction in the bubble diameter and increase in the site density. The increase in site density enhanced the boiling despite the reduction in bubble size. Presumably, the site density enhancement was caused by a layer enriched in hexane at the heat transfer surface. The addition of hexane to R123 also improved natural convection.

Theoretical Evaluation of the Vapor Compression Cycle with a Liquid-Line/Suction-Line Heat Exchanger, Economizer, and Ejector.
P. A. Domanski. Mar 95, 41p, NISTIR-5606.

Keywords: *Air conditioning, *Ejectors, *Heat exchangers, Refrigeration, Heat transfer, Feedwater heaters, Efficiency, *Vapor compression cycle, Liquid-line/suction-line heat exchange.

The report presents a theoretical analysis of three vapor compression cycles which are derived from the Rankine cycle by incorporating a liquid-line/suction-line heat exchanger, economizer, or ejector. These addendums to the basic cycle reduce throttling losses using different principles, and they require different mechanical hardware of different complexity and cost. The theoretical merits of the three modified cycles were evaluated in relation to the reversed Carnot and Rankine cycle. Thirty-eight fluids were included in the study using the Carnahan-Starling-DeSantis equation of state. In general, the benefit of these addendums increases with the amount of the throttling losses realized by the refrigerant in the Rankine cycle.

PC-Based Spinning Rotor Gage Controller.
Final rept.
J. P. Looney, F. G. Long, D. F. Browning, and C. R. Tilford. 1994, 8p.
Pub. in Review of Scientific Instruments 65, n9 p3012-3019 Sep 94.

Keywords: *Pressure measurement, *Vacuum gages, *Rotor dynamics, Vacuum apparatus, Measuring instruments, Rotors, Signal processing, Data analysis, Controllers, Reprints, *Spinning rotor gage controllers.

The spinning rotor gage (SRG) is a molecular drag vacuum gage. Commercial versions are available that operate between about 10(exp -4) and 1 Pa. In this paper we describe the design, and present performance data for a new SRG controller that uses a plug-in peripheral board and a personal computer (PC) to perform all control, signal processing, and data analysis functions. This controller offers several advantages over those presently available, including the simultaneous operation of multiple SRGs (at least four SRGs with a single PC), complete software control of all operating parameters, and significantly improved low-pressure performance.

Keywords: *Data processing equipment, *Fire protection, *Sprinkling, Fire fighting, Drops(Liquids), Size determination, Spraying, Nozzle geometry, Concentration(Composition), Velocity distribution, Fire extinguishing agents, Electronic equipment, *Fine water sprays, Halon 1301.

The major objective of the work presented here has been to determine how a fine water spray compares to a gaseous agent in extinguishing fires in data processing equipment, an environment typically protected by halon 1301. A scaled-down, generic electronics package was designed and a chamber built to contain the water spray to emulate the physical system of interest. The mock electronics cabinet is 0.5 m wide, 0.2 m deep and 0.4 m high. The fuel is a 3 mm thick plate of poly(methyl methacrylate), placed vertically in an aluminum frame centered among a number of aluminum circuit boards. The limitations imposed by the different transport phenomena associated with droplet versus gas dispersion have been investigated. The influence on extinguishing efficiency of the nozzles geometry, the location relative to the fire, the water application rate, and the amount of shielding surrounding the fire within the simulated cabinet are all parameters which have been examined. A gaseous agent, CF3H is used for comparison. A phase-Doppler particle analyzer measured the droplet size distribution and velocity. The water pressure has a significant effect on the size of the region in which a fire can be effectively suppressed. By contrast, similar fires in all geometric configurations can be successfully extinguished with CF3H as long as the concentrations in the chamber are close to those recommended in NFPA 2001.

Keywords: *Fire detection systems, *Research and development, *Meetings, Technology assessment, Smoke, Fire safety.

A workshop was convened February 6 and 7, 1995, to indentify the needs of users and specifiers of fire detection systems which are not currently being met by the U.S. fire protection industry. A series of experts from industry, government, certifying organizations and academia were invited to review the various applications for fire detection systems and to discuss recent development that could impact the future of the industry. The speakers were divided into focused panels of users and specifiers, systems and components manufactureres, regulators and certifiers, and researchers. Small working groups were convened after the panel discussions to identify critical research issues, concentrating on sensors, signal processing, systems integration and regulations.

On 11 December 1991, a radiation overexposure occurred at an industrial radiation facility in Gaithersburg, Maryland. During maintenance on the lower window pressure plate, an operator placed his hands, head, and feet in the beam. The operator's body, especially his extremities and head, were exposed to electron dark current. After prolonged periods of inactivity, particularly after the vacuum in the accelerator tube is lost, an electron beam current can be present even if the electron filament is cold or dark.

Keywords: *Pyrometers, Optical properties, Conversion, Emissivity, Tables(Data), *Temperature measurement.

The table of corrected optical pyrometer readings enables optical pyrometer users to convert observed temperature immediately to the true temperature, if the effective emissivity of the material being observed is known. The table gives observed temperatures from 1,000 to 3,000 K in increments of 5 degrees, from 3,000 to 5,000 K in increments of 10 degrees, from 5,000 to 10,000 K in increments of 50 degrees, and from 10,000 to 39,900 K in increments of 100 degrees. For these, true temperatures are tabulated for 49 emissivities ranging from 0.02 to 0.98 in increments of 0.02. These calculations were made on a 650 electronic computer using Planck's law, and the value c sub 2 =1,438 cm deg for the radiation constant.

Keywords: *Densimeters, Design, Pressure Measurement, Temperature Measurement, Thermostats, Volume, EDB/440500.

A dual-sinker densimeter to very accurately measure the pressure-volume-temperature (P-V-T) properties of fluids over a temperature range of 80 K to 520 K and at pressures up to 35 MPa is in the final stages of development at NIST. The density of a fluid is determined by measuring the difference in the buoyancy forces experienced by two sinkers of identical mass, surface area, and surface material, but very different volumes. The buoyancy forces on the sinkers are transmitted to a semi-microbalance by means of a magnetic suspension coupling. This paper reviews the principle of the measurement and describes the overall design of the system.

Contract AI01-90EW50009
Sponsored by Department of Energy, Washington, DC.

Keywords: *Measuring Instruments, Communications, Equipment Interfaces, Meetings, Standards, EDB/426000.

This Workshop was organized similarly to the previous meeting. After a presentation on Instrument Interfacing, three of the four Working Groups met individually. The Strategic Planning Committee did not meet at this Workshop, but it held a meeting in April; the minutes of that meeting are included. The Physical link and Transport Committee has defined the requirements for the link connecting modules to their controller, examined a new ASTM standard for low-level communication, and is determining what fits into to the various layers of the ISO model. The Module Requirements Group has proposed a process control model, has defined the core functionality, and has listed the requirements for a Standard Laboratory Module. The Software Engineering Group proposed that a document detailing the CAALS Modularity Architectural Specification be prepared and presented a working outline. The future structure and charters of the committees and the decision making criteria of the Workshop itself were questioned. These items will be examined in greater detail at the next Workshop.

The major aim of the NIST Standard Reference Data Program (SRD) is to provide critically evaluated numeric data to the scientific and technical community in a convenient and accessible form. A second aim of the program is to provide feedback into the experimental and theoretical programs to help raise the general standards of measurement. By communicating the experience gained in evaluating the world output of data in the physical sciences, NIST/SRD helps to advance the level of experimental techniques and improve the reliability of physical measurements.

The 78th Annual Meeting of the National Conference on Weights and Measures (NCWM) was held July 18 through 22, 1993, at the Ritz-Carlton Hotel, Kansas City, Missouri. The theme of the Meeting was 'Excellence Through Standards'. Reports by the standing and annual committees of the Conference comprise the major portion of the publication, along with the addresses delivered by Conference officials and other authorities from government and industry. Special meetings included those of the Metrologists, the Associate Membership Committee, the Retired Officials Committee, the Scale Manufacturers' Association, the American Petroleum Institute, the Industry Committee on Packaging and Labeling, the regional weights and measures associations, the National Association of State Departments of Agriculture Weights and Measures Division and the National Council on State Metrication.

The National Institute of Standards and Technology (NIST) has adopted a new policy for the expression of measurement uncertainty, effective 1 January 1994, that is consistent with recommendations from the Comite International des Poids et Mesures. Using this new method of expressing uncertainties, this paper gives the expanded uncertainties for NIST-calibrated resistance thermometers (from 0.65 K to 1234.93 K) that are suitable as either defining interpolating devices of the International Temperature Scale of 1990 (ITS-90) or as scale transfer thermometers.

Comparison of Finite Element and Analytic Calculations of the Resonant Modes and Frequencies of a Thick Shell Sphere.
D. E. Gilsinn, H. J. Hansen, Y. Xu, M. Huerta-Garnica, and E. C. Teague. May 91, 24p, NISTIR-4568.
Prepared in cooperation with Tianjin Univ. (China). and Centro de Investigacion y de Estudios Avanzados, Mexico City.

Keywords: High resolution, Dimensional measurement, Boundary value problems, Finite element analysis, Spherical shells, Resonant frequency, Simulation, Vibration, Comparison, *Coordinate measuring machines, *Molecular Measuring Machine, Normal mode analysis.

An ultra-high accuracy planar coordinate measuring machine, called the Molecular Measuring Machine (M(sup 3)) is being built at the National Institute of Standards and Technology (NIST). The design goal is to achieve a spatial resolution of 0.1 nm over an area of 50 mm X 50 mm. This goal requires that gravity loading and vibration response of a complicated mechanical structure be modeled to a high accuracy. Finite element analysis (FEA) was applied in the design of M(sup 3) as analytical modeling of the complicated structure was precluded. In order to achieve confidence in a specific FEA package, normal mode analysis results for a thick spherical shell that represented a first approximation to the M(sup 3) structure were compared to those predicted by another FEA package and to analytic results of the thick shell problem. The analytic model predicted degenerate modes due to the structural symmetry of the sphere. These were confirmed subsequently by both of the FEA packages. The FEA and analytic results differ by less than 5%.

Keywords: *Laboratories, *Accreditation, Administrative procedures, Requirements, Quality assurance, *National Voluntary Laboratory Accreditation Program, *NVLAP system.

The NVLAP Procedures are a part of the U.S. Code of Federal Regulations and set forth the conditions under which the National Voluntary Laboratory Accreditation Program (NVLAP) will function. The Procedures contain general information about NVLAP, requirements for establishing a program in a specific field of testing, the process for accrediting a laboratory, and conditions and criteria for accreditation. NVLAP is a system for accrediting testing laboratories found competent to perform specific tests and types of tests. Competence is defined as the ability of a laboratory to meet conditions and conform to criteria specified in the Procedures as tailored and interpreted for the test methods, types of test methods, products, services, or standards for which the laboratory seeks accreditation.

Keywords: *Metrology, *Computer program verification, Computer applications, Computer software, Measuring instruments, Dimensional measurement, Calibrating, Coordinates, Data analysis, US NIST, Tests, Performance evaluation, *CMS, *Coordinate measuring systems, *SRA, *Standard reference algorithm, ATEP(Algorithm Testing and Evaluation Program), ATS(Algorithm Testing System).

The report is directed towards the dimensional metrology community interested in standardizing geometric fitting algorithms used in coordinate measuring systems (CMSs) and is intended to stimulate suggestions for establishing a standard reference algorithm (SRA) selection process. An acceptance procedure for evaluating and selecting the SRAs is identified. The SRA selection process provides control of variation among national reference algorithms and ensures addressing the needs of industry. It is envisioned as a two-stage process: an alpha phase conducted by the National Institute of Standards and Technology (NIST) and a beta phase of public review. The report describes the details of both phases and provides a summary of related activities.

High-Temperature Laser-Pulse Thermal Diffusivity Apparatus.
Final rept.
A. Cezairliyan, T. Baba, and R. Taylor. Mar 94, 25p.
Pub. in International Jnl. of Thermophysics 15, n2 p317-341 Mar 94.

Keywords: *Thermal diffusivity, *High temperature tests, *Temperature measuring instruments, Radiative heat transfer, Thermophysical properties, Thermal properties, Boundary conditions, Transport properties, Pulsed lasers, Uncertainity, Reprints, *Laser pulse method.

A high-temperature laser-pulse apparatus for the measurement of thermal diffusivity in the temperature range from 1,500 to 2,500 K has been designed, constructed, and tested at the National Institute of Standards and Technology. A curve-fitting method is introduced by which the entire experimental temperature history curve is fitted with the theoretical curve under the boundary condition of radiative heat losses. The new apparatus and the curve-fitting method permit thermal diffusivity measurements with an uncertainty of not more than 3%.

Optical Fiber Sensors: Accelerating Applications in Navy Ships.
G. W. Day, P. S. Lovely, H. K. Whitesel, and R. K. Hickernell. May 94, 105p, NISTIR-5018.
Prepared in cooperation with Naval Surface Warfare Center, Annapolis, MD.

Keywords: *Naval vessels, *Fiber optics transmission lines, Pressure gages, Temperature measuring instruments, Cost analysis, Multiplexing, Military technology, Control systems, Specifications, Economic analysis, Signal processing, Damage assessment, Commercialization, Market research, *Optical fiber sensors.

The Navy needs new sensors for shipboard machinery monitoring and control, condition-based maintenance, and damage assessment. Optical fiber sensors are strongly preferred because of their immunity to electrical disturbances, as well as potential size, weight, and performance advantages. But despite well over a decade of development and promise, relatively few optical fiber sensors available today can meet the Navy's needs with acceptable performance and cost. This report examines the reasons and recommends strategies to help the Navy achieve its goals. Some of the recommendations confirm approaches that the Navy is already implementing. Optical fiber sensors have very valuable potential advantages, but those that the Navy can use may remain too expensive to be deployed if the Navy uses traditional methods of writing specifications and soliciting development and procurement bids. For this reason, the study focuses on cooperation with industry and promoting commercial off-the-shelf and dual-use technology.

Metric for Success.
G. P. Carver. May 94, 18p, NISTIR-5425.

Keywords: *Metric system, *Metrication, International system of units, Standards, United States, Federal agencies, Metrology, Units of measurement, Government/industry relations, National government, History, NIST(National Institute of Standards and Technology).

The federal agencies are working with industry to ease adoption of the metric system. The goal is to help U.S. industry to compete more successfully in the global marketplace, increase exports, and create new jobs. The strategy is to use federal procurement, financial assistance, and other business-related activities to encourage voluntary conversion. Based upon the positive experiences of firms and industries that have converted, federal agencies have concluded that metric use will yield long-term benefits that are beyond any one-time costs or inconveniences. It may be time for additional steps to move the Nation out of its dual-system comfort zone and to continue the progress toward metrication. The report includes Metric Highlights in U.S. History.

Millisecond-Resolution Pulse Heating System for Specific-Heat Measurements at High Temperatures.
Final rept.
A. Cezairliyan. 1992, 35p.
Pub. in Compendium of Thermophysical Property Measurements Methods, Chapter 17, v2 p483-517 1992.

Keywords: *Specific heat, *High temperature tests, *Test methods, *Pulse heating, Experiment design, Errors, Temperature measurement, Thermophysical properties, Test facilities, Reprints.

In the first volume of this Compendium, a general description and a brief survey of the pulse techniques, utilizing resistive self-heating of the specimen, for the measurement of specific heat at high temperatures were given. The presentation covered techniques over a wide regime of time response: from nearly a second to submicrosecond resolution. Most of the techniques were of an exploratory nature and were developed for specific immediate applications. However, as a result of extensive research performed during the last 25 years, the millisecond-resolution pulse heating technique for specific-heat measurements has reached a mature stage. The objective of the present chapter is to give details of the millisecond-resolution technique developed in the Dynamic Measurements Laboratory of the U.S. National Institute of Standards and Technology (NIST), formerly the U.S. National Bureau of Standards (NBS). The presentation includes a description of the measurement system, measurement procedure, consideration of various phenomena that affect the design and operation of the system, estimate of errors, and discussion summarizing recent improvements and additions to the overall system.

High-Speed Spatial Scanning Pyrometer.
uinal rept.
A. Cezairliyan, R. F. Chang, G. M. Foley, and A. P. Miiller. 1993, 9p.
Pub. in Review of Scientific Instruments 64, n6 p1584-1592 Jun 93.

Keywords: *Pyrometers, *Spectral emission, *Temperature measurement, Linear arrays, Line spectra, Temperature measuring instruments, Errors, Tungsten, Thermophysical properties, Reprints.

A high-speed spatial scanning pyrometer has been designed and developed to measure spectral radiance temperatures at multiple target points along the length of a rapidly heating/cooling specimen in dynamic thermophysical experiments at high temperatures (above about 1800 K). The design, which is based on a self-scanning linear silicon array containing 1024 elements, enables the pyrometer to measure spectral radiance temperatures (nominally at 650 nm) at 1024 equally spaced points along a 25-mm target length. The elements of the array are sampled consecutively every 1 microsecond thereby permitting one cycle of measurements to be completed in approximately 1 ms. The pyrometer output is recorded digitally with a full-scale resolution of 0.025% every 1 microsecond. Procedures for calibration and temperature measurement as well as the characteristics and performance of the pyrometer are described. The details of sources and estimated magnitudes of possible errors are given. An example of measurements of radiance temperatures along the length of a tungsten rod, during its cooling following rapid resistive pulse heating, is presented.

Intercomparison of the Effective Areas of a Pneumatic Piston Gauge Determined by Different Techniques.
Final rept.
K. K. Jain, C. D. Ehrlich, J. C. Houck, and J. K. N. Sharma. 1993, 9p.
Pub. in Meas. Sci. Technol. 4, p249-257 1993.

Keywords: *Pneumatic equipment, *Pressure gages, *Manometers, Calibration, Measuring instruments, Test methods, Pressure measurement, Uncertainty, Reprints, *Piston gages.

A variety of primary measurement techniques is now available for the measurement of pressure to 1 MPa and above. To ascertain the systematic uncertainty, if any, which exists in the measured pressure using the individual techniques, it is best to perform direct intercomparisons of primary instruments. However, when direct intercomparison is not possible, the next best alternative is to use a highly stable, reproducible transfer artifact such as a simple piston gage. Such intercomparisons are described here, utilizing a piston gage calibrated by a mercury manometer (with 0.1 MPa full-scale pressure), four large diameter 'dimensional' piston gages from two different manufacturers (all with 1 MPa full-scale pressure), and a controlled clearance piston gage (with 7 MPa full-scale pressure). The area ratio derived from dimensional measurements on two of the large diameter gages, when compared with the ratio obtained from measurements traceable to a manometer, agrees within 1 part per million (ppm). For one of the large diameter piston gages, the area value obtained from the manometer agrees within 3 ppm with its dimensional area, and within 10 ppm with the value obtained by its direct calibration against the controlled clearance piston gage.

Models and Interactions.
Final rept.
J. Mandel. 1991, 5p.
Pub. in Jnl. of Testing and Evaluation 19, n5 p398-402 1991.

Keywords: *Experimental data, Interlaboratory comparisons, Analysis of variance, Data analysis, Graphic methods, Test methods, Models, Reprints, Two way tables.

It is shown that the classical analysis of variance for two-way tables, with mean squares for rows, columns and interaction, is often a hindrance to understanding. For interlaboratory data resulting from the study of a test method, a row-linear model is generally more appropriate. However, in practice, a material-by-material analysis of such data, involving minimal prior assumptions, is the most appropriate way of dealing with interlaboratory test data. The importance of graphics is illustrated.

Prepared in cooperation with National Office of Measures, Budapest (Hungary).
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n3 p241-246 May/Jun 94.

Keywords: *Standards, *Conductivity, *Potassium chloride, Electrical resistivity, Tests, Aqueous electrolytes.

A new method for the absolute determination of electrolytic conductivity based on direct current and potentio-metric measurements is described. The unique design of the cell uses a removable center section whose length and cross-sectional area are accurately known. Two pairs of matched Ag, AgCl electrodes are used in a four terminal mode of resistance measurement. Measurements of the electrolytic conductivity of primary standard potassium chloride solution using this novel dc conductance cell are compared with the currently adopted IUPAC and OIML recommendations. In addition, measurements have been made of the electrolytic conductivity of a solution of potassium chloride having a molality of 1 mol/kg (mole KCl per kilogram H2O). The values so obtained over the temperature range of 0 deg C to 50 deg C are recommended as the new primary standards for electrolytic conductivity.

New Expressions of Uncertainties for Humidity Calibrations at the National Institute of Standards and Technology.
P. H. Huang, and J. R. Whetstone. Jun 94, 9p, NISTIR-5455.

Keywords: *Humidity measurement, *Calibration, *Uncertainty, Error analysis, Mixing ratios, Dew point, Tables(Data), US NIST.

Beginning January 1, 1994, the National Institute of Standards and Technology (NIST) requires all calibration reports to state the uncertainties according to the new policy. Reference is to be made to some published document. Uncertainties of calibration results are expressed using the method described in the 'Guide to the Expression of Uncertainty in Measurement' (NIST Technical Note 1297). This report explains how each component of the combined standard uncertainty was determined for providing the expanded uncertainties of humidity parameters.

Should NIST Accredit U.S. Calibration Laboratories.
Final rept.
S. D. Rasberry, and J. D. Simmons. 1991, 11p.
Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., January 31-February 1, 1991, 11p.

Keywords: Measurement, Standards, Reprints, *Calibration laboratories, *Laboratory accreditation, *Accreditation, Reference materials, Traceability, US NIST.

For nine decades the National Institute of Standards and Technology (NIST), and under its former name the National Bureau of Standards, has followed one model of providing traceability to National standards of measurement. In that model NIST offers calibration and reference material services, and leaves entirely to users of those services the burden of maintaining and demonstrating traceability. In this talk the authors explore the possibility of a new model. The NIST services mentioned above would be continued as would the feature of user responsibility for traceability. What would be added is accreditation by NIST of laboratory calibration competence, conformance to quality laboratory standards, and proficiency in providing calibration services. A NIST 'home' for such a system already exists in the National Voluntary Laboratory Accreditation Program (NVLAP) which currently accredits about 1000 testing laboratories. At least four pressures are building to move in this direction. They include (1) company quality programs aimed at the highest level of attainment; (2) customer requirements (including those of Federal executive branch departments); (3) requirements for accreditation as mandated in new laws; and (4) international trade requirements resulting from EC-92 developments.

Metrology Model for Submicrometer Dimensional Measurements.
Final rept.
J. Potzick. 1993, 10p.
Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., January 20-22, 1993, p1-10.

Keywords: *Dimensional measurement, *Length, Planar structures, Calibration, Metrology, Standards, Comparison, Precision, Accuracy, Models, Reprints, Nanostructures, Traceability.

A model for the accurate dimensional measurement of small planar objects is developed in terms of the comparison of the images of the test object and a standard object in a measuring device. A length measuring instrument is thus a comparator. The calibration of the standard and the conditions necessary for a valid comparison are discussed. The principles discussed here apply to many other types of measurement as well.

Keywords: *Vibration measurement, *Automation, *Personal computers, Accelerometers, Calibration, Standards, Laboratories, Measuring instruments, Vibration simulators, Shakers, High level languages, Reprints, US NIST.

The National Institute of Standards and Technology (NIST) provides calibration services for vibration pickups over a wide frequency range. Two experimental test measurement setups have been automated, each using a personal computer. One measurement system is for calibration of vibration shakers that uses an absolute reciprocity method, and the shaker is calibrated by measuring the changes in the electrical admittance of the shaker as a function of the mass attached to the shaker table. The second measurement system is for accelerometer calibration by comparison of a test accelerometer to a standard shaker which has been calibrated by an absolute method. These automated measurement systems make use of modern high level languages, one in Pascal and one in 'C'. The paper also gives some comparisons of the use of personal computers and technical laboratory computers.

Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results. 1994 Edition.
Technical note.
B. N. Taylor, and C. E. Kuyatt. Sep 94, 34p, NIST/TN-1297.
Supersedes PB93-159465. Also available from Supt. of Docs. as SN003-003-03292-1.

Keywords: Confidence level, Error analysis, Guidelines, Uncertainty, Standards, Accuracy, Precision, *Measurement uncertainty, ISO Guide, US NIST.

This Technical Note succinctly presents, in the context of the NIST Policy on Statements of Uncertainty Associated with Measurement Results, those aspects of the ISO Guide to the Expression of Uncertainty in Measurement that will be of most use to the NIST staff and others in implementing that policy, which is included as Appendix C. In this second (1994) edition of Technical Note (TN) TN 1297, Appendix D has been added to clarify and provide additional guidance on a number of topics in response to questions asked since the publication of the first (1993) edition.

Dimensional Characterization of Small Bores: A Survey.
Final rept.
J. Raja, and R. Veale. 1990, 10p.
Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., February 8-9, 1990, 10p.

Keywords: *Holes, *Cavities, *Dimensional measurement, Methodology, Precision, Diameters, Waveguides, Reprints, CMM(Coordinate measuring machines).

The measurement of small bores is now and has always been a difficult measurement problem. The problem is especially difficult when the length to diameter ratio of the bore is large. This paper presents a survey of the various techniques now in use as well as other methods which have been developed in the past. It lists the advantages, disadvantages, and expected accuracy which can be achieved using the various methods. Current work using coordinate measuring machines to characterize the internal dimensions of waveguides is also described.

Loading Device for Fracture Testing of Compact Tension Specimens in the Scanning Electron Microscope.
Final rept.
J. Rodel, J. F. Kelly, M. R. Stoudt, and S. J. Bennison. 1991, 7p.
Pub. in Scanning Microscopy 5, n1 p29-35 Mar 91.

Keywords: *Loading rate, *Fractography, *Scanning electron microscopy, Loads(Forces), Crack propagation, Aluminum oxide, Ceramics, Performance evaluation, Design criteria, Case studies, Reprints, Piezoelectric translators.

A loading device for compact tension specimens allowing fracture experiments in the scanning electron microscopy (SEM) has been designed. Its key elements are a piezoelectric translator for applying controlled displacements to the loading points on the specimen and a load cell to measure applied loads. The effective transmission of displacement from the piezoelectric driver to the specimen was found to be the major mechanical design problem. The peripheral equipment include a function generator and a high voltage amplifier to drive the piezoelectric translator as well as a video overlay and standard video equipment to record the image continuously during the course of the experiment. A case study on alumina describes qualitative observations on the toughening mechanism, crack-interface bridging, operating in this material. Quantitative information pertaining to the closure stresses associated with this toughening mode can be obtained by measuring the crack profile.

Two New Probes for a Coordinate Measuring Machine.
Final rept.
J. Stone, L. Carroll, G. Caskey, J. Rose, K. Lau, S. Phillips, and R. Resnick. 1993, 4p.
Pub. in Proceedings of the ASPE Annual Meeting (8th), Seattle, WA., November 7-12, 1993, p82-85.

Keywords: *Measuring instruments, *Probes, Dimensional measurement, Accuracy, Reprints, *CMM(Coordinate measuring machines), *Coordinate measuring machines, Analog probes, Touch-trigger probes.

We have performed tests of the measuring capabilities of two new analog probes used with coordinate measuring machines. Both probes are capable of sub-micrometer accuracies. The first is an LVDT-based three-dimensional analog probe with a range of 0.1 mm and a resolution of 0.025 micrometers. We found that the repeatability of the probe is 0.04 micrometers (1 standard deviation) and three-dimensional errors are less than 0.5 micrometers at small deflections. The second probe is a non-contact capacitance probe. The probe stylus is a precision ball mounted on the end of a hypodermic needle; the probe detects the position of a nearby surface through measuring the capacitance between the surface and the ball. The probe can be used as a true analog probe or it can simulate the operation of a touch-trigger probe, generating a trigger pulse when the reading exceeds a threshold value. The repeatability in analog mode is 0.05 micrometers and the repeatability as a touch-trigger probe is 0.1 micrometers. Used as a touch-trigger probe in three dimensions, the probe accuracy is about 1.3 micrometers.

Cryogenics.
Final rept.
L. L. Sparks. 1993, 20p.
Sponsored by American Society for Testing and Materials, Philadelphia, PA.
Pub. in Manual on the Use of Thermocouples in Temperature Measurement, Chapter 11, p214-233 1993.

Keywords: *Temperature dependence, *Thermocouples, *Cryogenic temperature, Magnetic fields, Thermoelectricity, Reprints, Reference tables, ITS-90.

Successful use of thermocouples for absolute or differential temperature measurement at low temperatures requires that particular attention be paid to thermocouple sensitivity and to the relative importance of thermoelectric effects such as dilute impurities, strain, and inhomogeneity. An important subset of cryogenic temperature measurement involves magnetic-field environments. Thermocouple types and the magnetic-field effect on the thermoelectric sensitivity are discussed. Reference tables based on ITS-90 are given for zero-field applications.

Look at Uncertainties over Twenty Decades of Pressure Measurement.
Final rept.
C. D. Ehrlich. 1994, 10p.
Pub. in Proceedings of VIII IMEKO World Congress, Torino, Italy, September 5-9, 1994, p1941-1950.

Keywords: *Pressure measurement, *Uncertainity, Transducers, Pressure gages, Accuracy, Test facilities, Test methods, Reprints.

A wide variety of instrumentation is required to perform state-of-the-art pressure measurements over the almost 20 decade range of pressure that is used in science and industry today. The uncertainties associated with such measurements similarly span a wide range, from several parts in a million near atmospheric pressure to around 10% or more at both pressure extremes. This paper provides an overview of the techniques, instrumentation and uncertainties associated with the most common primary measurements of pressure practiced today. A discussion of some of the more prominent types of pressure gages and transducers in the various pressure regimes is also included.

Influence of the Filament Potential Wave Form on the Sensitivity of Glass-Envelope Bayard-Alpert Gages.
Final rept.
P. J. Abbott, and J. P. Looney. 1994, 6p.
Pub. in Jnl. of Vacuum Science and Technology A 12, n5 p2911-2916 Sep/Oct 94.

