A study was conducted to compare the creep-rupture response (i.e., time-to-failure or TTF) of tape-bonded and liquid-adhesive-bonded seams of EPDM (ethylene-propylene-diene terpolymer) roofing membranes. Two commercial tape systems (i.e., tape and primer) and one liquid adhesive were applied to well-cleaned EPDM rubber.

Keywords: *Diamond films, *Thermal diffusivity, Chemical vapor deposition, Thermal conductivity, Thick films, Thin films, Wave propagation, Heating, Reprints, Photothermal radiometry, Thermal waves.

The use of photothermal radiometry to obtain the thermal diffusivity of CVD diamond is analyzed. The finite size of the heating beam and the radiation detector are taken into account. Heating a finite circularly symmetric region of the specimen surface is compared with uniform heating of the specimen surface. Thermal wave propagation in thick and thin diamond films in vacuum, in air, and on several substrate materials is modelled.

Photothermal radiometry, one of several methods based on the propagation of thermal waves, is a convenient noncontact technique to measure the thermal diffusivities of diamond films. Results of calculations for thermal wave propagation in diamond films are presented. Taken into account are the thickness of the film, the substrate material, the presence of air, the presence of a black absorbing layer, the finite size of the heating beam, and the finite size of the infrared detector used to measure the thermal energy emitted by the specimen.

1990, 13p.
Pub. in Jnl. of Materials Research 5, n11 p2456-2468 1990.

Keywords: *Crystal growth, *Crystal defects, *Raman spectroscopy, *Chemical vapor deposition, Atomic energy levels, Photoluminescence, Thin films, Diamonds, Reprints, *Diamond films.

Raman spectra were measured in 48 different polycrystalline diamond forms grown by hot-filament and microwave-plasma chemical vapor deposition, and one gem-quality diamond, and characterized by fitting the data to a model lineshape function. The lineshape function contains the following three components: a narrow symmetric line at -1333/cm, the Raman line of diamond; a broad symmetric band at -1520/cm due to s doublet p-bonded carbon; and a slowly varying background due to photoluminescence (PL). Four spectral parameters are observed to change in a correlated manner from one specimen to another: (1) the linewidth of the diamond Raman line, which varies from 3 to 30/cm; (2) the intensity in the tails of the diamond line, several halfwidths away from the peak; (3) the intensity of the s doublet p-bonded carbon band, relative to the diamond line, which varies from -0 to 1; and (4) the intensity of the PL background, relative to the diamond line, which varies from 0.03 to 9. The observed correlations suggest that these changes in the Raman spectrum are caused by a common set of defects.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Diamond Opt. 3, v1325 p130-141 1990.

Keywords: *Crystal growth, *Crystal defects, *Raman spectroscopy, *Chemical vapor deposition, Atomic energy levels, Diamonds, Cathodoluminescence, Luminescence, Photoluminescence, Thin films, Reprints, *Diamond films.

Diamond films grown under a variety of deposition conditions in hot-filament or microwave-plasma chemical vapor deposition (CVD) reactors were characterized by Raman and cathodoluminescence (CL) spectroscopies. The magnitudes of the following four Raman spectral features were observed to vary from specimen to specimen in a correlated manner: (1) the linewidth of the diamond Raman line; (2) the intensity of the tails of the diamond Raman line at several halfwidths from the peak; (3) the intensity ratio of the s doublet p-bonded carbon Raman band to the diamond Raman line; and (4) the intensity ratio of the broad photoluminescence (PL) background that underlies the Raman spectrum to the diamond Raman peak. We suggest that each of these features varies with the abundance of s doublet p-bonded carbon. A model of competing recombination between two sets of defects is proposed to explain the inverse correlation.

Keywords: *Coatings, *Diamond, *Tribology, Reprints, Friction, Wear.

Diamond-Like-Carbon films were characterized for their tribological properties. Films were made on 440C substrates by first sputter-depositing an intermediate layer of SiC, then extracting 450 eV carbonacceous ions to produce the diamond-like-carbon film. The intermediate SiC layer provides adhesions between 440C and the diamond-like-carbon film, and also provides the necessary nucleation sites for diamond-like-carbon film formation. Films were prepared in three thicknesses, 0.5, 1, and 2 micrometer, and tested at two temperatures, liquid oxygen (-184 deg C) and room temperature (25 degrees C). A coefficient of friction of 0.03 was measured in an oxygen environment. Specific wear rates that are two orders of magnitude lower than for 440C on 440C were measured. Data are

Keywords: *Electrochemical cells, *Copper chlorides, Reprints, Catalysts, Electric conductors, Cathodes, *Graphite intercalation compounds.

Structural and magnetic properties of stage-1, stage-2, and stage-3 CuCl2 graphite intercalation compounds (GIC's) were studied by means of x-ray, electron- and neutron-diffraction, dc magnetic susceptibility, and electron spin resonance (ESR) measurements. The Cu2+ ions form an isosceles triangular lattice with one short side and two longer sides. The in-plate dc magnetic susceptibility shows Cure-Weiss behavior above 150 K, a broad maximum around 62-65 K, indicative of low-dimensional magnetic correlations, and a Curie-type behavior below 20 K, attributable to paramagnetic inhomogeneities in the sample.

Pub. in Jnl. of the American Ceramic Society, v74 n7 p1578-1584 Jul 91.

Keywords: *Aluminum oxides, Additives, Density, Green(Color), Magnesium oxides, Microstructure, Neutron scattering, Porous materials, Sintering, Reprints, Alumina, Small angle scattering, Densification.

Small angle neutron scattering measurements were used to examine the effect of green density and the role of MgO additive on the evolution of the porous microstructure of alumina during intermediate- and final-stage sintering. It was found that the initial connectivity in the green state plays a dominant role in establishing the channel diameters during the intermediate stage of sintering, and contributes also to determining the onset density at which the final stage of sintering begins. The role of MgO as a sintering aid lies, at least in part, in prolonging the stability of intermediate stage sintering such that the body achieves greater density before the transition to final-stage sintering after which isolated pores are formed.

Pub. in Jnl. of the American Ceramic Society, v74 n10 p2538-2546 Oct 91.

Keywords: *Aluminum oxides, *Sintering, *X ray scattering, Magnesium oxides, Doping, Ceramic materials, High resolution, Density, Entropy, Neutron scattering, Reprints, *Pore size distribution, Alumina, Magnesia, Small angle.

Small-angle X-ray scattering was used to follow the evolution of the pore size distribution during final-stage sintering of alumina and of alumina doped with 0.25 wt% magnesia. The volume-weighted (Guinier) results indicate that the effective size of the largest pores increases as the body goes from 97% to more than 99% dense. The surface-area-weighted (Porod) results show that the median size of the smallest pores decreases slightly over the same density range. Taken together, these data indicate that the pore size distribution becomes broader as final-stage densification proceeds. This was confirmed by a maximum entropy analysis, which was used to derive pore size distributions directly from the data. Finally, the evolution of the pore size distributions in alumina, with and without sintering aid, were compared.

Contract MIPR-ARO-102-90
Pub. in Acta Crystallographica, vA47 p282-290 1991.

Keywords: Density, Microstructure, Neutron scattering, Sintering, Reprints, *Aluminum oxide, Small angle scattering.

Multiple small-angle neutron scattering was used to follow the evolution of the pore-size distribution in alpha-Al2O3 through the intermediate and final stages of sintering. This new technique enables the study of microstructure in the 0.08-10 micro size regime, which is the size range of importance for many materials systems, without needing to increase the resolution of currently available small-angle scattering instruments. The microstructure evolution results indicate a nearly constant effective pore radius for the alumina throughout the intermediate sintering stage, ranging from 0-19 micro at 54% of theoretical density to 0- 17 micro at 79% dense. As the alumina densifies further, there is a transition region after which the effective pore radius grows rapidly to 0.6 micro at 97-5% dense.

Pub. in Jnl. Mater. Res., v6 n12 p2706-2715, Dec 91.

Keywords: *Neutron scattering, *Sintering, *Ceramic materials, Microstructure, Polycrystalline, Reprints, *Glassy silica, *Crystalline ceramics, Porosity, SANS(Small Angle Neutron Scattering).

Small-angle neutron scattering measurements were used to examine the pore microstructure evolution of glassy silica and polycrystalline alpha-alumina as a function of sintering. It was shown that the two major sintering mechanisms, viscous flow and surface and volume diffusion, lead to very different microstructure evolution signatures in terms of the average pore size as a function of density. However, with respect to topology, the evolution of the porosity per unit surface area as a function of density is remarkably similar in the two systems.

Green compacts from a nano-size silicon nitride powder were fabricated having density up to 67% of theoretical at 2.8 GPa pressure using liquid nitrogen and pentane as compaction lubricant media. Pressureless sintering of these transparent samples did not promote further densification beyond that obtained for the green state. To further increase the density of these samples, a hot-pressing device was designed. In a series of experiments, hot-pressing of these samples at.0.5 to 1.0 GPa and 800 C, followed by pressureless sintering at 1400 C was studied. The resulting silicon nitride ceramic had a Vickers hardness of 9.0 GPa while transparency under visible light was maintained. Without the use of hot pressing, the hardness obtained was 5.8 GPa. In addition, the effect of compaction pressure on densification was studied for nano-size Al(sub 2)O(sub 3) to further understand factors contributing to achieving high green densities. The dense Al(sub 2)O(sub 3) green samples were pressureless sintered to near full density at temperatures several hundred degrees lower than those needed for sintering low density green material.

This paper describes a highly-specialized system for studies of time-dependent compaction of nanosize sili-

con nitride powders under a variety of atmospheres and at temperatures ranging from 77 to 1,000 K. The system incorporates a screw-driven press (10 ton capacity) with a piston-cylinder type die and can produce decylindrical powder compacts, 3 mm in diameter and approximately 1 mm in thickness, using pressures up to 3 GPa. The system is computer-controlled and permits accurate measurements of the sample volume, and, after appropriate calibration, can determine the rate and degree of densification of the compacting powder as pressure is applied. Frictional forces between the piston and the die are measured during the compaction process. For calibration of the system, powders with known volume-change accompanied by phase transition under pressure were studied, and good agreement with published results was demonstrated. Several Si(sub 3)N(sub 4) samples have been compacted and sintered at 1,300 to 1,600 C. A maximum random packing density of 64% has been obtained using liquid nitrogen as a lubricant medium at pressure lower than 2.5 GPa. Both green samples and sample sintered at temperatures to 1,500 C exhibited visual transparency under visible light.

Keywords: *Aluminium Oxides, *Silicon Nitrides, Compacting, Equations, Mechanical Properties, Microstructure, Powder Metallurgy, Processing, Sintering, EDB/360201, EDB/360203, EDB/360202.

The objective of the compaction process is to produce a dense green-state compact from a nanosize powder that subsequently can be sintered at high temperatures to form a dense ceramic piece. High density in the green-state after pressing is of primary importance for achieving high densities after sintering. Investigation of the compaction behavior of ceramic powders, therefore, is an important part of characterization of raw ceramic powders and evaluation of their compaction behavior, analysis of interaction between particles, and the study of microstructure of green body (unsintered) during pressure-forming processes. The compaction of nanosize ceramic particles into high density green bodies is very difficult. For the nanosize materials used in this study (amorphous Si(sub 3)N(sub 4) and (gamma) Al(sub 2)O(sub 3)), there is no evidence by TEM of partial sintering after synthesis. Nevertheless, strong aggregation forces, such as the van der Waals surface forces of attraction, exist and result in moderate precursor particle agglomeration. More importantly, these attractive surface forces, which increase in magnitude with decreasing particle size, inhibit interparticle sliding necessary for particle rearrangement to denser bodies during subsequent compaction. Attempts to produce high density green body compacts of nanosize particles, therefore, generally have been focused on overcoming these surface forces of attraction by using either dispersive fluids or high pressures with or without lubricating liquids. In the present work, the use of high pressure has been employed as a means of compacting nanosize powders to relatively high green densities.

Classification of Advanced Technical Ceramics.
S. Schneider. Jul 93, 128p.

Keywords: *Ceramics, *Chemical composition, *Chemical properties, *Classifications, Data bases, Utilization, Ceramic coatings, Ceramic fibers, Ceramic matrix composites, Glass, Information dissemination, Porous materials, Powder (Particles).

This document presents the basis and scheme for a unified classification system for advanced (technical) ceramics. The utility of the classification system is multi-fold. Its use is advantageous at the company level for purposes involving assembly of design and materials property databases, or tabulation of inventories, or invoicing. Industry can use the system for gathering and sorting trend data on market behavior or R&D expenditures, or for literature categorization. At the government level, the system can be used for gathering national and international economic data, or other vital statistics, or for determining demographics of the field. The classification system is based on defining advanced technical ceramics as 'a highly engineered, high performance, predominately non-metallic, inorganic, ceramic material having specific functional attributes.' This excludes commodity products, such as building materials and refractories. Five hundred different product types are identified as advanced technical ceramics in this classification. The classification is a non-hierarchical, matrix-type scheme accessible by a number of entry and retrieval routes to build relational databases. The classification provides a machine readable coding system built upon four independent descriptor fields (application, chemical character and product form, processing, and property data) and corresponding subdivisions that may be sequenced in order to match the users preference.

In 1993 the Ceramics Division continued to emphasize a technical program directly relevant to the needs of U.S. industry. The program is made up of tasks which involve standard materials development, construction of evaluated databases, and laboratory research focused on topics that address the dominant issues affecting commercialization of advanced ceramics, namely, processing costs and reliability. In accord with the strategic plan laid out by the Materials Science and Engineering Laboratory, the Ceramics Division is continuing to expand its direct involvement with industrially related research issues. Standard materials and data activities continue to represent an important portion of the Division's program. Three new Standard Reference Materials were developed this year, and an evaluated database on high Tc superconducting materials was begun in collaboration with a Japanese laboratory.

Error Propagation Biases in the Calculation of Indentation Fracture Toughness for Ceramics.
Final rept.
J. R. Kelly, M. E. Cohen, and J. A. Tesk. 1993, 4p.
Pub. in Jnl. of the American Ceramic Society 76, n10, p2665-2668 Oct 93.

Keywords: *Ceramics, *Bias, *Fracture(Mechanics), *Error analysis, Cracks, Mechanical properties, Toughness, Regression analysis, Loads(Forces), Monte Carlo method, Reprints.

Indentation fracture toughness models generally share the derived parameter Pc (exp -3/2), where P is the indentation load and c the measured crack length. Biases, inherent to error propagation through this nonlinear transformation (c to c(exp 3/2)), can be introduced into calculated values for K(sub Ic) depending upon the amount of averaging of crack length data performed prior to the transformation. The work utilizes Monte Carlo simulations to evaluate the bias in K(sub Ic) calculated using both mean and linear regression methods. Significant positive biases were demonstrated when using mean-based calculations where coefficients of variation (cv) in c exceeded 10%. Regression methods produced significantly less bias. With cv < 10% or when c is averaged per load, both methods produce essentially unbiased estimates for K(sub Ic).

Surface Forces and Adhesion between Dissimilar Materials Measured in Various Environments.
Final rept.
D. T. Smith, and R. G. Horn. 1990, 7p.
Pub. in Materials Research Society Symposia Proceedings, v170 p3-9 1990. Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Surface chemistry, *Adhesion, *Solids, *Dissimilar materials bonding, Materials science, Liquid phases, Vapor phases, Silicon dioxide, Mica, Ceramics, Reprints, Israelachvili surface force apparatus.

The Israelachvili surface force apparatus has been used extensively over the past decade to make detailed measurements of surface forces and adhesion between very smooth solids in various liquid and vapor environments. Most of those measurements have been made with mica surfaces, but the authors have recently developed a method of preparing smooth silica surfaces for use in place of the micra. The silica surfaces adhere in dry and humid atmospheres, but do not adhere when immersed in water. The use of a second material not only broadens the scope of the Israelachvili technique, but also enables studies of forces and adhesion between dissimilar materials. In this work, the authors present the results of measurements of adhesion in air and forces in aqueous solution between two silica surfaces; they also report preliminary results of the adhesion between a mica surface and a silica surface.

Contact Electrification Induced by Monolayer Modification of a Surface and Relation to Acid-Base Interactions.
Final rept.
R. G. Horn, D. T. Smith, and A. Grabbe. 1993, 2p.
Pub. in Nature 366, p442-443, 2 Dec 93.

Keywords: *Surface chemistry, *Electrification, *Electric contacts, *Layers, *Acid-base equilibrium, *Silicon dioxide, Reprints, Adhesion, Coatings, Revisions, pH, Polarization(Charge separation), Ion atom interactions, Surface force apparatus.

Electrical charge separation following contact between two materials (contact electrification or the triboelectric effect) is well known to occur between different materials as a consequence of their different electronic structures. Here the authors show that the phenomenon occurs between two surfaces of the same material if one is coated with a single chemisorbed monolayer. The authors use the surface force apparatus to study contact electrification and adhesion between two silica surfaces, one coated with an amino-silane. The presence of this monolayer results in significantly enhanced adhesion between the surfaces, owing to electrostatic attraction following contact electrification, in accord with Derjaguin's electrostatic theory of adhesion. These observations demonstrate a link between acid-base interactions and contact electrification.

Analysis of SANS from Controlled Pore Glasses.
Final rept.
N. F. Berk, C. J. Glinka, W. Haller, and L. C. Sander. 1990, 6p.
Pub. in Materials Research Society Symposia Proceedings Neutron Scattering Materials Science, v166 p409-414 1990.

Keywords: *Porous materials, *Glass, Small angle scattering, Neutron scattering, Probability density functions, Computerized simulation, Morphology, Silica, Reprints.

Small angle neutron scattering measurements have been performed on several samples of silica controlled pore glasses with pore sizes ranging from roughly 7 to 30 nm. The scattering intensity is strongly peaked at small Q and shows approximate Porod law behavior at large Q. Contrast variation measurements have shown that the pore space in these samples is entirely interconnected and thus forms a bicontinuous microstructure. The scattering data have been analyzed using the leveled wave method based on an early scheme for representing two-phase microstructures resulting from spinodal decomposition. The authors determined model probability density

functions by fitting the SANS data with the leveled wave scattering function and then used these to construct leveled wave images of the corresponding porous structures.

Cavitation Damage During Flexural Creep of SiAlON-YAG Ceramics.
Final rept.
C. F. Chen, S. M. Wiederhorn, and T. J. Chuang. 1991, 5p.
Pub. in Jnl. of the American Ceramic Society 74, n7 p1658-1662 Jul 91.

Keywords: *Ceramics, *Sialon, *Creep properties, *Cavitation, Flexing, High temperature tests, Tensile strength, Density measurement, Stress analysis, Reprints.

Cavitation damage in flexure bars crept at 1,170 C was studied by a density measurement technique. The cavity density within the flexure beams could be approximated by a linear function of position from the tensile surface. A threshold stress for cavitation damage is suggested from the results of this study. Below the threshold tensile stress, cavitation ceases, whereas above the threshold, cavitation damage is in the form of wedge-shaped cracks at grain-boundary triple junctions. Cavitation is not observed in compression for the conditions used in this study. From a stress analysis of the flexure bars, a cavitation threshold of 55 MPa is estimated for this material.

Contract GRI-TPSU-NBS-1302-37922
Pub. in Jnl. of Engineering Materials and Technology 114, p311-316 Jul 92. Sponsored by Gas Research Inst., Chicago, IL.

Keywords: *Creep buckling, *Finite element method, *Silicon carbides, Stress distribution, Stress relaxation, Creep properties, Creep tests, Displacement, Stress strain relations, Reprints.

The long-term creep deformation of a siliconized silicon carbide ceramic C-ring subjected to a compression load at 1300 C in air is studied by the finite element method. Based on asymmetric creep responses observed under uniaxial creep tests, multidirectional constitutive equations in power-law form are derived using the parameters of effective stress/strain. The elastic solutions are first solved and used as a guide to reach the final mesh design and as initial conditions. Solving the initial value problem in which equilibrium and constitutive equations are satisfied at all times, this model gives time-history of stresses and displacements. Fair agreements were obtained in load-point displacement rate, damage zone, neutral axis locations, stress relaxation and redistribution when compared with simple curved beam theory and experimental data. As common with other nonlinear problems, the convergence of the finite element solutions strongly depends on the time as well as the finess of the element size, particularly at the regions where principal stresses are close to the threshold stress for creep damage.

Transient Subcritical Crack-Growth Behavior in Transformation-Toughened Ceramics.
Final rept.
R. H. Dauskardt, W. C. Carter, D. K. Veirs, and R. O. Ritchie. 1990, 10p.
Pub. in Acta Metallurgica et Materialia 38, n11 p2327-2336 1990. Sponsored by Department of Energy, Washington, DC.

Keywords: *Crack propagation, *Ceramics, *Fatigue(Mechanics), *Transients, Transformations, Loads(Forces), Fracture(Mechanics), Cracking(Fracturing), Mechanical properties, Reprints, *Subcritical crack growth.

Transient subcritical crack-growth behavior following abrupt changes in the applied load are studied in transformation-toughened ceramics. A mechanics analysis is developed to model the transient nature of transformation shielding of the crack tip, Ks, with subcritical crack extension following the applied load change. Conditions for continued crack growth, crack growth followed by arrest, and no crack growth after the load change, are considered and related to the magnitude and sign of the applied load change and to materials properties such as the critical transformation stress. Using experimentally derived steady-state subcritical crack-growth relationships for cyclic fatigue in a transformation-toughened Mg-PSZ, the analysis is found to provide similar trends in Ks and accurate prediction of the post load-change transient crack-growth behavior compared to experimentally measured data.

Imaging of Fine Porosity in a Colloidal Silica: Potassium Silicate Gel by Defocus Contrast Microscopy.
Final rept.
H. Kerch, F. Cosandey, and R. Gerhardt. 1993, 14p.
Pub. in Jnl. of Non-Crystalline Solids 152, p18-31 1993.

Keywords: *Silicon dioxide, *Porosity, *Potassium silicates, *Gels, Transmission electron microscopy, Image processing, Fines, Colloids, Reprints.

The fine porosity present in a 10:90 colloidal silica:potassium silicate gel was imaged in the transmission electron microscope by the technique of defocus contrast microscopy. With this imaging method it is possible to detect very small pores (> or = 1 nm) and to obtain an accurate measure of their size and distribution. The technique allows independent measurement of the spatial location, morphology and size of the pores in the gel. Specifically, defocus contrast proves that the colloidal gel exhibits two pore populations in the micro- and mesopore range: a fine porous texture which is found uniformly across the gel particles, and larger pores with an interconnected globular morphology. This result, together with data from previous studies, showed that the gel composition possesses a polydisperse distribution of porosity which extends to many length scales. The influence of the gel structure on the resultant nitrogen sorption data is also discussed.

Observed and Theoretical Creep Rates for an Alumina Ceramic and a Silicon Nitride Ceramic in Flexure.
Final rept.
R. F. Krause. 1992, 4p.
Pub. in Jnl. of the American Ceramic Society 75, n5 p1307-1310 1992.

Keywords: *Aluminum oxide, *Silicon nitrides, *Ceramics, *Creep rate, *Flexing, Comparison, Compressive properties, Tensile properties, Reprints.

Observed creep curvature rates are compared to theoretical rates for both an alumina ceramic at 1,000 C and a silicon nitride ceramic at 1,200 C in four-point flexure. The observed rates have been calculated from published rise-displacement rates, and the theoretical rates have been calculated from published power-law parameters for compressive and tensile creep, which differ appreciably for these ceramics. Although both compressive and tensile creep measurements are easier to analyze than flexural creep measurements, the latter are usually less expensive and easier to conduct. The present work shows the usefulness of flexural creep tests to verify the accuracy of compressive and tensile creep tests.

Pub. in Thin Solid Films 217, p113-119 1992.

Keywords: *Zirconium oxides, *Yttrium oxides, *Crystal structure, X-ray absorption, Ceramic coatings, Bulk materials, Thin films, Porosity, Comparison, Reprints, Electron beam evaporation.

The structures of think films of zirconia and yttria, deposited by electron beam evaporation, have been examined by X-ray absorption fine structure (XAFS) analysis. It was found that the structure of the yttria film was similar to that of bulk yttria, which is a cubic oxide phase. The zirconia film, however, possessed a structure different from that of the bulk material. An analysis of the zirconia film data indicated a structure with a predominant tetragonal phase. Although lower coordination numbers were found in the films than in the standard powder specimens, it was not clear from the extended fine structure whether this deficit was due to film porosity observed in prior work or to the disorder that is generally observed in films. An analysis of the near-edge structure, however, suggested that porosity, rather than disorder, was present in the films. In addition, the K-edge positions observed for both the zirconia and the yttria films were higher in energy by approximately 3 eV than the corresponding K-edge in the powder specimens, indicating that the films may be more insulating than the standard bulk material.

S. G. Malghan, L. S. H. Lum, E. Lagergren, J. Kelly, and R. N. Kacker. 1992, 10p.
Pub. in Powder Technology 73, p275-284 1992.

Keywords: *Silicon nitrides, *Particle size distribution, *Powder(Particles), *Statistical analysis, Sedimentation, Experimental design, Surfactants, Regression analysis, Ultrasonic frequencies, Reprints, *Sedigraph method.

The need to achieve repeatability in the measurement of particle size distribution of submicron particles of silicon nitride powders, and its dependence on the appropriate application of deagglomeration forces and subsequent stabilization of particles from reforming into agglomerates are discussed. An analysis of parameters affecting the particle size distribution measurement by Sedigraph(Trademark), a gravity sedimentation method, is presented and major parameters are identified. Statistical factorial design of experiments was used to determine the influence of various parameters such as ultrasonic power, time and energy, type of surfactant, and concentration of surfactant in a suspension on particle size determination. The results were analyzed using statistical techniques such as graphical and least squares regression. This analysis led to the calculation of main and interaction effects of the major parameters mentioned above. Depending on the ultrasonic power level selected for a powder, the interaction effects between ultrasonic power, ultrasonic time, and surfactant concentration for the two types of surfactants were identified.

Pub. in Ceram. Trans. Adv. Compos. Mater. 19, p253-261 1991.

Keywords: *Silicon carbides, *Surface properties, *Phase studies, Ceramics, Surface chemistry, X-ray diffraction, Carbon, Washing, Transmission electron microscopy, Photoelectron spectroscopy, X-ray spectroscopy, Electrokinetics, Reprints, *Platelets(Materials).

Silicon carbide platelets manufactured by a carbothermic reduction process were characterized for bulk phase composition and surface properties by transmission electron microscopy (TEM), X-ray diffraction (XRD), X-ray photoelectron spectroscopy (XPS) and electrokinetic sonic amplitude (ESA). These studies indicated that the platelets consisted of 4H and 6H polytypes as major phases, and 39H, 15R and 7H as minor phases. The XRD established the percent weight ratio of 4H to 6H as 57 to 43. The ESA and XPS techniques identified differences between the sur-

face properties of two types of platelets--acid washed and unwashed. The surface of the platelets was found to contain several forms of carbon. The thickness of the oxygen layer on the two types of platelets was calculated using Si 2p photoelectron data.

Pub. in Composite Interfaces 1, n3 p193-210 1993.

Keywords: *Silicon nitrides, *Deposition, *Surface chemistry, *Colloids, Powder(Particles), Electrokinetics, Zirconium oxides, Yttrium oxides, Photoelectron spectroscopy, Sintering, X-ray spectroscopy, Substrates, Auger electron spectroscopy, Particle size, Reprints.

The deposition of alumina (Al2O3) and yttria (Y2O3) particles on silicon nitride (Si3N4) by electrostatic and electrosteric interactions was studied using acoustophoretic measurements. The characteristics of Si3N4, Al2O3, and Y2O3 powders in an aqueous environment were studied by measuring the electrokinetic sonic amplitude (ESA), and appropriate conditions for deposition by adsorption were identified. The deposition of Al2O3, Y2O3, and Y(NO3)3 on Si3N4 particles was conducted at different pH values where these chemically dissimilar particles exhibit electrical charges of opposite sign. The deposition studies indicated that the particle size has a strong effect on the amount of coating on Si3N4 particles. The presence of polyacrylic acid as an electrosteric stabilizer for Si3N4 had no measurable effect on Al2O3 adsorption. The shift of the isoelectric point of Si3N4 with Al2O3 showed that the total quantity of Al2O3 adsorbed on Si3N4 reached a maximum at approximately 75% coverage of the total surface area of Si3N4. Bremsstrahlung-excited Auger electron spectroscopy (AES) results showed that the as-received Si3N4 powder has a native oxide film of 8.9 A. The presence and relative differences in the surface composition of coated particles were established using X-ray photoelectron spectroscopy (XPS).

The process of compaction and densification of ultrafine powder of partially-stabilized zirconia with 3 mole % of Y2O3 (Y3-PSZ) during rapid hot pressing was investigated. Special apparatus was designed to allow rapid application of 1.6 GPa of quasi-isostatic pressure at temperatures of 1,100-1,300 C to powder compacts encapsulated in glass under vacuum. Pressure was applied for 10 seconds, then the samples were rapidly cooled, removed from glass and characterized using scanning electron microscopy (SEM), transmission electron microscopy (TEM) and X-ray diffraction. Density and mechanical properties of the prepared materials were measured and compared with that of similar materials fabricated via conventional hot pressing.

Pub. in Materials Research Society Symposia Proceedings, v125 p205-215 1988.

Keywords: *Ceramic materials, *Glass, *Single crystals, *Fracture(Mechanics), *Stress corrosion, Mechanical properties, Crack propagation, Cracking(Fracturing), Polycrystalline, Bonding, Reprints.

This paper presents a review of our current understanding of environmentally induced crack growth in glasses, single crystals, and polycrystalline ceramics. It is shown that the rate of crack growth is controlled by the chemical activity of the active species in the environment as well as by the crack tip stress. A molecular model of a stress-induced chemical reaction between vitreous silica and water is described, and the implications of this model for predicting the effects of other chemical species on crack growth are discussed. Effects of chemical changes both in the bonding in the solid as well as in the reacting solutions on the crack growth mechanism are elucidated. Finally, the complicating effects of multigrain arrays on crack extension in polycrystalline ceramics are pointed out.

Today's technological world might well be termed the age of new materials for industrial needs that now require engineered materials that perform totally new functions or old functions in much better ways. Unfortunately, companion standards development has not kept pace with technology advances and this lack represents one of the more important technical unknowns in the commercial market equation. For advanced ceramics the problem is acute for currently there are no consensus standards that allow national or international comparisons. While the standards needs are diverse and product specific, there are two areas that crosscut all advanced ceramic product lines. First, there is an international need for a unified classification system that uniquely categories an array of advanced products by a series of set apart features, like application and materials chemistry. Second, there is need for a set of mechanical test standards to assure the structural reliability of advanced ceramics. This paper presents a perspective on these issues and problems, in the context of the age of new materials.

Tensile Creep of a Silicon Nitride Ceramic.
Final rept.
R. F. Krause, and S. M. Wiederhorn. 1994, 6p.
Pub. in Key Engineering Materials 89-91, p619-624 1994.

Keywords: *Silicon nitrides, *Ceramic materials, *Tensile creep, Failure, Least squares method, Strain rate, Fatigue(Materials), Tensile properties, Reprints.

The tensile creep behavior of a hot isostatically pressed silicon nitride ceramic containing 6 percent yttria was characterized at temperatures between 1250 and 1400 C and applied stresses between 72 and 250 MPa. Creep extension of specimens with nominal 10 mm gage length was measured by laser extensometry, showing final extensions between 20 and 200 micrometers. Secondary creep strain rates varied from 0.3 to 3000 Gs(exp -1). Some tests ended with specimen failure between 1 and 500 h, but other tests were discontinued after 1000 up to 2500 h without failure. A least-squares fit of the Norton and Arrhenius functions to 31 strain-rate tests yielded a stress exponent of 8.4 + or - 0.9 and an activation energy of 1310 + or - 140 kJ/mol. A Monkman-Grant function was fitted to represent strain rate versus failure time.

Accuracy in the measurement of physical characteristics of ceramic starting powders is a critical factor in the control and reproducibility of powder processing unit operations. An international interlaboratory comparison program on powders characterization has been in progress under the auspices of the International Energy Agency. In this paper, the results of powder characterization effort on five powders by 25 industrial, university and governmental laboratories are presented. Selected results of density, specific surface area, and particle size distribution are presented and discussed in terms of factors affecting these measurements. The reasons for the discrepancies in the data are outlined.

Real-Time Small-Angle X-Ray Scattering Study of the Early Stage of Phase Separation in the SiO2-BaO-K20 System.
Final rept.
G. B. Stephenson, W. K. Warburton, W. Haller, and A. Bienenstock. 1991, 21p.
Pub. in Physical Review B 43, n16 p13417-13437 1991.

Keywords: *X-ray scattering, *Phase separation(Materials), *Silicates, Small angle scattering, Spinodal decomposition, Glass, Real time operations, Silicon dioxide, Barium oxides, Potassium oxides, Amorphous materials, Deformation, Reprints.

Time-resolved small-angle x-ray scattering was used to study the early stage of phase separation in a silicate system. Scattering patterns were acquired in real time as a sample was quenched in situ from a temperature T1 in the single-phase region directly to a tem-

perature T2 in the two-phase region and held isothermally. This was made possible by using the high x-ray intensity from a synchrotron radiation source, a fast position-sensitive detector based on a photodiode array, a sample heater capable of rapid quenches, and an appropriate sample composition. The composition studied, 90-mole-% SiO2, 5-mole-% BaO, and 5-mole-% K2O, undergoes subliquidus phase separation at temperatures below 1,021 K to form alkali-rich and alkali-poor amorphous phases. This is the best agreement between experiment and spinodal decomposition theory yet demonstrated for any system. For amorphous systems in particular, these results provide direct evidence that deformation is the rate-limiting step for the interdiffusion of network-forming and network-modifying species over the short length scales involved in the early stage of phase separation.

Measuring Contact Charge Transfer at Interfaces: A New Experimental Technique.
Final rept.
D. T. Smith. 1991, 18p.
Contract N0014-88-F-0034
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Jnl. of Electrostatics 26, p291-308 1991.

Keywords: *Surface energy, *Electric charge, *Charge transfer, *Ceramics, *Solid-solid interfaces, Experimental design, Silicon dioxide, Mica, Materials science, Interfaces, Test chambers, Charge density, Reprints.

A new experimental technique has been developed for measuring the amount of electric charge transferred when two dissimilar surfaces are brought into contact and separated without lateral motion in a controlled environment. The primary surfaces studied, silica and mica, are prepared with very low surface roughness (average roughness less than 0.5 nm); the macroscopic contact area, which can be measured directly, is therefore a better measure of microscopic contact area than is typically the case in contact electrification experiments, and the surface charge density can be more accurately determined. Observations reported include (1) the transfer of charge densities as high as .01 C/sq m after only a few contacts of a mica and silica surface in dry air or N2 gas at room temperature and (2) a reduction in transferred charge density in the silica-mica system as the relative humidity of the air in the environmental chamber is increased from 0% to 98%. The technique also permits the study of the rate at which the surface charge decays under various environmental conditions.

Pub. in Jnl. of the American Ceramic Society 77, n8 p2107-2112 Aug 94.

Keywords: *Aluminum oxides, Transmission electron microscopy, Temperature dependence, Pressure dependence, Heat treatment, Transparence, Hardness, Compacting, Temperature range 0065-0273 K, Room temperature, Reprints, Diamond anvils, Nanomaterials.

The compaction and heat-treatment behavior of nanosize gamma-Al2O3 powder (average diameter = 20nm) was studied. A diamond anvil high-pressure cell was used to compact the powder at pressures up to 3 GPa, both in air at room temperature and under liquid nitrogen, followed by pressureless heat treatment at 800 C. For all conditions studied, the fabricated compacts were optically transparent. X-ray diffraction confirmed retention of the gamma-phase. The compacts were also characterized before and after heat treatment by microhardness measurements and by transmission electron microscopy. For both ambient and cryogenic compaction, sample hardness increased with pressure, and heat treatment resulted in about a 50% increase in hardness independent of the initial green-state value. Samples compacted in LN2 were significantly harder (up to 9.6 GPa) than those compacted in air.

V. A. Hackley, and S. G. Malghan. 1993, 2p.
Pub. in Polymer Preprints 34, n1 p1024-1025 Mar 93.

Keywords: *Silicon nitrides, *Ceramics, *Colloiding, *Dispersants, *Polyelectrolytes, Powder(Particles), Sintering, Carboxylates, High temperature tests, Rheology, Homogeneity, Reprints.

Colloidal processing of submicron powders has become increasingly important in the commercial production of structural ceramic shapes. Silicon nitride is one of the materials of choice for high temperature load-bearing applications such as turbines and bearings for heat engines. To obtain chemical and microstructural homogeneity in the final sintered product, the powders must be dispersed at high solid loadings (up to 60% by volume) and then consolidated and dried. Carboxylate polyelectrolytes are routinely added to aqueous slurries to act as dispersants and obtain suitable rheological properties. Recipes for slurry preparation are often determined by trial and error, without specific knowledge of the complex interactions between solution, polyelectrolyte and colloidal particles. We have examined the electrostatic component of these interactions for PAA and PMMA using an electroacoustic technique and adsorption isotherms. These results are correlated with polymer structure and molecular weight and with the fluidity of dense slurries.

Pub. in Materials Chemistry and Physics 36, p112-118 1993.

Keywords: *Silicon nitrides, *Powder(Particles), *Surface chemistry, *Cleaning, *Colloids, *Oxide films, Electroacoustics, Isoelectronic sequence, pH, X ray spectroscopy, Auger spectroscopy, Interfaces, Solid solutions, Reprints, *Soxhlet extraction.

An aqueous soxhlet extraction procedure was used to surface-clean five commercial silicon nitride powders. The solid-solution interface properties were characterized before and after extraction by electrokinetic sonic amplitude measurements. The isoelectric point pH(sub iep) was found to increase significantly for some powders after treatment. The powder surface was analyzed using X-ray photoelectron spectroscopy and X-ray induced Auger electron spectroscopy before and after extraction. The surface oxygen content and oxide layer thickness decrease after treatment. A linear correlation was found between oxide thickness and pH(sub iep) which yields a pristine pH(sub iep) of about 9.7 for the unoxidized Si3N4 particle.

Contract N00014-90-J-4020
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA. and Office of Naval Research, Arlington, VA.
Pub. in Jnl. of the American Ceramic Society 77, n10 p2669-2680 1994.

Keywords: *Ceramic fibers, *Permeability, *Thermal conductivity, *Transport properties, Gas flow, Bundles, Microstructure, Thermophysical properties, Conduction(Heat transfer), Algorithms, Ceramics, Stokes law(Fluid mechanics), Reprints.

A model of the local microstructure of a bundle of fibers is simulated and used as the basis for calculations of transport properties. This, in turn, can be used in a macroscopic model of the chemical vapor infiltration process. An expanding/overlapping circle representation of the microstructure simulates the deposition of matrix in a uniaxial bundle of fibers. An iterative heat conduction algorithm is used to calculate the transverse thermal conductivity based on the thermal conductivities of the solid and gas phases. The permeability of gas through the microstructure is calculated for flow both parallel and transverse to overlapping cylinders using a Strokes equation and assuming a Darcy's law behavior. Both the simulations of the microstructure and associated calculations of the transport properties compare favorably with experimental data.

Stability and Surface Energies of Wetted Grain Boundaries in Aluminum Oxide.
Final rept.
D. Y. Kim, S. M. Wiederhorn, B. J. Hockey, C. A. Handwerker, and J. E. Blendell. 1994, 10p.
Pub. in Jnl. of the American Ceramic Society 77, n2 p444-453 Feb 94.

Keywords: *Aluminum oxide, *Grain boundaries, *Free energy, *Stability, *Surfaces, Crystal lattices, Interfaces, Wettability, Microstructure, Reprints.

The stability of a calcium-aluminum-silicate liquid film between two near-basal plane surfaces of sapphire at 1650 C was studied. Samples were prepared having an average basal misorientation across the interface of 6-7 deg about (10-10). Three types of interfaces were observed: faceted, solid-liquid interfaces; low-angle grain boundaries consisting of aligned arrays of dislocations; and boundaries consisting of alternating regions of dislocations and faceted solid-liquid interfaces. The type of interface observed depended on the orientation of the interface and could be predicted by using a construction based on Wulff shapes. Because the type of interface depends on crystal alignment and interface angle, these results suggest an absolute method of determining the surface free energy of wetted boundaries.

Keywords: *Ceramics, *Information systems, *Data bases, *Research projects, *Structural engineering,

Physical properties, Chemical properties, Criteria, High temperature tests, Implementation, Heat resistant materials, *Structural Ceramics Database System, *Advanced materials.

The objective of the project was to strengthen the link between the development of new materials in research laboratories and the application of these materials by design engineers. The medium for improving this link is a user-friendly database on materials properties of advanced ceramics. Papers containing data appropriate for the structural ceramics database (SCD) were identified by a computerized search of the open technical literature. Acceptance criteria were applied during careful review of the papers. At the end of this process, approximately seventy-five papers remained. Material and property information were extracted and evaluated by experts within the Ceramics Division at NIST who were particularly concerned with assessing the material specifications, the measurement methods and procedures, and the reliability of the data. Concurrently, user-friendly database software was developed to manage the data on personal computers. With this software, users can easily find the properties of a given material or identify materials that meet specified property values. After completion of code development and data entry, test sites were selected to review the database system.

Keywords: *Ceramics, *Test facilities, *Fixtures, *Temperature effects, Flexural strength, Room temperature, Standards, Design criteria, Mechanical properties, Loads(Forces), *Advanced materials.

A test fixture for the measurement of the flexure strength of advanced ceramic specimens is presented. This report presents a four-point flexure fixture that is in accordance with the requirements of U.S. Army MIL STD 1942 and ASTM C 1161. These standards prescribe specific specimen and fixture sizes, tolerance, and alignment requirements. The standards specify that the fixture must have sufficient articulation to ensure even line-loading pins. The fixture is designed so that it can be set up and aligned easily and quickly (about 30 minutes). The fixture in this report is intended for use with flat and parallel specimens.

Contract DE-AC05-840R21400
Color illustrations reproduced in black and white. Sponsored by Department of Energy, Washington, DC. Office of Transportation Technologies. and Martin Marietta Energy Systems, Inc., Oak Ridge, TN.

Keywords: *Ceramics, *Machining, *Damage assessment, *Imaging techniques, Grinding(Material removal), Cracks, Subsurface investigations, Nondestructive tests, Performance tests, Aluminum oxide, Silicon nitrides, *Thermal wave imaging.

The feasibility of a thermal wave imaging technique is evaluated for the detection and characterization of machining damage in ceramics. First, a well-defined crack system produced by Vickers indentation is used to examine the characteristic response of thermal wave signals to different forms of cracks (i.e., median/radial and lateral). The results clearly indicate that thermal wave imaging can be used for the detection of surface and subsurface cracks in ceramics. Thermal wave imaging is then conducted on the surfaces of ground alumina and the cross-section of scratched silicon nitride. Careful examinations of the thermal wave images confirm that this technique can be used to detect the grinding-induced subsurface microcracks. The limitations of the thermal wave imaging technique in the detection of small cracks and precautions regarding choosing appropriate sets of imaging parameters are pointed out.

X-ray Powder Diffraction from Carbon Nanotubes and Nanoparticles.
Final rept.
D. Reznik, C. H. Olk, D. A. Neumann, and J. R. D. Copley. 1995, 9p.
Pub. in Physical Review B, v52 n1 p116-124 Jul 95.

Keywords: *Powders, *Diffraction, Reprints, X ray diffraction, Interlayers, Cross section, *Nanomaterials.

We report detailed x-ray powder-diffraction measurements on a sample consisting of approximately 60 carbon nanotubes and approximately 40 carbon nanoparticles. These measurements demonstrate the existence of short-range interlayer stacking correlations. Our calculations show that such correlations should not be observable in idealized models of nanotubes. The observation of short-range interlayer correlations can be explained if many of the nanotubes and nanoparticles have polygonal cross sections, largely consisting of flat regions having graphitic interlayer correlations. This polygonization is almost certainly driven by the van der Waals interactions responsible for the AB AB stacking in crystalline graphite.

Damage Processes in Ceramics Resulting from Diamond Tool Indentation and Scratching in Various Environments.
Final rept.
A. W. Ruff, H. Shin, and C. J. Evans. 1995, 12p.
Pub. in Wear Jnl. 181-183, p551-562 1995.

Keywords: *Ceramic materials, *Diamonds, Reprints, Damage, Tools, Scratching, *Foreign technology.

Studies have been carried out to determine the influence of different chemical environments and tool shapes on damage produced during diamond tool scratching and indenting of two advanced ceramics: chemical-vapor-deposited silicon carbide and a composite aluminum oxide-titanium carbide. A nanoindentation/scratching apparatus was used in a controlled-load mode for the studies. Two diamond tool shapes were used: a wedge with -45 degrees rake and 0.5 mm radius curved edge, and a Vickers pyramid. The environments studied were: air, water, mineral oil, mineral oil + stearic acid and two commercial water-based fluids. It was of interest to identify damage mechanisms, critical loads for initiation of severe damage, specific scratching energies and the effect on damage of the different tool shapes.

Photodesorption Dynamics of CO from Si(111): The Role of Surface Defects.
Final rept.
P. M. Chu, S. A. Buntin, L. J. Richter, and R. R. Cavanagh. 1994, 6p.
Pub. in Surface Science, v321 p127-132 1994.

Keywords: *Silicon, *Carbon monoxide, *Desorption, *Surface defects, Etching, Ion beams, Annealing, Diagnostic techniques, Photochemical reactions, Reprints, *Photodesorption.

Laser-induced desorption of CO from an ion beam etched and annealed Si(111) surface is reported. State-resolved measurements of the desorbed CO reveal very high translational and vibrational energy contents, with the rotational excitation being quite low. The results suggest that the CO photodesorption is derived from CO bound to ion beam etch-induced active defect site(s) on the Si(111)7x7 surface that are only minimally influenced by either the ion beam etching conditions or the anneal. Comparison of the photoyields at 266 and 355 nm suggests that the desorption mechanism cannot be described using existing models for thermal- or carrier-mediated processes.

This paper describes the lubrication mechanism of alcohols with silicon nitride under boundary lubrication conditions. Dynamic wear tests and static chemical reaction studies were conducted to study the chemical interaction between alcohols and silicon nitride. Direct evidence of chemical reactions occurring between alcohols and silicon nitride was collected. Gel-permeation-chromat ography-graphite- furnace-atomic-absorption (GPC-GFAA) analysis detected the presence of high molecular weight (HMW), silicon-containing, metallo-organic compounds in the wearing contact. Secondary ion mass spectrometry (SIMS) analysis of the reactionproducts from wear tests revealed the formation of silicon alkoxides. These alkoxide subsequently reacted to form HMW products which had been independently verified as capable of lubricating silicon nitride surfaces.

Keywords: *Silicon nitrides, *Wear tests, *Lubrication, Oxygen compounds, Boundaries, Friction, Tribology, Wear, Lubricating oils, Alcohols, Reprints, *Boundary lubrication, BTF(Ball-on-three-flat), Oxygenates.

A ball-on-three-flat (BTF) wear tester was used to investigate the boundary lubricating characteristics of oxygenates on a commercial silicon nitride. A wide variety of oxygen-containing compounds were tested neat and/or at 1% by weight in a paraffin oil. Compounds containing hydroxyl functional groups were more effective compared to a base case of neat paraffin oil. Decreases of up to 58% in friction coefficient, and 95% in wear were obtained. In most cases, films were observed in and around the wear scar, suggesting chemical reactions had taken place in the contact. Additional wear tests, conducted using neat shorter-chain linear primary alcohols, i.e., 6-10 carbons, demonstrated boundary lubrication protection, with longer chain length providing better antiwear performance.

Pub. in Materials Research Society Symposia Proceedings, v371 p47-52 1995.

Keywords: *Porous materials, *Neutron scattering, *Silica, Reprints, Small angle scattering, Molecular sieves, Mesoporous materials.

The nanoscale structure and synthesis mechanisms of a recently developed class of inorganic mesoporous materials with ordered arrays of uniform mesopores have been investigated by small angle neutron scattering (SANS). SANS measurements with solvents imbibed into the pores to vary the scattering contrast demonstrate that the low angle diffraction peaks from these materials are entirely due to the pore structure and that the pores are fully accessible to both aqueous and organic solvents. SANS measurements on the concentrated cationic surfactant and silicate that the existence of preassembled supramolecular arrays that mimic the final pore structure is not essential for the synthesis of these materials.

Torsion Modulus and Internal Friction of a Fiber-Reinforced Composite.
Final rept.
H. Ledbetter, and M. Lei. 1994, 2p.
Pub. in Jnl. of Applied Physics, v76 n5 p3212-3213 1994.

Keywords: *Fiber composites, *Glass fiber reinforced plastics, *Epoxy matrix composites, Reprints, Torsional stress, Elastic properties, Ultrasonics, Internal friction.

By a kilohertz-frequency resonance method, we determined the torsion modulus and internal friction of a uniaxially fiber-reinforced composite. The composite was composed of glass fibers in an epoxy-resin matrix. We studied three fiber contents: 0.41 and 49 vol %. The internal friction failed to fit a classical free-damped-oscillator model where one assumes a linear rule-of-mixture for three quantities: oscillator mass, force constant, and mechanical-resistance constant. The torsion modulus approximately fits a plane-wave scattering ensemble-average model. The microstructure showed strong fiber-distribution nonhomogeneity. Considering this nonhomogeneity yielded a better agreement between model and observation. Thus, torsion-modulus measurements provide a method to detect and quantify fiber-distribution nonhomogeneity.

Pub. in Proceedings of the CIMTEC (8th): High Performance Materials in Engine Technology, Faenza, Italy, June 28-July 4, 1994, p497-513.

Keywords: *Silicon nitride, *Ceramics, Cutting, Hydration, Machining, Surface chemistry, Surfac films, Reprints, *Chemical assisted machining.

Ceramics are hard and brittle. Machining such materials is time-consuming, difficult, and expensive. Current machining technology requires ultra-stiff tools, diamond-bonded wheels, and low material removal rate to minimize surface damage. This study demonstrates the feasibility of a novel ceramic machining concept that utilizes tribo-chemical reactions at the tool-workpiece interface to reduce the stress and minimize the surface damage. A series of cutting tests using a diamond wheel on silicon nitride with different chemical compounds has been conducted. Results suggest that by using different chemistries, the material removal rate and the surface finish of the machined Si3N4 surface can be significantly altered. Halogenated hydrocarbons show significant improvement over some commercial machining fluids currently in use.

Electrokinetic Sonic Analysis of Silicon Nitride Suspensions.
Final rept.
V. A. Hackley, R. S. Premachandran, and S. G. Malghan. 1992, 8p.
Pub. in American Chemical Society, p141-148 1992.

Keywords: *Electroacoustics, *Silicon nitrides, Isoelectric point, Electrokinetics, Reprints, Interfacial chemistry.

In colloidal processing of ceramic slips, reactions occurring at the solid-solution interface play a dominant role in the dispersion properties. Electrokinetic sonic amplitude (EsA) measurements have been used to characterize the aqueous interfacial chemistry of Si3N4 suspensions. The ESA signal is proportional to the dynamic mobility and depends on the colloid shear-plane potential. Samples were subjected to acidic and alkaline soxhlet extraction, then titrated potentiometrically. Variations in the ESA signal and isoelectric pH indicate differences in the surface charge behavior of each powder. These differences may arise from surface contamination by specifically absorbed ionic species or modification of potential determining surface sites as a result of treatment history. This paper is intended to provide hands-on information regarding the electrokinetic sonic analysis of aqueous ceramic dispersions.

D. P. Bentz, D. A. Quenard, V. Baroghel-Bouny, E. J. Garboczi, and H. M. Jennings. 1995, 9p.
Pub. in Materials and Structures, v28 p450-458 1995.

Keywords: *Calcium silicates, *Hydrates, *Drying, *Shrinkage, Cements, Pases, Mortars(Material), Concretes, Physical properties, Sorption, Sorptive properties, Microstructure, Models, Simulation, Reprints.

The nanostructure of calcium silicate hydrate (C-S-H) gel contributes to many physical properties of concrete, including the important engineering properties of creep and shrinkage. A set of structural models for this gel and computational techniques for their validation have been developed. The basic nanostructure of C-S-H is conceived as a self-similar agglomeration of spherical particales at two levels (diameters of 5 nm and 40 nm). Computational techniques are presented for simulating transmission electron microscopy images and computing sorption characteristics of the model nanostructures. Agreement with available experimental data is reasonable. The development of these nanostructural models is a first step in a multiscale approach to computing the drying shrinkage of model cement-based materials. Such an approach will provide a better understanding of the relationships between microstructure and the shrinkage behavior of these systems.

Analysis of Small-Angle Scattering Data Dominated by Multiple Scattering for Systems Containing Eccentrically Shaped Particles or Pores.
Final rept.
A. J. Allen, and N. F. Berk. 1994, 14p.
Pub. in Jnl. of Applied Crystallography, v27 p878-891 1994.

Keywords: *Neutron scattering, *Porous ceramics, Sintering, Microstructure, Reprints, *X ray scattering, Multiple small angle scattering.

A previously developed formalism to interpret the beam broading due to multiple small-angle scattering of a collimated beam of radiation in condensed matter is extended to treat the case of nonspherical scattering particles or pores. The new formalism concerns the situation where coherent single-particle scattering is incoherently, or stochastically, compounded by a random system of spheroidal particles, of any given mean aspect ratio, in a uniform matrix. By appropriate transformation of axes to reflect a spherroidal particle symmetry, Bethe's analysis of scattering when the sample thickness greatly exceeds the scattering mean free path is combined with the dynamical analysis of single-particle scattering to model the beam broadening arising from a system containing nonspherical scattering objects. For the range of experimental parameters used in practical small-angle scattering studies of technological materials such as porous ceramics, it is shown that, while the previous formulation suffices for spheres, globules and even short capillary pores, the variation in beam broadening as a function of incident wavelength exhibits distinguishable signatures for systems in which a collapsed planar or extreme capillary scattering morphology predominates.

Friction Processes in Brittle Fracture.
Final rept.
B. Lawn. 1992, 29p.
Pub. in Fundamentals of Friction: Macroscopic and Microscopic Processes, Braunlage, July-August 1991, p137-165 1992.

Keywords: *Brittle materials, *Fiber reinforced composites, Reprints, Fracture, Friction, Strength, Toughness, *Foreign technology, *Contact cracks, Interface chemistry.

In this paper the authors consider the interrelations between friction and fracture in highly brittle materials. First, they examine frictional effects in the mechanics of crack formation at elastic and elastic-plastic contacts on brittle surfaces. Then they consider how fundamental intersurface forces manifest themselves as 'internal friction' at crack interfaces in 'model' solids like mica and glass, with special reference to environmental chemistry. Finally, the authors examine the controlling role of frictional processes in the strength and toughness of modern ceramic systems.

Model for Microcrack Initiation and Propagation beneath Hertzian Contacts in Polycrystalline Ceramics.
Final rept.
B. R. Lawn, N. P. Padture, F. Guiberteau, and H. Cai. 1994, 11p.
Pub. in Acta Metallurgica Materials, v42 n5 p1683-1693 1994.

Keywords: *Microcrack, *Crack propagation, *Ceramics, Fracture mechanics, Reprints, Initiation, *Foreign technology, Shear faults.

A fracture mechanics model of damage evolution within Hertzian stress fields in heterogeneous brittle ceramics is developed. Discrete microcracks generate from shear faults associated with the heterogeneous ceramic microstructure; e.g. in polycrystalline alumina, they initiate at the ends of intergrain twin lamellae and extend along intergrain boundaries. Unlike the well-de-

fined classical cone fracture that occurs in the weakly tensile region outside the surface contact in homogeneous brittle solids, the fault-microcrack damage in polycrystalline ceramics is distributed within a subsurface shear-compression zone below the contact. The shear faults are modelled as sliding interfaces with friction, in the manner of established rock mechanics descriptions but with provision for critical nucleation and matrix restraining stresses. This allows for constrained microcrack pop-in during the loading half-cycle. Ensuing stable microcrack extension is then analyzed in terms of a K-field formulation. For simplicity, only mode I extension is considered specifically here, although provision exists for including mode II. The compressive stresses in the subsurface field constrain microcrack growth during the loading half-cycle, such that enhanced extension occurs during unloading.

Model for Toughness Curves in Two-Phase Ceramics. 2. Microstructural Variables.
Final rept.
N. P. Padture, J. L. Runyan, S. J. Bennison, L. M. Braun, and B. R. Lawn. 1993, 7p.
Pub. in Jnl. of the American Ceramic Society, v76 n9 p2241-2247 Sep 93.

Keywords: *Damage accumulation, *Microstructural design, Reprints, Strength, *Fracture mechanics model, Toughness curve, Two-phase composites.

The fracture mechanics analysis of Part I is here extended to consider the effects of volume fraction and scale of second-phase particles on the toughness-curve properties of ceramic-matrix composites. Increasing these variables enhances the flaw tolerance of the material, but only up to certain limits, beyond which bulk microcracking occurs. These limits define domains of damage accumulation and potential strength degradation by microcrack coalesence. In the familiar approximation of elliptical crack-wall profiles, the authors show that the principal effects of increasing volume fraction (or expansion mismatch) and particle size is to enhance the slope and scale of the T-curve, respectively.

Objective Evaluation of Short-Crack Toughness Curves Using Indentation Flaws: Case Study on Alumina-Based Ceramics.
Final rept.
L. M. Braun, S. J. Bennison, and B. R. Lawn. 1992, 9p.
Pub. in Jnl. of the American Ceramic Society, v75 n11 p3049-3057 Nov 92.

Keywords: *Alumina, *Flaw tolerance, Reprints, *Indentation strength, Aluminum titanate, Toughness curves, Two phase composite.

An objective methodology is developed for evaluating toughness curves (T-curves) of ceramics using identation flaws. Two experimental routes are considered: (1) conventional measurement of inert strength as a function of indentation load; (2) in situ measurement of crack size as a function of applied stress. Central to the procedure is a proper calibration of the indentation coefficients that determine the K-field of indentation cracks in combined residual-contact and applied-stress loading, using data on an appropriate base material with single-valued toughness. Tests on a fine-grain alumina serve to demonstrate the approach.

Deformation and Fracture of Mica-Containing Glass-Ceramics in Hertzian Contacts.
Final rept.
H. Cai, M. A. Kalceff, and B. R. Lawn. 1994, 9p.
Pub. in Jnl. of Materials Research, v9 n3 p762-770 Mar 94.

Keywords: *Hertzian contact, Deformation, Machinability, Microfracture, Reprints, Glass-ceramic, Shear fault.

The Hertzian indentation response of a machinable mica-containing glass-ceramic is studied. Relative to the highly brittle base glass from which it is formed, the glass-ceramic shows evidence of considerable 'ductility' in its indentation stress-strain response. Section views through the indentation sites reveal a transition from classical cone fracture outside the contact area in the bae glass to accumulated subsurface deformation-microfracture in the glass-ceramic. The deformation is attributed to shear-driven sliding at the weak interfaces between the mica flakes and glass matrix. Extensile microcracks initiate at the shear-fault interfaces and propagate into the matrix, ultimately coalescing with neighbors at adjacent mica flakes to effect easy material removal. The faults are subject to strong compressive stresses in the Hertzian field, suggesting that frictional tractions are an important element in the micromechanics. Bend-test measurements on indented specimens show that the glass-ceramic, although weaker than its base glass counterpart, has superior resistance to strength degradation at high contact loads. Implications of the results in relation to microstructural design of glass-ceramics for optimal toughness, strength, and wear and fatigue properties are discussed.

Flaw Tolerance and Toughness Curves in Two-Phase Particulate Composites: SiC/Glass System.
Final rept.
H. Cai, N. P. Padture, B. M. Hooks, and B. R. Lawn. 1994, 9p.
Pub. in Jnl. of the European Ceramic Society, v13 p149-157 1994.

Keywords: *Composites, *Flaw tolerances, Glass, Reprints, *Foreign technology, Indentation-strength, Silicon carbide, Toughness-curve.

Flaw-tolerance and associated toughness-curve (T-curve) characteristics in SiC/glass particle/matrix composites are studied. Two glass compositions, chosen to produce composites at extremes of high (H) and low (L) thermal expansion mismatch relative to the SiC particles, are investigated. In-situ observations of crack extension from indentation flaws reveal widely different responses: in the L composite the path is relatively undistorted from the planar geometry, with trans-particle fractures: in the H composite the path deflects strongly around the particles, with consequent interfacial bridge formation and activity in the crack wake. Surface fracture patterns produced by spherical indenters confirm the implied transition from transparticle to inter-particle with increasing internal residual stress, and point to a potential degradation in short-crack properties like wear and fatigue. Indentation-strength measurements also show different characteristics in the two composites: minor flaw tolerance in the L material, consistent with a single-valued, 'rule of mixtures' toughness: major tolerance in the H material, consistent with a pronounced T-curve. The T-curves themselves are deconvoluted from the indentation-strength data for each composite and analyzed.

Wear of Enamel against Glass-Ceramic, Porcelain, and Amalgam.
Final rept.
L. A. George, and F. C. Eichmiller. 1996, 8p.
Pub. in Ceramic Transactions Series: Challenges in Ceramic Development, Manufacture, and Commercialization, v66 p181-188 1996.

Keywords: *Amalgam, *Betz-quartz, *Glass-ceramic, *Wear, Enamel, Procelain, Reprints.

The wear of human enamel opposing certain dental materials is a problem in restorative dentistry. A wear study was carried out on enamel that was in contact with three dental restorative materials, a beta-quartz glass-ceramic, a fused porcelain (Ceramco, Inc., Burlington, NJ), and a dispersed phase amalgam (Dispersalloy, Johnson & Johnson, Skillman, NJ). Twenty-seven human teeth tooled to form enamel cones were randomly assigned to the three restorative materials. Three groups of 9 enamel cones each were abraded against sample disks of each material. The test was carried out on a two-body, unidirectional, rotary wear testing machine. The wear of the enamel was evaluated by measurement of the volume of enamel lost during testing. The average wear volumes lost (cm cubed) for the enamel were: glass-ceramic, 5.0 x 10 to the minus 5 power (s = 2.1 x 10 to the minus 5 power); porcelain, 5.2 x 10 to the minus 4 power (s = 5.4 x 10 to the minus 4 power); amalgam, 3.5 x 10 to the minus 5 power (s = 1.8 x 10 to the minus 5 power). Comparison of the mean worn volume of enamel lost for the three materials, by the Turkey method of multiple comparisons with a significance level of 5%, indicated no significant difference between only the enamel worn against glass-ceramic and against amalgam. The results indicate that beta-quartz glass-ceramic material would produce less wear to opposing enamel than traditional fused porcelains. The wear of enamel opposing glass-ceramic should be equivalent to that resulting from contact with amalgam.

Effect of Grain Size on Hertzian Contact Damage in Alumina.
Final rept.
F. Guiberteau, N. P. Padture, and B. R. Lawn. 1994, 7p.
Pub. in Jnl. of the American Ceramic Society, v77 n7 p1825-1831 1994.

Keywords: *Alumina, *Damage accumulation, Deformation, Grain size, Microfracture, Reprints, *Hertzian contact.

The role of microstructural scale on deformation-microfracture damage induced by contact with spheres is investigated in monophase alumina ceramics over a range 3-48 um in grain size. Measurement of a universal indentation stress-strain curve indicates a critical contact pressure approximately 5 GPa, above which irreversible deformation occurs in alumina. A novel sectioning technique identifies the deformation elements as intragrain shear faults, predominantly crystallographic twins, within a confining subsurface zone of intense compression-shear stress. The twins concentrate the shear stresses at the grain boundaries and, above a threshold grain size, initiate tensile intergranular microcracks. Below this threshold size, classical Hertzian cone fractures initiate outside the contact circle.

Indentation Fatigue: A Simple Cyclic Hertzian Test for Measuring Damage Accumulation in Polycrystalline Ceramics.
Final rept.
F. Guiberteau, N. P. Padture, H. Cai, and B. R. Lawn. 1996, 14p.
Pub. in Philosophical Magazine A, v68 n5 p1003-1916 1993.

Keywords: *Alumina, *Damage accumulation, *Ceramics, Fatigue, Internal stress, Microfracture, Reprints, Hertzian contact.

A simple Hertzian contact procedure for investigating cyclic fatigue damage in brittle polycrystalline ceramics is described. Repeat loading of a shperical indenter on a coarse alumina ceramic produces cumulative mechanical damage. The mode of damage is one of deformation-induced intergranular microfracture, leading ultimately at large numbers of cycles and high contact pressures to severe grain dislodgement. In contrast to the classical Hertzian cone cracks that form in more homogeneous materials in the regions of tensile stress outside the contact circle, the damage in the coarse-grain alumina develops in a zone of high shear stress and hydrostatic compression beneath the contact circle. The fatigue damage is evident in inert environments, confirming the mechanical nature of the process, although exposure to moisture accelerates the effect. The relatively modest degradation in failure stress with number of repeat contacts for indented flexure specimens suggests that conventional strength and toughness testing procedures may not always provide sensitive indications of the extent of damage that can be incurred in concentrated loading.

Pub. in Jnl. of the American Ceramic Society, v76 n9 p2235-2240 1993.

Keywords: *Crack bridging, Strength, Reprints, *Fracture mechanics model, Microstructural design, Toughness-curve, Two-phase composites.

A fracture mechanics model is presented for the toughening of ceramics by bridging from second-phase particles, resulting in toughness curve (T-curve) behavior. It is assumed that the second-phase particles are in a state of residual thermal expansion dilatational mismatch relative to the matrix. In the long-crack region, these stresses augment frictional sliding stresses at the interphase boundaries, enhancing the crack resistance; in the short-crack region, the same stresses drive the crack, diminishing the crack resistance. The principal manifestation of these countervailing influences is a reduced sensitivity of strength to initial flaw size, i.e., an increased flaw tolerance.

Transient Creep Behaviour of Hot Isostatically Pressed Silicon Nitride.
Final rept.
S. M. Wiederhorn, B. J. Hockey, D. C. Cranmer, and R. Yeckley. 1993, 9p.
Pub. in Jnl. of Materials Science, v28 p445-453 1993.

Keywords: *Creep rupture, *Silicon nitride, *Ceramics, Lifetime, Reprints.

Transient creep is shown to dominate the high-temperature behavior of a grade of hot isostatically pressed silicon nitride containing only 4 wt% Y2O3 as a sintering aid. Contributing factors to transient creep are discussed and it is concluded that the most likely cause of long-term transient creep in the present study is intergranular sliding and interlocking of silicon nitride grains. In early stages of creep, devitrification of the intergranular phase, and intergranular flow of that phase may also contribute to the transient creep process. The occurrence of transient creep precluded the determination of an activation energy on the as-received material. However, after creep in the temperature range 1330-1430 degrees C for times exceeding approximately 1100 h, an apparent activation energy of approximately 1260 kJ mol to the minus 1 power was measured. It is suggested that the apparent activation energy for creep is determined by the mobility and concentration of diffusing species in the intergranular glassy phase. The time-to-rupture was found to be a power function of the minimum strain rate, independent of applied stress or temperature. Hence, creep-rupture behavior followed a Monkman-Grant relation. A strain rate exponent of -1.12 was determined.

The diffusional microcrack growth behavior in a bimaterial system is investigated with an aim at estimating service life of advanced ceramic composites under creep-rupture conditions. The crack is assumed to grow via a coupled surface and grain-boundary diffusion under steady state conditions. The tensile stress distribution along the interface ahead of the moving crack tip is solved, and it is found that a new length parameter exists as a scaling factor for which the solution becomes identical to the single phase case when plotted on the nondimensional physical plane. In contrast to the elastic stress solution which shows singularity at the tip, together with oscillatory character away from the tip, the creep stresses have a peak value away from the tip due to a wedging effect and interfacial sliding eliminates stress oscillation resulting in a decoupling between mode I and mode II loading. The solution ties the far-field loading parameter to the crack tip conditions in terms of the unknown crack velocity to give a specific V-K relationship. It is shown that an exponent of 12 in the conventional crack growth power law emerges at the higher applied stress range.

Keywords: *Ceramics, *Composites, *Creep rupture, Fiber-reinforced, Cavity growth, Damage mechanics, Engine materials, Life prediction, Reprints.

The paper is concerned with development of a lifetime prediction methodology for a unidirectional fiber reinforced ceramic composite subjected to creep conditions. A continuum damage mechanics approach is adopted in which constitutive creep laws incorporating damage are constructed based on micromechanical modeling. A unit cell model is established to take advantage of the periodic feature of the material. The model which entails two elements (one representing the fiber phase and the other the matrix phase) connected in parallel is subjected to a constant stress applied in the fiber direction. From the requirements of equilibrium and compatibility, a system of simultaneous differential equations was derived for the dependent variables: stress, strain and damage as functions of time, with the initial conditions given by the elastic state of the material. The algorithm for solving this time-dependent problem was given in a flow chart from which the lifetime limited by creep can be computed. The results suggested that creep life is strongly dependent on applied stress, temperature and volume fraction of the fibers.

Bulk Modulus and Young's Modulus of Nanocrystalline gamma-Alumina.
Final rept.
M. R. Gallas, and G. J. Piermarini. 1994, 4p.
Pub. in Jnl. of the American Ceramic Society, v77 n11 p2917-2920 Nov 94.

Keywords: *Nanocrystalline ceramic, *Bulk modulus, *Young's modulus, Reprints, Compression, Gamma-alumina, Diamond anvil cell, Energy dispersive x-ray.

Compression measurements were performed for the first time on nanocrystalline gamma-alumina utilizing a diamond anvil cell (DAC) and the energy dispersive X-ray diffraction method. The cubic unit cell (alpha=0.7924 nm) for gamma-alumina was found to have a volume compression of about 2.4% over the pressure range from ambient to 3.8 GPa at room temperature under both hydrostatic and nonhydrostatic conditions. Using the first-order Bridgman equation and the Birch equation of state, the isothermal bulk modulus (B0) was determined to be 162 plus or minus 14 GPa and Young's modulus (E) was estimated to be 253 plus or minus 22 GPa assuming a Poisson's ratio for gamma-alumina of 0.24 plus or minus 0.2.

Keywords: *Ceramics, *Crack growth, *Creep, Reprints, Rupture, Strength cavitation, *Foreign technology.

Structural ceramics are often two phase materials, in which rigid refractory grains, fibers, or whiskers are bonded by a less refractory matrix. At elevated temperatures, creep occurs by deformation of the matrix, resulting in the localization of stresses along grain boundaries, followed by cavitation and eventually be structural failure of the ceramic. The sequence of events prior to failure depends on the grain size and the amount of bonding matrix within the solid. Large amounts of matrix phase reduce constraints at grain boundaries, and thus the stresses that cause cavitation. Large grains, fibers or whiskers provie easy paths for crack growth, so that, once initiated, cracks readily propagate to failure. In structural ceramics, failure time can be expressed as a power function of the creep rate; the coefficient and exponent of the power function are determined by the failure mechanism. In the paper, models for creep rupture of ceramics are presented for cavity coalescence and for crack growth as primary failure processes. The model for cavity coalescence, in particular, is used to rationalize creep rupture data for a two phase ceramic that fails by cavity coalescence.

Keywords: *Ceramic materials, *Fracture(Mechanics), *Hot pressing, *Silicon nitrides, Reprints, Crack propagation, Creep, Failure, Fatigue(Materials), Flexual properties, Magnesium oxides.

Fracture mechanism maps provide means of assessing the structural reliability of ceramics at elevated temperatures. They can be used to summarize large quantities of data dealing with effects of load, temperature and environment on component lifetime. they also can be used to generate a design envelope that defines stress allowables for a given application. In this paper, the authors review the history and philosophy behind fracture mechanism maps and then discuss methods of obtaining such maps in an efficient manner. Based on data obtained in simple tensile tests, these methods are illustrated for one of the newer grades of silicon nitride. The map is then used to compare this material with a high temperature structural alloy, and another, older grade of silicon nitride. Finally, the authors discuss the use of fracture mechanism maps for design.

Pub. in Philosophical Magazine Letters, v64 n4 p191-195 1991.

Keywords: *Ceramics, *Flaw insensitivity, Bridging, Microstructures, Processing, Reliability, Reprints.

Ceramics are notorious for their 'brittleness', i.e. the sensitivity of mechanical strength to flaws on the microstructural scale. The association notion of the 'critical flaw' has dominated design considerations concerning structural reliability and materials processing of ceramic components. The accounts for the trend over the last decade towards a processing strategy of elimination strength-degrading flaws at source. Here the authors propose a fundamentally different approach, that of processing ceramics with crack-impeding elements integrated into the indigenous microstructures, such that any pre-existing or service-induced flaws are effectively stabilized. Strength data on a tailored alumina/aluminium-titanate material demonstrate the capacity of the approach to produce simple ceramics with unique flaw insensitivity.

Tension/Compression Creep Asymmetry in Si3N4.
Final rept.
W. E. Luecke, and S. M. Wiederhorn. 1994, 6p.
Pub. in Key Engineering Materials, v89-91 p587-592 1994.

Keywords: *Cavitation, *Creep, *Silicon nitride, Tension, Compression, Reprints, *Foreign technology.

The authors have deformed a commercial HIP-ed silicon nitride in both tension and compression at 1430 degrees C at stresses between 40 and 300 MPa. The material creeps up to 100 times faster in tension than in compression. The stress dependence of the tensile strain rate is not characterized by a single stress exponent, rising from about two at low stresses to about five at higher stresses. When stressed in tension, the material responds by cavitating, with the cavitation contributing signifciantly to the tensile strain. In compression, however, the material exhibits a stress exponent of unity, and cavitation is almost completely suppressed. The asymmetry in creep behavior between tension and compression is due to the dilatation of the material.

Role of Corrosion in a Material Selector Expert System for Advanced Structural Ceramics.
Final rept.
R. G. Munro. 1995, 9p.
Pub. in American Society for Testing and Materials Special Publication, p127-135 1995.

Keywords: *Ceramics, *Structural ceramics, *Corrosion, Expert systems, Heat exchangers, High temperature, Data bases, Material selection, Knowledge base, Reprints.

The primary goal in the development of advanced structural ceramics has been to provide high-strength, corrosion-resistant materials for use in high-temperature, aggressive environments. Much of the developmental effort has focused on heat exchangers for use in industrial gas- or coal-fueled systems with temperatures on the order of 1200 to 1400 degrees C. While ceramics are often popularly described as inert to chemical degradation, the corrosion resistance of these materials actually ranges from excellent to very poor, depending especially on the compositions of the environment and the materials selector expert system for advanced ceramics. The present paper examines the development of a set of rules for a material selector expert system based on relations among composition, microstructure, transport processes, operating conditions, and corrosion. The concurrent information requirements that must be provided in a computerized materials property database are discussed also.

Pub. in Jnl. of Research of the National Institute of Standards and Technology, v100 n1 p51-60 Jan/Feb 95.

Keywords: *Ceramic powder, *Variances, Characterization, Composition, Density, Particle size, Surface areas, Round robin, Reprints.

Variances in the measurement of properties used to characterize ceramic powders are discussed in the context of the International Energy Agency's study. Annex II, Subtask 2, which includes chemical and physical measurements for five powders: two grades of silicon nitride, and one grade each of silicone carbide, silicon, and ziconia. The analysis presented here includes results for 39 properties reported by 25 laboratories using approximately 700 samples of the powders. Measurement uncertainties are discussed in the contexts of measurement variations within given laboratories (within-laboratory variance, sometimes called repeatability), among different laboratories (between-laboratory variance, also called reproducibility), and among different measurement techniques (between-methods variance). The analysis shows that the between-laboratory variance tends to be significantly greater than either the within-laboratory or the between-methods variances. The implication of this results is that the most important improvements in powder characterization measurements may be achieved through the standardization of the measurement methodologies.

Flaw-Tolerance and Crack-Resistance Properties of Alumina-Aluminum Titanate Composites with Tailored Microstructures.
Final rept.
N. P. Padture, S. J. Bennison, and H. M. Chan. 1993, 9p.
Pub. in Jnl. of the American Ceramic Society, v76 n9 p2312-2320 Sep 93.

Keywords: *Alumina, *Aluminum titanate, Mechanical properties, Microstructure, Processing, Reprints, *Flaw tolerance, *Crack resistance.

The microstructures of alumina-aluminum titanate (A-AT) composites have been tailored with the intent of altering their crack-resistance (R- or T-curve) behavior and resulting flaw tolerance. Specifically, two microstructural parameters which influence grain-localized crack bridging, viz., (1) internal residual stresses and (2) microstructural titanate was added to alumina to induce intense internal residual stresses from extreme thermal expansion mismatch. It was found that A-AT composites with uniformly showed significantly improved flaw tolerance over single-phase alumina. Coarsening of the duplex microstructure via grain growth scaling was relatively ineffective in improving the flaw tolerance further. Onset of spontaneous microcracking precluded further exploitation of this scaling approach. Therefore, an alternative approach to coarsening was developed, in which a uniform distribution of large alumina grains was incorporated within a fine-grain A-AT matrix ('duplex-bimodal'), via a powder processing route. The duplex-bimodal composites yielded excellent flaw tolerance with steady-state toughness of approximately 8 MPa-m(1/2). A qualitative model for microstructure development in these duplex-bimodal composites is presented.

In situ-Toughened Silicon Carbide.
Final rept.
N. P. Padture. 1994, 5p.
Pub. in Jnl. of the American Ceramic Society, v77 n2 p519-523 Feb 94.

Keywords: *Silicon carbide, Sintering, Microstructure, Reprints, Yttrium aluminum garnet, Crack-wake bridging, Fracture toughness.

A new processing strategy based on atmospheric pressure sintering is presented for obtaining dense SiC-based materials with microstructures consisting of (1)

uniformly distributed elongate-shape alpha-SiC grains and (2) relatively high amounts (20 vol%) of second-phase yttrium aluminum garnet (YAG). This strategy entails the sintering of beta-SiC powder doped with alpha-SiC, Al2O3, and Y2O3. The Al2O3 and Y2O3 aid in the liquid-phase sintering of SiC and form in situ YAG, which has a significant thermal expansion mismatch with SiC. During a subsequent grain-growth heat treatment, it is postulated that the alpha-SiC 'seeds' assist in controlling in situ growth of the elongated alpha-SiC grains.

Pub. in Jnl. of Materials Research, v8 n6 p1411-1417 Jun 93.

Keywords: *Ceramics, *Cracking, *Indentation, Fracture, Lateral-cracks, Glass, Reprints.

Vickers indentation sites in ceramics have been examined after specimen failure from medial-radial indentation cracks. Evolution of a newcracking pattern of 'ortho-lateral' cracks, originating at the intact corners of the Vickers indentation and running orthogonal to the classic-lateral cracks and parallel to the new fracture surface, has been observed. In some instances postfailure extension of the classic-lateral cracks toward the surface was also observed. Enhanced residual tensile stress from relaxation of constraints on the indentation-plastic cavity by the generation of a fracture surface is postulated to drive the subsidiary cracking. A simple qualitative model to explain this phenomenon is presented. Possible implications of such postfailure subsidiary cracking on residual-stress-driven flaws, postmortem fractography, and wear in ceramics are discussed.

High Temperature Structural Reliability of Silicon Nitride.
Final rept.
S. M. Wiederhorn, G. D. Quinn, and R. Krause. 1994, 6p.
Pub. in Key Engineering Materials, v89-91 p575-580 1994.

Keywords: *Ceramics, *Silicon nitride, *Reliability, Strength, Creep, Fracture maps, Reprints, *Foreign technology.

Structural reliability of ceramics at elevated temperatures is often determined by crack growth, or by creep induced cavitation. Ceramics that fail in this manner fit a Monkman-Grant relation, in which the time to failure is represented as a power las function of the creep rate. In the paper the authors show that the Monkman Grant approach can be used to obtain fracture maps for characterizing creep and creep rupture behavior at high temperatures. Maps are presented for ceramics currently being considered for turbine or heat exchanger applications. Attributes of current grades of silicon nitride are compared.

See also PB93-166619.
Pub. in Annual Automotive Technology Development Contractors Coordination Meeting, Dearborn, MI., October 28-31, 1991, p1-8.

Keywords: *Ceramics, *Creep tests, Loads(Forces), Mechanical properties, Tension tests, Test methods, Deformation, Strains, Fractures(Materials), Mechanical tests, Reprints.

In order to use structural ceramics in heat engines, their high temperature properties must be characterized. Temperatures as high as 1400 degrees C are expected, hence, test equipment capable of this temperature will be needed. Furthermore, as the dominant wear-out mechanism for high temperature applications is creep rupture, test equipment must not only be capable of high temperatures and stresses, but must be stable and must be able to sustain applied stresses for extended periods of time. In the paper, the authors discuss an inexpensive tensile tests apparatus that can be used to collect creep data for the prediction of component lifetime. They use this equipment to collect creep and creep rupture data on two grades of silicon nitride. They also demonstrate the general tendency of silicon nitride ceramics to follow a Monkman-Grant type of stress rupture behavior. The tendency permits a simple design methodology to be used for lifetime prediction.

Chip Morphology, Tool Wear and Cutting Mechanics in Finish Hard Turning.
Final rept.
M. A. Davies, Y. Chou, and C. J. Evans. 1996, 6p.
Pub. in Annals of the CIRP, v45 n1 p77-82 Jan 96.

Keywords: *Machining, *Boron nitrides, *Wear, Cutting tools, Models, Reprints, Cubic baron nitrides.

Topography of surfaces produced in finish hard turning using cubic boron nitride (CBN) tools is affected by a large number of factors including tool wear and the mechanics of the chip formation process. The paper shows first that tool wear rates are affected by interactions between the world material and binder phase of the CBN tool. For finish hard turning, low CBN content, ceramic binder tools give longer lives and better finish than high CBN content metallic binder tools. For low CBN tools, wear rate is directly related to the microstructure of the work material and to the CBN grain size. SEM studies suggest that chip morphology is independent of work material microstructure, but varies with tool wear. Orthogonal cutting tests show that, above a critical speed, segmented chips are formed by catastrophic localized shear and that chip segmentation spacing may be reflected in a mdoulation of the machined surface. Segment spacing is a function of depth of cut, rake angle, and surface speed, approaching a limiting value with speed. Specific cutting energies decrease with speed, also approaching an asymptote. A simple mechanical model gives reasonable predictions of segment spacing along the original surface, although a full thermo-plastic model will be required to account for other aspects of the chip formation process.

Multi-Scale Picture of Concrete and Its Transport Properties: Introduction for Non-Cement Researchers.
E. J. Garboczi, and D. P. Bentz. Oct 96, 53p, NISTIR-5900.
Color illustrations reproduced in black and white.

Keywords: *Concretes, *Microstructure, Computerized simulation, Cements, Mortars(Material), Digital techniques, Silicate cements, Porosity, Hydration, Composite materials, US NIST.

Concrete is a multi-length scale composite material. From the nanometer to the millimeter scale, it is a random composite, and a different random composite at each length scale. Percolation processes play a key role in the microstructure of concrete, and help to describe the overall dependence of transport properties like ionic diffusivity on the microstructure. Computer models have been developed to describe the microstructure and transport properties, as the randomness of the material precludes most (but not all) analytical formulations. The overall description of concrete, over six orders of magnitude of length scales, in terms of computer models, precolation theory, and composite ideas is of interest to those studying other random materials as well, like ceramics and rocks. This report is written to present the ideas for concrete in such a way so as to be accessible to the non-cement researcher. It is hoped that these ideas will prove to be useful in other materials.

Sources of Strain-Measurement Error in Flag-Based Extensometry.
Final rept.
W. E. Luecke, and J. D. French. 1996, 10p.
Pub. in Jnl. of the American Ceramic Society, v79 n6 p1617-1626 Jun 96.

Keywords: *Strain measurement, *Extensometry, Advanced ceramics, Creep errors, Flag-based, Reprints.

The paper examines the sources of error in strain measurement using flag-based extensometry that uses either scanning laser or electroptical extensometers. These errors fall into two groups: errors in measuring the true gauge length of the specimen, which arise from the method of attachment of the flags, and errors arising from unanticipated disortions of the specimen during testing. The sources of errors of the first type include gauge-length errors from nonparallel flags and uncertainties in the true attachment point of the flag. During the test, strain-measurement errors of the second type can arise from horizontal translation of nonparallel flags, flag rotation that is induced by slippage, and flag motion from bending of the gauge length.

Pub. in Physical Review B, v54 n14 p9870-9882 Oct 96.

Keywords: *Annealing, *Antiferromagnetics, *Diffraction, Interlayers, Multilayers, X ray diffraction, Cross section, Reprints.

Sputtered Ni80Fe20/Ag multilayers, annealed postgrowth, exhibit giant magnetoresistance (GMR) with pronounced field sensitivity. The authors have characterized a series of Ni80Fe20(20 Angstroms/Ag(40 Angstroms)) multilayers annealed at temperatures ranging from 305 to 335 degrees C using x-ray and polarized neutron reflectivity techniques. For all of the samples, specular x-ray measurements reveal that the laterally averaged interfaces between the Ni80Fe20 and Ag layers are not well defined. The growth-plane morphology of the multilayers, determined from off-specular x-ray diffraction, shows a dependence on annealing temperature. Specular and off-specular polarized neutron reflectivity data indicate that the GMR in the annealed samples does not arise from long-range antiferromagnetic alignment of coherent ferromagnetic sheets, as generally observed in related materials. Instead, annealing promotes the formation of planar ferromagnetic domains of micrometer size within each Ni80Fe20 layer that are antiferromagnetically correlated along the growth axis. The length scales of these domains are consistent with a model in which weak dipolar forces dominate the interactions between them.

Small Angle Neutron Scattering Study of the Structure and Formation of MCM-41 Mesoporous Molecular Sieves.
Final rept.
C. J. Glinka, J. M. Nicol, G. D. Stucky, Q. Huo, J. B. Higgins, M. E. Leonowicz, E. Ramli, and D. Margolese. 1996, 6p.
Pub. in Jnl. of Porous Materials, v3 p93-98 1996.

Keywords: *Porous materials, *Neutron scattering, *Molecular sieves, Mesopores, Liquid crystals, Reprints, Mesoporous sieves.

The nanoscale structure and synthesis mechanisms of the MCM-41 class of inorganic mesoporous materials have been investigated by small angle neutron scattering (SANS). SANS measurements with solvents imbibed in the pores to vary the scattering contrast demonstrate that the low angle diffraction peaks from these materials are entirely due to the pore structure and that the pores are fully accessible to both aqueous and organic solvents. Static and shear flow SANS measurements on the concentrated cationic surfactant and silicate precursor solutions typically used in the synthesis

of the mesopore materials indicate that the existence of preassembled supramolecular arrays that mimic the final pore structure is not essential for the synthesis of these materials.

Nanoindentation and Instrumented Scratching Measurements on Hard Coatings.
Final rept.
A. W. Ruff. 1996, 3p.
Pub. in American Society for Testing and Materials Publication - Effect of Surface Coatings and Treatments on Wear, vSTP1278 p124-126 1996.

Keywords: *Ceramics, *Coatings, *Elastic modulus, Hardness, Indentation, Surface treatments, Scratching, Reprints, Plasma sprayed coatings.

Elastic, plastic, and cracking properties of ZrO2, a ZrO2-metal composite, and a Ni-NiO composite, all plasma-sprayed as coatings on metallic substrates, have been studied. Data comparisons were made with bulk ZrO2, bulk nickel, and single-crystal silicon as reference materials. A nanoindentation and scratching apparatus was used for the measurements. Three different indenter and scratching tool shapes were used: 200 micrometers radius sphere, Vickers four-sided pyramid, and a 45 degree wedge with a 0.5-mm radius curved edge. During indentation, over a load range of 10 mN to 1 N, continuous load versus depth data were obtained in each case to permit analysis for material hardness and elastic modulus. The loading curve data are used to calculate hardness, and the unloading curve data are used to calculate elastic modulus. The analytical models used are described and compared. An alternate method for deriving elastic modulus from the initial portion of the loading curve is described. Comparison among the results for different tool shapes will be discussed.

Pub. in Proceedings of the International Tribology Conference, Yokohama, Japan, October 29-November 2, 1995, p403-408 1996.

Keywords: *Ceramics, *Wear mechanics, *Silicon compounds, Fracture, Models, Carbides, Nitrides, Reprints, *Foreign technology.

Existing ceramic wear models have been evaluated against a large set of wear data of a Si3N4 and a SiC under dry sliding condition. The wear data cover a wide range of speeds and loads. The data include various wear mechanisms: deformation, fracture, and severe fracture corresponding to milk wear, severe, and ultra-severe wear regimes. Transition zones separate individual wear regimes. The wear models are assessed for their ability to predict both the level of wear and the locations of the wear transitions. The fracture models predict well in the severe wear regime but deviate from the data in the milk and ultra-severe wear regimes. In predicting the locations of wear transitions, the mild-to-severe wear transitions can be predicted reasonably well. The severe-to-ultra-severe wear transition in both materials can be successfully described by a critical velocity model. This suggests that thermal-shock-induced fracture damages are responsible for the existence of the ultra-severe wear regime. Consequently, a modified model was developed to include the thermal shock stresses.

Volatile Corrosion Inhibitors.
Dec 64, 15p.
Availability: Document partially illegible.

Keywords: *Corrosion, *Corrosion inhibition, *Volatility, *Packing materials, Test and evaluation, Materials, Steel, Coatings, External, Storage, Oils, Paper, Water vapor.

Significant reports covering the period since 1962 were selected for this study, with reference to relevant earlier works. Recent government RD on volatile corrosion inhibitors (VCI) has generally proceeded along three lines: extension of tests defining the protective value of these materials for longer storage periods to steel equipment, tolerances of various nonferrous materials and finishes toward tarnishing or corrosion by these materials, and effectiveness of exterior packaging materials in extending use of these inhibitors to more severe exposures of water vapor and liquid. Volatile corrosion inhibitors in the form of salts, dissolved in oils, or coated on paper within enclosed shipment parcels or storage spaces offer improved corrosion protection to hare steel while it is in a ready condition for withdrawal and immediate use.

A family of air-dry intaglio resin alkyds has been developed. The alkyds are based on pentaerythritol, sebacic, acid, linseed oil fatty acids and succinic anhydride. In laboratory tests, intaglio inks made from these resins washed well and cured to satisfactorily resistant films. Industrial quantities for press trials have been synthesized by a third party. A second series of resins has also been developed. These resins are based on tripentaerythritol, linseed oil fatty acids and succinic anhydride. Satisfactory washing and solvent resistance are obtained in laboratory tests. A third series of resins based on poly(vinyl alcohol) was synthesized but did not appear to be satisfactory for industrial development. The temperature program is important in the synthesis of alkyds. The influence of temperature has been studied so that satisfactory resins can be made industrially in minimum time.

Laser photolysis, optical emission, and laser-induced fluorescence (LIF) were used to study laser driven decomposition processes in the gas phase pertaining to the systems: SiH4 -> Si (s) and SiH4 + NH3 -> Si3N4 (s). These processes are important to silicon/silicon-nitride chemical vapor deposition, flame-driven gas phase silicon-particle nucleation, and laser-induced processes for materials fabrication. UV laser photolysis was used to generate SiHx and NHx species from silane and ammonia. A number of photo-fragments were identified by emission from excited states. The rate of reaction of NH2 with silane was measured using LIF to detect NH2 as a function of time following photolysis of ammonia.

Diffusion of Cations Beneath Organic Coatings on Steel Substrate.
J. Pommersheim, T. Nguyen, Z. Zhang, and C. Lin.
Apr 93, 42p, NISTIR-5102.
Prepared in cooperation with Bucknell Univ., Lewisburg, PA. Dept. of Chemical Engineering. and Xiamen Univ. (China). Dept. of Chemistry.

Keywords: *Polymeric films, *Steels, *Corrosion mechanisms, Cations, Diffusion, Transport properties, Organic coatings, Substrates, Sodium, Mathematical models, Computer codes, US NBS, National Institute of Standards and Technology.

Theoretical and experimental studies were carried out for the transport of cations in the channel between a polymer coating and a metal substrate from a defect in the absence of an electrical applied potential. The model consists of two stages: an initial period during which ions diffuse in the coating/metal interfacial 'channel' and adsorb on the coating surface and a propagation period during which ions also diffuse into the coating. The mathematical models were solved to predict the cation concentration and flux under the coating and the relative rate of diffusion between initial and propa-

gation periods. Model parameter values were derived from the results of an experiment conducted in a specially designed diffusion cell. The results also indicated that during the propagation period, the rate limiting step was the lateral diffusion along the coating/metal interface rather than diffusion through the coating.

Sponsored by Naval Civil Engineering Lab., Port Hueneme, CA.
Pub. in Jnl. of Coatings Technology 62, n790 p25-33 1990.

Keywords: *Coatings, *Blistering, *Surface defects, Steels, Substrates, Cracking(Fracturing), Stress corrosion tests, Protective coatings, Barrier coatings, Reprints, *Cathodic disbondment model.

A non-osmotic, defect-controlled cathodic disbondment model is proposed for explaining experimental results which were inconsistent with an osmotically controlled disbondment process. The proposed model attempts to integrate the physics of blister initiation and growth (that is, the development of internal stresses and the fracture of the coating from the substrate as the blister grows in size) with the better elucidated chemistry of blister growth. The proposed model has many features which are analogous to the buckling and stress corrosion cracking models proposed for other materials. It also provides an alternative explanation for the well-known barrier-effect in coatings.

Interface Modification and Characterization of Silicon Carbide Platelets Coated with Alumina Particles.
Final rept.
P. T. Pei, J. F. Kelly, and S. G. Malghan. 1993, 11p.
Pub. in Colloids and Surfaces A: Physicochemical and Engineering Aspects 70, p277-287 1993.

Keywords: *Coating processes, *Surface chemistry, *Silicon carbides, *Aluminum oxide, *Interfaces, Surface coating, Particle size, Colloids, Flocculation, Scanning electron microscopy, Additives, Electrodynamics, Aluminum coatings, Reprints.

A colloidal-chemistry-based technique was developed for interface modification of silicon carbide platelets (SiCp) by coating with alumina particles. The coating process utilizes electrostatic and/or electrosteric interactions between the particles to promote heterocoagulation. Since an understanding of the chemical interface between the SiCp and alumina is important for improving the coating process, the powders were characterized by the measurement of the electrokinetic sonic amplitude (ESA). The major factors studied were particle size, type of alumina, presence of polyacrylate surfactant, and concentration of alumina in the coating slip. The surface coverage and morphology of the alumina coating on SiCp was determined quantitatively by scanning electron microscopy (SEM). The results indicate that around pH 5.8, the surface charge difference between SiCp and alumina was the largest and the coating of alumina on SiCp was feasible. The SEM data showed that surface coverage was uniform, and the highest surface coverage on SiCp was 66% when the surface area ratio of alumina to SiCp was 250% in the suspension. No significant improvement of the coating rate was observed by the addition of a polyacrylate for dispersion of SiCp. The concentration of alumina in the slip exhibited a strong influence on the amount of surface coverage on SiCp.

In situ Measurements of Chloride Ion and Corrosion Potential at the Coating/Metal Interface.
Final rept.
T. Nguyen, and C. Lin. 1990, 4p.
Pub. in Proceedings of the Annual Meeting of the Adhesion Society (13th), (Extended Abstract), Savannah, GA., February 18-21, 1990, 4p.

Keywords: *Metal coatings, *Chlorides, *Corrosion, *In situ measurement, *Steels, Chemical attack, Chemical reactions, Interfaces, Metal-metal bonding, Corrosion tests, Reprints, *Corrosion potential.

One of the main reasons for the lack of a complete understanding of corrosion and adhesion failures of a coated metal is the lack of analytical instrumentation to probe the behaviors of corrosive agents at the coating/steel interface. We have developed a procedure based on microelectrodes for studying in situ the behaviors of potential and chloride ions at a coating/metal interface. The procedure requires an attachment of a Cl(-) selective microelectrode at the coating/metal interface, thus allowing direct measurements of Cl(-) concentration and corrosion potential changes at localized areas under a coating. Although it is intricate to prepare these microelectrodes, the procedure provided very useful information for mechanistic studies of corrosion under coatings, as well as for transport studies of Cl(-) ions through a coating on metal. The procedure should also be very useful for studying the roles of Cl(-) in localized corrosion.

Keywords: *Organic coatings, *Service life, *Environmental effects, *Life tests, *Coating processes, Reliability, Durability, Exposure, Life(Durability), Criteria, Fault trees, Time series analysis, Aging tests(Materials), Pollution abatement.

Over the last two decades, the organic coatings industry has undergone rapid technological and structural changes. These changes have been induced by legislative actions such as restrictions pertaining to hazardous chemicals, toxic effluents, and volatile organic compounds. The consequence of these changes has been the displacement of almost all commercially-important, well-established coatings (largely high-solvent coatings) by newer systems, the formulation and application of which are based on different chemistries and technologies. This report reviews the attributes of the service life prediction problem which are common to all materials, components, and systems in an effort to establish a set of criteria for assessing the adequacy of existing or proposed service life prediction methodology for coating systems. The current durability methodology and the reliability-based methodology are then evaluated against these criteria. The proposed criteria include the ability to (1) handle high variability in the time-to-failure data for nominally identical coated panels exposed in the same service environment, (2) analyze multivariate and censored time-to-failure data, (3) establish a connection between laboratory and field exposure results, and (4) quantitatively predict the service life of a coating system exposed in its intended service environment.

Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Thermal Spraying (ITSC '95) - Current Status and Future Trends, Kobe, Japan, May 22-26, 1995, p483-488.

Keywords: *Plasma sprayed alumina, *Pore surface area, *Neutron scattering, Porosity, Reprints.

Porosity is an important factor in determining the physical properties of plasma sprayed deposits. A significant fraction (2 - 15%) of the deposit volume consists of voids. These voids are in the form of pore between the splats and around any inclusions (unmelted particles) that may be present, and in the form of cracks within the splats. Neither the pores nor the cracks are spherical in shape, and the splat structure is circularly symmetric only when viewed from the spray direction. The microstructure of a plasma sprayed deposit contains significant anisotropy in the void shapes and there may be significant alignment of some of these shapes along particular directions. In this research, the voids in plasma sprayed deposits were investigated by measuring the specific surface areas of the voids from the terminal slope of small-angle neutron scattering, i.e., Porod scattering, by the deposits, and by means of mercury intrusion porosimetry. The results indicate that much of the void surface area is found perpendicular to the substrate and is associated with cracks. The second population of voids is found mostly parallel with the substrate and is associated with interlamellar pores. The surface areas measured by means of porosimetry were smaller than the surface areas derived from scattering, and were probably influenced by the presence of closed porosity, by the void model and by the low precision for measuring small voids.

Pub. in Symposium of the National Meeting of the American Chemical Society (208th), Washington, DC., August 21-25, 1994, p233-245.

Keywords: *Copolymers, Reprints, *Triblock copolymer, Transition temperature, Steady shear flow.

An overview of ongoing research on a triblock copolymer subjected to steady-shear flow is presented. The

copolymer is composed of polystyrene-polybut adiene-polystyrene (23 st% polystyrene-degrees) with cylindrical morphology in the quiescient state. The order-disorder transition (ODT) was studied by in-situ SANS in a couette geometry as a function of temperature and shear rate. We observed that the ODT temperature shifted upward by 20 degrees C as the shear rate was increased from - 0.1 to 25 s to the minus 1. Sheared samples were also quenched and studied by transmission electron microscopy. A unique shear-induced morphology was found and tentatively identified as a transformation from the original p31m space group to a p3m1 space group of lower symmetry, similar to a martensitic transformation in metals.

Development of a Test Method for Leaching of Lead from Lead-Based Paints Through Encapsulants.
T. Nguyen, M. E. McKnight, and E. Byrd. Feb 96, 40p, NISTIR-5783.
Sponsored by Department of Housing and Urban Development, Washington, DC. Office of Lead-Based Paint Abatement and Poisoning Prevention.

Keywords: *Lead(Metal), *Leaching, *Encapsulation, *Test methods, *Lead coatings, Chemical analysis, Paints, Acetic acid, Diffusion, Polymers, Standards, Pollution abatement, Toxic substances.

Lead in paints is one of the major sources of lead poisoning in children. Polymeric encapsulant is considered a viable approach for controlling the hazards associated with lead-based paints. Encapsulant is considered a viable approach for controlling the hazards associated with lead-based paints. This study aimed to provide a technical basis for the development of a standard test method for lead leaching through polymeric encapsulants. The effects of pigment type and concentration in the film, chemical types and pH of leaching solutions, and encapsulants of different generic resins on the leaching of lead from a lead-based film with and without an encapsulant covering it were investigated.

Pub. in Jnl. of Macromolecular Science: Chemistry Physics Reviews in Macromolecular Chemistry and Physics, nB35 p489-503 1996.

Keywords: *Copolymers, Reprints, *Triblock copolymer, Transition temperature, Steady shear flow.

A summary of the work on a triblock copolymer under steady shear is presented. The experiments were conducted using small-angle neutron scattering (SANS), as a function of shear rate and temperature, and transmission electron microscopy (TEM) on quenched specimens. The triblock copolymer is composed of polystyrene d8/polybutadiene/polystyrene-d8, and the ordered microstructure normally consists of hexagonally packed cylinders. Two temperature-dependent, characteristic shear rates, gamma(c1) and gamma(c2), are identified from the scattering results. The first characteristic shear rate identifies the shear rate required to go from a disordered state to an ordered state, while the second characteristic shear rate is interpreted as the shear rate necessary to produce a different ordered morphology.

Report on the Workshop on Manufacturing Polymer Composites by Liquid Molding. Held in Gaithersburg, Maryland on September 20-22, 1993.
R. S. Parnas, A. J. Salem, K. N. Kendall, and M. V. Bruschke. Feb 94, 284p, NISTIR-5373.
Prepared in cooperation with General Electric Corporate Research and Development, Schenectady, NY. and Ford Motor Co., Dearborn, MI.

Keywords: *Meetings, *Composite materials, *Molding techniques, *Composite fabrication, Permeability, Binders(Materials), Molding materials, Design, Mathematical models, Validation, Fiber composites, Reinforcing materials, Heat transfer, Rheology, Kinetics, *Liquid composite molding, Standard reference materials.

The report documents the workshop on manufacturing composites by liquid molding, held at NIST September 20-22, 1993. The workshop was jointly sponsored by NIST, Ford, and General Electric, and attracted a diverse international group of participants from Industry, University and government. Eight invited lectures were presented, and then the workshop divided into five discussion groups to focus on particular issues. A small number of critical issues were identified, including preform deformation inside and outside of the mold, high speed processing, and the establishment of standard reference materials, data, and test methods.

Pub. in Advanced Structural Inorganic Composites, p365-380 1991. Sponsored by Department of Energy, Washington, DC.

Keywords: *Ceramic matrix composites, *Creep properties, *Thermal degradation, *Structural components, Toughness, Failure(Mechanics), Whisker composites, Cavitation, Fracture(Mechanics), Mechanical properties, Reprints.

Ceramic matrix composites are being developed to improve the toughness of ceramics in structural applications. Modest success has been experienced in manufacturing ceramic matrix composites for which it is possible to double the room temperature toughness while still retaining the high strength of the untoughened material. As many of these new composites are expected to be used at high temperatures, their mechanical behavior at both high and low temperature must be characterized. In the paper, creep and creep rupture of both particulate and whisker reinforced ceramic matrix composites are discussed. Principal findings of experimental investigations on these materials indicate: (1) resistance to creep deformation is greater in compression than in tension; (2) the creep rupture lifetime follows a Monkman-Grant behavior in which the lifetime can be expressed as a power function of the steady state creep rate; (3) the principal mechanism of failure in creep is interfacial cavitation. Cavities nucleate at interfaces and then grow into full facet cavities. Failure occurs either by the growth or the linkage of these cavities to form critical size cracks in the composite.

Selection of Appropriate Ultrasonic System Components for NDE of Thick Polymer-Composites.
Final rept.
C. M. Fortunko, and D. W. Fitting. 1990, 8p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v10B 8p 1990.

Keywords: *Polymer matrix composites, *Ultrasonic flaw detection, *Test methods, Ultrasonic tests, Bandwidth, Construction materials, Transducers, Fibers, Polymers, Nondestructive tests, Pulse generators, Reprints.

In certain marine applications, thick polymer-composite materials may have to endure different operating environments than those experienced in traditional aerospace applications. In particular, structures made of such materials may experience very large compressive and bending forces. To prevent in-service failure, appropriate NDE methods and instrumentation are needed to characterize the state of the material. Specifically, in addition to detecting high-contrast anomalies (cracks and delaminations) it may be of interest to determine the pore content, measure the fiber volume, assess the severity of fiber waviness, and the like. The NDE requirements of thick marine composites cannot be met by using traditional ultrasonic instrumentation, particularly in the pulse-echo mode. For example, conventional ultrasonic instruments often lack features that permit effective pulse-echo operation below 1 MHz and have limited dynamic range. In this paper, we describe specific approaches that overcome the above limitations. Specifically, we describe a particularly effective transmit/receive circuit configuration that offers large dynamic range greater than 60 dB, wide bandwidth (100 kHz - 60 MHz), and fast recovery. We also describe the design of a very-low-noise, high-impedance input preamplifier. We found that this preamplifier is particularly useful for conditioning signals generated by very small ('phase insensitive') receiver transducers.

P. F. Becher, E. R. Fuller, and P. Angelini. 1991, 5p.
Pub. in Jnl. of the American Ceramic Society 74, n9 p2131-2135 1991.

Keywords: *Ceramic matrix composites, *Whisker composites, *Fracture strength, Composite materials, Reinforcing fibers, Silicon carbides, Aluminum oxide, Matrix materials, Grain size, Mechanical properties, Reprints.

The fracture toughness of whisker reinforced noncubic ceramic matrices increases with increase in matrix grain size, d, as well as increased whisker content. An analytical description for a grain bridging toughening contribution is derived which is combined with the whisker bridging contribution to describe the toughness of such composites. Results for SiC whisker reinforced alumina composites confirm the predicted d 1/2 dependence of the fracture toughness.

Interface Properties for Ceramic Composites from a Single Fiber Pull-Out Test.
Final rept.
E. P. Butler, E. R. Fuller, and H. M. Chan. 1990, 8p.
Pub. in Materials Research Society Symposia Proceedings, v170 p17-24 1990.

Keywords: *Ceramic matrix composites, *Interfaces, *Surface properties, *Fiber composites, Silicon carbides, Borosilicates, Friction measurement, Shear strength, Fracture properties, Thermal expansion, Reprints, *Pull-Out test.

An experimental approach has been developed using a single fiber pull-out test to measure the intrinsic materials properties of a ceramic composite interface. These properties are determined from the force-displacement curve, which is directly related to reinforcement toughening of composites via a fiber-debonding and frictional pull-out process. These interface properties were evaluated for a model composite system

of continuous SiC fibers with various surface treatments in a borosilicate glass matrix. For the processing conditions used the interface fracture toughness and the interface frictional shear resistance, were found to be 1.0 + or - 0.5 J/sq m and 3.3 + or - 0.6 MPa, respectivley, for as-received fibers. Experiments conducted with long embedded fiber lengths to be deconvolved into an interface friction coefficient of acid washed fibers has an increased interface toughness, 3.6 + or - 0.1 J/sq m, and friction coefficient, 0.08 + or - 0.02, but approximately the same initial clamping matrix thermal expansion mismatch and from measurements of the stress birefringence of glass were in general agreement with this value.

Generic Model for Creep Rupture Lifetime Estimation on Fibrous Ceramic Composites.
Final rept.
T. J. Chuang. 1992, 17p.
Contract NASA-C-82000-R
Pub. in Fracture Mechanics of Ceramics, v10 p441-457 1992. Sponsored by National Aeronautics and Space Administration, Cleveland, OH. Lewis Research Center.

Keywords: *Ceramic matrix composites, *Fiber composites, *Fracture mechanics, *Creep rapture strength, *Fatigue life, Crack initiation, Life(Durability), Ceramic fibers, Creep properties, Mechanical properties, Toughness, Reprints.

Because of their high strength and toughness at elevated temperatures, fiber reinforced ceramic composites have become potential candidates for the next generation of turbine engine materials for aerospace applications. A generic model is proposed for assessing lifetime of this class of materials when subjected to long-term creep rupture conditions. This two dimensional model consists of interfacial cracks growing beween square grains and rectangular fibers in the direction normal to the principal tensile stress axis. Neglecting transient effects, the total lifetime is derived based on the criterion that rupture is due to coalescence of adjacent cracks. It is found that lifetime is inversely proportional to crack growth rate, volume fraction, and aspect ratio of the fibers; but extremely sensitive to the applied stress owing to the high power of the V-K(sub I) law. This lifetime estimation seems to be in fair agreement with the creep rupture data of SiCw/Si3N4 composite with 0 and 30 vo1% reinforcement tested at 1250 C in air. Furthermore, TEM performed on the post crept specimens revealed that creep damage is predominantly in the form of microcracks at matrix/matrix as well as fiber/matrix interfaces, approximately in accord with the model simulation.

Asymmetric Tip Morphology of Creep Microcracks Growing Along Bimaterial Interfaces.
Final rept.
T. J. Chuang, J. L. Chu, and S. Lee. 1992, 9p.
Pub. in Acta Metall. Mater. 40, n10 p2683-2691 1992.

Keywords: *Microcracking, *Interfaces, *Crack propagation, *Composite materials, Elastic properties, Deformation, Diffusivity, Laminates, Morphology, Dihedral angle, Reprints, *Bimaterials.

The asymmetric tip morphology of a creep microcrack propagating along a bimaterial interface is presented based on the assumptions that the near-tip shapes are developed from surface diffusion controlled crack growth and that a steady state prevails. Following Chuang and Rice, a single master curve still can adequately describe the near-tip shapes to within 6% accuracy, but four cases of crack-tip morophology emerge depending on the ratio of surface to interfacial free energy and diffusivity of the adjoining phases. For fixed ratios of the two surface diffusivities, crack tip morphology maps in the space of specific surface energies are constructed with which areas associated with each individual case are indicated. Predicted cases on a set of bimaterial systems are tabulated and discussed. TEM photos of creep crack tips in alumina and silicon nitride are presented for illustration. The information given here is essential to a coupled analysis diffusion and elastic deformation at a composite interface which may ultimately yield predictions of the delamination rate between the reinforcing phase and the matrix phase as a function of applied stress, temperature and other relevant materials' constants.

Elastic Properties of Uniaxial-Fiber Reinforced Composites: General Features.
Final rept.
S. Datta, H. Ledbetter, and M. Lei. 1991, 6p.
Pub. in Nondestructive Evaluation and Material Properties of Advanced Materials, p23-28 1991.

Keywords: *Fiber composites, *Elastic properties, *Reinforcing fibers, Modulus of elasticity, Poisson ratio, Matrix materials, Fiber volume fraction, Reinforcing materials, Mechanical properties, Reprints, Scattered-plane-wave model, Ensemble-average model, Elastic constants.

The authors consider the complete set of elastic constants of composites comprising isotropic uniaxial fibers in an isotropic matrix. Such materials exhibit transverse-isotropic symmetry and five independent elastic constants, and the authors calculate and display all these constants over the entire fiber-volume-fraction range, 0.0-1.0. They also consider some practical elastic constants such as the principal Young moduli and the principal Poisson ratios. Except for one principal Poisson ratio, all other elastic constants show negative departures from a linear rule-of-mixture. Because one often uses sound velocities to study such materials, the authors give results for the four principal sound velocities.

Pub. in Wear 162-164, p314-321 1993.

Keywords: *Ceramic matrix composites, *Microstructure, *Wear tests, *Aluminum oxide, *Zirconium oxides, Mechanical properties, Lubrication, Particle size distribution, Environmental effects, Fractures(Materials), Reprints.

The mechanical properties of alumina ceramics can be improved by the addition of pure or partially stabilized zirconia particles. In the present study, the wear characteristics of zirconia-toughened alumina (ZTA) composites under a non-reactive fluid (paraffin oil) lubricated condition were investigated. The wear transition load (i.e. the load at which a rapid increase in wear occurs) increased with increasing zirconia content up to 20 vol.%. The transition from mild to fracture-controlled wear of ZTA depends on the material properties (e.g. hardness, elastic modules), the contact conditions (e.g. hertzian stress, coefficients of friction) and the microstructure of the material. The effect of the microstructure on wear was demonstrated and a Hall-Petch-type relationship between the microfracture stresses and the grain size was found. The effect of the grain size distribution on the wear transition load was also shown.

Pub. in Jnl. of Materials Science 26, n14 p3931-3939, 15 Jul 91.

Keywords: *Whisker composites, *Silicon nitrides, *Tensile creep, Tensile properties, Reinforcing fibers, Ceramics, Creep properties, Mechanical properties, Tensile deformation, Cavitation, Reprints.

In this paper we discuss the creep and creep rupture behavior of a grade of hot pressed silicon nitride reinforced with 30v/o SiC whiskers. The material was tested in both tension and compression at temperatures ranging from 1100 C to 1250 C for periods as long as 1000 hr. Principal findings were: (1) transient creep due to devitrification of the intergranular phase dominates high temperature creep behavior; (2) at high temperatures and stresses, cavitation at the whisker/silicon nitride interface enhances the creep rate and reduces the lifetime of the silicon nitride composite; (3) resistance to creep deformation is greater in compression than in tension; (4) the time to rupture is a power function of the creep rate, so that the temperature and stress dependence of the failure time is determined solely by the temperature and stress dependence of the creep rate.

Status of Electrocomposites.
Final rept.
C. E. Johnson, and M. Browning. 1990, 24p.
Pub. in Proceedings of the American Electroplaters and Surface Finishers Annual Technical Conference, Boston, MA., July 9-12, 1990, p1203-1226.

Keywords: *Electrochemistry, *Metal matrix composites, *Intermetallics, Coatings, Electrodeposition, Electroforming, Matrix materials, Hot pressing, Mechanical properties, Reprints.

This presentation is intended to discuss the current state of the art in the use of electrochemical techniques for the fabrication of metal and intermetallic matrix composites. Electroforming techniques are being evaluated for fabrication of near net-shape composite structures, for example, reusable rocket thrust chambers. Copper and nickel coated fibers are presently being used in polymer matrix composites for the pur-

pose of EMI shielding. If sufficiently thick, the coated fibers can be consolidated into metal matrix composites by hot pressing without the need for infusion of additional metal. Electrocoatings are also used as diffusion barriers to protect carbon fibers from degradation at high temperatures due to carbide formation and dissolution of carbon into the matrix alloy. Another use of electroplating is to provide improved fiber/matric interfacial adhesion. Multilayer fiber coatings (e.g. Fe/Cu/Al) can provide gradual transitions in the coefficient of thermal expansion and/or Young's modulus. These techniques can greatly improve the mechanical and thermal properties of the composites. Metal matrix composites which combine high stiffness and strength with low specific gravity are of particular interest in applications such as transportation (e.g. air and space craft, automobiles) and high speed machinery (e.g. textile machinery, drive shafts).

Thermal Expansion of an SiC Particle-Reinforced Aluminum Composite.
Final rept.
H. Ledbetter, and M. Austin. 1991, 9p.
Pub. in International Jnl. of Thermophysics 12, n4 p731-739 Jul 91.

Keywords: *Metal matrix composites, *Aluminum graphite composites, *Thermal expansion, Extensometers, Silicon carbides, Elastic properties, Microstructure, Single crystals, Thermophysical properties, Neutron diffraction, Reprints.

Using a push-rod dilatometer, we measured between 76 and 390 K the thermal expansion of a particle-reinforced-composite wrought plate obtained by powder-metallurgy methods. The particles, 30% by volume, consisted of monocrystals of alpha-SiC with sizes near 10 micrometers. The matrix consisted of a 6061 aluminum alloy with original particle sizes near 20 micrometers. We found the perpendicular thermal expansivity, alpha 3, higher by 26% than the in-plane thermal expansivity, alpha 1 approximately equal to alpha 2. These values differ from a rule-of-mixture prediction by -3 and -23%, respectively. All three alpha components lie outside the Rosen-Hashin bounds. Levin's isotropic model agrees within 10% with the alpha 1-alpha 2-alpha 3 average. Both the anisotropy and the bounds violation result from microstructural nonhomogeneity arising from processing. Rosen and Hashin's transverse-isotropic-symmetry relationships account approximately for these effects by introducing the anisotropic elastic constants. Using neutron diffraction, we determined that the SiC particles are textureless.

Pub. in Proceedings of Annual ASM/ESD Advanced Composites Conference (6th), Materials Park, OH., October 8-11, 1990, p637-644.

Keywords: *Process control(Industry), *Polymer matrix composites, *Curing, *Monitoring, *Nondestructive tests, Spectroscopy, Quality control, Real time operations, Inspection, Fluorescence, Ultrasonics, Reprints.

A driving force for implementation of on-line process control is the need to improve the efficiency and reliability of polymer composite processing. A critical element in process control is on-line process monitoring. This paper reviews and compares the most important techniques currently under development, i.e. dielectric, ultrasonic, optical and spectroscopic monitoring methods. A number of technical and scientific issues that must be addressed for these techniques to reach their full potential are identified. The chief technical barrier is to adapt the methods to operate in the harsh environment of a factory with industrial grade resin systems. The major scientific barrier is a need to improve our ability both to interpret the information provided by the sensor and translate this data into process control information. Although these issues are challenging, many programs are currently underway to address them so the future for on-line process control of composites looks very bright.

Keywords: *Polymers, *Glass transition temperature, *Composite materials, *Viscoelasticity, Stress relaxation, Mechanical properties, Mathematical models, Predictions, Performance tests, Temperature, Volume, Constitutive equations, Material clocks, Nonlinearity, National Institute of Standards and Technology.

The long term performance of polymers and their composites is an important aspect of their increasing use in engineering applications. Temporal, thermal, and mechanical stresses can all contribute to the deterioration of performance. Here we examine the concepts of the physics of glassy polymers and how they are important in developing constitutive equations that describe their volume/temperature/stress time response. The understanding of such response forms the basis of the prediction of long term performance.

Determination of Fiber-Matrix Interfacial Properties of Importance to Ceramic Composite Toughening.
Final rept.
E. R. Fuller, E. P. Butler, and W. C. Carter. 1991, 19p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Toughening Mechanisms in Quasi-Brittle Materials, p385-403 1991.

Keywords: *Ceramic composites, *Fiber composites, Mechanical properties, Interfaces, Silicon carbides, Borosilicate glass, Toughness, Shear strength, Reprints, *Debonding, *Single fiber pull-out test.

The fiber-matrix interface is investigated for its role during fiber debonding and pull-out and its effect on the toughening of ceramic composites. Possible interface debonding criteria (critical interface shear strength; interface toughness, or critical energy-release rate, and asperity interlock) are considered. The interfacial and mechanical properties of a model SiC-fiber, borosilicate-glass-matrix composite system are measured by a single fiber pull-out test. Initial stresses are determined by photoelastic methods.

Surface Energy Reduction in Fibrous Monotectic Structures.
Final rept.
A. C. Sandlin, and R. J. Schaefer. 1991, 6p.
Pub. in Metallurgical Transactions A 22, n8 p1881-1886 1991.

Keywords: *Surface energy, *Directional solidification(Crystals), *Monotectic alloys, *Metal matrix composites, Grain boundaries, Morphology, Lead alloys, Aluminum alloys, Copper alloys, Microstructure, Metal fibers, Reprints.

A study has been made of the morphology of directionally solidified Cu-Al-Pb monotectic alloys. The structure consisted of a hexagonal array of Pb rods in a Cu-based matrix. In addition, highly-curved grain boundaries in the Cu-based matrix with lens-shaped Pb fibers on the boundary and a 'denuded zone', depleted of Pb rods, were observed. Existence of these boundaries is shown to reduce the overall surface energy of the system leading to the formation of the highly-curved grain boundaries.

One- and Two-Sided Burning of Thermally Thin Materials.
Final rept.
T. Ohlemiller, and J. Shields. 1993, 8p.
Contract NLRC-C-32003-R
Sponsored by National Aeronautics and Space Administration, Cleveland, OH. Lewis Research Center.
Pub. in Fire and Materials 17, p103-110 1993.

Keywords: *Burning rate, *Composite materials, *Fire tests, *Flammability, Flame propagation, Temperature dependence, Heat flux, Fire safety, Combustion, Reprints.

The rate of heat release from a thermally thin material burning on both sides will be more than twice the value seen when only one side is burning. Two simplified models demonstrate that this is a consequence of the Arrhenius temperature dependence of the gasification rate of the solid. Experiments carried out on three composite materials over a range of incident heat fluxes confirm this effect. It is inferred that a further consequence of this heat release enhancement is an increased tendency for concurrent flame spread in the two-sided burning case. Materials whose application could lead to two-sided burning should thus be as-

sessed in this mode to obtain a true picture of their flammability potential.

Investigation into the Flammability Properties of Honeycomb Composites.
Special pub.
M. R. Nyden, and J. E. Brown. Oct 94, 23p, NISTIR-5509.

Keywords: *Polymers, *Composite materials, *Aircraft construction materials, *Flammability, *Aircraft fires, Fire resistant materials, Ignition, Burning rate, Honeycomb structures, Formaldehyde, Sandwich structures, Absorption spectra, Combustion, *Honeycomb composites.

The study, which is the subject of this report, was carried out in two stages. The objective of the first phase was to investigate the effect of electron beam irradiation and grafting on polymer flammability. The time to ignition and the rate-of-heat-release were measured for the combustion of a series of samples in which a fire resistant polymer was used to protect the surface of a more flammable polymer. The flammability properties of honeycomb composite materials, which are currently used in the interior cabin compartments of commercial aircraft, were examined in the second phase of this project. Analyses of the gases evolved during the thermal degradation of the components indicated that the phenol-formaldehyde resin makes a significant contribution to the flammability of these composites. The possibility that a more fire resistant formulation could be developed was examined by testing a series of resins which differed in the relative amounts of phenol and formaldehyde used in the reaction mixtures. The flammabilities of resins synthesized in excess phenol were measurably less than those synthesized in excess formaldehyde.

Measuring Matching Wear Scars on Balls and Flats.
Final rept.
E. P. Whitenton, and D. E. Deckman. 1989, 18p.
Pub. in Surface Topography 2, p205-222 1989.

Keywords: *Wear tests, *Aluminum oxides, *Profilometers, Profiles, Topography, Lubrication, Surface properties, Reprints, *Wear scars, Ball-on-three flat wear tests, Four-ball wear tests.

Four-ball and ball-on-three-flat wear tests are often performed to assess the tribological performance of lubricants and materials. Test results are described by the worn volume and or topography parameters of the balls or flats. As a general rule, relatively little effort goes into quantifying the wear scar of the top ball even though there is often useful information there. A computer-controlled profiling machine is described to measure the topography of the top ball and the bottom balls or flats. Several techniques are examined to turn this topographic information into useful parameters and aids for assessing the interaction between the balls or flats.

Creep Rupture of MoSi2/SiCp Composites.
Final rept.
J. D. French, S. M. Wiederhorn, and J. J. Petrovic. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v322 p203-208 1994.

Keywords: *Creep rupture strength, *Ceramic matrix composites, *Silicon carbides, Composite materials, Creep properties, Creep tests, Ductility, Molybdenum compounds, Reprints, *Molybdenum disilicide.

We studied the creep rupture of a series of MoSi2 materials reinforced with SiC particles. Particulate contents were in the range of O to 40 volume percent. Temperature and stress ranges were 1050 C to 1200 C and 10 MPa to 50 MPa, which gave failures ranging from 1 hour to 1500 hours. The creep curves show an extensive tertiary regime, accounting for 25-95% of the total lifetime. Tertiary creep increases with increasing stress and temperature. Cavitation occurs throughout the creep life, and tertiary creep is associated with the linkage of cavities into large cracks. The creep life improves with increasing SiC particle content, with a concurrent loss of creep ductility. Significant improvement occurs only when the particle content is greater than 30 volume percent. Our studies suggest that the creep and creep rupture behavior of MOSi2 can be further improved by increasing the content of SiC particles.

Residual Stresses in Aluminum-Mullite (alpha-Alumina) Composites.
Final rept.
D. Balzar, and H. Ledbetter. 1993, 9p.
Pub. in Advances in X-ray Analysis, p489-497 1993.

Keywords: *X-ray diffraction, *Metal matrix composites, *Residual stress, *Aluminum alloys, *Particulate reinforced composites, *Aluminum oxides, Strains, Matrix materials, Reinforcing materials, Anisotropy, Tensile properties, Reprints, Rietveld refinement.

We studied particle-reinforced 6061-aluminum-alloy composites with particle volume fractions ranging from 0 to 0.25. The mullite particles are approximately spherical and contain embedded alpha-alumina phase. We obtained lattice parameters of all three phases in the composites and starting materials by using Rietveld refinement of x-ray diffraction patterns. In all three phases stresses are tensile and approximately of the same magnitude, contradicting a requirement for mechanical equilibrium. Stresses increase with both increasing particle size and volume fraction. Measurements of extracted-from-composites particles showed no evidence of a possible chemical reaction at the matrix-particle interface. The matrix is (111) and (100) textured, but measurements of elastic constants reveal only small anisotropy. Thus, explanation of the mechanical-equilibrium violation remains uncertain.

Flat and Rising R-Curves for Elliptical Surface Cracks from Indentation and Superposed Flexure.
Final rept.
R. F. Krause. 1994, 7p.
Pub. in Jnl. of the American Ceramic Society 77, n1 p172-178 1994.

Keywords: *Whisker composites, *Aluminum oxides, *Silicon carbides, *Surface cracks, *Flexing, *Indentation, Fracture strength, Deformation, Stress intensity factors, Surface properties, Loads(Forces), Cracking(Fracturing), Defects, Reprints, *R-curves, *Superposed flexure.

Flat and rising R-curves, fracture resistance versus crack extension, were determined for a sintered 99% alpha-silicon carbide and for a hot-pressed composite of 25 wt% silicon carbide whiskers and alumina, respectively. The R-curves were evaluated from a combination of measured crack lengths, which were produced over a range of Vickers indentation loading, and of measured strengths, which were correlated either with the indentation flaws or with the most severe natural flaws or flexure specimens. A published analysis of the stress-intensity factor for a surface crack in flexure was interpreted to show that the crack front takes the form of a semiellipse where both the ratio of the minor to major radii and the configuration coefficient itself decrease with increasing crack extension. A power-law function of the indentation load was fitted to the product of an effective configuration coefficient and the flexural strength to evaluate the R-curves. When the configuration coefficient is assumed constant, a customary practice, the R-curves appear to have steeper rises. The assumed constancy of the coefficient of the indentation driving force may also have an effect on R-curves, but the effect would be much less.

Elastic Properties of Al2O3/Al Composites: Measurements and Modeling.
Final rept.
H. Ledbetter, and S. Datta. 1991, 6p.
Pub. in Damage and Oxidation Protection in High Temperature Composites AD, v25-2 p83-88 1991.

Keywords: *Metal matrix composites, *Elastic properties, *Particulate reinforced composites, Reinforcing materials, Composite materials, Aluminum oxides, Aluminum, Modulus of elasticity, Shear properties, Poisson ratio, Acoustic velocity, Reprints.

We considered seven Al2O3-particle-reinforced Al-matrix composites with particle volume fractions ranging from 0 to 0.24. At ambient temperature, we measured the elastic constants by two dynamic methods: kHz resonance and MHz pulse-echo-superposition. We report the usual elastic-constant set: bulk, shear, Young moduli, and Poisson ratio. The microstructures show a random distribution of spherical particles, from specimen to specimen ranging from 30 to 100 micrometers. The highest observed Young-modulus anisotropy was 1.04. To model this system, we used the long-wavelength limit of a plane-wave ensemble-average method. Measurements and modeling agree well: the average disagreement in the Young modulus is about one percent. As expected, except for the Poisson ratio, all measurements fall below a linear rule-of-mixture.

Keywords: *Porous materials, *Composite materials, *Resin transfer molding, *Flow distribution, *Preforms, Resin matrix composites, Fiber composites, Microparticles, Macromolecules, Permeability, Reprints.

Both experimental and modeling results are presented to convey the wide span of length scales over which flow in porous media can occur in a single material. Flow in such heterogeneous porous media are shown to be important in composites processing because the structure of fibrous reinforcements contains multiple length scales. Flow phenomena that arise due to material heterogeneity have been shown to include void formation and to explain the differences observed between measurements of the 'wet' permeability and the 'dry' permeability. The work presented indicates that the heterogeneous reinforcement structure may also contribute to the differences observed in permeability measurements carried out by the radial flow and the one-dimensional flow methods. The concept of heterogeneous porous media is also extended to the molecular level by considering the flow problem in a reinforcement sized with grafted macromolecules.

The VAMAS project is an international collaboration for prestandardization research. The participating countries are Canada, France, Germany, Italy, Japan, the United Kingdom, the United States, and the Commission of European Communities. Technical Working Area No. 3, Ceramics, has the objective of undertaking research on the reliability and reproducibility of test procedures for advanced technical ceramics. The Japan Fine Ceramics Center (JFCC) in 1988 organized a VAMAS round-robin to evaluate fracture toughness by three methods on two advanced ceramics. The three methods are schematically illustrated. Preliminary results from thirteen of the participating twenty-two laboratories have been previously reported. A comprehensive, more recent report with the results of the five United States laboratories has been prepared. The five USA laboratories were: NIST, NASA-Lewis, Worcester Polytechnic Institute, Allied-Signal, Norton-St. Gobain. The present paper highlights the principal results of the project.

J. L. Runyan, and S. J. Bennison. 1991, 7p.
Pub. in Jnl. of the European Ceramic Society 7, n2 p93-99 1991.

Keywords: *Particulate reinforced composites, *Aluminum oxide, *Fabrication, *Defects, *Ceramic composites, Composite materials, Ceramics, Crack propagation, Crack arrest, Grain structure, Microstructure, Reprints, *Aluminum titanates.

Fabrication and flaw tolerance properties of particulate aluminum-titanate-reinforced alumina composites have been studied. High-density (-99% theoretical) composites with controlled microstructures are readily produced via a conventional ceramics processing scheme utilizing starting powders of alpha-alumina and beta-aluminum titanate. Indentation-strength measurements demonstrate certain composites exhibit unusually pronounced flaw tolerance behavior. Direct observations of crack evolution from Vickers indentations during loading reveal strong stabilization of cracks with sizes in the millimeter range. It is concluded that this stabilization gives rise to the flaw tolerance properties and results from pronounced crack-resistance (R-curve) behavior. Grain-localized crack bridging is strongly active in this system and is believed to be a major contributor to the R-curve properties.

Elastic Green's Function for a Bimaterial Composite Solid Containing a Free Surface Normal to the Interface.
Final rept.
V. K. Tewary. 1991, 17p.
Pub. in Jnl. of Materials Research 6, n12 p2592-2608 1991.

Keywords: *Composite materials, *Greens function, Fracture(Mechanics), Stress analysis, Series(Mathematics), Numerical solution, Singularity, Anisotropy, Integrals, Cracks, Reprints, Hilbert problems, Free surfaces.

Elastic plane strain Green's function is calculated for an anisotropic bimaterial composite solid containing a free surface normal to the interface. An exact integral representation is obtained for the Green's function which is evaluated numerically. The integral is also evaluated analytically which gives a series representation for the Green's function. The singularities in the stress field associated with the presence of the free surface are identified and discussed. For the purpose of illustration, the formalism is applied to a cubic solid containing a Sigma-5 grain boundary.

Green's Function for Generalized Hilbert Problem for Cracks and Free Surfaces in Composite Materials.
Final rept.
V. K. Tewary. 1991, 7p.
Pub. in Jnl. of Materials Research 6, n12 p2585-2591 1991.

Keywords: *Composite materials, *Greens function, Vectors(Mathematics), Fracture mechanics, Stress analysis, Eigenfunctions, Cracks, Reprints, *Hilbert problems, Free surfaces.

Green's function for a generalized vector Hilbert problem is calculated which can be used to solve the Hilbert problem with any integrable inhomogeneity. The Green's function is obtained by using a complex transform defined by eigenfunctions of the homogeneous Hilbert problem. This method should be particularly convenient for the stress analysis of anisotropic composite materials containing cracks and free surfaces.

Creep and Creep Rupture of Ceramic Matrix Composites.
Final rept.
S. M. Wiederhorn. 1992, 26p.
Pub. in Flight-Vehicle Materials, Structures, and Dynamics: Assessment and Future Directions, v3 p239-264 1992.

Keywords: *Creep rupture strength, *Ceramic matrix composites, Matrix materials, Whisker composites, Creep properties, Aluminum oxides, Asymmetry, Ceramics, Silicon carbides, Silicon nitrides, Reprints.

Ceramic matrix composites are being developed to improve the toughness of ceramics in structural applications. As many of these new materials are expected to be used at high temperatures, their mechanical behavior at both high and low temperature must be characterized. In this paper, creep and creep rupture of both particulate and whisker reinforced ceramic matrix composites are discussed. Creep in these materials tends to be asymmetric, creep occurring faster in tension than in compression. Also, extended transient creep occurs for those materials that react with the air or undergo phase transformations. The creep rupture lifetime of ceramic matrix composites may be expressed as a power function of the creep rate regardless of load or test temperature, which implies that improvement in lifetime can be achieved solely by reducing the rate of creep in these materials. Structural use of these materials seems to be limited to about 1300 C at the present time.

Environmental Durability of Glass-Fiber Composites.
Final rept.
C. L. Schutte. 1994, 59p.
Pub. in Materials Science and Engineering R13, n7 p265-323, 15 Nov 94.

Keywords: *Environmental effects, *Fiber composites, *Polymer matrix composites, *Durability, Degradation, Polymer chemistry, Stress analysis, Moisture, Temperature, Reprints.

Durability of glass-fiber/polymer composites is dictated by the durability of the components: glass fiber, matrix, and the interface. Environmental attack by moisture, for example, can degrade the strength of the glass fiber; plasticize, swell, or microcrack the resin; and degrade the fiber/matrix interface by either chemical or mechanical attack. The relative rates of these degradation processes are a function of the chemistry of the resin, temperature, length of time of exposure, degree of stress (whether cyclic or static), chemistry and morphology of coating of coupling agent on the glass fiber, and type of glass fiber. Several examples illustrate how the chemistry and morphology of the coatings of coupling agents that are on the glass fiber influence the strength and durability of the interfacial region.

Geometrical Percolation Threshold of Overlapping Ellipsoids.
Final rept.
E. J. Garboczi, K. A. Snyder, J. F. Douglas, and M. R. Thorpe. 1995, 10p.
Pub. in Physical Review E, v52 n1 p819-828 Jul 95.

Keywords: *Percolation, *Composite materials, Porous materials, Ellipsoids, Shapes, Thresholds, Microstructure, Reprints.

A recurrent problem in material science is the prediction of the percolation threshold of suspensions and composites containing complex-shaped constituents. The authors consider an idealized material built up from freely overlapping objects randomly placed in a matrix, and numerically compute the geometrical percolation threshold p(sub c) where the objects first form a continuous phase. Ellipsoids of revolution, ranging from the extreme oblate limit of platelike particles to the extreme prolate limit of needlelike particles, are used to study the influence of object shape on the value of p(sub c). The reciprocal threshold 1/p(sub c)(p(sub c) equals the critical volume fraction occupied by the overlapping ellipsoids) is found to scale linearly with the ratio of the larger ellipsoid dimension to the smaller dimension in both the needle and plate limits.

Wear Transitions in Monolithic Alumina and Zirconia-Alumina Composites.
Final rept.
Y. S. Wang, C. He, B. J. Hockey, P. I. Lacey, and S. M. Hsu. 1994, 9p.
Pub. in Wear 181-183, p156-164 1995.

Keywords: *Aluminum oxide, *Zirconium oxides, *Composite materials, *Tribology, Wear, Microstructure, Grain size, Phase transformations, Residual stress, Ceramics, Toughness, Reprints.

The tribological properties of composite materials can be improved by its specially designed microstructure. Four zirconia-alumina composites (ZrO2-Al2O3) and a monolithic alumina were compared under paraffin oil lubricated wear test to investigate the effect of grain size, the residual stress and the phase transformation on the wear transitions. The tensile stress on the contact surface has been identified as the dominant stress which initiates the fracture wear of brittle materials. Wear transition occurs in the brittle materials when the tensile stress at the contact exceeds the critical value. The effect of zirconia content on the mean grain size of alumina and the wear transition resistance of the materials are presented.

Keywords: *Composite materials, *Offshore drilling, *Meetings, Petroleum industry, Fiberglass reinforced plastics, Fabrication, Construction, Safety, Tubes, Technology assessment, Research and development, Government policies.

The eight working group sessions focused on topics selected by the international steering committee of the workshop: (1) fabrication, construction, maintenance, and repair; (2) material performance, damage tolerance, durability, and environmental degradation; (3) structural design, optimization, testing, and reliability; (4) nondestructive evaluation; condition monitoring and inspection; (5) flammability and fire retardation; (6) facilities and secondary structural applications; (7) advanced applications; and (8) certification issues and policy concerns. In each group, leading experts, invited by the steering committee, made presentations and guided and stimulated the discussions. This proceedings describes the scope, the organization, and the program of the workshop. It contains a summary, recommendations reported by the steering committee representatives, invited lectures, keynote addresses, and most of the papers presented in the working-group sessions. Also included are a list of working-group chairs and panelists and their discussion summaries. A list of registered workshop participants is given at the end of this volume.

Intrinsic Viscosity and the Polarizability of Particles Having a Wide Range of Shapes.
Final rept.
J. F. Douglas, and E. J. Garboczi. 1995, 69p.
Pub. in Advances in Chemical Physics, vXCI p85-153 1995.

Keywords: *Mixtures, *Composite materials, *Solids, *Liquids, Shapes, Visocity, Polarization, Particles, Virial coefficients, Refractivity, Wave scattering, Reprints.

The intrinstic viscosity (Nu) and the electric alpha(sub e) and magnetic alpha(sub m) polarizabilities of objects having general shape are required in the calculation of some of the most basic properties (viscosity, refracture index, dielectric constant, magnetic permeability, thermal and electrical conductivity, and others) can often be expressed in terms of these functionals of object shape. These virial coefficients also provide basic input into effective medium theories describing higher concentration mixtures. We present an argument that the ratio of (Nu) and alpha(sub e) (the average electric polarizability tensor trace) is an invariant to a good approximation.

Cavitation Contributes Substantially to Tensile Creep in Silicon Nitride.
Final rept.
W. E. Luecke, S. M. Wiederhorn, B. J. Hockey, R. F. Krause, and G. G. Long. 1995, 12p.
Pub. in Jnl. of the American Chemical Society, v78 n8 p2085-2096 Mar 95.

Keywords: *Silicon nitride, *Tensile creep, *Cavitation, Dilation, Reprints.

During tensile creep of a hot isostatically pressed (HIPed) silicon nitride, the volume fraction of cavities increases linearly with strain; these cavities produce nearly all of the measured strain. In contrast, compressive creep in the same stress and temperature range produces very little cavitation. A stress exponent that increases with stress characterizes the tensile creep response, while the compressive creep response exhibits a stress dependence of unity. Futhermore, under the same stress and temperature, the material creeps nearly 100 times faster in tension than in compression. Transmission electron microscopy (TEM) indicates that the cavities formed during tensile creep occur in pockets of residual crystalline silicate phase located at silicon nitride multigrain junctions. Small-angle X-ray scattering (SAXS) from crept material quantifies the size distribution of cavities observed in TEM and demonstrates that cavity addition, rather than cavity growth, dominates the cavitation process. These observations are in accord with a model for creep based on the deformation of granular materials in which the microstructure must dilate for individual grains to slide past one another. During tensile creep the silicon nitride grains remain rigid; cavitation in the multigrain junctions allows nitride grain boundary sliding accommodates this expansion and leads to extension of the specimen. In compression, where cavitation is suppressed, deformation occurs by solution-reprecipitation of silicon nitride.

Modification of the Phase Stability of Polymer Blends by Diblock Copolymer Additivies.
Final rept.
J. Dudowicz, K. F. Freed, and J. F. Douglas. 1995, 12p.
Pub. in Macromolecules, n28 p2276-2287 1995.

Keywords: *Composite materials, *Polymer blends, Phase separation(Materials), Reprints, *Diblock copolymer additives.

The addition of a third component to a binary mixture usually alters the critical temperature and critical composition for phase seperation. In practice, these shifts can be large, leading to both increasing and decreasing of the phase stability of the mixture. Lattice cluster theory calculations show that the addition of a small amount of A-b-B dibock copolymer to an A/B polymer blend shifts the phase boundary as 'impurities' do in other fluid mixtures. The novel feature associated with the dilution of the blend by a diblock copolymer additive is that both stabilization and destabilization can be achieved for certain conditions merely by 'tuning' the asymmetry of the block lengths in the diblock copolymer. More substantial shifts are found in the phase diagram of a blend (polystyrene/poly(vinyl menthyl ether)) exhibiting a lower critical solution temperature. We also examine the relation between the shifts in the critical temperature and in the critical composition shift when the block copolymer is nearly symmetric, but no simple relation seems to exist for asymmetric diblock copolymers.

Mixing Plate-Like and Rod-Like Molecules with Solvent: A Test of Flory-Huggins Lattice Statistics.
E. A. Di Marzio, A. J. M. Yang, and S. C. Glotzer. 1995, 14p.
Prepared in cooperation with Armstrong World Industries, Lancaster, PA.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n2 p173-186 Mar/Apr 95.

Keywords: *Solvents, Lattice dynamics, Layered silicates, Liquid crystals, Flory Huggins theory, Discotic phase, Plate-rod transition, Rod-rod transition.

Boehm and Martire have shown that the Flory-Huggins (FH) lattice model applied to mixtures of squares and rigid rods in solvent on a two dimensional lattice gives different results depending on whether rods or squares are placed first onto the lattice. This correct derivation places the validity of the FH model itself into question since the final result should be independent of the order of placement. An analysis of the FH model in terms of Poisson statistics suggests an alternative formula for the probability of successfully placing a rectangle into an area partially filled with other rectangles, which when incorporated into the FH counting procedure gives the exact thermodynamic result for the tiling of squares (i.e., no solvent and no rods).

Unreacted Cement Content in Macro-Defect-Free Composites: Impact on Processing-Structure-Property Relations.
Final rept.
P. G. Desai, J. A. Lewis, and D. P. Bentz. 1994, 8p.
Pub. in Jnl. of Materials Science, v29 n24 p6445-6452 1994.

Keywords: *Cements, *Counstruction materials, Fracture(Mechanics), Reprints, Ceramic materials, Moisture, Physical properties, Defect analysis, Flexural properties, MDF(Macro defect-free) cements.

The effect of unreacted cement content on the processing, structure, and properties of macro-defect-free (MDF) composites fabricated from calcium aluminate cement (CAC), alpha-alumina (Al2O3), and polyvinyl alcohol-acetate (PVAA) has been investigated. Three systems were formed with inital CAC:Al2O3 ratios of 50:50, 35:65, and 25:75 by volume in their respective formulations. The amount of unreacted cement was reduced from 68.1 vol% which is present in standard (100% CAC) MDF cement, to 14.9 vol% for composites with an initial CAC: Al2O3 ratio of 25:75, while the hydration product content was reduced from 18.1 vol% to 11.4 vol% for these respective systems. A hard core/soft shell continuum percolation model was used to determine that alumina substitution did not significantly affect the percolative nature of the interphase and bulk polymer regions. However, experiments showed that the reduction in unreacted cement content through Al2O3 substitution affected both the processing and microstructural features of these composites.

Influence of an Impenetrable Interface on a Polymer Glass-Transition Temperature.
Final rept.
W. E. Wallace, J. H. van Zanten, and W. L. Wu. 1995, 4p.
Pub. in Physical Review E, v52 n4 pR3329-R3332 Oct 95.

Keywords: *Glass transition temperature, *Polymers, Substrate effects, Thermal expansion, Thin films, Reprints.

The thermal expansion of polystyrene thin films, supported on hydrogen-terminated silicon substrates, is measured by x-ray reflectivity. Films on the order of 400 Angstroms and thinner show no glass transition up to at least 60 degrees C above the bulk glass-transition temperature, while a break in the thickness versus temperature curve, signaling the glass transition and the onset of bulk behavior, is observed for thicker films. This increase in the glass-transition temperature is in contrast to similar studies on the silicon native-oxide surface where a decrease in the glass-transition temperature is observed. This illustrates the importance of the character of the substrate surface in determining thin film behavior.

Electrodeposited Cobalt-Tungsten as a Diffusion Barrier between Graphite Fibers and Nickel.
Final rept.
N. S. Wheeler, and D. S. Lashmore. 1995, 7p.
Pub. in Jnl. of Composites Technology and Research, v17 n4 p301-307 Oct 95.

Keywords: *Cobalt base alloys, *Composites, *Diffusion, Tungsten, Nickel, Coatings, Reprints.

An electrodeposited cobalt alloy coating have a composition of 7.1 plus or minus 0.8 at % tungsten was developed to serve as a diffusion barrier between graphite fibers and nickel. A nickel matrix was electrodeposited around the fibers, and the results composite was annealed in vacuum under various time/temperature conditions. The coating was shown to inhibit interdiffusion for up to 24 h at 800 degrees C. This represents an improvement of 200 degrees over the uncoated fibers.

Analysis of Transverse Flow in Aligned Fibrous Porous Media.
Final rept.
F. R. Phelan, and G. Wise. 1996, 10p.
Pub. in Composites Part A, v27A n1 p25-34 1996.

Keywords: *Fibrous porous media, *Porous media, Reprints, *Foreign technology, Darcy's law, Lubrication theory, Permeability prediction, Structure property relationships.

The permeability of preform materials used in liquid moulding proceses such as resin transfer moulding and structural reaction injection moulding is a complex function of weave pattern, packing characteristics, tow structure and intra-tow properties. The development of tools for predicting permeability as a function of these parameters is of great practical importance because such capability would speed process design and optimization, and provide a step towards establishing processing-performance relations. In this study, transverse flow in aligned fibrous porous media has been investigated. A semi-analytical model based on lubrication analysis is derived to predict the effect of tow shape and intra-tow permeability on the overall bed permeability for flow through rectangular arrays of porous elliptical cylinders. The Brinkman equation is used to model flow inside the porous structures, and the Stokes equation to model flow in the open media between the structures. The model predictions are verified by comparing with rigorous finite element calculations. The model shows that the influence of the intra-tow permeability on the overall bed permeability increases with inter-tow packing, and increasing degree of tow ellipticity. The influence is particularly critical for 'stacked' geometers for which previous models predict a zero permeability. A method for predicting intra-tow permeability is also proposed and investigated by comparing the model predications for overall bed permeability with some experimental data for flow in a model porous medium. The comparison shows that use of the method enables the experimentally measured permeability value to be properly bounded.

Estimation of the Orientation Distribution of Short-Fiber Composites Using Ultrasonic Velocities.
Final rept.
M. L. Dunn, and H. Ledbetter. 1996, 9p.
Pub. in Jnl. of the Acoustical Society of America, v99 n1 p283-291 Jan 96.

Keywords: *Composites, *Fiber reinforced composites, *Ultrasonic velocities, Reprints, Orientation distribution function, SiC/AL composite.

A method for estimating the orientation distribution function (ODF) of short-fiber composites using measured ultrasonic velocities is presented. The method is based on the coupling of (1) a forward micromechanics model of the effective ultrasonic velocities of the textured composite in terms of the coefficients in an expansion of the ODF in generalized spherical harmonics, (2) an inversion algorithm to obtain the coefficients of the ODF from the measured velocities and the forward model. The approach is used to determine the ODF coefficients for a transversely isotropic short-fiber SiC/Al metal-matrix composite. The ODF coefficients obtained by inversion of ultrasonic velocities agree reasonably with those obtained from neutron-diffraction pole figures. Corresponding elastic constants predicted with these coefficients also agree well with independently measured elastic constants.

Fracture of Silicon Nitride and Silicon Carbide at Elevated Temperatures.
Final rept.
S. M. Wiederhorn, A. B. Fields, and B. J. Hockey. 1994, 10p.
Pub. in Materials Science and Engineering, vA176 p51-60 1994.

Keywords: *Ceramic matrix composites, *Statistics, *Fracture(Mechanics), Silicon nitride, Silicon carbide, High temperature, Damage, Failure(Mechanics), Tension, Stresses, Strain(Mechanics), Reprints, *Foreign technology.