Keywords: *Bayard-Alpert ionization gages, *Waveforms, *Sensitivity, *Filaments, Controllers, Vacuum gages, Nonlinearity, Glass, Pressure gages, Reprints.

Nonlinearities of about 10%-15% in the sensitivity of glass envelope Bayard-Alpert gages (BA gages) have been observed in the pressure range 10(exp -7) to 10(exp -2) Pa. These nonlinearities were studied in modified BA gage tubes with platinum coatings on their inner glass surfaces by measuring the equilibrium potential of the platinum coating as a function of pressure. The sensitivities of the gage systems (gage tube plus controller) were found to depend on the inner surface potential, and this potential was found to depend on pressure and on the details of the filament potential waveform provided by the gage controller. It was found that the nonlinearities could be minimized by holding the inner surface to a fixed direct-current (dc) potential, by modifying the alternating-current filament potential wave form, or by using a controller that provides a noise-free dc filament-heating current.

Design and Machining of Copper Specimens with Micro Holes for Accurate Heat Transfer Measurements.
Final rept.
M. A. Kedzierski, and J. L. Worthington. 1993, 16p.
Pub. in Experimental Heat Transfer 6, p329-344 1993.

Keywords: *Drilling, *Micromachining, *Temperature measurement, *Copper, Thermocouples, Experiment design, Temperature distribution, Uncertainty, Errors, Reprints, Micro holes.

This article presents a technique that has been developed specifically for drilling 0.5334-mm-diameter, 19-mm-deep holes in copper for use in temperature measurement. The holes accept thermocouples, which are used for the measurement of the temperature gradient and the wall temperature of the specimen. Errors due to the intrusion of the probe, and the finite size and mass of the probe, are reduced as the diameter of the probes is reduced. A machining procedure for drilling deep micro holes in copper cannot be found in conventional texts; this article advocates holes that are deeper than those traditionally recommended. This article is written for both machinists and experimentalists. Both heat transfer and machining criteria are considered. The necessary equipment and their specifications are discussed. Special attention is given to specifying drilling speeds, feed rates, and lubricants. Step-by-step drilling instructions are given. An analysis is performed to reveal the important parameters for reducing the errors associated with the uncertainty in the location, the relative position of the thermocouples, and the individual temperature measurements.

Measurement of Very-Low Partial Pressures.
Final rept.
C. R. Tilford. 1994, 6p.
Pub. in Jnl. of the Vacuum Society of Japan 37, n9 p667-672 1994.

Keywords: *Pressure measurement, *Ultrahigh vacuum, *Partial pressure, *Residual gas, Measuring instruments, Sensitivity, Mass spectrometers, Gas analysis, Vacuum apparatus, Vapor pressure, Ionization gages, Reprints.

The measurement of partial pressures in the ultra high and extreme high vacuum ranges (below about 10(exp -6)) is important for residual gas analysis and the measurement of low-pressure constituents (both contaminants and deliberate additions) in higher-pressure process gases. Mass-spectrometer type instruments--partial pressure or residual gas analyzers (PPAs and RGAs)--are generally used for this purpose. Typically, these instruments consist of an electron-impact ionizer, a quadrupole mass filter, and an ion detector. This paper discusses these elements and other factors that determine the very-low-pressure performance of these instruments--detection limits, mass resolution, and stability and pressure-dependence of the sensitivity. Particular attention is paid to ion-source design and operating parameters, the coupling of ions between the ionizer and the mass analyzer, and the influence of the total pressure on partial pressure sensitivities.

Process Monitoring with Residual Gas Analyzers (RGAs): Limiting Factors.
Final rept.
C. R. Tilford. 1994, 5p.
Pub. in Surface and Coatings Technology 68/69, p708-712 1994.

Keywords: *Pressure measurement, *Partial pressure, *Gas analysis, *Residual gas, Mass spectrometers, Calibration, Metrology, Vacuum apparatus, Sensitivity, Reprints, *Residual gas analyzers.

Many vacuum processes are limited by low-level impurities introduced with process gases or generated with-

in the process chamber. Specific impurities are often monitored using residual gas analyzers (RGAs) or partial pressure analyzers (PPAs), most commonly, mass spectrometers of the quadrupole type. Unfortunately, the performance of these instruments can be affected significantly by a number of instrument and vacuum environment variables, so that the sensitivities of even calibrated instruments can differ significantly from expected values. These variables include ion source parameters, total pressure and prior exposure to active gases. The magnitude of the deviations in sensitivity varies for different instruments, but can reach orders of magnitude in extreme cases. This paper reviews the important factors affecting instrument performance, illustrates the magnitude of the effects for different instruments, recommends instrument test procedures, and suggests operating parameters and procedures that can minimize these effects.

Morphological Estimation of Tip Geometry for Scanned Probe Microscopy.
Final rept.
J. S. Villarrubia. 1994, 14p.
Pub. in Surface Science 321, p287-300 1994.

Keywords: *Tips, *Scanning tunneling microscopy, *Morphology, *Image processing, Geometry, Surface properties, Mathematical models, Image analysis, Reprints, *Atomic force microscopy.

Morphological constraints inherent in the imaging process limit the possible shapes of the tip with which any given tunneling microscope or atomic force microscope image could have been taken. Broad tips do not produce narrow image protrusions. Therefore, feature sizes within the image may be used to place an upper bound on the size of the tip. In this paper, mathematical morphology is used to derive, for each point on an image, a corresponding bounding surface for the tip. The actual tip must be equal to or smaller than the largest tip which satisfies all of the constraints. Example calculations are performed, demonstrating that if the imaged specimen contains sharp features and high relief, the tip shape deduced by this method will be a good estimate of the actual one. Once known, the tip geometry can be deconvoluted from images to recover parts of the actual surface which were accessible to the tip.

Measuring Long Gage Blocks with the NIST Line Scale Interferometer.
Technical note.
J. S. Beers. May 95, 24p, NIST/TN-1410.
Also available from Supt. of Docs. as SN003-003-03341-3. See also PB93-146645.

Keywords: *Interferometers, Length, Silicon dioxide, Measuring instruments, Uncertainty, Dimensions, Manufacturing, US NIST, Long gage blocks, Line scale interferometer.

An improved technique is described for temporarily converting long gage blocks into line scales so they can be measured by fringe counting (dynamic) interferometry in the National Institute of Standards and Technology (NIST) line scale interferometer. The new process employs fuzed silica rather than the previously used steel conversion gage blocks. Conversion blocks are pairs of small (26 mm) gage blocks with graduation lines on their side faces. The new conversion blocks have a number of advantages as shown by experimental evidence.

Keywords: *Calibrating, *Measuring instruments, *Metrology, Interferometers, Standards, Length, Statistical quality control, Comparison, *Gage blocks.

Calibration of gage blocks is one of the oldest and most sophisticated measurements in dimensional metrology. This work explains gage blocks are calibrated by both interferometry and mechanical comparison at the National Institute of Standards and Technology. The basic physical and geometrical properties, and the limitations on calibration caused by these properties are explained. All known sources of uncertainty are discussed along with the methods used to estimate these uncertainties. Finally, the measurement assurance program used to control the calibrations processes are explained with estimates of the process parameters.

This report contains the results of an international interlaboratory comparison program (round-robin) of powder characterization under the auspices of International Energy Agency (IEA). The results include the contributions of 25 industrial, university and governmental laboratories in the Federal Republic of Germany, Sweden and the United States. These laboratories surveyed a variety of methods for the characterization of physical properties and chemical characteristics of ceramic starting powders. For the first time, data from various measurement methods are available for critical comparison. Results of the same method from different laboratories are also provided. Recommendations for future studies are drawn from results of the present round-robin.

Comments on the Stability of Bayard-Alpert Ionization Gages.
Final rept.
C. R. Tilford, A. R. Filippelli, and P. J. Abbott. 1995, 3p.
Pub. in Jnl. of Vacuum Science and Technology, v13 n2 p485-487 Mar/Apr 95.

Keywords: *Bayard-Alpert gages, *Stability, Ionization gages, Measuring instruments, Tests, Experimental data, Reprints.

A recent group of three articles presents stability testing results for ionization gages, discusses the causes of gage instability, and describes a new type of Bayard-Alpert (BA) ionization gage. Although the authors are in general agreement with the analysis of gage instability presented by Bills, they are concerned that the test results of Arnold and Borichevsky and the discussion in all three references imply instabilities for existing types of BA gages that are much larger than they find to be the case. Here the authors briefly describe their experience with BA gage stability, indicate why they think their results are different from those of Arnold and Borichevsky, and describe the operating conditions that they believe will result in improved stability.

Keywords: *Temperature scales, *Radiance, *Interlaboratory comparisons, Calibration standards, Pyrometers, Quality assurance, Temperature measurement, United States, United Kingdom, NIST(National Institute of Standards and Technology), ITS-90.

An intercomparison of radiance temperature scales has been performed by the National Physical Laboratory (NPL) and the National Institute of Standards and Technology (NIST) using a standard transfer pyrometer operating at a wavelength of approximatelly 1000 nm. It was found that the radiance temperature scales established by the two laboratories were in agreement to 0.1% or better of the temperature over the range 1000 degrees C to 2500 degrees C.

Radiance Temperatures (in the Wavelength Range 523-907 nm) of Group IVB Transition Metals Titanium, Zirconium, and Hafnium at Their Melting Points by a Pulse-Heating Technique.
Final rept.
A. Cezairliyan, J. L. McClure, and A. P. Miiller. 1994, 17p.
Pub. in International Jnl. of Thermophysics, v15 n5 p993-1009 1994.

Keywords: *Metals, *Melting points, *Temperature measurement, Reprints, *Radiance temperatures, *Pulse heating.

The melting-point radiance temperatures (at six wavelengths in the range 523-907 nm) of the Group IVB transition metals titanium, zirconium, and hafnium were measured by a pulse-heating technique. The method is based on rapid resistive self-heating of the specimen from room temperature to its melting point in less than 1s and on simultaneously measuring the specimen radiance temperatures every 0.5 ms with a high-speed six-wavelength pyrometer. Melting was manifested by a plateau in the radiance temperature-versus-time function for each wavelength. The melting-point radiance temperatures for a given specimen were determined by averaging the measured temperatures along the plateau at each wavelength.

Pub. in Proceedings of the Workshop on the Measurement of Transient Pressure and Temperature, Gaithersburg, MD., April 23-24, 1991, p1-8 Apr 92.

Keywords: *Pressure measurement, *Meetings, Temperature measurement, Military requirements, Explosion effects, Pressure transducers, Shock waves, High pressure, Calibration, Transients, Standards, Reprints.

The Workshop on the Measurement of Transient Pressure and Temperature was held at the National Institute of Standards and Technology (NIST), Gaithersburg, MD, on 23-24 April 1991. There were 77 attendees, 55% from government and 45% from the private sector. Aerospace, automotive, and instrumentation manufacturers were present along with engineers from primate sector and government (Army, Navy, Air Force, and NASA) research organizations. The Army, Navy and NASA primary standards laboratories also were represented. The workshop drew international attention with participants from Taiwan, Sweden, Austria, and France. Only France currently offers transient pressure calibrations as part of their national measurement system. The purpose of the workshop was to identify current and emerging measurement problems and needs for transient pressure and temperature measurements, to explore scientific and technical barriers, and opportunities for achieving measurement accuracy goals, and to assist in the formulation of an appropriate role for NIST.

Testing the Sensitivity of Accelerometers Using Mechanical Shock Pulses Under NIST Special Publication 250 Test No. 24040S.
Final rept.
D. J. Evans. 1995, 15p.
Pub. in American Society of Mechanical Engineers International Mechanical Engineering Congress and Exposition, San Francisco, CA., November 12-17, 1995, p1-15.

Keywords: *Accelerometers, *Shock tests, *Mechanical vibration, Piezoelectric transducers, Calibration standards, Sensitivity, Reference standards, Acceleration, Inteferometry, Shock(Mechanics), Shock absorbers, Frequency analysis, Test and evaluation, Reprints, Drop-ball apparatus.

The complex sensitivity of a laboratory reference piezoelectric accelerometer in combination with a charge amplifier is obtained by comparison against two NIST standards which are calibrated periodically by reciprocity and by interferometric techniques. For each condition of test, a dynamic signal (FFT) analyzer is used to obtain estimates of the complex frequency response function (complex voltage output of the system under test relative to that of the reference system) and the coherence function from rms trispectral averages, as well as to obtain time averages of the complex linear spectra of the voltage outputs of the system under test and the reference system. Together with the calibrated complex sensitivity of the reference system, these spectra may then be used to estimate the magnitude of the sensitivity of the system under test as a function of frequency, and to obtain an estimate of the magnitude of the peak output voltage of the system under test relative to the magnitude of the peak acceleration for each condition of test.

Low Heat-Flux Measurements: Some Precautions.
Final rept.
A. F. Robertson, and T. J. Ohlemiller. 1995, 16p.
Pub. in Fire Safety Jnl., v25 n2 p109-124 1995.

Keywords: *Heat fluxes, *Measurement errors, Radiation, Gages, Sensors, Reprints, *Foreign technology.

Simple experiments are described for the purpose of illustrating measurement errors and their avoidance during use of Gardon or Schmidt-Boelter total heat flux sensors. These errors can assume serious proportions of the observed signal at flux levels below about 15 kW/sq. m. They result from two sources, both a consequence of the flux gage's temperature relative to its surrounding: firstly, convective heating of the gage by the boundary layer from hot surfaces surrounding it and second, heat exchange with the ambient environment by radiation and convection. Some proposals are made for standardizing measurement methods, but it seems unlikely that errors in measurement can be completely eliminated. It thus becomes important for users of experimentally derived data to understand the limitations which may exist in the data reported.

NIST High-Accuracy Sampling Wattmeter.
Technical note.
G. N. Stenbakken, and A. Dolev. Aug 96, 50p, NIST/TN-1420.
Portions of this document are illegible in microfiche products. Also available from Supt. of Docs. as SN003-003-03422-3.

Keywords: *Wattmeters, Ammeters, Voltmeters, Power measurement, Product development, Engineering drawings, US NIST.

A high-accuracy sampling wattmeter was developed at the National Institute of Standards and Technology (NIST) to investigate the feasibility of using waveform sampling techniques for making very accurate power measurements at frequencies from 50 Hz to 1000 Hz. The goal of this effort was to develop an instrument having a full scale measurement uncertainty over these frequencies of less than plus or minus 50 micro W/W. The prototype instrument that came out of the development was used to demonstrate the accuracy achievable with the digital sampling method. The new high-accuracy sampling wattmeter was built around a wideband instrument developed earlier at NIST.

Pub. in Metrologia, v33 p299-306 1996.

Keywords: *Temperature measurements, *Pyrometry, Radiation thermometry, High temperatures, Optica, Reprints, *Foreign technology, *High-speed techniques.

A brief summary is given of the developments in optical techniques for rapid temperature measurement during the last three decades in two national laboratories, the National Institute of Standards and Technology in the USA and the Instituto di Metrologia 'G. Colonnetti' in Italy. Results of research conducted in originating and advancing the state-of-the-art in high-speed (millisecond- and microsecond-resolution) pyrometry for measurement of temperatures in the range 1000 K to 5000 K are discussed. The main emphasis is on several key issues related to high-speed pyrometry including: high-speed operation, calibration of pyrometers, determination of true temperature and high-temperature reference points. Anticipated future directions in research, developments and applications in high-speed pyrometry are briefly discussed.

Simultaneous Measurement of Normal Spectral Emissivity by Spectral Radiometry and Laser Polarimetry at High Temperatures in Pulse-Heating Experiments: Application to Molybdenum and Tungsten.
Final rept.
A. Cezairliyan, S. Krishnan, and J. L. McClure. 1996, 19p.
Pub. in International Jnl. of Thermophysics, v17 n6 p1455-1473 Nov 96.

Keywords: *High-speed measurements, *Spectral radiometry, *Laser polarimetry, High temperatures, Molybdenum, Pulse heating, Pyrometry, Reprints.

Spectral radiometry and laser polarimetry are two independent methods for measurement of spectral emissivity of materials. In the paper, a high-speed system is described for the rapid measurements of normal spectral emissivity of a specimen based on the simultaneous utilization of the two techniques. One of the goals of the work is to ascertain the reliability of the laser polarimetry technique in measurement of normal spectral emissivity at high temperatures. To accomplish this, normal spectral emissivity, in the vicinity of 0.633 m, of molybdenum and tungsten were measured by the two techniques in the temperature range 2000-2800 K. The results obtained by the two techniques are in agreement with 1%. The total uncertainty (two standard-deviation level) in measurement of emissivity by either spectral radiometry or laser polarimetry technique is estimated to be not more than plus or minus 2%.

Keywords: *Surface finishing, *Technology innovation, *Coating processes, State of the art, Quality control, Deposition, Sputtering, Plating, Spray coating, Heat treatment, Ion implantation, Cathode sputtering, Chemical vapor deposition, Laser applications, Diamonds, Nitriding, *Advanced technology, Diamond films, Plasma enhanced chemical vapor deposition.

Over the last 20 years more advanced surface treatments have been developed. While some have been widely deployed (physical vapor deposition, chemical vapor deposition, thermal spray, and plasma nitriding, for example), others are less commonly used, or are just beginning to appear commercially (including ion implantation, diamond coating, and laser coating). The purpose of this volume is to provide information on the basics of advanced surface engineering processes to small businesses, especially to those not currently directly involved with the technology, in order to make them aware of the current state of the art. Each chapter has been written by an industrial expert in the particular area, and following the basic description of the technology are sections outlining the needs of the surface treatment (such as better controls, improved materials, or better knowledge of fundamental processes) and the future markets that can be expected to open. Meeting these needs and exploiting these new markets is likely to be best done by the combined efforts of present providers with companies whose experience lies in entirely different areas, and it is this type of cross-fertilization that this volume seeks to promote.

Comparison of the Unidirectional and Radial In-Plane Flow of Fluids Through Woven Composite Reinforcements.
Final rept.
R. S. Parnas, and A. J. Salem. 1993, 12p.
Pub. in Polymer Composites 14, n5 p383-394 Oct 93.

Keywords: *Flow distribution, *Woven composites, *Resin transfer molding, *Fluid flow, Fiber composites, Comparison, Glass fiber reinforced plastics, Newtonian fluids, Preforms, Reinforcing fibers, Reprints.

The in-plane flow of fluids through dense fibrous woven reinforcements was studied to aid the development of constitutive models for use in simulations of composite fabrication by resin transfer molding. As a first part of this effort, both one-dimensional and radial flow experiments were conducted with Newtonian fluids in several woven glass fabrics. Analysis of the one-dimensional flow experiments shows that the two experimental techniques are often, but not always, consistent, and both techniques suggest a relationship between the physical structure of the reinforcement and the mathematical structure of the permeability tensor. Preform features at the laminar and interlaminar scales were hypothesized to influence the experimental results.

Error motions between the tool and workpiece during cutting operations affect the surface finish of the final products. These error motions arise from a number of different sources including asynchronous axial machine and process vibrations, tool wear, and tool edge build up. In this work, the error motions and dynamic characteristics of a tapered-roller bearing spindle with adjustable bearing preload were measured, and their effect on hard turned surfaces was assessed.

Pub. in Annual Meeting of the American Society for Precision Engineering (8th), Seattle, WA., November 7-12, 1993, 6p.

Keywords: *Spindles, *Maching, *Axes of rotation, Precision, Defects, Roller bearings, Metrology, Reprints, *Hard turning.

In this study, we are to evaluate a spindle which consisted of a pair of high precision tapered roller bearings including a HYDRA-RIB tapered roller bearing. Roller bearing spindles are used for applications that require high bearing stiffness, and can be good candidates for applications such as precision hard turning. For evaluation purposes, we have classified our measurements into four categories: axis of rotation errors, thermal growth, static stiffness, and dynamic stiffness and damping. In this presentation, we will focus on the axis of rotation error measurements. In addition to evaluating the performance of the spindle, we will show that the axis of rotation error measurements can also be used to help diagnose, analyze and improve the spindle design.

Infinite Divisibility and the Identification of Singular Waveforms.
Final rept.
A. S. Carasso. 1992, 14p.
Pub. in Proceedings of Conference on Probabilistic and Stochastic Methods in Analysis, with Applications, Ciocco, Italy, July 14-27, 1991, p273-286 1992.

Keywords: *Ultrasonic tests, Nondestructive tests, System identification, Wave propagation, Elastic waves, Volterra equations, Stochastic processes, Waveforms, Reprints, Flaw detection, Impulse response, Deconvolution, Divisibility.

Infinitely divisible probability density functions on the half-line t = or > 0 form a convolution semigroup on t = or > 0, as they describe stochastic processes with stationary, non-negative, independent increments. A subclass D of such densities are C(sup infinity) functions on the whole t-line when extended by zero for t < 0. Such functions may be viewed as physically realizable, causal, C(sup infinity) approximations to the Dirac delta-function, with further positivity properties. The use of such probe waveforms for system identification is particularly advantageous in transient wave propagation problems, where the system's impulse response is typically highly singular. An ill-posed deconvolution problem must be solved to recover the system's response; the semigroup and positivity properties of the input probe enable the deconvolution problem to be implemented as a Cauchy problem or a diffusion equation. The approach allows the analyst to monitor the gradual and systematic development of sharp singularities in the presence of noise. One important context where this theory applies is ultrasonic flaw detection in nondestructive evaluation.

NIST Calibration of ASTM E127-Type Ultrasonic Reference Blocks.
J. A. Slotwinski, and G. V. Blessing. May 94, 49p, NISTIR-5430.
See also PB-258 105.

Keywords: *Calibrating, *Standards, Ultrasonic wave transducers, Underwater acoustics, Ultrasonic tests, Nondestructive tests, *Ultrasonic reference blocks, Aluminum alloy 7075, US NIST.

This document describes the procedures and instrumentation used by the National Institute of Standards and Technology (NIST) in calibrating aluminum ultrasonic reference blocks. The Ultrasonics Group performs this calibration service for technological and industrial customers. The calibration is based on the American Society of Testing and Materials (ASTM) recognized practice for calibrating aluminum reference blocks, designated E127-92a. Instructions for requesting calibrations of ultrasonic reference blocks are contained in Appendix I of this document. The NIST ultrasonic reference block calibration service was originated in the late 1970's, and is described in the NBS Technical Note 924 (PB258105). At that time the application of one master block for use as a reference standard was considered to be a temporary or interim measure. Today NIST uses this master block to set the ultrasonic system sensitivity in all calibrations of ultrasonic reference block sets. In addition, there are several newly implemented practices employed for checking the calibration system characteristics, both over a period of years and in preparation for a particular calibration. This current document updates the NBS Technical Note 924 in describing these practices for our calibration procedure.

Pub. in Jnl. of Electronic Materials, v24 n5 p697-705 1995.

Keywords: *Nondestructive tests, *Alloys, *Photoluminescence, Semiconductors(Materials), Optical measurement, Chemical composition, Lattice parameters, Cadmium alloys, X ray diffraction, Precision, Accuracy, Comparative evaluations, Variations, Epitaxy, Reprints, Photoreflectance.

The authors report an overview and a comparison of nondestructive optical techniques for determining alloy composition x in Cd, Zn, Te substrates for HgCdTe epitaxy. The methods for single-point measurements include a new x-ray diffraction technique for precision lattice parameter measurements using a standard high-resolution diffractometer, room-temperature photoreflectance, and low-termperature photoluminescence. The authors compare measurements on the same set of samples by all three techniques. Comparisons of precision and accuracy, with a discussion of the strengths and weaknesses of different techniques, are presented.

Contributions of Out-of-Plane Material to a Scanned-Beam Laminography Image.
Final rept.
T. A. Siewert, and M. A. Austin. 1994, 6p.
Sponsored by Harry Diamond Labs., Adelphi, MD.
Pub. in Materials Evaluation, v52 n10 p1193-1198 Oct 94.

Keywords: *X ray inspection, *Nondestructive tests, *Image resolution, Blurring, Focusing, Gray scale, Quality, Scanning, Beams(Radiation), Reprints, *Laminography, *X ray laminography, *Out-of-plane.

The authors studied the edge of a thin step wedge with a scanned-beam laminography system to learn how material above and below the plane of focus contributes to the image. The edge of a planar, 0.5 mm (0.02 in.) Thick lead sheet with large x and y dimensions was centered in the field of view. Images were captured as the lead sheet was moved in 0.075 mm (0.003 in.) Steps above and below the plane of focus of the system. The blurring (measured as its width on the image) was no more than 0.1 mm (0.004 in., or the system resolution) when the sheet was in focus and increased linearly with the deviation from focus. Blurring of out-of-plane objects is an essential feature of this laminography system, and is used to minimize the contribution to the image from material above and below the plane of focus. The authors also imaged various three-dimensional structures to show the ability of laminography to resolve different planes of focus.

Void Shape in Sintered Titanium.
Final rept.
H. Ledbetter, M. Dunn, S. Kim, and R. Fields. 1995, 7p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v14 p1633-1639 1995.

Keywords: *Sound velocities, *Titanium, Ultrasonics, Deformation, Reprints, *Void shapes.

Void shape in sintered materials is important because the shape affects both physical and plastic-deformation problem. For example, the mechanical stress distribution around a disc-shaped void differs drastically from that around a spherical void. Thompson, Spitzig, and coworkers made ultrasonic studies on compacted iron. Haynes reviewed the general topic of mechanical properties of sintered materials. Because voids are small, three-dimensional, and essentially empty space between grains, their geometry determination presents formidable problems. Here, we take an indirect approach to void shape: measure longitudinal-wave and transverse-wave sound velocities, use a solid-mechan-

ics model that predicts effective ('composite') sound velocities from matrix sound velocities and occlusion phase geometry, use model inversely to estimate void shape.

Also available from Supt. of Docs. as SNO03-003-03381-2. Prepared in cooperation with Emory Univ., Atlanta, GA.

Keywords: *Semiconductor devices, *Optical measurement, *Silicon, Ellipsometry, Infrared spectroscopy, Interferometry, Photoluminescance, Optical microscopy, Raman spectroscopy, Scutterometry, Microelectronics, Test methods, Surveys.

Contactless, nondestructive optical methods are used to characterize many critical properties of materials, processes, and devices in the semiconductor industry. To determine the extent of use and the relative importance of various opticals methods in the industry, the Smeiconductor Electronics Division of the National Institute of Standards and Technology conducted a survey of this field. The survey also sought to identify both advantages and limitations of these techniques as well as future requirements for and anticipated use of optical characterization methods within the semiconductor industry. Data from 42 firms were analyzed to show the impact of the methods, what they measure, their range and precision, and their cost. A significant finding of the study is the need expressed by many industrial users for improved standards and test methods for optical characterization, especially in the area of film thickness and composition.

Low-Frequency, Active Vibration Isolation System.
Final rept.
R. Stebbins, D. Newell, S. Richman, J. Mason, P. Bender, and J. Faller. 1994, 11p.
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Vibration Monitoring and Control, San Diego, CA., July 28-29, 1994, v2264 p27-37.

Keywords: *Vibration isolators, Extremely low frequency, Infrasonic frequencies, Seismic noise, Ground motion, Control systems, Active control, Performance, Design, Reprints.

We are developing an active vibration isolation system for reducing the disturbing effects of ground motion about six orders of magnitude between 1 and 30 Hz. The system consists of three cascaded stages, each comprising a suspended platform on which are located seismometers and actuators for six degrees of freedom. Our goal is to reduce the vibration noise to (1 x 10(exp -13) x (1 Hz/f)(sup 2.5) + 3 x 10(exp -15))m/Hz(sup 1/2) on the third stage. We have built and tested the initial stage, which is intended to reduce our laboratory noise level to that of a quiet site. The design, control system models, measured performance and current limitations for this stage are presented. The two main stages require a vacuum environment and interferometric readout. The design and models for the main stages are also presented.

Dilemma-Preservation versus Access.
Final rept.
T. C. Bagg. 1993, 5p.
Pub. in Preservation Research and Development - Round Table Proceedings, Washington, DC., September 28-29, 1992, p57-61 1993. Sponsored by Library of Congress, Washington, DC.

Keywords: *Data storage, *Information management, *Media, Preserving, Access, Indexes (Documentation), Information retrieval, Digital data, Papers, Microfilm, Reprints.

The dilemma is to find suitable techniques and media to preserve information now stored on media with a short life expectancy. A stable recording media such as an acid free buffered paper on microfilm, where the information is in human readable form and has access suitable to its needs, is the best solution today. Information requiring frequent access should be indexed and stored in a digital form for rapid automated retrieval with a back-up on a permanent medium. Today's digital systems, which are essential for rapid access, are not suitable for preservation because of the continuous changes in computer technology.

Relationships between the request for procurement (RFP) process and open system environment (OSE) standards are described. A guide was prepared to help Federal agency personnel overcome problems in writing an adequate statement of work and developing realistic evaluation criteria when transitioning to an OSE. The guide contains appropriate decision points and transition strategies for developing applications that are affordable, scalable and interoperable across a broad range of computing environments. While useful, the guide does not eliminate the requirement that agencies possess in-depth expertise in software development, communications, and database technology in order to evaluate open systems.

Pub. in SIGCHI Bulletin 22, n1 p42-48 Jul 90.

Keywords: *Information retrieval, *Natural language processing, Information systems, Prototypes, Man computer interface, Human factors engineering, Access, Tests, Response time(Computers), Reprints.

A prototype information retrieval system was developed that gives users fast and easy access to textual information. The system uses a statistical ranking methodology that allows a user to input a query using only natural language, such as a sentence or a noun phrase, with no special syntax required. The system returns a set of text titles or descriptions, ranked in order of likely relevance to the query. The user can then select one or more titles for further examination of the corresponding text. The prototype was tested by over forty users.

Coping with Different Retrieval Methods in Next Generation Networks.
Final rept.
D. Flater, and Y. Yesha. 1994, 7p.
Pub. in Proceedings of the International Conference on Parallel and Distributed Computer Systems (7th), Las Vegas, NV., October 6-8, 1994, p549-555.

Keywords: *Query languages, *Information retrieval, *Search profiles, *Computer networks, Natural language processing, Information systems, Data storage systems, Heuristic methods, Systems engineering, Man computer interfaces, Statistical analysis, Reprints.

Methods of information retrieval that rely on automated indexing, automated classification, and/or analysis of natural language queries are often categorically condemned by proponents of traditional retrieval methods. With statistical retrieval, a powerful and expressive query language is processed with limited success; with traditional retrieval, a less expressive query language is processed with 100% success. Some feel that a battle must be fought to decide what sort of information retrieval will serve the needs of the world. The challenge is to support both kinds of retrieval in an information space that is too large for global indexing.

See also Part 2, PB95-168738. Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Optics and Photonics News 5, n9 p36, 43, Sep 94.

Keywords: *Information retrieval, *Data retrieval, *Software tools, *Computer networks, Information transfer, Data transmission, Man computer interfaces, Data storage, Document storage, Reprints, *File format, *INTERNET.

File formats commonly used for electronic storage of Internet-accessible documents (TEX and PostScript) are discussed. File archiving, compression, and encoding formats used to reduce storage requirements and to facilitate transmission by electronic mail are discussed also. Sources for non-commercial software for processing electronic documents having these formats on IBM-compatible computers are listed.

J. P. Wack, and L. J. Carnahan. Dec 94, 92p, NIST/SP-800/10.
Also available from Supt. of Docs. as SN003-003-03313-8. See also PB94-139045.

Keywords: *Computer security, *Data processing security, Information systems, Computer networks, Local area networks, Access control, Computer privacy, Authentication, Telecommunication, *Internet, TCP/IP(Transmission Control Protocol/Internet Protocol).

This document provides an overview of the Internet and security-related problems. It then provides an overview of firewall components and the general reasoning behind firewall usage. Several types of network access policies are described, as well as technical implementations of these policies. Lastly, the document contains pointers and references for more detailed information. The document is designed to assist users in understanding the nature of Internet-related problems and what types of firewalls will solve or alleviate specific problems. Users can then use this document to assist in purchasing or planning a firewall.

Keywords: *Information storage, *Information retrieval, *Records management, *Strategic planning, Access to information, Information dissemination, Preservation, Primary sources, Computer system design, Information networks, Optical scanning, *Electronic Access Project, *National Archives and Records.

The Electronic Access Project of the National Archives and Records Administration (NARA) had three main tasks. They were to design a methodology for exploring the informational needs of remote customers, to survey the targeted population, and to develop a blueprint for NARA's long-term information delivery systems that would enable NARA to meet their customers' needs. This report covers the last task. It discusses the findings of the user study as they influence the design of an electronic access system for the National Archives and Records Administration and presents a blueprint for meeting the users' needs.

Information Technology Standards in a Changing World: The Rose of the Users.
Final rept.
J. H. Burrows. 1993, 8p.
Pub. in Computer Standards and Interfaces, v15 p49-56 1993.

Keywords: *Information technology, *Interoperability, *User requirements, Information systems, Integrated systems, Standards, Interfaces, Reprints, Open Systems Interconnection.

Standards for information technology (IT) systems are important to users in effectively applying IT and carrying out the business of their organizations. Users need standards to interconnect products developed by different vendors and to move software, data ad applications from one system to another. However, the formal standards development process does not always respond to user needs in a timely way. The cost and complexity of the process often inhibits direct user participation over the long period of time needed to develop standards. Users also have difficulty applying the standards when they are developed in a fragmented and non-integrated fashion.

Prototype Information Retrieval System to Perform a Best-Match Search for Names.
Final rept.
N. E. Willman. 1994, 11p.
Sponsored by Social Security Administration, Washington, DC.
Pub. in Proceedings of RIAO 94' Conference on Intelligent Multimedia Information Retrieval Systems and Management, New York, NY., October 11-13, 1994, p751-761.

Keywords: *Information retrieval, *Information systems, Performance evaluation, Pattern recognition, Errors, Prototypes, Ranking, Reprints, *Proper names.

Personal names are often used as keywords in searches to retrieve information. The presence of misspellings and other errors in names can make an exact match of a keyword and a search query impossible. In these cases, it is necessary to be able to retrieve personal names that are similar to that of the personal name given in the search query. In addition, if an interactive search is required, it is necessary to retrieve matches quickly and to rank them in terms of their similarity to the search query. This paper discusses a prototype information retrieval system which was developed to test the feasibility of such a search, and the experimental results obtained using this system.

Helium Refrigeration and Liquefactlon Using a Liquid Hydrogen Refrigerator for Precooling.
Technical note.
D. B. Shelton, J. W. Dean, T. R. Strobridge, B. W. Birmingham, and D. B. Mann. 27 Jan 60, 36p.

Keywords: *Helium, *Refrigeration systems, *Liquefaction, *Liquid hydrogen, Circuits, Evaporators, Heat exchangers, Hydrogen, Production, Requirements, Temperature, Low temperature, Gases, *Precooling, Refrigerators.

Consideration is given to the use of a hydrogen refrigerator to assist in the production of temperatures below those obtained with hydrogen. A hydrogen refrigerator is used to maintain a precooling evaporator at or near 21 deg K in a helium gas circuit. The helium circuit may be arranged to produce liquid for external use or to produce refrigeration between 21 deg K and 4. 2 deg K in a closed system. Charts have been developed that show the requirements of the composite helium - hydrogen system and the effect of heat exchanger performance. The relative quantities of refrigeration (hydrogen and helium) at various temperature levels have been determined.

Keywords: *Bibliographies, *US NIST, Dimensional measurement, Robotics, Artificial intelligence, Production engineering, Information systems, Metrology, Primary standards, Calibrating, Precision, Sensors, Automation, *Manufacturing Engineering Laboratory.

The mission of the Manufacturing Engineering Laboratory (MEL) is to bring the resources of the National Institute of Standards and Technology to bear on the standards and measurement problems associated with America's discrete parts manufacturing. To fulfill this mission MEL conducts active programs of research in the areas of: High-precision dimensional measurement and precision engineering; Robotics and intelligent machines; Manufacturing data description, data administration, and information processing; and Sensors for manufacturing processes. This list of publications reflects the diversity of scientific and technical problems which have been attacked over the past fourteen years in fulfillment of the Laboratory's mission.

Heat Transfer in Thin, Compact Heat Exchangers with Circular, Rectangular, or Pin-Fin Flow Passages.
Final rept.
D. A. Olson. 1992, 10p.
Contract NLRC-L7400C
Sponsored by National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
Pub. in Jnl. of Heat Transfer 114, p373-382 May 92.

Keywords: *Heat transfer, *Pressure gradients, *Channel flow, *Flow geometry, Heat flux, Friction factor, Reynolds number, Nusselt number, Helium, Gas flow, Viscosity, Thermal conductivity, Reprints, *Compact heat exchangers.

We have measured heat transfer and pressure drop of three thin, compact heat exchangers in helium gas at 3.5 MPa and higher, with Reynolds numbers of 450 to 36,000. The flow geometries for the three heat exchanger specimens were: circular tube, rectangular channel, and staggered pin fin with tapered pins. The specimens were heated radiatively at heat fluxes up to 77 W/sq cm. Correlations were developed for the isothermal friction factor as a function of Reynolds number, and for the Nusselt number as a function of Reynolds number and the ratio of wall temperature to fluid temperature. The specimen with the pin internal geometry had significantly better heat transfer than the other specimens, but it also had higher pressure drop. For certain conditions of helium flow and heating, the temperature more than doubled from the inlet to the outlet of the specimens, producing large changes in gas velocity, density, viscosity, and thermal conductivity. These changes in properties did not affect the correlations for friction factor and Nusselt number in turbulent flow.

Energy Flows in an Orifice Pulse Tube Refrigerator.
Final rept.
W. Rawlins, R. Radebaugh, P. Bradley, and K. Timmerhaus. 1993, 8p.
Pub. in Advances in Cryogenic Engineering, v39 ptB p1449-1456 1993.

Keywords: *Mass flow, *Flow measurement, Enthalpy, Refrigerators, Entropy, Heat flux, Refrigerating machinery, Reprints, *Orifice pulse tube refrigerators, *Energy flow, *Enthalpy flow.

A technique which allows for the instantaneous measurements of mass flow rate and temperature in an orifice pulse tube refrigerator (OPTR) during actual operation has been developed recently. This paper presents the values of enthalpy, entropy, and work fluxes at the cold end of the pulse tube evaluated from these measurements. They are thermodynamically self consistent within 1%. An analytical model describing the operation of an OPTR was developed at the National Institute of Standards and Technology (NIST) in the late 1980's. This model assumes adiabatic performance of the pulse tube and purely sinusoidal mass flow rates, temperature, and pressure oscillations in the OPTR. The experimentally measured enthalpy flux varies from 60% to 85% of that predicted by the adiabatic model. The experimental work reported here also gives values for various phase relationships that are needed for some calculations with the analytical model.

Graded and Nongraded Regenerator Performance.
Final rept.
W. Rawlins, K. D. Timmerhaus, R. Radebaugh, J. Gary, and P. Bradley. 1993, 13p.
Sponsored by National Aeronautics and Space Administration, Moffett Field, CA. Ames Research Center.

Pub. in Proceedings of International Cryocooler Conference (7th), Santa Fe, NM., November 17-19, 1992, p471-483 1993.

Keywords: *Regenerators, *Cooling systems, *Performance testing, Regeneration(Engineering), Refrigerating machinery, Cryogenic cooling, Temperature measurement, Heat loss, Mass flow, Effectiveness, Performance evaluation, Reprints, *Pulse tube refrigerators.

A method to measure regenerator performance, in situ, in an orifice pulse tube refrigerator has been successfully developed. This was accomplished by inserting two, 2 mm long, tungsten wires with diameters of 4 micrometers perpendicular to the fluid flow at the cold end of the regenerator. The paper compares the performance between two different regenerators constructed from stainless steel mesh: one with a graded mesh (where three different mesh sizes are used for the matrix material) and another with a single mesh size throughout. Both expeirmental and numerical model results are presented. The numerical model indicated that there was only a very slight advantage to using a graded mesh in a generator, whereas experiments showed the graded mesh regenerator to have a slightly higher ineffectiveness.

Effect of Inclination on the Performance of a Compact Brazed Plate Condenser and Evaporator.
M. A. Kedzierski. Nov 95, 33p, NISTIR-5767.
Sponsored by Trane Co., La Crosse, WI.

Keywords: *Heat exchanges, *Refrigerating machinery, Schematic diagrams, Refrigerants.

The origins of the compact brazed plate heat exchanger (CBE) began in the 1920's with the first commercially successful gasketed-plate heat exchangers (Saunders, 1988). Milk producers and other food and drink processors satisfied hygiene requirements by periodically disassembling and cleaning the gasketed-plates. Applications for the compact brazed plate heat exchangers (CBEs) have increased in recent years. Currently, the compactness of the CBE drives its use as refrigerant evaporators and condensers. The purpose of this study was to identify the performance degradation associated with tilting a CBE from the designed vertical position.

Gage Block Standards, Measurement Capabilities and Laboratory Accreditation.
Final rept.
T. Doiron. 1992, 12p.
Pub. in NCSL Workshop and Symposium, August 1992, p183-194.

Keywords: *Gage blocks, *Interlaboratory tests, Reprints, Accuracy, Error budget, Standards, *Laboratory accreditation.

As the United States begins to seriously consider laboratory accreditation for calibration labs, the calibration of gage blocks (one of the most accurate and sophisticated of industrial measurements) has been suggested as the prototype dimension laboratory accreditation. One of the technical problems in implementing laboratory accreditation is determining the laboratory accuracy which is adequate for calibration systems. The author will discuss some of the problems inherent in the classifcation schemes of both the US and ISO standards and their relation to the current state of the art for gage block calibration.

Pub. in Jnl. of Vacuum Science and Technology, v14 n2 p1540-1546 Mar/Apr 96.

Keywords: *Metrology, Tip, Manufacturing, Scanners, Image analysis, Reprints, *Atomic force microscopes.

Atomic force microscopes are being used increasingly for process metrology. As a case study, the measurement by atomic force microscope of a soda lime glass optical disk patterned using optical lithography and reactive plasma etching is examined. The atomic force microscope used for this measurement has a highly accurate scanner system. The X, Y, and Z axes are calibrated using laser interferometry. To determine the shape of the tip used a commercially available tip calibration artifact was imaged both before and after the measurement. The image was corrected for the tip shape using mathematical morphology. The value of the atomic force microscope measurement is defined to be the impacts of the metrology on the product or process. It is shown that the value of atomic force microscopy process metrology on an optical disk is increased by using an accurate scanner, tip characterization, and morphological image analysis; however, the cost per measurement in increased as well. In general, the characteristics of the metrology required depends on the secific manufacturing process being supported.

Scanned Probe Microscope Tip Characterization Without Calibrated Tip Characterizers.
Final rept.
J. S. Villarrubia. 1996, 4p.
Pub. in Jnl. of Vacuum Science and Technology B, v14 n2 p1518-1521 Mar/Apr 96.

Keywords: *Metrology, Morphology, Reprints, *Atomic force microscopes, *Blind reconstruction, Scanned probe microscopy, Scanning tunneling microscopy.

In scanned probe microscopy the image is a combination of information from the sample and the tip. In order to reconstruct the true surface geometry, it is necessary to know the actual tip shape. It has been proposed that this shape may be constructed from images of 'tip characterizer' artifacts of independently known shape. The requirements for this strategy-dimensional uncertainty and instability of the characterizer small compared to the tip size-are not trivial. An alternative is 'blind reconstruction', which requires no information about the characterizer geometry apart from that contained within its image, yet produces an outer bound on the tip shape which for appropriately chosen characterizers is a good approximation. With blind reconstruction dimensional instability of characterizers is less problematical, and characterizer measureability is no longer a constraint, so more complex distributed characterizer has a known shape, blind reconstruction and the known-characterizer method may be combined.

Ultrasonic NDE of Sprayed Ceramic Coatings.
Final rept.
J. A. Slotwinski, and G. V. Blessing. 1996, 8p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v15 p1613-1620 1996.

Keywords: *Ceramic coatings, *Plasma spray, *Nondestructive evaluation, Alumina, Elastic moduli, Ultrasonics, Zirconia, Reprints.

Thermal spraying of protective coatings has been in use since 1917 when the initial application was the spraying of zinc layers onto steel structures to prevent corrosion. In the 1970's plasma-spray technology was first used with the introduction of vacuum plasma-spraying. Today, gases such as argon and nitrogen (sometimes with an additional gas such as helium or hydrogen) are often used in plasma-spray guns. In plasma-spraying an electric-arc discharge heats the gas stream to high temperature (equal to or greater than 10,000 K), turning it into a plasma. The gas exits the spray-gun at high speed (approx. 200 m/s to 600 m/s) towards the material to be coated. Material powder (often carried by a second gas stream) is injected into the plasma stream, where it melts into liquid droplets. These droplets are carried onto the target surface, where they rapidly cool (approx. 10 to the sixth power K/s) into solid, flat splats. A layer of material can be built up by repeated spraying of the same surface area.

Intracycle Evaporative Cooling in a Vapor Compression Cycle.
B. S. Kim, and P. A. Domanski. Sep 96, 28p, NISTIR-5873.
Sponsored by Department of Energy, Washington, DC. Office of Building Technology.

Keywords: *Evaporative cooling, *Vapor compression refrigeration cycle, Heat pumps, Refrigerating, Buildings, Air conditioning.

The temperature glide of zeotropic mixtures during phase change provides the opportunity to limit throttling losses of the refrigeration cycle by intracycle evaporative cooling of the refrigerant leaving the condenser. Intracycle evaporative cooling is similar to the

use of the liquid-line/suction-line heat exchanger with the difference that a two-phase low-pressure refrigerant, instead of superheated vapor, is used to subcool the high-pressure liquid leaving the condenser. Intracycle evaporative cooling was evaluated by a semi-theoretical simulation model and in the NIST's Small Breadboard Heat Pump at the cooling mode operating condition typical for a water-to-water residential heat pump. The capacity, coefficient of performance (COP), pressures, and temperature profiles of refrigerant and heat-transfer fluid in the heat exchangers are reported. The laboratory measured improvement of the COP was 4.0% for R-32/152a, 3.6% for R-407C, and 1.8 percent for R-23/152a.

Transient Analysis of a Line-Focus Transducer Probing a Liquid/Solid Interface.
Final rept.
N. N. Hsu, D. Xiang, S. E. Fink, and G. V. Blessing. 1996, 8p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, Seattle, WA., July 30-August 4, 1995, p995-1002 1996.

Keywords: *Line-focus transducer, *Transient ultrasonic wave, Materials, Reprints, Time-domain Green's function, Transducer response function, Ultrasonic tests, Liquid-solid interfaces.

The use of a line-focus ultrasonic transducer in a vertical scanning reflection acoustic microscope system is well known for quantitative materials characterization. The technique relies on the measurement of the reflected radio frequency tone burst echo emplitude, V, as a function of amount of defocus, z, and analysis of the interference minima of the V(z) curve to obtain various interface wave speeds. The technique uses well developed theory representing fixed frequency ultrasound generated and detected by a cylindrical lens in the frequency domain. The authors have developed a large aperture lensless line-focus transducer which is highly efficient and has a bandwidth wide enough to allow the generation and detection of narrow transient pulses. From this transducer placed in water near a solid sample, the resulting echo waveforms have multiple features which can be interpreted as the arrival of specularly reflected axial ray and leaky surface waves. Using this transducer, the authors have developed a time-resolved and polarization-sensitive testing tehcnique for materials characterization. The objective of the paper is to provide a theoretical basis for interpretation and analysis of these time domain waveforms.

Material Characterization By a Time-Resolved and Polarization-Sensitive Ultrasonic Technique.
Final rept.
D. Xiang, N. N. Hsu, and G. V. Blessing. 1996, 8p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, Seattle, WA., July 30-August 4, 1995, v15 p1431-1438 1996.

Keywords: *Ultrasonic microscopy, *Transducers, Leaky waves, Reprints, *Line-focus transducer, PVDF transducers.

Acoustic microscopy provides materials characterization by measuring the leaky surface wave speed and attenuation in sample materials. These measurements may be interpreted by analyzing a V(z) curve, which is a record of the voltage of the transducer as a function of the defocus distance z between the focal point and sample surface. Since the V(z) curve results from the interference between the leaky surface waves and the direct-reflected wave in a tone-burst mode of operation, the fast Fourier transform (FFT) technique is commonly used to analyze the V(z) curve in the frequency domain. While this manner of acoustic microscopy utilizes a small aperture lens and high frequency tone bursts in order to obtain high spatial resolution, the system cost is greater than the alternative short-pulse broadband systems. Furthermore, high spatial resolution is not necessary for many practical measurements, for example in the case of composite materials.

Design, Construction and Application of a Large Aperture Lens-Less Line-Focus PVDF Transducer.
Final rept.
D. Xiang, N. N. Hsu, and G. V. Blessing. 1996, 7p.
Pub. in Ultrasonics, v34 p341-347 1996.

Keywords: *Transducers, *Materials characterization, Reprints, *Green's function, *PVDF transducers, *Line-focus transducers.

A large aperture lens-less line-focus transducer for materials characterization is described. The transducer design is based on a time-domain Green's function formalism, which also yields good theoretical corroboration of the experimental results. The transducer construction is readily achieved by conforming commercial polyvinylidene fluoride (PVDF) film to a cylindrical (convex) surface, followed by casting a tungsten-powder-loaded epoxy resin backing material into an attached housing. This transducer can be used to characterize sample material properties by simultaneously measuring surface wave speeds and bulk wave transit times, from which the thickness and anisotropy may be deduced.

The Database Language SQL (SQL) is a standard interface for accessing and manipulating relational databases. As such, SQL can be used in many different operational environments, with correspondingly different needs for security. One specific application of this standard is in the field of Product Data Exchange using STEP (PDES). This paper examines the security implications of the versions of the SQL standard as used to implement STEP. STEP does not imply any particular security policy, so a variety of security policies are examined. The paper has been written as a companion document to the National Institute of Standards and Technology's (NTIS's) general SQL security document, 'Security Issues in the Database Language SQL', and references that document frequently.

Variant Design for Mechanical Artifacts-A State of the Art Survey.
Internal rept.
J. E. Fowler. Feb 94, 28p, NISTIR-5356.

Keywords: *Computer aided design, Reasoning, Specifications, Feature extraction, Mathematical models, Standards, *Variant design, STEP(Standard for the Exchange of Product Model Data).

Variant design refers to the technique of adapting existing design specifications to satisfy new design goals and constraints. Specific support of variant design techniques in current computer aided design systems would help to realize a rapid response manufacturing environment. A survey of approaches supporting variant design is presented. Capabilities used in current commercial computer aided design systems are discussed along with approaches used in recent research efforts. Information standards applicable to variant design are identified as well. Barriers to variant design in current systems are identified and ideas are presented for augmentation of current systems to support variant design.

EXPRESS is the official information modeling language of the next generation of product information standards, commonly referred to as STEP or Standard for the Exchange of Product Model Data. This paper presents a Structural EXPRESS Editor (SEXE), which has two parts: an Interactive Editor, and a Translation Module. The Interactive Editor was built using a tool called the Data Probe Editor (DPE) Builder and is an interactive, friendly editor with which a user defines the structure of an EXPRESS schema. The output of the Interactive Editor is a STEP exchange file that is translated into EXPRESS by the Translation Module, a software system written in LISP. The paper describes the DPE Builder and both parts of SEXE. The editor is assessed and EXPRESS editors, generally, are discussed. Alternative representations of EXPRESS are presented. A few issues in information modeling highlighted in the course of building the editor are discussed.

Technical experts are developing the next generation product information exchange standards, called the Standard for the Exchange of Product Model Data (STEP). The STEP project is using the application protocol (AP) methodology for defining the information requirements of industry and for specifying standards for representing these requirements. Several APs have already been drafted. Before the AP methodology is expanded to address more complex problems, and before any more AP projects are initiated, the fundamental methods for developing and testing APs must be completed and proven. This report provides a description of application protocols, a summary of AP development issues (supplemented by discussions and case studies in the appendices), a listing of the relevant documentation and issues papers, and recommendations for resolving the identified issues. This includes recommendations on functional requirements for an AP framework, elements of AP structure, coordination of AP development, and AP classification. This report provides a baseline study for subsequent work on an AP Framework by members of the STEP community.

Keywords: *Industrial plants, *Automation, *Petrochemistry, Design, Construction, Operation, Engineering, Constraints, Data processing, Digital data, Benefit cost analysis, Computer aided design, Computer aided manufacturing.

Initially, the report presents a constraint framework that can identify all the root constraints and their associated activities for the engineering, construction, and operation of a petrochemical plant. Second, it demonstrates how the constraint framework leads to functional models of design that can be traced directly to the constraints they address. This avoids some of the problems in basing models on design tasks assigned within phases. Third, it demonstrates how external constraints do, in fact, influence design and how to analyze their influence. Fourth, it discusses some of the data that is produced to document that the constraints have been satisfied. It provides a list of some of the tools that support the creation and maintenance of these data sets. Last, it discusses the business case for 3D design and for digital Piping and Instrumentation Drawings (P&ID) delivery.

This paper gives a brief overview of the concepts of enterprise integration, defines a national strategy for enterprise integration (EI) that involves not only standards bodies but also the government and industry groups with an interest in EI technology and standards, and proposes that one specific standards organization, the US PRO that oversees the Initial Graphics Exchange Specification (IGES) Product Data Exchange using STEP (PDES) Organization, develop a new extended scope that will tackle the EI standards issues. Finally, a business case for US PRO involvement in EI is discussed, first through the identification of key issues requiring resolution, and then through listing the pros and cons of extending the scope to enterprise integration framework standards. As reference information to support the paper, the key government and industrial groups that are involved in EI-related technology development programs are described along with the organizations that have a stake in the standards process.

Industry has a need to share data among functions within its own enterprise and among its suppliers and partners. A standard specification for manufacturing data is needed that can support the entire product development and support life-cycle. The emerging international standard called the Standard for the Exchange of Product Model Data (STEP) is addressing this need by specifying what data is needed within industrial application areas, how it should be represented, and how it should be exchanged. The Application Protocol Development Environment (APDE) is a software project at the National Institute of Standards and Technology (NIST) designed to facilitate the development, acceptance, and use of STEP. The paper discusses the status of STEP, barriers to the development, acceptance, and use of STEP, and the benefits of using STEP in industry. Aspects of the APDE project are also discussed including current status, lans for a STEP information base, use of the Standard Generalized Markup Language (SGML) for facilitating the information base, barriers to the project, and expected benefits for STEP.

Initial NIST Testing Policy for STEP: Beta Testing Program for AP 203 Implementations. National PDES Testbed Report Series.
M. J. Mitchell. 3 Nov 94, 25p, NISTIR-5535.
Also available from Supt. of Docs. Sponsored by CALS Evaluation and Integration Office, Washington, DC.

Keywords: *Tests, Policies, Protocols, Programs, Laboratories, Methodology, Standards, Computer aided design, Product development, *STEP(STandard for the Exchange of Product model data), *STandard for the Exchange of Product model data, *US NIST, Conformance testing, ITI(Industrial Technology Institute), Application protocols.

The standard for Product Data Representation and Exchange, ISO 10303, defines a neutral, computer-interpretable representation for describing product data in a manner that is independent from any particular system. This standard is more commonly known as STEP, STandard for the Exchange of Product model data. This document describes the policy and procedures for a 'beta' conformance testing program for one of the application protocols: Configuration Controlled 3D Design for Mechanical Parts and Assemblies (ISO 10303-203). However, the concepts described are applicable to ISO 10303 in general, and the characteristics of the longer term testing program are described. This document describes the policy and procedures used by the National Institute of Standards and Technology (NIST) and the Industrial Technology Institute (ITI) for the Beta STEP Conformance Testing Program. The objective of this beta program is to develop an acceptable degree of confidence in the test methods and procedures.

Initial Graphics Exchange Specification (IGES): Procedures for the NIST IGES Validation Test Service.
J. A. Schneider, and L. S. Rosenthal. Dec 94, 36p, NISTIR-5541.

Keywords: *Tests, Computer aided design, Computer aided manufacturing, Data transfer(Computers), Preprocessors, Federal information processing standards, *CALS, *IGES(Initial Graphics Exchange Specification), *Initial Graphics Exchange Specification, Continuous Acquisition and Life-Cycle Support, Computer-aided Acquisition and Logistics Support, US NIST, Postprocessors, Conformance testing.

This document provides general procedures for the National Institute of Standards and Technology's (NIST) Initial Graphics Exchange Specification (IGES) Validation Test Service. The NIST IGES Validation Test Service provides a way of determining the degree to which an implementation conforms to the FIPS PUB 177, which adopts the ANSI standard (ASME/ANSI Y14.26M-1989) in its entirety. The NIST IGES Validation Test Service also provides a way of determining the degree to which an implementation confirms to the Continuous Acquisition and Life-Cycle Support (CALS) specification, MIL-D-28000, Class II subset. The goal of the NIST Validation Test Service is to maximize the probability of successful data exchange between dissimilar CAD/CAM systems. The document is divided into two testing programs: preprocessor and postprocessor testing. The procedures are organized into four sections: an introduction, general procedures, and specific procedures for the two testing programs.

The National Institute of Standards and Technology (NIST) has built numerous software toolkits and applications for manipulating STEP and EXPRESS data. The NIST EXPRESS Server is a computational facility at NIST, which provides the ability to run these toolkit-based applications remotely without installing them locally. Users e-mail EXPRESS Schemas and other data files to the Server. The Server runs the requested applications on the files and returns any diagnostics or output, also by e-mail. Applications requiring interaction can either be returned via e-mail so that they can be run locally, or run remotely by telnet or rlogin across the Internet.

Operating Procedures and Life Cycle Documentation for the Initial Graphics Exchange Specification.
G. F. Morea, E. Reid, and C. Parks. 22 Jun 95, 62p, NISTIR-5666.

Keywords: *Changes, *Editing, *Standards, Administrative procedures, Documentation, Record keeping, Standardization, Computer aided design, Data processing, Data transfer(Computers), Concurrent engineering, *IGES(Initial Graphics Exchange Specification), *Initial Graphics Exchange Specification.

The purpose of this document is to provide a record of the underlying rationale and the detailed procedures by which the Initial Graphics Exchange Specification (IGES) is changed, new versions are approved, and the document itself is edited, maintained, and published by the IGES Project of the IGES/PDES Organization (IPO). The document also defines the life cycle documentation supporting these activities and provides guidance for its use, including record keeping requirements, to provide evidence of compliance with these procedures. Procedures given in this document are intended to be supplementary to and consistent with the documented procedures of the General Assembly of the IPO for the IGES Project. In general, procedures in this document are at a more detailed, working level.

Product Models and Virtual Prototypes in Mechanical Engineering.
M. J. Pratt. May 95, 22p, NISTIR-5650.
Presented at the IFIP Working Group 5.10 Workshop on Virtual Prototyping, Providence, RI., September 21-23, 1994.

Keywords: *Product development, *Models, *Prototypes, *Mechanical engineering, Virtual reality, Computerized simulation, Computer graphics, Computer aided design, Computer aided manufacturing, Systems integration, Production engineering, Knowledge based systems, Feature extraction.

The paper gives an overview of some of the modeling and virtual prototyping techniques used in product realization, with emphasis on the mechanical engineering field. It is pointed out that virtual prototypes, in the commonly accepted sense of computer models permitting realistic graphical simulation, represent only one class amongst the many types of computer models used in design and planning for manufacture. Each such model is usually created for some comparatively narrow purpose, and one of the major problems faced by developers of product realization systems concerns the transmutation of one type of model into another. A related problem is that of interpretation by any model of information generated by interrogations of another model. These difficulties are compounded by the increasing presence in such models of semantic information concerning different aspects of the intended functionality or manufacturing requirements of the modelled artifact.