High temperature fracture of structural ceramics often results from creep and creep-related processes. Creep cavitation in particular plays an important role in the failure process, resulting in crack nucleation and crack growth prior to failure. Equations modeling cavitation and crack growth mechanisms are consistent with the Monkman-Grant behavior observed for structural ceramics. Both the mechanism of fracture and the mode of crack growth are affected by the test geometry. In flexure, cracks tend to remain stable because of stress relaxation near the tensile surface of test specimens. In tensile specimens, stress relaxation due to cavity formation occurs in the vicinity of crack tips. Intermittent crack growth results, in which the density of cavities at the crack tip has to reach a critical level for the occurrence of crack motion. Crack growth occurrs by microcrack nucleation and linkage with the dominant crack.

Hemispherical Test Fixture for Measuring the Wavefields Generated in an Anisotropic Solid.
Final rept.
D. W. Fitting, and C. M. Fortunko. 1991, 6p.
Pub. in Ultrasonics Symposium, Lake Buena Vista, Florida, December 8-11, 1991, p831-836.

Keywords: *Wave propagation, *Anistropy, *Solids, Directivity, Composite materials, Radiation, Patterns, Ultransonic tests, Reprints, Wavefields, Christoffel equation.

Recently, a closed-form representation for the exact solution of the Chirstoffel equation for wave propagation in an anisotropic solid has been derived. This development and the need to know the wavefield generated during ultrasonic inspection of composites has prompted the design and fabrication of an experimental system for measurement of wavefields in such materials. In the test fixture, a source transducer is affixed to the flat portion of a hemisphere of the anisotropic solid. A receiving transducer having a large field of view (FOV) is scanned over the surface of the hemisphere by a motorized C-arm, mapping out the wavefield generated in the specimen. The hemispherical shape of the test specimen permits scanning the wavefield over nearly a full 2pi solid angle, an improvement over the limited angular range afforded by a flat panel of the anisotropic solid. In this paper, the authors report the result of preliminary experiments designed to evaluate the fixture.

Orthotropic Elastic Constants of a Boron-Aluminum Fiber-Reinforced Composite: An Acoustic-Resonance-Spectroscopy Study.
Final rept.
H. Ledbetter, C. Fortunko, and P. Heyliger. 1995, 5p.
Pub. in Jnl. of Applied Physics, Chapter 78, v3 p1542-1546 Aug 95.

Keywords: *Composites, *Elastic constants, Model calculations, Reprints, Fiber reinforcements, Ultrasonic resonance spectroscopy.

Acoustic-resonance spectroscopy was used to determine the complete elastic constants of a uniaxial-fiber-reinforced metal-matrix composite: boron-aluminum. This material exhibits orthotropic macroscopic symmetry and, therefore, nine indepedent elastic stiffnesses Cij. The off-diagonal elastic constants (C12, C13, C23), which contain large errors when measured by conventional methods, were especially focused on. Good agreement emerged among present results, a previous pulse-echo study, and theoretical predictions using a plane-scattered-wave ensemble-average model. Attempts to measure the internal-friction 'tensor' failed.

Tensile Creep of Silicide Composites.
Final rept.
S. M. Wiederhorn, R. J. Gettings, D. E. Roberts, C. Ostertag, and J. J. Petrovic. 1992, 7p.
Pub. in Materials Science and Engineering, vA155 p209-215 1992.

Keywords: *Creep, *Silicides, *Composites, High temperatures, Tensile creep, Reprints, Molybdenum disilicide.

A study has been conducted on the creep behavior of a silicide composite consisting of 50 mol.% MoSi2 and WSi2 reinforced with SiC whiskers. Activation energies for creep in compression and tension were 312 kJ mol to the minus 1 power and 557 kJ mol to the minus 1 power respectively. Stress exponents for creep were 3.2 in tension and 2.3 in compression. These values lie within the range of values obtained by other investigators. The creep resistance of the composite is considerably better than that of current alloys used in heat engines. Most of this improvement comes from the addition of SiC whiskers to the base alloy. It is suggested that the addition of higher concentrations of whiskers or particles would result in additional improvement of the creep behavior of silicide composites.

Materials Aspects of Fiber-Reinforced Polymer Composites in Infrastructure.
J. W. Chin. Aug 96, 47p, NISTIR-5888.

Keywords: *Polymer composites, *Civil engineering, Retrofitting, Composite materials, Highway bridges, Corrosion, Beams(Supports), Maintenance, Reviews.

This paper provides a review of the technical literature pertaining to materials aspects of fiber-reinforced polymer (FRP) composites in infrastructural and other civil engineering applications. The main focus is placed upon the durability, chemical and mechanical aspects of structures reinforced with or constructed from FRP materials. Categories which are addressed include marine applications, structural shapes, joining/fastening, reinforced concrete and rehabilitation/retrofitting of structures. Effects of moisture, salt water, alkalinity and mechanical loading on the performance of FRP components are emphasized.

Composite Materials

Keywords: *Fluorescence, *Laser scattering, *Nanocomposites, *Vapor phase, In situ analysis, Mie imaging, Reprints, Iron oxide silica.

Planar laser-based imaging measurements of fluorescence and particle scattering have been obtained during flame synthesis of iron-oxide/silica superparamagnetic nanocomposites. The theory and application of laser-induced fluorescence, the spectroscopy of FeO(g), and the experimental approach for measurement of gas phase precursors to particle formation are discussed. The results show that the vapor phase FeO concentration rapidly rises at the primary reaction front of the flame and is very sensitive to the amount of precursor added, suggesting nucleation-controlled particle growth. The FeO vapor concentration in the main nucleation zone was found to be insensitive to the amount of silicon precursor injected, indicating that nucleation occurred independently for the iron and silicon components. Light scattering measurements indicate that nanocomposite particles sinter faster than single component silica, in agreement with TEM measurements.

Modeling Polarization Curves and Impedance Spectra for Simple Electrode Systems.
Final rept.
U. Bertocci, and R. E. Ricker. 1992, 19p.
Pub. in Proceedings of Symposium on Computer Modeling for Corrosion, San Antonio, TX., November 12-13, 1990, n1154 p143-161 1992.

Keywords: *Electrochemical corrosion, *Electrodes, *Impedance, *Electrolytic polarization, *Spectrum analysis, Models, Steady states, Impedance measurement, Reprints.

A method for modeling the behavior of electrochemical systems based on electrode kinetics instead of equivalent circuits is developed and examples of the application of this modeling method to three electrochemical systems are presented. It is shown that the behavior of simple, as well as relatively complex, electrochemical systems can be modeled on desktop computers yielding impedance spectra as a function of input quantities that describe steady state electrode kinetics and the electrode potential. This approach, since it is based on quantities that describe the kinetics of the actual processes that occur at the electrode, has the advantage over other approaches of having a built-in physical interpretation. The impedance plots produced in this way can give a feeling of what to expect experimentally, and can be useful in testing hypotheses, in establishing reasonable ranges for quantities not easily accessible to measurement, and in suggesting experimental strategies.

Relation between AC Impedance Data and Degradation of Coated Steel. 1. Effects of Surface Roughness and Contamination on the Corrosion Behavior of Epoxy Coated Steel.
Final rept.
C. Lin, T. Nguyen, and M. McKnight. 1992, 18p.
Pub. in Progress in Organic Coatings 20, n2 p169-186 1992.

Keywords: *Surface roughness, *Degradation, *Corrosion, *Steels, *Epoxy resins, *Contamination, Substrates, Protective coatings, Environment effects, Organic compounds, Reprints, AC impedance spectroscopy.

The effects of surface roughness and contamination on the corrosion behaviors of epoxy coated steel substrate were investigated using AC impedance spectroscopy. The results of the AC impedance spectroscopy were analyzed using equivalent circuit model to discern the different steps of the corrosion processes of coated steel. Two kinds of corrosion of coated steel, which can be discerned by AC impedance spectroscopy, were observed depending on surface treatment. The area of coating deficiency that causes rapid corrosion of coated metal could be calculated accurately from the AC impedance data as verified by scanning electron microscopy (SEM) and computer image analyses. Interpretations for the experimental results were suggested and the factors dominating the protective properties of an organic coating were discussed.

Interaction between Dislocations and Intergranular Cracks.
Final rept.
H. Zhang, A. H. King, and R. Thomson. 1991, 10p.
Pub. in Jnl. of Materials Research 6, n2 p314-323 1991.

Keywords: *Dislocations(Materials), *Intergranular corrosion, *Emission, Isotropic media, Crack propagation, Cracking(Fracturing), Surface properties, Crack tips, Reprints.

The elastic interactions of dislocations and intergranular cracks in isotropic materials have been studied. In the first part of the paper, a model based on Rice-Thomson theory is established under which the conditions for dislocation emission and crack propagation can be described in terms of an emission surface, cleavage surface and loading line in the local k-space associated with a mixed mode intergranular crack. For a given crack, the local k-field changes with the emission of dislocations from the crack tip, which alters the balance of cleavage and emission. In the second part, we present experimental results of in situ TEM observation of intergranular cracks in molybdenum. Alternating brittle crack propagation and dislocation emission is observed. The number of emitted dislocations corresponding to each crack propagation is in good agreement with the calculated values.

Evidence of Film-Induced Cleavage by Electrodeposited Rhodium.
Final rept.
R. E. Ricker, J. L. Fink, and E. Escalante. 1993, 7p.
Pub. in Corrosion-Deformation Interactions, p734-740 1993.

Keywords: *Stress corrosion cracking, *Cleavage, *Electrodeposition, *Rhodium, Crack tips, Fracture(Mechanics), Brittleness, Crack propagation, Metal powder, Cracking(Fracturing), Reprints.

Transgranular stress corrosion cracking (T-SCC) has been the subject of numerous investigations, but there is no universally accepted mechanism for this form of crack propagation. One of the mechanisms that has been proposed for T-SCC is film induced cleavage. According to this mechanism, T-SCC cracks propagate by discontinuous micro-cleavage initiated by the corrosion films that form at the crack tip. A critical hypothesis in this postulated mechanism is that when the crack in the surface layer reaches the matrix, it will continue to propagate in a brittle manner in the normally ductile matrix for some distance before it arrests. The objective of this work was to unambiguously evaluate this hypothesis by electrodepositing Rh, a metal which normally cleaves at room temperature, on samples of pure Ni, which does not normally cleave, and then deform these samples and examine the resulting cracks and the morphology of the cracks at the Rh/Ni interface.

Sorption of Moisture on Epoxy and Alkyd Free Films and Coated Steel Panels.
Final rept.
H. N. Rosen, and J. W. Martin. 1991, 9p.
Pub. in Jnl. of Coatings Technology 63, n792 p85-93 Jan 91.

Keywords: *Sorption, *Moisture, *Protective coatings, *Steels, *Corrosion, Degradation, Corrosion inhibition, Diffusion, Moisture content, Isotherms, Humidity, Corrosion prevention, Epoxy compounds, Reprints.

Adsorption isotherm curves at 23 C were determined for alkyd and epoxy free films and coated steel panels as well as for alkyd 'pocket' panels, consisting of an unadhered film surrounding steel panels. The isotherms consisted of a linear portion to about 75% relative humidity (RH) followed by a rapidly rising portion to 100% RH. A model assuming weak bonding forces between paint film and water with microvoid condensation at high RH gave an excellent fit to the data. Transient adsorption and desorption data on the approach to equilibrium conditions showed differences between alkyd and epoxy coatings. Surface boundary layer resistance was significant for alkyd films and sorption followed Fickian models. For the epoxy coating, surface resistance was not significant and moisture movement was non-Fickian.

Water Permeability and Chloride Ion Diffusion in Portland Cement Mortars: Relationship to Sand Content and Critical Pore Diameter.
Final rept.
P. Halamickova, R. J. Detweiler, D. P. Bentz, and E. J. Garboczi. 1995, 13p.
Pub. in Cement and Concrete Research, v25 n4 p790-802 1995.

Keywords: *Porosity, *Mortars(Material), *Portland cements, Interfaces, Construction materials, Diffusion, Ions, Chlorides, Percolation, Permeability, Cements, Sands, Reprints, Mercury intrusion porosimetry, Pore structure.

The pore structure of hydrated cement in mortar and concrete is quite different from that of neat cement

paste. The porous transition zones formed at the aggregate-paste interfaces affect the pore size distribution. The effect of the sand content on the development of pore structure, the permeability to water, and the diffusivity of chloride ions was studied on portland cement mortars. Mortars of two water-to-cement ratios and three sand volume fractions were cast together with pastes and tested at degrees of hydration ranging from 45 to 70%. An electrically-accelerated concentration cell test was used to determine the coefficient of chloride ion diffusion while a high pressure permeability cell was employed to assess liquid permeability. The data set provides an opportunity to directly examine the application of the Katz-Thompson relationship to cement-based materials.

Localization Model of Rubber Elasticity: Comparison with Torsional Data for Natural Rubber Networks in the Dry State.
Final rept.
G. B. McKenna, J. F. Douglas, K. M. Flynn, and Y. Chen. 1991, 7p.
Pub. in Polymer 32, n12 p2128-2134 1991.

Keywords: *Natural rubber, *Elastic properties, *Crosslinking, Strain energy methods, Vulcanizing, Elastomers, Thermodynamics, Free energy, Plastic analysis, Torsion, Networks, Reprints, Gaylord-Douglas Localization Model, Free energy density function.

Previously reported results from determinations of the first derivative of the elastic contribution to the free energy density function for dicumyl peroxide crosslinked natural rubber were analyzed within the context of the Gaylord-Douglas 'localization model' of rubber elasticity. It was found that the dry state properties of the rubbers are well described by the localization model and that the non-classical contribution to rubber elasticity arising from the confinement of network chains by surrounding chains varies according to the theory. The only other parameter in the model, the prefactor to a classical term, was set to the classical phantom value assuming a tetrafunctional network and that each dicumyl peroxide molecule decomposed to form one crosslink.

Pub. in Ceramic Engineering and Science Proceedings 11, n9-10 p1674-1684 1990.

Keywords: *Ceramic fibers, *Silicon carbides, *Ceramic composites, *Deposition, Composite materials, Colloids, Surface chemistry, Aluminum oxide, Fiber composites, Powder(Particles), Reprints.

A process for coating silicon carbide fibers with alumina particulates for control of interface characteristics in the sintering of fiber reinforced composites is described. The process is based on colloidal slurry processing techniques, in which the fibers are allowed to take up a positive surface charge, while the alumina particles are imparted a negative surface charge. When the oppositely charged fibers and particles are brought together, the particles deposit on the surface of fibers. Some unique features of the process, as well as characteristics of the resultant coating are described. Process variables of the coating technique that control the coating morphology, thickness and adherence to the fiber are examined.

Effect of Heterogeneous Porous Media on Mold Filling in Resin Transfer Molding.
Final rept.
R. S. Parnas, and F. R. Phelan. 1991, 8p.
Pub. in Society for the Advancement of Material and Process Engineers Quarterly 22, n2 p53-60 Jan 91.

Keywords: *Fluid flow, *Resin transfer molding, *Molding techniques, *Flow characteristics, *Fibers, Preforms, Porous media, Permeability, Curing, Polymers, Heterogeneity, Bundles, Reprints.

A model for fluid flow in the resin transfer molding (RTM) process is developed. The model takes into account two competing flow processes which occur simultaneously: the macroscopic flow of the resin through the preform and the impregnation of the individual fiber bundles which make up the preform. The model predicts the entrapment of air in the fiber bundles and the subsequent formation of voids in the cured part. In addition, the competition between the two flow processes leads to transient phenomena in which mold inlet pressure continues to rise even after the flow front has reached the outlet of the mold. This result agrees qualitatively with experimental data and has implications regarding the use of D'Arcy's law to model transient mold filling processes with heterogeneous preforms.

A prototype application protocol for ready-to-wear pattern making was developed for the communication of pattern pieces and related information between various computer aided design (CAD) systems. The basic methodology for the application protocol is the Standard for the Exchange of Product Model Data (STEP). STEP is an emerging international standard, the result of an effort to develop a mechanism for digitally representing the physical and functional characteristics of a product throughout the product's life cycle. The STEP application protocol addresses a specific application area and contains an information model written in the conceptual modeling language EXPRESS. The experience gained through the implementation of the prototype application protocol and recommendations received from apparel researchers provided us useful input to improve the prototype application protocol. The report presents a revised version of the information model using both the EXPRESS language and the EXPRESS-G graphical notation. An application activity model that defines the scope and information requirements of the prototype application protocol is also presented in this report. Neither the EXPRESS-G diagrams nor the application activity model was shown in the original prototype application protocol report.

Survey of Standards for the U.S. Fiber/Textile/Apparel Industry.
C. G. Pawlak. Apr 96, 94p, NISTIR-5823.
See also PB93-139095.

Keywords: *Textile industry, *Clothing industry, *Surveys, *Technology utilization, Design standards, Fibers, Textiles, Test methods, Industries, Integration systems, Standards, Specifications, *Apparel clothing.

The report documents a survey of standards relevant to the U.S. Fiber/Textile/Apparel (FTA) industry. The standards are discussed in four main groups--integration standards, test methods, quality standards, and standard reference data and materials. The Appendix of the report lists the titles of all standards found, grouped together by the organization responsible for them. Those organizations are also listed along with contact information for them. The report attempts to bring together useful information concerning FTA standards as a starting point to support the industry in intelligently planning future standards' development efforts.

Characterization of the Hydrogen Induced Cold Cracking Susceptibility at Simulated Weld Zones in HSLA-100 Steel.
M. R. Stoudt, and R. E. Ricker. Apr 94, 73p, NISTIR-5408.

Keywords: *Welding, *Cracks, *Low alloy steels, Simulation, Hydrogen, Navy, Microstructure, Martensite, Carbon, Precipitation, Strength(Mechanics), Toughness, Hardening, Mechanical properties, Strain(Mechanics), Sea water, Corrosion, Electrochemistry, *HY-100 Steel, *HSLA-100 Steel, Characterization, Fugacities, HY(High Yield), HSLA(High Strength Low Alloy), Susceptibility.

The relative susceptibilities to hydrogen induced cold cracking were evaluated for HY-100, a steel presently in service in naval applications and for HSLA-100. The martensitic microstructure of the HY-100 undergoes wide variations in the heat affected zone during welding which strongly influence the resistance of that alloy to cold cracking. The HSLA-100, a low carbon, precipitation hardened steel with similar strength and toughness to that of the HY-100, possesses a significantly lower degree of hardenability which results in minimal microstructural variations in the heat affected zone under the same simulated welding conditions. The mechanical properties of the base metal and the heat affected zone created during a simulated, single welding pass were characterized by the slow strain rate technique for both steels in an inert environment and in artificial seawater under free corrosion and controlled hydrogen fugacities. The electrochemical behaviors of both steels were also evaluated in artificial seawater.

Monte Carlo and Mean-Field Calculations of the Magnetocaloric Effect of Ferromagnetically Interacting Clusters.
Final rept.
L. H. Bennett, R. D. McMichael, L. J. Swartzendruber, R. D. Shull, and R. E. Watson.
1992, 2p.
Pub. in Jnl. of Magnetism and Magnetic Materials 104-107, p1094-1095 1992. See also DE91014792.

Keywords: *Ferromagnetic materials, *Monte Carlo method, *Curie temperature, *Magnetic properties, Magnetic moments, Entropy, Solid clusters, Ferromagnetism, Mean-field theory, Reprints, *Magnetocaloric effect.

The magnetic entropy change of a ferromagnet induced by an application of a magnetic field is greatest in the temperature region near the Curie point, and the magnitude of the effect is expected to rise monotonically with the size of the individual moments which make up the material. The authors explore the case of nanocomposite materials with ferromagnetically interacting clusters having large cluster magnetic moments as a function of cluster size. As cluster size increases, both Monte Carlo and mean-field calculations show a decrease in the entropy change at T(c) for a given applied field and constant total magnetic moment, and an increase in the entropy change well above T(c). In addition, for the first time, the authors present a comparison of the results of mean-field and Monte Carlo calculations of the magnetocaloric effect in classical Heisenberg ferromagnets. Previous calculations of the magnetocaloric effect have taken the mean-field approach, which is known to underestimate the spontaneous magnetization below T(c). These issues are relevant to devices employing magnetic refrigeration.

PC-Based Prototype Expert System for Data Management and Analysis of Creep and Fatigue of Selected Materials at Elevated Temperatures.
Final rept.
J. T. Fong, and B. Bernstein. 1990, 4p.
Pub. in Proceedings of International Conference on Computer Applications to Materials Science and Engineering, CAMSE-'90, Tokyo, August 1990 p65-68. Sponsored by Illinois Inst. of Tech., Chicago.

Keywords: *Creep properties, *Expert systems, *Data management, *Fatigue(Mechanics), *Stainless steel, *High temperature, Data bases, Mechanical properties, Algorithms, Stresses, Strains, Information systems, Viscoelasticity, Computer programs, Materials, Fatigue life, Reprints, LPA PROLOG Professional Computer Program, CFD Expert System.

An engineering expert system named CFD for storing, analyzing, and assessing experimental data of the creep and fatigue properties of a class of structural materials at elevated temperatures is presented. The system is coded in micro-PROLOG, a PC version (1.4) of a commercially-available software named LAP PROLOG Professional and is implemented on an IBM-PC-XT or compatible with DOS 2.11 or up. The system is menu-driven and is designed to assist a computer-unsophisticated user in managing creep and fatigue data for a variety of materials at various temperature, stress or strain levels. To illustrate the feasibility of this prototype system, selected data of AISI 304 stainless steel (fatigue life vs. hold time at 593 C) and AISI 316 stainless steel (stress relaxation test at 700 C) are examined and plotted. Based on the linear theory of viscoelasticity, the stress relaxation data are used to predict creep properties using a numerical algorithm due to Hopkins and Hamming (1957).

Nitrogen Effect on Elastic Constants of f.c.c. Fe-18Cr-19Mn Alloys.
Final rept.
S. Lin, and H. Ledbetter. 1993, 5p.
Pub. in Materials Science and Engineering A167, p81-85 1993. Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Keywords: Iron base alloys, Chromium alloys, Manganese alloys, Bulk modulus, Elastic properties, FCC lattices, Interstitials, Nitrogen, Reprints, *Iron alloy 18Cr 19Mn.

Previously, the authors studied the effects of interstitial carbon-plus-nitrogen (C + N) on the elastic constants of f.c.c. Fe-18Cr-10Ni-1Mn alloys. Consistent with a volume increase, all the elastic stiffnesses decrease with increasing C + N. The present alloys show different behavior: although volume increases, interstitial nitrogen atoms increase the bulk modulus. The peculiar bulk-modulus-electron-concentration behavior (B vs. n(sub e) of 3d electron elements is described. At first B increases with increasing n(sub e); beyond a critical concentration, B decreases rapidly. Application of Ducastelle's model (bandstructure and repulsion energies) shows that interstitial nitrogen increases the bandstructure contribution to the bulk modulus.

Microstructure and Tensile Properties of Microalloyed Steel Forgings.
Final rept.
P. T. Purtscher, and Y. W. Cheng. 1993, 10p.
Pub. in Proceedings of Iron and Steel Society's Mechanical Working Conference, Montreal, Canada, October 1992, p331-340 1993.

Keywords: *Steels, *Tensile properties, *Microstructure, *Forging, Austenite, Ferrites, Deformation, Metalworking, Strain rate, Grain size, Hardness, Mechanical properties, Simulation, Cooling, Pearlite, Automotive components, Reprints, *Microalloying.

Forging is studied by thermomechanical simulation of the process variables on the microstructure, hardness, and tensile properties of medium-C, ferrite plus pearlite steel with V or Nb additions, steels used for forged automotive components. Experiments were carried out on a test machine with a load capacity of 500kN and capable of high strain rates. The prior austenite grain size increases as the reheat temperature goes up from 950 to 1210 C and decreases with applied strain up 50%. The prior austenite grain size of the Nb- and V-treated steels are nearly equal. As the cooling rate after deformation decreases from 1.9 to 0.8 C/s, the ferrite content increases. Deformation reduces the prior austenite grain size and increases the ferrite content. The hardness, yield, ultimate, and fracture stresses are not a strong function of reheating and deformation temperature or strain, but are lowered by about 10% when the cooling rate is reduced.

Effect of Backfill and Atomizing Gas on the Powder Porosity and Mechanical Properties of 304L Stainless Steel.
Final rept.
G. M. Janowski, F. S. Biancaniello, G. E. Hicho, R. J. Fields, and S. D. Ridder. 1993, 6p.
Pub. in P/M in Aerospace, Defense and Demanding Applications, p363-370 1993.

Keywords: *Stainless steel-304L, *Powder metallurgy, *Porosity, *Mechanical properties, Austenitic steels, Atomization, Argon, Nitrogen, Particle size distribution, Reprints, Backfill gas.

A series of nitrogenated austenitic stainless steels was produced by gas atomization and HIP consolidation using various combinations of nitrogen and argon as the melt chamber backfill gas and as the atomizing gas. Analysis of the gas-only flow patterns and the physical properties of nitrogen and argon suggest that their atomization behavior should be quite comparable. The similar particle size distributions support this hypothesis and indicate that the liquid metal ligament and sheet break-up were unaffected by gas type. It was found that the nitrogen content of the powder was largely controlled by the backfill gas and that the fraction of hollow particles was determined by the atomization gas. The nitrogen content of the standard 304L alloy was 0.15 wt % when processed using nitrogen for both backfilling and atomizing, and a modified version of 304L with 23 wt % Cr contained 0.21 wt % nitrogen when processed in the same manner. Hardness, yield strength, and the ultimate tensile strength of the HIP consolidated powders were improved with the addition of nitrogen while retaining significant tensile elongation (about 40%).

Langevin Approach to Hysteresis and Barkhausen Modeling in Steel.
Final rept.
R. D. McMichael, L. J. Swartzendruber, and L. H. Bennett. 15 May 93, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p5848-5850, 15 May 93.

Keywords: *Carbon steels, *Hysteresis, *Barkhausen effect, Stochostic processes, Electromagnetism, Rolling(Metallurgy), Ferromagnetic materials, Magnetic properties, Metastable state, Reprints.

To represent the multiplicity of metastable states in a bulk ferromagnetic material with domain-wall pinning effects, fluctuations in the domain-wall energies are described in terms of an ensemble of stochastic Langevin functions. The model parameters used are a correlation length, a rms value for the amplitude of the fluctuations in the domain-wall energy gradient, and a 'demagnetizing factor.' The model generates both hysteresis loops and Barkhausen effect (BE) jump size distributions. Jump size distributions were determined experimentally for low-carbon rolled sheet steel with the field applied both parallel and perpendicular to the rolling direction. Both the model and the experimental BE jump size distributions show a power-law behavior for small jumps and a rapid cutoff at large jump sizes.

Hot-Deformation Apparatus for Thermomechanical Processing Simulation.
Final rept.
Y. W. Cheng, and H. I. McHenry. 1988, 8p.
Pub. in Proceedings of International Symposium on Physical Simulation of Welding, Hot Forming, and Continuous Casting, Canada, p1-8 1988.

Keywords: *Hot working, *Quenching(Cooling), *Thermomechanical treatments, *Simulation, Reprints, Hardening(Materials), Heat treatment, High strength steels, Microstructure, Deformation, *Thermomechanical processing, *Steel-ASTM-A710.

A hot-deformation apparatus designed to simulate thermomechanical processing of steel plates is described, and some initial results for a study on controlled rolling followed by direct quenching (CR-DQ) of ASTM A710 steel are presented. The apparatus has the following features: a servohydraulic load frame with a 250 kN capacity in tension or compression; a variable-actuator traveling speed up to 500 mm/s; a multiple-strike capability with controllable displacements and strain rates; a maximum heating rate of 150 deg. C/s with a 10 kW induction heater (for a cylindrical steel specimen mm in diameter and 18 mm in height); a maximum cooling rate of 25 deg C/s with helium-gas cooling; and vacuum to 1.33 x 10(exp-3) Pa (1 x 10 (exp-5) torr) within 25 min. Experimental results indicated that the hardenability of the steel increased with a simplified CR/DQ processing. The CR/DQ processed specimens showed variation of microstructure within the specimen due to nonuniform deformation during compression. Mechanisms that contributed to the increase of hardenability are discussed.

Determination of the Prior-Austenitic Grain Size of Selected Steels Using a Molten Glass Etch.
Final rept.
G. E. Hicho, L. C. Smith, C. A. Handwerker, and D. A. Kauffman. 1991, 11p.
Pub. in Jnl. of Heat Treating 9, n1 p37-47 1991.

Keywords: *Austenitic stainless steels, *Grain size, *Heat treatment, Microstructure, Austenite, Precipitates, Etching, Glass, Grain boundaries, Reprints.

A hot etching procedure was used to reveal the prior-austenitic grain size of several steels. Etching experiments, using molten glass, were conducted on a HSLA precipitation hardened steel, two alloy steels, and a control-rolled steel. Experiments were also conducted

on the HSLA precipitation hardenable steel in order to determine the effects of prolonged heating on the austenite grain size. For comparison purposes, the austenite grain size of the HSLA precipitation hardenable steel, as a function of temperature, was determined using a hot-stage microscope. Photomicrographs of the various steels showing the microstructures obtained using chemical etchants are also presented. A comparison of prior-austenitic grain sizes which were determined using the molten glass etch and chemical etches is shown.

Beneficial Effects of Nitrogen Atomization on an Austenitic Stainless Steel.
Final rept.
G. M. Janowski, F. S. Biancaniello, and S. D. Ridder. 1992, 10p.
Pub. in Metallurgical Transactions A 23A, p3263-3272 Dec 92.

Keywords: *Austenitic stainless steels, *Atomization, *Nitrogen, Copper alloys, Hardness, Powder metallurgy, Porosity, Hot pressing, Nickel alloys, Reprints.

Fully dense nitrogenated austenitic stainless steels were produced by gas atomization and HIP consolidation. The base alloy, 304L, contained about 0.15 weight percent nitrogen when melted under a nitrogen atmosphere, and a modified version of 304L with 23 weight percent Cr contained 0.21 weight percent nitrogen. A series of experiments using various combinations of N2 and Ar as the melt chamber backfill gas and atomizing gas demonstrated that the nitrogen content of the powder was largely controlled by the backfill gas and that the fraction of hollow particles was determined by the atomization gas. The hollow powder particles, which are common in inert-gas atomized materials, were virtually eliminated in the nitrogen atomized powders. Additional atomizing experiments using copper and a nickel-base superalloy indicate that low gas solubility in the metal leads to gas entrapment. Hardness and compression behavior (yield strength and flow stress) are substantially improved with the addition of nitrogen. The results of this study suggest that the properties of nitrogenated stainless steels fabricated in this manner are comparable to other high nitrogen austenitic alloys.

Dynamics vs. Static Young's Moduli: A Case Study.
Final rept.
H. Ledbetter. 1993, 2p.
Pub. in Materials Science and Engineering A165, pL9-L10 1993.

Keywords: *Austenitic stainless steels, *Dynamic modulus of elasticity, *Modulus of elasticity, Static tests, Dynamic tests, Mechanical properties, Uncertainty, Elastic properties, Case studies, Reprints.

For one material, a 316LN austenitic steel, a comparison is made between the Young's modulus measured statically with usual commercial equipment and that measured dynamically at mega-hertz frequencies. The first gives a + or - 6% uncertainty; the second a + or - 0.5% uncertainty. The two Young's moduli, 207 GPa (static) and 202 GPa (dynamic), agree within the statistical bounds of the static measurement, 195 GPa and 219 GPa, the extreme static values being 178 GPa and 229 GPa. Simple thermodynamics that shows the difference between dynamic and static elastic constants is also presented.

Cast-Iron Elastic Constants: Effect of Graphite Aspect Ratio.
Final rept.
H. Ledbetter, and S. Datta. 1992, 4p.
Pub. in Zeitschrift fuer Metallkunde 83, n3 p195-198 1992.

Keywords: *Cast iron, *Elastic properties, Bulk modulus, Shear modulus, Young modulus, Aspect ratio, Poisson ratio, Graphite, Reprints, Scattered plane wave method.

Using a scattered-plane-wave ensemble-average model developed for composite materials, we calculated the effective elastic constants of cast iron. We focused on the effect of graphite-particle aspect ratio on the Young modulus. Between model and observation, we found good agreement. Oblate spheroidal graphite flakes lower the elastic stiffness much more than do spheres. To obtain good model-measurement agreement, one must use graphite's lower third-order-bound (Kroner-bound) elastic constants. Besides the Young modulus, we give calculated results for all the other usual quasi-isotropic elastic constants: shear modulus, Poisson ratio, and bulk modulus.

Apparent Bias in the X-Ray Fluorescence Determination of Titanium in Selected NIST SRM Low Alloy Steels.
Final rept.
P. A. Pella, R. B. Marinenko, J. A. Norris, and A. Marlow. 1991, 4p.
Pub. in Applied Spectroscopy 45, n2 p242-245 1991.

Keywords: *X-ray fluorescence, *Titanium, *Low alloy steels, *Chemical analysis, Standards, Calibrating, Emission spectroscopy, Metallurgy, Comparison, Electron microprobe analysis, Reprints, *SRM 1165, *SRM 1264, Standard reference materials.

X-ray fluorescence (XRF) results of analysis of titanium in National Institute of Standards and Technology (NIST) SRM 1165 and 1264 low alloy steels were found to be significantly different from the certified values. These differences appear to be unique to the XRF results since results from other methods such as emission spectroscopy did not show any discrepancies. The microhomogeneity of selected samples was examined by electron probe microanalysis and revealed the presence of titanium inclusions containing varying amounts of zirconium, niobium, and tantalum. Differences in metallurgical uniformity is believed to be the major cause of apparent XRF bias in these SRM's. XRF analysis of the new 1760 series alloys indicates that these are more accurate for purposes of calibration than the 1160 series and 1260 series for such elements as titanium.

Keywords: *Metal sheets, *Anisotrophy, *Modules of elasticity, *Steels, *Ultrasonic tests, Resonant frequencies, Textures, Nondestructive tests, Process control, Mechanical properties, Tensile properties, Reprints, *Formability, Electromagnetic-acoustic transducers.

The anisotropy of Young's modulus in steel sheet is closely related to the r-value. Commercially available instrumentation is often used to predict formability by measuring the resonant frequencies of coupons cut at 0, 45, and 90 degrees to the rolling direction. This paper describes recent advances in instrumentation to acquire equivalent information nondestructively, with possibility of on-line process control. The technique uses electromagnetic-acoustic transducers (EMAT's) to excite and detect ultrasonic guided waves propagating in the plane of the sheet. Theories of wave propagation relate the velocities of these waves to Young's modulus anisotropy or to the orientation distribution coefficients (ODC's) describing the texture. The paper reviews the principles of the measurement and then presents correlations of the elastic anisotropy, as deduced by the ultrasonic instrumentation, with tensile measurements of r. Measurements of Young's modulus anisotropy and neutron diffraction measurements of ODC's are also included.

Cryogenic Toughness of Austenitic Stainless Steel Weld Metals: Effect of Inclusions.
Final rept.
A. O. Kluken, C. N. McCowan, and T. A. Siewert. 1992, 19p.
Pub. in Microstructural Science, v20 p45-63 1992.

Keywords: *Cryogenic equipment, *Welded joints, *Austenitic stainless steels, *Toughness, *Inclusions, Voids, Fractures(Materials), Fractography, Mechanical properties, Microstructure, Image analysis, Impurities, Crack initiation, Reprints.

The present investigation studies the effect of the volume fraction inclusion and size distribution of inclusions on the cryogenic (4 K) toughness of austenitic stainless steel weld metals. Two weld series with systematic variations in the volume fraction of inclusions were made by varying the oxygen potential of the shielding gas at a constant heat input. To obtain differences in the size distribution of inclusions, at a given volume fraction of inclusions, the heat input was varied. The subsequent examinations of the welds involved both optical microscopy and scanning electron microscopy. Automatic image analysis was used to determine the inclusion volume fraction and size distribution. The results from these examinations revealed that the arithmetic mean three-dimensional inclusion diameter increased with increasing volume fraction of inclusions. Moreover, for one of the weld series, a shift in the chemical composition of inclusions from spherical manganese silicates to predominantly angular chromium oxides was also observed with increasing content of weld-metal oxygen. Fracture toughness testing of the welds showed that the energy required to initiate and propagate cracks decreased as inclusion volume fraction increased. Fractographic examinations revealed that all specimens failed in a ductile manner with fracture surfaces exhibiting typical ductile dimple morphologies.

Pub. in Wear 160, p37-50 1993.

Keywords: *Steels, *Sliding friction, *Wear, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Temperature dependence, Coefficient of friction, Ball bearings, Oxidation, Reprints, Steel 440C.

Unlubricated sliding friction and wear of 440C steels in an oxygen environment have been studied under a variety of load, speed and temperature ranging from approximately -185 to 675 C. A specially designed test apparatus with a ball-on-flat geometry has been used for this purpose. The observed dependencies of the initial coefficient of friction, the average dynamic coefficient of friction, and the wear rate on load, speed, and test temperatures have been examined from the standpoint of existing theories of friction and wear. High contact temperatures are generated during the sliding friction causing rapid oxidation and localized surface melting. A combination of fatigue, delamination, and loss of hardness due to tempering of the martensitic structure is responsible for the high wear rate observed and the coefficient of friction.

Iron & Iron Alloys

Composite deformation theory is examined and applied to the case of ferrite and pearlite microstructures. The goal of this paper is to use the basic microstructural features (grain size and volume fraction of ferrite, and interlamellar spacing of pearlite) to predict as much of the stress-strain curve as possible, and from the stress-strain curve, to calculate strength. Two different deformation schemes are examined for the prediction of stress-strain curves: first, strain partitioning between ferrite and pearlite, and second, equal strain in ferrite and pearlite. The strain partitioning case can be used to predict the yield strength when the ferrite volume fraction is greater than about 33%. When the volume fraction of ferrite is less than about 15%, an equal-strain deformation scheme can be used to predict the flow curve up the uniform strain (both yield and ultimate strengths). Strengthening from microalloy precipitation can be incorporated by adding the assumed additional strengthening to the flow curves for the two phases.

Catastrophic Failures Propagate Field of Fracture Mechanics.
Final rept.
R. L. Blumberg. 1995, 2p.
Pub. in Materials Research Society Bulletin, v20 n8 p74-75 Aug 95.

Keywords: *Fracture mechanics, *Stresses, *Failure(Mechanics), Wires, Stress-strain relations, Failure analysis, Mechanical properties, Reprints, Size effect, Fracture analysis, Flaws.

The development of fracture mechanics dates back five centuries to Leonardo da Vinci, who carried out experiments on the fracture of iron wire. He demonstrated that the strength of a piece of wire varies inversely with its length; long wires are weaker, on average, while short wires are stronger. This behavior, better known today as the size effect, supported the theory that wire fracture is initiated by rare flaws. A longer piece of wire is more likely to contain a larger flaw that causes fracture at a lower critical stress.

Keywords: *Cryogenics, *Austenite, *Alloys, *Impact tests, *Fracture properties, Toughness, Mechanical properties, Standards, Tests methods, Low temperature tests, Reprints, Austenitic structural alloys, Charpy test.

A 4 K Charpy test is defined as a Charpy test in which the initial temperature of a specimen is 4 K. Two methods, a glass Dewar method and a flow method, are compared in this study to demonstrate that both provide consistent results as long as an initial specimen temperature is the same. An improved correlation between the Charpy absorbed energy and the fracture toughness at 4 K is also examined to clarify the limitation of Charpy test applications at cryogenic temperatures.

Prediction of Strengthening Due to V Additions in Direct-Cooled Ferrite-Pearlite Forging Steels.
Final rept.
P. T. Purtscher, Y. Cheng, R. Kuziak, and R. P. Foley. 1996, 11p.
Pub. in Mechanical Working and Steel Processing Conference (37th), Hamilton, Ontario, Canada, October 1995, p405-415 1996.

Keywords: *Forging steels, *Thermodynamic modeling, Vanadium, Yield strength, Microstructure, Solubility products, Reprints.

Two different approaches predict the yield-strength increment (deltaYS) due to V additions in ferrite-pearlite forging steels. The first is based on the cooling rate and on the V and N contents dissolved in austenite before transformation to ferrite. The second is based on the V available for precipitations strengthening in ferrite. Based on comparisons between the prediction schemes and measured results in the literautre for a range of compositions and forging variables, both approaches predict similar trends. There is no consistently better agreement with the measured deltaYS for one approach than for the other. Considering the reheat/deformation temperatures typically used in industrial practice, the first approach based on V and N dissolved in austenite is preferred.

Temperature-Induced Transition in Ductile Fracture Appearance of a Nitrogen-Strengthened Austenitic Stainless Steel.
Final rept.
P. T. Purtscher, G. Krauss, and D. K. Matlock. 1993, 9p.
Pub. in Metallurgical Transactions A, v24A p2521-2529 Nov 93.

Keywords: *Stainless steel, *Cryogenic properties, Reprints, Ductile fracture, Shear fracture, Sigma phase, Void nucleation.

A nitrogen-strengthened autenitic stainless steel was tested in uniaxial tension at room temperature (295 K) and in liquid nitrogen (76 K). A transition in ductile fracture appearance from a cup-cone fracture at room temperature to shear fracture at cryogenic temperature is observed and correlated to deformation behavior and micromechanisms (void nucleation and strain localization) of fracture. The flow stresses, fracture stresses, and strain hardening rates are all higher at liquid nitrogen temperature compared to those at room temperature, and the significant increases in platic flow stresses are accompanied by planar deformation mechanisms. At both temperatures, primary void nucleation is observed mainly at scattered, large patches of sigma phase, and initial primary void growth is associated with tensile instability (necking) in the specimen. Postuniform elongation at 195 K leads to secondary void growth and coalescence is highly localized and does not contribute to macroscopic elongation. At 76 K, uniform strain increases, total strain decreases, and strain location into shear bands between the primary voids and the surface of the neck leads directly to failure. Secondary void nucleation, growth, and coalescence are limited to shear bands and also do not contribute to the macroscopic elongation. The observations of void nucleation are characterized in terms of a continuum analysis for the interfacial stress at void-nucleating particles. The critical interfacial stress for void nucleation at the lower temperature correlates with the increased flow properties of the matrix.

Ductile Fracture and Tempered Martensite Embrittlement of 4140 Steel.
Final rept.
J. A. Sanders, P. T. Purtscher, D. K. Matlock, and G. Krauss. 1992, 10p.
Pub. in Speich Symposium Proceedings, Iron and Steel Society Meeting, Montreal, Canada, October 1992, p67-76.

Keywords: *Ductile fracture, *Fractography, *Steel, Strain hardening, Tensile properties, Void nucleation, Reprints, Tempered martensite embrittlement.

Specimens of martensitic 4140 steel were tempered at 200, 300, and 400 degrees C and subjected to uniaxial tensile testing and fractographic examination. Ductility does not increase as flow stresses decrease with increasing tempering temperature. This manifestation of tempered martensite embrittlement is related to the introduction of new void-nucleating carbide particles by high temperature tempering and the effect of the particle distributions on ductile fracture. Calculations of void-nucleating stresses at the interfaces of carbide particles at fracture, incorporating the effects of macroscopic changes during necking, were made. The effect of changing particle distributions on these calculations are discussed.

Fatigue Crack Thresholds of a Nickel-Iron Alloy for Superconductor Sheaths at 4 K.
Final rept.
R. L. Tobler, and I. S. Hwang. 1994, 8p.
Pub. in Advances in Cryogenic Engineering, v40 p1315-1322 1994.

Keywords: *Fracture mechanics, *Nickel base superalloy, Liquid helium, Fatigue tests, Cryogenic properties, Reprints, Superconductor conduit, Austenitic alloys.

Short crack simulation (SCS) tests were used to characterize the fatigue crack growth rates da/dN and thresholds deltaK(Th) of a Ni-Fe superalloy proposed for conduit sheath applications in superconducting magnets at 4 K. Experiments described demonstrate the reproducibility of the SCS data and confirm that this alloy has a relatively high fatigue crack growth rate threshold at 4 K. The effects of plate thickness and thermal treatment (650 degrees C, 180 h) on near-threshold fatigue properties are minor compared with a strong cryogenic temperature effect that increases the fatigue threshold from about 2 MPa.m(to the one half power) at room temperature to 9 or 10 MPa.m(to the one half power) at 4 K.

Mechanical Properties and Warm Prestress of Ultra-Low Carbon Steel at 4 K.
Final rept.
R. L. Tobler, L. M. Ma, and R. P. Reed. 1991, 8p.
Pub. in Supercollider III, Proceedings of the Supercollider Symposium (3rd), p139-146 1991.

Keywords: *Steel, *Fracture toughness, Ferritis steel, Cryogenic properties, Prestress effect, Tension tests, Warm prestress, Reprints, Low carbon steel.

The yield strength of ultra-low carbon steel increases from 137 MPa at 195 K to 705 MPa at 4 K. In liquid helium the material is brittle and cleaves in tension. Consequently it is difficult or impossible to properly fatigue-precrack toughness specimens for test at 4 K. We precracked a series of compact specimens at room temperature and then fractured them at 4 K. The toughness measurements at 4 K are affected by precracking at 295 K, and they provide only an estimate of K(Ic) for this steel: 15 MPa M(to the one half power). The tensile properties of the steel at 295 and 4 K are reported, and the effects of prestress on the tensile and fracture properties at 4 K are discussed.

Control of Friction and Wear of Alpha-Alumina with a Composite Solid-Lubricant Coating.
Final rept.
A. Gangopadhyay, and S. Jahanmir. 1990, 8p.
Pub. in Proceedings of a Conference on Tribology of Composite Materials, Oak Ridge, TN., May 1-3, 1990, p337-344.

Keywords: *Aluminum oxide, *Solid lubricants, *Ceramics, *Friction reduction, *Wear resistance, High temperature lubricants, Tribology, Alternatives, Performance evaluation, Coatings, Coefficient of friction, Reprints, *Advanced materials.

The successful utilization of advanced structural ceramic materials as tribological components in high temperature engine applications requires friction coefficients in the range of 0.1 to 0.2. The low values of friction coefficients are needed for energy conservation and control of the wear rate, since it has been shown that the wear of ceramics is adversely affected by friction. Presently, liquid lubricants are not available for the high temperature applications. Solid-lubricant coatings appear as a viable alternative to achieve a low friction coefficient. In the present study, the tribological characteristics of a multicomponent solid-lubricant coating deposited on alumina is investigated up to a temperature of 800 C, and compared with that of uncoated alumina.

Successful boundary lubrication is essential in the design and operation of many components. The lubrication process is complex and it involves contact mechanics, fluid mechanics, tribochemistry, and material deformation and fracture. Two schools of thought have emerged over the years in examining the mechanisms and modeling of boundary lubrication. The chemical school believes that chemical reactions at the rubbing surfaces control the efficacy of the lubrication process. The mechanical school believes that while chemistry is a factor, hydrodynamics, elastohydrodynamics (EHD), and micro-EHD can account for most of the load-bearing mechanisms, so at least in design, they are the principal issues. This paper attempts to bring the two schools together to examine a common set of experimental data. The experiments involved running wear tests on a four-ball wear tester using microliter of lubricant until seizure. Lubricant degradation and breakdown are therefore a factor in the wear test. The key to both models is the temperatures in the contest. This paper describes the two models and focuses on the temperatures in the contact. The temperatures calculated from the two models differ significantly.

The wear mechanisms of polycrystalline ceramics have been studied using wear map methodology. Wear of ceramic materials was examined under a wide range of speed and load to identify different wear regimes, and to establish the critical operating limits. The methodology also facilitates comparison among different materials under various systems parameters such as dry sliding, non-reactive fluids, and reactive fluids. The present study compares the wear mechanisms of alumina, silicon nitride, partially stabilized zirconia, and silicon carbide whisker reinforced alumina. Particular attention is given to the location of the transition zone from mild plastic deformation to rapid fracture controlled wear and the concomitant increase in wear rate.

Fracture Mechanics Analysis of Near-Surface Cracks.
Final rept.
S. Jahanmir, J. W. Dally, and Y. M. Chen. 1990, 6p.
Pub. in Proceedings of Japan International Tribology Conference, Nagoya, Japan, October 29-November 1, 1990, p581-586.

Keywords: *Ceramics, *Wear tests, *Fracture mechanics, *Crack propagation, Tribology, Photoelasticity, Particles, Stress intensity factors, Surfaces, Materials testing, Reprints.

The purpose of the analysis is to develop a qualitative understanding on the propagation of cracks relevant to the formation of wear particles in an elastically deforming stress field. A shallow subsurface crack oriented parallel to the boundary and a vertical surface-breaking crack were analyzed. Three different series of photoelastic experiments were conducted on each crack type and results for the stress intensity factors for both the opening mode and the shearing mode were determined. The relative signs of K(I) and K(II), which depend on the location of crack tip with respect to the point of load application, were used to predict the crack trajectories. The implications of these results on the process of wear particle formation in elastically deforming materials, such as ceramics, are discussed.

Keywords: *Wear tests, *Molybdenum disulfide, *Composite materials, *Films, *Tribology, *Vacuum coating, Friction tests, Coatings, Solid lubricants, Roller bearings, Space environments, Physical vapor deposition, Reprints.

Improved vacuum deposition methods are now available to produce dense, suitability oriented, durable films of molybdenum disulfide on substrates appropriate for tribological applications. It is of interest to examine materials in sliding contact with such films in order to identify optimum combinations, and to improve further tribological performance of the system. Results of wear and friction measurements are presented to a number of materials including self-lubricating composites sliding against four different types of vacuum-deposited MoS2 films. The testing program utilized a controlled environment, pin-on-ring tribometer, with load and speed conditions appropriate to a possible application. Differences in wear over four orders of magnitude, and friction up to a factor of seven times, were measured among the materials. One application area of interest for these material combinations would be as ball retainers in rolling element bearings for space satellite systems.

Sulfate Attack of Cementitious Materials: Volumetric Relations and Expansions.
J. R. Clifton, and J. M. Pommersheim. Apr 94, 24p, NISTIR-5390.
Prepared in cooperation with Bucknell Univ., Lewisburg, PA.

Keywords: *Cements, *Concretes, *Sulfates, *Environmental effects, *Mathematical models, Hydration, Expansion, Volume, Chemical composition, Density(Mass/volume), Gypsum, Construction materials, Tricalcium aluminate, Chemical reaction mechanisms, Ettringite.

A model was developed which predicts the conditions under which volumetric expansion of cementitious materials are most likely and the amount of expansion expected. Model parameters include concrete composition, phase densities, water-cement ratio, degree of hydration, extent of expansive reaction and reaction stoichiometry. The model was applied to several different reactions involving sulfate attack of concrete, including gypsum and ettringite formation reactions. The model predicted that ettringite formation from monosulfate would not cause general expansion. However, local expansion could occur if ettringite occupied the same space vacated by reacting monosulfate. The model predicted that if sufficient unhydrated tricalcium aluminate (C3A) was available in mature cement paste and it reacted with gypsum to form ettringite, the reaction could cause expansion at low water-to-cement ratios.

Mechanism of Mild to Severe Wear Transition in Alpha-Alumina.
Final rept.
S. Jahanmir, and X. Dong. 1992, 9p.
Pub. in Jnl. of Tribology 114, n3 p403-411 1992.

Keywords: *Aluminum oxide, *Wear, *Friction factor, *Coefficient of friction, Temperature, Ceramics, Tribology, Fractures(Materials), Reprints.

Friction and wear experiments were conducted on high purity alpha-alumina sliding against a similar material in air under different contact loads and at temperatures ranging from 23 C to 900 C. Experimental results indicate that tribochemical reactions between water vapor and alpha-alumina at room temperature produce aluminum hydroxide which result in relatively low coefficients of friction and low wear rates. Both the coefficient of friction and the wear rate of alumina were low at intermediate temperatures (200 C to 800 C), if the contact stress was below a threshold value. Above this load, wear occurred by fracture, the wear coefficient exceeded a value of .0001, and the coefficient of friction increased to 0.90. At 900 C, the coefficient of friction was 0.40 and the wear coefficient was reduced to .0001, because of the formation of a silicon-rich layer on the wear track. A contact mechanics model based on linear elastic fracture mechanics indicated that the propagation of cracks from pre-existing flaws controls the onset of catastrophic wear in the intermediate temperature range.

Iridium Oxide Thin-Film Stability in High-Temperature Corrosive Solutions.
Final rept.
K. Kreider. 1991, 5p.
Pub. in Sensors and Actuators B 5, p165-169 1991.

Keywords: *Iridium oxides, Temperature range 0400-1000, Radioactive waste facilities, Underground facilities, High temperature, Aluminum oxide, Thin films, pH meters, Substrates, Stability, Reprints, Sputtered films.

The stability of sputtered iridium oxide films is investigated after exposure to pH 4, 7, and 10 solutions at 200 C (15 bar) and 245 C (40 bar). These reactively sputtered films are being considered as pH-sensing electrodes in high-temperature high-pressure saline solutions such as those found underground in potential nuclear repositories. The sputtered iridium oxide films (SIROF) have a linear response of approximately 53-58 mV per pH at room temperature under a wide range of solution conditions. Other advantages include their ruggedness, small size, high voltage/low impedance output, and the low cost of fabrication. To evaluate their stability, the films are exposed in a Teflon-lined bomb for up to 70 h at high temperature. The pH testing of 50 samples includes cycling between pH 2 and pH 12 before and after exposure. Changes of the potential intercept and the slope are most severe after acidic conditions at 250 C. It is found that ion-assisted deposition helps to maintain film adherence and continuity on the alumina substrates during exposure to 200 C solutions.

Aging in Glasses Subjected to Large Stresses and Deformations.
Final rept.
G. B. McKenna, M. M. Santore, A. Lee, and R. S. Duran. 1991, 8p.
Pub. in Jnl. of Non-Crystalline Solids 131, p497-504 1991.

Keywords: *Glass, *Aging(Materials), *Dilatometry, Viscoelasticity, Torsion, Deformation, Creep, Glass transition temperature, Kinetics, Thermodynamics, Reprints, Erasure, Rejuvenation, Volume recovery.

Physical aging studies near to the conventional glass transition temperature Tg were made using a model epoxy glass. Nonlinear viscoelastic responses were measured after quenching the samples from above Tg to below it. The physical aging response in creep in simple extension was studied as a function of stress magnitude and in stress relaxation in torsion at a function of deformation magnitude. In each test the time t(star) for the aging time shift factor to approach a constant value was determined and found to be independent of the stress or deformation magnitude. These results are interpreted to mean that large mechanical stimuli do not alter the underlying therodynamic state of the glass and aging is not 'erased' by the large stresses or deformations.

Critical Factors in Non-Lubricated, Non-Abrasive Wear Testing.
Final rept.
A. W. Ruff. 1992, 6p.
Pub. in Jnl. of Friction and Wear 13, n1 p48-53 1992.

Keywords: *Wear tests, *Test methods, *Nondestructive tests, *Standardization, Tribology, Morphology, Wear, Friction, Wear resistance, Reprints, *Non-abrasive wear testing.

Some wear testing approaches used in research and in standardized testing are discussed, along with data from several interlaboratory studies of wear. Four critical factors are suggested to explain the relatively high variation in measured wear properties from three prominent test geometries and methods. The factors are: uniform wear scar morphology, wear debris retention in the contact, test system dynamic stiffness, and specimen shape. Further research efforts are needed to better identify and understand these factors, so that the test methods can be improved and the wear data obtained using them are more accurate and useful.

Artificial Crack in Steel: An Ultrasonic-Resonance-Spectroscopy and Modeling Study.
Final rept.
H. Ledbetter, P. Heyliger, K. Pei, S. Kim, and C. Fortunko. 1995, 7p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v14 p2019-2025 1995.

Keywords: *Cracks, *Steels, *Spectroscopy, Ultrasonics, Reprints, Defect detection, Finite element method, Ritz method, Natural-vibration frequencies.

The problem of detecting and characterizing cracks in solids is a major research area involving contributions from mathematics, physics, mechanics, and materials science. In the present study the authors approached this problem from both measurement and modeling viewpoints. In the measurements, the authors used ultrasonic-resonance spectropscopy to determine the macroscopic-vibration-frequency shifts caused by an artificial (electromachined) crack. The modeling used a finite-element method to approximate the macroscopic vibration frequencies of a cracked solid. As a check, the authors used the Ritz method to calculate the frequencies of the noncracked solid.

Dielectric Studies of Fluids with Reentrant Resonators. Appendix B.
A. R. H. Goodwin, and M. R. Moldover. 1993, 10p, CONF-9305134-4-APP.B.
Contract AI05-88ER13823
Symposium on Energy Engineering Sciences (11th), Argonne, IL (United States), 3-5 May 1993. Sponsored by Department of Energy, Washington, DC.

Keywords: *Dielectric Properties, Mixtures, Calibration, Cavity Resonators, Fluids, Fluorine Compounds, Measuring Methods, Phase Transformations, RF Systems, Temperature Dependence, *Refrigerants, EDB/420400.

We have used a reentrant radio-frequency (rf) cavity as a resonator operating near 375 MHz to measure changes in the dielectric constant of fluids within it. The utility of these measurements was demonstrated by determining the dipole moment of 1,1,1,2,5,3-hexafluoropropane, a candidate replacement refrigerant (denoted R236ea) and by detecting the phase boundaries in the mixture ((I-x)C(sub 2)H(sub 6) + xCO(sub 2)), for the mole fraction x = 0.492. The densities of the coexisting phases of the mixture, were determined using the Clausius-Mossotti relation which has errors on the order of 0.5 % in this application. To test the accuracy of the present techniques, the rf resonator was calibrated with helium and then used to redetermine the molar polarizability A(sub c) of argon. The results were in excellent agreement with published values. Our design of the recent resonator makes it suitable for use with corrosive fluids at temperatures up to 400(degrees)C.

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment and to design and optimize equipment to be reliable and energy efficient. Objective of this project is to provide highly accurate, selected thermophysical properties data for refrigerants HFC-143a (CH(sub 3)CF(sub 3)) and HFC-152a (CH(sub 3)CHF(sub 2)) and to use these data to fit complex equations of state and detailed transport property models. The new data will fill gaps in the existing data sets and resolve problems and uncertainties that exist in and between the data sets.

Objectives are to develop state-of-the-art experimental apparatus for measuring the thermophysical properties of a wide range of fluids and fluid mixtures important to the energy, chemical, and energy-related industries, and carry out benchmark measurements on key systems. Measurement capabilities to be developed cover transport properties, thermodynamic properties, phase equilibria properties, and dielectric properties. The new apparatus will make it possible to study a wide range of complex fluid systems under conditions that have been previously inaccessible. Specific measurement capabilities to be developed are: Thermal Conductivity Apparatus, Vibrating Wire Viscometer, Dual-Sinker Densimeter, High-Temperature Vibrating Tube Densimeter, Dynamic Phase Equilibria Apparatus, Apparatus for Dilute Solutions, Total-Enthalpy Flow Calorimeter, Dielectric Constant Apparatus. The research also includes benchmark experimental measurements on pure and mixed alternative refrigerants, aqueous solutions, and carefully selected systems consisting of species of diverse size (methane + neopentane) and polarity (methane + ammonia) important for development of predictive models for energy-related fluids. Contract FG02-91CE23810
Sponsored by Department of Energy, Washington, DC.

Keywords: *Refrigerants, Chlorofluorocarbons, Flammability, Testing, EDB/320106.

Due to the ozone-depleting effects of commonly used chlorofluorocarbon refrigerants, safe environmentally-friendly replacements must be found. HFC-32 (CH(sub 2)F(sub 2)) and other hydrochlorofluorocarbons are potential candidates; however, in contrast with the CFCs, many of these compounds are flammable. Testing the flammability limits of these hydrochlorofluorocarbons using traditional ASTM E-681 methods has produced a range of limits depending upon the vessel and ignition source used. This project demonstrates the feasibility of defining a fundamental flammability limit of HFC-32, that occurs at the limit of a zero strain rate and is independent of ignition source. Using a counterflow twin-flame burner to define extinction points for different strain rates, an extrapolation to zero strain rate is performed. Using this technique, preliminary results on the lean flammability limit of HFC-32 and the critical flammability ratio of HFC-125 (C(sub 2)HF(sub 5)) in ETC-32 are reported.

Simultaneous Visual and Calorimetric Measurements of R11, R123, and R123/Alkylbenzene Nucleate Flow Boiling.
Final rept.
M. A. Kedzierski. 1993, 7p.
Pub. in Proceedings of NHTC Session on Alternative Refrigerants in Heat Transfer Equipment, Atlanta, GA., August 8-13, 1993, 7p. See also PB94-120756. Sponsored by Department of Energy, Washington, DC.

Keywords: *Refrigerants, *Nucleate boiling, *Environmental chemical substitutes, *Air pollution abatement, Mixtures, Performance standards, Lubricants, Freons, Chlorohydrocarbons, Fluorohydrocarbons, Benzenes, Heat measurement, Visual inspection, Reprints, Methane/trichlorofluoro, Ethane/dichloro-trifluoro, R11, R123.

Bubble formation during horizontal flow boiling of trichloromethane (R11), 1,1-dichloro-2,2,2-trifluoroethane (R123) and two R123/alkylbenzene lubricant mixtures was investigated both visually and calorimetrically. Locally measured heat transfer coefficients were taken simultaneously with high speed motion picture images of the boiling process. The addition of a small amount (0.55%) of alkylbenzene to R123 increases the number of active nucleation sites by approximately 5 sites/sq cm which corresponds to a 12% to 50% increase in the site density. The increase in the site density contributed to the enhancement of the heat transfer coefficient of the R123/0.55% alkylbenzene mixture over that of the pure 123. Further increase in the amount of alkylbenzene to the R123 reduces the number of active sites to below that of pure R123 to approximately the value for that of R11. Consequently, the 0.55% lubricant mass fraction mixture exhibited a heat transfer coefficient that was larger than that of the 2% lubricant mass fraction mixture.

Keywords: *Refrigerants, *Working fluids, *Azeotropes, Heat transfer fluids, Cooling systems, Refrigeration, Solutions(Mixtures), Air pollution abatement, Mixtures, Reprints, *Near-azeotropes, *Zeotropes.

A review of the state-of-the-art of refrigerant mixtures is presented. The categories of azeotropes, near-azeotropes and zeotropes are discussed separately as to their advantages as a refrigerant system working fluid and as to their requirements for adaptation. It may be possible to find azeotropes and near-zeotropes which could be candidates for alternatives for existing systems as well as new systems with little or no change in system performance. Zeotropes are not applicable for existing systems but offer the potential for significant performance improvements if the new systems are redesigned so as to incorporate the zeotropic attributes of two phase flow temperature glide and variable composition. Whereas, the azeotropes and near-azeotropes development are likely to have impact on the immediate ozone depletion crisis, the development will take longer but will be necessary for the greenhouse warming crisis.

Refrigerant 22 is shown to be, like many other HCFC refrigerants, one of depletion potential, as a class, HCFC refrigerants, especially R22, are part of the interim solutions for the substitution of CFC refrigerants. Until refrigerants with no ozone depletion potential are developed and equipment designed and produced in quantity to use these refrigerants, the HCFC refrigerants will remain an important and vital refrigerant class. Except in a few applications, other factors such as global warming potential and efficiency, toxicity, safety, materials compatibility, and commercial availability of the refrigerant and of the refrigerating and air conditioning equipment make immediate replacement of R22 and all other HCFC refrigerants impossible. For some applications commitment of major capital investments and log lead times for design and production of new machinery systems using existing atmospherically benign alternatives are needed. Other applications require research for new refrigerants without ozone depletion potential, a process without a guarantee of success. The immediate replacement of R22 systems is not a viable choice.

Keywords: *Viscosity, *Refrigerants, *Fluids, *Compressible fluids, *Saturation(Chemistry), Temperature dependence, Fluorohydrocarbons, Pressure, Volume, Reprints, *Ethane/chloro-tetrafluoro, *Ethane/pentafluoro, Molar volume, R125, R124.

The shear viscosities of saturated and compressed fluid 1-chloro-1,2,2,2-tetrafluoroethane (R124) and pentafluoroethane (R125) have been measured with two torsional crystal viscometers at temperatures between 120 and 420 K and at pressures up to 50 MPa. At small molar volumes, the fluidity (reciprocal viscosity) increases linearly with molar volume at fixed temperature and weakly with temperature at fixed volume. We have described this behavior with simple empirical equations and have compared the data of Shankland and of Ripple with them. The data of Ripple are in good agreement with our data for both fluids.

Simplified Cycle Simulation Model for the Performance Rating of Refrigerants and Refrigerant Mixtures.
Final rept.
P. A. Domanski, and M. O. McLinden. 1993, 8p.
Pub. in International Jnl. of Refrigeration 15, n2 p81-88 1992. See also PB93-130383. Sponsored by Environmental Protection Agency, Washington, DC. and Electric Power Research Inst., Palo Alto, CA.

Keywords: *Refrigerants, *Thermodynamic properties, *Models, *Computerized simulation, Equations of state, Mixtures, Computer programs, Transport properties, Heat pumps, Refrigerators, Vapor compression refrigeration cycle, Reprints.

A simulation program, CYCLE11, which is useful for the preliminary evaluation of the performance of refrigerants and refrigerant mixtures in the vapor compression cycle is described. The program simulates a theoretical vapor-compression cycle and departures from the theoretical cycle as occur in a heat pump and in a refrigerator. The cycles are prescribed in terms of the temperatures of the external heat transfer fluids with the heat exchangers generalized by their average effective temperature differences. The isenthalpic expansion process is assumed. The program includes a rudimentary model of a compressor and a representation of the suction line and liquid line heat exchange. Refrigerant thermodynamic properties are calculated using the Carnahan-Starling-DeSantes equation-of-state. Refrigerant transport properties are not included in the simulations. The program can generate merit ratings of refrigerants for which limited measurement data are available. An example of simulation results stresses the need for careful application of simplified models and consideration for the involved assumptions.

Equation of State Formulation of the Thermodynamic Properties of R134a (1,1,1,2-Tetrafluoroethane).
Final rept.
M. L. Huber, and J. F. Ely. 1992, 8p.
Pub. in International Jnl. of Refrigeration 15, n6 p393-400 1992.

Keywords: *Thermodynamic properties, *Refrigerants, Specific heat, Volume, Mathematical models, Equations of state, Vapor pressure, Density, Temperature, Reprints, *R134a, *Tetrafluoroethane.

New correlations for the thermodynamic properties of R134a are presented. A classical equation for the molar Helmholtz energy is used with temperature and density as the independent variables. The equation is accurate for both the liquid and vapor phases at pressures up to 70 MPa, and for a temperature range from the triple point to 450 K. Temperatures are given on the new International Temperature Scale of 1990 (ITS 90). The equation was developed by using experimental data for pressure-volume-temperature properties, isochoric heat capacity, second virial coefficients, speed of sound and coexistence properties. Comparisons with experimental data and with two other equations of state are given. Ancillary equations representing the saturated liquid and vapor densities and the vapor pressure are also presented.

Sponsored by Department of Energy, Washington, DC.
Pub. in Fluid Phase Equilibria 80, p239-248 1992.

Keywords: *Viscosity, *Refrigerants, Mixtures, Equations of state, Thermodynamic properties, Mathematical models, Mass, Boundary conditions, Reprints, R134a, Tetrafluoroethane.

We have developed a predictive corresponding states model for the viscosity of pure refrigerants and refrigerant mixtures. The model uses extended corresponding states with R134a (1,1,1,2-tetrafluoroethane) as the reference fluid. The model uses equilibrium shape factors and an equivalent substance reducing ratio (ESRR) for the viscosity which involves the molecular mass. The 'mass' ESRR is found using viscosity data along the saturation boundary. We have fit these mass ESRR's to a general form involving reduced temperature and a structural factor. In addition, we have determined a set of universal coefficients for the mass ESRR that can be used to predict the viscosity of any halocarbon refrigerant given the critical parameters and the structural parameter. We give sample results comparing the model predictions with experimental data for pure fluids and a refrigerant mixture.

Causes of the Apparent Heat Transfer Degradation for Refrigerant Mixtures.
Final rept.
M. A. Kedzierski, J. H. Kim, and D. A. Didion. 1992, 10p.
Sponsored by Electric Power Research Inst., Palo Alto, CA. and Department of Energy, Washington, DC.
Pub. in Proceedings of National Heat Transfer Conference and Exhibition (28th), San Diego, CA., August 9-12, 1992, p149-158.

Keywords: *Thermal degradation, *Refrigerants, *Heat transfer coefficients, Mixtures, Evaporation, Heat transfer, Working fluids, Mass transfer, Nucleate boiling, Reprints.

This paper presents an investigation into the causes of the apparent heat transfer degradation associated with horizontal-annular flow evaporation of refrigerant mixtures. The apparent heat transfer degradation is the difference between the measured heat transfer coefficient and the heat transfer coefficient that would be obtained from a linear interpolation of the single component values. The degradation is apparent since the linearly interpolated values have no physical basis. For horizontal-annular flow evaporation, most of the heat transfer degradation is a consequence of the use of the locally uniform equilibrium temperature in the measurement and calculation of the heat transfer coefficient. In reality, both circumferential and radial composition gradients can exist within the liquid film which cause temperature distributions that deviate significantly from a uniform saturation temperature. If the actual liquid-vapor interface temperatures (local vapor temperatures) were used in the calculation of the measured heat transfer coefficient for the impose heat flux condition, most of the apparent degradation would not exist. The remainder of the heat transfer degradation is due to nonlinear mixture property effects. Previously published measured heat transfer coefficients for three mixtures were investigated.

Resistance Thermometers with Fast Response for Use in Rapidly Oscillating Gas Flows.
Final rept.
W. Rawlins, K. D. Timmerhaus, and R. Radebaugh. 1992, 4p.
Pub. in Temperature - Its Measurement and Control in Science and Industry, v6 p471-474 1992.

Keywords: *Thermometers, *Oscillating flow, *Cryogenic cooling, *Refrigerators, *Working fluids, Temperature measurement, Effectiveness, Coolers, Gas flow, Refrigerating machinery, Reprints.

The paper describes a resistance thermometer that permits instantaneous measurement of gas temperatures with the use of a 4 micrometer diameter tungsten wire mounted on heavier wire supports. This configuration provides sufficient strength to survive oscillating flows of helium gas up to 30 Hz at pressures up to 2.2 MPa. The probes are small enough to fit perpendicular to the flow in 3 mm diameter stainless steel tubes. Custom fittings designed to support the resistance thermometers introduce very little void volume to the system. Response time of the probes is approximately 260 microseconds, which permits resolution of temperature oscillations up to 30 Hz with negligible phase shifts. A very nearly linear response for these resistance thermometers is obtained from 80 K to 400 K. Sensitivity of these thermometers decreases rapidly below about 60 K. Results of dynamic temperature measurements obtained at the cold end of a pulse tube refrigerator will be shown.

Keywords: *Refrigerants, *Nucleate boiling, *Flow visualization, *Image analysis, Heat flux, Computer programs, Flow rate, Heat transfer, Bubbles, Vaporization, *Visual measurement.

This report provides a record of a visual measurement technique for the analysis of the bubbles formed by nucleate flow boiling. The purpose of measuring these bubbles is to extend the understanding of the boiling process. By studying the behavior of these vapor bubbles, a better understanding of the physics controlling boiling heat transfer will be gained. The boiling of refrigerants is simultaneously filmed with a high speed 16mm camera while heat transfer measurements are taken. These tests are performed over a range of heat fluxes and flow velocities in order to study the effect of these conditions on the bubble dynamics. The analysis of the 16mm films evolved from a manual to a computer assisted system, and finally to a digital image analysis system. The following is an overview of the filming apparatus and the bubble measurement schemes.

Pub. in Advances in Cryogenic Engineering, v39 p1865-1874 1994.

Keywords: *Cryogenic fluids, *Refrigerants, *Thermophysical properties, *Reference materials, Thermodynamic properties, Pressure, Temperature, Volume, Specific heat, Thermal conductivity, Equations of state, Transport properties, Technology transfer, Reprints, *Standard reference materials, US NIST, Phase equilibria, Sound speed profile.

The Thermophysics Division of the National Institute of Standards and Technology has long been involved in providing standard reference data for the thermophysical properties of cryogenic fluids. Comprehensive experimental facilities have been used to provide accurate data for Pressure-Vapor-Temperature (PVT) relations, heat capacities, sound speeds, phase equilibria, and transport properties for a large variety of well characterized cryogenic fluid systems. This critically evaluated information on the thermophysical properties of fluids and fluid mixtures of cryogenic interest is used for custody transfer applications and for efficient design and operation of cryogenic processes in the chemical, natural gas, aerospace, environmental, refrigeration, and other energy related industries.

Measurements of Molar Heat Capacity at Constant Volume (Cv) for 1,1,1,2-Tetrafluoroethane (R134a).
Final rept.
J. W. Magee. 1992, 9p.
Pub. in International Jnl. of Refrigeration 15, n6 p372-380 1992.

Keywords: *Specific heat, *Fluorohydrocarbons, *Refrigerants, Calorimetry, Temperature dependence, Pressure dependence, Triple point, Phase transformations, Thermodynamic properties, Liquid phases, Vapor phases, Reprints, *R134a, *1,1,1,2-Tetrafluoroethane.

The molar heat capacity at constant volume was measured by applying an adiabatic method. Heat capacities at 310 state conditions were measured. Measurements were made on liquid in equilibrium with its vapor, and on compressed liquid samples of 1,1,1,2-tetrafluoroethane (R134a), at temperatures from 172 to 343 K with pressures as high as 35 MPa. In the course of these measurements, a determination of the triple point temperature (169.85 + or - 0.01 K) was made. For the high purity (0.9999 +) sample, results were obtained for two-phase, saturated liquid and single phase molar heat capacities as a function of measured temperature, pressure and density. The maximum probable uncertainty of the heat capacity values is estimated not to exceed + or - 0.5%.

Vapour Pressure Measurements on 1,1,1,2-Tetrafluoroethane (R134a) from 180 to 350 K.
Final rept.
J. W. Magee, and J. B. Howley. 1992, 3p.
Pub. in International Jnl. of Refrigeration 15, n6 p362-364 1992.

Keywords: *Vapor pressure, *Fluorohydrocarbons, *Refrigerants, Thermodynamic properties, Temperature dependence, Reprints, *1,1,1,2-Tetrafluoroethane, *R134a.

Measurements of vapor pressures were made for 1,1,1,2-tetrafluoroethane (R134a) from 180 to 350 K by using a static cell. Temperatures were measured with a platinum resistance thermometer to within an accuracy of + or - 0.03 K. Pressures were measured with calibrated oscillating quartz-crystal pressure transducers with uncertainties estimated to range from 0.02 to 1.8 kPa.

Annex 18: An International Study of Refrigerant Properties.
Final rept.
M. O. McLinden. 1994, 4p.
Pub. in IEA Heat Pump Centre Newsletter 12, n1 p28-31 Mar 94.

Keywords: *Fluorohydrocarbons, *Refrigerants, *Environmental chemical substitutes, *Thermophysical properties, Thermodynamic properties, Transport properties, Research programs, International cooperation, Alternatives, Reprints, *Hydrochlorofluorocarbons, Halons, Hydrofluorocarbons.

The article highlights the activities of Annex 18 'Thermophysical Properties of the Environmentally Accpetalbe Refrigerants', which was established in 1990. The objectives of the Annex are to foster coordination and cooperation among researchers in this field and to determine thermophysical properties leading to internationally accepted formulations for the leading al-

ternative refrigerants. Tasks in support of these goals have included surveys of research, compilations of data, evaluations of equations of state, and the preparation of properties bulletins for HFC-134a and HCFC-123.

Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Symposium on Energy Engineering Sciences (11th), Argonne, IL., May 3-5, 1993, p63-69 1994.

Keywords: *Refrigerants, *Thermophysical properties, *Fluorohydrocarbons, *Environmental chemical substitutes, Thermodynamic properties, Transport properties, Boiling points, Specific heat, Thermal conductivity, Equations of state, Vapor pressure, Triple point, Pressure, Volume, Temperature, Alternatives, Reprints, *Hydrofluorocarbons, Phase equilibria, Sound speed profile.

The status and available data for several of the leading 'new' or alternative refrigerants are summarized. The data considered include triple point, normal boiling point, and critical point parameters; the temperature dependence of the vapor pressure, ideal gas heat capacity, and saturated liquid density. Also considered are single phase Pressure-Vapor-Temperature (p-V-T), heat capacity, sound speed, viscosity, and thermal conductivity data. The fluids of interest are the HFCs 23, 32, 125, 134a, 134, 143a, and 152a.

Need for, and Availability of, Working Fluid Property Data: Results from Annexes XIII and XVIII.
Final rept.
M. McLinden, and L. Vamling. 1993, 12p.
Pub. in Heat Pumps for Energy Efficiency and Environmental Progress, p115-126 1993.

Keywords: *Working fluids, *Thermodynamic properties, *Transport properties, Heat pumps, Equations of state, Refrigerants, Sensitivity analysis, Accuracy, Reprints, R134a, R123.

In these days of transition to new, more environmentally friendly working fluids, there is a definite need for good data and models of basic thermodynamic and transport properties of both pure compounds and mixtures to be used for cycle calculations and equipment redesign. Two annexes of the IEA Program on Advanced Heat Pumps have dealt with such data, namely Annex XIII--State and Transport Properties of High Temperature Working Fluids and Nonazeotropic Mixtures and Annex XVIII--Thermophysical Properties of the Environmentally Acceptable Refrigerants. In this paper, highlights of these two annexes are presented. A sensitivity analysis (from Annex XIII) gives an estimate of how accurately these basic data need to be known to reach a certain accuracy in heat pump coefficient of performance (COP) and heating or cooling capacity calculations. This analysis points out the importance of measured property data. Other projects to be highlighted are a comparison of equations of state with experimental density, vapor pressure, and heat capacity data for mixtures (XIII), a survey of current research on the properties of the 'new' refrigerants (XVIII), and an evaluation of equations of state for R134a and R123 which will lead to an international bulletin for the properties of these two alternative refrigerants (XVIII).

Measurement of the Thermal Properties of Electrically Conducting Fluids Using Coated Transient Hot Wires.
Final rept.
R. A. Perkins. 1994, 8p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of the Symposium on Energy Engineering Sciences (12th), Argonne, IL., April 27-29, 1994, p90-97.

Keywords: *Thermal conductivity, *Fluorohydrocarbons, Thermal properties, Supercritical fluids, Refrigerants, Temperature dependence, Thermophysical properties, Reprints, *R134a, *Electrically conducting fluids, Transient hot wire technique.

Measurements of fluid thermal properties using the transient hot-wire technique are described. When bare hot wires are used in electrically conducting fluids, there are additional measurement uncertainties due to the formation of electric double layers on the surfaces of the wires and the cell wall. If the electrical conductivity of the fluid is large enough, there is also significant power generation in the fluid. These measurement uncertainties can be eliminated by electrically insulating the hot wires with a thin film. The use of tantalum hot wires with an anodized layer of tantalum pentoxide is demonstrated with measurements on nonpolar argon and polar 1,1,1,2-tetrafluoroethane (R134a). Although coated tantalum hot wires have been used previously in a transient mode to measure the thermal conductivity of liquids, this work is the first demonstration of the use of coated wires to measure thermal conductivity in the liquid, vapor, and supercritical gas phases.

Predictive Extended Corresponding States Model for Pure and Mixed Refrigerants Including an Equation of State for R134a.
Final rept.
M. L. Huber, and J. F. Ely. 1994, 14p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Rev. Int. Froid 17, n1 p18-31 1994.

Keywords: *Refrigerants, *Thermophysical properties, *Equations of state, *Fluorohydrocarbons, Thermodynamic properties, Saturation, Boundary conditions, Mixtures, Phase equilibria, Phase studies, Liquid phases, Vapor phases, Density(Mass/Volume), Reprints, *R134a, *Tetrafluoroethane, Hydrofluorocarbons.

The authors have developed a predictive corresponding states model for the thermophysical properties of pure refrigerants and refrigerant mixtures. The bulk phase properties such as the density, enthalpy and entropy are predicted using the principle of extended corresponding states, incorporating a recent 32-term modified Benedict-Webb-Rubin correlation for the R134a (1,1,1,2-tetrafluoroethane) reference fluid. In the work the authors present the coefficients for density-independent shape-factor correlations for 21 refrigerants, and a set of universal coefficients that can be used with any refrigerant given only the critical parameters and the acentric factor. The authors show comparisons with experimental density data for each of the 21 refrigerants. They also demonstrate the use of generalized coefficients for shape factors where only the critical parameters and acentric factors are known. In addition, they present comparisons of the volume prediction for two binary refrigerant mixtures and one ternary refrigerant mixture.

Estimating the Virial Coefficients of Small Polar Molecules.
Final rept.
L. A. Weber. 1994, 22p.
Pub. in International Jnl. of Thermophysics 15, n3 p461-482 May 94.

Keywords: *Refrigerants, *Thermophysical properties, Density, Thermodynamic properties, Estimating, Mathematical models, Evanescence, Halogenated hydrocarbons, Reprints, *Virial coefficients, *Fugacity coefficients, *Small polar molecules.

We adapt existing models for estimating the second and third virial coefficients of small molecules to the halogenated methanes and ethanes. We compare the results with the abundant new, high-quality PVT data resulting from the search for alternative refrigerants. The present model provides an accurate method for calculating densities, and therefore it should provide reliable thermodynamic properties and fugacity coefficients. We give equations and parameters useful for estimating the properties of pure refrigerants and their mixtures when no PVT data are available.

Microform Calibration Uncertainties of Rockwell Diamond Indenters.
J. F. Song, F. F. Rudder, T. V. Vorburger, and J. H. Smith. 1995, 19p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n5 p543-561 Sep/Oct 95.

Keywords: *Rockwell hardness, *Calibration standards, Reprints, Metals, Data covariances, Diamond pyramid hardness tests, Geometry, Mechanical tests, NIST(National Institute of Standards and Technology).

National and international comparisons in Rockwell hardness tests show significant differences. Uncertainties in the geometry of the Rockwell diamond indenters are largely responsible for these differences. By using a stylus instrument, with a series of calibration and check standards, and calibration and uncertainty calculation procedures, we have calibrated the microform geometric parameters of Rockwell diamond indenters. These calibrations are traceable to fundamental standards. Under ISO and NIST guidelines for expressing measurement uncertainties, the calibration and uncertainty calculation procedures, error sources, and uncertainty components are described, and the expanded uncertainties are calculated.

Pub. in International Jnl. of Refrigeration, v18 n8 p518-523 1995.

Keywords: *Refrigerants, *Thermodynamic properties, Environmental chemical substitutes, Alternatives, Equations of state, Interfacial tension, Pressure dependence, Temperature dependence, Ethanes, Propanes, Butanes, Liquid phases, Vapor phases, Flammability, Reprints, *Interaction coefficients.

Bubble pressures were measured for 15 binary mixtures, each composed mainly of one flammable and one non-flammable component. The mixtures were trichlorofluoromethane + isopentane, pentafluoroethane + 1,1,1-trifluoroethane, 1,1-dichloro-2,2,2-trifluoroethane + (1,1-dichloro-1-fluoroethane or isopentane), 1,1,1,2-tetrafluoroethane + (1,1-difluoroethane or propane or cyclopropane or isobutane), difluoromethane + (pentafluoroethane or 1,1,1,2-tetrafluoroethane or 1,1-difluoroethane). Also studied were mixtures of 1,1-difluoroethane + (cyclopropane or propane or butane or isobutane), which comprise two flammable components. The bubble pressures were used to determine interaction coefficients that characterize the non-ideal behavior of these fluid mixtures. The interaction coefficients are used in equation-of-state models for the thermodynamic properties of refrigerant mixtures.

A comprehensive experimental program is described in which eleven gaseous agents and sodium bicarbonate powder have been screened, so that the best three candidates for subsequent full scale air craft fire extinguishment evaluation can be identified. Because the effectiveness of a fire supression agent is known to be related to its thermodynamic properties, its behavior during two-phase flow, its interaction with flame chemistry, the timing of its release and the nature of the fire, a series of carefully designed experiments was conducted to examine each of these factors.

Flame propagation, Halons, Atomization, Reprints, Hydrochlorofluorocarbons.

The work discussed in this paper is part of a large effort at NIST focused on finding an alternative to halon 1301 for application to aircraft engine nacelle and dry bay in-flight fire protection. Alternative chemical compounds are sought which will perform similarly to halon 1301, and which do not create unacceptable safety, environmental, or systems compatibility problems. A cup burner, an opposed flow diffusion flame, a turbulent spray flame, and a deflagration/detonation tube are used to rank the relative combustion suppression effectiveness.

Halons had been the agents of choice for numerous fire protection applications because of their inherent ability to inhibit flames at low concentrations with no residue while exhibiting a number of additional strongly positive attributes. To avoid costly mistakes in choosing replacements for aircraft applications, research has been conducted to determine the performance of different agents in extinguishing aircraft-type fires. This paper describes the major elements of the overall program and the rationale of how an alternative to halon 1301 was chosen for aircraft applications.

Pub. in Jnl. of Chromatography A, v686 p245-251 1994.

Keywords: *Refrigerants, *Chlorofluorocarbons, *Fluorocarbons, *Thermodynamic properties, Chemical analysis, Reprints, Gas chromatography, Temperature, Thermophysical properties, *Foreign technology, *Halocarbons, Relative retention.

The retention characteristics of 11 ethene-based chlorofluorocarbon, bromochlorofluorocarbon and fluorocarbon fluids have been studied as a function of temperature on a stationary phase consisting of a 5% (m/m) coating of a low-molecular-mass polymer of hexafluoropropylene epoxide on a graphitized carbon black absorbent. Measurements were performed at -20, 0, 20 and 40 deg C for trifluoroethene (R-1123), 1.1-difluoroethene(R1132a), and fluoroethene (R-1112a), chlorotrifluoroethene (R-113), 2-chloro-1,1-difluoroethene (R-1122), 1-chloro-1-fluoroethene (R1121a), 2-bromo-1,1-difluoroethene (R-1122B1) and bromoethene (Vinly bromide, R-1140B1). Measurements were performed at 60, 80, 100, and 120 deg C fortrans-1,2-dichloro- 1,2-difluoroethene (R1112t) and cis-1,2-dichloro- 1,2-difluoroethene (R-1112c). Net retention volumes, corrected to a column temperature of 0 deg C, were calculated from retention time measurements, the logarithms of which were fitted againstreciprocal thermodynamic temperature.

Suppression of High-Speed C2H4/Air Flames with C1-Halocarbons.
Final rept.
G. Gmurczyk, and W. Grosshandler. 1994, 7p.
Sponsored by Department of the Air Force, Wright-Patterson AFB, OH.
Pub. in International Symposium on Combustion (25th), Irvine, CA., July 31-August 5, 1994, p1497-1503.

Keywords: *Fire suppression, *Halogenated hydrocarbons, *Combustion kinetics, Fire extinguishing agents, Halons, Performance evaluation, Turbulent flow, Flame propagation, Detonations, Flames, Thermodynamic properties, Heat flow, Reprints, Turbulent flames.

A primary objective of the work has been to determine the relative suppression efficiencies of different agents under highly dynamic situations, without the undue influence of either the ignition event or the mixing of the agent into the flame front. This was accomplished by generating a highly turbulent flame/quasi detonation in the driver section, which contain no suppressant, followed by measurements of the velocity and pressure ratio as the wave front entered the test section of the tube, which contained suppressant premixed with the same fuel/air combination. The experimental facility was successfully employed to clearly discriminate among the dynamic characteristics of the five compounds, revealing behavior distinct from what was observed in companion studies using atmospheric nonpremixed flames. The suppression process is strongly influenced by the concentration of an agent, the structure and composition of a agent molecule, and the composition of the combustible mixture itself.

Effectiveness of Halon Alternatives in Suppressing Dynamic Combustion Process.
Final rept.
W. L. Grosshandler, C. Presser, and G. Gmurczyk. 1995, 21p.
Pub. in American Chemical Society Halon Replacements: Technology and Science Symposium, Washington, DC., August 21-25, 1994, p204-224 1995.

Keywords: *Aircraft fires, *Fire extinguishing agents, *Environmental chemical agents, *Combustion kinetics, Fire suppression, Alternatives, Halons, Fluorocarbons, Fire fighting, Fuel sprays, Turbulent flow, Thermodynamic properties, Detonations, Reprints, Explosiveness.

C3F8 is shown to require the least storage volume among twelve fluorocarbons for suppressing a quasi-detonation. CF3I performs the best of the gaseous suppressants evaluated in a spray burner. Two experimental facilities are describes as part of an effort to identify suitable replacements for CF3Br is aircraft applications. A turbulent spray burner simulates the hazards associated with a ruptured fuel line in an engine nacelle or dry bay. A deflagration/detonation tube evaluates the ability of a gaseous agent to attenuate the pressure build-up and Mach number of a quasi-detonation.

Halon Thermochemistry: 'Ab Initio' Calculations of the Enthalpies of Formation of Fluoromethanes.
Final rept.
R. J. Berry, D. R. F. Burgess, M. R. Nyden, M. R. Zachariah, and M. Schwartz. 1995, 6p.
Pub. in Jnl. of Physical Chemistry, v99 n47 p17145-17150 1995.

Keywords: *Fluorocarbons, *Thermochemistry, *Calculation methods, Thermodynamic properties, Thermophysical properties, Quantum chemistry, Molecule molecule interactions, Chemical bonds, Molecular orbitals, Reprints, *Enthalpy of formation.

Atomic equivalent (AEQ), BAC-MP4, G2(MP2), G2, CBS-4, CBS-Q, and CBS-QCI/APNO molecular orbital calculations were used to calculate enthalpies of formation in the series of fluoromethanes, CH(sub x)F(sub(4-x)),x = 0-4. Enthalpies of formation calculated with the G2(MP2) and G2 procedures exhibited systematic deviations from experiment which were linearly dependent upon the number of C-F bonds in the molecule. This technique had no significant effect on the quality of results from the AEQ, BAC-MP4, and CBS-4 methods.

Live-fire full-scale testing has been conducted at Wright-Patterson Air Force Base to identify an agent to replace CF3 Br (halon 1301) for suppressing fires in military aircraft dry bays. High pressures motivated the current study to determine the initial conditions which would lead to dangerous situations, and to explore a less extreme regime more representative of a realistic threat. Based upon over a hundred experiments with modified facility, it was possible to reconfirm the conclusion that FC-218 provides the most consistent performance over the widest range of fuel/air mixtures and tube geometries. The CF3I has the greatest positive impact at low partial pressure fractions, but exhibits non-monotonic behavior of flame speed and shock pressure ratio at increasing concentrations. The dangerously high over-pressures previously exhibited by HFC-125 were not observed during suppression under more moderate (and realistic) combustion conditions.

Suppression of Ignition Over a Heated Metal Surface.
Final rept.
A. Hamins, P. Borthwick, and C. Presser. 1995, 5p.
Pub. in International Conference on Fire Research and Engineering, Orlando, FL., September 10-15, 1995, p77-81.

Keywords: *Fire suppression, *Halogenated hydrocarbons, *Metals, *Surfaces, Fire extinguishing agents, Halons, Performance evaluation, Flames, Temperature, Combustion kinetics, Heat flow, Heat transmission, Thermal radiation, Thermodynamic properties, Fire fighting, Radiant heat flow, Reprints.

The objective of this work is to investigate the effectiveness of various agents in suppressing flame ignition. Experiments were conducted to determine the amount of agent needed to suppress the ignition of a gaseous propane flow over a heated metal disk. The metal surface was heated by a regulated power supply which provided up to 200 W. With the fuel and oxidizer flowing, flame ignition occurred in a repeatable fashion by increasing the power through the metal disk. Various amounts of agent were added to the air flow and the temperature of the heated metal disk was measured at flame ignition using an optical pyrometer. The effectiveness of N2, HFC-125, HFC-227 and CF3I were compared in suppressing the ignition event.

Viscosities are reported for two fluorinated propane isomers in the saturated-liquid state at temperatures from 262 K to 353 K. The compounds are 1,1,1,2,3,3-hexafluoropropane (R236ea) and 1,1,1,3,3,3-hexafluoropropane (R236fa). The measurements were performed in a capillary viscometer designed for fluids with vapor pressures above ambient. A free-volume model was used to correlate the experimental results, and they were also compared with predictions from an extended corresponding states model.

The properties of refrigerants that may serve as replacements to the chlorofluorocarbons (CFCs) are considered. The characteristics required of a refrigerant are reviewed, and the data needed to evaluate possible alternative refrigerants are summarized. These data include thermophysical properties, toxicity and flammability data, materials compatibility information, and parameters characterizing environmental consequences. The available data for 45 potential replacement refrigerants are summarized.

A modified Benedict-Webb-Rubin (MBWR) equation of state has been developed for Refrigerant 123 (2,2-dichloro- 1,1,1-trifluoroethane) basedon recently measured thermodynamic property data and data available fromthe literature. Single-phase pressure-volume-temperature (PVT), heat capacity, and sound speed data, as well as second virial, vapor pressure, and saturated liquid and saturated vapor density data, were used with multiproperty linear least squares fitting techniques to fit the 32 adjustable coefficients of the MBWR equation. Coefficients for the equation of state and for ancillary equations representing the vaporpressure, saturated liquid and saturated vapor densities, and ideal gas heat capacity are given.

Keywords: *Gas metal arc welding, *Electrodes, Spray transfer, Electric potential, Mapping, Transferring, Reprints, CTWD, GMAW(Gas metal arc welding), Metal transfer modes, Wire feed rate.

Welds were made with a 1.2-mm-diameter AWS ER100S-1 electrode using Ar-2% O2 shielding gas to map the effects of contact-tube-to-work distance (13, 19 and 25 mm), current, voltage, and wire feed rate on metal transfer. The droplet transfer modes were identified for each map by both the sound of the arc and images from a laser back-lit high-speed video system. The modes were correlated to digital records of the voltage and current fluctuations. The maps contain detailed information on the spray transfer mode, including the boundaries of drop spray modes. The metal transfer mode boundaries shifted with an increase in contact-tube-to-work distance.

P. G. Jonsson, J. Szekely, R. B. Madigan, and T. P. Quinn. 1995, 10p.
Pub. in Welding Jnl., p93s-102s Mar 95.

Keywords: *Power, *Gas metal arc welding, Numerical analysis, Electric power distribution, Input, Models, Electric potential, Reprints, GMAW(Gas metal arc welding), Arc column, Arc length.

The voltage and power distributions in gas metal arc welding (GMAW) were studied both experimentally and numerically. The principal voltage drop takes place in the arc, which also constitutes the dominant power contribution. Within the arc, the dominating voltage contributions are from the arc column and the cathode fall, while the anode fall and the electrode regions are less significant. The power input to the arc column increases with both increasing current and increasing arc length. These results indicate that it is critical to control the arc length in order to control the power input to the system.

Pub. in International Trends in Welding Science and Technology, Gatlinburg, TN., June 1-5, 1992, p999-1002 1993.

Keywords: *Gas metal arc welding, *Electrodes, Currents, Electric potential, Detectors, Luminous intensity, Transferring, Drops(Liquid), Frequencies, Reprints, GMAW(Gas metal arc welding), Arc length, Arc current.

An arc light intensity sensor, in conjunction with voltage and current sensors, was evaluated to detect droplet detachment and electrode extension under spray transfer welding conditions. Arc length, electrode extension and droplet transfer frequency were obtained from high-speed video images of the process and correlated to arc current and arc light intensity measurements. The arc light intensity sensor was able to detect droplet frequency from variations in arc light intensity caused by changes in arc length due to droplet detachment. Arc length could be estimated using this regression within 1 mm with current ranging from 180 to 300 A and arc length ranging from 4 to 12 mm.

Keywords: *Thermal properties, *Temperature dependence, *Ultraviolet absorption, *Absorption cross sections, Chlorofluorocarbons, Halogenated hydrocarbons, Vapor phases, Liquid phases, Wavelengths, Reprints, *HCFC-123, *HCFC-142b.

The absorption cross sections for HCFC-123 (CF3CHCl2) and HCFC-142b (CH3CF2Cl) have been measured in the gas and liquid phases over the temperature range of about 220-330 K. The liquid phase results were converted into effective gas phase cross sections using a wavelength shift procedure, thereby extending the gas phase cross sections to longer wavelengths. The results are compared with other available data and lend increased confidence in atmospheric lifetime calculations for these important industrial alternatives to the fully halogenated chlorofluorocarbons.

The authors report the thermodynamic properties of 1,1,1,2,3,3-Hexafluoropropane (known in the refrigeration industry as HFC-236ea) in the temperature and pressure region commonly encountered in thermal machinery. The properties are based on measurements of the vapor pressure, the density of the compressed liquid (PVT), the refractive index of the saturated liquid and vapor, the critical temperature, the speed of sound in the vapor phase, and the capillary rise. From these data, the authors deduce the ideal-gas heat-capacity, the saturated liquid and vapor densities, the equation of state of the vapor phase, the surface tension, and estimates of the critical pressure and density. The data determine the coefficients for a Carnahan-Starlings-DeSantis (CSD) equation of state.

The introduction of a new chemical species into the environment raises the question of the ultimate fate of that compound. In most cases, any compound which is introduced into the environment can undergo various transformations, physical and chemical. Of considerable importance is accumulation in the biosphere, which can take place when the chemical is lipid soluble. In this case, the concentration of the substance through the food chain becomes important. In concert with these physical transformations are chemical transformations such as oxidation, photolysis, hydrolysis, and complexation. It is important to understand both the rates and the mechanisms of these transformations in order to evaluate the environmental impact of a chemical species which may be introduced into the environment.

A series of fracture tests on large-scale, precracked, aluminum alloy panels were carried out to examine and characterize the process by which cracks propagate and link up in this material. Extended grips and test fixtures were specially designed to tension load the panel specimens in a 1780-kN capacity universal testing machine. Single sheets of bare 2024-T3 aluminum alloy, approximately 4 m high, 2.3 m wide, and 1 mm thick were fabricated with simulated through cracks oriented horizontally at midheight. Using existing information, a test matrix was set up to explore regions of failure controlled by fracture mechanics, with additional tests near the boundary between plastic collapse and fracture. In addition, a variety of multiple site damage (MSD) configurations were included to distinguish between various proposed linkage mechanisms. All tests but one used antibuckling guides. Three specimens were fabricated with a single central crack, six others had multiple cracks on each side of the central crack, and one had a single crack but no antibuckling guides. The results of each fracture event were recorded on various media: film, video, computer, magnetic tape, and occasionally optical microscope. The video showed the crack tip with a load meter in the field of view, using motion picture film for one tip and super VHS video tape for the other. The computer recorded the output of the testing machine load cell, the stroke, and the twelve strain gages at 1.5-second intervals. A wideband FM magnetic tape recorder was used to record data from the same sources. The data were analyzed by two different procedures: (1) the plastic zone model based on the residual strength diagram and (2) the R-curve.

Slow-strain-rate tensile tests and electrochemical experiments were performed in different aqueous solutions on ductile nickel aluminide, Ni(sub 3)Al+B, in order to evaluate the possibility of environmentally induced fracture of this material in neutral pH solutions as a result of hydrogen absorption. Two different processes were postulated that could lead to hydrogen absorption and embrittlement: (1) local acidification due to hydrolysis of the corrosion reaction products and (2) hydrogen reduction during the potential transient that accompanies film rupture and repair. Experiments were designed to evaluate each of these possibilities. First, slow strain rate tests were conducted in solutions with varying concentrations of metal ions and pH to determine the critical metal ion concentration and pH that result in hydrogen absorption and embrittlement of this material. Second, the potential transient that follows the mechanical rupture of the protective surface film in different solutions was measured and the minimum potential during the transient was compared to the potential that results in a hydrogen fugacity large enough to cause cracking. The results indicate that hydrogen reduction, absorption, and embrittlement are not to be expected in neutral solutions as a result of local acidification during crevice corrosion or film rupture during crack propagation or cyclic loading.

The mass spectra of a metal alloy sample consisting of Al, Cu and Fe were studied using both glow discharge mass spectrometry (GDMS) and resonance ionization mass spectrometry (RIMS). Particular emphasis was placed on the reduction of isobaric interferences and discrimination between those ions formed by the discharge and those formed by the laser radiation.

Dynamic Measurements of Thermophysical Properties of Metals and Alloys at High Temperatures by Subsecond Pulse Heating Techniques.
A. Cezairliyan. Nov 93, 15p.
In NASA. Lewis Research Center, Workshop on the Thermophysical Properties of Molten Materials p 71-85.

Keywords: *High temperature environments, *Pulse heating, *Thermophysical properties, *Liquid alloys, *Liquid metals, Dynamic characteristics, Electric potential, Electrical resistivity, Enthalpy, Phase transformations, Specific heat, Temporal resolution, Thermal expansion, Heat of fusion, Interfacial tension, Liquidus, Microgravity, Solidus, Spectral emission.

Rapid (subsecond) heating techniques developed at the National Institute of Standards and Technology for the measurements of selected thermophysical and related properties of metals and alloys at high temperatures (above 1000 C) are described. The techniques are based on rapid resistive self-heating of the specimen from room temperature to the desired high temperature in short times and measuring the relevant experimental quantities, such as electrical current through the specimen, voltage across the specimen, specimen temperature, length, etc., with appropriate time resolution. The first technique, referred to as the millisecond-resolution technique, is for measurements on solid metals and alloys in the temperature range 1000 C to the melting temperature of the specimen. It utilizes a heavy battery bank for the energy source, and the total heating time of the specimen is typically in the range of 100-1000 ms. Data are recorded digitally every 0.5 ms with a full-scale resolution of about one part in 8000. The properties that can be measured with this system are as follows: specific heat, enthalpy, thermal expansion, electrical resistivity, normal spectral emissivity, hemispherical total emissivity, temperature and energy of solid-solid phase transformations, and melting temperature (solidus). The second technique, referred to as the microsecond-resolution technique, is for measurements on liquid metals and alloys in the temperature range 1200 to 6000 C. It utilizes a capacitor bank for the energy source, and the total heating time of the specimen is typically in the range 50-500 micro-s. Data are recorded digitally every 0.5 micro-s with a full-scale resolution of about one part in 4000. The properties that can be measured with this system are: melting temperature (solidus and liquidus), heat of fusion, specific heat, enthalpy, and electrical resistivity. The third technique is for measurements of the surface tension of liquid metals and alloys at their melting temperature. It utilizes a modified millisecond-resolution heating system designed for use in a microgravity environment.

Convection and Morphological Stability During Directional Solidification.
S. R. Coriell, A. A. Chernov, B. T. Murray, and G. B. Mcfadden. Aug 94, 6p.
In NASA. Lewis Research Center, Second Microgravity Fluid Physics Conference p 175-180.

Keywords: *Anisotropy, *Binary alloys, *Convection, *Directional solidification (Crystals), *Interface stability, *Phase stability (Materials), Crystallography, Destabilization, Germanium alloys, Melts (Crystal growth), Morphology, Shear flow, Silicon alloys, Traveling waves.

For growth of a vicinal face at constant velocity, the effect of anisotropic interface kinetics on morphological stability is calculated for a binary alloy. The dependence of the interface kinetic coefficient on crystallographic orientation is based on the motion and density of steps. Anisotropic kinetics give rise to traveling waves along the crystal-melt interface, and can lead to a significant enhancement of morphological stability. The stability enhancement increases as the orientation approaches a singular orientation and as the solidification velocity increases. Shear flows interact with the traveling waves and, depending on the direction of the flow, may either stabilize or destabilize the interface. Specific calculations are carried out for germanium-silicon alloys.

Fracture Behavior of Large-Scale Thin-Sheet Aluminum Alloy.
R. Dewit, R. J. Fields, L. Mordfin, S. R. Low, and D. Harne. Sep 94, 21p.
Contract DTFA03-92-Z-00018
In NASA. Langley Research Center, FAA/NASA International Symposium on Advanced Structural Integrity Methods for Airframe Durability and Damage Tolerance, Part 2 p 963-983.

Keywords: *Aluminum alloys, *Cracks, *Failure, *Fracture mechanics, *Fracturing, *Metal sheets, *Residual strength, Crack tips, Field of view, Loads (Forces), Magnetic recording, Microscopy, Strain gages.

A series of fracture tests on large-scale, pre-cracked, aluminum alloy panels is being carried out to examine and to characterize the process by which cracks propagate and link up in this material. Extended grips and test fixtures were specially designed to enable the panel specimens to be loaded in tension, in a 1780-kN-capacity universal testing machine. Twelve panel specimens, each consisting of a single sheet of bare 2024-T3 aluminum alloy, 3988 mm high, 2286 mm wide, and 1.016 mm thick are being fabricated with simulated through-cracks oriented horizontally at mid-height. Using existing information, a test matrix has been set up that explores regions of failure that are controlled by fracture mechanics, with additional tests near the boundary between plastic collapse and fracture. In addition, a variety of multiple site damage (MSD) configurations have been included to distinguish between various proposed linkage mechanisms. All tests but one use anti-buckling guides. At this writing seven specimens have been tested. Three were fabricated with a single central crack, three others had multiple cracks on each side of the central crack, and one had a single crack but no anti-buckling guides. Each fracture event was recorded on film, video, computer, magnetic tape, and occasionally optical microscopy. The visual showed the crack tip with a load meter in the field of view, using motion picture film for one tip and SVHS video tape for the other. The computer recorded the output of the testing machine load cell, the stroke, and twelve strain gages at 1.5 second intervals. A wideband FM magnetic tape recorder was used to record data from the same sources. The data were analyzed by two different procedures: (1) the plastic zone model based on the residual strength diagram; and (2) the R-curve. The first three tests were used to determine the basic material properties, and these results were then used in the analysis of the two subsequent tests with MSD cracks. There is good agreement between measured values and results obtained from the model.

Boundary Conforming Grid Generation System for Interface Tracking.
B. V. Saunders. Feb 94, 22p, NISTIR-5352.

Keywords: *Liquid-solid interfaces, Mapping(Transformations), Binary alloys, Tensor products, Spline functions, Coordinates, Directional solidification, Grid generation(Mathematics).

The development of an algebraic grid generation system that tracks a solid-liquid interface during directional solidification of a binary alloy is discussed. A single mapping, constructed with tensor product B-splines, is proposed for calculations of both shallow and deep solidification cells. The initial spline coefficients for the coordinate mapping are modified to minimize a discrete functional that regulates the smoothness and orthogonality of the mesh. The use of transfinite blending function interpolation to obtain an initial grid is examined.

Effects of Elastic Stress on Phase Equilibrium in the Ni-V System.
Final rept.
M. J. Pfeifer, P. W. Voorhees, and F. S. Biancaniello. 1994, 6p.
Pub. in Scripta Metallurgica et Materialia 30, No. 6, p743-748 1994.

Keywords: *Elastic properties, *Stress analysis, *Phase diagrams, Nickel base alloys, Vanadium alloys, Phase transformations, Precipitation(Chemistry), Chemical equilibrium, Phase coherence, Transition points, Reprints, *Nickel vanadium, Congruent points.

Using our predictions of the effects of elastic stresses on the phase diagram of an alloy displaying a congruent point as a guide we studied experimentally the effects of elastic stress on the Ni-V phase diagram in the neighborhood of the Ni-V--> Ni3V congruent point. The Ni-V--> Ni3V transformation has been well studied and displays a congruent point at 25 at % V, 1,045 C. These experiments have shown that the effects of elastic stress on phase equilibrium is observable in the Ni-V system.

Pub. in Flammability Sensitivity of Materials in Oxygen-Enriched Atmospheres, ASTM STP 111, p193-215 1991. See also AD-A242 956.

Keywords: *Impact tests, *Flammability, Aluminum alloys, Lithium alloys, Chemical properties, Chemical reactions, Cracking(Fracturing), Mechanical tests, Deformation, Reprints, *Aluminum-Lithium alloys, *Oxygen compatibility.

Open-cup and pressurized mechanical impact tests were conducted at White Sands Test Facility (WSTF) on Al-Li alloys (2090, 8090, and WL049) and Al Alloy 2219 in various tempers. Pressure, drop height (potential energy), and environment (gaseous (GOX) or liquid (LOX)) oxygen were variables in the test program. Reactions were detected in all alloys. The reaction sensitivity was found to vary with specimen absorbed energy. Large, macroreactions occurred on specimen shear lips, a region that has very high deformation and is exposed to striker pin-specimen friction. Small, microreactions were found to occur over many areas of the specimen. The effects of the test variables (pressure, drop height, LOX, GOX) on the frequency of macro- and microreactions is discussed. It is shown that the energy for fracture is always less than, or equal to, the energy for (oxygen) reaction.

Successful hot isostatic pressing (HIP) of metal or intermetallic powders requires that the product meet many goals with respect to shape, density, microstructure and cost. The development of sensors which can detect sample characteristics during HIP consolidation and process models which can predict how the sample characteristics will respond to changes in its environment raises the possibility of active control based on these characteristics. The report describes intelligent processing of hot isostatic pressing.

Temperature Increases in Aluminum Alloys during Mechanical-Impact Tests for Oxygen Compatibility.
Final rept.
N. J. Simon, and R. P. Reed. 1991, 14p.
Pub. in Flammability Sensitivity of Materials in Oxygen-Enriched Atmospheres, ASTM STP 111, p367-380 1991.

Keywords: *Impact tests, *Aluminum alloys, *Fracture(Mechanics), *Temperature gradients, Thermal analysis, Cracking(Fracturing), Mechanical tests, Strain rate, Deformation, Reprints.

In mechanical-impact testing of Al-Li alloys and Al alloy 2219 for oxygen compatibility, specimens absorb a significant amount of energy in a short time. The absorbed energy is sufficient to crack and, in many cases, produce large fractures (splits) in the specimens. The high strain rate from impact results in the formation of adiabatic shear bands under adiabatic conditions in the deformed areas. Large local temperature increases in the specimens occur during deformation. Localized melting is more prevalent in alloy 2219, compared to Al-Li alloys. Microreactions also occur more frequently in 2219, but larger, macroreactions occur more readily in the Al-Li alloys. Estimates of temperature increases assuming macroscopic homogeneous deformation during impact are presented. Characteristic times to propagate a thermal transient and to complete the mechanical deformation process are estimated. The difference between the alloy systems in this characteristic time to propagate a thermal disturbance is used to discuss the sizes and frequencies of macro- and microreactions.

Keywords: *Aluminum intermetallics, *Niobium intermetallics, *Titanium intermetallics, Transmission electron microscopy, Binary systems(Materials), Orthorhombic lattices, Bcc lattices, Precipitates, Reprints.

Alloys of composition Ti2AlNb and Ti4AlNb3, cooled from 1400 C and equilibrated at 700 C for 26 days, were both found to consist of two phases: the Ti- and Nb-rich bcc phase and the orthorhombic phase based on Ti2AlNb. Depending on the alloy composition, each phase was observed as a precipitate with a plate morphology in the matrix of the other phase. In both cases, the phases share a common direction, (left bracket)011(right bracket)(bcc) (left bracket)001(right bracket)(ort), and interface (habit plane, (2(-1)1)(bcc) (1(-1)0)(ort). Geometrical patterns of plates of the different orientational variants were also observed. Analysis of the orientation relation, habit plane and plate patterns are consistent with the concept of a strain-type transition even though long range diffusion is required.

Pub. in Metallurgical Transactions A 22, n1 p5-10 1991.

Keywords: *Aluminum intermetallics, *Crystal structure, Transmission electron microscopy, X-ray diffraction, Hexagonal lattices, Monoclinic lattices, Single crystals, Lattice parameters, Reprints, *Chromium intermetallics.

Two Al-Cr compounds known in literature as the nu and epsilon phases were studied in the present work by precession camera single crystal x-ray diffraction and transmission electron microscopy (TEM). The results are different from those reported in the literature. The epsilon phase was found to be hexagonal P6(3)/mmc, with lattice parameters a=2.01 nm and c=2.48 nm. The phase is believed to be isomorphous to the Al4Mn nu phase. The nu phase has monoclinic (pseudo-orthorhombic) C centered Bravais lattice with a(3) approx.=1.76 nm, b(3) approx.=3.05 nm, c(3) approx.=1.76 nm and beta approx.=90 deg. Single crystal of the nu phase are usually twinned.

Pub. in Physical Review B 46, n22 p14 436-14 447, 1 Dec 92. Sponsored by Department of Energy, Washington, DC.

Keywords: *Martensitic transformation, *Sodium, Neutron diffraction, Neutron scattering, Inelastic scattering, Stacking faults, Temperature dependence, Temperature range 0013-0065 K, Cryogenic temperature, Reprints.

The martensitic transformation in sodium metal has been studied using neutron-diffraction and neutron-inelastic-scattering techniques. In two separate experiments the transformation was observed on cooling near 32 K. Measurements of the diffuse scattering, diffraction linewidths, quasielastic scattering, and the temperature dependence of the Sigma(4)(left bracket)hh0(right bracket) phonon energies above the transformation show no evidence of transformation precursors. The sodium martensite appears as 24 rhombohedral variants, four about each bcc (110), with reflections from their basal planes at (1.018, 0.92, + or - 0.06), (0.92, 1.018, + or - 0.06), and equivalent points. The layer stacking order of the variants is fixed by their relationship to the host bcc material. The crystallography of the low-temperature phase is shown to be a complex mixture of stacking-fault-affected rhombohedral polytypes of a particular 'almost-hexgonal' structure. These form a ladder of structures connected, one to another, by stacking faults. As the martensite is warmed and before the complete reversion to a bcc structure, the relative fraction of the different martensite phases changes. Near 55 K, the longest-period polytypes are the most stable.

Modeling the Evolution of Structure in Unstable Solid Solution Phases by Diffusional Mechanisms.
Final rept.
J. W. Cahn. 1991, 9p.
Pub. in Scandinavian Jnl. of Metallurgy 20, n1 p9-17 1991.

Keywords: *Crystal-phase transformation, *Solid solutions, *Diffusion theory, Reprints, Nonlinear differential equations, Order disorder transformations, Spinodal decomposition, Difference equations, Mathematical models, Alloys.

Certain phase changes evolve entirely by atom rearrangements among neighboring sites in a crystal structure, and can be understood through the formulation and solution of a realistic diffusion equation. A portion of the 1956 thesis by Mats Hillert, published in 1961 under the title 'A Solid-solution Model for Inhomogeneous Systems', is the seminal theoretical paper in this subject. It deals with solid solutions that have atoms confined to lattice points with a one-dimensional concentration variation, that are unstable to ordering or phase separation, and that evolve entirely by atom exchanges. The results of the theory were applied to his experimental observations on a spinodal alloy. Subsequent theoretical studies have extended the theory to include many factors that make the theory more realistic. Among them is another of Mats Hillert's themes; the introduction of the effects of stresses that result from the diffusional processes.

Stability, Microstructural Evolution, Grain Growth, and Coarsening in a Two-Dimensional Two-Phase Microstructure.
Final rept.
J. W. Cahn. 1991, 11p.
Pub. in Acta Metallurgica et Materialia 39, n10 p2189-2199 1991.

Keywords: *Grain growth, Binary systems(Materials), Grain boundaries, Two dimensional, Surface energy, Microstructure, Polycrystalline, Coarseness, Interfaces, Stability, Reprints.

The stability of microstructural features and how this affects grain growth and coarsening in a two-dimensional polycrystalline two-phase material with isotropic energies for the two grain boundaries and the interphase interface is examined using classical concepts of classical capilarity and surface energy driven processes. A catalog of stable microstructural features depends on surface-energy ratios; it is shown to include a four-grain junction that is stable for a range of surface-energy ratios, and, for a given set of ratios, is stable over a range of angles. It is the grain boundary analog of the line junctions among four phases, discussed by Gibbls. Three-grain junctions and grain boundaries had been known to have a limited range of stability. Inferences about grain growth, coarsening, and evolving morphology are obtained from the integrated curvature of the bounding surface of a grain, which depends on the number and phase of neighboring grains, as well as the order of their arrangement. Under some conditions, a dispersion of grains of a boundary phase will tend to a uniform size; this phase resists coarsening.

Measuring the Stability of Three Copper Alloys.
Final rept.
T. Doiron, J. Stoup, P. Snoots, and G. Chaconas. 1990, 8p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers, San Diego, CA., July 12-13, 1990, v1335 p45-52.

Keywords: *Dimensional stability, *Copper alloys, *Experimental design, Dimensional measurement, Measuring instruments, Length, Probability theory, Error analysis, Brass, Beryllium copper, Reprints, Tellurium copper alloys.

In the paper the authors report measurements of the dimensional stability of samples of brass, beryllium copper, and tellurium copper taken over an 18 month time span. Of the materials, brass was the most stable, decreasing slightly in length at the rate of 1 part per million per year (ppm/y) with an uncertainty (3) of about 1 ppm/y. Tellurium copper shrank at an average rate of 2.4 ppm/y and beryllium copper at the rate of 5.8 ppm/y. In order to measure the instrumental uncertainty there were 4 samples of each material were measured, and the measurement scheme was designed to detect and correct for thermal drift during measurements. The experiment design and the problems associated with these measurements and their associated uncertainties are discussed.

Pub. in Proceedings of International Conference on Isostatic Pressing (4th), Stratford-upon-Avon, UK, November 5-7, 1993, p38.1-38.17. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Metal powder, *Hot isostatic pressing, *Densification, *Distortion, Compacting, Shear stress, Plastic properties, Finite element method, Porous materials, Powder metallurgy, Reprints.

While compaction under purely isostatic pressure is distortion-free, the introduction of shear stresses, e.g. by the canister, can cause a change in shape of a powder compact. The paper describes a plasticity theory for both shape and volume change of compacts. It is first formulated at a level sufficiently general to apply to both porous and particulate media. It is then combined with the Ashby micromechanical plasticity model for powder compaction, modified to allow for work-hardening, and applied to particulate compacts. It tests favorably against experimental data for a variety of powder compacts in uniaxial and isostatic stress states. The theory of Gurson for porous materials does not fit this data from particulate materials very well. The effect of shear stresses, generated by the containment cansiter, on shape change is then examined using data from copper powder compacts in copper canisters. The theory is available for finite element modeling.

In the present work we report finding a new Ti-Al-Nb phase which is apparently a more ordered derivative of the B82 phase. The phase was found as fine precipitates in the presumably B8(2) matrix in Ti-37.5Al-20Nb at% alloy. A possible structure of the new phase will be discussed based on the results of electron diffraction and high-resolution microscopy.

Energy and Migration of Grain Boundaries in Polycrystals.
Final rept.
C. Handwerker. 1993, 11p.
Pub. in Interfaces: Structures and Properties, Chapter 20, p339-349 1993.

Keywords: *Grain boundaries, *Microstructure, *Polycrystals, *Physical properties, *Diffusion, Scanning electron microscopy, Electron diffraction, Backscattering, Surfaces, Reprints.

A challenge in the field of microstructure evolution is to understand the physical processes that govern microstructure evolution and the relationship between microstructure and the resulting physical properties of the polycrystal. In this paper two new scanning electron microscope (SEM) techniques for measuring two fundamental characteristics of grain boundaries are described. A metal reference line technique (MRL) has been developed for measuring surface-grain boundary dihedral angles from thermal grooves at a sample surface using an SEM. The second technique is the electron backscattered diffraction pattern (EBDP) for measuring grain texture and grain-grain misorientations.

Fabrication of Platinum-Gold Alloys in Pre-Hispanic South America: Issues of Temperature and Microstructure Control.
Final rept.
C. Handwerker, H. Lechtman, R. Marinenko, D. Bright, and D. Newbury. 1991, 16p.
Pub. in Materials Research Society Symposia Proceedings, v185 p649-664 1991.

Keywords: *Metallurgy, *Platinum alloys, *Gold alloys, *Temperature, *Microstructure, Sintering, Electron microscopy, Phase diagrams, Chemical composition, Fabrication, Historical aspects, Reprints.

The microstructures and compositions of sintered Pt-Au objects from La Tolita, Ecuador, and of experimentally simulated Pt-Au alloy samples were analyzed using new electron microprobe microanalysis (EPMA) techniques and data from the Pt-Au phase diagram in an effort to determine the fabrication temperatures used by Pre-Hispanic South American smiths. A comparison of EPMA results from the simulated materials with the corresponding results from the La Tolita Pt-Au objects suggests that the Pt-Au objects were never heated as high as 1100 C and probably never contained a liquid phase. As illustrated by this comparison, the qualitative and quantitative information provided by these new digital acquisition and display techniques far exceeds what conventional line scan and x-ray dot maps could provide.

In-situ Fume Particle Size and Number Density Measurements from a Synthetic Smelt.
Final rept.
J. C. L. Hsu, C. Presser, and D. T. Clay. 1990, 9p.
Pub. in Proceedings of American Institute of Aeronautics and Astronautics/American Society of Mechanical Engineers Thermophysics and Heat Transfer Conference, Seattle, WA., June 18-20, 1990, p67-75.

Keywords: *Particle size distribution, *Smelting, Polarization, Density, Fumes, Sodium, Potassium, Light scattering, Reprints.

In Kraft recovery furnaces, significant fuming takes place of sodium and potassium. It is essential to quan-

tify the fume generation rate because fume particles coat heat transfer tubes and plug flue gas passages. To address this problem an ensemble light scattering technique, based on measurement of the polarization ratio, was used to measure fume particle size and number density from a synthetic Kraft smelt. This in-situ nonintrusive technique is used because of its application to high density particle-laden flows. Measurements were also carried out at different scattering angles in order to determine the imaginary part of the particle complex refractive index. In addition, fume particle size distributions obtained from scanning electron microscope images were correlated with the log-normal distribution function. Results indicated that an increase in nitrogen flow rate generated smaller fume particles, while a higher air flow rate produced larger fume particles. In addition, increased nitrogen flow rate increased fume mass density, but the air flow rate had a negligible effect. The fume particle geometric mean diameter (Dg) was found to vary with gas flow rate between values of 0.2 and 0.3 m, and number density varied between 3 x 10(exp 7) and 2 x 10(exp 8) particles/cc.

Development in the Theory and Analysis of Eddy Current Sensing of Velocity in Liquid Metals.
Final rept.
A. H. Kahn, and L. C. Phillips. 1992, 12p.
Pub. in Res. Nondestr. Eval. 4, p237-248 1992.

Keywords: *Velocity measurement, *Liquid metals, *Eddy currents, Magnetic properties, Nondestructive tests, Magnetic fields, Velocity distribution, Magnetic coils, Flow measurement, Reprints, *Electromagnetic flowmeters.

We have performed a theoretical study of the magnetic fields produced by a single turn ac coil encircling a moving conductive rod or tube of flowing liquid metal. A solution exact to first order in the velocity has been obtained as a closed-form integral. Radial variation of the velocity profile is included. The solution allows a calculation of the voltages induced in two secondary coils wired in opposition for application as a velocimeter. With secondary coils wired in series, the calculation provides the classical impedance vs. frequency curves which allow determination of sample conductivity and diameter. The solution has been used to optimize design for a sensor to be used for monitoring speed and tube bore diameter in a liquid metal atomizer system. An additional solution has been obtained for arbitrary magnitude of velocity, but for constant velocity profile.

Thermodynamic Calculation of the Ternary Ti-Al-Nb System.
Final rept.
U. R. Kattner, and W. J. Boettinger. 1992, 9p.
Pub. in Materials Science and Engineering A152, p9-17 1992.

Keywords: *Ternary alloy systems, *Titanium alloys, *Aluminum alloys, *Niobium alloys, Phase diagrams, Thermodynamics, Computation, Reprints, Phase equilibrium.

Phase equilibria of the ternary Ti-Al-Nb system are dominated by the large range of homogeneity of (beta-Ti,Nb), the binary intermetallic compounds of the Nb-Al and Ti-Al systems and the formation of two ternary compounds. The available ternary experimental data, together with a thermodynamic extrapolation of the ternary system from the binary systems, have been used to calculate the ternary phase diagram. The model descriptions of the Gibbs energies of most of these compounds are given by the existing calculations of the binary systems. In order to model a phase which is present in only one binary system, but has a ternary homogeneity range, a hypothetical phase with the same structure was analytically described for each binary system. Such a phase would, of course, be metastable in the other binary systems. Constraints on the Gibbs energies of formation were derived from the crystal structures of the corresponding ordered compounds. These same constraints were employed for the corresponding phases in the ternary system. In a final optimization step, ternary parameters were introduced and adjusted to the available experimental data. The as-derived description of the ternary Ti-Al-Nb system can be used to estimate single or multiphase fields and thermodynamic quantities where no experimental data are yet available. It is also useful as an indicator of problem areas for which additional experimental data are required.

Thermodynamic Assessment and Calculation of the Ti-Al System.
Final rept.
U. R. Kattner, J. C. Lin, and Y. A. Chang. 1992, 10p.
Pub. in Metallurgical Transactions A 23A, p2081-2090 Aug 92.

Keywords: *Binary alloy systems, *Titanium alloys, *Aluminum alloys, Least squares method, Phase diagrams, Thermodynamics, Intermetallics, Computation, Reprints.

A thermodynamic description of the Ti-Al system has been developed. Three different analytical descriptions were used to describe the three different types of phases occurring in the Ti-Al system: the stoichiometric compounds, the disordered solution phases, and the ordered intermetallic compounds which have homogeneity ranges. A least-squares technique was used to optimize the thermodynamic quantities of the analytical description using experimental data available in the literature. The calculated phase diagram, as well as the thermodynamic functions, agree well with the critically evaluated experimental data from the literature.

A cooperative test program to assess the oxygen compatibility of aluminum-lithium alloys with White Sands Test Facility (WSTF), Marshall Space Flight Center (MSFC), and the National Institute of Standards and Technology (NIST) led to assessment of the mechanical impact test by NIST. There were substantially different variations in test parameters between the test laboratories; some of these led to significant variability in the actual energy absorbed by the specimens. Therefore, test results varied widely. To reduce the large disparities in interlaboratory test results, a number of changes are recommended in the current ASTM test standards.

Electric Field Effects on Crack Growth in a Lead Magnesium Niobate.
Final rept.
A. S. Raynes, G. S. White, and S. W. Freiman. 1990, 14p.
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Ceram. Trans. 15, p129-142 1990.

Keywords: *Crack propagation, *Electric fields, *Lead compounds, *Niobates, *Magnesium compounds, Strain(Mechanics), Field strength, Electrodes, Fracturing, Reprints, Electrostrictive strain.

The influence of an applied electric field on crack extension in a lead magnesium niobate ceramic was investigated in order to evaluate possible effects of electrostrictive strain on crack propagation. Cracks were generated by indenting polished specimen surfaces equidistant between imbedded parallel electrodes. The field was applied before indentation and maintained for the duration of the measurement. Results showed that cracks emanating from indentations perpendicular to the applied field were consistently shorter than those from indentations made with no field present. No effect of field was observed on cracks parallel to the field. Crack length also appeared to depend on the indentation location relative to the electrodes. A qualitative model explaining these results is proposed.

Pub. in Proceedings of the Symposium on Flammability and Sensitivity of Materials in Oxygen-Enriched Atmospheres, Cocoa Beach, FL., May 14-16, 1991, ASTM STP 1111, p240-259.

Keywords: *Aluminum alloys, *Lithium alloys, *Impact tests, *Accelerated life tests, Morphology, Metallography, Liquid oxygen, Oxygen, Pressure, Reprints, Macroreactions, Microreactions.

Open-cup and pressurized mechanical-impact tests have been conducted at White Sands Test Facility on selected tempers of Al-Li alloys (2090, 8090, WL049), and Al alloy 2219. Both liquid (LOX) and gaseous (GOX) oxygen environments were used and pressure and drop height (potential energy) were varied in each environment. Reactions were observed in all alloys and tempers on both sides of the specimens. Reaction sizes, morphologies, and locations were characterized using a magnifying glass (2X power), a light microscope (5 to 100X), and a scanning electron microscope (100 to 3000X). Photomicrographs of various types of macro- and microreactions are presented and discussed. The variety of sizes of reactions poses a serious problem for the definition of a reaction in standards documents for LOX and GOX mechanical-impact qualification testing. This dilemma is discussed.

Keywords: *Impact tests, *Aluminum alloys, *Lithium alloys, *Energy absorption, Fracture mechanics, Liquid oxygen, Potential energy, Deformation, Strain(Mechanics), Reprints.

In mechanical impact tests, the potential energy of the plummet is divided between energy absorbed by the specimen, the plummet kinetic energy of rebound, and various losses in the test machine. Thus, all of the potential (or drop height) energy is not transferred to the specimen. The fracture and deformation characteristics and the reactability of metal specimens are dependent on the amount of energy that the specimen absorbs. The absorbed energy may be calculated either from knowledge of the potential energy and rebound height (assuming losses are negligible), or from the depth of striker-pin penetration into the specimen. The depth measurement gives an estimate of specimen strain; a reasonable estimate of force exerted on the specimen during deformation allows calculation of the work of deformation. The effects of the absorbed energy on fracture and deformation characteristics and on reactions in Al-Li alloys and alloy 2219 are discussed.

Keywords: *Atomization, *Powder metals, *Particle size distribution, *Size determination, *Diffraction analysis, Reprints, Powder metallurgy, Solidification, Flow velocity, Microstructure, *Laser diffraction.

Special properties of rapidly solidified metal powders that are of particular interest to materials engineers include improved chemical homogeneity, novel microstructures, increased solubility and spherically smooth surfaces. These properties have a strong dependence on the solidification rate, and therefore on the particle size. Inert gas pressure, nozzle design and gas/melt flow rates can be used to control powder size, once the particular characteristics of a system are understood. A size, once the particular characteristics of a system are understood. A state-of-the-art sensor system is therefore required to provide high-speed, nonintrusive measurements of particle characteristics for process feedback and control. To address this challenge, a commercially-available particle size analyzer, based on laser diffraction is used to monitor the powder stream in the exhaust section of the Supersonic Inert Gas Metal Atomizer (SiGMA) at NIST. A line-of-sight measurement technique is preferred over one with a discrete point measurement, since this technique provides particle size information which is more representative of the entire flow stream passing through the atomizer exhaust section.

Phase-Field Model for Solidification of a Eutectic Alloy.
A. A. Wheeler, G. B. McFadden, and W. J. Boettinger. Sep 94, 52p, NISTIR-5523.

Keywords: *Eutectic alloys, *Solidification, *Phase transformations, Liquid-soil interfaces, Crystallization, Concentration(Composition), Mathematical models, *Phase field models.

In this paper we discuss two phase-field models for solidification of a eutectic alloy, a situation in which a liquid may transform into two distinct solid phases. The first is based on a regular solution model for the solid with a chemical miscibility gap. This model suffers from the deficiency that, in the sharp interface limit, it approximates a free-boundary problem in which the surface energy of the solid/solid interface is zero and consequently mechanical equilibrium at a trijunction requires that the solid/solid interface has zero dihedral angle (locally planar). We propose a second model which uses two order parameters to distinguish the liquid phase and the two solid phases. We provide a thermodynamically consistent derivation of this phase-field model which ensures that the local entropy production is positive. We conduct a sharp interface asymptotic analysis of the liquid/solid phase transition and show it is governed by a free-boundary problem in which both surface energy and interface kinetics are present. Finally, we consider a sharp interface analysis of a stationary trijunction between the two solid phases and the liquid phase, from which we recover the condition that the interfacial surface tensions are in mechanical equilibrium (Young's equation). This sharp interface analysis compares favorably with numerical solutions of the phase-field model appropriate to a trijunction.

R. M. Waterstrat. 1992, 4p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of the American Dental Association 123, p33-36 Dec 92.

Keywords: *Zirconium alloys, *Palladium alloys, *Ruthenium alloys, *Wear resistance, *Fracture strength, Implantation, Dental equipment, Medical equipment, Performance evaluation, Crack propagation, Reprints.

A newly invented alloy of zirconium, palladium and ruthenium holds great promise for use in high-strength orthodontic wires, dental and medical implants, and in other applications because of its extraordinary fracture-toughness and wear resistance. Cracks produced experimentally in alloy samples are apparently prevented from propagating by internal stress-induced transformations that occur at the crack tips. This type of behavior has been observed previously in certain industrial ceramics and alloy steels but is a relatively rare phenomenon. ADA and government scientists at the National Institute of Standards and Technology are particularly excited about the alloy because of the insights it might offer on the wear process mechanism and because of its practical implications.

J. J. Wlassich, and R. B. Clough. 1989, 6p.
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA. and Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in Proceedings of International Conference on Hot Isostatic Pressing (2nd): Theory and Applications, Gaithersburg, MD., June 7-9, 1989, p123-128.

Keywords: *Grain growth, *Hot isostatic pressing, *Metals, Grain structure(Metallurgy), Sintering, Copper, Microstructure, Diffusion, Pressing(Forming), Reprints.

This paper describes an investigation into a practical model of grain growth for coupling with a microstructural model of densification during Hot Isostatic Pressing (HIP). Grain growth affects densification through plastic yielding and diffusive mechanisms, which are grain size dependent. Depending on the HIP conditions, grain growth can increase or inhibit densification. The grain growth formulation stated here contains relatively well-established parameters for many materials. Coupled with the densification model it executes rapidly on modest computer resources, making the models amenable for further study into the effects of microstructural coarsening on densification. The grain growth model was compared to experiments using OFHC copper compacts that were sintering. Results show that the grain growth model can yield good results but is necessarily sensitive to the value for the activation energy of volume self diffusion.

Keywords: *Indentation, *Copper, *Micromechanics, *Impact tests, Deformation, Finite element method, Penetration, Computational grids, Plastic properties, Elastic properties, Reprints, *EPIC computer program, *Hybrid methods.

The impact code EPIC was employed to study the relationship between the applied force and the penetration depth in a micrometer-scale indentation experiment with oxygen free high conductivity (OFHC) copper. EPIC is an elastic-plastic finite element code that uses a Lagrangian formulation and triangular mesh, which can accommodate large deformation without the need to remesh during the computation process. By fitting the force-penetration curves for a triangular indenter with second degree polynomials, it was demonstrated that the fit changed with two material constants in the constitutive equation. A systematic procedure for determining the material constants is described that is based on matching either the slope or the curvature of the force penetration depth curves from numerical simulation and experiments. It is concluded that material constants can be determined from indentation data obtained using pyramidal or spherical indenters as well as a flat-ended indenter.

Ultrasonic Method for Reconstructing the Two-Dimensional Liquid-Solid Interface in Solidifying Bodies.
Final rept.
F. A. Mauer, S. J. Norton, Y. Grinberg, D. Pitchure, and H. N. G. Wadley. 1991, 7p.
Pub. in Metallurgical Transactions B 22, n4 p467-473 1991.

Keywords: *Solidification, *Ultrasonic tests, *Aluminum, Tomography, Time of flight spectrometers, Strands, Fluid boundaries, Least squares method, Reprints, *Liquid-solid interfaces.

A method is demonstrated for reconstructing the two-dimensional boundary of the liquid core in a solidifying strand of aluminum using ultrasonic time-of-flight data. Approximating the boundary by an ellipse leads to a model that can be used to calculate the time-of-flight along any path in the plane of the ellipse. The shape and location of the ellipse are specified by four free parameters. A least-squares algorithm is then used to find the set of four parameters that provides the best fit to the measured time-of-flight data on ten intersecting paths through the strand. For a strand with a 6 inch square cross section, the agreement between the actual interface and the computed interface was within about + or - 2%. Reference data for the temperature dependence of longitudinal velocity for solid 1110 aluminum are included.

Sponsored by National Science Foundation, Washington, DC. and National Aeronautics and Space Administration, Washington, DC.
Pub. in Applied Mechanics Reviews 43, n5 pS54-S55 May 90.

Keywords: *Liquid-solid interface, Binary alloys, Stability, Reprints, *Crystal-melt interface, Directional solidification, Elastic stresses.

The effects of elastic stress on the stability of solid-liquid interfaces under a variety of conditions are discussed. In the cases discussed, the nonuniform composition field in the solid, which accompanies either the melting process or the development of a perturbation on the solid-liquid interface during solidification, generates nonhydrostatic stresses in the solid. Such compositionally generated elastic stresses have been shown experimentally to induce a solidifying solid-liquid interface to become unstable. We are in the process of analyzing the effects of these stresses on the conditions for morphological stability of a directionally solidified binary alloy.

Sponsored by Department of Energy, Washington, DC.
Pub. in Materials Research Society Symposia Proceedings, v230 p61-66 1992.

Keywords: *Aluminum, *Niobium, Metal films, Thin films, Microstructure, Reprints, *Interfacial reactions, Phase formation, Multilayers.

We investigated the phase formation sequence in the reaction of multilayer thin films of Nb/Al with overall compositions of 25 and 33 at.% Al. We report novel phenomena which distinguish thin-film reactions unequivocally from those in bulk systems. For sufficiently thin layers, composition and stability of product phases are found to deviate significantly from that predicted from the equilibrium phase diagram. We demonstrate that in the Nb/Al system, the length scales below which such deviations occur is about 150 nm. We believe that these phenomena occur due to the importance of grain boundary diffusion and hence microstructure in these thin films.

Sponsored by Department of Energy, Washington, DC.
Pub. in Materials Research Society Symposia Proceedings, v230 p55-60 1992.

Keywords: *Niobium, Aluminum, Transmission electron microscopy, X ray diffraction, Metal films, Thin films, Calorimetry, Annealing, Aluminum intermetallics, Niobium intermetallics, Reprints, *Interfacial reactions, Phase formation, Niobium aluminides, Multilayers.

Phase formation kinetics in the reaction of Nb/Al multilayered thin films were investigated using scanning calorimetry, x-ray diffraction, and transmission electron microscopy. The first phase to form upon annealing the Nb/Al layered structure is the NbAl3 intermetallic. Its formation is clearly identified by the calorimetry to be a two-stage process, which has been modeled as the nucleation and three-dimensional growth to coalescence of the product phase in the plane of the initial interface, followed by the thickening of the product layer by one-dimensional growth perpendicular to the interface plane. For the initial reaction stage the reaction front velocity is higher than can be supported by diffusional transport within the lattice adjacent to the moving interface. Thus diffusion along nonequilibrium interfaces must be the growth mechanism. The large volume fraction consumed during the initial reaction stage indicates a lower nucleation site density than expected at a Nb/Al interface at local equilibrium, suggesting that the interface transport is reducing the driving force for nucleation.

P. G. Sanders, J. R. Weertman, J. G. Barker, and R. W. Siegel. 1993, 6p.
Pub. in Scripta Metallurgica et Materialia 29, p91-96 1993.

Keywords: *Neutron scattering, *Palladium, *Crystal defects, *Grain boundaries, Small angle scattering, Particle size, Mechanical properties, Crystal structure, Reprints, *Nanocrystalline materials.

Nanocrystalline materials, with grain sizes on the order of nanometers, have many interesting properties as a result of having confining grain sizes and a significant fraction of their atoms in grain boundary regions. Nanocrystalline materials may be synthesized by inert gas condensation and compaction, as developed by Gleiter and co-workers. While this processing method is very effective, it does produce specimens containing defects of various sizes. Evidence for the presence of these defects in nanocrystalline metals includes substantial deviations from theoretical density, positron lifetime measurements, and small angle neutron scattering (SANS) measurements. Previous SANS results have been interpreted primarily in terms of scattering from low density grain boundaries, although the contribution from pores has also been recognized. The presence of such defects is believed to have a strong influence on the apparent strength of nanocrystalline metals; therefore, any comprehensive study of mechanical behavior should include detailed information on the defect structure of the material. As part of a study of mechanical properties and their correlation with changes in internal structure, SANS measurements were made on a series of nanocrystalline palladium (n-Pd) samples. Preliminary results of the study are described.

Keywords: *Particle shape, Boundary integral method, Particle motion, Thermodynamics, Coarseness, Elasticity, Morphology, Anisotropy, Dynamics, Reprints, Two phase systems, Ostwald ripening, Particle coarsening.

We examine the equilibrium shape and the dynamics of the morphological evolution of a coherent misfitting particle in an elastically anisotropic medium. No a priori assumptions are made on the possible particle morphologies; the particle evolves in a manner consistent with both the diffusion and elastic fields surrounding the particle and the thermodynamics of interfaces in stressed solids. Through these calculations we find the thermodynamically stable equilibrium shape of a misfitting particle. By thermodynamically stable we mean that all the equilibrium conditions, elastic, chemical and interfacial are satisfied simultaneously, in contrast to previous treatments which determined the equilibrium shape by minimizing the sum of the elastic and interfacial energies for certain classes of particle shapes. We find that the equilibrium particle morphologies are not simple geometric shapes, have fourfold symmetry and a continuously varying interfacial curvature with position along the interface. Furthermore, the results show that the times required for a particle to evolve to its equilibrium morphology are likely to be within those which are accessible experimentally. In addition, we develop a general approach for determining the equilibrium shape of a particle in an elastically stressed solid.

Radiance Temperatures (in the Wavelength Range 523-907 nm) of Group IV B Transition Metals Titanium, Zirconium, and Hafnium at Their Melting Points by a Pulse-Heating Technique.
Final rept.
A. Cezairliyan, J. L. McClure, and A. P. Miller. 1994, 18p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in International Jnl. of Thermophysics, v15 n5 p993-1009 1994.

Keywords: *Emissivity, *Transition metals, *Melting points, *Pulse heating, Temperature measurement, Radiant flux density, Hafnium, Titanium, Zirconium, High temperature, Reprints.

The melting-point radiance temperatures (at six wavelengths in the range 523-907 nm) of the Group IVB transition metals titanium, zirconium, and hafnium were measured by a pulse-heating technique. The method is based on rapid resistive self-heating of the specimen from room temperature to its melting point in less than 1 s and on simultaneously measuring the specimen radiance temperatures every 0.5 ms with a high-speed six-wavelength pyrometer. Melting was manifested by a plateau in the radiance temperature-versus-time function for each wavelength. The melting-point radiance temperatures for a given specimen were determined by averaging the measured temperatures along the plateu at each wavelength.

Keywords: *Liquid solid interfaces, Reprints, Mapping(Transformations), Binary alloys, Tensor products, Spline functions, Coordinates, Directional solidification, Grid generation(Mathematics).

The development of an algebraic grid generation system to track a solid-liquid interface during directional solidification of a binary alloy is discussed. A single mapping, constructed with tensor product B-splines, is proposed for calculations of both shallow and deep solidification cells. The initial spline coefficients for the coordinate mapping are modified to minimize a discrete functional that regulates the smoothness and

orthogonality of the mesh. The use of transfinite blending function interpolation to obtain an initial grid is examined.

Factors Significant to Precracking of Fracture Specimens.
C. G. Interrante, and J. J. Filliben. Nov 89, 102p, NISTIR-89/4214.

Keywords: *Fracture tests, *Impact tests, *Titanium, *Aluminum, *Steels, Standards, Cracking(Fracturing), Toughness, Fatigue(Materials), Stress analysis, Bend tests.

The significance of four controlled variables in the technique used to precrack Charpy specimens is determined by analyses of seven response variables computed from results of slow-bend tests of metallic materials. The results can be summarized in three major conclusions: (1) All seven computed responses are linearly related to crack size and the sensitivity to crack size depends on the choice of response parameter and on the material. (2) Precracking at either very high or very low levels of stress-intensity factor KF, are to be avoided. (3) For the three methods of notch preparation, the effects of notch preparation were largely not significant. This work is the result of a study conducted by ASTM Task Group E24.03.03 and members of eight participating laboratories.

Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n2 p119-171 Mar/Apr 95.

Keywords: *Mechanical properties, *Silver, Temperature, Physical properties, Conductivity, Cryogenics, Superconductors, Thermodynamics.

Pure silver is used extensively in the preparation of high-temperature superconductor wires, tapes, films, and other configurations in which the silver not only shields the superconducting material from the surrounding materials, but also provides a degree of flexibility and strain relief, as well as stabilization and low-resistance electrical contact. Silver is relatively expensive, but at this stage of superconductor development, its unique combination of properties seems to offer the only reasonable means of achieving usable lengths of conductor. In this role, the low-temperature physical (electrical, thermal, magnetic, optical) and mechanical properties of the silver all become important. Here the authors present a collection of properties data extracted from the cryogenic literature and, to the extent possible, selected for reliability.

Effects of Copper, Nickel and Boron on Mechanical Properties of Low-Alloy Steel Weld Metals Deposited at High Heat Input.
Final rept.
A. O. Kluken, T. A. Siewert, and R. Smith. 1994, 7p.
Pub. in Welding Research Supplement, p193s-199s Aug 94.

Keywords: *Weld metal, *Heat, *Fracture resistance, *Submerged arc welding, Reprints, Mechanical properties, Tensile strength, High heat input.

The authors studied the effects of copper, nickel and boron on the mechanical properties of low-alloy steel weld metals deposited at high heat input (4.8 kJ/mm) by the submerged arc process. The copper and nickel contents of the welds were systematically varied within the ranges of 0.03 to 0.89 wt-% Cu and 0.01 to 1.54 wt-% Ni. In addition, several of these copper and nickel combinations were duplicated with welds containing 36 to 44 ppm B. Tensile testing revealed yieled strengths in the range from 462 to 546 Mpa, and ultimate tensile strengths from 638 to 869 Mpa. The weld metal Charpy V-notch (CVN) data showed a 35 J transition temperature, ITT, ranging from -28 to 55 C. Upon adding boron, patches of intergranular fracture were present on the CVN fracture surfaces. This was particularly true when boron was added at the higher copper and nickel levels. Qualitative metallographic examinations revealed the presence of extensive amounts of particles at the prior austenite grain boundaries in boron containing welds. Furthermore, adding boron at the higher copper and nickel levels promoted the formation of the MAC (martensite-austenite-carbide) microconstituent. Also nickel seemed to promote formation of MAC in reheated weld metal. At this high heat input (4.8 kJ/mm), additions of copper, nickel and boron did not improve the mechanical properties.

See also PB87-111662.
Pub. in Jnl. of Materials Research, v10 n6 p1352-1353 Jun 95.

Keywords: *Elastic properties, *Copper, Internal friction, Reprints, Ultrasonics, Vibrations, Spectroscopy, Koehler-Granato-Lucke model.

Using ultrasonic-resonance spectroscopy (URS), we measured the elastic constant C and companion internal friction Q-1 of isotropic polycrystalline copper. The annealed material was 0.9999 pure with equiaxed heavily twinned grains averaging about 75 micrometers diameter. The URS method offers the principal advantage of point contact or loose coupling, thus there was no contribution from a transducer-specimen bond and only small contributions from transducers and fixture. A second advantage is one measurement for all elastic constants and all associated internal frictions. The C's agree with established values. The Q-1's are much lower than pulse-echo-method values. Comparison of measured Q-1 with the Koehler-Granato-Lucke model permits estimating an effective dislocation-loop length. Q-1 (shear) exceeds Q-1 (Longitudinal) by a factor of about 1.5.

Effect of Charpy V-Notch Striker Radii on the Absorbed Energy.
Final rept.
T. A. Siewert, and D. P. Vigliotti. 1995, 13p.
Pub. in Pendulum Impact Machines, p140-152 May 95.

Keywords: *Impact tests, *Energy absorption, Fracture mechanics, Strain(Mechanics), Reprints, Charpy V-notch, Striker radius.

The two most common Charpy V-notch striker designs (8-mm and 2-mm radii on the striking edge) were compared using verification (reference-grade) impact specimens. Other variables in the test matrix included two different brands of U-type pendulum machines and four different specimen energy ranges (near 18, 45, 100, and 200 J). In this comparative study, we found a very small difference betwenn the two striker designs and an even smaller difference between the two brands of machines. At 200 J, the difference between the two striker designs was about 10 J. This difference might not be important in most production testing, but must be considered in verification testing where the acceptable range may be 5 percent. The standard deviations of absorbed energy for the two strikes were similar, except at 200 J were the 2-mm striker produced standard deviations about 3 times higher than the 8-mm striker.

Inelastic Neutron Scattering Study of Hydrogen in Nanocrystalline Pd.
Final rept.
U. Stuhr, H. Wipf, T. J. Udovic, J. Weissmuller, and H. Gleiter. 1995, 4p.
Pub. in NanoStructured Materials, v6 p555-558 1995.

Keywords: *Neutron scattering, *Palladium, *Grain boundaries, Crystal structure, Reprints, *Foreign technology, *Nanocrystalline materials.

The vibrational excitations and the position of hydrogen in nanocrystalline Pd was investigated by neutron spectroscopy. This study was restricted to low hydrogen concentrations where no hydrogen precipitation was observed at room temperature. The experiments show that most of the hydrogen is incorporated in the grain boundaries and at the inner surfaces of the grains. Surface modes of the hydrogen can be identified. Compared to coarse-grained Pd, no change in the hydrogen solubility was found for the lattice regions of the nanocrystalline Pd.