Object-Oriented Tel/Tk Binding for Interpreted Control of the NIST EXPRESS Toolkit in the NIST STEP Application Protocol Development Environment.
Final rept.
D. Libes, and S. N. Clark. 1995, 14p.
Pub. in Proceedings of the EXPRESS User Group Workshop (EUG '95), Grenoble, France, October 21-22, 1995, p1-14.

Keywords: *Software tools, *Object-oriented programming, *Standards, Computer aided design, Computer aided manufacturing, Systems engineering, Protocols, Reprints, PDES(Product Data Exchange using STEP), National PDES Testbed, STEP(Standard for the Exchange of Product model data), APDE(Application Protocol Development Environment), TCL(Tool Command Language), TCL programming language, TK(Task knowledge).

The National Institute of Standards and Technology (NIST) has built numerous software toolkits and applications for manipulating STEP and EXPRESS data. These toolkits are traditionally used as compiled libraries which are linked to other complied modules. This paper describes a binding allowing the toolkit interfaces to be called from interpreted scripts. This significantly reduces the time required to construct and compile new applications. An X11 extension allows the construction of graphic elements, providing easy creation and integration of existing applications into X graphic user interfaces. We describe how the combination of bindings has been used to construct a STEP Application Protocol Development Environment.

Guidelines for the Development of Mapping Tables.
A. B. Feeney, and D. Craig. 16 Nov 95, 24p, NISTIR-5716.
Prepared in cooperation with Product Data Integration Technology, Long Beach, CA.

Keywords: *Computer aided language, *Computer aided manufacturing, *Standards, Data processing, Product development, Data management, *STEP(Standard for the Exchange of Product Model Data), APDE(Application Protocol Development Environment).

The mapping table is a pivotal component of an application protocol (AP). The mapping table documents the traceability of the application information requirements between the specification of these requirements in clause 4 of the AP and the application interpreted model (AIM) that documents how standardized constructs are applied to satisfy these requirements in clause 5. The document is intended to provide guidance to application protocol development teams on the creation of mapping tables. Additionally, the document may aid reviewers and implementors of APs in understanding mapping tables. The document describes the methodology for producing a complete mapping table, focusing on the development of the mapping table content. Specifics on style, format, boiler plate text, and other presentation issues are provided in the Supplementary directives for the drafting and presentation of ISO 10303 (Supplementary directives). Additional guidance on other areas of AP development is found in the Guidelines for development and approval of STEP application protocols.

STandard for the Exchange of Product Model Data (STEP): Procedures for NIST STEP Validation.
L. S. Rosenthal. Nov 95, 19p, NISTIR-5771.
See also PB95-154688.

Keywords: *Tests, Policies, Protocols, Programs, Laboratories, Standards, Computer aided design, Product development, *STEP(Standard for the Exchange of Product Model Data), Standard for the Exchange of Product Model Data, Conformance testing, Application protocols, ITI(Industrial Technology Institute), ISO 10303.

The standard for Product Data Representation and Exchange, ISO 10303, defines a neutral, computer-interpretable representation for describing product data in a manner that is independent from any particular system. This standard is more commonly known as STEP, Standard for the Exchange of Product model data and it is designed to support a wide range of design, engineering, and product support applications. STEP was adopted verbatim as an American National Standard (ANS) titled Product Data Exchange using Step, ANSI USPRO 200. Support for specific applications is provided through an Application Protocol. This document provides general procedures for the National Institute of Standards and Technology's (NIST) STEP FIPS Validation Service. The Validation Service provides a way of determining the degree to which an implementation conforms to the proposed STEP FIPS. The goal of the Validation Service is to maximize the probability of successful interchange among systems which implement the same STEP applications protocol.

Template-Driven Systems Development with IDEF: Enterprise Standards for Reuse.
Final rept.
M. H. Law. 1992, 10p.
Pub. in IDEF Users Group Business Process Design: A Strategy for Corporate Information Management, Washington, DC., October 19-22, 1992, p1-10.

Keywords: *Software reuse, *Systems approach, *Integrated systems, Computer-aided design, Computer-aided manufacturing, Software engineering, Software reliability, Object-oriented programming, Parameterization, Standards, Reprints, IDEF(Integrated Definition), CASE(Counter-Aided Software Engineering), System development, Domain analysis, Life cycles(Software).

This paper addresses the use of reusable template-driven architectures to improve system and software development methods with an extended IDEF. Extended IDEF is proposed as a family of modeling techniques that has been integrated with the proposed Federal Information Processing Standards (FIPS) for IDEFO and IDEFIX, and extended to offer more support for the system and software development lifecycle. Integrated through a metamodel, Extended IDEF will present a number of distinct views to users working in different aspects of the lifecycle, such as activity modeling, data modeling, object modeling, state/event modeling, etc. Integration through the metamodel is intended to maintain the critical relationships among the IDEF techniques; extension through the lifecycle is intended to expand the utility of IDEF.

Group 1 for the Plant Spatial Configuration STEP Application Protocol.
S. W. Kline, M. E. Palmer, W. Burkett, and J. Skeels. Jun 95, 202p, NISTIR-5675.
Prepared in cooperation with Product Data Integration Technology, Long Beach, CA.

Keywords: *Computer aided manufacturing, *Industrial plants, *Computer aided design, *Standards, Standard tools, Pipes tubes, Models, *STEP(Standard for the Exchange of Product Model Data), ISO 1303, Standard for the the Exchange of Product Model Data, Application protocols, Spatial distribution.

The document specifies the scope and information requirements of the STEP application protocol (AP) for the exchange of spatial configuration information of plant systems with a central emphasis on piping systems. It specifies the information required to construct a piping system, including the shape, material, and arrangements of the system components. It also specifies requirements for the physical aspects of other plant systems (e.g., structure) needed to design and layout the piping system. The document includes the application activity model (AAM) and application reference model (ARM) for this AP. The document was submitted to ISO TC184/SC4 and to international experts for review and comment on the scope and requirements of the AP. Additional clauses and annexes and refinements will be added to the AP after the completion of the ISO Committee Draft for Comment review.

Aspects of a Product Model Supporting Apparel Virtual Enterprises.
P. O. Denno. 16 Apr 96, 15p, NISTIR-5821.
See also PB96-128194.

Keywords: *Clothing industry, *Computer aided design, Computer aided manufacturing, Data transfer, Patterns, Tests, Models, Data structures, Data exchange, Standard, Product data, Textile industry, STEP(Standard for the Exchange of Product Model Data).

Emerging computer technology, including an infrastructure for virtual enterprises and more capable apparel product development software, is providing an opportunity to reinvent how apparel is produced. The development of an information-rich and unambiguous garment product model would help realize this opportunity. This product model would improve the effectiveness of product development software and enhance the industry's ability to distribute work in virtual enterprises. This paper suggests what such a product model should contain, how it can be developed and how it would be utilized throughout the product development life cycle to enable apparel virtual enterprises.

Application Protocol Information Base World Wide Web Gateway.
Technical rept.
J. Lubell. 31 Jul 96, 27p, NISTIR-5868.

Keywords: *Documents, *Standards, Parsers, Text processing, Information retrieval, *STEP(Standard for the Exchange of Product Model Data), Standard for the Exchange of Product Model Data, SGML(Standard Generalized Markup Language), Standard Generalized Markup Language, APID(Application Protocol Information Base), Application Protocol Information Base, Internet, World Wide Web, HTML, Browsers.

The Application Protocol Information Base (APIB) is an on-line repository of documents for the Standard for the Exchange of Product Model Data (STEP, officially ISO 10303-Product Data Representation and Exchange). STEP Application Protocols are standards that are intended to be implemented in software systems, and Integrated Resources are used by them as building blocks. Application Protocols and Integrated Resources are represented in the Standard Generalized Markup Language (SGML) in the APIB in order to facilitate efficient information search and retrieval. This paper describes a World Wide Web gateway to the APIB, implemented using the Common Gateway Interface(CGI) standard. The APIB gateway allows STEP developers to efficiently search for ISO 10303 standards and supporting information. The only client software required to use the APIB gateway is a third party web browser.

Representing Designs with Logic Formulations of Spatial Relations.
Final rept.
S. C. Chase. 1996, 9p.
Pub. in International Conference on Artificial Intelligence in Design (AID) (4th): Workshop Notes, Visual Representation, Reasoning and Interaction in Design, Stanford University, CA., June 22-27, 1996, p1-9.

Keywords: *Logic programming, *Computer-aided design, *Representations, Computer graphics, Feature extraction, Pattern recognition, Shape, Geometry, Parameterization, Formalism, Computer models, Specifications, Reprints, *Spatial relations.

A new method of describing designs by combining the paradigms of shape algebras and predicate logic representations is presented. Representing shapes and spatial relations in first order predicate logic provides a natural, intuitive method of developing complete computer systems for reasoning about designs. Shape algebraic representations provide several advantages over more traditional geometric representations. The method described involves the definition of a large set of high level design relations from a small set of simple structures and spatial relations.

Combining Interactive Exploration and Optimization for Assembly Design.
Final rept.
G. J. Kim, and S. Szykman. 1996, 12p.
Pub. in American Society of Mechanical Engineers Design Engineering Technical Conference and Computers in Engineering Conference, Irvine, CA., August 18-22, 1996, p1-12.

Keywords: *Computer aided design, *Tools, Optimization, Standards, Quality assurance, Reprints.

The paper presents an integrated framework for assembly design. The framework allows the designer to represent knowledge about the design process and constraints, as well as information about the artifact being designed, design history and rationale. Because the complexity of assembly design leads to extremely large design spaces, adequately supporting design space exploration is a key issue that must be addressed. This is achieved in part by allowing the designer to use both top-down and bottom-up ap-

proaches to assembly design. Exploration of the design space is further enabled by incorporating a simulated annealing-based optimization tool that allows the designer to rapidly complete partial designs, refine complete designs, and generate multiple design alternatives.

Improving the Design Process by Predicting Downstream Values of Design Attributes.
Final rept.
S. Szykman. 1996, 9p.
Pub. in Proceedings of the American Society of Mechanical Engineers Design Engineering Technical Conference and Computers in Engineering Conference, Irvine, CA., August 18-22, 1996, p1-9.

Keywords: *Computer-aided design, *Product development, Design analysis, Design criteria, Feature extraction, Attributes, Specifications, Automation, Computer tools, Computer models, Reprints, *Design process.

The paper presents a computational approach to developing design space models that are utilized to improve the design process by predicting values of downstream design attributes based on information available at early stages, such as preliminary design specifications. The predictive models are similar in function, though not in form, to the internal (mental) models created by experienced designers; however, the advantages of these models are that it may be possible to construct them in the absence of a designer's internal models, and that they can be passed on to and used by less experienced designers. Once created, the computational models aid designers in exploration of design alternatives and to reduce design costs and product development time.

Keywords: *Computer aided design, *Computer aided manufacturing, Product development, Automation, Standards, Production planning, Specifications, Process engineering, Systems engineering, Protocols, *PDES(Product Data Exchange using STEP), Concurrent engineering, STEP(Standard for the Exchange of Product Model Data), ISO(International Standards Organization), ISO10303.

The document specifies the scope and information requirements of the STEP application protocol (AP) for the exchange of process engineering data with a central emphasis on process design and major equipment. It specifies the information required to exchange process engineering and conceptual design information for process plants. The information forms the conceptual basis for the specification, selection, and operation of process plant equipment over the plant life cycle. The AP supports continuous and batch processes, process simulations, stream data, unit operations, conceptual design requirements for major process equipment, and conceptual process control strategies. The document includes the application activity model (AAM) and application reference model (ARM) for this AP. The document was submitted to ISO TC184/SC4 and to international experts for review and comment on the scope and requirements of the AP. The document follows the format and clause numbering scheme prescribed for this type of International organization for Standardization (ISO) standard. Additional clauses and annexes and refinements will be added to the Ap after the completion of the ISO Group 1 review.

Capabilities for Product Data Exchange.
Final rept.
M. J. Mitchell. 1996, 7p.
Pub. in Proceedings of an International Multidisciplinary Conference Intelligent Systems: A Semiotic Perspective, Capabilities for Product Data Exchange, 7p 1996.

Keywords: *Computer-aided design, *Computer-aided manufacturing, Reprints, Product development, Standards, Specifications, Data management, Communication, Integrated systems, ISO, *STEP(Standard for the Exchange of Product Model Data), *Standard for the Exchange of Product Model Data, *PDES(Product Data Exchange Specification), *Product Data Exchange Specifications.

The paper describes the need for standardized representations of product information which are suitable for electronic communication between engineering and manufacturing functions. It then describes how a single international standard, ISO 10303 - Product data representation and exchange, has been designed to meet this industrial need. The benefits of STEP and the scope of the standard are presented. A high level technical description is given; this includes a description of the segments of the standard that can be used by readers to determine if the standard satisfies any of their company's needs for product data exchange. Key players in the development and implementation of STEP along with sources of additional information are provided.

Keywords: *Computer aided manufacturing, *Management information systems, Scheduling, Shops(Work areas), Integrated systems, Computer applications, Graphical languages, Functions, *IDEF0(Integration Definition for Function Modeling), Software standards, Modeling techniques, Business process improvement, Activity modeling.

The standard is based on the Air Force Wright Aeronautical Laboratories Integrated Computer-Aided Manufacturing (ICAM) Architecture, Part II, Volume IV -- Function Modeling Manual (IDEF0), June 1981 (AD-B062 457). The standard describes the IDEF0 modeling language (semantics and syntax), and associated rules and techniques, for developing structured graphical representations of a system or enterprise. Use of this standard permits the construction of models comprising system functions (activities, actions, processes, operations), functional relationships, and data (information or objects) that support systems integration. The standard is the reference authority for use by system or enterprise modelers required to utilize the IDEF0 modeling technique, by implementors in developing tools for implementing the technique, and by other computer professionals in understanding the precise syntactic and semantic rules of the standard.

Applying Virtual Environments to Manufacturing.
S. Ressler. Jan 94, 28p, NISTIR-5343.

Keywords: *Manufacturing, Computer graphics, Man computer interface, Technology assessment, Computer applications, Case studies, *Virtual environments, Synthetic environments, Virtual reality.

This document presents a high level overview on the use of Virtual Environments for manufacturing applications. A brief introduction of the many component technologies used to create 'virtual environments' gives the reader enough background for discussion. The terms virtual environment, virtual reality and synthetic environments all refer to the concepts of placing a human inside a synthetic or virtual environment and allowing interaction with the environment in a number of ways. In recent years applications of virtual environments are beginning to appear. In addition to the basics of the various technologies, information on where to go to get more information on these technologies is also included. A series of case studies illustrating the use of virtual environments for a variety of manufacturing applications is presented.

The Manufacturing Engineering Laboratory (MEL) at the National Institute of Standards and Technology (NIST), has been conducting research on control of mechanical systems for more than sixteen years. The Robot Systems Division has developed an architecture, the Real-time Control System (RCS) which focuses on providing real-time control of equipment. The Factory Automated Systems Division has developed the Manufacturing System Integration (MSI) architecture which focuses on providing information integration with factory production systems. While the architectures share some common features such as the use of hierarchical control and task decomposition, there are also differences. This report documents the work performed in assessing the feasibility of combining the RCS and MSI architectures into a single reference architecture. The report is written primarily for the team of researchers charged with developing the joint architecture. It includes a literature survey, a framework for developing the joint architecture, a detailed set of issues about architectures and control architectures, and a preliminary sketch of the joint architecture.

The report describes the 1993 technical program of the Factory Automation Systems Division (FASD), one of five technical divisions in the Manufacturing Engineering Laboratory (MEL), within the National Institute of Standards and Technology (NIST). MEL supports the U.S. mechanical manufacturing industry through research and measurement services that are oriented toward a modern automated environment. The mission of FASD is to provide a focus for national research and standards efforts related to information systems for manufacturing. In carrying out its mission, the Division contributes to the strength of manufacturing in the United States and to the ability of the United States to remain competitive in world markets. The Division provides leadership in the development of national and international standards relating to information technology and manufacturing systems to meet U.S. industry needs for the twenty-first century. The work is organized around five key technologies: Enterprise Integration, Product Data Exchange, FCIM Processes, Communications and Networking, and Database and Database Management. Typical outputs for the Division include: draft specifications for future standards, journal papers describing research results, prototype software systems that demonstrate proof-of-concept, test methodologies for supporting the implementation of standards and testbeds for use by NIST, industry, and academia.

Keywords: *Clothing, *Anthropometry, *Size determination, *Bibliographies, Measurement, Clothing industry, Standards, APDES(Apparel Product Data Exchange Specification).

Anthropometric data and sizing systems is an important component of apparel quality. Apparel can not be top quality unless it fits satisfactorily the potential wearers. Much research has been conducted on this topic area. Some of these research results are documented but scattered. The purpose of the report is to collect these documentation/references for the quick use of apparel researchers who are studying sizing and its related issues. The report presents an annotated bibliography for apparel sizing and related issues. The report lists full bibliographic reference data and a brief abstract or summary for each technical paper or book. The literature collection for the bibliography includes documents from books, journals, reports, and national and international standards.

Contract N00014-92-F-0082
Sponsored by Naval Research Lab., Washington, DC. Navy Manufacturing Technology Program.

Keywords: *Metrology, *Computer aided manufacturing, *Dimensional measurement, *Weapon systems, Inspection, Navy, Measuring instruments, Quality assurance, Surveys, Production engineering, *Coordinate Measuring Machines, Integrated manufacturing.

This report presents the results of a one year study of Coordinate Measuring Machine (CMM) technology at US Navy manufacturing facilities, both in-house and contractor. The study was sponsored by the Navy Manufacturing Technology (ManTech) program through the NIST Automated Manufacturing Research Facility (AMRF) and was conducted by technical staff members of the NIST Manufacturing Engineering Laboratory (MEL). The results of the study are an analysis of the state-of-the-practice in the Navy regarding CMM utilization specifically with respect to weapon system manufacture. The results of the study are also an analysis of the Navy's needs in CMM technologies.

AMRF Composite Fabrication Workstation.
Final rept.
R. J. Norcross, W. R. Bunch, and R. D. Kilmer. 1990, 6p.
Pub. in Proceedings of International Symposium on Robotics and Manufacturing (3rd): Research, Education, and Applications, British Columbia, Canada, July 18-20, 1990, p655-660.

Keywords: *Thermosetting plastics, *Workstations, *Robots, *Computer aided manufacturing, *Fiber reinforced composites, Manipulators, Robotics, Composite materials, Real time, Matrix materials, Control systems, Reprints.

The Robot Systems Division of the National Institute of Standards and Technology (NIST) has initiated development of an advanced manufacturing workstation for the fabrication of composite parts. The focus of this project will be the application of sensor-based hierarchically controlled robot systems to automated fiber placement of thermoplastic composite materials. In such a system, continuous fiber reinforced thermoplastic polymer is fed from a spool and applied onto a mandrel or part form. The orientation of the fiber is based on the part's geometry and structural design. As the composite material is applied, it is heated to melt the polymer matrix, and then consolidates in place as it cools. The intention of this project is to demonstrate that the use of fiber placement via two cooperating robot manipulators and in-situ consolidation, can provide the capability to efficiently produce complex shaped composite parts.

Keywords: *Process control, *Computer aided manufacturing, *Nondestructive testing, *Composite materials, Microstructure, Artificial intelligence, Sensors, Signal processing, Control systems, Reprints, *Intelligent processing.

Advanced materials are capable of providing outstanding or specialized properties, or combinations of properties, that cannot be obtained in conventional materials. These unique properties are the result of the sophisticated microstructure that is designed and built into the materials. However, advanced materials generally require unusual and difficult to control processing operations in order to achieve their unique microstructures. A promising direction towards overcoming these difficulties involves intelligent processing of materials. This approach controls the microstructure in contrast to conventional materials processing where process variables such as temperature and pressure are automatically controlled to preselected values. In an intelligent processing system advanced nondestructive evaluation (NDE) sensors are utilized to characterize the evolution microstructure of the material in real time. Moreover, these data and data from conventional process variable sensors are transmitted to a computerized decision-making system. This computer system transmits control signals based on the sensor data, a process model, and process data.

State-of-the-Art Survey of Methodologies for Representing Manufacturing Process Capabilities.
M. E. A. Algeo. Mar 94, 30p, NISTIR-5391.

Keywords: *Computer aided manufacturing, *Processes, Data management, Industrial plants, Resources, Standards, Mathematical models, Data bases, State of the art, Methodologies.

Representations of manufacturing process capabilities are essential for the integration of manufacturing applications as well as the dynamic management of factory data. The survey presents methodologies for describing and using such information within the domain of discrete parts manufacturing. Current practices in industry are identified. Standards and research efforts related to representing manufacturing process capabilities also are described. Finally, a course of action for advancing current practices is presented.

Keywords: *Computer aided manufacturing, *Control systems, *Interfaces, *Specifications, Integrated systems, Hierarchies, Production planning, Models, Production control, NIST(National Institute of Standards and Technology), MSI(Manufacturing Systems Integration), Job control.

This document is concerned with defining the details of the interfaces for control entities which are incorporated into an integrated system that conforms to the National Institute of Standards and Technology (NIST) Manufacturing Systems Integration (MSI) architectural model as revised in 1992. The purpose of this document is twofold: to document the progress and current status of the MSI architecture's control entity interfaces and to provide designers and implementors with specifications for an MSI architectural compliant control entity. Section 2 provides an overview of the MSI project. Section 3 discusses production plans in the context of the interaction between planners and job controllers. Section 4 discusses generic data objects which are common to several of the 5 control entity interfaces. Sections 5-9 detail the 5 different control entity interfaces: the planning interface, the job control interface, the planning-to-job-control interface, the guardian planning interface and the guardian job control interface. Section 10 gives an example scenario of how the different messages from the 5 interfaces work together.

Visualization Applications for Manufacturing: A State-of-the-Art Survey. Final Report.
H. T. Moncarz. May 94, 35p, NISTIR-5427.

Keywords: *Computer aided manufacturing, *Computer graphics, *Technology assessment, *Scientific visualization, Standards, Production engineering, Computerized simulation, Data transmission, Algorithms, Software tools, State of the art, Surveys, Product development, *Rapid response manufacturing.

A state-of-the-art (SOTA) survey was performed for visualization software applications (VAs) in the context of a rapid response manufacturing (RRM) environment. VAs are standalone, commercially-available products, that have sophisticated capabilities for interactively visualizing data. The data includes geometry, image, and scientific data. VAs' capabilities to visualize data can be advantageously applied to manufacturing if VAs are integrated within RRM. In general, integration enables any RRM process to access data from other RRM processes in the product life cycle. However, having access to data isn't necessarily useful if it is too overwhelming for a human to use it. VAs offer the potential for users to cognitively integrate the data from multiple RRM processes to make sense of it and to intelligently use it. This SOTA describes the capabilities of VAs and methods for integrating them within RRM to ultimately enable the full potential of VAs to be realized.

Implementing a Transition Manager in the AMRF Cell Controller.
Final rept.
B. A. Catron. 1993, 5p.
Pub. in the Proceedings of International Conference CAD/CAM Robotics and Factories of the Future (3rd), Southfield, MI., August 14-17, 1988, v3 p42-46.

Keywords: *Computer aided manufacturing, *Controllers, Control systems, Synchronism, Process control, Integrated systems, Automation, Remote control, Reprints, *Transition management, AMRF(Automated Manufacturing Research Facility), US NIST.

The Transition Manager is one of several managers which are responsible for providing functionality to the cell controller in the Automated Manufacturing Research Facility (AMRF) at the National Institute of Standards and Technology. The cell controller implementation of the Transition Manager is based on a model developed at the University of Virginia (UVA). This model provides identical functionality at each level of the AMRF control hierarchy. The paper outlines the changes and additions which were needed in order to integrate the Transition Manager into the AMRF cell controller. An extension to the model is also proposed to allow more flexibility in the automated remote control capabilities. The extension to the UVA model will allow the cell controller the flexibility of controlling resources and then releasing the resource when finished.

Generic Manufacturing Controllers.
Final rept.
B. A. Catron, and B. H. Thomas. 1989, 3p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Symposium on Intelligent Control, Arlington, VA., August 24-26, 1988, p742-744.

Keywords: *Computer aided manufacturing, *Controllers, *Software reuse, Integrated systems, Process control, Computer program portability, Reprints, AMRF(Automated Manufacturing Research Facility), US NIST.

The cost of developing software for the factory is continuing to increase due in part to the problems of integrating equipment and controllers from multiple vendors. A consistent philosophy is needed for designing reusable code for integrating manufacturing control systems. Development of a 'generic controller' will minimize the problem of redundant software. An outline of a generic controller architecture is discussed and key concepts are identified. A generic controller is under development at the Automated Manufacturing Research Facility at the National Institute of Standards and Technology. The implementation is outlined and future work identified.

The National Institute of Standards and Technology (NIST) has established an Advanced Manufacturing System and Networking Testbed (AMSANT) which supports research and development (R&D) in high-performance manufacturing systems and testing high-performance computer and networking hardware and software in a manufacturing environment. A standards-based data exchange effort for computer integrated manufacturing will focus on improving data exchange among computer aided design, process and manufacturing activities. This new program, Systems Integration for Manufacturing Applications (SIMA), is part of the government's High Performance Computing and Communications Initiative. Applications may include enterprise integration for manufacturing applications, integrated product/process design, simulation and agile manufacturing. Prototype systems, and interface specifications will be communicated to appropriate standards organizations. The report describes the objectives of the program and highlights the projects to be initiated in FY94 and proposed for FY95.

The Manufacturing Engineering Laboratory (MEL) at the National Institute of Standards and Technology (NIST) has been conducting research on control of mechanical systems for more than sixteen years. The Robot Systems Division and Factory Automation Systems Division have been working jointly for over a year to develop a reference architecture for computer integrated control of mechanical systems, drawing on the best of past work in both divisions. The architecture is not yet complete, and work on the architecture is continuing. This report describes the architecture in its current, incomplete state. The architecture is a hierarchical control architecture aimed at the domain of discrete parts manufacturing, including considerations of data systems, communications systems, planning, resource allocation, real-time control, and error recovery.

Using Grafcet to Design Generic Controllers.
Final rept.
B. H. Thomas, and C. R. McLean. 1988, 10p.
Pub. in Proceedings of International Conference on Computer Integrated Manufacturing, Troy, NY., May 23-25, 1988, p110-119.

Keywords: *Computer aided manufacturing, *Controllers, *Systems engineering, Control systems, Software engineering, Parallel processing, Process control, Software reuse, Reprints, Grafcet programming language.

The purpose of this paper is to outline some ways Grafcet is being used to help design generic controllers within the Automated Manufacturing Research Facility. Grafcet is a powerful graphical language for expressing control flow and allows the expression of both parallel and sequential control logic. The paper describes the rationale for using Grafcet as a design tool for expressing software for a generic controller. Grafcet helps the designer determine: modularization of the code, functions that can be performed in parallel, communication flow, and problems in control flow.

Integration of Real-Time Process Planning for Small-Batch Flexible Manufacturing.
Final rept.
C. Yang, and K. Lee. 1989, 5p.
Pub. in Proceedings of IASTED International Symposium on Robotics and Manufacturing (12th), Santa Barbara, CA., November 13-18, 1989, p230-234.

Keywords: *Computer aided manufacturing, *Process control, *Planning, Automation, Control systems, Hierarchies, Task complexity, Task planning(Robotics), Workstations, Machine tools, Reprints.

Automation of just-in-time, small-lot, mixed-batch manufacturing at the workcell level is a topic of interest in Flexible Manufacturing Systems (FMS) research today. The control processes involved in producing different parts in small batches can be very complex. This paper describes a method of generating the process plan in real time based on part manufacturing attributes and execution of the plan by a three-level hierarchical controller. This method is currently implemented in the workstation controller for the Mare Island Flexible Manufacturing Workstation (MIFMW), a small-batch workcell designed for just-in-time, untended operation.

Development of Adaptive Control Strategies for Inert Gas Atomization.
Final rept.
S. D. Ridder, S. A. Osella, P. I. Espina, and F. S. Biancaniello. 1990, 10p.
Pub. in MD (Intell. Process. Mater.) 21, p79-88 1990.

Keywords: *Atomizers, *Particle size, *Process control, *Metal powders, Real time operations, Artificial intelligence, Expert systems, Supersonic flow, Cinematography, Gas flow, Rare gases, Adaptive control, Particulates, Controllers, High speed, Monitors, Reprints, SiGMA method.

The Supersonic inert Gas Metal Atomization (SiGMA) technique produces ultra-fine (< 45 micrometer median particle diameter), rapidly solidified metal powder via high energy gas atomization. Research at the National Institute of Standards and Technology (NIST, formerly NBS) on SiGMA has focused on providing this system the ability to monitor and control particle size during atomization. The process controller currently under development for SiGMA includes a novel real-time particle size measurement sensor (incorporating an adaptive pattern recognition scheme) into a multiple level I/O command interface. The modular nature of both the hardware and software design will be adaptable to other particulate producing equipment. Gas and liquid flow imaging, gas flow modeling, real-time particle size measurement and process control will be discussed.

Analysis of Autocorrelations in Dynamic Processes.
Final rept.
N. F. Zhang, and J. F. Polland. 1994, 15p.
Pub. in Technometrics 36, n4 p354-368 Nov 94.

Keywords: *Autoregressive processes, *Process control, *Data analysis, Error detection codes, Mass balance, Material balance, Autocorrelation, Time series analysis, Mathematical models, Reprints.

Data collected by process information and control systems are almost always correlated due to process dynamics combined with short sampling times. The traditional time series approach for dealing with autocorrelated data has been to model the autocorrelation. This modeling effort is substantially more difficult than simply treating the time series as a sequence of independent data. In this article, we develop and demonstrate a methodology that yields insight into the error introduced by not modeling the autocorrelation of the process data when performing material balances around process equipment. This work shows that in many cases data analysis (e.g., gross-error detection) can be done using the simplified models.