Nonlocal Effects of Existing Dislocations on Crack-Tip Emission and Cleavage.
Final rept.
V. Shastry, P. M. Anderson, and R. Thomson. 1994, 16p.
Pub. in Jnl. of Materials Research, v9 n3 p812-827 Mar 94.

Keywords: *Ductile brittle transition, *Crack propagation, Cleavage, Emission, Reprints, Fractures(Materials), *Dislocations(Materials).

This paper investigates the criterion for a ductile-to-brittle transition in materials, due to nonlocal shielding effects at the crack tip when the dislocation free zone (DFZ) size is small. It is found that both cleavage and emission criteria are altered by nonlocal shielding, but that the emission shift is dominant, and is always in the direction to increase the local critical stress intensity for emission, kIIe. The nonlocal shift varies with the sum sigma(gamma(sub us)dj) to the negative 3/2, over each dislocation (j), where gamma(sub us) is the unstable stacking fault energy, and dj is the distance from each dislocation to the crack tip. When there is a pileup of many shielding dislocations against a barrier near the crack tip, the total shift for the pileup varies as (gamma(sub us)d) to the minus 1 power. The most likely candidates for a brittle transition induced by the nonlocal shift are materials where barriers to dislocation motion exist within 10-100 nanometers of the crack tip, such as in thin films, multilayers, or ultrafine grain materials.

Keywords: *BCC lattices, *Orthorhombic lattices, Phases, Reprints, Structural relations, *Domain structures, Elastic accommodation, Space group relations.

Possible paths for the constant composition coherent transformation of BCC or B2 high temperature phases to low temperature HCP or Orthorhombic phases in the Ti-Al-Nb system are analyzed using a sequence of crystallographic structural relationships developed from subgroup symmetry relations. Symmetry elements lost in each step of the sequence determine the possibilities for variants of the low symmetry phase and domains that can be present in the microstructure. The orientation of interdomain interfaces is determined by requiring the existence of a strain-free interface between the domains.

Keywords: *BCC lattices, *Orthorhombic lattices, Phases, Reprints, Structural relations, *Domain structures, Elastic accomodation, Space group relations.

Possible transformation paths that involve no long range diffusion and their corresponding microstructural details were predicted by Bendersky, Roytburd, and Boettinger for Ti-Al-Nb alloys cooled from the high temperature BCC/B2 phase field into close-packed orthorhombic or hexagonal phase fields. These predictions were based on structural and symmetry relations between the known phases. In the present paper experimental TEM results show that two of the predicted transformation paths are indeed followed for different alloy compositions.

Sensor System for Intelligent Processing of Hot-Rolled Steel.
Final rept.
A. V. Clark, M. G. Lozev, B. J. Filla, and L. J. Bond. 1994, 8p.
Pub. in International Symposium on Nondestructive Characterization of Materials VI (6th), Honolulu, HI., June 7-11, 1993, p29-36 1994.

Keywords: *Acoustics, *Intelligent processing, *Steel, Ultrasonics, Reprints.

Microstructural engineering offers a means of reducing cycle time and improving product quality with reduced energy cost. Process modelling of hot-rolling of steel has advanced to the point where key metallurgical parameters (e.g. austenite grain size) can be predicted from computer models if other process parameters such as temperature are known. However, a need still remains to develop on-line sensors because sensors can rapidly acquire data for model validation, and could be combined with a process control strategy in feedforward or feedback loops. The authors report a study to develop an on-line sensor for autenite grain size measurement at temperatures up to 1000 degrees C. They are developing a system for measurement of attenuation in ultrasonic waves propagating through hot steel samples. Existing theories allow the authors to infer grain size for attenuation measurement. The authors' system consists of a high temperature transducer acoustically coupled to a high strength, low loss buffer rod. The rod is to be pressed against a hot steel specimen sufficiently good contact to transmit ultrasound into the specimen. To avoid plastic deformation of the specimen, they implement computer control of the load applied to the buffer rod. Attenuation measurements were performed at room temperature on specimens of known grain size. Good agreement with optically measured grain size was obtained. The system is now being assembled for measurement at elevated temperatures.

Aluminum-Lithium Alloys: Evaluation of Fracture Toughness by Two Test Standards, ASTM Method E 813 and E 1304.
Final rept.
P. T. Purtscher, J. D. McColskey, and E. S. Drexler. 1992, 21p.
Pub. in Standard Technical Publication 1172, p110-130 1992.

Keywords: *Aluminum lithium alloys, *Fracture toughness, Standards, Cryogenic properties, Declaminations, Reprints, Alloy 2219.

Fracture toughness of three aluminum-lithium alloys and Alloy 2219 (a total of nine different plates) was measured with two different types of specimens and methods: (1) compact specimens using ASTM E 813 and (2) chevron-notched short-bar specimens using ASTM E 1304. The properties were measured in two orientations (T-L and L-T) and at three temperatures (295, 76, and 4 K). In general, the short-bar specimens exhibited a higher fracture toughness than the compact specimens. The difference between the two procedures was relatively constant, independent of test orientation and strength. However, when the specimens exhibited extensive declamations on the fracture surface, the compact specimens had a higher fracture toughness than the short bar specimens. The difference in fracture toughness measured by the two procedures is explained in terms of the alloys' crack growth behavior.

Cavity Evolution during Tensil Creep of Si3N4.
Final rept.
W. Luecke, S. M. Wiederhorn, B. J. Hockey, and G. G. Long. 1993, 6p.
Pub. in Materials Research Society Symposium Proceedings, Boston, MA., November 30-December 3, 1992, v287 p467-472 1993.

Keywords: *Silicon nitride, *Creep, *Cavities, Reprints, Lifetime, Rupture, Monkman-Grant.

The authors have characterized the evolution of cavities during tensile creep of a Y2O3-hot isostatically pressed Si3N4, using precision density measurements, small angle x-ray scattering (SAXS) and transmission electron microscopy (TEM). The cavities ae bimodally distributed in size. Lenticular, 200 nm-size cavities are common, and lie primarily on two-grain boundaries. Irregularly shaped 500-1000 nm size cavities are rare and lie at multi-grain junctions, but comprise approximately half of the total volume fraction of cavities. Although the material shows a continuous decrease in strain rate with strain, the cavity volume fraction evolves linearly with strain. Cavities account for approximately 85% of the total strain at any point during creep.

Experimental Assessment of Crack-Tip Dislocation Emission Models for an Al67Cr8Ti25 Intermetallic Alloy.
Final rept.
W. G. Meng, M. D. Vaudin, M. F. Bartholomeusz, and J. A. Wert. 1995, 13p.
Pub. in Metallurgical and Materials Transactions A, v26A p329-341 Feb 95.

Keywords: *Dislocation emission, Reprints, Cleavage, *Intermetallic alloys, Electron backscatter pattern, Grain orientations.

A potential explanation for the cleavage fracture of intermetallic alloys with low or moderate critical resolved shear stress (CRSS) is the existence of an energy barrier for crack-tip dislocation emission, as described by models that analyze the energetics of dislocation emission from crack tips. In the present study, an intermetallic alloy with the L1(2) crystal structure, Al67Cr8Ti25, has been used to experimentally assess th predictions of the Rice-Thomson dislocation-emission model. The assessment is performed in two ways. First, model predictions of a fracture mode transition at elevated temperature are compared with experimental results. Bend tests performed at temperatures in the range of 293 to 1061 K reveal that the fracture mode of Al67Cr8Ti25 changes from predominately cleavage fracture at room temperature to a mixed mode of cleavage and intergranular fracture at intermediate temperatures and then to predominantly intergranular fracture at high temperatures. Second, model predictions of the effect of grain orientation on the fracture mode are compared with experimental results.

Pub. in Jnl. of Physics: Condensed Matter, n8 p6357-6379 1996.

Keywords: *Iron alloys, *Titanium alloys, *Vanadium alloys, Binary alloy systems, Electronic structure, Mixing, Perturbation theory, Phase stability, Reprints, *Foreign technology, *Ternary alloy systems.

A reliable and consistent scheme for studying phase equilibria in ternary substitutional alloys based on the tight-binding approximation is presented. With the electronic parameters obtained from linear muffin-tin orbital calculations, the authors show that the computed densities of states and band structures compare well with those obtained from more accurate ab initio calculations. Disordered alloys are studied within the tight-binding coherent-potential approximation formalism extended to multi-component alloys. The energetics of ordered systems is obtained through effective-pair interactions computed with the general perturbation method. Finally, partially ordered alloys are studied with a novel simplification of the molecular coherent-potential approximation combined with the general perturbation method.

Torsional Dilatometer for Volume Change Measurements on Deformed Glasses: Instrument Description and Measurements on Equilibrated Glasses.
Final rept.
R. S. Duran, and G. B. McKenna. 1990, 27p.
Pub. in Jnl. of Rheology 34, n6 p813-839 1990.

Keywords: *Epoxy resins, *Volume, *Extensometers, *Torsion, Glass, Design criteria, Deformation, Rheology, Glass transition temperature, Aging tests(Materials), Performance evaluation, Reprints.

An automated mercury dilatometer has been designed and built for the purpose of making volume change measurements on cylindrical samples subjected to torsional deformations. In its current configuration the instrument takes readings of torque, normal force and volume change upon application of a twist at one end of the sample. Here we describe the instrument and preliminary measurements on epoxy glasses which have been equilibrated by annealing near to the glass transition. Our results show that the volume of the sample tested at temperatures ranging from T(sub g)-10 to T(sub g) increases upon application of a torsional deformation. This result is contrary to results reported in the literature for samples tested well below T(sub g).

Investigation of the Thermal Stability and Char-Forming Tendency of Cross-linked Poly(methyl methacrylate).
Final rept.
S. M. Lomakin, J. E. Brown, R. S. Breese, and M. R. Nyden. 1993, 15p.
Pub. in Polymer Degradation and Stability 41, p229-243 1993.

Keywords: *Polymethyl methacrylate, *Thermal stability, *Charring, Combustion products, Crosslinking, Thermal degradation, Pyrolysis, Thermographs, Thermogravimetric analysis, Reprints.

The thermal degradation of two network copolymers of methyl methacrylate was studied as a function of the chemical nature of the cross-linking agent and the frequency of cross-links. Unlike the linear homopolymer, both the trimethylolpropane triacrylate and trimethylolpropane trimethacrylate networks were found to char when burned. The corresponding derivative thermograms indicate that there are dramatic differences in the thermal degradation of these polymers even in the absence of oxygen. These differences are interpreted in terms of a simple model for the kinetics of depolymerization.

Influence of Physical Aging on the Yield Response of Model DGEBA + Poly(propylene oxide) Epoxy Glasses.
Final rept.
C. G'Sell, and G. B. McKenna. 1992, 11p.
Pub. in Polymer 33, n10 p2103-2113 1992.

Keywords: *Aging tests(Materials), *Epoxy resins, *Polyoxypropylene, *Laminated glass, Kinetics, Plastic flow, Temperature, Crosslinking, Plasticity tests, Plastic analysis, Stress analysis, Reprints, DGEBA(Diglcidyl ether of Bisphenol).

Cylindrical specimens were prepared from two DGEBA + amine-terminated PPO networks of different crosslink density and subjected to quenching and isothermal aging treatments at different temperatures and aging times in the range from 0.1 to 1000 hours, The changes in the structure of the glasses during the aging towards equilibrium was subsequently assessed by the measurement of the yield stress in uniaxial compression at the same temperature as the aging. From the influence of temperature and strain rate on the above phenomena, the kinetics of physical aging were examined quantitatively in terms of the time-aging time-temperature equivalence principle. The results suggest that the increase in yield stress on aging is correlated to volume recovery and to the induced increase of the relaxation times as the polymeric glass evolves towards its equilibrium state.

Volume Recovery in Epoxy Glasses Subjected to Torsional Deformations: The Question of Rejuvenation.
Final rept.
M. M. Santore, R. S. Duran, and G. B. McKenna. 1991, 5p.
Pub. in Polymer 32, n13 p2377-2381 1991.

Keywords: *Laminated glass, *Epoxy resins, *Aging tests(Materials), *Deformation, Dilatometry, Torsion, Mechanical properties, Volume, Viscoelasticity, Kinetics, Stress relaxation, Reprints, *Rejuvenation.

Torsional dilatometry was used to examine the mechanical properties of an epoxy glass during physical aging, i.e. after a quench from above the glass transition temperature to slightly below it. Volume changes in the sample were measured simultaneously with the viscoelastic responses in stress relaxation experiments as functions of the deformation magnitude. In this epoxy, the torsional deformations induce volume expansions which relax on a time scale similar to those of the torque relaxation. Mechanical stimuli only momentarily disrupt the volume evolution following a quench: the underlying volume recovery kinetics, which are much slower than the mechanical torque or volume relaxation, remain unaltered. Both the independence of t* of the magnitude of the strain and the fact that the volume recovery after a quench remains unaltered in spite of the imposition of mechanical deformations support the argument that mechanical stimuli neither alter the underlying (nonequilibrium) thermodynamic state of the glass nor erase physical aging.

Torsional Relaxation and Volume Response during Physical Aging in Epoxy Glasses Subjected to Large Torsional Deformations.
Final rept.
M. M. Santore, and G. B. McKenna. 1991, 6p.
Pub. in Materials Research Society Symposia Proceedings 215, p81-86 1991.

Keywords: *Laminated glass, *Epoxy resins, *Aging tests(Materials), *Deformation, Dilatometry, Torsion, Mechanical properties, Volume, Viscoelasticity, Stress relaxation, Reprints, *Rejuvenation.

We present torsional dilatometry experiments to simultaneously measure torque relaxation and volume recovery in an epoxy glass quenched from above its glass transition temperature to below it. Two strain histories are employed: one with strains of equal sizes and a second where small strains follow a large one. The baseline for the thermally induced volume recovery is insensitive to intermittent torsional strains whose magnitude can be well into the non-linear regime. The torque relaxations from equal intermittent mechanical

stimuli can be superposed by a time-aging time shift in a way that indicates fast changes cease to occur at approximately 10,000 seconds after the quench, a 'mechanical equilibration' time. Stimuli of different sizes can confound superposition via nonlinear effects, but do not affect the ultimate volume recovery of the glass or its mechanical equilibration time. Our results show the signature of rejuvenation; however, this may result from the nonlinear response of the material in a nonisochoric strain history. Our data firmly show that mechanical stimuli do not erase aging or rejuvenate this epoxy.

Using Torsional Dilatometry to Measure the Effects of Deformations on Physical Aging.
Final rept.
M. Santore, R. Duran, and G. McKenna. 1990, 1p.
Pub. in Abstracts of Papers of the American Chemical Society 200, 344p Aug 90.

Keywords: *Aging tests(Materials), *Epoxy resins, *Deformation, *Laminated glass, Dilatometry, Torsion, Mechanical properties, Volume, Reprints, *Rejuvenation.

An epoxy glass was studied via torsional dilatometry to test the 'rejuvenation' hypothesis, i.e. that large deformations retard physical aging. For example, rejuvenation predicts that samples subjected to deformations after a quench to below Tg will contract more slowly than those quenched without subsequent deformations. The model further implies that the mechanical properties should evolve more slowly toward equilibrium when deformations are imposed during aging. Our torsional dilatometry tests both premises: Simultaneous measurements of volume recovery and torque relaxation suggest that the application of large deformations does not directly influence the physical aging process. However, we do observe an interesting effect: the equilibration time based on the time required for the mechanical properties to cease evolving is at least one order of magnitude shorter than that evidenced by the volume recovery measurements.

Pub. in Jnl. of Polymer Science: Part B, Polymer Physics 32, p2695-2703 1994.

Keywords: *Hydration, *Small angle scattering, *Nylon fibers, *Nylon 6, *Drawing, Neutron scattering, Thermoplastic resins, Amorphous materials, Crystallinity, Water, Polymer physics, Reprints.

Water absorbed by nylons appears to be partitioned into interlamellar and interfibrillar spaces. The amount of water in the interfibrillar region remains essentially unchanged with increasing draw ratio, whereas that in the interlamellar regions decreases with draw ratio; the latter accounts for the decrease in the water uptake in the drawn fibers. These results suggest that the amount of the amorphous material in the interfibrillar regions remains unchanged during drawing, and the increase in the crystallinity during drawing results from the incorporation of the amorphous chain segments in the interlamellar regions into the crystalline lamellae. Further, the interfibrillar water is more tightly bound than the interlamellar water. The length of the longitudinal channels into which water diffuses is about the same as that of the fibrils, and increases from ca. 1500 to 2000 A upon drawing. The longitudinal channels are highly oriented even in undrawn fibers, and their misorientation increases from 5 degrees to 15 degrees upon drawing. These channels can be described as surface fractals of dimension 3.4-3.6.

Keywords: *Polystyrene, *Fourier transformation, *Infrared spectrophotometers, Chemical analysis, Calibration standards, Optical measuring instruments, Standardization, Wavelengths.

Standard Reference Material (SRM) 1921 is a matte finish polystyrene film and is intended for use in calibrating the wavelength scale of spectrophotometers in the infrared (IR) spectral region from 545.49 cm exp(-1) to 3082.19 cm exp(-1) (18.332 micrometers to 3.2445 micrometers). Thirteen absorption peak positions obtained using a center-of-gravity method are certified. The expanded uncertainty value associated with these peak values are between 0.06 cm exp(-1) and 0.66 cm exp(-1), except for 1.84 at 2850.13 cm exp(-1) and 12.29 at 545.49 cm exp(-1). This publication describes the IR spectrophotometer, instrument calibration, SRM material, measurement procedure, calibration of polystyrene films, and uncertainty determination.

Flow-Induced Structure in Polymer. Chapter 1. An Introduction to Flow-Induced Structures in Polymers.
Final rept.
A. I. Nakantani. 1995, 19p.
Pub. in National Meeting of the American Chemical Society (208th), Washington, DC., August 21-25, 1994, p1-19.

Keywords: *Polymers, Morphology, Blends, Solutions, Melts, Multicomponent systems, Reprints, *Flow induced structures.

An overview of flow-induced structures in polymers is presented and recent references to research in the areas of polymer solutions, homopolymer melts, polymer blends, block copolymers and multi-component systems, and liquid crystalline polymers are given. The research area of flow-induced structures in polymers has expanded with the advent of in-situ measuring techniques. Studies of this type are useful for probing fundamental issues such as chain deformation, shifts in phase behavior, and the formation of novel shear-induced structures. The applications addressed include the kinetics of morphology evolution and the relationship between ultimate properties and morphology.

Various flammability properties of polycarbonate samples were measured with the cone calorimater and lateral ignition and flame spread (LIFT) devices at various external fluxes. Four different sample mountings were used with the cone calorimeter to investigate the effects of sample mounting on the flammability properties of these samples. The mounting configurations allowed the intumesced char to rise free. The results show that peak heat release rate curves were significantly affected by the sample mounting configuration but total heat released, effective heat of combustion, and soot yield were not significantly affected by the sample mounting configuration but total heat released, effective heat of combustion, and soot yield were not significantly affected. Tow sample mounting configurations were used, the standard method and the standard method with the addition of a wire grid to retain intumesced char. Significant differences in flame spread rates were observed between the two sample mounting configurations with and without the grid.

Today's microelectronics products rely heavily on the use of polymeric materials; whether to package and protect the integrated circuit or to manufacture printed wiring boards and assemblies. In this work, NIST is pursuing a three-pronged strategy to improve the quality of measurement techniques and resulting data for characterizing the out-of-plane, or z-axis, coefficient of thermal expansion (CTE) of polymer films. The strategy consists of effecting evolutionary improvements in commonly used measurement techniques and standards for measuring CTE using the thermomechanical analyzer (TMA), introducing revolutionary improvements in measuring CTE by developing and applying a new NIST capacitance technique that has vastly improved sensitivity and accuracy over the TMA or existing capacitance-based approaches, and utilizing X-ray reflectivity measurements to understand the behavior of ultra-thin polymer films (50 to 1000A).

Keywords: *Polymer blends, *Hydrogen bonding, *Lattice models, Phase diagrams, Concentration, Mean-fields, Reprints.

A mean-field lattice model is used to investigate some possible aspects of the low-temperature behavior of a lower critical solution temperature (LCST) polymer blend made miscible by a dilute distribution of a hydrogen-bonding comonomer. The nature of the binding interaction is examined for both a random comonomer distribution and for the case of identically end-modified chains. For the latter case, competition between the interaction responsible for the immiscibility of the homopolymer components and the attraction due to hydrogen bonding leads to a stable intermediate

phase. For random distributions, polydispersity in the binding interaction restricts this intermediate phase to an extremely narrow window in reduced temperature, consistent with a 'smeared' transition. The free-energy landscape contains local minima separated by energy barriers.

Pub. in Chemistry of Materials, v8 n8 p2128-2137 1996.

Keywords: *Organic liquids, *Nanoscale pores, O-terphenyl, Vitrification, Crystallization, Benzyl alcohol, Calorimetry, Glass transition temperature, Reprints.

The effect of finite size on the solidification of o-terphenyl and benzyl alcohol confined in model controlled pore glass (CPG) materials is described. These two organic liquids form either amorphous glasses or crystalline solids in the bulk upon cooling, depending on the rate of cooling and other factors. The solidification behavior of the liquid in the pores was studied as a function of pore diameter (4-73 nm), chemical surface treatment of the CPG and the degree of pore filling, by differential scanning calorimetry (DSC). The authors observe that the glass transition Tg, shifts to a lower temperature as pore size decreases. This shift is independent of the degree of pore filling for both o-terphenyl and benzyl alcohol, suggesting that a reduction in bulk density or a negative pressure effect is not the cause of the observed shift. The crystallization behavior of o-terphenyl and benzyl alcohol is also altered by confinement and strongly depends on the pore size and degree of pore filling.

Evidence of Crosslinking in Methyl Pendent PBZT Fiber.
Final rept.
V. R. Mehta, S. Kumar, M. B. Polk, T. D. Dang, D. L. Vanderhart, and F. E. Arnold. 1996, 11p.
Pub. in Jnl. of Polymer Science, Part B, Polymer Physics, v34 p1881-1891 1996.

Keywords: *Crosslinking, *Methyl pendant PBZT, *Fibers, Reprints, Poly(p-phenylene benzobis thiazole).

In order to influence the compressive strength of the rigid rod polymeric fibers, methyl pendent poly (p-phenylene benzodisthiazole) fibers have been heat treated in the 400 to 550 degrees C temperature range in air and in nitrogen for varying times to achieve intermolecular crosslinking. These fibers have been examined using Fourier transform infrared (FTIR) spectroscopy, (13)C solid-state nuclear magnetic resonance (NMR) swelling behavior, and scanning electron microscopy. (13)C NMR has also been carried out on solutions of as-spun fibers. Fibers heat-treated at 400 degrees C, both in nitrogen and in air, up to heat-treatment times of 60 min are insoluble in 99% chlorosulfonic acid, however, no direct evidence of crosslinking has been obtained for these fibers using spectroscopic techniques, suggesting that in these fibers the degree of crosslinking must be very low. Evidence that methyl groups are precursors to certain crosslinks was first seen via a weak methylene resonance in (13)C solid state NMR, corresponding to about 2% of the the original methyl intensity, in a sample heat-treated at 450 degrees C in air.

Relaxation After a Temperature Jump Within the One Phase Region of a Polymer Mixture.
Final rept.
G. Merkle, B. Bauer, and C. Han. 1996, 4p.
Pub. in Jnl. of Chemical Physics, v104 n23 p9647-9650 Jun 96.

Keywords: *Polymer blends, *Hydrogen bonding, *Spinodal decomposition, Small angle neutron scattering, Concentration fluctuation growth, Reprints.

Small-angle neutron scattering was used to observe the relaxation of the structure factor from a smaller to a larger fluctuation state after a temperature jump within the one-phase region of a miscible polymer blend. The blend studied is a 60/40 by weight mixture of a hydrogen bonded polymer blend which consists of hydroxy modified dueterated polystyrene and poly(butylmethacrylate). A peak clearly evolved during the transition from the initial state at Ti to the final state at Tf as predicted by linear as well as nonlinear theories. This relaxation process, which took more than 10 h, could be represented reasonably well by a simple linear approximation of the Chn-Hilliard-Cook (CHC) theory without involving nonlinear calculations for the evolution of the dynamic structure factor. The measurement offers an alternative method for estimating the order parameter relaxation rate in the one-phase region. Also, this demonstrates experimentally the correct relaxation (to a higher fluctuation state) mechanism predicted by the linear theory of CHC type.

Final rept.
J. F. Douglas. 1996, 13p.
Pub. in Physical Review E, v54 n3 p2677-2689 Sep 96.

Keywords: *Polymers, *Membranes, *Sponges, Network swelling, Wiener sheet, Reprints, Branched polymers, Blocked copolymers.

Polymers can be formed into a wide range of structures depending on the monomer chemistry and the kinetic conditions of growth. A general model of polymers have higher-order connectivity is introduced that reduces to flexible linear polymers, membranes, and sponges as special cases. This 'Wiener sheet' model, which extends the conventional Wiener path model of linear polymers, is argued to describe various classes of branched polymers, as well as different types of interacting random surfaces. For example, lattice animals and percolation clusters are considered to be perforated sheets whose large-scale dimensions are described by the Wiener sheet model with excluded volume interactions. To within the approximations of the model calculations, the properties of the Wiener sheet 'membrane' are consistent with this correspondence. The influence of the excluded volume and the kinetics of growth of membrane and sponge structures are treated at a Flory-level approximation, although the Wiener sheet model should admit to a renormalization-group treatment as in the case of linear polymers. Predictions of the self-interacting Wiener sheet model are contrasted with an alternative and complementary random surface model introduced by Nelson and co-workers and are compared with recent simulations and experiment.

Radiance Temperature (in the Wavelength Range 519-906 nm) of Tungsten at Its Melting Point by a Pulse-Heating Technique.
Final rept.
A. P. Miiller, and A. Cezairliyan. 1993, 14p.
Pub. in International Jnl. of Thermophysics 14, n3 p511-524 1993. Sponsored by National Aeronautics and Space Administration, Washington, DC.

Keywords: *Tungsten, *Melting point, *Radiation pyrometers, Wavelengths, Radiance, Heating, Temperature measurement, Surface temperature, Thermophysical properties, Uncertainty, Reprints.

Radiance temperatures (at six wavelengths in the range 519-906 nm) of tungsten at its melting point were measured by a pulse-heating technique. The method is based on rapid resistive self-heating of the specimen from room temperature to its melting point in less than 1 s; and on simultaneously measuring the specimen radiance temperatures every 0.5 ms with a high-speed six-wavelength pyrometer. Melting was manifested by a plateau in the radiance temperature versus time function for each wavelength. The melting-point radiance temperatures for a given specimen were determined by averaging the measured temperatures along the plateau at each wavelength. The melting-point radiance temperatures for tungsten were determined by averaging the results at each wavelength for 10 specimens (standard deviation in the range 0.5-1.1K, depending on the wavelength) as follows: 3319 K at 519 nm, 3236 K at 615 nm, 3207 K at 652 nm, 3157 K at 707 nm, 3078 K at 808 nm, and 2995 K at 906 nm. Based on estimates of the random and systematic errors arising from pyrometry and specimen conditions, the total uncertainty in the reported values is about + or - 7 K at 653 nm and + or - 8 K at the other wavelengths.

Wavelength Dependence of Normal Spectral Emissivity of High-Temperature Metals at Their Melting Point.
Final rept.
A. Cezairliyan, A. P. Miiller, F. Righini, and A. Rosso. 1991, 8p.
Pub. in High Temperatures - High Pressures 23, p325-332 1991. Sponsored by National Aeronautics and Space Administration, Washington, DC.

Keywords: *Refractory metals, *Spectral emittance, *Melting point, *Emissivity, *Wavelengths, Thermophysical properties, Literature surveys, Spectral emission, Spectral lines, Line spectra, Molybdenum, Niobium, Tantalum, Reprints.

The literature data on normal spectral emissivity of selected high-temperature metals at their melting points are reviewed. This study is motivated by recent results published by a major laboratory which show a common wavelength-independent behavior for the emissivity (in the wavelength range 500-1,000 nm) of several high-temperature metals (including V, Nb, Mo, Ta, and W) at their melting points. Based on the present study of accurate data for Ni, Ti, V, Nb, Mo, Ta, and W reported in the literature, it is concluded that the normal spectral emissivity of these high-temperature metals at their melting points is not constant but decreases with increasing wavelength in the range 400-1,000 nm.

Pub. in International Jnl. of Thermophysics 14, n3 p449-455 1993.

Keywords: *Heat of fusion, *Refractory metals, *Pulse heating, *Tungsten, High temperature, Melting, Transients, Reprints.

A microsecond-resolution pulse-heating technique was used for the measurement of the heat of fusion of tungsten. The method is based on rapid (100 to 125 microseconds) resistive self-heating of a specimen by a high-current pulse from a capacitor discharge system and measuring current through the specimen and voltage across the specimen as functions of time. Melting of a specimen is manifested by changes in the slope of the electrical resistance versus time function. The time integral of the power absorbed by a specimen during melting yields the heat of fusion. Measurements gave a value of 48.7 kJ/mol for the heat of fusion of tungsten with an estimated maximum uncertainty of + or - 6%. The electrical resistivity of solid and liquid tungsten at its melting temperature was also measured.

Application of ODF to the Rietveld Profile Refinement of Polycrystalline Solid.
Final rept.
C. S. Choi, E. F. Baker, and J. Orosz. 1994, 9p.
Pub. in Advances in X-ray Analysis, v37 p49-57 1994.

Keywords: *Nodular iron, *Tungsten, Diffraction patterns, Polycrystalline, Texture, Reprints, *Rietveld method, Orientation distribution functions.

The Rietveld profile refinement method is probably the most popular technique used for the crystallographic characterization of materials including crystal structures and phase analysis, but it has been used mostly with ideal powder sample, not with textured polycrystals, because effects of strong and complex textures. Most technological materials are fabricated by using thermo-mechanical forming processes, which inevitably produce strong and complex preferential orientations of the crystallites. Consequently, the diffraction patterns of a given technological material are not unique but vary considerably with the measuring direction, with intensity variations as large as factors of hundreds, depending on the degree of texture. Part I of this study describes the determination of the orientation distribution function (ODF) and its application to the Rietveld profile refinement of the highly textured tungsten sample. Part II demonstrates the application of the Rietveld method to the quantitative analysis of the austempered ductile irons.

National Inst. of Standards and Technology (TS), Gaithersburg, MD. Office of Standards Services.
Voluntary Product Standard PS 20-94. American Softwood Lumber Standard.
Mar 94, 45p, NIST/PS-20/94.
Supersedes PB87-158564. Also available from Supt. of Docs as SN003-003-03257-3. Sponsored by American Lumber Standards Committee, Germantown, MD.

Keywords: *Softwoods, *Lumber, *Standards, *Measurement, Requirements, Sizes, Quality, Classifying, Marking, Inspection, Surface roughness, Industries, US NIST, Certification, Design criteria, Maintenance, Voluntary standards.

The Standard pertains to softwood lumber. It establishes standard sizes and requirements for development and coordination of the lumber grades of the various species, the assignment of design values when called for, and the preparation of grading rules applicable to each species. It provides for implementation of the Standard through an accreditation and certification program to assure uniform industry-wide grade marking and inspection. It establishes principal trade classifications and lumber sizes for yard, structural, factory and shop use and provides for the classification, measurement, grading and grade marking of rough and dressed sizes of lumber items. Terms and procedures are defined to provide a basis for the use of uniform methods in the grading, inspection, measurement, and description of softwood lumber. It also includes the organization and functions of the American Lumber Standard Committee, the Board of Review, and the National Grading Rule Committee. Commercial names of the principal softwood species, definitions of terms used in describing standard grades of lumber and commonly used industry abbreviations are also provided.

Rate of Heat Release of Wood Products.
Final rept.
M. Janssens. 1991, 22p.
Pub. in Fire Safety Jnl. 17, n3 p217-238 1991.

Keywords: *Wood, *Fires, *Heat transfer, Burning rate, Calorimeters, Ignition, Combustion, Mathematical models, Pyrolysis, Reprints.

The importance of energy release rate in a fire is illustrated. Two ways are identified to calculate rate of heat release in compartment fires from wood products used as interior finish: (1) use of detailed mathematical models of wood pyrolysis and combustion; (2) use of experimental bench-scale rate of heat release data. Available wood pyrolysis models are briefly reviewed. The second option is looked at in more detail. Rate of heat release data is presented and analyzed for 22 different wood products which were tested on the NIST Cone Calorimeter over the past 6 years. The experimental data cover two orientations, a range of irradiance levels, conditioned and oven dried samples and wood species covering a wide range of densities. Oven dry density is used as the key independent variable to analyze the data. Some important conclusions are drawn concerning the influence of density, conditioning, irradiance and specimen orientation on the rate of heat release. Further analysis and more data are required to confirm the results and to provide an answer to the questions which could not be resolved.

Pub. in Proceedings of Institute of Electrical and Electronics Engineers Ultrasonics Symposium, Honolulu, HI., December 4-7, 1990, p1099-1103.

Keywords: *Wood, *Ultrasonic flow detection, *Grain boundaries, Nondestructive tests, Ultrasonic radiation, Ultrasonic tests, Acoustic measurement, Acoustic velocity, Acoustic properties, Wave propagation, Reprints.

The speed of ultrasound is approximately 330 m/sec in air and 1500 m/sec in water. Many materials exhibit surface-acoustic-wave velocities in the 300-1500 m/sec range. For this reason, air appears to be the ideal coupling fluid for exciting and detecting flexural waves, which are generally slower than surface acoustic waves, and shear waves. Air coupling may also be ideal for launching and detecting the quasi-longitudinal plate wave in materials which can exhibit very low longitudinal phase velocities, such as balsa wood (800 m/sec). In this paper, we describe an experimental, air-coupled, ultrasonic measurement system that can be used to study the propagation of MHz signals in wooden plates ranging in thickness from 3mm to 25mm. Also, we report experimental measurements of the amplitude of through-transmitted, narrow-band, 0.5 MHz signals as a function of the angle of incidence for different grain orientations.

The Federal Internetworking Requirements Panel (FIRP) was established by the National Institute of Standards and Technology (NIST) to reassess Federal requirements for open systems networks and to recommend policy on the Government's use of networking standards. The Panel was chartered to recommend actions which the Federal Government can take to address the short and long-term issues of interworking and convergence of networking protocols--particularly the Internet Protocol Suite (IPS) and Open Systems Interconnection (OSI) protocol suite and, when appropriate, proprietary protocols. The Panel was created at the request of the Office of Management and Budget in collaboration with the Federal Networking Council and the Federal Information Resources Management Policy Council. The Panel's membership and charter are contained in an appendix to this report.

Monte Carlo Approach to the Approximation of Invariant Measures.
Final rept.
F. Y. Hunt. 1994, 23p.
Pub. in Random and Computational Dynamics 2, n1 p111-133 1994. See also PB93-159069.

Keywords: Monte Carlo method, Numerical solution, Approximation, Optimization, Convergence, Reprints, *Invariant measures, Frobenius-Perron operator, Ulam method.

Approximation of absolutely continuous measures of maps of the interval and the closely related tasks of computing Lyapunov exponents and metric entropy are accomplished in principle by iterating the map to produce a sufficiently long trajectory. There is an alternative approach based on approximating the fixed point of the Frobenius-Perron operator. The authors present a Monte-Carlo implementation of the original piecewise constant method proposed by Ulam. This method has the advantage of not requiring explicit evaluation of the elements of the approximate Frobenius-Perron operator. Convergence rates of Ulam's method and some recently proposed higher order variants are discussed. Finally Ulam's scheme is used to estimate the leading Lyapunov exponent of a one dimensional map with an absolutely continuous measure.

Computing S(alpha) Using Symbolic Monte Carlo.
Final rept.
I. M. Beichl, and F. Sullivan. 1992, 7p.
Pub. in Physica D 60, p358-364 1992.

Keywords: *Computation, Monte Carlo method, Mapping(Transformations), Numerical solution, Reprints, Entropy functions, Symbolic dynamics.

We describe a method for carrying out a computation of the entropy function of the invariant set of a particular class of maps. We illustrate the method for the case of the quadratic and the Feigenbaum map. Elementary consequences of the symbolic dynamics associated with a map f lead to an algorithm that is a novel application of the Monte Carlo method. To sample, we use the fact that the salient features of the thermodynamic properties of the map are captured by its symbolic dynamics. In the symbolic domain, samples are chosen by manipulating character strings, rather than by performing floating-point calculations. Therefore, exact symbolic answers can be obtained by purely combinatorial methods. These symbolic answers then provide a recipe for performing high-precision numerical computations.

Pub. in Jnl. of Scientific Computing 1, n2 p117-144 1986.

Keywords: *Boundary integral method, Time dependence, Two dimensional, Free boundaries, Integral equations, Iterative methods, Binary alloys, Coarseness, Simulation, Reprints, Ostwald ripening, Particle coarsening.

A boundary integral method for the solution of a time-dependent free-boundary problem in a two-dimensional, multiply-connected, exterior domain is described. The method is based on an iterative solution of the resulting integral equations at each time step, with the initial guesses provided by extrapolation from previous time steps. The method is related to a technique discussed by Baker for the study of water waves. The discretization is chosen so that the solvability conditions required for the exterior Dirichlet problem do not degrade the convergence rate of the iterative solution procedure. Consideration is given to the question of vectorizing the computation. The method is applied to the problem of the coarsening of two-dimensional particles by volume diffusion.

Constructing Invariant Tori for Two Weakly Coupled van der Pol Oscillators.
Final rept.
D. E. Gilsinn. 1993, 20p.
Pub. in Nonlinear Dynamics 4, p289-308 1993.

Keywords: *Van der Pol differential equation, Partial differential equations, Fast Fourier transforms, Perturbation theory, Periodic functions, Nonlinear systems, Approximation, Toruses, Algorithms, Reprints, *Van der Pol oscillators, Invariant tori.

An algorithm is developed for the construction of an invariant torus of a weakly coupled autonomous oscillator. The system is put into angular standard form. The determining equations are found by averaging and are solved for the approximate amplitudes of the torus. A perturbation series is then constructed about the approximate amplitudes with unknown coefficients as periodic functions of the angular variables. A sequence of solvable partial differential equations is developed for determining the coefficients. The algorithm is applied to a system of nonlinearly coupled van der Pol equations and the first order coefficients are generated in a straightforward manner. The approximation shows both good numerical accuracy and reproducibility of the periodicities of the van der Pol system. A comparative analysis of integrating the van der Pol system with integrating the phase equations from the angular standard form on the approximate torus shows numerical errors of the order of the perturbation parameter epsilon = 0.05 for integrations of up to 10,000 steps. Applying fast Fourier transforms (FFT) to the numerical periodicities generated by integrating the van der Pol system near the torus reveals the same predominant frequencies found in the perturbation coefficients. Finally an expected rotation number is found by integrating the phase equations on the approximate torus.

I. C. Goyal, R. L. Gallawa, and A. K. Ghatak. 1993, 7p.
Pub. in Jnl. of Mathematical Physics 34, n3 p1169-1175 Mar 93.

Keywords: *Differential equations, *Eigenvalues, Boundary value problems, Variational methods, Numerical solution, Perturbation, Comparative evaluations, Matrices, Estimates, Accuracy, Reprints, Langer method, WKB method.

The problem of estimating the eigenvalues lambda of the equation (second derivative of psi with respect to x) + (lambda)f(x)psi(x) = 0, where f(x) is smooth and positive in the closed interval (0,l) and the imposed boundary conditions are psi(0) = psi(l) = 0 is revisited. Two methods, the Wentzel-Kramers-Brillouin (WKB) method and Langer's method, which until very recently has been virtually ignored, are compared. The variational principle further improves the accuracy of the eigenvalues. The results obtained when the WKB and Langer's results are used as trial functions with the variational principle are also compared. Results are given in tabular form.

Inserting Line Segments into Triangulations and Tetrahedralizations.
J. Bernal. Mar 95, 27p, NISTIR-5596.

Keywords: *Computational geometry, *Triangulation, *Tetrahedrons, Algorithms, Three dimensional models, Two dimensional models, *Segment insertion, Edge swapping, Delaunay triangulations, Voronoi diagrams.

In this paper, we further develop an algorithm by Bernal, De Floriani, and Puppo, for inserting a line segment into a Constrained Delaunay triangulation. The new version of the algorithm inserts the line segment in exactly the same manner in which the old version does but has the additional capability that it does not delete the triangles intersected by the line segment but transforms them through edge-swapping. A 3-dimensional version of the algorithm without the optimization step for the Delaunay property is also presented for attempting to insert a line segment into a tetrahedralization. It is shown that for certain cases the failure of the 3-dimensional algorithm to insert a line segment is an indication that it can not be done. Finally, 3-dimensional problems that can be approached algorithmically as 2-dimensional problems are identified.

Overcoming Hoelder Continuity in Ill-Posed Continuation Problems.
Final rept.
A. S. Carasso. 1994, 23p.
Pub. in Society for Industrial and Applied Mathematics Jnl. on Numerical Analysis 31, n6 p1535-1557 Dec 94.

Keywords: *Partial differential equations, Fast Fourier transforms, Image processing, Banach space, Numerical stability, Numerical solution, Computation, Reprints, *Image deblurring, Ill posed problems, Holder continuity, SECB constant, Tikhonov-Miller regularization.

Many ill-posed continuation problems in partial differential equations obey a logarithmic convexity inequality and can be stabilized in an appropriate Banach space by imposing an a priori bound on the solutions. The present paper analyzes the effects of prescribing a physically motivated supplementary constraint, the so-called slow evolution from the continuation boundary (SECB) constraint. When the SECB constraint is applicable, there results an improved stability estimate. This theoretical result is valid for a large class of ill-posed continuation problems. The computational significance of this result is demonstrated in the latter half of the paper. An important class of image deblurring problems is reformulated as a backwards-in-time continuation problem for a generalized diffusion equation. A quadratic functional on L(sup 2)(R(sup 2)) is constructed for which the SECB deblurred image is the unique minimizer. An explicit formula is then obtained for SECB restoration in the Fourier transform domain, leading to a fast, practical, numerical restoration procedure involving fast Fourier transform (FFT) algorithms. For a 512 X 512 image, SECB restoration requires about 20 seconds of cpu time on current desktop workstations.

Bounds on Frequency Response Estimates Derived from Uncertain Step Response Data.
Final rept.
J. P. Deyst, and T. M. Souders. 1995, 6p.
Pub. in Institute of Electrical and Electronics Engineers Instrumentation and Measurement Technology Conference Proceedings, Waltham, MA., April 24-26, 1995, p252-257.

Keywords: *Frequency response, *Probability theory, *Dynamic response, Estimates, Boundaries, Step functions, Time, Reprints, Electrical measurment, Simulation, *Uncertainty bounds, Time domain.

A system's frequency response can be estimated from measurements of its step response; however, many error sources affect the accuracy of such estimates. This paper investigates the effects of incertainty in the knowledge of the step response. Methods for establishing uncertainty bounds for the frequency response estimates are developed, based on the corresponding time-domain uncertainties associated with the step-like waveform. Two methods are described. One is a provable upper bound that is often very conservative. The other is more realistic, but it is based on an unproved conjecture. End effects that influence the bounds are also considered. A simulated example of the bounds is presented.

Effects of Nonmedel Errors on Model-Based Testing.
Final rept.
G. N. Stenbakken. 1995, 5p.
Pub. in Institute of Electrical and Electronics Engineers Instrumentation/Measurement Conference, IMTC '95, Watham, MA., April 24-26, 1995, p38-42.

Keywords: *Confidence intervals, Efficient testing, Simulation, Reprints, Empirical modeling, Nonmodel error, Prediction intervals.

In previous work, methods have been developed for efficient testing of components and instruments that are based on models of these units. These methods allow for the full behavior of these units to be predicted from a small but efficient set of test measurements. Such methods can significantly reduce the testing cost of such units by reducing the amount of testing required. But these methods are valid only as long as the model accurately represents the behavior of the units. Previous papers on this subject described many methods for developing accurate models and using them to develop efficient test methods. However, they gave little consideration to the problem of testing units which change their behavior after the model has been developed, for example, as a result of changes in the manufacturing process. Such changed behavior is referred to as nonmodel behavior or nonmodel error. When units with this new behavior are tested with these more efficient methods, their predicted behavior can show significant deviations from their true behavior. This paper describes how to analyze the data taken at the reduced set of measurements to estimate the uncertainty in the model predictions, even when the device has significant nonmodel error. Results of simulation are used to verify the accuracy of the estimates and to show the expected variation in the results for many modeling variables.

Hybrid Gauss-Trapezoidal Quadrature Rules.
B. K. Alpert. Jul 96, 36p, NISTIR-5048.
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *Gaussian quadrature, *Convergence, Functions(Mathematics), Numerical methods, Numerical analysis, Algorithms.

A new class of quadrature rules for the integration of both regular and singular functions is constructed and analyzed. For each rule the quadrature weights are positive and the class includes rules of arbitrarily high order convergence. The quadratures result from alterations to the trapezoidal rule, in which a small number of nodes and weights as the ends of the integration interval are replaced. The new nodes and weights are determined so that the asymptotic expansion of the resulting rule, provided by a generalization of the Euler-Maclaurin summation formula, has a prescribed number of vanishing terms. The superior performance of the rules is demonstrated with numerical examples and application to several problems is discussed.

Pub. in ORSA Jnl. on Computing 1, n3 p159-171 1989.

Keywords: *Linear programming, Algorithms, Optimization, Convergence, Trajectory analysis, Ordinary differential equations, Two dimensional models, Reprints, *Method of centers, Interior point method.

Interior point algorithms to solving linear programming problems are considered. The techniques are derived from a continuous version of Huard's method of centers that yields a family of trajectories in the feasible region that all converge to an optimal solution. The tangential direction of these trajectories is the dual affine direction. Deficiencies in some of these trajectories are discussed, and the need to recenter is argued. Several new algorithms that use the dual affine direction and a recentering direction in a multi-direction approach are then derived. The most promising of these algorithms is based on minimizing the cost function on a sequence of two-dimensional cross sections of the feasible region. Numerical results are presented.

Controversy often surrounds the reporting of results from scientific experimentation. Guidelines for the reporting of the results of experimentation have helped to reduce some common errors and to clarify some issues for all concerned. As experience grows in new areas, such as the reporting of the results of computational experiments, it is natural to attempt to update and revise the guidelines to stimulate further discussion and to improve the reporting of results. In this spirit, the Council of the Mathematical Programming Society asked the Committee on Algorithms (COAL) to reconsider the existing guidelines and to offer extensions and modifications as deemed necessary. The proliferation of powerful desktop workstations, microcomputers, mainframes, supercomputers, and novel machines with some form of parallel architecture, will continue to place increasing pressure on developers of algorithms to support their ideas with the results of computational experiments. Our hope is that we can supply a document that authors, editors, and referees can agree upon, and one that can provide a solid basis for the presentation of results.

Dynamic programming is a modeling technique used for the decision making process. This method can be used to find the set of nondominated paths in a network with time dependent vector costs. In this report a dynamic programming algorithm and its implementation are discussed. An application to a fire egress problem is also included.

We have been working on a particular class of interior point methods for solving linear programming problems for several years. Our methods combine several search directions that are readily computed at each iteration. The final step is then calculated by computing the step that solves the original problem restricted to the subspace spanned by these several directions. In this paper we propose an extension of these ideas to the case of convex quadratic programming.

Keywords: *Optimization, *Convergence, *Numerical analysis, Algorithms, Approximation, Iteration, Matrices(Mathematics), Newton methods, Sequences(Mathematics), Reprints.

Many optimization algorithms generate, at each iteration, a pair (I(sub K), H(sub K)) consisting of an approximation to the solution I(sub K) and a Hessian matrix approximation H(sub K) that contains local second-order information about the problem. Much is known about the convergence of I(sub K) to the solution of the problem, but relatively little is known about the behavior of the sequence of matrix approximations. The sequence H(sub K), generated by the extended Broyden class of updating schemes independently of the optimization setting in which they are used, is analyzed. Various conditions under which convergence is assured are derived, and the structure of the limits is delineated. Rates of convergence are also obtained. These results extend and clarify those already in the literature.

Keywords: *Search profiles, *Self organizing systems, *Heuristic methods, *Data structures, Markov chains, Eigenvalues, Search theory, Probability distribution functions, Trees(Mathematics), Costs, Reprints, Binary search trees, Move-to-root rule.

The move-to-root (MTR) heuristic is a self-organizing rule which attempts to keep a binary search tree in near-optimal form. It is a tree analogue of the well-studied move-to-front (MTF) scheme. The authors study a Markov move-to-root (MMTR) model, where the sequence of record requests is a Markov chain, and analyze several characteristics of the tree chain, including the stationary distribution, eigenvalues, and stationary expected search cost.

Noise-Induced Chaos and Phase Space Flux.
Final rept.
M. Frey, and E. Simiu. 1993, 20p.
Pub. in Physica D 63, p321-340 1993.

Keywords: *Dynamical systems, Stochastic processes, Random noise, Phase space, Excitation, Chaos, Reprints.

We study the effect of additive noise on near-integrable second-order dynamical systems whose unperturbed flows have homoclinic or heteroclinic orbits. The noise is represented by a type of Shinozuka stochastic process capable of arbitrarily closely approximating Gaussian noise with any specified spectrum. We derive a formula for the flux factor applicable for any asymptotic mean stationary excitation. This derivation shows that, to first order, the effect of the external excitation on the system is mediated by a linear filter associated with the system homoclinic or heteroclinic orbit. It also shows that the stationary mean distribution of the filtered excitation determines the average phase space flux. This is true for both random and nonrandom excitations and indicates that, for the dynamical systems considered here, these two classes of excitation play substantially equivalent roles in the promotion of chaos.

Approximate Confidence Intervals on Linear Combinations of Expected Mean Squares.
Final rept.
C. M. Wang. 1992, 13p.
Pub. in Jnl. of Statistical Computation and Simulation 43, p229-241 1992.

Keywords: *Confidence limits, *Variance(Statistics), Mean square values, Approximation, Probability theory, Mathematical models, Simulation, Reprints.

In this article, we develop new procedures for obtaining approximate confidence intervals on linear combinations of the expected mean squares. The proposed approximations are indexed by a 'tuning' constant. By choosing the appropriate constant, which can be easily determined from data, we show that the proposed methods produce confidence intervals that maintain the stated confidence level. Numerical examples compare the performance to other approximations.

Pub. in Communications in Statistics - Simulation 20, n1 p81-96 1991.

Keywords: *Confidence limits, *Variance(Statistics), Mean square values, Approximation, Probability theory, Reprints.

In this article, we develop new procedures for obtaining approximate confidence intervals on positive linear combinations of the expected mean squares. The proposed approximations, in many cases, are the weighted average of liberal and conservative confidence limits. By choosing the appropriate weight, which can be easily determined from data, we show that the proposed methods produce confidence intervals with confidence coefficients very close to the stated level. Numerical examples compare the performance to other approximations.

Pub. in Communications in Statistics - Simulation 19, n4 p1165-1178 1990.

Keywords: *Confidence limits, Variance(Statistics), Mathematical models, Approximation, Reprints.

The among variance component is the balanced one-factor nested components-of-variance model is of interest in many fields of application. Expect for an artificial method that uses a set of random numbers which is of no use in practical situations, an exact-size confidence interval on the among variance has not yet been derived. This paper provides a detailed comparison of three approximate confidence intervals which possess certain desired properties and have been shown to be the better methods among many available approximate procedures. Specifically, the minimum and the maximum of the confidence coefficients for the one- and two-sided intervals of each method are obtained. The expected lengths of the intervals are also compared.

Constant-Width Calibration Intervals for Linear Regression.
Final rept.
K. R. Eberhardt, and R. W. Mee. 1994, 9p.
Pub. in Jnl. of Quality Technology 26, n1 p21-29 Jan 94.

Keywords: *Linear regression, *Calibrating, Regression analysis, Mathematical models, Confidence limits, Independent variables, Dependent variables, Probability theory, Reprints, Tolerance intervals.

Calibration, in the sense of inverse regression, is widely used in measurement science and other applications. For univariate regression models, simultaneous calibration intervals enable one to construct confidence intervals for the unobserved values of the independent variable corresponding to an unlimited sequence of future observations of the dependent variable. The intervals considered have the interpretation that if the initial training sample belongs to a specified set G of 'good' outcomes, the conditional coverage probability for each future confidence interval will be at least the nominal value. The set G is constructed to occur with high probability. All methods for constructing calibration intervals currently in the literature are conservative in that they are obtained from simultaneous tolerance intervals for which the actual confidence level exceeds the nominal level. This work develops constant-width simultaneous tolerance intervals for which the bound on the nominal coverage probabilities is exact under normality. The resulting confidence intervals represent an attractive balance between efficiency and simplicity for linear calibration problems.

Existence and Nonexistence Theorems of Finite Diameter Sequential Confidence Regions for Errors-in-Variables Models.
Final rept.
J. T. Hwang, and H. Liu. 1992, 11p.
Pub. in Statistics and Probability Letters 13, p45-55 1992.

Keywords: Stopping rules(Mathematics), Principal components analysis, Sequential analysis, Confidence limits, Existence therorems, Reprints, *Errors in variables models.

In errors-in-variables models, confidence sets (or intervals) for the key parameters with finite diameter and with asymptotic coverage probabilities greater than some nominal level 1-alpha have been constructed. Do these sets have good coverage probabilities for any fixed sample size. The answer may be no. In fact, in these models, any finite diameter confidence sets have zero minimum coverage probability, no matter how large the sample size is as long as it is fixed. The results apply to various models, including most linear and nonlinear errors-in-variables and inverse regression problems. Sequential approach appears to lie in between fixed-sample and asymptotic approaches. It seems to be interesting to investigate whether it is possible to construct good sequential confidence sets. In the paper, we focus on the errors-in-variables models and show that the answer is negative for K-stage, for any finite positive interger K, sequential sampling. However, the answer is positive for fully sequential sampling.

Outlier-Resistant Methods for Estimation and Model Fitting.
Final rept.
D. F. Vecchia, and J. D. Splett. 1994, 10p.
Pub. in ISA Transactions 33, p411-420 1994.

Keywords: *Mathematical models, *Curve fitting, *Estimating, *Outliers(Statistics), Least squares method, Estimators, Robustness(Mathematics), Regression analysis, Computer software, Reprints, LMS(Least Median of Squares).

Least squares is perhaps the most widely used technique for model fitting. In this article, we illustrate the poor performance of least squares when there are spurious values, or outliers, in a sequence of measurements. A brief overview of three well-known classes of robust alternatives to the least-squares mean is presented. For robust regression, a recent proposal called least median of squares (LMS) is described. LMS regression is compared to least-squares regression in an example involving the estimation of optical fiber geometry. References are provided for software that is available for robust estimation techniques surveyed in this article.

Pub. in Technometrics, v34 n2 p127-161 May 92.

Keywords: *Parameters, *Statistical analysis, *Experimental design, Analysis of variance, Factoral design, Reliability, Variations, Quality assurance, Quality control, Process control, Signal-to-noise ratio, Performance evaluation, Reprints.

The statistical techniques used by Taguchi to implement parameter design have been the subject of much debate, however, and there has been considerable research aimed at integrating the parameter-design principles with well-established statistical techniques. On the other hand, Taguchi and his colleagues feel that these research efforts by statisticians are misguided and reflect a lack of understanding of the engineering principles underlying Taguchi's methodology. This panel discussion provides a forum for a technical discussion of these diverse views. A group of practitioners and researchers discuss the role of parameter design and Taguchi's methodology for implementing it. The topics covered include the importance of variation reduction, the use of noise factors, the role of interactions, selection of quality characteristics, signal-to-noise ratios, experimental strategy, dynamic systems, and applications. The discussion also provides an up-to-date overview of recent research on alternative methods of design and analysis.

Principal Points and Self-Consistent Points of Symmetric Multivariate Distributions.
Final rept.
T. Tarpey. 1995, 13p.
Pub. in Jnl. of Multivariate Analysis, v53 n1 p39-51 Apr 95.

Keywords: *Elliptical distributions, *Multivariate distributions, Reprints, *Principal points, Self consistent points, Unimodal distributions.

Principal points and self-consistent points are cluster means of a distribution and represent a generalization of the population mean from one to several points. Principal points and self-consistent points are studied for a class of strongly symmetric multivariate distributions. Elliptical distributions belong to the class of strongly symmetric distributions. Several results are given for principal points and self-consistent points of strongly symmetric multivariate distributions. One result relates self-consistent points to principal component subspaces. Another result provides a sufficient condition for any set of self-consistent points lying on a line to be symmetric to the mean of the distribution.

Anova Estimates of Variance Components for a Class of Mixed Models.
Final rept.
M. G. Vangel. 1995, 6p.
Pub. in Proceedings of the Section on Physical and Engineering Sciences, Toronto, Canada, August 13-18, 1994, p91-96 1995.

Keywords: *Analysis of variance, Reprints, *Variance estimates, *Henderson method, Quadratic form, Singular value decomposition.

This article examines a simple and intuitively appealing way to estimate variance components in mixed models: perform as many ordinary least squares regressions as there are variance components, using dummy variables for all but one random effect in each regression. By equating these residual sums of squares to their expectations, unbiased estimates of all of the variance components can be obtained. This approach is a special case of Method 3 of Henderson (1953). For a class of 'nearly balanced' nested mixed models, having no interactions involving both fixed and random effects, the exact distributions (under normality) of residual sums of squares are derived.

One-Sided beta-Content Tolerance Intervals for Mixed Models.
Final rept.
M. G. Vangel. 1995, 7p.
Pub. in Proceedings of the Section on Physical and Engineering Sciences, Toronto, Canada, Chapel Hill, NC., June 13-15, 1994, Birmingham, AL., p200-206 1995.

Keywords: *Mathematical models, *Confidence limits, Variance(Statistics), Reprints, Approximation, *Material strength.

Lower confidence limits on lower tail quantiles of a population of material strength measurements are routinely used to characterize the strength of a material, particularly in air craft design. Composite materials typically exhibit considerable between-batch variability, so that the approach discussed in this article could have important applications. For example, if three batches of five specimens each are tested at each of four temperatures, and it is desired to determine as a function of temperature a lower confidence limit on the tenth percentile of the population corresponding to the strength of a specimen chosen at random from a randomly selected batch, then the proposed methodology could be applied.

Calcium Phosphate Precipitation in Liposomal Suspensions.
Final rept.
E. D. Eanes. 1990, 10p.
Pub. in Materials Research Society Symposia Proceedings, v174 p15-24 1990. Sponsored by National Inst. of Dental Research, Bethesda, MD.

Keywords: *Liposomes, *Calcium phosphates, *Mineralization, Artificial membranes, Bones, In vitro analysis, Phosphatidycholines, Cholesterol, pH, Reprints, Diacetylphosphates.

Artificial lipid vesicles (liposomes) provide an in vitro approach for microencapsulating calcium phosphate precipitation reactions in a manner similar to that which occurs in matrix vesicles, the initial loci for extracellular mineralization in many skeletal tissues. Apatitic precipitates readily form within the aqueous interiors of liposomes prepared from phosphatidycholine, dicetylphosphate, and cholesterol when the liposomal membranes enclosing pH 7.4 buffered PO4 solutions are made permeable to external Ca2+ with ionophores. If the external Ca solution is rendered metastable with PO4, the apatitic precipitates rapidly expand to outside the liposomes as well. The present paper describes the basic features of liposomal mineralization and presents some specific examples on how compositional alterations in the liposomal membrane and external Ca solution can affect the progress of this mineralization.

Characterization of the Binding of Gallium, Platinum, and Uranium to Pseudomonas Fluorescens by Small-Angle X-ray Scattering and Transmission Electron Microscopy.
Final rept.
S. Krueger, G. J. Olson, D. Johnsonbaugh, and T. J. Beveridge. 1993, 9p.
Pub. in Applied and Environmental Microbiology 59, n12 p4056-4064 Dec 93.

Keywords: *Gallium, *Platinum, *Uranium, *Pseudomonas fluorescens, *Radiation scattering, *Electron microscopy, *Binding sites, X rays, Cell membrane, Particle size, Peptidoglycans, Reprints.

Small-angle X-ray scattering (SAXS) was used to determine the binding of Ga, U, and Pt to Pseudomonas fluorescens in aqueous buffer. Atomic absorption spectrophotometry was used to quantify the heavy metals during bulk analysis, whereas transmission electron microscopy of whole mounts and thin sections was used to determine the locations of the cell-bound metal precipitates, as well as their sizes and physical structures. Energy-dispersive X-ray spectroscopy confirmed the compositions and identities of the precipitates and helped show that they were associated primarily with the envelope layers of the bacteria. Unlike Ga and Pt, which were located only at the cell surface, U was also found intracellularly in approximately 10% of the cells. The cytoplasmic location ultimately killed and lysed the cells. Surface-bound Ga and U were spread over the entire cell envelope (outer membrane-peptidoglycan-plasma membrane complex), whereas Pt was associated only with the lipopolysaccharide-rich, external face of the outer membrane. SAXS confirmed these data and showed that the bacteria were metal-enshrouded particles that were 1.0 to 1.5 micrometers in diameter. SAXS also provided a statistically significant representation of the bound metal precipitates, which ranged in size from 10 nm to 1 micrometers. The correlation between the microscopic data and the scattering data was extremely good. Since SAXS is performed in an aqueous milieu, it yields a more representative picture of the physical state of the metal bound to cell surfaces.

Calorimetric Determination of the Standard Transformed Enthalpy of a Biochemical Reaction at Specified PH and pMg.
Final rept.
R. A. Alberty, and R. N. Goldberg. 1993, 11p.
Pub. in Biophysical Chemistry 47, p213-223 1993.

Keywords: *Chemical equilibrium, *pH, *Metals, *Ions, *Heat of reaction, Reprints, Calorimetry, Hydrogen ions, Enthalpy, Biochemistry, *Metallic ions.

In a biochemical reaction there is generally a change in the binding of hydrogen ions and metal ions. Therefore, calorimetric measurements of enthalpies of reaction have to be adjusted for the enthalpies of reaction of the hydrogen ions and metal ions produced or consumed with the buffer. It can be shown that this yields the standard transformed enthalpy of reaction that determines the change in the apparent equilibrium constant (written in terms of sums of concentrations of species of a reactant) with temperature at the chosen pH and concentration of free metal ion. The derivations are based on the assumption that the changes in pH and free metal ion concentrations in the calorimetric experiment are small. This assumption is experimentally realized if a solution is well buffered for hydrogen and metal ions. The derived equations are discussed in terms of the implications they have for the performance and interpretation of calorimetric measurements.

Thermodynamic Analysis of Heparin Binding to Human Antithrombin.
Final rept.
S. DeLauder, F. P. Schwarz, J. Williams, and D. H. Atha. 1992, 9p.
Pub. in Biochimica et Biophysica Acta 1159, p141-149 1992.

Keywords: *Heparin, *Antithrombin III, *Thermodynamics, Binding sites, Differential scanning calorimetry, Protein denaturation, Protein folding, Reprints.

The binding of heparin to human antithrombin III (ATIII) was investigated by titration calorimetry (TC) and differential scanning calorimetry (DSC). TC measurements of homogeneous high-affinity pentasaccharide and octasaccharide fragments of heparin in 0.02 M phosphate buffer and 0.15 M sodium chloride (pH 7.3) yielded binding constants of (7.1 + or - 1.3) times 10 to the fifth power/M and (6.7 + or - 1.2) times 10 to the sixth power/M, respectively, and corresponding binding enthalpies of -48.3 + or - 0.7 and -54.4 + or - 5.4 kJ/mol. The binding enthalpy of heparin in phosphate buffer (0.02 M, 0.15 M NaCl, pH 7.3) was estimated from TC measurements to be -55 + or - 10 kJ/mol, while the enthalpy in Tris buffer (0.02 M, 0.15 M NaCl, pH 7.3) was -18 + or - 2 kJ/mol. The heparin-binding affinity was shown by fluorescence measurements not to change under these conditions. The 3-fold lower binding enthalpy in Tris can be attributed to the transfer of a proton from the buffer to the heparin-ATIII complex. DSC measurements of the ATIII unfolding transition exhibited a sharp denaturation peak at 329 + or - 1 K with a van 't Hoff enthalpy of 951 + or - 89 kJ/mol, based on a two-state transition model and a much broader transition from 333 to 366 K. The transition peak at 329 K accounted for 9-18% of the total ATIII. At sub-saturate heparin concentrations, the lower temperature peak became bimodal with the appearance of a second transition peak at 336 K. At saturate heparin concentration only the 336 K peak was observed. This supports a two domain model of ATIII folding in which the lower stability domain (329 K) binds and is stabilized by heparin.

Molar Absorptivities of Bilirubin (NIST SRM 916A) and Its Neutral and Alkaline Azopigments.
Final rept.
B. T. Doumas, B. W. Perry, R. B. McComb, K. L. J. Vink, J. C. Koedam, R. C. Paule, A. Kessner, and H. L. Vader. 1990, 4p.
Pub. in Clinical Chemistry 36, n9 p1698-1701 1990.

Keywords: *Pigments, *Azo compounds, *Bilirubin, *Absorptivity, Interlaboratory comparisons, Reprints, *Standard reference materials.

Three laboratories in the U.S. and two in the Netherlands determined molar absorptivities (epsilon) of bilirubin from the National Institute of Standards and Technology (NIST, the former National Bureau of Standards), Standard Reference Material SRM 916a. In caffeine reagent average epsilon values were 50,060 and 48,980 L times mol(sup -1) times cm(sup -1) at 432 and 457 nm, respectively. The epsilon value of the blue azopigment, obtained with the reference method for total serum bilirubin was 76,490 L times mol(sup -1) times cm(sup -1) at 598 nm. When the addition of alkaline tartrate was omitted, the molar absorptivity of the red azopigment was 56,600 L times mol(sup -1) times cm(sup -1) at 530 nm.

Mixed Phospholipid Liposome Calcification.
Final rept.
E. D. Eanes. 1992, 4p.
Sponsored by National Inst. of Dental Research, Bethesda, MD.
Pub. in Bone and Mineral 17, p269-272 1992.

Keywords: *Liposomes, *Phospholipids, *Calcification, Precipitation, Phosphatidylserines, Sphingomyelins, Reprints.

Synthetic lipid vesicle (liposome) suspensions have been used to experimentally model many of the calcium phosphate precipitation steps observed in matrix vesicle (MV) calcification. In particular, precipitate development in liposomes can be made to preferentially follow the progression seen in MV, i.e. to occur initially in intraliposomal spaces and then to expand into the surrounding suspending medium. This paper reviews results from studies by us which show that certain phospholipid constituents of the liposomal membrane can modulate this progression. Of greatest relevance to MV calcification is the observation that phosphatidylserine and sphingomyelin, two lipids selectively enriched in MV, slow the expansion of the precipitation from inside to outside the liposome.

Modification of Deoxyribose-Phosphate Residues by Extracts of Ataxia Telangiectasia Cells.
Final rept.
L. R. Karam, P. Calsou, W. A. Franklin, T. Lindahl, R. B. Painter, and M. Olsson. 1990, 8p.
Pub. in Mutation Research 236, n1 p19-26 1990.

Keywords: *Ataxia telangiectasia, *Deoxyribose, *Phosphates, Molecular weight, Cell line, pH, Chromatography, Xeroderma pigmentosum, Bloom syndrome, Friedreich's ataxia, Werner's syndrome, Reprints.

The release of DNA 5'-terminal deoxyribose-phosphate residues from enzymatically incised apurinic/apyrimidinic sites by human cell extracts has been under investigation. During the course of these studies, we observed that ataxia telangiectasia cell extracts modify deoxyribose-phosphate (dRp) residues by converting them to an adduct form, dRp-X, which shows altered chromatographic properties on high pressure liquid chromatography (HPLC) analysis. The chemical nature of the adduct is as yet unknown, but dRp-X is stable to both heat and acid. The modification requires an enzymatic activity and a low-molecular weight cofactor. Extracts of normal cells contain a dialyzable inhibitor that suppresses the reaction occurring with ataxia telangiectasia cell extracts. Formation of dRp-X has been observed in 7 out of 7 ataxia telangiectasia lymphoblastoid lines which represent at least 3 genetic complementation groups. Similar modification of dRp did not occur with extracts of cells of normal origin, nor those representing Fanconi's anemia, xeroderma pigmentosum, Bloom's syndrome, Werner's syndrome or Friedreich's ataxia.

Apparent Molar Heat Capacities and Apparent Molar Volumes of Aqueous Glucose at Temperatures from 298.15 K to 327.01 K.
Final rept.
N. Kishore, R. N. Goldberg, and Y. B. Tewari. 1993, 13p.
Pub. in Jnl. of Chemical Thermodynamics 25, p847-859 1993.

Keywords: *Glucose, *Aqueous solutions, *Specific heat, *Density(Mass/Volume), *Volume, Temperature dependence, Thermodynamic properties, Error analysis, Reprints, *Molar volume, Thermodynamic excess properties.

Specific heat capacities, apparent molar heat capacities, densities, and apparent molar volumes were determined for aqueous glucose over the temperature range 298.15 to 327.O K. The molal concentrations of the solutions ranged from 0.20 to 1.54 mol/kg. The results were used to calculate c(sub p,2,m)(sup o) and V(sub 2,m)(sup o) for glucose at 298.15 K and the first and second derivatives of these quantities with respect to temperature. The first virial coefficient in the expression for the excess molar volume was determined. The results were compared with published data. A discussion of systematic errors attributable to instrumental errors, sample impurities, and incomplete anomeric and relaxation in the solutions is given.

Pub. in Jnl. of Chemical Physics 93, n7 p5062-5066 1990.

Keywords: *Signal transduction, *Electric fields, *Proteins, Conformational changes, Gradients, Concentration(Composition), Membranes, Reprints, *Electroconformational coupling, *Alternating electric fields, Membrane transduction.

A four-state transport protein that has electric charges that move concomitantly with conformational changes can transduce energy in either direction between an alternating membrane potential and a concentration gradient. An alternating electric potential of very large amplitude is considered, and the rapid-equilibrium approximation is used for the conformational changes. This permits deriving simple expressions for the transport flux, the power supplied by the alternating potential, and the power applied to the concentration gradient.

Pub. in Jnl. of Colloid and Interface Science 153, n2 p457-460, 15 Oct 92.

Keywords: Light scattering, Correlation functions, Alternating current, Electric fields, Suspensions, Reprints, *Electrophoretic mobility, Homodyne measurement.

The homodyne correlation function for light scattered from a suspension of particles in an oscillating field is derived, assuming there are two species of particles of the same size but with different mobilities. If the mobility of one species is known, the mobility of the other can be determined from the modulation of the correlation function. This method of determining mobility is insensitive to thermal convection effects, electroosmotic flow, and mechanical vibrations.

Keywords: *Arginine, *Heat measurement, *Hydrolysis, *Thermochemistry, Thermodynamics, Urea, Metabolic processes, Models, Chemical reactions, Enzymes, Ammonia, Catalysis, Biotechnology, Reprints, *Molar enthalpy, Microcalorimetry, L-arginine.

Molar enthalpies of reaction for the hydrolysis of L-arginine(aq) to (L-ornithine(aq) + urea(aq)) and for the hydrolysis of L-arginine(aq) to (L-citrulline(aq) + ammonia(aq)) have been measured by microcalorimetry. These reactions are catalyzed, respectively, by arginase and by arginine deiminase. The effects of variations in pH, temperature, and ionic strength of the molar enthalpies of reaction were studied. The results have been analyzed with a model which accounts for the complex equilibria in solution. The results are discussed in terms of thermodynamic-cycle calculations and in terms of the metabolic urea cycle.

Sponsored by California Univ., San Diego, La Jolla. Dept. of Biology.
Pub. in Jnl. of Biological Chemistry 265, n30 p8581-8589 1990.

Keywords: *Bacillus subtilis, *Peptides, Sucrose, Glucose, Biological transport, Phosphorylation, Cell membrane, Phosphoenolpyruvate, Protein conformation, Reprints, *Glucose permease, *Sucrose permease.

Biochemical, immunological and sequence analyses demonstrated that the glucose permease of Bacillus subtilis, the glucose-specific Enzyme II of the phosphoenolpyruvate-dependent phosphotransferase system (PTS), is a single polypeptide chain with a C-terminal Enzyme III-like domain. A flexible hydrophilic linker, similar in length and amino acid composition to linkers previously identified in other regulatory or sensory transducing proteins, functions to tether the Enzyme III(glc)-like domain of the protein to the membrane-embedded Enzyme II(glc). Evidence is presented demonstrating that the Enzyme III(glc)-domain of the glucose permease plays a dual role and functions in the transport and phosphorylation of both glucose and sucrose. The sucrose permease appears to lack a sucrose-specific Enzyme III-like domain or a separate, soluble III(scr) protein. Enzyme II(scr) was capable of utilizing the III(glc)-like domain of the glucose permease regardless of whether the III(glc) polypeptide was provided as a purified, soluble protein, as a membrane-bound protein within the same membrane as Enzyme II(scr), or as a membrane-bound protein within membrane fragments different from those bearing Enzyme II(scr). These observations suggest that the III(glc)-like domain is an autonomous structural unit that assumes a conformation independent of the hydrophobic, N-terminal intramembranal domain of Enzyme II(glc).

Inorganic support materials have been used for chromatography for over 75 years. However, it is only been within the last 25 years that these materials have been applied to affinity separations in which the affinity ligand is covalently bonded to the support. This review will cover the application of inorganic silicas and metal oxides for coupling to ligands of various types for the isolation and purification of antigens, antibodies, enzymes, nucleic acids and related species. Specific protocols for the activation and coupling of ligands are presented. The review will not cover ion chromatography or use of hydrocarbon bonded phases for protein isolations, nor will it cover the application of ion exchange as a separation and purification method on inorganic supports. The review contains 77 references.

Membrane-Mediated Precipitation of Calcium Phosphate in Model Liposomes with Matrix Vesicle-Like Lipid Composition.
Final rept.
D. Skrtic, and E. D. Eanes. 1992, 11p.
Sponsored by National Inst. of Dental Research, Bethesda, MD.
Pub. in Bone and Mineral 16, p109-119 1992.

Keywords: *Calcium phosphates, *Membrane lipids, *Liposomes, *Precipitation(Chemistry), pH, Divalent cations, Phospholipids, In vivo analysis, Minerals, Biochemistry, Reprints, *Matrix vesicles, Apatite/hydroxy, Serine/phosphatidyl, Sphingomyelin.

The present study examined calcium phosphate precipitation in aqueous suspensions of artificial liposomes which closely resembled matrix vesicles (MV) in membrane lipid composition. At 22 C, the liposomes per se did not initiate precipitation in the suspending medium for up to 120 h when the latter was made supersaturated with respect to hydroxyapatite (2.25 mM Ca(2+), 1.5 mM PO4, 240 mosmol, pH 7.4). Likewise, the suspending medium remained stable for up to 72 h when precipitation was induced within the aqueous interiors of the liposomes by encapsulating pH 7.4-buffered 50 mM PO4 solutions in the interior spaces and making the enclosing membranes permeable to external solution Ca(2+) ions with the ionophore X-537A. However, extraliposomal precipitation readily occurred under these latter conditions when phosphiatidylserine (PS) and sphingomyelin (Sph) were deleted from the MV-like lipid formulation used to prepare the liposomes. These results suggest that lipidic membrane constituents such as PS and Sph may have a controlling influence on MV-mediated calcification in vivo by affecting the release of intravesticularly formed mineral crystals into the extracellular matrix space where they can subsequently grow and proliferate.

Effect of 1-Hydroxyethylidene-1,1-Bisphosphonate on Membrane-Mediated Calcium Phosphate Formation in Model Liposomal Suspensions.
Final rept.
D. Skrtic, and E. D. Eanes. 1994, 11p.
Sponsored by National Inst. of Dental Research, Bethesda, MD.
Pub. in Bone and Mineral 26, p219-229 1994.

Keywords: *Calcium phosphates, *Membrane lipids, *Liposomes, Dental materials, Mineralization, Precipitation(Chemistry), Biochemistry, Physicochemical properties, In vivo analysis, Phosphatidylserines, Matrix bands, Reprints, *Ethylidene bisphosphonate/hydroxy.

The bisphosphonate, 1-hydroxyethylidene-1,1-bisphosphonate (HEBP), was examined for its effect on calcium phosphate precipitation in pH 7.4, 22 C suspensions of 7:2:1 phosphatidylcholine (PC):dicetylphosphate (DCP):cholesterol (Chol) and 7:1:1 PC:phosphatidylserine (PS):Chol liposomes. HEBP (0.5-50 micromol/l) in the suspending medium had little, if any, effect on precipitation that formed inside phosphate-rich (50 mmol/l) aqueous interiors of liposomes as a result of ionophore (X-537A) driven 2.25 mmol/l Ca(2+) influxes from the medium. These results provide a possible physicochemical explanation for the suppression of matrix vesicle initiated mineralization in ectopically-induced osteoid tissue of HEBP treated mice. In particular, the liposome results suggest that membrane phosphatidylserine interactions with mineral may enhance HEBP's effectiveness in vivo.

Supported Phospholipid/Alkanthiol Biomimetic Membranes: Insulating Properties.
Final rept.
A. L. Plant, M. Gueguetchkeri, and W. Yap. 1994, 8p.
Pub. in Biophysical Jnl. 67, p1126-1133 Sep 94.

Keywords: *Phospholipids, *Lipid bilayers, *Artificial membranes, Spectroscopy, Electron transfer, Gold, Melittin, Dielectrics, Insulation resistance, Conductivity, Resistance, Reprints, *Alkanethiol monolayers.

A novel model lipid bilayer membrane is prepared by the addition of phospholipid vesicles to alkanethiol monolayers on gold. This supported hybrid bilayer membrane is rugged, easily and reproducibly prepared in the absence of organic solvent, and is stable for very long periods of time. We have characterized the insulating characteristics of this membrane by examining the rate of electron transfer and by impedance spectroscopy. Supported hybrid bilayers formed from phospholipids and alkanethiols are pinhole-free and demonstrate measured values of conductivity and resistivity which are within an order of magnitude of that reported for black lipid membranes. Capacitance values suggest a dielectric constant of 2.7 for phospholipid membranes in the absence of organic solvent. The protein toxin, melittin, destroys the insulating capability of the phospholipid layer without significantly altering the bilayer structure. This model membrane will allow the assessment of the effect of lipid membrane perturbants on the insulating properties of natural lipid membranes.

A. L. Plant, M. Brigham-Burke, E. C. Petrella, and D. J. O'Shannessy. 1995, 7p.
Pub. in Analytical Biochemistry 226, p342-348 1995.

Keywords: *Phospholipids, *Lipid bilayers, *Artificial membranes, Reprints, Electron transfer, Conductivity, Resistance, Dielectrics, *Alkanethiol monolayers.

Supported hybrid bilayer membranes (HBM) composed of a monolayer of phospholipid and a monolayer of alkanetiol associated with a thin gold film on glass are useful as model lipid bilayer membranes for studying membrane receptor-ligand and cell-cell binding events by surface plasmon resonance (SPR). Measurements of specific binding of proteins and lipid vesicles to well-defined HBMs have been performed under conditions or continuous flow using a commercial SPR instrument (BIAcore). HBMs are shown to be stable in flow and to block nonspecific adsorption of proteins to the alkanethiol/gold surface. The use of such supported lipid bilayers in flow provides a means of conducting equilibrium and kinetic studies of models of ligand-cell and cell-cell interactions with receptors or ligands in a membrane environment. Compared to the extended dextran polymer layer that is currently used for surface modification of BIAcore 'sensor chips,' the described HBMs provide a well-defined surface that will permit less ambiguous modeling of these important biological interactions.

Sponsored by Environmental Protection Agency, Washington, DC.
Pub. in Analytical Chemistry, v67 n5 p787-792, 1 Mar 95.

Keywords: *Deoxyribonucleic acids, *Biosensors, *Aromatic compounds, Reprints, Flow injection analysis, *Intercalation, Wave sensors, Fluorophore, Fluorescence radiation.

A flow injection analysis system coupled with an evanescent wave biosensor employing total international reflection of fluorescence radiation for the detection of the compounds that intercalate within DNA is reported. A highly fluorescent intercalator, ethidium bromide, has been used as the reference compounds for the detection. The evanescent wave biosensor was developed using immobilized double-strand DNA (daDNA) over the surface of a cylindrical wave guide. The response of the DNA-modified fiber is significantly higher than the responce obtained with an unmodified fiber. The response of the biosensor at a constant concentration of ethidium bromide increases on increasing the concentration of immobilized dsDNA. At the steady-state response of the biosensor, obtained at a constant concentration of ethidium bromide, there is a decrease in the response to the injection of another DNA intercalator that competes for the intercalation sites on the dsDNA, displacing the ethidium bromide. This is immediately followed by recovery of the steady-state response. The decrease in the sensor response is a linear function of the concentrations of injected intercalator. Responce curves for 9, 10-anthraquinone-2, 6-disulfonic acid, remazol brillant blue, decacyclene, and 4', 6-diamidino-2-phenylindole dihydrochloride are reported.

Physicochemical Characterization of Low Molecular Weight Heparin.
Final rept.
D. Atha, B. Coxon, V. Reipa, and A. Gaigalas. 1995, 5p.
Pub. in Jnl. of Pharmaceutical Sciences, v84 n3 p360-364 Mar 95.

Keywords: *Heparin, *Light scattering, Reprints, Anticoagulants, Physicochemistry, HPLC, Raman spectroscopy.

Nuclear magnetic resonance spectroscopy (NMR), Raman spectroscopy, dynamic light scattering (DLS) and high performance exclusion chromatography (HPLC) were used to characterize two different commercial preparations of low molecular weight heparin produced by peroxide cleavage using nitrous acid. Proton NMR showed that the contamination by dermatam sulfate varied from 2% in the material produced by deaminative cleavage using nitrous acid, to 4% for the material produced by peroxide cleavage. The Raman spectra of the nitrous acid produced material showed an equivalent amount of O - sulfation to that in the material produced by peroxide, but about a 10% reduction in the content of N-sulfated glucosamine, as expected from the deamination reaction. DLS and HPLC indicated the presence of less than 0.2% of very high molecular weight/aggregate material for the peroxide preparation as compared to 1% for the nitrous acid prepared material. The weight average molecular weight (Mw) determined from HPLC was 5900 Da for the nitrous acid prepared material and 6850 Da for the peroxide produced material. The number average molecular weight (Mn) calculated from this data was 5200 Da for the nitrous acid preparation and 5300 Da for the peroxide produced material. In addition, the nitrous acid prepared material exhibited a much narrower size distribution of oligomeric species, as evidenced by the polydispersity (MwMn) of 1.1 for the nitrous acid prepared material, as compared with a value of 1.3 for the peroxide prepared material.

Small Angle Neutron Scattering Studies of Structural Characteristics of Argarose Gels.
Final rept.
S. Krueger, A. P. Andrews, and R. Nossal. 1994, 10p.
Pub. in Biophysical Chemistry, v53 p85-94 1994.

Keywords: *Neutron scattering, *Gels, Reprints, Structural analysis, *Agarose.

The 30 m small angle neutron scattering facility at the National Institutes of Standards and Technology has been used to examine neutron scattering from agarose gels formed in D(2)O. Differential scattering cross sections have been acquired over a continuous range of O between 0.005 and 0.3 Angstroms to the minus 1.power. Subtle changes in gel structure are observed when pre-gelation agarose concentration is varied. Similarly, except when the gelling solution is rapidly cooled to a low temperature, the rate at which the gels are formed does not seem to have much effect. Clearer evidence of structural rearrangement is observed when the solvent quality is changed by the addition of dimethyl sulfoxide, or when the temperature of the gel is elevated above 70 degrees C. These data are consistent with a description of a randomly structured polymer network containing discrete self-similar, hydrogen-bonded, junctions normally of minimal thickness = 35-40 Angstroms.

Extending the Angular Range of Neutron Reflectivity Measurements from Planar Lipid Bilayers: Applications to a Model Biological Membrane.
Final rept.
S. Krueger, J. F. Ankner, S. K. Staija, M. Colombini, C. F. Majkrzak, and D. Gurley. 1995, 5p.
Pub. in Langmuir, v11 n8 p3218-3222 1995.

Keywords: *Lipids, *Neutron reflectivity, *Membranes, Measurement, Mitochondria, Reprints.

A novel experimental setup has been used to measure the specularly reflected neutron intensity from a model biological membrane containing components from the outer membrane of Neurospora crassa mitochondria. The specular reflectivity from a single bilayer membrane, formed by the fusion of vesicles onto a phospholipid monolayer supported on a flat substrate, was measured in both D2O and H20 solvents. In D2O solvent, reflected neutron intensities down to 10 to the minus 6 power were measured for wavevector transfers out to 0.25 A-1. A symmetric model for the neutron scattering length density profile perpendicular to the bilayer surface was constructed based on fits to the D2O data. The overall bilayer thickness was found to be 43 plus or minus 2 A. The individual lipid head group and hydrocarbon tail layer thickness were 7.5 plus or minus 1.4 and 28.0 plus or minus 2.8 A, respectively. The fitted results are consistent with the H2O data. The integrity of the model membrane bilayer was confirmed by comparing its measured reflectivity to that obtained from a single lipid bilayer consisting of soybean phospholipids (asolectin) which was deposited on a flat substrate by the Langmuir-Blodgett technique.

Optical Control of Enzymatic Conversion of Sucrose to Glucose by Bacteriorhodopsin Incorporated into Self-Assembled Phosphatidylcholine Vesicles.
Final rept.
M. F. McCurley, and S. A. Glazier. 1995, 5p.
Pub. in Analytica Chimica Acta, v311 p211-215 1995.

Keywords: *Enzymatic methods, *Vesicles, Bacteriorhodopsin, Invertase, Reprints.

This report describes an alternative method to modulate enzyme activity optically through pH modulation. Bacteriorhodopsin (BR) is used to regulate the activity of an enzyme which it does not naturally regulate. In this study BR controlled the pH-dependent conversion of sucrose to glucose by the enzyme, invertase. BR is oriented in the wall of phosphatidylcholine vesicles so that at pH values greater than 4-5 it pumps protons into the vesicles and at pH values less than 4 it pumps protons out of the vesicle when illuminated with light of the proper wavelength. The bulk-solution pH correspondingly changes as a result. At an intial pH of 5.57 the change in pH of the solution due to pumping by the bacteriorhodopsin-vesicle complex was 0.17 pH units. To study this effect on the enzyme, samples containing BR vesicles and invertase were assayed for enzyme activity under dark and illuminated conditions. It was found that changes in enzyme activity, upon illumination, were generally larger than predicted for the corresponding changes in the bulk solution pH generated by the BR vesicles.

Mapping Domains in Proteins: Dissection and Expression of 'Escherichia coli' Adenylyl Cyclase.
Final rept.
P. Reddy, J. Hoskins, and K. McKenney. 1995, 5p.
Pub. in Analytical Biochemistry, n231 p282-286 1995.

Keywords: Oligonucleotides, Reprints, *Protein expression, *Domains, PRE expression vector.

The authors have used the pRE expression vector containing the Escherichia coli adenylyl cyclase gene (cya) with the unique NdeI restriction site CATATG at the initiation codon in conjunction with a family of self-complimentary oligonucleotides to create amino- and carboxy-terminal domains in adenylyl cyclase. The three sets of oligonucleotides contain a TAA translation stop condon in all reading frames flanked by the NdeI restriction endonuclease sequence and one or two nucleotides (5' NNCATATGTTAATTAATTAACATATGNN 3'). Ligation of one of these annealed oliognucleotides into a restriction site or creation of 5' TAA/CATATG 3' translation stop/NdeI restriction site along a gene in the pRE expression vector facilitates the premature termination of protein synthesis thus yielding amino-terminal domains. Removal of a fragment of the gene corresponding to the amino-terminal portion by NdeI restriction and ligation brings the 3' end of the gene in frame with the initiator ATG. With this strategy, expression of the carboxyl-terminal domain of a protein is possible which is otherwise not as simple as the expression of the amino-terminal domain. The feasibility of expression of any domain of protein is demonstrated using the cya gene to create several amino- and carboxyl-terminal domains of adenylyl cyclase.

Keywords: *DNA damage, *Deoxyribonucleic acids, *Enzyme kinetics, Reprints, Isodialuric acid, Hydroxyl radical.

Uracil DNA N-glycosylase is a repair enzyme that releases uracil from the DNA. A major function of this enzyme is presumably to protect the genome from premutagenic uracil resulting from deamination of cytosine in DNA. Here, we report that human uracil DNA N-glycosylase also recognizes three uracil derivatives that are generated as major products of cytosine in DNA by hydroxyl radical attack or other oxidative processes. DNA substrates were prepared by y-irradiation of DNA in aerated aqueous solution and incubated with human uracil DNA N-glycosylase, heat-inactivated enzyme or buffer. Ethanol-precipitated DNA and supernatant fractions were then separated.

Structural Analysis of Heparin by Raman Spectroscopy.
Final rept.
D. H. Atha, A. K. Gaigalas, and V. Reipa. 1996, 5p.
Pub. in Jnl. of Pharmaceutical Sciences, v85 n1 p52-56 Jan 96.

Keywords: *Heparin, *Raman spectroscopy, Anticoagulants, Reprints, Physicochemistry.

The Raman spectra of commercially available heparin disaccharide standards exhibit bands associated with the N-sulfate and the 6-O-sulfate groups of the glucosamine and the 2-O-sulfate of the iduronic acid. The N-sulfate has a strong band at 1039 cm to the minus one. The 6-O-sulfate and the 2-O-sulfate exhibit bands at 1055 and 1065 cm to thh minus one, respectively. The pattern of these modes, which are assigned to the symmetric SO3 vibrations, was supported by semiempirical quantum mechanical calculations. The above bands were identified in the Raman spectrum of a commercial preparation of porcine mucosal heparin and were used to determine the relative proportion of the N-sulfate, 6-O-sulfate, and 2-O-sulfate groups in the heparin molecule. The information, which is complementary to that obtained by NMR spectroscopy, is of particular importance in relation to biological activity.

New Method for the Detection and Measurement of Polyaromatic Carcinogens and Related Compounds by DNA Intercalation.
Final rept.
J. J. Horvath, M. Gueguetchkeri, A. Gupta, D. Penumatchu, and H. H. Weetall. 1995, 17p.
Sponsored by Environmental Protection Agency, Research Triangle Park, NC. Atmospheric Research and Exposure Assessment Lab.
Pub. in National Meeting of the American Chemical Society (209th), Anaheim, CA., April 2-6, 1995, Biosensor and Chemical Sensor Technology, Process Monitoring and Control, ACS Symposium Series, Chapter 5, v613 p44-60.

Keywords: *Deoxyribonucleic acids, *Fluorescence, Measurement, Polarization, Reprints, *Polyaromatic carcinogens, DNA intercalation.

A simple and sensitive method for detection and quantification of carcinogens and related polyaromatic compounds by DNA intercalation has been devised. The experimental technique is based on the phenomenon of DNA intercalation using fluorescence polarization for quantitative measurements. The assay architecture is analogous to a protocol presently used for competitive immunoassays, whereby an intercalating dye of fluorochrome would compete with or be displaced by the analyte (test compound). Our competitive binding assay utilizes DNA binding sites and a fluorescent intercalating dye. The carcinogenic analytes investigated were benzo(a)pyrene, dibenz(a,h)anthracene, dibenz(a,j)anthracene, benz(a)anthracene, benzo(j)fluoranthene, benzidine, aniline, parathion, pentachlorophenol and nitrobenzene. The non-carcinogenic hydrocarbons studies were naphthalene, anthracene, phenanthrene, benzo(k)fluoranthene and 1,2,3,4,5,6,7, 8-octahydronaphthalene. The intercalating dyes examined were acridine orange, ethidium bromide, proflavin and 4,6-diamidino 2-phenylindale chloride (DAPI). Of the compounds studied, only the single ring compounds gave a negative response. All the other compounds investigated displaced the intercalated dye molecule. It has been determined that molecules require at least two adjacent benzene rings for intercalation to occur. The detection limits of this analytical method were between 10 to the minus 5th power mol/L and 10 to the minus 8 power mol/L for all materials tested.

Quantitative Determination of Oxidative Base Damage in DNA by Stable Isotope-Dilution Mass Spectrometry.
Final rept.
M. Dizdaroglu. 1993, 6p.
Pub. in Federation of European Biochemical Societies Letter, v315 n1 p1-6 1993.

Keywords: *Radiation damage, *DNA, *Spectrometry, Free radical, Hydroxyl radical, Modified base, Reprints, *Foreign technology, Isotope-labeled analogue, Selected-ion monitoring.

For understanding of the role of oxidative DNA damage in biological processes such as mutagenesis and carcinogenesis, it is essential to identify and quantify the type of DNA damage in cells. This can be achieved by gas chromatography/mass spectrometry. The present study describes the quantification of modified bases in DNA by isotope-dilution mass spectrometry with the use of stable isotope-labeled analogues as internal standards. A number of isotopically labeled DNA bases were synthesized. The mass spectra of their trimethylsilyl derivatives were recorded. Calibration plots were obtained for known quantities of modified bases and their isotope-labeled analogues. Quantification of various modified DNA bases by isotope-dilution mass spectrometry was demonstrated in isolated chromatin exposed to ionizing radiation. The results indicate that gas chromatography/stable isotope-dilution mass spectrometry is an ideally suited technique for selective and sensitive quantification of modifed bases in DNA.

Biochemistry

Commentary: The Measurement of Oxidative Damage to DNA by HPLC and GC/MS Techniques.
Final rept.
B. Halliwell, and M. Disdaroglu. 1992, 13p.
Pub. in Free Rad. Res. Comms., v16 n2 p75-87 1992.

Keywords: *DNA, *Hydroxyl radical, Singlet oxygen, Mass spectrometry, Reprints, *Foreign technology, 8-hydroxyguanine, Electro-chemical detection.

Oxidative damage to DNA has been measured by quantitating 8-hydroxy-2'-deoxyguanosine (8-OHdGuo) after enzymic digestion of DNA, followed by HPLC separation and electrochemical detection. Alternatively, 8-hydroxyguanine (and a wide range of other base-derived products of free radical attack) may be measured after acidic hydrolysis of DNA or chromatin, followed by derivatization and gas-chromatography/mass spectrometry. Both techniques have comparable sensitivity, but GC/MS enables determination of a wide variety of chemical changes to all four DNA bases and it can be applied to DNA-protein complexes. However, the two techniques do not always give similar results. Potential reasons for this are discussed. Greater attention of methodological questions is required before using measurement of 8-OHdGuo as a 'routine' marker of oxidative DNA damage in vivo.

Intercomparison of DNA Sizing Ladders in Electrophoretic Separation Matrices and Their Potential for Accurate Typing of the D1S80 Locus.
Final rept.
M. C. Kline, J. W. Redman, D. J. Reeder, and D. L. Duewer. 1996, 9p.
Pub. in Applied and Theoretical Electrophoresis, v6 p33-41 1996.

Keywords: *DNA, *Separation matrices, Acrylamide, Agarose, Basepair, Genetic markers, Quantitative analysis, Reprints, Electrophoretic mobility, Polymerase chain reaction.

The 100-1,000 basepair size typical of PCR-amplified DNA fragments demands high resolution electrophoretic gels for the adequate characterization of small differences among samples. We have studied the behavior of a number of commercial sizing ladders in three ladders in three classes of separation systems: polyacrylamides with discontinuous buffer, proprietary acrylamides with continuous buffer, and agarose-like materials with continuous buffer. None of the ladders examined perform adequately in any of these systems using vendor-supplied nominal ladder component basepair sizes. All ladders successfully types D1S80 alleles after calibration with the allelic ladder (replacing the nominal size values with the least squares estimate of allele/matrix-specific apparent sizes). Some ladders and matrices are qualitatively better than others. No one ladder proved consistently better than others; a polyacrylamide gell with ribose modifier provided the most precise results in the study. Appropriate allelic ladders or a well defined subset of known alleles can serve as the calibration system.

Pub. in Biochemistry, v35 p3418-3425 1996.

Keywords: *Hemoglobin, Blood proteins, Oxygenation, Regulations, Reprints, *Allosteric effectors, Oxygen affinity, Sebacylhemoglobin.

Cross-linked human hemoglobin (Hba) is obtained by reaction with bis(3,5-dibromosalicyl) sebacate. Peptide maps and crystallographic analyses confirm the presence of the 10 carbon atom long sebacyl residue cross-linking the two beta82 lysines of the beta-cleft (DecHb). The Adair's constants, obtained from the oxygen binding isotherms, show that at the first step of oxygenation normal hemoglobin and DecHb have a very similar oxygen affinity. In DecHb negative binding cooperativity is present at the second step of oxygenation, which has an affinity 27 times that of the second step. Positive cooperativity is present at the third binding step, whose affinity is 380 times that of the second step. The fourth binding step shows a weak negative cooperativity with an affinity one-half that of the third step. Crystals of deoxy-DecHb diffracted to 1.9 Angstroms resolution. The electron density map of deoxy-DecHb indicates the presence of the 10 carbon bridge between the beta82 lysines.

As part of the analytical research leading to the certification of the new Apple and Peach Leaves Standard Reference Materials (SRMs), a study was undertaken to evaluate different sample dissolution techniques for losses of analyte species. Possible loss mechanisms include absorption or adsorption of analyte elements at the walls of the sample decomposition vessels, and the formation or persistence of insoluble particulate material during sample dissolution. Results of this study indicated that significant fractions of some elements were present on particles after acid dissolution, despite visual indications that dissolution was complete. In addition, large amounts of some elements remained in the platinum crucibles used to fuse samples with lithium metaborate.

N. Bir, A. Paliwal, K. Muralidhar, P. Reddy, and P. Usha Sarma. 1995, 11p.
Pub. in Preparative Biochemistry, n25(4) p171-181 1995.

Keywords: *Deoxyribonucleic acids, Genomes, Diagnosis, Reprints, *Aspergillus fumigatus, Polymerase chain reaction.

A majority of Aspergillus induced diseases are reported to be caused by Aspergillus fumigatus. In immunocompromized and post transplant cases it can lead to invasive aspergillosis. Due to this the molecular fingerprinting of aspergillus isolates by RFLP analysis and development of DNA diagnostic probes are gaining importance. Different methodologies are being adopted for extraction of the genomic DNA from fungus. The existing procedures for isolation of DNA are time consuming and range from several hours to few days. The most difficult step in the isolation of DNA from aspergillus species is to disrupt the tough chitin rich cell wall without causing damage to genomic DNA. The authors report here a rapid method for extraction of genomic DNA based on the cleavage of chitin with chirinase. The subsequent modification steps included are lysis and microwave treatment.

The National Institute of Standards and Technology (NIST) (formerly the Natioanl Bureau if Standards (NBS)) issued the first botanical reference material certified for elemental content in January 1971, as Standard Reference Material (SRM) 1571, Orchard Leaves. In the following years a total of nine additional botanical certified reference materials have been issued by NIST. Each of these materials was certified for major, minor and trace elements except for SRM 2695, certified for fluorine only. Botanical SRMs issued since 1991 are significantly improved over previous materials in a number of ways. Probably the most significant change is the use of a jet-milling process to grind them to extremely fine particles. This has resulted in botanical SRMs wth significantly improved homogeneity. These NIST reference materials are described with information on homogeneity, drying techniques and grit content.

Results of the ASTM Nuclear Methods Intercomparison on NIST Apple and Peach Leaves Standard Reference Materials.
Final rept.
D. A. Becker. 1993, 15p.
Pub. in Jnl. of Radioanalytical and Nuclear Chemistry, Articles, v168 n1 p169-183 1993.

Keywords: *Botany, *Analytical techniques, *Chemical analysis, Plants(Botany), Leaves(Botany), Trace elements, Comparisons, Absorption, Adsorption, Reprints, *Foreign technology, Standard reference materials.

The ASTM Task Group on Nuclear Methods of Chemical Analysis (E10.052.12) has conducted a trace element intercomparison among some of its members over the past two years. Eight non-NIST laboratories submitted data using nuclear techniques, with a total of 111 values for the apple leaves and 116 values for the peach leaves, on 46 to 50 elements, respectively. This intercomparison provided a unique opportunity for the analyical laboratories, because the analytical values submitted could be later compared to the NIST certified values. For the seven elements which were certified by NIST and had three or more intercomparison values, the results showed that: (1) 61% of all 56 intercomparison values submitted had results whose stated uncertainty overlapped the uncertainty limits of the NIST certified values, and (2) less than 6% of the intercomparison values had means which fell outside plus or minus 20% of the NIST values. In general, the intercomparison values submitted showed excellent agreement with the NIST values. However, many reported uncertainties accompanying intercomparison values appeared overly optimistic.

Regulation of Lithium and Boron Levels in Normal Human Blood: Environmental and Genetic Considerations.
Final rept.
R. M. Barr, W. B. Clarke, R. M. Clarke, R. G. Downing, J. Venturelli, and G. R. Norman. 1993, 6p.
Pub. in Jnl. of Laboratory and Clinical Medicine 121, n4 p614-619 Apr 93.

Keywords: *Lithium, *Boron, *Blood chemical analysis, *Genetics, *Environmental health, Mass spectroscopy, Carrier proteins, Water supply, Twins, Reprints.

Blood lithium levels may be both genetically and environmentally regulated. The genetic component is evidenced mainly from studies in twins who were either normal or had a manic-depressive disorder. An environmental contribution is adduced from the relationship between the blood lithium level and the amount of the element ingested. No such information is available for boron, another element present in ultra trace amounts in human blood. Unusually high levels of lithium and

boron in the waters of northern Chile offer an opportunity to study the genetic and environmental regulation of these elements in the blood of healthy subjects. Samples of blood (n = 40) and water (n = 47) were collected at seven locations in the province of Tarapaca. Most of the healthy subjects were Aymara who had been resident in the respective communities for at least 3 years. Because some of the individual subjects (n = 15) were first-degree relatives, a genetic component to the regulation of blood levels was explored. The variance in blood levels of lithium and boron was significantly greater between than within families ($p < 0.0001$). There are environmental and apparent genetic contributions to the regulation of blood levels of lithium and boron in healthy human subjects.

Determination of 3-Quinuclidinyl Benzilate (Qnb) and Its Major Metabolites in Urine by Isotope Dilution Gas Chromatography Mass Spectrometry.
Final rept.
G. D. Byrd, R. C. Paule, L. C. Sander, H. T. Bausum, L. T. Sniegoski, and E. White. 1992, 6p.
Pub. in Jnl. of Analytical Toxicology 16, n3 p182-187 1992. Sponsored by Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.

Keywords: *Urinalysis, *Quinuclidinyl benzilate, *Metabolites, *Hallucinogens, Mass fragmentography, Isotopes, Chemical analysis, Reprints, *3-Quinuclidinol, *Benzilic acid.

In response to the scheduled destruction of U. S. military stockpiles of the hallucinogenic agent 3-quinuclidinyl benzilate (BZ), a specific confirmatory test for human exposure to BZ was developed. The amount of the parent compound in the urine as well as the two major metabolites, 3-quinuclidinol (Q) and benzilic acid (BA), was determined since the exact relationship between BZ dose and levels of BZ and its metabolites in urine is not well known. BZ was determined in urine samples spiked at a target level of 0.5 ng/mL and the metabolites Ba and Q were determined at a target level of 5 ng/mL. The variabilities in the method are more or less evenly distributed between three imprecision categories (GC/MS measurement, sample preparation, and sample). The imprecision of a single measurement is about 15% for each analyte. The method developed uses solid phase extraction to isolate each analyte from the urine and isotope dilution GC/MS for quantitation. Each analyte is converted to its trimethylsilyl derivative for analysis. The analytical method was tested on 8 different urines spiked with known amounts of analytes near the target levels, at ten times the target levels, and blank (unspiked) urine samples.

Pub. in Jnl. of Chromatography 584, p207-212 1992. Sponsored by National Cancer Inst., Bethesda, MD.

Keywords: *Pesticides, *Blood chemical analysis, High pressure liquid chromatography, Mass spectroscopy, Isotopes, Reference standards, Reprints, *Oltipraz.

Three methods have been developed for the analysis of Oltipraz in serum. A method suitable for routine use employs spiking with a homologous internal standard, off-line solid-phase extraction, high-performance liquid chromatographic separation, and optical absorbance detection at 450 nm. Method detection limit is about 1 ng/ml. A second method, less susceptible to bias from co-eluting interferences, uses a stable isotope-labeled internal standard, similar extraction and separation, and detection by thermospray mass spectrometry. Method detection limit is about 0.2 ng/ml. A third method was developed which can be used without specially synthesized internal standards. it uses on-line solid-phase extraction, with quantification by comparison with external standards. Method detection limit is about 3 ng/ml. Good agreement was observed between these methods and with similar and different methods run in other laboratories. Calibration curves were linear over the entire range which was investigated, i.e., up to 500 ng/ml. Coefficients of variation were similar for all three methods, being about 5%.

Keywords: *Liposomes, *Flow injection analysis, *Theophylline, *Blood chemical analysis, *Immunoassay, Competitive binding, Fluorescence polarization immunoassay, Antibodies, Reprints.

We developed a method for quantitatively determining theophylline in serum, using a heterogeneous immunoassay called flow-injection immunoanalysis. The reaction involves competition between serum theophylline and theophylline-labeled liposomes. Separation occurs on a solid-phase reactor column containing immobilized antibody to theophylline incorporated in a flow-injection system. Subsequent lysis of the bound liposomes provides sensitive detection of the analyte. Effective regeneration of the immobilized antibody activity allows the reactor to be reused for hundreds of sequential samples. Comparison of the results of the flow-injection immunoassay method with results obtained with a commercially available fluorescence polarization method showed an excellent correlation.

Ascorbic and Dehydroascorbic Acids Measured in Plasma Preserved with Dithiothreitol or Metaphorphoric Acid.
Final rept.
S. A. Margolis, R. C. Paule, and R. G. Ziegler. 1990, 6p.
Pub. in Clinical Chemistry 36, n10 p1750-1755 Oct 90.

Keywords: *Ascorbic acid, *Dehydroascorbic acid, *Blood chemical analysis, *Dithiothreitol, *Blood preservation, Reference standards, pH, Temperature, Lyophilization, Accuracy, Precision, Stability, Reprints, *Metaphosphoric acid.

The accurate and precise measurement of ascorbic and dehydroascorbic acids in human plasma requires reference materials of demonstrable stability and homogeneity, and analytical methodology of demonstrable accuracy and precision. We have developed a rapid (8 min.), accurate (gravimetric and assessed values agree) and precise (CV<2%) method for ascorbic acid analysis. The stability and homogeneity of lyophilized plasma samples supplemented with ascorbic acid and dithiothreitol is sufficient for the materials to be used as control or reference materials. Plasma samples supplemented with ascorbic acid and dehydroascorbic acid, and preserved with 5% metaphosphoric acid were used to develop an assay for dehydroascorbic acid and to study the stability of both ascorbic and dehydroascorbic acid under these conditions. The assay consists of measuring the native ascorbic acid, then reducing the dehydroascorbic acid at neutral pH with dithiothreitol and measuring the total ascorbic acid. The metaphosphoric acid treated samples were shown to be stable at -70 C and the stability decreased with temperature over the range of 4 to 50 C.

Secondary Target X-Ray Excitation for In vivo Measurement of Lead in Bone.
Final rept.
P. A. Pella, and C. G. Soares. 1991, 6p.
Sponsored by Agency for Toxic Substances and Disease Registry, Atlanta, GA.
Pub. in Advances in X-ray Analysis 34, p293-298 1991.

Keywords: *Lead(Metal), *In vivo analysis, *Toxic substances, *X-ray analysis, *Bones, Biomedical measurement, Radiation dosage, Pollution sources, Excitation, Reprints.

Secondary target x-ray excitation (L-shell) was explored for possible application in x-ray systems designed for in vivo measurement of lead in bone (e.g. tibia bone) for screening purposes. Since x-ray output from secondary targets is due mostly to characteristic x-rays and is many times lower than from direct excitation from high power tubes, it was of interest to measure the x-ray dose. This consisted of the experimental measurement of the x-ray fluorescence followed by appropriate conversion to an effective equivalent dose. Minimum detection limits were calculated using simulated bone samples (i.e. bone ash) using different instrumental configurations. An overlay of lucite was used to simulate the absorption of the skin layer.

The article describes the type of reference materials available for laboratories conducting urine drug testing. It describes how laboratories can check their standards to assure accuracy in their methods. Some description is provided on how NIST determines the purity of standard reference materials. The laboratories doing the drug testing do not have the time, facilities, or expertise to test their standards as thoroughly as is done at NIST. Some recommendations are provided concerning testing that these laboratories can and should perform on their standards.

Amperometric Flow-Injection Analysis Biosensor for Glucose Based on Graphite Paste Modified with Tetracyanoquinodimethane.
Final rept.
P. C. Pandey, S. A. Glazier, and H. H. Weetall. 1993, 5p.
Pub. in Analytical Biochemistry 214, p233-237 1993.

Keywords: *Flow injection analysis, *Glucose, *Biosensors, Immobilized enzymes, Reproducibility of results, Oxidation, Reduction(Chemistry), Graphite, Blood, Humans, Reprints, *Tetracyanoquinodimethane.

A biosensor system using flow injection analysis (FIA) has been developed for the analysis of glucose in human serum. The system consists of the enzyme glucose oxidase incorporated into graphite paste modified with the electroactive material tetracyanoquinodimethane (TCNQ). Data are presented to show the effect of sample injection volume and flow rate on the response of the FIA sensor. The biosensor exhibited excellent reproducibility for 800 injections. The loss of response after 800 injections was due to leaching of TCNQ from the graphite paste. Each assay takes 3 min giving a sample throughput of 20 per hour at a flow rate of 30 ml/h. The sensor was applied to the determination of glucose in human serum. The glucose measurements are in good agreement with those of a commercially available spectrophotometric method. Data showing the effect of interfering substances, ascorbic acid and acetaminophen, on the response of the sensor are also reported.

Clinical Chemistry

The National Institute of Standards and Technology has developed and certified a Standard Reference Material, SRM 2381, for use in testing for bias in determinations of morphine and codeine in human urine. Three different analytical methods, employing GC/MS, LC/MS, and MS/MS, were used to certify the concentrations of each analyte. Results from the three methods were in good agreement and, therefore, were statistically combined to yield certified values of 138,293, and 578 ng/mL for morphine and 134,283, and 591 for codeine.

Keywords: *Hair, *Drug abuse, *Test methods, *Quantitative chemical analysis, *Interlaboratory comparisons, Laboratories, Detection, Cocaine, Morphine, Gas chromatography, Mass spectroscopy, Enzyme digestion, Acid extraction, Analytical techniques, Drug users, Reprints, Benzoylecgonine.

Eleven laboratories interested in the analysis of human hair for drugs of abuse participated in a study to determine how well drugs could be detected and quantified in hair. Samples sent to the participating laboratories included hair from drug users, drug-free hair, and hair into which drugs had been soaked. For the first exercise, the hair samples were sent as powders; for the second, they were in the form of short segments. Results from these studies have shown that the laboratories, with a few exceptions, have performed very well qualitatively. Various approaches were used to liberate drugs from the hair, with the most commonly used, acid extractions and enzyme digestions, producing similar results.

Pub. in Jnl. of Analytical Toxicology 17, p389-398 Nov/Dec 93.

Keywords: *Hair, *Drug users, *Quantitative chemical analysis, *Detection, *Biomarkers, *Reference standards, Cocaine, Morphine, Codeine, Drug abuse, Certification, Test methods, Analytical techniques, Gas chromatography, Mass spectroscopy, Acid extraction, Enzyme digestion, Reprints, *Standard reference materials.

Methods for extraction of cocaine, some of its metabolites, morphine, and codeine from hair and methods for analyzing the extracts have been investigated. Results of these studies have shown that extractions with 0.1N HCl are efficient at removing the target compounds from hair and appear to be as effective as enzymatic digestions that dissolve the hair. To assist laboratories in evaluating the accuracy of their methods, two human hair reference materials with recommended concentrations of cocaine, benzoylecgonine, morphine, and codeine determined by GC/MS have been developed.

Keywords: *Calibration, *Clinical chemistry, Chloride, Reprints, Cholesterol, Creatinine, Glucose, Lithium, Calcium, Standard Reference Materials, National Institute of Standards and Technology.

The issuance of cholesterol as a Standard Reference Material (SRM) in 1967 started the National Institute of Standards and Technology (NIST; then named the National Bureau of Standards) on a major effort to help clinical laboratories establish and improve the quality of measurements they make. NIST now issues three kinds of SRMs for that purpose: analyte samples of certified purity as primary standards, serum samples having certified analyte concentrations as accuracy controls, and materials certified for calibrating instruments. In working with clinical laboratory scientists to establish Reference Methods (RMs) for measuring the analytes NIST developed Definitive Methods (DMs) to use for evaluating RM accuracy and then used the DMs for assigning analyte values to its SRMs. The development of SRMs and DMs is discussed.

The National Institute of Standards and Technology (NIST) supports accuracy in drugs of abuse testing by proving Standard Reference Materials (SRMs) with certified concentrations of drugs of abuse in urine- and hair-based reference materials. NIST, working in collaboration with the College of American Pathologist (CAP), has developed urine-based SRMs for marijuana metobolite, cocaine metabolite, morphine and codeine, and morphine glucuronide and CAP Reference Materials for amphetamines and phencyclidine. Certification measurements performed at NIST involve two independent methods for each analyte, one of which always uses GC/MS with the other usually being an LC method with either MS or UV detection. Work has recently been completed on a seven component drug in urine SRM. In addition NIST conducts research in the analysis of hair for drugs of abuse. To assist laboratories testing hair for that purpose, NIST has developed two drugs in hair reference materials.

Determination of Vitamin K1 in Serum Using Catalytic-Reduction Liquid Chromatography with Fluorescence Detection.
Final rept.
W. A. MacCrehan, and E. Schonberger. 1995, 9p.
Pub. in Jnl. of Chromatography B, Biomedical Applications, v670 p209-217 1995.

Keywords: *Vitamin K, *Fluorescence detection, *Chromatography, Phylloquinone, Reverse phase separation, Solid phase fractionation, Reprints.

A new method for the liquid chromatographic-fluorescene determination of serum vitamin K, is described using reduction of the K-quinone to the fluorescent K-hydroquinone. The reduction reaction occurs 'on-line' in the LC system using a catalytic reducer column and an alcohol mobile phase as reductant. A procedure for serum determination utilizes a liquid-liquid serum lipid extraction followed by normal-phase fractionation on a solid-phase extraction cartridge. The final measurement uses a reversed phase (C18) seperation with a ethanol-methanol mobile phase and provides a detection limit of approximately 20 pg/ml.

Keywords: *Blood, *Ion selective electrodes, Potassium, Reprints, Potentiometry, Serium, Sodium, Ultrafiltration, *Interlaboratory test, Standard Reference Material.

A research project, sponsored by the National Committee for Clinical Laboratory Standards and funded by eight manufacturers of clinical potentiometric instruments, is being conducted in the Electroanalytical Research Group at the National Institute of Standards and Technology (NIST, formerly NBS). The goal of this research is to bring conformity to the direct potentiometric measurements of sodium and potassium in human serum through the development of ref-

erence materials. Currently, different manufacturers of clinical analyzers each recommend their own calibration standards. These materials range from simple aqueous solutions to complex mixtures containing bovine serum albumin. Hence, different electrolyte values for the same sample of human serum analyzed by different instruments are not uncommon. A series of four interlaboratory tests has been carried out to quantify the problem and to identify the most suitable reference materials. Ideally, an accurate calibration standard should simulate the actual sample to minimize the effects of liquid junction, activity, protein volume, and other factors that affect the electrode potential. It also should also be easy to prepare in large quantities, be stable for long periods, and be convenient to use in hospital laboratory environment.

Fourteen laboratories interested in the analysis of human hair for drugs of abuse participated in a fifth interlaboratory study to determine how well drugs could be detected and quantified in hair. The drugs of above included cocaine, benzoylecgonine, cocaethylene, codeine, morphine, and 6-monoacetylmorphine. The size hair samples analyzed included three in the form of short segments and three in a powder form and included hair from drug users, drug-fortified hair (drug-free hair into which drugs had been soaked), and drug-free hair. Results from the study show that the laboratories performed well qualitatively, particularly for drug levels above 0.5 ng/mg. While there was significant scatter in quantitative results, results were less scattered overall than had been seen previously. Various methods were used to extract the drugs from the hair, and the most commonly used approaches (i.e., acid extraction, methanol extractions, and enzyme digestions) have comparable results. For analysis of the extracts, gas chromatography/mass spectrometry (GC/MS) was used by all but one laboratory, which used a radioimmunoassay (RIA). Of the laboratories using GC/MS, some produced consistently good results, while others produced poorer quality results.

Keywords: *Ascorbic acid, *Blood chemical analysis, *Metaphosphoric acid, Blood plasma, Bias, Dithiothreitol, Liquid chromatography, Repeatability, Reproducibility, Reprints.

The authors demonstrate that total ascorbic acid (TAA, the sum of ascorbic acid and dehydroascorbic acid) in property prepared human plasma is stable at -70 degrees C for at least 6 years when preserved with dithiothreitol. TAA in human plasma or serum preserved with metaphosphoric acid degrades slowly, at the rate of no more than 1% per year. As assessed from the stability data and from data obtained from 23 laboratories over a period of greater than 2 years, the intralaboratory repeatability of TAA measurements is approximately 2 micromol/L, irrespective of TAA concentration. Nonchromatographic analytical methods involving dinitrophenylhydrazine and o-phenylenediamine yield biased results relative to chromatographic methods.

K. E. Sharpless, T. J. Brown, L. C. Sander, and S. A. Wise. 1996, 9p.
Pub. in Jnl. of Chromatography B: Biomedical Applications, v678 p187-195 Oct 96.

Keywords: *Trace elements, *Serums, *Quantitative analysis, Carotenoids, Liquid chromatography, Blood, Plamsa, Carbon, Reprints, *Chemopreventive agents.

A C30 stationary phase was specifically engineered for carotenoid separations, and carotenoid measurements using this column are compared with those obtained using a somewhat more conventional C18 column. Both methods were used to contribute measurements for the certification of carotenoids in Standard Reference Material 968b, Fat-Soluble Vitamins and Cholesterol in Human Serum. Analytes were extracted from the serum into hexane. Measurements on the C18 column were made using a gradient of acetonitrile, methanol, and ethyl acetate, which is described in detail elsewhere. Measurements on the C30 column were made using a graident of water, methanol, and methyl tert.-butyl ether.

Use of a Radiochromic Detector for the Determination of Stereotactic Radiosurgery Dose Characteristics.
Final rept.
W. L. McLaughlin, C. G. Soares, J. A. Sayeg, A. Wu, A. H. Maitz, E. C. McCullough, and R. W. Kline. 1994, 10p.
Pub. in Med. Phys. 21, n3 p379-388 Mar 94.

Keywords: *Radiosurgery, *Radiotherapy dosage, *Detectors, Gamma rays, Densitometry, Lasers, Quality control, Precision, Resolution, Dosimetry, Reprints, *Radiochromic films.

The measurement of absorbed dose as well as dose distributions (profiles and isodose curves) for small radiation fields (as encountered in stereotactic surgery) has been difficult due to the usual large detector size or densitometer aperture (> 1 mm) relative to the radiation field (as small as 4 mm). The radiochromic direct-imaging film, when read with a scanning laser microdensitometer (laser beam diameter 0.1 mm), overcomes this difficulty and has advantages over conventional film in providing improved precision, better tissue equivalence, greater dynamic range, higher spatial resolution, and room light handling. As a demonstration of suitability, the calibrated radiochromic film has been used to measure the dose characteristics for the 18-, 14-, 8-, and 4-mm fields from the gamma-ray stereotactic surgery units at the Mayo Clinic and the University of Pittsburgh. Intercomparisons of radiochromic film with conventional methods of dosimetry and vendor-supplied computational dose planning system values indicate agreement to within + or - 2%. The dose, dose profiles, and isodose curves obtained with radiochromic film can provide high-spatial-resolution information of value for acceptance testing and quality control of dose measurement and/or calculation.

Pub. in Seminars in Arthritis and Rheumatism 20, n2 p97-106 1990.

Keywords: *Nutrition, *Growth abnormalities, Reprints, Anthropometry, Biochemistry, Vitamin and mineral preparations, Blood proteins, Nutritional requirements, *Juvenile rheumatoid arthritis.

Juvenile rheumatoid arthristis (JRA) has been associated with short stature. However, the specific cause is unknown. One hypothesis is that altered growth is due to inadequate nutrition. The authors looked at 34 children with JRA and 9 healthy controls using 3-day diet records, anthropometric measures and biochemical analysis of plasma protein, vitamin and mineral levels. The children with JRA were compared between groups according to type of JRA: systemic, polyarticular and pauciarticular. Significant differences in growth and biochemical status were found. Those with polyarticular or systemic types of JRA had lower levels of zinc, vitamins A and C, and retinol binding protein. No direct relationship between intake and plasma levels of nutrients was found. However, alterations in nutritional needs according to disease type and severity could not be ruled out.

Keywords: *Calorimeters, *Radiation doses, *Water, Dissolved gases, Calorimetric dosemeters, Measuring instruments, Temperature effects, Thermistors, Exothermic reactions, Endothermic reactions, Heat defect, Convective barrier, National Institute of Standards and Technology.

The sealed water calorimeter is intended for direct measurement of absorbed dose to water. This calorimeter was used for a series of approximately 3700 measurements to investigate the so-called heat defect, that is, anomalous endothermic or exothermic effects caused by dissolved gases. The three systems investigated were high-purity water saturated with N2, H2, and mixtures of H2/O2. The repeatability of measurements of absorbed dose rates for the (60)Co teletherapy beam was studied with different water fillings and accumulated absorbed dose. Measurements with the H2/O2 system varied with accumulated absorbed dose. Based on the measurements and theoretical considerations, it appears that the H2-saturated system is the best choice for eliminating the heat defect. Measurements with both the N2- and H2-saturated systems are in good agreement with those determined with a graphite and graphite-water calorimeter (for which there is no heat defect).

Measurement of Radial Dose Distributions Around Small Beta Particle Emitters Using High Resolution Radiochromic Foil Dosimetry.
Final rept.
C. G. Soares, and W. L. McLaughlin. 1993, 6p.
Pub. in Radiation Protection Dosimetry 47, n1/4 p367-372 1993.

Keywords: *Radiation doses, *Beta particles, *Ophthalmology, Calibrating, Densitometry, Dosimetry, Strontium 90, Yttrium 90, Cobalt 60, Thulium 170, Reprints, *Radiochromic foils.

A method is described for the direct measurement of the radial dose distributions around small (from several mm down to tens of micrometers in diameter) beta particle emitters. The method employs the high resolution readout of radiochromic dye foils. These foils form a blue image upon irradiation and require no processing to stabilize the image. The color change (in units of absorbance) is nearly linear with absorbed dose over a range of 10 Gy to 1000 Gy and the response to electrons is nearly identical to (60)Co gamma radiation which makes the system easy to calibrate. Readout is performed with a laser scanning densitometer with a 100 micrometer spot size which can be stepped in increments of 40 micrometers in two dimensions. Examples of the results of measurements of (90)Sr/(90)Y eye applicators as well as particle sources of (90)Sr/(90)Y, (60)Co, and (170)Tm are given.

Isotope Dilution Mass Spectrometry as a Candidate Definitive Method for Determining Total Glycerides and Triglycerides in Serum.
Final rept.
P. Ellerbe, L. T. Sniegoski, and M. J. Welch. 1995, 8p.
Pub. in Clinical Chemistry, v41 n3 p397-404 1995.

Keywords: *Isotope dilution, *Mass spectrometers, *Glycerol, *Cholesterol, Triglycerides, Isotope ratio, Test methods, Tracer techniques, Isotope applications, Gas chromatography, Blood serum, Humans, Reprints.

A new isotope dilution mass spectrometric method for total glycerides and triglycerides in human serum is described. Total glycerides are defined as the sum of tri-, di-, and monoglycerides plus free glycerol; triglycerides are defined as the pure triglyceride species. In both determinations, serum samples are supplemented by additon of (13C3) tripalmitin, processed, derivatized, and the abundance ratios of selected ions are determined. The CV for a single measurement ranged from 0.35% to 0.72%, and the relative SEM ranged from 0.10% to 0.34%; there was no significant bias in the measurements. The combination of high precision and absence of significant bias in the results qualify this method for consideration as a Definitive Method as defined by the National Committee for Clinical Laboratory Standards.

Preliminary Investigation of Oleoresin Capsicum.
Final rept.
R. G. Christensen, and D. E. Frank. 1995, 20p.
Sponsored by National Inst. of Justice, Washington, DC.
Pub. in Preliminary Investigation of Oleoresin Capsicum, NIJ Report 100-95, 20p, 15 Apr 95.

Keywords: *Medicinal plants, *Peppers, *Oleoresins, Chemical composition, Toxicity, Reprints.

This report documents a preliminary investigation into the anlaytical characterization of Oleoresin Capsicum (OC), an oily extract of hot peppers that is increasingly used in law enforcement applications. Being a natural product, it is subject to variations in composition. The characteristic hot sensation or pungency is quantified in the industry in terms of 'Scoville Heat Units,' (SU). SU is defined as the dilution at which the pungency can barely be detected by a trained taster. Pure capsaicin, the most pungent constituent, has an SU value of 16 times 10 to the sixth power mL/g (milliliters of diluent per gram of base material). Recently, OC has come into use as a pain-producing agent in aerosol sprays used in an attempt to subdue violent individuals. This use raises the question of how to assign an objective index of potency to these sprays. Published information on the pharmacology of capsaicinoid compounds has been studied to examine correlations between pungency and pain production. Experiments in the analytical chemistry of OC have been carried out to check the feasibility of determining the concentrations of the pungent constituents.

Needs for Brachytherapy Source Calibrations in the United States.
Final rept.
B. M. Coursey, L. J. Goodman, D. D. Hoppes, C. G. Soares, J. T. Weaver, R. Loevinger, and W. L. McLaughlin. 1992, 5p.
Pub. in Nuclear Instruments and Methods in Physics Research, vA312 p246-250 1992.

Keywords: *Brachytherapy, *Dosimetry, *Gamma rays, Radiation, Radionuclides, Standards, Therapy, Reprints, *Foreign technology.

Brachytherapy sources of beta and gamma radiation ('brachy' is from the Greek, meaning 'near') have a long history of use in interstitial, intracavitary, intraluminal, and ocular radiation therapy. In the past the US national standards for these sources were often specified in activity of milligram radium equivalent. With the introduction of new radionuclide sources to replace radium. Source strength calibrations are now expressed as air kerma rate at a meter. In the paper, the authors review the NIST standards for brachytherapy sources, list some of the common radionuclides and source encapsulations in use in the US radiology community, and describe the latest NIST work, in collaroation with several US medical institutions, on a method of two-and three-dimensional dose mapping of brachytherapy sources using radiochromic films.

Pub. in International Jnl. of Nuclear Medicine and Biology, v20 p693-699 1993.

Keywords: *Nuclear medicine, *Radioassays, Standards, Liquid scintillation, Gamma counters, Dose calibrators, Reprints, *Foreign technology, *Yttrium-90, Cerenkov counting.

Yttrium-90 radioassays are required in nuclear medicine at the gigabecquerel activity level (Gbq) for measuring injected activity, and at the becquerel level for measuring individual tissue samples in biodistribution studies. A method of standardizing 90Y for activity using high-efficiency liquid-scintillation counting is described. Solution standards were used to establish the calibration factors for commercial radionuclide-calibrators. Detection efficiencies are also presented for liquid-scintillation counting. NaI(Ti) bremsstrahlung counting and Cerenkov counting.

beta-D-Glucosyl-Hydroxymethyluracil: A Novel Modified Base Present in the DNA of the Parastic Protozoan T. brucei.
Final rept.
J. Gommers-Ampt, F. Van Leeuwen, A. de Beer, J. Kowalak, P. Crain, P. Borst, J. Vliegenthart, and M. Dizdaroglu. 1993, 8p.
Pub. in Cell 75, p1129-1136, 17 Dec 93.

Keywords: *Protozoan DNA, *Trypanosoma brucei, *Nucleotides, Surface antigens, Gene expression, Telomere, Reprints, *Uracil/5-((beta-D-glycopyranosyl oxy)-methyl).

We have previously shown that the DNA of the unicellular eukaryote T. brucei contains about 0.1% of a novel modified base, called J. The presence of J correlates with a DNA modification associated with the silencing of telomeric expression sites for the variant sur-

face antigens of trypanosomes. Here we show that J is 5-((beta-D-glucopyranosyloxy)-methyl)-uracil (shortened to beta-D-glucosyl-hydroxymethyluracil), a base not previously found in DNA. We discuss putative pathways for the introduction of this base modification at specific positions in the DNA and the possible contribution of this modification to repression of surface antigen gene expression.

Oxidative Damage to DNA in Mammalian Chromatin.
Final rept.
M. Dizdaroglu. 1992, 12p.
Pub. in Mutation Research 275, p331-342 1992. Sponsored by Department of Energy, Washington, DC.

Keywords: *DNA damage, *Chromatin, Mammals, Ionizing radiation, Hydrogen peroxide, Toxicology, Mass fragmentography, Cross-linking reagents, Cultured cells, In vivo analysis, In vitro analysis, Reprints.

Efforts have been made to characterize and measure DNA modifications produced in mammalian chromatin in vitro and in vivo by a variety of free radical-producing systems. Methodologies incorporating the technique of gas chromatography/mass spectrometry have been used for this purpose. A number of products from all four DNA bases and several DNA-protein cross-links in isolated chromatin have been identified and quantitated. Product formation has been shown to depend on the free radical-producing system and the presence or absence of oxygen. A similar pattern of DNA modifications has also been observed in chromatin of cultured mammalian cells treated with ionizing radiation or H2O2 and in chromatin of organs of animals treated with carcinogenic metal salts.

Modification of DNA Bases in Chromatin of Intact Target Human Cells by Activated Human Polymorphonuclear Leukocytes.
Final rept.
M. Dizdaroglu, R. Olinski, J. Doroshow, and S. Akman. 1993, 4p.
Pub. in Cancer Research 53, p1269-1272, 15 Mar 93.

Keywords: *DNA damage, *Tetradecanoylphorbol acetate, *Pharmacology, *Chromatin, *Leukocytes, Hydroxy compounds, Deoxyribonucleic acids, Mass fragmentography, Guanine, Adenine, Free radicals, In vivo analysis, Reprints.

The authors investigated whether phorbol-12-acetate-13-myristate (PMA)-activated human polymorphonuclear leukocytes (PMNs) induce base modifications in target cell DNA in vivo. Human PMNs produced 9.4 + or - 0.8 (SD) nmol of H2O2/10 to the sixth power cells during 50 min of exposue to 2 micrograms/ml PMA and 13.7 + or - 2.8 nmol/10 to the sixth power cells during exposure to PMA plus 5 mM NaN3. Neither nonstimulated PMNs, nor PMA alone, nor NaN3 alone induced base modifications in chromatin-associated DNA of human Ad293 cells above control levels, when assayed by gas chromatography/mass spectrometry with selected-ion monitoring, However, a 60-min exposure to 1.7 + or - 0.4 times 10 to the sixth power PMNs/ml in the presence of 2 micrograms/ml PMA induced a 2-3-fold increase in the level of all modified bases detected by gas chromatography/mass spectrometry with selected-ion monitoring. The guanine-derived products 8-hydroxyguanine and 2,6-diamino-4-hydroxy-5-formamidopyrimidine, and the adenine-derived product 4,6-diamino-5-formamidopyrimidine were induced to the highest levels among those bases detected. These data demonstrate that exposure to activated PMNs causes DNA base modifications in target cells in vivo typical of those induced by hydroxyl radical attack. The induction of potentially promutagenic modified bases may contribute to the mutagenicity of activated PMNs.

Salt-PEG Two-Phase Aqueous Systems to Purify Proteins and Nucleic Acid Mixtures.
Final rept.
K. D. Cole. 1992, 12p.
Pub. in Proceedings of Frontiers in Biochemistry II, Boulder, CO., June 17-21, 1990, p340-351 1992.

Keywords: *Proteins, *Nucleic acids, *Purification, Deoxyribonucleic acids, pH, Polyethylene glycols, Salts, Molecular weight, Protein denaturation, Reprints.

This paper examines the effect of variables on protein and nucleic acid partitioning in aqueous two-phase extraction systems composed of salt and polyethylene glycol (PEG). The variables that can be changed in these systems include: pH, PEG concentration, PEG molecular mass, salt type, salt concentration and addition of protein denaturants such as chaotropic salts and detergents. Methods for the preparation of high molecular mass DNA from crude mixtures are described. These methods offer the advantages of simplicity, speed and use of nontoxic materials.

S. A. Margolis, L. Jassie, and H. M. Kingston. 1991, 3p.
Pub. in Jnl. of Automatic Chemistry 13, n3 p93-95 May/Jun 91.

Keywords: *Bovine serum albumin, *Hydrolysis, *Microwaves, Valine, Isoleucine, Automation, Reprints.

Microwave energy, at manually-adjusted, partial power settings has been used to hydrolyze bovine serum albumin at 125 C. Hydrolysis was complete within 2 h, except for valine and isoleucine which were completely liberated within 4 h. The amino acid destruction was less than that observed at similar hydrolysis conditions with other methods and complete hydrolysis was achieved more rapidly. These results provide a basis for automating the process of amino acid hydrolysis.

Y. B. Tewari, and R. N. Goldberg. 1991, 10p.
Pub. in Proceedings of International Enzyme Biotechnology Symposium, Veracruz, Mexico, October 1991, p1-10.

Keywords: *Thermodynamics, *Biotechnology, Temperature, Osmolar concentration, Heat, Enthalpy, Gibbs free energy, Chemical reactions, Reprints.

High product yield is important for the successful commercialization of any chemical reaction. The factors influencing the product yields are temperature, ionic strength, pH, and the concentrations of the substrates and cofactors. Thermodynamics plays an important role in understanding the interrelationships between these various factors. Thus, a knowledge of the Gibbs energy, enthalpy, and heat capacity change can be used to calculate the optimal product yield. This, in turn, is important in assessing the economic viability of the reaction. Thermodynamic data also provides the amount of heat evolved or absorbed in a reaction and defines the energy costs for that reaction. Thus, a reaction can be carried out under optimal condition to ensure maximum life and activity of the enzyme. In consideration of these points, a thermodynamic assessment will be made for several enzyme-catalyzed reactions of industrial importance.

Preparation of Immobilized Proteins Covalently Coupled Through Silane Coupling Agents to Inorganic Supports.
Final rept.
H. H. Weetall. 1993, 32p.
Pub. in Applied Biochemistry and Biotechnology 41, p157-188 1993.

Keywords: *Proteins, *Silane, Enzymes, Antibodies, Antigens, Molecular weight, Reprints, *Inorganic supports, Immobilization(Chemistry), Sol-gel.

Enzymes were first immobilized on inorganic supports through silane coupling agents over 25 yr ago. Since that initial report, literally hundreds of laboratories have utilized this methodology for the immobilization of enzymes, antigens, antibodies, receptors, and other high and low mol wt compounds. Today silane coupling is one of the commonly used techniques in the arsenal of the biochemist for the binding of material of all sorts to inorganic surfaces. Inorganic materials come in a variety of shapes, sizes, and characteristics. Sol-gel entrapped enzymes are also produced by the application of silane technology by the polymerization of the silane to form glass-like materials with entrapped protein. This review will discuss the general preparation and characterization of silane coupled proteins with special emphasis on enzymes and describe in detail the actual methods for the silanization and specific chemical coupling of proteins to the silanized carrier.

S. Wickner, J. Hoskins, and K. McKenney. 1991, 3p.
Pub. in Nature 350, n6314 p165-167, 14 Mar 91.

Keywords: *Heat-shock proteins 60, *Heat-shock proteins 70, *Origin of replication, *Deoxyribonucleic acids, *DNA-binding proteins, Escherichia coli, Cell membrane, Biological transport, Plasmids, Phage lambda, Protein folding, Reprints.

Heat-shock proteins are normal constituents of cells whose synthesis is increased on exposure to various forms of stress. They are interesting because of their ubiquity and high conservation during evolution. Two families of heat-shock proteins, hsp60s and hsp70s, have been implicated in accelerating protein folding and oligomerization and also in maintaining proteins in an unfolded state, thus facilitating membrane transport. The Escherichia coli hsp70 analogue, DnaK, and two other heat-shock proteins, DnaJ and GrpE, are required for cell viability at high temperatures and are involved in DNA replication of phage lambda and plasmids P1 and F. These three proteins are involved in replication in vitro of P1 DNA along with many host replication proteins and the P1 RepA initiator protein. RepA exists in a stable protein complex with DnaJ containing a dimer each of RepA and DnaJ. We report

here that DnaK and DnaJ mediate an alteration in the P1 initiator protein, rendering it much more active for oriP1 DNA binding.

Potentiometric Enzyme-Amplified Flow Injection Analysis Detection System: Behavior of Free and Liposome-Released Peroxidase.
Final rept.
T. G. Wu, J. M. Bellama, and R. A. Durst. 1989, 18p.
Pub. in Analytical Letters 22, n5 p1107-1124 1989.

Keywords: *Flow injection analysis, *Potentiometric analysis, *Liposomes, *Peroxidases, *Enzymes, Electrodes, Immunochemistry, Reprints, Triton X-100.

A flow injection analysis (FIA) system was designed for the determination of free and liposome-released peroxidase activity. The inclusion of an extra washing channel in the FIA system provided a solution to problems of electrode fouling and slow recovery of response. The addition of Triton X-100 to acetate buffer resulted in an effective and reliable wash solution, and improved the electrode recovery rate by a factor of three. The sensitivity also increases by about 20% for the enzyme with 3 mU activity by using the wash solution containing Triton X-100. Based on 16 replicate measures of the solution containing 3 mU enzyme, the relative standard deviation of the enzyme determination was 1.5%. Based on the sensitivity obtained with this prototype FIA system, it should be possible to adapt this approach to an immunochemical-based flow injection analysis system capable of measuring an analyte at the femtomole level.

Substrate Specificity of the Escherichia coli Endonuclease III: Excision of Thymine- and Cytosine-Derived Lesions in DNA Produced by Radiation-Generated Free Radicals.
Final rept.
M. Dizdaroglu, J. Laval, and S. Boiteux. 1993, 7p.
Pub. in Biochemistry 32, n45 p12105-12111 1993.

Keywords: *Substrate specificity, *Escherichia coli, *Deoxyribonucleic acids, *Thymine, *Cytosine, *Ionizing radiation, Free radicals, Mass fragmentography, DNA damage, DNA repair, Reprints, *Endonuclease III.

The excision of modified bases from DNA by Escherichia coli endonuclease III was investigated. Modified bases were produced in DNA by exposure of dilute buffered solutions of DNA to ionizing radiation under oxic or anoxic conditions. The technique of gas chromatography/mass spectrometry (GC/MS) was used to identify and quantify 16 pyrimidine- and purine-derived DNA lesions. DNA substrates were incubated either with the native enzyme or with the heat-inactivated enzyme. Subsequently, DNA was precipitated. Pellets were analyzed by GC/MS after hydrolysis and derivatization. Supernatant fractions were analyzed after derivatization without hydrolysis. The results provided unequivocal evidence for the excision by E. coli endonuclease III of a number of thymine- and cytosine-derived lesions from DNA. None of the purine-derived lesions was excised by endonuclease III. The present work extends the substrate specificity of E. coli endonuclease III to another thymine-derived and four cytosine-derived lesions. It is the first investigation of the substrate specificity of this repair enzyme in the context of a large number of pyrimidine- and purine-derived lesions in DNA.

Electrophoretic Separations of Polymerase Chain Reaction: Amplified DNA Fragments in DNA Typing Using a Capillary Electrophoresis-Lased Induced Fluorescence System.
Final rept.
K. Srinivasan. 1993, 9p.
Sponsored by National Inst. of Justice, Washington, DC.
Pub. in Jnl. of Chromatography A 652, p83-91 1993.

Keywords: *Polymerase chain reaction, *Deoxyribonucleic acids, *Fluorescence spectroscopy, Lasers, Ultraviolet spectroscopy, Apolipoproteins B, Alleles, Viral DNA, Bacteriophages, Reprints, *Capillary electrophoresis.

Analysis of polymerase chain reaction (PCR)-amplified DNA fragments for human identification requires high-resolution separation and efficient detection of amplified alleles. Capillary electrophoresis (CE) with its speed, automation, high resolution and efficiency shows promise for analyzing the amplified DNA fragments. CE with UV detection, however, suffers from lack of detector sensitivity owing to the limited detection path length of the capillary. By the use of intercalating dyes (TOTO and YOYO) a laser-induced fluorescence (LIF) detection system can provide much greater sensitivity for detecting DNA fragments. Femtogram quantities of dsDNA (Phi X174 HaeIII restriction digest mixture) per nanoliter of injected volume have been detected. Application of CE-LIF to analysis of PCR-amplified DNA fragments from three different genetic loci (apolipoprotein B, VNTR locus D1S80, mitochondrial DNA) is shown here. Further, the resolving power of a polymer-network capillary separation system is compared to that of a capillary-gel separation system.

Electropermeabilization of Cell Membranes: Effect of the Resting Membrane Potential.
Final rept.
E. Tekle, R. D. Astumian, and P. B. Chock. 1990, 6p.
Pub. in Biochemical and Biophysical Research Communications 172, n1 p282-287 1990.

Keywords: *Cell membrane, *Membrane potential, Electric fields, 3T3 cells, Fluorescent dyes, Plants(Botany), Electroporation, Erythrocyte membrane, Reprints.

Electric field induced permeabilization of cell membranes is a potentially important technique for biomedical research. Its application includes gene transfection and cell hybridization. To study the mechanism of this process, Mehrle et al. monitored the uptake of fluorescent indicator by plant protoplasts (Avena Mesophyll) and showed the permeabilization occurs predominantly on the hemisphere facing the positive electrode. However, Dimitrov and Sowers using erythrocyte ghosts loaded with fluorescent-labeled dextran demonstrated that the probes exit through the hemisphere facing the negative electrode. They proposed that electopores were symmetrically formed and electroosmosis is the dominant mechanism for molecular exchange in electroporation. To resolve these 'apparent' controversial observations, we conducted a systematic study of electroporation of NIH3T3 cells with varying electric field strength, waveform and frequency. Results indicate the electropermeabilization of cell membranes is affected by its resting potential and electroosmosis is not the dominant mechanism for the cellular uptake of foreign molecules in electroporation.

Deletion Analysis of the Mini-P1 Plasmid Origin of Replication and the Role of E.coli DnaA Protein.
Final rept.
S. Wickner, J. Hoskins, D. Chattoraj, and K. McKenney. 1990, 6p.
Pub. in Jnl. of Biological Chemistry 265, n20 p1622-1627 1990.

Keywords: *Plasmids, *Origin of replication, *Sequence deletion, *Escherichia coli, Binding sites, In vivo analysis, Adenine nucleatides, Deoxyribonucleic acids, Bacteriophages, Reprints, *DnaA proteins.

The mini-PI plasmid origin of replication is contained on a 246 base pair (bp) piece of DNA. At one end there are five 19 bp binding sites for the PI initiator protein, RepA and near the other end there are two 9 bp DnaA protein binding sites. To further define the limits of the origin we cloned the origin region in M13 and constructed deletions of either end. We sequenced the DNA and tested the RF 1 DNA of the deletion phages for their ability to support RepA-dependent DNA replication in an in vitro system. The origin that is functional in vitro could be reduced to 202 bp. It includes three intact and one incomplete RepA binding sites at one end and the two DnaA binding sites at the other end. When the two naturally occurring DnaA binding sites were replaced with one or two synthetic sites, only the construction containing two sites was active in vitro. We found that the minimal origin that is functional in vivo contains all of the five RepA and the two DnaA binding sites. Mini-PI plasmid replication both in vivo and in vitro requires two initiator proteins, the Escherichia coli DnaA protein and the PI RepA protein. We have found that the ADP form of DnaA is as active as the ATP form of the protein in the in vitro replication of mini-PI. In contrast, only the ATP form is active for in vitro replication of plasmids carrying the E. coli origin.

Chemical Determination of Oxidative DNA Damage by Gas Chromatography-Mass Spectrometry.
Final rept.
M. M. Dizdaroglu. 1994, 15p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Methods in Enzymology 234, p3-17 1994.

Keywords: *DNA damage, *Mass fragmentography, Nucleosides, Oxidation, Nuclear proteins, Cross-linking(Chemistry), Free radicals, Isotopes, Reprints.

Measurement of oxidative DNA damage by gas chromatography-mass spectrometry (GC/MS) is described. The use of GC/MS with selected-ion monitoring facilities unequivocal identification and quantification of a large number of modified bases, nucleosides and DNA-protein cross-links that are produced in DNA or nucleoprotein by free radicals or by other DNA-damaging agents. Recently available stable isotope-labeled compounds permit precise quantification at low analyte concentrations. Methodologies involved are presented and discussed in detail.

Optical Biosensor Using a Fluorescent, Swelling Sensing Element.
Final rept.
M. F. McCurley. 1994, 7p.
Pub. in Biosensors and Bioelectronics 9, p527-533 1994.

Keywords: *Fluorescence, *Gels, *Polymers, *Fluorometry, Biotechnology, Fiber optics, Swelling, Enzymes, Crosslinking, Amines, Glucose oxidase, Reprints, *Optical biosensors.

An optical sensor based on coupling the swelling of a polymer gel to a change in fluorescence intensity is discussed. A fluorophore, an amine functional group and the enzyme glucose oxidase were each incorporated into a crosslinked polymer gel, which was formed on the end of a fiber optic rod. While the amount of fluorophore remains constant, the gel volume changes in response to a change in the ionization state of the amine moiety. This change is related to glucose concentration. These effects were examined along with subsequent changes in the fluorescence of the gel.

Interlaboratory Comparison of Autoradiographic DNA Profiling Measurements. 1. Data and Summary Statistics.
Final rept.
J. L. Mudd, F. S. Baechtel, D. L. Duewer, S. D. Leigh, H. K. Liu, L. A. Currie, and D. J. Reeder. 1994, 15p.
Pub. in Analytical Chemistry 66, n20 p3303-3317, 15 Oct 94.

Keywords: *Deoxyribonucleic acids, *Autoradiography, *Interlaboratory comparisons, Reference standards, Restriction fragment length polymorphism, Base composition, Reproducibility of results, Methods, Least-squares analysis, Reprints.

The data obtained during an interlaboratory precision study sponsored by the Technical Working Group of DNA Analysis Methods are summarized. These data are representative of DNA restriction fragment length polymorphism (RFLP) autoradiographic measurements using laboratory protocols based upon procedures validated by the Federal Bureau of Investigation. Measurement reproducibility for a given RFLP fragment is a nonlinear function of the fragment's size, with the logarithm of the sample standard deviation (SD) approximately proportional to fragment size. The least-squares estimate of this relationship for fragments composed of 600 to 11,000 DNA base pairs (bp) is SD = 10.4 x 10(sup (bp/8300)). Among-analyst and among-laboratory differences appear to contribute about equally to the variance in RFLP measurements. Autoradiographic imaging is a relatively small component of the overall variance for fragments < or = 10,000 bp. Currently available data are sufficient to establish reliable tolerances for the expected interlaboratory variation for any given RFLP band size in this size range, assuming that relevant laboratories continue to use RFLP analysis protocols that are within the current 'statistical population' (i.e., protocols similar to those used by the laboratories that participated in the interlaboratory study). This consistency may best be maintained through appropriate use of Standard Reference Materials, internal quality assurance programs, and external proficiency demonstrations.

Novel Activity of E. coli uracil DNA N-glycosylase Excision of Isodialuric Acid (5,6-dihydroxyuracil), a Major Product of Oxidative DNA Damage, from DNA.
Final rept.
T. Zastawny, P. Doetsch, and M. Dizdaroglu. 1995, 4p.
Sponsored by Department of Energy, Washington, DC.
Pub. in FEBS Letters 364, p255-258 1995.

Keywords: *Carcinogenesis, *E. coli, *DNA, Enzymes, DNA repair, Hydroxyl radicals, Isodialuric acid, Oxidation, Damage, Uracil glycosylase, Reprints, E. coli uracil, Isodialuric acid, N-glycosylase.

The authors describe a novel activity of E. coli uracil DNA N-glycosylase (UNG) that excises isodialuric acid from DNA. Isodialuric acid is formed in DNA as a major oxidative product of cytosine. DNA substrates, which were prepared by gamma-irradiation, were incubated with UNG. Following precipitation of DNA, analyses of pellets and supernatant fractions by gas chromatography/mass spectrometry showed an efficient excision of isodialuric acid from DNA by UNG. None of the other 15 identified DNA base lesions was excised. The excision of isodialuric acid indicates that the non-aromaticity of a substrate may not be a limiting factor for UNG.

Rapid pH Change Due to Bacteriorhodopsin Measured with a Tin-Oxide Electrode.
Final rept.
B. Robertson, and E. P. Lukashev. 1995, 11p.
Pub. in Biophysical Jnl., v68 p1507-1517 Apr 95.

Keywords: *Bacteriorhodopsin, *Electrodes, Measurements, pH, Photosynthetic bacteria, Sensitivity, Membranes, Reprints, Tin oxide electrodes.

The photocurrent transient generated by bacteriorhodopsin (bR) on a tin-oxide electrode is due to pH change and not to charge displacement as previously assumed. Films of either rendomly oriented of highly oriented purple membranes were deposited on transparent electrodes made of tin-oxide-coated glass. The membranes contained either wild-type or D96N-mutant bR. When excited with yellow light through the glass, the bR pumps protons across the menbrane. The results is a rapid local pH change as well as a charge displacement. Experiments with these films show that it is the pH change rather than the displacement that produces the current transient. The calibration for the transient pH measurement is given. The sensitivity of a tin-oxide electrode to a transient pH change is very much larger than its sensitivity to a steady-state pH change.

Keywords: *Deoxyribonucleic acids, *Autoradiography, *Interlaboratory comparisons, Reprints, Reference standards, Base composition, Measurement, *Band size.

Identifying the intrinsic sources of measurement uncertainty greatly facilitates control and further optimization of a measurement system. We have developed a model which quantitatively describes the observed interlaboratory variability autoradiographic DNA band sizing. The model focuses on optical imaging measurements of band position and the calibration techniques used to convert measured band position to reported band size. The imaging components of measurement variability is described as a 0.05-02.% standard deviation in determining the relative location of sample and calibration bands on a given film image. While developed solely with optical imaging information, the model is consistent with interlaboratory band sizing measurement variability observed with pristine samples. This interlaboratory variability can be modeled as a 0.2-0.4% standard deviation in the relative positions of sample and calibration bands across different electrophoretic gels. Further band sizing protocol standardization among laboratories would thus be expected to achieve at best a 2-fold reduction in interlaboratory.

Keywords: *Purple membranes, *Holography, *Geletin films, Optical properties, Reprints, *Bacteriorhodopsin.

The purple membrane (PM) of the microorganism Halobacterium salinarium contains a hexagonally packed monolayer of the light-sensitive protein, bacteriorhodopsin (BR). The optical characteristics of gelatin-immobilized PMs depend strongly on the chemical environment of the PMs in the matrix. Here we present photoinduced absorptive and holographic characteristics of gelatin-embedded PMs solubilized with the non-ionic detergent, Triton X-100. The BR/detergent interaction was shown to slow the M-to-initial state transition of the photocycle and to increase the photosensitivity of the BR films. The lifetime of the holographic grating in Triton X-100-treated BR films was 2-3 times greater, when compared to the unmodified sample. Holographic grating growth times in BR films were shown to change depending on the extent of solubilization. The measured holographic sensitivity appeared to maximize in the range of Triton X-100/BR molar ratios from 15:1 to 25:1. The possible advantages of solubilized PM films as they are applied to optoelectronic devices are discussed.

In situ Fluorescence Cell Mass Measurements of 'Saccharomyces cerevisiae' Using Cellular Tryptophan.
Final rept.
J. J. Harvath, S. A. Glazier, and C. J. Spangler. 1993, 5p.
Pub. in Biotechnology Progress, Nov/Dec Issue, v9 p666-670 1993.

Keywords: *Spectroscopy, *Fluorescence, *Bioreactors, In situ, Sensors, Fermentation, Reprints, *Cell mass.

This work describes a new spectroscopic optical fiber/rod technique for in situ real time measurement of cell mass and product concentrations in bioreactors using intrinsic fluorescence. The variable excitation/emission wavelength capability of this sensor allows for the species-selective measurement during fermentations. Cell mass (tryptophan) and product concentrations (pyridoxine) have been measured during fermentations of Saccharomyces cerevisiae. The effects of varying substrate concentration and oxygen concentration on the observed cell mass signals are eliminated by direct measurement of cell mass, as opposed to indirect measurement schemes such as those using NADH fluorescence. The sensor is robust and able to undergo many cycles of in situ steam sterilization without degradation, and its fluorescence signal is linear with concentration for all species studied in this work. Tryptophan fluorescence from yeast is shown to be a better measure of cell mass than NADH fluorescence.

Pub. in Physica B Condensed Matter, v213-214 p780-782 1995.

Keywords: *DNA, *Excitations, Thermal neutrons, Thermodynamic properties, Neutron scattering, Reprints, Proton self-correlations, Time-of-flight.

The self-correlation spectrum of DNA hydrogens has been measured by thermal neutron scattering for two orientations of the helical axis in the temperature range 200K equal to or less than T equal to or less than 300 K. Typical spectra for glass formers are observed which show that DNA hydrogens become increasingly delocalized above T equals 200 K. This self-correlation is essentially isotropic. Anisotropic contributions to the scattering are identified as being due too compressional waves along the helix and the low-lying optical band observed in Raman scattering. Both modes show strong coupling to relaxational modes at the zone center (10th layer line). It is argued that the observability of the optical band at this position is due to an antiparallel displacement of the base-pair centers along the helix direction.

Novel DNA N-Glycosylase Activity of E. coli T4 Endonuclease V That Excises 4,6-Diamino-5-Formamidopyrimidine from DNA, a UV-Radiation- and Hydroxyl Radical-Induced Product of Adenine.
Final rept.
M. Dizdaroglu, T. H. Zastawny, J. R. Carmical, and R. S. Lloyd. 1996, 8p.
Pub. in Mutation Research DNA Repair, v362 p1-8 1996.

Keywords: *Deoxyribonucleic acids, *Mutagenesis, Reprints, *Foreign technology, UV-radiation, Hydroxyl radical.

We report on a novel activity of T4 endonuclease V. This enzyme is well known to be specific for the excision of pyrimidine dimers from UV-irradiated DNA. In this work, we show that T4 endonuclease V excises 4.6-diamino-5-for-mamidopyrimidine from DNA. 4,6-Diamino-5-formamidopyrimidine is formed as a product of adenine in DNA upon action of hydroxyl radicals and upon UV-irradiation. DNA substrates were prepared by UV-or y-irradiation of DNA in aqueous solution. DNA substrates were incubated either with active

T4 endonuclease V or with heat-inactivated T4 endonuclease V or without the enzyme. After incubation, DNA was precipitated and supernatant fractions were separated. Supernatant fractions after derivatization, and pellets after hydreolysis and derivatization were analyzed by gas chromatography/ isotopedilution mass spectrometry. The results provide evidence for the excision of 4.6-diamino-5-formamidopyrimidine by T4 endonuclease V from both y-annd UV-irradiated DNA. Kinetics of excision were also determined. Fifteen other pyrimidine-and purine-derived base lesions that were identified in DNA samples were not substrates for this enzyme. It was concluded that, in addition to its well known activity for pyrimidine photodimers, T4 endonuclease V possesses an N-glycosylase activity for a major UV-radiation- and hydroxyl radical-induced monomeric product in DNA.

Alpha-Hemolysin (alphaHL), which is secreted by Staphylococcus aureus as a single polypeptide chain of 293 amino acids, is capable of self-assembling into hexameric pores -1.1 nm in internal diameter. Based on an understanding of the assembly mechanism and the functional properties of the pore, genetic manipulation and chemical modification will be used to construct new pores with potential applications in novel materials, such as monolayer coatings for selective electrodes. Details of the mechanism of self-assembly are being revealed by the isolation of mutant of recombinant alphaHL that become arrested at various stages in assembly, alphaHL first binds to membranes as a monomer, which undergoes a conformational change. It is then converted to a non-conducting hexamer and finally to the open pore.

Keywords: *Biosensors, *Divalent cations, *Heavy metals, Reprints, Ion channels, Proteins, Toxins.

The authors are investigating the potential use of proteins that form pores in cell membranes as biosensors for heavy metals in the aqueous phase. Specifically, the authors are producing genetically engineered versions of the alpha-hemolysin (alphaHL) from Staphlococcus aureus with properties that are sensitive to low concentrations of divalent cations. For example, in contrast to wild-type alphaHL, the assembly of one mutant (alphaHL-H5: residues 130-134 inclusive replaced with His) into pores was inhibited by Zn squared concentrations as low as 1.0 micro M as judged by its ability to lyse rabbit RCBs and to increase the conductance of planar lipid bilayer membranes. Previously, the authors demonstrated two intermediates in the assembly of alphaHL a membrane-bound monomer and a hexameric prepore complex. Zn squared can act pn the alpha HL-H5 prepore complex to inhibit pore formation.

Determination of Total Protein Adsorbed on Solid (Membrane) Surface by a Hydrolysis Technique: Single Protein Adsorption.
Final rept.
M. K. Ko, K. D. Cole, and J. Pellegrino. 1994, 10p.
Pub. in Jnl. of Membrane Science, v93 p21-30 1994.

Keywords: *Adsorption, *Fouling organisms, *Proteins, Analytical methods, Reprints, Lactoglobulin, Hydrolysis, Polycarbonate, Ultrafiltration, *Biofouling, Bovine serum albumin.

We developed a new analytical technique for single protein adsorption in the context of basic studies on membrane fouling. This method simply comoines two well-established techniques. HCl hydrolysis and reaction of the resultant amino acids with ninhydrin (10 to the minus 6th power M sensitivity). The HCl hydrolysis step, using 6 N HCl solution, breaks up the adsorbed protein into its constituent amino acids by hydrolyzing the peptide bonds, resulting in complete removal of the absorbed protein from the surface. After the HCl hydrolysis, the condition of the hydrolysate is adjusted for the ninhydrin derivatization by mixing with 6 N NaOH and 6 m sodium acetate. The optimal pH for the ninhydrin derivatization reaction of the hydrolysate is approx. 6. This technique uses an unmodified protein and determines protein loading on the membrane's surface (external and/or pore wall), under static or filtration environments, in a consistent manner. This method provides an absolute measurement of the total protein adsorbed and holds good promise for high sensitivity, accuracy, and reproducibility at a relatively low cost. Other amino acid analytical techniques (such as flourescence and HPLC) may be used to eliminate artifacts, improve sensitivity, and extend the aproach to multi-protein adsorption.

Pub. in Materials Research Society Symposium Proceedings, v330 p217-223 1994.

Keywords: *Hemolysin, *Dynamic range, Longevity, Response time, Selectivity, Sensitivity, Reprints, Staphylococcus aureus.

We are adapting proteins that form pores in lipid bilayers for use as components of biosensors. Specifically, we have produced genetically engineered variants of the alpha-hemolysin (alpha HL) from Staphylococcus aureus with properties that are sensitive to low concentrations of divalent cations. For example, the pore-forming activity of one mutant (alpha HL-H5: residues 130-134 inclusive replaced with histidine) is inhibited by Zn2+ at concentrations as low as 1 micromoles, as judged by the reduction in its ability to lyse rabbit red blood cells and to increase the conductance of planar lipid bilayer membranes. When alpha HL-H5 is added to the aqueous phase bathing one side of a planar membrane, the subsequent addition of 100 micromoles Zn2+ to either side blocks the pores that form. This result suggests that at least part of the mutated region lines the channel lumen. Ca2+ and Mg2+ do not block the channel and therefore the H5 mutation confers a degree of analyte specificity to the alpha HL pore.

Staphylococcal alpha-hemolysin, a pore-forming exotoxin, is a poplypeptide of 293 amino acids that is secreted by Staphylococcus aureus as a water-soluble monomer. It assembles to form hexameric pores in lipid bilayers. Previous studies of pore formation have established the involvement of a central glycine-rich loop. Here, we show that when five consecutive histidine residues replace amino acids 130-134 at the midpoint of the loop, they provide a switch with which pore activity can be (1) turned off by micromolar concentrations of divalent zinc ions and (2) turned back on with the chelating agent EDTA.

Oxidative DNA damage is the most frequent type of damage encountered by aerobic cells and may play an important role in biological processes such as mutagenesis, carcinogenesis and aging in humans. Oxidative damage generates a myriad of modifications in DNA. The authors investigated the cellular repair of DNA base damage products in DNA of cultured human lymphoblast cells, which were exposed to oxidative stress by by H2O2. This DNA-damaging agent is known to cause base modifications in genomic DNA of mammalian cells. The results showed a significant formation of these DNA base products upon H2O2-treatment of cells.

Pub. in Nucleic Acids Research, v24 n7 p304-307 1996.

Keywords: *DNA damage, Bones, Tissues, Archeological remains, Hydroxyl radical, Reprints, *Foreign technology, 8-hydroxyguanine.

Gas chromatography/mass spectrometry (GC/MS) was used to determine the amounts of eight oxidative base modifications in DNA extracted from 11 specimens of bones and soft tissues, ranging in age from 40 to 50,000 years. Among the compounds assayed hydantoin derivatives of pyrimidines were quantitatively dominant. From five of the specimens endogenous ancient DNA sequences could be amplified by PCR. The DNA from these specimens contained substantially lower amounts of hydantoins than the six specimens from which no DNA could be amplified. Other types of damage, e.g., oxidation products of purines, did not correlate with the inability to retrieve DNA sequences. Furthermore, all samples with low amounts of damage and from which DNA could be amplified stemmed from regions where low temperatures have prevailed throughout the burial period of the specimens.

DnaJ, DnaK, and GrpE Heat Shock Proteins are Required in 'ori'P1 DNA Replication Solely at the RepA Monomerization Step.
Final rept.
S. Wickner, D. Skowyra, J. Hoskins, and K. McKenney. 1992, 5p.
Pub. in Proc. Natl. Acad. Sci., v89 p10345-10349 Nov 92.

Keywords: *Heat shock proteins, *Deoxyribonucleic acids, *Replication, *Monomerization, DNA, Escherichia coli, Cell membrane, Biological transport, Reprints.

The authors have found that three Escherichia coli heat shock proteins, DnaK (the hsp 70 homolog), DnaJ, and GrpE, function in oriP1 DNA replication in vitro solely to activate DNA binding by the replication initiator protein RepA. Activation results from the conversion of P1 or P7 RepA dimers to monomers that bind with high affinity to the origin of replication of plasmid P1. Thus, the essential role of these three heat shock proteins in this replication system is to change the quaternary structure of a single protein, RepA.

Keywords: *Dental materials, *Permanent dental restoration, Biocompatible materials, Composite materials, Cements(Adhesives), Adhesives, Alloys, Fluorescent dyes, Sealants, Chemical analysis.

The research described herein is designed to achieve a number of objectives leading to improved dental restorative materials, techniques and applications of dental materials science for improved delivery of health care. The bulk of the research is related in one manner or another to dental composites, cements, adhesives, and sealants. Composite research focuses on improvements through the development of durable resin matrices, stronger, durable coupling between fillers and resins (defining the best overall combination of components) and optimal curing systems. A major emphasis of the programs is on the synthesis and applications of monomers which reduce polymerization shrinkage through the use of expanding monomers (or monomers which undergo much less shrinkage than conventional monomers). A second distinct area of effort focuses on dental alloy and ceramic systems. Weibull statistics and finite element stress analysis are employed for the determination of the strengths of ceramic and ceramic-metal systems as affected by processing parameters and thermo-mechanical properties.

The amounts of loosely bound fluoride (F) deposited on human enamel by 4-min and 2-hour treatments with either acidulated phosphate fluoride (APF) or a monocalcium phosphate monohydrate and sodium hexafluorosilicate (MCPM-SHFS)-containing gel were measured with the use of a constant-composition F washing method. Enamel biopsies conducted before treatment and after washing were used to determine the firmly bound F uptake. The results showed that the MCPM-SHFS treatments produced significantly more loosely bound F than did the APF treatments. The 4-min treatment with either APF or MCPM-SHFS did not produce significant firmly bound F deposition, but the 2-hour treatments did, with that produced by MCPM-SHFS being significantly greater. The MCPM-SHFS gel, which had the same F content as APF and which may be applied to the proximal tooth surfaces in vivo without the use of a tray, has the potential to be more efficacious than APF because it deposits greater amounts of both loosely bound and firmly bound F.

Keywords: *Dental plaque, *Fluorides, *Saliva, *Microanalysis, Tooth, Sodium fluorides, Mouthwashes, Dental caries, Dental care, Reprints.

An ultramicro method has recently been described for measurement of plaque-fluid fluoride concentration. This method was used: (1) for exploration of the variation in fluoride concentration of plaque fluid collected from the same buccal tooth sites following a 0.048 mol/L NaF (0.2%) rinse, and (2) for examination of the distribution of fluoride in plaque fluid and saliva within one hour after this rinse. Results indicated an average coefficient of variation (CV) of 31% for plaque-fluid fluoride in triplicate samples recovered simultaneously from the buccal-proximal region of two teeth after the rinse. The variations suggest that an examination of plaque-fluid fluoride from specific tooth regions may be essential for understanding the effects of fluoride on the site-specificity of caries.

Effects on Whole Saliva of Chewing Gums Containing Calcium Phosphates.
Final rept.
L. C. Chow, S. Takagi, R. J. Shern, B. A. Sieck, T. H. Chow, and K. K. Takagi. 1994, 7p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Dental Research 73, n1 p26-32 Jan 94.

Keywords: *Chewing gum, *Calcium phosphates, *Salivation, *Tooth remineralization, Additives, Weight, pH, Calcium, Phosphates, Reprints, Dicalcium phosphate anhydrous, Calcium phosphate hydrate, Tetracalcium phosphate.

To evaluate chewing gums as a vehicle to increase salivary mineral saturation levels and enhance salivation, monocalcium phosphate monohydrate (MCPM) and an equimolar mixture of tetracalcium phosphate (TTCP) with dicalcium phosphate anhydrous (DCPA) were chosen as experimental chewing gum additives. The saliva samples collected every 2 min were analyzed for weight, pH, and total calcium (Ca) and phosphate (P) concentrations. The degree of saturation of tooth mineral was significantly increased by both experimental gums, with the greater increase being produced by the TTCP-DCPA gum. The MCPM gum produced a significantly greater saliva flow and a lower salivary pH than did the control and TTCP-DCPA gums. The results suggest that the experimental gums may be useful for promoting remineralization in general and for inducing salivation in xerostomic patients.

Procedure for the Study of Acidic Calcium Phosphate Precursor Phases in Enamel Mineral Formation.
Final rept.
C. Siew, S. E. Gruninger, L. C. Chow, and W. E. Brown. 1992, 5p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Calcified Tissue International 50, p144-148 1992.

Keywords: *Dental enamel, *Acidification, *Minerals, Magnesium, Calcium phosphates, Fluorides, Biochemistry, Hydrolysis, In vitro analysis, In vivo analysis, Reprints, *Octacalcium phosphate, Apatite/hydroxy.

Considerable evidence suggests that an acidic calcium phosphate, such as octacalcium phosphate (OCP) or brushite, is involved as a precursor in enamel and other hard tissue formation. Additionally, there is in vitro evidence suggesting that fluoride accelerates and magnesium inhibits the hydrolysis of OCP to hydroxyapatite (OHAp). As the amount of OCP or brushite in enamel cannot be measured directly in the presence of an excess of hydroxyapatite, a procedure was developed that allows for their indirect in vivo quantification as pyrophosphate. This permits study of the effects of fluoride and magnesium ions on enamel mineral synthesis.

Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in American Jnl. of Dentistry 5, n6 p324-328 Dec 92.

Keywords: *Dentin permeability, *Glycine, *Solutions, In vitro analysis, pH, Buffers, Reprints, *Aluminum oxalate, *Pretreatments, Smear layers.

Aluminum oxalate buffered with glycine to pH 0.5 - 2.5 has been proposed as a dentin pretreatment for the Gluma bonding system. In this experiment, the effects of 1-minute treatments of smear layers with these aluminum oxalates on the permeability of human dentin were determined in vitro. The aluminum oxalate solutions at pH 0.5 - 1.5 removed most of the original smear layer but occluded the tubules with crystalline deposits which decreased dentin permeability. Those solutions used at pH 2.0 and 2.5 increased dentin permeability. All dentin pretreatments increased dentin permeability when measured after a 24-hour storage period, especially the solutions at pH 2.0 and 2.5. The SEM correlates of these permeability changes indicated that these solutions remove the smear layer but reocclude the tubules with precipitates which are probably different forms of calcium oxalate, aluminum phosphate and calcium phosphates.

Interaction of Chlorhexidine Digluconate with and Adsorption of Chlorhexidine on Hydroxyapatite.
Final rept.
D. N. Misra. 1994, 7p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Biomedical Materials Research 28, p1375-1381 1994.

Keywords: *Adsorption, *Hydroxyapatites, *Reaction kinetics, *Chlorhexidine, *Mouthwashes, *Dentistry, Dental cements, Aqueous solutions, Oral hygiene, Precipitation(Chemistry), Solubility, Reprints, *Chlorhexidine digluconate.

It is well known that chlorhexidine digluconate provides an effective microbicidal activity during oral rinsing, and therefore, it was considered worthwhile to investigate its interaction with hydroxyapatite on a fundamental level. The kinetics of uptake (or reaction) of the compound from aqueous solutions by synthetic hydroxyapatite was studied at 23 C for four time periods by monitoring its concentration. All of the experimental facts can be qualitatively explained on the basis of the solubility considerations of hydroxyapatite and of chlorhexidine phosphate, the reaction product that slowly precipitates out of the solution. To explore the nature of interaction, the uptake of chlorhexidine base was studied from p-dioxane and it is irreversible. The uptake is total below a threshold equilibrium concentration and constant above it.

Remineralization of Root Lesions with Concentrated Calcium and Phosphate Solutions.
Final rept.
L. C. Chow, and S. Takagi. 1995, 6p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Dental Materials Jnl., v14 n1 p31-36 Jun 95.

Keywords: *Teeth, *Enamels, *Calcium phosphates, Solutions, Diffusion, Caries, Teeth roots, Holes(Openings), Reprints, *Remineralization, Lesions, Root caries.

Remineralization of enamel lesions in vitro by use of sequential treatments with an alkaline (pH 9) phosphate (1 mol/L) solution and slightly acidic (pH 6) calcium (1 mol/L) solution was reported to be relatively ineffective. An analysis of the diffusion processes that may occur during the remineralization treatments suggested that the driving force for diffusion of Ca into the lesion can be increased by making the calcium solution more alkaline than the phosphate solution. In the present study this modified treatment procedure was evaluated for remineralizing root lesion in vitro.

Effect of Supersaturation on Apatite Crystal Formation in Aqueous Solutions at Physiologic pH and Temperature.
Final rept.
K. Ishikawa, E. D. Eanes, and M. S. Tung. 1994, 8p.
Pub. in Jnl. of Dental Research, v73 n8 p1462-1469 Aug 94.

Keywords: *Apatites, *Calcification, *Crystal size, Reprints, Supersaturation, X ray diffraction.

The importance of supersaturation in the dynamics of apatite precipitation from aqueous solutions is well-established. To determine whether this parameter has a comparable impact on the concomitant development of the textural properties of this phase, such as crystal size and shape, the authors investigated mineral accretion in synthetic solutions seeded with 0.67 g/L apatite over a range of supersaturations at pH 7.4 and 37 degrees C. A dual specific-ion electrode-controlled titration method was used to maintain the seeded reactions under the following solution conditions: 1.0 to 1.8 mmol/L Ca2+, 0.67 to 1.2 mmol/L total phosphate (PO4), Ca/PO4 (initial) = 1.5, 143 mmol/L KNO3, and 10 mmol/L HEPES. Samples were collected for chemical and textural analyses when the seed apatite was reduced by new accretions to 1/2, 1,4. 1/8, 1/16, and 1/32 of the total solids in suspension. All new accretions were found to be apatitic. At the lowest supersaturation, accretion occurred primarily by growth of the seed crystals. However, at the highest supersaturation examined, the crystals at the end of the experiments were actually smaller, on average, than the original seeds, even though the total mass increased 32-fold. The results suggest that proliferation of new crystals supplanted growth of the seed crystals as supersaturation was increased. The results also suggest that differences in tissue fluid supersaturation may contribute to the large disparity in dimensions between dentin and enamel apatite crystals.

Bioactive Polymeric Dental Materials Based on Amorphous Calcium Phosphate.
Final rept.
J. M. Antonucci, D. Skrtic, and E. D. Eanes. 1994, 2p.
Pub. in Polymer Preprints, v35 n2 p460-461 1994.

Keywords: *Calcium phosphates, *Dental cements, Tooth remineralization, Physiologic calcification, Phototchemical reactions, Monomers, Amorphous compounds, Hydroxyapatites, Composite materials, Physicochemical properties, Biochemistry, Dental materials, Reprints, *Bioactive materials, Coupling agents, HAP(Hydroxyapatite).

Amorphous calcium phosphate (ACP) is an important intermediate in HAP formation, has received far less attention as a biomaterial. The two principal reasons for this are ACP's high solubility in aqueous media and its rapid conversion to HAP. These very properties, however, suggest its use as a bioactive filler in polymeric materials, e.g., composites, sealants, adhesives, that can preserve teeth against demineralization and possibly promote remineralization of defective tooth structure. In this study, several visible light curable composites based on several acrylic monomer systems and a stablized ACP were prepared, polymerized and evaluated for their ability to release calcium and phosphate ions in the presence of an aqueous environment in a sustained fashion and at levels adequate to favor HAP formation.

Many of the physicochemical principles of crystal nucleation and growth relevant to understanding biomineralization dynamics have been elucidated by solution studies on synthetic calcium phosphate analogs. These studies have also helped to delimit the range of action of specific biological substances. e.g., matrix macromolecules, that may be involved in initiating and regulating mineral formation in vivo. Together with our present knowledge of the ultrastructural features of skeletal mineral and mineral-matrix associations, these synthetic studies have provided valuable insight into biomineral formation and the physiological constraints placed on it. This chapter reviews current knowledge in these areas.

Pub. in Industrial Biotechnological Polymers, Chapter 25, p393-408 1995.

Keywords: *Teeth, *Enamels, *Calcium phosphate, Composites, Reprints, *Remineralization.

Calcium phosphates constitute an increasingly important class of inorganic dental materials. Their excellent compatibility with both hard and soft tissues as well as with other dental materials, especially polymeric resins and acids, has led to a number of possible prophylactic, prosthetic and restorative uses. Crystalline calcium phosphates such as hydroxyapatite (HAP) and various di-, tri- and tetracalcium phosphates have received the greatest consideration for such purposes. Less attention in this regard has been given to the possible use of amorphous calcium phosphate (ACP), an important intermediate in the formation of apatite, as a dental material. One reason for this neglect is that the relatively high solubility of ACP and its conversion to apatite in aqueous environments poses limitations in applications where structural, mechanical and chemical stabilities are desired. These same properties, however, may make ACP suitable as a potential mineralizing agent. When compounded with appropriate polymeric resins, ACP's bioactivity may be particularly useful in enhancing the performance of sealants and adhesives in preventing tooth demineralization or promoting its remineralization when defective.

Pub. in Fluoride in Dentistry, Chapter 2, p27-39 1996.

Keywords: *Dental, *Fluoride, Soil, Tissue, Analysis, Fluorine, Foods, Research, Reprints, *Foreign technology.

The emergence of fluoridation of public water supplies as a safe and economic mass caried-control measure was based on epidemiologic studies and on the concurrent elucidation of the tranpsort and metabolism of fluoride, the mechanism of action of fluoride compounds, their biological effects, and the environmental aspects of fluorides. The success of these studies depended, among other things, on the development of sound fluoride analytical methods. This involved fluorine analysis of water, soil, minerals, vegetation, foods and a host of other biological materials such as bone, teeth (enamel, dentin, cementum), body fluids (urine, blood, saliva) and soft tissues (kidney, liver, muscle).

Keywords: *Cements, *Calcium phosphate cements, Biomaterials, Hydroxyapatite, Mechanical strength, Setting time, Reprints.

Since their development in 1987 (1), self-hardening calcium phosphate cements (CPC) have been a subject of considerable interest in biomaterials research. The first CPC's consisted of tetracalcium phosphate (Ca4(PO4)2O or TTCP) and anhydrous dicalcium phosphate (CaHPO4 or DCPA), or TTCP and dicalcium phosphate dihydrate (ChH-PO4.2H2O or DCPD). These cements set in about 30 minutes after mixing the powder with water or dilute acid (e.g., 25 mmol/L H3PO4) and develop sufficient mechanical strength for many clinical applications.

Adsorption of Polyacrylic Acids and Their Sodium Salts on Hydroxyapatite: Effect of Relative Molar Mass.
Final rept.
D. N. Misra. 1996, 8p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Colloid and Interface Science, Article No. 0380, v181 p289-296 1996.

Keywords: *Polyacrylics, *Hydroxyapatites, *Molar mass, Molecular conformation, Acids, Salts, Adsorption, Langmuir plot, Molecular association, Reprints.

The effect of molar mass on the adsorptive properties of polyacrylic acids and their sodium salts (polymers) has an important bearing on the adhesive mechanisms of restorative resins based on these or similar polymers. The adsorption isotherms of the aqueous solution of polymers were determined on synthetic hydroxyapatite at room temperature to elucidate the role of physico-chemical factors involved in the process. The adsorption of lower molar mass (<90,000) polyacrylic acids shows that the isotherms first rise, reach a maximum, then decrease. In contrast, a higher molar mass (250,000) polyacrylic acid shows no maximum and follows a regular isotherm. The adsorption isotherms of sodium polyacrylates are regular, do not exhibit any maxima, and merge into each other for higher molar mass salts (>60,000). The adsorption is irreversible for the acids as well as for the salts. The concentrations of calcium and phosphate ions were also determined in the filtrates in order to establish any possible correlation with the adsorbed amounts of polymers. The self-association of the polyacrylic molecules by intermolecular hydrogen bonding that may be responsible for the decrease in adsorption at higher concentrations may not play a significant role for higher molar mass acids where individual molecules can fold on themselves as intramolecular hydrogen bonding becomes more dominant.

Interaction of Citric Acid with Hydroxyapatite: Surface Exchange of Ions and Precipitation of Calcium Citrate.
Final rept.
D. N. Misra. 1996, 8p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Dental Research, v75 n6 p1418-1425 1996.

Keywords: *Calcium citrate, *Hydroxyapatite, *Citric acid, *Surface exchange, Formation, Interactions, Peridontal regeneration, Restorative bonding, Reprints.

The use of citric acid is efficacious and distinctive in the demineralization of dentinal root surfaces for periodontal regeneration and in the etching and conditioning of enamel or dentin for bonding restorative resins. To decipher the role of citric acid in these applications, it is important to have a basic understanding of its interaction with synthetic hydroxyapatite. The uptake or removal of citrate ions from aqueous solutions of citric adic (4 to 100 mmol/L, 10 mL) by hydroxyapatite (1 g) was studied at 22 degrees C after a given reaction period (from 3 hr to 11 days) by immediate spectrophotometric monitoring of the concentration of the filtrates (214 nm). The concentrations of calcium, phosphate and hydrogen ions were also determined in the same solutions. The interaction: (1) is a time-independent ionic exchange process with the substrate when the initial acid-concentrations are dilute (4 to 12.5 mmol/L), and (2) is a reactive process that is time-dependent for higher acid concentrations. The exchange process shows an adsorption of about one citrate ion per (100) face of the unit cell of hydroxypatite for a maximally exchanged surface.

The abstracts presented in the volume provide a summary of much of the research conducted during the past year at the American Dental Association Health Foundation's (ADAHF) Paffenbarger Research Center (PRC) and the National Institute of Dental Research (NIDR)-funded Center of Excellence for Materials Science Research (CEMSR). PRC research is primarily conducted in four areas: dental chemistry, polymer chemistry, clinical research, and dental crystallography.

Planar Waveguide Optical Sensors.
Final rept.
S. Choquette, L. Locascio-Brown, and R. A. Durst. 1990, 9p.
Pub. in Proceedings of Sensors Expo, Chicago, IL., September 11-13, 1990, p206A-1-206A-9.

Keywords: *Theophylline, *Optical waveguides, Planar structures, Fluorescence, Liposomes, Sensors, Reprints, *Ammonium ions, Immunosensors, Flow injection analysis.

The report addresses on-going research involving the development of optical waveguides as analytical sensors. Optical waveguides were fabricated in our laboratory using a metal ion diffusion method, and were employed in independent assays for ammonium and theophylline. The assay for ammonium ion was performed in a flow injection analysis (FIA) system in which the waveguide was used as the detector for an absorbance-based measurement. Detection limits of this assay were 300 M, and the throughput for the system was 60 samples per hour. As a fluorescence sensor, anti-theophylline was immobilized to the surface of the waveguide to create an immunospecific sensor for theophylline. Immunospecific binding of theophylline derivatized liposomes has been demonstrated, and work is progressing on developing a competitive assay for theophylline using planar waveguides.

In situ On-Line Optical Fiber Sensor for Fluorescence Monitoring in Bioreactors.
Final rept.
J. J. Horvath, and C. J. Spangler. 1992, 17p.
Pub. in Front. Bioprocess. 2, Proc., p99-115 1992.

Keywords: *Bioreactors, *Fluorescence spectroscopy, *Optical fibers, On-line systems, Pyridoxine, Tryptophan, NAD, Riboflavin, Saccharomyces cerevisiae, Reprints.

This work examines the fluorescence properties of natural cell components such as tryptophan, pyridoxine, NADH, and riboflavin in batch fermentations of S. cerevisiae. Measurements were made using both an external flow-thru cuvette loop and an in-situ optical fiber/rod sensor. Pyridoxine gave the largest fluorescence signal; the spectrum of pyridoxine overlaps that of NADH, complicating its interpretation. A good correlation was found between the dry weight of yeast and on-line fluorescence measurements of pyridoxine and tryptophan. The pyridoxine signal was linear with the dry mass of yeast and the tryptophan signal showed absorption effects starting at a dry mass of 0.5 g/l in the cuvette. No deviations were observed with the in-situ optical fiber/rod.

Current Fluctuations Reveal Protonation Dynamics and Number of Ionizable Residues in the alpha-Toxin Channel.
Final rept.
J. J. Kasianowicz, and S. M. Bezrukov. 1993, 1p.
Pub. in Biophysical Jnl., v64 pA344 Feb 93.

Keywords: *Ion channels, *Ion transport, *Noise analysis, Reprints, Proteins, Protons, Dynamics.

The I-V relationship of channels formed by Staphlococcus aureus alpha-toxin is pH dependent. To understand the nature of this effect, the authors measured the fluctuations in current through the open channel as a function of pH. The low frequency noise levels in NaCl solutions exhibits a single, well-defined peak over the range 4.5 less than pH less than 7.5. The noise can be described theoretically assuming the channel has several ionizable sites that bind protons with first-order kinetics. In the model, the association of a proton with each of the binding sites in the channel is assumed to increase the conductance in a stepwise manner. Data analysis shows that the residues responsible for the pH dependent noise have a PKa = 5.5. Moreover, the rate constants for the association and dissociation of protons are kg = 8 10 to the 9th power M to the minus 1 power S to the minus 1 power, and KD = 10 to the 5th power, respectively.

Protonation Dynamics in an Ion Channel Pore.
Final rept.
J. J. Kasianowicz, and S. M. Bezrukov. 1993, 1p.
Pub. in International Biophysics Conference (11th), Budapest, Hungary, July 25-30, 1993, p136.

Keywords: *Alpha toxin, *Ion channels, *Noise analysis, Reprints, Protons, Rate constant, Spectral analysis, *Foreign technology, Diffusion limited reactions, Ionizable group, Protein structure.

Staphylococcus aureus alpha-hemolysin (alpha-HL) forms channels that have a pH dependent I-V relationship. To evaluate the rate constants for these protonation reactions, the authors measured the fluctuations in current through fully open alpha-HL channels as a function of pH in the presence of 1M NaCl. Spectral analysis shows that the data are well described by a model in which protons bind independently to n ionizable residues with first-order kinetics and that pK = 5.5, kon = 8 10 to the 9th power M to the minus 1 power S to the minus 1 power, koff = 2.5 10 to the 4th power S to the minus 1 power and n = 4 (Phys. Rev. Lett. 70). The value the authors obtain for the association rate constant, kon, is similar to the values measured by Eigen and co-workers for reactions between H+ and free carboxyl or imidazole groups, which suggests that the protonation reactions inside these pores are diffusion limited.

Autofluorescence Detection of 'Escherichia coli' on Silver Membrane Filters.
Final rept.
S. A. Glazier, and H. H. Weetall. 1994, 5p.
Pub. in Jnl. of Microbiological Methods, v20 p23-27 1994.

Keywords: *Bacteria, Reprints, Escherichia coli, *Foreign technology, *Autofluorescence, *Epifluorescence.

This report describes the measurement of the limit of detection of the bacterium, Escherichia coli, on the surface of membrane filters employing autofluorescence. Investigation of detection of E. coli by this method was prompted by NASA's need for a method which could detect, principally, fecal coliforms in initially sterile storage water on-board the space station. This method was examined, with E. coli as a model, because it could be conducted rapidly with little or no need for disposables, large amounts of instrumentation, or constant human involvement. The autofluorescence of E. coli collected on the surface of silver membrane filters was quantitated by epifluorescence microscopy and related to a viable count of the bacteria. The fluorescence was excited using a broad region of ultraviolet radiation from a mercury arc lamp (approx. 250-400 nm) examined in the wavelength region of 495 nm and higher through a long pass optical filter. From these measurements, the limit of detection of viable E. coli collected on the membrane filters was fewer than 550 plus or minus 32 viable bacteria or 170,000 plus or minus 10,000/ml in terms of solution concentration.

Bacterial Enumeration in Storage Water.
Final rept.
S. A. Glazier, and H. H. Weetall. 1993, 33p.
Pub. in Bacterial Enumeration in Storage Water, 33p, 17 Feb 93.

Keywords: *Bacteria, *Water analysis, *Fluorescence, Reprints, Enumeration, Microscopy.

This report describes the progress of a NASA funded project. The goal of this project is the enumeration of bacteria which are present in storage water. This work is part of NASA's efforts to prepare environmental monitoring systems for the space station currently under construction. A prototype system for enumeration of bacteria in storage water is proposed based on the fluorescence detection of single bacterial cells collected on a membrane filter. This method of bacterial detection was chosen because it conveniently concentrates the bacteria from the water and enumerates them without the need for disposable reagents and supplies. The report describes the model enumeration system proposed, explains the origins of bacterial cells by laser confocal microscopic imaging, explores the possibility of distinguishing between live and dead bacteria based on their native fluorescence, and details progress on the construction of a simple, compact bacterial enumeration system.

Escherichis coli Cyclic AMP Receptor Protein Mutants Provide Evidence for Ligand Contacts Important in Activation.
Final rept.
J. Moore, M. Kantorow, D. Vanderzwaag, and K. McKenney. 1992, 6p.
Pub. in Jnl. of Bacteriology, v174 n24 p8030-8035 Dec 92.

Keywords: *Protein mutants, *Ligand contacts, *Receptor proteins, Activation, Escherichis coli, Reprints, Cyclic AMP.

The three-dimensional model of the Escherichia coli cyclic AMP (cAMP) receptor protein (CRP) shows that several amino acids are involved as chemical contacts for binding cAMP. We have constructed and characterized mutants at four of these positions, E72, R82, S83, and R123. The mutations were made in wild-type crp as well as a cAMP-independent crp, crp(star). The activities of the mutant proteins were characterized in vivo for their ability to activate the lac operon. These results provide genetic evidence to support that E72 and R82 are essential and S83 and R123 are importnat in the activation of CRP by cAMP.

Mixed Diet Reference Materials for Nutrient Analysis of Foods: Preparation of SRM-1548 Total Diet.
Final rept.
W. R. Wolf, G. V. Iyengar, and J. T. Tanner. 1990, 3p.
Sponsored by Department of Agriculture, Beltsville, MD. and Food and Drug Administration, Washington, DC.
Pub. in Fresenius Jnl. of Analytical Chemistry 338, n4 p473-475 1990.

Keywords: *Food analysis, *Chemical analysis, *Diets, *Trace elements, *Nutritive value, Nutrients, Human nutrition, Fats, Proteins, Cholesterol, Caloric requirements, Reprints, *Standard reference materials, *SRM 1548.

Several mixed component diet materials have been available for use as Reference Materials for determination of elemental contents in foods. Wide acceptance of these materials has resulted in supplies being no longer available. A new mixed food material, SRM 1548 Total Diet has been prepared and characterized for a number of elemental and organic constituents of nutritional concern. SRM 1548 was prepared from foods obtained from collections of the USFDA's Total Diet Study, which are representative of foods consumed by the US population. SRM 1548 has been composited from these foods, proportional to a representative daily intake. The composited foods were blended, freeze-dried, reblended and bottled in six gram sample size. Homogeneity studies were carried out along with certification analyses for elements, cholesterol, caloric, and proximate content. This material is available from NIST and will be useful for multipurpose determinations of constituents in the naturally occurring range in foods and food related materials.

Virtual Environments for Health Care. A White Paper for the Advanced Technology Program (ATP), the National Institute of Standards and Technology.
Special pub.
J. Moline. Nov 95, 60p, NISTIR-5740.

Keywords: *Virtual reality, *Health, Surgery, Therapy, Education, Databases, Rehabilitation, *Augmented reality, *Telemedicine.

This report surveys the state of the art in applications of virtual environments (VE) and related technologies for healthcare. After a brief introduction, terms are defined and a review of the healthcare applications is presented. The report also discusses the value-added of these application, their limitations, and areas of current research and development concerning virtual environments for healthcare. Applications of virtual environments and related technologies are being developed for healthcare in the following areas: surgical procedures (remote surgery or telepresence, augmented or enhanced surgery, and planning and simulating procedures before surgery), medical therapy, medical diagnosis and monitoring (telemedicine), preventive medicine and patient education, medical education and training, visualization of massive medical databases, skills enhancement and rehabilitation, and architectural design for healthcare facilities. Virtual environments are benefiting healthcare. To date, the developments have improved the quality of healthcare and in the future will result in substantial cost savings. Tools are being refined or developed which respond to needs of present VE systems. However, additional large scale research is necessary in the following areas: users' studies, use of robots for teleoperated procedures, enhancing system reality, and improving system functionality.

In vitro Inhibition of Membrane-Mediated Calcification by Novel Phosphonates.
Final rept.
D. Skrtic, N. Eidelman, G. Golomb, E. Breuer, and E. D. Eanes. 1996, 8p.
Pub. in Calcified Tissue International, v58 p347-354 1996.

Keywords: *Bone disorders, *Calcium metabolism, *Hydroxyapatite, Reprints, Geminal bisphosphonates.

The effects of a series of novel phosphonates on the kinetics of mineral development in an ionophore-primed 7:2:1 phosphatidylcholine (PC): dicetylphosphate (DCP): cholesterol (Chol) liposomal model system are reported. When present at 2.5 micro mol/L or 25 micro mol/L concentrations in the solution surrounding the liposomes, the investigated phosphonates did not significantly delay the initial formation of hydroxyapatite-like calcium phosphate salts (HAP) within the liposomes or the penetration of HAP crystals through the enclosing membranes. However, the phosphonates variably retarded the subsequent growth and proliferation of the HAP crystals once they became directly exposed to the phosphonate-containing solution. The effectiveness of phosphonates in inhibiting extraliposomal precipitation strongly depended on their structure. The inhibitory action on active surface growth sites of released intraliposomal crystals was found to be the most effective if the phosphonate molecule contained two phosphonic groups linked to the same C atom. At a phosphonate concentration of 25 micro mol/L the following general order of effectiveness was established: geminal bisphosphonate equal to or greater than geminal tetrakisphosphonate greater than bisacylphosphonates greater than monoacylphosphonate greater than bisalkylphosphonate.

Thermodynamics of the Hydrolysis of Penicillin G and Ampicillin.
Final rept.
N. Kishore, Y. B. Tewari, W. T. Yap, and R. N. Goldberg. 1994, 12p.
Pub. in Biophysical Chemistry 49, p163-174 1994.

Keywords: *Penicillin G, *Ampicillin, *Thermodynamics, *Hydrolysis, Calorimetry, High performance liquid chromatography, Enthalpy, beta-Lactamase, Reprints.

Apparent equilibrium constants and calorimetric enthalpies of reaction have been measured for the beta-lactamase catalyzed hydrolysis of penicillin G(aq) and ampicillin(aq) to penicillinoic acid(aq) and to ampicillinoic acid(aq), respectively. High-pressure liquid-chromatography and microcalorimetery were used to perform these measuremens. Calorimetric enthalpies of reaction for the beta-lactamase catalyzed hydrolysis of cephalosporin C have also been measured but the reaction products have not been identified and the measured enthalpies cannot be assigned to a specific reaction. Acidity constants for ampicillin, penicillin G, ampicillinoic acid, and penicillinoic acid are also reported. A strain of energy of 116 kJ mol for the beta-lactam ring is obtained from thermochemical data.

Determination of Amphetamine and Methamphetamine in a Lyophilized Human Urine Reference Material.
Final rept.
P. Ellerbe, T. Long, and M. J. Welch. 1993, 6p.
Pub. in Jnl. of Analytical Toxicology 17, p165-170 May/Jun 93.

Keywords: *Amphetamine, *Methamphetamine, *Urine, *Reference standards, Mass fragmentography, Clinical chemistry, Humans, Freeze drying, Isotope dilution, Reprints, Heptafluorobutyryl derivative, N-trifluoroacetyl-1-prolyl chloride.

The concentrations of amphetamine and methamphetamine in a new lyophilized human urine reference material (RM) were determined at the National Institute of Standards and Technology, in cooperation with the College of American Pathologists. In order to minimize the possibility of undetected bias, two different methods were developed. Both methods were based on isotope-dilution gas chromatography/mass spectrometry (GC/MS) with a deuterium-labeled standard. The first method used a solid phase extractor (SPE) to isolate the analytes, followed by the forming the heptafluorobutyryl (HFB) derivatives for measurement by GC/MS. The second method used another kind of SPE to isolate the analytes, followed by forming the N-trifluoroacetyl-1-prolyl chloride (TPC) derivatives for measurement by GC/MS. The RM consists of three levels of amphetamine, three levels of methamphetamine, and a blank. For amphetamine, the concentrations are 291, 558, and 1081 ng/mL of human urine. For methamphetamine, the concentrations are 311, 573, and 1137 ng/mL of human urine.

Physical Characterization of Herparin by Light Scattering.
Final rept.
A. K. Gaigalas, J. B. Hubbard, R. LeSage, and D. H. Atha. 1995, 5p.
Pub. in Jnl. of Pharmaceutical Science, v84 n3 p355-359 Mar 95.

Keywords: *Heparins, *Light scattering, *Transport properties, Physical properties, Anticoagulants, Size determination, Diffusion coefficient, Charge density, Electric charge, Reprints.

Dynamic and electrophoretic light scattering were used to measure the size and charge heterogeneity of a

commercial preparation of heparin. For this preparation of porcine mucosal heparin (M(sub r) = 10-20 kDa), the diffusion coefficient was 1.2 plus or minus 0.5 x 10(exp -8) square cm/s and the mobility was 4.4 plus or minus 0.9 x 10(exp -4) square cm/V s for an unfiltered solution at 22 deg. C in distilled water. This diffusion constant is 2 orders of magnitude smaller than expected for a molecule the size of heparin. A fast diffusion component of 5.8 plus or minus 1.0 x 10(exp -7) square cm/s, corresponding to the individual molecule, was observed in the presence of 2 M NaCl, where single molecule motion is better observed. This indicates that a portion of the heparin population is in an aggregated state, which produces a higher scattering intensity than individual heparin molecules. The electrophoretic light-scattering measurements also indicate that the aggregate scattering species have very similar surface charge densities resulting from the aggregates being formed from heparin molecules. These results can provide a framework to interpret future light-scattering data for various preparations of heparin.

Source of Phenol Emissions Affecting the Indoor Air of an Office Building.
Technical note.
J. W. Martin, F. R. Guenther, T. Nguyen, L. Oakley, W. S. Liggett, and E. Byrd. Feb 94, 53p, NISTIR-5353.
Sponsored by General Services Administration, Washington, DC.

Keywords: *Phenols, *Indoor air pollution, *Office buildings, Occupational exposure, Building materials, Epoxy compounds, Floors, Occupational safety and health, Chemical analysis, Industrial hygiene, Environmental surveys, *Silver Spring(Maryland), Leveling materials.

For several years, National Oceanic and Atmospheric Administration (NOAA) employees occupying Floors 3 through 5 of the Silver Spring Metro Center Building One (SSMC-1) in Silver Spring, MD have complained about ailments which they have associated with poor indoor air quality. NOAA and the General Services Administration (GSA) commissioned at least six indoor air quality surveys to seek the causes of these complaints. In one of the later surveys (5), it was concluded that phenol emissions from an epoxy floor-leveling material used in leveling the floor slabs were causing the indoor air quality complaints from Floors 3 through 5. To obtain an independent analysis and assessment, NOAA and GSA asked the National Institute of Standards and Technology (NIST) to ascertain whether phenol (or any other volatile organic compound) was being emitted from the epoxy floor-leveling material and, if so, to recommend remedial actions for mitigating or eliminating the emissions.

Pub. in American Society for Testing and Materials Standardization News, p32-39 Dec 93.

Keywords: *Lead(Metal), *Health hazards, *Buildings, *Lead poisoning, Children, Legislation, Guidelines, Government agencies, Reprints.

The subject of lead-containing painted surfaces has received a great deal of attention in recent years. Much of this interest has been fueled by the potential hazard that this toxic metal poses to the developmental capabilities and health of young children. New federal and state guidelines and legislation concerning lead have spurred many activities in government agencies, academia, and the private sector. In 1988, the Agency for Toxic Substances and Disease Registry (ATSDR) provided, in a report to Congress, a comprehensive review of the health risks that lead in anthropogenic sources pose to children. In 1991, the Centers for Disease Control (CDC) reduced the 'level of concern' of childhood blood lead concentrations from 25 to 10 micrograms per deciliter. According to the CDC report, millions of children in the United States are believed to be at risk of lead poisoning.

Also pub. as National Inst. for Occupational Safety and Health, Cincinnati, OH. Div. of Standards Development and Technology Transfer rept. no. DHHS/PUB/NIOSH-94-116. Also available from Supt. of Docs.

Keywords: *Occupational safety and health, *Chemical compounds, *Health hazards, *Handbooks, Industrial hygiene, Exposure, Chemical properties, Physical properties, Concentration(Composition), Classifications, Toxic substances, Signs and symptoms, First aid, Nomenclature, Identifying, Tables(Data), Exposure limits, Listings.

This guide is intended as a source of general industrial hygiene information for workers, employers, and occupational health professionals. It presents key information and data in abbreviated tabular form for 677 chemicals or substance groupings (e.g., manganese compounds, tellurium compounds, inorganic tin compounds, etc.) that are found in the work environment. The industrial hygiene information found in the Guide should help users recognize and control occupational chemical hazards. The chemicals or substances contained in this revision include all substances for which the National Institute for Occupational Safety and Health (NIOSH) has recommended exposure limits (RELs) and those with permissible exposure limits (PELs) as found in the Occupational Safety and Health Administration (OSHA) General Industry Air Contaminants Standard (29 CFR 1910.1000). This revision includes updated sampling and analytical methods, updated Department of Transportation (DOT) identification and guide numbers, current exposure limits, revised respirator selections, and revised IDLH (immediately dangerous to life or health concentration) values.

NIOSH Comments to DOL on Risk Estimates from the Cadmium Cohort Study by L. Stayner, February 7, 1992.
7 Feb 92, 8p.

Keywords: *Occupational safety and health, *Testimony, *Risk assessment, *Cadmium, Epidemiology, Carcinogenesis, Mortality, Occupational exposure, Pulmonary neoplasms, Models, CAS 7440439.

This testimony includes a table summarizing the risk estimates from fitting the multistage model to a specific cadmium (7440439) cohort study. The risk estimates from fitting the multistage model to the cadmium study were intermediate between estimates derived from fitting the Cox and Poisson regression models. NIOSH further notes that the risk estimates from the Cost and Poisson models are about 50% higher than the estimates in the risk assessment report submitted earlier by NIOSH. The lifetime risk was calculated over the entire life span rather than the median life span. Lung cancer rates were used rather than respiratory cancer rates. NIOSH assumed a five stage model for the analysis, as this is the number of stages generally observed in other multistage analyses of lung cancer. The model was fit by varing the stage affected by cadmium exposure and the model fit best when NIOSH assumed that cadmium affected the third stage.

The excision of radiation-induced lesions in DNA by a DNA repair enzyme complex, namely the UvrABC nuclease complex, has been investigated. Irradiated DNA was treated with the enzyme complex. DNA fractions were analyzed by gas chromatography/isotope-dilution mass spectrometry. The results showed that a number pyrimidine- and purine-derived lesions in DNA were excised by the UvrABC nuclease complex and that the enzyme complex does not act on radiation-induced DNA lesions as a glycosylase. This means that it does not excise individual base products, but it excises oligomers containing these lesions. A number of pyrimidine-derived lesions that were no substrates for other DNA repair enzymes investigated in our laboratory were substrates for the UvrABC nuclease complex.

Contract AI02-93ER61529
Sponsored by Department of Energy, Washington, DC.

Keywords: *Man, *Radiation Hazards, *Radiation Transport, Biological Radiation Effects, Dosimetry, Mathematical Models, Progress Report, EDB/560100.

The general objective of this project has been to carry out studies of radiation interactions with matter, and of radiation transport in bulk media, in order to generate basic radiological physics information needed as input for: Biomedical radiation dosimetry, Assessment of radiation hazards in nuclear technology, Modeling of biological radiation action. This work has included the development of transport-theoretic methods, the compilation and critical evaluation of the underlying single-scattering cross sections, and the application of the transport methods to radiological physics problems. The project carried out for DOE has been closely related to other projects of the Radiation Interactions and Dosimetry Group of the Ionizing Radiation Division supported in-house by NIST (radiation standards for medical and industrial applications). It has shared with these projects mathematical methods, computer programs, and cross section data bases. The support from DOE has covered approximately 20% of the activities in the radiation transport area by the Radiation Theory Task. The research for DOE was carried out by S. M. Seltzer and M. J. Berger.

Experimental assessment of absorbed dose to mineralized bone tissue from internal emitters: An electron paramagnetic resonance study.
M. F. Desrosiers. 1994, 7p, DOE/EH/89334-T1.
Contract AI01-93EH89334
Sponsored by Department of Energy, Washington, DC.

Keywords: *Electron spin resonance, *Bone Tissues, Humans, Radiation Doses, EDB/560161, EDB/560151, EDB/560101.

EPR resonances attributable to radiation-induced centers in hydroxyapatite were not detectable in bone samples supplied by the USTUR. These centers are the basis for imaging and dose assessment. Presumable, the short range of the alpha particles emitted precluded the formation of appreciable amounts of hydroxyapatite centers. However, one bone sample did offer a suggestion of hydroxyapatite centers and newly-developed methods to extract this information will be pursued.

Pub. in Radiation Protection Dosimetry 52, n1-4 p377-380 1994. Sponsored by Department of Energy, Washington, DC.

Keywords: *Bronchi, *Radon, *Alpha particles, *Biological radiation effects, *Daughter products, Carcinogenesis, Cells(Biology), Cell nucleus, Polonium 218, Polonium 214, Reprints, *Y spectra.

This study is concerned with the irradiation of target cells by alpha particles from radon daughters deposited in the bronchial airways, which may lead to cellular damage and carcinogenesis. Alpha particle energy spectra and y spectra at cell nuclei have been calculated for cell depths between 10 and 70 micrometers for the radon daughter nuclei, (218)Po, (214)Po, and for mixtures of the two. Calculations were performed for airways of diameters 1.130, 0.651, 0.435, and 0.198 cm (generations 2, 4, 6, and 10 of the Yeh and Schum morphometry). The y spectra assume a site size of 5 micrometers: the changes in the spectra are studied as functions of particular parameters. This information is useful as input to biophysical models of radon induced carcinogenesis. The significance of this work for the radon biological effectiveness problem is discussed.

Pub. in Applied Radiation and Isotopes 44, n1/2 p81-84 1993.

Keywords: *Bones, *Dosimetry, Electron paramagnetic resonance, Radiation accidents, Reprints.

Electron paramagnetic resonance (EPR) dosimetry was used to assess the dose to bone samples from radiation accident victims. Complications in the measurement process arose from overlapping resonances of multiple paramagnetic centers. A computer fitting routine was developed to enhance measurement of the EPR signal of interest, thereby improving the precision of the dose assessment.

Keywords: *Radiopharmaceuticals, *Bones, *Dosimetry, *Physiologic calcification, Clinical trials, Electron paramagnetic resonance, Reprints.

Therapeutic and palliative uses of bone-seeking radiopharmaceuticals are undergoing clinical trials for human subjects. Radiation dosimetry for these applications is based on the Medical Internal Radiation Dosimetry (MIRD) schema. An experimental method for dosimetry of bone tissue based on electron paramagnetic resonance (EPR) spectrometry is described. Preliminary results for beagle bone exposed to radiopharmaceuticals under clinical conditions have indicated that the EPR dose measurements give approximately the calculated dose, but suggest that the dose distribution may be non-uniform.

National Quality Assurance Program for Personnel Radiation Dosimetry: A Case History.
Final rept.
E. H. Eisenhower. 1988, 11p.
Pub. in Proceedings of the National Conference of Standards Laboratories Workshop and Symposium on Competitiveness in a World Market, Washington, DC., August 14-18, 1988, p18-1 - 18-11.

Keywords: *Quality assurance, *Personnel dosimetry, *Radiation dosage, *Dosimetry, *Performance standards, Ionizing radiation, Occupational safety and health, Standards, Radiation protection, Health physics, Exposure, Case studies, Reprints.

The estimated 1.3 million workers who are potentially exposed to ionizing radiation in the United States must be monitored for exposure by wearing personnel dosimeters. Accurate measurement of radiation doses received by workers is needed because of the health, economic, and legal consequences of exposure to radiation. Because of a general concern about the reliability of reported doses, government and industry groups made several attempts during 25 years to establish dosimetry performance standards. In 1973 the Conference of Radiation Control Program Directors stated that the necessary degree of reliability was not being achieved, in spite of attempts to provide reliability testing of personnel dosimetry services. This paper describes the subsequent development of a national program which now accredits personnel dosimetry processors that satisfy a prescribed level of performance. Reasons are given why the present program is successful, in contrast to earlier attempts.

Shields and stents of metals with high atomic number, which are custom cast in molds from the melt, are the materials most widely used to protect surrounding tissues during treatment of skin or oral lesions with therapeutic electron beams. An improved fabrication method is to mix a polysiloxane-metal composite, which is readily cast at room temperature by combining a metal-powder/polysiloxane resin mixture with a hardening catalyst. The purpose of the present study is to compare the shielding effectiveness of two different metal-polysiloxane composites with that of conventional cast Lipowitz metal (50.1% Bi, 26.6% Pb, 13.3% Sn, 10% Cd). Also, a 2(sup 3) factorial experiment was run to investigate the effects and interactions of metal particle size (20-micrometers vs 100-micrometers diameter), the atomic weight of the metal (304 stainless steel vs 70% Ag, 30% Cu alloy), and the presence or absence of a layer of unfilled polymer added to the forward-scatter side of the shield. The composites of different thicknesses were made by blending 90% (w/w) metal powder separately with 10% polysiloxane base and catalyst. A thin GafChromic (TM) dosimeter film was placed between the shielding material and a polystyrene base to measure the radiation shielding effect of composite disc samples irradiated with a 6-MeV electron beam normal to the flat surface of the disc. The results show that composite shields with the metal of higher atomic weight and density (Ag-Cu) combined with an additional unfilled layer are more effective than the stainless-steel composite with a similar additional unfilled layer, in terms of diminishing the dose at the surface of the polystyrene backing material.

A three-day workshop on Standard Phantoms for In-vivo Radioactivity Measurements was co-sponsored by the Bureau of Radiation and Medical Devices, the National Institute of Standards and Technology (NIST), U.S. Nuclear Regulatory Commission, and the U.S. Department of Energy and held at NIST. It was established at the workshop that: (1) Standards Writing Groups must be organized to specify requirements for Torso, BOMAB, Thyroid, and Bone phantoms; (2) quality assurance of all manufacturing and radioactivity loading stages must include and stress documentation and be traceable to NIST; (3) radionuclides identified by the ANSI N13.30 draft standard are satisfactory; (4) the present Torso, BOMAB, and Thyroid reference phantoms are satisfactory as starting points for standard phantom research, development, and specification, and a set of 5, 10, 15 year old and 95 percent adult male is sufficient to fulfill the needs of the community; and (5) radionuclides should be homogeneously distributed in the phantoms.

National Voluntary Laboratory Accreditation Program: Ionizing Radiation Dosimetry.
Handbook.
P. R. Martin. Aug 94, 116p, NIST/HB-150-4.
Also available from Supt. of Docs. as SN003-003-03286-7. See also PB94-178225.

Keywords: *Personnel dosimetry, *Dosimetry, *Laboratories, *Handbooks, Dosimeters, Beta dosimetry, Gamma dosimetry, X-ray dosimetry, Standardization, Performance evaluation, Assessments, Calibration, Test methods, Government policies, *National Voluntary Laboratory Accreditation Program, *NVLAP program, *Ionizing radiation dosimetry, Traceability, US NIST.

NIST Handbook 150-4 presents the technical requirements of the National Voluntary Laboratory Accreditation Program (NVLAP) for Ionizing Radiation Dosimetry (formerly called the Personnel Radiation Dosimetry program). It is intended for information and use by staff of accredited laboratories, those laboratories seeking accreditation, other laboratory accreditation systems, users of laboratory services, and others needing information on the requirements for accreditaton under the Ionizing Radiation Dosimetry program. This publication supplements NIST Handbook 150, NVLAP Procedures and General Requirements, (PB94-178225) which contains Part 285 of Title 15 of the U.S. Code of Federal Regulations (CFR) plus all general NVLAP procedures, criteria, and policies. Handbook 150-4 contains information that is specific to the Dosimetry program and does not duplicate information contained in the Procedures and General Requirements. It is organized to cross-reference with Handbook 150; for example, Section 285.3 of Handbook 150 presents the description and goal of NVLAP, whereas Section 285.3 of Handbook 150-4 presents the description of the Dosimetry program. Where there is no material specific to the field of accreditation, the section number is omitted.

The microdosimetric interaction model simulates individual interactions of alpha particles with nuclei of sensitive target cells in human bronchial airway generations 2, 4, 6 and 10. For a normalized source density of Po 218 and Po 214 alpha particles, number of hits, microdosimetric spectra and related parameters for cell nuclei located at various depths in bronchial epithelium are calculated. The lineal energy spectrum is a spherical nuclear target is then converted into probabilities for cell killing, mutation and transformation by multiplying the single event chord length distribution with event specific effect probabilities per unit track length as a function of LET. These effect probabilities are finally weighted by the depth-density distributions of basal and secretory cells. The predicted transformation probability is compared with other physical indicators of lung cancer risk, such as dose, dose equivalent, biologically weighted dose, mean lineal energy, and number of alpha particle hits.

Extrapolation Chamber Measurements on (90)Sr + (90)Y Beta-Particle Ophthalmic Applicator Dose Rates.
Final rept.
J. O. Deasy, and C. G. Soares. 1994, 9p.
Pub. in Medical Physics 21, n1 p91-99 Jan 94.

Keywords: *Ophthalmology, *Radiation doses, *Beta dosimetry, *Extrapolation chambers, Strontium 90, Yttrium 90, Monte Carlo method, Electrodes, Accumulators, Ionizing radiation, Reprints, *Ophthalmic applicators, Collector electrodes.

Aspects of extrapolation chamber dose-rate measurements of (90)Sr + (90)Y beta-particle ophthalmic applicators are examined in this report, including the proper choice of collector electrode size, the gap width over which the measurement should be done, the effect of the entrance window materials, and the stopping-power ratio. Experiments, a simple analytic model for the effect of chamber geometry and nonzero gap width, and more detailed Monte Carlo simulations were used. The variation of the planar flux density as a function of angle for a thick (90)Sr + (90)Y source was measured and used as input for the model. From Monte Carlo simulation, the dose rate for tissue irradiation falls off by 8% between the surface and a depth of 7 mg/sq cm. The derivative of chamber ionization as a function of gap width, needed for the dose-rate calibration, increases rapidly as the gap width decreases, typically by a factor of about 2 between gap widths of 1.5 and 0.15 mm. The backscattering effect increases the derived surface dose by a factor of 1.46. A satisfactory dose-rate extrapolation is obtained from gap widths of 0.1-0.25 mm, where the total ionization current is observed to be nearly linear in gap width.

DNA Base Damage Generated In vivo in Hepatic Chromatin of Mice upon Whole Body γ-Irradiation.
Final rept.
T. Mori, Y. Hori, and M. Dizdaroglu. 1993, 6p.
Sponsored by Department of Energy, Washington, DC.
Pub. in International Jnl. of Radiation Biology 64, n6 p645-650 1993.

Keywords: *DNA damage, *Liver, *Chromatin, *Gamma rays, Dose-response relationships, Mutagenesis, Carcinogenesis, Mass fragmentography, Reprints, Hydroxyl radicals.

DNA base lesions in hepatic chromatin formed upon whole-body irradiation of mice were studied. After gamma-irradiating (20-470 Gy) and killing animals, chromatin was isolated from their livers and analyzed by gas chromatography-mass spectroscopy (GC-MS). Five pyrimidine- and five purine-derived DNA lesions were identified and quantified. There were 5-hydroxy-5-methylhydantoin, 5-hydroxycytosine, 5-(hydroxymethyl)uracil, 4,6-diamino-5-formamidopyrimidine, 7,8-dihyro-8-oxoadenine, 2-hydroxy-adenine, 2,6-diamino-4-hydroxy-5-formamidopyrimidine, 7,8-dihydro-8-oxoguanine, thymine glycol and 5,6-dihydroxy-uracil. Except for the latter two, the amounts of these compounds were increased significantly over control levels in the dose range of 100-470 Gy. Above 200 Gy, a deviation from linearity was observed, although the yields were increased in most cases up to 470 Gy. The modified bases that were identified are typically produced by hydroxyl radical attack on the DNA bases. This may indicate a role for hydroxyl radicals in their formation in vivo. These lesions may play a role in the biological consequences of ionizing radiation such as mutagenesis and carcinogenesis.

Characterization of a Health Physics Instrument Calibration Range.
Final rept.
L. A. Slaback, and C. G. Jones. 1988, 9p.
Pub. in Proceedings of Midyear Topical Meeting on Instrumentation (22nd), San Antonio, TX., December 4-8, 1988, p281-288.

Keywords: *Health physics, *Measuring instruments, *Calibrating, *Test facilities, *Occupational safety and health, Cesium 137, Radiation dosage, Radiation protection, Radiation shielding, Alternatives, Attenuators, Filtration, Reprints.

The radiation field of an instrument calibration facility consisting of a 4m range and an 80 Ci Cs-137 source with various attenuators was characterized in terms of secondary field components such as backscatter and buildup; intensity of the radiation beam versus distance; actual effective energy of the filtered beams; useful field size and useful calibration distance as a function of detector size. The relative effectiveness of the attenuators with respect to an unfiltered beam is consistent at distances greater than one meter. At distances less than this, the relative effectiveness of the filters is not constant with up to an 8% change under certain conditions. Aluminum filtration was added to lead attenuators to correct for low energy emissions. This paper examines the scattered environment for a relatively small calibration room (3m x 7m) and presents it as a viable alternative to a large facility. A PC computer program is available which fits the calibration data that are described here.

Interpreting the Readings of Multi-Element Personnel Dosimeters in Terms of the Personal Dose Equivalent.
Final rept.
M. Ehrlich, and T. Soodprasert. 1994, 13p.
Pub. in Radiation Protection Management 11, n3 p39-51 May/Jun 94.

Keywords: *Multi-element analysis, *Personnel dosimetry, *Dose equivalents, *Occupational exposure, Dosemeters, Radiation dose units, Radiation monitoring, Calibration, Performance evaluation, Algorithms, Reprints, Angle dependence, Energy dependence, Photon dosimeters.

In 1989, one of the authors (M.E.) suggested an algorithm for extending the well-known method of evaluating the readings of multi-filter and/or multi-element photon personnel dosimeters to take into account the dependence of their response both on energy and on angle, as is required for an interpretation in terms of the operational quantity 'personal dose equivalent.' This algorithm was tested on a widely used commercial photon dosimeter. At irradiation levels at which the dosimeter's less sensitive elements of low atomic numbers can be employed, the algorithm was found to be unnecessary for the interpretation of the readings in terms of the personal dose equivalent at a depth of 10 mm in tissue, over the entire photon-energy range and angles of photon incidence up to 60 deg.

Ionizing Radiation Causes Greater DNA Base Damage in Radiation-Sensitive Mutant M10 Cells That in Parent Mouse Lymphoma L5178Y Cells.
Final rept.
T. Mori, and M. Dizdaroglu. 1994, 6p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Radiation Research 140, p85-90 1994.

Keywords: *DNA damage, *Mutation, *Ionizing radiation, *Radiation tolerance, Dose-response relationships, Lymphoma, Cultured tumor cells, Chromatin, Mass fragmentography, Pyrimidines, Reprints.

The DNA base damage in radiation-sensitive mutant M10 cells and parent mouse lymphoma L5178Y cells was studied. Cells were exposed to ionizing radiation in the dose range of 48 to 400 Gy. Chromatin was isolated from cells and analyzed by gas chromatography-mass spectrometry. Ten DNA base products were identified and quantified. A dose-dependent formation of the products was observed. The yields of products in M10 cells were up to threefold greater than in L5178Y cells. Of the products measured, formamidopyrimidines had the highest difference in their yields between the two cell lines. The greater initial DNA base damage in M10 cells may play a role in their hypersensitivity to ionizing radiation.

Pub. in Health Physics, v68 n3 p350-358 1995.

Keywords: *Neptunium 237, *Radioassay, *Bioassay, *Urine, Urinalysis, Occupational exposure, Biological accumulation, Excretion, Radiochemical analysis, Qualitative chemical analysis, Alpha detection, Alpha particles, Coprecipatation, Anion exchanging, Reprints, Inductively coupled plasma mass spectroscopy.

An intercomparison study of low-level Np-237 determination in artificial urine samples has been carried out. The purpose of this study was to find the 'optimal' method presently available for use in a routine in-vitro radiobioassay program for occupationally exposed workers. The solutions were submitted to 10 alpha-particle and 10 inductively coupled plasma-mass spectrometry (ICP-MS) laboratories of which six and four laboratories, respectively, returned results. The best results obtained by ICP-MS were comparable with but not better than the most accurate results obtained by alpha-particle spectrometry. Alpha-particle spectrometry measurements overall gave consistently better agreement with known values.

Since the resumption of the NIST calibration service for 90Sr + 90Y beta-particle ophthaimic applicators, 65 sources have been calibrated using the revised technique (C. G. Soares, Med. Phys. 18, 787-793(1991)). For 59 of these sources, the manufacturer's calibration results were available for comparison to the NIST calibration results were available for comparison to the NIST calibration results. The 59 sources represent eight different manufactures, only one of which is still selling new sources. Manufacturer calibration dates range from the present back to 1954. The resuls of the comparisons are presented, broken down by both manufacturer and calibration date: there are interesting and significant trends in both, with average differences of 20% not uncommon. The obsolete unit, 'roentgen-equivalent-beta' (reb), in which some of the manufacturer calibrations are expressed, is discussed, and a factor (0.00982 Gy reb sub -1) for its conversion to absorbed dose is suggested.

Cancer therapy studies using proton accelerators are underway in several major medical centers in the U.S., Russia, Japan and elsewhere. To facilitate dosimetry intercomparisons between these laboratories, alanine-based detectors produced at the National Institue of Standards and Technology and commercially available radiochromic films were studied for their possible use as passive transfer dosimeters for clinical proton beams. Evaluation of characteristics of these instruments, including the LET dependence of their response of proton energy, was carried out at the Institute of Theoretical and Experimental Physics.

Pub. in Workshop Proceedings, Health Physics, v63 n1 p33-40 1992.

Keywords: *Health physics, Patients, Dose, Tissue sampling, Reprints, *Thorotrast.

Results of gamma-ray measurements of selected tissues from a patient who was injected with Thorotrast almost 36 y ago are reported. The purposes of this study were: (1) to determine the relative tissue distribution and activities of specific radionuclides in the Th decay chain, specifically Ra (as measured by Ac), Pb, and Ra (measured directly and as measured by Pb), and (2) to evaluate the level of radioactive disequilibrium among the daughter products. The spleen and liver had the highest concentrations of radioactivity. Bone also appears to be a long-term sink for Th daughter products based on estimates from a small portion of one rib. Larynx and esophagus contained measurable activity, which may have been due to their proximity to the 'Thorotrastoma.'

Pub. in Radiation Research, v138 p1-8 1994.

Keywords: *X rays, *Tooth enamel, *Cortical bone, *Dosimetry, Energy dependent, Gamma rays, Reprints.

Previous investigators have reported that the radiation-induced EPR signal intensity in compact or cortical bone increases up to a factor of two with decreasing photon energy for a given absorbed dose. If the EPR signal intensity was dependent on energy, it could limit the application of EPR spectrometry and the additive reirradiation method to obtain dose estimates. The authors have recently shown that errors in the assumptions governing conversion of measured exposure to absorbed dose can lead to similar 'apparent' energy-dependence results. They hypothesized that these previous results were due to errors in the estimated dose in bone, rather than the effects of energy dependence per se. To test this hypothesis the authors studied human adult cortical bone from male and female donors ranging in age from 23 to 95 years, and bovine tooth enamel, using 34 and 138 keV average energy X-ray beams and (137)Cs (662 keV) and (60)Co (1250 keV) gamma rays.

Exposure-to-Absorbed-Dose Conversion for Human Adult Cortical Bone.
Final rept.
D. A. Schauer, S. M. Seltzer, and J. M. Links. 1993, 5p.
Sponsored by Navy Health Sciences Education and Training Command, Bethesda, MD. and Department of Energy, Washington, DC. Office of Health and Environmental Research.
Pub. in Applied Radiation and Isotopes, v44 n3 p485-489 1993.

Keywords: *Bones, *Photons, Humans, Dose-absorbed, Exposure, Reprints, F-factors, Mass energy-absorption coefficients.

The conversion of measured exposure to absorbed dose at a point in bone, under conditions of electron equilibrium, involves a factor (the f-factor) which is proportional to the ratio of the spectrum-averaged photon energy-absorption coefficient for bone to that for air. The paper gives mass energy-absorption coefficients and f-factors for three compositions of human adult compact or cortical bone recommended in publications by the ICRU and ICRP, for photon energies from 1 keV to 1.5 MeV. Spectrum-averaged f-factor results reflect: (1) the rather large differences due to the differing calcium contents among the recommended compositions for bone; and (2) the generally poor predictions obtained when replacing a broad energy spectrum by an equivalent photon energy.

Keywords: *Dosimetry, Radiotherapy, Radiation dosage, Clinical medicine, Absorption, Gamma rays, Reprints, *Foreign technology, *Radiochromic films.

New transparent radiochromic films, GafChromic MD-55 and NMD-55, which turn from colorless to deep blue upon irradiation, have been designed particularly for measuring radiation therapy absorbed doses (1 Gy to 100 Gy). They are also useful for high resolution mapping of dose distributions, radiographic imaging, treatment planning dosimetry, beam penumbra measurements, and interface dosimetry with ionizing photons, electrons and protons. The gamma ray responses are linear with dose in terms of increase of optical absorbance at 670.633, and 600 nm and are independent of absorbed dose rate and relative humidity. The radiochromic images show a slight gradual post-irradiation increase in absorbance especially during the first 24 h. In addition, there is a small but predictable variation of sensitivity with temperature, both during iraddiation and during spectrophotometry. The films also have a slight sensitivity to ultraviolet radiation (250 to 350 nm) in direct sunlight. Experiments with X ray beams show no appreciable energy dependence relative to dose in water at photon energies greater than 100 keV, but they have a sensitivity that gives readings of about 60% of the dose in water for photons at 20 to 40 keV.

Pub. in British Jnl. of Radiology, v69 p636-649 Jul 96.

Keywords: *X ray, *Mammography, *Spectrography, Crystals, Voltage calibration, Analytical equations, Reprints.

The demand for improved spectral understanding of mammographic X-ray sources and non-invasive voltage calibration of such sources has led to research into applications using curved crystal spectroscopy. Recent developments and the promise of improved precision and control are described. Analytical equations are presented to indicate effects of errors and alignment problems in the flat and curved crystal systems. These are appropriate for all detection systems. Application to and testing of spectrographic detection (using standard X-ray film) is presented. Suitable arrangements exist which can be used to measure X-ray tube voltages well below 1 kV precision in the operating range of 20-35 kV.

Pub. in Cancer Letters, v106 p207-215 1996.

Keywords: *Radiation therapy, *DNA damage, *Lymphocytes, Patients, Cancer, Free radicals, Hydroxyl radical, Reprints, *Foreign technology.

The authors investigated DNA base damage in genomic DNA of lymphocytes of cancer patients undergoing radiation therapy. Lymphocyte chromatin samples were analyzed by gas chromatography/isotope-dilution mass spectrometry for DNA base damage. The results provided evidence for formation of typical hydroxyl radical-induced base modifications in genomic DNA of lymphocytes. Different levels of DNA products in individuals were observed and, in the case of some patients, there was no significant product formation, possibly resulting from differences between individuals and between the types of radiation exposures. Decreases in product levels after an initial increase by radiation exposure were observed. This may indicate the removal of modified bases from lymphocyte DNA by cellular repair.

Keywords: *DNA damage, *Mutagens, Cultured cells, Mass spectrometry, Escherichia coli, Dose-response relationships, Hybridomas, Free radical scavengers, Chromatin, Reprints, *Tert-butyl hydroperoxide.

Tert-Butyl hydroperoxide has been utilized to study the effect of oxidative stress on living cells; however, its effect on DNA bases in cells has not been characterized. In the present work, we have investigated DNA base damage in mammalian cells exposed to this organic hydroperoxide. SP2/0 derived murine hybridoma cells were treated with 4 concentrations of tert.-butyl hydroperoxide for varying periods of time. Chromatin was isolated from treated and control cells and subsequently analyzed by gas chromatography-mass spectrometry with selected-ion monitoring for DNA-base damage. Quantification of damaged DNA bases was achieved by isotope-dilution mass spectrometry. The amounts of 8 products were significantly higher than control levels in cells treated with tert.-butyl hydroperoxide at a concentration range of 0.01-0.1 mM. At concentrations from 1.0 to 10 mM, product formation was inhibited and the amounts of products were similar to those in control cells. The bimodal nature of the dose-response may be qualitatively analogous to previous reports of bimodal killing of E. coli bacteria by hydrogen peroxide. The nature of the identified DNA base lesions suggests the involvement of the hydroxyl radical in their formation. The inhibition of product formation at high concentrations of tert.-butyl hydroperoxide may be explained by the scavenging of tert.-butoxyl radical by tert.-butyl hydroperoxide resulting in inhibition of oxidative stress. The plausibility of the scavenging mechanism was evaluated with a mathematical simulation of the dose-response for DNA damage in solutions containing hydrogen peroxide.

Keywords: *DNA damage, *Copper, *Mutagens, *Benzoyl peroxide, In vitro analysis, Ions, Mass fragmentography, Free radical scavengers, Dimethyl sulfoxide, Reprints.

The mouse skin tumor promoter benzoyl peroxide (BzPO), in conjunction with Cu(I), causes promutagenic damage in DNA. Because free radical intermediates are produced by the reaction of BzPO with Cu(I), the authors sought to determine whether BzPO plus Cu(I) caused DNA base damage typical of that caused by the hydroxyl radical. A broad range of modified DNA bases were measured by GC-MS with selected-ion monitoring after exposure of purified plasmid pCMV beta gal DNA to BzPO + or - Cu(I). Exposure to BzPO/Cu(I) caused up to 20-fold increases in the levels of adenine-derived modified bases, up to 4-fold increases in guanine- and cytosine-derived modified bases, and only a <2-fold increase in thymine-derived modified bases. The guanine-derived modified base 8-hydroxyguanine was elevated to the highest net amount. Exposure to BzPO alone or Cu(I) alone induced only minor (< <2-fold) DNA base modification. Also, benzoic acid, the major non-radical metabolite of BzPO, or BzPO plus Fe(II) were ineffective at inducing DNA base modification. The hydroxyl radical scavenger dimethyl sulfoxide inhibited BzPO/Cu(I)-induced base modification by 10-50%. These data suggest that the reaction of BzPO with Cu(I) generates hydroxyl radical or a similarly reactive intermediate which causes DNA base damage. This damage may be responsible for BzPO/Cu(I)-mediated mutagenesis.

Nickel(II)-Mediated Oxidative DNA Base Damage in Renal and Hepatic Chromatin of Pregnant Rats and Their Fetuses. Possible Relevance to Carcinogenesis.
Final rept.
K. Kasprzak, B. Diwan, J. Rice, M. Dizdaroglu, M. Misra, and R. Olinski. 1992, 7p.
Pub. in Toxicology 5, n6 p809-815 Nov/Dec 92.

Keywords: *DNA damage, *Nickel, *Liver, *Kidney, *Teratogens, *Chromatin, Carcinogens, Fetus, Oxidation, Reprints.

DNA base damage was studied in renal and hepatic chromatin of nickel(II)-injected pregnant female F344/NCr rats and their fetuses under conditions leading to initiation of sodium barbital-promotable renal tumors, but not liver tumors, in the male offspring. Pregnant rats were given a total of 90 or 180 micromol of nickel(II) acetate/kg body wt in a single ip dose on day 17 or in 2 or 4 ip doses between days 12 and 18 of gestation. Control rats received 180 micromol of sodium acetate/kg body wt. The animals were killed 24 or 48 h after the last injection. Chromatin was isolated from livers and kidneys from both adults and fetuses and analyzed by gas chromatography/mass spectrometry with selected ion monitoring. Eleven products derived from the purine and pyrimidine bases in DNA bases were identified and quantified. Nickel(II) exposure increased the content of these products, especially those derived from purines, in both renal and hepatic chromatin of pregnant rats. The major difference between these two organs was the content of 8-OH-Gua, which increased greatly in the kidney but remained unchanged in the liver. In the corresponding fetal organs, the relative increases in 8-OH-Gua were comparable to the findings in adults. Fetal kidney DNA was relatively higher in pyrimidine-derived products (especially thymine glycol and 5-hydroxyhydantoin) and lower in purine-derived products (except for 8-OH-Gua) than fetal hepatic DNA. No consistent dose effect of nickel(II) on the amounts of the DNA base products recovered from either organ was observed in either the dams or their fetuses. The present results indicate possible involvement of oxidative DNA base damage in the mechanism of nickel(II) carcinogenesis in the rat kidney.

Oxidative DNA Base Damage in Renal, Hepatic, and Pulmonary Chromatin of Rats After Intraperitoneal Injection of Cobalt (II) Acetate.
Final rept.
K. Kasprzak, T. Zastawny, S. North, J. Rice, M. Dizdaroglu, C. Riggs, and B. Diwan. 1994, 7p.
Pub. in Chemical Research in Toxicology 7, n3 p329-335 May/Jun 94.

Keywords: *DNA damage, *Chromatin, *Liver, *Kidney, *Lung, *Mutagens, Rats, Mass fragmentography, Sex factors, Oxidation, Carcinogens, Reprints, *Cobalt acetate.

DNA base damage was studied in renal, hepatic, and pulmonary chromatin of male and female F344/NCr rats that had been given either 50 or 100 micromol of Co(II) acetate/kg body wt in a single ip dose and killed 2 or 10 days later. Control rats received 200 micromol of sodium acetate/kg body wt. Chromatin was isolated from organs and analyzed by gas chromatography/mass spectrometry with selected ion monitoring. Eleven products derived from purine and pyrimidine bases in DNA were quantified. The response was organ-specific. Eight of the DNA base products in renal chromatin of CO(II)-treated rats, five in hepatic chromatin, and two in pulmonary chromatin were increased by 30% to more than 200% over control levels with increasing CO(II) dose. The renal and hepatic, but not pulmonary, DNA base damage tended to increase with time. No significant differences in response were found between male and female rats. The bases determined were typical products of hydroxyl radical attack on DNA, suggesting a role for this radical in the mechanism(s) of DNA damage caused by Co(II) in vivo. Some of these bases have been shown previously to be promutagenic. The present results imply involvement of oxidative DNA damage in Co(II)-induced genotoxic and carcinogenic effects.

DNA Base Modifications in Renal Chromatin of Wistar Rats Treated with a Renal Carcinogen, Ferric Nitrilotriacetate.
Final rept.
S. Toyokuni, T. Mori, and M. Dizdaroglu. 1994, 6p.
Sponsored by Department of Energy, Washington, DC.
Pub. in International Jnl. of Cancer 57, p123-128 1994.

Keywords: *DNA damage, *Carcinogens, *Chromatin, *Kidney, Wistar rats, Mass fragmentography, Proximal kidney tubules, Necrosis, Mutagens, Carcinogenesis, Reprints, *Ferric nitrilotriacetate.

Ferric nitrilotriacetate (Fe-NTA) causes renal proximal tubular necrosis, a consequence of iron ion-mediated free-radical-associated damage, that finally leads to a high incidence of renal adenocarcinoma in male rats and mice. We have investigated the levels of typical hydroxyl radical-induced DNA base modifications in renal chromatin of male Wistar rats treated with a single or repeated administrations of Fe-NTA. Five pyrimidine-derived and 5 purine-derived modified DNA bases were identified and quantified by gas chromatography/mass spectrometry with selected-ion monitoring. The amounts of most of these compounds were significantly increased over control levels in renal chromatin of Fe-NTA-treated rats as measured 3 and 24 hrs after treatment. Elevated levels of modified bases were accompanied by proximal tubular necrosis. Presence of modified DNA bases concomitant with necrosis and regeneration of the renal proximal tubules may be a critical step in Fe-NTA-induced carcinogenesis.

Treatment of Wistar Rats with a Renal Carcinogen, Ferric Nitriiotriacetate, Causes DNA-Protein Cross-Linking between Thymine and Tyrosine in Their Renal Chromatin.
Final rept.
S. Toyokuni, T. Mori, H. Hiai, and M. Dizdaroglu. 1995, 5p.
Pub. in International Jnl. of Cancer, v62 p309-313, 14 Sep 95.

Keywords: *DNA damage, *Carcinogens, *Chromatin, *Kidney, Reprints, Wistar rats, Carcinogenesis, Necrosis, Proximal kidney tubules, *Ferric nitrilotriacetate.

Ferric nitrilotriacetate (Fe-NTA) induces renal proximal tubular damage associated with lipid peroxidation and oxidative DNA base modifications that finally leads to a high incidence of renal adenocarcinoma in rodents. In the present study, we report on the in vivo formation of DNA-protection cross-links (DPCs) involving thymine and tyrosine in the renal chromatin of Wistar rats treated with single or repeated i.p. administration of Fe-NTA. Analyses of chromatin samples by gas chromatography/mass spectrometry revealed a significant increase in the amount of 3-((1,3-dihydro- 2,4-dioxopyrimidin- 5-yl)-methyl)-L-tyrosine (Thy-Tyr cross-link) 23 and 48 hr after the administration of Fe-NTA. At19th day of FE-NTA treatment, the amount of Thy-Tyr cross-link decreasedto the control level, indicating the presence of cellular repair activity. Thy-Tyr cross-link may play a role in the genetic alteration of this renal carcinogenesis model, since mitoses for reregeneration of renal proximal tubules were closely associated with the increase in DPCs.

Further Development of the N-Gas Mathematical Model: An Approach for Predicting the Toxic Potency of Complex Combustion Mixtures.
Final rept.
B. C. Levin, E. Braun, M. Navarro, and M. Paabo. 1995, 19p.
Pub. in Fire and Polymers II, Chapter 20, p293-311 Oct 95.

Keywords: *Combustion, Mathematical models, Carbon dioxide, Carbon monoxide, Complex mixtures, Hydrogen chloride, Hydrogen cyanide, Toxicity, Reprints, *N-gas model.

A methodology has been developed for predicting smoke toxicity based on the toxicological interactions of complex fire gas mixtures. This methodology consists of burning materials using a bench-scale method that simulates realistic fire conditions, measuring the concentrations of the following primary fire gases - CO,

CO2, O2, HCN, HCl, Hbr, and NO2 - and predicting the toxicity of the smoke using an empirical mathematical model called the N-Gas Model. The model currently in use is based on toxicological studies of the first six of the above listed primary gases both as individual gases and complex mixtures. The predicted toxic potency (based on this N-Gas Model) is checked with a small number of animal (Fischer 344 male rats) tests to assure than an unanticipated toxic gas was not generated. The results indicate whether the smoke from a material or product is extremely toxic (based on mass consumed at the predicted toxic level) or unusually toxic (based on mass consumed at the predicted toxic level) or unusually toxic (based on the gases deemed responsible). The predictions based on bench-scale laboratory tests have been verified with full-scale room burns of a limited number of materials of widely differing characteristics chosen to challenge the system.

Formation of DNA-Protein Cross-Links in Cultured Mammalian Cells Upon Treatment with Iron Ions.
Final rept.
S. A. Altman, T. H. Zastawny, L. Randers-Eichhorn, M. Dizdaroglu, G. Rao, M. A. Cacciuttolo, and S. A. Akman. 1995, 6p.
Pub. in Free Radical Biology and Medicine, v19 n6 p897-902 1995.

Keywords: *DNA-binding proteins, *Crosslinking, *Chromatin, *Iron, Toxicity, Reprints, Hydroxyl radical, Oxidative stress, Free radicals, Thymine-tyrosine crosslinks.

Formation of DNA-protein crosslinks (DPCs) in mammalian cells upon treatment with iron or copper ions was investigated. Cultured murine hybridoma cells were tested with Fe(II) or Cu(II) ions by addition to the culture medium at various concentrations. Subsequently, chromatin samples were isolated from treated and control cells. Analyses of chromatin samples by gas chromatography/mass spectrometry after hydrolysis and derivatization revealed a significant increase over the background amount of 3-((1,3-dihydro- 2,4-dioxopyrimidin- 5-yl)-methyl)-L-tyrosine (Thy-Tyr crosslink) in cells treated with Fe(II) ions in the concentration range of 0.01 to 1 mM. In contrast Cu(II) ions at the same concentrations did not produce this DPC in cells. No DNA base damage was observed in cells treated with Cu(II) ions, either. Preincubation of cells with ascorbic acid or coincubation with dimethyl sulfoxide did not significantly alleviate the Fe(II) ion-mediated formation of DPCs. In addition, a modified fluorometric analysis of DNA unwinding assay was used to detectDPCs formed in cells. Fe(II) ions caused significant formation of DPCs, but CU(II) ions did not. The nature of the Fe(II)-mediated DPCs suggeststhe involvement of the hydroxyl radical in their formation. The Thy-Tyr crosslink may contribute to pathological processes associated with free radical reactions.

Protonation Dynamics of the alpha-Toxin Ion Channel from Spectral Analysis of pH-Dependent Current Fluctuations.
Final rept.
J. J. Kasianowicz, and S. M. Bezrukov. 1995, 12p.
Pub. in Biophysical Jnl., v69 p94-105 Jul 95.

Keywords: *Conductance fluctuations, *Amino acids, *Noise analysis, Reprints, *Deuterium isotope effects, Ionization dynamics, Protein ion channels.

To probe protonation dynamics inside the fully open alpha-toxin ion channel, the authors measured the pH-dependent fluctuations in its current. In the presence of 1 M NaCl dissolved in H2O and positive applied potentials (from the side of protein addition), the low frequency noise exhibited a single well defined peak between pH 4.5 and 7.5. A simple model in which the current is assumed to change by equal amounts upon the reversible protonation of each of N identical ionizable residues inside the channel describes the data well. These results, and the frequency dependence of the spectral density at higher frequencies, allow the authors to evaluate the effective pK = 5.5, as well as the rate constants for the reversible protonation reactions: kon = 8 x 10 to the 9th power M to the minus 1 power S to the minus 1 power and Koff = 2.5 x 10 to the 4th power S to the minus 1 power. The estimate of kon is only slightly less than the diffusion-limited values measured by others for protonation reactions for free carboxyl or imidazole residues. Substitution of H2O by D2O caused a 3.8-fold decrease in the dissociation rate constant and shifted the pK to 6.0. The decrease in the ionization rate constants caused by H2O/D3O substitution permitted the reliable measurement of the characteristic relaxation time over a wide range of D+ concentrations and voltages. The dependence of the relaxation time on D+ concentration strongly supports the first order reaction model.

The purpose of this study is to assess the potential of the DOD Goal Security Architecture (DGSA) as a model and framework for the development of non-military computer information security architectures. To achieve this goal, this study presents an overview of the DGSA and provides a cursory comparison of some of the features of the DGSA with several prominent, proposed non-military security architectures including: the International Standards Organization (ISO); SESAME; the Internet Security Architecture (ISA); and Open Systems Foundation (OSF) Distributed Computing Environment (DCE). The study concludes the DGSA has the potential for being applicable in both the civilian and commercial sectors. However, there are some attending restrictions that may prevent its acceptance. These restrictions are detailed in the Summary Observations.

The National Institute of Standards and Technology (NIST) has had an historic and fruitful relationship with the Department of Defense, its predecessors, and the three military services, particularly the Navy. In this paper, we will outline some of the historic support, current collaborations, and what areas of technology may require our support for the Navy of the future.

CALS-Automated Interchange of Technical Information.
Irregular repts.
1994, open series.
Supersedes PB93-962000.
Paper copy available on Standing Order, deposit account required (minimum deposit $100 U.S., Canada, and Mexico; all others $200). Single copies also available in paper copy or microfiche.

Keywords: *Standards, *Specifications, Digital data, Manuals, Computer graphics, Computer aided design, Computer aided manufacturing, File management systems, Automation, Information processing, *CALS(Computer-aided Acquisition and Logistics Support).

The publication is the parent document for a family of military specifications through which the Computer-aided Acquisition and Logistics Support (CALS) standards will be published. It provides the 'enveloping' rules for organizing files of digital data into a complete document--for example, a technical manual composed of MIL-M 28001 text, MIL-D-28003 Vector Graphics, and MIL-R-28001 Raster Graphics.

CALS-Raster Graphics Representation Binary Format Requirements.
Irregular repts.
1994, open series.
Supersedes PB93-962300.
Paper copy available on Standing Order, deposit account required (minimum deposit $100 U.S., Canada, and Mexico; all other $200). Single copies also available in paper copy or microfiche.

Keywords: *Computer aided design, *Computer graphics, File management systems, Documents, Facsimile communication, Image processing, Standards, Computer aided manufacturing, *CALS(Computer-aided Acquisition and Logistics Support), Department of Defense.

The publication defines Department of Defense (DoD) technical requirements for raster (bit-map) graphics that have been compressed to reduce file size and transmission time. Computer-aided Acquisition and Logistics Support (CALS) must apply raster graphics to both office documents and facsimiles (for which the international standard that MIL-R-28002 implements was prepared), and for engineering drawings and other oversize documents. An option is included to use tiling, in which the raster image is divided into a series of tiles that can be individually processed to reduce throughout and terminal storage requirements.

Present Worth Factors for Life-Cycle Cost Studies in the Department of Defense (1995).
Final rept.
S. R. Petersen. Oct 94, 63p, NISTIR-4942-2.
See also PB94-109238. Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC.

Keywords: *Life cycle costs, *Present worth, *Energy supplies, *Military facilities, Benefit cost analysis, Economic analysis, Energy conservation, Buildings, Construction, Return on investment, Cost engineering, Fuels, Regional analysis, Department of Defense, Tables(Data), Military Construction Program.

This document provides 47 tables of present worth factors to be used in computing the present worth of future costs (or cost reductions) in economic analyses of design decisions for projects in the Department of Defense (DoD) Military Construction Program. These factors are especially useful for the life-cycle cost analysis of investments in buildings or building systems which are intended to reduce future operating, maintenance, repair, replacement, and energy costs over the life of the facility. The tables include present worth factors for both one-time costs and annually recurring costs, based on the Federal Energy Management Program (FEMP) discount rate of 3.0% (FY 1995) for energy-related studies and on the Office of Management and Budget (OMB) discount rate of 2.5% and 2.8% for short-term and long-term non-energy studies, respectively. Forecasts of future energy prices used in the calculation of present worth factors for energy costs were provided by the Energy Information Administration.

TEM/Reverberating Chamber Electromagnetic Radiation Test Facility at Rome Laboratory.
M. L. Crawford, B. F. Riddle, and D. G. Camell. Jan 96, 75p, NISTIR-5002.

Keywords: *Reverberation chambers, *Electromagnetic testing, Electromagnetic susceptibility, Vulnerability, Test facilities, Performance evaluation, Radio frequencies, Electromagnetic pulses, Rome Air Development Center, Griffis Air Force Base, Weapons systems, Magnetic permeability, Electric equipment.

This report summarizes the measurement and evaluation of a TEM/reverberating chamber. This chamber was developed as a single, integrated facility for testing radiated electromagnetic compatibility/vulnerability (EMC/V) of large systems over the frequency range of 10 kHz to 18 GHz or higher. The facility consists of a large shielded enclosure configured as a transverse electromagnetic (TEM) transmission line-driven reverberating chamber. TEM mode test fields are generated at frequencies below multimode cutoff, and mode-stirred test fields are generated at frequencies above multimode cutoff. The report discusses the basis for such a development including the theoretical concepts, the advantages and limitations, the experiments approach for evaluating the operational parameters, and the procedures for using the chamber to perform EMC/V measurements. Both the chamber's cw and pulsed rf characteristics are measured and analyzed.

Metrication.
Final rept.
G. P. Carver. 1993, 6p.
Pub. in Point of Beginning magazine, p74-78, 81, Oct/Nov 93. See also PB93-188969.

Keywords: *Surveying(Geographic), *Mapping, *Metrication, Government policies, Metric system, Standardization, Conversion, USA, Reprints.

The metric system is one key to success in the global marketplace, where non-metric products are becoming increasingly unacceptable. Procurement is the primary federal tool for encouraging and helping U.S. industry to convert voluntarily to the metric system. Common sense, based upon the knowledge, experience, and needs of an industry, should be the determinant in choosing a practical conversion approach. In the United States, besides the perceived unwillingness of the customer, and certain legal definitions in some states, there are no major impediments to conversion of surveying and mapping to metric units. Instead, there are good reasons for changing, including an opportunity to rethink many industry standards and to take advantage of size standardization. Also, when surveying and mapping services adopt the metric system, they will come into conformance with federal agencies engaged in similar activities.

Standards: A Cardinal Direction for Geographic Information Systems.
Final rept.
H. Tom. 1988, 11p.
Pub. in Proceedings of Annual Conference of the Regional Information Systems Association (26th), Los Angeles, CA., August 7-11, 1988, v2 p142-152.

Keywords: *Geographic information systems, *Computer applications, *Standards, Computer aided mapping, Automatic mapping, Digital data, Systems integration, Interoperability, Reprints, Digital spatial applications.

Geographic Information Systems reflect the changing role of computer technology within earth science disciplines. Successful use of computer technology includes the ability to interchange or interface computer data, software, and hardware. This ability, in large part, is predicated on standards. Intensifying the need for standards is the changing use of computer technology to provide information. Standardization of fundamental parameters and the implementation, integration, and support of standards facilitate system integration and interoperability. A clear understanding of standards is decisive in determining the impact of geographic information systems. The focus is primarily on the applicability, strategy, and commitment regarding standards pertaining to geographic information systems.

Keywords: *Geographic information systems, *Computer aided mapping, *Standards, Automatic mapping, Digital data, Computer applications, Systems integration, Interoperability, Information technology, Reprints, Digital spatial data.

Spatial data standards are associated with defining, describing, and processing spatial data. Information technology (IT) standards are generic computer standards. IT standards specifically implemented or generically configured for GIS usage can also be considered GIS standards. The adaptation of IT standards provides GIS with an existing set of common computer standards for enabling integration within a GIS. These standards also facilitate interoperability between different GIS or between a GIS and its overall corporate computer environment.

Integrated Laser Doppler Method for Measuring Planetary Gravity Fields.
Final rept.
P. L. Bender. 1992, 10p.
Pub. in Proceedings of International Association of Geodesy Symposium on Gravity Field Determination from Space and Airborne Measurements, Vienna, Austria, August 20, 1991, p63-72 1992.

Keywords: *Gravitational fields, *Earth gravitation, *Lunar gravitation, *Planetary gravitation, Polar orbits, Satellite tracking, High resolution, Geodynamics, Reprints, Laser doppler techniques.

Four main approaches have been applied to, or studied extensively for use in, high-resolution determination of the global gravity fields of the Earth, other planets, or the Moon. These approaches are the following: laser or microwave tracking of spacecraft orbiting the Earth; microwave tracking from the Earth of spacecraft orbiting other planets or the Moon; satellite-to-satellite microwave tracking; and gravity gradiometry from an orbiting spacecraft. The paper will discuss another possibility which has been studied much less extensively. It is the use of integrated laser Doppler measurements between two spacecraft in essentially the same nearly polar orbit. In this case, the shot noise in the measurement system can be extremely low, even for 5 cm diameter transmit and receive apertures and 1 milliwatt of laser power. For the highest accuracy, it is assumed that a Disturbance Reduction System would be used to strongly reduce the disturbing forces on a freely floating and carefully shielded test mass inside each spacecraft. As one example, the authors take 50 km spacecraft separation and a spurious acceleration level of 5 x 10(sup -10) m/s(sup 2)/Hz(sup 0.5) from 0.005 to 0.1 Hz. The achievable accuracy with laser Doppler measurements is then expected to be 10(sup -5) Eotvos/Hz(sup 0.5) in this frequency range for the difference of the line-of-sight test mass accelerations divided by the spacecraft separation.

Crystal Structure and Compressibility of 3:2 Mullite.
Final rept.
D. Balzar, and H. Ledbetter. 1993, 5p.
Pub. in American Mineralogist 78, p1192-1196 1993.

Keywords: *Mullite, *Crystal structure, *Compressibility, X ray diffraction, Ionic crystals, Crystal models, Bulk modulus, Ultrasonic radiation, Aluminum oxide, Silicon dioxide, Reprints.

The crystal structure of 3:2 mullite (3Al2O3 (center dot) 2SiO2) has been refined by Rietveld refinement of X-ray powder diffraction data. The average structure is described successfully by previously published models for 2:1 mullite. Bond lengths of tetrahedral cations are slightly shorter, because of the smaller ionic radii of Si(4+) relative to Al(3+). Using ultrasonic methods, we determined the bulk modulus (reciprocal compressibility). The result, 174 GPa, is slightly lower than that of a prediction based on a rigid-ion ionic crystal model: 190 GPa.

Keywords: *Lunar rangefinding, *Geodynamics, Apollo 11 flight, Laser range finders, Equivalence principle, Lunar rotation, Gravitation, Moon, Uses, Reprints.

On 21 July 1969, during the first manned lunar mission, Apollo 11, the first retroreflector array was placed on the moon, enabling highly accurate measurements of the Earthmoon separation by means of laser ranging. Lunar laser ranging (LLR) turns the Earthmoon system into a laboratory for a broad range of investigations, including astronomy, lunar science, gravitational physics, geodesy, and geodynamics. Contributions from LLR include the three-orders-of-magnitude improvement in accuracy in the lunar ephemeris, a several-orders-of-magnitude improvement in the measurement of the variations in the moon's rotation, and the verification of the principle of equivalence for massive bodies with unprecedented accuracy. Lunar laser ranging analysis has provided measurements of the Earth's precession, the moon's tidal acceleration, and lunar rotational dissipation. These scientific results, current technological developments, and prospects for the future are discussed.

Calibration of a Superconducting Gravimeter Using Absolute Gravity Measurements.
Final rept.
J. Hinderer, N. Florsch, J. Makinen, H. Legros, and J. E. Faller. 1991, 7p.
Pub. in Geophys. Jnl. Int. 106, p491-497 1991.

Keywords: *Gravimeters, *Calibration, Superconducting devices, Sensitivity analysis, Uncer-

tainty, Precision, Tests, Reprints, *Superconducting gravimeters, Absolute gravity.

A 24 hr continuous parallel registration between an absolute free-fall gravimeter and a relative cryogenic gravimeter is analyzed. Different adjustment procedures (L(1), L(2) norms) are applied to the sets of absolute and relative readings in order to estimate the value of the calibration factor of the superconducting meter, as well as its uncertainty. In addition, a sensitivity test is performed to investigate the influence of some parameters (like the laser frequency and its short-term drift) upon this factor. The precision in the calibration factor is found to be better than 1 per cent, but systematic effects related to the short time interval may add another one and half per cent uncertainty. From preliminary results, it appears that this calibration experiment leads to a close agreement between the values of the gravimetric factor for the reference tidal wave O(1) observed with the superconducting meter and the theoretical value (Dehant-Wahr body tide + ocean loading).

Continuous Gravity Observations Using Joint Institute for Laboratory Astrophysics Absolute Gravimeters.
Final rept.
T. M. Niebauer, and J. E. Faller. 1992, 9p.
Pub. in Jnl. of Geophysical Research 97, nB9 p12,427-12,435, 10 Aug 92.

Keywords: *Gravimeters, *Gravity, Calibration, Correction, Reprints, Absolute gravity.

We discuss two different 1-month gravity records taken with two different Joint Institute for Laboratory Astrophysics (JILA) gravimeters. These records were corrected for the effects of Earth tides, ocean loading, local and global barometric effects, and polar motion. These data allowed precise determinations of the local air pressure admittance. We also obtained a value for the second-order gravimetric factor which agreed with the theoretical value to about 0.3% where the predominant uncertainty is the ocean load modeling. We note that absolute gravimeters have a sensitivity to time varying gravity that is comparable to that obtained with superconducting relative gravimeters. The sensitivity of these data emphasizes the need for better modeling of ocean loads, air pressure effects, and even man-made environmental noise.

Measurement and Interpretation of Tidal Tilts in a Small Array.
Final rept.
M. L. Kohl, and J. Levine. 1995, 13p.
Pub. in Jnl. of Geophysical Research, v100 nB3 p3929-3941, 10 Mar 95.

Keywords: *Tiltmeters, *Strain measurement, Reprints, Geodynamics, Boreholes, Sensitivity, *Earth tides, Tilt tides.

Strain-induced tilts caused by variations in materials properties can produce large perturbations in the tilt field near a material discontinuity. This is evidenced in data from a closely spaced array of borehole tiltmeters that has been operating at Pinon Flat Geophysical Observatory in southern California since 1987. The array is composed of three borehole tiltmeters located at depths of 24, 36, and 120 m. The tiltmeters have a sensitivity of a few nanoradians. Tidal measurements show differences between the boreholes of up to 50%. The largest percent difference occurs in the semidiurnal band where the tilt field measured in the 36-m borehole differs by approximately 10 nrad at the M2 frequency. This difference has been modeled as a strain-induced tilt caused by the weathering layer.

Measurement of Very Low Frequency Vibrations.
Final rept.
J. Levine. 1994, 10p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Vibration Monitoring and Control, San Diego, CA., July 28-29, 1994, v2264 p160-169.

Keywords: *Low frequency vibrations, *Tiltmeters, *Strain measurement, Reprints, Boreholes, Geodynamics, Sensitivity, Laser strainmeter.

We have developed a number of instruments that are capable of measuring vibrations at very low frequencies (below 1 Hz). Two of these instruments are a laser strainmeter, which can respond to strains with frequencies ranging from 0 to about 100 Hz and a borehole tiltmeter which can respond to deflections of the vertical or horizontal accelerations in the frequency range from 0 to about 1 Hz. We have also modified commercial gravity meters (vertical accelerometers) and have used them to make measurements at comparable frequencies. Most of our work has been motivated by geophysical considerations including the dynamics of the earth in seismically active regions, but the instrumentation might also be useful in vibration monitoring for other purposes.

Temperature and Frequency Dependence of Anelasticity in a Nickel Oscillator.
Final rept.
R. F. Berg. 1995, 6p.
Pub. in Review of Scientific Instruments, v66 n9 p4665-4670 Sep 95.

Keywords: *Creep, *Rock mechanics, Flexural properties, Oscillators, Transfer function, Reprints, *Anelasticity.

The frequency dependance of the real and imaginary parts of a nickel oscillator's transfer function is described over 3 decades in frequency by the use of simple expressions. These expressions incorporate only the resonance frequency w0, the quality factor Q, and a characteristic exponent Beta determined by a single measurement of creep. They are based on the ansatz phi (w) = Q(-1)(w/w0)-Beta, where psi is the imaginary part of the spring constant. Over a 100 K range of temperature T, the exponent Beta=0.18 was constant even though Q(T) changed by a factor of 8. These expressions are potentially useful for accurately describing a mechanical oscillator whose transfer function must be modeled at frequencies far below w0. Examples include accelerometers based on a flexure element and suspensions for interferometric gravitational wave detectors.

Possibly the best set of data for earthquake excitation of soils exists for the test site operated by the Electric Power Research Institute (EPRI) and the Taiwan Power Company at Lotung Taiwan. At this site, two locations are instrumented with three-component accelerometers at depths of 47, 17, 11, 6 meters, and at the surface. One array is in the free-field while the other is adjacent to a one-quarter scale nuclear containment vessel. The site is also well instrumented with piezometers at various depths and locations. The report summarizes the data and signal processing that was done to the EPRI Lotung data at the Colorado School of Mines. The over 2000 files were organized into MATLAB experiments by event. The provided acceleration data were carefully double integrated to yield velocity and displacement time history records.

Pub. in AMP Jnl. of Technology, v4 p95-102 Jun 95.

Keywords: *Electrification, *Electrical insulation, *Adhesion, *Static electricity, Reprints, Silicon dioxide, Mica, Charge transport, Electric discharges.

When two different materials contact and separate, an electrical charge transfer from one surface to the other can take place because of the different electronic structures of the two materials. In the paper, it is shown that the same can occur between two surfaces of the same material, if one of the two surfaces carries a monolayer of a chemi-sorbed species. A surface force apparatus is used for studying contact electrification and resulting adhesion between two surfaces. It is shown that the interaction between a silica surface presenting an amine, i.e., basic, termination to a silanol terminated, i.e., acidic surface, is vastly greater than between two ordinary silica surfaces. The increased adhesion demonstrates the connection between acid-base interactions and contact electrification.

Keywords: *Natural gas wells, *Diffusion flames, *Oil wells, *Radiative heat transfer, Atomizers, Soot, Heat flux, Burners, Sprayers, Mathematical models, Jet flow, *Well fires, *Well flares, Effervescent atomization.

A theoretical and experimental study of jet flames with applications to large fires resulting from oil well and gas well accidents is reported. The results have been used in the interpretation of the single point radiation heat flux data collected around well fires in Kuwait. Based on the high liquid loading involved in actual well fires, a new device called effervescent atomizer/burner was successfully designed, constructed and tested during the grant period. Measurements of flame heights, radiative heat loss fractions, emission temperatures, and path integrated transmittances were completed for nine crude oil and methane/air flames in the 10-20 KW range. The significant accomplishments during the grant include: (1) Development of a technique to find total radiative heat loss from turbulent jet flames based on measurements of heat flux at a single location; (2) Design and successful operation of an effervescent atomizer/burner. The burner also allows laboratory measurements of such flames for the first time; and (3) Study of global properties of the high liquid loading jet flames have shown that their lengths are affected by two-phase flow effects and that their soot loading and radiant output is lower than equivalent pool flames.

Integration of Servo Control into a Large-Scale Control System Design: An Example from Coal Mining.
J. A. Horst. Jun 94, 10p, NISTIR-5446.

Keywords: *Continuous miners, *Systems integration, *Servocontrol, *Motion simulators, *Robotics, *Coal mining, Control systems design, Systems engineering, Cutting machines, Controllers, Mining engineering, Computerized simulation, Autonomous navigation, Mathematical models, *Real-time Control Systems, Coal interface detection, Proportional-plus-Integral-plus Derivative controllers.

Closed loop control of cutting drum height of a continuous mining machine (CM) using a coal interface detection (CID) sensor is described. The control is accomplished using a discrete-time Proportional-plus-Integral-plus-Derivative (PID) controller. The mining machine, sensor, and mine environment are simulated. The dynamic model of the cutting drum arm (boom) and motors is described and a discrete time version of the solution to the plant equation of boom angle and angular velocity is derived. Cutting drum height control is placed in the context of an existing large-scale Real-time Control System (RCS) for CM control, simulation, and animation. RCS is a paradigm for defining, describing, and designing intelligent control systems developed at the Robot Systems Division of the National Institute of Standards and Technology (NIST).

Environment Simulation for a Continuous Mining Machine.
J. A. Horst. Jun 94, 11p, NISTIR-5449.

Keywords: *Continuous miners, *Mining equipment, *Coal mining, *Motion simulators, *Robotics, Computerized simulation, Mining engineering, Systems engineering, Cutting machines, Mathematical models, Controllers, Autonomous navigation, Collisions.

A simulator is described for the motion of a continuous mining machine (CM) in a coal mine. Of special interest is the motion of the CM following collision with an immovable obstacle in the mine. This type of constrained motion effected our choice of presentation of the CM and its environment. The CM is represented as a two dimensional polygonal hull and the mine obstacles are given two separate representations, certainty grids and obstacle boundary curves, each of which efficiently perform specific tasks. The object boundary curve representation is most useful for determining motion following a collision and the certainty grid is most useful for determining whether and where a collision has occurred.

Keywords: *Autonomous navigation, *Computer vision, *Real time operation, *Telerobotics, Remotely piloted

vehicles, Architecture(Computers), Robotics, Control systems design, Hierarchies, Teleoperators, Pattern recognition, Video compression, Reprints, *Unmanned vehicles.

This paper focuses on two related topics: a control system architecture that unifies autonomous and teleoperated control of unmanned vehicles, and examples of how real-time vision processing fits into this architecture. The National Institute of Standards and Technology (NIST) hierarchical real-time control system architecture and its application to unmanned vehicles is presented. The paper then discusses recent work at NIST in real-time vision for both teleoperated and autonomous vehicles. For teleoperated vehicles, we describe a system for video compression for low data rate remote vehicle driving. For autonomous vehicles, we describe passive range extraction from optical flow for applications such as target extraction and identification, vehicle driving, and terrain mapping. We also describe how each of these vision systems fits into the control system architecture.

Irradiation Damage in Inorganic Insulation Materials for ITER Magnets: A Review.
N. J. Simon. Sep 94, 424p, NISTIR-5025.
See also PB93-206928. Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Keywords: *Thermonuclear reactor materials, *Iter tokamak, *Superconducting magnets, *Electrical insulation, *Radiation damage, *Literature surveys, Aluminum oxide, Aluminum nitrides, Magnesium oxides, Silicon dioxide, Zirconium oxides, Porcelain, Mica, Spinel, Quartz, Toroidal configuration, Neutron irradiation, Crystal defects, Amorphous materials, Ceramics, Magnesium aluminates, Amorphization.

A literature search on the irradiation resistance of inorganic insulators for the ITER toroidal field superconducting magnets is reported. The materials included Al2O3, AlN, MgO, porcelain, SiO2, MgAl2O4, ZrO2, and mica. No in situ measurements of the 4-K compressive, shear, and electrical breakdown strengths after 4-K neutron irradiation were retrieved. Limited optical and thermal property measurements made on these insulators after cryogenic irradiations indicate that recovery occurs in ceramic oxides at ambient temperatures. Host atom amorphization has been demonstrated in Al2O3 at 77 K, but was not successful at 300 K. Apparently, host ion amorphization does not occur in most ceramic oxides at 300 K. Amorphization has evidently not been attempted in AlN, MgO, or MgAl2O4 at 77 K. Silicate-bonded structures, such as mica, porcelain, and silica, do amorphize at ambient temperature and are, at present, considered unacceptable unless proven otherwise by in situ electrical and mechanical property testing after 4-K irradiation. Zirconia, even if stabilized, will probably transform under neutron irradiation and is, therefore, considered unsuitable. Mica layers delaminated under low energy electron bombardment. Natural mica layers are porous, owing to spontaneous and induced tracks from U impurities. Tracks caused a decrease in electrical breakdown strength. Simulation of neutron irradiation by other radiation species is also reviewed in this report.

Cryogenic Properties of Inorganic Insulation Materials for ITER Magnets: A Review.
N. J. Simon. Dec 94, 218p, NISTIR-5030.
Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Keywords: *ITER tokamak, *Superconducting magnets, *Electrical insulation, Literature surveys, Electrical properties, Mechanical properties, Thermal properties, Aluminum nitrides, Aluminum oxides, Magnesium oxides, Silicon dioxide, Zirconium oxides, Porcelain, Cryogenics, Spinel, Mica, Reviews, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Graphs(Charts), Magnesium aluminates.

Results of a literature search are reported on the cryogenic properties of candidate inorganic insulators for the toroidal field magnets of the International Thermonuclear Experimental Reactor. The materials investigated include: Al2O3, AlN, MgO, porcelain, SiO2, MgAl2O4, ZrO2, and mica. A graphical presentation is given of mechanical, elastic, electrical, and thermal properties between 4 and 300 K. A companion report reviewed the low temperature irradiation resistance of these materials.

System for Intercomparing Standard Solutions of Beta-Particle Emitting Radionuclides.
Final rept.
J. M. Calhoun, J. T. Cessna, and B. M. Coursey. 1992, 7p.
Pub. in Nuclear Instruments and Methods in Physics Research, Section A (ICRM Symposium Issue), Chapter A312, p114-120 1992.

Keywords: *Radioisotopes, *Beta particles, *Aqueous solutions, Technetium 99, Tritium, Carbon 14, Hexadecane, Liquid scintillation, Quantum efficiency, Comparisons, Radiochemistry, Reference standards, Reprints, *Standard reference materials.

A system for intercomparing standard solutions of pure beta-particle emitting radionuclides is described. The CIEMAT/NIS technique of beta-particle efficiency tracing is based on establishing a parameter in a simple calculational model, using a (H-3) standard with comparable quenching. Measurements were made under similar geometrical and quenching conditions for each radionuclide with a commercial scintillator and conventional liquid-scintillation counter with two phototubes operating in coincidence. The technique was then tested at different sites in the area using a set of flame-sealed vials and state-of-the-art liquid-scintillation counters.

Pub. in Applied Radiation and Isotopes, Chapter 12, v43 n12 p175-189 1992.

Keywords: *Radon 222, *Interlaboratory comparisons, *Air sampling, Radiation monitoring, Photon emission scanning, Ionization chambers, Calibration standards, Standardization, Quality control, Reprints.

A new secondary measuring system for Rn22-in-air that can be used as a very efficacious transfer calibration standard for measurement intercomparisons be-

tween laboratories has been developed and extensively tested. The system is based on measurements of the photon emission rate of radon samples contained in spherical 35-mL glass ampoules with a NaI(Tl) well counter. The system is calibrated against the NIST pulse-ionization-chamber (PIC) national radon measuring system, and has an overall uncertainty of approximately 2 percent. An international intercomparison of 11 laboratories, including NIST, using this system was performed.

Keywords: *Scintillation counting, *Nuclear medicine, *Radionuclides, Radiopharmaceuticals, Standards, Therapy, Reprints, *Foreign technology.

Radionuclides are increasingly used in therapeutic nuclear medicine. The CIEMAT/NIST method of standardizing high-energy beta-particle emitters is being applied to a list of candidate radionuclides developed by the US nuclear medicine community. Standards and standard methods are needed by the pharmaceutical manufacturers in North America before these nuclides can be widely distributed. Solutions standardized-by liquid-scintillation counting are used to establish counting efficiencies for Cerenkov counting and NaI(Tl) well crystals, and potentiometer settings for commercial radionuclide calibrators. Results are presented for a number of beta-particle-emitting radionuclides.

Improving measurement quality assurance for photon irradiations at Department of Energy facilities. Final technical report.
PROGRESS REPT.
1996, 24p, DOE/EH/89321-T1.
Contract AI01-93EH89321
Sponsored by Department of Energy, Washington, DC.

Keywords: *Calibration Standards, *Dosemeters, Personnel Dosimetry, Photon Beams, Progress Report, Quality Assurance, Radiation Protection, US DOE, X Radiation, EDB/440102.

For radiation-instrument calibration to be generally acceptable throughout the US, direct or indirect traceability to a primary standard is required. In most instances, one of the primary standards established at NIST is employed for this purpose. The Department of Energy Laboratory Accreditation Program (DOELAP) is an example of a program employing dosimetry based on the NIST primary photon-, beta particle- and neutron-dosimetry standards. The NIST primary dosimetry standards for bremsstrahlung were first established in the 1950s. They have been updated since then on several occasions. In the 1970s, Technical Committee 85 of the International Standards Organization (ISO) started its work on establishing sets of internationally acceptable, well-characterized photon beams for the calibration of radiation-protection instruments. It is the intent of this paper to make a detailed comparison between the current NIST and the most up-to-date ISO techniques. At present, 41 bremsstrahlung techniques are specified in ISO 4037 while NIST supports a total of 32 techniques. Given the existing equivalences, it makes sense to try to extend the NIST techniques to cover more of the ISO Narrow Spectrum and High Air-Kerma Rate Series. These extensions will also allow the possibility for use of ISO beam techniques in future revisions of the DOELAP standard, which has been suggested by DOE. To this end, NIST was funded by DOE to procure material and make adaptations to the existing NIST x-ray calibration ranges to allow NIST to have the capability of producing all the ISO bremsstrahlung techniques. The following sections describe the steps that were taken to achieve this.

Beginning in 1987 the U.S. Council for Energy Awareness (USCEA) in cooperation with the National Institute of Standards and Technology (NIST) established a measurement assurance program for the nuclear power industry. It was designed to serve the needs of the utility companies, source suppliers, and service laboratories which were not addressed by other programs in existence at that time. The program distributes various samples prepared at NIST to all participants, with the NIST value undisclosed until the measurement result from the participant is reported. In another part of the program, source suppliers also submit samples of their standards to NIST for verification and traceability. The mechanics of the program are described, and the results from the first three years of the program are summarized.

Pub. in Radiation Protection Dosimetry 47, n1/4 p693-696 1993.

Keywords: *Electron dosimetry, *Proton dosimetry, *Film dosimetry, MeV range 1-10, Electron irradiation, Proton irradiation, Fabrication, Sensitivity, Reprints, *Radiochromic dyes, *Radiochromic dosimeters.

The systematic study and identification of the mechanisms responsible for changes occurring in radiochromic dye films (RDFs) as a result of exposure to ionizing radiation, requires the possibility of varying a number of parameters during their fabrication. A series of RDFs were developed with thicknesses in the range of 15 to 60 micrometers. The amount of dye precursor and stabilizers was varied in a systematic way. A series of unexposed films was irradiated with 1 MeV electrons and 10 MeV protons. Optical characterization of the films was performed. Irradiations were carried out in the dose range from 0 to 440 kGy. The fabrication techniques, the irradiation procedures, and the optical characterization of the films are described. Conclusions are presented regarding the useful dose range for the RDFs, their sensitivity to different types of radiation, and a comparison is made with other similar film dosemeters used in the materials processing industry.

Dose Mapping of Radioactive Hot Particles Using Radiochromic Film.
Final rept.
C. G. Soares, B. M. Coursey, F. F. McWilliams, and M. J. Scannell. 1990, 2p.
Pub. in Radioact. Radiochem. 1, n2 p14, 16-17 1990.

Keywords: *Dosimetry, *Radioactivity, *Cobalt 60, Dosage, Films, Radioactive isotopes, Beta particles, Radiation protection, Reprints, Hot particles, Radiochromic films, Dose profile, Scanning densitometer.

An attempt to standardize hot particle beta dosimetry is addressed through the generation and characterization of (60)CO micro-spheres. An electrical arc, rapid solidification process of a cobalt alloy was used to produce uniform spherical particles of various diameters ranging from 50 to 250 microm. Neutron activation of these particles yielded essentially pure (60)CO in the microcurie range. The particles were characterized by physical size and activity; dose rates were determined using extrapolation chamber and radiochromic dye film measurements.

Anionic Triphenylmethane Dye Solutions for Low-Dose Food Irradiation Dosimetry.
Final rept.
N. B. El-Assy, Y. D. Chen, M. L. Walker, M. Al-Sheikhly, and W. L. McLaughlin. 1995, 9p.
Pub. in Radiation Physics and Chemistry, v45 n4-6 p1189-1197 Oct 95.

Keywords: *Dosimetry, *Food irradiation, Reprints, Gamma radiation, Radiation processing, *Foreign technology, *Dye bleaching, Fast Green FCF, Light Green SF, Radiolytic bleaching.

The radiolytic bleaching of aryl sulfonic-substituted para-diethyl-amino triphenylmethane dye solutions can be used for dosimetry in the absorbed dose range 10 to 400 Gy. The sulfonic anions provide solubility of these acid dyes in water. Two of these dyes are supplied as stable greenish-blue biological stains when dissolved in weakly-acidic aqueous solution. Light Green SF Yellowish and East Green FCF. They have, respectively, linear molar absorption coefficents of 7.14 x 10 to the 3rd power (at pH 5.4) and 10.0 x 10 to the 3rd power (at pH 4.2) sq. m. mol to the minus one power, when measured at the peaks of the primary absorption bands, 630 nm and 622 nm, respectively. The bleaching due to irradiation with gamma rays shows a linear function with a positive slope between the negative algorithm of the absorbance and the absorbed dose. The effect of pH on the response is studied, as well as the effects of light and temperature on pre- and post-irradiation stability. A mechanism, based mainly on radiolytic oxidation of the protonated phenolic or sulfonated phenyl group by OH, with the abstraction of H-atom to water, is postulated for neutral to slightly acidic aerated aqueous solutions.

Keywords: *Radiochromic dosimeters, *Dosimetry, Reprints, Dyes, Formazan, Gamma rays, *Foreign technology, *Triphenyl tetrazolium chloride.

The radiolytic reduction of colorless tetrazolium salts in aqueous solution to the highly colored formazan dye is well-known acid-forming radiation chemical reaction. Radiochromic thin films and three-dimensional hydrocolloid gels have been used for imaging and mapping absorbed dose distributions. The high solubility of

2.3.5-triphenyl-tetrazolium chloride (TTC) in alcohols provides a useful liquid dosimeter (45 mM TTC in aerated ethanol) and shows a linear response of absorbance increase (lambda(sub max) = 480 nm) with dose over the range 1-16 kGy. The linear molar absorption coefficient lambda for the formazan at the absorption peak is 1.5 x 10 to the third power sq. m. mol to the minus one power, and the radiation chemical yield for the above solution is G (formazan) = 0.014 micromoles J to the minus 1 power. The irradiation temperature coefficient is about 0.8 percent per degree Celsius rise in temperature over the temperature range 0-30 degrees C but is much larger between 30 degrees and 60 degrees C.

Keywords: *Dosemeters, *Radiation monitors, *Calibration, *Quality assurance, Gamma dosimetry, Electron dosimetry, Calorimetric dosemeters, Radiation doses, Dose rates, Dose-response relationships, Thin films, Solids state devices, Reprints, Radiation processing.

Dosimetry serves important functions in radiation processing, where large absorbed doses and dose rates from photon and electron sources have to be measured with reasonable accuracy. Proven dosimetry systems are widely used to perform radiation measurements in development of new processes, validation, qualification, and verification (quality control) of established processes and archival documentation of day-to-day and plant-to-plant processing uniformity. Proper calibration and traceability of routine dosimetry systems to standards are crucial to the success of many large-volume radiation processes. Recent innovations and advances in performance of systems that enhance radiation measurement assurance and process diagnostics include dose-mapping media (new radiochomic film and solutions), optical waveguide systems for food irradiation, solid-state devices for real-time and passive dosimetry over wide dose-rate and dose ranges, and improved analytical instruments and data acquisitions.

W. L. McLaughlin, J. M. Puhl, and A. Miller. 1995, 7p.
Pub. in International Conference on Radiation Processing (9th), Istanbul, Turkey, September 11-16, 1994, Radiation Physics and Chemistry, v46 n4-6 p1227-1233 Oct 95.

Keywords: *Colorimetric dosemeters, *Environmental effects, *Temperature effects, *Relative humidity, Gamma dosimetry, Electron dosimetry, Radiation monitors, Electron beams, Radiation doses, Gamma radiation, Thin films, Reprints, Radiation processing.

Nylon-base radiochromic films are commercially-available, thin dosimeters that are widely used in radiation processing. Based on some earlier studies, their response functions have been reported to be dependent on the temperature and relative humidity during irradiation. The present study investigates differences in response over practical ranges of temperature, relative humidity, dose, and for different recent batches of films of both types. It is observed that for each new batch of film to be used for radiation processing, the effects of such parameters on response to both gamma rays and electrons should be investigated.

Keywords: *Dosimeters, *Elcetron paramagnetic resonance, *Alanine, *Polymers, Thin films, Orientation, Pressing(Forming), Extrusion, Shape, Reprints, ESR(Electron spin resonance), Film dosimeter, Rod dosimeter.

Orientation effects during electron spin resonance (ESR) measurement are studied on alanine-polymer dosimeters prepared by different molding procedures (press-molding or extrusion), and also according to different shapes (rods with different lengths and thin-films). The variation in ESR signal amplitude was measured by rotating a dosimeter around the vertical mid-axis and at a right angle to the magnetic field in the ESR cavity, at a temperature of 22 deg C. Orientation effects for rod dosimeters with both molding procedures (press and extrusion), and with different lengths, were negligible. Orientation effects on the film dosimeters can be eliminated, however, when they are positioned vertically and parallel to the mid-axis of the ESR cavity.

Keywords: *Cracking(Fracturing), *Concrete structures, *Predictions, *Low-level radioactive wastes, Creep properties, Shrinkage, Construction materials, Radioactive waste disposal, Permeability, Tensile properties, Reinforced concrete.

The useful life of a buried concrete, containment structure for low level nuclear waste may be controlled by the loss of its load-bearing capacity or an increase in permeability. The latter factor is controlled by the general degradation of the concrete and by the presence of discrete cracks resulting from externally applied loads or from restraint to normal volume changes. To be able to predict the effects of cracks on permeability, it is necessary to understand the causes and mechanisms of discrete crack formation in reinforced concrete structures. The objective of this report is to provide an overview of the design and behavior of reinforced concrete members and to discuss the factors affecting the formation of cracks in hardened concrete.

4SIGHT Manual: A Computer Program for Modelling Degradation of Underground Low Level Waste Concrete Vaults.
K. A. Snyder, and J. R. Clifton. Jun 95, 80p, NISTIR-5612.
Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.

Keywords: *Low-level radioactive wastes, *Radioactive waste disposal, *Underground disposal, *Concretes, *Performance evaluation, Service life, Leaching, Precipitation(Chemistry), Dissolution, Sulfates, Ion transport, Computer models, One-dimensional models, 4SIGHT computer program.

A computer program has been written to facilitate performance assessment of concrete vaults used in Low Level Waste (LLW) disposal facilities. The computer program is a numerical computer model of degradation in concrete. A one-dimensional finite different equation is used to propagate ions by precipitation/dissolution of available salts. The precipitation/dissolution of salts, in turn, changes the transport properties, which changes the rate of ion transport. The result is a model which incorporates the synergism of multiple degradation mechanisms.

The United States Nuclear Regulatory Commission (NRC), in cooperation with the National Institute of Standards and Technology conducted the Digital Systems Reliability and Nuclear Safety Workshop on September 13-14, 1993, in Rockville, Maryland. The workshop provided a forum for the exchange of information among experts within the nuclear industry, experts from other industries, regulators and academia. The information presented at this workshop provided in-depth exposure of the NRC staff and the nuclear industry to digital systems design safety issues and also provided feedback to the NRC from outside experts regarding identified safety issues, proposed regulatory positions, and intended research associated with the use of digital systems in nuclear power plants. Technical presentations provided insights on areas where current software engineering practices may be inadequate for safety-critical systems, on potential solutions for development issues, and on methods for reducing risk in safety-critical systems. The report contains an analysis of results of the workshop, the papers presented, panel presentations, and summaries of discussions at this workshop.

Liquid-Hydrogen Cold Neutron Source for the NBSR.
Final rept.
R. E. Williams, J. M. Rowe, and P. Kopetka. 1992, 3p.
Pub. in Transactions of the American Nuclear Society 66, p169-171 1992.

Keywords: *NBSR reactor, *Neutron sources, *Liquid hydrogen, *Cold neutrons, Research reactors, Neutron scattering, Thermosyphons, Moderators, Safety, Reprints.

The NBSR is a 20-MW research reactor operated by the National Institute of Standard and Technology. It was designed with a 55 cm diameter beam port for the purpose of installing a D20-ice cold neutron source, completed in 1987. A liquid hydrogen cold neutron source is being developed to replace the D20 ice in order to increase the cold-neutron yield. A simple, passively-safe system has been designed, with multiple barriers preventing air from mixing with hydrogen. A thermosiphon will be used to maintain the liquid hydrogen inventory in the moderator chamber. The hydrogen condenser is cooled by a 3.5-kW helium refrigerator. A ballast tank is connected to the condenser so the entire hydrogen inventory can expand freely into the tank, providing completely passive protection against refrigerator failures.

Nuclear Heat Load Calculations for the NBSR Cold Neutron Source Using MCNP.
M. Blau, J. M. Rowe, and R. E. Williams. 1993, 2p.
Pub. in Transactions of the American Nuclear Society 69, p404-405 1993.

Keywords: *NBSR reactor, *Neutron sources, *Liquid hydrogen, *Moderators, Spherical configuration, Annular shape, Reactor cores, Heavy water, Monte Carlo method, Cold neutrons, Heating load, Computation, Reprints.

The existing D2O-ice cold neutron source in the 20-MW NBSR will be replaced in 1994 with a liquid-hydrogen (LH2) source to increase the yield of cold neutrons (lambda greater than 0.4 nm). Two series of Monte Carlo calculations using MCNP were performed to determine the optimum cold moderator geometry, and to verify its performance. Only the region near the cryostat was modeled for the first series of calculations, leading to the choice of a spherical annulus for the LH2 source. A complete MCNP model of the core was subsequently developed.

MCNP Model of the National Bureau of Standards Reactor (NBSR) Core.
Final rept.
R. E. Williams. 1995, 2p.
Pub. in Transactions of the American Nuclear Society, San Francisco, CA., October 29-November 2, 1995, v73 n0003-18x p397-398 1995.

Keywords: *NBSR reactor, *Reactors, *Cold neutrons, Monte Carolo method, Reactor cores, Reprints, *Criticality calculations, MCNP model, National Institute of Standards and Technology(NIST).

The National Bureau of Standards reactor (NBSR) is a 20-MW research reactor operated for the U.S. Department of Commerce at the National Institute of Standards and Technology in Gaithersburg, Maryland.

Earlier this year, a liquid hydrogen cold neutron source was installed in the NBSR to increase the yield of long wavelength (lambda equal to or greater than 0.4 nm) neutrons. As part of the design effort for the new cold source, Monte Carlo simulations of the core and the cryogenic beam port were performed using the MCNP code. The model has been steadily improved and, where possible, compared with measurements.

Assessing Functional Diversity by Program Slicing.
Final rept.
K. B. Gallagher, J. R. Lyle, D. Wallace, and L. Ippolito. 1993, 1p.
Pub. in Transactions of the Water Reactor Safety Information Meeting (21st), Bethesda, MD., October 25-27, 1993, p9-1.

Keywords: *Nuclear power plants, *Electronic security, *Software engineering, Safety programs, Validation, Debugging(Computers), Computer program verification, Software reliability, Computer program integrity, Computer programming, Mathematical calculations, Reprints, *Program slicing, Functional diversity.

One of the most commonly invoked safeguards against design basis events in nuclear power plants is the use of functional diversity. When auditors for the United States Nuclear Regulatory Commission (NRC) examine safety systems for nuclear power plants, they also inspect the software embedded within the safety systems to ensure functional diversity. For computer software, this means that there is no common code shared among diverse computations. The steps the auditor must take include identifying the types of system hazards that could occur, using techniques, like fault tree analysis, to locate software that should be examined further, and then inspecting the code for diversity. This paper describes an approach using a concept called program slicing to support auditors.

Pub. in Transactions of the American Nuclear Society, v72 n0003-018X p312-313 1995.

Keywords: *Heat exchangers, *Nuclear reactors, *Refueling system, Reprints, NBSR, Cold Neutron Research Facility(CNRF).

The National Bureau of Standards (now the National Institute of Standards and Technology (NIST)) reactor (NBSR), a 20-MW research reactor operated by NIST, has become the leading U.S. laboratory in research using nuclear methods. About 1000 scientists from 200 industries, government and foreign laboratories, and universities conducted experiments at the NBSR last year. Since 1990, when the first instruments in the Cold Neutron Research Facility (CNRF) became available, the number of research participants has doubled. A major program of modernization and facility upgrade was initiated to meet this growing demand and to ensure safe and reliable reactor operations for 30 additional yr.

New NIST Rapid Pneumatic Tube System.
Final rept.
D. A. Becker, R. M. Lindstrom, J. K. Langland, and R. R. Greenberg. 1996, 7p.
Pub. in Jnl. of Trace and Microprobe Techniques, v14 n1 p1-7 1996.

Keywords: *Neutron activation analysis, Neutron irradiation, Reprints, Epithermal irradiation, Nuclear reactors, *Foreign technology, *Pneumatic tube terminal, Rapid activation analysis.

The Nuclear Methods Group of NIST is developing a new rapid pneumatic tube irradiation system to be inserted into our 20 MW nuclear reactor. The terminal will be inserted into an existing horizontal pneumatic tube location, the only one of five pneumatic tubes which has not been operational since the reactor upgrade from 10 to 20 MW ten years ago. This new terminal will contain two irradiation locations, one at the tip in a void area between several fuel elements for epithermal fluence optimization, the second in a D2O tank midway in the terminal to optimize the thermal fluence. Estimated neutron fluence rates (in n-cm-2s-1) are 9E13 thermal/3E13 epithermal for the tip irradiation location inside the D2O tank.

Magnetic Structure Determination for Annealed Ni80Fe20/Ag Multilayers Using Polarized-Neutron Reflectivity.
Final rept.
J. A. Borchers, P. M. Gehring, C. F. Majkrzak, K. R. Coffey, M. A. Parker, J. K. Howard, J. F. Ankner, and T. L. Hylton. 1995, 6p.
Pub. in Materials Research Symposium Proceedings, Boston, MA., November 1994, v386 p577-582 1995.

Keywords: *Magnetoresistance, *Neutron reflectivity, Reprints, *Antiferromagnetic coupling, Metallic multilayers.

Sputtered Ni80Fe20/Ag multilayers, annealed post-growth, show giant magnetoresistive (GMR) effects at unusually low magnetic fields (approx. 5 Oe). Structural characterization by cross-sectional TEM and x-ray diffraction indicates that the Ag preferentially diffuses into the Ni80Fe20 layers at the interfaces. Using polarized-neutron specular reflectivity, the authors have obtained magnetization depth profiles for a series of annealed (Ni80Fe20(20A)/Ag(40A))4 multilayers. Though GMR in related materials is associated with coherent antiferromagnetic alignment of the ferromagnetic layers, specular neutron data for the Ni80Fe20/Ag multilayers show no trace of half-order spin-flip intensity characteristic of this simple structure. In small applied fields, transverse scans at the half-order position show a broad feature which disappears upon saturation. These data suggest that while the Ni80Fe20 moments are antiferromagnetically correlated along the growth axis, the in-plane magnetic domains are only of micron-order size and are thus not apparent in a specular measurement.

Energy Distributions of Neutrons Scattered from Solid C60 by the Beryllium Detector Method.
Final rept.
J. R. D. Copley, D. A. Neumann, and W. A. Kamitakahara. 1995, 9p.
Pub. in Canadian Jnl. of Physics, v73 p763-771 1995.

Keywords: *Fullereness, *Spectroscopy, Reprints, *Foreign technology, Internal mode dynamics, Neutron scattering, Vibrational spectrometer, C60.

The authors measured the energy distribution scattered from polycrystalline C60, using a high-resolution filter-analyzer spectrometer. In the energy range 30-90 meV (242-726 cm to the minus one power) the authors observed a rich spectrum that the authors fitted to a sum of 15 Gaussian functions, each of which is assigned to one or a set of several degenerate normal vibrational modes of the C60 molecule. The authors also observed two broad features in the energy range from 90-130 meV (726-1049 cm to the minus one power). The authors' results are generally in excellent agreement with published spectroscopic data. Detailed comparisons with the results of several first-principles calculations suggest that present-day theories can predict the internal vibrational frequencies of C60 rather well, at least in the 30-90 meV range of energies.

Keywords: *Nuclear power plants, *Barriers, *Fire protection, *Performance testing, Fire tests, Flammability, Ratings, Scenarios, Threats, Reactor safety, Fire safe-

ty, Exposure, Fire resistance, Test methods, Temperature-time curves, ASTM E 119 Standard.

The aim of the current study is to propose a methodology for developing and implementing NPP-specific descriptions of fire environments and associated ASTM-type furnace test methods. Here the terminology ASTM E 119-type test is used to refer to a test method that basically follows the ASTM E 119 test procedures, but where the ASTM E 119 standard temperature-time curve is replaced with a relevant, NPP-specific, alternative curve. The approach taken in the current study consists of three steps or tasks: (1) review the history of the ASTM E 119 temperature-time curve to assess its current applicability and limitations in simulating real fires; (2) review the history of efforts to develop alternative curves and the methodologies used; and (3) use the findings from (1) and (2), knowledge of NPP construction, fuel types and loads, and state-of-the-art fire science to propose a methodology for developing and implementing NPP-specific descriptions of fire environments and associated ASTM-type temperature-time curves and test methods.

Pub. in Jnl. of Applied Crystallography, v28 p604-610 1995.

Keywords: *Furnances, *Research and development, *Ceramics, Neutron scattering, Experimental data, Nuclear reactors, Sintering, Glasses, Silicon dioxide, Reprints, *Small angle neutron scattering, SANS, SANS furnace, MSANS.

The design and operation of a new research furnace, optimized for small-angle neutron scattering experiments at a steady-state nuclear reactor with a cold source, are presented. The apparatus enables the study of thermal processing of materials, such as the sintering behavior in ceramics, through the measurement of their microstructural parameters (e.g. pore sizes, pore volumes and pore surface areas) during thermal treatment. Small-angle neutron scattering measurements can be performed in situ in an oxidizing, reducing or neutral environment at temperatures up to 2000 K.

Characterization of the Hydrogen Induced Cold Cracking Susceptibility at Simulated Weld Zones in HSLA-100 Steel.
M. R. Stoudt, and R. E. Ricker. 1994, 71p, NISTIR-5408.
See also AD-A224 341. Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Alloys, *Carbon steels, *Crack resistance, *Welding, *Naval vessels, Fracture(Mechanics), Fabrication, Impact strength, Hydrogen embrittlement, Cold forming, Mechanical properties, Structural steel, Strength(General), Corrosion, Sea water, Performance evaluation, Comparison, Strain rate, Tests, Electrochemistry.

The relative susceptibilities to hydrogen induced cold cracking were evaluated for HY-100, a steel presently in service in naval applications and for HSLA-100. The martensitic microstructure of the HY-100 undergoes wide variations in the heat affected zone during welding which strongly influence the resistance of that alloy to cold cracking. The HSLA-100, a low carbon, precipitation hardened steel with similar strength and toughness to that of the HY-100, possesses a significantly lower degree of hardenability which results in minimal microstructural variations in the heat affected zone under the same simulated welding conditions. The mechanical properties of the base metal and the heat affected zone created during a simulated, single welding pass were characterized by the slow strain rate technique for both steels in an inert environment and in artificial seawater under free corrosion and controlled hydrogen fugacities. The electrochemical behaviors of both steels were also evaluated in artificial seawater.

Intelligent Control for Multiple Autonomous Undersea Vehicles.
Final rept.
M. Herman, J. S. Albus, and T. H. Hong. 1990, 48p.
Pub. in Neural Networks for Control, Chapter 18, p427-474 1990.

Keywords: *Autonomous navigation, *Underwater vehicles, *Artificial intelligence, Neural nets, Architecture(Computers), Control systems design, Remotely piloted vehicles, Real time operation, Hierarchies, Robotics, Models, Reprints, *Multiple Autonomous Undersea Vehicles project, *MAUV project.

Intelligent control for autonomous vehicles in a natural, potentially hostile environment requires a system that integrates artificial intelligence with modern control theory, and that is implemented on parallel, possibly special-purpose hardware. Issues dealing with the requirements of such a system are discussed in the context of the Multiple Autonomous Undersea Vehicles (MAUV) project. The MAUV control system and its implementation are also presented. The goal of the MAUV project was to have multiple undersea vehicles exhibiting intelligent, autonomous, cooperative behavior. The MAUV control system is hierarchically structured and incorporates sensing, world modeling, planning and execution. The levels in the hierarchy include: mission, group, vehicle task, elemental action, primitive action, and servo. Issues of real-time planning and dynamic replanning in unstructured environments are discussed. A multi-level world model that supports real-time planning is also described. Finally, timing issues, implementation, and initial experimental results are presented.

Stranding Experiments on Double Hull Tanker Structures.
Final rept.
J. L. Rodd, M. P. Phillips, and E. D. Anderson. 1994, 17p.
Pub. in Advanced (Unidirectional) Double-Hull Technical Symposium, Gaithersburg, MD., October 25-26, 1994, p1-17.

Keywords: *Oil tankers, *Double hulls, Ship structural components, Tanker ships, Ship hulls, Losses, Structural failures, Design analysis, Failure analysis, Crashworthiness, Ship accidents, Reprints, *Strandings, *Groundings.

Three different hull designs were evaluated in the 30,000-40,000 lon range: a baseline conventional double hull bottom with transverse and longitudinal framing, an advanced double hull (ADH) with unidirectional longitudinal web, and a variant of the AH design incorporating curved plates. A large fabricated 'rock' was used to indent each structure vertically, causing first rupture of the outer shell, and then rupture of the inner shell. Inner shell rupture occurred at model loads of up to 750,000 lbs, and the rock intrusion into the ship was nearly twice the double hull spacing. The results

are proving to be vital in validating numerical modeling tools needed to develop reliable design and analysis methods. In addition, efforts are already underway to develop an ADH crash worthiness system that can minimize or eliminate rupture of the inner shell during the high energy dissipation that occurs during a grounding.

Transitions to Chaos Induced by Additive and Multiplicative Noise.
Final rept.
E. Simiu, and M. Frey. 1994, 4p.
Pub. in Proceedings of the Toyota Conference (7th) 'Towards the Harnassing of Chaos', Amsterdam, p405-408 1994.

Keywords: *Noise, *Building technology, *Chaos, Reprints, Transitions, Stochastic processes, *Foreign technology.

For a class of multistable systems, deterministic and stochastic chaos are closely related mathematically; a necessary condition for the occurrence of noise-induced chaos with sensitive dependence on initial conditions can be derived from the generalized Melnikov function. Proof that this condition is applicable requires the approximate representation of the noise in the form of a modified Shinozuka process or other uniformly continuous and uniformly bounded processes. Additive and/or multiplicative Gaussian noise with any spectral density can be accommodated, as can other types of noises, including shot noise and non-Gaussian noise. We review recent results, including a successful verification of our Melnikov-based approach against results based on a solution of the Fokker-Planck equation. We conclude by briefly describing ongoing research.

Operator Experience with a Hierarchical Real-Time Control System (RCS).
H. M. Huang. Jun 96, 19p, NISTIR-5862.

Keywords: *Submarines, *Real time control, Automatic control, Computer architecture, Human computer interface, Artificial intelligence, Knowledge bases, Computer programming, Underwater vehicles, Autonomous navigation.

The issue of operator interface in the RCS hierarchical control systems is the focus of this report. In a submarine automation project, the authors have studied the logical structure of the operator interface function and the way it should be integrated to existing systems. A design issue is to allow operators to be involved in system operations at in different degrees. In some situations, the operators are requested to perform certain manual operations and report the status back to the control systems. In some other situations, the operators are required to make some decisions for the controllers. At different control levels, operators require different information. A system developer may require total different types of information.