Overview of the Manufacturing Engineering Toolkit Prototype.
M. J. Iuliano. Oct 95, 12p, NISTIR-5730.

Keywords: *Software tools, *Computer aided manufacturing, *Prototypes, Standards, Interfaces, Validation, Systems integration, Systems approach, Systems engineering, Software engineering, Life(Durability), Applications programs(Computers), METK(Manufacturing Engineering Toolkit).

A computer-aided Manufacturing Engineering Toolkit (METK) prototype is currently under development at the National Institute of Standards and Technology (NIST). The toolkit is being used to identify the integration standards and issues which must be addressed to implement plug-compatible environments in the future. The toolkit consists of commercial-off-the-shelf (COTS) manufacturing software applications housed together on a high speed computer workstation. The purpose of the CAME project at NIST is to provide an integrated framework, operating environment, common databases, and interface standards for manufacturing engineering software applications. This paper describes an initial METK prototype.

Although many software tools are currently available for manufacturing engineers, they do not work together and cannot be readily integrated. This lack of integration significantly diminishes the productivity of manufacturing engineers, reduces the quality of their work, and increases the time it takes to plan the production of a part. The Manufacturing Engineering Tool Kit project is attempting to develop an integrated tool kit. This tool kit will be used to generate a process plan for production and to validate the engineering data package and process plan prior to release to production. The application software tools are based on commercially available off-the shelf products. This paper describes the validation requirements for the engineering data package and the categories and types of data errors compiled from a need analysis from the industry end users.

The NIST 'RS274KT interpreter' is a software system which reads numerical control code in the 'KT' dialect of the RS274 numerical control language and produces calls to a set of canonical machining functions. The output of the interpreter can be used to drive a Kearney and Trecker 800 4-axis machining center. The report describes the RS274KT interpreter.

Product Realization Process Modeling: A Study of Requirements, Methods and Research Issues.
K. W. Lyons, M. R. Duffey, and R. C. Anderson. Jun 95, 48p, NISTIR-5745.
Prepared in cooperation with George Washington Univ., Washington, DC.

Keywords: *Computer aided manufacturing, *Process models, *Product development, Computerized simulation, Industrial plants, Electromechanical devices, Materials handling, Artificial intelligence, Automation.

The purpose of the document is to identify and document key requirements, industry practices, and research questions which should drive new methods and computer tools for process modeling of product realization. It addresses a wide range of industry-relevant modeling issues to help focus discussion on future research directions and its intended audience are modeling researchers and practitioners in industry, universities, and other federal agencies. Although process modeling methods have been applied to many types of development efforts (e.g., software engineering, VLSI), our sole focus in the report is realization of discrete electro-mechanical products.

Machine Performance Standard Provides Opportunity to Improve Quality and Productivity.
C. D. Lovett. Dec 95, 8p, NISTIR-5775.
Sponsored by American Society of Mechanical Engineers, Washington, DC.

Keywords: *Process control, *Machine tools, *Computer aided manufacturing, Measurement, Performance evaluation, Standards, Quality control.

Evaluating manufacturing capability and monitoring any decrease in performance of CNC machines may provide some trends of manufacturing process variables which can be used for estimating better control over the manufacturing process. This in turn could lead to improved quality and a reduction in manufacturing

lead time. A performance standard for CNC machining centers and a draft standard for turning centers provide methods for evaluating performance of machines comparative analysis as well as ongoing assessment of machine tool performance.

The Manufacturing Systems Integration Divison (MSID) hosted a workshop November 14-16, 1994, on Systems Integrations for Manufacturing Application (SIMA). The workshop was held at the Defense Systems Mangement College (DSMC) in Fort Belvoir, Virginia. A total of 27 people participated in the workshop including representatives from industry, industry consortia, other government manufacturing programs, and the Natioanl Institute of Standards and Technology (NIST). The focus of the workshop was to identify critical problems and actions that can be taken to solve these problems in the context of advancing information technology for manufacturing systems and improving the effectiveness of related programs. This document contains diagrams that illustrate relationships between problems and actions related to removing barriers to manufacturing systems integration. In addition, it contains a description of the Interactive Management process that was used to facilitate the NIST SIMA workshop at Fort Belvoir, Virginia.

Quality in Automated Manufacturing.
Final rept.
D. S. Blomquist. 1991, 34p.
Pub. in Control and Dynamic Systems, v45 p163-196 Aug 91.

Keywords: *Computer-aided manufacturing, *Dimensional measurement, *Automation, Process control, Computerized control systems, Machine tools, Real-time systems, Integrated systems, Quality control, Error correcting codes, Reprints, Coordinate measuring machines, Initial Graphics Exchange Specifications.

The Quality in Automation (QIA) program is described at the Manufacturing Engineering Laboratory of the National Institute of Standards and Technology (NIST). The purpose of the QIA program is to develop a quality control and quality assurance system that exploits deterministic metrology principles in an automated manufacturing environment, producing small batches with commercially available and affordable equipment. This 'deterministic manufacturing' is based on the premise that most errors occuring in the manufacturing process are repeatable, thus predictable. The QIA program combines statistical process control methods with on-machine sensing and gauging, real-time error compensation and distributed processing to produce parts of consistently high quality.

Development of a New Quality Control Strategy for Automated Manufacturing.
Final rept.
M. A. Donmez. 1992, 12p.
Pub. in Proceedings of Manufacturing International 1992, MI92 Technologies, Economics, Information for Global Partnership Realignments, Dallas, TX., March 19-April 1, 1992, 12p.

Keywords: *Computer-aided manufacturing, *Machine tools, *Quality control, *Automation, Process control, Computerized control systems, Real time systems, Inspection, Error corection, Accuracy, Reprints.

A new quality control strategy is being developed at the Manufacturing Engineering Laboratory of the National Institute of Standards and Technology (NIST) with a project called Quality In Automation (QIA). The objective of this strategy is to demonstrate that the likelihood of producing defective parts can be dramatically reduced through better control of the manufacturing process. The QIA project is an effort to develop and implement a real-time, on-line quality control/quality assurance system to improve the quality of the parts produced in a small-batch, automated manufacturing environment using commercially available and affordable equipment. In order to obtain high-quality parts consistently, we are building a three-layered control strategy around the metal cutting process. These three control layers are: real-time, process-intermittent, and post-process.

Keywords: *Machining, *Planning, *Models, Computer aided manufacturing, Systems analysis, Software engineering, *STEP(Standard for the Exchange of Product Model Data), *Standard for the Exchange of Product Model Data.

A key issue of integrating process planning systems with design systems and production planning systems is how to overcome barriers in data exchange and sharing amongst software systems. A machining process planning activity model was developed at NIST to address some of the barriers. The model represents functional components and data requirements in process planning systems. The purpose of the model is to create the context in which data requirements and data flow for NC machining process planning are defined. The model was developed as a unification of many previously developed process planning activity models.

PIECS: A Software Program for Machine Tool Process-Intermittent Error Compensation.
H. T. Bandy, and D. E. Gilsinn. Mar 96, 140p, NISTIR-5797.

Keywords: *Machine tools, *Automation, *Error correction codes, Computer aided manufacturing, Numerical control, Feedback control, Coding, Cutting tools, Quality control, Algorithms, Real time, PIECS computer program, C programming language.

This report documents software, called PIECS, that performs process-intermittent error compensation for a turning center. The program is a part of a larger three loop control architecture that includes a real-time geometric-thermal error compensation, loop and a post-process loop. In process-intermittent error compensation, a part is measured by on-machine gauging after a semifinish cut which uses the same cutting parameters (speed, feed, and depth of cut) as are used in the finish cut, to reproduce process-dependent errors such as cutting-force induced tool or part deflection. During gauging a touch-trigger probe signal indicates that the part surface has been contacted. The coordinates of the points are then transformed to the part coordinate system and compared to the corresponding nominal coordinates so that errors may be determined. The error vector is defined as having its head at the measured coordinates of the gauged point and its tail at the nominal coordinate for that point. Since the philosophy chosen in this program is to compensate process-intermittent errors by changing the position and orientation of features, least squares curve fitting through the ends of the error vectors is used to determine the adjusted tool curve. The compensation curve becomes the tool path for the corresponding feature for the finish cut. The report includes a description of the program algorithm, the input and output data sets as well as descriptions of each of the C-programming language functions that compose PIECS. A listing of the program is included in the appendix.

Procedure for Product Data Exchange Using STEP Developed in the AutoSTEP Pilot.
D. A. Rosenfeld, and S. Dhar. Apr 96, 33p, NISTIR-5833.
Prepared in cooperation with Industrial Technology Inst., Ann Arbor, MI. Center for Electronic Commerce.

Keywords: *Automotive industry, *Product models, *Information exchange, *Computer aided manufacturing, Standards, Computer aided design, Interoperability, Production planning, Information systems, Motor vehicles, *STEP(Standard for the Exchange of Product Model data), *Standard for the Exchange of Product Model data, ISO 10303, STEP AP203.

The AutoSTEP Pilot Project, directed by the Automotive Industry Action Group (AIAG), is an effort whose goal is to promote the use of STEP (STandard for the Exchange of Product model data) as a neutral mechanism for product data exchange within the automotive industry. To explore and demonstrate the capabilities of STEP, AutoSTEP organized a number of trading pairs to exchange product model data represented in STEP Application Protocol 203, configuration controlled design conformance class six, or data represented with advanced boundary representation (b-rep). Model data would be transferred from one company's CAD system to its partner company's system via STEP. AutoSTEP Phase One organized pairs of automotive companies and their first-tier suppliers, and involved exchanges relating to packaging applications. Later phases will include exchanges of product model data relating to other applications, and will extend the information exchange further down the supply chain. Exchange results are logged in a database, and reports assessing the results will be produced. This document provides a complete description of the product model data exchange scenario envisioned for transactions using STEP, both in general and in the context of the AutoSTEP Pilot. It outlines the entire process that model data undergoes in STEP exchanges, and it identifies the significant metrics throughout the process. It also provides forms and tables for the benefit of the AutoSTEP participants to assist them in performing exchanges and logging metrics.

Computer Aided Manufacturing (CAM)

Keywords: *Computer aided manufacturing, *Meetings, Planning, Data processing, Process control, Integrated systems, Systems engineering, Materials handling, Concurrent engineering, Computerized simulation.

The paper reports results of the Computer-Aided Manufacturing Engineering (CAME) Forum Second Technical Meetings held in August 1995. This meeting built on work completed since the first technical meeting held in March 1995. The meeting brought together software developers, manufacturing technology managers and engineers, and university researchers to address important issues related to developing a Manufacturing Engineering Tool Kit (METK). The meeting was organized around three major segments. During the first segment, NIST computer scientists and engineers updated participants on the status of ongoing METK development work. Presentations were given on issues regarding the manufacturing data validation methodology, business case and implementation plan, and system architecture and tools integration. An overview was given on the Systems Integration for Manufacturing Applications (SIMA) Production System Engineering project. The METK baseline pilot system was demonstrated to the Forum attendees. The second segment used breakout groups to solicit ideas and feedback from meeting attendees on the issues discussed in the presentation topics. In the third segment, breakout groups prepared outbriefs and presented results to all meeting participants.

Compensation of Errors Detected by Process-Intermittent Gauging.
Final rept.
H. T. Bandy, and D. E. Gilsinn. 1995, 4p.
Pub. in Proceedings of the American Society for Precision Engineering Annual Meeting, October 15-20, 1995, v12 p440-443.

Keywords: *Machine tools, *Automation, *Error correction codes, Computer aided manufacturing, Numerical control, Feedback control, Cutting tools, Quality control, Algorithms, Real time, Metals, Reprints.

The paper describes a software design for implementing compensation of errors detected by process-intermittent gauging. This is the function of one control loop in the three-loop Quality In Automation (QIA) architecture that is under development at the National Institute of Stadards and Technology (NIST) (Donmez, 1992). Process-intermittent error compensation is useful for improving the accuracy of metal cutting processes on turning or machining centers (Brandy, 1991). During machining processes, errors due to tool wear, tool deflection, part deflection, etc., are independent of the accuracy of the machine tool itself, and can, therefore, be measured using the machine tool. The approach discussed here is to reduce those process errors. The term process-intermittent refers to inspection occurring during an interval between the semifinish and finish machining processes. Although in-process measurement techniques may allow uninterrupted machining (Fan, 1991), process intermittent inspection has advantages. For instance, a simple measurement device such as a tough-trigger probe may be used instead of the more intrusive apparatus required for measurement during active machining. Also, since a complete profile of the error pattern may be obtained in advance of finish machining, computational filters may be applied to the compensating tool path to minimize the effects of measurement irregularities.

Data Management for Error Compensation and Process Control.
Final rept.
H. T. Bandy, and D. E. Gilsinn. 1995, 10p.
Pub. in Proceedings Reprint, Modeling, Simulation, and Control Technologies for Manufacturing, Philadelphia, PA., October 25-26, 1995, v2596 p114-123.

Keywords: *Machine tools, *Automation, *Error correction codes, Computer aided manufacturing, Numerical control, Feedback control, Data management, Cutting tools, Metals, Quality control, Reprints.

Strategies for managing data flow are described for a system which controls processes to compensate machine tool and process errors. A CAD representation of the part is the basis for generating the data used in the processes and analyses. A process-oriented view of part features is used for tracking data regarding design, part programming, manufacture, error compensation, and inspection. Part ID and file name nomenclature have been developed to facilitate data identification. All data are stored in a database, enabling error trends over time to be studied so that error compensation algorithms may be refined.

This is the final report for the second year of a joint project between the National Institue of Standards and Technology (NIST) and SEMATECH. It presents the results from investigation in two areas that were proposed in the first year report: conformance testing and specification management. In conformance testing, a number of technologies are reviewed with special emphasis on using Java and Corba to develop a conformance testing environment. For specification management, technologies were reviewed for ways to use a single format with multiple uses and multiple distribution formats. This task looked at pragmatic solutions to the problem of maintaining complex documents with multiple uses through combinations of radily available software.

Unified Process Specification Language: Requirements for Modeling Process.
C. Schlenoff, A. Knutilla, and S. Ray. Sep 96, 78p, NISTIR-5910.

Keywords: *Computer aided manufacturing, *Process control, *Software tools, Production management, Scheduling, Systems integration, Industrial plants, Automation, Life cycles, PSL(Process Specification Language), Process Specification Language.

A wide range of applications deal with the manipulation and expression of collections of activities. Examples include project management, workflow management, business process reengineering, product realization process modeling, process planning, production scheduling, simulation, and Computer Aided Software Engineering, each of which is supported by some combination of graphical programming and control languages, Petri nets, PERT charts or other representation methodology. Each of these applications serves a specific audience and need, and focuses on particular aspects of a process. Nevertheless, much could be gained by sharing information among applications. One of the primary obstacles to such integration is the lack of any common representation of what is really the common underlying concept of process. The objective of the work described here is an investigation of the feasibility of a unifying specification of process which is applicable to all of the above applications, yet powerful and robust enough to meet each set of requirements. The document represents the results of the first phase of the work - that of researching the process representational requirements for design/manufacturing process life-cycle applications. These requirements are categorized into four categories; core, outer core, plug-ins, and application, which aided in describing the role of the requirements in the overall challenge of process representation.

K. A. Notarianni. 1993, 2p.
Pub. in Society of Fire Protection Engineers Bulletin, p8-9 Summer 1993.

Keywords: *Sprays, *Fire suppression, *Commercialization, *Fire extinguishing agents, Workshops, Water vapor, Spraying, Fire fighting, Drop size, Technology assessment, Reprints, *Water mist.

The water mist fire suppression workshop was organized to facilitate the commercialization of water mist technology. The imminent lack of availability of halon fire suppressants has sparked worldwide efforts in developing other fire fighting agents. Water mist systems are potential replacements in many industrial uses, as well as in new markets, such as commercial passenger aircraft. Speakers presented state-of-the-art papers on the incentives of using misting sprays, the advances in spray drop size measurement and the engineering criteria for water mist fire suppression systems. Three papers discussed projects demonstrating the use of water mist systems in aircraft, marine, and telecommunications applications. The speakers and attendees were divided into three panels: Research Needs; End-Use Criteria; Marketing. The proceedings brings together the recommendations of each panel and the individual technical papers.

Commission V on Quality Control and Quality Assurance of Welded Products handles inspection and quality issues for the International Institute of Welding. The activities of this commission are important to the nondestructive evaluation industry because the annual meetings serve as an international review of research activities and many of its draft standards are forward to the International Organization for Standards (ISO) for international approval. Thus, this summary of the meeting provides an up-to-date review of research in other countries and advance notice of standardization activities. This commission has activities in many areas, with subcommissions that cover major techniques for nondestructive inspection (x-ray, ultrasonic, electrical, magnetic, and optical techniques) and groups with interests in inspection of offshore construction, in significance of defects, and in quality assurance in welding technology. This year, Commission V met for three days and sponsored a seminar on the fourth. Thirty delegates and experts from sixteen countries attended the meetings. Following are reports of the subcommissions and working groups, in the order of presentation.

Through-the-Arc Sensing for Monitoring Arc Welding.
Final rept.
T. A. Siewert, R. B. Madigan, T. P. Quinn, and M. A. Mornis. 1993, 4p.
Pub. in Proceedings of International Conference on Trends in Welding Research (3rd), Gatlinburg, TN., June 1-5, 1992, p1037-1040 1993. Sponsored by Department of the Navy, Washington, DC.

Keywords: *Monitoring, *Quality control, Real time operation, Signal processing, Video signals, Welding machines, Wear, Algorithms, Process control(Industry), Reprints, *Through-the-arc sensing, *Pulsed gas metal arc welding.

Current and voltage records for pulsed gas metal arc welding were captured at data collection rates up to 9 kHz, then correlated with a high-speed video image of the arc. Loss of shielding gas coverage and contact tube wear caused characteristic changes in the current and voltage records. Change in contact-tube-to-work distance or change in the droplet transfer mode, also affected the current and voltage records. Algorithms were developed which use the current and voltage signals to automatically detect these undesirable welding conditions or variations in the welding procedure. The algorithms were incorporated in a computerized data collection and analysis system for real-time monitoring of the weld.

On November 16, 1990 the United States Congress enacted the Fastener Quality Act, P.L. 101-592 (The Act). The Act requires the establishment of procedures and conditions for the accreditation of laboratories engaged in the inspection and testing of certain fasteners entered into commerce within the United States. This document describes the National Institute of Standards and Technology (NIST) process to evaluate accreditation bodies as required by section 6 of the Act. The text of this handbook provides specific NIST interpretations of the general requirements. It explains the procedures, conditions, and requirements for gaining NIST approval/recognition.

Keywords: *Fasteners, *Computer aided manufacturing, *Workstations, Control systems, UNIX(Operating system), Man machine systems, Computer software, Operators(Personnel), User manuals(Computer programs), US NIST, AMRF(Automated Manufacturing Research Facility).

A user manual is written for the integrated fastener manufacturing workstation which was jointly developed in the Automated Manufacturing Research Facility at the National Institute of Standards and Technology (NIST) by the Automated Production Technology Division and Portsmouth Naval Shipyard. The manual is intended to be used to train the operators or machinists to run the computer-controlled workstation. The workstation is controlled by a complex UNIX-based control system and requires operator interactions with the computer, machine and gaging devices. The workstation software is developed with ease of operation in mind and provides an operator-friendly environment for the machinists who usually have very little experience with computers, particularly a UNIX multitasking, multi-window system. The manual describes the workstation, the software, and operation procedures and leads the operator to order part batches, examine status and perform diagnostics.

Status Report: AWS Standards for Identifying Arc Welds (A91.1) and Recording Weld Data (A9.2).
Final rept.
T. A. Siewert. 1993, 4p.
Pub. in Proceedings of International Conference on Computerization of Welding Information IV, Orlando, FL., November 3-6, 1992, p3-6 1993.

Keywords: *Arc welding, *Data bases, Data processing, Standards, Materials specifications, Physical properties, Reprints, PQR, NDE data, Property data, Standard formats.

Standard formats are being developed for a wide range of data associated with materials and their properties. Two committees have cooperated in the development of two standards for welds, one covering the identification of welds (unique identification of a specific weld, as well as details on the preparation of the weld) and the other covering the properties and inspection of welds. Separation of the data into these two categories makes the standards compatible with the formats developed by E49 for other materials. The report provides more details on these standards.

Through-the-Arc Sensing for Real-Time Measurement of Gas Metal Arc Weld Quality.
Final rept.
T. A. Siewert, R. B. Madigan, T. P. Quinn, and M. A. Mornis. 1992, 9p.
Sponsored by Department of the Navy, Washington, DC.
Pub. in Proceedings of International Conference on Computerization of Welding Information IV, Orlando, FL., November 3-6, 1992, p198-206.

Keywords: *Gas metal arc welding, *Quality control, *Real time operations, Computer systems programs, Electric potential, Electric current, Records, Detection, Reprints, Droplet transfer, Voltage records, Current records.

The voltage drop across the arc in gas metal arc welding is affected by droplet transfer, spatter formation, and many other arc characteristics. The current is affected in a similar manner. The authors collected voltage and current records with a high-speed data acquisition system, and correlated features in the records to various welding problems. Interruption in the shielding gas coverage, wear of the contact tube, change in the contact-tube-to-work distance, and change in the droplet transfer mode were detected through this sensing strategy. These effects were developed into general correlations and incorporated into a computerized data collection and analysis system.

Variations in Size Measurements by Indicating Gaging Systems.
Final rept.
R. Veale, A. Strang, and C. Hsiao-Yu. 1994, 13p.
Pub. in Proceedings of the 1994 Measurement Science Conference, Pasadena, CA., January 27-28, 1994, p1-13.

Keywords: *Size determination, *Dimensional measurement, *Screw threads, Measuring instruments, Pitch(Inclination), Gages, Tests, Reprints, Pitch diameters.

The National Institute of Standards and Technology has investigated the efficacy of indicating gaging systems used to measure pitch diameter and functional size of threaded fasteners. Three external systems and four internal systems, representing four manufacturers, were used in the test. Twenty-seven external threads and eleven internal threads were measured. Some of the samples were purposely produced with form errors near and beyond product tolerances. The study shows that when the form errors are outside the product tolerances, indicating gages from different manufacturers give different results and do not always match the values obtained by alternate methods. Results of the tests are presented in tabular form.

Lubrication Theory for Reactive Spreading of a Thin Drop.
R. J. Braun, B. T. Murray, W. J. Boettinger, and G. B. McFadden. Dec 94, 50p, NISTIR-5557.

Keywords: *Soldering, *Lubrication, *Capillary flow, *Drops, Mass transfer, Transport properties, Solder, Concentration(Composition), Marangoni convection, Heat transfer, Temperature gradients.

Solder drops spreading on metallic substrates are a reactive form of the wetting problem. A metallic component may diffuse into the metal substrate and form intermetallics. This reaction with the substrate may affect the bulk transport in the spreading drop via coupling with the flow field via the Marangoni effect. Motivated by this situation, we extend a lubrication theory for the spreading of thin drops in the presence of gravity and thermocapillarity to include mass transport and solutocapillarity. We use an approximate solute profile in the drop to derive coupled evolution equations for the free surface shape and concentration field. Numerical solutions for the non-reactive (single component) drop agree well with previous theory. Including reactive effects in the model affects the flow patterns and spreading rates at relatively early times; but by the end of the spreading, solutal effects have died out in the model. We compare our results with some experimental results.

Droplet Transfer Modes for a MIL 100S-1 GMAW Electrode.
P. R. Heald, R. B. Madigan, T. A. Siewert, and S. Liu. Oct 91, 54p, NISTIR-3976.
See also PB91-174250. Prepared in cooperation with Colorado School of Mines, Golden. and Phillips Co., Borger, TX. Sponsored by David Taylor Research Center, Annapolis, MD. Programmable Automated Welding System Program.

Keywords: *Gas metal arc welding, *Welding electrodes, *Drops, *Mass transfer, Weldments, Standard deviation, Weld metal, Data acquisition, Computer applications, Computer aided manufacturing, MIL 100S-1 electrode.

Welds were made with a 1.2-mm-diameter MIL 100S-1 electrode using Ar-2% O2 shielding gas to investigate the effects of contact-tube-to-work distance (13, 19, and 25 mm) on metal transfer. The transfer modes were identified by the sound of the arc, images from a laser back-lit high-speed video system, and digital records of the voltage and current fluctuations. The spray transfer region was mapped on a current-voltage plot, with a range that included the boundaries of adjacent transfer modes. The metal transfer mode boundaries shifted with an increase in contact-tube-to-work distance. Increasing the contact-tube-to-work distance from 13 mm to 19 mm required a 15 mm/s increase in the wire feed rate for the globular-to-drop-spray transition.

Determination of the Residual Stresses Near the Ends of Skip Welds Using Neutron Diffraction and X-ray Diffraction Procedures.
P. C. Brand, G. E. Hicho, and H. J. Prask. Jun 95, 40p, NISTIR-5671.
Also pub. as National Inst. of Standards and Technology (MSEL), Gaithersburg, MD. Metallurgy Div. rept. no. REPT-29.

Keywords: *Residual stress, *X ray diffraction, *Neutron diffraction, *Metal plates, Spot welds, Welding, Stress analysis, Stress distribution, Nondestructive tests, Stress measurement.

Welding is known to be a significant factor in the formation of residual stresses. Residual stresses are suspected as the reason for the occurrence of leaks in some railroad tank cars that had stiffeners welded to them. Residual stresses at the surface and in the bulk of metals can be measured non-destructively by x-ray and neutron diffraction respectively. In this report the results of such non-destructive residual stress measurements on one-pass, skip, bead-on plate welds are presented. The plate specimens used for this investigation contained two beads that represent the skip weld process. Of the full weld bead only positions close to the end of the first and the start of the second bead are investigated. The results show longitudinal tensile stresses and compressive transverse and perpendicular residual stresses in the region close to both the weld end and the weld start.

Keywords: *Gas metal arc welding, *Feedback control, Automation, Models, Process control, Radiation, Sensors, Arc length, Droplet-transfer frequency, National Institute of Standards and Technology.

In this development of closed-loop control of the gas-metal-arc welding process using light emitted by the arc, two process parameters were controlled in real time: arc length and droplet-transfer frequency. An arc-length sensor and controllers to regulate arc length and to actuate welding current were developed. The transfer frequency depended on current, wire-feed speed, and electrode extension, these results led to the design of a transfer-frequency controller.

Mathematical Models of Transport Phenomena Associated with Arc-Welding Processes: A Survey.
Final rept.
P. G. Jonsson, J. Szekely, R. T. C. Choo, and T. P. Quinn. 1994, 22p.
Pub. in Modelling Simulation Materials Science and Engineering, v2 p995-1016, 1994.

Keywords: *Arc models, *Welding, Surveys, Reprints, Mathematical models, Process control, GNAW, GTAW.

A comprehensive survey is presented of research on transport phenomena, that is, heat flow, fluid flow, mass transfer, and electrodynamics, associated with arc welding. Both gas-metal arc-welding (GMAW) and gas-tungsten arc welding (GTAW) systems are considered, and appropriate emphasis is placed on the intrinsic differences between these systems. The topics discussed include the behavior of the arc, and its interaction with both the electrode and the surrounding medium, on the one hand, and the behavior of the weld pool on the other. The limited work done on the coupling between arcs, electrodes, and weld pools is also discussed, as are some process-control issues, but the problems of thermal stress evolution and stress-induced deformation in the solid state are not treated. A critical discussion of the comparison between model predictions and experimental measurements is a key feature of the presentation, which concludes with a discussion of the critical problems that still need to be addressed.

Electrode Extension Model for Gas Metal Arc Welding.
Final rept.
T. P. Quinn, R. B. Madigan, and T. A. Siewert. 1994, 8p.
Pub. in Welding Research Supplement, p241s-248s Oct 94.

Keywords: *Welding, *Electrode extensions, Reprints, Transfer functions, Temperature profiles, Spray transfer mode, *Describing functions, GMAW, Electrode feed speed.

The electrode extension during gas metal arc welding is predicted using a one-dimensional model of the melting electrode. Jouile heating in the electrode, heat directly applied to the end of the electrode from the condensing electrons, and heat transferred from the droplet, together with conduction along the electrode are considered. The thermal conductivity, the thermal diffusivity, and the electrical resistivity of the electrode material are allowed to bary with temperature. The steady-state electrode extension is predicted to an accuracy of 1.9 mm (0.074 in.). The onset of short-circuiting as the current is decreased for a given electrode feed speed is predicted within 9%. Dynamic anal-

ysis shows that the gas metal arc welding process acts as a low-pass filter for electrode extension with respect to the square of the current (proportional to power) and with respect to electrode feed speed. As the mean welding current is increased, the electrode extension (or arc length if the contact-tube-to-work distance is constant) has a smaller response to perturbations in the current or electrode feed speed. The quasi-linear transfer functions between electrode extension and current squared and between electrode extension and electrode feed speed can be described by one zero, two pole parametric fits. The transfer functions are linear in the amplitude of the excitation up to 10% of the mean excitation. The model transfer functions were verified with experiments.

Contact Tube Wear Detection in Gas Metal Arc Welding.
Final rept.
T. P. Quinn, R. B. Madigan, M. A. Mornis, and T. A. Siewert. 1995, 7p.
Pub. in Welding Research Supplement, p115s-121s Apr 95.

Keywords: *Wear tests, *Gas metal arc welding, *Welding current, *Sensors, Reprints, Weldments, Welding electrodes, Wear, Robots, Sliding contact, Tube wear detection.

A real-time algorithm has been developed to detect contact tube wear during gas metal arc welding. The integral from 0.3 to 4 Hz of the power spectral density of voltage (constant current and pulsed current power sources) or current (constant voltage power sources) is called the wear parameter and is used to measure wear. The contact tube is predicted to be worn when the parameter grows nonlinearly or exceeds a threshold. For 11 contact tubes worn by welding on a rotating pipe, the wear parameter predicted the observed increase in the area of the contact tube's exit bore of 140% of the original area within a standard deviation of 20%. Welds were made with a constant voltage power source and with a pulsed current power source at two different voltages. The pulsed current welds were made with and without automatic voltage control by wire feed speed and with and without weaving in a V-groove. No significant differences were detected between the wear parameters for all test welds, indicating that the algorithm can be used under these welding conditions.

Pub. in International Conference on Welding Research Trends in Welding Technology (3rd), ASM International, Metals Park, OH., p2-14 1992.

Keywords: *Defects, *Gas Metal-Arc Welding, Transducers, Computerized control systems, Reprints, Data acquisition systems, Detection, Feedback, Monitoring, Nondestructive analysis, Personal computers, *Ultrasonography, Welded joints.

In-process ultrasonic sensing of welding allows detection of weld defects in real-time (1). For a sensing effort to be practical in a production environment, a noncontracting ultrasonic system is developed. The system components are a pulsed laser for ultrasound generation and an electromagnetic acoustic transducer (EMAT) for ultrasound reception. A personal computer (PC)-based system acquires and analyzes data to determine the quality of the welding process on a pass-by-pass basis. The laser/EMAT system interrogates an area in the weld volume where defect conditions are most likely to occur. This area of interest is computer calculated on a pass-by-pass basis using weld planning information provided by the off-line programmer (OLP). The absence of a signal level above threshold in the computer calculated time interval indicates a disruption of the sound path to the EMAT due to the presence of a defect condition. The ultrasonic sensor system then provides an input signal to the weld controller about the defect condition.

Well-Shielded EMAT for On-Line Ultrasonic Monitoring of GMA Welding.
Final rept.
A. V. Clark, S. R. Schaps, and C. M. Fortunko. 1992, 3p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers Ultrasonics Symposium, Orlando, FL., 1991, 3p 1992.

Keywords: *Acoustics, *Ultrasonics, *Welding, Reprints, *EMATs.

A hybrid laser/EMAT system is currently being developed for pass-by-pass inspection of weldment defects. The laser source is inherently broadband, whereas the EMAT is a narrow-band detector. The authors review some of the theory used to develop an optimized EMAT system for use with a laser source. The EMAT will be used close to a welding torch. The welding system has a 40 kHz (fundamental) switching power supply. This gives rise to severe electromagnetic interference (EMI). The authors review the means of temperature- and EMI-hardening used to develop a practical EMAT system for this environment. They developed a balanced system of counter-wound coil and differential preamplifier which greatly suppressed EMI. Other measures, such as multiple shielding, bandpass filtering, and attention to grounds, were used. The system gives about 32 dB signal-to-noise ratio, when operated 125 mm from a welding torch.

The National Institute of Standards and Technology (NIST) and the South Carolina Research Authority (SCRA) co-hosted the first Custom Footwear Manufacturing Workshop in Charleston, SC on March 10-11, 1994. At the workshop we discussed the potential creation of a nationwide, collaborative research and development (R&D) effort to benefit the American footwear industry. We discussed applicable technologies for custom and therapeutic footwear manufacturing, related business requirements, national impacts on the economy and health care, and potential strategies to launch a nationwide R&D effort. We decided that our best strategy will be to concentrate initial efforts on the technology requirements of therapeutic footwear. We believe that the proper development, commercialization, and particularly, the integration of the advanced technologies discussed will enable the cost-effective design, manufacture, and distribution of therapeutic footwear. This report documents the workshop and is intended as a starting point to initiate the R&D program proposed.

In machining discrete parts, Material Removal Shape Element Volumes (MRSEVs) may be used to convey shape information from process planning to numerically controlled (NC) programming. This paper discusses sixteen issues regarding MRSEVs and presents, in summary form, a proposed library of MRSEVs for 3-axis machining.

Agile Manufacturing from a Statistical Perspective.
R. G. Easterling. Oct 95, 44p, NISTIR-5573.
Also pub. as Sandia National Labs., Albuquerque, NM. New Initiatives Dept. rept. no. SAND95-1552. Prepared in cooperation with Sandia National Labs., Albuquerque, NM. New Initiatives Dept.

Keywords: *Manufacturing, *Industrial management, *Systems analysis, Industrial plants, Product development, Industrial plants, Statistics, Research programs, Agile manufacturing.

The objective of agile manufacturing is to provide the ability to quickly realize high-quality, highly-customized, in-demand products at a cost commensurate with mass production. More broadly, agility in manufacturing, or any other endeavor, is defined as change-proficiency--the ability to thrive in an evironment of unpredictable change. This report discusses the general direction of the agile manufacturing initiative, including research programs at the National Institute of Standards and Technology (NIST), the Department of Energy, and other government agencies, but focuses on agile manufacturing from a statistical perspective. The role of statistics can be important because agile manufacturing requires the collection and communication of process characterization and capability information, much of which will be data-based. The statistical community should initiate collaborative work in this important area.

Keywords: *Dimensional measurement, *Data analysis, *Computer program integrity, Metrology, Coordinates, Computer software, Algorithms, Computer program verification, Standards, National Institute of Standards and Technology.

This report proposes a National Institute of Standards and Technology (NIST) service for testing and evaluating coordinate measuring systems (CMS) software. This program addresses industry's need for a formal mechanism that tests data analysis software used in CMSs. The NIST Algorithm Testing and Evaluation Program (ATEP) combines the NIST Algorithm Testing System (ATS), test procedures based on emerging na-

tional standards, and control over the ATS reference algorithms. This report presents a concept for this formal mechanism to provide testing methods and tools to test and evaluate CMS data analysis software.

Models, Managing Models, Quality Models: An Example of Quality Management.
J. E. Tyler. Dec 91, 20p, NISTIR-4738.
See also PB91-193367.

Keywords: *Product development, *Quality, *Management, *Standards, Models, Data bases, Technology innovation, Design standards, Production models, Commerce, Competition, International trade, STEP(Standard for the Exchange of Product Model Data), PDES(Product Data Exchange using STEP), Malcolm Baldrige National Quality Award, IGES(Initial Graphics Exchange Specification), ISO(International Organization for Standardization), Quality levels, Model assessment, Information models, Data models.

Quality is an increasingly important element in competitiveness. This paper will focus on strategies used by an international standards committee for improving the development of its complex standard. The paper outlines an approach for use within the standards-making community. Aside from the standards-making community, any organization interested in establishing quality metrics and quality thresholds to assess technical quality should find this paper useful. An overview of a methodology for evaluating the technical quality of information and data models is also included. Quality management techniques for models are described along with management's role in ensuring that high quality models are produced. Many basic concepts of the Malcolm Baldrige National Quality Award were used in building the foundation for this new approach to standards development.

Uncertainties in Dimensional Measurements Made at Nonstandard Temperatures.
D. A. Swyt. 1994, 14p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n1 p31-44 Jan/Feb 94.

Keywords: *Dimensional measurement, *Length, Temperature effects, Tolerances(Mechanics), Thermal expansion, Uncertainty, Metrology, Reprints, Reference temperature.

The report examines the effects of uncertainties in temperature and coefficient of thermal expansion on the expanded uncertainty of length dimensional measurements made away from the international standard reference temperature of 20 C for artifact standards and workpieces of various materials. Specific cases examined deal with (1) uncertainties of thermal-expansion coefficients associated with values given in engineering references, standard reference data, standard reference materials and direct measurements; and (2) uncertainties of part temperature measurements associated with realizing the International Temperature Scale of 1990 (ITS-90) and determining part temperatures relative to ITS-90 with the principal types of thermometry and achievable levels of temperature control.

Development of a Calibrated Atomic Force Microscope.
Final rept.
T. H. McWaid, and J. Schneir. 1994, 6p.
Pub. in Proceedings of the ASPE Conference, Tucson, AZ., 1994, 6p.

Keywords: *Microscopes, Process control, Calibration, Metrology, Operation, Height, Pitch(Inclination), Design, Reprints, *Atomic force microscopes, Atomic force microscopy.

Advances in the manufacture of integrated circuits, x-ray optics, magnetic read-write heads, optical data storage media, razor blades, etc. require advances in ultraprecision metrology. Each of these industries is currently investigating the use of Atomic Force Microscopy (AFM) to improve the precision and accuracy of their manufacturing process control measurements. To facilitate the use of AFM for manufacturing, we are developing a specially designed AFM system that we call the Calibrated AFM (C-AFM). The C-AFM will be used to calibrate artifacts which, in turn, can be used to calibrate commercial AFMs. The system design goals are first presented. The critical electro-mechanical and metrology issues involved in the design, construction, and operation of the C-AFM are then summarized. The current status and performance of the instrument is then presented. The effects of stage stiffness on system performance are discussed in depth. Finally, plans for the future development of the instrument are summarized.

Supersedes PB93-217529. Also available from Supt. of Docs. as SN003-003-03272-7.

Keywords: *Laboratories, *Standards, *Directories, Units of measurement, States(United States), Puerto Rico, Virgin Islands, Tolerances(Mechanics), Calibration, Tests, *State services, *Weights and measures, National Type Evaluation Program, State Standards Program, Accreditation.

The support of its mission to promote uniform standards of measurement throughout the United States, the National Institute of Standards and Technology (NIST) received funding in 1965 to provide new standards of mass, length, and volume to State weights and measures laboratories. This program, called the (New) State Standards Program, also provided the equipment needed to perform calibration in these measurement areas. Part I describes the accreditation program whereby NIST accredits State weights and measures laboratories. Part II is the directory of State weights and measures laboratories and lists the services they provide to State and local weights and measures agencies as well as to industry. The directory is intended to assist potential users of the laboratory services in locating and obtaining needed measurement services.

High-Sensitivity Acoustic Emission Sensor/Preamplifier Subsystems.
Final rept.
C. M. Fortunko, M. A. Hamstad, and D. W. Fitting. 1993, 17p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v12 17p 1993.

Keywords: *Acoustic emission, *Piezoelectric ceramics, *Ultrasonic wave transducers, Failure analysis, Nondestructive tests, Ultrasonics, Acoustic measurement, Preamplifiers, Ultrasonic tests, Reprints.

An experimental study was conducted to evaluate the suitability of five piezoelectric materials for use in high-sensitivity, broadband (10 kHz-2 MHz) acoustic-emission (AE) 'point' sensors. The scope of the study included effects of the material parameters and preamplifier input-impedance characteristics. Computer-model predictions were compared with results of measurements. The NIST Standard Reference Material (SRM) 'conical' transducer was used as a reference high-performance sensor. The experimental study was carried out using 'pinducers' made of: PZT-5A, lead metaniobate, x-cut quartz, 36 deg Y-cut LiNbO3, and PVDF. It is shown that materials exhibiting the highest dielectric constant are best suited for high-performance AE sensor applications.

Sensitivity of Three-Point Circle Fitting.
T. H. Hopp. Sep 94, 14p, NISTIR-5501.

Keywords: *Inspection, *Metrology, *Curve fitting, Dimensional measurement, Circles(Geometry), Coordinates, Estimating, *CMMs(Coordinate Measuring Machines), *Coordinate Measuring Machines.

This paper establishes to first order the sensitivity of the center coordinates and radius of a circle through three points in terms of small, random perturbations of those points. This problem arises in the estimation of measurement errors from coordinate measurement systems. Formulas developed herein express the uncertainty of circle parameters as functions of point measurement uncertainty and the arc angle between points. We show that for practical measurement procedures, task uncertainties depend only on the mean and variance of the point measurement errors and are essentially independent of their statistical distribution.

Nondestructive Evaluation and Materials Processing.
Final rept.
L. H. Schwartz. 1991, 16p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v10A p35-50 1991.

Keywords: *Nondestructive tests, *Test methods, Ultrasonic tests, Polymers, Process control, Heat treatment, Research, Eddy currents, Fluorescence, Aluminum alloys, Reprints, *Intelligent processing of materials, US NIST.

A brief introduction to this paper will be given describing the relationship of materials science to the industrial challenge facing the United States and the role of the National Institute of Standards and Technology (NIST) in helping to meet this challenge. The main portion of the talk will deal with the important role of Nondestructive Evaluation (NDE) in the processing of materials. NDE research and engineering at NIST aimed at developing sensors for such applications will be discussed and illustrated by the following examples: fluorescent sensors for polymer processing, ultrasonic sensors for high Tc superconductor heat treatment, and eddy current probes for aluminum processing. The focus on the intelligent processing of materials will be illustrated by examples involving high pressure gas atomization and hot isostatic processing of metal powders. Future directions of the NIST program will be presented.

This paper describes the theory and implementation of automated optical roughness inspection. Our work has been accomplished at the Inspection Workstation (IWS) in the Automated Manufacturing Research Facility (AMRF) at the National Bureau of Standards. The Surface Roughness Instrument Controller (SRIC) supervises the automated optical roughness inspection of parts. This controller is an integrated, data-driven, hierarchical control software system. The SRIC controls two pieces of equipment--the surface roughness instrument (SRI) and the automatic dial indicator (ADI). The SRI is a photo-optical surface roughness inspection device which monitors surface roughness by measuring the angular distribution of light scattered from the surface of a part. Its tasks are coordinated with those of the IWS inspection robot. Using the SRI optical signals as sensory input, the robot properly aligns the part in front of the SRI so that a valid optical scattering reading is obtained. The ADI is used to help the robot to position the part in front of the SRI for its initial reading. The SRIC uses the optical data obtained to estimate values of roughness average and root mean square roughness for parts machined in the AMRF.

X-Ray Image Quality Indicator Designed for Easy Alignment.
Final rept.
T. A. Siewert, and M. W. Austin. 1992, 4p.
Pub. in Materials Evaluation, p1069-1072 Sep 92.

Keywords: *X-ray inspection, *Welded joints, *Image processing, *X-ray imagery, Image analysis, Quality control, Radiography, Imaging techniques, Nondestructive tests, Reprints, *Image quality indicator.

A new image quality indicator (IQI) design is proposed that is particularly suitable for fundamental measurements of image unsharpness. The design is that of a thin strip, with its larger cross-sectional dimension aligned parallel to the beam at some location along the strip. One end of the strip is given a half twist so some section near the center of the strip is perfectly aligned with the beam, without requiring the careful alignment as with some IQI designs. A strip configuration is apt because it is available for many materials at low cost and in thin dimensions. Our report describes preliminary evaluation of the concept using a steel strip with cross-sectional dimensions of 0.07 by 3 mm.

Through-the-Arc Sensing for Measuring Gas Metal Arc Weld Quality in Real Time.
Final rept.
T. Siewert, B. Madigan, T. Quinn, and M. Mornis. 1992, 4p.
Pub. in Materials Evaluation, p314-318 Nov 92.

Keywords: *Arc welding, *Electrical measurement, *Real time, *Quality control, Drop transfer, Shielding, Wear, Electric current, Voltage, Data acquisition, Monitoring, Inspection, Reprints, *Through-the-arc sensing, *Gas metal arc welding.

The voltage drop across the arc in gas metal arc welding is affected by droplet transfer, spatter formation, and many other arc characteristics, and the current is affected in a similar manner. We collected voltage and current records with a high-speed data acquisition system, and correlated features in the records to various welding problems. Interruption in the shielding gas coverage, wear of the contact tube, change in the contact-tube-to-work, distance, and change in the droplet

transfer mode were detected through this sensing strategy. These effects were developed into general correlations and incorporated into a computerized data collection and analysis system.

Dimensional Inspection Planning Based on Product Data Standards.
Final rept.
S. C. Feng. 1994, 10p.
Pub. in Proceedings of International Conference on Concurrent Engineering (1st): Research and Applications, Pittsburgh, PA., August 29-31, 1994, p333-342.

Keywords: *Dimensional measurement, *Inspection, *Standards, Computer aided design, Models, Information processing, Planning, Computer aided manufacturing, Reprints, *DMIS(Dimensional Measuring Interface Standard), *Dimensional Measuring Interface Standard, STEP(Standard for the Exchange of Product Model Data), CMMs(Coordinate Measuring Machines).

This paper describes an activity model for dimensional inspection planning that bridges the gap between product design and the dimensional measurement of manufactured products. Functionally, this model specifies requirements for developing a part of a product data exchange standard that enables design, inspection resource, and measurement data to be exchanged among computer aided design systems, computer aided process planning systems, and coordinate measuring systems. A set of diagrams has been generated to represent the activity and its sub-activities, inputs, outputs, controls, and mechanisms, when such inspection planning is based on technologies of product data exchange, process planning, and information modeling.

Improving Photomask Linewidth Measurement Accuracy via Emulated Stepper Aerial Image Measurement.
Final rept.
J. E. Potzick. 1994, 8p.
Pub. in Society of Photo-Optical Instrumentation Engineers Photomask Technology and Management 10, n47 p1-8 Sep 94.

Keywords: *Photomasks, *Dimensional measurement, *Line width, Integrated circuits, Uncertainty, Chromium, Accuracy, Reprints.

The most significant contribution to uncertainty in the measurement of photomask linewidths is the rough shape of the edge of the etched chrome lines. This uncertainty can be greatly reduced if the emulated stepper aerial image of the feature is measured instead of its geometric linewidth. That is: measure what the photomask does, not what it is. Phase-shift and other kinds of mask can be measured in the same way.

Proceedings Report of the International Invitation Workshop on Development Assurance. Held in Ellicott City, Maryland on June 16-17, 1994.
P. Toth. Jan 95, 35p, NISTIR-5590.

Keywords: *Quality assurance, *Product development, Product inspection, Evaluation, Competition, Models, Methodology, *Developmental assurance, US NIST.

Ninety-eight participants from the US, EC, Canada, and Japan representing government agencies, both defense and civil, private corporations, evaluators, users, and vendors of trusted products met to discuss the concept of developmental assurance. The majority of the participants felt that the concept of developmental assurance was valid. The participants recommended that all future developmental assurance work take place on the international level. The developmental assurance concept must first be proven at the lower levels of trust. Developmental assurance may provide a level of assurance that approaches the current C2/E2. If this is possible, developmental assurance may then be extended to the higher levels of trust. Developmental assurance may not replace third party evaluations completely but may help to speed up the evaluation process. Developmental assurance in combination with third party evaluation may provide a useful level of assurance in a more reasonable period of time.

Keywords: *US NIST, *Metrology, *Tolerances(Mechanics), Electronics industry, Automobile industry, Specifications, Engines.

Increasing numbers of economically important products manufactured by U.S. companies are comprised of assemblies of component parts which have macroscopic dimensions and microscopic tolerances. Micrometer-tolerance assemblies include not only integrated-circuit devices and mangetic-memory read-write heads, but automobile-engine systems, including fuel injectors, hydraulic valve lifters and even piston and cylinder assemblies. Focusing on these, this paper: (1) reports examples of micrometer-tolerance assemblies; (2) discusses strategies in design, specification, and tolerancing (DS&T) which some companies have adopted for the manufacture of such assemblies; and (3) identifies generic-technology, measurement, and standards issues in DS&T associated with that manufacture.

Coordinate Measuring Machines (CMMs) have emerged as the primary tool for manufactured part dimensional inspection. However, models which completely characterize CMM errors are not currently available. The Interim Testing Artifact (ITA) was developed at the National Institute of Standards and Technology (NIST) to help CMM users determine the performance of their CMMs. This document is a user manual which contains the complete instructions for the assembly, use and maintenance of the ITA.

Keywords: *Verification inspection, *Fitting, *Geometry, *Computer program verification, Algorithms, Computer software, Data analysis, Graphical user interface, Input output processing, Online systems, User manuals(Computer programs), ATEP(Algorithm Testing and Evaluation Program), CMS(Coordinate Measuring Systems), US NIST.

The Algorithm Testing System (ATS) is a software system which support the Algorithm Testing and Evaluation Program for Coordinate Measuring Systems (ATEP-CMS). ATEP-CMS is a National Institute of Standards and Technology (NIST) special test service for evaluating the performance of CMS geometric fitting software. ATEP-CMS uses the ATS to analyze such software. The ATS typically performs such an analysis by generating data sets, applying its own fitting routines to fit geometries onto the datasets, and comparing its own fit results to the fit results of the software under test for the same data. The ATS provides the above capabilities, and extensive on-line help. The report provides a user's guide for the ATS. It introduces the overall design and functionality of the ATS and guides the user through a number of hands-on tutorials.

Integrated Vision Touch-Probe System for Dimensional Inspection Tasks.
M. Nashman, W. Rippey, T. H. Hong, and M. Herman. Jun 95, 18p, NISTIR-5678.

Keywords: *Verification inspection, *Dimensional measurement, *Computer vision, *Tactile sensors(Robotics), Control systems, Real time operation, Hierarchies, Image processing, CMMs(Coordinate Measuring Machines), NGIS(Next Generation Inspection System).

The paper discusses the integration of vision and touch sensors in a coordinate measuring machine (CMM) controller used for dimensional inspection tasks. A real-time hierarchical control system is presented in which a vision system extracts positions of features. The probe is tracked by the vision system as it scans surfaces so that its motion can be visually served. Minimalist sensor-derived representations, involving only task-specific information, are used in this process. Although the camera itself remains incalibrated, a real-time calibration of very limited scope is performed each processing cycle to transform the task-specific image informaiton into 3-D information as feedback to guide the probe. The ability to integrate vision and touch sensors for CMM tasks promises expanded capabilities for flexible inspection data acquisition.

Estimation of Measurement Uncertainty of Small Circular Features Measured by CMMs.
S. D. Phillips, B. Borchardt, and W. T. Estler. Aug 95, 16p, NISTIR-5698.

Keywords: *Dimensional measurement, *Accuracy, *Estimating, Circular plates, Algorithms, Metrology, Geometry, Uncertainty, Graphs(Charts), *CMMs(Coordinate Measuring Machines), *Coordinate Measuring Machines.

This paper examines the measurement uncertainty of small circular features as a function of the sampling strategy, i.e., the number and distribution of measurement points. Specifically, we examine measuring a circular feature using a three-point sampling strategy in which the angular distance between the points varies from widely spaced, 120 degrees, to closely grouped, a few degrees. Both theoretical and experimental results show that the measurements uncertainty is a strong function of the sampling strategy. The uncertainty is shown to vary by four orders of magnitude as a function of the angular distribution of the measurement points. A conceptual framework for theoretically estimating the measuring uncertainty is described and a good agreement with experiment is obtained when the measurements are consistent with the assumptions of the theoretical model.

Metrology and Regional Trade Pacts.
Final rept.
H. Oppermann. 1995, 7p.
Pub. in Metrology for the Americas Symposium, Miami, FL., November 6-8, 1995, p1-7.

Keywords: *Dimensional measurements, *Standards, *International trade, Specifications, Metrology, Regulations, Laboratories, Accreditation, Reprints, Trade agreements, Technical barriers.

International investment and trade are driving forces for national economies, building a sound industrial base, and developing jobs. However, as tariffs have decreased, technical barriers have become significant as potential impediments to trade. These technical barriers are often the result of technical regulations (mandatory standards). Some of the major technical barriers to trade stem from product standards, conformity assessment, laboratory accreditation, and demonstrating traceability to national laboratories.

This handbook compiles the latest Uniform Laws and Regulations and related interpretations and guidelines adopted by the National Conference on Weights and Measures (NCWM). At the 1983 Annual Meeting, the NCWM voted to change the title of Handbook 130 and the titles of the Laws and Regulations compiled in this handbook. The former title of the handbook was 'Model State Laws and Regulations.' 'Model State' was changed to 'Uniform' in the titles to reflect that these Laws and Regulations are (1) intended to be standards rather than just guidelines, and (2) intended for adoption by political subdivisions other than States when deemed appropriate. The compilation itself was approved by the NCWM in 1979. This edition includes amendments adopted at the Annual Meeting in 1995.

Present and Future Standard Specimens for Surface Finish Metrology.
Final rept.
T. V. Vorburger, J. F. Song, E. Marx, B. R. Scace, and T. R. Lettieri. 1992, 4p.
Pub. in International Symposium on Optical Fabrication Testing and Surface Evaluation, Society of Photo-Optical Instrumentation Engineers, v1720 p78-81 Feb 92.

Keywords: *Surface profiling, *Metrology, Bidirectional reflectance, Roughness average, Sinusoidal, Spatial wavelength, Reprints, *Standard reference materials.

The accurate measurement of surface finish requires standard specimens to calibrate and check the operation of the measuring instruments. This is true both for profiling techniques such as the stylus and area averaging techniques such as light scattering. For profiling stylus instruments, the international standard ISO 5436 has enumerated four types of standard specimens which may be classified as step height specimens, periodic roughness specimens, random roughness specimens, and specimens for checking probe tip resolution. A draft of a related U.S. standard uses the same taxonomy. For light scattering instruments, the use of standard specimens are discussed in the ASTM standard for total integrated scatter. In addition, several ad hoc standard specimens have been used in an interlaboratory comparison of instruments that measure the bidirectional reflectance distribution function (BRDF). The group has developed a series of specimens, known as Standard Reference Materials (SRMs), for calibrating stylus profiling instruments. The authors are also in the process of developing a series of profile specimens for calibrating the linearity of BRDF instruments. Both types of specimens have sinusoidal profiles and are discussed in turn.

Importance of Measurement in Technology-Based Competition.
Final rept.
H. Hellwig. 1990, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 39, n5 p685-688 1990.

Keywords: *Measurement, *Manufacturing, *Technology innovation, *Quality assurance, Metrology, Measuring instruments, Production, Productivity, Online systems, Reprints.

In this paper, measurement challenges are related to the changes taking place in emerging technologies, quality and production. The act of measurement is increasingly associated with the process rather than the product. As a result, the role of measurement is becoming proactive and anticipatory. Measurements are increasingly done on-line and at the place of need within the production process. Measurement problems must be addressed early in the research and development phase; and the purpose of measurement must be seen as assuring good product at all times as opposed to the traditional role of measurement which was focussed on eliminating bad products.

The conference addressed the many challenges and opportunities confronting manufacturers. Presentations were made by representatives from a host of manufacturing industries, each of which has been trying to chart its course for the future by developing a 'road map' of technology directions and needs. The conference was a unique opportunity to examine the spectrum of manufacturing industries, identify the commonalities and differences, and start assessing the value of road maps. The conference also provided a glimpse of the full spectrum of government programs in manufacturing technology. The ultimate goal was to develop a plan for moving forward to assure that the United States maintains a strong, dynamic manufacturing sector that is globally competitive and capable of meeting national challenges. Among other themes, the papers reflect growing government collaboration with industry, increasing cooperation within and among federal agencies, expanded technical agendas in government, and experimentation with innovative government programs.

Pub. in Proceedings of International Symposium on Robotics and Manufacturing (3rd): Research, Education, and Applications, British Columbia, Canada, July 18-20, 1990, p243-250.

Keywords: *Control systems, *Robotics, *Real time systems, Artificial intelligence, Automation, Technology innovation, Technology transfer, Government/industry relations, Computer architecture, Models, Systems engineering, Reprints, ARTICS(Architecture for Real-Time Intelligent Control Systems).

The paper presents a concept for the development of a reference model open-system architecture for real-time, sensory interactive, intelligent machine systems. Central to the notion is a desire to accelerate technological development, technology transfer and commercialization of world class control system products in the field of robotics, intelligent machines, and automation. A plan is outlined whereby a reference model Architecture for Real-Time Intelligent Control Systems (ARTICS) can be defined through the cooperative efforts of industry, academia, and government. As envisioned, ARTICS would be a series of evolving guidelines specifying an infrastructure of hardware components, software components, interfaces, communications protocols and application development tools. An ARTICS reference model would make it possible for industry to develop and market a diverse line of control system components which could be interchangeable and realizable on many different vendors' intelligent machine systems platforms.

World Model Registration for Effective Off-Line Programming of Robots.
Final rept.
N. Tarnoff, A. Jacoff, and R. Lumia. 1990, 8p.
Pub. in Proceedings of International Symposium on Robotics and Manufacturing (3rd): Research, Education, and Applications, British Columbia, Canada, July 18-20, 1990, p783-790.

Keywords: *Robots, *Computer programming, *Manufacturing, Trajectories, Robot dynamics, Control systems, Off line systems, Calibrating, US NIST, Reprints, *World models, AMRF(Automated Manufacturing Research Facility).

The paper discusses progress in world model calibration and environmental modeling of sensory information in the context of the Off-Line Programming (OLP) project at the National Institute of Standards and Technology's (NIST) Automated Manufacturing Research Facility (AMRF). The project began in 1988 to demonstrate an integrated OLP implementation. The baseline OLP system accepts IGES CAD data, enables graphical simulation of objects and devices and produces VAL II robot trajectories. The robot trajectories, however, are based on a world model that is inherently inaccurate. A basic OLP system and most existing commercial OLP systems, therefore, are more effective only as a prototyping tool. Consequently, the authors are now developing the new OLP system into a production tool for generating robust robot control programs. The authors recently completed work on world model calibration and environmental modeling of force and torque in an attempt to improve world model registration of the real world.

The Hierarchical Ada Robot Programming System (HARPS) is a telerobot control system which can perform some simple but useful tasks: this capability is demonstrated by performing an ORU exchange demo. HARPS is based on the National Institute of Standards and Technology (NIST) NASA Standard Reference Model (NASREM) model. The primary programming language for all developed software is Ada, and the project incorporated a number of different Computer Aided Software Engineering (CASE) development tools. NASREM was found to be a valid and useful model for building a telerobot control system: Its hierarchical and distributed structure creates a very natural and logical flow for developing and implementing large, complex, and robust control systems. Similarly, the ability of Ada to create and enforce abstraction was found to enhance the implementation of such a control system. The CASE tools utilized showed some promise in helping to design a large system which processed a tremendous amount of data involving very complex computations and relationships. An overview of NASREM, the ORU exchange demo, the HARPS system, and the development tools used in HARPS is given in this paper.

Real-Time Obstacle Avoidance Using Central Flow Divergence and Peripheral Flow.
D. Coombs, M. Herman, T. Hong, and M. Nashman. Feb 95, 22p, NISTIR-5605.