Keywords: *Air-water interfaces, *Metalloids, *Metals, *Marine chemistry, *Environmental monitoring, *Environmental impact assessments, Trace elements, Geochemistry, Biotechnology, State of the art, Natural emissions, Pollutants, Metal containing organic compounds, Reprints.

Valid monitoring and assessment of metals and metalloids active in our planetary environment is now established with analytical methodology employing ultratrace (microgram/L) molecular speciation of illustrative organometallic substances. During the past 20 years, such measurements have placed into realistic context the vital interplay betwen abiotic geochemical sources and man's technological effluents, in terms of the frequent rate-deterring and extensive biogeorganometallic chemistry dictating heavy element transport and speciation, especially at bioactive surface microlayers featuring heightened bioprocessing of both depositional and emissive fluxes of metals and metalloids. The report places its overview of this current state of art with air-sea measurement capability for monitoring such biogenic organometal(loid)s, within the context of independently established predictive mimetic aqueous chemistry of metals and metalloids, with implications for marine biotechnology.

F. J. Lovas, and R. D. Suenram. 4 Apr 95, 45p, ARO-29596.2-CH.
Contract ARO-MIPR-126-94

Keywords: *Thermal properties, *Propellants, *Decomposition, *Nitramines, Spectroscopy, Vapors, Test methods, Microwaves, Chemical composition, Amines, Organic compounds, Rdx, Reactants(Chemistry), Pyrolysis, Nitro radicals, Microwave spectroscopy, Pathways.

We have investigated intermediates and products in the thermal decomposition of RDX vapor, using a variety of experimental microwave techniques previously employed in our laboratory in studies of pyrolysis decomposition of organic amines. We used microwave spectroscopy to determine the chemical composition of the decomposition of nitramines by pyrolysis methods and identify the products in the thermal decomposition processes. The objective was to determine the validity of proposed decomposition mechanisms, and to identify new reaction products or pathways. jg p.1.

Texture Study of Two Molybdenum Shaped Charge Liners by Neutron Diffraction.
Final rept.
C. S. Choi, H. J. Prask, J. Orosz, and E. L. Baker. 1993, 7p.
Pub. in Jnl. of Materials Science 28, p3557-3563 1993.

Keywords: *Shaped charges, *Cavity liners, *Molybdenum, Neutron diffraction, Conical bodies, Texture, Reprints.

The textures of two different conical shaped liners, fabricated by the same forging processes from arc-cast and powder-sintered ingots, were investigated by using neutron-diffraction measurements and three-dimensional orientation-distribution-function (ODF) analysis. The major textures of both liners could be described by the (111)<uvw> and (100)<uvw> type. The two liners had essentially identical texture at the 8 cm position (measured from the base of the cone) with strong sheet-type texture components, i.e. (111)<(-1)01>, (111)<(-1)10> and (100)<011>. However, the dominant textures at the 3 cm positions were <111> and <100> fiber textures with the fiber axes oriented parallel to the normal direction in both liners. A strong cube texture was observed at the 3 cm position of the arc-cast liner but it was not observed for the powder-sintered liner. The arch-cast liner had a generally higher degree of texture than the powder-sintered liner.

The effects of pressure on the chemical reactivity, phase behavior and thermal decomposition of energetic materials can be studied by a combination of measurement techniques in conjunction with a high pressure diamond anvil cell and the ruby fluorescence method of pressure measurement. These techniques include: (1) optical polarizing microscopy and (2) Fourier transform infrared (FTIR) spectroscopy. Recent results on the study of 1,4-dinitrocubane and cubane will be presented.

Microstructure Study of Molybdenum Liners by Neutron Diffraction.
Final rept.
C. S. Choi, E. L. Baker, and J. Orosz. 1994, 8p.
Pub. in Nondestructive Characterization of Materials VI, p637-644 1994.

Keywords: *Shaped charges, *Cavity liners, Neutron diffraction, Microstructure, Molybdenum, Reprints, Orientation distribution functions, Plastic strain ratio, R values.

The crystallites orientation distributions of three different conical molybdenum shaped-charge liners, labeled C00, C20 and C40, fabricated with different thermo-mechanical treatment processes, were investigated by using neutron diffraction measurements and three-dimensional ODF (orientation distribution function) analysis. Two specimens were obtained from each liner, one from 25 mm below the apex and the other from 25 mm above the liner base. Results are discussed.

Study to Determine the Most Important Parameters for Evaluating the Resistance of Soft Body Armor to Penetration by Edged Weapons.
N. J. Calvano. Jul 93, 47p, NISTIR-4895.
See also PB87-105524. Sponsored by National Inst. of Justice, Washington, DC.

Keywords: *Body armor, *Puncture resistance, Blades, Knives, Police, Law enforcement officers, Protective clothing, Impact tests, Lightweight armor, Polyaramid fabrics.

The paper describes tests that were conducted to determine the most important parameters for measuring the resistance of soft body armor to penetration by edged weapons. Samples consisting of multiple layers of polyaramid fabric were tested against the following variables: blade, geometry, backing material, conditioning, impact angle, and velocity. Stab and slice tests were conducted. Some commercial armors were also tested. The commercial armors were constructed of ultra-high molecular weight polyethylene, polyaramid fabric, and combinations of ultra-high molecular weight polyethylene, polyaramid fabric, and titanium. Results

indicate that penetration is a strong function of blade geometry. Backing material, conditioning, and impact angle appeared to have only a minimal affect upon the results.

Keywords: *Communication equipment, *Ground based control, *Inertial navigation, *Real time operation, *Teleoperators, Military operations, Radio communication, Communication networks, Highways, Measuring instruments, Steering, *Military vehicles, *Autonomous navigation.

NIST is applying their Real-time Control System (RCS) methodology for control of ground vehicles for both the U.S. Army Research Lab, as part of the DOD's Unmanned Ground Vehicles program, and for the Department of Transportation's Intelligent Vehicle/Highway Systems (IVHS) program. The actuated vehicle, a military HMMWV, has motors for steering, brake, throttle, etc. and sensors for the dashboard gauges. For military operations, the vehicle has two modes of operation: a teleoperation mode--where an operator remotely controls the vehicle over an RF communications network; and a semi-autonomous mode called retro-traverse--where the control system uses an inertial navigation system to steer the vehicle along a prerecorded path. For the IVHS work, intelligent vision processing elements replace the human teleoperator to achieve autonomous, visually guided road following.

Control System Architecture for a Remotely Operated Unmanned Land Vehicle.
Final rept.
S. Szabo, H. A. Scott, K. Murphy, and S. A. Legowik. 1990, 8p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers International Symposium on Intelligent Control (5th), Philadelphia, PA., September 5-7, 1990, p876-883.

Keywords: *Control systems, *Systems architecture, Military vehicles, Remote control, Teleoperators, Real time operation, Unmanned, Ground vehicles, Robot dynamics, Systems engineering, Reprints, *Mobile robots.

The U.S. Army Laboratory Command, as part of its Robotics Initiative, is developing a testbed for cooperative, real-time control of unmanned land vehicles. The National Institute of Standards and Technology is supporting this program by developing the vehicle control system using an architecture based on the Real-time Control System (RCS). RCS is a hierarchical, sensory-based control system, initially developed for the control of industrial robots and automated manufacturing systems. In this application, RCS controls all vehicle mobility functions, coordinates the operations of the other subsystems on the vehicle, and communicates between the vehicle and the remote operator control station. The paper reviews the overall control system architecture and the design of the mobility and communication functions.

Keywords: *Electromagnetic interference, *Torpedoes, Electromagnetic pulses, Convolution integrals, Continuous radiation, Resonant frequency, Transfer functions, Laplace transformation, Linear systems, Approximation, Magnitude, Phase, Graphs(Charts), Impulse response.

A newly developed theory for predicting the response of a linear system to an electromagnetic pulse, based only on the measured continuous-wave magnitude, is applied to the problem of possible electromagnetic interferences at a sensitive part of a torpedo. The measured magnitude representing the system's transfer function is deduced first from the measured response at this sensitive point to a known cw source, supplied by the Naval Surface Warfare Center. We derive an analytic expression for the magnitude square of the transfer function to approximate the measured data and obtain a system transfer function in terms of the complex frequency, from which we predict the system's cw phase characteristics and its multiple solutions due to a given impulse source.

Bacteriorhodopsin (bR) thin films have been fabricated with varying amounts of the detergent Triton X-100 to measure the effects of this additive on the holographic performance of these thin films. Holographic spectroscopy is used to measure the effect of these detergents on the overall diffraction efficiency as well as on the phase and amplitude components of the overall signal. The diffracted rise and decay kinetics of these materials will also be presented as a function of varying detergent concentration. This research also studied the effect of this additive on the absorptive properties of bR-based thin films. Comparison of the two complimentary sets of data are drawn.

Planar Near-Field Measurements and Microwave Holography for Measuring Aperture Distribution on a 60 GHz Active Array Antenna.
Final rept.
J. Guerrieri, N. Canales, K. MacReynolds, and D. Tamura. 1995, 6p.
Pub. in Annual Meeting and Symposium (17th), Antenna Measurement Techniques 1995 Association, Williamsburg, VA., November 13-17, 1995, p295-300.

Keywords: *Amperture amplitude distribution, Reprints, *Planar near-field method, Aperture phase distribution, Black transform, Phase-shifter settings.

This paper discusses results of a recent attempt to measure aperture distribution of a small active steerable array antenna at 60 GHz using planar near-field measurements and the back transform. Using a procedure which exercises every phase shifter without steering the antenna beam, it is possible to isolate problems with individual bits in the phase shifters. From calculation of the aperture fields for each case we hope to infer the individual phase shifter bit loss. We will also discuss problems which arose in the measurement because of the short wavelength signal-to-noise ratio and small number of elements.

P. Rice, B. Hallett, and J. Moreland. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4248-4250 Nov 94.

Keywords: *Recording heads, *Magnetic fields, Imaging techniques, Thin films, Magnetization, Comparison, Reprints, Magnetic force microscopy, Magnetic imaging, Hard disks, Bit patterns.

We have used de-mode magnetic force microscopy to image the magnetic fringing fields of several thin-film heads and the bit patterns written with these heads. The images were taken with Si3N4 tips coated with 10-nm Fe and 5-nm Au. The heads and disks are typical industry standards. The heads had a variety of pole piece configurations. A large track separation was used so that the erase bands could be thoroughly studied. We were surprised to discover magnetic fields that correspond to layers in the alumina overcoat near the pole pieces. The magnetic force microscope images of the bit pattern show a definite twist at the track edge that points toward the trailing pole piece. We also observed disk magnetization patterns that remained after an ac erase procedure.

Contract ARO-MIPR-107-94
Pub. in Jnl. of Molecular Spectroscopy, v170 p178-214, 1995.

Keywords: *Trapping(Charged particles), *Solids, *Near infrared radiation, *Neon, *Infrared spectra, Reprints, Vibration, Vapor phases, Spectra, Shifting, Isotopes, Ground state, Absorption, Energy levels, Low frequencies, Chemical shifts.

Spectra have been recorded from 700 to 12 000/cm for HCC and DCC trapped in solid neon. In this region, which includes not only the ground-state absorptions but also all of the absorptions of appreciable intensity in the highly perturbed A (2)pi state, all of the matrix shifts are to lower frequencies, and none of them exceeds 30 /cm. The X(OnO) and X(On1) progressions of HCC, recently reported in the photoelectron spectrum of HCC-, also appear in the infrared spectrum. The spectra of the singly and doubly carbon-13 substituted species of HCC and of doubly carbon-13 substituted DCC are presented. Except in a few regions of very strong mixing of energy levels of the X and A states, correlations of the HCC and DCC bands with their carbon-13 substitution counterparts are possible, and the resulting isotopic shift data are useful in assigning the vibronic spectra. Assignments are proposed for a considerable number of HCC and DCC bands. These assignments are aided by the carbon-13 shift data, by the results of recent ab initio calculations, and, where they are available, by the upper-state symmetries of bands observed in the gas phase. Absorptions of C2, C2-, C4, HC4, HCCO, and C2H3 isolated in a neon matrix are also identified. jg.

Keywords: *Spectroscopy, *Combustion, *Decomposition, *Nitramines, Water, Solids, Short range(Time), Spectra, Responses, Diagnostic techniques, Free radicals, Neon, Infrared spectra, Nitromethane, Photodecomposition, Molecular ions.

The infrared spectra of reaction intermediates trapped in solid neon were studied in order to support the development of diagnostics for short-lived species which are reaction carriers in nitramine decomposition and combustion and to derive information about reactions which are important in the condensed-phase decomposition of nitramines. Nitromethane and monomethylnitramine were used as model compounds in these studies. Evidence was obtained for the formation of water complexes with both of these species. The results support the water-catalyzed decomposition mechanism for nitramines that was proposed by Melius. Studies of the photodecomposition of isotopically substituted monomethylnitramine demonstrate that four different groups of products are formed. Tentative spectral assignments are made for the aci-isomer of monomethylnitramine and for CH3NHONO. The final photodecomposition products are CH4, NO, CH3OH, and N20. Other studies have provided evidence for the formation of a weakly bonded complex of H2 with H20, as well as spectral data for the HCC free radical and for the H20+, N02+, NO(2-), and NO(3-), molecular ions.

Keywords: *Niobium Alloys, *Superconducting Super Collider, *Superconducting Wires, *Titanium Alloys, Evaluation, Magnetic Flux, Magnetic Properties, Magnetization, Superconducting Magnets, EDB/430300.

In synchrotron accelerator applications, such as the Superconducting Super Collider (SSC), superconducting magnets are cycled in magnetic field. Desirable properties of the magnets include field uniformity, field stability with time, small residual field, and fairly small energy losses upon cycling. This paper discusses potential sources of problems in achieving these goals, describes important magnetic characteristics to be considered, and reviews measurement techniques for magnetic evaluation of candidate SSC wires. Instrumentation that might be practical for use in a wire-fabrication environment is described. The authors report on magnetic measurements of prototype SSC wires and cables and speculate on causes for instability in multipole fields of dipole magnets constructed with such cables.

Keywords: *Electron-Atom Collisions, *Sodium, EV Range 10-100, Elastic Scattering, Electron Reactions, Optical Pumping, Polarized Beams, Progress Report, EDB/664300, Electron spin polarization, Electron scattering.

This report discusses progress made during the current contract period on the authors research program

to study collisions between spin-polarized electrons and optically prepared atoms. The objective of this work is to stimulate a deeper theoretical understanding of the electron-atom interaction by providing more complete experimental measurements on colliding systems. By preparing the internal states of the collision partners before scattering, they are able to extract substantially more information about the scattering process than is available from more conventional measurements of differential cross sections. The authors are principally interested in observing the role played by spin in low energy electron-atom collisions. The additional information provided by these spin-dependent measurements can greatly enhance understanding of both exchange and the spin-orbit interaction in the scattering process. They have made substantial progress in the past three years in their measurements both of elastic and superelastic scattering of spin-polarized electrons from optically pumped sodium.

This report discusses progress made during the current contract period on the authors research program to study collisions between spin-polarized electrons and spin-polarized atoms. The objective of this work is to stimulate a deeper theoretical understanding of the electron-atom interaction by providing the most complete possible experimental characterization of the colliding system. Through the use of optical state preparation techniques to prepare both the incident electrons and atom in well-defined initial states, the authors are able to extract substantially more information about the scattering process than is available from more conventional measurements of differential scattering cross sections. Their primary interest is to study in detail the role played by spin in electron-atom collisions at low to intermediate energies. The additional information provided by these spin-dependent measurements greatly enhances understanding of both exchange and the spin-orbit interaction in the scattering process. During this three-year period they have made substantial progress in measurements of both elastic and superelastic scattering of spin-polarized electrons from optically pumped sodium. The elastic scattering measurements in particular were made possible by several important improvements to the experimental apparatus.

Implementation of a Standard Format for GPS Common View Data.
M. A. Weiss, and C. Thomas. May 95, 14p.
In NASA. Goddard Space Flight Center, the 26TH Annual Precise Time and Time Interval (Ptti) Applications and Planning Meeting p 75-88.

Keywords: *Data processing, *Global positioning system, *Standardization, *Time signals, Receivers, Time measurement.

A new format for standardizing common view time transfer data, recommended by the Consultative Committee for the Definition of the Second, is being implemented in receivers commonly used for contributing data for the generation of International Atomic Time. We discuss three aspects of this new format that potentially improve GPS common-view time transfer: (1) the standard specifies the method for treating short term data, (2) it presents data in consistent formats including needed terms not previously available, and (3) the standard includes a header of parameters important for the GPS common-view process. In coordination with the release of firmware conforming to this new format the Bureau International des Poids et Mesures will release future international track schedules consistent with the new standard.

Wavelengths and Energy Levels of Neutral Kr(84) and Level Shifts in All Kr Even Isotopes.
V. Kaufman. 1993, 8p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v98 n6 p717-724 Nov/Dec 93.

Keywords: *Atomic energy levels, *Krypton 84, *Isotope effect, Spectral shift, Krypton 86, Krypton 82, Krypton 80, Krypton 78, Interferometry, Wavelengths.

Interferometrically-measured wavelengths of 109 lines of neutral Kr(84) are compared with those of Kr(86). Sixty energy levels of neutral Kr(84) derived from those wavelengths and 25 Kr(86)-Kr(84) isotope shifts previously measured are given along with their shifts from the energy levels of Kr(86). Twenty levels of each of Kr(82), Kr(80), and Kr(78) are also evaluated using isotope-shift information in the literature. The differences between the experimentally observed shifts and the normal mass shift leave large negative residuals which are accounted for by ionization energy differences and by the specific mass shift. It appears that the volume effect causes only a very small, if any, energy level shift.

Mass Unit Disseminated to Surrogated Laboratories Using the NIST Portable Mass Calibration Package.
R. M. Schoonover, J. E. Taylor, and J. Rothleder. Feb 94, 18p, NISTIR-5290.
See also PB89-132336.

Keywords: *Calibration, Interlaboratory comparisons, Primary standards, Portable equipment, Computer applications, Uncertainty, Balances, Buoyancy, *Mass standards, California State Laboratory, US NIST.

Over a ten-year period, three mass calibration packages were circulated to selected laboratories by the Mass Group at NIST. Initially the objective was to determine if the NIST mass calibration service could be disseminated to qualified users via a 'do-it-yourself' package. However, it became obvious that the technique could be very useful in the training of personnel and the examination of laboratories. The first package of 1-kilogram artifacts was circulated to see what problems might arise in their calibration. The second package was designed to overcome the difficulties encountered and to ensure the quality of the next package. The third and final package incorporates improvements and demonstrates the method with the calibration of the California State primary mass standards from 1 kg to 1 mg. This report looks briefly at the entire project experience with comments about the pitfalls and benefits of calibrations by surrogate laboratories and other likely uses of the method.

Assessment of Uncertainties of Thermocouple Calibrations at NIST.
Internal rept.
D. Ripple, G. W. Burns, and M. G. Scroger. Jan 94, 37p, NISTIR-5340.

Keywords: *Thermocouples, *Calibration, Temperature measurement, Uncertainty, Estimates, International Temperature Scale of 1990, ITS-90, US NIST.

The uncertainties of thermocouple calibrations performed at the National Institute of Standards and Technology are described in this report, and they are expressed in a manner consistent with the newly-adopted NIST standard for the expression of uncertainties. The adoption of the International Temperature Scale of 1990 (ITS-90) has resulted in alterations in data analysis techniques that affect the uncertainties, and these are described also.

Keywords: *Fire suppression, *Evaporative cooling, *Spray cooling, *Cooling, *Surfaces, Computerized simulation, Thermal conductivity, Temperature distribution, Computer programs, Solid fuels, Transients, Aluminum, Conduction, Water, *Droplet-solid interactions, Macor.

The long term objective of the study of droplet-solid interaction is to obtain information applicable to the extinguishment of fire through a droplet array (e.g. spray). The solids of concern include low thermal conductivity materials, typical of fire applications. The research described hereafter constitutes portion of an extensive research program aimed at developing accurate droplet cooling models of burning solid fuel surfaces. This research is only concerned with the evaporation of single droplets on a hot surface. Limited experiments are also performed in the nucleate boiling range. This report consists of three different portions; each portion focuses on an independent issue of the research program. In Part A the major progresses in the numerical simulation of a single droplet evaporation are described. In Part B the experimental program conducted with radiant heat input for single droplets evaporating on Macor is described. In Part C a novel model is presented, which extends the single droplet results to a multi-droplet system.

Examination of Parameters That Can Cause Error in Mass Determinations.
R. M. Schoonover, and F. E. Jones. Feb 94, 14p, NISTIR-5376.

Keywords: Weight measurement, Error analysis, Stainless steels, Platinum, Iridium, Silicon, Buoyancy, Uncertainty, Metrology, Comparison, Calibration, *Mass standards, Kilogram.

The parameters that can cause error in mass determinations are examined and estimates of the magnitude of consequent errors are given. We examine the possible errors in the embodiment of the kilogram in the platinum-iridium (Pt-Ir) artifact. We trace the propagation of errors from the Pt-Ir artifact to the system of stainless steel artifacts through mass comparison. We examine in detail such parameters as buoyancy corrections, including uncertainties in measurement of environmental variables.

Electronic Balance and Some Gravimetric Applications. (The Density of Solids and Liquids, Pycnometry and Mass).
R. M. Schoonover, M. S. Hwang, J. Taylor, and C. Smith. c1993, 26p, NISTIR-5375.
See also PB91-112854. Prepared in cooperation with Industrial Technology Research Inst., Hsinchu (Taiwan). Center for Measurement Standards. and Aluminum Co. of America, Alcoa Center, PA. Alcoa Technical Center.

Keywords: *Density measurement, Pycnometers, Calibration, Gravimetry, Liquids, Solids, Water, Air, Silicon, Algorithms, *Electronic balances, Hydrostatic weighing, Pycnometry.

In recent years the electronic force balance has been perfected to a degree that it can replace the mechanical balance in both precision and capacity. Hence, the mechanical balance is rapidly disappearing from the scene. The work reported here describes the use of the electronic balance in some high precision gravimetric applications. The balance has been examined from the user's viewpoint and its use is illustrated in measuring solid and liquid densities and mass. The density assigned to a silicon crystal is in good agreement with its accepted value to within 2.4 ppm. Likewise, the water density measurements substantiate Kell's equation for the density of water near 23 degrees Celsius. (Copyright (c) ISA, 1993.)

Piggyback Balance Experiment: An Illustration of Archimedes' Principles and Newton's Third Law.
R. M. Schoonover. Feb 94, 13p, NISTIR-5377.

Keywords: *Buoyancy, Weight measurement, Gravimetry, Force, Mass, Metrology, Newton third law, Archimedes principles, Electronic balances, Piggyback balance experiment, Mass measurement.

The lifting force of a fluid upon an immersed body was analyzed and reported by Archimedes in the third century B.C. In these modern times many people employed in metrology find it difficult to grasp the concept of buoyancy as it applies to mass measurement. Antiquated techniques in use today propagate ignorance of the concept. The modern electronic balance makes possible a simple, educational two-balance experiment that provides the observer with a clear picture of the buoyant force and Newton's third law. The experiment, when performed carefully, yields an excellent volume determination of the demonstration mass and brings together the SI units of mass, length and temperature and the derived units of force, pressure and density.

See also PB91-112854. Prepared in cooperation with Industrial Technology Research Inst., Hsinchu (Taiwan). and Mettler-Toledo A.G., Greifensee (Switzerland).

Keywords: *Density measurement, Weight indicators, Error analysis, Calibration, Silicon, Hydrostatic weighing, Electronic balances.

The usual method of a mass assignment to an artifact is by comparing the forces exerted on a balance pan. The observed difference between the standard mass and the unknown object is then expressed as the solution of the two force equations and includes terms for their respective displacement volumes, i.e, densities. With the advent of commercially available balances with precision near the 1 part per billion level (ppb), the user must pay particular attention to the artifact density and its associated error if the available precision is to be meaningful. Described here is the need and a method to determine the artifact density with an error analysis that leads to the selection of the appropriate equipment. Measurements of a 200 g silicon crystal of known density were performed to demonstrate the accuracy of the method.

Complete Reduction of the Euler-Poinsot Problem.
Final rept.
A. Deprit, and A. Elipe. 1993, 26p.
Pub. in Jnl. of the Astronautical Sciences 41, n4 p603-628 Oct-Dec 93.

Keywords: Rigid structures, Hamiltonians, Dynamics, Reprints, *Euler-Poinsot problem, Serret-Andoyer variables.

The authors propose a new way of defining the Serret-Andoyer variables that does not call on spherical trigonometry. The authors use those variables to present a complete solution of the Euler-Poinsot problem in the phase space determined by the components of the angular momentum along the principal axes of inertia. The authors use the solution to convert directly the Serret-Andoyer variables into action- and angle-variables, thereby making the Hamiltonian dependent on only two momenta.

Pub. in Nuclear Instruments and Methods in Physics Research A 339, p109-115 1994.

Keywords: *Alpha sources, *Calibration, Plutonium 238, Plutonium 239, Monitoring, Alpha particles, Reprints, X-ray emission.

Work has been performed at NIST to develop and calibrate large-area (238)Pu alpha-particle sources and related measuring equipment. A large-area-source X-ray counting system and a 2pi(alpha) internal gas-proportional counting system were used for the primary calibration of these sources. Studies have been performed to relate these calibrations to the measurement of thin, large area (239)Pu sources, which are of primary interest but are generally unavailable in the necessary high specific activities required. Two systems have been characterized for the monitoring and measurement of large-area alpha sources: (1) a source-detector mounting unit developed at NIST to calibrate monitoring systems by mounting a standard source of plutonium at an accurately calibrated distance from the user's alpha-monitoring detector; (2) a diffused-junction silicon semiconductor detector which is used as a transfer standard from low to high activity of large-area alpha-particle sources. A determination of the L X-ray emission probability for (239)Pu has been made.

Investigation of LS Coupling in Boronlike Ions.
Final rept.
S. Glenzer, H. J. Kunze, J. Musielok, Y. K. Kim, and W. L. Wiese. 1994, 7p.
Pub. in Physical Review A 49, n1 p221-227 Jan 94.

Keywords: *L-S coupling, Reprints, Light elements, Transition probabilities, *Boron-like ions.

In order to test the validity of the LS-coupling approximation for light elements, the line-intensity ratios of the 3s-3p and 3p-3d multiplets in C II through F V and C II through Ne VI, respectively, have been investigated experimentally with emission sources. Also, calculations with multiconfiguration Dirac-Fock wave functions have been performed. Within the errors of the experimental procedure, no significant violations of the LS-coupling approximation were found for the lines of the 3s-3p and 3p-3d multiplets in C II through F V. However, in the case of Ne VI, small deviations of measured intensities from those obtained by applying the LS-coupling approximation were observed.

Pub. in Canadian Jnl. of Physics 70, p1218-1221 1992.

Keywords: *Anharmonic oscillators, Reprints, Schrodinger equation, WKB approximation, Wave equations, Airy function, Numerical solution, WKB-J approximation.

The authors have applied the modified Airy function (MAF) method to the analysis of an anharmonic oscillator, characterized by the potential V(x) = k(x squared)/ 2 + alpha(x (sup 4)), k > 0, alpha > 0. The MAF method gives an accurate closed-form expression for the wave function as well as very accurate eigenvalues with much less numerical effort than the five-term (eighth-order) WKBJ approximation. The application of the first-order perturbation correction to the MAF eigenvalues makes them even more accurate than those obtained by the five-term WKBJ approximation.

Pub. in Proceedings of International Conference on the Physics of Highly Charged Ions (6th), Manhattan, KS., September 28-October 2, 1992, p463-472 1993. Sponsored by Department of Energy, Washington, DC.

Keywords: *Electron-ion collisions, *Argon ions, Reprints, Multicharged ions, Electron scattering, Electron impact, Inelastic scattering, Backscattering, Excited states, Cross sections, Excitation.

For the first time, evidence for strong back-scattering of electrons during near threshold excitation of highly charged ions has been observed. By measuring the apparent cross section for the electron-impact excitation of Ar(7+)(3s->3p) as a function of center-of-mass velocity, over 90% of the inelastically scattered electrons were found to be deflected by more than 90 degrees in the center-of-mass frame. This unusual angular scattering has not been previously observed for atoms or ions, but may be typical for multiply charged ions. Our observation of backscattering has been confirmed recently by close-coupling calculations and distorted-wave calculations. Absolute total excitation cross sections measured in an energy range extending to 2.2 eV above threshold are also reported and are in agreement with close-coupling calculations.

Intermediate Structure in the Neutron-Induced Fission Cross Section of 236U.
Final rept.
W. E. Parker, J. E. Lynn, G. L. Morgan, N. W. Hill, P. W. Lisowski, and A. D. Carlson. 1994, 6p.
Pub. in Physical Review C 49, n2 p672-677 Feb 94.

Keywords: *Uranium 236 target, *Fission cross sections, *Neutron reactions, Intermediate structure, Intermediate resonance, Reprints.

Neutron-induced fission of (236)U has been measured at the Los Alamos Neutron Scattering Center with a white neutron source using a fast parallel plate ionization chamber at a flight path of about 56 m. In the resonance and the intermediate resonance region, very little of the previously reported structure was detected. Only five resonance structures were observed. Additionally, the width of the 5.45 eV resonance is approximately 100 times smaller than previously reported. An explanation for the discrepancies between old data and data reported here is discussed. New fission widths for resonances from 5.45 eV to 10.4 keV are reported. The new data are in agreement with theoretical estimates.

Use of the Electronic Balance for Highly Accurate Direct Mass Measurements Without the Use of External Mass Standards.
R. M. Schoonover, and F. E. Jones. May 94, 20p, NISTIR-5423.

Keywords: Weight measurement, Calibration, Uncertainty, *Mass measurement, Electronic balances, Traceability.

The object of the paper is to show how to make highly accurate mass measurements using an appropriate electronic balance without the use of external mass standards. The method eliminates the need for a set of external mass standards and, therefore, the need to have these mass standards calibrated periodically at a standards laboratory. Traceability to NIST can be achieved by periodic calibration of the built-in mass standard of the balance by a standards laboratory and by self-verification of balance linearity and function. The method benefits the user with lower cost and a higher measurement rate. Presented here is a detailed analysis of the method, a determination of measurement uncertainty, and the traceability path. Lastly, the method is illustrated by specific examples including the calculation of uncertainty.

Bibliography of Photon Total Cross Section (Attenuation Coefficient) Measurements 10 eV to 13.5 GeV, 1907-1993.
J. H. Hubbell. May 94, 102p, NISTIR-5437.
See also PB87-116141.

Keywords: *Photon cross sections, *Far ultraviolet radiation, *X rays, *Gamma rays, *Bibliographies, Vacuum ultraviolet radiation, Extreme ultraviolet radiation, Absorption coefficients, Total cross sections, Bremsstrahlung, Attenuation coefficients.

A bibliography is presented of papers reporting absolute measurements of photon (XUV, x-ray, gamma-ray, bremsstrahlung) total interaction cross sections or attenuation coefficients for the elements and some compounds. The energy range covered is from 10 eV to above 10 GeV. These papers are part of the reference collection of the National Institute of Standards and Technology Photon and Charged Particle Data Center. They cover the period from 1907 through 1993 and into 1994. Thus this report is an update of the 1986 earlier report NBSIR 86-3461 (PB87-116141), and also includes additional papers dating back as far as 1966 which have since been found or brought to the attention of the author. Included with each reference are annotations specifying the energy range covered and the substances studied. This updated bibliography now includes 573 non-duplicative references to available measured data, plus 42 references to critical evaluations and review articles.

Single-Phase Heat Transfer and Pressure Drop Characteristics of an Integral-Spine-Fin Within an Annulus.
M. A. Kedzierski, and M. S. Kim. Jun 94, 37p, NISTIR-5454.
Sponsored by Department of Energy, Washington, DC. Building Equipment Div.

Keywords: *Fins, *Heat transfer, *Pressure gradients, *Annular flow, Nusselt number, Friction factor, Heat transfer coefficients, Mathematical models, Test facilities, Skin friction.

The laminar, single phase heat transfer and friction characteristics of an integral-spine-fin pipe within an annulus are presented. The heat-transfer coefficient was determined using a modified version of the Wilson Plot method. The test fluid was pumped through the annulus of a straight, 3m test section. Three fluids were investigated: (1) tap water, (2) 34% ethylene glycol/water mixture, and (3) 40% ethylene glycol/water mixture. These fluids produced a significant variation in the Prandtl number so that its exponential dependence could be determined. The annulus-Reynolds numbers were varied from 100 to 1400 to obtain the Reynolds number exponent. An empirical correlation for the Nusselt number was developed which accounts for the development of the thermal boundary layer. An empirical correlation for the friction factor is also presented. It is demonstrated that the spines enhance the heat transfer through additional surface area and fluid mixing.

Characteristics of Light Emission After Low-Energy Electron Impact Excitation of Caesium Atoms.
Final rept.
K. Bartschat, U. Thumm, and D. W. Norcross. 1992, 6p.
Contract DE-A105-86ER53237
Pub. in Jnl. of Physics B: Atomic and Molecular Opt. Physics 25, pL641-L646 1992. Sponsored by Department of Energy, Washington, DC. Office of Energy Research.

Keywords: *Electron-atom collisions, *Polarized light, *Cesium, EV range 1-10, Electron scattering, Electron impact, Atomic excitations, Excited states, R matrix, Reprints.

Results of a recent calculation for e-Cs scattering, carried out in a fully relativistic (Dirac R-matrix) framework, are used to calculate the polarization of the light emitted by excited cesium atoms in an energy range from threshold to 2.7 eV. They are compared with previous semirelativistic Breit-Pauli calculations and the available experimental data. The results indicate that the Percival-Seaton theory approximating relativistic scattering amplitudes by recoupling amplitudes from a non-relativistic LS calculation is not valid for low-energy e-Cs scattering.

Scattering Properties of the Leveled-Wave Model of Random Morphologies.
Final rept.
N. F. Berk. 1991, 11p.
Pub. in Physical Review A 44, n8 p5069-5079, 15 Oct 91.

Keywords: *Scattering, Light scattering, Neutron scattering, X-ray scattering, Random processes, Standing waves, Porous materials, Morphology, Reprints, Leveled wave model.

In the leveled-wave model, random porous morphologies are simulated by discrete maps of continuous stochastic standing waves generated by adding sinusoids over suitable distributions of wave vectors and phase constants. The mathematical structures obtained this way appear to be useful models for certain kinds of random geometries, such as the bicontinuous morphologies that occur in microemulsions and porous glasses. Properties of the leveled-wave method are developed, and the scattering behavior is derived. Scattering from an arbitrary three-phase system can be analyzed by adding different instances of scattering from a generalized film morphology in which the scattering phase is confined to the interior of the interspatial region bounded by two leveled-wave interfaces that are separated everywhere. General results for this interspace scattering are derived. Fractal surfaces, dimension 2 = or < D = or < 3, are incorporated into the leveled-wave scheme by using a wave-number distribution having an appropriate long-tailed asymptotic behavior. Scenarios are discussed for the scattering as D -> 2 from above and for D -> 3 from below. For D = 3 the asymptotic scattering falls faster than algebraically as the scattering wave vector O -> infinity.

The authors report the temperature dependence of the gamma-ray anisotropies from oriented (160)Tb nuclei produced by neutron activation of the central portion of a high-purity single crystal Tb slab. The magnetically saturated sample was studied over a wide temperature range from 18 mK to 150 mK. The temperatures were determined using precision resistance thermometry with in situ calibration by a magnetically shielded six-element superconducting fixed point device. Temperature stability during data acquisition was better than 0.1%, and least-squares fitting of the resulting temperature dependences of 0 deg and 90 deg anisotropies allowed both the magnetic dipole and the electric quadrupole hyperfine interaction frequencies to be determined with good accuracy. The weighted averages for 18 gamma rays are nu(M) = 1393.8 (8.1) MHz and nu(P) = 178.0 (2.1) MHz, in excellent agreement with NMR results on ion-implemented samples.

Measurements of collision-induced emission in the fundamental vibration-rotation band of hydrogen are presented for argon, xenon, and neon collision partners. These absolute, spectrally-resolved infrared measurements were performed at high densities behind reflected shock waves over the temperature range of 900 to 3,400 K. The emission was found to be dominated by Q branch transitions at high temperature due primarily to the dipole moment induced by the overlap between the electron clouds of the collision pair. The strength of this interaction was evaluated from the data and compared with similar evaluations determined from low temperature absorption studies.

Slowly Divergent Space Marching Schemes in the Inverse Heat Conduction Problem.
Final rept.
A. S. Carasso. 1993, 16p.
Pub. in Numerical Heat Transfer 23, ptB p111-126 1993.

Keywords: *Conduction, Reprints, One dimensional calculations, Finite difference theory, Rocket nozzles, Divergence, Lax-Richtmyer theory, Tikhonov regularization, Ill posed problems, Inverse problems.

Recently developed 'slowly divergent' space marching difference schemes, coupled with Tikhonov regularization, can solve the one-dimensional inverse heat conduction problem at values of the nondimensional time step (Delta)t(+) as low as (Delta)t(+) = 0.0003. A Lax-Richtmyer analysis is used to demonstrate dramatic differences in error amplification behavior among various space marching algorithms, for the same problem, on the same mesh; maximum error amplification factors may differ by more than 10 orders of magnitude at parameter values that are of interest in rocket nozzle applications. Slowly divergent schemes are characterized by their damping behavior at high frequencies. A widely used benchmark problem, where the surface

temperature gradient is a step function, provides a basis for evaluating Tikhonov-regularized marching computations.

Some predominantly experimental considerations concerning both few electron highly charged ion spectra and inner-shell vacancy spectra are discussed in relation to the currently available theoretical approaches. For the cases of H-like and He-like spectra, theoretical machinery appears to be well in hand particularly in comparison to the relatively sparse experimental database which is also of limited accuracy in most cases. Owing particularly to some impressive recent theoretical progress on the problem of nearly neutral ions containing inner-shell vacancies, the traditional X-ray data suitably filtered and strengthened by modern measurements, appear to offer some quite useful insights in spite of their formidable complexity. With the advent of new storage ring facilities and advanced technology ion sources as well as a new effort on transuranic X-ray spectra, one can reasonably foresee an upcoming period of fruitful activity.

Grant NSF-PHY-9014103
Pub. in Jnl. of Physics B: At. Mol. Opt. Phys. 25, pL653-L656 1992. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *Positron-atom collisions, *Alkali metals, *Polarized light, Reprints, Linear polarization, EV range 10-100, EV range 1-10, Excitation, Lithium, Sodium, Potassium, Rubidium, Percival-Seaton hypothesis, Close coupling approximation.

Recent two-state and five-state close-coupling calculations for positron-alkali scattering are used to predict the linear polarization of the resonance line (np) double P(0) -> (ns) double S emitted by the alkali atoms Li, Na, K and Rb after positron impact excitation. The collision energies considered range from threshold (about 2 eV) to 40 eV. The results are interpreted in terms of elementary collision theory, including depolarization of the line radiation through fine- and hyperfine-structure effects. Given the size of the polarizations predicted and the recent developments in positron physics, an experimental test of our results should be possible. This should provide an independent test of the theoretical model, in addition to the cross sections considered so far.

Keywords: *Neutron lifetime, *Neutron decay, Reprints, Trapping(Charged particles), Neutron beams, Particle decay, Measurement, Protons, Penning traps.

The availability of an accurate value for tau(n) has important implications for tests of the standard V - A theory of semi-leptonic weak processes, cosmology, and astrophysics. The lack of agreement between values of g(A)/g(V) derived from recent lifetime measurements and values obtained from recent beta-decay asymmetry experiments hints at a problem with the current theoretical framework. In this neutron beam measurement, the lifetime is determined by counting decay protons stored in a Penning trap whose magnetic axis coincides with the neutron beam axis. The recent result, tau(r) = 893.5 + or - 5.3s, is based upon data accumulated during one reactor cycle at the Institut Laue-Langevin in Grenoble, France. In the next two years a final accuracy approaching 1s will be sought.

Improvements in Computation of Form Factors.
Final rept.
C. T. Chantler. 1993, 8p.
Pub. in Radiation Physics and Chemistry 41, n4/5 p759-766 1993.

Keywords: *Form factors, EV range 10-100, EV range 100-1000, KeV range 1-10, KeV range 10-100, Dispersion relations, Cross sections, X rays, Computation, Reprints, Anomalous dispersion.

Tables for form factors and anomalous dispersion are of wide general use in the UV, X-ray and gamme-ray communities, and have existed for a considerable period of time. The generality of these works has entailed numerous simplifications compared to detailed relativistic S-matrix calculations. However, the latter calculations do not appear to give convenient tabular application for the range of Z and energy of general interest, whereas the former tables have large regions of limited validity throughout the range of Z and energies, and in particular have limitations with regard to extrapolation to energies outside tabulated ranges. Intermediate theoretical and procedural assumptions limit the precision and applicability of available tabulations and procedures. The paper identifies regions of Z and energy where these assumptions fail and the improvement which can be achieved by their avoidance, both in tabulated ranges and by extrapolation. Particular concern involves the application of the dispersion relation to derive Re(f) from photoelectric absorption cross-sections. Revised formulae can lead to significant qualitative and quantitative improvement, particularly above 30-60 keV energies, near absorption edges, or at 30-3000 eV energies.

Pub. in Applied Optics 32, n13 p2371-2397, 1 May 93. See also Part 2, PB94-200094 and Part 3, PB94-200102.

Keywords: *X rays, *Vacuum ultraviolet radiation, *Photographic analysis, Reprints, KeV range 01-10, KeV range 10-100, EV range 1-10, EV range 10-100, EV range 100-1000, Optical density, Photographic emulsions, Linearization, Estimates, Intensity, Beam foil spectra, DEF-392 emulsion.

Formulations for specular optical density as a function of incident x-ray intensity are shown to be inadequate, theoretically and compared with available data. Ap-

proximations assuming low intensities, grain densities, or energies yield significant error in typical emulsions. Unjustifiable simplifications limit analysis and consequent results. The avoidance of assumptions leads to models for rough and smooth emulsion surfaces, which correspond to Kodak 101-01 and DEF-392 emulsion types. The self-consistent use of spherical grains yields scaling that is dependent on emulsion roughness. The authors obtained improvement over standard formulations, avoiding the empirical character of earlier models and associated parameterization. The correlation of grain locations and occluded emulsion area is approximated within monolayer depths but neglected between layers. Effects of the incident angle from a broad source, scattering and photoelectrons are considered. The models presented herein apply to the vacuum UV and x-ray energies from 9eV to 20 keV and may be preferred over alternative models at lower energies, densities greater than unity, emulsions with high grain fractions, or where interpolation over energy ranges is desired.

Keywords: *X rays, *Vacuum ultraviolet radiation, *Photographic analysis, Reprints, KeV range 01-10, KeV range 10-100, EV range 1-10, EV range 10-100, EV range 100-1000, Optical density, Photographic emulsions, Photographic grain, Statistics, Models, DEF-392 emulsion.

In the paper models from the first paper are generalized so that they include the correlation of attenuation coefficients and coverages with emulsion depth. They avoid further assumptions and can provide physically meaningful parameters (as opposed to earlier studies); thus closer agreement with experimental measurements is obtained. The difficulty in estimating correlated overlap functions is discussed. Error estimates resulting from grain statistics are generalized and computed in a self-consistent manner. Contributions to granularity from densitometer and grain statistics have been shown to be significant or dominant in most emulsion types. The formulation derives reliable error estimates. Correlated models are important for thick emulsions such as DEF-392, whereas integral formalisms may be as useful for thin emulsions. In agreement with the first paper, reciprocity failure appears to be negligible for UV or x-ray energies above 9eV.

Keywords: *X rays, *Photographic analysis, Reprints, Optical density, Linearization, Statistics, Models, Beam foil spectra.

In the paper models for the relation of specular density to incident (x-ray) intensity with uncertainties are applied to experimental data, indicating methods for the correction of additional effects. Linearization and error calculations are simplified by double linear interpolation, and the effect of this is quantified. Relative first-order intensities are determined directly. Secondary linearization or calculation for higher-order lines gives correction factors that yield absolute and relative higher-order intensity ratios. The effects of energy and angle on linearization are included. Densitometry uncertainty is estimated and quantified.

Analysis of Scattering Asymmetry Statistics When Background Corrected Counts Are Negative.
Final rept.
K. J. Coakley. 1993, 4p.
Pub. in Review of Scientific Instruments 64, n7 p1895-1898 Jul 93.

Keywords: *Signal processing, Reprints, Background noise, Confidence limits, Polarized beams, Scattering, Uncertainty, Asymmetry, Correction, Estimates, Poisson processes, Bootstrap technique.

An asymmetry statistic of physical interest is an estimate of the ratio of the difference and the sum of the Poisson rate parameters for two scattering processes. Typically, an additive background signal contributes to measurements of each signal. Background is measured in a third experiment. Data are corrected by subtracting measured background. When the measured background is larger than one of the other measurements, background-correlated counts are negative. For this case, it would seem that no useful information can be extracted from the experiment. Here, asymmetry and an associated uncertainty interval are estimated for such cases using a bootstrap approach.

Uncertainty Intervals for Polarized Beam Scattering Asymmetry Statistics.
Final rept.
K. J. Coakley, J. J. McCelland, M. H. Kelley, and R. L. Celotta. 1993, 7p.
Pub. in Review of Scientific Instruments 64, n7 p1888-1894 Jul 93.

Keywords: *Polarized beams, *Signal processing, Reprints, Monte Carlo method, Confidence limits, Asymmetry, Uncertainty, Statistics, Background noise, Correction, Bootstrap technique, Poisson processes.

In many scattering experiments, the quantity of most direct physical interest is a measure of the difference between two closely related scattering signals, each generated by a Poisson scattering process. The difference is often expressed in terms of an asymmetry statistic, that is, the difference normalized to the sum of the two signals, corrected for an additive background contribution. Typically, a propagation of errors approach is used to compute confidence intervals for asymmetry. However, these confidence intervals are not reliable in general. In this work, generally accurate confidence intervals for asymmetry are obtained using a parametric bootstrap approach. Based on the observed data, data are simulated using a Monte Carlo resampling scheme. The resampled data sets satisfy a constraint that ensures that background-corrected count rates are not negative.

Acceptance Diagram Analysis of the Performance of Multidisk Neutron Velocity Selectors.
Final rept.
J. R. D. Copley. 1993, 10p.
Pub. in Nuclear Instruments and Methods in Physics Research A 332, p511-520 1993.

Keywords: Reprints, Neutron scattering, Neutron beams, Performance, Design, Algorithms, *Neutron velocity selectors, Acceptance diagrams, Multidisk rotors, Neutron monochromators.

Transmission and absorption properties of helical multidisk neutron velocity selectors can be calculated using the method of acceptance diagrams. In this approach, neutron trajectories are characterized by a transverse spatial coordinate and by a coordinate that is linearly related to wavelength and angle relative to the selector axis. It is then possible to classify neutron trajectories according to the number of absorbing sectors that they cross within the sector. In this way the authors can determine the extent to which a given selector is successful in eliminating neutrons that get through the selector other than via one of the intended helical channels. The authors describe the design algorithm for selectors such as those in use at the National Institute of Standards and Technology, and the authors discuss the properties of a selector built according to this algorithm. The authors also consider what happens when the direction of the neutron beam is reversed. The problem of optimizing the design of a multidisk velocity selector is briefly discussed.

Acceptance Diagram Analysis of the Performance of Vertically Curved Neutron Monochromators.
Final rept.
J. R. D. Copley. 1991, 11p.
Pub. in Nuclear Instruments and Methods in Physics Research A301, p191-201 1991.

Keywords: Reprints, Neutron scattering, Neutron guides, Beam forming, Bragg reflection, Thermal neutrons, *Neutron monochromators, Acceptance diagrams.

Vertically curved monochromator crystals are commonly used to increase the intensity in thermal neutron scattering applications. Such devices are found on spectrometers installed both at nonreflecting beam tubes and at totally reflecting guide tubes. The authors present an analysis of the performance of vertically curved monochromators located at instruments of both types. The acceptance diagram approach gives considerable insight into the behavior of vertically curved monochromators. The analysis can be extended to more complicated systems, which closely represent what is acutally found at a neutron scattering installation.

Joy of Acceptance Diagrams.
Final rept.
J. R. D. Copley. 1993, 16p.
Pub. in Jnl. of Neutron Research 1, n2 p21-36 1993.

Keywords: Reprints, Neutron scattering, Neutron guides, Ray tracing, Phase space, Collimators, *Acceptance diagrams, Neutron velocity selectors, Neutron monochromators.

An acceptance diagram is a convenient and instructive way to represent spatial/angular neutron distributions within a neutron scattering instrument. In complicated systems, ray-tracing is used to calculate acceptance diagrams whereas in simple systems an analytical approach is appropriate. In the latter case, the action of a device such as a collimator or reflecting guide corresponds to one or more rather simple operations on the entrance acceptance diagram. Acceptance diagrams can also be used to investigate the behavior of devices such as focusing monochromators and velocity selectors.

B. M. Coursey, J. M. Calhoun, J. Cessna, M. P. Unterweger, D. B. Golas, A. P. Callahan, S. Mirzadeh, F. F. Knapp, D. D. Hoppes, and F. J. Schima. 1990, 9p.
Pub. in Radioact. Radiochem. 1, n4, 38, p42-49 1990.

Keywords: *Rhenium 188, Radiopharmaceuticals, Liquid scintillators, Decay schemes, Half life, Standardization, Tungsten 188, Radioisotopes, Reprints.

The alumina-based (188)W-(188)Re generator from ORNL can be eluted with saline to provide the (188)Re daughter as a short-lived high-energy beta-particle emitter which shows great promise for radiolabelling therapeutic radiopharmaceuticals. In this work, key parameters in the decay scheme of the (188)Re have been measured, and standard methods for quantitating the eluent have been developed. Rhenium-188 has been standardized for activity by the CIEMAT/NIST method of 4(pi)(beta) liquid-scintillation efficiency tracing with tritium, with an uncertainty (equivalent to one standard deviation) of 0.3%. Half-life measurements with a pressurized ionization chamber gave a T(1/2) = 17.01 + or - 0.01 hours. Photon emission rates were measured with semi-conductor detectors, and the probability of emission of the principal gamma ray at 155 keV was found to be P(gamma) = 0.1588 + or - 0.0011.

Keywords: *Molecular collisions, *Atomic collisions, Colliding beams, Cross sections, Orientation, Alignment, Calcium, Helium, Reprints.

The laboratory integral cross section under crossed-beam conditions is examined for collisions between a structured and an unstructured species, where the orientation (or alignment) of the initial and final states is determined with respect to arbitrarily configured laboratory axes. Three parameters are necessary to characterize the mutual orientation of the relevant axes in this case and these parameters then also characterize the cross section. The laboratory cross section is expanded in terms of a more fundamental (angle-independent) set of cross sections as determined in the so-called collision frame, where projections of the structured species are taken with respect to the direction of the initial relative velocity vector. Drawing upon a number of symmetry relations, we count the numbers of fundamental cross sections for arbitrary initial and final angular momenta. Then we consider the explicit dependence on angular parameters which can be anticipated for the laboratory cross section. Finally, we raise a number of experimental considerations in attempting to determine the fundamental cross sections. These considerations are 'fleshed out' by applying our cross-section analysis to a recent three-vector correlation experiment involving collisions between Ca and He.

Contract DE-A105-86ER53237
Sponsored by Department of Energy, Washington, DC. Office of Energy Research.
Pub. in Recombination of Atomic Ions, p115-131 1992.

Keywords: *Dielectronic recombination, *Atomic ions, Electric fields, Cross sections, Magnesium ions, Calcium ions, Carbon ions, Autoionization, Measurement, Reviews, Reprints.

Dielectronic recombination (DR) cross sections measurements on singly charged ions are reviewed, including a perspective on events leading to the exciting breakthroughs that occurred in 1982-83 for the study of this process. The DR mechanism is discussed along with the effect of electric fields on the process. The measurements on Mg ions in variable fields and the measurements of the effects of fields on the inverse process of autoionization are cited as the definitive experimental work on the field effects on DR. The quite spectacular disagreements between theory and experiment for DR cross section in C and Ca ions remain a perplexing mystery.

Keywords: *Calcium ions, *Strontium ions, *Barium ions, *Radium ions, *Fine structure, Electron scattering, Spin orbit interactions, Negative ions, Perturbation theory, Reprints.

Fine-structure intervals np(sub 1/2)-np(sub 3/2) (np(sub 1/2) is the ground state) are calculated for negative ions using relativistic many-body perturbation theory: Ca(1-) 4p, 56/cm; Sr(1-) 5p, 178/cm; Ba(1-) 6p, about 460/cm; and Ra(1-) 7p, 1,341/cm. Comparison of the fine-structure interval with affinity: Ca(1-) 10%, Sr(1-) 22%, Ba(1-) 30%; for Ra(1-) the fine-structure interval is larger than the affinity. Thus the Ra(1-) (sup 7)p(sub 3/2) state is a resonance in the continuous spectrum with energy 0.018 eV. This means that the relativistic spin-orbit interaction plays a determining role in slow electron-radium scattering.

Slab Transmission and Reflection for Point Source and Point Detector.
Final rept.
C. M. Eisenhauer. 1990, 2p.
Pub. in Transactions of the American Nuclear Society 62, p449-450 1990.

Keywords: *Neutron transport, *Photon transport, Monte Carlo method, Gamma rays, Point sources, Polyethylene, Reflection, Slabs, Reprints.

Using Monte Carlo calculations, we show that the transmission of scattered neutrons or gamma rays from a point source, through a plane slab of infinite extent, to a point detector, depends on the orientation of the slab but varies very little with the slab position. This statement is also true for reflected radiation if the source is replaced by its image source and the results are interpreted in terms of a transmission problem. We also show that the transition from a slab of small extent (narrow beam conditions) to a slab of infinite extent (broad beam conditions) can be characterized by a simple function of the single scatter angle. This function, too, can be applied to reflected radiation by invoking the image source. Typical results are presented for polyethylene.

Asymptotic Wave Function Splitting Procedure for Propagating Spatially Extended Wave Functions: Application to Intense Field Photodissociation of H2(+).
Final rept.
R. W. Heather. 1991, 14p.
Pub. in Computer Physics Communications 63, n1-3 p446-459 1991.

Keywords: *Hydrogen ions 2 plus, *Photodissociation, Wave functions, Reprints.

We describe an efficient procedure for propagating a spatially extended wave function evaluated on a small grid. The procedure involves the repeated splitting of the wave function into a part residing mainly in the interaction region (small fragment separation) and parts residing solely in the asymptotic region (large fragment separation), and propagating each part separately. The total wave function can be reassembled at a later time by adding the individual asymptotic pieces, propagated to a common final time with a free particle propagator, to the part of the wave function remaining in the interaction region. This procedure is well suited to propagation methods that evaluate the wave function on a spatial grid, because the amount of asymptotic region included in the grid, and therefore the computational effort, can be minimized (the smaller the asymptotic region, the more frequent the splitting).

Pub. in Jnl. of X-ray Science and Technology 2, n1 p17-80 Mar 90.

Keywords: *X-ray optics, *Analyzers, EV range 100-1000, EV range 10-100, X-ray analysis, Spectroscopy, Reflectance, Design, Reprints.

Detailed absolute reflectivity characterizations are presented for selected examples of multilayers, which have been semi-empirically determined for Mica, KAP and the fabricated Langmuir-Blodgett and sputtered multilayer analyzers with d-spacings in the 10-200 A range. Design requirements for absolute spectrometry are established. Efficient analytical multilayer reflectivity models are derived and parameterized (based upon a modification of the Darwin-Prins model for the low-energy x-ray region) -- including, for the sputtered multilayers, parameters for defining interface structure. The dependence of the reflectivity characteristics, high-order Bragg diffraction suppression, and over-all efficiency upon the model parameters is analyzed. A special spectrograph and procedure for the absolute measurement of the relevant reflectivity characteristics are described. Detailed measurements and semi-empirical characterizations are presented.

Quantum Projection Noise: Population Fluctuations in Two-Level Systems.
Final rept.
W. M. Itano, J. C. Bergquist, J. J. Bollinger, F. L. Moore, M. G. Raizen, D. J. Wineland, J. M. Gilligan, and D. J. Heinzen. 1993, 17p.
Pub. in Physical Review A 47, n5 p3554-3570 May 93.

Keywords: *Quantum mechanics, *Ion storage, Laser spectroscopy, Frequency standards, Internal energy, Beryllium ions, Beryllium 9, Mercury ions, Mercury 199, Reprints, Penning traps, Ion traps, Quantum noise.

Measurements of internal energy states of atomic ions confined in traps can be used to illustrate fundamental properties of quantum systems, because long relaxation times and observation times are available. In the experiments described here, a single ion or a few identical ions were prepared in well-defined superpositions of two internal energy eigenstates. The populations of the energy levels were then measured. For an individual ion, the outcome of the measurement is uncertain, unless the amplitude for one of the two eigenstates is zero, and is completely uncertain when the magnitudes of the two amplitudes are equal. In one experiment,

a single (199)Hg(1+) ion, confined in a linear rf trap was prepared in various superpositions of two hyperfine states. In another experiment, groups of (9)Be(1+) ions, ranging in size from about 5 to about 400 ions, were confined in a Penning trap and prepared in various superposition states. The measured population fluctuations were greater when the state amplitudes were equal than when one of the amplitudes was nearly zero, in agreement with the predictions of quantum mechanics. These fluctuations, which we call quantum projection noise, are the fundamental source of noise for population measurements, with a fixed number of atoms. These fluctuations are of practical importance, since they contribute to the errors of atomic frequency standards.

High Resolution Hard X-Ray Microscope.
Final rept.
M. Kuriyama, R. Dobbyn, and R. Spal. 1990, 11p.
Pub. in Rigaku Jnl. 7, n2 p5-15 1990.

Keywords: Hard x radiation, X-ray optics, X-ray diffraction, X-ray detection, Modulation transfer function, Spatial resolution, High resolution, Microradiography, Tomography, Uses, Reprints, *X-ray microscopes, Microtomography, Multilayers.

A high resolution hard x-ray microscope is described. This system is capable of detecting line features as small as 0.5 micrometer in width. The spatial resolution determined by the modulation transfer function is 1.0 micrometer. Three types of two-dimensional image detectors are discussed and compared for use with hard x-rays in high resolution. Principles of x-ray image magnification are also discussed, based on x-ray optics and diffraction physics. The effect of the x-ray source size is discussed as an important factor limiting spatial resolution. Some examples of applications are demonstrated in microradiography and diffraction imaging (topography). High resolution tomography has now become a reality.

Thermal Conductivity of R134a.
Final rept.
A. Laesecke, R. A. Perkins, and C. A. Nieto de Castro. 1992, 12p.
Sponsored by Environmental Protection Agency, Washington, DC.
Pub. in Fluid Phase Equilibria 80, p263-274 1992.

Keywords: *Fluorohydrocarbons, *Thermal conductivity, Supercritical fluids, Refrigerants, Substitutes, Temperature dependence, Reprints, *R134a, Ethane/tetrafluoro.

Thermal conductivity measurements are reported for the alternative refrigerant 1,1,1,2-tetrafluoroethane (R134a). These measurements were made over the temperature range from 200 to 390 K at pressures to 70 MPa. Data are reported for the liquid, vapor, and supercritical fluid phases. A significant critical enhancement is observed for R134a. A thermal conductivity surface, which fits our data to + or - 3.8% at 95% confidence, is provided for R134a. Correlations are also provided for the saturated vapor and saturated liquid thermal conductivity of R134a. Comparisons are made with other available thermal conductivity data for the dilute gas, saturated vapor, and saturated liquid.

Elastic Deformation of a Monolithic Perfect Crystal Interferometer: Implications for Gravitational Phase Shift Experiments.
Final rept.
H. P. Layer, and G. L. Greene. 1991, 5p.
Pub. in Physics Letters A 155, n8,9 p450-454, 27 May 91.

Keywords: *Gravitation, Finite element method, Elastic deformation, Phase shift, Distortion, Neutrons, Reprints, Silicon interferometers.

A calculation of the gravitationally induced distortion of a monolithic silicon interferometer using the finite element method has been used to analyze the data from a gravitational phase shift experiment using neutrons. The observed dependence of the X-ray phase shift on interferometer rotational angle has been reproduced. An additional interferometer distortion has been identified which can explain the discrepancy between the observed neutron phase shift and the theoretical value.

Keywords: *Photoionization, *Helium, KeV range 1-10, KeV range 10-100, Synchrotron radiation, Correlation, Reprints.

We report that the ratio of double-to-single photoionization of He at several photon energies from 2 to 12 keV. By time-of-flight methods, we find a ratio consistent with an asymptote at 1.5% + or - 0.2%, essentially reached by h(nu) approx = 4 keV. Fair agreement is obtained with older shake calculations of Byron and Joachain (Phys. Rev. 164, 1 (1967)), of Aberg (Phys. Rev. A 2, 1726(1970)), and with recent many-body perturbation theory (MBPT) of Ishihara, Hino, and McGuire (Phys. Rev. A 44, 6980 (1991)). The result lies below earlier MBPT calculations by Amusia et al. (J. Phys. B 8, 1248 (1975)) (2.3%), and well above semiempirical predictions of Samson (Phys. Rev. Lett. 65, 2861 (1990)), who expects no asymptote and predicts sigma (He(2+))/sigma(He(1+))=0.3% at 12 keV.

Pub. in Nuclear Instruments and Methods in Physics Research B40-41, p257-261 Apr 89.

Keywords: *X-ray fluorescence, *X-ray spectroscopy, Polarization(Waves), Synchrotron radiation, Excited states, Methyl chloride, Reprints, Inner-shell spectroscopy, X-ray emission.

Strongly polarized x-ray fluorescence from gas-phase molecules has been observed by selectively exciting near core level ionization thresholds using monochromatized synchrotron radiation. Both the degree and the direction of the polarization are very sensitive to the incident excitation energy, and the symmetry of the occupied and unoccupied molecular orbitals involved in the excitation/fluorescence process. Illustration of the phenomenon will be made using Cl K-edge excitation on the molecule methyl chloride, CH3Cl. The possibility of extracting orientational, geometrical, and orbital-symmetry information directly from experiment will be discussed, and the importance of the rapid time scale of the x-ray fluorescence decay (about 10 fs), which effectively precludes disorientation effects, will be stressed. Expectations are that x-ray polarized fluorescence spectroscopy will enjoy wide applicability to, for example, solids, surfaces and interfaces, oriented molecules such as surface adsorbates, and active sites in macromolecules.

Measurement of CO Pressures in the Ultrahigh Vacuum Regime Using Resonance-Enhanced Multiphoton-Ionization Time-of-Flight Mass Spectroscopy.
Final rept.
J. P. Looney, J. E. Harrington, K. C. Smyth, T. R. O'Brian, and T. B. Lucatorto. 1993, 10p.
Pub. in Jnl. of Vacuum Science and Technology A 11, n6 p3111-3120 Nov/Dec 93.

Keywords: *Carbon monoxide, *Pressure measurement, Time-of-flight method, Two photon absorption, Ultrahigh vacuum, Laser radiation, Photoionization, Reprints.

An evaluation is made of measurements of CO pressures in the UHV regime using resonance-enhanced multiphoton ionization coupled with time-of-flight mass spectroscopy (REMPI-TOFMS). It has been found that once the REMPI-TOFMS system has been calibrated, quantitative measurement of CO pressures as low as 10(sup -10) Pa is possible, even in overwhelming N2 backgrounds. With compensation for laser pulse energy variations, we find measurements with uncertainties of 10%-15% are possible for pressures down to 10(sup -7) Pa, and an ultimate detection limit for CO pressures of 10(sup -10) Pa for our measurement system. In this study, the REMPI-TOFMS system was calibrated using a pressure division technique along with a spinning rotor gage. The ionization of CO is achieved using 230 nm radiation to excite the B singlet Sigma(1+) state of CO at 10.8 eV via a two-photon absorption and then ionizing some of the excited state molecules by the absorption of an additional photon from the laser beam.

Analytical Method of Determining the Heat Capacity at High Temperatures from the Surface Temperature of a Cooling Sphere.
Final rept.
R. A. MacDonald. 1992, 7p.
Pub. in High Temperature-High Pressures 24, p127-133 1992.

Keywords: *Specific heat, *Spheres, *Radiant cooling, *Surface temperature, *Molybdenum, Thermophysical properties, High temperature, Temperature dependence, Emissivity, Reprints, Time dependent temperature profiles.

The feasibility of determining thermophysical properties at high temperatures from measurements of the surface temperature of a radiating sphere is investigated. For a sphere initially maintained in a steady state but with no heat supplied after some time, t = 0, the subsequent temperature profile in the sphere has been calculated as a function of time. The material properties of the sphere: thermal conductivity, heat capacity at constant pressure, thermal expansion, and emissivity, are assumed to have a quadratic dependence on temperature over a limited temperature range (several hundred degrees). The sensitivity of the temperature profile to the material parameters has been examined for values representative of molybdenum. The surface temperature shows some sensitivity to the heat capacity and to the emissivity but it is quite insensitive to the thermal conductivity and thermal expansion. In spite of the rather small effect, a method for determining the heat capacity, given the surface temperature of the sphere as a function of time, has been developed on the basis of these calculations for the full range of temperature, 1500-3000 K.

Sponsored by National Science Foundation, Washington, DC. and Office of Naval Research, Arlington, VA.
Pub. in Proceedings Foundations of Quantum Mechanics Workshop, Santa Fe, NM., June 1991, p298-307 1992.

Keywords: *Atomic beams, *Beam splitters, Beam optics, Laser spectroscopy, Raman effect, Deflection, Reprints, *Beam mirrors, Atomic interferometry.

We study atomic beam deflection by adiabatic passage between Zeeman ground-levels via Raman transitions induced by counterpropagating Sigma + - polarized lasers. We show that complete population transfer between the ground states can be achieved which corresponds to the scattering of the atomic wave packet into a single final momentum state by absorption and induced emission of laser photons. Although the lasers can be resonant, the excited state(s) are never populated during the adiabatic transfer which suppresses the effects of spontaneous emission and preserves the coherence of the atomic wave function. This scheme has attractive features as a beam splitter and mirror for atomic interferometry.

Keywords: *Tagged photon method, Polarization, Marking, Reprints.

The idea behind photon tagging is conceptually simple; a signal from a detector looking at one of the particles involved in the photon production process provides information on both the energy and the time of creation of each photon, thereby 'tagging' the energy of each of the photons in a continuous spectrum. A fast time coincidence between the signal from the tagging detector and the signal from the nuclear reaction product detector indicates that the reaction was initiated by the associated photon and serves to identify the energy of the photon that initiated the reaction. Three tagging techniques have been implemented at a number of accelerator laboratories.

Measurements of spin-resolved elastic electron-sodium scattering have been carried out at incident energies of 4.1 and 12.1 eV, and the ratio of triplet to singlet scattering cross sections has been obtained at each energy. The ratio is used to provide a determination of not only the magnitudes of the triplet and singlet amplitudes, but also the cosine of the relative phase difference between them. These determinations of magnitude and relative phase represent the most detailed characterization to date of electron-atom scattering from a 'one-electron' target.

Laser Focusing of Atoms: A Particle Optics Approach.
Final rept.
J. J. McClelland, and M. R. Scheinfein. 1990, 1p.
Pub. in Proceedings of International Conference on Atomic Physics (12th), Ann Arbor, MI., July 29-August 3, 1990, 1p.

Keywords: *Atomic beams, *Focusing, Photon-atom interactions, Laser radiation, Reprints, Laser focusing, Atomic diffraction.

The use of a TEM(sub 01, sup *) ('donut') mode laser beam has been proposed as a means of focusing an atomic beam to extremely small spot sizes. In the initial analysis, Balykin and Letokhov showed that when a donut mode laser beam is focused to a small spot of order 1 micrometer, and an atom beam is passed concentrically through the focus, the dipole force on the atoms has the correct radial dependence to produce first order focusing. They then estimated the effects of atomic diffraction (due to the deBroglie wavelength of the atom), spherical and chromatic aberration, and diffusion arising from spontaneous emission. It was found that spot sizes of order a few Angstroms could be obtained with reasonable values for atomic beam collimation and monochromaticity, and laser power and detuning.

Keywords: *Hydrogen fluoride, *Argon, *High resolution, *Librational motion, Matrix isolation, Van der Waals Forces, Quantum mechanics, Three body problem, Isomers, Supersonic aircraft, Infrared radiation, Microwaves, Molecular interactions, Reprints, Argon clusters.

The availability of pairwise additive 'two-body' potentials for van der Waals systems from near-IR, far-IR and microwave data permits detailed prediction of librational behavior for isolated HF chromophores solvated by successive numbers of rare gas Ar atoms. The paper describes theoretical calculations of Ar(n)HF equilibrium structures and intermolecular HF vibrational frequencies based on an Ar(n)HF 'two-body' potential energy surface developed from previously determined Ar-Ar and Ar-HF potentials. Isomeric structures are predicted from local minima on these multidimensional surfaces, and are found to be in excellent qualitative agreement with near-IR observations of Ar(n)HF clusters with n=1,2,2, and 4 Ar atoms. Quantum mechanical calculations are performed for the HF librational and van der Waals stretching modes against a rigid Ar(n) frame. In the limit of sufficient Ar atoms to fill the first coordination sphere around the HF, the calculations indicate a nearly perfect concellation of angular anisotropy for HF librational motion, consistent with the nearly free internal rotation of the HF observed in cryogenic Ar matrices.

Thin Dyed-Plastic Dosimeter for Large Radiation Doses.
Final rept.
F. Abdel Rehim, S. Ebraheem, W. Z. Ba, and W. L. McLaughlin. 1992, 8p.
Pub. in Applied Radiation and Isotopes 43, n12 p1503-1510 1992.

Keywords: *Gamma dosimetry, *Film dosimetry, *Dosimeters, Polyvinyl chloride, Phthalocyanines, Polymeric films, Gamma radiation, Spectrophotometry, Performance, Stability, Dyes, Reprints, Radiation processing, Absorbed dose.

A commercially available, thin, dyed-plastic film (mean thickness 30 micrometers) having a transparent green color, changes color progressively to brown shades and then to a deep red shade upon irradiation at successively higher values of absorbed dose (gamma radiation) in the range 8-60 kGy. The analysis for dosimetry is made with spectrophotometric measurements (at visible light wavelengths) of pre-irradiation absorbance, A(0), and radiation-induced absorbance, A(1). Either the wavelength of the maximum of the absorption band that bleaches upon irradiation (wavelength = 425 nm) or the wavelengths of the maxima of the two overlapping radiation-induced absorption bands (wavelength = 525 or 556 nm) are used to make these measurements. The most reproducible calibration consists of the ratio, A(1)/A(0), at a given wavelength, as a function of the absorbed dose. The new film dosimeter is flexible, rugged, and relatively stable at temperatures between -80 C and +50 C, and in daylight. The radiation-induced color, in terms of the absorbance, A(1), at selected wavelengths, is unstable for about two days subsequent to irradiation, after which the values of A(1)/A(0) remain stable for at least several months, even under illumination with white fluorescent or indirect daylight.

Pub. in Nuclear Instruments and Methods in Physics Research A 303, n1 p133-140 1991.

Keywords: *Neutron lifetime, *Lithium fluorides, *Lithium 6, *Boron 10, Vacuum deposition, Preparation, Characteristics, Measurement, Deposits, Silicon, Wafers, Reprints.

In beam experiments, the achievement of an accurate neutron lifetime measurement depends heavily on the use of well characterized boron and/or lithium reference deposits to assess the neutron density. Sets of (6)LiF and (10)B reference deposits on silicon wafers were prepared by vacuum deposition using planetary rotating substrate holders. The uniformity of deposition was investigated using visible light spectrophotometry and accurate dimensional characterization was carried out on the basis of travelling microscope and talistep measurements. The results obtained agreed well with theoretical calculations based on the geometry of the evaporation system. The deposits prepared in successive evaporation runs were then characterized by neutron induced charged particle measurements calibrated by isotope dilution mass spectrometry. (6)Li and (10)B surface densities are certified with accuracies of 0.35-0.50% and 0.30-0.41%, respectively. An intercomparison of the (6)Li and (10)B calibrations confirms the consistency of the measurements.

Keywords: Temperature range 0000-0013 K, Temperature measurement, Neutral atoms, Reprints, *Optical molasses, Polarization gradient cooling, Laser cooling, Atom cooling, Sodium atoms, Cesium atoms, Atomic fountains, Laser trapping.

Temperature measurements on atoms released from optical molasses are found to agree very well with the predictions of the theoretical models of polarization gradient cooling. This agreement extends over a wide range of laser intensity and detuning and even covers values of those parameters where it was originally believed the cooling would not be effective. The lowest temperatures achieved in a 3-D optical molasses are 25 microK and 2.5 microK for sodium and cesium respectively. In each case, this is equivalent to an rms velocity of about three times the recoil velocity.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 40, n2 p78-80 Apr 91.

Keywords: Atomic spectroscopy, Frequency standards, Neutral atoms, Temperature range 0000-0013 K, Reprints, *Optical molasses, Laser cooling, Ultracold atoms, Cesium atoms, Precision measurements.

Reduction of atomic kinetic motion by laser cooling has important applications to atomic frequency standards and other precision measurements. The optical molasses technique, used for cooling neutral atoms, has produced temperatures below 3 microK for cesium atoms, corresponding to an rms velocity of about 13 mm/s. This is considerably lower than the lower limit originally thought to apply to laser cooling and is apparently the lowest kinetic temperature ever measured for three-dimensional cooling. New laser cooling mechanisms have been identified to explain the low temperature.

Keywords: Temperature range 0000-0013 K, Atomic clocks, Doppler effect, Neutral atoms, Reprints, *Optical molasses, Laser cooling, Atom cooling, Sodium atoms, Cesium atoms, Ultracold atoms, Atomic fountains.

Optical molasses is a three-dimensional (3-D) configuration of laser beams used to laser-cool and to confine neutral atoms. Atoms laser cooled in optical molasses reach temperatures much lower than the limit given by the original theories of laser cooling based on the Doppler effect. This cooling below the Doppler-Cooling limit is now seen as being due to new laser cooling mechanisms not present in the original theories. The dependence of the atomic temperature on parameters such as laser intensity and detuning shows good agreement between calculations performed in 1-D and experiments performed in 3-D. For cooling of Na and Cs atoms, the lowest observed temperatures correspond to rms velocities between three and four times the single photon recoil velocity. For Cs the temperature is 2.5 + or - 0.6 microK and is the lowest temperature ever measured for 3-D cooling.

Associative Ionization in Collisions of Slowed and Trapped Sodium.
Final rept.
A. Gallagher. 1991, 11p.
Pub. in Physical Review A 44, n7 p4249-4259, 1 Oct 91.

Keywords: *Atom-atom collisions, *Atomic collisions, Energy transfer, Ionization, Photoabsorption, Reprints, *Sodium atoms, Atom traps.

Collisions of trapped atoms occur over time intervals that are often longer than radiative lifetimes. This leads to radiative interruption of excited-state collision dynamics and constrains collisional interactions to atom pairs that are in close proximity at the time of excitation. Using classical dynamics, I show that this causes Na associative ionization to be dominated by a four-step process in which the longer-range Na(star)-Na interaction initiates inward motion that is completed as Na(star) + Na(star) --> Na2(1+) + e. Thus low-temperature associative ionization does not result from Na(star) + Na(star) collisions. I predict strong single- and two-wavelength dependencies, which have a molecular character due to the close proximity at the time of photoabsorption. These are amenable to experimental observation. I also calculate saturation that results from the depletion of interacting pairs. This produces very-low-power saturation and explains the associative ionization measurements of Gould et al. (Phys. Rev. Lett. 60, 788 (1988)).

Temperature of Optical Molasses for Two Different Atomic Angular Momenta.
Final rept.
C. Gerz, T. Hodapp, P. Jessen, C. Westbrook, K. Molmer, K. Jones, and W. Phillips. 1993, 6p.
Sponsored by Office of Naval Research, Washington, DC.
Pub. in Europhysics Letters 21, n6 p661-666 1993.

Keywords: Fokker-Planck equation, Isotope effects, Temperature dependence, Quantum optics, Neutral atoms, Rubidium 85, Rubidium 87, Reprints, *Rubidium atoms, Laser cooling, Optical molasses.

We have measured the temperature of laser-cooled Rb atoms in optical molasses as a function of laser intensity and detuning. For both (85)Rb and (87)Rb, cooled on the F = 3--> F' = 4 and F = 2 --> F' = 3 transitions, respectively, the temperatures are proportional to the ratio of laser power and detuning for a wide range of these parameters. We observe a small but significant difference between the two isotopes. We also show the results of three-dimensional semi-classical numerical calculations. Our results favor a model which includes atomic localization in optical standing waves.

Some Aspects of Fundamental Neutron Physics.
Final rept.
G. L. Greene. 1990, 9p.
Pub. in Proceedings of Rencontre Moriond New Exotic Phenom., v25 p163-171 1990.

Keywords: *Neutron physics, Sommerfeld constant, Neutron lifetime, Cold neutrons, Fundamental constants, Reprints, Gravitational phase shift, Fine structure constants, Neutron interferometry.

Low energy neutrons provide a tool of great versatility in the investigation of fundamental interactions. Recent experimental work with 'cold' neutrons have addressed such issues as the study of weak interactions, nuclear physics and astrophysics. They have also been employed in the study of invariance principles and for the determination of fundamental constants. This contribution focuses on three particular areas of investigation which reflect this broad nature of neutron physics. The examples discussed include gravitational phase shift experiments with neutron interferometers, the measurement of the neutron lifetime, and the determination of the fine structure constant by a new method.

Pub. in Physical Review A 47, n1 pR9-R12 Jan 93.

Keywords: *Electron-ion collisions, *Electron scattering, *Backscattering, *Argon ions, Total cross sections, Multicharged ions, Electron impact, Excited states, Inelastic scattering, Excitation, R matrix, Reprints, Sodium-like ions.

Measurements of absolute total cross sections for electron-impact excitation of Ar(7+)(3s--> 3p) using a merged-beams electron-energy-loss technique show that near threshold, the inelastically scattered electrons are ejected primarily in the backward direction. This unusual angular scattering has not been previously observed for atoms or ions, but may be typical for multiply charged ions. The total cross sections, measured over an energy range to 2.2 eV above threshold, agree with seven-state R-matrix close-coupling calculations. Both close-coupling and distorted-wave calculations also confirm the backscattering observed in these measurements.

Thermal Hydraulic Tests of a Liquid Hydrogen Cold Neutron Source.
J. D. Siegwarth, D. A. Olson, M. A. Lewis, P. Kopetka, J. M. Rowe, and R. E. Williams. Jul 94, 28p, NISTIR-5026.

Keywords: *NBSR reactor, *Neutron sources, *Cold neutrons, *Moderators, Liquid hydrogen, Hydraulic tests, Thermal testing, Scale models, Thermosyphons.

We have built and tested a simplified full scale model of the planned liquid hydrogen moderator for the cold neutron source of the NIST reactor. The heat load to the liquid hydrogen will be removed to an external refrigerator by means of a thermosyphon. Our experiments showed that this system could be filled, would operate stably, and the gas volume in the moderator chamber would not exceed 20 percent. Results of the tests suggested some improvements to the original designs. The circulation of liquid hydrogen proved to be self-regulating even when the available liquid inflow rate was sufficient to flood the vapor line.

Measurement of the (235)U(n,f) Reaction from Thermal to 1 keV.
Final rept.
R. A. Schrack. 1988, 4p.
Pub. in Proceedings of International Conference on Nuclear Data for Science and Technology, Mito, Japan, May 30, 1988, 4p.

Keywords: *Fission cross sections, *Neutron reactions, *Uranium 235, Milli eV range, EV range 01-10, EV range 10-100, EV range 100-1000, Accelerator facilities, Nuclear fission, Measurement, Boron 10, Reprints.

The neutron induced fission cross section for (235)U has been measured from .02 to 1000 electron volts at the NBS electron LINAC facility. This cross section, especially the integrals from 7.8 to 11 eV and from 100 to 1000 eV is widely used as a standard to normalize shape experiments. A special ion chamber incorporating both the (235)U foils and the (10)B foils used to monitor the neutron beam was built. The geometry of the chamber and the data taking system was designed to give the effect of a common environment and flight path so as to reduce or eliminate background and energy assignment problems. The shape measurements were normalized at thermal. Results are compared to other recent measurements, and ENDF/B-V.

Wavelengths and Isotope Shifts for Lines of Astrophysical Interest in the Spectrum of Doubly Ionized Mercury (Hg III).
Final rept.
C. J. Sansonetti, and J. Reader. 1993, 5p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Physical Review A 47, n4 p3080-3084 Apr 93.

Keywords: *Mercury ions, *Ultraviolet spectra, *Isotope effect, *Spectral shift, *Peculiar stars, Stellar spectra,

Mercury isotopes, Line spectra, Wavelengths, Radio frequency discharge, Multicharged ions, Reprints, Isotope abundance.

Wavelengths and isotope shifts have been measured for the 1738.4-, 1738.5-, 1740.2-, and 2354.2-A lines of Hg III with an uncertainty of 0.002 A. The lines were excited in a pulsed radio-frequency discharged and observed with a 10.7-m normal-incidence vacuum spectrograph. Observations were made with lamps containing natural Hg, (198)Hg, and (204)Hg. By using well-established relative isotope shifts, wavelengths of these four lines for (196)Hg, (200)Hg, (202)Hg, and the centers of gravity for (199)Hg and (201)Hg were also determined. The results provide important data for determining elemental and isotopic abundances of Hg from spectra of Hg-rich chemically peculiar stars.

Keywords: *Neutron beams, *Cold neutrons, *Focusing, Borosilicate glass, Grazing incidence, Thermal neutrons, Neutron transport, Mirrors, Lenses, Reprints, *Neutron focusing, Multiple reflection.

Multiple mirror reflection at small grazing angles from the smooth surfaces of the narrow channels of polycapillary fibers can be used to transport, bend, and focus thermal neutron beams. We report the results of the focusing of a polychromatic cold neutron beam using a compact lens of borosilicate fibers and with a focal distance of 57 mm. The intensity profile of the beam at the focus is approximately conical in shape with a full width at half-maximum of 0.49 mm, and with an average gain in intensity of about 20. These experimental results agree well with those obtained by computer simulation.

Keywords: *Droplets, *Surface temperature, *Evaporative cooling, *Hot surfaces, Heat transfer, Computer programs, Heat flux, Green's function, Water, Vaporizing, Thermal conductivity, Numerical integration.

A computer code is developed and tested which simulates the transient evaporation of a single liquid droplet from the surface of a semi-infinite solid subject to radiant heat input from above. For relatively low temperature incident radiation, it is shown that the direct absorption of radiant energy by the droplet can be treated as purely boundary conditions, while a model for higher temperature incident radiation would require the addition of constant heat source terms. The heat equation is numerically coupled between the liquid and solid domains by using a predictor-corrector scheme. Three one-dimensional solution schemes are used within the droplet: a start-up semi-infinite medium solution, a tridiagonal Crank-Nicholson transient solution, and a steady-state solution. The solid surface temperatures at each time step are calculated through careful numerical integration of an axisymmetric Green's functions solution with the forcing function given by the past lower droplet surface and solid-vapor boundary heat fluxes. The time step is increased after a sensitive initial period to allow for reasonable run times. Two geometry models are included which give the droplet height as a function of current droplet volume and initial wetted radius; the second allows inclusion of the effects of initial contact angle and receding angle. Using water as the liquid and Macor, a low-thermal conductivity material, as the solid, the program output was compared to the experimental results in this line of research. They correlate well to the experiments in which the critical geometric shape factor and evaporation time were most easily measured.

Resonance and Threshold Effects in Polarized X-Ray Emission from Atoms and Molecules.
Final rept.
S. H. Southworth. 1994, 6p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Nuclear Instruments and Methods in Physics Research B 87, p247-252 1994.

Keywords: *X-ray spectra, *Polarized electromagnetic radiation, Inner-shell excitation, Molecular spectra, Atomic spectra, X-ray absorption, Molecular orbitals, Angular distribution, Threshold effects, K shell, Anisotropy, Resonance, Gases, Reprints, *X-ray emission.

Strongly anisotropic and polarized K-V (valence to K-vacancy) X-ray emission has been observed from gas-phase molecules following excitation of a K-shell electron to valence-like subthreshold resonances using a narrow bandwidth, linearly polarized X-ray beam. Distinctively different polarizations and angular distributions are observed for emission involving molecular orbitals of different symmetries. A classical model of the X-ray absorption/emission process accurately describes the observed radiation patterns. Relatively weak polarizations and anisotropies are observed following excitation of atomic subthreshold resonances, due to averaging over unresolved final states. However, resonance and threshold studies of atomic X-ray spectra illustrate the inelastic resonance scattering process and the onset of characteristic fluorescence.

Keywords: *Gas discharges, *Hydrogen plasma, *Deuterium plasma, *Balmer lines, Electron-ion collisions, Electron impact, Gas ionization, Ionization coefficients, H alpha line, Excitation, Reprints.

Measurements have been made of electron-impact ionization and excitation of Balmer lines in low-current, steady-state discharges of hydrogen and deuterium. Results were obtained from spatial scans of H(alpha) lines for E/N ranging from 250 Td to 10 kTd. Here E is the electric field, N is the gas density, and 1 Td=10(exp -21) V meters squared. Ionization and excitation coefficients versus E/N are presented for E/N between 250 and 1,800 Td, and Nd (where d denotes the gap length) between 2.3 X 10(exp 22) and 1.7 X 10(exp 21) per square meter. Excitation coefficients obtained for H(alpha) and D(alpha) are placed on an absolute scale using a standard tungsten lamp calibrated against the blackbody radiation standard. The ionization coefficients are compared with previous experimental and theoretical data, while the excitation coefficients are compared with the calculated values.

Keywords: Hypergeometric functions, Einstein coefficients, Oscillator strengths, Computer calculations, Cross sections, Photoionization, Reprints, *Hydrogen-like ions, Gaunt factor.

Three subroutines are described for the very fast calculation of bound-bound, bound-free, and free-free cross-sections for nonrelativistic hydrogenic systems of arbitrary nuclear charge and reduced mass. The first two are essentially exact, being based on recursion relations which are known to be stable. The third evaluates the thermally-averaged free-free Gaunt factor by means of a two-dimensional Chebyshev expansion calculated by numerical evaluation of the cross-sections expressed as hypergeometric functions, augmented by other analytical approximations.

Keywords: *Erbium ions, *Ytterbium ions, *Hafnium ions, *Tungsten ions, *Platinum ions, *X ray spectra, Soft x-rays, Multicharged ions, Isoelectronic sequence, TEXT devices, Plasma spectra, Metal films, Laser ablation, Reprints, *Rhodium-like ions.

The TEXT tokamak was used to obtain spectra of highly ionized Er, Yb, Hf, W, and Pt. Injection of these elements into the plasma was achieved by laser ablation of thin films of metal deposited on glass slides and mounted at the inner wall of the vessel. The spectra were photographed with a 2.2-m grazing-incidence spectrograph set at a grazing angle of 4 deg. These spectra occur in a very small wavelength interval, for example about 2 A at 50 A in W. In this spectral range we previously classified lines of the Ag and Pd isoelectronic sequences. We have now classified lines of the Rh isoelectronic sequence 4d(9)-4d(8)4f, which accounts for the remaining strong lines in this dense but well-resolved group. No lines of this array have previously been identified. They were classified by comparison of observed and calculated transition energies along the isoelectronic sequence.

Keywords: *Atomic collisions, *Sodium, Hyperfine structure, Laser spectroscopy, Reprints, Associative ionization, Ultracold atoms, Laser cooling, Millikelvin temperature.

We observe a new resonance structure in the associative ionization spectrum of laser-cooled sodium due to the collision of two atoms in different ground hyperfine states. This associative ionization is due to doubly resonant excitation at moderate internuclear separation through intermediate molecular states. Substructure within this resonance is evidence for the role of molecular bound states in this process. We present calculations modeling the effect of ground-state hyperfine structure, the importance of which was unanticipated in earlier theoretical studies.

Pub. in Physical Review Letters 66, n2 p157-160, 14 Jan 91.

Keywords: *Electron-ion collisions, *Silicon ions, Multicharged ions, Electron impact, Cross sections, Excitation, Reprints, Electron energy loss spectroscopy.

For the first time, absolute cross sections for electron-impact excitation of a multiple charged ion have been measured using an electron-energy-loss technique. Cross sections for e+Si(3+) 3s doublet S(1/2) --> e+Si(3+) 3p doublet P(1/2,3/2) - 8.88 eV have been measured with an accuracy of + or - 20% (at 90%-confidence level) over a narrow energy range (+ or - 0.6 eV) about the threshold energy with an energy resolution of 0.2 eV. Results are in good agreement with close-coupling calculations.

Magneto-Optical Trapping of Metastable Xenon: Isotope-Shift Measurements.
Final rept.
M. Walhout, H. J. L. Megens, A. Witte, and S. L. Rolston. 1993, 4p.
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Physical Review A 48, n2 pR879-R882 Aug 93.

Keywords: *Trapped particles, *Xenon isotopes, *Isotope effect, *Magnetooptics, Metastable state, Zeeman effect, Spectral shift, Hyperfine structure, Reprints, Atom traps, Laser cooling.

We have magneto-optically trapped the nine stable isotopes of xenon. Using the Zeeman slowing method to decelerate a beam of xenon atoms in the metastable 6s 3/2 (3/2)(sub 2) state (notation representing nl J(core) (K = J(core) + l)(sub J)), we load our trap to a collisionally limited density of more than 10(exp 10) atoms/cc. The two odd isotopes are trapped without a repumping frequency, even though they have hyperfine structure. The sensitivity of the trapping process to the laser frequency is exploited to make accurate measurements of the isotope shifts for the 6s 3/2 (3/2)(sub 2) --> 6p 3/2 (5/2)(sub 3) laser-cooling transition and of the hyperfine constants for (131)Xe.

Measurements of the Virial Coefficients and Equation of State of the Carbon Dioxide + Ethane System in the Supercritical Region.
Final rept.
L. A. Weber. 1992, 22p.
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in International Jnl. of Thermophysics 13, n6 p1011-1032 Nov 92.

Keywords: *Virial equation, *Binary mixtures, *Carbon dioxide, *Ethane, *Equations of state, Density(Mass/volume), Critical pressure, Critical temperature, Thermophysical properties, Temperature dependence, Reprints, Phase boundaries.

Gas-phase densities of the system carbon dioxide + ethane were measured with a Burnett apparatus at 320 K and at pressures up to approximately 10 MPa. Measurements were made on systems having carbon dioxide mole fractions of 0, 0.25166, 0.49245, 0.73978, and 1. Second and third virial coefficients were determined for each composition, and the cross virial coefficients were calculated. Comparisons were made with other recent high-quality measurements on this system. For each mixture composition PdT measurements were made on five isochores having densities within + or - 30% of the critical density. Temperatures varied from 288 to 320 K. The two-phase boundary was determined and estimates are given for Tc and Pc for each composition.

Pub. in Physica Scripta 41, n4 p487-489 1990.

Keywords: *Photoelectron spectroscopy, *Photoionization, *Nitrogen, Near infrared radiation, High resolution, Rydberg series, Nitrogen ions, Autoionization, Reprints.

This is a preliminary report on a series of measurements, using high optical resolution, on the photoionization of the nitrogen molecule in the wavelength region 740 - 780A where there are at least five Ryberg series converging onto the lst excited state of N2(1+) A doublet Pi(u). An advanced electron spectrometer system is used which provides measurements of the angular distribution parameter beta for three members of the ground state of the ion, on a wavelength mesh sufficient to show variations in beta over the width of the autoionizing lines. This study was undertaken to assist in the identification of these series, and to encourage further theoretical work on interaction between electronic and vibrational motion in the region of autoionizing resonances.

C. I. Westbrook, and W. D. Phillips. 1991, 3p.
Pub. in McGraw-Hill Yearbook of Science and Technology, p208-210 1991.

Keywords: Temperature range 0000-0013 K, Range(Extremes), Atomic mobilities, Atomic clocks, Doppler effect, Limits, Reprints, *Laser cooling, Millikelvin temperature, Photon recoil.

Laser cooling can reduce the thermal motion of atoms in a gas. Such cooling has achieved temperatures less than one millikelvin. The traditional view of laser cooling involves the Doppler-effect induced velocity dependence of light absorption and predicts a limit on the lowest achievable temperature. The energy imparted to an atom from a single photon recoil also implies a separate limit. Recent experiments have shown that both of these limits can be broken with the help of new laser cooling mechanisms.

D. J. Wineland, J. J. Bollinger, W. M. Itano, F. L. Moore, and D. J. Heinzen. 1992, 4p.
Pub. in Physical Review A 46, n11 pR6797-6800, 1 Dec 92.

Keywords: *Atomic spectroscopy, Atomic clocks, Frequency standards, Reprints, Squeezed states(Quantum theory), Quantum noise, Correlated states.

We investigate the quantum-mechanical noise in spectroscopic experiments on ensembles of N two-level (or spin-1/2) systems where transitions are detected by measuring changes in state population. By preparing correlated states, here called squeezed spin states, we can increase the signal-to-nose ratio spectroscopy (by approximately N(exp 1/2) in certain cases) over that found in experiments using uncorrelated states. Possible experimental demonstrations of this enhancement are discussed.

Multiphoton Ionization Spectroscopy Measurements of Silicon Atoms during Vapor Phase Synthesis of Ceramic Particles.
Final rept.
M. R. Zachariah, and R. G. Joklik. 1990, 7p.
Pub. in Jnl. of Applied Physics 68, n1 p311-317 1990.

Keywords: *Vapor phases, *Silicon, *Particle production, *Ceramics, *Ionization, *Chemical vapor deposition, Chemical reactors, Silanes, Spectrum analysis, Concentrating, Clumps, Particle size distribution, Reprints, *Silicon atoms, Multiphoton ionization spectroscopy.

Resonance Enhanced Multi-Photon Ionization spectroscopy has been applied to the problem of detection of gas phase species in a dense particle forming flow. Relative silicon atom profiles of an atmospheric pressure flame reactor producing silica particles have been made using a '2 + 1' ionization scheme. The results have shown that silicon atoms are confined to a very narrow time window in the reactor (less than 15 msec). In addition, the non-resonant background indicated the presence of ionizable clusters and could be a valuable tool for observing the presence and location of small clusters. The effect of varying silane loading changed both the location and magnitude of the silicon concentration observed. The results suggest that chain branching chemistry is important in the production of silicon and that enhancement of pyrolytic relative to oxidative processes occurs as the silane loading is increased.

Effect of Splitting on Estimation of Emission Rate Profiles from Neutron Depth Profiling Spectra.
Final rept.
K. J. Coakley. 1994, 5p.
Pub. in Proceedings of 1993 Section on Physical and Engineering Sciences of the American Statistical Association, San Francisco, CA., August 8-12, 1993, p77-82 1994.

Keywords: Stopping rules(Mathematics), Iterative methods, Estimating, Reprints, *Neutron depth profiling, Cross validation, Data splitting, EM algorithm.

Based on Neutron Depth Profiling spectra, emission rate profiles are estimated using a data splitting and cross-validation approach. In the procedure, data are split into a variable number of parts. From each part, emission rate profiles are estimated using the iterative EM algorithm. The algorithm is halted according to a cross-validation criterion. The estimates from all parts are averaged. As the split becomes finer, the stopping point is reached sooner and the estimate gets smoother. Mean and variance curves are computed for simulated data. An experimental data set is analyzed.

Pub. in Physical Review A 48, n6 p4286-4291 Dec 93.

Keywords: *Electron-ion collisions, *Indium ions, *Xenon ions, Ionization cross sections, EV range 10-100, EV range 100-200, Electron impact, Excited states, Colliding beams, Autoionization, Reprints.

Absolute ionization cross sections for In(1+) and Xe(1+) by electron impact have been measured from below threshold to 200 eV using the crossed-beams technique. The cross sections for In(1+) were possibly enhanced by indirect ionization processes. The excitation of the ion from the 4d(10)5S(2) ground state to the 4d(9)5S(2)5P state followed by autoionization has been postulated. The In(1+) cross sections show a peak value at about 80 eV. The cross sections for Xe(1+) peak at a value at about 35 eV. Also presented are ionization-rate coefficients and fitting parameters for both ions for temperatures in the range 10(exp 4) K = or < T = or < 10(exp 7) K.

Contract NASA-C-32009-M
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Physical Review E 48, n3 p1799-1805 Sep 93.

Keywords: *Critical point, *Liquid-vapor interfaces, Density distribution, Thermodynamic properties, Heat transfer, Relaxation(Mechanics), Temperature gradients, Reprints, *Thermal equilibrium.

Two calculations are presented that clarify how the density profile equilibrates near the liquid-vapor critical point. Both use the equation of heat transfer recently improved to account for the large compressibility near the critical point. Previous work by others indicated that in one dimension the slowest mode of this equation relaxes at a rate four times faster than that predicted by the older, usual equation of heat transfer. However, this is not always true in higher dimensions. The first calculation demonstrates this for the cases of isobaric modes excited by temperature gradients in a rectangle and in a thin disk. For thin experimental cells with isothermal walls the slowest mode is accurately estimated by the usual heat-transfer equation. The second calculation indicates that gravity-induced stratification plays an insignificant role in determining the final relaxation rate. This is done by estimating the size of the V (center dot) Del P term in the improved heat-transfer equation.

Sponsored by Office of Naval Research, Arlington, VA. and National Science Foundation, Washington, DC.
Pub. in Physical Review A 48, n1 p525-545 Jul 93.

Keywords: *Trapped particles, *Ion storage, Beryllium ions, Electrostatics, Reprints, Nonneutral plasmas, Ion plasmas, Ion traps, Laser cooling, Penning traps, Paul traps.

The electrostatic modes of a non-neutral plasma confined in a Penning or Paul (rf) trap are discussed in the limit that the Debye length is small compared to the plasma dimensions, and the plasma dimensions are small compared to the trap dimensions. In this limit, the plasma shape is spheroidal and analytic solutions exist for all of the modes. The solutions for the modes of a Paul-trap plasma are a special case of the modes of a Penning-trap plasma. A simple derivation of some of the low-order quadrupole modes is given. Experimental measurements of these mode frequencies on plasmas of laser-cooled Be(+) ions in a Penning trap agree well with the calculations. A general discussion of the higher-order modes is given. The modes provide a nondestructive method for obtaining information on the plasma density and shape. In addition, they may provide a practical limit to the density and number of charged particles that can be stored in a Penning trap.

Dynamic Technique for Measuring Normal Spectral Emissivity of Electrically Conducting Solids at High Temperatures with a High-Speed Spatial Scanning Pyrometer.
Final rept.
A. Cezairliyan, and A. P. Miiller. 1993, 6p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in International Jnl. of Thermophysics 14, n5 p1109-1114 1993.

Keywords: *Temperature measurement, *Spectral emission, *Molybdenum, Temperature range 1000-4000 K, High temperature, Optical measurement, Blackbody radiation, Electric conductors, Pyrometers, Emissivity, Reprints.

A dynamic (subsecond) technique is described for measuring normal spectral emissivity of electrically conducting solids at high temperatures, primarily in the range 1800 K up to near their melting point. The basic method involves resistively heating a tubular specimen from ambient temperature through the temperature range of interest in less than 1 s by passing an electrical current pulse through it, while using a high-speed spatial scanning pyrometer to measure spectral radiance temperatures along a 25-mm length on the specimen. This portion of the specimen includes a small rectangular hole that approximates a blackbody cavity. Measurements of spectral radiance temperature of the specimen surface as well as specimen true temperature enable the determination of the normal spectral emissivity of the surface via Planck's law. The applicability of the technique is demonstrated by measurements performed on molybdenum in the range 1900-2850 K.

Keywords: *Neutron beams, *Neutron transport, *Cold neutrons, Neutron guides, Grazing incidence, Borosilicate glass, Reprints, *Neutron focusing lenses, Neutron reflection, Polycapillary fibers.

Multiple mirror reflection at small grazing angles from the smooth surfaces of the narrow channels of polycapillary fibers can be used to transport, bend, and focus thermal neutron beams. We report the results of the focusing of a polychromatic cold neutron beam using a compact lens of borosilicate fibers and with a focal distance of 57 mm. The intensity profile of the beam at the focus is approximately conical in shape with a full width at half-maximum of 0.49 mm, and with an average gain in intensity of about 20. These experimental results agree well with those obtained by computer simulation.

Hydrogen Balmer Alpha Line Shapes for Hydrogen-Argon Mixtures in a Low-Pressure rf Discharge.
Final rept.
S. Djurovic, and J. R. Roberts. 1993, 8p.
Pub. in Jnl. of Applied Physics 74, n11 p6558-6565, 1 Dec 93.

Keywords: *Hydrogen plasma, *Balmer lines, *Atom-atom collisions, *Ion-atom collisions, Radio frequency discharge, Line broadening, Doppler effect, Plasma spectra, Argon plasma, Line shape, Gas mixtures, Reprints, Reference cells.

The spectral and spatial profiles of atomic hydrogen emission (the Balmer lines H(alpha) and H(beta)) from a low-pressure rf (13.56 MHz) discharge in H2 + Ar mixtures have been studied. The plasma emission was observed in a direction normal to the applied electric field. The H(alpha) profiles exhibit central narrow components and wide components which are due to Doppler broadening. Comparisons of the H(alpha) profiles in a pure hydrogen plasma with those in H2 + Ar mixtures show that collisions of molecular hydrogen ions and hydrogen atoms with argon atoms play a significant role in the production of the H(alpha) profile shapes.

Semiclassical Explanation of the Generalized Ramsauer-Townsend Minima in Electron-Atom Scattering.
Final rept.
W. F. Egelhoff. 1993, 4p.
Pub. in Physical Review Letters 71, n18 p2883-2886, 1 Nov 93.

Keywords: *Electron-atom collisions, *Ramsauer effect, Electron scattering, Reprints, Semiclassical methods.

The generalized Ramsauer-Townsend minima which occur, at certain scattering angles, in the intensity of electrons elastically scattered by atoms have been a subject of interest in atomic physics for over sixty years. While quantum mechanical calculations predict these minima with great accuracy, no clear, simple, intuitively appealing description of the underlying scattering processes has been given. It is shown here for the first time that simple semiclassical calculations provide such a description.

Polarization Effects on Multiple Scattering Gamma Transport.
Final rept.
J. E. Fernandez, J. H. Hubbell, A. L. Hanson, and L. V. Spencer. 1993, 52p.
Pub. in Radiation Physics and Chemistry 41, n4/5 p579-630 1993.

Keywords: *Polarization(Waves), *Gamma ray scattering, *X-ray scattering, *Photon-electron collisions, Polarized electromagnetic radiation, Photoelectron emission, Rayleigh scattering, Compton effect, Multiple scattering, Polarized beams, Backscattering, Reprints.

The scattering of X-rays and gamma-rays are events that have strong dependencies on the polarization of the incident and scattered photons. Because of this, scattering problems that can be solved without explicit reference to the state of polarization of the incident and scattered radiation are exceptional. This article reviews available information on polarization effects arising when photons in the X-ray and gamma-ray regime undergo photoelectric effect, coherent (Rayleigh) scattering and incoherent (Compton) scattering by atomic electrons. In addition to descriptions and discussion of these effects, we study the backscattering of gamma-rays from an infinite thickness target excited with a plane slant monodirectional and monochromatic source, using the Boltzmann transport theory and the mathematical representation of polarization introduced by Stokes. Results from this model, for both unpolarized and polarized gamma-ray sources, are compared with computations performed neglecting or averaging polarization effects, showing the limitations of such approximations.

Keywords: *Electron beams, *Calibration, *Calorimeters, *Radiation doses, MeV range 1-10, MeV range 10-100, Temperature measurement, Industrial production, Thermistors, Reprints, *Graphite calorimeters, Radiation processing.

A multi-body graphite calorimeter has been designed for the absolute calibration of high-intensity electron beams in the energy regime of 2 to 12 MeV. This novel calorimeter consists of eight thermally and electrically insulated disks of high-purity graphite that serve as the active calorimetric bodies, arranged in a stacked array and oriented so that the flat surfaces are perpendicular to the electron-beam axis. Calibrated thermistors imbedded in the disks act as temperature sensors. The temperature of each disk is measured in real-time during irradiation by a scanning multichannel digital meter interfaced with a computer-based data acquisition system. The resultant data provide a depth-dose profile from which the electron energy can be calculated. Calorimeters of this type would be useful in standardizing the absorbed dose to passive routine dosimeters in the range of 100 Gy to 50 kGy, typical of that delivered by industrial processing electron beams.

When a quantum state is subjected to a measurement and the state is not an eigenstate of the dynamical variable being measured, the outcome is unpredictable. Only the probabilities of the various possible outcomes are predicted by theory. This phenomenon is sometimes discussed in terms of 'wavefunction collapse.' Trapped ions can be used for real, as opposed to 'gedanken' demonstrations of this basic process. In the experiments described here, a single ion, or a few identical ions, were prepared in well defined superpositions of two internal energy eigenstates. The populations of the energy levels were then measured. When the state amplitudes were equal, the population fluctuations were greater than when one of the amplitudes was nearly zero, in agreement with the predictions of quantum mechanics. In other experiments, such as those with atomic beams, the number of atoms under observation fluctuates, and this obscures the fluctuations from other sources. However, if the number of atoms is small and constant, the fundamental quantum mechanical fluctuations can be observed.

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in Spectral Line Shapes, v6 p191-205 1990.

Keywords: *Photon-atom collisions, *Atomic collisions, Molecular spectroscopy, Alkali metals, Bound state, Neutral atoms, Temperature range 0000-0013 K, Dimers, Reprints, Laser cooling, Laser trapping, Atom traps, Ultracold atoms, Millikelvin temperature, Associative ionization, Photoassociation spectroscopy.

Recent developments in laser cooling and trapping of neutral atoms have opened the new field of atomic collisions at ultracold temperatures, T < 1 mk. This field offers many new challenges and opportunities for both theory and experiment in the general area of spectral line shapes. We will outline here some of the key problems in this field, and present calculations on several collisional processes which have been observed in atom traps. First the very unusual energy, time and distance scales encountered in ultracold collisions will be described. Second, the molecular physics of excited plus ground alkali dimers will be examined, and the T-dependent rate coefficients will be calculated for processes which lead to loss of alkali atoms from an atom trap. Finally, a new kind of free-bound molecular spectroscopy, photoassociation spectroscopy, will be described which should permit the observation of long range molecular bound states extremely close to the molecular dissociation limit.

Practical Applications of the ITS-90: Inherent Uncertainties.
Final rept.
B. W. Mangum, E. R. Pfeiffer, and G. F. Strouse. 1991, 12p.
Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., January 31-February 1, 1991, 12p.

Keywords: *Temperature measurement, Temperature range 0013-0065 K, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Resistance thermometers, Platinum, Error analysis, Calibration, Uncertainty, Reprints, *International Temperature Scale of 1990, *ITS-90, Fixed points.

We report results of a study of the non-uniqueness of the ITS-90 at temperatures in the range 13.8033 K to 933.473 K (660.323 C) of a variety of capsule-type and long-stem type standard platinum resistance thermometers (SPRTs). The capsule SPRTs were calibrated by comparison techniques and at some fixed points of the ITS-90; the long-stem SPRTs were calibrated at the relevant defining fixed points. In addition, we present results on subrange inconsistencies for several partly overlapping ranges of the ITS-90. Error propagation curves and errors introduced by extrapolations will be discussed also.

ESR-Based Analysis in Radiation Processing.
Final rept.
W. L. McLaughlin, M. F. Desrosiers, and M. C. Saylor. 1993, 27p.
Sponsored by Johnson and Johnson, New Brunswick, NJ.
Pub. in Proceedings of International Kilmer Memorial Conference on the Sterilization of Medical Products, Brussels, Belgium, June 13-15, 1993, p213-239.

Keywords: *Electron spin resonance, *Dosimetry, Radiation doses, Radiation effects, Nuclear medicine, Sterilization, Food irradiation, Polymers, Alanines, Uses, Reprints, *Radiation processing, *ESR dosimetry.

Electron spin resonance (ESR) spectrometry has attracted attention in radiation processing. Not only is ESR analysis of alanine achieving success as a reference dosimetric system, but ESR also provides a means of evaluating short- and long-term effects of radiation on polymers, composites and ceramics, and in the post-irradiation analysis and imaging of absorbed dose in teeth and bone. The broad range of doses (10(exp -1) - 10(exp 8) Gy) and dose rates (up to 10(exp 8) Gy/s) measurable with relatively high precision and accuracy, and the small size, ruggedness, and inexpensiveness of sensor materials, such as L-alpha-alanine pellets and films and other sensor materials (e.g., hydroxyapatite, sugar, quartz, cellulose, etc.), make ESR dosimetry attractive for radiation sterilization dosimetry, radiation treatment planning, nuclear medicine dosimetry, food irradiation and the study of radiation effects on materials. Within the next few years, there may well be impact of this ESR-based analysis on international radiation standards practices and 2D and 3D imaging of radiation dose distributions, especially as the trend toward lowering the cost of the analytical equipment and simplifying its operation continues. ESR dosimetry may, in fact, be the future method of choice for interlaboratory transfer metrology, process validation, and measurement quality assurance.

Measurement of Surface Tension of Tantalum by a Dynamic Technique in a Microgravity Environment.
Final rept.
A. P. Miiller, and A. Cezairliyan. 1993, 13p.
Pub. in International Jnl. of Thermophysics 14, n5 p1063-1075 1993.

Keywords: *Interfacial tension, *Tantalum, *Weightlessness simulation, *High temperature, Melting points, Research aircraft, Dynamic tests, Thermophysical properties, Reprints.

A dynamic technique has been used in a microgravity environment to measure the surface tension of tantalum at its melting point. The basic method involves resistively heating a tubular specimen from ambient temperature to temperatures above its melting point in about 1 s by passing an electrical current pulse through it, while simultaneously measuring the pertinent experimental quantities with millisecond resolution. A balance between the magnetic and the surface tension forces acting on the specimen is achieved by splitting the current after it passes through the specimen tube and returning a fraction of the current along the tube axis and the remaining fraction concentrically outside of the specimen. Values for surface tension are determined from measurements of the equilibrium dimensions of the molten specimen tube and the magnitudes of the currents. Rapid melting experiments were performed during microgravity simulations with NASA's KC-135 aircraft and the results were analyzed, yielding a value of 2.07 + or - 0.06 N/m for the surface tension of tantalum at its melting point.

Sponsored by Department of Energy, Washington, DC.
Pub. in Physical Review A 47, n4 p3000-3006 Apr 93.

Keywords: *Electron-atom collisions, *Sodium, Polarization(Spin alignment), Optical pumping, EV range 1-10, EV range 10-100, Electron scattering, Elastic scattering, Asymmetry, Reprints.

Angle-resolved ratios of the separate triplet and singlet spin channel cross sections have been measured for elastic scattering of spin-polarized electrons from optically pumped spin-polarized sodium atoms. The triplet-to-singlet ratios are reported at incident energies of 4.1, 10.0, and 20.0 eV for scattering angles from 20 deg to 140 deg. The data demonstrate that spin-exchange scattering plays an important role in the description of electron scattering from sodium at these energies. Comparisons are made with the results of several close-coupling theoretical calculations.

Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Jnl. of the Optical Society of America B 9, n11 p1997-2007.

Keywords: Fokker-Planck equation, Diffusion coefficient, Magnetic fields, Numerical solution, Magnetooptics, Reprints, *Optical molasses, *Atom cooling, Polarized gradient cooling, Atom traps.

We investigate the effect of a longitudinal magnetic field on the orientational cooling mechanism that operates both in sigma(+) - sigma(-) optical molasses and in a magneto-optical trap. For an atom with different Lande g factors in its ground and excited states, single-photon scattering and stimulated Raman scattering are resonant at different field-dependent velocities. The sharp polarization-gradient feature in the force-versus-velocity curve may therefore be translated to a velocity at which the Doppler force is dominant. In addition to this, we find that the momentum diffusion coefficient can grow as the field is increased. By numerically solving a semiclassical Fokker-Planck equation, we show that these effects lead to a field-induced inhibition of efficient sub-Doppler cooling for atoms with unequal g factors. Our treatment also enables us to discuss other phenomena that are accessible only if both Doppler and polarization-gradient effects are included in the calculation.

Pub. in Jnl. of Applied Physics 75, n1 p115-125 Jan 94.

Keywords: *Radio frequency discharge, *Gas discharges, *Argon ions, Argon plasma, Kinetic energy, Reprints, Reference cells.

Kinetic-energy distributions are presented for ions sampled from 13.56-MHz discharges in argon in a capacitively-coupled, parallel-plate, Gaseous Electronics Conference (GEC) radio-frequency reference cell. The cell was modified to allow sampling of ions through an orifice in the grounded electrode. Kinetic-energy distributions are presented for Ar(1+), Ar(2+), Ar2(1+), and ArH(1+), and several trace ions for plasma pressures ranging from 1.3 Pa, where ion-atom collisions in the plasma sheath are not important, to 33.3 Pa, where collisions are important. Applied peak-to-peak radio-frequency (rf) voltages of 50, 100, and 200 V were used, and the current and voltage waveforms at the powered electrode were measured. Dependences of the ion fluxes, mean energies, and kinetic-energy distributions on gas pressure and applied rf voltage are interpreted in terms of possible ion-collision processes.

Labeling Conventions in Isoelectronic Sequences - Reply.
Final rept.
E. B. Saloman, and Y. K. Kim. 1990, 2p.
Pub. in Physical Review A 42, n3 p1824-1825 1990.

Keywords: *Isoelectronic sequence, Atomic energy levels, Relativistic effects, Multicharged ions, Electron correlation, Labelling, Reprints, *Sulfur-like ions.

We agree with the Comment by Maniak and Curtis (Phys. Rev. AI (1990)) that qualitative isoelectronic behavior of low-lying energy levels of sulfur-like ions with high nuclear charges, Z, can easily be understood using single jj configuration labels. However, such labels are, in general, useful only for high-Z ions. We do not recommend mixing numerical results from multiconfiguration calculations with those from single configuration calculations because such a mixed usage may introduce artificial discontinuities in Z dependence, defeating the main advantage of studies along an isoelectronic sequence.

High resolution imaging of magnetic microstructure has important ramifications for both fundamental studies of magnetism and the technology surrounding the magnetic recording industry. A focused beam of electrons excites secondary electrons on a ferromagnet's surface. The secondaries leave the solid with an electron spin polarization which is characteristic of the net spin density in the ferromagnet. This is related directly to the sample magnetization. By scanning the beam and analyzing the secondary electron spin polarization at each point, a magnetization map of the ferromagnet's surface is generated.

How Accurate Are the Josephson and Quantum Hall Effects and QED.
Final rept.
B. N. Taylor, and E. R. Cohen. 1991, 5p.
Pub. in Physics Letters A 153, n6-7 p308-312 1991.

Keywords: *Quantum electrodynamics, *Josephson effect, Fundamental constants, Sommerfeld constant, Accuracy, Reprints, *Quantum Hall effect, Von Klitzing constant, Fine structure constant.

We assess the accuracy of the theories of the Josephson and quantum Hall effects by testing precisely the exactness of the theoretically predicted relations K(J) = 2e/h and R(K) = h/e(squared), where K(J) and R(K) are the phenomenological Josephson and von Klitzing constants, respectively. Using the reported results of the most accurate determinations of various fundamental constants and related quantities currently available, we find K(J)/(2e/h) = 1 - (219 + or - 103) X 10(exp -9) and R(K)/(h/e(squared)) = 1 + (60 + or - 22) X 10(exp -9). If, as theory predicts, the relations are assumed to be exact, quantum electrodynamics (QED) may be tested precisely by comparing the QED value of the inverse fine-structure constant obtained from the electron magnetic moment anomaly, with the essentially QED-independent value derived from all of the other data.

Pub. in Proceedings of ASTM-EURATOM Symposium (7th) on Reactor Dosimetry, Strasbourg, France, August 27-31, 1990, p371-375.

Keywords: *Niobium 93 target, *Neutron reactions, *Neutron cross sections, Neutron monitors, Fast neutrons, Fission spectra, Metastable state, Radioactivation, Dosimetry, Uranium 235, Niobium 92, Reprints.

When niobium is used as a fast neutron monitor, the isotopes (93m)Nb and (92m)Nb are produced. Much interest has been placed on the (93)Nb(n,n') (93m)Nb reaction because of the long half life of the product isotope and the low threshold energy of the reaction. On the other hand, the (93)Nb(n,2n) (92m)Nb reaction product has a half life of 10.1 days and the reaction has a threshold energy of about 9 MeV. It is useful for relatively short irradiations and for cases in which information is desired about high energy neutrons, such as in fusion applications. The spectrum-averaged cross section for the reaction (93)Nb(n,2n) (92m)Nb in a (235)U fission spectrum has been measured. The measured value is 0.433 + or - 0.017 mb. Comparisons are made with calculated values.

Keywords: *Gravitation, *Gravity, Basic interactions, Validation, Measurement, Towers, Tests, Reprints, Inverse square laws, Fifth force.

Eckhardt et al (1988) point out that gravity measurements on towers provide a straightforward way of testing Newton's inverse square law of gravitation, whose validity in the distance range of 10-1000 m has been repeatedly questioned during the last decade. Eckhardt et al (loc. cit.) and Romaides et al (1989) have interpreted their measurements on the 600 m WTVD tower in North Carolina as evidence for non-Newtonian gravitation. This paper describes a similar experiment using a 300 m meteorological tower at Erie on the plains of Colorado some 20 km east of Boulder. Gravity was measured at eight levels and, in contrast with the results from North Carolina, these measurements are in excellent agreement with values obtained by upward continuation of surface values using Newton's inverse square law.

L. P. Howard, and E. C. Teague. 1994, 5p.
Pub. in Proceedings of American Society for Precision Engineering Annual Meeting, Cincinnati, OH., October 2-7, 1994, p13-17.

Keywords: *Atomic force microscopy, *Calibration, Electrical measurement, Prototypes, Tribology, Pens, Reprints, *Force measurement, *Nanohardness, NanoNewton forces, Nanotechnology, Force balances.

The paper describes an instrument and experiments for calibrating forces encountered with atomic force microscopes (AFMs) and nanohardness instruments. Calibration needs of such instruments are examined and a prototype calibration instrument is briefly introduced. Our force balance performs nulling measurements using a capacitance gage for displacement detection, a magnet and coil actuator for application of nulling forces and a Proportional Integral Derivative (PID) control system. Experiments using electrical power measurements to calibrate the force balance magnet and coil actuator are described. Our experiments were modeled after Absolute Ampere and kilogram comparisons to S1 electrical units. Actual applied forces of tens of microNewtons were compared against the electrical calibrations to an agreement of approximately 3%. For forces of tens of microNewtons, type A uncertainties of approximately 14 nN were observed with estimated type B uncertainties of about 1.7% as a coefficient of variation (CV).

Pub. in Proceedings of International School of Physics: Laser Manipulation of Atoms and Ions, Varenna, Italy, July 9-19, 1991, p553-567 1992.

Keywords: *Ion storage, Trapped particles, Hyperfine structure, Atomic spectroscopy, Laser spectroscopy, High resolution, Radiation pressure, Optical spectra, Beryllium ions, Beryllium 9, Mercury ions, Mercury 199, Reprints, Laser cooling, Penning traps, Paul traps.

These lecture notes summarize the work performed by the Ion Storage group of NIST in the year preceeding July, 1991. Specific topics discussed are (1) the measurement of a hyperfine pressure shift in (9)Be(1+); (2) construction and testing of a Paul trap with linear geometry; (3) density limitations in a Penning trap; (4) a search for anomalous spin-dependent forces using spectroscopy of (9)Be(1+) ions; (5) the theory of Sisyphus cooling for a bound atom; (6) the observation of 'atomic projection' noise; (7) a precision measurement of the g(j) factor of Mg(1+); (8) subharmonic excitation of a single electron; (9) observation of time varying radiation pressure forces; and (10) high resolution optical spectroscopy of (199)Hg(1+) ions.

Pub. in Proceedings of International School of Physics: Laser Manipulation of Atoms and Ions, Varenna, Italy, July 9-19, 1991, p539-552 1992.

Keywords: *Ion storage, *Atomic spectra, Atomic spectroscopy, High resolution, Hyperfine structure, Laser spectroscopy, Beryllium ions, Beryllium 9, Mercury ions, Mercury 199, Reprints, Laser cooling, Penning traps, Paul traps, Nonneutral plasmas.

Techniques for obtaining high-resolution atomic spectra of laser-cooled ions are illustrated by on-going experiments at NIST. In one experiment, an rf oscillator is locked to a nuclear spin-flip hyperfine transition (frequency approx = 3.03 X 10(exp 8) Hz) in (9)Be(1+) ions which are stored in a Penning trap and sympathetically laser-cooled. Stability is better than 3 X 10(exp -12) tau (sup -1/2) and uncertainty in Doppler shifts is estimated to be less than 5 X 10(exp -15). In a second experiment, a stable laser is used to probe an electric quadrupole transition (frequency approx = 1.07 X 10(exp 15) Hz) in a single laser-cooled (199)Hg(1+) ion stored in a Paul trap. The measured Q value of this transition is approximately 10(exp 13). Future possible experiments are also discussed.

Keywords: *Positron sources, Ion storage, Beryllium ions, Beryllium 9, Feasibility, Reprints, Laser cooling, Penning traps, Millikelvin temperature, Nonneutral plasmas.

We examine, theoretically, the feasibility of producing a sample of cold (= or < 4 K), high-density (approx 10(exp 10)/cc) positrons in a Penning trap. We assume (9)Be(1+) ions are first loaded into the trap and laser-cooled to approximately 10 mK where they form a uniform density column centered on the trap axis. Positrons from a moderator are then injected into the trap along the direction of the magnetic field through an aperture in one endcap of the trap so that they intersect the (9)Be(1+) column. Positron/(9)Be(1+) Coulomb collisions extract axial energy from the positrons and prevent them from escaping back out the entrance aperture. Cooling provided by cyclotron radiation and sympathetic cooling with the laser-cooled (9)Be(1+) ions causes the positrons to eventually coalesce into a cold column along the trap axis. We present estimates of the efficiency for capture of the positrons and estimates of densities and temperatures of the resulting positron column. Positrons trapped in this way may be interesting as a source for antihydrogen production, as an example of a quantum plasma, and as a possible means to produce a bright beam of positrons by leaking them out along the axis of the trap.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Vibration Monitoring and Control, San Diego, CA., July 28-29, 1994, v2264 p20-26.

Keywords: *Vibration isolators, Computerized control systems, Pneumatic servomechanisms, Degrees of freedom, Proximity devices, Interferometers, Inclinometers, Metrology, Design, Reprints, *Neutron interferometry, CNRF facility, US NIST.

A two stage, position stabilized vibration isolation system has been constructed and is now in operation at the Cold Neutron Research Facility of the National Institute of Standards and Technology, Gaithersburg, Md. The system employs pneumatic isolators with a multiple input/multiple output pneumatic servo system based upon pulse width modulation control loops. The first stage consists of a 40,000 kg reinforced concrete table supported by pneumatic isolators. A large environmentally isolated laboratory enclosure rests on the concrete table. The second stage consists of a 3000 kg granite optical table located within the enclosure and supported by another set of pneumatic isolators. The position of the two stages is monitored by proximity sensors and inclinometers with 12 degrees of freedom. The system controls 12 independent pneumatic airsprings. The signals from these sensors are fed into a personal computer based control system. The control system has maintained the position of the two stages to better than 1 micrometer in translation and 5 (micro)rad in orientation for a period of a few months. A description of the system and its characteristics is given.

Pub. in Proceedings of Conference on Strongly Coupled Plasma Physics, Rochester, NY, August 17-21, 1992, p393-398 1993.

Keywords: *Ion storage, *Beryllium ions, Strongly coupled plasmas, Cold plasmas, Beryllium 9, Trapping(Charged particles), Reprints, Electrostatic modes, Normal modes, Nonneutral plasmas, Penning traps, Ion plasmas, Ion traps.

Experimental measurements of some of the low order electrostatic modes of a nonneutral plasma of (9)Be(1+) ions stored in a Penning trap are discussed. The ions are laser-cooled and typically are strongly coupled with couplings as large as 200 to 300. The measured mode frequencies agree well with a cold fluid calculation. The modes provide a nondestructive method for obtaining information on the plasma density and shape. In addition, the mode excitation by field asymmetries may provide a practical limit to the density and number of charged particles that can be stored in a Penning trap. Future measurements of the damping of the modes should provide information on the plasma viscosity in a strongly correlated plasma.

Pub. in Phys. Plasmas 1, n5 p1403-1414 May 94.

Keywords: *Ion storage, *Atomic clocks, Strongly coupled plasmas, Brillouin flow, Trapping(Charged particles), Reprints, Penning traps, Paul traps, Ion plasmas, Ion traps, Millikelvin temperature, Laser cooling, Nonneutral plasmas.

Experimental work which uses Penning and Paul traps to confine non-neutral ion plasmas is discussed. Penning traps use a static uniform magnetic field and a static electric field to confine ions. The Paul trap uses the ponderomotive force from inhomogeneous radio-frequency fields to confine ions to a region of minimum field strength. In many atomic physics experiments, these traps are designed to produce a harmonic restoring force for small numbers of stored ions (< 10,000). Under these conditions and at low temperatures, both traps produce plasmas with simple shapes whose mode properties can be calculated exactly. Laser cooling has been used to reduce the temperature of trapped ions to less than 10 mK with ion spacings less than 20 micrometers. At such temperatures and interion spacings, the Coulomb potential energy between nearest neighbor ions is greater than the ion thermal energy and the ions exhibit spatial correlations characteristic of a liquid or crystal. Laser beams also apply a torque which, by changing the plasma angular momentum, changes the plasma density. Atomic clocks are an important application of ion trap plasmas. Better control of the plasma dynamics will reduce fluctuations in the relativistic time dilation, yielding better clocks.

Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Physical Review A 49, n5 p3842-3853 May 94.

Keywords: *Electron clouds, Diagnostic techniques, Reprints, *Electrostatic modes, Nonneutral plasmas, Penning traps.

A subset of the electrostatic modes of a cold cloud of electrons, a non-neutral electron plasma, trapped in a Penning trap has been observed and identified using a recent theoretical model. The detection of these modes is accomplished using electronic techniques which could apply to any ion species. The modes are observed in the low-density, low-rotation limit of the cloud where the cloud approaches a two-dimensional charged disk. We observe both axially symmetric and asymmetric drumhead modes. The shape, rotation frequency, and density of the cloud are found in a real-time nondestructive manner by measuring the frequency of these modes. In addition, it is found that radio-frequency sideband cooling compresses the cloud, increasing its density. The ability to measure and control the density of a trapped ion cloud might be useful for experiments on low-temperature ion-neutral-atom collisions, recombination rates, and studies of the confinement properties of non-neutral plasmas.

Keywords: *Atomic spectroscopy, Atomic clocks, Trapped particles, Reprints, *Squeezed states(Quantum theory), Quantum noise, Atom traps.

We investigate the properties of angular-momentum states which yield high sensitivity to rotation. We discuss the application of these 'squeezed-spin' or correlated-particle states to spectroscopy. Transitions in an ensemble of N two-level (or, equivalently, spin-1/2) particles are assumed to be detected by observing changes in the state populations of the particles (population spectroscopy). When the particles' states are detected with 100% efficiency, the fundamental limiting noise is projection noise, the noise associated with the quantum fluctuations in the measured populations. If the particles are first prepared in particular quantum-mechanically correlated states, we find that the signal-to-noise ratio can be improved over the case of initially uncorrelated particles. We have investigated spectroscopy for a particular case of Ramsey's separated oscillatory method where the radiation pulse lengths are short compared to the time between pulses.

Photoionization of the CO molecule and inner-valence states of CO(1+) between 22 and 45 eV have been studied by means of photoelectron spectroscopy using both synchrotron radiation and He II radiation. Vibrational structure has been resolved in many bands up to 45 eV. CASSCF (complete active space self-consistent field) and MRCI (multireference configuration interaction) calculations of potential curves in the 22-30 eV range have been performed and these have been used to predict vibrational levels and Franck-Condon factors. In this energy range three valence states, have been identified, and spectroscopic constants have been determined for the first two of these. Above 30 eV, all valence states have been found to be repulsive. In addition to the broad bands expected for these states, several progressions of narrow lines are observed, most probably reflecting transitions to Rydberg states.

Keywords: *Laplace equation, Boundary integral method, Dirichlet problem, Integral equations, Iterative methods, Computational fluid dynamics, Computation, Matrices, Reprints, Ostwald ripening.

A variety of problems in materials science and fluid dynamics require the solution of Laplace's equation in multiply connected domains. Integral equation methods are natural candidates for such problems as they discretize the boundary alone, require no special effort for free boundaries, and achieve superalgebraic convergence rates on sufficiently smooth domains in two space dimensions, regardless of shape. Current integral equation methods for the Dirichlet problem, however, require the solution of M independent problems of dimension N, where M is the number of boundary components and N is the total number of points in the discretization. In this paper, we present a new boundary integral equation approach, valid for both interior and exterior problems, which requires the solution of a single linear system of dimension N + M. We solve this system by making use of an iterative method (GMRES) combined with the fast multipole method for the rapid calculation of the necessary matrix vector products. For a two-dimensional system with 200 components and 100 points on each boundary, we gain a speedup of a factor of 100 from the new analytic formulation and a factor of 50 from the fast multipole method.

Keywords: *Pressure measurement, *Ultrahigh vacuum, Laser applications, Reprints, *Laser photoionization.

For some time, laser photoionization has been used to detect low concentrations of atoms, molecules, and radical intermediates in a variety of applications, including analytical chemistry, combustion, plasma and CVD diagnostics. Several of these studies have shown that laser photoionization has the fundamental sensitivity and selectivity necessary for species-specific partial pressure measurement in the ultrahigh vacuum regime. This body of work has, in part, spurred interest in the application of laser photoionization to measurements of pressures in the UHV regime. In this paper we discuss the results of the recent research conducted at NIST on the use of laser photoionization for quantitative pressure measurements and the factors which limit the pressure measurements based upon this technique.

In order to evaluate materials such as superconducting magnet components for use in the high-dose radiation environment of the large recirculating charged-particle accelerators such as CERN's Large Hadron Collider (Switzerland/France), CEBAF (Virginia), HERA (Hamburg, Germany), Fermilab's Tevatron (Illinois), and the recently cancelled Superconducting Super Collider (Texas), a study of the radiation resistance of these materials was carried out. These materials must withstand absorbed doses as large as 10(exp 7) Gy at a temperature of 4 K and were tested under these conditions using an electron beam from a 20 MeV linear accelerator. This paper describes the dosimetry at such very large doses and how the dose was delivered to the samples.

Keywords: *Rubidium 87, Trapped particles, Laser radiation, Magnetooptics, Lifetime, Reduction, Losses, Reprints, *Atom traps, Collisional energy transfer.

We have demonstrated an order of magnitude increase in the number and in the lifetime of magneto-optically trapped (87)Rb atoms collected from a low-pressure vapor. The improvement results from the reduction of light-assisted collision losses and is achieved by shelving the atomic population into the lower hyperfine ground state. Large fractional populations of the lower hyperfine ground state have been obtained by blocking the hyperfine repumping light in the region of the trapped atoms and by application of laser light that optically pumps the atoms into that state. We have observed trap lifetimes in excess of 700 s at our highest vacuum levels. At the rubidium pressure that maximizes the product of the number and lifetime of trapped atoms we observe a lifetime of 240 s with 5 X 10(exp 7) trapped atoms, under conditions for which an ordinary magneto-optical trap has a lifetime of only 14 s with 3 X 10(exp 6) atoms.

Pub. in Physical Review Letters 48, n1 p836-837 Jul 93.

Keywords: *Electron-atom collisions, *Polarized beams, *Sodium, Electron transitions, Electron scattering, Elastic scattering, Inelastic scattering, Polarization(Spin alignment), Low energy, Reprints.

It is shown how the results of a recent experiment by Jiang, Zuo, Vuskovic, and Bederson (Phys. Rev. Lett. 68, 915 (1992)), who investigated low-energy electron scattering from laser-excited polarized sodium atoms in the initial (3p) doublet P(sub 3/2, sup 0) (F = 3, M(F) = 3) state, can be related to the inelastic 3S --> 3P transition involving initially unpolarized electron and atom beams. Hence, this method can provide an independent check of the traditional electron-scattering experiment with unpolarized beams.

Femtosecond Time-Resolved Molecular Multiphoton Ionization: The Na2 System.
Final rept.
T. Baumert, M. Grosser, R. Thalweiser, and G. Gerber. 1991, 4p.
Pub. in Physical Review Letters 67, n27 p3753-3756, 30 Dec 91.

Keywords: *Sodium, Multi-photon processes, Molecular ions, Molecular beams, Excited states, Diatomic molecules, Autoionization, Reprints, *Multiphoton ionization, Femtosecond pulses, Time-of-flight spectroscopy.

We report here the first experimental study of femtosecond time-resolved molecular multiphoton ionization. Femtosecond pump-probe techniques are combined with time-of-flight spectroscopy to measure transient ionization spectra of Na2 in a molecular-beam experiment. The wave-packet motions in different molecular potentials show that incoherent contributions from direct photoionization of a singly excited state and from excitation and autoionization of a bound doubly excited molecular state determine the observed transient ionization signal.

Roles of Local Classical Acceleration and Spatial Separation in the Neutral Particle Analogs of the Aharonov-Bohm Phases.
Final rept.
R. C. Casella. 1994, 5p.
Pub. in Physical Review Letters 73, n22 p2941-2945, 28 Nov 94.

Keywords: *Aharonov-Bohm effect, Neutral particles, Quantum theory, Acceleration, Spin, Reprints, Neutron interferometry.

The author shows that neither local nonuniform classical acceleration nor spatial separation of the quantized spin components plays an essential role in a number of neutron interferometer experiments designed to detect phases phi(+-)(B, E) akin to the Aharonov-Bohm phases. These neutral particle phases, which simply manifest quantum interference in spin space, can also

be detected by single beams, as exemplified by a recent breakthrough experiment by Sangster et al.

Keywords: *Electron-molecule collisions, *Hydrogen, Vibrational states, Colliding beams, Cross sections, Reprints, Vibrational excitation.

During the last four years, we have undertaken a major effort to resolve a serious, long-standing discrepancy between various experimental and theoretical determinations of the cross section for the upsilon(0) = 0 --> upsilon = 1 vibrational excitation of H2. This effort has involved crossed electron-beam molecular-beam measurements of relative angular distributions, measurements of transport coefficients in mixtures of H2 and various rare gases, and ab initio theoretical calculations using a vibrational close-coupling formalism with an exact treatment of non-local exchange effects. The discrepancy remains unresolved--a fact with potentially wide-ranging consequences for beam experiments, theory, and the unfolding of inelastic electron-molecule cross sections from swarm data. New analyses of the transport data and the application of a new method of extrapolating angular distributions beyond the range of measurement sheds light on this disagreement and its implications.

Pub. in Jnl. of Geophysical Research 96, nB12 p10,073-20,092, 10 Nov 91.

Keywords: *Gravitation, *Gravity, Basic interactions, Measurement, Validation, Towers, Tests, Reprints, Inverse square laws, Fifth force.

Gravity was measured at eight different heights on a 300-m meteorological tower, using electrostatically nulled LaCoste and Romberg gravimeters. The observed values were corrected for tides, temperature, and gravimeter screw errors, and tested for systematic effects due to (wind-induced) tower motion (no such effects were found). These corrected results were compared with values predicted by means of Newton's inverse square law from surface gravity values. The differences exhibit no systematic trends, and their rms value is only 10 microGal, well within the errors of the experiment, as the estimated measurement errors increase from 9 microGal at the lowest platform to 14 microGal at the top and those of the predictions from 10 microGal to 23 microGal. These results set new constraints on the magnitude of any non-Newtonian gravitational force; if such a force is derived from a Yukawa potential, the absolute value of alpha must be less than 0.001 for lambda = 1,000 m.

Multistructure cross sections, of both conventional and coherence types, are calculated for the fine structure transition Na(doublet P(1/2)<--doublet P(3/2)) + He in an energy range of 10-200 meV. The cross sections are related to conditions of a crossed beams experiment in which the three controlled vectors are the initial relative velocity and the two polarization directions of excitation and probe laser beams. Both semiclassical and quantum mechanical calculations are performed. The semiclassical method is employed to interpret and visualize the collision mechanism leading to the multistructure cross sections. In addition, the validity of the approximations used in the semiclassical model is investigated.

The crossed beams technique has been used to measure absolute cross-sections for the single ionization of Se(1+) and Te(1+) at electron energies from threshold to 200eV. The peak cross-sections obtained are 16.6 x 10(exp -17)sq cm at about 53eV for Se(1+) and 24.3 x 10(exp -17)sq cm at about 43eV for Te(1+). The measured Se(1+) cross-sections are bracketed from above by directionization cross-sections from configuration-averaged distorted-wave calculations of Pindzola (unpublished work) and from below by results using the single parameter semi-empirical formula of Lotz (Z. Phys., 216 (1968) 241), with both calculations giving results in moderate agreement with the measurements. In contrast, comparisons of measured Te(1+) cross-sections with similar calculations are generally poor. Ionization-rate coefficients for a Maxwellian electron-temperature distribution calculated from the experimental data presented.

J. P. J. Driessen, and S. R. Leone. 1992, 11p.
Pub. in Jnl. of Physical Chemistry 96, n15 p6136-6146 1992.

Keywords: *Atomic collisions, *Calcium, Vectors(Mathematics), Atomic orbitals, Polarized light, Laser radiation, Energy transfer, Orientation, Alignment, Coherence, Reprints.

An introduction is presented of vector correlations in collision experiments involving atomic orbital alignment or orientation. At present, aligned or oriented species can be prepared (or probed) with 'relative' ease using polarized laser beams. First, an extensive expose of the necessary mathematical formalisms for two- and three-vector correlations is given, and then experimental examples for atomic Ca are discussed to elucidate the theory. It is demonstrated both theoretically and experimentally that azimuthal structure about the initial relative velocity vector (called coherence) becomes important when three or more vector quantities are controlled in the collision process.

Keywords: *Hydrogen ions, *Electron detachment, *Photodetachment, Polarized light, Cross sections, Negative ions, Excitation, Reprints, Two photon processes.

The cross sections for resonant two-color, two-photon detachment of H(1-) with excitation of the degenerate H(2s) and H(2p) levels are calculated within a semiempirical adiabatic hyperspherical representation. The first photon, with energy omega(1) = 0.4017 au, is resonant with the well-known Feshbach (sup 1)P(sup o) resonance below the H(n = 2) threshold. The second photon, with energy omega(2) = or > 0.12605 au, scans the energy region above the H(n = 2) threshold over which long-range dipole-field-induced cross-section oscillations are predicted to occur. Such Gailitis-Damburg oscillations have not yet been observed experimentally. Results for various pairs of light polarization for the two photons are presented.

Quantum Mechanics of a Solid-State Bar Gravitational Antenna.
Final rept.
L. P. Grishchuk. 1992, 8p.
Pub. in Physical Review D 45, n8 p2601-2608, 15 Apr 92.

Keywords: *Gravitational wave antennas, *Quantum mechanics, Absorption cross sections, Solid state devices, Bars, Reprints.

A quantum-mechanical treatment of a bar gravitational antenna is presented. The theory takes into account the crystalline structure of the bar and collective behavior of its mass elements. The low-frequency and high-frequency (Debye) modes of oscillations are considered. It is shown that the quantum-mechanical derivation of the absorption cross section of the gravitational antenna agrees totally with the classical result. The recent claims of a significant (six orders of magnitude) quantum-mechanical enhancement of the cross section are shown to be incorrect.

Pub. in Jnl. of Physics B: Atomic and Molecular Optical Physics 25, p703-725 1992.

Keywords: *Electron-molecule collisions, *Effective range theory, *Hydrogen, *Nitrogen, Electron scattering, Cross sections, Low energy, Feasibility, Reprints.

We investigate the feasibility of using modified effective range theory to 'project' results of theoretical scattering calculations to energies so low that such calculations are numerically intractable. In particular, this theory, as developed by Fabrikant in the body-frame fixed-nuclei formulation of electron scattering from non-polar molecules, provides expansions of the reactance matrix that enable determination of the scattering length (and other parameters as needed) and total cross sections with greater accuracy and over a larger range of energies than do conventional implementations of such expansions for the total cross section. We have explored the viability, accuracy and potential problems of this stratagem for the e-H2 and e-N2 systems; in both cases, careful use of these expansions enables calculation of highly accurate cross sections at very low energies without resource to numerically problematic, CPU-intensive close-coupling calculations.

C. Liu, B. Gao, and A. F. Starace. 1992, 14p.
Pub. in Physical Review A 46, n9 p5985-5998, 1 Nov 92.

Keywords: *Hydrogen ions, Electron affinity, Electron correlation, Electron detachment, Negative ions, Hyperspheres, Reprints, Keldysh approximation, Hyperspherical coordinates.

A variationally stable, adiabatic hyperspherical treatment of two- and three-photon detachment of H(1-) is presented. Results are compared with analytic predictions of a zero-range potential model of H(1-). Detailed comparisons are made also with other theoretical results which include the effects of electron correlations. We predict analytically (and demonstrate numerically) an extreme sensitivity of the theoretical predictions to any errors in the value of the electron affinity employed. In an Appendix we show that the low-intensity limit of the Keldysh treatment of detachment of an electron bound in a zero-range potential agrees with the results of a perturbative treatment.

Keywords: *Rydberg states, *Sodium, Atomic energy levels, Laser radiation, Pulsed lasers, Density matrix, Excitation, Alignment, Atomic orbitals, Reprints.

Aligned atomic Rydberg states of sodium can be prepared using two-step excitation from the ground state by linearly polarized pulsed lasers. Information that is normally inaccessible, e.g., sublevel partial cross sections in charge-transfer experiments, can be obtained when aligned targets are used. The calculations of orbital alignment must carefully allow for fine and hyperfine structure, laser linewidths, pulse widths and delays, sublevel coherences, and other factors. In this paper we derive the orbital alignments and time-averaged d-state sublevel populations for 3 doublet S(1/2)-->3 doublet P(J sub 1)-->n doublet D excitations in Na using angular-momentum and density-matrix methods. We consider both quadrupole alignment A(sup (2)) and hexadecapole alignment A(sup (4)), with excitation through either J(1)=1/2 or 3/2 intermediate states considered on the same footing. We show sublevel populations for absolute values of M(L)=0, 1, and 2 analytically and graphically.

Keywords: *Atomic collisions, *Strontium, Atomic energy levels, Oscillator strengths, Excited states, Pulsed lasers, Radiative lifetime, Transition probabilities, Rare gases, Reprints, Collisional energy transfer.

Inert-gas induced collisional transfer between the first four excited states of Sr has been measured by determining excited-state densities following pulsed laser excitation of the 5 singlet P state. We observe 5 singlet P collisional transfer exclusively to the 4 triplet D state, with (about 800 K) rate coefficients ranging from 0.24 to 2.0 X 10(exp -11)cc/s for the various gases. We also measure 4 singlet D(2) transfer primarily to the 4 triplet D state, with rate coefficients of 0.65 to 6.8 X 10(exp -11)cc/s. The 4 triplet D state radiative lifetime is observed to be 2.9 + or - 0.2 microsec.

Importance of Bound-Free Correlation Effects for Vibrational Excitation of Molecules by Electron Impact: A Sensitivity Analysis.
Final rept.
M. A. Morrison, and W. K. Trail. 1993, 13p.
Grant NSF-PHY90-12244
Sponsored by National Science Foundation, Washington, DC.
Pub. in Physical Review A 48, n4 p2874-2886 Oct 93.

Keywords: *Electron-molecule collisions, *Hydrogen, Electron scattering, Electron impact, Colliding beams, Cross sections, Sensitivity analysis, Correlation, Reprints, Vibrational excitation.

One of the most interesting, important, and problematic components of interaction potentials for electron-atom and -molecule scattering arises from many-body effects in the near-target region. Such 'core-polarization' effects are of particular concern for vibrational-excitation calculations, where these short-range bound-free correlation and nonadiabatic velocity-dependent effects have remained resistant to rigorous treatment, being represented instead by approximations or model potentials. In order to provide guidance for assessing such potentials and insight into the nature of these many-electron effects, we have investigated the sensitivity to core polarization of total, momentum-transfer, rotational-excitation, and vibrational-excitation e-H2 cross sections. The sensitivity analysis for the latter cross section also comments on a long-standing, severe discrepancy between cross sections determined in various crossed-beam experiments and by transport analysis of swarm data for this simplest electron-neutral-molecule system.

Grant NSF-PHY90-12244
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Physical Review A 50, n2 p1292-1300 Aug 94.

Keywords: *Barium, *Atomic collisions, Atomic energy levels, Excited states, Energy transfer, Reprints, Rate coefficients.

Rate coefficients for energy-pooling collisions between low-lying excited states of Ba have been measured. The 6s6p triplet P(1) level in Ba is pumped by a cw diode laser, and radiative decay and collisions with buffer-gas atoms also populate the 5d6s (singlet D) and 5d6s (triplet D) metastable levels. The densities of these low-lying excited states are measured by the absorption of lines from a Ba hollow-cathode lamp, and the states populated by energy-pooling collisions are studied by comparing their fluorescence intensity to that of the laser-excited level. The rate coefficients are on the order of gas-kinetic rates, and they are not strongly dependent on energy defect, spin changes, or angular-momentum changes.

Pub. in Physical Review A 47, n1 p295-304 Jan 93.

Keywords: *Photoionization, *Photodetachment, *Chlorine, Branching ratio, Cross sections, Electron transitions, Fine structure, Negative ions, Positive ions, Reprints.

The relative photoionization cross section for starting from a particular fine-structure level of the initial state of an atomic system and leading to a particular fine-structure level of the residual ion is presented for the case of atomic systems having one open subshell using a simple theoretical model in which emphasis is placed on the analysis of geometrical effects. This model parametrizes photoionization cross sections in terms of LS-dependent, single-configuration dynamical amplitudes, unlike previous treatments which assume LS-independent transition amplitudes from the start. In special cases our general formulas are shown to reduce to those of previous workers. We highlight photoionization of inner s subshells in open-shell atoms and show that when the total angular momenta for the initial atomic and final ionic fine-structure levels differ by more than 1/2 then such transitions are quasiforbidden. This prediction is tested in detail for the case of Cl 3s-subshell photoionization by comparison of our single-configuration results with the multiconfiguration, eigenchannel R-matrix results of Robicheaux and Greene. All of our results apply also to photoionization of open-shell positive ions or photodetachment of open-shell negative ions.

Pub. in Jnl. of the Optical Society of America B 11, n8 p1332-1335 Aug 94.

Keywords: Trapped particles, Laser radiation, Magnetic fields, Magnetooptics, Reprints, *Atom traps, Laser cooling.

We investigate the behavior of a cloud of atoms in a magneto-optical trap, which--after collection--is compressed when the field gradients of the trap magnetic field are increased. We measure sizes and shapes of the atom cloud as a function of laser detuning, magnetic field gradient, and number of trapped atoms. A transient density increase of more than an order of magnitude has been achieved. Moreover, reproducible Gaussian density distributions are observed at large detunings and intermediate magnetic-field gradients, permitting an accurate determination of density.

Pub. in Physical Review A 49, n2 p933-938 Feb 94.

Keywords: *Electron-ion collisions, *Electron capture, *Scandium ions, Ionization cross sections, Electron impact, Colliding beams, Excited states, Reprints.

Theoretical and experimental results are presented for the electron-impact ionization of Sc(2+) in the near-threshold energy region where strong resonance features due to dielectronic capture processes are found. The indirect ionization contributions are calculated in the close-coupling approximation. Both absolute and scan measurements for the ionization cross section are obtained in a crossed-beams experimental geometry. The overall agreement between theory and experiment is good, once a sufficient number of singly excited states are included in the close-coupling expansion. The additional states allow a proper theoretical determination of the decay pathways available to the resonances formed following dielectronic capture of the incident electron.