Keywords: *Robot dynamics, *Obstacle avoidance, *Computer vision, Real time, Robotics, Navigation, Image processing, Flow visualization, Control systems, PIPE(Pipelined Image Processing Engine).

The lure of using motion vision as a fundamental element in the perception of space drives this effort to use flow features as the sole cues for robot mobility. Real-time estimates of image flow and flow divergence provide the robot's sense of space. The robot steers down a conceptual corridor, comparing left and right peripheral flows. Large central flow divergence warns the robot of impending collisions at 'dead ends.' When this occurs, the robot turns around and resumes wandering. Behavior is generated by directly using flow-based information in the 2-D image sequence; no 3-D reconstruction is attempted. Active mechanical gaze stabilization simplifies the visual interpretation problems by reducing camera rotation. By combining corridor following and dead-end deflection, the robot has wandered around the lab at 30 cm/s for as long as 20 minutes without collision. The ability to support this behavior in real-time with current equipment promises expanded capabilities as computational power increases in the future.

The Unified Telerobotic Architecture Project (UTAP) open architecture is intended for operator-supervised, teleoperated and shared control robotic maintenance tasks. The basic premise is to augment, not replace, the human operator by blending the individual skills of each into a system - the human's superior cognition and pattern recognition, and the robot's tireless, precise, and repeatable, motion. Further, many of the tasks are unsafe and hazardous. This document describes the UTAP architecture and a standard environment and Application Programming Interface for the architecture. The document presents a discussion of the Interface Framework including the reasoning process applied to the interface definition. It also presents a UTAP configuration and classification strategy. It describes the UTAP information model used for representing the interface data. The UTAP interfaces, including the format, types, syntax, semantics and significant features of operation are presented. Appendix I describes the architecture and module functionality. Appendix II summarizes the UTAP interface messages, and Appendix III contains specific definitions for each of the UTAP interfaces. Appendix IV contains profiles for the Remote modules in the system. Appendix V discusses a sample scenario for a refurbishing task, and then presents an overview of the message traffic.

Image Gradient Evolution: A Visual Cue for Danger.
H. Liu, T. H. Hong, M. Herman, and R. Chellappa. Oct 95, 19p, NISTIR-5728.
Prepared in cooperation with Maryland Univ., College Park. Center for Automation Research.

Keywords: *Computer vision, *Position sensing, *Collision avoidance, Autonomous navigation, Robot dynamics, Robot sensors, Motion perception, Three dimensional motion, Optical flow(Image analysis), Image processing, Divergence, Image analysis, Artificial intelligence, *Image gradient.

This paper is concerned with the task of visual motion-based navigation. A critical requirement of the task is the ability to estimate 3-D depth and motion from visual information. We present a new concept called image gradient evolution (IGE), which utilizes the change of image spatial gradients over time as a threat cue; an approaching object induces 2-D expanding motion and causes the image spatial structure to stretch so the image gradients decrease. Based on this idea, our method offers a one-step solution directly from image gradients, instead of from optical flow and its derived properties.

Scale-Space-Based Visual-Motion-Cue for Autonomous Navigation.
S. R. Kundur, D. Raviv, and E. Kent. Feb 96, 96p, NISTIR-5790.
Grant NSF-IRI-9115939
Prepared in cooperation with Florida Atlantic Univ., Boca Raton. Sponsored by National Science Foundation, Arlington, VA. Div. of Information, Robotics and Intelligent Systems.

Keywords: *Computer vision, *Autonomous navigation, *Robotics, Collision avoidance, Image analysis, Three dimensional bodies, Artificial intelligence, Image processing, Algorithms, Cameras, Visual perception, Computer motion.

This paper presents a new visual motion cue, the authors call the Hybrid Visual Threat Cue (HVCT) that provides some measure for a change in relative range as well as absolute clearances, between a 3D surface and a fixated observer in motion. The visual field associated with the HVTC can be used to demarcate the regions around a moving observer into safe and danger zones of varying degree, which may be suitable for autonomous navigation tasks, in particular collision avoidance and maintenance of clearance. The HVTC is independent of the 3D environment and needs almost no a-priori information about it. It is rotation independent, and is measured in (time(sup -1)) units. When there is a relative motion between a fixation point on a 3D surface and an observer, the perceived texture details the image vary. The rate at which the details vary provides an indication of the observer's relative motion with respect to the 3D surface. Scale space representation which is a multiscale approach provides a concrete way to analyze the variations of image details The authors derive a relation between the relative temporal variations of the image inner scale and the HVTC. A practical method to extract the HVTC from a sequence of images of a 3D textured surface obtained by a fixated, fixed-focus monocular camera in motion is also presented. A global dissimilarity measure is extracted directly from the raw data of the gray level of textured images from which the HVTC is obtained. This approach of extracting the HVTC is independent of the type of 3D surface texture and needs no optical flow information, 3D reconstruction, segmentation, feature tracking. It needs almost no camera calibration. This algorithm to extract the HVTC was applied to a set of twelve different texture patterns (of 3D scenes) from the Brodatz's album, where the authors observed a similar behavior for most of the textures.

Novel Active-Vision-Based Motion Cues for Local Navigation.
S. R. Kundur, and D. Raviv. Feb 96, 65p, NISTIR-5791.
Grant NSF-IRI-9115939
Sponsored by National Inst. of Standards and Technology (MEL), Gaithersburg, MD. Intelligent Systems Div. and National Science Foundation, Arlington, VA. Div. of Information, Robotics and Intelligent Systems.

Keywords: *Robots, *Autonomous navigation, *Computer vision, *Collision avoidance, Sensors, Controllers, Cameras, Image processing, Visual perception, Real time operation.

In the absence of a-priori information about the information an autonomous mobile robot relies on sensory information to make local judgments about its surrounding. Generation of a local collision-free path based on sensory data plays an important role in the control of the robot's motion. The paper presents a novel active vision-based approach for generating local collision-free paths for mobile robot navigation in indoor as well as outdoor environments. Two measurable visual motion cues that provide some measure for a relative change in range as well clearance between a 3D surface and fixated observed in motion are described. These visual cues are independent of the 3D environment and need no a-priori knowledge about it. For each visual motion cue, there is a visual field surrounding the moving observer. In other words, there are imaginary 3D surfaces attached to the observer that move with it, each of which correspond to a value of the cue. These visual fields can be used to demarcate regions around a moving observer into safe and danger zones of varying degree to make local decisions about the sterring as well as speed commands to the mobile robot. We describe a practical method to extract these cues from a sequence of images. This approach needs no feature tracking between images and almost no camera calibration.

Open Architectures for Machine Control.
F. M. Proctor, B. Damazo, C. Yang, and S. Frechette. Dec 93, 20p, NISTIR-5307.

Keywords: *Machine tools, *Controllers, *Standards, Interactive graphics, Man machine systems, Error cor-

recting devices, Modular structures, Extensibility, Workstations, Computer architecture, National Institute of Standards and Technology, EMC(Enhanced Machine Controller), NURBS(Non-Uniform Rational B-Splines).

A major impediment to improving the performance and functionality of machine tools is the limited access that users or third parties have to the internals of the machine controller. This limit has suppressed the emergence of a community of third-party vendors who could provide a wide range of applications at competitive prices. The result is that users are often faced with all-or-nothing compromises when choosing controllers, and are restricted to the original controls vendors for everything from spare parts to software. Machine tool users would benefit from an open architecture that can serve as both a target for innovative third party product development, and as a specification which produces multiple competitive sources for interoperable products. The National Institute of Standards and Technology has initiated a project which will demonstrate the feasibility of open architectures for machine control. This project, the Enhanced Machine Controller (EMC), has selected several target applications which improve the accuracy and ease of use of machine tool controllers: selectable look-and-feel, tool management, alternate part programming languages, spline-based motion, on-machine inspection, and thermal-geometric error compensation.

Prediction of Geometric-Thermal Machine Tool Errors by Artificial Neural Networks.
D. E. Gilsinn, and M. A. Donmez. Apr 94, 149p, NISTIR-5367.
Sponsored by Naval Research Lab., Washington, DC. Navy Manufacturing Technology Program.

Keywords: *Machine tools, *Error correction codes, *Neural nets, Conjugate gradient method, Optimization, Cutting machines(Tools), Algorithms, Artificial neural networks, Fortran programming language, Gradient descent method.

In machining operations, the precision of the workpiece dimensions depends on the accuracy of the relative position of the cutting tool and the workpiece. Among the key factors that affect the accuracy of this relative position are the geometric errors of the machine tool and the thermal effects on these geometric errors. Recent work on developing models to predict volumetric errors on NC lathes has led to a synthesis technique that combines the modeling of individual axis related geometric-thermal components by way of a rigid body kinematic model to produce predicted errors in the work volume of the machine. An alternative method of modeling these component errors is described in this report. Neural network computing is shown to be a viable technique for developing mappings between machine tool component error measurements and the vector consisting of both a component slide position and the temperature state of the machine as reported by the thermal sensors. The conjugate gradient algorithm, used to compute the optimum neural network weights for the machine tool error components, is described. A case study of the mapping results for one component error of an actual NC lathe is given. Finally, the source codes for the neural network algorithm and the conjugate gradient algorithm are given in FORTRAN.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Dimensional Stability, San Diego, CA., July 12-13, 1990, v1335 p186-193.

Keywords: *Turning(Machining), *Errors, *Computer vision, Real time, Cutting tools, Algorithms, Numerical control, Inspection, Reprints, CMMs(Coordinate Measuring Machines).

Deviations from the circular shape of the cutting edge of a single-point turning tool cause form errors in the workpiece during contour cutting. One can compensate for these tool-form errors by determining the size of the effective deviation at a particular instant during cutting, and then adjusting the position of the cutting tool accordingly. An algorithm for the compensation of tool-nose-radius errors in real time has been developed and implemented on a CNC turning center. A previously developed computer-vision-based tool-inspection system is used to determine the size of the deviations. Information from this system is fed to the error compensation computer which modifies the tool path in real time. Workpieces were cut utilizing the compensation system and were inspected on a coordinate measuring machine. Significant improvements in workpiece form were obtained.

Pub. in CIRP Annals 38, n1 17p 1988.

Keywords: *Displacement measurement, *Machine tools, *Calibration, Three dimensional, Error analysis, Metrology, Interferometry, Reprints, *Coordinate measuring machines.

It is shown that the volumetric errors of a three-axis machine tool or measuring machine can be determined by measuring the displacement error along 22 lines in the machine work zone. Pitch and yaw are derived from measuring the displacement error on two parallel lines for each axis. The squareness and straightness errors are determined by measuring two diagonals and one additional line. Roll errors are derived from the straightness errors on two parallel planes. Formulae for calculating these components of error and also the three-dimensional positioning error at any particular point are given. Experiments done at both Tianjin and NBS show that this method simplifies machine calibration, reduces the equipment needed, and can improve accuracy.

The National Institute of Standards and Technology (NIST) has conducted a study of United States Military Standard MIL-STD-1312, Fastener Test Methods. Military Standard MIL-STD-1312 is a unified compilation of over 35 individual fastener test methods for determining the capability of fasteners to withstand various environmental and mechanical conditions encountered in service. Each of the individual fastener test methods is itself a fastener test standard, and is designated with its own document number. For this study, only selected test methods which prescribe certain mechanical tests for fasteners were reviewed. These test methods were evaluated and recommendations formulated for upgrading or replacing them to reflect the current state-of-the-art.

Sponsored by National Aeronautics and Space Administration, Moffett Field, CA. Ames Research Center.
Pub. in Proceedings of International Cryocooler Conference (7th), Santa Fe, NM., November 17-19, 1992, p783-804 1993.

Keywords: *Scaling laws, *Design criteria, *Refrigerant compressors, Seals(Stoppers), Electric motors, Mathematical models, Springs, Refrigerating machinery, Refrigerators, Reprints, *Flexural springs.

Linear-resonant compressors with flexure springs and clearance seals have recently been developed for use in long-life Stirling and pulse tube refrigerators. This paper describes a set of equations that are used to design the various components in the compressor given specified performance criteria. The components considered are the moving-coil linear motor, the mass of the moving components, the magnet assembly, the flexure springs, and the clearance seals. Both radially and axially magnetized magnets are analyzed and the criteria for selection are developed. Methods for reducing the compressor size and mass are discussed as well as the influence of the stroke-to-diameter ratio on the design of flexure springs. The design equations have allowed the development of scaling laws for linear motor compressors covering a wide range of compressor sizes from 3 watts to 4 kilowatts.

Comparing NIST-B 50 mm Orifice Meter Gas Data to the ANSI Equation.
Final rept.
J. L. Scott. 1993, 7p.
Pub. in Proceedings of Fluid Engineering Conference Fluid Measurement and Instrumentation Forum, Washington, DC., June 20-24, 1993, p13-19.

Keywords: *Orifice meters, *Flowmeters, *Flow distortion, Orifice flow, Flow measurement, Reynolds number, Discharge coefficient, Orifices, Reprints.

A revised equation for computing discharge coefficients in orifice meters has been adopted by the American National Standards Institute (ANSI). The empirical data base used to develop this equation did not include gaseous fluid measurements for the 50 mm orifice meter. New experimental data that extend the Reynolds number range of the data base have been generated using nitrogen gas in this meter size. These new data are compared to the discharge coefficients calculated from the equation and to the original, lower Reynolds number data. The comparisons are beta ratio dependent, but, in general, the comparisons between the new data and the original data are quite good for all the beta ratios tested. Work was sponsored by Gas Research Institute (GRI).

Geometric Characterization of Rockwell Diamond Indenters.
Final rept.
J. F. Song, F. F. Rudder, T. V. Vorburger, J. H. Smith, A. W. Hartman, and B. R. Scace. 1994, 6p.
Pub. in Proceedings of IMEKO World Congress (13th) 'From Measurement to Innovation', Torino, Italy, September 5-9, 1994, v1 p779-784.

Keywords: *Calibration, Rockwell hardness, Uncertainty, Pens, Microform, Reprints, *Diamond indenters, Surface finish.

By using a stylus instrument, a series of calibration and check standards, and calibration and uncertainty calculation procedures, we have calibrated Rockwell diamond indenters with traceability to fundamental measurements. The combined measurement uncertainties (95%) of the calibration are less than 1/10 of the tolerance requirements of calibration grade Rockwell diamond indenters. Our combined measurement uncertainties are: + or - 0.4 micrometer in least squares radius, + or - 0.01 deg in cone angle, and + or - 0.023 deg in holder axis alignment. The profile deviation from least squares radius and cone flank straightness is also calibrated. Engineering features of the diamond indenter's surface finish, such as surface roughness, and flat or sharp-shaped spherical tip are explored and quantified.

Microform Calibrations in Surface Metrology.
Final rept.
J. F. Song, F. F. Rudder, T. V. Vorburger, J. H. Smith, A. W. Hartman, and B. R. Scace. 1995, 10p.
Pub. in Int. Jnl. Mach. Tools Manufact. 35, n2 p301-310 1995.

Keywords: *Microform, *Calibration, Rockwell hardness, Measurement, Uncertainty, Pens, Reprints, *Surface metrology, Diamond indenters, Surface texture.

Microform calibrations include the measurement of complex profile forms and position errors of micrometer scale in combination with the measurement of deviations from specified profile and surface texture of profile segments. Tolerances on the profile form are specified and may correspond geometrically to surface texture parameters. One example of microform calibration is the calibration of Rockwell diamond indenters used for hardness testing of materials. Previously reported measurement techniques do not meet the stringent microform calibration requirements for Rockwell diamond indenters. Inadequate microform calibration of hardness indenters may be one factor resulting in significant interlaboratory differences in results from Rockwell hardness tests. By using a stylus instrument, in combination with a series of calibration and check standards and calibration and measurement uncertainty calculation procedures, we have calibrated Rockwell diamond indenters in accordance with the definitions specified in ISO and ASTM standards. Our procedures for conducting microform calibration yield total measurement uncertainties less than ten percent of the tolerance values specified in ISO and ASTM standards. In this paper, the general calibration requirements, calibration and check standards, and calibration and uncertainty procedures that we use in performing microform calibrations are introduced. Some general considerations on stylus radius correction, data fitting, calibration traceability, uncertainty and reproducibility are also discussed.

Pub. in Manufacturing Review 7, n3 p252-266 Sep 94.

Keywords: *Machine tools, *Control, *Automation, Quality assurance, Real time, Error detection codes, Process control, Reprints, US NIST, QIA(Quality in Automation), Post-process.

The automated control of machine-tool accuracy is discussed based on a quality architecture that is being implemented at the National Institute of Standards and Technology (NIST) under the Quality in Automation (QIA) project. The quality architecture contains three control loops: real-time, process-intermittent, and post-process. This paper highlights the post-process loop, although the QIA project emphasizes the measurement and control of process variables to control the quality of the product, post-process dimensional measurements of the finished product play a role in the system and may be used for correction of certain variables. The strategy for the post-process loop includes classification schemes for the adjustable parameters in the system, for the error diagnostics, and for the error model of the machine tool.

This report looks at critical research needs for leading-edge technology developments in machining and precision that are important to the competitiveness of the US discrete-part industry. Key driving forces in manufacturing are identified. These include the increased demand for higher speed, greater flexibility, greater precision, automation, advanced materials, and the emergence of new processes. Infrastructural developments required for improvements in and control of manufacturing precision are discussed. Research challenges in machine tool characterization, machine tool performance enhancement, closed-loop precision manufacturing, process modeling, high speed machining and costs of precision are identified.

Proposed Changes to Charpy V-Notch Machine Certification Requirements.
Final rept.
J. D. Splett, and J. C. M. Wang. 1995, 13p.
Pub. in Symposium on Pendulum Impact Machines: Procedures and Specimens for Verification, Montreal, Quebec, Canada, May 18-19, 1994, p182-194 May 95.

Keywords: *Certification programs, Reprints, Impact testing, Requirements, *Charpy V Notch machines, *Pendulum impact machines, Notched bar testing.

In 1989 the administration of the Charpy V-Notch Certification Program was assumed by the National Institute of Standards and Technology. The United States Army originated the program to insure the measurement integrity of Charpy V-notch machines across the country. The program has been operated for many years using candidate machine acceptance limits which can possibly be traced to a 1955 paper by Driscoll, however, the original statistical justification for using these acceptance criteria has been lost or never existed. A statistical analysis of recent certification program data indicates that the existing candidate machine acceptance limits should be modified. In this paper, the authors will discuss and justify potential changes to candidate machine acceptance limits.

Metrology Approach to Unifying Rockwell C Hardness Scales.
Final rept.
J. F. Song, J. H. Smith, and T. V. Vorburger. 1995, 13p.
Pub. in Proceedings of the International Symposium on Hardness Testing in Theory and Practice (9th), Dusseldorf, Germany, November 23-24, 1995, p19-31.

Keywords: *Rockwell hardness, *Calibration, Microforms, Etching, Diamond pyramid hardness tests, Indentation hardness tests, Verification, Metrology, Uncertainty, Reference standards, Reprints, *Diamond indenters, Traceability.

Current Rockwell C hardness scales (HRC) are unified by performance comparisons. Unless a reliable metrology approach is used for the direct verification of standard hardness machines and diamond indenters, the unified hardness scale may exhibit a systematic offset from the true value of the harness scale. Based on the recently developed NIST microform calibration system, a metrology approach is suggested to unify Rockwell C hardness scales. The true value and reference-value scales are defined. It is proposed to use the reference standards, including standard hardness machines and NIST standard-grade Rockwell diamond indenters, to create, maintain, and reproduce the reference-value scale for the metrology-based Rockwell hardness standard system, and to overcome the systematic offset in existing performance-based hardness scales.

J. Mou, and M. A. Donmez. 1993, 10p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers, Vision, Sensors, and Control for Automated Manufacturing Systems, Boston, MA., September 9-10, 1993, v2063 p22-31.

Keywords: *Machine tools, *Displacement measurement, *Inspection, *Precision, Computerized control systems, Process control, Accuracy, Quality control, Error analysis, Calibration, Data analysis, Algorithms, Reprints, CNC(Computer Numerical Control).

An integrated inspection system for improving the accuracy of CNC machine tools is proposed. The sysem described in this paper emphasizes the integration of the on-machine inspection and analysis techniques with the information coming from post-process inspection. The proposed system utilizes the information from both post-process and on-machine inspection to improve machine performance automatically. Algorithms are derived for analyzing the post-process and on-machine inspection data to identify residual systematic errors and relate them to the machine performance. Various data analysis algorithms and techniques are compared. A feature comparison approach is developed to relate the dimensional and form errors of a manufactured workpiece to the systematic machine tool errors. Inverse kinematics technique and statistical methods are used to identify and characterize the contribution of each geometric error component. A self tuning algorithm is also proposed to fine tune the geometric-thermal model.

Standards Promote Credibility and Technology Transfer: The Need for Greater Industry Support of Technical Committees.
C. D. Lovett. Oct 96, 13p, NISTIR-5899.

Keywords: *Technology transfer, *Standards, *Machining, Machine tools, International trade, Competition, Technical organizations, International Standards Organization.

The intent of this paper is to call attention to the need for greater industry participation in both national and international standards committees. This need is described by giving an overview of U.S. standardization by the voluntary consensus-based process and describing some of the benefits of participating in standards-developing committees. The U.S. National Machining Center Standards Committee is cited as an example of a voluntary consensus-based process, involving cooperation among industry, government and academia.

Considerations on Data Requirements for Tribological Modeling.
Final rept.
A. W. Ruff. 1991, 16p.
Pub. in Tribological Modeling for Mechanical Designers, ASTM STP 1105, p127-142 1991.

Keywords: *Tribology, *Data bases, Mechanical engineering, Lubrication, Test methods, Friction, Wear, Materials, Models, Design, Reprints.

An idealized database for tribology is described that contains numeric data with characteristics needed for use in modeling approaches in tribology. Tribological data on materials are considered in detail, and other types of required data are identified. Testing methodologies for obtaining data are examined. Priority areas for future work in data gathering and data evaluation in tribology are suggested.

Tribological Characteristics of Alpha-Alumina at Elevated Temperatures.
Final rept.
X. Dong, S. Jahanmir, and S. M. Hsu. 1991, 9p.
Pub. in Jnl. of American Ceramic Society 74, n5 p1036-1044 1991.

Keywords: *Aluminum oxide, *Tribology, *Mechanical properties, High temperature tests, Friction, Performance evaluation, Wear, Ceramics, Reprints.

The tribological characteristics of alpha-alumina sliding on a similar material under dry sliding conditions are divided into four distinct regimes. At low temperatures, T < 200 C, tribochemical reactions between alumina surface and water vapor in the environment control the tribological performance. At temperatures above 800 C, formation of silicon oxide layers on the wear track, by viscous flow and diffusion of the grain boundary phase, reduces the coefficient of friction to 0.4; and the wear coefficient is reduced to a value less than .000001. The results of the wear tests and observations of the fundamental mechanisms controlling the tribological behavior of this material are consolidated in a simple wear transition diagram. The wear transition diagram can be used for the identification of wear mechanisms and the transition boundaries.

Tribochemical Reaction of Stearic Acid on Copper Surface Studied by Surface Enhanced Raman Spectroscopy.
Final rept.
Z. S. Hu, S. M. Hsu, and P. S. Wang. 1992, 6p.
Pub. in Tribology Transactions 35, n3 p417-422 1992.

Keywords: *Tribology, *Lubricants, *Copper, *Stearic acid, *Surface chemistry, Chemical reactions, Raman spectroscopy, Chemisorption, Wear, Reprints, Cupric stearate, Hexadecane.

Micro-Raman, back-scattered by Ar ion laser, was used to study the tribochemical reaction of copper surface and hexadecane containing 0.4 weight percent stearic acid. The characteristic Raman signals of cupric stearate at 1,547, 623, 288, and 243 wavenumbers were detected during the reaction and the formation of cupric stearate confirmed. The tribochemical reaction was initiated by the formation of a chemisorbed stearic acid on the native oxide film of the copper surface. This chemisorbed stearic acid is in the form of monomer and is approximately perpendicular to the copper surface. The native oxide film is necessary for this chemisorption to occur. Further wearing of the surface converts the chemisorbed stearic acid into cupric stearate.

Tribology Education: Present Status and Future Challenges.
Final rept.
S. Jahanmir, and F. E. Kennedy. 1991, 3p.
Pub. in Jnl. of Tribology 113, n2 p229-231 1991.

Keywords: *Tribology, *Education, *Mechanical engineering, *Lubrication, Recommendations, Surveys, Forecasting, Friction, Wear, Reprints, *Research Committee on Tribology, American Society of Mechanical Engineering.

The ASME-Research Committee on Tribology has been concerned that some of today's engineering students may not be learning enough about fundamentals of tribology. A survey of engineering schools was conducted to assess the current status of tribology education at universities. The survey results were presented and discussed at a panel session on Tribology Education. The panel consisted of an invited group of distinguished tribologists representing academia, industry, and federal government. A set of recommendations was prepared based on the presentations and the discussions that followed. Since only a small fraction of engineering colleges offer any treatments on tribology in their curricula, it is recommended that tribology fundamentals be incorporated in the course offerings to prepare the engineering students for future advanced technical developments.

Asperity-Asperity Contact Mechanisms Simulated by a Two-Ball Collision Apparatus.
Final rept.
T. N. Ying, and S. M. Hsu. 1993, 9p.
Pub. in Wear 169, p33-41 1993.

Keywords: *Wear, *Test methods, *Friction, Wear resistance, Interfaces, Friction measurement, Wear tests, Tribology, Reprints, *Two-ball collision test apparatus, *Asperity.

Wear of materials is controlled by asperity-asperity contacts. Since the asperities are of uneven height, the stresses imposed by different pairs of asperities necessarily are unequal. When two surfaces come together, there is a distribution of the contact stresses. In a wear experiment, we measure wear by measuring the cumulative wear across the interface from the beginning of the experiment, and we measure friction by measuring the average friction of all the asperity contacts across the interface at the particular instance in time. The friction and wear characteristics at the asperity level have interested the tribology community for a long time. Data at that level, however, are difficult to obtain and the conditions that lead to a single asperity wear event are not understood. This paper describes the design and construction of a two-ball collision test apparatus to simulate asperity contacts. Materials used include steels, brass, and aluminum of different hardness and elasticity. Dynamic friction and wear of the collision were measured under dry, paraffin oil lubricated conditions. The results suggested that at a coefficient of 0.4, wear of the asperity contact occurred. A simple plain strain model confirmed the observations that under certain conditions, asperity wear should occur at a coefficient of 0.39.

A tribometer at the National Institute of Standards and Technology in Boulder, Colorado is used to measure the coefficient of friction and the wear rate for various specimens in a controlled atmosphere of oxygen or non-corrosive gas. The wide range of demonstrated operating temperature of 80 to 1030 K is presently unavailable in any commercial apparatus. The machine

use ball-on-flat or ring-on-flat specimen geometries for comparison of conforming and non-conforming contacts. The apparatus is described and some test results are compared with known values.

Diffraction Imaging of Polycrystalline Materials.
Final rept.
D. R. Black, H. E. Burdette, M. Kuriyama, and R. D. Spal. 1991, 8p.
Pub. in Jnl. of Materials Research 6, n7 p1469-1476 1991.

Keywords: *X-ray diffraction, *Imaging techniques, Residual stress, Crystal defects, Grain size, Polycrystalline, Strains, Shape, Reprints, *Diffraction imaging, Industrial materials.

For the characterization of industrial materials, a new diffraction imaging technique is proposed and applied to obtain direct information about individual grains and their size and shape distributions and, in turn, strains in materials. Unlike traditional powder diffractometry, the highly parallel and monochromatic beam available from a synchrotron x-ray source is employed to observe and measure diffraction images from individual grains and component particles in consolidated materials prepared by various processes. Unlike traditional diffractometry, this new technique provides the ability to measure shape, size and strain without model based analyses. The spatial distribution of strain within individual grains, displayed as a diffraction image (topograph), indicates the presence of defects, such as dislocations, subgrain boundaries and precipitates, and sheds new light on the origins of residual strains (stresses) in industrial materials. The resolution of the imaging system used is limited to particles 1 micrometer or larger due to diffraction broadening and the resolution of the recording medium.

Crack Growth Resistance of Strain-Softening Materials under Flexural Loading.
Final rept.
T. J. Chuang. 1993, 4p.
Pub. in Proceedings of American Society of Civil Engineers Structure Congress, Indianapolis, IN., April 29, 1991, p466-469.

Keywords: *Crack propagation, *Flexural properties, *Strain(Mechanics), *Brittle materials, Loads(Forces), Flexural strength, Mechanical properties, Toughness, Deformation, Reprints, Subcritical crack growth.

The subcritical crack growth resistance of a bend bar is investigated for a group of brittle materials exhibiting strain-softening behavior. Based on a nonlinear constitutive law ascribed to the process zone ahead of the crack tip in a strain gradient field, the evolution of the process zone size, crack length and applied load is predicted for a given deformation history. The results showed that the crack growth resistance or toughness increases to a peak, then decays precipitously to zero as the crack grows towards the compressive edge, in qualitative agreement with experimental data. The fact that the K value, in general, never reaches a plateau suggests that a bend bar geometry is not suitable for K(sub IC) measurement.

NIST Workshop on Nanostructured Material (1st): Report of an Industrial Workshop Conducted by the National Institute of Standards and Technology. Held in Gaithersburg, Maryland on May 14-15, 1992.
Internal rept.
R. D. Shull. Mar 94, 56p, NISTIR-5456.

Keywords: *Meetings, Particle size, Composite materials, Information transfer, Synthesis(Chemistry), Industries, Phase studies, Physical properties, Thermodynamics, Mechanical properties, Corrosion, Processing, *Nanomaterials, *Nanostructures, *Advanced materials, Nanocomposites.