Keywords: *Electron-atom collisions, Polarized beams, Electron impact, Heavy elements, Charge distribution, Multipoles, Mercury, Thallium, Reprints, Electron spin polarization.

We consider the charge cloud distribution of heavy atoms after impact excitation by polarized electrons. A general formula in terms of state multipoles is derived and interpreted with regard to ratios of principal axes and three independent angles of rotation. Finally, the theory is illustrated by numerical results for excitation of mercury and thallium.

Time-resolved Fourier transform infrared (FT-IR) emission experiments are used to study photofragmentation processes, single collision reactions, energy transfer events, and laser-initiated radical-radical reactions. In the experimental apparatus, a 200-Hz ArF excimer laser is coupled to a commercial 0.01/cm resolution Fourier transform infrared spectrometer. Fringes from the He:Ne reference laser are used for time synchronization of the laser pulses to the FT-IR mirror retardation. We report here on the comprehensive details of our experimental apparatus and discuss several of the processes studied with the use of this apparatus.

Keywords: *Atom-atom collisions, *Atomic collisions, *Calcium, Atomic energy levels, Atomic orbitals, Angular momentum, Colliding beams, Cross sections, Laser radiation, Pulsed laser, Polarized light, Alignment, Correlation, Helium, Reprints.

In a crossed beam atomic energy transfer experiment, relative cross sections are measured between initial and final magnetic substates of atomic orbitals in a three vector correlation experiment. A pulsed laser beam prepares Ca(4s5p singlet P(1)) in a single magnetic sublevel (vertical stroke)j(1)m(i)> with respect to the laser polarization vector. Subsequent collision with He at a well-defined relative velocity yields Ca(4s5p triplet P(2)). The near-resonant Ca(4s5P triplet P(2)) is probed by a second polarized pulsed laser, revealing its magnetic sublevel (vertical stroke)j(2)m(f)> distribution with respect to the probe laser polarization vector. The experiment is analyzed in the collision frame where the direction of the initial relative velocity vector serves as the quantization axis.

Pub. in Physical Review A 47, n1 p305-316 Jan 93.

Keywords: *Electron-atom collisions, *Cesium, Electron scattering, Elastic scattering, Inelastic scattering, Momentum transfer, EV range 170, Electron collisions, Cross sections, Relativistic effects, Excitation, Reprints.

Based on a previous Dirac R-matrix calculation, we have derived elastic and inelastic angle-differential and elastic momentum-transfer cross sections for slow electrons (E(kin) = or < 2.8 eV) colliding with neutral Cs atoms. Qur results for the angle-differential cross sections are in good agreement with scaled experimental data and, depending on the incident electron energy, in qualitative or fair quantitative agreement with previously published theoretical work. The inelastic angle-differential cross sections for sextet p(1/2) and sextet p(3/2) excitation differ by more than a statistical branching ratio due to relativistic effects. For the momentum-transfer cross sections, we hope to resolve existing discrepancies in the literature and to provide more reliable input for transport calculations.

U. Thumm, and D. W. Norcross. 1992, 22p.
Contract DE-A105-86ER532337
Sponsored by Department of Energy, Washington, DC. Qffice of Energy Research.
Pub. in Physical Review A 45, n9 p6349-6370, 1 May 92.

Keywords: *Electron-atom collisions, *Alkali metals, *Cesium, Milli EV range, EV range 1-10, Electron scattering, Electron collisions, Relativistic effects, Cross sections, R matrix, Low energy, Multiplets, Reprints.

We have reformulated the Dirac R-matrix method for low-energy electron scattering by (effectively) one-electron, alkali-metal-like systems and developed an independent computer program for this special purpose. A highly accurate and relativistic representation of the target was used to perform a multichannel close-coupling calculation of cross sections for electron scattering. Qur results include the negative-ion affinity and elastic, inelastic, and total cross sections for incident electrons with 0 to 2.8 eV kinetic energy. We find that core-polarization and relativistic effects lead to multiplets of very narrow triplet P(j), J = 0,1,2 shape resonances: the effect of the induced core polarization on the electron-electron correlation leads to 6s6p triplet P(sub j, sup 0) resonances in contrast to previously predicted bound states of Cs(1-), and relativistic interactions are responsible for the autoionizing decay of 6p(2) triplet P(J) states below the first excitation threshold.

Keywords: *Hydrogen ions, *Electron detachment, *Photodetachment, Electric fields, Negative ions, Cross sections, Laser radiation, Reprints, Laser photoionization.

Quantum interference effects occurring in photodetachment of H(1-) in the presence of a uniform, static electric field are shown theoretically to be controllable through use of short laser pulses having characteristic times comparable to photodetached electron reflection times. In particular, calculated cross sections for single-photon detachment by two laser pulses that are delayed and phase shifted relative to one another are shown to oscillate as a function of the relative phases of the laser pulses at fixed photodetached electron energy.

Keywords: *Qscillator strengths, *Strontium, Transition probabilities, Branching ratio, R matrix, Reprints, Radiative transitions.

Tables of radiative transition rates (A) are provided for allowed singlet and triplet transitions between Sr states below n approx. = 11. These are obtained from a combination of R-matrix, multichannel-quantum-defect-theory (MQDT), and modified Coulomb-approximation calculations, plus branching-ratio measurements. Measurements of some spin-changing branchings and of the 4 singlet D(2) - 5 singlet S(0) quadrupole transition rate are also reported. Lifetime and A-value measurements from the literature are included in the tables and compared to the calculations. These and the present measurements provide the most comprehensive test to date of calculated transition probabilities for divalent atoms. The MQDT calculation achieves 0-20% agreement with experiment in the great majority of cases tested.

Pub. in Physical Review A 50, n3 p2174-2181 Sep 94.

Keywords: *Atomic energy levels, *Cesium, Mode locked lasers, Excited states, Atomic beams, P invariance, Lifetime, Parity, Reprints, Titanium sapphire lasers, Femtosecond pulses, Photon counting.

Time-correlated single-photon counting is used to measure the lifetimes of the 6p doublet P(1/2) and 6p doublet P(3/2) levels in atomic Cs with accuracies of approx. 0.2-0.3%. A high-repetition-rate, femtosecond, self-mode-locked Ti:sapphire laser is used to excite Cs produced in a well-collimated atomic beam. The time interval between the excitation pulse and the arrival of a fluorescence photon is measured repetitively until the desired statistics are obtained. The lifetime results are 34.75(7) and 30.41(10) ns for the 6p doublet P(1/2) and 6p doublet P(3/2) levels, respectively. These lifetimes fall between those extracted from ab initio many-body perturbation-theory calculations by Blundell, Johnson, and Sapirstein (1991) and V. A. Dzuba et al (1989) and are in all cases within 0.9% of the calculated values. The measurement errors are dominated by systematic effects, and methods to alleviate these and to approach an accuracy of 0.1% are discussed. The technique is a viable alternative to the fast-beam laser approach for measuring lifetimes with extreme accuracy.

Keywords: *Zirconium ions, *Hyperfine structure, Atomic energy levels, Atomic spectroscopy, Atomic structure, Metastable state, Electric moments, Quadrupole moments, Experimental data, Zirconium 91, Reprints, Ab initio calculations.

We report an experimental and theoretical study of the hyperfine structure (hfs) in various metastable levels in (91)Zr II. Hyperfine structures in 11 levels arising from the 4d(3) and 4d(2)5s configurations were measured using the laser-rf double-resonance method in a collinear laser-ion-beam geometry. The hfs A and B constants were measured to a precision of 4 and 11 kHz, respectively. Less precise values for hfs constants for nine upper levels in the 4d(2)5p configuration were derived from optical spectra. Theoretically, the A and B constants for the metastable levels having J=0.5 and 1.5 were calculated using a relativistic configuration-interaction (RCI) approach. The calculations confirm a previous report that the level at 17,614.00/cm reported in Moore's Atomic Energy Levels, Vol. II (US Government Printing Office, Washington, DC, 1971) is spurious.

DETAN 95: Computer Code for Calculating Spectrum-Averaged Cross Sections and Detector Responses in Neutron Spectra.
C. M. Eisenhauer. Mar 95, 70p, NISTIR-5622.

Keywords: *Neutron cross sections, *Neutron spectra, *Programming manuals, Neutron detectors, Spectrum analysis, Personnel dosimetry, Fission spectra, Response functions, Computer programs, Tables(Data), Computation, *DETAN 95 computer code.

DETAN 95 is a computer code for converting an input neutron spectrum to a spectrum or detector response function expressed in arbitrary energy-group structure. The input spectrum may be expressed either in analytic form or in some energy-group structure. The code also calculates spectrum-averaged neutron cross sections or responses for neutron personnel detectors. The code includes 625-group neutron cross sections for a number of reactions common to materials dosimetry. Other energy-dependent cross sections or response functions supplied by the user may be used to calculated spectrum-averaged values.

Reproducibility of the Temperature of the Ice Point in Routine Measurements.
Technical note.
B. W. Mangum. Jun 95, 27p, NIST/TN-1411.
Also available from Supt. of Docs. as SN003-003-03347-2.

Keywords: *Temperature measurement, *Water, Resistance thermometers, Triple point, Reproducibility, *Ice point, Fixed points.

This note presents results on the reproducibility and temperature of the ice point of water. The data were obtained over the years 1963 to 1970, in 1992 and in 1995. The data from 1963 to 1970 are from resistance measurements of a standard platinum resistance thermometer in ice points, made for the purpose of obtaining the reference value for the thermometer to be used for determining temperatures of calibration of liquid-in-glass thermometers. In 1992 and in 1995, measurements of the temperature of the ice point were made, using water (and ice) from different sources. The value of the temperature determined for the ice point prepared from the authors' highest-purity water is in excellent agreement with that determined previously. Also, the reproducibility of routine measurements at the ice point are consistent with what has been generally accepted, but heretofore undocumented.

Pub. in Physical Review A 49, n6 p4585-4596 Jun 94.

Keywords: *Beams(Radiation), *Energy dissipation, *Electron-ion coupling, Cross sections, Oxygen, Ionization, Backscattering, Spectroscopy, Reprints, *Merged beams, O(5+).

A merged-beams electron-energy-loss technique is described, by which absolute cross sections can be measured for near-threshold electron-impact excitation of multiple charged ions. The experimental data are in good agreement with a seven-state close-coupling throughout the energy range of the experiment. Results agree with calculations showing that more than 90% of the electrons causing excitation are ejected in the backward direction in the center-of-mass frame. This backscattering is shown in both quantum-mechanical and semiclassical calculations. Evidence is observed for high-lying metastable autoionizing states with a life-time of approximately 0.9 microseconds which are made to ionize by electron impact.

Pub. in Physical Review E 51, n2 pR867-R868 Feb 95.

Keywords: *Monte Carlo method, *Simulation, Crystal growth, Kinetics, Computerized simulation, Equilibrium equations, Reprints, Computer time.

For Monte Carlo simulations of systems of size M, either kinetic simulations or equilibrium simulations that use the method of Bortz, Kalos, and Liebowitz the best computer time per event has been O(M(sup 1/2)). The authors present two methods whose computer time per event is O(M(sup 1/k)) or O(logM). In practice, for typical simulation sizes, K = 4 or K = 5 is fastest, requiring even less computer time than the O(logM) method. For typical simulation sizes, the authors are able to achieve speedup factor of 5 to 7 over the O(M(sup 1/2)) technique.

Vapour Pressures and Gas-Phase (p, rho n, T) Values for CF3CHF2{R125).
Final rept.
S. J. Boyes, and L. A. Weber. 1995, 12p.
Pub. in Jnl. of Chemical Thermodynamics 27, p163-174 1995.

Keywords: *Vapor pressure, *Gases, *Fluorinated celiphatic hydrocarbons, Refrigerants, Pressure, Temperature, Density(Mass/volume), Virial equation, Thermodynamic properties, Reprints, *Pentafluoroethane, R125 refrigerant.

The authors present new vapor pressures and the (p, p(sub n), T) surface of CF3CHF2 (pentafluoroethane, designated R125 by the refrigeration industry) in the temperature range T = 273 K to 363 K. The (p, p(sub n), T) measurements are for the gas phase at densities up to approximately the critical density. The static vapor pressures reported here have been combined with previous ebulliometric measurements made in this laboratory at lower temperatures. Correlating equations are given for the vapour pressures from T = 220 K to the critical temperature: T(sub c) - 339.30 K. A virial equation has been used to correlate the (p, p(sub n), T) surface at amount-of-substance densities up to 1600 mol/cubic m. Second and third virial coefficients have been derived from the (p, p(sub n), T) measurements.

Energy Dependences of Absorption in Beryllium Windows and Argon Gas.
Final rept.
C. T. Chantler, and J. L. Staudenmann. 1995, 4p.
Pub. in Review of Scientific Instruments 66, n2 p1651-1654 Feb 95.

Keywords: *Energy dependence, *Beryllium, *Argon, *Absorption, Gas detectors, Coefficients, Synchrotron radiation, X rays, Form factors, Particle properties, Reprints.

In part of an ongoing work on x-ray form factors, new absorption coefficients are being evaluated for all elements, across the energy range from below 100 eV to above 100 keV. These new coefficients are applied herein to typical problems in synchrotron radiation stations, namely the use of beryllium windows and argon gas detectors. Results are compared with those of other authors. The electron-ion pair production process in ionization chambers is discussed, and the effects of 3d-element impurities are indicated.

Transmission Properties of Short Curved Neutron Guides. Part 1. Acceptance Diagram Analysis and Calculations.
Final rept.
J. R. D. Copley. 1995, 9p.
Pub. in Nuclear Instruments and Methods in Physics Research A, v355 p469-477 1995.

Keywords: *Transmittance, *Neutron guides, Neutron reflectors, Beam acceptance, Optical properties, Gamma rays, Performance evaluation, Reprints, *Curved guide, *Acceptance diagrams, Ray-tracing.

A curved neutron guide is considered 'short' if there are direct lines of sight through the device. Such guides have the disadvantage that they transmit high energy neutrons and gamma rays, which are generally unwanted, as well as the desired low energy neutrons. Nevertheless short curved guides have several uses at thermal neutron research facilities because they can be combined with sections of straight guide to produce composite guides through which there is no line of sight. The authors analyze the transmission properties of short curved neutron guides using the method of acceptance diagrams, and they present the results of several calculations of their performance.

Fluctuations in Probability Distribution on Chaotic Attractors.
Final rept.
M. Franaszek. 1995, 7p.
Pub. in Physics Letters A 203, p115-121 1995.

Keywords: *Probability distribution functions, *Variations, *Chaos, *Strange attractors, Perturbation, Periodic variations, Noise, Amplitudes, Time series analysis, Stochastic processes, Reprints.

Fluctuations in probability distribution are used to study the influence of a weak periodic perturbation on chaotic system. A detailed analysis of one very long time series reveals a great sensitivity to external perturbation. The case of large amplitude stochastic perturbation is also discussed. It is shown that the fractal geometry of an experimental attractor may be visualized up to length scales smaller than noise amplitude.

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. and National Science Foundation, Washington, DC.
Pub. in Jnl. of Chemical Physics 100, n9 p6359-6367, 1 May 94.

Keywords: *Charge transfer, *Ions, *Reaction kinetics, Molecular interactions, Nitrogen isotopes, Lasers, Ionic reactions, Vibration, Reprints.

Vibrationally state-selected measurements of the kinetics and dynamics of 14N2(1+)(nu = 1 and 2) and 15N2(1+)(nu = 0, 1, and 2) in collisions with (14)N2 are made using a selected ion flow tube (SIFT), laser induced fluorescence (LIF) technique at thermal energies. Kinetics are measured by monitoring the LIF signal amplitudes of N2(1+)(nu) as a function of (14)N2 concentration, added after ion injection. By comparison with the known N2(1+)(nu = 1) + Ar rate, the (15)N2(1+)(nu = 0) + 14N2 rate constant is found to be one-half of the Langevin collision rate or 4.2 + or - 0.2 x 10(exp -10) cubic cm/molecule/s. This suggests that the reaction proceeds via an N4(1+) energized adduct in which charge is shared on a time scale shorter than the adduct lifetime. The removal rates of (14)N2(1+)(nu = 1 and 2) reactions by (14)N2 are also found to proceed at one-half of the Langevin collision rate. Thus product channels that remove vibrational energy from the ion upon dissociation of the adduct account for 50% of the collision probability.

Analytical Method for Determining Thermal Conductivity from Dynamic Experiments.
Final rept.
R. A. MacDonald. 1995, 8p.
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in International Jnl. of Heat and Mass Transfer, v38 n14 p2549-2556 1995.

Keywords: *Thermal conductivity, *Rods, *Tungsten, Temperature dependence, Specific heat, Surface temperature, Profiles, Cylindrical bodies, High temperature, Partial differential equations, Heat transmission, Radiative heat transfer, Thermodynamics, Reprints.

The temperature profile along a cylindrical rod or tube as it cools has been obtained by numerical solution of the second-order time-dependent partial differential equation for heat conduction. The surface temperature is calculated for given temperature dependent values of the heat capacity, hemispherical total emissivity, thermal expansion and thermal conductivity and, by adjusting the thermal conductivity, is fitted to experimental temperature profiles from preliminary measurements on a cooling cylindrical tungsten rod. The surface temperature of the rod is quite sensitive to the thermal conductivity but the accuracy of the predicted thermal conductivity cannot be assessed without further experimentation.

Evolution of X-ray Resonance Raman Scattering into X-ray Fluorescence from the Excitation of Xenon Near the L3 Edge.
Final rept.
M. A. MacDonald, S. H. Southworth, J. C. Levin, T. Lebrun, Y. Azuma, P. L. Cowan, B. A. Karlin, A. Henins, and R. D. Deslattes. 1995, 6p.
Pub. in Physical Review A, v51 n5 p3598-3603 May 95.

Keywords: *Xenon, *Raman spectra, *X ray fluorescence, Synchrotron radiation, Absorption spectra, Edges, Experimental data, Reprints, Absorption edge, L3 edge.

Near an absorption edge, x-ray emission cannot be treated separately from the absorption process itself; a scattering formalism must be used. Experimental data have been recorded showing x-ray emission from xenon following excitation by tunable synchrotron radiation below and above the L3 absorption edge. Complete data sets are presented for Xe La1,2 and Lbeta2,15 emission from 10 eV below to 40 eV above the L3 edge. In accord with the resonant-inelastic-scattering model, the observed x-ray emission evolves from resonant Raman scattering into characteristic fluorescence as the excitation energy is scanned from below to above the absorption edge.

Effect of Electrode Material on Measured Ion Energy Distributions in Radio-Frequency Discharges.
Final rept.
J. K. Olthoff, R. J. Van Brunt, and S. B. Radovanov. 1995, 3p.
Pub. in Applied Physics Letters, v67 n4 p473-475, 24 Jul 95.

Keywords: *Electrodes, *Ions, *Radio frequency discharge, Reprints, Ion energy analysis, Distribution, Discharges, Surface charging.

Evidence is presented for a significant influence of electrode surface material and condition on the measurement of the kinetic energies of ions sampled from discharges through a orifice in the electrode. Significant differences in ion energy shifts and/or discrimination of low-energy ions are found using aluminum and stainless-steel electrodes in a radio-frequency (rf) discharge cell. It is argued that the observed differences in energy shifts may be attributable in part to differences in charging oxide layers on the electrode surface around the sampling orifice.

Energy Calibration of X-ray Photoelectron Spectrometers: Results of an Interlaboratory Comparison to Evaluate a Proposed Calibration Procedure.
Final rept.
C. J. Powell. 1995, 12p.
Pub. in Surface and Interface Analysis, v23 p121-132 1995.

Keywords: *Spectrometers, *Calibration, Reprints, Copper, Gold, Silver, X rays, Photoelectrons, *Foreign technology, *Binding energy.

Results are reported of an interlaboratory comparison conducted to evaluate a proposed procedure for calibration of the binding energy (BE) scales on x-ray photoelectron spectrometers. The calibration was performed at two points on the BE scale (the Au 4f7/2 and Cu 2p3/2 lines) and checks were made of the assumption of BE-scale linearity from measurements on other lines. It is shown here that small offsets can arise if peaks are located with assumed backgrounds on non-zero slope or if multipeak fits are made to Cu L3VV and Ag M4VV Auger spectra.

Pub. in Jnl. of Applied Physics, v78 n2 p746-757, 15 Jul 95.

Keywords: *Radiofrequency charges, *Gas discharges, *Argon ions, Reprints, Hydrogen, Balmer lines, Neutrals, Electrodes, Ion kinetic energy.

Excited neutrals and fast ions produced in a 13.56 MHz radio-frequency discharge in a 90% argon -10% hydro-

gen gas mixture was investigated, respectively, by spatially and temporally resolved optical emission spectroscopy, and by mass-resolved measurements of ion kinetic energy distributions at the grounded electrode. The electrical characteristics of the discharge were also measured and comparisons are made with results obtained for discharges in pure H2 under comparable conditions. Measurements of Balmer-alpha emission show Doppler-broadened emission that is due to the excitation of fast atomic hydrogen neutrals formed from ion neutralization processes in the discharge.

Pub. in Physical Review A 49, n5 p3620-3645 May 94.

Keywords: *Cross sections, *Electron-atom collisions, *Elastic scattering, *Inelastic scattering, Sodium, R matrix, Angular momentum, Electron diffraction, Experimental data, Data bases, Reprints.

The electron-Na system is the prototype for nonrelativistic scattering of a charged particle from a quasi-one-electron system. At scattering energies below several eV, e-Na cross sections are particularly sensitive to the exchange interaction and manifest a rich variety of near-threshold structures in various spin channels. By applying the nonperturbative coupled-channel R-matrix method in carefully converged calculations the authors have generated a comprehensive data base of accurate scattering quantitities for studying these phenomena and for comparison to present and future experimental data. In addition to conventional integrated and differential cross sections, the authors consider partial cross sections for changes in the projection of the spin and orbital angular momentum of the Na valence electron, comparing results for all these quantities to experimental data where available.

Keywords: *Photoionization, *Electron scattering, *Xenon, *Krypton, Photoelectrons, Angular distribution, Ponderomotive forces, Electrodynamics, Rings, Wave functions, Reprints, Multiphoton processes, Photoelectron angular distributions.

Angular distributions of high energy photoelectrons from Xe and Kr, excited by a 50 ps, 1.05 micro m laser, are presented. In Xe, strong, narrow, rings about 45 deg. off the polarization axis appear in a limited energy range centered around U(sub p), where U(sub p) is the ponderomotive energy. This effect is much weaker in Kr. Single active electron calculations agree well with these observations. The authors conclude that the rings result from single-electron ionization dynamics, most likely involving rescattering from the ion core of the tunneling component of the continuum wave function.

Vibrational Excitations and the Position of Hydrogen in Nanocrystalline Palladium.
Final rept.
U. Stuhr, H. Wipf, T. J. Udovic, J. Weissmuller, and H. Gleiter. 1995, 12p.
Pub. in Jnl. of Physics: Condensed Matter, v7 p219-230 1995.

Keywords: *Palladium, *Hydrogen atoms, *Vibrational spectroscopy, Position(Location), Grain boundaries, Solubility, Crystal lattices, Neutron scattering, Absorption, Reprints, *Nanocrystals, *Hydrogen absorption.

The vibrational excitations and the position of hydrogen in nanocrystalline palladium were investigated by means of inelastic neutron-scattering and H solubility measurements. The study focuses on the H concentration regime (less than or equal to 4.8 at.% H) where, at room temperature, no precipitation of the H in a hydride phase (Beta-phase) was observed. In this concentration regime, the solubility measurements show an enhanced H solubility relative to coarse-grained Pd. The neutron-scattering experiments show that this additional H is incorporated in the grain boundaries and at the surface of the grains. Surface modes of H at approximately 90 and 120 meV were identified. Compared to coarse-grained Pd, no change in the H solubility was found for the crystal lattice of the nanosized grains.

Pub. in Physical Review B, v51 n9 p5824-5838, 1 Mar 95.

Keywords: *Magnetic properties, *Spin dynamics, *Praseodymium, *Copper, Crystal structure, Magnons, Atomic interactions, Velocity, Phase diagrams, Temperature dependence, Zero point energy, Field theory, Neutron scattering, Reprints, *Zero-field ordered moment.

Neutron-scattering techniques have been used to study the magnetic structure and spin dynamics of the Pr and Cu spins in Pr2CuO4. In the ordered state the Cu spin-wave velocity c has been determined to be 0.85 + or - 0.08 eV Angstroms, which corresponds to an in-plane nearest-neighbor exchange constant J = 130 + or - 13 meV. A spin-wave gap of approximately 5 meV has been observed, corresponding to a reduced anisotropy constant alpha(sub parrallel sign) = (J - J(sup xy))/J of about 2 x 10(exp -4). In the paramagnetic regime the evolution of the Cu spin-correlation length with temperature is adequately described by the renormalized classical theory for the quantum nonlinear sigma model.

Quantum-Limited Cooling and Detection of Radio-Frequency Oscillations by Laser-Cooled Ions.
Final rept.
D. J. Heinzen, and D. J. Wineland. 1990, 18p.
Pub. in Physical Review A, v42 n5 p2977-2994, 1 Sep 90.

Keywords: *Radio frequency detection, Reprints, Quantum measurements, Mass spectroscopy, *Ion traps, *Laser cooling, Squeezed states.

A single trapped ion, laser cooled into its quantum ground state of motion, may be used as a very-low-temperature detector of radio-frequency signals applied to the trap end caps. If the signal source is a resonant oscillator of sufficiently high Q, the source may also be placed in its quantum ground state by coupling to the ion. Parametric couplings may be used to cool and detect source modes other than the mode directly coupled to the ion. A theoretical analysis of these cooling and detection processes is presented, and as an example, their application to single trapped electron and proton spectroscopy is examined. Squeezing and low noise detection of one quadrature component of the source oscillation are also discussed. The techniques discussed here may lead to radio-frequency measurements of improved accuracy and sensitivity. Cooling and detection of vibrations of macroscopic oscillators also appear possible.

See also PB89-202147.
Pub. in Cryogenics, v34 n11 p899-908 1994.

Keywords: Reprints, Electrical measurement, *Superconducting wires, *Niobium stannides, *Critical current, Niobium tin, Interlaboratory comparisons.

The paper is a summary of an international collaboration endorsed by VAMAS to study problems associated with critical current measurements in Nb3Sn superconductors and provide guidelines for a standard measurement. Two series of critical current measurements were implemented. In the fifth series, three different sample conductors were used and participants made measurements using their own techniques. As a result, coefficients of variation for these samples at 12 T turned out the be 8-29.9%. A major source of these variations was attributed to strain sensitivity of the Nb3Sn conductors. Thus, the second series of measurements were done on one sample conductor and under specified measurement conditions, particularly in terms of specimen strain. The coefficient of variation decreased to 2.2%, which is regarded as a reasonable base for future establishment of an international standard measurement method.

High-Order Multipole Excitation of a Bound Electron.
Final rept.
C. S. Weimer, F. L. Moore, and D. J. Wineland. 1993, 4p.
Pub. in Physical Review Letters, v70 n17 p2553-2556, 26 Apr 93.

Keywords: *Multipole excitation, Reprints, *Parametric processes, Penning trap, Single electron.

The nonlinear resonant response of a bound electron to a time-varying spatially inhomogeneous electric field was studied experimentally. By use of the artifical atom 'geonium' (an electron bound in a Penning trap), the authors observed up to ninth-order multiple (pentacosiododecapole) coherent excitation of the electron's magnetron motion, and up to third-order (octuple) excitation of the cyclotron motion. Also, by applying two fields simultaneously, the authors have observed coherent stimulated Raman Excitation of the electron's motion.

Potential and Current Distributions Calculated Across a Quantum Hall Effect Sample at Low and High Currents.
M. E. Cage, and C. F. Lavine. 1995, 13p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n5 p529-541 Sep/Oct 95.

Keywords: *Hall effect, *Quantum theory, Potential, Charge distribution, Current distribution, Electron gas, Reprints, NIST(National Institute of Standards and Technology).

The potential and current distributions are calculated across the width of a quantum Hall effect sample for applied currents between 0 microA and 225 microA. For the first time, both a confining potential and a current-induced charge-redistribution potential are used. The confining potential has a parabolic shape, and the charge-redistribution potential is logarithmic. The solution for the sum of the two types of potentials is unique at each current, with no free parameters. The calculated potential distributions are in excellent agreement with contactless electro-optic effect laser beam measurements of Fontein et al.

Keywords: *Blackbody radiation, *Apertures, Reprints, Cavities, Emissivity, Temperature, Reflectance, Radiometry, Measuring instruments, NIST(National Institute of Standards and Technology).

A third generation water bath based blackbody source has been designed and constructed in the Radiometric Physics Division at the National Institute of Standards and Technology, Gaithersburg, MD. The goal of this work was to design a large aperture blackbody source with improved temporal stability and reproducibility compared with earlier designs, as well as improved ease of use. These blackbody sources operate in the 278 K to 353 K range with water temperature combined standard uncertainties of 3.5 mK to 7.8 mK. The calculated emissivity of these sources is 0.9997 with a relative standard uncertainty of 0.0003. With 50 mm limiting aperture at the cavity; entrance, the emissivity increases 0.99997.

Atom Cooling and Trapping, and Collisions of Trapped Atoms.
Final rept.
A. Gallagher. 1992, 14p.
Pub. in International Conference on the Physics of Electronic and Atomic Collisions (17th), Invited Papers, Brisbane, Australia, July 10-16, 1991, Section 3, p139-152.

Keywords: *Atomic collisions, *Energy transfer, Sodium, Densities, Temperatures, Reprints, *Foreign technology, Atom cooling, Trapped atoms.

Methods currently used to optically cool and trap atoms, and the resulting trap densities and temperatures are discussed. Next, the types of cold-atom collision processes that occur in these traps are discussed, with emphasis on their differences compared to more familiar atomic collisions at thermal and higher energies. A semiclassical model and calculations for trap-loss and associative ionization, due to excited state collisions of these very cold atoms, is then described.

Noise Characteristics Below 1 Hz of Zener Diode-Based Voltage Reference.
Final rept.
A. F. Clark, and R. L. Steiner. 1995, 90p.
Pub. in Bulletin of the American Physical Society Meeting, San Jose, CA., March 13-17, 1995, v40 n1 90p.

Keywords: *Calibration, *Low frequency noise, *Voltage reference, Zener diode, Reprints.

The short- and mid-term noise of voltage references based on Zener diodes are the limiting factors in the accuracy of their application as voltage standards. Although these references are relatively rugged, survive the rigors of shipping, and have predictable long-term behavior, they do have noise in the voltage output values with a time dependence about the same as the desired measurement intervals. We have characterized several of these references in the frequency range of 10 to the minus 1 power to 10 to the minus 6 power Hz (time intervals of seconds to months) by direct comparison to a Josephson array voltage standard at the 10 and 1 volt level with nanvolt precision. Several distincty different regions of noise characteristics are observed. Comparisons are made with 1/f and other expected behaviors and resulting accuracy limitations discussed.

Search for Small Violations of the Symmetrization Postulate in an Excited State of Helium.
Final rept.
K. Deilamian, J. D. Gillaspy, and D. E. Kelleher. 1995, 4p.
Pub. in Physical Review Letters, v74 n24 p4787-4790 Jun 95.

Keywords: *Excited states, *Helium, *Laser spectroscopy, Reprints, Pauli Exclusion Principles, Symmetrization postulate.

We have searched for the existence of the permutation symmetric 1s2siS state of helium in an atomic beam. Such a state directly violates the symmetrization postulate (SP) of quantum mechanics and implies a breakdown of the Pauli exclusion principle. Our data constrain recent SP-violating models at the 5 ppm level. This is the first experiment to look systematically for an SP-violating state with no multiple occupancy of a quantum state.

Ion Kinetics and Symmetric Charge-Transfer Collisions in Low-Current, Diffuse (Townsend) Discharges in Argon and Nitrogen.
Final rept.
S. B. Radovanov, R. J. Van Brunt, and J. K. Olthoff. 1995, 11p.
Pub. in Physical Review E, v51 n6 p6036-6046 Jun 95.

Keywords: *Discharge, *Argon, *Nitrogen, Gas mixture, Hydrogen, Ion energy, Optical emission, Radio frequency, Reprints, Balmer alpha, Doppler broadened emission.

Translational kinetic-energy distributions of mass-selected ions have been measured in diffuse, low-current Townsend-type discharges at high electric field-to-gas density ratios (E/N) in the range of 1 x 10 to the minus 18 -2 x 10 to the minus 17 Vm2 (1-20 kTd). The discharges were generated in Ar and N2 under uniform-field conditions and ion energies were measured using a cylindrical-mirror energy analyzer coupled to a quadrupole mass spectrometer. The mean ion energies determined from measured energy distributions of Ar+ in Ar and N2+ in N2 are compared with the mean energies predicted from solutions of the Boltzmann transport equation based on the assumption that symmetric resonant charge transfer is the predominant ion-neutral interaction. The results for Ar+ and N2+ are consistent with predictions made using a constant (energy independent) cross section for which an effective ion temperature can be defined. However, for both ions, the measured mean energies tend to fall increasingly below the predicted values as E/N increases.

Relativistic Modifications of Charge Expansion Theory.
Final rept.
A. W. Weiss, and Y. K. Kim. 1995, 7p.
Pub. in Physical Review A, v51 n6 p4487-4493 Jun 95.

Keywords: *Atomic structure, Relativistic effects, Reprints, *Electron correlation, *Charge expansion theory.

We examine the effects of relativity on the high-Z (where Z denotes nuclear charge) behavior of isoelectronic sequences and the modifications require of the traditional charge expansion theory. We propose that the idea of a complex be refined as the set of all configurations with the same occupation of angular-momentum quantum numbers j as well as the same principal quantum numbers n. This leads to asymptotic, high-Z grouping of states that might cut across the conventional LS-coupled states, grouping together levels from different configurations, as long as the n and j occupation numbers remain the same. This regrouping substantially reduces the asymptotic configuration interaction from the predicted by a nonrelativistic theory. Frequently correlation configurations that are significant in low-Z ions disappear entirely in high-Z ions.

Calorimetric and Visual Measurements of R123 Pool Boiling on Four Enhanced Surfaces.
M. A. Kedzierski. Nov 95, 62p, NISTIR-5732.
Sponsored by Department of Energy, Washington, DC.

Keywords: *Pool building, *Heat transfer, Surface treatment, *Electric resistance heating, R-123 refrigerant, TURBO-B tubes.

Pool boiling of R-123 on four commercial enhanced surfaces was investigated both calorimetrically and visually. The four surfaces were: (1) Turbo-BIITM-LP, (2) High-FluxTM, (3) GEWA-KTM, and (4) GEWA-TTM. The surfaces were either machined or soldered onto a flat thick OFHC copper plate. This permitted 20 sheathed thermocouples to be embedded in the copper for accurate heat transfer measurements. The difference between electric resistance and fluid heating was investigated. The fluid heating condition results in heat fluxes that are as much as 32% greater than those obtained by electric resistance heating. Hysterisis effects near the results in heat fluxes that are as much as 32% greater than those obtained by electric resistance heating. Hysterisis effects near the onset of nucleate boiling were also investigated. The boiling was visually recorded with 16mm high speed film. Mechanistic descriptions of the boiling activity are given for each surface.

Pub. in International Meeting on Radiation Processing (9th), Istanbul, Turkey, September 11-16, 1994, v46 n4-6 p1211-1215 Oct 95.

Keywords: *Chlorobenzene, *Dosimetry, *Conductivity, Reprints, *Foreign technology, *Ethanol monochlorobenzene, Electron beam dosimetry, Gamma ray dosimetry, Oscillometry.

Conductometric and oscillometric evaluation methods have earlier been developed to determine absorbed dose in the ethanol-monochlorobenzene dosimeter solution. Recent investigations on the same solution as well as on alanine solutions included the study of the possible use of different type 'conductometric' electrodes and the study of the effect of frequency on the sensitivity of the method. On the basis of these investigations an oscillometric reader has been designed and tested. The same evaluation methods have been tested on the irradiated aqueous alanine solutions, aiming also at the study of the applicable concentration of the alanine solute and the dose (1 to 50 kGy) and dose-rate range using both electron and gamma radiation.

Pub. in International Meeting on Radiation Processing (9th), Istanbul, Turkey, September 11-16, 1994, Radiation Physics and Chemistry, v46 n4-6 p1235-1242 Oct 95.

Keywords: *Calorimeters, *Electron beams, Reprints, Dosimeters, Calibration, Radiation processing, *Foreign technology, *Beam calibration.

Graphite calorimeters in both single-slab and modular multiple-slab disk geometries have been designed and used for measuring absorbed doses in graphite in intense electron beams of 2 to 12 MeV energy. The modular system has also been used with two to eight graphite elements to measure electron-beam depth-dose curves and to calibrate the response functions of radiochromic-film and alanine-pellet dosimeters. An advantage of this new design is that such calibrations can be accomplished without requiring electron-beam current or charge monitoring, since the calorimeter modules adjacent to the dummy graphic element used to hold the dosimeters during calibration provide simultaneous calorimetric dose monitoring. Temperature-dependence corrections for dosimeter response are also simplified in this way.

Pub. in Physical Review A, v51 n5 p3588-3597 May 95.

Keywords: Emission, Spectrum, Reprints, *Atomic transition probabilities, *Spectroscopic coupling, LS-coupling, Neutral nitrogen.

With a wall-stabilized arc source, the authors have measured the relative transition probabilities of 100 lines of neutral nitrogen in the visible and near-infrared spectrum and have normalized their data to an absolute scale utilizing four recent lifetime results. The authors estimate that the expanded uncertainties of their data are in the range of plus or minus 11-15%. For a number of 3s-3p and 3p-3d multiplets. They have measured complete sets of lines and observe that most 3p-3d multiplets show considerable departure from LS coupling, while the 3s-3p multiplets adhere to it within plus or minus 20%. Agreement between intermediate coupling calculations and their experimental data for the 3p-3d multiplets is noticeably better, but significant differences are still encountered for two multiplets originating from the 3d4P level.

Pub. in Electromagnetics, v15 p301-319 1995.

Keywords: *Electric charge, *Dipoles, *Conductors, Electormagnetic wave transmission, Lossy media, Frequencies, Numerical analysis, Reprints.

Excitation of currents on an infinitely long conductor is analyzed for horizontal electric dipole or line sources and for plane-wave, far-field source. Any of these sources can excite strong currents which produce strong scattered fields for detection. Numerical results for these sources indicate that long conductors produce a strong anomaly over a broad frequency range. The conductor can be either insulated or bare, to model either ungrounded or grounded conductors.

Keywords: *Ion distribution, *Radio frequency discharge, *Glow discharges, Microelectronics, Gases, Mixtures, Helium, Nitrogen, Inelastic collisions, Interactions, Fabrication, Reprints, IEDs(Ion energy distributions), Ion molecule reactions.

The ion energy distributions (IEDs) striking surfaces in rf glow discharges are importatnt in the context of plasma etching during the fabrication of microelectronics devices. In discharge sustained in molecular gases of multicomponent gas mixtures, the shape of the IED and the relative magnitudes of the ion fluxes are sensitive to ion-molecule collisions which occur in the presheath and sheath. Ions which collisionlessly traverse the sheaths or suffer only elastic collisions arrive at the substrate with a measurably different IED than do ions which undergo inelastic collisions. In this article we present measurements and results from parametric calculations of IEDs incident on the grounded electrode of a rf glow discharge sustained in a He/N2 gas mixture while using a Gaseous Electronics Conference Reference Cell (33.3 Pa, 13.56 MHz).

High-Speed Interconnection Characterization Using Time Domain Network Analysis.
Final rept.
R. B. Marks, D. C. DeGroot, and J. A. Jargon. 1995, 5p.
Pub. in Advancing Microelectronics, v22 n6 p35-39 Nov/Dec 95.

Keywords: *Time, *Calibration standards, *Packaging, *Microelectronics, Network analysis, Errors, Joining, Measurement, Reprints, *Time domain, TDNA(Time Domain Network Analysis).

Time domain network analysis (TDNA) has become a realistic competitor to conventional automatic network analyzers. Off-line processing of data from fast digital sampling oscilloscopes can provide measurements of network parameters with an accuracy that is acceptable for many packaging and interconnection problems at frequencies from dc to over 10 GHz. Since many packaging laboratories have ready access to the required instruments, TDNA brings many advanced measurement capabilities into the hands of engineers to whom a conventional network analyzer is unavailable.

Necessary Condition for Homoclinic Chaos Induces by Additive Noise.
Final rept.
E. Simiu, M. Frey, and M. Grigoriu. 1992, 8p.
Pub. in Proceedings of the International Conference on Computational Stochastic Mechanics (1st), Corfu, Greece, September 17-19, 1991, p889-896 1992.

Keywords: *Chaos, *Noise, Reprints, *Foreign technology, Duffing equation, Dynamical systems, Homoclinic orbits, Nonlinear differential equations.

The effect of noise on the possible occurrence of chaos in systems with a homoclinic orbit was recently investigated in the literature on the bais of a redefinition of the Melnikov function. The purpose of this note is to show that, even in the case of deterministic equations, this redefinition is not consistent with the geometry of the perturbed orbits and would therefore lead to incorrect solutions. The possibility is then explored in developing a necessary condition for the occurrence of homoclinic chaos in forced systems perturbed additively by a commonly used approximate representation of white noise.

Model for Calculating Virial Coefficients of Natural Gas Hydrocarbons with Impurities.
Final rept.
L. A. Weber. 1995, 12p.
Pub. in Fluid Phase Equilibria, v111 p15-26 1995.

Keywords: *Activity coefficient, Vapor pressure, Reprints, *Foreign technology, *Ebulliometry, *Refrigerant mixtures, Vapor liquid equilibrium.

A model for calculating second and third virial coefficients, originally developed to describe the behavior of polar halocarbon refrigerants and their mixtures, has been applied to systems of natural gas hydrocarbons and their common impurities, namely H2S, H2O, CO2, CO, and N2. It can be used to correlate data, point out probable errors and provide predictions where data are nonexistent or unreliable. It also provides a means for calculating accurate gas-phase densities, thermodynamic properties, fugacities, and 'calculated data' which can be incorporated into global equations of state for phase equilibrium calculations. Examples are shown for some of the pure components and for the binary systems C2H6 + H2S and CH4 + H2O. In the case H2O, terms are included that account for association. Comparisons are made with available data, and predicted values are shown where no data exist.

Simple Variable Line Space Grating Monochromator for Synchrotron Light Source Beamlines.
Final rept.
T. A. Callcott, W. L. O'Brien, J. J. Jia, R. N. Watts, D. R. Mueller, Q. Y. Dong, and D. L. Ederer. 1992, 7p.
Pub. in Nuclear Instruments and Methods in Physics Research, vA319 p128-134 1992.

Keywords: *Monochromators, *Spectrometers, Synchrotrons, Vacuum ultraviolet, Reprints, Soft x ray, Varied line spaced grating.

In this paper, the authors present and analyze an improved spectrometer design that has evolved from studies of the focal properties of transmission gratings in converging light beams. This design uses a variable line space grating at a fixed angle of incidence to focus the diffracted light in one dimension, producing resolutions in excess of 1000 over a large wavelength region. Attractive features of this concept include high throughput, simple wavelength scanning, simple optical elements (plane gratings and plane and toroidal mirrors), and relatively inexpensive realizations. After presenting a mathematical analysis of the primary design features, the authors discuss implementations of this design both as a spectrometer and as two versions of beamline monochromators. Design parameters for the two monochromators will be given.

Modeling Detector Response for Neutron Depth Profiling.
Final rept.
K. J. Coakley, R. G. Downing, G. P. Lamaze, C. Ronning, H. C. Hofsass, and J. Biegel. 1995, 8p.
Pub. in Nuclear Instruments and Methods in Physics Research, Section A, vA366 p137-144 1995.

Keywords: *Detector response, Semiconductors, Straggling, Reprints, *Foreign technology, *Neutron depth profiling, Diamond-like carbon, Statistical modeling.

In Neutron Depth Profiling (NDP), inferences about the concentration profile of an element in a material are based on the energy spectrum of charged particles emitted due to specific nuclear reactions. The detector response function relates the depth of emission to the expected energy spectrum of the emitted particles. Here, the detector response function is modeled for arbitrary source and detector geometries based on a model for the stopping power of the material, energy straggling, multiple scattering and random detector measurement error. At the the NIST Cold Neutron Research Facility, a NDP spectrum was collected for a diamond-like carbon (DLC) sample doped with boron. A vertical slit was placed in front of the detector for collimation. Based on the computed detector response function, a model for the depth profile of boron is fit to the observed NDP spectrum. The contribution of straggling to overall variability was increased by multiplying the Bohr Model prediction by a ramp factor. The adjustable parameter in the ramp was selected to give the best agreement between the fitted profile and the expected shape of the profile. The expected shape is determined from experimental process control measurements.

Al L2,3 Core Excitons in AlxGa1-x as Studied by Soft-X-ray Reflection and Emission.
Final rept.
Q. Y. Dong, W. L. O'Brien, J. J. Jia, T. A. Callcott, and D. L. Ederer. 1992, 7p.
Pub. in Physical Review B, v46 n23 p15 116-15 122 Dec 92.

Keywords: *X ray emission, Reprints, *Aluminum gallium arsenide, Absorption spectra, Core exciton.

The Al L2.3 soft-x-ray reflection and emission spectra of AlxGa1-xAs have been measured for x between 0.17 and 1.0. The valence-band maximum was monitored via the emission spectra using a fit based on band-structure parameters. The dominant features in the reflection spectra are produced by the L2.3 core excitons. Since both the reflection spectra and emission spectra were obtained using the same soft-x-ray spectrometer, the energies of the excitons above the

valence-band maximum are acurately obtained. The known values of the optical band gap, as a function of x, are then used to determine the core exciton binding energy. The core excitons are found to follow and lie above the conduction-band minimum by 0.3 eV as the Al composition changes. Our results are compared to various core exciton theories and to previous experiments.

Stochastic Modeling of a New Spectrometer.
Final rept.
C. Hagwood, K. Coakley, A. Negiz, and K. Ehara. 1995, 17p.
Pub. in Aerosol Science and Technology, n23 p611-627 1995.

Keywords: *Aerosol spectrometers, Equations, Reprints, *Stochastic differential, *Transfer function, Exit probability.

A new spectrometer for classifying aerosol particles according to specific masses is being considered (Ehara et at. 1995). The spectrometer consists of concentric cylinders which rotate. The instrument is designed so that an electric field is established between the cylinders. Thus, aerosol particles injected into the spectrometer are subjected to a centrifugal force and an electric force. Depending on the balance between these two forces, as well as Brownian motion, charged particles either pass through the space between the cylinders or stick to either cylinder wall. Particles which pass through are detected. Given the rotation rate, voltage drop and physical dimensions of the device, we calculate the probability of detection in terms of particle density, diameter and charge.

Pub. in Jnl. of Applied Physics, v69 n11 p7800-7804 Jun 91.

Keywords: *X ray emissions, *Semiconductors, Core excitation, Silicide, Reprints, Band structure, Ion implantation.

The Si L2,3 emission spectra of silicon crystals implanted with Co at doses of (1-8) x 10 to the 17th power Co/cm2 have been examined using soft-x-ray-emission (SXE) spectroscopy. At the lowest dose, the spectra are little modified from that of crystalline Si, indicating that only a small fraction of Si is in the form of silicides within the probe depth of SXE spectroscopy. For higher doses and implant profiles with Co extending to the surface, there is clear evidence ordered CoSi2 combined with richer Co phases, but little evidence for pure Si or for ordered regions of CoSi.

Pub. in Physical Review B, v46 n15 p9446-9451 Oct 92.

Keywords: *Electronic structure, *Iron silicides, *X ray emissions, Reprints, Iron implanted silicon, Partial density.

Bulk iron silicides and implanted iron silicides have been studied by soft-x-ray emission (SXE) spectroscopy. The Si L2,3 emission spectra of these materials are measured. For bulk silicides, these spectra provide a measure of s- and d-type partial density of states (PDOS) localized on the Si sites. We compare them with available band-structure calculations and also with photoemission measurements. For implanted systems, the Si L2,3 emission spectra provide useful information about the silicide formation process with the variation of implant doses.

Influence of Coadsorbed Potassium on the Electron-Stimulated Desorption of F(+), F(-), and F(*) from PF3 on Ru(0001).
Final rept.
S. A. Joyce, C. Clark, V. Chakarian, T. E. Madey, P. Nordlander, B. Maschhoff, H. S. Tao, D. K. Shuh, and J. A. Yarmoff. 1992, 9p.
Pub. in Physical Review B, v45 n24 p14 264-14 272 Jun 92.

Keywords: *Charge transfer, *Fluorine, *Photoemission, Ruthenium, Reprints, PF3, Stimulated desorption.

The electron-stimulated-desorption ion angular distributions (ESDIAD) of positive ions, negative ions, and metastable species from PF, and K coadsorbed on a Ru(0001) surface are measured. In the absence of K, only positive- and negative-ion ESDIAD is observed, showing highly anisotropic, off-normal fluorine-ion emission (F+, F-) from PF3, which demonstrates that PF bonds are inclined away from the surface normal. In the presence of K, ESDIAD patterns of F+, F-, and metastable F(star) display only normal emission, suggesting a reorientation or chemical reaction which results in fluorine bonding perpendicular to the surface. Thermal desorption spectrometry, Auger electron spectroscopy, and soft-x-ray photoemission (SXPS) are used to determine the surface chemistry as an aid in intepreting the ESDIAD results. The SXPS data show that in the presence of potassium, PF3 dissociates, possibly forming KF-like species, which suggests that an alkali-metal-induced chemical reaction is responsible for the changes observed in ESDIAD. The yields of the various desorbed fluorine species vary strongly with potassium coverage; the results for F- and F(star) are interpreted in terms of a charge-transfer model.

RIS Measurement of AC Stark Shifts and Photoionization Cross Sections in Calcium.
Final rept.
J. B. Kim, X. Xiong, T. R. O'Brian, T. J. McIlrath, and T. B. Lucatorto. 1992, 4p.
Pub. in Inst. Phys. Conf. Ser. No. 128, RIS 92, Santa Fe, NM., May 24-29, 1992, p59-62.

Keywords: *Calcium, Reprints, *AC Stark shifts, Intense laser fields, Multiphoton ionization, Photo-ionization, Resonance ionization spectroscopy, Rydberg levels.

The ac Stark shifts of four high-lying Ca levels in intense laser fields (10 to the 8th power to 10 to the 10th power W/sq. cm) are studied using two-photon ionization spectroscopy. The two-photon Rabi rates and photoionization cross sections for excited states are also measured, and compared to values obtained from detailed modeling of the RIS profiles. Although three Rydberg levels studied display the expected pondermotive energy shifts, a fourth doubly-excited level deviates significantly from the ponderomotive behavior.

Comment On: Two-Photon Absorption Series of Calcium.
Final rept.
J. R. Krumrine, A. Musgrove, and T. B. Lucatorto. 1995, 2p.
Pub. in Canadian Jnl. of Physics, v73 p403-404 1995.

Keywords: *Calcium, *Energy levels, *Laser spectroscopy, Series, Spectra, Quantum defects, Reprints, *Foreign technology.

Using two-photon absorption laser spectroscopy of calcium, Makdisi and Bhatia presented a well-resolved series that they tentatively assigned as 4S2 1S0 - 4snf 1F3 (n = 33 - 59). We find this assignment to be erroneous. Calculations of quantum defects and a comparison of their observed energy levels with previously determined values reveal that the spectra actually represent the 4s2 1S0 - 4snp 1P1 series (n = 34 - 60).

Pub. in Physical Review Letters, v67 n16 p2139-2142 Oct 91.

Keywords: *Atomic collisions, *Laser cooling, Optical molasses, Trapped atoms, Reprints, *Ultracold atoms, Associative ionization, Laser trapping, Low energy collisions.

Julienne recently predicted a dramatic laser-intensity-dependent modification of the associative ionization (AI) rate in ultracold collisions. We observe such a modification, but with a behavior inconsistent with the originally proposed mechanism. Furthermore, we find resonant structure in the spectrum of AI rate versus laser frequency, showing the importance of molecular bound states in the AI process. These observations are explained in a new theoretical treatment by Julienne and Heather (preceding Letter).

Pub. in Physical Review B, v52 n13 p9702-9708 Oct 95.

Keywords: *Barium partial density, *Photon beam excitation, *Soft x ray emission, Reprints, BaF2, BaTiO3, PrBa2Cu307, YBA2Cu307.

Monochromatic photon beams were used to excite barium NIV,V soft x-ray emission spectra from YBa2Cu3O7-delta, prBa2Cu3O7-delta, BaF2, and BaTiO3. Near threshold excitation was used to demonstrate that small contributions to the barium NV and NIV emission spectra in the energy region above the 5p-->4d core-core transitions do not arise as satellite emission from transitions in multiply excited atoms but rather occur as a result of transitions from the valence states. The emission spectrum of YBa2Cu3O7-delta and PrBa2Cu3O7-delta reveals a contribution to the electronic density of states at the barium site in the region near the Fermi level. The YBa2Cu3O7-delta compound is a superconductor and PrBa2Cu3O7-delta is an insulator. It has been proposed that the difference between them is due to mixing of praseodymium and barium among the sites occupied by yttrium and barium, with an accompanying change in electronic structure. However, the authors' measurements indicate that the barium partial density of states for the two compounds are essentially identical.

Pub. in Physical Review B, v46 n17 p11 069-11 074 Nov 92.

Keywords: *Cupric oxide, *Electron density, Cuprous oxide, Reprints, *X ray fluorescence, Superconductivity bismuth cuprate.

Photon-excited soft x-ray emission spectra for CuO, Cu2O, and bismuth cuprate in the region of the Cu 3d->3p transitions were measured to obtain bulk-sensitive electronic partial density-of-states information. For CuO and Cu2 transitions from the valence levels into the Mn and Mm levels were clearly resolved. The emission features were separated by the 2.3-eV spin-orbit interaction of the copper 3p1/2 and 3p3/2 states and appeared in the statistical intensity ratio. The copper Mm emission spectrum of the superconductor is broader than the spectra CuO and Cu2O. For all three compounds the shape of the Mm emission spectrum extracted from the data is qualitively similar to calculations of the copper single-particle local density of states. No evidence of multiplet structure was observed in the emission spectrum of CuO in spite of the open d shell in the ground state. The measurements are compared with published copper L emission data and photoemission results.

Pub. in Physical Review B, v44 n3 p1013-1018 Jul 91.

Keywords: *Absorption spectra, *Reflection spectra, *Exciton, Measurement, Reprints, MgO, AL203, SiO2.

The L23 reflection spectra for single-crystal MgO, alpha-Al2O3, and alpha-SiO2 are measured. These reflection spectra are used to generate absorption spectra that agree well with electron-total-yield and electron-energy-loss measurements. Exciton features are shown to exist in the band gap by comparing the valence-band maximum plus optical band gap to the observed transition energies. The energy splitting on the L2-L3 excitons, as seen in reflection, is clearly resolved for Al2O3 and SiO2, while in electron-total-yield measurements the doublets are not resolved for Al2O3. This resolution allows the calculation of the exchange energy using intermediate-coupling theory.

The authors have recently begun a series of upgrades to the NIST/ARPA National Reflectometry Facility at the Synchrotron Ultraviolet Radiation Facility. The facility currently consists of a new monochromator and the original sample manipulator which allows the authors to measure optical components less than 10 cm in diameter. The monochromator offers high throughput and modest resolution over the wavelength range 3.5-40 nm. In the next year the authors will be installing a sample manipulator that will be able to accommodate the much larger optics that will be used in future x-ray projection lithography and astronomy instruments. The authors offer preliminary measurements of the throughput and resolution of the new monochromator.

Dynamics of Hydrogen Interactions with Si(100) and Si(111) Surfaces.
Final rept.
K. W. Kolasinski. 1995, 57p.
Pub. in International Jnl. of Modern Physics B, v9 n21 p2753-2809 1995.

Keywords: *Internal state distribution, *Molecular beam scattering, Reaction dynamics, Reprints, Silicon, Adsorption, Desorption, Hydrogen, *Foreign technology, Disilane.

Experimental and theoretical work probing the dynamics of dissociative adsorption and recombinative desorption of hydrogen at Si(100) and Si(111) surfaces is reviewed. Whereas molecular beam experiments demonstrate that molecular excitations do aid in overcoming a substantial activation barrier toward adsorption, desorbed molecules are found to 'have a total energy content only slightly above the equilibrium expectation at the surface temperature. A consistent interpretation of the ad/desorption dynamics is arrived at which requires neither a violation of microscopic reversibility nor defect-mediated processes. An essential element of this model is that surface atom relaxations play an essential role in the dynamics such that different portions of the potential energy hypersurface govern the results of adsorption and desorption experiments. The 'lost' energy, i.e. that portion of the activation energy not evident in the total energy of the desorbed molecules, is deposited in the surface coordinates where it is inaccessible to experiments that probe the desorbates final state.

Pub. in Applied Physics Letters, v63 n24 p3330-3332, 13 Dec 93.

Keywords: *Silicon defects, Reprints, *Silicon on insulator, Oxygen implanted silicon, Stacking faults, Transmission electron microscopy.

The defect microstructure of silicon-on-insulator wafers produced by multiple cycles of oxygen implantation and annealing was studied with transmission electron microscopy. The dominant defects are stacking fault pyramids (SFPs), 30-100 nm wide, located at the upper buried oxide interface at a density of approx. 10 to the 6th power cm to the minus 2 power. The defects are produced by the expansion and interaction of narow stacking fault (NSF) ribbons pinned to residual precipitates in the top silicon layer. Consideration of the energetics of the transformaion from a collection of four NSF ribbons to a single SFP indicates that the reaction is energetically favorable below a critical NSF length. Thus small defects are stable as SFPs while large defects are stable as NSF ribbons.

Keywords: *Magnetoabsorption, *Liquid phase epitaxy, One photon, Trap levels, Impurities, Defects, Reprints, *Foreign technology, HgCdTe, Mercury interstitials.

Resonant impact ionization (RII) spectroscopy, a new technique for studying low concentrations of trap levels in narrow-gap Hg(1-x)Cd(x)Te, has been used to investigate impurity and defect levels in both bulk and liquid phase epitaxy (LPE) crystals of this ternary material. Mercury interstitials, deliberately introduced into bulk samples with x equals 0.22 and x equals 0.24, provide direct evidence for the formation of trap levels near 45 and 61 meV above the valence band edge for these x-value samples. The 61meV level in the x equals 0.24 (Eg =121 meVat 5 K) sample is seen to enhance the transition strength of resonant two-photon magneto-absorption (TPMA) observed at high fields by acting as a near-resonant intermediate state for the two-photon process. In the LPE material, samples which have received just a post-anneal in an Hg-saturated atmosphere show strong (RII) structure due to defect levels at equals 60 meV above the valence band, whereas samples which are both doped with indium and post-annealed show only intrinsic one-photon magneto-absorption structure.

Pub. in Physical Review B, v47 p140-143 1993.

Keywords: *Insulators, *Phonons, Photon excitation, Reprints, Soft x ray emission, Stoke shift, Synchrotron radiation.

Phonon-relaxation effects on the L2.3 soft-x-ray emission of MgO, Al2O3, and SiO2 are measured by comparing soft-x-ray emission spectra to photoelectron spectra. The observed shifts of the soft-x-ray emission spectra relative to the photoelectron spectra are identified as Stokes shifts and are described in terms of partial phonon relaxation. The observed Stokes shifts are 0.5, 0.9, and 1.2 eV for MgO, Al2O3, and SiO2, respectively. Similar measurements on Mg, Al, and Si show no detectable Stokes shift within the experimental uncertainty of 0.2 eV. The larger Stokes shifts observed in the oxides are due to the longer core-hole lifetime, the faster phonon relaxation, and larger phonon relaxation energy in the oxides.

S. L. Rolston, and W. D. Phillips. 1991, 9p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers, v79 n7 p943-951 Jul 91.

Keywords: *Atomic fountain, *Frequency standards, *Laser cooling, Microwave standards, Optical clock, Reprints, Two-photon spectroscopy.

Recent advances in laser cooling, including temperatures as low a few microkelvin, and the demonstration of the ability to launch atoms while maintaining these low temperatures, now allows the realization of atomic fountain frequency standards. An analysis of a Cs microwave fountain predicts potential stability anmd accuracy improvements of a factor of 100 over present laboratory standards, with an ultimate accuracy near 10 to the 16th power. An optical frequency standard based on a two-photon transition in xenon is analyzed and shown to have potential stability 5 orders of magnitude better than current Cs standards, and a possible accuracy of 10 to the 18th power. Neutral atom frequency standards will have much better signal-to-noise (S/N) ratios than ion standards, but suffer from large systematic effects, making the two technologies complementary in many ways.

E. C. Teague. 1993, 42p.
Pub. in Society of Photo-Optical Instrumentation Engineers Handbook 'The Technology of Proximal Probe Lithography', Part 3, p322-363 Jun 93.

Keywords: *Metrology, *Displacement, Workplace layout, Interferometry, Accuracy, Motion studies, Lithography, Reproducibility, Reprints, Positioning uncertainty, Abbe offset, Proximal probe lithography.

Four major tasks of accurate positioning are examined: generating highly repeatable motion in a workspace, constructing a metrology frame from highly-stable, accurate lines and planes, realizing a metric in the workspace, and linking the workpiece to the coordinate system with a probe. Optical scales, x-ray interferometry, optical heterodyne interferometry, Fabry-Perot etalons, and impedance-based transducers are evaluated as possible means to realize a metric. The major error sources, practical limitations, and guidelines for establishing a coordinate reference frame are described. The repeatability of sliding bearings and flexure bearings is examined and this combined with cosine and Abbe offset errors is used to estimate uncertainties in generating and measuring linear motion. Finally, the effects of probe-substrate forces and energies of interactions on positioning accuracy are discussed.

Residual Error Compensation of a Vision-Based Coordinate Measuring Machine.
Final rept.
M. V. Ananda, J. Raja, T. Doiron, and J. Zimmerman. 1993, 5p.
Pub. in Proceedings of the American Society for Precision Engineering Fall Meeting, p66-70 1993.

Keywords: *Calibration, *Metrology, Reprints, *Dimensional metrology, Error compensation, Grid plate.

The commercial equipment for measuring lithography patterns has reached an accuracy level which makes it difficult to provide two dimensional artifact of higher accuracy for use as calibration standards. Because of the simpler nature of one-dimensional measurements, it is still possible to measure one line of a grid plate to a higher accuracy than is possible using the two dimensional measurement machines. The main idea of this paper is to introduce the idea of using a partially calibrated grid plate (one of two lines calibrated) and a series of measurements of the whole plate on the two dimensional machine to produce a calibration of both the grid plate and the machine. The authors' procedure involves measurement of a grid plate in three specified orientation. The measurement data is used to build an error compensation model. The following sections give a brief description. Software compensation of a coordinate measuring machine has become an accepted practice to enhance the accuracy of a CMM. In addition to parametric error compensation schemes, research work in self calibration schemes have also been carried out in recent years. Hocken and Borchardt used the measurements of an artifact in two specified orientations to model squareness and scale error. Belforte, et al. Developed a model that included the twenty one error components. They used legendre polynomials to model the errors. The self calibration methods eliminate the need for calibrated artifacts, but require the dimensional stability of the artifacts during the measurement. Raugh has also developed a method that falls under this category. The authors' method is an extension of the Hocken-Borchardt method.

Measurement of the Neutron Lifetime.
Final rept.
M. S. Dewey, D. M. Gilliam, W. M. Snow, and G. L. Greene. 1992, 8p.
See also PB91-118026. Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of the Weak and Electromagnetic Interactions in Nuclei Conference, Dubna, Russia, 1992.

Keywords: *Neutrons, Measurement, Counting, Reprints, Penning traps, Lifetime.

Neutron beta-decay is a proto-typical semi-leptonic weak interaction whose rate is of considerable theoretical importance. Accurate measurements of the neutron decay rate along with Big Bang nucleosynthesis calculations and measurements of light element abundances constrain the number of light neutrino species, Nv. This constraint currently agrees with the number of neutrino species inferred from the recent precision measurements of the decay width of the Z boson. A resolution of the current disagreement among experimental values for the neutron lifetime Tn, the neutron beta asymmetry An, and fr-values of pure Fermi O+ goes to O+ superallowed beta-transitions might require extensions to the Standard Model. In the coming year the authors hope to improve by a factor of four the accuracy of their previous measurement of the neutron lifetime (5.3 goes to approximately 1.5s). The current status and future prospects for the measurement are discussed.

Pub. in Measurement, v12 p1-8 1993.

Keywords: *Solder joints, *Inspections, Reprints, *Foriegn technology, Dimensional metrology, Interim artifact, Statistical process control.

Automated inspection of printed wiring assemblies, particularly those using surface mount technology, has become practical with the advent of high-speed vision processing for dimensional measurements on each feature coupled with artificial intelligence tools to make decisions based on the measurements. In this paper the authors present accuracy tests of such a system based on the measurement of known artifacts which simulate the geometry of typical solder joints.

Length Metrology of Complimentary Small Plastic Rulers.
Final rept.
D. T. Doiron, and T. D. Doiron. 1994, 7p.
Pub. in Proceedings of the Measurement Science Conference, Pasadena, CA., January 1994, 7p.

Keywords: *Measurement systems, *Rulers, *Metrology, Reprints, *Scale error standards.

The national measurement system concerns the relationships between individual measurements and the specific units of measure. In some cases, gage blocks for example, there are standards, a large body of scientific research, and considerable effort taken to trace the accuracy of blocks used in manufacturing back to the unit of length. The international trend to laboratory accreditation (NVLAP, NAMAS, etc.) is a formalization of the idea of assuring measurement accuracy by assessment of laboratory practice and evaluation of a measurement system's relation to the unit of length.

Pub. in Nuclear Data for Science and Technology, Forschungszentrum Julich, Federal Republic of Germany, May 13-17, 1991, p507-509 1992.

Keywords: *Germanium detector, *Neutron standards, Cross sections, Reprints, *Foreign technology, *Black detectors, Monte Carlo.

A relative cross section measurement of the 10B(n, alpha, gamma)7Li cross section was made using the ORELA neutron source. The reaction was measured by observing the 478 keV photon using a 30% efficiency germanium detector. The neutron flux was monitored with a high efficiency plastic scintillator. Data analysis required the use of extensive Monte Carlo calculations for corrections to the data. The measured cross section differs as much as 40% from the ENDF/B-VI evaluation for neutron energies greater than 1.5 MeV.

Gas Absorption during Ion-Irradiation of a Polymer Target.
Final rept.
W. E. Wallace, T. T. Chiou, J. B. Rothman, and R. J. Composto. 1995, 5p.
Pub. in Nuclear Instruments and Methods in Physics Research B, v103 p435-439 May 95.

Keywords: *Blistering, *Polyimide, *Gas absorption, Reprints, Water absorption, *Foreign technology, *Ion beam modification.

The presence of a high partial pressure of deuterated water in the vacuum of the scattering chamber of an MeV ion accelerator system was shown to promote the incorporation of deuterium into a thin polyimide target subjected to 1.3 MeV 4He+ irradiation. When the background pressure in the chamber was low, 2.7 x 10 to the minus 5th power Pa (2 x 10 to the minus 7th power Torr), the polyimide was shown by forward recoil spectrometry to evolve hydrogen when ion bombarded. This was an expected, and commonly observed phenomenon. However, when the pressure in the scattering chamber was raised to 1.3 x 10 to the minus 2 power Pa(1 x 10 to the minus 4 power Torr) by the addition of D2O vapor through a leak valve, deuterium was readily incorporated into the target in the ion-irradiated area. The degree to which the polyimide film absorbed gas from the vacuum of the scattering chamber was unexpected. The deuterium/hydrogen atomic concentration ratio reached 0.235 after a dose of 3.5 x 10 to the 15th power ions/sq. cm. The absorption of deuterium was accompanied by blistering in the polyimide at high ion fluences.

Interfacial Crack in a Two-Dimensional Hexagonal Lattice.
Final rept.
R. Thomson, and S. J. Zhou. 1994, 11p.
Pub. in Physical Review B, v49 n1 p44-54 Jan 94.

Keywords: *Crack propagation, Fracture, Interfaces, Dislocation, Reprints, *Interfacial crack, *Lattices.

In this paper we compare a set of atomic calculations of interfacial crack structure and properties with the predictions of an augmented elastic theory. Our intent is to critique the elastic predictions, especially the mode conversion and displacement closure oscillation features of the elastic theory. A simple physical picture is developed based on a crack stability diagram, using two sets of stress intensity axes. The first set is the normal applied stress intensity K and the second is a local stress intensity factor k, defined to describe the physics of the core region. The Griffith condition is different from that for dislocation emission. In each case, the effective core size is much smaller than the physical core size, which means that the mode shift at the crack tip is considerably larger than would be expected on the basis of linear elasticity. However, with appropriately defined condition is also surprisingly well satisfied in the mode-II emission configuration. The crack is found never to exhibit displacement oscillations, in part, because of the necessary condition that the Griffith condition be satisfied at the crack tip, and in part because the amount of shear in the core is limited by dislocation emission.

Dislocation Core-Core Interaction and Peierls Stress in a Model Hexagonal Lattice.
Final rept.
S. J. Zhou, A. E. Carlsson, and R. Thomson. 1994, 6p.
Pub. in Physical Review B, Condensed Matter, Third Series, v49 n10 p6451-6456 Mar 94.

Keywords: *Dislocation core, Fracture, Reprints, *Lattices, *Atomistic calculations, Peierls Stress.

A series of atomistic calculations is performed in order to explore dislocation core-core interactions and the Peierls stress in a model hexagonal lattice. The method of calculation is the lattice Green's function method, using several pair potentials with variable parameters. We confirm that dislocation cores broaden as a pair of dislocations with opposite sign move closer to each other. Continuum theories are surprisingly accurate in describing the dislocations-dislocation interaction force even in the range of strong core-core overlap. However, our atomistic calculations show that while the relation between the Peierls stress and dislocation width is exponential as the Peierls-Nabarro model predicts, that model underestimates the Peierls stress by nearly a factor of 10 to the 4th power.

Pub. in Physical Review A, v52 n6 p4457-4461 Dec 95.

Keywords: *Lanthanum, *Multiplet structures, *Emission spectrum, Reprints, *Soft x-ray emission spectra.

Soft-x-ray emission spectra for the La N4.5O2.3 transitions in lanthanum aluminate LaAlO3 include contributions from several relatively intense multiplet lines near 80 eV. The appearance of this spectrum contrasts sharply with the three diagram lines observes for the N4.5O2.3 emission spectrum of Ba in BaF2. An atomic model of the La N4.5O2.3 transition, assuming single occupancy of the 4f shell by a spectator electron, provides a good approximation of the measured spectrum. Emission features due to the low-energy 3P0 and 3D0 terms of the 4d94f configuration are also apparent in the laAlO3 emission spectra, but not in emission spectra from BaF2. Reflection measurements indicate that the 4f level is not occupied in the ground state in LaAlO3. The data suggest that charge transfer from ligand orbitals following creation of a 4d vacancy prior to the emission process is the predominant mechanism giving rise to the required 4f occupancy.

Non-Newtonian Flow between Concentric Cylinders Calculated from Thermophysical Properties Obtained from Simulations.
Final rept.
A. P. Narayan, J. C. Rainwater, and J. M. Hanley. 1995, 7p.
Pub. in International Jnl. of Thermophysics, v16 n2 p347-353 Mar 95.

Keywords: *Colloidal suspension, *Rheology, Reprints, *Foreign technology, *Couette flow, Shear thickening, Soft sphere fluid, Weissenberg effect.

A study of the Weissenburg effect (rod climbing in a stirred system) based on nonequilibrium molecular dynamics (NEMD) is reported. Simulation results from a soft-sphere fluid are used to obtain a self-consistent free-surface profile of the fluid of finite compressibility undergoing Couette flow between concentric cylinders. A numerical procedure is then applied to calculate the height profile for a hypothetical fluid with thermophysical properties of the soft-sphere liquid and of a dense colloidal suspension. The height profile calculated is identified with shear thickening and the forms of the visometric functions. The maximum climb occurs between the cylinders rather than at the inner cylinder.

Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p318-321 1996.

Keywords: *Microscopy, Measurements, Reprints, Electrical data, Topographic data, *Scanning capacitance microscopy, 2-D dopant profiling.

The authors have developed a setup which uses scanning capacitance microscopy (SCM) to obtain electrical data of cross-sectioned samples while simultaneously acquiring conventional topographical AFM data. The results presented here include 2D SCM maps of cross-sections of blanket implanted, annealed Si wafers as well as test structures on Si. The authors found the technique to be sensitive over several orders of magnitude of carrier density concentrations less than E15 to E20 atoms/sq. cm., with a lateral resolution of 20-150 nm, depending on probe tip and dopant level. The authors find excellent agreement of total implant depth obtained from SCM signals of cross-sectioned samples with conventional Secondary Ion Mass Spectrometry (SIMS) profiles of the same sample.

Pub. in Physical Review Letters, v74 n22 p4468-4471 May 95.

Keywords: *Fractal aggregation, *Gelaton, Molecular dynamics, Reprints, Scaling, Spinodal decomposition.

The evolution of a 2D Lennard-Jones system, quenched from the fluid to below the triple point, is simulated by molecular dynamics. We show that the structure factor obeys the scaling relation S(q/qm(t)) approx. qm(t)-dfS(q/qm). Here qm is the location of the low angle peak in S(q), df equals 1.85 plus or minus 0.05 is a fractal dimension, and S(q/qm) is a time-independent characteristic function which peaks at qm. The quenching process is thermodynamically similar to the formation of a gel from a sol. Hence the relation suggests that a characteristic fractal dimension of even a dense gel can be derived from measurements of the time evolution of S(q).

Keywords: *Ceramics, *Crystal growth, *X ray diffraction, Reprints, Crystal structure.

The compound Sr5TiNb4O17 was prepared and its crystal structure determined by single-crystal X-ray diffraction. This compound crystallizes with an orthorhombic unit cell (space group Pnnm (No. 58); a equals 5.6614(4), b equals 32.515(7), c equals 3.9525(3) Angstroms; Z equals 2). The structure consists of alternating perovskite-like slabs offset with respect to each other by a/2 and c/2. The Sr2+ ions occupy two 12-fold coordinated sites within the slabs and a distorted (7 + 1)-fold coordinated site in the gap separating the slabs. Nb5+ and Ti4+ are distributed among the octahedral sites of the sperovskite slabs with preferential odering of Ti4+ on octahedral sites on the center of the slabs adjacent to the gap. This compound is the n equals 5 member of a structural series AnBnO(3n + 29) (A equal Sr; B equal Ti, Nb) where n is the number of perovskite layers within each slab.

Electrical Characteristics of Argon Radio Frequency Glow Discharges in an Asymmetric Cell.
Final rept.
M. A. Sobolewski. 1995, 17p.
Pub. in Institutue of Electrical and Electronics Engineers Transactions on Plasma Science, v23 n6 p1006-1022 Dec 95.

Keywords: *Current, *Discharges, Diagnostics, Electrical, Impedance, Plasma, Radio frequency, Voltage, Reprints, *Gaseous Electronics Conference.

Measurements of the current and voltage at both electrodes of a parallel-plate, capacitively coupled RF discharge cell (the Gaseous Electronics Conference Reference Cell) were combines with measurements of the voltage on a wire inserted into the glow region between the electrodes, for argon discharges at pressures of 1.3-133 Pa and peak-to-peak applied voltages equal to or less than 400 V. Together, these measurements determined the RF voltage, current, impedance, and power of each sheath of the plasma. Simple power laws were found to describe changes in sheath impedances observed as voltage and pressure were varied. An equivalent circuit model for the electrical behavior of the discharge was obtained. The equivalent circuit model can be used to relate the electrical data to plasma properties such as electron densities, ion currents, and sheath widths. The results differ from models previously proposed for asymmetric RF discharges, and the implications of this disagreement are discussed.

Automated Measurement of Nonlinearity of Optical Fiber Power Meters.
Final rept.
I. Vayshenker, S. Yang, X. Li, and T. R. Scott. 1995, 8p.
Pub. in Society of Photo-Optical Instrumentation Engineers: Photodetectors and Power Meters II, Sand Diego, CA., July 11-12, 1995, v2550 p12-19.

Keywords: *Optical fibers, *Fiber optics, Nonlinearity, Power calibration, Power meter, Reprints.

We have developed a system for measuring the nonlinearity of optical power meters or detectors over a dynamic range of more than 60 dB at telecommunications wavelengths. This system uses optical fiber components and is designed to accommodate common optical power meters and optical detectors. It is based on the triplet superposition method. The system also measures the range discontinuity between neighboring power ranges or scale settings of the optical power meter. We have developed an algorithm to treat both the nonlinearity and the range discontinuity in a logically consistent manner. Measurements with this system yield correction factors for powers in all ranges. The measurement system is capable of producing results which have standard deviations as low as 0.02%. With slight modification the system can operate over a 90 dB dynamic range at telecommunications wavelengths. This measurement system provides accurate determination of optical power meter or detector nonlinearity; the characterized detectors then can be used for such applications as absolute power and attenuation measurements.

Small-Angle Neutron Scattering (SANS) Study of Worm-Like Micelles Under Shear.
Final rept.
M. Y. Lin, H. J. M. Hanley, G. C. Straty, S. K. Sinha, D. G. Peiffer, and M. W. Kim. 1994, 10p.
Pub. in International Jnl. of Thermophysics, v15 n6 p1169-1178 Nov 94.

Keywords: *Neutron scattering, *Shear alignment, Anisotropy, Couette flow, Polymers, Rods, Reprints, *Foreign technology, *Small angle neutron scattering, Polydispersity, Worm-like micelles.

The structure of a cationic worm-like cylindrical micelle was investigated by SANS (small-angle neutron scattering). Intensities from 0.1% by weight solutions in D2O, at rest and under shear, were measured on the NIST Cold Neutron Research Facility 30-m spectrometer in the wave vector range 0.03 equal to or less than Q (nm to the minus one power) equal to or less than 2.0. Scattered intensity patterns from the solutions subjected to shears equal to or greater than 40 s to the minus one power showed pronounced anisotropy, but such anisotropy could not be detected below this apparent threshold shear. The threshold was characterized by a relaxation time since anisotropy was detected only after several minutes of shearing. In contrast, the anisotropy was apparent immediately the shear was applied at the higher shears. The data were analyzed based on the assumption that the micelles behave as rigid rods. Estimates of the radii and length under shear are given. Polydispersity in rod length is discussed, and the authors argue that it contributes significantly to the scattering patterns.

Dynamics of Mu(+) in Sc and ScHx.
Final rept.
F. N. Gygax, A. Amato, R. Feyerherm, T. J. Udovic, G. Solt, A. Schenck, and I. S. Anderson. 1996, 4p.
Pub. in Jnl. of Alloys and Compounds, v231 p248-251 1995.

Keywords: *Muon spin rotations, *Crystals, Relaxation rate, Reprints, Dynamics, Locations, Magnetic fields.

Muon spin rotation (microSR) experiments on single-crystal samples of ScHx, with x = 0, 0.05, and 0.10 and 0.25, were performed in order to investigate the muon location and possible systematic variations in muon dynamics in these systems. The angular and magnetic field dependence of the microSR relaxation rates shows that at temperatures below 50 K the muon is localized at the interstitial tetrahedral (T) sites. The results for pure Sc, covering a wide range of high and low fields, are coherent with the picture that the muon performs fast tunnelling between two adjacent T sites, separated by 2z = 0.18c, above and below the a-b plane. This value for the muon position along the c axis is remarkably near the sz = 0.194c found for D in Sc by neutron diffraction. The anisotropy of the relaxation rate at low magnetic fields varies sensitively with the H concentration, indicating a change in the ratio of the radial, muon-induced and the partly inherent, uniaxial electric field gradients at the position of the Sc nuclei.

Electrostatic Rigidity of Polyelectrolytes from Reparametrization Invariance.
Final rept.
A. L. Kholodenko, J. F. Douglas, and T. A. Vilgis. 1996, 7p.
Pub. in Macromolecules Theory Simul., v5 p121-127 1996.

Keywords: *Persistence length, *Polyelectrolytes, Electrostatics, Rigidity, Reprints, *Reparametrization invariance.

The persistence length of a polyelectrolyte chain can be represented as lp = lo + le where lo is the bare persistence and le is the electrostatic contribution coming from the effects of electrostatic chain self-interactions. Using a reparametrization-invariant path integral model of semiflexible polymers the authors find that le depends on the ionic strength I as le approximately I to the minus 1/2. This result accords with experimental observations and recent Monte Carlo simulations. Reparametrization-invariance is apparently an essential constraint in selecting acceptable models of semiflexible polymers.

Assessing MOS Gate Oxide Reliability on Wafer Level with Ramped/Constant Voltage and Current Stress.
Final rept.
A. Martin, J. Suehle, P. Chaparala, C. Messick, P. O'Sullivan, and A. Mathewson. 1996, 11p.
Pub. in Proceedings of the Institute of Electrical and Electronics Engineers International Integrated Reliability Workshop Final Report, Lake Tahoe, CA., October 22-25, 1996, p81-91.

Keywords: *Accelerated testing, *Oxide breakdown, Reliability, Reprints, *MOS gate oxides.

In this study time to breakdown distributions are compared for MOS gate oxides which were stressed with a constant voltage (or current) stress or a pre-stressing voltage (or current) ramp followed by a constant voltage (or current) stress. Results show clearly that a pres-stress can increase time to breakdown. This increase is discussed and it is shown that it is dependent on oxide thickness, pre-stressing ramp rate and the processing conditions. The current-time (or voltage-time) characteristics of the constant stress are investigated and it is observed that charge trapping in the oxide is the reason for the time to breakdown increase. The pre-stressed oxide clearly shows a different initial charge trapping characteristic than the non pre-stressed oxide. The measurement results are discussed and it will be demonstrated that the common understanding of oxide breakdown cannot explain the observed results. Therefore, a new parameter will be proposed which is related to oxide degradation and breakdown and which has to be considered in combined ramped/constant stress measurements.

Designations of ds(2)p Energy Levels in Neutral Zirconium, Hafnium, and Rutherfordium (Z=104).
Final rept.
W. C. Martin, and J. Sugar. 1996, 4p.
Pub. in Physical Review A, v53 n3 p1911-1914 Mar 96.

Keywords: *Atomic energy levels, *Electron configuration, *Energy-level calculations, Atomic spectroscopy, Hafnium, Level designation, Rutherfordium, Reprints.

The authors have examined available data for the odd-parity energy-level structures in Zr and Hf, stimulated by the designations of four predicted 6d7s27p levels in the homologous atom rutherfordium (Rf, Z = 104) by Eliav et al. (Phys. Rev. Lett. 74, 1079 (1995)). The authors point out some errors and deficiencies in the Zr data and give the results of Hartree-Fock calculations for Hf 5d6s26p-6p and Rf 6d7s27p levels. Configuration interactions within the (d + s)3p complexes were included. The resulting eigenvectors allow meaningful LS-coupling designations for most of the levels belonging mainly to Hf 5d6s26p and for most of the predicted Rf levels belonging mainly to 6d7s27p. Some changes in the designations assigned to these levels in the literature are suggested: in particular, the lowest level of both Hf 5d626p and Rf 6d7s27p is most appropriately designated 3F02. The authors point out the need for systematic whole-row studies of the low odd-parity configurations in 4d- and 5d-shell spectra.

Keywords: *Energy levels, *Hyperfine structures, *Promethium, Spectrum, Reprints.

Hyperfine structure splittings have been measured for 75 lines of singly ionized promethium 147 PmII with a hollow cathode discharge and a Fabry-Perot interferometer. Magnetic dipole and electric quadrupole splitting factors A and B have been determined for 10 levels of the 4f56s configuration, 2 levels of 4f5d, and 57 upper undesignated levels. The A-factors are in general agreement with calculated values. With the aid of Hartree-Fock calculations and Zeeman-effect data, four new levels of the 4f5(6H)5d7K term were located. The strong lines terminating on these 7K levels originate from levels of 4f5(6H)6p7I, which were already known, but had not been designated. An unidentified line at 556.17 nm previously observed with collinear laser ion-beam spectroscopy is now classified as 4f5(6H)5d 7K6-4f5(6H)6p7I5.

Pub. in Physical Review A, v52 n4 p2686-2688 Oct 95.

Keywords: *Atomic spectra, *Isotope shift, *Laser spectroscopy, Lithium, Wavelengths, Reprints.

Using Doppler-free frequency-modulation spectroscopy, the authors have measured most of the hyperfine components and the centers of gravity of the D1 line of 7Li and the D2 line of 6Li. By using previously measured fine- and hyperfine-structure splittings, the authors have also determined centers of gravity for the D2 line of 7li and the D1 line of 6Li. The present results are more accurate than previously reported values by a factor of more than 100. The wave numbers are 7Li D2: 14,903.983,468 (14) cm to the minus 1 power; 7Li D1: 14,903.648,130 (14) cm to the minus 1 power; 6Li D2: 14.903.632,116(18) cm to the minus 1 power; 6Li D1: 14,903.296,792 (23) cm to the minus 1 power. Values for the isotope shifts of the resonance lines of 0.351,338 (21) cm to the minus 1 power for the D1 line and 0.351,352 (15) cm to the minus 1 power for the D2 line have been derived. All uncertainties represent a 95% level of confidence.

Alpha-Particle and Electron Capture Decay of (209)Po.
Final rept.
F. J. Schima, and R. Colle. 1996, 5p.
Pub. in Nuclear Instruments and Methods in Physics Research A, v369 p498-502 Feb 96.

Keywords: *Electron capture decay, Alpha decay, Reprints, Photon spectrometry, Radioactivity, *Foreign technology, *Internal conversion coefficients, Bismuth-209, Lead-205, Polonium-209.

Gamma-ray and K alpha X-ray emissions have been measured from a very pure 209 Po source containing less than 0.13% 208 Po activity and no detectable 210 Po (equal to or less than (2 x 10 to the minus 4 power)%). The alpha-particle emission rate for this source has previously been determined. Data are presented that confirm alpha decay to the 205 Pb excited level at 262.8 keV, with an alpha-particle emission probability (+ or - standard uncertainty) of 0.00559 + or - 0.00008. The ratio of K-shell electron capture to total electron capture for the second forbidden unique electron capture decay to the 896.6 keV level in 209 Bi was determined to be 0.594 + or - 0.018. The electron capture decay fraction was found to be 0.00454 + or - 0.00007, while the probabilities per decay for the 896.6, 262.8, and 260.5 keV gamma rays and the Bi K alpha and PB K alpha X-rays were measured as 0.00445 + or - 0.00007. 0.00085 + or - 0.00002, 0.00254 + or - 0.00003, 0.00202 + or - 0.00005, and 0.00136 + or - 0.00005, respectively.

Scattered Fractions of Dose from 18 and 25 MV X-ray Radiotherapy Linear Accelerators.
Final rept.
J. Shobe, J. E. Rodgers, P. L. Taylor, J. Jackson, and G. Popescu. 1996, 3p.

Keywords: *Radiotherapy, *Linear accelerator scatter, Neutrons, Shielding, Reprints, *Foreign technology, *Scattered fractions of dose.

Over the years, measurements have been made at few energies to estimate the scattered fraction of dose from the patient in medical radiotherapy operations. This information has been a useful aid in the determination of shielding requirement for these facilities. With these measurements, known characteristics of photons, and various other known parameters, Monte Carlo codes are being used to calculate the scattered fractions and hence the shielding requirements for the photons of other energies commonly used in radiotherapeutic applications. The National Institute of Standards and Technology (NIST) acquired a Sagittaire medical linear accelerator (linac) which was previously located at the Yale-New Haven Hospital. This linac provides an x-ray beam of 25 MV photons and electron beams with energies up to 32 MeV. The housing on the gantry was permanently removed from the accelerator during installation. A varian Clinac 1800 linear accelerator was used to produce the 18 MV photons at the Frederick Memorial Hospital Regional Cancer Therapy Center in Frederick, MD. This paper presents a study of the photon dose scattered from a patient in typical radiation treatment situations as it relates to the dose delivered at the isocenter in water. The results of these measurements will be compared to Monte Carlo calculations. Photon spectral measurements were not made at this time. Neutron spectral measurements were made on this Saggitaire machine in its previous location and that work was not repeated here, made at this time. Neutron spectral measurements were made on this Sagittaire machine in its previous location and that work was not repeated here, although a brief study of the neutron component of the 18 and 25 MV linacs was performed utilizing thermoluminescent dosimetry (TLD) to determine the isotropy of the neutron dose.

Coarsening of Unstable Surface Features during Fe(001) Homoepitaxy.
Final rept.
J. A. Stroscio, D. T. Pierce, M. D. Stiles, and A. Zangwill. 1995, 4p.
Pub. in Physical Review Letters, v75 n23 p4246-4249 Dec 95.

Keywords: *Surface morphology, *Epitaxial growth, Reprints, STM, RHEED, Fe homoepitaxy, Non self-affine surface, Nonequilibrium growth.

The evolution of the surface potential during homoepitaxial growth of Fe(001) is studied by scanning tunneling microscopy and reflection high energy electron diffraction. The observed morphology exhibits a non-self-affine collection of moundlike features that maintain their shape but coarsen as growth proceeds. The characteristic feature separation L is set in the submonolayer regime and increases with thickness t as L(t) approx. t 0.16 plus or minus 0.04. During the coarsening phase, the mounds are characterized by a magic slope and a lack of reflection symmetry. These observations are shown to be described by a continuum growth equation without capillarity.

Pub. in Europhysics Letters, v30 n7 p439-440 1995.

Keywords: *Trapping(Charged particles), Electric fields, Dynamics, Gravitational fields, Ground state, Equilibrium(General), Reprints, *Atom traps, *Foreign technology.

Riis and Barnett have examined the motion of a polarizable atom in the electric field in the vicinity of a sphere with time-arying charge. The configuration they examined may be experimentally useful but their paper propagates a common misconception about the mechanism of dynamic stabilization. Dynamic stabilization is an important techique in atom and ion trapping, and the purpose of the comment is to clear up the misconception.

Grant NSF-PHY90-12244
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Jnl. of Chemical Physics, v102 n24 p9522-9531, 22 Jun 95.

Keywords: *Calcium, *Collision, Lasers, Alignment, Reprints, *Rydberg states.

The possibility of probing the collisions of aligned Rydberg atoms by stimulated emission is assessed with studies of a polarized state and a new measurement of a collisional alignment effect in atomic Ca. The stimulated emission method uses a laser to dump the desired state to a lower level which subsequently fluoresces. The technique can be used to obtain populations and polarization dependent information. First, the method is tested by applying it to an aligned Ca(4s17d1D2) state. Alignment curves are measured when the initial state is prepared with both parallel and perpendicular relative polarizations. The experimentally observed alignment compares well with that derived from theoretical considerations of a saturated stimulated transition. Second, a two-vector collisional alignment experiment (initial state and relative velocity vector) is performed to study the energy transfer process and alignment effects are measured by both stimulated emission and conventional direct fluorescence detection.

Pairwise and Nonpairwise Additive Forces in Weakly Bound Complexes: High Resolution Infrared Spectroscopy of ArnDF (n=1,2,3).
Final rept.
J. T. Farrell, S. Davis, and D. J. Nesbitt. 1995, 16p.
Pub. in Jnl. of Chemical Physics, v103 n7 p2395-2411 1995.

Keywords: *Spectroscopy, *Intermolecular forces, Infrared, Reprints, *Nonpairwise additive forces, Potential energy surface, Vander Waals, Argon hydrogen fluoride.

High resolution infrared spectra of the vDF=1<-0 stretch in ArnDF (n=1-3) have been recorded using a slit-jet infrared spectrometer. Analysis of the rotationally resolved spectra provides vibrationally averaged geometries and vibrational origins for a DF chromophore sequentially 'solvated' by Ar atoms. Calculations using pairwise additive Ar-Ar and Ar-DF potentials predict lowest energy equilibrium structures consistent with the vibrationally averaged geometries inferred spectroscopically. Variational calculations by Ernesti and Hutson using pairwise additive potentials predict rotational constants which are in qualitative agreement with, but consistently larger than, the experimental values. The inclusion of nonpairwise additive (three-body) terms improves the agreement, though still not to within the uncertainty of the pair potentials.

Stable, Tightly Confining Magnetic Trap for Evaporative Cooling of Neutral Atoms.
Final rept.
W. Petrich, M. H. Anderson, J. R. Ensher, and E. A. Cornell. 1995, 4p.
Pub. in Physical Review Letters, v74 n17 p3352-3355 Apr 95.

Keywords: *Magnetic traps, *Evaporative cooling, Atoms, Reprints, *Bose condensation, Orbiting potential.

We describe a new type of magnetic trap whose time-averaged, orbiting potential (TOP) supplies tight and harmonic confinement of atoms. The TOP trap allows for long storage times even for cold atom samples by suppressing the loss due to nonadiabatic spin flips which limits the storage time in an ordinary magnetic quadrupole trap. In preliminary experiments on evaporative cooling of 87Rb atoms in the TOP trap, we obtain a phase-space density enhancement of up to 3 orders of magnitude and temperatures as low as 200 nK.

Quantum Hall Effect-Based Resistance Standard (Quantum Hall Res).
Final rept.
K. C. Lee. 1996, 18p.
See also PB96-180096.
Pub. in Proceedings of the Annual National Aeronautics and Space Administration Metrology and Calibration Workshop (19th), NASA Kennedy Space Center, FL., February 26-March 1, 1996, p577-594.

Keywords: *Digital multimeter, Temperatures, Magnetic fields, Reprints, *Quantum Hall effect, *Resistance standard.

The present technology for observing the quantum Hall effect requires that a quantum Hall resistor (QHR) be maintained at temperatures below 1.4 K, and in magnetic fields between 5 T and 15 T. Furthermore, in contrast with wire-wound standard resistors that can pass milli-amperes of current, present quantum Hall resistors are limited to currents between 25 micro Angstroms and 60 micro Angstroms. This means that expensive cryogenic systems and super conducting solenoids are required to produce the conditions for the QHE to be observed. The very limited current-carrying capacity of present QHRs requires highly specialized and complex measurement systems that can compare the low voltages developed across them to the voltages developed across the resistors being calibrated. The primary objective of the project is to develop QHRs that can operate at lower magnetic fields, higher temperatures, and higher currents, in order to reduce the costs and complexity of the cryogenic system and the measurement system. A secondary objective is to develop and improve simple measurement techniques that can calibrate wire-wound resistors using QHRs with combined relative uncertainties less than 0.1 ppm, even with the present limitations on the current that can be passed through the devices.

New Oxide Degradation Mechanism for Stresses in the Fowler-Nordheim Tunneling Regime.
Final rept.
A. Martin, J. S. Suehle, P. Chaparala, P. O'Sullivan, and A. Mathewson. 1996, 10p.
Pub. in Proceedings of the International Reliability Physics Conference, Dallas, TX., April 30-May 2, 1996, p67-76.

Keywords: *Oxides, *Tunneling, Reliability, Degradation, Stresses, Reprints, *Fowler-Nordheim.

In the study, voltage and current stress measurements in the Fowler-Nordein regime, performed on gate oxides (9nm-28nm), indicated that a ramped pre-stress prior to a constant stress can increase the time to breakdown in some cases. In the literature oxide breakdown is said to be related to a fixed amount of trapped oxide charge or to a fixed amount of generated traps in the oxide. However, these models cannot explain our experimental observations. Current-time, current-charge, voltage-time characteristics and results of high frequency pre-stresses have been extensively studied in order to gain information about the charge trapping properties of the virgin and pre-stressed oxides. It is concludes from experimental results that the rate of initial positive charge build up in the oxide during the constant stress is a key factor for oxide degradation and breakdown.

Modification of a Commercial SEM with a Computer Controlled Cathode Stabilized Power Supply.
Final rept.
M. T. Postek, W. J. Keery, and A. E. Vladar. 1993, 4p.
Pub. in Scanning, v15 p208-211 1993.

Keywords: *Accelerating voltage, *Scanning electron microscopes, Anode, Cathode, Computer control, Reprints, Wehnelt.

Modification of the high-voltage circuitry of the thermionic electron gun of a commercial scanning electron microscope (SEM) to a fully computer-controlled, cathode-stabilized system is described. The modification permits automatic filament saturation and monitoring. Using this system, variations and drifts in the emission current over time can be adjusted and compensated automatically with a feedback loop in the computer-controlled system. This change also enables the accurate determination and setting of the primary electron beam energy. Therefore, the accelerating voltage is known for comparison to Monte Carlo computer modeling of the electron beam specimen interaction.

Pub. in Jnl. of Applied Physics, v79 n8 p5805-5810 Apr 96.

Keywords: *Interface transmission, *Magnetic multilayers, Reflection, Exchange coupling, Reprints, Magnetoresistance, Magnetotransport.

First-principles calculations of transmission and reflection from Ag/Fe, Au/Fe, Cu/Co, and Cu/Ni interfaces show very strong spin dependence that differs significantly from expectations based on free electron approximations. The results can be used to understand both the giant magnetoresistance and the oscillatory exchange coupling observed in magnetic multilayers of these materials. The spin dependent of the reflection probabilities is strong enough to give a large giant magnetoresistance even if there is no spin-dependent defect scattering. The calculated reflection amplitudes determine the strength of the oscillatory exchange coupling.

Pub. in Jnl. of Applied Physics, v79 n8 p6079-6083 Apr 96.

Keywords: *Nanostructure, *Atomic deposition, Reprints, Fabrication, Atoms, *Laser focusing.

Nanostructured materials and devises will play an important role in a variety of future technologies, including magnetics. The authors describe a method for nanostructure fabrication based on the use of laser light to focus neutral atoms. The method uses neither a mask nor a resist, but relies on the direct deposition of atoms to form permanent structures. Since the atomic de Broglie wavelength is of picometer order, the size of structurs produced is not significantly limited by diffraction, as in optical lithography. Lines as narrow as 38 nm full width at half maximum spaced by 213 nm have been produced and the authors have demonstrated the production of a two-dimensional array of dots. The highly parallel process of nanostructure formation and the intrinsic accuracy of the optical wavelength that determines structure spacing suggest a number of interesting applications, including calibration standards for various types of microscopy, lithography, and micromeasurement systems. Possible magnetic applications include the production of arrays of magnetic elements, laterally structures giant magnetoresistive devices, and the patterning of magnetic media.

Keywords: *X-rays, *Photodiodes, Silicon, Vacuum ultraviolet, Absolute detectors, Reprints, *Foreign technology.

Stable silicone photodiodes with 100% internal quantum efficiency have been developed for the vacuum ultraviolet and soft x-ray regions. It is demonstrated that the response of these detectors can be reasonably well represented by a simple model for photon energies above 40 eV. The measured efficiency is consistent with a constant electron-hole pair creation energy for Si above 40 eV. Radiation damage is demonstrated to result in loss of carriers to recombination at the front surface. The uniformity of the diodes is shown to be better than 0.1% RMS at 110 eV.

Pub. in Radiation Research, v136 p147-170 1993.

Keywords: *Photons, *Energy absorption, *Energy transfer, Bremsstrahlung, Cross sections, Calculations, Reprints, Positron annihilation.

Calculations of mass energy-transfer and mass energy-absorption coefficients for photon energies from 1 keV to 100 MeV have been developed, based on a re-examination of the processes involved after the initial photon interaction. The probabilities for the initial interaction are from the current photon interaction cross-section database at the National Institute of Standards and Technology. The calculation then take into account (1) electron binding effects on the Compton-scattered photon distribution; (2) the complete cascade of fluorescence emission after ionization events in any atomic subshell, including those associated with incoherent scattering and triplet production; and (3) the radiative energy losses of the secondary electrons and positrons slowing down in the medium, including the emission of bremsstrahlung, characteristic x-rays from impact ionization, and positron in-flight as well as at-rest annihilation quanta. Consideration of the processes in (3) goes beyond the continuous-slowing-down approximation and includes the effects of energy-loss straggling. Results for the mass energy-absorption coefficient are compared with those from recent tabulations.

Positronium in Relativistic Quantum Mechanics.
Final rept.
E. Marx. 1992, 11p.
Pub. in Jnl. of the Franklin Institute, v329 n5 p869-879 1992.

Keywords: *Quantum mechanics, *Positronium, Bound states, Pair annihilation, Electromagnetic interactions, Reprints, Klein-Gordan equation.

The problem of bound states of a charged particle and its antiparticle is formulated in the framework of the relativistic quantum mechanics of a single scalar particle interacting with the electromagnetic field. The Coulomb interaction between the particle and the antiparticle gives rise to the bound states, and the coupling of the wave function to the radiation field is responsible for the decay of the pair into electromagnetic energy. The contribution of a pion-pion interaction is discussed briefly. The theory is extended to the spin-1/2 electron.

E. Marx. 1992, 13p.
Pub. in Jnl. of Mathematical Physics, v33 n6 p2290-2302 Jun 92.

Keywords: *Quantum mechanics, *Spinor equations, Wave functions, Formulas, Weyl equations, Reprints.

A set of two first-order equations for classical spinor fields are used to formulate the relativistic quantum mechanics (RQM) of a single massive spin-one half particle. These equations are generalized Weyl equations and they are not equivalent to the Dirac equation. They lead to a conserved charge that is not positive definite, thus allowing for a probabilistic interpretation fo the wave function in RQM. The charge is also conserved when the fields interact with a scalar field through the charge-current densities.

Pub. in Review of Scientific Instruments, v67 n7 p2528-2533 Jul 96.

Keywords: *Beam lines, *Ion optics, *Highly charged ions, Electron beams, Reprints, Electron beam ion trap.

The design and operation of a beam line for transporting and charge-to mass selecting highly charged ions extracted from the National Institute of Standards and Technology electron beam ion trap (EBIT) are described. This beam line greatly extends the range of experiments possible at this facility. Using the transport system, pure beams of low-energy, highly charged ions up to Xe(44+) have been produced with substantially higher fluxes than previously reported from an EBIT source. Design choices and computer modeling for the various components of the beam line are explained in detail.

Quantum Conductance Fluctuations in the Larger-Size-Scale Regime.
Final rept.
C. A. Richter, D. G. Seiler, and J. G. Pellegrino. 1996, 5p.
Pub. in Physical Review B, v53 n19 p13 086-13 090 May 96.

Keywords: *Conductance, *Fluctuations, Heterostructure, Magnetoresistance, Mesoscopic, Reprints, *GaAs/AlGaAs, UCF.

The authors report the results of experimental studies of 'universal' conductance fluctuations in a variety of millimeter-sized GaAs/AlxGal-xAs heterostructures. The ability to observe these mesoscopic fluctuations in traditionally macroscopic semiconductor devices is due to the enhanced sensitivity of the magnetic field modulation measurement technique, which allows a coherent interference effect to be observed and studied in the large-size-scale regime where both the sample length and width are much greater than the quantum scattering lengths.

Size Effects and Giant Magnetoresistance in Unannealed NiFe/Ag Multilayer Stripes.
Final rept.
S. C. Sanders, R. W. Cross, S. E. Russek, A. Roshko, and J. O. Oti. 1996, 3p.
Pub. in Jnl. of Applied Physics, v79 n8 p6240-6242 Apr 96.

Keywords: *Magnetoresistance, *Magnetostatics, Annealing, Barkhausen noise, Multilayers, Size effects, Thin films, Reprints, NiFe/Ag.

The authors have observed giant magnetoresistance (GMR) in unannealed NiFe/Ag multilayer thin-film stripes. Rectangular stripes having constant thickness and a constant 11:1 length-to-width aspect ratio, but varying widths down to 0.5 micrometers were measured. Two types of multilayer configurations were tested, a system of five NiFe/Ag bilayers with 5.5-nm-thick Ag spacer layers, and a system of nine bilayers with 4.4-nm-thick Ag layers. In contrast to the characterstics of annealed NiFe/Ag multilayer stripes, the unannealed stripes produced increasing GMR ratios for decreasing stripe sizes, with the 0.5-micrometer-wide stripe of the five-bilayer system exhibiting a deltaR/R of 2.5%. Barkhausen noise and response broadening also increased with decreasing stripe size, however. The results are discussed in terms of magnetostatic coupling of the NiFe layers within the stripes.

Commercial Helium Permeation Leak Standards: Their Properties and Reliability.
Final rept.
P. J. Abbott, and S. A. Tison. 1996, 5p.
Pub. in Jnl. of Vacuum Science and Technology A, v14 n3 p1242-1246 May/Jun 96.

Keywords: *Helium, *Permeation leaks, Decay rates, Stability, Properties, Reliability, Reprints.

Standard leaks or leak artifacts are used extensively in industrial and research environments, typically for the calibration of helium leak detectors. The most commonly used leak is the helium permeation type, which uses a glass, quartz, or polymer barrier to restrict the flow of helium via diffusion. Physical leaks, on the other hand, use a physically restrictive element to limit the flow. The article will discuss the properties and reliability of helium permeation standard leaks, based on eight years of accumulated calibration data. Physical helium leaks will not be discussed since relatively few have been calibrated at the National Institute of Standards and Technology.

X-ray Reflectivity Determination of Interface Roughness Correlated with Transport Properties of (AlGa)As/GaAs High Electron Mobility Transistor Devices.
Final rept.
J. A. Dura, J. G. Pellegrino, and C. A. Richter. 1996, 3p.
Pub. in Applied Physics Letters, v69 n8 p1134-1136 Aug 96.

Keywords: *X ray reflectivity, *Aluminum gallium arsenide, *Gallium arsenide, Interface roughness, Mobility, Molecular beam epitaxy, Transport properties, Reprints.

To explore the role of interface scattering in high electron mobility transistor (HEMT) device performance, a series of samples consisting of both a superlattice and a HEMT structure were grown by molecular beam epitaxy (MBE) at temperatures ranging from 500 to 630 degrees C. Hall measurements indicate a trend toward higher mobilities in samples growth at higher temperatures. Subsequent x-ray reflectivity measurements were made, and the data were fitted by least-squares refinement of a calculated reflectivity curve determined from a model of the sample structure to obtain the composition profile along the growth direction. These results indicate smoother interfaces for the samples with higher mobilities.

Intrinsic Conductivity of Objects Having Arbitrary Shape and Conductivity.
Final rept.
E. J. Garboczi, and J. F. Douglas. 1996, 12p.
Pub. in Physical Review E, v53 n6 p6169-6180 1996.

Keywords: *Intrinsic conductivity, *Conductivity, Arbitrary, Shapes, Reprints.

The authors study the electrical conductivity omega of a dispersion of randomly oriented and positioned particle inclusions having common shape and conductivity omega(p), suspended in an isotropic homogeneous matrix of conductivity omega(0). For this problem, the mixture conductivity is a scalar and the authors concentrate on the leading order concentration virial coefficient, the 'intrinsic conductivity' (omega). Results for (omega) are summarized for limiting cases where there is a large mismatch between the conductivities of the inclusions and the suspending matrix. For a general particle shape, the authors then treat the more difficult case of arbitrary relative conductivity delta equal or minus omega(p)/omega(0) through the introduction of a Pade approximant that incorporates (exact or numerical) information for (omega(delta)) in the delta -> infinity, delta -> 0+, and delta approximately 1 limits. Comparison of this approximation for (omega(delta)) to exact and finite element calculations for a variety of particle shapes in two and three dimensions shows excellent agreement over the entire range of delta. This relation should be useful for inferring particle shape and property information from conductivity measurements on dilute particle dispersions. The leading order concentration virial coefficient for other mixture properties (thermal conductivity, dielectric constant, refractive index, shear modulus, bulk modulus, viscosity, etc.) are equally well described by a similar Pade approximant.

Systematic Correction in Bragg X-ray Diffraction of Flat and Curved Crystals.
Final rept.
C. T. Chantler, and R. D. Deslattes. 1995, 25p.
Pub. in Review of Scientific Instruments, v66 n11 p5123-5147 Nov 95.

Keywords: *Systematic corrections, *Bragg x-ray diffraction, *Crystals, Curved crystals, Flat crystals, Refractive index shifts, Spectral wavelengths, Foreign technology, Reprints.

Measurements of spectral wavelengths in Bragg diffraction from crystals often require refractive index corrections to allow a detailed comparison of experiment with theory. These corrections are typically 100-300 ppm in the x-ray regime, and simple estimates may sometimes be accurate to 5% or better. The inadequacies of these estimates are discussed. Even with a possibly improved index of refraction estimate, this correction is insufficient since additional systematics in the diffraction process occur at or above this level. For example, asymmetries of diffraction profiles with pi-polarized radiation or due to three-beam diffraction can approach the magnitude of refractive index corrections for flat or curved crystals. The depth of penetration of the x-ray field inside curved crystals, the shift of the mean angle to the diffracting planes, and lateral shifts around the crystal surface are rarely considered but can dominate over refractive index corrections, particularly for high-order diffraction or medium-energy x rays. Shifts and nonlinearities arise when diffracting surfaces lie off the Rowland circle, and exhibit strong and rapidly varying angular dependencies.

Pub. in Applied Physics Letters, v68 n22 p3099-3101 May 96.

Keywords: *Thin films, *Magnetoresistance, *Currents, Multilayers, Peaks, Magnetic fields, Reprints, NiFe-Ag.

The authors show that thin-film Ni82Fe18/Ag multilayer structures display multiple peaks in their magnetoresistance curves when biased at current densities above 10(6) A/cm(2). These peaks appear for annealed and unannealed structures, and their number is correlated with the number of NiFe layers. At high bias currents, the peak positions shift linearly with the internal magnetic field created by the bias current. The peak positions extrapolate to nonzero fields at zero bias currents, providing an upper bound on the magnetic layer-layer coupling strength of J(0) approximately equal to 10(-20) J (k(B) x 700 K). The peak positions do not shift with temperature over the range 200-375 K; their widths narrow with increasing temperature. The single-domain magnetic moment micro is estimated as 10 17 J/T from the peak widths of approximately 0.8 kA/m.

Pub. in Physical Review Letters, v76 n23 p4424-4427 Jun 96.

Keywords: *Neutron scattering, *Ligand environment, *Magnetism, Sub-lattices, Dispersionless, Inelasticity, Reprints.

The authors show by inelastic neutron scattering that the frustrated magnet SrCr9pGa12-9pO19 (p = 0.92(5)) has dispersionless magnetic excitations at energies 18.6(1) and 37.2(5) meV. The wave vector and temperature dependence of the excitations as well as the ratio 1:2 of excitation energies is perfectly accounted for by isolated antiferromagnetically exchange coupled pairs of spins s = 3/2. Consideration of the layered structure of magnetic chromium ions and the ligand environment indicates that these pairs are adjacent spins in neighboring triangular lattice planes which separate two-dimensional sublattices of interacting kagome-triangle-kagome layers.

Pub. in Jnl. of Chemical Physics, v105 n6 p2153-2160 Aug 96.

Keywords: *Neon atoms, *Matrix isolation, Infrared spectrum, Photodissociation, Photionization, Reprints.

When a Ne:O3 sample is codeposited at approximately 5 K with neon atoms that have been excited in a microwave discharge, the most prominent infrared absorptions of the resulting solid are contributed by trans- and cyc-O4(=) and by O3(-). The failure to detect infrared absorptions of O3(+) is consistent with the initial formation of that species in one or more dissociative excited states. The v3 absorption of O3(-) appears at 796.3 cm(-1), close to its position in earlier argon-matrix experiments in which photoionization of an alkali metal atom provided the electron source and in which diffusion of the atomic cation would result in the stabilization of appreciable M+O3(-). The identification of O3(-) isolated in solid neon is supported by observations of O3(-) generated from isotopically substituted Ne:O2:N2O samples, also codeposited with excited neon atoms. An upper bound of 810 cm to the minus 1 power is estimated for the gas-phase band center of v3 of O3(-). Infrared absorption which grow on mild warmup of the sample are tentatively assigned to an O2...O4(+) complex.

Pub. in Physical Review Letters, v76 n21 p4046-4069 May 96.

Keywords: *Quasielastic component, *Polycrystalline, Isotropic, Ferromagnetic, Despersion relation, Reprints.

Neutron scattering has been used to study the magnetic correlations and long wavelength spin dynamics of La(l-x)Ca(x)MnO3 in the ferromagnetic regime (0 equal to or less than 1/2). For x = 1/3 (T(C)=250 K) where the magnetoresistance effects are largest the system behaves as an ideal isotropic ferromagnet at low T, with a gapless (less than 0.04 meV) dispersion relation E = Dq2 and D(T-0) approximately equal to 170 meV Angstroms. However, an anomalous strongly field-dependent diffusive component develops above approximately 200 K and dominates the fluctuation spectrum at T -> T(C). This component is not present at lower x.

Pub. in Jnl. of Applied Physics, v79 n8 p6386-6388 Apr 96.

Keywords: *Spin valves, *Magnetization, Anisotropy, Exchange, Magnetoresistance, Magnetostatic, Reprints.

The effects of magnetostatic interactions on the giant magnetoresistive (GMR) response of NiFe/Cu/NiFe spin valves are studied using an analytical model. The model is applicable to devices small enough for the magnetic layers to exhibit single-domain behavior. Devices having lengths in the track-width direction of 10 micrometers and interlayer separations of 4.5 nm are studied. Stripe heights are varied from 0.5 to 2 micrometers. The magnetization of one magnetic layer is pinned by a transverse pinning field that is varied from 0 to 24 kA/m (300 Oe). GMR curves for transverse fields are calculated. At zero external field and magnetization of the layers shows a tendency to align themselves antiparallel in the transverse direction. This

results in an offset from the ideal biasing of the device. Broadening of the curves due to shape anisotropy occurs with decreasing stripe height and increasing magnetic layer thickness, and the magnetization in the pinned layer becomes less stable.

Colossal Magnetoresistance without Mn(3+)/Mn(4-) Double Exchange in the Stoichiometric Pyrochlore Tl2Mn2O7.
Final rept.
M. A. Subramanian, B. H. Toby, A. P. Ramirez, G. H. Kwei, W. J. Marshall, and A. W. Sleight. 1996, 4p.
Pub. in Science, v273 p81-84 Jul 96.

Keywords: *Magnetic structure, *Magnetoresistance, *Neutron diffraction, Pyrochlore, Single crystal diffraction, Reprints.

Structural analysis with powder neutron and single-crystal x-ray diffraction data for a sample of the Tl2Mn2O7 pyrochlore, exhibiting colossal magnetoresistance (CMR), shows no deviations from ideal stoichiometry. Furthermore, the analysis gives an Mn-O distance of 1.90 Angstroms, significantly shorter than the Mn-O distances in the range 1.94 to 2.00 Angstroms observed in phases based on LaMnO3 perovskites which show CMR. Both the stoichiometry and shorter Mn-O dsitance in Tl2Mn2O7 indicate oxidation states very close to Tl2Mn2O7. Thus Tl2Mn2O7 has neither mixed valency for a double exchange magnetic interaction or a Jahn-Teller cation such as Mn(3+). Both were thought to play an essential role in CMR materials. The authors propose an alternate mechanism for CMR in Tl2Mn2O7 based on magnetic ordering driven by superexchange and strong spin fluctuation scattering above Tc. Thus the pyrochlores represent a distinct new class of CMR materials.

Pub. in Metrologia, v32 p473-477 1995/96.

Keywords: *Scales, *Radiometers, *Spectral comparator, *Photometers, Detectors, Filters, Illuminance, Irradiance, Quartz halogen lamp, Reprints, *Foreign technology.

Narrowband filter radiometers are being used in the development of a new method of irradiance scale realization at the National Institute of Standards and Technology (NIST). To improve the accuracy of the current spectral-irradiance scale, the authors propose to eliminate several steps from the calibration process and to use the filter radiometers and a high-temperature black body in realizing the scale. Ultimately, the filter radiometers will be calibrated against a trap detector measured at the NIST High Accuracy Cryogenic Radiometer, which maintains an expanded uncertainty at 633 nm of 0.0266% for a coverage factor of k = 2. In the work, the filter and detector were calibrated as a unit using the NIST Detector Comparator Facility, and the aperture areas were measured by flux comparison with a uniform source. Six filter radiometers covering the spectral range 350 nm to 1100 nm were used to measure a known irradiance source; the measurements agreed with predictions to within 1%.

Diffraction of Neutron Standing Waves in Thin Films with Resonance Enhancement.
Final rept.
H. Zhang, S. K. Satija, P. D. Gallagher, C. P. Flynn, J. F. Ankner, J. A. Dura, and K. Ritley. 1996, 5p.
Pub. in Physica B, v221 p450-454 1996.

Keywords: *Thin films, *Standing waves, *Neutrons, Diffraction, Resonance, Reprints.

Diffraction on neutron standing waves in thin films has been demonstrated for the first time with experiments on an epitaxial Y/Gd/Y/Nb/Al2O3 sample. Resonance enhancement in the diffraction intensity has been observed. The new diffraction scheme for neutrons and x-rays provides an oscillatory spatial concentration in thin films, in contrast to the evanescent diffraction which provides an exponential concentration. It also discriminates against diffraction background from substrate, and may be especially useful when diffraction in transmission geometry is not available due to high absorption of substrate.

Experimentally Measured Total X-ray Attenuation Coefficients Extracted from Previously Unprocessed Documents Held by the NIST Photon and Charged Particle Data Center.
J. H. Hubbell. Sep 96, 37p, NISTIR-5893.

Keywords: *Bibliographies, *Photon cross sections, *X-rays, Tables(Data), Nuclear data collections, Data bases.

This report lists and annotates 47 previously unprocessed original-source documents held by the NIST Photon and Charged Particle Data Center (PCPDC), containing experimentally measured absolute values of the mass attenuation coefficient, or total photon interaction cross section for one or more elemental materials. The data from these documents had not been previously extracted for purposes of entering into the PCPDC x-ray attenuation measurement data base. Tables of the extracted data, with all photon energies converted to multiples of eV (electron volts), and all photon cross sections converted to units of barns/atom, are given. In some cases, photon wavelengths in angstroms or nm (nanometers) are given in the source documents instead of photon energies, in which case the reciprocal conversion to photon energies (in eV) has been made. A total of 3735 data points were extracted and are presented.

Bimolecular Interactions in (Et)3SiOH:Base:CCl4 Hydrogen-Bonded Solutions Studied by Deactivation of the Free OH-Stretch Vibration.
Final rept.
W. T. Grubbs, T. P. Dougherty, and E. J. Heilweil. 1995, 4p.
Pub. in Jnl. of the American Chemical Society, v117 n48 p11989-11992 1995.

Keywords: *Bimolecular reaction, *Hydrogen bonding, Complexes, Diffusing control, Infrared, Picoseconds, Reprints, Time-resolved spectroscopy, Vibrational relaxation.

Picosecond infrared (PI) pump-probe measurements of the OH-stretch (v=1) population lifetime were performed for uncomplexes (Et)3SiOH present in dilute, room temperature, tertiary (Et)3SiOH:base:CCl4 hydrogen-bonded solutions (base = acetonitrile, tetrahydrofuran, and pyridine). When base is present in solution, the intrinsic OH-stretch T1 vibrational population lifetime (183 plus or minus 6 ps for (Et)3SiOH in CCl4) is reduced by bimolecular (Et)3SiOH:base hydrogen-bonding encounters. The base concentration dependence of the 'free' OH-stretch vibrational deactivation rate is analyzed by a Stern-Volmer kinetic model and a least-squares fit to all the data yielded a single rate constant k(BM)=1.2 plus or minus 0.2 x 10 to the 10th power dm to the 3rd power mole(-1)s(-1) for (Et)3SiOH:base bimolecular encounters. This vlaue is in agreement with estimate sfor the bimolecular diffusion limit, k(BM) was found to be the same for all (Et)3SiOH:base interactions studied, suggesting that the bimolecular OH-stretch deactivation mechanism is relatively insensitive to the proton-accepting strength of the base.

See also PB92-154095.
Pub. in International Workshop on Subsecond Thermophysics (4th), Koln, Germany, June 27-29, 1995, International Jnl. of Thermophysics, v17 n5 p1069-1078 Sep 96.

Keywords: *Niobium, *Temperature measurement, Pulse heating, High temperature, Near infrared radiation, Visible radiation, Melting, Reprints, *Foreign technology, *Radiance temperatures.

Radiance temperatures at 1500 nm of niobium and molybdenum at their melting points were measured by a pulse-heating technique. The method is based on rapid resistive self-heating of the strip-shaped specimen from room temperature to its melting point in less than 1 s and measuring the specimen radiance temperature every 0.5 nm with a high-speed infrared pryometer. Melting of the specimen was manifested by a plateau in the radiance temperature-versus-time function. The melting-point radiance temperature for a given specimen was determined by averaging the measured values along the plateau. A total of 12 to 13 experiments was performed for each metal under investigation. The melting-point radiance temperatures for each metal were determined by averaging the results of the individual specimens.

Microwave Spectrum and Structure of CH2O-H2O.
Final rept.
F. J. Lovas, and C. L. Lugez. 1996, 4p.
Pub. in Jnl. of Molecular Spectroscopy, Article No. 0210, v179 p320-323, 1996.

Keywords: *Microwave spectrum, *Dipole moment, Dimer, Formaldehyde, Structure, Water, Reprints, *Formaldehyde-water complex, Rotational spectrum.

The microwave spectrum of the formaldehyde-water complex (CH2O-H2O) has been studied with a pulsed-beam Fourier transform Fabry-Perot cavity spectrometer. Both a-type and b-type transitions were observed for each of the isotopic species studied. To provide additional structural information, the spectra of H2O, HDO, and D2O substituents combined with H2CO and D2CO were assigned. Measurement of the dipole moment components yielded the values micro a=3.379(13) x 10 to the minus 30 power C.m(micro a=1.043(4)D) and micro b=2.54(20) x 10 to the minus 30 power C.m (micro b=0.76(6)D) and indicated that the dipole moment vectors are anti-aligned. The molecular structure derived from the moments of inertia has a center of mass separation of 2.00(3)Angstroms with the C2v symmetry axes of the monomers oriented at 19.3 degrees from parallel with the dipole moments opposed. The complex is quite strongly bound with a harmonic pseudodiatomic stretching force constant, k2=8.93 N/m, and hydrogen bond lengths of approximately 2.68 Angstroms between the water oxygen atom and a CH2 hydrogen atom, and 2.03 Angstroms between a water hydrogen atom and the oxygen atom of H2CO. Expanded uncertainties (coverage factor k = 2 i.e., two standard deviations) are shown in parentheses for each experimental value reported above.

Colour Centres in LiF for Measurement of Absorbed Doses Up to 100 MGy.
Final rept.
W. L. McLaughlin. 1996, 4p.
Pub. in Radiation Protection Dosimetry, v66 n1-4 p197-200 1996.

Keywords: *Lithium fluoride, *Dosimeters, *Radiation damage, Measurements, Absorbed doses, Reprints.

Radiation damage studies on electronic components, polymers, composites, ceramics, metals, and insulating materials exposed to very large doses of ionizing photons and particles (i.e. electrons, protons, and neutrons) require reproducible and accurate passive dosimetry. Absorbed doses in the range 10 to the 2nd power - 2 x 10 to the 6th power Gy have previously been measured with optical quality, undoped LiF by spectrophotometry of radiation-induced absorption bands of stable color centers. These include the relatively stable F center (247 nm), M center (443 nm), R1 center (315 nm), R2 center (374 nm), and N2 center (547 nm). It is now possible to extend this range to 10 to the 8th power Gy by spectrophotometry of the N1 center (517 nm) and an 'X' Center (785 nm). These dosemeters can be used from cryogenic (4 K) to relatively high radiation temperatures (up to 500 K). the radiation-induced coloration can be bleached for reuse of the dosemeters by a two hour thermal annealing treatment at 830 K.

Rotational Spectra of CH3CCH-NH3, NCCCH-NH3, and NCCCH-OH2.
Final rept.
R. M. Omron, A. R. Hight Walker, G. Hilpert, G. T. Fraser, and R. D. Suenram. 1996, 9p.
Pub. in Jnl. of Molecular Spectroscopy, v179 p85-93 1996.

Keywords: *Cyanoacetylene, *Hydrogen bonding, *Methlacetylene, Microwave spectroscopy, Complexes, Reprints.

Microwave spectra of NCCCH-NH3, CH3CCH-NH3, and NCCCH-OH2 have been recorded using a pulsed-nozzle Fourier-transform microwave spectrometer. The complexes NCCCH-NH3 are found to have symmetric-top structures with the acetylenic proton hydrogen-bonded to the nitrogen of the NH3. The data for CH3CCH-NH3 are further consistent with free or nearly free internal rotation of the methyl top against the ammonia top. For NCCCH-OH2, and acetylenic proton is hydrogen-bonded to the oxygen of the water. The complex has a dynamical C2 structure, as evidenced by the presence of two nuclear-spin modifications of the complex. The hydrogen bond lengths and hydrogen-bond stretching force constants are 2.212 Angstroms and 10.8N/m, 2.322 Angstroms and 6.0N/m, and 2.125 Angstroms and 9.6N/m, for NCCCH-NH3, CH3CCH-NH3, and NCCCH-OH2, respectively. For the cyanoacetylene complexes, these bond lengths and force constants lie between the values for the related hydrogen cyanide and acetylene complexes of NH3 and H2O. The NH3 bending and weak-bond stretching force constants of CH3CCH-NH3 are less than those found in NCCCH-NH3, NCH-NH3, and HCCH-NH3, suggesting that the hydrogen bonding interaction is particularly weak in CH3CCH-NH3. The weakness of this hydrogen bond is partially a consequence of orientation of monomer electric dipole moments in the complex. In CH3CCH-NH3 the antialigned monomer dipole moments leads to a repulsive dipole-dipole interaction energy, while in NCH-NH3 and NCCCH-NH3 the aligned dipoles give an attraction interaction.

Effect of Formulation Changes on the Response to Ionizing Radiation of Radiochromic Dye Films.
Final rept.
M. Barcelo, R. M. Uribe, W. L. McLaughlin, and G. Belmont. 1996, 6p.
Pub. in Radiation Protection Dosimetry, v66 n1-4 p237-242 1996.

Keywords: *Film dosimetry, *Gamma radiation, *Radiochromic films, Ultraviolet radiation, Radiation processing, Reprints, *Foreign technology, Pararosaniline cyanide.

Radiochromic dye films have been studied with the purpose of optimizing the formulation in order to increase their sensitivity to ultraviolet and ionizing radiation. The films consist of certain substituted triphenylmethane leucodyes incorporated in an acid solution with polyacetal resins, which can be cast into thin, colorless, tansparent films. Upon irradiation they become deeply colored due to dye formation (without development); they are analyzed for dosimetry by absorption spectrophotometry at the visible wavelength of maximum absorption, in terms of increase of absorbance versus delivered absorbed dose. Response functions were obtained for different films, in which the concentrations of each of the constituents, the dye precursors, as well as the types of acids and solvents were varied. A new formulation is suggested for radiochromic dye films useful in the dose range from 5 kGy to 35 kGy.

Keywords: *Standard cross section, *Neutron energy, *Fission chamber, Telescopes, Measurements, Fluence, Reprints, *Foreign technology.

To improve the accuracy of the 235U(n,f) cross section, measurements have been made of this standard cross section at the target 4 facility at Los Alamos National Laboratory (LANL). The data were obtained at the 20-meter flight path of that facility. The fission reaction rate was determined with a fast parallel plate ionization chamber and the neutron fluence was measured with an annular proton recoil telescope. The measurements provide the shape of the 235U(n,f) cross section relative to the hydrogen scattering cross section for neutron energies from about 3 to 30 MeV neutron energy. The data have been normalized to the very accurately known value near 14 MeV. The results are in good agreement with the ENDF/B-VI evaluation up to about 15 MeV neutron energy. Above this energy differences as large as 5% are observed.

Pub. in Jnl. of Vacuum Science and Technology A, v14 n5 p2953-2957 Sep/Oct 1996.

Keywords: *Envelopes, *Ionization gauges, *Extractors, Nude, Sensitivity, Reprints, Bayard-Alpert.

This article presents the results of some measurements of the influence of envelope size and shape on the N2 sensitivity of two nominally identical 'nude' extractor ionization gauges, and three common 'nude' versions of the Bayard-Alpert ionization gauge. Measurement were made over the pressure range 10 to the minus 7 power - 10 to the minus 1 power Pa, using typical gauge operating parameters and with vacuum chamber and gauge envelope at ground potnetial. Sensitivity values corresponding to three different envelopes used in this work differed by as much as a factor of 2 (comparing maximum value to minimum value for each gauge) for the Bayard-Alpert gauges. For the extractor gauges, the diferences were as large as 7%.

Pub. in Nuclear Instruments and Methods in Physics Research A, v334 p149-153 1993.

Keywords: *Ionization chambers, *Neutron beams, *Boron targets, Deposits, University, Vacuum evaporation, Reprints.

The areal densities (g/cm2) of enriched boron and lithium fluoride targets were compared to those of reference deposits from the Central Bureau of Nuclear Measurements (CBNM, Geel, Belgium) by charged-particle counting at the NIST Research Reactor. The

uniformity of the target thicknesses was also investigated by scans with a small-diameter, intense neutron beam. The neutron uniformity measurements agree satisfactorily with previously reported interferometric results and no pattern of uniformity variation except the expected, small radial dependence was found. In a separate series of measurements, the boron areal density ratios of a number of the deposits were determined using a new double ionization chamber. The new double ionization chamber permits a comparison of two targets directly without a beam monitor and without sensitivity to the exact placement of the samples. The new device needs only a very simple data acquisition system and requires less neutron beam intensity than the previously employed systems with arrays of surface barrier detectors. The ionization chamber counting losses from the combined effects of self-absorption and sub-threshold pulse-height formation were determined by comparison with ratio measurements made by the conventional surface barrier detector technique.

Generalized Optical Theorem for On-Axis Gaussian Beams.
Final rept.
G. Gouesbet, C. Letellier, G. Grehan, and J. T. Hodges. 1996, 21p.
Pub. in Optics Communications, v125 p137-157 1996.

Keywords: *Optical theorems, *Beams, *Gaussian beams, Plane waves, Finite scatters, Reprints, *Foreign technology.

The optical theorem for an incident plane was interacting with a finite scatterer is generalized to the case of on-axis Gaussian beams, taken as examples of shaped beams. The results are restricted in the paper to homogeneous spheres. The beams are defined by using (1) the standard description (2) the localized approximation and (3) the modified localized approximation. Rigorous expressions generalizing the classical plane wave case expression are given and numerically discussed. A recently proposed approximation is investigated in order to point out assumptions underlying its validity.

K. M. Jones, P. S. Julienne, P. D. Lett, C. J. Williams, W. D. Phillips, and E. Tiesinga. 1996, 5p.
Pub. in Europhysics Letters, v35 n2 p85-90 1996.

Keywords: *Atomic interactions, *Lifetimes, *Retardation, Atoms, Molecules, Measurements, Reprints, *Foreign technology.

From molecular spectroscopy of the Na2 purely long-range O-g state the authors determine the Na(3P) lifetime and measure the predicted but previously unobserved effect of retardation in the interaction between two atoms. The lifetime tau(P3/2)=16.230(16) ns helps to remove a longstanding discrepancy between experiment and theory. Electron cloud overlap is unimportant in the O-g state (R greater than 55ao) and the spectrum is calculated, ab initio, from atomic properties. By measuring the binding energies the 120 MHz correction due to retardation of the resonant-dipole R-3 interaction is confirmed.

Pub. in Jnl. of Enhanced Heat Transfer, v3 n3 p201-210 1996.

Keywords: *Fins, *Heat transfer, *Pressure gradients, *Annular flow, Nusselt number, Friction factor, Heat transfer coefficients, Mathematical models, Test facilities, Reprints.

The laminar, single-phase heat transfer and friction characteristics of a porcupine-like surface (integral-spine fin) within an annulus are presented. The heat-transfer coefficient was determined using a modified version of the Wilson Plot method on a 3 m test section. Three fluids were investigated: (1) water, (2) 34% ethylene glycol/water mixture, and (3) 40% ethylene glycol/water mixture. These fluids produced a sufficient variation in the Prandtl number, so that its exponential dependence could be determined. The annulus Reynolds numbers were varied from 100 to 1400 to obtain the Reynolds number exponent. An empirical correlation for the Nusselt number that accounts for the development of the thermal boundary layer is presented. An empirical correlation for the Fanning friction factor is also provided. It is shown that the spines enhance the heat transfer through additional surface area and fluid mixing.

Pub. in Applied Optics 32, n19 p3433-3437, 1 Jul 93.

Keywords: *Surface roughness, *Ultrasonic tests, *Profilometers, Wave propagation, Sound transmission, Test methods, Surface properties, Real time, Process control, Acoustic properties, Scattering, Reflection, Reprints.

Pulsed ultrasound propagating in water was used at megahertz carrier frequencies (nominally 10-50 MHz) to reflect and scatter from rough surfaces in the same way as light. We have considered noncontact ultrasonic techniques as complementary to optical techniques in several ways: (a) for specific applications such as wet surfaces, (b) for rougher surfaces with average roughness, Ra > or = 0.1 micrometer, and (c) for (simultaneous) profilometry by time-of-flight measurements. Stylus and ultrasonic data are compared. An example of application to the manufacturing environment is for on-line, real-time sensor feedback and process control in the cutting or grinding of metals and ceramics.

Pub. in Jnl. Acoust. Soc. Am. 92, n4 p2006-2015 Oct 92.

Keywords: *Ultrasonic radiation, *Acoustic absorption, *Air, MHz range 01-100, Acoustic measurement, Acoustic velocity, Acoustic waves, High frequency, Room temperature, Reprints.

A high power and sensitive gated radio-frequency (rf) measurement system has been used to determine the absorption of compressional waves in air, in the frequency range from 10-20 MHz. The measured absorption, between 80 and 90 kPa and at room temperature (15 deg C to 25 deg C), has been found to be in good agreement with that predicted, by extrapolation, from low-frequency (below 1 MHz) data for the combination of the classical and rotational loss effects. The velocity of ultrasound in air in the frequency range from 10-18 MHz has also been measured and is in good agreement with that predicted from theory. Normalized velocity and attenuation data plotted against Knudsen numbers and a rarefaction parameter are in good agreement with those obtained at reduced pressure and lower frequencies.

Interaction of Rayleigh Waves with a Rib Attached to a Plate.
Final rept.
L. J. Bond, and J. Taylor. 1991, 8p.
Pub. in Ultrasonics 29, p451-458 Nov 91.

Keywords: *Rayleigh waves, *Wave propagation, *Acoustic emissions, Plates, Ribs, Surface acoustic waves, Models, Finite difference method, Interactions, Reprints.

An analysis of the interaction of a pulse of Rayleigh waves on a plate with a rectangular flange or rib at-

tached in the far field of its acoustic emission (AE) source is presented. A finite difference (FD) model is used to give numerical visualizations of the development of the complete wave-field propagating through the structure and also to give displacement data for selected points. An 'energy partition model', for Rayleigh wave propagation across the rib has been developed and is described. Ray theory wave arrival time calculations are given for the propagation of various mode-converted components transmitted across the flange. A series of experimental measurements of AE wave propagation across a T-butt welded rib on a plate were made and these are compared with the model predictions. The practical implications of these findings for acoustic emission monitoring of large structures of complex shape are discussed.

Pub. in J. Acoust. Soc. Am. 91, n5 p2637-2642 May 92.

Keywords: *Ultrasonic spectroscopy, Vibrational spectra, Resonant frequency, Magnetic fields, Elastic properties, Aluminum, Spheres, Reprints.

An ultrasonic technique for studying vibrational resonant modes of metallic spheres is presented. The technique employs electromagnetic-acoustic transduction with a configuration consisting of a sample surrounded by a coil in a static magnetic field. Resonance spectra from 0.5 to 4.5 MHz with the coil axis parallel and perpendicular to the magnetic field are measured for a 3.145-mm-diam sphere of polycrystalline 2024 aluminum. Elastic constants calculated from the resonant peak frequencies are consistent with results obtained using an ultrasonic pulse-echo system. This new technique has advantages over pulse-echo and conventional resonance techniques for experiments where high absolute accuracy is necessary or where samples are heated far above room temperature.

Leady Axisymmetric Modes in Infinite Clad Rods. Part 1.
Final rept.
J. A. Simmons, E. Drescher-Krasicka, and H. N. G. Wadley. 1992, 30p.
Pub. in Jnl. of the Acoustical Society of America 92, n2 p1061-1090 1992.

Keywords: *Waves, *Clad metals, *Rods, *Computation, Composite materials, Reinforcing materials, Wave propagation, Phase velocity, Nondestructive tests, Aluminum, Silicon carbides, Reprints, Leaky waves, Clad rods, Radial-axial modes, Ultrasonic waves, Interface waves.

A detailed computational study is presented for the radial-axial modes-both leaky and non-leaky-in an infinitely clad isotropic rod. The complex phase velocities of leaky modes are located using an application of the argument principle. Particle orbits are determined, and leaky modes are shown to have an asymptotic leakage angle away from the interface. By using the homotopic methods of varying densities and elastic constants, clad-rod modes are compared with those in a bare rod. The topology of the clad-rod mode dispersion diagram differs qualitatively from that of a bare rod, even when the cladding has negligible density, with no velocity cutoffs and with wave mode knitting. Comparison is also given with modes occuring in a cladding without a rod present (a tunnel) and for a planar interface. Most leaky modes can be correlated with rod modes; only a limited number of tunnel modes exist. Energy flow contours within modes are also calculated. The local energy velocity, which generalizes group velocity, can vary considerably in the radial direction for bare rod modes. For leaky modes the contours are quite complex due to the cylindrical geometry, giving rise to apparent shifts in wave position across the interface.

Keywords: *Acoustic testing, *Acoustic measurement, *Laboratories, Acoustic absorption, Acoustic attenuation, Sound transmission, Noise reduction, Performance evaluation, Test methods, Ear protection, Hearing, Calibration, National Voluntary Laboratory Accreditation Program, NVLAP program.

NIST Handbook 150-8 presents the technical requirements of the National Voluntary Laboratory Accreditation Program (NVLAP) for Acoustical Testing Services. It is intended for information and use by staff of accredited laboratories, those laboratories seeking accreditation, other laboratory accreditation systems, users of laboratory services, and others needing information on the requirements for accreditation under this program. This publication supplements NIST Handbook 150, NVLAP Procedures and General Requirements, which contains Part 285 of Title 15 of the U.S. Code of Federal Regulations (CFR) plus all general NVLAP procedures, criteria, and policies. Handbook 150-8 contains information that is specific to the Acoustical Testing Services program and does not duplicate information contained in the Procedures and General Requirements. It is organized to cross-reference with Handbook 150; for example, Section 285.3 of Handbook 150 presents the description and goal of NVLAP, whereas Section 285.3 of Handbook 150-8 presents the description of the Acoustical Testing Services program. Where there is no material specific to the field of accreditation, the section number is omitted.

Pub. in International Jnl. of Thermophysics 15, n5 p821-847 Sep 94.

Keywords: *Thermodynamic properties, *Halohydrocarbons, *Ethers, *Gases, *Acoustic velocity, Specific heat, Ideal gas, Virial coefficients, Intermolecular forces, Reprints, Difluoromethoxy-difluoromethane, 2-Difluoromethoxy- 1-1-1-trifluoroethane.

The authors present measurements of the speed of sound in gaseous difluoromethoxy-difluoromethane (CHF2-O-CHF2) and 2-difluoromethoxy- 1,1,1-trifluoroethane (CF3-CH2-O-CHF2). These measurements were performed in an all-metal apparatus between 255 and 384 K. The authors have obtained ideal-gas heat capacities and second acoustic virial coefficients from analysis of these measurements. Two methods of correlating the second acoustic virial coefficients, a squarewell model of the intermolecular interaction and a function due to Pitzer and Curl, are presented.

Determination of Acoustic Center Correction for Type LS2aP Condensor Microphones.
Final rept.
R. P. Wagner, and V. Nedzelnitsky. 1995, 1p.
Pub. in Jnl. of the Acoustical Society of America, v98 n5 pt2 p2917 Nov 95.

Keywords: *Acoustical instruments, *Microphones, Reprints, Calibration, Acoustic center.

Acoustic center corrections for microphones are necessary for accurate free-field calibration by the reciprocity technique. Such correction for several pairs of the relatively new type LS2aP microphone (IEC Std. 1094-1: 1992) were obtained by utilizing the theoretical inverse relationship between the sound pressure amplitude at the receiving microphone and the distance between the acoustic centers of the source and receiving microphones. For a nominally 10-V sinusoidal rms excitation of the source microphone, source-to-receiver voltage ratios were measured with a dynamic signal analyzer at 500 Hz intervals in the extended frequency range (2 to 50)kHz. This procedure allowed all the data for a microphone pair to be gathered within several hours as a function of microphone diaphragm separation at 10-mm intervals from 101 to 311 mm. At each frequency, these ratios were corrected for atmospheric effects, including attenuation of sound, and then fit to a straight line (ratio versus diaphragm separation). Acoustic center corrections were calculated from the derived values of the fit parameters. These corrections agree with appropriately scaled values (IEC Publication 486-1974) for 'l-in.' microphones with recessed diaphragms. Physical phenomena that cause small deviations from the linear fits will be discussed along with uncertainty estimate, and effects of spatially truncating data.

Thermal Wave NDE of Advanced Materials Using Mirage Effect Detection.
Final rept.
L. Wei, and G. S. White. 1993, 8p.
Pub. in Proceedings of the International Conference on Photoacoustics, Maine, 1993, p1-8.

Keywords: *Meetings, *Mirage detection, *Thermal waves, Reprints, Advanced materials, Nondestructive evaluation, Thermal property.

The dramatic improvement in modern materials has driven the search for improved measurement techniques, for both the detection of flaws which will prevent or limit applications and for the evaluation of basic physical parameters of the materials themselves. The mirage thermal wave technique has been used successfully to meet both requirements. Because thermal waves are sensitive to changes in the heat flow in a material, the thermal wave technique is complementary to techniques such as ultrasonics and light scattering measurements, which are sensitive to changes in elastic and optical properties, respectively.

Air Flow in the Boundary Layer of an Elliptic Cylinder.
G. B. Schubauer. 1939, 25p, NBS-652.
Document partially illegible.

Keywords: *Air flow, *Boundary layer, Velocity, Position(Location), Intensity, Turbulence, Turbulent flow, Turbulent boundary layer, Variations, Cylindrical bodies, Scale, Airspeed, Transitions, Hot wire, Ellipses.

The boundary layer of an elliptic cylinder of major and minor axes 11.78 and 3.98 inches, respectively, was investigated in an air stream in which the turbulence could be varied. Conditions were arranged so that the flow was two-dimensional with the major axis of the ellipse parallel to the undisturbed stream. Speed distributions across the boundary layer were determined with a hot-wire anemometer at a number of positions about the surface for the lowest and highest intensities of turbulence, with the air speed in both cases sufficiently high to produce a turbulent boundary layer over the downstream part of the surface. The magnitude and the frequency of the speed fluctuations in the boundary layer were also measured by the use of the conventional type of hot-wire turbulence apparatus. Stream turbulence was found to affect both the nature of transition from to turbulent flow in the layer and the position on the surface at which transition occurred. Transition was then investigated in detail with stream turbulence of several different scales and intensities. It was found that the position of transition could be expressed as a function of the intensity divided by the fifth root of the scale. (KAR) P.5.

The design and operation of two ebulliometers is described. One is constructed of glass and is used for measuring vapor pressures of fluids at low reduced temperatures and pressures. The other is constructed of metal. It can be used for vapor pressure measurements, and also for the study of fluid mixture thermodynamics through the determination of the activity coefficients at infinite dilution. The advantages and potential problems associated with ebulliometers are described, and typical results are given for the properties of alternative refrigerants.

This report presents recent results obtained in a consortium-sponsored research program on flowmeter installation effects being conducted at NIST-Gaithersburg, MD. The objective of this research program is to produce improved flowmeter performance when meters are installed in non-ideal conditions. Ideal meter installation conditions are those where long straight lengths of constant diameter piping precede the meter locations. Actual installations seldom conform to these conditions. This research effort has also included experimental studies of the flow into and out of several tube bundle flow conditioners. These results have produced, for the first time, detailed descriptions of the effects these devices have on swirling pipe flows. Specifically, this report contains measurements of the pipeflows produced downstream of the conventional reducer. Results are given for the performance characteristics of a range of orifice meter geometries and a specific turbine meter in these pipe flows. Also included are the velocity profile measurements downstream of the tee used as an elbow and several arrangements of tube bundles installed downstream of the single elbow and the tee used as an elbow.

Sponsored by Department of Energy, Washington, DC.
Pub. in Physical Review A 46, n10 p6731-6734, 15 Nov 92.

Keywords: Small angle scattering, Neutron scattering, Molecular dynamics, Suspensions, Simulation, Shear rate, Reprints, *Atomic fluids.

A nonequilibrium molecular-dynamics method is proposed to simulate the behavior of simple fluids under high shear rates. A thermostat that makes no assumptions regarding the form of the streaming velocity of the fluid is introduced. Simulations are carried out for a Weeks-Chandler-Andersen dense liquid. With the form of the streaming velocity partially or wholly constrained, we find evidence for a reentrant solid or string phase, but the phase disappears if constraints are removed. Small-angle neutron-scattering data from a sheared colloidal suspension are presented. There is no evidence of a steady-state shear-induced structure in the suspension.

Keywords: *Fluids, *Thermodynamic properties, *Mixtures, *Critical point, Equations of state, Free energy, Ethane, Carbon dioxide, Thermophysical properties, Reprints.

In a previous publication (Z. Y. Chen, A. Abbaci, S. Tang, and J. V. Sengers, Phys. Rev. A 42, 4470 (1990)) a renormalized Landau expansion was constructed for the thermodynamic free energy of one-component fluids that incorporates the crossover from singular thermodynamic behavior at the critical point to regular behavior far away from the critical point. In the present paper the approach is extended to obtain a crossover free energy for binary fluid mixtures in the region around the vapor-liquid critical line. The thermodynamic equations thus obtained are compared with experimental equation-of-state and specific-heat data for mixtures of carbon dioxide and ethane.

Pub. in Jnl. of Fluid Mechanics 237, p101-187 Apr 92.

Keywords: *Turbulent boundary layer, *Boundary layer transition, *Vortex generators, *Roughness, Reynolds number, Vortices, Unsteady flow, Steady flow, Three dimension flow, Vortex shedding, Reprints.

An experimental investigation of the transition from a laminar to a fully-developed turbulent boundary layer induced by a three dimensional roughness element in a zero pressure gradient boundary layer, incorporating an extensive bibliography, is described. The critical roughness Reynolds number at which turbulence is regarded as originating at the roughness was determined for the roughness elements herein considered and evaluated in the context of data existing in the literature. The effect of a steady and oscillatory free stream velocity on eddy shedding was also investigated and whether the eddy shedding is governed by an inflectional instability is examined. Distributions of mean velocity and turbulence intensity demonstrating the evolution toward a fully developed turbulent boundary layer were measured at various Reynolds numbers. A two region model is postulated for the evolutionary change toward a fully developed turbulent boundary layer: an inner region where the turbulence is generated by the complex interaction near the surface of hairpin eddies with pre-existing stationary vortices, and an outer region where the hairpin eddies deform and generate turbulent vortex rings. The structure of the resulting fully developed turbulent boundary layer is discussed in the light of the proposed model for the evolutionary process.

Flow Conditioner Tests for Three Orifice Flowmeter Sizes.
Technical note.
J. L. Scott, and M. A. Lewis. May 94, 87p, NIST/TN-1367.
Also available from Supt. of Docs. as SN003-003-03287-5. Sponsored by Gas Research Inst., Chicago, IL.

Keywords: *Orifice flow, *Flowmeters, Flow measurement, Discharge coefficient, Flow resistance, Orifices, Pipe flow, Turbulent flow, Reynolds number, *Flow conditioners, Beta ratio.

Tests sponsored by the Gas Research Institute were performed with orifice flowmeters of three nominal

sizes: 52, 104, and 154 mm (2, 4, and 6 in). Tests with the 52 mm orifice meter included establishing a baseline curve for 6 beta ratios and then conducting flow conditioner performance tests with an elbow located 17 pipe diameters (17D) upstream of the orifice plate. Results from this laboratory indicate that beta ratios of 0.54 or less do not require flow conditioning in this configuration and the 19 tube bundle flow conditioner at 12D produces the best results for larger beta ratios. For the 104 mm orifice meter in the same piping configuration, flow conditioning is necessary for beta ratios of 0.55 and greater. Meter performance is less sensitive to the location of the 7 tube bundle than the 19 tube bundle flow conditioner, but the influence of the flange tape location is greater. Testing of two beta ratios in the 154 mm orifice meter in a baseline configuration and with a tee located 18D from the orifice plate indicates that placing a 19 tube bundle flow conditioner at 12D produces discharge coefficients equivalent to those measured in baseline conditions. Flow rates for all tests were in the turbulent regime.