This workshop, the 'First NIST Workshop on Nanostructured Materials,' was the first of a series of workshops on the synthesis, characterization, properties, and applications of nanostructured materials to be held every three years at NIST. The workshop was organized to bring together people from industry, federal agencies, and universities to: (1) expedite the flow of information in the field, (2) identify key synthesis and processing methods with scalability potential, (3) acquaint the various communities with the unique properties of nanostructured materials, (4) assist industry in identifying potential application areas, and (5) identify needed areas of study. The workshop also was planned because of the recognition that in order for the U.S. to take advantage of the promise these materials hold, a concerted effort in this area is needed early. The workshop could highlight this need and provide directions for a concerted effort. Finally, it was felt that the workshop would provide NIST with additional guidance in directing its own programmatic initiative in the area.

Method for Determining Both Magnetostriction and Elastic Modulus by Ferromagnetic Resonance.
Final rept.
R. D. McMichael. 1994, 3p.
Pub. in Jnl. of Applied Physics 75, n10 p5650-5652, 15 May 94.

Keywords: *Modulus of elasticity, *Ferromagnetic resonance, *Magnetostriction, Ferromagnetic materials, Elastic properties, Bending, Substrates, Ferromagnetism, Strains, Anisotrophy, Nickel, Polymers, Magnetic properties, Reprints.

The magnetostriction constant lambda(sub s) includes a combination of both elastic constants C(sub ij) and magnetoelastic coupling constants B(sub i). To provide information on both C(sub ij) and B(sub i), a method for measurement of both lambda(sub s) and the elastic modulus Y of thin films has been developed using ferromagnetic resonance (FMR). As in prior FMR schemes for measuring lambda(sub s), a strain is produced in the film by bending the substrate, and the resulting anisotropy field is measured. However, by using a triangular polymer beam as a substrate, three important advantages are obtained (1) the triangular beam shape has uniform strain along its surface, (2) the polymer material supports large strains (> 10(exp -3)) without breaking, and (3) the low elastic modulus of the beam allows measurement of the sample elastic modulus through variation of the sample aspect ratio. Measurements on Ni foils yield values of lambda(sub s) and Y which fall within the scatter of literature data.

During the period June 16, 1995 to June 30, 1995, an interagency delegation of materials scientists from the Department of Commerce (DOC), Department of Energy (DOE), National Aeronautical and Space Administration (NASA), and the National Science Foundation (NSF) visited China and Hong Kong to explore areas for possible cooperation in materials research between the two countries under the general science and technology agreement. Recognizing the daunting task of assessing the state-of-the-art in a nation with so vast a scientific and academic structure as China, the study team's itinerary was organized to split into four smaller teams which began together in Beijing, spread out to visit separate locations and then met again in Shanghai. The visit ended at the Hong Kong University of Science and Technology (HKUST) which graciously provided facilities for the drafting of this report. The itineraries of these four teams (Appendix E) allowed for visits to 30 institutions in a period of a week and one half. Reports describing each of these visits are assembled in Appendix F, and should be referred to for detailed description.

Evolution Equations for Phase Separation and Ordering in Binary Alloys.
Final rept.
J. W. Cahn, and A. Novick-Cohen. 1994, 33p.
Pub. in Jnl. of Statistical Physics, v76 n3/4 p877-909 1994.

Keywords: *Alloys, *Phase separation, *Phase ordering, Reprints, Equations, Binary alloys, Allen-Cahn equations, Cahn-Hilliard equations.

The authors explore two phenomenological approaches leading to systems of coupled Cahn-Hilliard and Cahn-Allen equations for describing the dynamics of systems which can undergo first-order phase separation and order-disorder transitions simulateneously, starting from the same discrete lattice free energy function. In the first approach, a quasicontinuum limit is taken for this discrete energy and the evolution of the system is then assumed to be given by gradient flow. In the second approach, a discrete set of gradient flow evolution equations is derived for the lattice dynamics and a quasicontinuum limit is then taken. The authors demonstrate in the context of BCC Fe-Al binary alloys that it is important that variables be chosen that accommodate the variations in the average concentration as well as the underlying ordered structure of the possible coexistent phases. Only then will the two approaches lead to roughly the same continuum descriptions.

Pub. in Proceedings of the Materials Research Society Symposium, Boston, MA., December 2-6, 1991, v235 p133-138 1992.

Keywords: *Annealing, Defects, Reprints, *SIMOX, *Silicon on insulator, Transmission electron microscopy.

The microstructural changes in oxygen implanted silicon-on-insulator material (SIMOX) at intermediate annealing steps and the changes by rapid thermal annealing (RTA) were studied with transmission electron microscopy. Defects found in as-implanted SIMOX, including multiply faulted defects, short stacking faults, and (113) defects, were all removed in anneals from 900 degrees C to 1100 degrees C. The threading dislocations in annealed materials from at these temperatures during thermal ramping. RTA shows that the microstructure is significantly influenced by the ramp rate. The very high ramp rate in RTA results in very flat interfaces and a buried oxide layer with no Si islands, but significantly increases the defect density. Overall, the results show that intermediate thermal processing steps strongly affect the final microstructure of SIMOX material.

Interface Roughness, Composition, and Alloying of Low-Order AlAs/GaAs Superlattices Studies by X-ray Diffraction.
Final rept.
W. R. Miller, J. G. Pellegrino, and J. Comas. 1993, 6p.
Pub. in Proceedings of the Materials Research Society Symposium, 1992, v280 p265-270 1993.

Keywords: *Interface roughness, Superlattices, Reprints, *X ray diffractometry, AlAs/GaAs, Heterostructures, Migration enhanced epitaxy.

Low-order, monolayer by monolayer (1x1) AlAs/GaAs superlattices grown by MBE using different growth techniques have been studied by X-ray diffractometry. High-resolution multiple-crystal diffractometry was used to study diffraction features near the (004) peaks due to the substrate and epilayers. Using this technique, we have investigated the effect of growth techniques on the strain and tilt of the superlattices. High-resolution X-ray diffraction (HRXRD) results suggest that the sample grown by migration-enhanced epitaxy (MEE) is more highly strained and has more tilt than the same superlattice sample grown using the interrupted growth (IG) technique.

Instrumental Smearing Effects in Radially Symmetric Small-Angle Neutron Scattering by Numerical and Analytical Methods.
Final rept.
J. G. Barker, and J. S. Pedersen. 1995, 9p.
Pub. in Jnl. of Applied Crystallography, v28 p105-114 1995.

Keywords: *Resolution functions, Reprints, *Foreign technology, *Small angle neutron scattering, Smearing shadowing, Beamstop shadowing.

A numerical calculation method for determining the resolution functions for radially symmetric collimation and scattering is described. In the present approach, the total number of integrations is reduced to four by use of the radial symmetry of the geometry. Futhermore, the beam-stop shadowing effect is included exactly. A typical calculation can be completed in minutes on current personal computers. An interactive computer program allows the user to enter the experimental parameters such as aperture size and wavelength spread, allowing smearing calculations to be handled rountinely as a 'black box' operation. The exact smearing treatment is compared both to an improved technique involving Gaussian resolution functions where corrections for the beam stop are included and to results from Monte Carlo simulations. In most experiments, the use of a Gaussian distribution to approximate the resolution is preferred on account of its ease of calculation. But in a few cases, such as Porod scattering, the present more extensive numerical calculation or inclusion of the developed beam-stop-shadowing correction factors into a Gaussian scheme are needed for an adequate prediction of the smearing effects.

Lattice Statics of Interfaces and Interfacial Cracks in Bimaterial Solids.
Final rept.
V. K. Tewary, and R. Thomson. 1991, 39p.
Pub. in Jnl. of Materials Research, p1-39 1991.

Keywords: *Composites, *Films, *Fracture, Reprints, Interfaces, Calculation, Green's function.

A method for calculating a lattice statics Green's function is described for a bimaterial lattice or a bicrystal containing a plane interface. The method involves creation of two half space lattices containing free surfaces and then joining them to form a bicrystal. The two half space lattices may have different structures as in a two phase bicrystal or may be of the same type but joined at different orientations to form a grain boundary interface. The method is quite general but, in this paper, has been applied only to a simple model bicrystal formed by two simple cubic lattices with nearest neighbor interactions. The bimaterial Green's function is modified to account for an interfacial crack which is used to calculate the displacement field due to an applied external force. It is found that the displacement field, as predicted by the lattice theory, does not have the unphysical oscillations predicted by the continuum theory.

Correlations between Flaw Tolerance and Reliability in Zirconia.
Final rept.
M. J. Readey, C. L. McCallen, P. D. McNamara, and B. R. Lawn. 1993, 5p.
Pub. in Jnl. of Materials Science, v28 p6748-6752 1993.

Keywords: *Flaw tolerance, *Zirconia, Reliability, Indentations, Reprints, *Weibull modulus, R-curve.

Interrelations between flaw tolerance and reliability in Y-TZP, Ce-TZP and Mg-PSZ ceramics are investigated. Indentation-strength tests indicate an enhanced flaw tolerance with increasing R-curve behaviour from tetragonal goes to martensite transformation. The Weibull modulus of unindented specimens increases with the enhanced tolerance. However, even the most tolerant zirconias show persistent scatter in strength, implying that variability in material microstructure may be as important a factor in reliability evaluation in these materials as variability in flaw size.

Pub. in Computational Materials Science, v2 p137-142 1994.

Keywords: *Elasticity theory, Mechanical properties, Reprints, Computations, Fractures, *Computational materials science.

A claim is made that analysis will remain important and become a useful ally in helping computational materials science live up to its ultimate potential. Examples are given in the mechanical properties area where numerical simulations have been able to parameterize and mark out areas of validity for elasticity theory. The important role of developing asymptomic paths from one level or category of theory to another is discussed.

Fracture in Multilayers.
Final rept.
P. Anderson, I. H. Lin, and R. Thompson. 1992, 6p.
Pub. in Scripta Metallurgica, 6p 1992.

Keywords: *Fractures, *Multilayers, *Interfaces, Reprints, *Foreign technology, *Green's functions.

Fracture in multilayers is a subject about which very little is known. One of the only papers on the mechanisms of interfacial fracture of multilayers at the microstructural scale is that by Hirth and Evans. General references to the experimental literature are given in the paper by Lashmore and Foecke in this series. The main thrust of this paper, however, will be the discussion and interpretation of a single observation of an interfacial crack in a Cu/Ni multilayer by Lashmore, and since the theory is so little developed, the authors will often be projecting what the authors know about interfacial cracking into the multilayer world. For presentation of the results by Lashmore, again, see the paper in this series by lashmore and Foecke. Some preliminary interpretation of this micrograph is reported in Reference, based on extrapolation from dislocation emission theory in homogeneous solids. It was suggested there that the fracture toughness of multilayers may be higher than in the corresponding homogeneous materials because emitted dislocations will shield the crack more forcefully due to the limited mobility of shielding glide dislocations in the multilayer.

Cracks and Dislocations in Face-Centered Cubic Metallic Multilayers.
Final rept.
D. S. Lashmore, and R. Thomson. 1992, 8p.
Pub. in Jnl. of Materials Science, v7 n9 p2379-2386 Sep 92.

Keywords: *Coherent interfaces, Reprints, *Dislocation emission, *Interfacial fracture, Metallic multilayers.

In this paper, the authors have demonstrated that very perfect thin multilayers of the Cu/Ni system can be prepared with coherent interfaces if the layer modulation wavelength is in the 10 nm range. At modulation thickness above about 60 nm, the interfaces become incoherent. The authors have injected a crack into a coherent interface in the 10 nm case which has generated dislocations into the interface forming the crack plane, as well as into the layers adjacent to the crack plane. The dislocations injected into the crack plane presumably from misfit dislocations on that interface, and are grouped so close to the crack tip that individual dislocations are not completely imaged. The dislocations injected into the adjacent layers are distributed rather widely. The authors have analyzed the dislocation emission from a crack in the fcc geometry appropriate to the multilayers using a simplified elastic theory developed for cracks in homogeneous materials. The mixed mode loading which the misfit stresses are expected to produce lead one to expect these materials to be ductile and to have high toughness. Very high dislocation densities on the crack plane near the crack, however, may lead to a brittle mode of failure, which is beyond the purview of the elastic theory. The dislocations are observed to have strong interactions with alternating interfaces in the multilayers, and this effect could be due to elastic bunching of the dislocations at alternating interfaces caused by the misfit stress.

Compressibility of Polycrystal and Monocrystal Copper: Acoustic-Resonance Spectroscopy.
Final rept.
H. Ledbetter, S. Kim, C. Fortunko, and P. Heyliger. 1996, 7p.
Pub. in International Jnl. of Thermophysics, v17 n1 p263-269 Jan 96.

Keywords: *Bulk-modulus, *Compressibility, *Copper, Reprints, *Elastic constants, Ultrasonics.

Using a method used mainly by geophysicists for small specimens-acoustic-resonance spectroscopy (ARS)-we measured the elastic-stiffness constants of centimeter-size copper specimens with rectangular-parallelepiped shapes. The polycrystal consisted of heavily twinned 75-micromoles crystallites. From the specimens' macroscopic resonance-vibration frequencies (midkilohertz to low-megahertz), we calculated the least-squares elastic-stiffness coefficients, two and three for the two cases. Using the same specimens, we augmented the ARS measurements with conventional pulse-echo-method measurements. Using rod specimens, we measured the Young modulus E and torsional modulus G, and we calculated the bulk modulus B. The less direct and less familiar ARS method gives the same results as a usual pulse-echo method and a rod-resonance method.

Growth and Nucleation of Hydrogenated Amorphous Silicon on Silicon (100) Surfaces.
Final rept.
D. M. Tanenbaum, A. Laracuente, and A. C. Gallagher. 1995, 6p.
Pub. in Materials Research Society Symposium Proceedings, v377 p143-148 1995.

Keywords: *Dynamic scaling, *Nucleation, Islanding, Reprints, *Nanoparticulates, A-SiiH.

A scanning tunneling microscope (STM) has been used to study the topology of the surfaces of a series of thin hydrogenated amorphous silicon (a-Si:H) films deposited by rf discharge from pure silane. The substrates were atomically flat, oxide-free, single-crystal Si(100). Films were grown in our laboratory and transferred to the STM with no air exposure between growth and measurement. A series of thin films between 1 and 50 nm in thickness reveals the initial growth stage of a-Si:H on Si(100). Initial nucleation and islanding can be seen on these films. The surface has a distribution of island sizes. The rms roughness and a surface lateral correlation length were measured as functions of film thickness. The rms roughness grows sublinearly with thickness from 0.3-0.5 nm as the film thickness is raised from 1 to 50 nm. The lateral size of the surface features also grows with film thickness. The growth of the roughness and correlation length can be compared with the dynamic scaling model. In addition, the topographs reveal occasional structures of larger size and low density on the film surface. These structures are nanoparticles of silicon deposited from the plasma during film growth. The frequency of these features scales with film thickness, and represents 10 to the minus 5th power - 10 to the minus 4th power of the total film volume.

Design of a High-Flux Backscattering Spectrometer for Ultra-High Resolution Inelastic Neutron Measurements.
Final rept.
P. M. Gehring, C. W. Brocker, and D. A. Neumann. 1995, 6p.
Pub. in Materials Research Society Symposium Proceedings, v376 p113-118 1995.

Keywords: *Nuetron measurements, *Backscattering spectrometers, Design, Reprints, High-flux, Ultra-high resolution.

The authors discuss the design of a new backscattering spectrometer to be installed at the Cold Neutron Research Facility at the National Institute of Standards and Technology. Si (111) crystals cover both monochromator and analyzer which are spherically bent to a radius of curvature of approxmately 2 m to focus the incident and scattered neutron beams. The bending increases the intrinsic lattice gradient of Si beyond its Darwin limit, resulting in an energy resolution of approximately 0.75 mueV FWHM. The monochromator is Doppler-driven, allowing users access to a dynamic range of plus or minus 60 mueV. The elastic Q-range covers 0.15 to 1.8 Angstroms to the minus one power. The most novel aspect of this design lies in the incorporation of a phase-space transform chopper. This device rotates at 4700 rpm while neutrons are Bragg-diffracted from sets of pyrolytic graphite crystals affixed to its periphery. The process enhances the neutron flux at the backscattering energy of 2.08 meV, but at the expense of a larger horizontal divergence. Computer simulations indicate a resultant flux increase of order 3 should be obtained.

Diffusion of Water along 'Closed' Mica Interfaces.
Final rept.
R. Horn, K. T. Wan, S. Courmont, and B. R. Lawn. 1996, 3p.
Pub. in Jnl. of Colloid and Interface Science, v159 p509-511 1993.

Keywords: *Adhesion, *Cracks, *Mica, Fracture, Humidity, Reprints, Interface diffusion.

The responses of internal cracks at recontacted mica interface to change in external humidity are reported and analyzed. Cracks on interfaces reformed in lattice registry remain effectively stationary; cracks formed at

interfaces with a twist misorientation expand and contract reversibly with increasing and decreasing humidity. The results indicate that the internal cracks in the misoriented configuration are accessible to atmospheric water, which diffuses along the dilated interface and lowers the interface energy, but remain impervious to other constituent molecules of air.

Pub. in Chemistry of Materials, v8 n3 p727-733 1996.

Keywords: *Polymer networks, *Acrylate, Synthesis, Sol-gel, Scattering, Reprints, *Interpenetrating polymer network, Transmission electron microscopy.

Organic-inorganic interpenetrating polymer networks were synthesized with an SiO2 phase made by sol-gel chemistry and the organic phase made from poly(2-hydroxyethyl acrylate). The resultant morphologies were characterized by small-angle scattering and electron microscopy. When the vinyl polymerization is more rapid than the sol-gel reaction, gross phase separation occurs giving a heterogeneous structure. For comparable rates of the two polymerizations, the specimens have a dendritic morphology on the scale of 0.5 micro m. The more rapid formation of the silica phase relative to the organic network produces rigid and optically transparent materials, with a finely divided structure as seen by transmission electron microscopy. The glass content of these materials is about 0.15 g/g and the sizes of the SiO2-rich domains are 100 Angstroms or less. Addition of tetrakis(2-(acryloxy)ethoxy)silane was also studied and found to promote phase mixing between the organic and inorganic phases.

Pub. in Mineral Scale Formation and Inhibition, Washington, DC., August 21-26, 1995, p271-282.

Keywords: *Calcium hydroxyapatite, *Chemical analysis, *Solubility products, Composition, Reprints, Statistical analysis, Thermal analysis.

Synthetic calcium hydroxyapatites (HA's) have, in general, excellent biocompatibility with tooth and bone tissues, and they are frequently used as biomedical materials. The properties of synthetic HA's depend strongly on preparative conditions. They are well known to be variable and the composition deviates from the stoichiometric HA formula. Ca10(POa)6(OH)2, that comprises the unit-cell content. In order to properly characterize these HA's, accurate determinations of complete chemical composition, unit-cell parameters, solubility, surface area, crystallinity, etc., are needed. The focus of this paper is on the procedures and methods for accurate and precise determinations of two important parameters, the Ca/P molar ratio and solubility product, of a HA that was prepared and characterized in the author's group for use as a HA reference material (HA-RM).

Effect of Chemical Interaction on Barenblatt Crack Profiles in Brittle Solids.
Final rept.
K. T. Wan, and B. R. Lawn. 1992, 7p.
Pub. in Acta Metallurgica Materials, v40 n12 p3331-3337 1992.

Keywords: *Brittle solids, *Chemical interactions, Cohesive zone, Reprints, Bareblatt profile, Crack-tip field, Molecular wedge.

A self-consistent solution for continuum-slit Barenblatt cracks with interactive chemistry is presented. Environmental species entering the crack mouth are limited in their transport along the ever-narrowing interface by molecular size restrictions. The ensuing cohesion zone behind the tip consists of three regions: an extended far region of weak solid-fluid-solid attraction; a small intermediate region of strong solid-fluid-solid repulsion; and an exclusinary near-tip intrinsic region of strong solid-solid attraction. To facilitate an analytical solution of the equations for the crack-opening displacements, the cohesion stresses are taken to be uniformly distributed within each of these zones. The magnitudes of these stresses are expressed in terms of the intersurface energies that define equilibrium crack states, for virgin and healed interfaces. Illustrative calculations of the crack profiles are given for the well-documented mica-water system. It is shown that the penetrating species cause a significant local bulge in the repulsion region, consistent with Thomson's picture of a molecular wedge.

Pressurized Internal Lenticular Cracks at Healed Mica Interfaces.
Final rept.
K. T. Wan, R. G. Horn, S. Courmont, and B. R. Lawn. 1993, 9p.
Pub. in Jnl. of Materials Research, v8 n5 p1128-1136 May 93.

Keywords: *Adhesion, *Fracture mechanics, *Interface cracks, Mica, Reprints, Lenticular flaws, Pressure difference.

The equilibrium states of internal penny cracks at interfaces in thin-sheet bodies are investigated. Consideration is given to cracks held open by a center-loading force from an entrapped particle in combination with a uniform pressure from a fixed mass of entrapped gas. A fracture mechanics analysis indicates that under these conditions the crack are stable, but are amendable to growth from an enhancement in net pressure (increase in internal pressure or decrease in external pressure) or effective particle size. Essential details of the theory are confirmed by experiments on linticular crack at healed interfaces in muscovite mica. The results are pertinent to flaw responses in brittle ceramic systems where structural integrity is an issue.

Development of Neutral-Density Infrared Filters Using Metallic Thin Films.
Final rept.
Z. M. Zhang, R. U. Datla, and L. M. Hanssen. 1995, 6p.
Pub. in Materials Research Society Symposium Proceedings, v374 p117-122 1995.

Keywords: *Infrared filters, *Optical density, Optical properties, Spectrometers, Reprints.

Broadband infrared filters with uniform spectral transmittance are used for spectrometer calibration and other applications. However, commercially available neutral-density filters with optical density (OD) greater than 2 exhibit significant variations in OD over the wavelength region from 2 micrometers to 25 micrometers. In this work, the authors found a single-layer alloy film that, for appropriate thicknesses, yields a flat transmittance for OD near 3 and 4. The transmittance and reflectance of the filters were measured using a Fourier-transform infrared spectrometer. The optical constants of the alloy films were obtained from transmittance and reflectance measurements, which can be used for future design optimization.

What Is a 'Standard Reference Material' - What Is Any Reference Material.
Final rept.
J. A. Tesk, and J. Colbert. 1996, 3p.
Pub. in Newsletter of the Society of Biomaterials, The Torch, v18 n1 p6-7 and 17, Jan/Feb 96.

Keywords: *Standards, Reprints, *Standard Reference Material, *Certified Reference Material, *NIST Reference Materials, ISO Reference Materials.

One of the pressing topics of discussion at the 1995 meeting of the Biomaterials Society Standards Committee (SC) was the need for Reference Materials (RMs). As discussions proceeded, however, it became apparent that some members of the SC were unaware of the different kinds of RMs that can be obtained and that the significance of their differences lies in their intended applications. This situation is not unique to SC members; it appears to be prevalent to varying degrees throughout the scientific and engineering community, including the Biomaterials Society at large. The fact is that there are two classifications of reference materials, readily distinguished by their definitions, which prescribe the kind of technical information that is supplied with them when they are acquired.

Neutron and Raman Spectroscopies of 134 and 134a Hydrofluorocarbons Encaged in Na-X Zeolite.
Final rept.
T. J. Udovic, J. M. Nicol, R. R. Cavanagh, C. P. Grey, D. R. Corbin, J. J. Rush, and M. K. Crawford. 1995, 6p.
Pub. in Materials Research Society Symposium Proceedings, v376 p751-756 1995.

Keywords: *Hydrofluorocarbon, *Neutron spectroscopy, *Raman spectroscopy, Refrigerants, Reprints, Inelastic neutron scattering, Nax zeolite.

Inelastic neutron scattering methods were used in conjunction with Raman spectroscopy to probe the vibrational density of states of the hydrofluorocarbons (HFCs) 134 (HF2C-CF2H) and 134a (F3C-CFH2) adsorbed in the cages of dehydrated Na-X zeolite. A comparison of the vibrational spectra of the encaged HFC species with those of their gas-phase analogs indicates that the HFCs adsorb nondissociatively at room temperature and are most likely associated with Na cations in the supercages at the Sm sites. Guest-hose interactions are manifested by adsorption-induced perturbations of the gas-phase torsional and C-H stretching vibrations and the presence of additional features presumably due to low-energy whole-molecule vibrations and adsorbate-coupled zeolite framework vibrations. Moreover, although the 134 trans conformer is favored by 5 kJ/mole in the gas phase at 300 K, the gauche conformer seems to be more prevalent in the zeolite at this temperature and below. This suggests that a sizeable fraction of the Na-X adsorption sites provides a stabilizing configuration for the otherwise higher-energy gauche conformation, perhaps due to hydrogen-bonding interactions with the zeolite framework.

General

Charpy Specimen Tests at 4 K.
Final rept.
R. L. Tobler, and A. Bussiba. 1992, 8p.
Pub. in International Cryogenic Materials Conference (9th), Huntsville, AL., June 11-14, 1991, Advances in Cryogenic Engineering (Materials), v38 p217-224 1992.

Keywords: *Austenitic steels, *Fracture toughness, Impact tests, Mechanical properties, Materials, Standards, Reprints, *Cryogenic test procedures.

The paper describes nonstandard methods of testing Charpy specimens at 4 K. We show that the initial temperature can be achieved using a helium flow method with U-type as well as C-type machines. Unfortunately, heating during impact loading weakens the correlation with quasistatic fracture toughness parameters. Alternative test procedures using fatigue precracked specimens were not fully satisfactory, either: (1) Precracking reduces the impact energy by 35-54%, but the specimen heating is still significant; (2) slow bending curtails the heating most effectively, but then the desired simplicity of a screening test is lost.

Scanning Electron Microscopy Observations of Misfit Dislocations in Epitaxial In0.25Ga0.75As on GaAs(001).
Final rept.
R. R. Keller, and J. M. Phelps. 1996, 3p.
Pub. in Jnl. of Materials Research, v11 n3 p552-554 Mar 96.

Keywords: *Scanning electron microscopes, *Dislocations, *Epitaxial films, Thin films, Electron channeling, Reprints, Kikuchi patterns, Backscattered electrons.

Dislocations in the misfit epitaxial film system In0.25Ga0.75As on GaAs(001) were imaged using a modified electron channeling contrast technique in a LaB6 SEM. We obtained images at an incident beam energy of 30 KeV, a beam divergence of less than 1 mrad and a specimen tilt of 70 degrees in conjunction with a movable scintillator detector mounted at a take-off angle of approximately 3 degrees to 5 degrees. We achieved a spatial resolution of approximately 80 to 100 nm with this technique. Such resolution allowed rapid imaging of clusters consisting of only a few closely spaced dislocations in a 55 nm thick film. At such small film thicknesses, we did not require accurate knowledge of the incident beam direction in order to obtain sufficiently strong channeling contrast for qualitative characterization. The observed defect arrangements included features that we believe represent clustered threading segments.

P. S. Kandhal, Y. Wu, F. Parker, and P. A. Spellerberg. 1996, 6p.
Pub. in Jnl. of Testing and Evaluation (JTEVA), v24 n1 p20-25 Jan 96.

Keywords: *Stones, *Marshall stability, Percent voids, Precision statement, Marshall flow, Reprints, Large stone mixes.

Earlier studies have shown that the repeatability of Marshall stability, flow, and air voids content measurements on 6-in. (152.5-mm) diameter specimens of large stone mixes is better than the repeatability on 4-in. (101.6-mm) diameter specimens. A round robin study involving twelve participating laboratories was conducted to provide information for developing a precision statement for the ASTM Test Method for Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus (6 inch-Diameter Specimen) (D 5581). Difference two-sigma (d2s) limits were developed to determine acceptable single and multilaboratory differences for bulk specific gravity, percent voids, Marshall stability, and Marshall flow measurements. Analysis of other data collected during the study indicated that stability and flow measurements are not sensitive to minor differences in various 6-in. (152.4-mm) diameter breaking heads currently in use.

In 1992 the National Institute of Standards and Technology (NIST) expanded its intramural efforts on development of metrology for microelectronics packaging and interconnection. The new intramural projects concentrate on development or refinement of metrology for measuring the properties of the materials as they actually exist in modern packaging and interconnection, and not as measured on idealized or bulk specimens. Also, work begin in 1991 accelerated a major consortium effort led by the National Center for Manufacturing Species (NCMS) and jointly supported by the consortium members and the NIST Advanced Technology Program (ATP) to develop new materials and production technology for printed wiring boards. This is an update on the progress of those efforts.

Neutron Diffraction Texture Study of Deformed Uranium Plates.
Final rept.
C. S. Choi, and M. Staker. 1996, 6p.
Pub. in Jnl. of Materials Science, v31 p3397-3402 1996.

Keywords: *Uranium plates, *Neutron diffraction, Orientational distribution functions, Deformation, Reprints.

The texture of two depleted uranium (DU) samples, labelled DUWR and DUWRs, were studied by neutron diffraction. DUWR was prepared by warm rolling of a cast ingot, and DUWR2 was prepared by adding 20% tensile strain to the warm-rolled DUWR. Complete three-dimensional orientation distribution functions were determined using four neutron pole figures for the DUWR, and using six neutron pole figures for the DUWR2 sample, by the WIMV method of the program popLA. The textures of the two samples were essentially identical to each other. They could be described by a twisted helical density tube spiralling continously along the psi-axis of the Euler space. The projection of the backbone of the density tube along the Bragg angle-axis cast a linear shadow running parallel to the diagonal of the integral-psi plane, which could be defined by a integral = psi + 90 degrees (and integral = psi + 270 degrees) relation. The helical tube was confined within narrow Braggs angle-angle limits, from 14 degrees to 30 degrees with the peak orientation at (103) (010).

Previous work has shown the importance of the crack-tip deformation zone in determining the fracture energies for both samples of bulk adhesive and the corresponding adhesive joints. To gain a better understanding of deformation zone development, the crack-tip events in compact tension specimens of bulk adhesive were monitored during loading and failure. The results show no clear onset point for crack growth but rather a gradual acceleration. Moreover, in regions of stable crack growth, the size of the deformation zone correlates with the crack velocity. This has important implications for failure criteria.