Reconstructing Stratified Fluid Flow from Reciprocal Scattering Measurements.
Final rept.
S. J. Norton. 1991, 6p.
Pub. in Jnl. of the Acoustical Society of America 89, n6 p2567-2572 1991.

Keywords: *Fluid flow, *Acoustic scattering, *Stratification, Inhomogeneity, Wave propagation, Flow measurement, Acoustic properties, Defects, Acoustic signals, Reprints.

The authors show how an inversion formula can be derived for reconstructing the magnitude and direction of stratified fluid flow from two scattering measurements. The measurements are recorded by transmitting an acoustic pulse from a source below the region of stratified flow and then recording the scattered wave at another point horizontally displaced from the source. A second measurement is performed with the source and receive interchanged and the result is subtracted from the first scattering measurement. This difference is, within the Born approximation, independent of scattering that arises from stationary inhomogeneities and thus solely sensitive to scattering due to flow. As a by-product, the sum of the two scattering measurements with source and receiver interchanged yields a quantity sensitive only to scattering from stationary inhomogeneities. This allows the stationary inhomogeneities to be recovered independently of flow.

Also available from Supt. of Docs. as SN003-003-03296-4. See also PB94-160736.

Keywords: *Flow meters, *Pipe bends, *Pipe flow, *Meetings, Flow measurement, Turbulence, Velocity distribution, Orifice meters, Orifices, Pipes(Tubes), Government/industry relations, Research programs, Concentric tube bundle flow conditioners.

The report presents recent results obtained in a consortium-sponsored research program on flowmeter installation effects being conducted at National Institute of Standards and Technology (NIST)-Gaithersburg, MD, presented at the meeting of consortium participants in November 1992. This project is supported by an industry-government consortium and has been underway for several years. This piping element tested and reported here is the conventional 45 degree elbow; the conventional 19- and 7-tube concentric tube bundle flow conditioners were also tested. The LDV velocity measurements are reported for the pipeflows produced downstream of the 45 degree elbow with and without the 19-tube tube bundles. The performance characteristics of a range of orifice meters with various pressure tap geometries and a specific turbine meter are obtained downstream of the 45 degree elbow with and without the 19- and 7-tube bundle flow conditioners.

Pub. in Physical Review E 48, n6 p4584-4591 Dec 93.

Keywords: *Porous materials, *Permeability, *Stokes law(Fluid mechanics), Solubility, Stokes flow, Diffusion, Nuclear magnetic resonance, Electrical resistivity, Reprints.

Results from a numerical study examining cross-property relations linking fluid permeability to diffusive and electrical properties are presented. Numerical solutions of the Stokes equations in three-dimensional consolidated granular packings are employed to provide a basis of comparison between different permeability estimates. Estimates based on the lambda parameter (a length derived from electrical conduction) and on d(sub c) (a length derived from immiscible displacement) are found to be considerably more reliable than estimates based on rigorous permeability bounds related to pore space diffusion. We propose two hybrid relations based on diffusion which provide more accurate estimates than either of the rigorous permeability bounds.

Experimental Data and Theoretical Modeling of Gas Flows Through Metal Capillary Leaks.
Final rept.
S. A. Tison. 1993, 5p.
Pub. in Vacuum 44, n11/12 p1171-1175 1993.

Keywords: *Flow rate, *Capillary tubes, *Leak detectors, *Gas flow, Flow measurement, Leakage, Viscous flow, Vacuum gages, Vacuum apparatus, Slip flow, Calibration, Pressure measurement, Transition flow, Reprints.

Metal capillary tubes are commonly used as leak elements to admit known flows of gases into vacuum systems for calibration of vacuum gaging equipment. In many instances it is desired to generate flow rates over a range of three or more decades, preferably with a single leak element. The generation of flow rates over wide ranges is possible with metal capillary leaks, but in most cases the conductance of the leak element will need to be measured as a function of the relevant pressures due to the changing of the flow regimes. Many fits to experimental data and theoretical models exist for predicting the flow rate through tubes, but their validity is not well established in this study, measured conductances of stainless steel tubes for flow rate of 10(exp -8) to 10(exp -14) mol/s with several inert gases are compared with various experimental and theoretical models of gas flow in the molecular, viscous and transition flow regimes. Characteristics of crimped metal capillaries are also examined over this range of flows.

Global Density Effects on the Self-Preservation Behavior of Turbulent Free Jets.
Final rept.
C. Richards, and W. Pitts. 1993, 19p.
Pub. in Jnl. of Fluid Mech. 254, p417-435 1993.

Keywords: *Turbulent jets, *Free jets, *Jet mixing flow, *Density(Mass/volume), Jet flow, Turbulent flow, Concentration(Composition), Boundary conditions, Nozzle flow, Light scattering, Axisymmetric flow, Density measurement, Velocity distribution, Reprints, *Global density ratio, *Self-preservation behavior.

An experimental investigation was designed to test the hypothesis that all axisymmetric turbulent free jets become asymptotically independent of the source conditions and may be described by classical similarity analysis. Effects of initial conditions were studied by varying jet exit boundary conditions and the global density ratio. The exit velocity profile and turbulence level was changed by using both pipe and nozzle flow hardware. Initial density differences were imposed by using three gases: helium, methane, and propane. The scalar field (concentration) in the momentum-dominated regime of the far field (10 to 60 jet exit diameters downstream) of turbulent free jets was characterized using Rayleigh light scattering as the diagnostic. The results show that regardless of the initial conditions axisymmetric turbulent free jets decay at the same rate, spread at the same angle, and both the mean and r.m.s. values collapse in a form consistent with full self-preservation. The means and fluctuations follow a law of full self-preservation in which two virtual origins must be specified.

Convective Stability in the Rayleigh-Benard and Directional Solidification Problems: High-Frequency Gravity Modulation.
Final rept.
A. A. Wheeler, G. B. McFadden, B. T. Murray, and S. R. Coriell. 1991, 12p.
Sponsored by National Aeronautics and Space Administration, Washington, DC. and Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Physics of Fluids A 3, n12 p2847-2858 Dec 91.

Keywords: Rayleigh-Benard convection, Gravitational effects, Asymptotic series, Numerical solution, Flow stability, Solutes, Rayleigh number, Schmidt number, Reprints, *Directional solidification, Floquet theory.

The effect of vertical, sinusoidal, time-dependent gravitational acceleration on the onset of solutal convection during directional solidification is analyzed in the limit of large modulation frequency Omega. When the unmodulated state is unstable, the modulation amplitude required to stabilize the system is determined by the method of averaging, and is O(Omega). Comparison of the results from the averaged equations with numerical solutions of the full linear stability equations (based on Floquet theory) show that the difference is O(Omega(Sup 1/2)). When the unmodulated state is stable, resonant modes of instability occur at large modulation amplitude. These are analyzed using matched asymptotic expansions to elucidate the boundary-layer structure for both the Rayleigh-Benard and directional solidification configurations.

Probabilistic Computation of Poiseuille Flow Velocity Fields.
Final rept.
F. Y. Hunt, J. F. Douglas, and J. Bernal. 1995, 16p.
Pub. in Jnl. of Mathematical Physics, v36 n5 p2386-2401 May 95.

Keywords: *Open channel flow, *Laminar flow, Probability theory, Fractals, Pipe flow, Cross sections, Torsion, Rigidity, Reprints.

Velocity fields for Poiseuille flow through tubes having general cross sections are calculated using a path integral method involving the first-passage times of random walks in the interior of the cross sectional domain of the pipe. This method is applied to a number of examples where exact results are available and to more complicated geometries of practical interest. These examples include a tube with 'fractal' cross section and open channel flows. The calculations demonstrate the feasibility of the probabilistic method for pipe flow and other applications having an equivalent mathematical description (e.g., torsional rigidity of rods, membrane deflection).

Results are presented of an intercomparison of pressure measurements between the National Physical Laboratory (NPL), India, and the National Institute of Standards and Technology (NIST), USA, using piston guage pressure standards over the range 6 MPa to 26 MPa. The intercomparison, using the NPL piston gauge pressure standard, with a normal effective area of 8.4 x 10(exp-5) square m., and the NIST piston gauge pressure standard, with a nominal effective area of 2.0 x 10(exp-5) square m., was carried out at the NPL. The intercomparison data obtained show a relative difference of 1 x 10(exp-6) in the zero-pressure effective area A(sub 0) of the NPL standard as obtained by the NIST standard.

Long-Lived Structures in Fragile Glass-Forming Liquids.
Final rept.
A. I. Mel'cuk, R. A. Ramos, H. Gould, W. Klein, and R. D. Mountain. 1995, 4p.
Pub. in Physical Review Letters, v75 n13 p2522-2525, 25 Sep 95.

Keywords: *Molecular structure, *Supercooling, *Liquids, *Glass, *Lennard-Jones potential, Computerized simulation, Clumps, Monte Carlo method, Thermodynamic properties, Thermal stability, Kinetics, Two dimensional, Reprints, *Molecular dynamics, *Fragile glass, Voronoi analysis.

We present molecular dynamics results for the existence of long-lived clusters near the glass transition in a two component, two-dimensional Lennard-Jones supercooled liquid. Several properties of this system are similar to a mean-field glass-forming liquid near the spinodal. This similarity suggests that the glass 'transition' in the supercooled liquid is associated with an incipient thermodynamic instability. Our results also suggest that single particle properties are not relevant for characterizing the instability, but are relevant to the kinetic transition that occurs at a lower temperature than the glass transition.

Non-Gaussian Noise Effects on Reliability of Multistable Systems.
Final rept.
E. Simiu, and M. Grigoriu. 1993, 7p.
Pub. in Proceedings of the International Conference on Offshore Mechanics and Arctic Eng., OMAE (12th), Glargow, Scotland, June 20-24, 1993, v2 p65-71 1993.

Keywords: *Chaos, *Noise, *Dynamical systems, *Ocean engineering, Stability, Elastic properties, Nonlinear systems, Stochastic processes, Branching(Mathematics), Reliability, Reprints, *Non-gaussian effects, Fluidelasticity.

For certain types of compliant structures the designer must consider limit states associated with the onset of fluidelastic instability. For a wide class of dynamical systems, a fundamental connection between deterministic and stochastic chaos allows the application of this condition to obtain probabilities that chaotic motions with jumps cannot occur in multistable systems excited by processes with tail-limited marginal distributions.

See also PB95-189460.
Pub. in Phys. Fluids, v7 n8 p1797-1810 Aug 95.

Keywords: *Contact line, *Lubrication theory, Reactive spreading, Solder, Reprints, *Foreign technology.

Solder drops spreading on metallic substrates are a reactive form of the wetting problem. A metallic component may diffuse in the liquid toward a metal substrate, where it is consumed by a reaction that forms a solid intermetallic phase. The resulting spatial variation in the composition of the drop may cause composition gradients along the free surface of the drop. Together with any thermal gradients along the free surface. Marangoni effects may, in turn, modify the bulk transport in the spreading drop. Motivated by this situation, we extend lubrication theory for the spreading of thin drops in the presence of gravity and thermocapillarity to include mass transport and equations for the free surface shape and concentration field. Numerical solutions for the nonreactive (single component) drop agree well with previous theory. In the reactive case, we are only able to compute results for parameters outside of the range for solder materials. Including reactive effects in the model impacts the flow patterns and spreading rates at relatively early times; but by the end of the spreading, solutal effects have died out in the model.

Keywords: *Random walk, *Hydrodynamics, *Computational fluid dynamics, Random processes, Phase transitions, Dynamical systems, Equilibrium, Stochastic processes, Numerical analysis, Mathematical models, Reviews, Reprints.

Scientists have often pondered the 'unreasonable effectiveness' of mathematics in describing the complex cooperative phenomena which occur at many scales in our physical environment - processes ranging from subatomic to cosmic dimensions. The success of random walk models, and the limit theorems associated with these walks, in describing the origin of various kinds of cooperative phenomena (phase transitions, fluid flow,..) is similarly remarkable and we can expect the perspective and tools of random walk theory to offer clues into the microscopic origin of large-scale regularities in the natural world and into the success of hydrodynamic mathematical models introduced to describe dynamic and equilibrium cooperative phenomena.

Improved Gas Flow Measurements for Next-Generation Processes.
Final rept.
S. A. Tison. 1996, 5p.
Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p497-501 1996.

Keywords: *Gas flow, Semiconductors, Meters, Reprints, Mass flow controller.

Many semiconductor processes require stable and known flows of gas be delivered to the processing chamber. Gas types and flow rates are process dependent, but it is clear that next-generation processes will require flow measurements that are two to three decades lower than current requirements. Specifically, the Semi-Sematech-sponsored Mass Flow Controller Working Group recently identified the need for flow measurements with an accuracy of 1% or better to be extended to cover the range 7 x 10 to the minus 8th power to 7 x 10 to the minue 5th power mol/s (0.1 to 100 sccm, standard cubic centimeters per minute). At least two problems must be overcome if this goal is to be attained. Achieving 1% accuracy in the process chamber will require reference standards with an accuracy of 0.2% or better, but adequate reference standards do not exist over this range. Further, the thermal mass flow controllers (TMFCs) used to measure and control the process gases are generally calibrated with nitrogen and 'corrected' for other gases, but the correction factors are not well understood and of questionable reliability. The National Institute of Standards and Technology (NIST) is addressing both of these problems by developing new flow standards and by investigating the performance of TMFCs. This paper will present data on the performance of five TMFCs, from different manufacturers, with full scale rangers of 1.5 x 10 to the minus 6th power mol/s to 3.7 x 10 to the minus 6th power mol/s (2 to 5 sccm).

Pub. in Proceedings of the National Heat Transfer Conference (30th), Portland, OR., August 6-8, 1995, v3 p121-126.

Keywords: *Critical flow, *Electric fields, *Electrostriction, *Microgravity, Reprints, Sulfur hexafluoride, Meetings, Critical point, Density distribution, Interferometry.

The authors have studied the effects of an electric field on a sample of SF6 fluid in the vicinity of the liquid-

vapor critical point. The authors measured the isothermal increase of the density of a near-critical sample as a function of the applied electric field. In agreement with theory, this electrostriction effect diverges near the critical point as the isothermal compressibility diverges. Also as expected, turning on the electric field in the presence of density gradients can induce flow within the fluid, in a way analogous to turning on gravity. These effects were observed in a microgravity environment by using the Critical Point Facility which flew onboard the Space Shuttle Columbia in July 1994 as part of the Second International Microgravity Laboratory Mission. Both visual and interferometric images of two separate sample cells were obtained by means of video downlink.

Thermal Anemonetry for Mass Flow Measurement in Oscillating Cryogenic Gas Flows.
Final rept.
W. Rawlins, R. Radebaugh, and K. D. Timmerhaus. 1993, 7p.
Pub. in Review of Scientific Instruments, v64 n11 p3229-3235 Nov 93.

Keywords: *Oscillating flow, *Anemometers, Reprints, Pulse tube refrigerator, Cryocoolers, Constant temperature anemometer, Resistance temperature detectors.

Constant temperature anemometers and resistance temperature detectors have been adapted to measure the instantaneous mass flow rates and tempeatures in oscillating gasflows at frequencies up to 30 Hz and temperatures down to 70 K. These devices were used to study the behavior of the oscillating working fluid (helium) in a regenerative refrigerator called an orifice pulse tube refrigerator with little instrusion in the system. The probes have proved to be very robust with no probe breakage even under the severe operating conditions imposed by the oscillating mass flow. Calibration procedures are presented for correcting the anemometer output associated with the oscillating temperatures and pressures in such systems. Under these conditions the sensors appear to have an uncertainty of less than 1.6%. Typical results obtained with these sensors are presented in this paper. These sensors could be used in many other applications for studies of oscillating systems where instantaneous mass flow rates and temperatures are required.

Tomographic Reconstruction of the Moments of Local Probability Density Functions in Turbulent Flow Fields.
Final rept.
M. R. Nyden, P. Vallikul, and Y. R. Sivathanu. 1996, 12p.
Pub. in Jnl. of Quantative Spectroscopy Radiation Transfer, v55 n3 p345-356 1996.

Keywords: *Turbulent flow, *Flow fields, *Probability density functions, Turbulent heat transfer, Turbulent jets, Flame propagation, Jet mixing flow, Jet flow, Propenes, Algorithms, Numerical flow visualization, Fourier transformation, Reprints, Ethenes.

An algorithm for the tomographic reconstruction of the individual moments of the probability density functions describing the local transmittance of radiation through a turbulent flow field is advanced. The new method, which is based on Fourier inversion, is applicable to asymmetric (as well as, to axiymmetric) flows. The validity of the method is examined by comparing reconstructed moments of the local probability functions in a buoyant propene/air flame and an ethene/air jet flame to the corresponding values obtained from optical probe measurements.

Greenspan Acoustic Viscometer for Gases.
Final rept.
K. A. Gillis, J. B. Mehl, and M. R. Moldover. 1996, 8p.
Pub. in Review of Scientific Instruments, v67 n5 p1850-1857 May 96.

Keywords: *Viscometers, *Transport properties, Reprints, Viscosity, Speed-of-sound, Thermophysical properties, *Helmholtz resonators.

Double Helmholtz acoustic resonators, first proposed by Greenspan for measuring the viscosity of gases, were tested with helium, argon, and propane. Two different resonators were tested extensively with all three gases. For each of these instruments, the results for the viscosities of the three gases were consistent within plus or minus 5% at pressures spanning the range 25-1000 kPa. Without calibration, the viscosities deduced from one viscometer were systematically 1% larger than data from the literature; the viscositites from the second viscometer were systematically 3% larger than data from the literature. If the systematic differences were removed for each viscometer by calibration with a single gas at a single temperature and pressure, then nearly all the results for both instruments would have fallen within plus or minus 0.5% of the data from the literature. In these viscometers, the gases are in contact with robust metal parts only; thus, these instruments are applicable to a very wide variety of gases over a very wide range of temperatures.

Internal Waves in Xenon Near the Critical Point.
Final rept.
R. F. Berg, M. J. Lyell, G. B. McFadden, and R. G. Rehm. 1996, 12p.
Pub. in Physics of Fluids, v8 n4 p1464-1475 Jun 96.

Keywords: *Critical points, *Internal waves, *Density profiles, Mode symmetry, Stratified fluid, Reprints, Brunt-Vaisala frequency.

Just above the liquid-vapor critical point, a fluid's large compressibility causes a stable stratification in which the density varied by as much as 10% in 1 cm. This stratification supports internal gravity waves which the authors observe with an oscillator immersed in a near-critical xenon sample. The authors found the number and frequencies of the observable modes depended on the sample cell's orientation, with only two modes seen in the horizontal cell. The frequencies of the two modes had different temperature dependences: with decreasing temperature, the higher frequency increased monotonically from 0.7 to 2.8 Hz, but the lower frequency varied nonmonotonically, with a maximum of 1.0 Hz at 20 mK above the critical temperature. These temperature dependences continued to 20 mK below the critical temperature, where the xenon was separated into liquid and vapor phases. The authors calculated these two frequencies by solving the eigenvalue problem of internal waves in a box containing a stratified fluid. The fluid's density profile was obtained from xenon's equation of state. The calculated and measured frequencies agree to within 15%. Analytical calculations based on simple approximations of the density profile provide insight into the observed temperature dependences.

Keywords: *Infrared filters, Intermediate infrared radiation, Carbon dioxide lasers, Optical heterodyning, Laser radiation, Light modulation, Transmittance, Attenuators.

The authors have set up a novel direct detection system to measure filter transmittances over an attenuation range of at least 5 decades, with relative combined standard uncertainties as low as 0.5% (1 sigma) per decade, in the 9 micrometer to 11 micrometer spectral region. This system, using an apparatus originally designed for a heterodyne measurement of transmittance, achieves higher accuracy at the expense of a reduced dynamic range. The high modulation frequency and narrow bandwidth of the system allow thermal background radiation to be suppressed and high accuracy to be achieved. The authors correct for the non-ideal natures of the detector and attenuators. In particular, the detector position is scanned to reduce the effect of its spatial nonuniformity and the deflection of the transmitted beam caused by the nonparallel surfaces of the filter. The authors discuss the sources of systematic errors and the methodology to reduce their contribution.

Keywords: *Light scattering, *Smoke, Method of moments, Maxwells equations, Agglomerates, Combustion, Fires, Soot, Coupled dipole method, Dielectric spheres.

Smoke agglomerates are made of many soot spheres, and their light scattering response is of interest in fire research. The numerical techniques chiefly used for theoretical scattering studies are the method of moments and the coupled dipole moment. The two methods have been obtained in this tutorial paper directly from the monochromatic Maxwell curl equations and shown to be equivalent. The effects of the finite size of the primary spheres have been numerically delineated.

Spectrum and Energy Levels of Five-Times-Ionized Niobium (Nb VI).
Final rept.
J. O. Ekberg, and J. Reader. 1994, 13p.
Pub. in Jnl. of the Optical Society of America B 11, n3 p415-427 Mar 94. Sponsored by Department of Energy, Washington, DC.

Keywords: *Atomic energy levels, *Ultraviolet spectra, *Niobium ions, Vacuum ultraviolet radiation, Atomic spectra, Line spectra, Hyperfine structure, Ionization, Reprints, Krypton-line ions.

The spectrum of the kryptonlike ion Nb VI was observed from 325 to 2,700 A with sliding-spark discharges on 10.7-m normal-incidence and grazing-incidence spectrographs. Experimental energies were determined for all levels of the 4s(2)4p(6), 4s(2)4p(5)4d, 4f, 5s, 5p, 5d, 5g, 6s, and 4s4p(6)4d configurations as well as for some levels of the 4s(2)4p(5)6g and 6h configurations. A total of 303 lines are now classified as transitions between 99 observed levels. Large hyperfine splittings were found for several levels of the 4p(5)5s and 5p configurations. The observed configurations were theoretically interpreted by means of Hartree-Fock calculations and least-squares fits of the energy parameters to the observed levels. An improved value of the ionization energy was determined from the 4p(5)5g, 6g, and 6h configurations.

J. M. Bridges. 1993, 9p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Ultraviolet Technology IV, San Diego, CA., July 20-21, 1992, v1764 p262-270 1993. Sponsored by Office of Space Science and Applications, Washington, DC.

Keywords: *Vacuum ultraviolet radiation, *Ultraviolet radiation, *Radiometry, *Calibration, SURF II storage ring, Electric arcs, Irradiance, Radiance, Reprints, Hydrogen arcs, Argon arcs, US NIST.

A program exists at NIST to calibrate radiometric sources for the spectral range from 118-350 nm. These include deuterium lamps, hollow-cathode lamps, RF-excited dimer lamps, and wall-stabilized argon arcs. Sources have been calibrated for and used by researchers in solar physics, astrophysics, atmospheric physics (ozone measurements), magnetically controlled fusion, and photobiology. The argon arcs were developed in our laboratory, and provide intense sources of both radiance and irradiance. Calibrations are performed relative to two primary sources, a wall-stabilized hydrogen arc and a 12,000 K black-body line arc, both developed in our laboratory. Also we recently have begun periodic calibrations on the NIST storage ring, SURF II, to ensure consistency between our respective radiometric bases. Various sources have been calibrated for space applications, including several which are flyable. Also, some development and testing of radiometers for semiconductor lithography were recently carried out with an intense argon arc source.

Also available from Supt. of Docs. as SN003-003-03277-8. See also PB93-102259. Prepared in cooperation with Lasers and Electro-Optics Society (IEEE), Piscataway, NJ. and Optical Society of America, Washington, DC.

Keywords: *Fiber optics, *Optical fibers, *Optical measurement, *Meetings, Optical polarization, Electrooptics, Transmission lines, Reviews, US NBS, Integrated optics, National Institute of Standards and Technology.

The Digest contains the manuscripts of 50 papers, 10 invited and 40 contributed, presented at the eighth Symposium on Optical Fiber Measurements, September 13-15, 1994 in Boulder, Colorado. The most significant theme of the symposium is the present importance of polarization measurements. More than 20% of the papers are concerned either with polarization measurements, especially polarization mode dispersion and polarization dependent loss, or the characterization of fibers and components with special polarization properties. Optical time-domain reflectometry (OTDR) measurements are another important theme, as they have been since the first Symposium in 1980, and the characterization of optical fiber amplifiers continues to be important. Nonlinear processes in fiber seem to be a growing interest. Approximately two thirds of the papers come from outside of the United States, up from about half at the seventh Symposium. Ten countries are represented in the program.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Imaging Infrared: Scene Simulation, Modeling, and Real Image Tracking, Orlando, FL., March 30-31, 1989, v1110 p49-60.

Keywords: *Infrared sources, *Calibration, Temperature range 0013-0065 K, Blackbody radiation, Research facilities, Radiometry, Irradiance, Reprints, US NIST.

Details will be given about the recently completed facility for the calibration of infrared sources in a low background environment. The basic components of the facility are a large (60 cm diameter by 152 cm long) stainless steel vacuum chamber housed in a soft-wall cleanroom. A low background environment inside the chamber is achieved by cooling internal cryoshields to temperatures less than 20 K using a closed cycle helium refrigerator. Sources of up to 30 cm square can be inserted into the chamber for calibration. Total radiant power from the blackbodies is measured with an Absolute Cryogenic Radiometer. Plans will be discussed for future enhancement of the system allowing for measurement of spectral and angular distribution of the emitted radiation and possible experiments which could utilize the full capabilities of this system.

Comparison of Regular Transmittance Scales of Four National Standardizing Laboratories.
Final rept.
K. E. Eckerle, J. Bastie, J. Zwinkels, V. Sapritsky, and A. Ulyanov. 1993, 6p.
Pub. in COLOR Research and Application 18, n1 p35-40 Feb 93.

Keywords: *Transmittance, International, Interlaboratory comparisons, Spectrophotometers, Standardization, Optical filters, Uncertainty, Reprints.

A comparison of the regular spectral transmittance scales of the National Institute of Standards and Technology (USA), Institut National de Metrologie (France), National Research Council (Canada), and All-Union Research Institute for Optical and Physical Measurements (CIS) was accomplished using neutral glass filters with transmittances ranging from approximately 0.92 to 0.001. Storing the filters for almost four years produced no conclusive evidence of improvement over a previous interchange between NIST and three different national standardizing laboratories when the filters were stored for only 30 days. The agreement ranges from 0.01% to 0.3% depending on the laboratory and the filter used. This interchange is part of an ongoing effort to obtain international standardization.

A secondary standard silicon photodiode matched with a V-lambda filter was calibrated against primary standard, self-calibrated inversion layer silicon photodiodes, to achieve a high accuracy photometer, according to the new definition of the candela (the photometric base unit). The measured several percent/year specular spectral reflectance change of the windowless primary standard photodiodes was eliminated by their repeated self-calibration. This self-calibration also eliminated the measured several tenth of a percent/year spectral response change of the secondary standard silicon photodiode. The secondary standard detector could be a nonunity quantum efficiency light detector. The spectral response calibration of the V-lambda matched detector of medium spectral mismatch against the absolute spectral responses of three self-calibrated photodiodes resulted in a standard deviation of 0.17% in luminous flux (lumen) calibration. Also illuminance (lux) and light intensity (candela) calibrations were derived from the above primary photometric calibration. It is shown that the V-lambda matched photometer with the above spectral calibration can be used for accurate photometric measurements for all kinds of light sources of known spectral power distribution.

Pub. in Proceedings of International Conference on Laser Spectroscopy (10th), Font-Romeu, France, June 1991, p83-90 1992.

Keywords: *Laser stability, *Laser spectroscopy, High resolution, Beam cooling, Tunable lasers, Calcium, Silver, Reprints, Laser cooling.

Even if we propose using general, widely-tunable lasers for our ultra-resolution dream spectroscopy, we show that the S/N available from a cavity locking scheme is adequate to define sub-milliHertz laser linewidths. We prove that present External Stabilizer servo technology is adequate to track an error signal precisely enough that 97% of the emitted power lies within the narrow spectral feature defined by phase- or cavity-locking. Cavity stability of + or - 5 kHz for several weeks is documented, and efforts to eliminate the influence of laboratory vibrations are described. The paper concludes with a dream: application of these lasers to two delicious laser-cooled species, Ag and Ca.

Pub. in Optics Letters 18, n1 p19-21, 1 Jan 93.

Keywords: Near infrared radiation, Light amplifiers, Optical measurement, Doped materials, Erbium ions, Interferometry, Dispersion, Reprints, *Fiber amplifiers, Fourier transform spectroscopy, Group index.

We report the measurement of group index and dispersion in an erbium-doped fiber amplifier by Fourier transformation of low-coherence interferograms. In a germania-codoped fiber whose background dispersion was -14 ps/(km nm), we measured resonant gain-induced changes as high as 9 and -12 ps/(km nm) near 1.536 micrometers. The interferometric measurements agree with calculations based on a Kramers-Kronig transformation of absorption and emission spectra.

A free-electron laser (FEL) facility is being constructed at the National Institute of Standards and Technology (NIST) in collaboration with the Naval Research Laboratory (NRL). The FEL will be driven by the electron beam from the NIST racetrack microtron (RTM). The anticipated performance of the FEL is given. Initial operation of the FEL is scheduled for 1991. The NIST-NRL FEL will provide a powerful, tunable light source for research in biomedicine, materials science, physics, and chemistry.

The National Institute of Standards and Technology (NIST) and the Naval Research Laboratory (NRL) free electron laser (FEL) will use a 3.64-m hybrid undulator that is being constructed at Brobeck Division of Maxwell Laboratories. The undulator has a period of 2.8 cm, a variable gap with a 1.0-cm minimum, a peak magnetic field of 0.54 T, and a total number of periods of 130. The magnetic design uses SmCo permanent magnets and vanadium permendur pole pieces. Provision has been made to operate the undulator at half its length to enhance lasing at longer wavelengths. Remote control of gap and taper will permit on-line tuning of the wavelength. Vacuum chambers for both full and half length operation are available. The oval aperture of the vacuum chambers is 0.86 cm by 1.6 cm. A system to measure the magnetic field along the undulator is included in the structure. A full-scale, one-period model of the magnetic design has been tested and the results exceed specifications. The mechanical structure of the undulator is nearly complete as is the control system. Construction of the magnet assemblies is underway.

R. D. Jones, and T. R. Scott. 1992, 12p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Laser Energy Distribution Profiles: Measurement and Applications, Boston, MA., November 16-18, 1992, v1834 p60-71.

Keywords: *Laser beams, Statistical analysis, Reprints, Beam analysis, Round robins.

We present the results of a round robin in which six U.S. manufacturers of beam analysis instruments participated. Following a procedure recommended by the International Organization for Standardization (ISO), participants used a camera, pinhole, slit, or knife-edge to determine several parameters characterizing the beam of a common laser source. Their results and ours are displayed graphically and analyzed statistically. Agreement on beam width measurements is in a range around five percent relative standard deviation while significantly less agreement exists for other quantities calculated within the ISO procedure.

Normal-Incidence Complex-Index Refractometry.
Final rept.
R. D. Larrabee. 1992, 8p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Laser-Induced Damage in Optical Materials, v1848 p86-93 1992.

Keywords: *Refractive index, *Refractivity, *Optical measurement, Electromagnetic absorption, Optical materials, Optical prisms, Complex numbers, Reprints.

Traditional refractometry of bulk transmissive optical materials is usually restricted to the lossless case where the material can be completely characterized by a real index of refraction. This paper is concerned with the measurement of both the real and the imaginary parts of the index of refraction (i.e., including any loss) using a single prism-shaped specimen of homogeneous material. The normal-incidence configuration is analyzed and discussed in this paper because of its mathematical simplicity compared to the minimum-deviation configuration. The measurement of the imaginary part of the index of refraction (i.e. loss) is practical when the longest and shortest optical paths through the prism differ by an absorption length or more. The measurement of the real part of the index can ignore loss and still be accurate to better than one part per million if the power absorption length in the prism material is longer than 60 wavelengths in that material. An equation to determine the real part of the index of refraction is given when the loss must be taken into consideration.

Light Scattering from Glossy Coatings on Paper.
Final rept.
T. R. Lettieri, E. Marx, J. F. Song, and T. V. Vorburger. 1991, 9p.
Pub. in Applied Optics 30, n30 p4439-4447 1991.

Keywords: *Light scattering, *Surface roughness, *Coatings, Optical measurement, Laser radiation, Angular distribution, Autocorrelation, Texture, Pens, Reprints, Angle resolved scattering, Glossy paper.

The application of angle-resolved light scattering (ARLS) to the measurement of the surface roughness of coatings on glossy paper was investigated. To this end, ARLS patterns were measured for laser light scattered from several glossy paper samples, and these experimental patterns were compared to those calculated using a theoretical model based on plane-wave scattering from an isotropic, two-dimensional, rough surface. The calculated patterns were computed using, as input, mechanical stylus data for the rms roughnesses and the autocorrelation lengths of the coatings. For all of the paper samples measured, as well as for all of the incidence angles used, there was very good agreement between the experimental and the calculated patterns, indicating that ARLS may be used to determine the coating roughness parameters. As a check on these results, measurements were also made with a commercial optical surface probe; these data compared favorably with both the ARLS and the stylus results.

Autocorrelation Functions from Optical Scattering for One-Dimensionally Rough Surfaces.
Final rept.
E. Marx, B. Leridon, T. R. Lettieri, J. F. Song, and T. V. Vorburger. 1993, 10p.
Pub. in Applied Optics 32, n1 p67-76, 1 Jan 93.

Keywords: *Surface roughness, *Light scattering, One dimensional, Fourier transformation, Autocorrelation, Pens, Reprints, Angle resolved scattering, Fraunhofer approximation.

The relationship between the height autocorrelation function of a one-dimensionally rough surface and the Fourier transform of the intensity distribution of the light scattered by that surface is tested experimentally. The theory is derived by using the Fraunhofer approximation, without recourse to the inconsistent Kirchhoff boundary conditions. In spite of the limitations imposed by the approximations used, the results obtained from optical data agree well with those obtained from stylus data, even for an autocorrelation length as small as the optical wavelength. However, this method should be limited to surfaces with rms roughness smaller than approximately 0.14 times the wavelength of light.

Light Scattered by Coated Paper.
Final rept.
E. Marx, J. F. Song, T. V. Vorburger, and T. R. Lettieri. 1990, 9p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Optical Testing and Metrology III: Recent Advances in Industrial Optical Inspection, San Diego, CA., July 8-13, 1990, v1332 p826-834.

Keywords: *Light scattering, *Surface roughness, *Coatings, Optical measurement, Laser radiation, Angular distribution, Autocorrelation, Profiles, Pens, Reprints, Angle resolved scattering, Glossy paper.

Angle-resolved light scattering (ARLS) was used to investigate the roughness of coatings on glossy paper. The angular spectra were measured for laser light scattered from several glossy paper samples, and these spectra were compared to those calculated using the Beckman model of a surface that is isotropic, random, and rough in two dimensions. A surface was characterized by its rms roughness and autocorrelation function, which were determined from surface profiles measured with a stylus instrument. There was very good agreement between the measured and the computed spectra. The surfaces are too rough to produce a specular beam and we cannot get an accurate value of the rms roughness from the angular spectrum, but ARLS provides information about the coating roughness when the measured spectra are compared to computed ones.

Complex Propagation Constants for Nonuniform Optical Waveguides: Calculations.
Final rept.
R. L. Gallawa. 1993, 4p.
Pub. in Microwave and Optical Technology Letters 6, n8 p490-493, 20 Jun 93.

Keywords: *Optical waveguides, *Optical fibers, *Fiber optics, Refractive index, Light transmission, Planar structures, Galerkin method, Attenuation, Reprints, Hermite-Gauss functions, Basis functions.

A method of calculating the complex propagation constant of a planar optical waveguide under very general but weakly guiding conditions is derived. The method, based on Galerkin's formalism using Hermite-Gaussian basis functions, allows a nonuniform and complex refractive index profile. The real and imaginary parts of the index are allowed to vary independently and arbitrarily as a function of position. The planar waveguide is used so the results can be compared with exact solutions. The method is more general than this, however, and can be used with any geometry. The results are inherently stationary.

Fiber Spot Size: A Simple Method of Calculation.
Final rept.
R. L. Gallawa, I. C. Goyal, and A. K. Ghatak. 1993, 6p.
Pub. in Jnl. of Lightwave Technology 11, n2 p192-197 Feb 93.

Keywords: *Optical fibers, *Fiber optics, Sizes(Dimensions), Symbolic programming, Radiation patterns, Galerkin method, Far field, Algorithms, Reprints, Laguerre-Gauss functions, Spot size, Mode field diameter.

The ability to integrate the Laguerre-Gauss functions in closed form is exploited to allow a simple but accurate evaluation of single-mode fiber spot size using Galerkin's method. The method avoids the need for numerical integration in a broad class of refractive-index profiles. Its simplicity depends on the use of a pattern-matching algorithm to avoid the numerical integration normally called for. The algorithm is very fast and gives exact results. The development of symbolic computer languages makes this approach especially easy. We used a symbolic program to predict the spot size and the far-field radiation pattern and compared the results with the exact values, getting excellent results.

Modal Properties of Circular and Noncircular Optical Waveguides.
Final rept.
R. L. Gallawa, I. C. Goyal, and A. K. Ghatak. 1992, 26p.
Pub. in Fiber and Integrated Optics 11, p25-50 1992.

Keywords: *Optical waveguides, Circular configuration, Rectangular configuration, Trigometric functions, Variational methods, Orthogonal functions, Galerkin method, Wave equations, Reprints, Laguerre-Gauss functions, Hermite-Gauss functions, Basis functions, Modal analysis.

We give a review and a comparison of recent methods of analyzing circular and noncircular optical waveguides. Comparison among competing methodologies is made as follows: Galerkin's method is used with Laguerre-Gauss basis functions in circular geometry to examine the modal solution in a step index fiber, and comparison with the exact solution is made. A W-fiber, which has no exact solution, is then examined. Rectangular geometry is considered, and discussion centers on the use of Galerkin's method using trigonometric basis functions and Hermite-Gauss basis functions. The difficulty arising from the use of basis functions that do not decay exponentially for large argument (trigonometric functions) is illustrated. Finally, a square step index waveguide is used to illustrate a comparison between a variational method that uses the Gaussian approximation as the starting point, and Galerkin's method using Hermite-Gauss basis functions. We conclude that the variational method does well in predicting the propagation constant beta but does not do well in predicting the modal field.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers Frequency-Stabilized Lasers and Their Applications, Boston, MA., November 16-18, 1992, v1837 p146-153 1993.

Keywords: *Erbium glass lasers, *Frequency stability, *Frequency standards, Near infrared radiation, Infrared spectroscopy, Electron transitions, Rubidium 87, Stabilization, Optical communication, Laser spectroscopy, Reprints, *Wavelength standards, Fiber lasers, Laser cooling, Atom traps.

Spectroscopy of the rubidium 5P(3/2) --> 4D(5/2) transition near 1.529 micrometers has been performed using a single-longitudinal-mode erbium-doped fiber laser. Rubidium atoms were laser-cooled and confined in a vapor-cell Zeeman optical trap. This produced a dense sample of cold atoms and reduced the Doppler broadening of the transition to less than the natural linewidth. Transition linewidths of 10 MHz were observed on the 5P(3/2) --> 4D(5/2) transition and the fiber laser was actively stabilized to the 5P(3/2), F = 3 --> 4D(5/2), F' = 3 line of (87)Rb.

Approximate Solution to the Scalar Wave Equation for Optical Waveguides.
Final rept.
I. C. Goyal, R. L. Gallawa, and A. K. Ghatak. 1991, 5p.
Pub. in Applied Optics 30, n21 p2985-2989, 20 Jul 91.

Keywords: *Optical waveguides, *Wave equations, WKB approximation, Circular configuration, Planar structures, Integrated optics, Scalars, Reprints.

We consider an approximate solution to the wave equation appropriate to the optical waveguides encountered in practice. The refractive-index profile may be arbitrary, and the geometry may be two or three dimensional. A circular or a planar waveguide could thus be treated by this method. The technique is more accurate and more useful than the WKB method, which is often used in problems of this type, because the technique is valid even at the turning points, where the WKB solution fails. The fields and the propagation constraints of the lowest-order modes for two profiles are calculated, and they compare well with the exact solutions. The solutions that we proposed are, in fact, not new. However, insofar as we know, they are unknown and unused by the optics community.

Sub-Doppler Frequency Measurements on OCS at 87 Thz (3.4 micrometers) with the CO Overtone Laser: Considerations and Details.
Technical note.
A. Dax, J. S. Wells, L. Hollberg, A. G. Maki, and W. Urban. Jul 94, 34p, NIST/TN-1365.
Also available from Supt. of Docs. as SN003-003-03285-9. Prepared in cooperation with Bonn Univ. (Germany, F.R.). Inst. fuer Angewandte Physik.

Keywords: *Carbon oxysulfide, *Frequency measurement, Intermediate infrared radiation, Carbon monoxide lasers, Optical heterodyning, Electron transitions, Calibration standards, Frequency synthesizers, *Carbonyl sulfide, Polarization spectroscopy, Saturated absorption spectroscopy.

The authors have investigated two techniques for making sub-Doppler frequency measurements with the CO overtone laser. They studied three OCS transitions whose frequencies overlap either directly with CO (Delta)v=2 overtone transition frequencies or with the overtone lines after they have been shifted by an acousto-optic modulator. The authors have investigated both conventional saturated-absorption and an optical heterodyne polarization. While they eventually used the latter technique for their measurements, it is too cumbersome to use as a conventional laser stabilization tool. Saturation absorption is considerably simpler and has potential for a more accurate measurement, if some technical problems are overcome. This becomes more important in the light of a potential use of the CO (Delta)v=2P(sub 26)(9) transition in a new frequency chain. This transition was used for the OCS P(27) 10(sup 0)1-00(sup 0)0 measurement. Polarization spectroscopic techniques with optical heterodyne detection were used to observe the features and then to provide the discriminant for locking the overtone laser to the OCS transitions. A CO2 laser synthesizer was used for the frequency measurement basis.

Rare-Earth-Doped Waveguide Devices: The Potential for Compact Blue-Green Lasers.
Final rept.
N. A. Sanford, J. A. Aust, D. R. Larson, and K. J. Malone. 1992, 4p.
Pub. in Technical Digest Compact Blue-Green Lasers, Santa Fe, NM., February 20-21, 1992, p1-4.

Keywords: *Waveguide lasers, Lithium niobates, Doped materials, Electron transitions, Optical pumping, Visible radiation, Erbium, Reprints, *Blue green lasers, Titanium sapphire lasers.

Er-doped LiNbO3 channel waveguides produce efficient upconversion luminescence from two bands centered at 520 nm and 550 nm due to radiative decay from the doublet H(11/2) and quartet S(3/2) levels, respectively. The doping density of the rare earth was approximately 10(exp 19)/cu cm. Pumping experiments were performed near 800 nm and again near 970 nm with a cw Ti:sapphire laser. The excitation paths are given. The integrated luminescence efficiency, defined as the total visible output (guided and unguided) divided by the absorbed pump power in the waveguide, was approximately 1%. Laser action in the visible due to a single-wavelength pump appears to be prevented by parasitic nonradiative decay from the intermediate levels.

Linewidth Narrowing in an Imbalanced Y-Branch Waveguide Laser.
Final rept.
N. A. Sanford, J. A. Aust, K. J. Malone, and D. R. Larson. 1993, 3p.
Pub. in Optics Letters 18, n4 p281-283, 15 Feb 93.

Keywords: *Neodymium lasers, *Waveguide lasers, *Line narrowing, *Line width, Near infrared lasers, Optical pumping, Glass lasers, Reprints, Titanium sapphire lasers.

A Y-branch channel waveguide laser whose branch segments were mismatched in length by 2.4% was fabricated by electric-field-assisted ion exchange in Nd-doped, mixed alkali-silicate glass. The laser output wavelength was centered at 1057.3 nm, and the linewidth was 0.4 nm FWHM. Our similarly fabricated single-channel Fabry-Perot lasers and balanced Y-branch lasers display linewidths of 3-4 nm. Pumping was performed with a cw Ti:sapphire laser operating at 785 nm. The imbalanced Y-branch laser reached threshold with an absorbed pump power of 48 mW when a 2% transmitting output coupler was used. The slope efficiency was 2%. An extended cavity was used to imbalance the arms in a second laser by a ratio of 2.8:1. This device displayed a linewidth of approximately 3.7 GHz FWHM. The linewidth narrowing of these coupled-cavity lasers is analogous to that seen in a Michelson laser.

Pub. in Optics Letters 17, n22 p1578-1580, 15 Nov 92.

Keywords: *Neodymium lasers, *Waveguide lasers, Near infrared radiation, Lithium tantalates, Infrared lasers, Wafers, Reprints.

Waveguide lasers operating near 1092 and 1076 nm were fabricated in Z-cut Nd-Ti codiffused LiTaO3. The Nd diffusion was at 1400 C for 120 h. Samples from two wafers were examined. The Nd film starting thickness was 7 nm in wafer 1 and 15 nm in wafer 2. Ti stripes, 8-15 micrometers wide, were diffused at 1500 C for 4 h for wafer 1 (130-nm stripe thickness) and 2 h for wafer 2 (100-nm stripe thickness). Pumping was at 750 nm. Threshold occurred at 330 mW of absorbed pump power for the best waveguides from wafer 1 and 100 mW for the best waveguides from wafer 2. The slope efficiency of the latter was 0.07%.

Integrating Sphere Simulation: Application to Total Flux Scale Realization.
Final rept.
Y. Ohno. 1994, 11p.
Pub. in Applied Optics 33, n13 p2637-2647, 1 May 94.

Keywords: *Optical measurement, Computerized simulation, Ray tracing, Light sources, Calibration, Photometry, Lumens, Reprints, *Luminous flux, *Integrating spheres.

A method is proposed for realizing the total flux scale of light sources by use of an integrating sphere with an opening to introduce a known amount of flux from a luminous intensity standard or a spectral irradiance standard lamp placed outside the sphere. Computer simulations were made on several models of an integrating sphere, designed to compare the total flux of a test lamp inside the sphere with the flux introduced from an external source. The author describes the theory and algorithm of the simulation, presents the results of the simulation for varying conditions of sphere geometry such as size and location of the baffles, internal source, and wall reflectance, and predicts that one of the models has sufficient accuracy to calibrate lamps for total flux.

Pub. in Electronics Letters 28, n20 p1889-1891, 24 Sep 92.

Keywords: *Light amplifiers, *Optical measurement, Optical fibers, Planar structures, Refractive index, Erbium additions, Doped materials, Wave dispersion, Reflectometers, Silica, Reprints, Fourier transform spectroscopy, Group delay.

The group delay and dispersion, including the erbium ion contributions, of the highly erbium-doped silica planar waveguide amplifier and multicomponent glass fiber amplifiers are directly measured at different pump powers using a low coherence reflectometer and dispersive Fourier spectroscopy. This method derives the refractive index spectra of these amplifiers directly from the produced reflectograms without any physical or mathematical assumptions. The dispersion of the planar waveguide amplifier at 500 mW pumping changes between +300 and -200 ps/km/nm with a 0.4 wt % erbium concentration.

Use of Sum Rules on the Energy-Loss Function for the Evaluation of Experimental Optical Data.
Final rept.
S. Tanuma, C. J. Powell, and D. R. Penn. 1993, 15p.
Pub. in Jnl. of Electron Spectroscopy and Related Phenomena 62, p95-109 1993.

Keywords: *Optical data, *Sum rules, *Aluminum, *Iridium, *Molybdenum, *Silicon, *Titanium, *Tungsten, EV range 10-100, EV range 100-1000, Electron spectroscopy, Energy losses, Reprints, Energy loss functions.

We present an evaluation of optical data for Al, Si, Ti, Mo, W, and Ir based on two sum rules for the energy-loss function, the familiar f-sum rule and another sum rule based on a limiting form of the Kramers-Kronig integral. These sum rules were used to evaluate sets of energy-loss function data constructed first from tabulated optical data which have been supplemented by interpolations in the 40-100 eV range for Ti, Mo, W, and Ir. A second set of energy-loss function data was constructed for each material by substituting energy-loss function values calculated from the optical data of Windt et al. (Appl. Opt., 27(1988) 246, 279) in the 10-525 eV range. The deviations in the results of the sum-rule tests with the second set of optical data were about twice those found for the first set. We conclude that the first set of optical data is preferred over the second set.

T. V. Vorburger, E. Marx, and T. R. Lettieri. 1993, 8p.
Pub. in Applied Optics 32, n19 p3401-3408, 1 Jul 93.

Keywords: *Surface roughness, *Light scattering, *Optical measurement, Directional measurement, Angular distribution, Fourier transformation, Autocorrelation, Reflectance, Reprints, Angle resolved scattering.

In this paper we summarize a number of previous experiments on the measurement of the roughness of metallic surfaces by light scattering. We identify several regimes that permit measurement of different surface parameters and functions, and we establish approximate limits for each regime. Using a straightforward criterion, we calculate that the smooth-surface regime, in which the angular distribution of scattered light is closely related to the power spectral density of the roughness, ranges over 0 < sigma/lambda approx = or < 0.05, where sigma is the rms roughness and lambda is the optical wavelength. Above that, the surface autocorrelation function may be calculated from a Fourier transform of the angular distribution over 0 < sigma/lambda approx = or < 0.14. Then comes the specular regime where the specular beam can still be identified and measured over 0 < sigma/lambda approx = or < 0.3. For all of these regimes and for rougher surfaces too, the rms width of the scatter distribution is proportional to the rms slope of the surface.

Keywords: *Optical materials, *Crack propagation, *Water erosion, *Moisture, Environment effects, Fracture properties, Fatigue(Materials), Sensitivity, Zinc sulfides, Silicon dioxide, Titanium dioxide, Glass, Reprints.

A number of optically important materials such as ZnS, SiO2, SiO2-TiO2, GaAs, and heavy metal fluoride (e.g., ZBLAN) glasses are subject to moisture- and/or liquid water-induced crack growth. A notable exception to this behavior appears to be Si. Such environmentally enhanced crack growth can lead to ultimate failure in service at stresses well below those expected from normal strength tests. The sensitivity of a material to water can be obtained by determining a crack growth parameter, N. This parameter can be combined with other easily obtainable fracture information which include measures of the strength and strength distribution to create a lifetime design diagram using fracture mechanics concepts. Methods for determining these fracture parameters including direct crack growth measurements and dynamic fatigue are reviewed, and the influence of environmental water on the materials is discussed. Crack growth mechanisms including physical (dielectric) and chemical reaction mechanisms are discussed, and lifetime design diagrams which can be used to determine stress levels in service are presented.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Frequency-Stabilized Lasers and Their Applications, Boston, MA., November 16-18, 1992, v1837 p2-15 1993.

Keywords: *Laser stability, *Frequency stability, Atomic clocks, Frequency standards, Laser spectroscopy, Laser cavities, High resolution, Uses, Reprints, Atomic interferometry, Atom traps.

This article is meant to serve as a useful introduction to the art of stabilized lasers, especially for those who are entering this activity from other fields. With the current explosion of interest in atom trapping techniques, we can look forward to major progress in the narrow-line laser/super-sharp absorber high resolution spectroscopy business. Applications range from atomic clocks to cold atom collision physics to tests of special relativity. The combination of ultra-stable lasers with cold atom interferometry will be especially powerful in offering new tests of atomic charge neutrality and of time reversal invariance via new limits on atomic electric dipole moments. Remarkably, a practical instrument for oil and gas prospecting might be based on a laser-diode/atom-interferometric measurement of local 'g'.

Bending-Induced Phase Shifts in Dual-Mode Planar Optical Waveguides.
Final rept.
A. Kumar, and R. L. Gallawa. 1993, 3p.
Pub. in Optics Letters 18, n17 p1415-1417, 1 Sep 93.

Keywords: *Optical waveguides, *Bending, Refractive index, Phase shift, Planar structures, Dual mode, Reprints, Waveguide sensors.

We examine the manner in which the effective index for each of the two modes of a bent dual-mode planar waveguide changes with curvature. We find that the bending-induced changes in the effective indices depend strongly on core-cladding index contrast and the value of V. For waveguides with large contrast, the changes in effective indices are such that the change in the phase difference between the modes is positive (or negative) at large (or small) values of V. The change becomes zero at a V value that depends on the waveguide parameters and curvature. If the index contrast is small, the bending-induced phase difference may change sign with increase in curvature. This might help in ultimately explaining the bipolar phase shift seen in a recent experiment. The results of our study can be used to increase or decrease the bending sensitivity of dual-mode optical-waveguide sensors and devices.

Optical Fiber Geometry by Gray-Scale Analysis with Robust Regression.
Final rept.
L. Mamileti, C. M. J. Wang, M. Young, and D. F. Vecchia. 1992, 4p.
Pub. in Applied Optics 31, n21 p4182-4185, 20 Jul 92.

Keywords: *Optical fibers, *End effects, *Image analysis, Elliptical configuration, Regression analysis, Fiber optics, Geometry, Reprints, Gray scale.

We have used least-median-of-squares (LMS) regression to analyze gray-scale images of optical fiber ends. This regression is a form of robust regression that ignores outlying data points. We fitted ellipses to the images of each of two fiber ends by using LMS and least-sum-of-squares regression. The two methods yielded nearly identical results on a pristine fiber end, but the LMS method was far superior on a damaged fiber end, even though we made no effort to filter the outlying data points.

Detector-Based Candela Scale and Related Photometric Calibration Procedures at NIST.
Final rept.
Y. Ohno, C. L. Cromer, J. E. Hardis, and G. Eppeldauer. 1994, 10p.
Pub. in Jnl. of the Illuminating Engineering Society, p89-98 1994.

Keywords: *Calibration, *Accuracy, *Luminosity, *Photometers, Light sources, Lumens, Detectors, Uncertainty, Standards, Luminous intensity, Spectrum analysis, Luminance, Illuminance, Flux density, Reprints, *Candela scale.

The candela scale, one of the SI base units, has been realized by using absolutely calibrated detectors rather than sources. A group of eight photometers were constructed using silicon photodiodes, precision apertures, and glass filters for V(lambda) match. Their absolute spectral responsivities were calibrated against the NIST absolute spectral responsivity scale. The measurement chain has been significantly shortened compared with the old scale based on a black body. This resulted in improving the calibration uncertainty to be 0.46% (2 sigma), a factor-of-2 improvement. This revision has made various photometric calibrations at NIST more versatile and flexible. Luminous intensity of light sources, ranging from 10(exp -3) to 10(exp 4) candelas, is directly calibrated with the standard photometers which have a linear response over that range. Illuminance meters are calibrated directly against the standard photometers. The luminance scale has also been realized on the detector base using an integrating sphere source. The total flux ranging from 10(exp -2) to 10(exp 5) lumens can be measured in a 2m integrating sphere using a photometer of the same design. These revisions accompanied significant improvement of the calibration accuracy.

Pub. in Review of Scientific Instruments 65, n1 p42-48 Jan 94.

Keywords: *Spectrometers, *Calibration, Continuous radiation, Difference frequency, Molecular spectra, Near infrared radiation, Intermediate infrared radiation, Helium neon lasers, Argon lasers, Ring lasers, Dye lasers, Frequency stability, Reprints, Transfer cavities.

A novel, simple, and inexpensive calibration scheme for a continuous-wave difference frequency spectrometer is presented, based on the stabilization of an open transfer cavity by locking onto the output of a polarization stabilized HeNe laser. High frequency, acoustic fluctuations of the transfer cavity length are compensated with a piezoelectric transducer mounted mirror, while long term drift in cavity length is controlled by thermal feedback. A single mode Ar(1+) laser, used with a single mode ring dye laser in the difference frequency generation of 2-4 micrometers light, is then locked onto a suitable fringe of this stable cavity, achieving a very small long term drift and furthermore reducing the free running Ar(1+) linewidth to about 1 MHz. The dye laser scan provides tunability in the difference frequency mixing process, and is calibrated by marker fringes with the same stable cavity. Due to the absolute stability of the marker cavity, precise frequency determination of near infrared molecular transitions is achieved via interpolation between these marker fringes. It is shown theoretically that the residual error of this scheme due to the dispersion of air in the transfer cavity is quite small, and experimentally that a frequency precision on the order of 1 MHz per hour is routinely obtained with respect to molecular transitions.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: X-ray/EUV Optics for Astronomy, Microscopy, Polarimetry, and Projection Lithography, San Diego, CA., July 9-13, 1990, v1343 p274-282 1991.

Keywords: *Optical coatings, *Reflectance, Extreme ultraviolet radiation, Comparative evaluations, Optical measurement, Soft x-rays, Reflectometers, Molybdenum, Silicon, Reprints, Multilayers, X-ray mirrors, Systematic errors.

The reflectance of seven Mo/Si multilayer coatings made at AT&T Bell Labs and at Lawrence Livermore National Laboratories (LLNL) have been measured using three different reflectometers, in order to determine whether reflectance measurements made using different reflectometers yield consistent results. By comparing the deduced adjustable parameters used to fit the measured reflectances with those calculated from a model based on recursive application of the modified Fresnel equations, we conclude that the measurements made with the three reflectometers are inconsistent. We attribute the discrepancies to systematic measurement errors, including those associated with the spectral purity of the incident radiation.

Mode Coupling and Loss on Tapered Optical Waveguides.
Final rept.
R. L. Gallawa, A. Kumar, and A. Weisshaar. 1994, 3p.
Pub. in Proceedings of Integrated Photonics Research Topical Meeting, San Francisco, CA., February 17-19, 1994, p57-59.

Keywords: *Optical waveguides, *Dielectric waveguides, Coupled modes, Galerkin method, Approximation, Tapering, Reprints.

Tapered dielectric waveguides have been analyzed using a variety of methods including coupled mode theory, a step tapered configuration, a method that uses a ray-optics model, and the beam propagation method. We also use a step taper approach, approximating the smooth taper with a series of discrete steps. Our method accounts for the interaction between modes and is capable of tracking the propagation through the taper by using an expansion of the field on each side of the step; we use basis functions that are known to approximate the field very accurately. Integration is avoided in evaluating the coupling efficiency across the step.

Symbolic Programming with Series Expansions: Applications to Optical Waveguides.
Final rept.
R. L. Gallawa, A. Kumar, and A. Weisshaar. 1994, 7p.
Pub. in Proceedings of Annual Review of Progress in Applied Computational Electromagnetics (10th), Monterey, CA., March 21-26, 1994, p475-481.

Keywords: *Optical waveguides, *Optical fibers, *Symbolic programming, Series expansion, Approximation, Eigenvalues, Eigenvectors, Reprints, Single mode fibers.

We discuss the utility of symbolic computer languages in the context of optical fiber analysis. The symbolic Mapping command, for example, is useful whenever a series expansion approach is used in eigenvalue problems if the basis functions are integrable in closed form. We show how this command allows a simple but accurate evaluation of single-mode fiber parameters in most cases of practical interest. The Replacement command is also demonstrated in tracking the variation of fiber operational parameters as a function of the V-parameter. The saving in CPU time is substantial.

Improved Variational Analysis of Inhomogeneous Optical Waveguides Using Airy Functions.
Final rept.
I. C. Goyal, R. L. Gallawa, and A. K. Ghatak. 1993, 4p.
Pub. in Jnl. of Lightwave Technology 11, n10 p1575-1578 Oct 93.

Keywords: *Optical waveguides, Variational methods, Airy function, Planar structures, Light transmission, Approximation, Inhomogeneity, Eigenvalues, Reprints.

Variational trial fields that are based on modified Airy functions are proposed to obtain the propagation characteristics of inhomogeneous planar optical waveguides. We compare with other recently proposed trial fields to demonstrate the improved accuracy obtained through the use of these Airy function trial fields. The probable reason that the proposed fields are better suited than others is that, unlike the others, they depend on the profile shape. The argument of the Airy function trial field is also sensitive to the rate of change of the profile. The fields are thus better matched to the exact field, improving the variational results.

Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Proceedings of the International Conference on Lasers '93, Lake Tahoe, NV., December 6-9, 1993, p412-419 1994.

Keywords: *Optical interference, *Light scattering, Trapped particles, Laser radiation, Mercury ions, Ion storage, Photon-atom collisions, Quantum mechanics, Quantum optics, Reprints, Polarization dependence, Laser cooling, Atom traps, Complementarity.

We have observed interference fringes, like those in Young's classic experiment, in the laser light scattered by two trapped atoms. The interference fringes are present only in one polarization of the scattered light. The polarization dependence is related to the complementarity principle, which forbids the simultaneous observation of wave-like and particle-like aspects of light. The interference fringes are due to processes in which a single photon scatters from two atoms. We describe methods which might be used to observe other interference effects due to two photons scattering from two atoms.

Widths and Propagation of a Truncated Gaussian Beam.
Final rept.
R. D. Jones, and T. R. Scott. 1994, 12p.
Pub. in Proceedings of Workshop on Laser Beam Characterization (2nd), Berlin, Germany, May 30-June 1, 1994, p161-172.

Keywords: *Laser beams, Light transmission, Beam profiles, Near field, Far field, Slits, Irradiance, Truncation, Reprints, Gaussian beams, Beam divergence.

We calculated irradiance profiles resulting from the truncation of a gaussian beam by hard-edged slits transmitting 95 or 99 percent of the incident power. Three definitions--second moment, slit, and knife edge--were used to obtain widths of the near and far field profiles. From these widths, we calculated the propagation factors of the beam, with and without a lens. Second moment widths are indeterminate, due to their dependence on the extent of integration. Scanning slit and knife-edge widths are measurable, but do not, in general, fit the hyperbolic propagation equation. Least-squares fits of the measurements can result in propagation factors better than the ideal limit. Beam divergence values calculated from single beam width measurements, or from least-squares fits of many data, differ by several percent.

Bending-Induced Loss in Dual-Mode Rectangular Waveguides.
Final rept.
A. Kumar, and R. L. Gallawa. 1994, 3p.
Pub. in Optics Letters 19, n10 p707-709, 15 May 94.

Keywords: *Optical waveguides, Rectangular waveguides, Elliptical configuration, Dual mode, Reprints, Bending losses.

We examine how the bending-induced mode losses in a dual-mode rectangular-core waveguide vary with bend orientation. Bending about the minor axis (case (i)) and bending about the major axis (case (ii)) are considered. The second (LP(11)) mode is more lossy in case (i) than in case (ii), while the reverse is true for the first (LP(01)) mode. Further, in case (i) the LP(11)-mode loss is larger than than LP(01)-mode loss, but in case (ii) the LP(01)-mode loss is, surprisingly, larger than the LP(11)-made loss. LP(11)-mode loss is consistent with the recent experimental results. This study should be useful in designing efficient elliptical-core fiber components such as LP(11)-mode strippers based on differential mode loss of the first two modes.

Bent Rectangular Core Waveguides: An Accurate Perturbation Approach.
Final rept.
A. Kumar, and R. L. Gallawa. 1994, 5p.
Pub. in Microwave and Optical Technology Letters 7, n6 p281-285, 20 Apr 94.

Keywords: *Dielectric waveguides, *Optical waveguides, *Optical fibers, Rectangular waveguides, Perturbation theory, Waveguide bends, Reprints.

We discuss a method of evaluating the effective indices of quasi-modes of a bent rectangular core waveguide taking into account the correct dielectric constant of the corner regions, which is ignored in earlier methods. At small bend curvatures and low V values, the corner regions contribute much more to the effective index change than the bending itself. (Copyright(c) 1994 John Wiley & Sons, Inc).

Tilt Effects in Optical Angle Measurements.
Y. H. Oueen. 1994, 12p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n5 p593-604 Sep/Oct 94.

Keywords: *Calibrating, *Angles(Geometry), *Collimators, Tilt, Errors, Vector analysis, Tests.

Vector analysis is used to determine the quantitative error in angle calibration using autocollimators. This error is caused by tilt in the mount upon which the artifact is placed. For tilt angles that are less than 1 degree, the error can be simplified to be the product of a coefficient and three terms. The three terms are: (1) the square of the tilt, (2) the sine of the artifact's nominal angle, and (3) the cosine of the artifact's nominal angle plus two times the artifact's position angle. It is shown that the error can be eliminated by placing the artifact at designated periodic positions.

Keywords: *Optical fibers, *Transmission loss, *Refractive index, Galerkin method, Complex numbers, Fiber optics, Attenuation, Computation, Reprints.

A method of calculating the attenuation constant of an optical fiber under very general but weakly guiding conditions is derived. The method, based on Galerkin's formalism, allows a nonuniform and complex refractive-index profile. The real and imaginary parts of the refractive index are allowed to vary independently and arbitrarily as a function of radius. The result is the predicted complex propagation constant. The results are inherently stationary.

Fibre Splice Loss: A Simple Method of Calculation.
Final rept.
R. L. Gallawa, A. Kumar, and A. Weisshaar. 1994, 8p.
Pub. in Optical and Ouantum Electronics 26, pS165-S172 1994.

Keywords: *Optical fibers, *Transmission loss, *Splices, Galerkin method, Fiber optics, Computation, Splicing, Eigenvectors, Reprints, Single mode fibers.

We evaluate the loss encountered when splicing between two circular single-mode fibers with unmatched parameters. Our method represents a significant improvement in simplicity over other methods, with only an insignificant degradation of accuracy. We use Galerkin's method, but expand the field of both fibers in terms of the same set of basis functions, leading to considerable simplicity: the overlap integral is simply the inner (dot) product of the eigenvectors. Integration is thus avoided. We assume that weakly guiding conditions prevail.

Improved Rubidium Frequency Standards Using Diode Lasers with AM and FM Noise Control.
Final rept.
C. Szekely, and R. E. Drullinger. 1992, 7p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Frequency-Stabilized Lasers and Their Applications, Boston, MA., November 16-18, 1992, v1837 p299-305.

Keywords: *Rubidium frequency standards, *Frequency standards, Semiconductor lasers, Optical pumping, Noise reduction, Reprints.

Diode-laser-pumped, rubidium cell frequency standards have potential short-term stability that is vastly better than their lamp-pumped counterparts. However, AM and FM noise in monolithic laser diodes limit their performance. With extended-cavity, grating-feedback diode lasers, the AM and FM noise can be controlled. In the preliminary work reported here, we have used such a laser to make measurements in two different rubidium cell systems. Measured line Q and signal-to-noise ratios corresponding to sigma(sub y)(tau) = 4 X 10(exp -13) tau(sup -1/2) in a commercial, buffer gas type standard and sigma(sub y)(tau) = 2 X 10(exp -13) tau(sup -1/2) in an evacuated, wall-coated cell are demonstrated. We believe both of these numbers can be improved significantly in a fully engineered and optimized standard.

Rayleigh Scattering Limits for Low-Level Bidirectional Reflectance Distribution Function Measurements.
Final rept.
C. Asmail, J. Hsia, A. Parr, and J. Hoeft. 1994, 8p.
Pub. in Applied Optics 33, n25 p6084-6091, 1 Sep 94.

Keywords: *Light scattering, *Rayleigh scattering, Optical measurement, Optical paths, Angular distribution, Surfaces, Nitrogen, Helium, Air, Reprints, *Bidirectional scattering distribution functions, *BSDF(Bidirectional Scattering Distribution Function).

The objective is to estimate the Rayleigh limit in bidirectional reflectance distribution function (BRDF) measurements caused by air in the laboratory, the wavelength, and the path length of light in the receiver field of view. Moreover, we intend to show the trend for the reduction of this limit by introducing a medium with small refractive index and by using a longer wavelength. Although the BRDF typically describes the angular distribution of scattered light from surfaces, the expression describing the equivalent BRDF caused by the optical scattering from gas molecules in the optical path is derived through the use of the Rayleigh scattering theory. The instrumentation is described, and the experimental results of the equivalent BRDF caused by gas scattering from molecules in clear air, nitrogen, and helium gases are reported. These results confirm the trends of the prediction.

Passively Q-Switched Nd-Doped Waveguide Laser.
Final rept.
J. A. Aust, K. J. Malone, D. L. Veasey, N. A. Sanford, and A. Roshko. 1994, 3p.
Pub. in Optics Letters 19, n22 p1849-1851, 15 Nov 94.

Keywords: *Waveguide lasers, *Neodymium lasers, Solid state lasers, Q switched lasers, Infrared lasers, Glass lasers, Near infrared radiation, Intergrated optics, Reprints.

A passively Q-switched waveguide laser operating at 1.054 micrometers has been demonstrated in a Nd-doped phosphate glass. The channel waveguide was fabricated by K-ion exchange from a nitrate melt. Passively Q-switched pulses were achieved by placement of an acetate sheet containing an organic saturable-absorbing dye within the laser cavity. The resulting pulse train consisted of pulses with a FWHM of about 25 ns and peak powers of 3.04 W. With an 80% transmitting output coupler, cw operation of the laser provided a 5.2 mW of output power at 1.054 micrometers for 229 mW of absorbed 794-nm pump power.

Broadband High-Optical-Density Filters in the Infrared.
Final rept.
A. Frenkel, and Z. M. Zhang. 1994, 3p.
Pub. in Optics Letters 19, n18 p1495-1497, 15 Sep 94.

Keywords: *Infrared filters, Intermediate infrared radiation, Near infrared radiation, Cadmium tellurides, Zinc selenides, Metal films, Thin films, Substrates, Broadband, Reprints, Lexan(Trademark), Multilayers.

A new concept for the design of broadband (2-25 micrometers and beyond) neutral-density filters in the infrared region without etaloning effects is proposed and demonstrated. One important aspect of the technique is to use metallic-thin-film (10-200-nm-thick) multilayer combinations deposited onto different substrates (ZnSe, CdTe, Lexan). Neutral-density filters with optical densities as high as 4 are designed and built in the broadband region (2-25 micrometers). Another key innovation is the use of ultrathin substrates (about 100 nm thick) for elimination of etaloning effects normally present in thick (>0.5-mm) substrates. Neutral-density filters with such ultrathin substrates are also designed and investigated.

Error Propagation in Laser Beam Spatial Parameters.
Final rept.
R. D. Jones, and T. R. Scott. 1994, 10p.
Sponsored by Army Test Measurements and Diagnostic Equipment Activity, Redstone Arsenal, AL.
Pub. in Optical and Quantum Electronics 26, p25-34 1994.

Keywords: *Laser beams, Light transmission, Beam profiles, Spatial distribution, Semiconductor lasers, Error analysis, Uncertainty, Reprints, Beam analysis.

We have performed a propagation-of-errors analysis on two methods used to determine the spatial parameters of a laser beam. We measured diameters of a diode laser beam focused by a 993 mm focal length lens. Measurement uncertainties of less than 1% can result in uncertainties greater than 200% in locating the beam waist of the laser. We compare the inherent uncertainties in the spatial parameters as obtained by the two methods. Longer focal length lenses and lens position can reduce this magnification of uncertainty, but would require large propagation distances.

Modal Characteristics of Bent Dual Mode Planar Optical Waveguide.
Final rept.
A. Kumar, R. L. Gallawa, and I. C. Goyal. 1994, 4p.
Pub. in Jnl. of Lightwave Technology 12, n4 p621-624 Apr 94.

Keywords: *Optical waveguides, *Waveguide bends, Planar structures, Modal response, Dual mode, Bending, Reprints.

Modal characteristics of bent dual-mode planar optical waveguides are obtained. The bending-induced changes in the modal power distribution is found to be quite different for the two modes. Surprisingly, unlike the fundamental mode, bending causes the fractional modal power for the second mode to increase in the inner core-half and to decrease in the outer core-half of the waveguide. Interestingly, this leads to a decrease in effective index of the second mode due to bending at sufficiently high V-values.

Improved Molecular Constants and Frequencies for the CO2 Laser from New High-J Regular and Hot-Band Frequency Measurements.
Final rept.
A. G. Maki, C. C. Chou, K. M. Evenson, L. R. Zink, and J. T. Shy. 1994, 14p.
Pub. in Jnl. of Molecular Spectroscopy 167, p211-224 1994.

Keywords: *Carbon dioxide lasers, *Frequencies, Intermediate infrared radiation, Frequency measurement, Electron transitions, Carbon 12, Carbon 13, Oxygen 16, Oxygen 18, Reprints, Molecular constants.

New frequencies are given for the (12)C(16)O2, (13)C(16)O2, (12)C(18)O2, and (13)C(18)O2 regular band laser transitions and for the hot-band transitions of (12)C(16)O2. These frequencies are based on a new least-squares analysis of all of the frequency measurements of these four molecular species including new high-J measurements reported here and recent absolute frequency measurements. Fourteen new high-J transitions of the regular (12)C(16)O2 laser bands have been observed, the lasers have been stabilized with sub-Doppler saturated 4.3-micrometer fluorescence, and their frequencies have been measured. Nine of these transitions fill the gap between the 9.4- and 10.4-micrometer bands. New frequency measurements are reported for 84 hot-band lines, which were also included in the reanalysis of the CO2 laser transitions.

Stabilization of 3.3 and 5.1 m Lead-Salt Diode Lasers by Optical Feedback.
Final rept.
M. Murtz, M. Schaefer, M. Schneider, U. Schiessl, M. Tacke, J. S. Wells, and W. Urban. 1992, 6p.
Sponsored by National Aeronautics and Space Administration, Washington, DC. Upper Atmospheric Research Program.
Pub. in Optics Communications 94, n6 p551-556 1994.

Keywords: *Semiconductor lasers, *Laser stability, Intermediate infrared radiation, Lead inorganic salts, Frequency stability, Line narrowing, Molecular spectroscopy, Infrared lasers, Tunable lasers, Feedback, Reprints.

Optical stabilization of tunable lead-salt diode lasers (TDL) in the mid-infrared is presented for the first time. By introducing an external feedback mirror both the linewidth is substantially narrowed and the frequency of the TDL is stabilized and controlled via this mirror in a frequency-offset locked scheme. We achieved narrowing of the linewidth by 1-2 orders of magnitude or better. The TDL is offset-locked to a CO gas laser by a heterodyne technique: the beatnote between the two lasers is used to control the length of the external resonator. By this scheme we gain the capability of absolute frequency measurements with sub-Doppler accuracy. The improved spectral properties of the diode laser provide a new tool for high-resolution molecular spectroscopy in the mid-infrared.

Sponsored by Department of Energy, Washington, DC.
Pub. in Jnl. of the Optical Society of America B 11, n10 p1930-1934 Oct 94.

Keywords: *Iron ions, *Ultraviolet spectra, Laser-produced plasma, Multicharged ions, Tokamak devices, Electron transitions, Extreme ultraviolet radiation, Line spectra, Energy levels, Reprints, *Lithium-like ions.

Spectra of highly ionized iron were generated in a laser-produced plasma and a tokamak. In the spectra from the laser-produced plasma, new lines of Fe(23+) were observed that were identified as 3s-4p, 3p-4d, and 3d-4f transitions. The measured wavelengths of these lines were combined with measurements of the 2s-2p resonance lines measured in the tokamak plasma and with earlier measurements of n = 2 to n = 3 transitions to yield an improved system of energy levels for Fe(23+). The measured wavelengths are compared with ab initio theoretical values calculated with a Dirac-Fock code. With the 4f energy levels, which are nearly hydrogenic, an improved ionization energy of 16,503,000 + or - 1400/cm (2046.11 + or - 0.17 eV) was determined.

Antenna-Coupled High-Tc Air-Bridge Microbolometer on Silicon.
Final rept.
J. P. Rice, E. N. Grossman, and D. A. Rudman. 1994, 3p.
Pub. in Applied Physics Letters 65, n6 p773-775, 8 Aug 94.

Keywords: *Bolometers, Temperature range 0065-0273 K, High temperature superconductors, Superconducting devices, Infrared detectors, Reprints, *Microbolometers, Silicon substrates.

An antenna-coupled high-T(c) superconducting microbolometer on a silicon substrate, operating at infrared wavelengths, is described. This detector incorporates a silicon-micromachined yttria-stabilized zirconia air bridge at the feed of a planar lithographic antenna to simultaneously minimize the thermal conductance and the heat capacity of the bolometer. At an operating temperature of 87.4 K, the optical responsivity measured using a 300-K blackbody source over a 0.2-2.9 THz bandwidth is 2900 V/W, the optical noise-equivalent power (NEP) is 9 X 10(exp -12) W/Hz(exp 1/2), and the time constant is <10 microsec. This NEP is nearly a factor of 2 lower than the previous record for a liquid-nitrogen-cooled thermal detector, and the time constant is several orders of magnitude shorter.

Pub. in Jnl. of Heat Transfer 116, p993-998 Nov 94.

Keywords: *Infrared radiometers, *Radiometers, Finite element method, Resistance thermometers, Temperature sensors, Superconducting devices, Cryogenic temperature, Recommendations, Germanium, Reprints.

This work consists of a detailed thermal modeling of two different radiometers operated at cryogenic temperatures. Both employ a temperature sensor and an electrical-substitution technique to determine the absolute radiant power entering the aperture of a receiver. Their sensing elements are different: One is a germanium resistance thermometer, and the other is a superconducting kinetic-inductance thermometer. The finite element method is used to predict the transient and steady-state temperature distribution in the receiver. Recommendations are given based on the modeling for future improvement of the dynamic response of both radiometers.

An efficient method for generation of high energy pulsed infrared light between 0.9 and 1.5 micrometers is described. The technique uses difference frequency mixing of pulsed, visible dye and Nd:YAG laser light in a 10 mm long BBO crystal. Quantum efficiencies of up to 23% and infrared pulse energies up to 4.5 mJ are demonstrated. The low shot-to-shot fluctuations of difference frequency generation in BBO make this technique an attractive alternative to the conventional optical parametric oscillator or Raman shifting methods that are currently used to access this spectral region.

Pub. in Optics Communications 111, p331-337 1994.

Keywords: Four wave mixing, Optical pumping, Blue(Color), Pulsed lasers, Dye lasers, Strontium, Vapors, Reprints, *Cone emission.

Strontium vapor is pumped by an unfocused, single-mode, pulsed dye laser tuned near the 461 nm resonance transition. With blue laser detuning the previously reported red-shifted conical emission is present. We simultaneously resolve in angle and in frequency the emissions from this intense, near-resonant pumping of a 'two-level' atom. This quantitative spectral and angular discrimination provides uniquely detailed measurements and demonstrates a serious lack of understanding of this highly nonlinear phenomenon.

Pub. in Optical Materials 3, p209-216 1994.

Keywords: *Optical fibers, *Radiation effects, *Fluorescence, Near ultraviolet radiation, Refractive index, Germanium additions, Boron additions, Doped materials, Blue(Color), Silica, Reprints, Bragg gratings.

We exposed optical fibers to UV light and simultaneously measured the intensity of the blue fluorescence from the fiber core. Two silica glass fibers with different core dopants were investigated: a germanium-doped fiber and a germanium-boron-codoped fiber. The fibers were exposed transversely to pulsed or continuous-wave 244 nm light for times ranging from a few minutes to over an hour. For all UV intensities and exposure times used, the fluorescence decreased during UV exposure. For a given fiber, the fractional decrease in fluorescence seen from the side of the fiber was dependent only on the total UV fluence.

Frequency Shifting of Pulsed Narrow-Band Laser Light in a Multipass Raman Cell.
Final rept.
R. Sussmann, T. Weber, E. Riedle, and H. J. Neusser. 1992, 7p.
Pub. in Optics Communications 88, p408-414 1992.

Keywords: *Laser radiation, *Frequency shift, *Raman effect, Molecular spectroscopy, High resolution, Light sources, Light pulses, Optical pumping, Carbon dioxide, Hydrogen, Benzene, Narrowband, Reprints.

A multipass cell is described which allows efficient stimulated Raman frequency shifting for low pump laser intensities and low gas pressures. The latter is important for Raman shifting of narrow-band Fourier-transform limited light pulses (Delta nu = 75 MHz). It is shown that frequency broadening of the Raman shifted light can be largely avoided in the Dicke narrowing regime at low pressures. For 75 MHz pump pluses and an H2 density of 2.5 amagat, we found a negligible broadening to 90 MHz of the stimulated Stokes light. This is far below the value of 250 MHz expected from spontaneous emission. The narrow-band Stokes pulses achieved in CO2 enabled us to measure the pressure shift coefficient (-0.71 X 10(sup -2)/cm/amagat) of this gas. It is demonstrated, for the example of benzene, that our technique provides a very practical light source for high resolution molecular spectroscopy.

Sponsored by National Science Foundation, Washington, DC.
Pub. in Physical Review A 45, n11 p8095-8109, 1 Jun 92.

Keywords: *Resonance fluorescence, Parametric oscillators, Excitation, Reprints, Squeezed light.

Resonance fluorescence from a single two-level atom driven by a beam of squeezed light is studied in the weak-field limit. We consider the situation where the atom is coupled to the ordinary vacuum and only a few field modes corresponding to the driving field are squeezed. The field produced by the degenerate optical parametric oscillator is used as the driving field. Heisenberg equations of motion are solved in the steady-state and analytic expressions for the fluorescent-light intensity and the spectrum of fluorescent light are derived. We also consider photon statistics of fluorescent light. In particular, squeezing, antibunching, and sub-Poissonian statistics of fluorescent photons are discussed, and analytic expressions for the quadrature variance and the two-time intensity correlation function are presented. Contrary to the case of coherent excitation, the second-order intensity correlation function does not factorize. This and other differences are discussed, and curves are presented to illustrate the behavior of various quantities. We also present results for thermal excitation of the atom.

See also Part 2, PB95-203592. Sponsored by National Science Foundation, Washington, DC.
Pub. in Physical Review A 46, n5 p2903-2924, 1 Sep 92.

Keywords: Four wave mixing, Resonance fluorescence, Laser pumping, Quantum theory, Light transmission, Reprints, *Cone emission.

This is the first of a series of papers on the theory of cone emission from a laser-pumped two-level atomic medium. Starting from microscopic quantum theory for both the active medium and the field, equations for the slowly varying macroscopic quantities are derived. In the steady-state limit, which experimentally corresponds to cw excitation, we find that the sources for the paraxial fields of interest have a long coherence length despite the random nature of spontaneous emission. These radiation sources enter into the equations for the fields in the same form as the source generated by four-wave mixing and therefore may be considered as a 'spontaneous four-wave mixing,' since the photons emitted in the Rabi sidebands are correlated. This has far-reaching consequences on the physics of cone emission and also sheds some new light on the fluorescence from strongly driven atomic systems.

Pub. in Physical Review A 46, n5 p2925-2938, 1 Sep 92.

Keywords: Four wave mixing, Spontaneous emission, Cherenkov radiation, Resonance fluorescence, Laser pumping, Models, Reprints, *Cone emission.

We establish a mechanism, which supports Cherenkov-type radiation, as a source of cone emission. This can be considered as an additional mechanism to the previously discussed four-wave mixing (4WM) and initial encoding and follow-up refraction effects. The radiation source is provided by spontaneous emission of the driven atoms at the frequencies of interest. Due to the medium dispersion, the pump field propagates faster than the phase velocity of the field that is generated at the Rabi sideband at lower frequency. Cherenkov radiation is then possible if the source has a long correlation length, which is indeed the case despite the random nature of spontaneous emission. Coherent superposition of the source for the lower-frequency field is in an off-axis direction given by the Cherenkov radiation condition. Differences between 4WM and Cherenkov-type models are consequently resolved.

Pub. in Jnl. of Molecular Spectroscopy 168, p416-428 1994.

Keywords: *Carbonyl compounds, *Sulfides, *Lasers, *Frequency measurement, Calibrating, Standards, Polarization, Molecular spectroscopy, Wavelengths, Tables(Data), Reprints, *Sub-Doppler frequencies.

Sub-Doppler frequency measurements have been made on three transitions of OCS in the 87-THz region (near 2900 1/cm). The CO overtone laser was used as the saturating laser. Polarization spectroscopic techniques utilizing optical heterodyne detection were used to observe the features and subsequently provide the discriminant for locking the overtone laser to the OCS transitions. A CO2 laser synthesizer was used to measure the frequency of the CO overtone laser and thereby measure the frequencies of the OCS lines. The resulting frequencies of the three new measurements are given. These new numbers have been fitted along with more than 5700 other data points in our OCS data bank and improved constants have been obtained. These latest constants are used to calculate updated calibration tables containing values with much smaller uncertainties; three such tables are included.

Characterization of a Clipped Gaussian Beam.
Final rept.
1995, 15p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Beam Control, Diagnostics, Standards, and Propagation, San Jose, CA., February 6-7, 1995, v2375 p360-374.

Keywords: *Laser beams, Light transmission, Beam profiles, Divergence, Irradiance, Wave propagation, Width, Slits, Diffraction, Reprints, Times diffraction limit.

The authors calculated irradiance distributions resulting from clipping a Gaussian beam with hard-edged slits transmitting 99 or 95 percent of the incident power. The authors determined the widths -- second moment (with 8- and 12-bit resolution), scanning slit, and knife-edge -- of these profiles at several distances from the source, both with and without a focusing lens. When using a lens, they had the option of determining the characterization parameters from two beam width measurements and one axial distance, or from a least-squares fit of several beam width measurements and axial distances. Finite resolution of irradiance, inherent in any measurement device, truncates integrals necessary for calculation of the second moment of irradiance distributions.

New Method for Realizing a Luminous Flux Scale Using an Integrating Sphere with an External Source.
Final rept.
Y. Ohno. 1995, 10p.
Pub. in Jnl. of the Illuminating Engineering Society 24, n1 p106-115 1995.

Keywords: *Luminous flux, *Optical measurement, Reprints, Lumens, Light sources, Computerized simulation, Integrating spheres, Calibration.

A method is proposed to realize a total luminous flux scale (lumens) using an integrating sphere with a known amount of flux introduced from an external source. The integrating sphere features an opening for a detector, a test lamp in its center, a baffle between the test lamp and the detector. A second opening is used to introduce flux from an external source, and is appropriately baffled from the test lamp. Flux from the external source is introduced into the sphere through limiting aperture of known area. The flux entering the sphere is determined from knowledge of the illuminance on the aperture plane and the area of the aperture. The total flux from the test lamp is deduced by comparison to the flux from the external source. Theoretical analysis was first made by computer simulation based on a ray tracing technique. Several integrating sphere designs were analyzed under various conditions, and based on the results of the simulation, an integrating sphere 50 cm in diameter was built to conduct experimental analysis. The characteristics of the sphere were measured and compared with the simulation results. The total luminous flux values of several miniature lamps measured with this method were found to agree within 0.5% with measurements using goniophotometric technique. This method can be applied also to realize a total spectral radiant flux scale.

Keywords: *Glass, *Optical systems, Reprints, Ion exchange, Neodymium, Erbium, Waveguide lasers.

Waveguide lasers formed by ion exchange in rate-earth-doped glasses have emerged as an attractive new technology on the threshold of commercial insertion. These devices can be used as both laser oscillators and optical amplifiers. In this article, we review ion exchange and glass composition. We then discuss the performance of ion-exchanged waveguide lasers made in silicate and phosphate glasses.

Beamcon III, a Linearity Measurement Instrument for Optical Detectors.
A. Thompson, and H. M. Chen. 1994, 5p.
Prepared in cooperation with Alabama Univ. in Huntsville. Dept. of Electrical and Computer Engineering.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n6 p751-755 Nov/Dec 94.

Keywords: *Optical detection, *Beams(Radiation), *Linearity, Detectors, Radiation measuring instruments, Silicon, Photodiodes, *Beam addition method, NIST(National Institute of Standards and Technology).

The design and operation of Beamcon III, the latest linearity measurement instrument using the beam addition method in the detector metrology program at the National Institute of Standards and Technology, is described. The primary improvements in this instrument are the reduction of stray radiation to extremely low levels by using three well-baffled chambers, a larger dynamic range, and an additional source entrance port. A polynomial response function is determined from the data obtained by this instrument using a least-squeares method. The linearity of a silicon photodiode-amplifer detector system was determined to be within 0.054% (2 sigma estimate) over nine decades of signal.

Magnetooptic Effects.
Final rept.
M. N. Deeter, G. W. Day, and A. H. Rose. 1995, 36p.
Pub. in CRC Handbook of Laser Science and Technology, Supplement 2: Optical Materials, Section 9.1, p367-402 1995.

Keywords: *Magnetooptics, *Faraday effect, *Kerr magnetooptical effect, Liquid crystals, Birefringence, Magnetohydrodynamics, Ferromagnetic materials, Paramagnetic materials, Diamagnetism, Ferrimagnetic materials, Antiferromagnetism, Reprints.

We review the orgins and applications of various magneto-optic effects, including the Faraday and Kerr effects, and magnetic linear birefringence. Mathematically, we show how all of these effects can be derived from a single dielectric tensor. We then consider the characteristics of magneto-optic effects in specific material classes, including diamagnetic, paramagnetic, ferromagnetic, ferrimagnetic, and antiferromagnetic materials. Relevant data for each class are summarized in tabular format. Finally, both scientific and commerical applications of magneto-optic materials are described.

Doppler-Free Spectroscopy of Large Polyatomic Molecules and van der Waals Complexes.
Final rept.
H. J. Neusser, E. Riedle, T. Weber, and E. W. Schlag. 1992, 7p.
Pub. in Topics in Applied Physics, v70 p205-212 1992.

Keywords: *Tunable lasers, *Laser spectroscopy, *Benzene, *Polyatomic molecules, Spectral line width, Molecular structure, Energy distribution, Electronic spectra, Ultraviolet spectra, Van der Waals forces, Chemical bonds, Coupling, Reprints, *Doppler-free spectroscopy, Molecular clusters, Coriolis coupling.

It is shown that high-resolution spectroscopy with tunable dye lasers leads to rotationally resolved electronic spectra of large molecular systems. Two-photon absorption of narrow-band cw light in an external cavity eliminates Doppler broadening in the S(sub 1) inversely maps to S(sub 0) transition of the prototype organic molecule benzene. Several thousands of rotational lines in the room temperature spectrum are analyzed, providing spectroscopic constants with a hitherto inaccessible precision. Investigations of the homogeneous linewidth of individual rotational transitions reveals that Coriolis coupling plays an important role in the intramolecular energy redistribution process in this moloecule. Rotationally resolved UV spectra of benzene-noble-gas van der Waals clusters were measured. These measurements yield precise information on the van der Waals bond lengths and structures of these complexes.

Using Secondary Ion Mass Spectrometry (SIMS) to Characterize Optical Waveguide Materials.
Final rept.
S. W. Novak, J. M. Zavada, and K. Malone. 1994, 2p.
Pub. in Proceedings of the Annual MAS Meeting (28th), Microbeam Analysis Society, New Orleans, LA., July 31-August 5, 1994, p167-168.

Keywords: *Optical waveguides, *Mass spectroscopy, Measuring instruments, Lithium niobates, Oxides, Glass, Diffusion, Ion implantation, Refractivity, Titanium, Silver, Reprints, SIMS(Secondary Ion Mass Spectrometry).

Secondary ion mass spectrometry (SIMS) has proven to be a versatile technique to obtain depth resolved information on optical waveguides in materials such as LiNbO3, LiTaO3 and glasses. Optical waveguides are typically formed by diffusing an element into the material to cause a localized change in its refractive index. In LiNbO3 this is done using Ti indiffusion from a deposited metal film or proton exchange in an acid bath. Optical waveguides in glasses have been made using Ag indiffusion from AgNO3 solutions. SIMS instruments have been used to obtain depth profiles of planar waveguides using either a normal-incidence electron gun in a magnetic sector SIMS instrumental or a quadrupole-based SIMS instrument.

Improved Annealing Technique for Optical Fiber.
Final rept.
A. H. Rose, Z. B. Ren, and G. W. Day. 1994, 4p.
Pub. in International Conference on Optical Fibre Sensors (10th), Glasgow, Scotland, UK, October 11-13, 1994, v2360 p306-309.

Keywords: *Birefringence, Reprints, *Foreign technology, *Current sensing, *Fiber annealing.

The authors demonstrate that twisting a fiber a few turns per meter before it is annealed largely eliminates the residual linear bierefringence. This dramatically improves the yield of annealed coils for current sensing and makes it possible to use fibers that previously could not be successfully annealed. It is believed that twisting is effective because the residual birefringence is associated with core ellipticity and this contribution is averaged to near zero by twisting. The authors also show the temperature stability of sensors made with this new technique.

Pub. in Proceedings of the LEOS '94 Symposium on Photoinduced Devices in Optical Fibers and Waveguides (IEEE Lasers and Electro-Optics Society 1994 Annual Meeting), Boston, MA., October 31-November 3, 1994, p131-132.

Keywords: *Gratings, *Fiber optics, Bragg angle, Optical fibers, Ultraviolent radiation, Reprints, *Fiber gratings.

We have measured the time and UV intensity dependence of the growth of Bragg gratings in germanium-doped and germanium-boron-codoped optical fiber. We compare this with the change in blue fluorescence and theoretical predictions. We find that the index change during UV exposure is correlated with a decrease in fluorescence and that a simple one-photon model for defect absorption does not explain the time and intensity dependence of the grating growth.

This lecture deals with one of the impressive and exciting topics of our time--the development and application of superstable lasers. Their relevance to this school arises in large measure from the incipient marriage of such stable laser sources with the remarkable samples of free-floating quantum absorbers which can be assembled. Manipulated and cooled using light forces on atoms--the later forming the main course of our study here. In addition, such gas samples and stable laser sources represent now in many cases the tools of choice in ultra-precise experiments designed to test our cherished beliefs about the fundamental physical laws. Indeed, a large number of important and impressive measurements have already been carried out using stable-laser techniques. Still, many of us in the field believe that the best is just ahead, becoming freshly enabled in a significant number of examples by progress in the 'atom manipulation business',

The Journal of Research of the National Institute of Standards and Technology features advances in measurement methodology and analyses consistent with the NIST responsibility as the nation's measurement science laboratory. It includes reports on instrumentation for making accurate and precise measurements in fields of physical science and engineering, as well as the mathematical models of phenomena which enable the predictive determination of information in regions where measurements may be absent. Papers on critical data, calibration techniques, quality assurance programs, and well-characterized reference materials reflect NIST programs in these areas. Special issues of the Journal are devoted to invited papers in a particular field of measurement science. Occasional survey articles and conference reports appear on topics related to the Institute's technical and scientific programs.

Test of a Slow Off-Axis Parabola at Its Center of Curvature.
Final rept.
R. E. Parks, C. J. Evans, and L. Shao. 1995, 5p.
Pub. in Applied Optics, v34 n31 Nov 95.

Keywords: *Optical testing, Interferometry, Reprints, *Zernike polynomials, *Off-axis aspherics.

The authors describe the interferometric testing of a slow (F/16 at the center of curvature) off-axis parabola, intended for use in an x-ray spectrometer, that uses a spherical wave front matched to the mean radius of the asphere. The authors find the figure error in the off-axis mirror by removing the theoretical difference between the off-axis segment and the spherical reference from the measured wave-front error. This center of curvature test is easy to perform because the spherical reference wave front has no axis and thus alignment is trivial. The authors confirm that the test results are the same as the double-pass null test for a parabola that uses a plane autocollimating mirror. They also determine that the off-axis section apparently warped as the result of being cut from the symmetric parent part.

Inexpensive Laser Cooling and Trapping Experiment for Undergraduate Laboratories.
Final rept.
C. Wieman, G. Flowers, and S. Gilbert. 1995, 14p.
Pub. in American Jnl. of Physics, v63 n4 p317-330 Apr 95.

Keywords: *Laboratories, Spectroscopy, Rubidium, Reprints, *Laser cooling, *Laser trapping, Vapor cell trap.

We present detailed instructions for the construction and operation of an inexpensive apparatus for laser cooling and trapping of ribidium atoms. This apparatus allows one to use the light from low power diode lasers to produce a magneto-optical trap in a low pressure vapor cell. We present a design which has reduced the cost to less than $3000 and does not require any matching or glassblowing skills in the construction. It has the additional virtues that the alignment of the trapping laser beams is very easy, and the rubidium pressure is conveniently and rapidly controlled. These features make the trap simple and reliable to operate, and the trapped atoms can be easily seen and studied. With a few milliwatts of laser power we are able to trap 4 x 10 to the 7th power atoms for 3.5 s in this apparatus. A step-by-step procedure is given for construction of the cell, setup of the optical system, and operation of the trap. A list of parts with prices and vendors is given in the Appendix.

Pub. in ASME/AIAA National Heat Transfer Conference, Portland, OR., August 6-9, 1995, AIAA 95-3520, p1-11.

Keywords: *Calorimeters, *Laser radiation, Measurements, Thermal analysis, Reprints.

We performed detailed thermal analysis and modeling of the C-series laser calorimeters at the National Institute of Standards and Technology for calibrating laser power or energy meters. A finite-element method was employed to simulate the space and time dependance of temperature at the calorimeter receiver. The inequivalence in the temperature response caused by different spatial distributions of the heating power was determined. The inequivalence between electrical power applied to front and rear portions of the receiver is approximately 1.7 percent, and the inequivalence between the electrical and laser heating is estimated to be less than 0.05 percent. The computational results are in good agreement with experiments at the 1 percent level. The effects of the deposited energy, power duration, and relaxation time on the calibration factor and cooling constant were investigated. This paper provides information for the future design improvement on the laser calorimeters.

R. W. Leonhardt, and T. R. Scott. 1995, 12p.
Pub. in Society of Photo-Optical Instrumentation Engineers: The International Society for Optical Engineering, Santa Clara, CA., February 20-22, 1995, v2439 p448-459.

Keywords: *Eximer lasers, *Beamsplitters, *Calorimeters, Dosage, Reprints, Volume absorbers.

The National Institute of Standards and Technology has designed and built two electrically calibrated laser calorimeters as primary standards for absolute energy measurements at the wavelength of 248 nm. Under the sponsorship of SEMATECH, NIST developed the calorimeters to improve measurements of dose energy in excimer laser based microlithography. The calorimeter system can be used to calibrate transfer standards which in turn can be used to calibrate detectors employed for energy measurements of semiconductor wafer exposure. The excimer calorimeter uses a glass filter which functions as a volume absorber that allows collection of nanosecond pulses of laser radiation without suffering damage. The measurement range of the calorimeters is 0.3-25 J, but can be extended to 1 mJ with beamsplitters. Electrical calibration of the calorimeters shows a standard deviation in the calibration factor of less than 0.5 percent for entire energy range. The total uncertainty of typical power and energy meter calibrations is approximately 2 percent.

Atom-Optical Properties of a Standing-Wave Light Field.
Final rept.
J. J. McClelland. 1995, 8p.
Pub. in Jnl. of the Optical Society of America B, v12 n10 p1761-1768 Oct 95.

Keywords: *Atomic optics, *Lithography, Lasers, Standing waves, Reprints, Dipole force, Paraxial approximation.

The focusing of atoms to nanometer-scale dimensions by a near-resonant standing-wave light field is examined from a particle optics perspective. The classical equation of motion for atoms traveling through the lens formed by a node of the standing wave is derived and converted to a spatial trajectory equation. A paraxial solution is obtained, which results in simple expressions for the focal properties of the lens, useful for estimating its behavior. Aberrations are also discussed, and an exact numerical solution of the trajectory equation is presented. The effects on focal linewidth of angular collimation and velocity spread in the atomic beam are investigated, and it is shown that angular collimation has much more significant effect than velocity spread, even when the velocity spread is thermal.

Vector and Quasi-Vector Solutions for Optical Waveguide Modes Using Efficient Galerkin's Method with Hermite-Gauss Basis Functions.
Final rept.
A. Weisshaar, R. L. Gallawa, and I. C. Goyal. 1995, 6p.
Pub. in Jnl. of Lightwave Technology, v13 n8 p1795-1800 Aug 95.

Keywords: *Optical waveguides, Galerkin method, Reprints, *Scalar approximation, *Polarization, Vector solution, Basis functions.

An efficient vector formulation and corresponding quasi-vector formulation for the analysis of optical

waveguides are presented. The proposed method is applicable to a large class of optical waveguides with general refractive index profile in a finite region of arbitrary shape and surrounded by a homogenous cladding. The vector formulation is based on Galerkin's procedure using Hermite-Gauss basis functions. It is shown that use of Hermite-Gauss basis functions leads to a significant increase in computational efficiency over trigonometric basis functions. The quasi-vector solution is obtained from the standard scalar formulation by including a polarization correction. The accuracy of the scalar, vector, and quasi-vestor solutions is demonstrated by comparison with the exact solution for the fundamental mode in a circular fiber. Comparison of the model solutions obtained with the various methods for optical wave-guides with square, rectangular, circular, and elliptical core demonstrate the accuracy and advantage of the quasi-vector solution.

Absolute Response Calibration of a Transfer Standard Cryogenic Bolometer.
Final rept.
G. Eppeldauer, A. L. Migdall, T. R. Gentile, and C. L. Cromer. 1995, 11p.
Pub. in Proceedings Reprint, Society of Photo-Optical Instrumentation Engineers: The International Society for Optical Engineering, San Diego, CA., July 11-12, 1995, v2550 p36-46.

Keywords: *Bolometers, *Calibration, Standards, Reprints, Cryogenic radiometer, Infrared detector, Spectral response.

A cryogenic bolometer has been developed for use as a transfer standard in an ambient temperature infrared detector response comparator facility at the National Institute of Standards and Technology (NIST). Issues affecting calibration of the bolometer response were studied and a calibration procedure was developed. These issues included frequency dependence, stability, repeatability, and spectral flatness. The relative spectral response as determined from the reflectance of the bolometer absorber and the transmittance of the bolometer window. The bolometer calibration has been tied to the NIST primary standard High Accuracy Cryogenic Radiometer (HACR) using a silicon trap detector and a pyroelectric detector.

Partially Coherent Transmittance of Dielectric Lamellae.
Final rept.
E. N. Grossman, and D. G. McDonald. 1995, 7p.
Pub. in Optical Engineering, v34 n5 p1289-1295 May 95.

Keywords: *Dielectrics, *Lamella, *Transmittance, Interferometers, Fourier transformations, Coherence, Surface roughness, Microstructure, Reprints, Nonparallelism, Fabry-Perot fringes.

The authors derive an analytic formula for the transmittance of a dielectric lamella when the interference between successive internal reflections is only partially spatially coherent. This allows effects such as surface roughness and nonparallelism, which produce cumulative distortions in the phase front with each reflection, and which result in a loss of fringe contrast at high frequencies, to be accounted for quantitatively. The transmittance of a Si lamella agrees with the authors' formula to within the accuracy of the data, which is dominated by systematic instrumental effects.

Also available from Supt. of Docs. as SN003-003-03384-7.

Keywords: *Interlaboratory comparisons, *Fibers, *Geometry, Calibration, Coatings, Optical fibers, Connectors, Glass fibers, Parameterization, Diameter, Standards, Fiber connectors ferrule, Geometric parameters, Pin gage, NIST(National Institute of Standards and Technology).

Interlaboratory measurement comparisons, dealing with geometrical parameters of optical fibers, fiber coatings, and fiber connector ferrules (including steel pin gages used to determine ferrule inside diameter), have been coordinated by National Institute of Standards and Technology (NIST). The international fiber (glass) geometry comparison showed better agreement among participants, for all measured parameters, than in previous comparisons. Many participants' test set were calibrated for fiber cladding diameter measurements by means of calibration artifacts from NIST or other national standards laboratories; there was significantly better agreement among those participants than among participants whose test sets were not calibrated. NIST is developing ferrule, pin gage, and coating calibration artifacts.

Annealing of Bragg Gratings in Hydrogen-Loaded Optical Fiber.
Final rept.
H. Patrick, S. L. Gilbert, A. Lidgard, and M. D. Gallagher. 1995, 6p.
Pub. in Jnl. of Applied Physics, v78 n5 p2940-2945 Sep 95.

Keywords: *Annealing, *Optical fibers, Change, Reprints, *Bragg gratings, Photo induced index, Hydrogen loaded fiber.

The authors have conducted a detailed study of the thermal stability of Bragg gratings written in hydrogen-loaded and unloaded germanium-doped optical fiber. Interference of either continuous-wave or pulsed ultraviolet light was used to induce the index modulation gratings. Some gratings were kept at room temperature and others were annealed at fixed temperatures for 10-20 h. For temperatures between room temperature and 350 degrees C, gratings in the hydrogen-loaded fiber showed significantly greater decay than those in the unloaded counterpart. The ultraviolet-induced index modulation in hydrogen-loaded fiber was reduced by 40% after 10 h at 176 degrees C, whereas it was reduced by only 5% in unloaded fiber under the same conditions. The annealing behavior of gratings written using the pulsed source was identical to that of gratings written with the continuous-wave source, and the thermal stability of gratings in hydrogen-loaded fiber did not depend on the magnitude of the index modulation.

Pub. in Proceedings of the Photosensitivity and Quadratic Nonlinearity in Glass Waveguides, Fundamentals and Applications Topical Meeting, Portland, OR., September 9-11, 1995, p148-151.

Keywords: *Optical fibers, *Fluorescence, Near ultraviolet radiation, Reprints, Continuous radiation, Optical measurement, Fiber gratings, *Bragg gratings.

The authors have conducted a comparison of the UV photosensitivity of optical fiber with the blue fluorescence emitted during the exposure. In a survey of ten non-hydrogen-loaded germanium-doped fibers, the authors measured the UV photosensitivity and monitored the blue fluorescence during the growth of fiber gratings. The authors' goal was to determine whether the initial fluorescence, or the change in the fluorescence during exposure, is correlated with the index change. This provides insight into the underlying physical mechanism of UV-induced index change and also determines whether the blue fluorescence can be used as an indicator of the photosensitivity of a fiber.

Configuration-Dependent AC Stark Shifts in Calcium.
Final rept.
Q. Li, T. R. O'Brian, T. B. Lucatorto, X. Xiong, T. J. McIlrath, and J. B. King. 1992, 3p.
Pub. in Optics Letters, v17 n19 p1373-1375 Oct 92.

Keywords: *Calcium, *Laser spectroscopy, Light shifts, Reprints, *AC stark effect, Configuration intervention, Rydberg levels.

The energy shifts caused by intense laser radiation (10 to the 8th power to 10 to the 10th power W/sq. cm) are investigated for several high-lying levels of calcium in order to determine the ac Stark shift of a loosely bound electron in a strong electromagnetic field. Energy shifts are measured for the closely spaced levels 4s9s 1S0. 4s8d 1D2. 4s10s 1S0. and 3d5s 1d2 by using resonance ionization spectroscopy. The levels associated with Rydberg configurations show the expected pondermotive energy shifts, but the 3d5s 1D2 shift is approximately half as large as the ponderomotive shifts.

Soft-X-ray Damage to p-terphenyl Coatings for Detectors.
Final rept.
E. L. Benitez, M. L. Dark, D. E. Husk, S. E. Schnatterly, and C. Tarrio. 1994, 3p.
Pub. in Applied Optics, v33 n10 p1854-1856 Apr 94.

Keywords: *Detectors, *Soft x ray, Efficiency, Phosphor, Rerints, Reprints, P-terphenyl, Photoluminescence, Photon damage.

The organic phosphor p-terphenyl is used as a wavelength-converter coating in some soft-x-ray detectors. The authors have measured the absolute photoluminescent efficiency of p-terphenyl as a functon of incident photon energy from 36 to 191 eV. The authors have also measured changes in the efficiency caused by soft-x-ray fluence (total photons absorbed per unit area) at several photon energies in this range. The authors find that efficiency drops rapidly as a function of fluence, with the rate of decrease increasing with higher soft-x-ray energies.

Pub. in Conference on Multilayer and Grazing Incidence X-ray/EUV Optics for Astronomy and Projection Lithography, No. 1742, San Diego, CA., July 19-22, 1992, p373-381.

Keywords: *Deposition, *Soft x ray, Multilayer, Sputtering, Uniformity, Reprints.

High performance in normal incidence Soft X-Ray optical systems requires accurate control of the d-spacing

across the surface of each mirror in the system. As a first step towards being able to fabricate any desired d-spacing variation, the authors demonstrate the ability to produce large (25 mm x 150 mm) flat Mo/Si multilayer coated mirrors with a d-spacing uniformity of +/ -0.4%. Instead of applying the approach most often taken to minimize the d-spacing variation physical shielding of the deposition source, the authors use a mask with a corrected profile positioned just in front of the rotating substrate to compensate for the non-uniform deposition flux. Results obtained from hard (lambda = 0.154nm) and soft (wavelength of interest) X-Ray mapping of the surface are presented along with a discussion of the technique used to control the d-spacing distribution.

Keywords: *Gaseous electronics, *Electrical measurements, *Plasma, Argon, Current, Discharge, Reprints, Impedance, Real-time, Transient, Voltage.

We have investigated the possibility of using current and voltage measurements for real-time monitoring and control of radio-frequency discharges. Specifically, we have equipped a Gaseous Electronics Conference (GEC) rf Reference Cell with a computer-controlled measurement system that samples the voltage and current waveforms at the cell power input and Fourier analyzes these waveforms to obtain the amplitude and phase of their fundamental and harmonic components. The system accounts for errors introduced by the stray impedance of the cell, yielding corrected values that more accurately reflect the values of voltage and current at electrode surfaces in contact with the plasma. These corrected values are monitored to reveal changes in fundamental plasma parameters such as sheath voltages, sheath fields, and sheath (dark space) thickness. Futhermore, the corrected values serve as better control parameters than the raw values of voltage, current or power, measured externally. The time required for the acquisition and analysis of a pair of current and voltage waveforms is approximately one second, making these measurements suitable for real-time sensing and control applications.

Elastic Scattering from Spheres under Non Plane-Wave Illumination.
Final rept.
J. T. Hodges, G. Grehan, C. Presser, and H. G. Semerjian. 1993, 15p.
Pub. in Laser Applications in Combustion and Combustion Diagnostics, Los Angeles, CA., January 16-23, 1993, SPIE Proceedings, v1862 n33 p294-308.

Keywords: *Light scattering, *Elastic scattering, Reprints, Measurements, Gaussian laser beams, Lorenz-Mie theory, Laser beam illumination.

Measurements of the scattered light intensity from individual droplets illuminated by focused Gausssian laser beams are presented. The results are compared with both the generalized Lorenz-Mie theory and classical Lorenz-Mie theory of elastic scattering. The data are shown to be consistent with the generalized theory. Besides experimental results, computations indicate that differences between the two theoretical approaches exist. It is shown that for sufficiently small beam diameter, characteristic of focused laser between the two theoretical approaches exist. It is shown that for sufficiently small beam diameter, characteristic of focused laser beam illumination, the departure of elastic scattering from that predicted by the classical Lorenz-Mie Theory can be significant.

Population Trapping in Short-Pulse Multiphoton Ionization.
Final rept.
M. Edwards, and C. W. Clark. 1996, 12p.
Pub. in Optical Society of America B, v13 n1 p101-112 Jan 96.

Keywords: *Multiphoton ionization, Reprints, *Complex resonance energies, *Excitodion spectra, Floquet analysis, Photoelectron spectra, Population trapping.

We have studied population trapping in a one-dimensional model interacting with a short-pulse high-intensity laser, using Floquet analysis and direct numerical integration of the time-dependent Schrodinger equation for a range of peak pulse intensities. We find that photoelectrons are efficiently produced only by pulses whose peak intensities lie in a narrow range around the resonant intensity for a given intermediate state. Excited-state populations, however, are generated throughout a larger volume than are photoelectrons. Interpretations of recent experiments are examined in light of this result.

Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p639-643 1996.

Keywords: *Laser structures, *Photoreflectance, Luminescence, Reprints, Pump beams, Bandgap, Double modulation, Quantum-well.

A double-modulation photoreflectance (PR) procedure is presented, where both the probe and pump beams are modulated, and the photoreflectance signal can be isolated from the luminescence and the scattered pump beam signals. The PR signal is separated from the other two signals through detection at the sum frequency. A careful choice of frequencies and specially design filters and tuned amplifiers were needed to achieve optimum operation. A couple system, along with the necessary circuits, is presented and applied to the characterization of a highly luminescent quantum-well laser structure. The freedom allowed by such a system to easily accommodate any pump wavelength is an important feature. We have exploited this added versatility, and the ordering of the bandgap of the multiple layers required in complex laser structures, to extract the bandgap and alloy composition of each of the constituent regions as well as the built-in strain in the pseudomorphic quantum-well.

Keywords: *Fiber optics, *Optical fibers, *Optical measurement, *Meetings, Optical polarization, Electrooptics, Transmission lines, Reviews, Nonlinear optics, Integrated optics, National Institute of Standards and Technology.

Measurements of polarization mode dispersion (PMD) and nonlinear processes in optical fibers are two of the major topics in this digest of papers presented at the ninth Symposium on Optical Fiber Measurements, Held October 1-3, 1996, at the laboratories of the National Institute of Standards and Technology in Boulder, Co. Summaries of all the papers presented at the Symposium-10 invited and 39 contributed-are included. The statistical nature of PMD complicates its measurement and makes verification of accuracy difficult. This is reflected in the content of the papers, many of which focus on comparisons of measurement techniques. In wavelength division multiplexed systems employing optical amplification, high powers can be lead to problems from nonlinear processes such as Brillouin scattering and four-wave mixing. The importance of these issues is seen by the inclusion of several papers regarding the measurement of nonlinear coefficients and effective area. Strong international participation has been maintained, as about two thirds of the paper in this digest originated outside of the United States.

Optical Scattering from Moderately Rough Surfaces.
Final rept.
T. V. Vorburger, E. Marx, and T. R. Lettieri. 1991, 3p.
Pub. in ICO Topical Meeting on Atmospheric, Volume and Surface Scattering Propagation, Florence, Italy, August 27-30, 1991, p205-207.

Keywords: *Optical scattering, *Surface roughness, Light scattering, Optical metrology, Reprints, Fraunhofer diffraction.

Light-scattering techniques have become important tools for the study of surface finish, and several such techniques have been developed. The choice depends, among other factors, upon the degree of roughness: for very smooth surfaces a technique such as total integrated scatter can be used, while for rougher surfaces angle-resolved light scattering should be applicable. In the paper, the authors discuss some of the work being conducted at the National Institute of Standards and Technology which applies laser light scattering to the measurement and understanding of the topographic properties of moderately rough surfaces.

Compensation for Errors Introduced by Nonzero Fringe Densities in Phase-Measuring Interferometers.
Final rept.
C. J. Evans. 1993, 4p.
Pub. in Annals of the CIRP, v42 n1 p577-580 1993.

Keywords: *Optical interferometers, *Instrument errors, *Geometric abberations, Optical tests, Optical measurement, Surfaces, Optical correction procedures, Reprints.

Interferometers offer rapid full aperture measurement of optics. Flats, spheres and conics can be measured to high accuracy with computer controlled systems using high density detectors. In principle, aspheres that depart from the base sphere or conic by several micrometers could also be measured. The paper demonstrates that substantial errors may be incurred and describes simple tests to evaluate the scale of those errors. The paper then discusses the error sources and presents a method for compensating for those errors.

Light Scattering by Sinusoidal Surfaces: Illumination Windows and Harmonics in Standards.
Final rept.
E. Marx, T. R. Lettieri, and T. V. Vorburger. 1995, 9p.
Pub. in Applied Optics, v34 n7 p1260-1277 Mar 95.

Keywords: *Light scattering, *Sinusoidal surfaces, Windowing effects, Harmonics, Bidirectional reflectance, Distribution function, Reprints, Angle-resolved scattering.

Sinusoidal surfaces can be used as material standards to help calibrate instruments that measure the angular distribution of the intensity of light scattered by arbitrary surfaces, because the power in the diffraction peaks varies over several orders of magnitude. The calculated power in the higher-order diffraction peaks from sinusoidal surfaces expressed in terms of Bessel functions is much smaller than the values determined from angular distributions that are measured or computed from measured profiles, both of which are determined mainly by the harmonic contents of the profile. The finite size of the illuminated area, represented by an illumination window, gives rise to a background that is much larger than the calculated power in the higher-order peaks. For a rectangular window of a size equal to an even number of periods of the sinusoid, a computation of the power distribution produces minima at or near the location of the diffraction angles for higher-order diffraction angles.

Sinusoidal Surfaces as Standards for BRDF Instruments.
Final rept.
E. Marx, T. R. Lettieri, T. V. Vorburger, and M. McIntosh. 1991, 7p.
Pub. in Proceedings Reprint, Optical Scatter: Applications, Measurement, and Theory, San Diego, CA., July 24-26, 1991, v1530 p15-21.

Keywords: *Sinusoidal surfaces, *Lasers, *Electromagnetic scattering, Diffraction peaks, Reprints, BRDF standards, Kirchhoff approximation.

The study of light scattered by sinusoidal surfaces shows that such a configuration can be used as a material standard to help calibrate instruments that measure the BRDF of arbitrary surfaces. Measured and computed values of the power scattered into the diffraction peaks show good agreement, and such calculations can be further improved and used to verify the standards.

Windowing Effects for Light Scattering by Sinusoidal Surfaces.
Final rept.
E. Marx, and T. V. Vorburger. 1993, 14p.
Pub. in Proceedings Reprint, Optical Scattering: Applications, Measurement, and Theory II, San Diego, CA., v1995 p1-14 1993.

Keywords: *Sinusoidal surfaces, *Window functions, *Light scattering, Diffraction peaks, Rough surfaces, Reprints, BRDF.

A window function is used to represent the variation in the intensity of the radiation in a light beam. Windowing effects are factored into computations of the angular distribution of light scattered by a sinusoidal surface. These effects, as well as those of harmonics and noise, are shown for the angular distributions computed from simulated profiles. The integrated power in each diffraction peak computed for perfect sinusoids, measured profiles, and simulated profiles with different window functions is compared to that of a measured angular distribution.

Magneto-Optic Rotation Sensor Using a Laser Diode as Both Source and Detector.
Final rept.
K. B. Rochford, and A. H. Rose. 1996, 4p.
Pub. in International Conference on Optical Fiber Sensors (11th), Sapporo, Japan, May 21-24, 1996, p686-689.

Keywords: *Detectors, *Fiber optic sensors, *Laser diodes, Rotation sensors, Self-detection, Reprints, *Foreign technology.

The authors show that a laser diode can serve as both the emitter and detector in a diffraction-based magneto-optic rotation sensor. Self-detection devices have sufficient linearity and stability for applications with discrete measurands. Signal-to-noise ratios greater than 50 dB (1 Hz bandwidth) are possible for binary measurands, and a fiber optic rotation sensor with a signal-to-noise ratio of 18 dB in a 1.25 kHz bandwidth is demonstrated.

Numerical Reference Models for Optical Metrology Simulation.
Final rept.
G. L. Wojcik, J. Mould, E. Marx, and M. P. Davidson. 1992, 13p.
Pub. in Society of Photo-Optical Instrumentation Engineers Microlithography '92: IC Metrology, Inspection, and Process Control VI, v1673-06 p1-13 1992.

Keywords: *Electromagnetic scattering, *Optical measurement, Integral equations, Finite element analysis, Maxwell equations, Computerized simulation, Reprints, Numerical reference models.

Optical modeling on the computer can aid R&D efforts to enhance metrology methods, and similarly for lithography, alignment, and particulate monitoring. However, full exploitation of optical modeling is hindered by the lack of appropriate benchmarks for verifying algorithms and evaluating approximations. To help remedy this situation the authors describe a preliminary set of scalar, 2D numerical reference models (NRMs). These include isolated thin and thick lines, periodic lines, and an isolated trench. Scattered fields are compared for three different solution methods, based on time-domain finite elements, boundary integrals, and a waveguide model. Correlation is good in general, although important differences are seen in both code accuracy and performance. NRM generalizations are suggested that accommodate 3D effects, imaging, and experiment verification.

Laser Bandwidth Effects in Quantitative Cavity Ring-Down Spectroscopy.
Final rept.
J. T. Hodges, J. P. Looney, and R. D. van Zee. 1996, 5p.
Pub. in Applied Optics, v35 n21 p4112-4116 Jul 96.

Keywords: *Lasers, *Spectroscopy, *Cavity ringdown, Absorption, Bandwidths, Oxygen, Reprints.

The authors have investigated the effects of laser bandwidth on quantitative cavity ring-down spectroscopy using the (r)R transitions of the b(v=0)<--X(v=0) band of molecular oxygen. It is found that failure to account properly for the laser bandwidth leads to systematic errors in the number of densities determined from measured ring-down signals. When the frequency-integrated expression for the ring-down signal is fitted and measured laser line shapes are used, excellent agreement between measured and predicted number densities is found.

Forward Scattering of a Gaussian Beam by a Nonabsorbing Sphere.
Final rept.
J. T. Hodges, G. Grehan, G. Gouesbet, and C. Presser. 1995, 13p.
Pub. in Applied Optics, v34 n12 p2120-2132 Apr 95.

Keywords: *Gaussian beams, *Light scattering, *Spheres, Diffractions, Reprints, Lorenz-Mie theory.

The forward scattering of a Gaussian laser beam by a spherical particle located along the beam axis is analyzed with the generalized Lorenz-Mie theory (GLMT) and with diffraction theory. Forward-scattering and near-foward-scattering profiles from electrodynamically levitated droplets, 51.6 micrometers in diameter, are also presented and compared

with GLMT-based predictions. The total intensity in the forward direction, formed by the superposition of the incident and the scattered fields, is found to correlate with the particle-extinction cross section, the particle dimater, and the beam width. Based on comparison with the GLMT, the diffraction solution is accurate when beam widths that are approximately greater than or equal to the particle diameter are considered and when large particles that have an extinction efficiency near the asymptotic value of 2 are considered. However, diffraction fails to describe the forward intensity for more tightly focused beams. The experimental observations, which are in good agreement with GLMT-based predictions, reveal that the total intensity profile about the forward direction is quite sensitive to particle axial position within a Gaussian beam.

Large Local-Field Corrections in Optical Rotatory Power of Quartz and Selenium.
Final rept.
L. Jonsson, Z. H. Levine, and J. W. Wilkins. 1996, 4p.
Pub. in Physical Review Letters, v76 n8 p1372-1375 Feb 96.

Keywords: *Rotary powers, *Corrections, *Quartz, *Selenium, Local fields, Nonconductors, Calculations, Reprints.

The authors show that local fields can increase the rotatory power rho of nonconductors by a factor of 10--in contrast to the typical 10% effect in other properties. The authors present calculations for quartz and Se, and a general method to estimate the size of local-field corrections. Notably, only scalar local fields are needed despite the vector character of light. A self-energy-corrected local-density band structure yields corrections to rho of a factor of +7 in quartz and -4 in Se. These values are 30% above experiment for quartz, and, for one sign choice, within the 50% error bars for Se.

Photonic Band-Structure Effects for Low-Index-Contrast Two-Dimensional Lattices in the Near Infrared.
Final rept.
A. Rosenberg, R. J. Tonucci, H. B. Lin, and E. L. Shirley. 1996, 4p.
Pub. in Physical Review B, v54 n8 pR5195-R5198 Aug 96.

Keywords: *Lattices, *Low index contrast, Attenuation, Two dimensional, Reprints, *Photonic band structure.

The authors demonstrate that two-dimensional periodic dielectric structures with low index contrast give rise to remarkable, easily measurable photonic band-structure effects. The structures consist of triangular arrays of glass cylinders embedded in a glass matrix, having centr-to-center nearest-neighbor separations from 1.08 micrometers to 0.54 micrometers. The cylinders and the matrix are composed of different glasses, but the difference between the indices of refraction is as low as 0.02 throughout the relevant spectral region. The attenuation features corresponding to the boundaries of the first Brillouin zone appear in the near-infrared, at photon energies between 0.4 eV and 0.9 eV.

Measurements of quantum electrodynamic sensitive transitions in Na-like and Cu-like ions: Final report, 1 October 1993--29 September 1994.
PROGRESS REPT.
J. Reader. 1994, 7p, DOE/SF/20143-T2.
Contract FG03-93SF20143
Sponsored by Department of Energy, Washington, DC.

Keywords: *Iron Ions, *Laser-Produced Plasma, Cations, Emission Spectra, Energy Levels, Energy-Level Transitions, Experimental Data, ICF Devices, Modifications, Plasma Diagnostics, Progress Report, Research Programs, Theoretical Data, Tokamak Devices, X-Ray Lasers, Tables(data), EDB/700320, EDB/700380, EDB/426002.

The object of this research was to use the GDL laser at the Laboratory for Laser Energetics at the University of Rochester to measure the energies of spectral transitions that would be of importance for testing the accuracy of calculations used to predict properties of plasmas found in inertial fusion experiments as well as in tokamaks and x-ray lasers. The general method to be used for this experiment was to focus the beam from the GDL laser to a small point so as to create a laser-produced plasma of the material of interest. Light from the plasma was to be photographed with a 2.2-m grazing incidence spectrograph transported to Rochester from NIST. The region of observation was 10-300 angstroms. In the initial phase of the work, a series of spectrograms were made of highly ionized iron. For this, a special target chamber was fabricated at NIST and interfaced to the light beam from the GDL laser. The results for iron provided valuable data for Li-like iron, Fe(sup 23+). Fig. 2 shows an example of the spectrum obtained in the region of 30-40 angstroms. The lower spectrum shows intense lines of Fe(sup 23+), obtained by focusing the GDL beam tightly onto the target surface. For the upper spectrum the GDL beam was focused slightly in front of the target, producing lines of Fe(sup 23+) that are much reduced in intensity. The lines of Fe(sup 23+) in the 30-40 angstrom region were observed for the first time in this experiment. Measurement of their wavelengths provided the following comparison with ab initio values calculated with the Dirac-Fock quantum mechanics computer code of Desclaux. After completing the observations for Li-like iron, the GDL laser was shut down for the planned upgrade to much higher energy. Extensive work was undertaken to interface the NIST target chamber to the 30-cm-diameter beam of the upgraded GDL laser. The NIST system is now ready for use with the upgraded GDL laser.

Gaseous Electronics Conference Radio-Frequency Reference Cell: A Defined Parallel-Plate Radio-Frequency System for Experimental and Theoretical Studies of Plasma-Processing Discharges.
Final rept.
1994, 15p.
Pub. in Rev. Sci. Instrum. 65, n1 p140-154 Jan 94.

Keywords: *Radio frequency discharge, *Glow discharges, Electrical measurement, Interlaboratory comparisons, Argon plasma, Reprints, Reference cells.

A 'reference cell' for generating radio-frequency (rf) glow dicharges in gases at a frequency of 13.56 MHz is described. The reference cell provides an experimental platform for comparing plasma measurements carried out in a common reactor geometry by different experimental groups, thereby enhancing the transfer of knowledge and insight gained in rf discharge studies. The results of performing ostensibly identical measurements on six of these cells in five different laboratories are analyzed and discussed. Measurements were made of plasma voltage and current characteristics for discharges in pure argon at specific values of applied voltages, gas pressures, and gas flow rates. Data are presented on relevant electrical quantities derived from Fourier analysis of the voltage and current wave forms. Amplitudes, phase shifts, self-bias voltages, and power dissipation were measured.

Physics and Prospects of Inertial Confinement Fusion.
Final rept.
M. M. Basko. 1993, 10p.
Pub. in Plasma Phys. Control. Fusion 35, pB81-B90 1993.

Keywords: *Inertial confinement fusion, Plasma confinement, Trends, Reprints, Prospects.

Some key physical aspects of the inertial confinement fusion (ICF) are discussed. The minimum scale of ICF microexplosions is determined by the ability to implode spherical shells with high radial convergence ratios C(R) and high initial aspect ratios A(RO). The attainable values of C(R) are limited by large-scale drive asymmetries, while the values of A(RO) are constrained by the Rayleigh-Taylor instability. Under the indirect drive approach to ICF, it is easier to achieve the required uniformity of the drive pressure, but the penalty is a factor 4-5 reduction of the target energy gain as compared to the direct drive option. Spark ignition is a crucial issue for indirect drive targets (at least for those to be used in power reactors), while the targets driven directly by heavy ion beams could, in principle, use a less demanding volume ignition scheme.

Pub. in IEE Proc.-Sci. Meas. Technol. 141, n2 p105-110 Mar 94.

Keywords: *Helium ions, *Argon ions, Radio frequency discharge, Mass spectroscopy, Metastable state, Kinetic energy, Helium plasma, Argon plasma, Gas mixtures, Semiconductors, Reprints, Ion energy analysis, Plasma processing.

A mass spectrometer equipped with an electrostatic ion energy analyzer has been used to measure the kinetic-energy distributions of ions sampled through an orifice in the grounded electrode of a parallel-plate radio-frequency (RF) discharge cell. Kinetic-energy distributions are presented for Ar(1+), Ar2(1+), Ar(2+), He(1+), and ArHe(1+) sampled from argon-helium plasmas with helium concentrations ranging from 0-95 mole percent, applied peak-to-peak RF voltages of 200 V, and gas pressures of 13.3 Pa. Variations in the ion kinetic-energy distributions and ion fluxes observed for different gas mixtures demonstrate the ability of this diagnostic technique to monitor plasma conditions and to investigate the ion kinetic processes occurring in the system.

Pub. in Proceedings of International Conference on Spectral Line Shapes (10th), Austin, TX., June 25-29, 1990, p78-79.

Keywords: *Hydrogen plasma, Many-body problem, Ion collisions, Line broadening, Stark effect, Reprints, Hydrogen-like ions, Ion dynamics.

As a rule, hydrogen and hydrogen-like systems are the most sensitive to collisional Stark broadening in plasmas. The l-degeneracy in hydrogen gives rise to a first-order Stark effect. This same fact accounts for the long-range of the interaction between the hydrogenic radiator and the charged perturbers in the plasma, and thus for the fact that strong ion collisions which overlap in time are likely to occur, except at very low densities.

Spectroscopic Diagnostics of Low Temperature Plasmas: Techniques and Required Data.
Final rept.
W. L. Wiese. 1991, 11p.
Pub. in Spectrochimica Acta B 46, n6-7 p831-841 1991.

Keywords: *Cold plasmas, *Plasma diagnostics, *Spectroscopic analysis, Atomic spectroscopy, Transition probabilities, Electron density, Stark effect, Argon, Iron, Reprints.

An overview of plasma diagnostic techniques based on atomic spectroscopy, interferometry, and laser scattering is given. Two widely used spectroscopic techniques--the Boltzmann-plot or slope method for excitation temperature measurements, and Stark width determinations for electron density measurements--are discussed in detail. As these techniques depend critically on the availability of accurate atomic data, specifically transition probabilities and Stark broadening parameters, the numerical data are reviewed with respect to availability and quality. For the important spectra of Ar I and Fe I, tables of the most accurate available transition probabilities--typically with uncertainties of + or - 10% or less--are given, which are based on very recent critical compilations. Some specific data needs are pointed out which would significantly contribute to improve the accuracy of the diagnostic techniques.

Electrical Sensors for Monitoring rf Plasma Sheaths.
Final rept.
M. A. Sobolewski, and J. K. Olthoff. 1994, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Microelectronic Processes, Sensors, and Controls, Monterey, CA., September 27-29, 1992, v2091 p290-300 1994.

Keywords: *Plasma sheath, *Argon, *Radiofrequencies, Sensors, Glow discharges, Electric current, Electrical impedance, Electrical properties, Electric potential, Kinetics, Distribution functions, Reprints.

The authors have investigated the use of radio-frequency (rf) current and voltage measurements to monitor the electrical characteristics of rf plasmas and to predict changes in ion kinetic energy distributions. These studies were performed at 2.7 and 13.3 Pa (20 and 100 mTorr) in a Gaseous Electronics Conference (GEC) RF Reference Cell in mixtures of argon with oxygen, nitrogen and water. Simultaneous with the electrical measurements, the kinetic energy distributions of ions at the grounded electrode were obtained using a mass spectrometer equipped with an ion energy analyzer. It is expected that the measurement techniques described here could be extended to monitor the sheath above a wafer during plasma etching to obtain information about changes in the condition of the wafer surface and energies of ions bombarding it.

M. V. V. S. Rao, S. B. Radovanov, R. J. Van Brunt, and J. K. Olthoff. 1995, 1p.
Pub. in International Conference on the Physics of Electronic and Atomic Collisions (19th), Whistler, British Columbia, Canada, July 26-August 1, 1994, p392 1995.

Keywords: *Gas discharges, *Kinetic energy, *Charge transfer, Argon, Neon, Reprints, Mass spectrometry, Townsend discharge, Electric fields, Ions.

Results are reported from measurements of the kinetic energy distributions of mass selected ions from diffuse, Townsend discharges in neon and argon at high electric field-to-gas density (E/N) ratios from 3 x 10 to the minus 18th power Vm2 to 6 x 10 to the minus 18th power Vm2. The ion energies were measured using a cylindrical mirror analyzer coupled to a quadruple mass spectrometer. The measured ion energy distributions are compared with predictions from solving the Boltzmann transport equation assuming that symmetric resonant charge transfer is the dominant ion-neutral interacton. Results for Ne+ in Ne show evidence of deviations from equilibrium.

Keywords: *Charged particles, *Ions, *Plasma diagnostics, Atomic properties, Spectroscopy, Nuclear fusion, Electron beams, Ion traps(Instrumentation), Reprints, HCIs(Highly charged ions), EBIT(Electron beam ion trap).

This news article discusses one of the applications of our research on highly charged ions: an optical diagnostic for extremely hot plasmas, such as those found in fusion devices. Our results were published in Phys. Rev. Letters earlier this year and are reviewed and updated, and put into perspective for a more general audience.

Kinetic Energy Distributions of H(+), H2(+), and H3(+) from a Diffuse Townsend Discharge in H2 at High E/N.
Final rept.
M. V. V. S. Rao, R. J. Van Brunt, and J. K. Olthoff. 1995, 2p.
Pub. in International Symposium on Electron- and Photon-Molecule Collisions and Swarms, Berkley, CA., July 22-25, 1995, pH-9.

Keywords: *Hydrogen ions, *Gas discharges, Kinetic energy, Distribution functions, Townsend discharge, Reprints.

The translational kinetic-energy distributions of the predominant ions, H+, H2+, and H3+, formed in a diffuse Townsend discharge in H2 were measured for electric field-to-gas density ratios (E/N) from 7 x 10 to the minus 19th power Vm2 to 2 x 10 to the minus 18th power Vm2. The discharge was generated in a parallel-plate electrode gap for conditions corresponding to the 'left-hand' side of the Paschen minimum where the electric field in the gap is expected to be constant and uniform, i.e., the discharge is characterized by a well defined E/N. The discharge cell configuration and ion measurement system are similar to those described previously. The ions were sample through a 0.1 mm diameter orifice in the center of the stainless-steel cathode. Simultaneous analyis of ion energy and mass was performed using a cylindrical mirror analyzer coupled to a quadrupole mass spectrometer.

Nonequilibrium Total-Dielectric-Function Approach to the Electron Boltzmann Equation for Inelastic Scattering in Doped Polar Semiconductors.
Final rept.
B. A. Sanborn. 1995, 9p.
Pub. in Physical Review B, v51 n20 p14 247-14 255 May 95.

Keywords: *Dielectric functions, *Semiconductors, Inelastic scattering, Reprints, *Doped polar semiconductors, Boltzmann equation.

The paper describes a simple and general method for deriving the inelastic collision term in the electron Boltzmann equation for scattering from a coupled electron-phonon system and applies the method to the case of doped polar semiconductors. In the Born approximation, the inelastic differential scattering rate W(inel) can be expressed in terms of the nonequilibrium total dynamic dielectric function, which includes both electronic and lattice contributions. Within the random-phase approximation W(inel) separates into two componenents: an electron-electron interaction containing the nonequilibrium distribution function for excitations of the electron gas and a Frohlich interaction including the phonon distribution function and self-energy due to polarization of the electrons. Each of these two interactions is screened by only the electronic part of the total dielectric function, which contains the high-frequency dielectric constant, unlike commonly used expressions that contain the static dielectric constant.

Apparatus for Resistance Measurement of Short, Small-Diameter Conductors.
Final rept.
C. A. Thompson. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurements, v43 n4 p675-677 Aug 94.

Keywords: *Electrical resistivity, *Conductors, Copper, Reprints, Fibers, Measurement, Resistance.

A system for determining the dc resistance of individual conductors 2 micrometers in diameter and 0.5-1 mm in length is described. The system uses a four-wire measurement, computerized data acquisition, and unique sample handling and contacting methods. To demonstrate system operation, data from measurements made on small-diameter copper wires are presented. These wires were first measured in long lengths on another system and then cut into short lengths and remeasured on this system. The results from these two measurement systems show that this system is an effective tool for determining the resistance per unit length of short, small-diameter conductors.

Shear Suppression of Critical Fluctuations in a Diluted Polymer Blend.
Final rept.
E. K. Hobbie, A. I. Nakatani, H. Yajima, J. F. Douglas, and C. C. Han. 1996, 3p.
Pub. in Physical Review E, v53 n5 p4322-4324 May 96.

Keywords: *Phase separation, *Diluted blends, Reprints, Neutron scattering, Light scattering, *Fisher renormalization.

Small-angle neutron scattering has been combined with equilibrium dynamic light scattering to study shear-induced mixing in a diluted high-molecular-weight polymer blend. The data show an enhancement of critical fluctuations upon dilution and are found to collapse onto a universal scaling curve containing no free parameters. The scaling curve is motivated by the theoretical predictions of Onuki and Kawasaki for undiluted binary mixtures. The data also appear to suggest that 'Fisher renormalization' is relevant in this diluted pseudobinary polymer mixture, consistent with a previous dynamic-light-scattering study.

Pub. in Jnl. of Thermal Spray Technology, v5 n3 p343-351 Sep 96.

Keywords: *Plasma spray, *Zirconia powder, *Spray dried powder, Powder characterization, Thermal barrier coatings, Thermal rupture test, Reprints.

The correlation between the performance of plasma spray coatings and feedstock powder properties is not fully understood. To demonstrate this correlation, eight spray-dried zirconia powders containing a mass fraction of 20% Y2O3(yttria) were characterized with respect to their physical, bulk chemical, and surface chemical properties. The same powders were plasma spray deposited as coatings, and their relative performance was evaluated using a thermal rupture test developed by Pratt and Whitney. The specific powder properties studied were chemical composition, binder content, particle size distribution, powder morphology, interface chemistry, thermogravimetry, phase composition, and specific surface area. Among the characterization data, the binder-related properties of the powder correlated most strongly with the thermal rupture test data. Specifically, higher binder contents were associated with poor thermal rupture test performance.

Higher-Order Approximations in Ionospheric Wave-Propagation.
J. Feinstein. Jun 50, 10p.
Pub. in Jnl. of Geophysical Research, v55 n2 p161-170, Jun 50.

Keywords: *Approximation, *Ionospheric propagation, Velocity, Mathematical models, Electromagnetic fields, Ionosphere, Reprints, Vibration, Equations of motion, Time dependence, Electromagnetic wave transmission, Drift, Resonance, Perturbations, Transverse waves, Maxwells equations, Plane waves, Difference frequency.

It is found that the ionosphere, even when considered homogeneous, is a linear medium for the propagation of electromagnetic waves only as a first approximation. Second-order terms give rise to harmonics, and to sum and difference frequencies when low independent waves traverse the same physical region. These new frequencies are, in general, of the nature of forced vibrations, except in the case where their propagation characteristics are those of a natural mode capable of existing in the region. A resonance effect then occurs, the new wave increasing its energy at the expense of the interacting waves, and assuming an independent existence. While these effects couple energy from the primary wave, they do not affect its propagation characteristics. As a result of the degeneracy of the determinantal equation for the propagation constant, the introduction of any disturbing physical effects, such as a layer drift velocity, raises the degree of the equation, resulting not merely in changes in the values of the propagation constants of the usual modes, but, in addition, introducing new ones. For the usual disturbing effects encountered in the ionosphere, the energy content of these new modes is negligibly small. (AN).

Electromagnetic Scattering by a Periodic Surface with a Wedge Profile.
Final rept.
D. A. Hill. 1992, 18p.
Pub. in Electromagnetics 12, p247-264 1992.

Keywords: *Electromagnetic scattering, Polarization(Waves), Two dimensional, Numerical solution, Perturbation theory, Absorbers(Materials), Matrices, Electromagnetic absorption, Reprints, Dielectric wedges, Periodic surfaces, Extended boundary conditions, Ill-conditioned problems(Mathematics).

Two-dimensional scattering from a periodic surface with a wedge profile is treated for both TE and TM polarization. The interface can be either perfectly conducting or penetrable, and the extended boundary condition (EBC) is used in both cases. The method results in simple matrix elements and is easy to apply. Comparison with a perturbation solution shows that the EBC method has greater accuracy and a greater range of validity. Even so, EBC becomes numerically ill conditioned for surface heights that are a significant fraction of the period or the wavelength. Numerical results are presented for conservation of power, and some comparisons are made with previous results for sinusoidal surfaces. Some applications to rf absorber are also presented.

Pub. in NDT and E International, v28 n3 p155-162 1995.

Keywords: *Electromagnetic scattering, *Compton effect, Reprints, Monte Carlo method, Computerized simulation, *Foreign technology, *Multiple scattering.

The multiple scattering background in Compton scatter imaging at 662 keV is studied, both experimentally and by Monte Carlo radiation transport calculations as a function of the scattering angle, scattering material (aluminum, brass and tin) and object thickness. A double-peak structure was observed in the pulse-height distribution for the thicker brass and tin objects and at the larger scattering angles (90 degrees and 120 degrees). In addition to the Compton peak, a second peak appeared at a higher energy. Monte Carlo transport simulations have revealed the origin of the second peak: photons that have scattered exactly twice before reaching the detector. The ratio of the multiple-scattered radiation to the total radiation detected was calculated as a function of the energy-window width around the Compton peak and scattering angle. The results of this study may help in the design of future Compton scatter imaging apparatus.

The plane-wave spectrum representation has been found useful for providing a mathematical description for the response of a receiving antenna or other test object in a reverberation chamber and for calculating the quality factor (O) for reverberation chambers of arbitrary geometries. The purpose of this correspondence is to show that the plane-wave spectrum representation can also be used to provide a simple derivation for the spatial correlation function of the fields. The identical correlation function has been derived via a cavity mode representation and has been tested experimentally.

E. Marx. 1992, 4p.
Pub. in Institute of Electrical and Electronics Engineers Antennas and Propagation Society International Symposium, Chicago, IL., July 18-25, 1992, v4 p1865-1868, 1992 Digest.

Keywords: *Dielectric wedge, *Electromagnetic scattering, Far fields, Hypersingular integrals, Integral equations, Sharp edges, Reprints.

The theory of the behavior of electromagnetic fields near the edge of a dielectric wedge is poorly understood and disagrees with numerical results. Here the authors compute the fields scattered by a finite dielectric wedge and compared the results obtained by using two different integral equations. The unknown boundary function is either the jump n in the normal derivative of the auxiliary field across the boundary or the jump 0 in the field itself. In the latter case, one of the integrals is hypersingular.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Antennas and Propagation, v41 n8 p1001-1008 Aug 93.

Keywords: *Electromagnetic scattering, *Dielectrics, Integral equations, Reprints, Dielectric wedges.

Electromagnetic fields scattered by a finite dielectric wedge are computed using a hypersingular integral equation (HIE). The results are compared with those obtained previously using a singular integral equation (SIE) and with the theory that predicts that the fields near the edge of the wedge behave like static fields. The HIE produces more consistent results than the SIE, probably because the unknown boundary function tends to a constant near the edge instead of diverging. The two numerical methods agree reasonably well, and these results agree only in part with the static field behavior.

The electrical performance of many superconducting materials is strongly dependent on mechanical load. This report presents electromechanical data on a broad range of high-magnetic-field superconductors. The conductors that were studied fall into three general categories: Candidate conductors, experimental conductors, and reference conductors. Research on candidate conductors for fusion applications provides screening data for superconductor selection as well as engineering data for magnet design and performance analysis. The effect of axial tensile strain on critical-current density was measured for several Nb(sub 3)Sn candidate conductors including the US-DPC (United States Demonstration Poloidal Coil) cable strand and an ITER (International Thermonuclear Experimental Reactor) candidate conductor. Also, data are presented on promising experimental superconductors that have strong potential for fusion applications. Axial strain measurements were made on a V(sub 3)Ga tape conductor that has good performance at magnetic fields up to 20 T. Axial strain data are also presented for three experimental Nb(sub 3)Sn conductors that contain dispersion hardened copper reinforcement for increased tensile strength. Finally, electromechanical characteristics were measured for three different Nb(sub 3)Sn reference conductors from the first and second VAMAS (Versailles Project on Advanced Materials and Standards) international Nb(sub 3)Sn critical-current round robins. Published papers containing key results, including the first measurement of the transverse stress effect in Nb(sub 3)Sn, the effect of stress concentration at cable-strand crossovers, and electromechanical characteristics of Nb(sub 3)Al, are included throughout the report.

A comparison is made of measurements of the effect of axial tensile strain on the critical current of multifilamentary Nb(sub 3)Sn superconductors by three different laboratories. Two of the laboratories used short sample testing apparatus wherein a straight section of conductor was cooled in a force-free state. One of the laboratories used a spring apparatus wherein a long sample was reacted in a coil shape and attached to a spring sample holder. The agreement between the results for the two laboratories that used the straight sample apparatus was quite good, within 15% for all three conductors at 15 T, except at very high strain for one conductor which had an upper critical field close to the measurement field. To make a comparison with the data obtained using the spring method, it was necessary to fit the data to the compressive prestrain determined using the straight-sample technique. With such a fit, the agreement was variable, between 15 and 25% depending on the conductor. Values of the prestrain and irreversible strain obtained from the straight sample data agreed within 0.06% and 0.05% respectively. Values of the maxi (strain-free) upper critical fields agreed within several tenths of a tesla.

Contract AI01-84ER52113
Japan-US workshop on high field superconductors materials and standard procedures for high-field superconducting materials testing (6th), Boulder, CO (United States), 22-24 Feb 1989. Sponsored by Department of Energy, Washington, DC.

Keywords: *Niobium Alloys, *Tin Alloys, Comparative Evaluations, Critical Current, Fabrication, Intermetallics, Stresses, Superconducting Magnets, Tensile Properties, Wire, EDB/360107, EDB/360103, EDB/665412.

The effect of transverse stress on the critical current density, J(sub c), has been shown to be significant in bronze process Nb(sub 3)Sn, with the onset of significant degradation at about 50 Mpa. In an applied field of 10 T, the magnitude of the effect is about seven times larger for transverse stress than for axial tensile stress. In a subsequent study, similar results were observed in another bronze process Nb(sub 3)Sn conductor made by a different manufacturer. The mechanism accounting for the transverse stress effect and its large magnitude compared with the axial tensile effect is still the subject of speculation. In an attempt to better understand the nature of the effect, The authors have undertaken a series of experiments to determine whether the transverse stress effect depends on the grain morphology of the Nb(sub 3)Sn reaction layer in the superconductor. To do this, the authors have measured the effect in an internal tin conductor with excess tin, which yields a more equiaxed Nb(sub 3)Sn grain morphology than for bronze process Nb(sub 3)Sn, where the grains are more columnar. The results for the effect of transverse compression on the J(sub c) of a round bronze process Nb(sub 3)Sn wire are given. The data are probably applicable to a wide variety of Nb(sub 3)Sn conductors for magnet engineering.

Keywords: *Magnetic susceptibility, *Superconductors, High temperature superconductors, Superconducting films, Critical temperature, Critical current, Critical field, Meissner effect, Alternating current, Calibration, Diamagnetism, Demagnetization, Granular materials, Sensitivity, Design, Reviews, Bibliographies, *Susceptometers.

The review critically analyzes current practice in the design, calibration, sensitivity determination, and operation of alternating-field susceptometers, and examines applications in magnetic susceptibility measurements of superconductors. Critical parameters of the intrinsic and coupling components of granular superconductors may be deduced from magnetic susceptibility measurements. The onset of intrinsic diamagnetism corresponds to the initial decrease in electrical resistivity upon cooling, but the onset of intergranular coupling coincides with the temperature for zero resistivity. The lower critical field may be determined by the field at which the imaginary part of susceptibility increases from zero. Unusual features in the susceptibility of superconductor films, such as a magnetic moment that is independent of film thickness and the variation of susceptibility with angle, are related to demagnetization. Common misunderstandings of the Meissner effect, magnetic units, and formula conversions are discussed. There is a comprehensive summary of critical-state formulas for slabs and cylinders, including new equations for complex susceptibility in large alternating fields. Limitations on the use of the critical-state model for deducing critical current density are listed and the meaning of the imaginary part of susceptibility is considered.

Computation of Dendrites Using a Phase Field Model.
A. A. Wheeler, B. T. Murray, and R. J. Schaefer. Jul 92, 42p, NISTIR-4894.

Keywords: *Dendritic crystals, *Crystal growth, *Solidification, Finite difference theory, Mathematical models, Two-dimensional calculations, Numerical solution, Interfaces, Nickel, Spheres, Free boundary problems, Phase field models.

A phase field model is used to numerically simulate the solidification of a pure material. We employ it to compute growth into an undercooled liquid for a one-dimensional spherically symmetric geometry and a planar two-dimensional rectangular region. The phase field model equations are solved using finite difference techniques on a uniform mesh. For the growth of a sphere, the solutions from the phase field equations for sufficiently small interface widths are in good agreement with a numerical solution to the classical sharp interface model obtained using a Green's function approach. In two dimensions, we simulate dendritic growth of nickel with four-fold anisotropy and investigate the effect of anisotropy level on the growth of a dendrite. The quantitative behavior of the phase field model is evaluated for varying interface thickness and spatial and temporal resolution. Results are discussed.

The lattice spacing comparator established at the National Institute of Standards and Technology to measure the lattice spacing differences between nearly perfect crystals is described in detail. Lattice spacing differences are inferred from the measured differences in Bragg angles for different crystals. The difference in lattice spacing between silicon samples used at Physikalisch-Technische Bundesanstalt (PTB) and NIST has been measured with a relative uncertainty of 1 x 10(-8). The measurement is consistent with absolute lattice spacing measurements made at PTB and NIST. Components of uncertainty associated with systematic effects due to misalignments are derived and estimated.

Short range order in an AlCuFe quasicrystal was investigated using the double isotopic substitution of Fe in

order to determine partial radial distribution (pair correlation) functions of the system. The experiment was carried out on the 7c2 spectrometer at Orphee designed for studies of atomic local order in liquid and amorphous systems. Very accurate total radial distribution functions were calculated. All of the observed pair distances, up to about 10 A, are consistent with the atomic positions of the model proposed by Cornier-Quiquandon et al. (Phys. Rev. B44 (1991) 2071). Partial Fe-Fe pair correlation functions have been extracted and show that Fe atoms occupy only a subset of sites.

Raman and Fluorescence Spectra Observed in Laser Microprobe Measurements of Several Compositions in the Ln-Ba-Cu-O System.
Final rept.
E. S. Etz, T. D. Schroeder, and W. Wong-Ng. 1990, 5p.
Pub. in Proceedings of Annual Conference of the Microbeam Analysis Society (25th), Seattle, WA., August 12-18, 1990, p243-247.

Keywords: *Superconductors, Rare earth compounds, Vibrational spectra, Raman spectra, Microanalysis, Microprobes, Fluorescence, Impurities, Reprints, Erbium barium cuprates, Europium barium cuprates.

The superconducting and related phases in the Ln-Ba-Cu-O system are investigated by Raman microprobe measurements to obtain their vibrational Raman spectra and any structure-specific fluorescence spectra from active lanthanide (Ln) or rare earth ions. These studies are aimed at relating the observed optical spectra to the compositional and structural aspects of these materials. Specific examples are discussed with special reference to the erbium and the europium analogs of the yttrium 1:2:3 superconductor. Highlighted are the results from certain phases that are known to constitute potential impurity phases in the superconducting compositions. The microanalytical implications of these results are discussed.

Neutron-Spectroscopy Study of the Hydrogen Vibrations in Hydrogen-Doped YBa2Cu3Ox.
Final rept.
U. Knell, H. Wipf, H. J. Lauter, T. J. Udovic, and J. J. Rush. 1993, 7p.
Pub. in Jnl. of Phys.: Condens. Matter 5, p7607-7613 1993.

Keywords: *YBCO superconductors, Electron phonon interactions, Neutron spectroscopy, Orthorhombic lattices, Tetragonal lattices, Doped materials, Cryogenic temperature, Reprints, *Hydrogen vibrations.

The authors studied H vibrations in H-doped YBa2Cu3O(x)H(y) (y = 0.6) by neutron spectroscopy. Neutron spectra were taken at 10 and 14 K from both orthorhombic (x approx equals 6.9) and tetragonal (x approx equals 6.3) samples. The spectra exhibit large H-induced intensities in the energy range between 40 and 130 meV. In comparison to orthorhombic samples, the H vibrations in tetragonal samples are shifted to lower energies by about 11%. This shift is opposite to the spectral shift of the lattice vibrations between H-free orthorhombic and tetragonal YBa2Cu3O(x), frequently attributed to differences in the electron-phonon coupling. The results show that any such differences in the electron-phonon coupling are not apparent in the H vibrations. The results also support previous suggestions that the H occupies sites in the close neighborhood of the Cu(1) atomic planes.

Pub. in Jnl. of Applied Physics 73, n10, p6886-6891, 15 May 93. Sponsored by Office of Naval Research, Arlington, VA. and National Science Foundation, Arlington, VA.

Keywords: *Iron oxides, *Nickel oxides, *Superlattices, Antiferromagnetic materials, X ray diffraction, Neutron diffraction, Magnetization, Thin films, Reprints, Magnetic ordering, Exchange interactions, Multilayers.

Presented are studies of the magnetic and structural ordering in superlattices composed of Fe3O4 and NiO, and their study by a variety of techniques including x-ray and neutron diffraction, and SQUID magnetometry. X-ray diffraction indicates that structures with individual layer thicknesses down to 8.5 A grow as single crystals in registry with the substrate lattice with a layer-thickness-dependent tetragonal lattice distortion due to epitaxial and interfacial lattice mismatch. The lattice coherence of the Fe3O4 layers, however, is degraded by stacking faults between adjacent spinel layers. Neutron diffraction indicates that the NiO orders antiferromagnetically along the (in brackets: 111) direction with a magnetic coherence that extends over several superlattice bilayers, and the presence of an enhancement in the NiO Neel temperature in thin layered superlattices. These results are compared with SQUID magnetometry, which shows large anisotropy energies, but a lack of favored magnetization direction, indicating that the magnetic ordering in these systems is dominated by the exchange coupling across the interfaces.

Keywords: *Dysprosium, *Lutetium, *Superlattices, Curie temperature, Magnetostriction, Thin films, Ferromagnetic materials, Alignment, Reprints.

We have grown high quality superlattices of Dy with nonmagnetic Lu and find that the 2.4% epitaxial compression nearly doubles the ferromagnetic T(c) of Dy with little change in the Neel temperature. A helimagnetic phase exists over a narrow temperature range. Below T(c) in superlattices, 300 A orthorhombic domains form despite epitaxial constraints, each with a magnetostrictive distortion comparable to that of bulk Dy. For the thinnest intervening Lu layers, individual ferromagnetic Dy blocks have parallel alignment; the remaining samples show antiparallel alignment, coherent over many bilayer periods.

Dispersions of Magnetic Excitations of the Pr Ions in Pr2CuO4.
Final rept.
I. W. Sumarlin, J. W. Lynn, and T. Chattpadhyay. 1994, 5p.
Pub. in Physica C 219, p195-199 1994.

Keywords: *Superconductors, Praseodymium ions, Crystal field, Dispersion, Excitons, Reprints, *Praseodymium cuprates, Exchange interactions.

The authors have used inelastic neutron scattering techniques to measure the dispersion of the singlet-doublet magnetic excitons of the Pr(3+) ions in the singlet ground state system Pr2CuO4. The excitons exhibit significant dispersion both within the basal plane as well as along the c-axis direction, directly demonstrating the Pr-Pr exchange interactions. These exchange interactions must be mediated through the CuO2 layers involved in the formation of the superconducting state.

Pub. in Physical Review Letters 70, n23 p3615-3618, 7 Jun 93. Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Iron, *Epitaxial growth, Scanning tunneling microscopy, Whiskers(Single crystals), Electron diffraction, Surface diffusion, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Metal films, Reprints.

The authors report real space views of the homoepitaxial growth of Fe on Fe(001) whiskers observed by scanning tunneling microscopy. A measure of the surface diffusion of the Fe atoms is obtained over the temperature range of 20-250 deg C. The effect of the diffusion kinetics is observed in the surface morphology as a decrease in the interface width with temperature. Measurements of reflection-high-energy-electron diffraction during growth allow a comparison of real and reciprocal space techniques.

Effects of Critical Current Density, Equilibrium Magnetization and Surface Barrier on Magnetization of High Temperature Superconductors.
Final rept.
D. X. Chen, R. W. Cross, and A. Sanchez. 1993, 9p.
Pub. in Cryogenics 33, n7 p695-703 1993.

Keywords: *High temperature superconductors, *Magnetization, YBCO superconductors, Critical current, Surface barrier, Mathematical models, Temperature range 0065-0273 K, Current density, Reprints, Yttrium barium cuprates.

An extended critical state model which includes the effects of bulk critical current density, equilibrium magnetization and surface barrier is developed for the magnetization of superconductors. The equilibrium magnetization and surface barrier are modeled by an applied field dependent surface supercurrent density j(sub s)(H), whose presence changes the boundary field of the bulk. The volume supercurrents flow with a density equal to the internal field dependent critical current density J(sub c)(H(sub i)). The magnetization M is produced by both supercurrents. For the M(H) curve computation, exponential-type J(sub c(H(sub i)) and j(sub s)(H) values are used for the general case of an infinite sample of rectangular cross-section. A comparison between the experimental magnetization curves of a sintered YBa2Cu3O7 superconductor at 76 K and the model fit shows that j(sub s)(H) is null for the coupling matrix, whereas a non-zero j(sub s)(H) is needed for the grains. The model fit for the irreversible magnetization of the grains is improved by including a surface barrier to the entry and exit of flux.

Final rept.
S. Guha, D. Peebles, V. Browning, M. Norton, T. Wieting, and D. Chandler-Horowitz. 1993, 11p.
Pub. in Jnl. of Superconductivity 6, n5 p339-349 1993.

Keywords: *Infrared reflectance, Reprints, Single crystals, Room temperature, Superconductors, Ellipsometry, Polarons, Phonons, *Potassium barium bismuthates, *Rubidium barium bismuthates, Optical conductivity.

Reflectance data (0.001-4.0 eV) from several large (a typical surface area 3 x 3 sq mm) single crystals of Ba(l - x) K(x) BiO3 (x = 0.04, 0.37) (BKBO) and Ba(l - x) Rb(x) BiO3 (x = 0.37) (BRBO) were obtained by Fourier Transform infrared (FTIR) and ellipsometric methods. Normal-state optical conductivities of these samples were obtained from infrared and ellipsometric measurements using a Kramers-Kronig transform. A broad mid-IR band was observed that peaked at 0.3 eV for BKBO and at 0.16 eV for BRBO at room temperature. Each band was fitted with two Lorentz oscillators. The optical mass of the charge carriers was obtained from a Drude fit, and was found to be large.

These overdamped charge carriers can be viewed as polarons with a large effective mass. An optic phonon mode at 325/cm was also observed in the metallic phase. Interpretations of low-temperature measurements on BKBO and BRBO were complicated due to the change of color of the sample from bluish-green to bronze-red. Upon warming, samples revert to their original bluish-green color.

Interfacial Free Energies from Substrate Curvature Measurements of the Creep of Multilayer Thin Films.
Final rept.
D. Josell. 1994, 8p.
Pub. in Acta Metall. Mater. 42, n3 p1031-1038 1994.

Keywords: *Free energy, Creep properties, Thin films, Substrates, Interfaces, Reprints, Biaxial curvature, Multilayers.

The equilibrium biaxial curvature of a multilayer thin film adhering to a free standing substrate is determined when plastic flow is possible in the multilayer. The relationship found between the equilibrium biaxial curvature and the interfaces in the multilayer is modified to account for grain boundaries in the layers. Two possible experiments that use the resulting relationship to determine interfacial free energies are described.

Pub. in Surface Science 298, p215-224 1993. Sponsored by National Science Foundation, Washington, DC. and Air Force Office of Scientific Research, Washington, DC.

Keywords: *Nickel, *Copper, *Phonons, Temperature dependence, Molecular dynamics, Surface potential, Simulation, Reprints, Anharmonicity.

Molecular dynamics simulations were performed for Ni(110) and Cu(110) using Finnis-Sinclair model potential. During the simulations the temperature dependencies of the mean-square displacements (MSD), the layer-by-layer stress tensors, and the surface phonon spectral densities were measured. The simulation results imply that the Ni(110) and Cu(110) surfaces do not extensively roughen before the onset of adatom-defect formation, and, in confirmation of experimental findings, that the rapid decrease of specular intensity for helium or electron scattering at elevated temperatures is due to the influence of anharmonicity in the surface potential.

Keywords: Temperature range 0013-0065 K, Gadolinium-gallium garnet, Magnetic refrigerators, Solid clusters, Entropy, Reprints, *Gadolinium gallium ferrates, *Magnetocaloric effect, Cryogenic refrigerators, Exchange interactions, Nanostructures.

The working refrigerant material in the majority of magnetic refrigerators has been Gd3Ga5O12 (GGG) which has an upper temperature limit near 15 K. In this paper we report on the field-induced adiabatic magnetic entropy change, Delta S(sub m)(H,T), of a series of iron-substituted gadolinium garnets (GGIG) Gd3Ga(5-x)Fe(x)O12 which have the potential to increase the working temperature range or to reduce the field requirements of cryogenic magnetic refrigeration. Depending on Fe concentration, x, the entropy change of these materials at applied fields of 0.9 and 5.0 T is much greater than that of GGG, especially at temperatures above 15 K. At low Fe concentrations, the results are consistent with formation of magnetically ordered clusters of spins at low temperatures. Room temperature electron paramagnetic resonance measurements show that Fe(3+) ions mediate exchange interactions which are responsible for clustering at low temperatures.

Pub. in NanoStructured Materials 2, p277-283 1993.

Keywords: Magneto-thermal effects, Magnetic refrigerators, Magnetic fields, Neodynium containing alloys, Boron containing alloys, Aluminum alloys, Iron alloys, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Temperature dependence, Magnetization, Entropy, Reprints, *Magnetocaloric effect, Rapid solidification.

We have measured the temperature and field dependence of the magnetization of several rapidly solidified Nd(0.14)(Fe(1-x)Al(x))(0.80)B(0.06) alloys in the 290-500 K temperature range at fields from 0 to 0.9 T. At room temperature the materials are ferromagnetic. Calculations of the magnetocaloric effect from the magnetization data clearly show a peak in the field-induced entropy change, Delta S, at a critical temperature T(p), which varies with aluminum content and is identified as the Curie temperature, T(c), by differential scanning calorimetry measurements. The magnitude, shape and width of the Delta S vs. T curves differ greatly from that predicted for elemental ferromagnets, but are consistent with curves predicted for magnetic nanocomposites. This similarity suggests that the magnetic moments are (1) grouped in clusters with moments on the order of 20 - 50 mu(sub B) and (2) that these materials may be potential candidates for high temperature magnetic refrigerants.

Correction to the Decay Rate of Nonequilibrium Carrier Distributions Due to Scattering-in Processes.
Final rept.
B. A. Sanborn, B. Y. K. Hu, and S. Das Sarma. 1994, 3p.
Pub. in Physical Review B 49, n11 p7767-7769, 15 Mar 94.

Keywords: *Charge carriers, Electron scattering, Doped materials, Semiconductors, Correction, Reprints.

We show that, for doped semiconductor structures at nonzero temperatures, processes which scatter electrons into a state (vertical stroke) K > can contribute strongly to the decay of a nonequilibrium electron occupation of (vertical stroke) K >. For electrons, the decay rate gamma (K) is given by the sum of the total scattering-out and scattering-in rates of state (vertical stroke) K >. The scattering-in term is safely neglected in the nondegenerate and highly degenerate limits, but it increases gamma (K) of low-energy electrons injected into semidegenerate systems (between these limits) by the factor (1 - f(0)(K))(sup -1). We show that the degree of degeneracy of a system of fermions depends strongly on the system dimension, so that doped systems of reduced dimension can be semidegenerate, with the two scattering rates comparable, even at high temperature.

Magnetocaloric Effect of Ferromagnetic Particles.
Final rept.
R. D. Shull. 1993, 2p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 29, n6 p2614-2615 Nov 93.

Keywords: Magneto-thermal effects, Gadolinium-gallium garnet, Magnetic refrigerators, Superparamagnetism, Solid clusters, Entropy, Reprints, *Gadolinium gallium ferrates, *Magnetocaloric effect, Nanocomposites.

The entropy change accompanying the removal of an applied magnetic field (i.e., the magnetocaloric effect) has been calculated for a system of magnetic spins independent of each other and also clustered together into independently-acting magnetic particles. Mean-field theory calculations have also been made for interacting, single magnetic spins and also for interacting, magnetic particles. In both cases, there are found temperature and field regimes where the entropy changes are larger when the spins are coupled together into nanometer-sized magnetic particles. Entropy change data is shown for a new Gd3Ga(5-x)Fe(x)O(12) (X = or < 2.5) magnetic nanocomposite, confirming the calculations and possessing magnetocaloric effects larger than the presently preferred low temperature paramagnetic refrigerant, gadolinium gallium garnet.

Viewpoint: Nanocrystalline and Nanophase Materials.
Final rept.
R. D. Shull. 1993, 4p.
Pub. in Jnl. of NanoStructured Materials 2, p213-216 1993.

Keywords: Nucleation, Magnetism, Metals, Ceramics, Reprints, *Nanomaterials, Nanocomposites, Nanophases.

Nanocrystalline materials represent one of the most active laboratories in recent times for the atomic tailoring of materials with specific properties and property combinations. However, it is still in its infancy; its emergence as a major materials science thrust has just begun. At this stage in its development, there have been glimpses of exciting new properties (e.g., superplasticity, giant magnetoresistance, transparency in opaque ceramics, enhanced homogeneity, unusually soft ferromagnetism, and giant magnetocaloric effects) possessed by materials containing some critical length which has been reduced to nanometer dimensions. But, for many of these cases, it still remains to be determined whether the property changes are due to new physics of the mechanisms at small dimensions or to an extension of larger-scale systematics to small sizes.

Weak-Link-Free Behavior of High Angle YBa2Cu3O7-x Grain Boundaries in High Magnetic Fields.
Final rept.
S. E. Babcock, X. Y. Cai, D. L. Kaiser, and D. C. Larbalestier. 1990, 3p.
Pub. in Nature 347, n6289 p167-169 1990.

Keywords: *YBCO superconductors, *Grain boundaries, High temperature superconductors, Transport properties, Critical current, Current density, Magnetic fields, Bicrystals, Reprints, *Yttrium barium cuprates, Weak links.

The transport properties across grain boundaries in several bi-crystals of YBa2Cu3O(7-delta) have been measured. In three cases, including two high angle grain boundaries, no weak link behavior was observed. These results remove an important restriction suggested by earlier thin film bi-crystal results, showing that at least some high angle grain boundaries can transmit supercurrents in high magnetic fields at 77 K. Such results are conceptually important in searching for ways to improve the J(ct) characteristics of bulk, polycrystalline high temperature superconductors for high field applications.

D. Balzar. 1992, 12p.
Pub. in Jnl. of Applied Crystallography 25, p559-570 1992.

Keywords: *X-ray diffraction, *Line broadening, Reprints, High temperature superconductors, Distribution functions, Fourier analysis, Lanthanum strontium cuprates, Warren-Averbach method, Voigt functions, Microstains.

The extraction of pure-specimen X-ray diffraction-line broadening is described using a convolution of the instrumental profile and an exact Voigt function. Real Fourier coefficients were computed from the Cauchy and Gauss integral breadths and were input for Warren-Averbach analysis. Smooth surface-weighted and volume-weighted column-length distribution functions were obtained and errors in root-mean-square strains as well as effective domain sizes were evaluated. The method was applied to two cubic structures with average volume-weighted domain sizes up to 3600 A as well as patterns of tetragonal and orthorhombic (La, Sr)2CuO4, which exhibit weak line broadenings and highly overlapping reflections. Comparison with the integral-breadth methods is given. Reliability of the method is discussed in the case of a cluster of overlapping peaks.

Pub. in Jnl. of Materials Science Letters 11, p1419-1420 1992.

Keywords: *BSCCO superconductors, High temperature superconductors, X-ray diffraction, Size determination, Domains, Reprints, *Bismuth strontium calcium cuprates, Warren-Averbach method, Microstrains.

We present an x-ray diffraction peak-broadening analysis of three Bi-Cu-O high-T(c) superconductors. The diffraction line profiles were fitted with a convolution of instrumental and specimen functions. The specimen's particle size and strain contributions to the peak-broadening were analyzed with the Warren-Averbach method. We found that for both the 2212 and 2223 Bi-Cu-O superconductors, microstrain along the c-axis is larger than in the basal plane, because of larger stacking disorder. In the specimen containing both phases, strain is relieved by the macroscopic intergrowth of two phases within the same grain, and effective domain sizes are smaller than in one-phase specimens.

Pub. in Jnl. of Applied Crystallography 26, p97-103 1993.

Keywords: *X-ray diffraction, Reprints, Fourier analysis, Strains, *Voight functions, Warren-Averbach method.

With the assumption that both size- and strain-broadened profiles of the pure-specimen function are described with a Voigt function, it is shown that the analysis of Fourier coefficients leads to the Warren-Averbach method of separation of size and strain contributions. The analysis of size coefficients shows that the 'hook' effect occurs when the Cauchy content of the size-broadened profile is underestimated. The ratio of volume-weighted and surface-weighted domain sizes can range from about 1.31, for the minimum allowed Cauchy content, to 2, when the size-broadened profile is given solely by a Cauchy function. If the distortion coefficient is approximated by a harmonic term, mean-square strains decrease linearly with increasing the average distance. The local strain is finite only in the case of purely Gaussian strain broadening, because strains are then independent of averaging distance.

Experimental Constraints on Some Mechanisms for High-Temperature Superconductivity.
Final rept.
T. W. Barbee, M. L. Cohen, and D. R. Penn. 1991, 7p.
Pub. in Physical Review B 44, n9 p4473-4479 1991.

Keywords: *High temperature superconductors, Electron phonon interactions, Isotope effect, Spectral shift, Transition temperature, Specific heat, Cuprates, Reprints.

Three years after its discovery, many mechanisms have been suggested to explain the phenomenon of high-temperature superconductivity (HTS) in oxides. We propose that experimental data, along with theoretical models, can place constraints on or exclude many of these mechanisms. The isotope shift a, the transition temperature T(o), the ratio of the electronic specific heat jump to the normal state specific heat (Delta)C/(gamma)T(o) and the superconducting gap ratio 2(Delta)/k(B)T(c) are considered. We find limits on the applicability of solely phonon-based and combined phonon-electronic mechanisms.

Meissner, Shielding, and Flux Loss Behavior in Single-Crystal YBa2Cu3O6+x.
Final rept.
L. H. Bennett, L. J. Swartzendruber, and D. L. Kaiser. 1991, 2p.
Pub. in Jnl. of Applied Physics 69, n8 p4889-4890 1991.

Keywords: *Meissner effect, *Ytterbium compounds, Twinning, Flux(Rate), Crystal properties, Magnetic properties, Temperature, Reprints.

Meissner effect measurements were performed on a nearly cubic single crystal of YBCO, which exhibited a predominant (110) twin habit, by cooling the crystal from above T(c) to 10 k in an applied field, H, of 10 Oe. A significant difference was observed for H applied parallel and perpendicular to the c axis, but little difference could be seen for H perpendicular and parallel to the twin boundaries. After cooling from above T(c) in 10 Oe to 10 K, the field was reduced to zero. The magnetization changed sign, increasing by approx. 15 G, which is the value expected for complete flux expulsion by a crystal of this geometry. Magnetization measurements were then made as the temperature was raised back to 100 K. Again, there is a significant difference for the results with H parallel and perpendicular to the c axis, especially above 60 K, with only a small (but possibly meaningful) difference for perpendicular and parallel to the twin boundaries.

W. R. Bennett, C. D. England, D. C. Person, and C. M. Falco. 1991, 7p.
Pub. in Jnl. of Applied Physics 69, n8 p4384-4390 1991.

Keywords: *Palladium, *Cobalt, Reprints, Magnetic anisotropy, Temperature dependence, Domain walls, Metal films, Thin films, Interfaces, Magnetization, Multilayers.

Measurements of the magnetic anisotropy of a series of Pd/Co multilayers grown by magnetically enhanced dc triode sputter deposition revealed an interface contribution of 0.53 ergs/sq cm and a net volume anisotropy of -13.2 x 10(sup 6) ergs/cc. A characteristic reduction of perpendicular anisotropy for ultrathin Co layers (<4A) is explained by using a pair interaction model to evaluate a thickness dependence of the interface anisotropy. Temperature dependence of saturation

magnetization of a Pd(11A)/Co(7.8A) multilayer demonstrates complete mixing of Pd and Co by 380 C.

Keywords: *Kerr magnetooptical effect, *Antiferromagnetism, *Copper, *Iron, Metal films, Epitaxy, Reprints, Multilayers.

The authors report the observation of major enhancements in the magneto-optical polar Kerr rotation in the Fe/Cu/Fe system. These enhancements are as much as a factor of two greater than those anticipated due to recently reported plasma resonance effects. A close connection between these enhancements and antiferromagnetic coupling between the two Fe films is established by the observation of concurrent oscillations in the magnitude of these two effects as a function of Cu thickness.

Non-Equilibrium Thermodynamic Theory of Viscoplastic Materials.
Final rept.
B. Bernstein, and J. T. Fong. 1993, 9p.
Pub. in Jnl. of Applied Physics 74, n4 p2220-2228, 15 Aug 93.

Keywords: *Viscoplasticity, Constitutive equations, Continuum mechanics, Creep properties, Mechanical properties, Fatique(Materials), Thermodynamic, Irreversible processes, Reprints.

A nonequilibrium thermodynamic theory for predicting the mechanical behavior of materials beyond the elastic range is formulated. The theory incorporates the idea of a 'concealed' parameter alpha, originally due to Bridgman (Rev. Mod. Phys. 22, 56 (1950)), where the constitutive equations are governed by (1) a thermodynamic potential such as a generalized Gibbs function, G, or Helmholtz free-energy function, F, each with an explicit dependence on alpha, and (2) a prescription for (alpha dot), the time rate of change of alpha, such that (alpha dot) is directly proportional to the negative of G(alpha) or F(alpha), the partial derivative of G or F with respect to alpha, respectively. The theory is found to be consistent with (1) the second law of thermodynamics regarding entropy production; (2) the concept of Lyapunov stability at equilibrium; (3) the rule of invariance with respect to a transformation of parameters; and (4) the powerful law of invariance with respect to the Legendre transformation. Significance of the new formulation is discussed by solving a class of one-dimensional creep and fatigue modeling problems and by comparing the new theory with several similar approaches in the literature.

Asymptotic Behavior of Modulated Taylor-Couette Flows with a Crystalline Inner Cylinder.
Final rept.
R. J. Braun, G. B. McFadden, B. T. Murray, M. E. Selleck, S. R. Coriell, and M. E. Glicksman. 1993, 13p.
Pub. in Phys. Fluids A 5, n8 p1891-1903 Aug 93. See also PB93-139061.

Keywords: *Crystal growth, *Solidification, Coaxial configuration, Prandtl number, Asymptotic series, Hydrodynamics, Cylinders, Instability, Reprints, Crystal-melt interface, Taylor-Couette flow, Floquet theory.

The linear stability of a modulated Taylor-Couette system when the inner cylindrical boundary consists of a crystalline solid-liquid interface is considered. Both experimentally and in numerical calculations, it is found that the two-phase system is significantly less stable than the analogous rigid-walled system for materials with moderately large Prandtl numbers. A numerical treatment based on Floquet theory is described, which gives results that are in good agreement with preliminary experimental findings. In addition, this instability is further examined by carrying out a formal asymptotic expansion of the solution in the limit of large Prandtl number. It is surprising that the determination of the linear stability of the two-phase system is considerably simpler than that of the rigid-walled system, despite the complications introduced by the presence of the crystal-melt interface.

Pub. in Proceedings of Institute of Electrical and Electronics Engineers Symposium on Applications of Ferroelectrics (7th), Urbana-Champaign, IL., June 6-8, 1990, p181-184 1991.

Keywords: *Lead zirconate titanates, *PZT, Reprints, Ferroelectric materials, Dielectric properties, Laser ablation, Thin films, Microstructure, Neodymium lasers, Polarization, X-ray diffraction, Silicon substrates.

Lead titanate-zirconate films were produced by laser-induced vaporization from a PZT target with the use of a focused q-switched Nd:YAG laser. Deposition was onto room-temperature platinum-covered silicon substrates. Although the films were initially amorphous as indicated by x-rays, they crystallized when annealed. EDX results showed that the film and targets were similar in composition. SEM and optical dark field micrographs showed a structure which might be interpreted as a sintered assemblage of particulate. A pattern of platinum electrodes was sputter deposited onto each sample to form parallel plate capacitors for investigating dielectric and ferroelectric properties. For a 2.5-micrometer-thick film annealed at 700 C, the relative dielectric constant was approximately that of the bulk target. Hysteresis loops were obtained. The remanent polarization was 5.1 microC/sq cm measured at a 160 kV/cm peak sinusoidal field.

Laser Melting of Thin Silicon Films.
Final rept.
L. N. Brush, G. B. McFadden, and S. R. Coriell. 1991, 21p.
Pub. in Jnl. of Crystal Growth 114, p446-466 1991.

Keywords: *Silicon films, Reprints, Laser-radiation heating, Liquid-solid interfaces, Boundary integral method, Boundary conditions, Numerical solution, Melting, Stability.

Thin silicon films on a cooled substrate are often found to develop two-phase lamellar structures upon radiative heating. Jackson and Kurtze developed a two-dimensional model for the process in which the heated film consists of alternating parallel bands of liquid and solid phases separated by planar solid-liquid interfaces. To understand the cellular or dendritic structures that sometimes are observed in these interfaces, they also performed a linearized morphological stability analysis and obtained the conditions for the growth or decay of infinitesimal perturbations to the interface. In this work the authors extend that analysis to finite amplitudes by developing a boundary integral representation of the thermal field, and obtain steady-state numerical solutions for nonplanar solid-liquid interfaces. Eigenvalue calculations to determine the linear stability of the nonplanar solutions are also performed. The effects of the lateral boundary conditions on the stability of the solutions are investigated as well.

Quantized Dissipation of the Quantum Hall Effect at High Currents.
Final rept.
M. E. Cage. 1993, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Instrumentation and Measurement 42, n2 p176-178 Apr 93. See also PB93-150712.

Keywords: *Hall effect, Two dimensional, Electric current, Electron gas, Quantization, Dissipation, Reprints, *Quantum Hall effect.

Quantized dissipative voltage states are observed when large currents are passed through a high-quality quantized Hall resistance device. These dissipative states are interpreted as occurring when electrons are excited to higher Landau levels and then return to the original Landau level. We show that the quantization is more complicated than previously thought. For example, the quantization can be a function of magnetic field. Therefore, the dissipative voltage quantization can, in general, be difficult to verify and determine.

Singularities in Minimum Surface Energy Problems and Their Influence in Surface Motion.
Final rept.
J. W. Cahn. 1992, 3p.
Pub. in Proceedings of Computational Crystal Growers Workshop, Minneapolis, MN., February 22-28, 1992, p28-30.

Keywords: *Minimal surfaces, *Surface energy, Reprints, Three dimensional, Singularity, Froth, Soap bubbles.

Singularities can arise in area minimizing problems in three dimensions when three or more contiguous volumes separated by surfaces are considered. In a soap froth, the catalog of singularities has two members: a trijunction curve, where three bubbles meet with the three surface separating them meeting with 120 degree dihedral angles along a curve, and a quadrijunction point, where four bubbles and four trijunctions curves meet along tetrahedral angles and where there are six surfaces, each spanning a pair of trijunction curves (Taylor). For the soap froth, all surfaces have the same energy per unit area, and thus surface energy minimization is the same as area minimization. Furthermore, no energy is assigned to the point or line singularities. Recent research has focussed on the singularities that arise when the problem is altered to add certain complications, some realistic and some hypothetical.

Hysteresis Measurements of Remanent Polarization and Coercive Field in Polymers.
Final rept.
B. Dickens, E. Balizer, A. S. DeReggi, and S. C. Roth. 1992, 7p.
Pub. in Jnl. of Applied Physics 72, n9 p4258-4264, 1 Nov 92. Sponsored by Naval Surface Warfare Center, Silver Spring, MD.

Keywords: *Polymers, *Ferroelectric materials, *Hysteresis, *Polarization(Charge separation), Reprints, Electric potential, Electric conductivity, *Remanent polarization, Coercive fields.

An experimental method is described which allows estimation of remanent polarization and coercive fields without assuming functional forms for the capacitive and electrical resistance terms. The method can be used to measure polarization in specimens with voltage-dependent conductivity (often arising from the presence of ions in the specimens), voltage-dependent capacitance, and significant amounts of space charge. It consists of: (1) performing bipolar current/voltage hysteresis loops to allow a steady state of remanent polarization and space charge to build up in the specimen, and (2) following a bipolar loop with two or more unipolar loops in the first unipolar loop. Both sinusoidal and linear time-dependent applied voltages may be used. Automatic data processing of hysteresis loops is described for cases in which specimen behavior may be considered to be ideal.

Contract AFOSR 88-0018
Pub. in Physical Review B 47, n1 p76-83, 1 Jan 93. Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC. and Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *X-ray diffraction, Bragg reflection, Bragg angle, Reprints, Truncation rod scattering.

It is known that the kinematical and dynamical theories of diffraction by perfect crystals predict the same values for the intensities scattered into the vicinity of the Bragg peaks whenever those intensities are low. Here we address the question of whether this is also true throughout the region between two Bragg peaks. We show that the two theories give equivalent results for the weak intensities in the far tails of the Bragg peaks, provided better approximations for both the shape of the dispersion surface and the boundary conditions are used: One needs to take into account the asymptotic sphericity of the dispersion surface and the difference between electric and displacement fields. This results in a nontrivial transmission coefficient for the diffracted electric field as it leaves the crystal. By explicitly showing the equivalence of kinematical and dynamical results, this work provides additional theoretical support for the kinematical approach usually adopted to describe the so-called truncation-rod-scattering.

Electronic Correlations and Satellites in Superconducting Oxides.
Final rept.
K. J. Chang, M. L. Cohen, and D. R. Penn. 1988, 6p.
Pub. in Physical Review B38, n13 p8691-8696 1988.

Keywords: *YBCO superconductors, High temperature superconductors, Electron correlation, Band theory, S matrix, Satellites, Reprints, *Lanthanum strontium cuprates, *Yttrium barium cuprates.

The satellite observed at a binding energy of 12 to 13 eV below the Fermi level in the high T(c) oxide superconductors, La(2-x)Sr(x)CuO4 and YBa2Cu3O(7-delta), is viewed as originating from a state with two holes bound at the same Cu site. As in the case of Ni metal, the satellite is caused by an intra d-shell shake-up process into a Cu 3d(8) final state and its intensity is enhanced at resonance because of a super Koster-Kronig transition. Based on the t-matrix approach for the hole self-energy, the authors study the effect of electronic correlations on the one-electron band structure. They examine the position of the satellite and find a large Coulomb interaction energy of 5 eV at the Cu site when the experimental satellite position is duplicated by the theory. Since this energy is comparable with the 3d bandwidth, the two-hole bound state is a high energy excitation. This indicates that in the ground state a creation of two holes at the Cu site is unlikely and thus holes are formed at the O sites when Sr is substituted for La in La2CuO4 and when the oxidation is increased in YBa2CuO(7-delta).

Surface Barrier and Lower Critical Field in YBa2Cu3O7-delta Superconductors.
Final rept.
D. X. Chen, R. B. Goldfarb, R. W. Cross, and A. Sanchez. 1993, 5p.
Pub. in Physical Review B 48, n9 p6426-6430, 1 Sep 93.

Keywords: *YBCO superconductors, High temperature superconductors, Ginzburg-Landau theory, Temperature dependence, Surface barrier, Critical field, Magnetization, Reprints, *Yttrium barium cuprates.

The fields for first vortex entry and last vortex exit, H(1) and H(2), and the lower critical field H(C1) for a grain-aligned, sintered YBa2Cu3O(7-delta) superconductor have been determined from saturated magnetic-hysteresis loops using an extended critical-state model. For fields oriented along the grain c axis, H(1) increases with decreasing temperature, showing an upturn below 50 K, whereas H(2) remains small and positive, in general agreement with the theory of Bean-Livingston surface barriers. H(C1) has a Bardeen-Cooper-Schrieffer temperature dependence above 50 K, but it rises at low temperatures. For fields oriented in the ab plane, H(C1) has a similar temperature dependence, but surface barriers are not evident in the magnetization.

M. Chester, T. Jach, and J. A. Dagata. 1993, 7p.
Pub. in Vacuum Science and Technology A 11, n3 p474-480 May/Jun 93.

Keywords: *Gallium arsenides, *Surface analysis, *Oxidation, X-ray photoelectron spectroscopy, Auger electron spectroscopy, Temperature dependence, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Thermal stability, Passivation, Annealing, Reprints.

In the paper the authors discuss the results of a study undertaken to investigate the composition and thermal stability of ultraviolet/ozone oxidized, P2S5/(NH4)2S treated GaAs(100) surfaces. In particular, the authors have used x-ray photoelectron spectroscopy and Auger electron spectroscopy to probe the oxide and interface at room temperature and as a function of annealing temperature. The room temperature data indicate that S is buried between the oxide overlayer and the GaAs substrate. This oxide contains a variety of As and Ga bonding configurations which, after moderate annealing, are transformed into thermally more stable phases, such as As2O3 and Ga2O3. Complete desorption of the oxide occurs after annealing at 600 deg C. Annealing the as-oxidized surface to high temperatures also has a profound effect on the S.

Pub. in Jnl. of Vacuum Science and Technology B 11, n4 p1609-1613 Jul/Aug 93.

Keywords: *Gallium arsenides, *Surface analysis, X-ray photoelectron spectroscopy, Grazing incidence, Oxidation, Reprints, Depth profiles.

When a beam of x rays (about 1 keV) impinges on a flat surface at grazing angles (approx = or < 3 deg) the x rays undergo total external reflection. Under these conditions, the penetration depth of the x rays can become comparable to photoelectron escape depths and the photoelectron yields from the surface are enhanced. As the incidence angle of the x rays is increased, and x-ray penetration depth increases and the photoelectron yields contain a larger contribution from deeper layers within the sample. By exploiting this depth-dependence of photoelectron yields as a function of incident x-ray beam angle, it is possible to obtain information about the depth distribution of the photoelectron emitting atoms. The authors have used this novel application of grazing-incidence x-ray photoelectron spectroscopy (GIXPS) to study the ultraviolet oxidized GaAs(100) surface. Much insight into the composition and depth-dependence of these oxide phases can be obtained by directly comparing the spectra collected at different x-ray incidence angles.

Pub. in Physical Review B 42 n10 p6200-6208, 1 Oct 90. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *YBCO superconductors, *Doped materials, *Gold, Orthorhombic lattices, X-ray diffraction, Neutron diffraction, Transition temperature, Crystal structure, High temperature superconductors, Reprints, *Yttrium barium cuprates.

The structural and superconducting properties of gold-doped YBa2Cu3O7 compounds have been studied with x-ray and neutron diffraction, optical microscopy, weight-loss analysis, magnetization, and resistivity measurements. The solubility of Au in YBa2Cu3O7 is closed to 10 at. %, below which all samples are thermally stable up to the processing temperature (950 C). Metallic Au grains precipitate out when the Au content exceeds 10 at. %. Analysis of the x-ray and neutron-scattering intensities shows that Au substitutes for the Cu(1) chain site exclusively and has a probable valence state of Au(3+). The main effect of Au doping is a substantial uniaxial lattice expansion, while the orthorhombic structure is preserved. The authors present a detailed set of structural data including the Cu-O bond lengths and interplanar distances in a Au-doped sample. Unlike all other known dopants on Cu sites, the Au dopant is not detrimental to the superconducting properties. On the contrary, T(c) is slightly enhanced over that of YBa2Cu3O7. Such an enhancement, observed for the first time for a Cu site dopant, is intrinsic and reproducible. The authors discuss the possible causes of the T(c) increase and the features of Au dopant useful in the investigation of high-T(c) superconductivity.

Keywords: *YBCO superconductors, *Doped materials, *Gold, High temperature superconductors, X-ray diffraction, Neutron diffraction, Transition temperature, Crystal structure, Reprints, *Yttrium barium cuprates, Rietveld method.

Using high-resolution x-ray and neutron diffraction measurements, the authors have shown that gold can be doped into YBa2Cu3O7 (1:2:3) up to 10% per formula unit, exclusively at the Cu(1) sites. Au doping causes a larger uniaxial expansion along the c axis, accompanying an increase in the Cu(1)-O(1) bond length and a decrease in the Cu(2)-O(1) bond length. The superconducting transition temperature (T(c)) is enhanced upon Au doping and the normal-state transport properties are altered even for small levels of Au doping. The widely held belief in the inert nature of Au with regard to high T(c) superconductors is therefore invalid. These findings also raise questions concerning results using single crystals grown from gold crucibles.

High-Frequency Linear Response of Anisotropic Type-II Superconductors in the Mixed State.
Final rept.
M. W. Coffey. 1993, 9p.
Pub. in Physical Review B 47, n18 p12 284-12 287, 1 May 93.

Keywords: *Type 2 superconductors, *Superconductors, Penetration depth, High frequency, Effective mass, Response functions, Anisotropy, Complexity, Linearity, Tensors, Vortices, Reprints, Surface impedance.

Effective-mass anisotropy is incorporated into a self-consistent phenomenological theory of the high frequency electrodynamic response of type-II superconductors in the mixed state. The theory accounts for two-fluid effects, including a possible anisotropic normal-fluid contribution, in addition to nonlocal vortex interaction. The approach, applicable to the modeling of a wide range of complex response functions, is illustrated in the calculation of the complex penetration depths and surface impedance for uniaxially anisotropic type-II superconductors.

Pub. in Jnl. of Non-Crystalline Solids 153 and 154, p10-14 1993.

Keywords: *Crystal structure, Aluminum alloys, Copper alloys, Iron alloys, Correlation functions, Isotope exchange, Neutron diffraction, Reprints, *Quasicrystals, Icosahedral phase.

Neutron diffraction data with double isotopic substitution using two isotopes each of Fe and Cu has been obtained on six samples of quasicrystalline AlCuFe with a 6D face-centered icosahedral symmetry. Calculations of heteroatomic and homoatomic pair correlation functions for this structure have been made. The authors find that there is a localized position of copper on a 6D body center site which gives a clear but still qualitative picture of the structure with iron, copper, and aluminum chemically ordered and occupying successive concentric 'shells' in the large atom surfaces centered at the two major atomic positions, n(1) = left bracket 0, 0, 0, 0, 0, 0 right bracket and n(2) = left bracket 1, 0, 0, 0, 0, 0 right bracket, (indexed with respect to a primitive unit cell) in this 6D NaCl type structure. There is an indication that some of the aluminum is mixed with the iron (or is encapsulated in a small volume inside an iron surface).

Anharmonic Phonons and the Isotope Effect in Superconductivity.
Final rept.
V. H. Crespi, M. L. Cohen, and D. R. Penn. 1991, 4p.
Pub. in Physical Review B 43, n16 p2921-2924 1991.

Keywords: *High temperature superconductors, *Phonons, High-Tc superconductors, Isotope effects, Electron phonon interactions, Schrodinger equation, Cuprates, Reprints, Anharmonicity.

Anharmonic ionic potentials are examined to study the unusual isotope effect exponents for the high-T(c) oxides. Numerical solutions of Schrodinger's equation for a double well potential produce electron-phonon coupling constants lambda in the range 1.5 to 4 for a material with a vanishing isotope effect parameter alpha. However, low phonon frequencies limit T(c). Within our approximations, double well potential cannot produce alpha, >1/2. However, a negative quartic perturbation to a harmonic well can increase alpha above 1/2. In the extreme strong coupling limit, alapha is 1/2 regardless of anharmonicity.

Measurement of Boron at Silicon Wafer Surfaces by Neutron Depth Profiling.
Final rept.
R. G. Downing, J. P. Levine, T. Z. Hossain, J. B. Russell, and G. P. Zenner. 1990, 3p.
Pub. in Jnl. of Applied Physics 67, n8 p3652-3654, 15 Apr 90.

Keywords: *Silicon, *Boron, Secondary ion mass spectroscopy, Concentration(Composition), Boron 10 target, Neutron reactions, Measurement, Aerosols, Surfaces, Wafers, Reprints, Neutron depth profiling.

The thermal neutron reaction (10)B(n, alpha)(7)Li is used to measure the boron concentration on the surface of silicon wafers. The technique, referred to as neutron depth profiling (NDP), requires no special sample preparation. Boron is determined on the as-received wafers at a level of 10(sup 12) to 10(sup 13) atoms/sq cm. A boron level of about 2 X 10(sup 12) atoms/sq cm is found at the wafer surface after oxidation, epitaxial, or polycrystalline silicon deposition. Additional measurements are given from SIMS measurements of multilayer structures on silicon also showing the presence of boron. Ambient air appears to be a significant source of the boron.

Brillouin Light Scattering Intensities for Thin Magnetic Films with Large Perpendicular Anisotropies.
Final rept.
J. R. Dutcher, W. F. Egelhoff, J. F. Cochran, and I. Jacob. 1989, 3p.
Pub. in Physical Review B 39, n14 p430-432 1989.

Keywords: *Magnetic films, *Light scattering, *Brillouin effect, Metal films, Thin films, Magnetization, Anisotropy, Copper, Iron, Reprints.

The intensity of light scattered from thermal magnetic waves in thin magnetic films with large perpendicular uniaxial anisotropies was calculated. The anisotropies were large enough to pull the magnetization out of the sample plane. The intensity of light scattered from the surface magnetic mode in a 3.0 monolayer thick fcc Fe film grown on Cu(001) was measured as a function of the applied in-plane d.c. magnetic field. The measured intensities are in excellent agreement with those calculated using the magnetic parameters determined from the measured values of the surface mode frequency. Both the frequency and intensity data indicate that the magnetization of the Fe film was perpendicular to the sample plane in zero applied field.

Half-Integral Constant Voltage Steps in High-Tc Grain Boundary Junctions.
Final rept.
E. A. Early, A. F. Clark, and K. Char. 1993, 3p.
Pub. in Applied Physics Letters 62, n25 p3357-3359, 21 Jun 93.

Keywords: *Superconducting junctions, High temperature superconductors, YBCO superconductors, Grain boundaries, Superhigh frequency, Josephson effect, Magnetic fields, Reprints, Yttrium barium cuprates.

A novel effect from microwave radiation near 9.3 GHz applied to high-T(c) YBa2Cu3O(7-delta) single grain boundary junctions was observed. In addition to the usual Shapiro steps resulting from the ac Josephson effect, constant voltage steps with voltages halfway between the voltages of the Shapiro steps were present. The widths of these 'half-integral' steps were measured as a function of microwave power, and the influence of a magnetic field was investigated. From previous results on high-T(c) grain boundary junctions and a comparison of the results presented here with single- and multiple-junction effects in low-T(c) materials, we conclude that the half-integral steps are likely to be a result of grain boundaries being composed of multiple junctions in parallel.

Critical Magnetic-Field Angle for High-Field Current Transport in YBa2Cu3O7 at 76 K.
Final rept.
J. W. Ekin. 1992, 4p.
Pub. in Cryogenics 32, n11 p1089-1092 1992.

Keywords: *YBCO superconductors, *Critical current, High temperature superconductors, Temperature range 0065-0273 K, Flux pinning, Reprints, *Yttrium barium cuprates, High magnetic fields.

High magnetic field (0.5 T to 9 T) measurements of the in-plane transport critical current density J(c) of YBa2Cu3O7 at liquid nitrogen temperature are reported as a function of the orientation of magnetic field B with respect to the a,b-plane. In contrast to earlier results at lower fields (< 3 T), the measurements reported here at high fields reveal a J(c) versus angle curve with a head-and-shoulders shape with two angular regions having distinctly different behavior. For magnetic field oriented close to the a,b-plane, a sharp, narrow intrinsic-pinning peak in J(c) about the B perpendicular c-axis is observed; on either side of the peak, J(c) is still relatively high and nearly independent of magnetic field magnitude and angle. However, beyond a critical angle theta(c), the J(c) versus theta dependence crosses over to a markedly different behavior, characterized by a decrease in the sharpness of the voltage-current characteristic and a rapid decrease in J(c). To take advantage of the high, nearly field-independent J(c) on either side of the intrinsic pinning peak, magnet design will need to allow an adequate angular margin to avoid the pinning transition at theta(c).

Superconducting Materials: Specification.
Final rept.
J. W. Ekin. 1992, 6p.
Pub. in Concise Encyclopedia of Magnetic and Superconducting Materials, p578-583 1992.

Keywords: *Superconductors, Mechanical properties, Critical current, Specifications, Stabilizers, Standards, Reprints.

The specification of superconductors is needed both in the purchase of practical superconductors, as well

as in the characterization of superconductor materials for research. In the case of research, the emphasis is usually in specifying parameters that are intrinsic to the material such as the critical temperature T(c) and upper critical field H(c2). In the case of procuring superconductors for practical applications, the primary concern is, rather, with the extrinsic parameters such as the physical shape of the conductor, critical current, matrix resistivity, and mechanical properties. The emphasis of this article is on practical superconductors and, consequently, specification of the extrinsic parameters. The extrinsic parameters are described under three general headings: physical, electrical, and mechanical specification.

Transport Critical Current of Aligned Polycrystalline Yttrium Barium Copper Oxide (YBa2Cu3O7-delta).
Final rept.
J. W. Ekin. 1990, 4p.
Pub. in Prog. High Temp. Supercond. 25, p23-26 1990.

Keywords: *YBCO superconductors, *Critical current, High temperature superconductors, Magnetic fields, Direct current, Polycrystalline, Reprints, Yttrium barium cuprates, Grain boundaries, Weak links.

A study of grain alignment and its effect on the dc transport critical current in fine-grained bulk Y1Ba2Cu3O(7-delta) is reported in magnetic fields from 10(sup -4) T to 26 T. This paper presents a summary of the main results. The data are interpreted as evidence for two parallel components for intergranular current conduction, one consisting of weak-linked material, the other behaving like intrinsic intragranular material that is not weak-linked. A comparison with unaligned YBa2Cu3O7 indicates that the volume fraction of such nonweak-linked material is significantly enhanced by grain alignment, but still only 0.01 to 0.1% of the grain boundary area.

Effect of Axial Strain on the Critical Current of Ag-Sheathed Bi-Based Superconductors in Magnetic Fields Up to 25 T.
Final rept.
J. W. Ekin, D. K. Finnemore, Q. Li, J. Tenbrink, and W. Carter. 1992, 3p.
Pub. in Applied Physics Letters 61, n7 p858-860, 17 Aug 92.

Keywords: *BSCCO superconductors, *Critical current, *Axial strain, High temperature superconductors, Superconducting wires, Magnetic fields, Silver, Reprints, *Bismuth strontium calcium cuprates.

The irreversible strain limit epsilon(irrev) for the onset of permanent axial strain damage to Ag-sheathed Bi2Sr2Ca1Cu2O(8+x) and Bi2Sr2Ca2Cu3O(10+x) superconductors has been measured to be in the range of 0.2%-0.35%. This strain damage onset is about an order of magnitude higher than for bulk sintered Y-, Bi-, or Tl-based superconductors and is approaching practical values for magnet design. The measurements show that the value of epsilon(irrev) is not dependent on magnetic field, nor does the critical current depend on strain below epsilon(irrev) at least up to 25 T at 4.2 K. Both of these factors indicate that the observed strain effect in Ag-sheathed Bi-based superconductors is not intrinsic to the superconductor material. Rather, the effect is extrinsic and arises from superconductor fracture. Thus, the damage onset is amenable to further enhancement. Indeed, the data suggest that subdividing the superconductor into fine filaments or adding Ag to the superconductor powder prior to processing significantly enhances the damage threshold epsilon(irrev) to above 0.6%.

In situ Noble Metal YBa2Cu3O7 Thin-Film Contacts.
Final rept.
J. W. Ekin, S. E. Russek, C. C. Clickner, and B. Jeanneret. 1993, 3p.
Pub. in Applied Physics Letters 62, n4 p369-371, 25 Jan 93.

Keywords: *YBCO superconductors, *Electric contacts, High temperature superconductors, Thin films, Metal films, Silver, Gold, Reprints, *Yttrium barium cuprates, Ohmic contacts.

Thin-film contacts to YBa2Cu3O7 have been fabricated by an in situ noble-metal process and patterned down to 2X2 sq micrometers; at this small size, the contacts carry transport current over 10(sup 6) A/sq cm while maintaining a specific contact resistivity rho(sub c) in the 10(sup -8) to 10(sup -9) ohm sq cm range. No oxygen annealing was used in the processing, thus avoiding the problem of silver or gold agglomeration, as well as preserving a sharp interface for Josephson-device applications. Rho(sub c) was measured to increase only about 25% as temperature was increased from 4 to 90 K. The measurements were carried out on a series of film morphologies using both superconductor-normal metal and superconductor-normal metal-superconductor test structures; a carefully designed test pattern was used to correct for spreading conduction in the noble-metal contact layer. The contacts were ohmic with voltage-current characteristics that were linear over more than four orders of magnitude.

Pub. in Proceedings of Neutron Scattering for Materials Science Symposium, Boston, MA., November 27-30, 1989, p133-138 1990.

Keywords: *Magnetostriction, *Dysprosium, *Yttrium, *Erbium, Phase transformations, Neutron scattering, Critical field, Metal films, Epitaxy, Reprints, Multilayers.

The magnetic structure has been measured with neutron scattering and SQUID magnetometry for a number of epitaxial multilayers and films of the magnetic rare-earths dysprosium and erbium grown with non-magnetic yttrium. In almost all cases the first order ferromagnetic phase transitions are suppressed, although the Neel temperatures are within 5% of the bulk values. The observed critical fields are explained by including epitaxial constraints with the bulk theory of magnetoelasticity.

C. Heremans, B. J. Wuensch, J. K. Stalick, and E. Prince. 1993, 6p.
Pub. in Materials Research Society Symposium Proceedings, v293 p349-354 1993.

Keywords: *Order-disorder transformations, *Ionic conductivity, *Crystal structure, Zirconium additions, Reprints, Yttrium zirconate titanates, Rietveld method, Pyrochlore structure.

Structural refinements have been carried out on the Y2(Zr(y)Ti(1-y))2O7 system for increasing amounts of Zr substitution. The structure changes from an ordered pyrochlore structure (superstructure of the fluorite structure) to an anion-deficient fluorite structure. Separate processes govern the disordering of the cation and anion arrays. In particular, the anions begin to disorder at lower values of y than the cations. For intermediate compositions, a minor amount of fluorite phase coexists with the primary partially-disordered pyrochlore phase.

Microstructural Evolution in Two-Dimensional Two-Phase Polycrystals.
Final rept.
E. A. Holm, D. J. Srolovitz, and J. W. Cahn. 1993, 18p.
Pub. in Acta Metallurgica Materials 41, n4 p1119-1136 1993.

Keywords: *Microstructure, *Crystal growth, *Polycrystals, Crystal structure, Phase transformations, Crystallization, Thermodynamic properties, Crystal lattices, Crystal field theory, Reprints.

In two-dimensional polycrystals composed of alpha-phase and beta-phase grains the stability of three-grain junctions and four-grain junctions depends on the interfacial energies. A computer simulation which generates thermodynamically consistent microstructures for arbitrary interfacial energies has been used to investigate microstructural evolution in such polycrystals when phase volume is not conserved. Since grain shapes, phase volume, and phase arrangements are dictated by interfacial energies, clustered-, alternating-, isolated-, and single-phase microstructures occur in different interfacial energy regimes. Despite great differences in microstructure, polycrystals which contain only three-grain junctions evolve with normal grain growth kinetics. In contrast, structures containing flexible four-grain junctions eventually stop evolving. We conclude that two dimensional polycrystals continually evolve when grain junction angles are thermodynamically fixed, while grain growth ultimately ceases when grain junction angles may vary. Predictions concerning three-dimensional and phase-volume conserved systems are made.

Q. Huang, S. A. Sunshine, R. J. Cava, and A. Santoro. 1993, 8p.
Pub. in Jnl. of Solid State Chemistry 102, p534-541 1993.

Keywords: *Crystal structure, Orthorhombic lattices, Neutron diffraction, Reprints, *Yttrium strontium aluminum cuprates.

The structure of YSr2AlCu2O7 has been analyzed by neutron powder diffraction techniques. This compound crystallizes with space group P4/mmm symmetry and with lattice parameters a = 3.8646(1), c = 11.1139(3)A. The general structural features of YSr2AlCu2O7 are similar to those found for the 123 superconductor YBa2Cu3O(6+x), and in particular the sequence of layers is the same in the two materials, with SrO substituting for BaO. The Al ions substitute for the copper ions of the chain sites of the 123 parent structure and have tetrahedral coordination. The tetrahedra form chains propagating along the a and b axes on the basal plane of the unit cell. Thus the structure is made of short-range domains within which the local symmetry is orthorhombic. All of the oxygen atoms in this compound have a disordered configuration around the specialized positions of the 123 structure. This arrangement results in tilting of the CuO5 pyramids and in significant distortions of the coordination polyhedra of the other cations.

Pub. in Physical Review B 47, n3 p1174-1180, 15 Jan 93.

Keywords: *Barium titanates, *Electronic structure, Photoelectron spectroscopy, Single crystals, Band theory, Photoemission, Valence, Surfaces, Reprints.

We present valence and core-level photoemission measurements from vacuum-fractured, single-crystal barium titanate. These results resolve contradictory measurements in the literature which have employed other methods of sample surface preparation. The valence-shell electronic structure is compared with previously published results of band structure and cluster calculations. Resonant photoemission is used to probe the covalent coupling between titanium and oxygen in the cubic and tetragonal phases of this ionic compound. Photoelectron spectra of the Ti 2p and O 1s core levels reveal the valence of these two ions to be TiO2-like. Valence, core, satellite, and Auger transitions are also assigned and tabulated.

Surface Core-Level Shifts of Barium Observed in Photoemission of Vacuum-Fractured BaTiO3 (100).
Final rept.
L. T. Hudson, R. L. Kurtz, S. W. Robey, D. Temple, and R. L. Stockbauer. 1993, 7p.
Pub. in Physical Review B 47, n16 p10 832-10 838, 15 Apr 93.

Keywords: *Barium titanates, X-ray photoelectron spectroscopy, Ultraviolet spectroscopy, Electronic structure, Band theory, Photoemission, Oxides, Reprints, Core level shift.

When clean, vacuum-fractured surfaces of BaTiO3 are analyzed using ultraviolet and x-ray photoelectron spectroscopy (UPS and XPS), more than one set of barium core levels is observed. Sputtering the surface with ions removes lower-binding-energy intensity within the barium line shapes in UPS spectra while little change is noted in XPS. Sputtering of the surface also causes band bending and the creation of band-gap surface states of Ti 3d character. From a comparison of UPS and XPS Ba 4d line shapes from a vacuum-fractured surface, the lower-binding-energy component is assigned to barium with 12-fold oxygen coordination representative of bulk stoichiometry; the higher-binding-energy intensity originates from undercoordinated barium in the region of the sample surface. Reasonable values for the energy-dependent attenuation length of electrons in BaTiO3 are derived from the relative intensities of bulk and surface components using a simple model of electron attenuation.

Flux Expulsion at Intermediate Fields in Type-II Superconductors.
Final rept.
O. B. Hyun. 1993, 7p.
Pub. in Physica C 206, p169-175 1993.

Keywords: *BSCCO superconductors, *YBCO superconductors, *Niobium stannides, *Superconductors, High temperature superconductors, Type 2 superconductors, Temperature dependence, Critical current, Current density, Magnetic fields, Magnetic flux, Magnetization, Reprints, *Bismuth strontium calcium cuprates, *Yttrium barium cuprates.

The flux expulsion behavior at an intermediate field H was studied for type-II superconductors Nb3Sn, YBa2Cu3O7, and Bi2Sr2CaCu2O8. Based on a temperature-dependent critical-state model, magnetization as a function of temperature, M(T), for the zero-field-cooled (ZFC) measurement was used to predict flux expulsion in the field-cooled (FC) measurement and to construct the internal flux profiles for both ZFC and FC at an applied field of 1 T. The model includes empirical relations of the temperature dependence of the reversible magnetization, and the critical current density. Various M(T) patterns are demonstrated by the exponent n, varying from 2 for Nb3Sn to over 20 for Bi2Sr2CaCu2O8.

T. Ishida, R. B. Goldfarb, A. B. Kos, and R. W. Cross. 1992, 4p.
Pub. in Physical Review B 46, n18 p12 080-12 083, 1 Nov 92.

Keywords: *High temperature superconductors, *YBCO superconductors, *Superconductors, Temperature dependence, Magnetic fields, Fourier analysis, Magnetometers, Reprints, *Yttrium barium cuprates, *Offset susceptibility.

The novel concept of offset susceptibility chi(0) is presented for superconductors in applied fields H(dc) + H(ac) sin (omega)t. Chi(0) represents the dc component of the time-dependent magnetization M(t). For sintered YBa2Cu3O7, chi(0) was measured as a function of H(ac), H(dc), and temperature using a Hall probe magnetometer and Fourier analysis. For intragranular diamagnetism, chi(0) behaves as the real part of complex fundamental susceptibility chi'(1), confirming a London-like field penetration. However, chi(0) arising from intergranular coupling is positive at temperatures just below the onset of the coupling transition, in good agreement with theoretical predictions of a simplified Kim critical-state model of magnetization.

Pub. in Communications in Statistics, Theory and Methods 20, n2 p441-456 1991.

Keywords: *High temperature superconductors, Experimental design, Formulations, Collinearity, Processing, Approximation, Polynomials, Ceramics, Mixtures, Reprints, Scheffe method.

Materials formulation and processing research are important industrial processes and most materials know-how comes from physical experiments. Our impression, based on discussions with materials scientists, is that statistically planned experiments are infrequently used in materials research. This scientific and engineering area provides an excellent opportunity for both using the available techniques of statistically planned experiments, including mixture experiments, and identifying opportunities for collaborative research leading to further advances in statistical methods for scientists and engineers. This paper describes an application of Scheffe's (1958) simplex approach for mixture experiments to formulation of high-temperature superconducting compounds. This example has given us better appreciation of the needs of materials scientists and has provided us opportunities for further collaborative research.

Pub. in Jnl. of Applied Physics 73, n5 p2386-2396, 1 Mar 93.

Keywords: *Electron temperature, Electron-phonon coupling, Electron tunneling, Hot electrons, Electrometers, Aluminum, Reprints.

A detailed comparison between theory and experiment is used to demonstrate the presence of self-heating in the Coulomb-blockade electrometer. When three different heating models are considered, the best fit with experimental electrometer characteristics is obtained for a model in which the electron temperature of the island electrode is determined by heat transfer to the lattice via electron-phonon coupling. In the successful model, the temperature of the island electrons is related to the power dissipated in the island and the temperature of the phonons. The best fit between theory and experiment yields a value of electron-phonon coupling parameter for the electron-phonon coupling in aluminum. Our calculations show that the electron temperature of the island commonly exceeds 100 mK even when the lattice remains at 35 mK.

Compositional Homogeneity in Processing Precursor Powders to the Ba2YCu3O7-x High Tc Superconductor.
Final rept.
J. F. Kelly, and J. J. Ritter. 1992, 5p.
Pub. in Jnl. of Materials Research 7, n3 p580-584 1992.

Keywords: *YBCO superconductors, *Composition(Property), High temperature superconductors, Scanning electron spectroscopy, X-ray spectroscopy, Powder(Particles), Homogeneity, Processing, Precursor, Ceramics, Reprints, *Yttrium barium cuprates.

We have used scanning electron microscopy (SEM) and energy dispersive x-ray spectroscopy (EDS) to study compositional homogeneity at several stages in the processing of powders to the Ba2YCu3Ox high T(c) superconductor. We investigated the effects of solution pH and ionic concentration in the precipitation preparation of mixed hydroxycarbonates of Ba, Y, and Cu as precursor to the Ba2YCu3O(7-x) high T(c)

superconductor. Our results show that both powder homogeneity and particle morphology are strongly dependent on these parameters. Additionally, studies of the compacted powders by EDS mapping at successive stages of processing show the development of phase inhomogeneities, even in homogeneous starting powders.

Correlations of Modulation Noise with Magnetic Microstructure and Intergranular Interactions for CoCrTa and CoNi Thin Film Media.
Final rept.
M. R. Khan, S. Y. Lee, S. L. Duan, D. E. Speliotis, M. R. Scheinfein, J. L. Pressesky, and N. Heiman. 1991, 3p.
Pub. in Jnl. of Applied Physics 69, n8 p4745-4747 1991.

Keywords: *Cobalt alloys, Chromium containing alloys, Nickel containing alloys, Tantalum containing alloys, Magnetic alloys, Magnetic anisotropy, Magnetic films, Remanent magnetism, Coercive force, Thin films, Demagnetization, Microstructure, Reprints, Modulation noise.

This paper reports on two thin film media alloys Co(86)Cr(12)Ta(2) and Co(75)Ni(25) which have very different noise characteristics. The magnetic microstructure of these films were observed with SEMPA. The variance of the magnetization across the transition region was calculated. The origin of anisotropy was determined by measuring the temperature coefficients of H(c) and M(s). The interaction strengths between grains, M(H), were obtained from the measurements of the reverse demagnetization remanence Md(H), and the forward magnetization remanence Mr(H). We found that the CoNi film showed a greater degree of interparticle interaction which may explain the observed cross-bit linkages in SEMPA image, larger RMS transition variation, and higher modulation noise.

Materials Science with SR Using X-Ray Imaging: Spatial-Resolution/Source Size.
Final rept.
M. Kuriyama. 1991, 12p.
Pub. in Nuclear Instruments and Methods in Physics Research 303, n3 p503-514 1991.

Keywords: *Materials science, *Synchrotron radiation, *X-ray imagery, Synchrotron radiation sources, X-ray diffraction, Spatial resolution, Single crystals, Microradiography, Polycrystalline, Reprints, Multilayers.

Some examples of applications of synchrotron radiation to materials science demonstrate the importance of microstructure information within structural as well as functional materials in order to control their properties and quality as designed for industrial purposes. To collect such information, x-ray imaging in quasi real time (50 - 100 sec time intervals) is required in either the microradiographic mode or the diffraction (in transmission) mode. New measurement technologies based on imaging are applied to polycrystalline materials, single crystal materials and multilayered device materials to illustrate what kind of synchrotron radiation facility is most desirable for materials science and engineering.

Analysis of Boron in CVD Diamond Surfaces Using Neutron Depth Profiling.
Final rept.
G. P. Lamaze, R. G. Downing, L. Pilione, A. Badzian, and T. Badzian. 1993, 6p.
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Applied Surface Science 65/66, p587-592 1993.

Keywords: *Diamond films, *Surface analysis, *Boron, Chemical vapor deposition, Concentration(Composition), Semiconducting films, Cold neutrons, Doped materials, Single crystals, Thin films, Reprints, Neutron depth profiling, Depth profiles, CNRF facility.

Neutron depth profiling (NDP) is a method of near surface analysis for isotopes that undergo neutron-induced positive Q-value charged particle reactions, e.g., (n,alpha), (n,p). Because of its large cross section and large Q-value, the (10)B(n,alpha)(7)Li reaction has been widely employed for NDP studies. We have used the NDP technique to study the concentration and distribution of boron in CVD diamond layers. The measurements were made using the new Cold Neutron Depth Profiling instrument at the NIST Cold Neutron Research Facility. The diamond samples were prepared at the Materials Research Laboratory at the Pennsylvania State University. The doped diamond single crystal films were grown by microwave plasma chemical vapor deposition from a mixture of methane, hydrogen and diborane. Natural type IIa crystals cut along the (001) plane were used as substrates. Results of the measurements are presented.

Magnetic and Structural Properties of Electrodeposited Copper-Nickel Microlayered Alloys.
Final rept.
D. S. Lashmore, R. R. Oberle, L. H. Bennett, M. P. Dariel, L. Romankiw, L. Swartzendruber, and U. Atzmony. 1990, 11p.
Pub. in Proceedings of Symposium on Magnetic Materials, Processes, and Devices, Hollywood, FL., October 15-19, 1989, p347-357 1990.

Keywords: *Electrodeposited coatings, *Superlattices, X-ray diffraction, Magnetic properties, Magnetic films, Metal films, Thin films, Electrodeposition, Copper, Nickel, Reprints, Multilayers.

Magnetic measurements of Ni-Cu compositionally modulated alloys prepared by electrochemical deposition suggest a high degree of perfection is achieved. The magnetic behavior closely resembles that of bulk nickel and suggests little interdiffusion between the copper and the nickel. The high value of the saturation magnetization implies that no magnetic dead layer exists at the nickel/copper interface for wavelengths greater than 2.5 nm. A magnetic after effect has been found which increases with decreasing temperature and is a maximum at the coercive field. The electrochemical technique has progressed to the point where third order satellites are now commonly observed, suggesting a very square composition profile. Continuous layers of copper as thin as 5 A (about 2 monolayers) have been produced.

Elastic Constants of Polycrystalline Y1Ba2Cu3Ox.
Final rept.
H. Ledbetter. 1992, 3p.
Pub. in Jnl. of Materials Research 17, n11 p2905-2907 Nov 92.

Keywords: *YBCO superconductors, *Elastic properties, High temperature superconductors, Ultrasonic radiation, Acoustic velocity, Debye temperature, Bulk modulus, Ionic crystals, Polycrystalline, Reprints, *Yttrium barium cuprates, Oxygen content.

We measured the elastic constants of polycrystalline Y1Ba2Cu3Ox with eleven oxygen contents varying from 6.2 to 6.9. Reported properties include sound velocities; bulk, shear, Young's moduli; Poisson ratio; Debye temperature. After correction to the void-free state, the measurements fail to show a systematic dependence on oxygen content. Focusing on the bulk modulus, all measurements fall below an ionic-crystal model prediction, by 5-50%. We attribute this macroscopic softness to either microcracks or weak grain-boundary mechanical linkages. For the case x = 6.9, we suggest a set of intrinsic elastic constants.

Correlation between Tc and Elastic Constants of (La-M)2CuO4.
Final rept.
H. Ledbetter, S. Kim, and A. Roshko. 1992, 3p.
Pub. in Zeitschrift fuer Physikalische B - Condensed Matter 89, p275-277 1992.

Keywords: *Superconductors, High temperature superconductors, Electron phonon interactions, Ultrasonic radiation, Acoustic velocity, Debye temperature, Elastic properties, Transition temperature, Correlation, Reprints, *Lanthanum calcium cuprates, *Lanthanum barium cuprates, *Lanthanum strontium cuprates.

By an ultrasonic method, we measured the elastic constants of polycrystalline La(1.85)M(0.15)CuO4 with M=Ca, Ba, Sr. These materials show zero-resistance normal-superconductive transition temperatures of 19, 28, and 36 K. Versus T(c), all the elastic stiffnesses - bulk modulus, Young modulus, shear modulus - increase. Derived from the elastic constants and average atomic volume, the Debye temperature increases linearly with T(c). In conventional BCS superconductors, T(c) decreases with increasing 1 Theta(D).

Elastic Constants and Debye Temperature of Y1Ba2Cu3Ox: Effect of Oxygen Content.
Final rept.
S. Lin, M. Lei, and H. Ledbetter. 1993, 4p.
Pub. in Materials Letters 16, p165-168 1993.

Keywords: *YBCO superconductors, *Elastic properties, High temperature superconductors, Ultrasonic radiation, Debye temperature, Bulk modulus, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Polycrystalline, Reprints, *Yttrium barium cuprates, Oxygen content.

Using ultrasonic methods, we measured the elastic constants of polycrystalline Y1Ba2Cu3Ox between 295 and 4 K. For a single specimen, using vacuum annealing and oxygen annealing, we varied the oxygen content in four steps from x=6.2 to x=6.9. Elastic stiffnesses that depend mainly on shear modes increase monotonically with increasing oxygen content. Stiffnesses that depend on dilatation modes increase up to about x=6.7 and then decrease. The elastic Debye temperature, which depends mainly on shear modes, increases monotonically, in agreement with the specific-heat Debye temperature. An ionic-model calculation for the bulk modulus and Debye temperature predicts a monotonic increase for both. We conjecture that the irregular oxygen-content dependence of the dilatation-mode-related elastic constants arises from changes in copper-oxygen valences.

Polarization Analysis of the Magnetic Excitations in Invar and Non-Invar Amorphous Alloys.
Final rept.
J. W. Lynn, N. Rosov, and G. Fish. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p5369-5371, 15 May 93.

Keywords: *Invar, Phosphorus containing alloys, Boron containing alloys, Nickel alloys, Iron alloys, Polarized beams, Neutron scattering, Inelastic scattering, Amorphous materials, Spin waves, Ferromagnetic materials, Reprints, *Amorphous ferromagnets, Magnetic excitations, METGLAS 2826.

Conventional spin wave theory works remarkably well in describing the spin dynamics of both Invar and non-Invar isotropic ferromagnets, with the important exception that for Invar systems the magnetization decreases much more rapidly with temperature than can be explained based on the measured spin wave dispersion relations. We have been carrying out triple-axis polarized inelastic neutron scattering experiments on the amorphous ferromagnets Fe86B14 (Invar system) and Fe40Ni40P14B6 (METGLAS (R(circled)) 2826) in order to separate the longitudinal magnetic fluctuations from the transverse (spin wave) excitations, and thereby determine if the presence of longitudinal excitations might resolve this discrepancy. The present measurements exhibit longitudinal excitations below t(c), but in both materials. Possible interpretations of the results are discussed.

Pub. in MRS Bulletin 15, n11 p65-71 Nov 90.

Keywords: *Surfaces, *Interfaces, Neutron diffraction, Grazing incidence, Magnetic materials, Superconductors, Polymers, Reprints, Neutron reflectometry, Multilayers.

During the past decade, scientific and technological interest in the properties of surfaces and interfaces has grown at an astounding rate. Electron, atomic beam, and x-ray diffraction techniques have been used to study surface or near surface problems. Neutrons can also be used in many cases and because neutrons can distinguish between different isotopes of the same element, most notably hydrogen and deuterium, as well as couple to atomic magnetic moments via a dipolar interaction, they can be an indispensable and complementary probe. The purpose of this paper is to give a concise description of the methodology of neutron reflectometry, multilayer diffraction, and grazing angle diffraction, including specific examples of the characterization of magnetic, superconducting, and polymeric surfaces or interfaces.

Crystal Structure of Pb2Sr2YCu3O8+delta with delta=1.32, 1.46, 1.61, 1.71, by Powder Neutron Diffraction.
Final rept.
M. Marezio, A. Santoro, J. J. Capponi, Q. Huang, R. J. Cava, and O. Chmaissem. 1992, 10p.
Pub. in Physica C 199, p365-374 1992.

Keywords: *Crystal structure, Neutron diffraction, Reprints, *Lead strontium yttrium cuprates, Oxygen content.

The structures of Pb2Sr2YCu3O(8 + delta) with delta = 1.46, 1.61, 1.71, have been determined by powder neutron diffraction data. As previously shown for Pb2Sr2YCu3O(9.32), the extra oxygen atoms are incorporated on the Cu layer sandwiched between two PbO layers. The structural refinements indicated that the most stable structure is that of Pb2Sr2YCu3O(9.5) in which the two possible oxygen sites on the Cu layer are filled up to 75%. These extra oxygen atoms give rise to superstructures and change the coordination of the cations belonging to the (PbO)(Cu)(PbO) blocks. In Pb2Sr2YCu3O(9.5) the Cu cations inside these blocks are surrounded by an oxygen pyramid, while the Pb cations are surrounded by seven, eight, or nine oxygen atoms, depending upon the specific site in the superstructure. At the same time, the valences of these cations increase from 1+ to 2+ for Cu and from 2+ to 4+ for half of the Pb. The oxidation of the Pb cations hinders the charge transfer from the CuO(1.5) layers to the superconducting (CuO2)(Y)(CuO2) blocks and the oxidation of Pb2Sr2YCu3O8 does not lead to a superconducting state. Every sample we analyzed should be considered either an oxygen-deficient compound or one containing an excess oxygen with respect to the Pb2Sr2YCu3O(9.5) structure.

Atomic Theory of Fracture of Brittle Materials: Application to Covalent Semiconductors.
Final rept.
K. Masuda-Jindo, V. K. Tewary, and R. Thomson. 1991, 14p.
Pub. in Jnl. of Materials Research 6, n7 p1553-1566 1991.

Keywords: *Brittle fracturing, *Atomic theory, *Silicon, Perturbation theory, Greens function, Chemical bonds, Semiconductors, Cracks, Reprints, LCAO theory.

Using the lattice Green's function approach and LCAO (linear combination of atomic orbitals) electron theory, we investigate the atomistic configuration and lattice trapping of cracks in Si. The LCAO electron theory coupled to second order perturbation (SOP) theory has been used to derive explicit expressions for the bond breaking non-linear forces between Si atoms. We calculate the cracked lattice Green's functions for a crack on the (111) plane and lying in the (110) direction. With the non-linear forces acting in a cohesive region near the crack tips, the crack structure is then calculated. The calculated structure possesses a crack opening at the Griffith load which should allow penetration of typical external molecules to the crack tip at the Griffith loading. Other consequences for chemical reactions at the crack tip are discussed in the light of these results. The lattice trapping is low, only a few percent of the Griffith load.

Effect of Modulated Taylor-Couette Flows on Crystal-Melt Interfaces: Theory and Initial Experiments.
Final rept.
G. B. McFadden, B. T. Murray, S. R. Coriell, M. E. Glicksman, and M. E. Selleck. 1992, 20p.
Pub. in Proceedings of IMA Workshop on the Evolution of Phase Boundaries, September 17-21, 1990, p81-100 1992.

Keywords: *Crystal growth, *Solidification, Cylindrical configuration, Free boundaries, Reprints, *Crystal-melt interface, *Taylor-Couette flow, Floquet theory, Two phase systems.

An important problem in the process of crystal growth from the melt phase is to understand the interaction of the crystal-melt interface with fluid flow in the melt. This area combines the complexities of the Navier-Stokes equations for fluid flow with the nonlinear behavior of the free boundary representing the crystal-melt interface. Some progress has been made by studying explicit flows that allow a base state corresponding to a one-dimensional crystal-melt interface with solute and/or temperature fields that depend only on the distance from the interface. This allows the strength of the interaction between the flow and the interface to be assessed by a linear stability analysis of the simple base state. The case of a time-periodic Taylor-Couette flow interacting with a cylindrical crystalline interface is currently being investigated both experimentally and theoretically; some preliminary results are given here. The results indicate that the effect of the crystal-melt interface in the two-phase system is to destabilize the system by an order of magnitude relative to the single-phase system with rigid walls.

Magnetic Moments in Cr Thin Films on Fe(100).
Final rept.
D. T. Pierce, R. J. Celotta, and J. Unguris. 1993, 3p.
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Jnl. of Applied Physics 73, n10 p6201-6203, 15 May 93.

Keywords: *Magnetic moments, *Chromium, Whiskers(Single crystals), Polarization(Spin alignment), Antiferromagnetic materials, Scanning electron microscopy, Spin waves, Metal films, Thin films, Epitaxy, Iron, Reprints, *Surface magnetism, Electron spin polarization, Secondary electrons.

The magnetism at the surface of a Cr film grown epitaxially on a Fe(100) whisker is observed as a function of Cr thickness by scanning electron microscopy with polarization analysis. Use of a wedge-shaped film of linearly increasing thickness allows the magnetism to be followed continuously for 75 Cr layers. Over the temperature range measured from just below the Neel temperature of bulk Cr, T(N), to 1.8 T(N), the surface magnetic moment is seen to persist and change direction with each additional Cr layer, but there are phase slips in this antiferromagnetic ordering. These are con-

sistent with an incommensurate spin density wave (SDW) in the Cr film having a wavelength of 40 layers at T(N). An irregularity in the antiferromagnetic stacking order in the first four layers is discussed and the behavior of the moments at the subsequent phase slip is examined. The limitations which prevent the determination of the surface magnetic moment from the spin polarization of secondary electrons are discussed.

Mathematical Aspects of Rietveld Refinement.
Final rept.
E. Prince. 1993, 12p.
Pub. in Rietveld Method, Chapter 3, p43-54 1993.

Keywords: Least squares method, X-ray diffraction, Neutron diffraction, Crystal structure, Data processing, Reprints, *Rietveld method, Parameter estimation.

The method of least squares is a powerful technique for estimating the parameters of a model given a set of observations. In the Rietveld method, the observations are the intensities of neutrons or x-rays in a powder diffraction pattern, and the model predicts these intensities as a function of background, peakshape and crystallographic parameters. The loss of information due to overlapping peaks can be compensated for by incorporating additional information, such as chemical composition, noncrystallographic symmetry and rigid body motion, in the model by means of constraints and restraints. Careful attention to the efficiency and stability of refinement procedures is important. Statistical analysis can be used to assess the uncertainties in the parameters of a refined model and to compare two or more models.

Asymmetry between Flux Penetration and Flux Expulsion in Tl-2212 Superconductors.
Final rept.
M. Foldeaki, H. Ledbetter, M. Paranthaman, H. M. Duan, and A. M. Hermann. 1993, 5p.
Pub. in Jnl. of Superconductivity 6, n3 p185-189 1993.

Keywords: *High temperature superconductors, Temperature range 0013-0065 K, Irreversible processes, Time dependence, Magnetic hysteresis, Flux pinning, Direct current, Single crystals, Polycrystals, Asymmetry, Reprints, *Thallium barium calcium cuprates.

dc magnetic hysteresis as well as flux penetration and flux expulsion were investigated in Tl(2-y)Ba2CaCu2O(8-x) polycrystals and monocrystals. All measurements were performed at 35 K and in the 0-5 T field range. Hysteresis measurements revealed an irreversibility field of about 2 T. Existing models predict identical field-cooled (fc) and zero-field-cooled (zfc) magnetizations and vanishing time dependence above this field. Although the identical fc and zfc magnetizations are in fact observed, the time dependence vanishes only for flux penetration after zero-field cooling; a remanence is preserved after field cooling and decays with a finite relaxation rate. Activation energies calculated on the basis of the thermal activation model display a pronounced field dependence, and are lower for flux penetration than for flux expulsion in high fields (H = or > 3 T) for all orientations. This behavior of extreme layered superconductors contradicts classical theoretical models and questions the original definition of the irreversibility line as well. All of our results are consistent with the recent theory of lock-in transition, and can be well interpreted by using those principles.

Nature of (001) Tilt Grain Boundaries in YBa2Cu3O6+x.
Final rept.
F. W. Gayle, and D. L. Kaiser. 1991, 8p.
Pub. in Jnl. of Materials Research 6, n5 p908-915 1991.

Keywords: *YBCO superconductors, *Grain boundaries, High temperature superconductors, Crystal-phase transformations, Orthorhombic lattices, Tetragonal lattices, Twinning, Reprints, *Yttrium barium cuprates, Tilt boundaries.

Fifty-two facetted grain boundary segments ((left bracket) 001 (right bracket) tilt boundaries) in clusters of bulk-scale YBa2Cu3O(7-x) crystals having coincident c-axes were characterized by optical microscopy techniques. Grain boundary orientations were widely distributed, with a slight favoring of (110), (310), and (510) boundary planes. All grain boundaries, except those far from the symmetric condition and those with (110) facets, exhibited well-developed matching of the twin domains across the boundary. It is suggested that this newly-reported phenomenon of twin pattern matching occurs due to a local coordination of the tetragonal --> orthorhombic transformation strain across grain boundaries and may be beneficial with regard to electrical transport in highly-textured polycrystalline material.

Keywords: *YBCO superconductors, Secondary ion mass spectroscopy, High temperature superconductors, Single crystals, Oxygen 18, Diffusion, Reprints, *Yttrium barium cuprates, Depth profiles.

An analytical strategy for quantifying the diffusion of (18)O in small, melt-grown single crystal YBa2Cu3O(7-x) superconductors by image depth profiling SIMS (Secondary Ion Mass Spectroscopy) is presented. This technique was used to obtain data for both in-depth (along the c axis) and lateral (in the ab plane) diffusion from one superconducting crystal. Cross sectional images, generated from the image depth profiling data, revealed features of the diffusion processes which would not have been apparent in a standard depth profile. Retrospective selected area depth profiling was used to remove the influence of background species, edge effects, and imperfections in the crystals, resulting in processed depth profiles with greater dynamic range. Finally, the influence of detector artifacts on the analytical results were evaluated.

Magnetic Measurement of Transport Critical Current Density of Granular Superconductors.
Final rept.
R. B. Goldfarb, R. W. Cross, L. F. Goodrich, and N. F. Bergren. 1993, 5p.
Pub. in Cryogenics 33, n1 p3-7 1993.

Keywords: *High temperature superconductors, *Critical current, Granular materials, Magnetic measurement, Current density, Magnetization, Reprints.

We describe two magnetic techniques that may be used to determine the transport critical current density J(ct) of granular superconductors by measuring the intergranular magnetization of a sample. In the first method, magnetization critical current density J(cm) is used to estimate J(ct) by isolating the intergranular magnetization and applying the critical state model. In the second method, magnetic detection is used to measure J(ct) directly: intergranular magnetization hysteresis loops are obtained while increasing a transport current through a sample. The critical current density J(ct) is that value of transport current density which causes the intergranular magnetization to collapse at a given magnetic field and temperature. Both methods give values of J(ct) in fair agreement with values obtained from conventional transport measurements of J(ct). Magnetization was measured with both extraction and Hall probe magnetometers.

Inelastic Neutron Scattering Measurements of Phonons in Icosahedral Al-Li-Cu.
Final rept.
A. I. Goldman, C. Stassis, R. Bellissent, F. W. Gayle, H. Moudden, and N. Pyka. 1991, 4p.
Pub. in Physical Review B 43, n10 p8763-8766 1991.

Keywords: Aluminum copper alloys, Lithium alloys, Neutron scattering, Inelastic scattering, Icosahedrons, Reprints, *Quasicrystals, Phonon dispersion.

We describe the results of inelastic neutron scattering measurements on a single grain of the icosahedral alloy Al-Li-Cu. Within experimental error the acoustic phonon dispersion at small, but finite, q is independent of direction, confirming the isotropic elasticity expected for icosahedral crystals. By following the longitudinal phonon dispersion curve along a five-fold axis, we can identify the location of a 'quasi-Brillouin zone boundary.' Furthermore, the measurements suggest the presence of an optical or localized mode along the two-fold axis at approximately 10 meV.

n-Value and Second Derivative of the Superconductor Voltage-Current Characteristic.
Final rept.
L. F. Goodrich, A. N. Srivastava, M. Yuyama, and H. Wada. 1993, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity 3, n1 p1265-1268 Mar 93.

Keywords: *Superconductors, High temperature superconductors, BSCCO superconductors, Critical current, Electric current, Transition points, Voltage, Copper, Simulators, Data acquisition, Reprints, Niobium titanium.

We studied the n-value (V varies as I(sup n)) and second derivative of V with respect to I, of the voltage-current curve of high and low temperature superconductors and superconductor simulators. We used these parameters for diagnosing problems with sample heating and data acquisition, and as indicators of the superconducting-to-normal state transition. The superconductor simulator may be useful in testing the measurement system integrity and reducing measurement variability as its characteristics are highly repeatable.

Keywords: *Indium gallium arsenides, *Ion implantation, Secondary ion mass spectroscopy, Semiconductor doping, Chromium ions, Iron ions, Phosphorus ions, Vanadium ions, Annealing, Reprints, Photoreflectance.

Single- and multiple-energy Fe, Cr, and V implants are performed into InGaAs. Annealing of the implanted InGaAs samples results in redistribution of the im-

planted atoms, as determined by secondary ion mass spectrometry. Coimplantation of Fe with P does not prevent this redistribution. A transport equation calculation of Fe-implantation-induced stoichiometric disturbances in InGaAs is done. The lattice quality of implanted InGaAs is investigated by photoreflectance measurements. Fe-implanted InGaAs has a resistivity close to the intrinsic limit, whereas Cr- and V-implanted InGaAs have a lower resistivity than the unimplanted material.

Pub. in Jnl. of Applied Physics 69, n1 p162-167 1991.

Keywords: *Indium gallium arsenides, Secondary ion mass spectroscopy, KeV range 10-100, KeV range 100-1000, MeV range 1-10, Semiconductor doping, Doped materials, Radiation damage, Rutherford scattering, Ion implantation, Iron ions, Backscattering, Reprints, Amorphization.

Single-energy Fe-implantation at energies in the range 50 keV - 2 MeV to achieve a peak Fe-concentration of 1 - 2 X 10(exp 18)/cu cm is performed into undoped (n-type) In-GaAs layers grown on InP:Fe. The first four statistical moments of the Fe-profiles measured by secondary ion mass spectrometry are determined. The Pearson IV distribution calculated from these moments matches the implant-profile closely. Samples implanted with Fe to doses in the range 5 X 10(exp 12) - 2 X 10(exp 15)/sq cm at 380 keV are analyzed by Rutherford backscattering measurements to study ion-induced damage. For 380 KeV implants, amorphization takes place at a dose of = 6 X 10(exp 13)/sq cm.

xi-Vector Formulation of Anisotropic Phase-Field Models: 3-D Asymptotics.
A. A. Wheeler, and G. B. McFadden. 17 Oct 94, 25p, NISTIR-5505.
Sponsored by Bristol Univ. (England). School of Mathematics.

Keywords: *Solidification, Liquid-solid interfaces, Surface energy, Differential geometry, Asymptotic series, Vector analysis, Three dimensional, Anisotropy, *Phase field models, Allen-Cahn equation, Gibbs-Thomson equation, Xi vector.

In the paper the authors present a new formulation of a large class of phase-field models, which describe solidification of a pure material and allow for both surface energy and interface kinetic anisotropy, in terms of the Hoffman-Cahn xi-vector. The Hoffman-Cahn vi-vector has previously been used in the context of sharp interface models, where it provides an elegant tool for the representation and analysis of interfaces with anisotropic surface energy. The authors show that the usual gradient-energy formulations of ansotropic phase-field models are expressed in a natural way in terms of the vi-vector when approximately interpreted. The authors use this new formulation of the phase-field equations to provide a concise derivation of the Gibbs-Thomson-Herring equation in the sharp-interface limit in three dimensions.

Defective Structures of Barium Yttrium Copper Oxide (Ba2YCu3Ox) and Ba2YCu3-yMyOz (M=Fe, Co, Al, Ga, ..).
Final rept.
A. Santoro. 1992, 44p.
Pub. in Chem. Supercond. Mater., p146-189 1992.

Keywords: *YBCO superconductors, *Crystal defects, High temperature superconductors, Vacancies(Crystal defects), Twinning, Substitutes, Reprints, *Yttrium barium cuprates, Oxygen transport.

The structural determination of Ba2YCu3O(x) for 6.8 = or < x = or < 7.0 was completed in several laboratories by Rietveld analysis of powder neutron diffraction data. The neutron diffraction experiments confirmed the space group Pmmm and the main structural features found by x-rays by Siegrest et al., but revealed that some of the oxygen assignments made in the x-ray studies were not entirely correct. The refined structural parameters obtained in four of these neutron diffraction analyses are given and the structure of Ba2YCu3O7.0 is schematically illustrated where it is compared with the parent structure of perovskite. Data collected at low temperatures revealed that no phase transitions take place in going from room temperature down to 5K.

Neutron Powder Diffraction Study of the Structures of La1.9Ca1.1Cu2O6 and La1.9Sr1.1Cu2O6+Delta.
Final rept.
A. Santoro, F. Beech, and R. J. Cava. 1990, 6p.
Pub. in Materials Research Society Symposia Proceedings 166, p187-192 1990.

Keywords: *Crystal structure, Tetragonal lattices, Lattice parameters, Neutron diffraction, Superconductors, Reprints, *Lanthanum calcium cuprates, *Lanthanum strontium cuprates, Reitveld method, Powder diffraction.

The title compounds are structurally isomorphous and crystallize with the symmetry of space group I4/mmm. The lattice parameters are a = 3.8248(1), c = 19.4286(5)A for La(1.9)Ca(1.1)Cu2O6 and a = 3.8601(1), c = 19.9994(5)A for La(1.9)Sr(1.1)Cu2O(6 + delta). The structure can be easily derived from that of La2CuO4 by substituting the layers of composition CuO2 present in La2CuO4 with a block of three layers having composition and sequence (CuO2) - (R) - (CuO2), where R is Ca, Sr, and/or La. Although the general structural configuration is the same for the Ca and the Sr compounds, the distribution of the metal atoms is different in the two cases.

Normal Modes and Structure Factor for a Canted Spin System: The Generalized Villain Model.
Final rept.
W. M. Saslow, and R. W. Erwin. 1992, 10p.
Pub. in Physical Review B 45, n9 p4759-4768, 1 Mar 92.

Keywords: Structure factors, Heisenberg model, Antiferromagnetism, Ferromagnetism, Spin waves, Hamiltonians, Reprints, *Villain model, Normal modes.

The generalized Villain model has a rich variety of possible structures, ranging from a pure ferromagnet to a pure antiferromagnet. In between these extremes, the system is canted. Using a Heisenberg exchange Hamiltonian and linearized spin-wave theory, we have studied the normal modes and structure factors for this model. The exchange ratio J'/J and the external field have both been varied. The effect of canted spin structures on the modes and structure factors is readily seen. We believe that it is now a practical matter to study the normal modes and structure factors for more complicated systems described by this type of model.

Pub. in Proceedings of Symposium on High Temperature Superconducting Compounds: Processing and Related Properties, Las Vegas, NV., February 27-28, 1989, p303-310.

Keywords: *YBCO superconductors, *Precipitation(Chemistry), *Precursors, High temperature superconductors, Chemical composition, Synthesis(Chemistry), Particle size, Polycrystalline, Reprints, *Yttrium barium cuprates, Hydroxycarbonates.

The precipitation of the mixed hydroxycarbonates of Ba, Y and Cu as precursors to the YBa2Cu3O(7-x) high T(c) superconductor is an attractive route to this material. However, studies in our laboratory indicate that powder homogeneity is strongly dependent upon ionic concentrations and system pH. Moreover, we have assessed the composition of the precipitated moieties. These data have been incorporated into controlling the precipitation process in order to optimize particle size and powder homogeneity. Further processing of these powders has yielded polycrystalline solids with sharp transitions near 95K and high transport current densities.

Keywords: *Electronic structure, *Band theory, Photoelectron spectroscopy, Ultraviolet spectroscopy, Barium titanates, Binding energy, Substitutes, Reprints, *Yttrium barium titanates, *Lanthanum barium titanates, *Neodymium barium titanates, Metal insulator transition, Mixed oxides.

Changes induced in the electronic structure of BaTiO3 by substitutions of R=Y, La, or Nd for Ba to form the mixed oxides, R(x)Ba(1-x)TiO(3-delta) have been investigated using ultraviolet photoelectron spectroscopy. Substitution of formally R(3+) ions for Ba(2+) leads to the introduction of filled states in the band gap that are shown by resonant-photoemission measurements to have significant Ti 3d character, consistent with a Mott-Hubbard-insulator description for these oxides. Various contributions to the binding energy and width of these states are considered. It is suggested that the dominant factor is electron-electron correlation and this leads to the estimates U approx equals Delta approx equals 3 eV for this system, where U is the correlation energy for the 3d electrons and Delta is the charge-transfer energy.

Keywords: Orthorhombic lattices, Platinum intermetallics, Ternary compounds, Neel temperature, Neutron diffraction, Magnetic moments, Reprints, *Uranium platinum germanides, *Magnetic ordering, Uranium intermetallics, Germanium intermetallics, Powder diffraction.

The orthorhombic uranium (1:1:1) ternary compound UPtGe has been studied by means of neutron powder diffraction, using both the time-of-flight method at a spallation source and the constant-wavelength reactor method. The material exhibits incommensurate magnetic order with q = (0,0.5543,0), with a uranium moment at the lowest temperature of 1.11 mu(sub B) and a Neel temperature of 51 K. The moments are confined to the bc plane, which includes the propagation vector for the incommensurate modulation, and they rotate within that plane as one moves parallel to the b axis. The magnitude of the ordered uranium moment is the only order parameter in the problem.

Keywords: *Crystal structure, Antiferromagnetic materials, Gold intermetallics, Tin intermetallics, Neutron

diffraction, Magnetic properties, Reprints, *Uranium gold stannides, Uranium intermetallics, Powder diffraction, Uranium palladium stannides, Uranium copper stannides.

The uranium intermetallic compound UAuSn has been studied by means of neutron powder diffraction. It crystallizes in the CaIn2 structure type, with space group P6(3)/mmc, in agreement with previous x-ray work. Below 37 K, it exhibits long-range antiferromagnetic order, in a double-sized orthohexagonal magnetic unit cell. At the lowest temperature measured, the uranium moment is 1.10 mu(sub B). The magnetic structure is collinear with moments parallel to the orthorhombic b axis and the magnetic space group is C(p)m'cm'. We discuss the Au/Sn disorder in terms of metallic radii and discuss the consequences of this symmetry on the collinearity of the magnetic structure. These results are compared with work on the isostructural compounds UPdSn and UCuSn.

Keywords: *YBCO superconductors, *Superconducting films, *Laser ablation, High temperature superconductors, Scanning tunneling microscopy, Temperature dependence, Transition temperature, Critical current, Substrates, Thin films, Reprints, *Yttrium barium cuprates, Lanthanum aluminates.

YBa2Cu3O(7-delta) films have been laser ablated under a variety of conditions, onto four different substrate materials. Using scanning tunneling microscopy, it was observed that the films grow by an island nucleation and growth mechanism. The properties of the films were studied as functions of the deposition conditions. Films on LaAlO3 had the best and most reproducible properties. The superconducting transition temperatures of films deposited on LaAlO3 proved to be fairly insensitive to the substrate temperature during deposition; T(c) > 90 K were obtained for films deposited over a temperature range from 760 to 850 C. The oxygen partial pressure during the deposition had a large effect on the transition temperature; the highest T(c)s were obtained for films deposited in 26.7 Pa (200 mTorr) oxygen.

Magnetic Ordering of the Cu Spins in PrBa2Cu3O6+x.
Final rept.
N. Rosov, J. W. Lynn, G. Cao, J. E. Crow, J. W. O'Reilly, and P. Pernambuco-Wise. 1992, 8p.
Pub. in Physica C 204, p171-178 1992.

Keywords: Neel temperature, Neutron diffraction, Single crystals, Antiferromagnetic materials, Copper, Reprints, *Praseodymium barium cuprates, *Magnetic ordering.

Neutron diffraction has been employed to investigate the magnetic ordering of the Cu spins in a single crystal of PrBa2Cu3O(6+x). At small x we have observed a Neel temperature T(N) of 370 K, where both the chain and plane Cu spins order simultaneously. For x approx 0.6, the Cu planes still order at T(N) about 370 K; however, the ordering temperature of the chain spins has decreased to about 160 K. The observed intensities of the magnetic reflections cannot be explained by keeping the chain layer Cu spin direction in the ab plane; rather, the chain moments must have a component along the c direction. We discuss these results in light of recent optical reflectivity measurements on PrBa2Cu3O(6+x) by Takenaka et al. (Phys. Rev. B 46 (1992) 5833).

Pub. in Physical Review B 47, n22 p15 256-15 265, 1 Jun 93.

Keywords: *Crystal structure, Neutron diffraction, Magnetic moments, Reprints, *Neodymium barium copper niobates, *Praseodymium barium copper niobates, *Magnetic ordering.

Using neutron diffraction, we have studied the crystal structure and magnetic ordering of the rare-earth and Cu moments in the layered perovskite systems NdBa2Cu2NbO8 (Nd 2:2:1:8) and PrBa2Cu2NbO8 (Pr 2:2:1:8). These are systems similar to R Ba2Cu3O(6+x) (R 1:2:3:(6+X)) for which the chain Cu-O layers have been fully replaced by layers of Nb-O octahedra. Powder profile refinements below 20 K show that both Nd 2:2:1:8 and Pr 2:2:1:8 are in space group I4/mcm, because the near-neighbor Nb-O octahedra are rotated about the c axis in opposite senses. The Cu moments are ordered below 375(10) K for Nd 2:2:1:8 and 340(15) K for Pr 2:2:1:8, with saturation moments in both cases of 0.5(1)mu(sub B). The near-neighbor Cu spins are aligned antiparallel, just as for the Cu 'plane' ordering in R 1:2:3:(6 + X).

Quasielastic and Inelastic Neutron-Scattering Studies of ((CD3)3ND)FeCl3.2D2O: A One-Dimensional Ising Ferromagnet.
Final rept.
N. Rosov, J. W. Lynn, J. J. M. Williams, and C. P. Landee. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p6081-6083, 15 May 93.

Keywords: Orthorhombic lattices, Cryogenic temperature, Hydrogen bonds, Deuterium compounds, Iron compounds, Neutron scattering, Inelastic scattering, One dimensional, Hydrates, Reprints, *Ferrous trimethylammonium chloride, Ising ferromagnets.

Ferrous trimethylammonium chloride (FeTAC) is a member of a family of compounds that consist of chains of bihalide-bridged metal ions aligned along the b axis of the orthorhombic unit cell. FeTAC orders three dimensionally below T(N) = 3.16 K, with the moments, which are canted from the b axis by approx 20 deg, coupled ferromagnetically along the b axis and staggered along the (left bracket) 101 (right bracket) direction. The order parameter follows the exact Onsager solution for a rectangular 2D Ising lattice below T/T(N) approx 0.95. However, quasielastic scattering measurements in the vicinity of T(N) show that the correlations do not evolve as do those of the 2D Ising antiferromagnets ErBa2Cu3O7 and K2CoF4. Above T(N), magnetic excitations along the b axis that follow the dispersion relation of a 1D ferromagnet with a gap of 3.7 meV have been observed.

Thermally Activated Hopping of a Single Abrikosov Vortex.
Final rept.
S. C. Sanders, J. Sok, D. K. Finnemore, and Q. Li. 1993, 5p.
Pub. in Physical Review B 47, n14 p8996-9000, 1 Apr 93.

Keywords: Joseph junctions, Lead(Metal), Metal films, Thin films, Flux pinning, Superconductors, Reprints, *Abrikosov vortices, Thermal activation.

Thermally activated hopping of a single Abrikosov vortex has been investigated for a thin Pb film that was decorated with an artificial pinning structure. To determine the location of the vortex, the Pb film is fabricated to be one electrode of a cross-strip superconductor/normal-metal/insulator/superconductor (SNIS') Josephson junction. Distortions in the Fraunhofer pattern specify the vortex location. As the temperature is raised toward T(c), the vortex depins from the artificial pinning site and reproducibly moves through the same sequence of other pinning sites before it leaves the function area of the Pb film. The first thermal depinning occurs when the order parameter of the bulk superconductor is about 20% of the T = O value. The trajectory is not random.

R. H. Ono, L. F. Goodrich, J. A. Beall, M. E. Johansson, and C. R. Reintsema. 1991, 3p.
Pub. in Applied Physics Letters 58, n11 p1205-1207 1991.

Keywords: *YBCO superconductors, *Critical current, *Superconducting films, High temperature superconductors, Magnetic fields, Current density, Metal films, Thin films, Anisotropy, Laser ablation, Interfaces, Silver, Reprints, *Yttrium barium cuprates, Bilayers.

We have measured the transport critical current density (J(c)) in epitaxial-quality films of YBa2Cu3O(7-delta) which were covered by thin (10 nm) Ag films. The films, both with and without Ag, had J(c) values greater than 10(exp 6) A/sq cm in liquid nitrogen. The effect of the Ag was to greatly reduce the dependence of J(c) on external magnetic fields, but only in the case where the field was oriented in the plane of the film perpendicular to the c axis. It is unlikely that the effect is simply due to altered surface pinning, although qualitative agreement with critical state models is observed.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 29, n2 p1265-1275 Mar 93.

Keywords: *Magnetic films, Magnetic recording, Magnetic anisotropy, Thin films, Magnetostatics, Cobalt alloys, Reprints, Micromagnetic models, Exchange interactions.

A micromagnetic model of dual-layer magnetic-recording thin films is described. The model, which is capable of simulating magnetic layers having different magnetic and geometric properties, is applied to the study of the magnetic properties of dual-layer media characterized by a three-dimensional isotropic distribution of anisotropy axes in both layers, using parameters typical of cobalt-alloy films. In the absence of exchange interactions between the layers, a correlation is found between squareness ratios, average magnetostatic energy densities, and structural dimensions of the media. An in-phase magnetization reversal of the layers is found to occur with increasing interlayer exchange

coupling. A complex relationship is found between coercivity and media parameters.

Micromagnetic Simulations of Tunneling Stabilized Magnetic Force Microscopy.
Final rept.
J. O. Oti, and P. Rice. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p5802-5804, 15 May 93.

Keywords: Electron tunneling, Magnetic films, Simulation, Images, Reprints, *Magnetic force microscopy, *Garnet films, Micromagnetics.

A micromagnetic model simulating the images produced by tunneling stabilized magnetic force microscopy is described. The images are related to the force interactions between the fringing fields from the imaged surface and stray fields from the sensing probe. The model, which allows for variations in the magnetization states of the probe, is used to examine the dependence of the interaction forces on varying probe-film separations for a magnetic garnet film. The results show that the images are sensitive to separation and that the changing probe magnetization plays an important role in determining the final image.

Experimental Verification of a Micromagnetic Model of Dual-Layer Magnetic Films.
Final rept.
J. O. Oti, and S. E. Russek. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p5845-5847, 15 May 93.

Keywords: *Magnetic films, Thin films, Cobalt alloys, Nickel alloys, Magnetostatics, Chromium, Reprints, *Micromagnetic models, Exchange interactions, Multilayers.

A micromagnetic model has been used to characterize the magnetic properties of dual-layer magnetic films. The model calculations, with experimentally determined input parameters, have been compared with measurements on fabricated Co alloy dual-layer films. Calculations are done with a more general version of a previous micromagnetic model, modified to allow the variation of certain media parameters which were previously held constant. Each of the experimental media consists of a bilayer of 30-nm-thick Co(0.75) Ni(0.25) magnetic films separated by a Cr decoupling layer. The calculations predict a split in the coercivities of the layers for small Cr thicknesses which is observed experimentally. The model correlates an observed increase in media squareness ratio and coercivity, as the Cr thickness is increased, with diminishing exchange and magnetostatic interactions between the magnetic layers.

Sponsored by Stanford Univ., CA. Dept. of Physics.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p3021-3024 1991.

Keywords: Frequency dependence, Optical switching, Noise reduction, SQUID devices, Laser radiation, Light pulses, Magnetometers, Niobium, Reprints, *Flux vortices, *Flux trapping, Microbridges.

We are experimenting with optical switches for use in a noise reduction device for SQUID magnetometers. Laser light pulsed onto a Nb microbridge drives it momentarily normal and changes the quantum flux state of a superconducting circuit. For certain laser pulse parameters, a vortex is sometimes trapped in the microbridge and is detected by a SQUID coupled to the circuit. The trapping frequency and vortex position were studied using various waveforms.

Variation in Magnetic Properties of Cu/Fcc (001) Sandwich Structures.
Final rept.
W. Schwarzacher, J. Penfold, I. Jacob, R. F. Willis, W. Allison, R. C. Ward, and W. F. Egelhoff. 1989, 4p.
Pub. in Solid State Communications 71, n7 p563-566 1989.

Keywords: Polarization(Spin alignment), Magnetic moments, Fcc lattices, Sandwich structures, Magnetization, Copper, Magnetic films, Metal films, Thin films, Epitaxy, Reprints, *Ion films, Ultrathin films, Neutron reflection.

Spin-polarized neutron reflection is used to determine the magnetization of ultrathin epitaxial fcc Fe films sandwiches by Cu (001). A 3.0 ML film had a measured average magnetic dipole moment per atom of 1.9 + or - 0.6 Bohr magnetons/atom which is the highest value yet observed for an fcc Fe film and is consistent with the high spin-moment phase predicted for bulk fcc iron. This state appears to be unstable since increasing the film thickness or using a higher growth temperature leads to a considerable decrease in the observed moment.

Pub. in Physical Review B 49, n1 p368-377, 1 Jan 94.

Keywords: *Magnetoresistance, *Superlattices, Boltzmann equation, Chromium, Copper, Iron, Reprints, *Interface roughness, Magnetic multilayers.

The Boltzmann equation is solved for a system consisting of a ferromagnetic-normal-metallic multilayer. The in-plane magnetoresistance of Fe/Cr and Fe/Cu superlattices is calculated for (1) varying interfacial geometric random roughness with no lateral coherence, (2) correlated (quasiperiodic) roughness, and (3) varying chemical composition of the interfaces. The interplay between these three aspects of the interfaces may enhance or suppress the magnetoresistance, depending on whether it increases or decreases the asymmetry in the spin-dependent scattering of the conduction electrons. Properties of the interfaces relevant to the giant negative magnetoresistance are discussed.

Keywords: *Invar, Iron alloys, Nickel containing alloys, Polarization characteristics, Polarized beams, Neutron beams, Spin waves, Temperature dependence, Single crystals, Amorphous materials, Comparative evaluations, Reprints, *Magnetic excitations.

Triple-axis inelastic polarized neutron measurements have been performed as a function of temperature on a single crystal of the Invar alloy Fe(65)Ni(35) to distinguish longitudinal from transverse magnetic excitations in the magnetically ordered phase. Well below the Curie temperature of 501 K the magnetic excitation spectrum is dominated by conventional transverse spin-wave excitations, which in fact follow the predictions of spin-wave theory very well. In particular, we find no evidence for propagating longitudinal excitations in this system, in sharp contrast to the behavior observed in the amorphous Invar Fe(86)B(14) material as well as the non-Invar amorphous system Fe(40)Ni(40)P(14)B(6).

Keywords: *Silicon dioxide, *Oxide films, Dielectric films, Ellipsometry, Substrates, Strains, Silicon, Reprints, *Interface roughness.

The existence of both the strain and microroughness at the interface of thermally grown SiO2 films on Si was ascertained unambiguously for the first time by high accuracy spectroscopic ellipsometry. The dielectric function of the interface was determined by a comprehensive data analysis procedure. By carefully examining the dielectric function obtained by our model, the strain was seen to cause a red shift of 0.042 eV of the interband critical point E(1) compared with the bulk silicon value. The thickness of the interface region was found to be 2.2 nm of which a significant part is due to the strain.

Spot-Profile-Analyzing LEED Study of the Epitaxial Growth of Fe, Co, and Cu on Cu(100).
Final rept.
G. L. Nyberg, M. T. Kief, and W. F. Egelhoff. 1993, 11p.
Pub. in Physical Review B 48, n19 p14 509-14 519, 15 Nov 93.

Keywords: *Epitaxial growth, *Cobalt, *Copper, *Iron, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature dependence, Thermal diffusion, Metal films, Thin films, Microstructure, Substrates, Reprints, Low energy electron diffraction, Henzler rings, Ultrathin films.

The structure of epitaxial films of Fe, Co, and Cu grown at 80-300 K on Cu(100) has been investigated using a spot-profile-analyzing low-energy electron-diffraction (LEED) instrument. In all three systems rings appear around the substrate LEED spots, although the rings differ in intensity and in diameter depending upon the variables of film thickness and deposition temperature. Rings of this type have been studied extensively by Henzler et al and correlated with the mean separation between islands. Much can be inferred about the growth mechanism through a study of these Henzler rings. The rings contract radially with increasing deposition temperature or with increasing annealing temperature as thermally activated diffusion permits the formation of larger islands with greater distances between them. The value of the mean separation suggests that upon consideration these atoms do not come to rest at the immediate site of impact but instead experience some very transient type of mobility associated with the impact and accommodation process.

Keywords: *Epitaxial growth, *Chromium, *Iron, Scanning electron microscopy, Scanning tunneling microscopy, Polarization characteristics, Temperature range 0273-0400 K, Exchange interactions, Metal films, Magnetization, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning electron microscopy with polarization-analysis (SEMPA) measurements of the dependence of the oscillations of the exchange coupling in Fe/Cr/Fe(100) structures on the Cr growth temperature are correlated with the thickness fluctuations in Cr films measured by scanning tunneling microscopy (STM) at similar growth temperatures. Layer-by-layer growth was observed by STM for Cr deposition on very flat Fe(100) whiskers at deposition temperatures = or > 300 C. The SEMPA measurements of the magnetization of the Fe overlayer as a function of Cr spacer-layer thickness at this temperature could be simulated well by oscillatory coupling with periods 2.105 + or - 0.005d and 12 + or - 1d, where d is the layer spacing. Rougher Cr growth, limited by diffusion kinetics, occurs at lower growth temperatures giving a distribution of thicknesses in the growth front as determined by STM. We modeled the Fe magnetization for lower-temperature Cr growth by assuming that the exchange coupling at each discrete Cr thickness is the same as found for layer-by-layer growth. Important characteristic length scales and the role of biquadratic coupling in the SEMPA measurements are addressed.

Keywords: *Platinum containing alloys, *Iron alloys, Temperature dependence, Neutron scattering, Inelastic scattering, Single crystals, Spin waves, Reprints, *Magnetic excitations.

We have performed inelastic neutron scattering measurements of the long-wavelength spin wave excitations of both ordered and disordered Fe(72)Pt(28) single crystals below their critical temperatures, T(C) = 510 and 375 K, respectively. The spin waves followed the expected E = D(q squared) dependence, and the temperature-dependent spin stiffness D decreased as T/T(C)(exp 5/2), as expected for an isotropic ferromagnet. The extrapolated zero-temperature spin stiffness was D = 98(4) meV (A squared) and 107(1) me V (A squared) for the disordered and ordered alloy, respectively. These values are significantly higher than the zero-temperature stiffness as determined by magnetization measurements.

The techniques of atom optics can be applied during the deposition of atoms onto a surface to produce nanostructures. A laser is used to form a standing wave intensity pattern in front of the substrate. An atom beam, which has been collimated by optical means, is focused onto the substrate by dipole forces from the standing wave pattern so as to deposit a series of lines spaced by half the laser wavelength. We describe the fabrication of a Cr nanograting formed using this new technique. The experimental arrangement for deposition and the optical collimation of the atom beam are described. Scanning electron microscopy (SEM) and atomic force microscopy (AFM) images of the resulting nanostructures are presented.

Effect of a Crystal Monochromator on the Local Angular Divergence of an X-Ray Beam.
Final rept.
R. D. Spal. 1994, 7p.
Pub. in Acta Crystallographica A50, p295-301 1994.

Keywords: *X-ray monochromators, *X-ray optics, X-ray diffraction, Synchrotron radiation, Incident radiation, Divergence, Asymmetry, Collimation, Reprints.

The performance of an X-ray optical system often depends critically on the local angular divergence of the X-ray beam. For example, in systems for radiography, tomography and diffraction topography, the angular divergence of the incident beam at a point in the sample determines the limiting spatial resolution. In this paper, formulas are derived for the local divergence in the diffracted beam of the non-dispersive asymmetric reflection double-flat-crystal monochromator, illuminated by synchrotron or characteristic radiation. The formulas are analyzed to determine the general behavior of the local divergence as a function of the asymmetry factors of the crystal reflections. For synchrotron radiation, one surprising conclusion is that the local divergence of the magnifying monochromator is always greater than that of the symmetric monochromator, significantly so for even moderate magnification factors.

Exchange Coupling in Magnetic Heterostructures.
Final rept.
M. D. Stiles. 1993, 21p.
Pub. in Physical Review B 48, n10 p7238-7258, 1 Sep 93.

Keywords: Exchange interactions, Fermi surfaces, Oscillations, Reprints, *Magnetic heterostructures, Magnetic multilayers, Exchange coupling.

Many structures consisting of magnetic layers separated by a nonmagnetic spacer layer show an oscillatory exchange coupling. This behavior is explained in terms of a simple model that shows that the Fermi surface of the spacer-layer material is responsible for the oscillatory coupling. The periods of the oscillatory coupling are set by extremal spanning vectors of the Fermi surface of the spacer-layer material. The strength of the coupling depends both on the geometry of the Fermi surface and on the reflection amplitudes for electrons scattering from the interfaces between the spacer layers and the magnetic layers. To test this and related models, the extremal spanning vectors and the associated Fermi-surface geometrical factors have been calculated for a large set of spacer-layer materials and interface orientations. These models are at least consistent with the experimental data. All measured oscillation periods are consistent with the calculated periods, but particularly for transition metals there are many more periods calculated than are seen experimentally.

Growth of Iron on Iron Whiskers.
Final rept.
J. A. Stroscio, and D. T. Pierce. 1994, 6p.
Pub. in Jnl. of Vacuum Science and Technology B 12, n3 p1783-1788 May/Jun 94.

Keywords: *Epitaxial growth, *Iron, Whiskers(Single crystals), Scanning tunneling microscopy, Electron diffraction, Surface roughness, Surface diffusion, Temperature range 273-400 K, Temperature range 400-1000 K, Temperature dependence, Metal films, Thin films, Islands, Scaling, Reprints.

Real space views of the homoepitaxial growth of Fe on Fe(001) whiskers is reported, observed by scanning tunneling microscopy (STM), during the initial stages of growth. Scaling of the Fe island sizes and separation distribution are observed as a function of the diffusion rate to the deposition rate. A measure of the surface diffusion of the Fe atoms is obtained over the temperature range of 20-250 C from the temperature dependence of the island density. The effect of the diffusion kinetics is also observed in the surface morphology as a decrease in surface roughness with increasing temperature in thin Fe films. A comparison of real and reciprocal space techniques is obtained from a comparison of STM images and reflection-high-energy-electron-diffraction measurements during growth.

Pub. in Jnl. of Vacuum Science and Technology B 12, n3 p1789-1792 May/Jun 94.

Keywords: *Epitaxial growth, *Chromium, Scanning tunneling microscopy, Whiskers(Single crystals), Temperature range 400-1000 K, Temperature dependence, Electron diffraction, Exchange interactions, Film thickness, Metal films, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning tunneling microscopy (STM) and reflection high-energy electron diffraction (RHEED) were used to study the epitaxial growth of Cr on Fe(001) whiskers as a function of the Fe whisker temperature during growth. The STM images give real space views of the morphology of Cr growth, which can be correlated with the nature of the RHEED intensity oscillations. Layer by layer growth is found for Cr deposition on an Fe(001) surface at 300 C, and very rough growth, limited by diffusion kinetics, is observed at lower temperatures. The variation in the interlayer exchange coupling in Fe/Cr/Fe sandwiches as a function of the thickness of the Cr interlayer, which has been found to depend strongly on the growth temperature of the Cr interlayer, can be explained by the thickness fluctuations determined from the STM measurements of Cr films grown at different temperatures.

Keywords: *Epitaxial growth, *Gold, *Iron, Scanning electron microscopy, Polarization characteristics, Electron diffraction, Exchange interactions, Fermi surfaces, Metal films, Thin films, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning electron microscopy with polarization analysis was used to investigate the interlayer exchange coupling in Fe/Au/Fe(100) sandwich structures. The films were epitaxially grown on single-crystal Fe(100) substrates. Electron diffraction measurements revealed that the Au spacer film grew with a surface reconstruction consistent with that observed for bulk Au crystals. The exchange coupling oscillates between primarily ferromagnetic and antiferromagnetic coupling for Au spacer layers up to 65 layers (13 nm) thick, but a significant biquadratic coupling component was also observed. The oscillatory coupling exhibited two components with periods of 2.48 + or - 0.05 layers (0.506 + or - 0.010 nm) and 8.6 + or - 0.3 layers (1.75 + or - 0.06 nm). The measured periods are in excellent agreement with those calculated from spanning vectors of the Au Fermi surface.

Keywords: *Gallium arsenides, *Photoluminescence, *Band structure of solids, Carbon additions, Doped crystals, Energy gap, Fermi level, Emission spectra, Epitaxy, Reprints, *Interband absorption, Bandgap narrowing, Density of states.

Heavily carbon-doped GaAs samples with doping levels as high as 4.1 X 10(exp 20)/cc were studied by photoluminescence and luminescence excitation spectroscopies. Luminescence and absorption band gaps were determined, from which the positions of the Fermi levels were deduced. A variety of factors which affect the observed emission spectra, including diffraction and refraction of the luminescence, substrate effects, and lattice contraction in the carbon-doped epilayer, were examined. A first-principles calculation was performed to calculate the density of states, the band gap, the Fermi energy, and the emission spectrum. Comparison of the calculation results with the experiments shows that the theoretical model we use is a good approximation for describing band structure for doping levels higher than 10(exp 20)/cc. However, the discrepancy between the measured and the calculated emission spectra indicates that the usual assumptions such as constant momentum matrix elements and quasiequilibrium distribution of photoexcited electrons in the conduction band may not be appropriate in treating the transition processes in highly degenerate semiconductors.

Keywords: *Surfaces, Monte Carlo method, Cubic lattices, Topology, Simulation, Reprints, *Self-avoiding surfaces, Oct trees.

With Monte Carlo simulation, we study closed self-avoiding surfaces (SAS) of arbitrary genus on a cubic lattice. The gyration radius and entropic exponents are v = 0.506 + or - 0.005 and theta = 1.50 + or - 0.06, respectively. Thus, SAS behave like lattice animals (LA) or branched polymers at criticality. This result, contradicting previous conjectures, is due to a mechanism of geometrical redundancy, which is tested by exact renormalization on a hierarchical vesicle model. By mapping SAS into restricted interacting site LA, we conjecture v(sub theta) = 1/2 phi(sub theta) = 1, and theta(sub theta) = 3/2 at the LA theta point.

Keywords: *Amorphous silicon, *Surface analysis, *Silicon, Radio frequency discharge, Scanning tunneling microscopy, Gallium arsenides, Topography, Substrates, Single crystals, Reprints, Nanostructures.

A scanning tunneling microscope has been used to study the topography of the as-grown surface of device-quality, intrinsic, hydrogenated amorphous silicon deposited by rf discharge from silane. The substrates were atomically flat, oxide-free, single-crystal silicon or gallium arsenide. No evidence for island formation or nanoscale irregularities was seen in studies of 100-A-thick films on either silicon or gallium arsenide. The topography of 1000- and 4000-A-thick films has much variation; many regions can be characterized as 'rolling hills,' but atomically flat areas have also been observed nearby. Generally, it appears that surface diffusion plays a role in smoothing the film topography. In most regions, the observed slopes were 10% or less from horizontal, but some steep-sided valleys, indicating incipient voids, were observed. The effect of the finite size of the scanning tunneling microscope probe tip is considered; this has an effect on the observed images in some cases.

Insulating Nanoparticles on YBa2Cu3O7-delta Thin Films Revealed by Comparison of Atomic Force and Scanning Tunneling Microscopy.
Final rept.
R. E. Thomson, J. Moreland, N. Missert, B. F. Cole, D. A. Rudman, and S. Sanders. 1993, 3p.
Pub. in Applied Physics Letters 63, n5 p614-616, 2 Aug 93.

Keywords: *High temperature superconductors, *Superconducting films, *YBCO superconductors, Atomic force microscopy, Scanning tunneling microscopy, Surface analysis, Thin films, Topography, Reprints, *Yttrium barium cuprates, Nanostructures.

The surface topography of YBa2Cu3O(7-delta) thin films has been studied with both atomic force microscopy (AFM) and scanning tunneling microscopy (STM). The AFM images reveal a high density of small distinct nanoparticles, 10-50 nm across and 5-20 nm high, which do not appear in STM images of the same samples. In addition, we have shown that scanning the STM tip across the surface breaks off these particles and moves them to the edge of the scanned area, where they can later be imaged with the AFM.

Lattice Imperfections Studied by Use of Lattice Green's Functions.
Final rept.
R. Thomson, S. Zhou, A. Carlsson, and V. Tewary. 1992, 10p.
Pub. in Physical Review B 46, n17 p10 613-10 622, 1 Nov 92.

Keywords: *Crystal defects, *Crack propagation, *Greens function, Crystal dislocations, Hexagonal lattices, Fractures(Materials), Numerical solution, Interfaces, Reprints.

This paper explores the use of lattice Green's functions for calculating the static structure of defects in lattices, in that the atoms of the lattice interact with their neighbors with an arbitrary nonlinear (short-range) potential. The method is hierarchical, in which Green's functions are calculated for the perfect lattice, for increasingly complicated defect lattices, and finally the nonlinear structure problem is iterated until a converged solution is found. As an illustration of the method, we report numerical calculations for an interfacial crack emitting dislocations from an interface between two joined two-dimensional hexagonal lattices. The supercell size was 4 x 10(exp 6), and the crack length was 101 lattice spacings. After the Green's functions were obtained for the defective lattice, the dislocation and crack structures were obtained in a minute or less, making possible detailed studies of the defects with various external loads, force laws, defect relative positions, etc., with negligible computer time.

Technique to Evaluate Benchmarks: A Case Study Using the Livermore Loops.
Final rept.
J. C. M. Wang, J. M. Gary, and H. K. Iyer. 1990, 16p.
Sponsored by Department of Energy, Washington, DC.
Pub. in International Jnl. of Superconductor Application 4, n4 p40-55 1990.

Keywords: Principle components analysis, Least squares method, Data reduction, Data analysis, Cluster analysis, Kernel functions, Superconductors, Reprints, *Livermore loops.

This paper is devoted to an analysis of the data from the Livermore kernels benchmark. We will show that in the sense of least squares prediction the dimension

of these data is rather small; a reduction of the data to dimension four has about the same predictive power as the original data. Two techniques are used that reduce the 72 kernel timings for each machine to a few scores by which the machine is characterized. The first is based on a principal component analysis, the second on a cluster analysis of the kernels. The validity of the reduction to lower dimension is checked by various means. The possible use of the Livermore data to predict the running time of larger codes is demonstrated.

Manipulation of Adsorbed Atoms and Creation of New Structures on Room-Temperature Surfaces with a Scanning Tunneling Microscope.
Final rept.
L. J. Whitman, J. A. Stroscio, R. A. Dragoset, and R. J. Celotta. 1991, 5p.
Pub. in Science 251, n4998 p1206-1210, 8 Mar 91.

Keywords: Scanning tunneling microscopy, Room temperature, Indium antimonides, Gallium arsenides, Adsorbates, Semiconductors, Diffusion, Cesium, Surfaces, Alkali metals, Reprints, *Atomic manipulation, Nanostructures, Nanoclusters.

A general method of manipulating adsorbed atoms and molecules on room-temperature surfaces with the use of a scanning tunneling microscope is described. By applying an appropriate voltage pulse between the sample and probe tip, adsorbed atoms can be induced to diffuse into the region beneath the tip. The field-induced diffusion occurs preferentially toward the tip during the voltage pulse because of the local potential energy gradient arising from the interaction of the adsorbate dipole moment with the electric field gradient at the surface. Depending upon the surface and pulse parameters, cesium (Cs) structures from one nanometer to a few tens of nanometers across have been created in this way on the (110) surfaces of gallium arsenide (GaAs) and indium antimonide (InSb), including structures that do not naturally occur.

Keywords: *High temperature superconductors, *BSCCO superconductors, *Crystallization, Scanning electron microscopy, X-ray diffraction, Heat treatment, Lead additions, Microstructure, Glass, Reprints, *Bismuth lead strontium calcium cuprates.

Phase assemblages in two Sr-Bi-Pb-Ca-Cu-O glasses and their crystallization into glass-ceramics through a sequence of heat treatments are described. Samplers were heat treated at various temperature based on differential thermal analysis (DTA) of the as-quenched glasses. X-ray powder diffraction was used to identify the compounds in each sample; and the different phases formed in these two samples were compared. Results of microstructural characterization of selected samples using scanning electron microscopy are discussed.

The influence of the ionic size of the lanthanides R on melting relations of Ba2RCu3O(6+x), where R=Y, Eu and Nd, was studied and compared with that of a high T(c) superconductor mixed-lanthanide phase Ba2(Y(0.75)Eu(0.125)Nd(0.125))Cu3O(6+x). These materials have been characterized by a variety of methods including scanning electron microscopy (SEM). Single phase samples of Ba2(Y(0.75)Eu(0.125)Nd(0.125))Cu3O(6+x) were annealed at 1004, 1040, 1052, 1060, 1078, 1107 and 1160 C and quenched into a helium gas container cooled by liquid nitrogen. The SEM micrographs of these samples showed the progressive changes in features of the microstructures from sintering and grain growth through melting and then recrystallization from the melt. The addition of the SEM technique in conjunction with X-ray diffraction has been helpful in the study of phase equilibria in this system.

A twin-free single crystal of YBa2Cu3O(6+x) has been studied at room temperature and 115 K by x-ray diffraction analysis. The crystal was grown from an Y-Ba-Cu-O melt in a gold crucible, leading to a 2% substitution of Au for Cu. Twins were removed from the as-grown crystal by a novel thermomechanical process, resulting in an orthorhombic (Pmmm), single-domain crystal. Oxygen positions and occupancies in the Cu-O basal plane have been refined, showing that the O(5) site is completely vacant, and the O(4) atoms are offset from the crystallographic mirror plane positions by 0.15 A in a zig-zag fashion. Gold, which is a common impurity in crystals grown by the present technique, was found to occupy Cu(1) sites only. Weak superlattice reflections suggest a possible three-dimensional ordering of O and/or Au. To our knowledge, this paper reports the first high-resolution x-ray study of an intentionally detwinned, superconducting YBa2Cu3O(6+x) single crystal.

The compounds BaR2O4, where R = La, Nd, Sm, Gd, Eu, Dy, Ho and Er have been prepared from a stoichiometric mixture of BaCO3 and lanthanide oxides, and characterized by X-ray powder diffraction. Standard X-ray patterns of these phases were prepared. In general, BaR2O4 crystallizes in the pervoskite-related CaFe2O4 structure which is orthorhombic with a space group Pnam. The cell parameters of these compounds from R = Er to La were found. When R = Tm, Lu and Yb, the BaO R2O3 composition produced the mixture Ba3R4O9 and the unreacted lanthanide oxide. Under the present experimental conditions, the compound BaRO3 was the predominant component when R = Ce, Pr, and Tb.

Keywords: *High temperature superconductors, *Dysprosium ions, Neutron scattering, Two dimensional, Antiferromagnetism, Reprints, *Dysprosium barium cuprates, *Magnetic ordering, Bilayers.

Neutron scattering has been used to investigate the magnetic ordering of the Dy ions in the superconducting (T(c) approx = 60 K) Dy2Ba4Cu7O15 (2:4:7) material. A modulated saw-tooth scattering profile is observed, indicative of a coupled-bilayer two-dimensional (2D) system in which the nearest-neighbor Dy spins within the a-b plane are coupled antiferromagnetically, with the moment direction along the c axis. The a-b-plane spin configuration is identical to the one which has been observed for the related DyBa2Cu3O7 (1:2:3) and Dy2Ba4Cu8O16 (2:4:8) materials. We anticipate that a similar coupled-bilayer 2D behavior should occur in other R2Ba4Cu7O15 systems (R = rare-earth element, except Er) which exhibit the same a-b-plane spin configuration as the Dy.

Keywords: *Potassium tantalates, *Thermal expansion, Temperature dependence, Cryogenic temperature, X-ray diffraction, Neutron scattering, Inelastic scattering, Niobium additions, Lattice parameters, Cubic lattices, Single crystals, Anomalies, Reprints, *Potassium tantalate niobates, Phonon dispersion.

The temperature dependences of the lattice constant and TA phonon dispersion in dilute single crystals of KTa(1-x)Nb(x)O3 with 0.012 less than or equal to x less than or equal to 0.09 have been studied using x-ray diffraction and neutron scattering techniques, respectively. For x less than or equal to 0.06 an anomalous low-temperature expansion of the cubic lattice parameter is observed at a temperature T(sub min) that increases monotonically with Nb concentration, with no measurable change in symmetry down to 10 K. Concurrent with T(sub min) is a monogeneous broadening of the x-ray Bragg peaks which persists down to 10 K, as well as a strong relief of extinction seen by neutron diffraction. Inelastic neutron scattering measurements reveal that the coupling between TA and TO modes, first observed in pure KTaO3, is both wavevector and concentration dependent.

Pub. in Physical Review B 49, n17 p11 967-11 978, 1 May 94.

Keywords: *Terbium, Transition temperature, Neutron scattering, Reprints, *Magnetic correlation lengths.

Extensive neutron-scattering experiments have been performed in order to characterize the nature of the two correlation lengths observed in Tb, a phenomenon common to Ho as well as SrTiO3. In the vicinity of the transition temperature, each of those crystals exhibits an anomalous two-component q profile in the critical scattering; the usual broad peak and an unexpected additional narrow peak. In order to clarify the spatial origin of the narrow component, the (0,0,delta) magnetic satellite peak of Tb has been closely examined using a very narrow neutron beam realized by a high spatial resolution reflectometer at the National Institute of Standards and Technology, which can produce well-defined beam widths of 0.3 mm and less. The small scattering angle (theta approx = 1.35 deg) and the narrow beam width result in an extraordinarily fine q and E resolution. As recently reported, we have confirmed that the intensity of the narrow component is enhanced near the edge of the crystal; it demonstrates that the major part is located within the near surface volume or 'skin' of the crystal.

Using a mean-field approach, Carrico and Camley (Phys. Rev. B 45, 13117 (1992)) have determined the magnetic behavior expected for superlattices consisting of uniaxial antiferromagnets. They state that the resulting phase transitions in a real system cannot be observed by standard, bulk measurements of the magnetization. In fact, the predictions of their model can be explicitly tested using neutron-diffraction techniques, which have already been applied toward the study of antiferromagnetic Ni0/CoO and Fe3O4/NiO superlattices.

Effects of Critical Current Density, Equilibrium Magnetization and Surface Barrier on Magnetization of High Temperature Superconductors.
Final rept.
D. X. Chen, R. W. Cross, and A. Sanchez. 1993, 9p.
Pub. in Cryogenics 33, n7 p695-703 1993.

Keywords: *High temperature superconductors, *High-TC superconductors, *Magnetization, Critical current, Current density, Surface barrier, YBCO superconductors, Reprints, Yttrium barium cuprates.

An extended critical state model which includes the effects of bulk critical current density, equilibrium magnetization and surface barrier is developed for the magnetization of superconductors. The equilibrium magnetization and surface barrier are modeled by an applied field dependent surface supercurrent density j(s)(H), whose presence changes the boundary field of the bulk. The volume supercurrents flow with a density equal to the internal field dependent critical current density J(c)(Hi). The magnetization M is produced by both supercurrents. For the M(H) curve computation, exponential-type J(c)(Hi) and j(s)(H) values are used for the general case of an infinite sample of rectangular cross-section. A comparison between the experimental magnetization curves of a sintered YBa2Cu3O7 superconductor at 76 K and the model fit shows that j(s)(H) is null for the coupling matrix, whereas a non-zero j(s)(H) is needed for the grains. The model fit for the irreversible magnetization of the grains is improved by including a surface barrier to the entry and exit of flux.

M. J. Chester, and T. Jach. 1993, 9p.
Pub. in Physical Review B 48, n23 p17-262 - 17-270, 15 Dec 93.

Keywords: *X-ray photoelectron spectroscopy, *Chemical composition, *Thin films, Concentration(Composition), Grazing incidence, Gallium arsenides, Gallium oxides, Interfaces, Reprints, Total external reflection, Multilayers.

At the energies of interest in x-ray photoelectron spectroscopy (XPS), total external reflection of the x-ray beam occurs from a smooth surface at small incidence angles. The penetration of the x rays into the material is strongly attenuated at these angles and surface sensitivity is enhanced in the XPS yields. As the incidence angle is increased, the x rays penetrate more deeply into the material and the XPS signal contains a larger contribution from the bulk. By exploiting this angle-dependent x-ray penetration depth, it is possible to obtain depth-dependent XPS spectra from which the concentration profiles of the photoelectron-emitting atoms can be inferred. In this paper we develop a general formalism for calculating grazing-incidence XPS (GIXPS) yields from multilayer media. A quantitative analysis of GIXPS spectra acquired from an oxidized GaAs(100) surface that was annealed to remove oxidized As will be discussed. The results show that this annealed oxide is composed of Ga2O3 and that the oxide-GaAs substrate interface is rough.

Keywords: *Crystal growth, *Solidification, Liquid-solid interfaces, Binary alloys, Morphology, Stability, Reviews, Reprints, Crystal-melt interface.

During crystal growth, a smooth crystal-fluid interface is subject to instability and may become cellular or dendritic. Linear morphological stability theory described the conditions under which the interface becomes unstable. The theory is applicable to first order phase transformation in general, but in this article we will treat the growth of a crystal from a liquid phase. There are many reviews of morphological stability. In this article we will review the basic theory and discuss extension of the theory with emphasis on recent developments. A number of important topics will not be treated in this article, but will be covered in other articles in this volume. Effects of fluid flow are treated in the Chapter by Davis. Dendritic growth is treated in the Chapter by Billia and Trivedi. We will also assume that effects of crystalline anisotropy are small enough that facets or missing interface orientations do not occur.

Single crystal thin films of (111) oriented C(60) are grown on epitaxial layers of single crystal antimony. The C(60)/Sb epitaxy is confirmed by low-energy electron diffraction which indicates that the (left bracket) (1-10) (right bracket) in-plane directions are parallel in the two layers. X-ray diffraction shows that the C(60) film is entirely (111) oriented and of high quality with sharp Bragg peaks and narrow mosaic spread. In this study, the Sb films were grown on GaSb, to which they are lattice matched; however, as Sb can be epitaxially grown on surfaces with a large lattice mismatch, this technique may be applied to integrate C(60) single crystals onto many substrates or devices with a surface having sixfold symmetry.

Keywords: *Superconductors, Superconducting junctions, Symmetry breaking, Asymmetry, Reprints, Single electron tunneling, Andreev reflection.

We have measured at low temperatures the current through a submicrometer superconducting island connected to two normal metal leads by ultrasmall tunnel junctions. As the bias voltage is lowered well below twice the superconducting energy gap, the current changes from being e periodic with gate charge to 2e periodic. This behavior is clear evidence that there is a difference in the total energy between the ground states of an even and odd number of electrons on the island. The 2e-periodic current peaks are the first observation of the Coulomb blockade of Andreev reflection.

Practical electromechanical properties of a high T(c) superconductor have been measured for Ag-sheathed Bi2Sr2Ca1Cu2O(8+x) superconductors at high magnetic fields up to 25 T. A melt-processed powder-in-tube Bi2Sr2Ca1Cu2O(8+x) conductor had an irreversible strain of 0.2% for the onset of permanent damage and a 50% critical-current-degradation strain of 0.36%. Measurements of a discontinuous filament melt-processed Ag-sheathed Bi2Sr2Ca1Cu2O(8+x) superconductor show an irreversible strain of 0.6% and a 50% degradation strain of about 1%. These strain damage thresholds are about an order of magnitude higher than for high-temperature superconductors made by bulk sintering and are reaching practical values for magnet design.

Pub. in Applied Physics Letters 63, n13 p1774-1776, 27 Sep 93.

Keywords: Atomic force microscopy, Vapor phase epitaxy, Electron diffraction, Gallium arsenides, Substrates, Reprints, *Gallium indium phosphides, *Surface topography, Nomarski microscopy, Epilayers.

Using transmission electron diffraction dark-field imaging, atomic force microscopy (AFM), and Nomarski microscopy, we demonstrate a direct connection between surface topography and cation site ordering in GaInP2. We study epilayers grown by organometallic vapor-phase epitaxy on GaAs substrates oriented 2 deg off (100) towards (110). Nomarski microscopy shows that, we growth proceeds, the surface of ordered material forms faceted structures aligned roughly along left bracket 011 right bracket. A comparison with the dark-field demonstrates that the left bracket 1-11 right bracket and left bracket 11-1 right bracket ordering variants are segregated into complementary regions corresponding to opposite-facing facets of the surface structures. This observation cannot be rationalized with the obvious but naive model of the surface topography as being due to faceting into low-index planes. However, AFM reveals that the facets are in fact not low-index planes, but rather are tilted 4 deg from (100) towards (111)(sub B). This observation explains the segregation of the variants: the surface facets act as local (111)(sub B)-misoriented growth surfaces which select only one of the two variants.

High q-resolution neutron-scattering measurements of the critical scattering in Tb above the magnetic-spiral phase transition temperature T(s) exhibit a two-component line shape, as recently documented in Ho. This implies the existence of a second length scale. By using a narrow beam only 300 micrometers wide, and then translating the crystal through the beam, we have established that the origin of the second length scale lies within the near-surface volume or 'skin' of the Tb crystal. This is manifested by a large enhancement of the scattering intensity at the c-axis face of the cube-shaped crystal.

Volume Magnetic Hysteresis Loss of Nb3Sn Superconductors as a Function of Wire Length.
Final rept.
R. B. Goldfarb. 1993, 1p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of U.S.-Japan Workshop (8th) on High-Field Superconducting Materials, Wires and Conductors and Standard Procedures for High-Field Superconducting Wires Testing, Madison, WI., March 17-19, 1993, p72.

Keywords: *Superconducting wires, *Magnetic hysteresis, *Niobium stannides, Temperature range 0000-0013 K, SQUID devices, AC losses, Reprints, *Niobium ten, Multifilaments.

The magnetic hysteresis losses of samples of reacted multifilamentary Nb3Sn superconductor wire in coiled and straight geometries were measured at 4.1 K with a superconducting-quantum-interference-device (SQUID) magnetometer and an extraction dc magnetometer (DCM) for fields perpendicular to the wire axis. There were significant differences in the volume energy dissipation for the various samples. These differences are a function only of the length of the wire samples and are independent of whether the samples are straight segments or coils. As sample length increases from 2.6 mm, losses per total sample volume, for complete field cycles of + or - 3 T, increase nonlinearly from 0.19 to an asymptotic value of 0.43 MJ/cu m. A coiled sample with wire length 3 cm has 97% of the losses of a coiled sample with wire length 15 cm or greater. Losses are very length-dependent below 1 cm.

Keywords: *High temperature superconductors, *Crystal structure, Tetragonal lattices, Neutron diffraction, Oxygen additions, Annealing, Temperature dependence, Reprints, *Mercury barium calcium cuprates.

Neutron profile refinements have been carried out on powders of as-prepared and oxygen annealed samples of the layered HgBa2CaCu2O(6 + delta)(1212) cuprate superconductors. The crystal structure is tetragonal P4/mmm over the range of temperatures 10 K to 298 K investigated, with no structural transitions of any kind being detected. The extra oxygen that electrically dopes these materials is found to reside in the centered position of the Hg plane, and no other excess oxygen is present in these samples. In addition, we found no conclusive evidence for mixing of the Hg and Cu cations. In the as-prepared sample we found delta = 0.22, while the oxygen content increased substantially to delta = 0.35 with annealing. This extra oxygen had only a small effect on the superconductivity, broadening the transition somewhat and shifting T(c) from 112 K to 120 K. The incorporation of extra oxygen also had the effect of constricting the lattice parameters by about 0.1%. The overall behavior is similar to the single-layer Hg-1201 system.

Pub. in Materials Science Forum 137-139, p103-131 1993.

Keywords: *High-temperature superconductors, *Magnetic susceptibility, *YBCO superconductors, Alternating current, Direct current, Sintered materials, Superconducting films, Single crystals, Flux pinning, Temperature dependence, Thin films, Comparison, Reprints, *Yttrium barium cuprates, Gadolinium barium cuprates, Magnetic field dependence.

Intergranular properties of the sintered superconductor YBa2Cu3O7 have been studied in terms of complex harmonic magnetic susceptibility chi(sub n) = (chi prime)(sub n) - i(chi double prime)(sub n) (n integer) as well as DC susceptibility chi(dc). As functions of temperature T, (chi prime)(sub 1) and (chi, double prime)(sub 1) depend on both the AC magnetic-field amplitude H(ac) and the magnitude of a superimposed DC field H(dc). Only odd-harmonic susceptibilities are observed below the critical temperature, T(c), for zero H(dc) while both odd and even harmonics are observed for nonzero H(dc). With T constant, odd-harmonic susceptibilities are even functions of H(dc), whereas even-harmonic susceptibilities are odd functions of H(dc). In contrast, even-harmonic susceptibilities measured for a GdBa2Cu3O7 thin film and an YBa2Cu3O7 single crystal are not prominent due to missing weak links, whereas odd-harmonic susceptibilities are remarkable. A survey of several models for the harmonic response of superconductors is presented.

Grazing Angle X-Ray Photoemission System for Depth-Dependent Analysis.
Final rept.
T. Jach, M. J. Chester, and S. M. Thurgate. 1994, 4p.
Pub. in Review of Scientific Instruments 65, n2 p339-342 Feb 94.

Keywords: *X-ray photoelectron spectroscopy, *X-ray spectrometers, *Gallium arsenides, *Surface analysis, Grazing incidence, Photoemission, Oxidation, Oxides, Reprints, Depth dependence, Depth profiles.

We have developed an x-ray photoelectron spectrometer system which combines an adjustable grazing incidence angle source with reflected beam detection. When operated about the critical angle, this combination permits a variation of the x-ray penetration depth which can be monitored by means of the reflectivity. At angles of incidence less than the critical angle, the sampling depth of the photoemission is diminished, but the photoemission from the surface is enhanced due to the constructive interference of the incident and reflected x-ray beams. When used with Mg K(alpha) radiation (E(sub gamma) = 1253.6 eV), the spectrometry system obtains useful distributions of chemical species in surface layers of 10-40 A thickness. We present data showing the depth dependence obtained with the spectrometer of different oxides in a sulfide-treated, oxidized GaAs (100) surface.

Pub. in Zeitschrift fur Physikalische Chemie 179, p397-401 1993.

Keywords: *High temperature superconductors, *YBCO superconductors, *Hydrogen additions, Spin lattice relaxation, Nuclear magnetic resonance, Neutron spectroscopy, Neutron scattering, Inelastic scattering, Relaxation time, Vibrational spectra, Doped materials, Reprints, *Yttrium barium cuprates.

The high temperature superconductor YBa2Cu3O(x) absorbs considerable amounts of hydrogen if it is kept at elevated temperatures in a hydrogen gas atmosphere. In parallel neutron spectroscopic and nuclear magnetic resonance experiments, we studied the vibrational spectra and the spin lattice relaxation time of the protons in YBa2Cu3O(x) samples that were doped with hydrogen due to the absorption of hydrogen gas. Both the vibrational spectra and the spin lattice relaxation time are a sensitive probe for the local environment of the protons. We carried out analogous measurements on samples with a similar proton concentration due to the uptake of water vapor. These experiments demonstrated a totally different local environment of the protons. This fact is a strong indication that the protons absorbed from the hydrogen gas atmosphere did not react with the oxygen of the sample under formation of molecular water.

Grain Alignment and Transport Properties of Bi2Sr2CaCu2O8 Grown by Laser Heated Float Zone Method.
Final rept.
J. Luo, X. P. Jiang, H. M. Chow, T. P. Orlando, D. A. Rudman, M. J. Cima, and J. M. Graybeal. 1991, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p1499-1502 Mar 91.

Keywords: *High temperature superconductors, *BSCCO superconductors, *Grain structure, *Critical current, Grain boundaries, Orientation(Direction), X-ray analysis, Temperature dependence, Transport properties, Zone melting, Float zones, Laser heating, Alignment, Anisotropy, Reprints, *Bismuth strontium calcium cuprates, Magnetic field dependence.

Single phase Bi2Sr2CaCu2O8 bulk superconductor (T(c) approx = 82 K) has been grown by laser heated floating zone method. The samples are highly textured with the grains, typically 100 micrometers in diameter and 0.5 cm long, elongated along the crystal a-axis which is the preferred growth direction. Our X-ray analysis and transport measurements indicate that the b, c axes are also orientated from grain to grain in the plane perpendicular to the growth direction. The upper limit of the misalignment between the grains is estimated to be less than 2 degrees from the measured upper critical field anisotropic ratio. The critical current density for such highly textured polycrystalline is anisotropic and limited mainly by the weak links at the grain boundaries. The grain boundary effects will be discussed on the basis of the measured temperature and magnetic field dependence of the critical current.

Effects of Anneal Time and Cooling Rate on the Formation and Texture of Bi2Sr2CaCu2O8 Films.
Final rept.
M. M. Matthiesen, J. M. Graybeal, T. P. Orlando, J. B. Vander Sande, and D. A. Rudman. 1991, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p1223-1226 Mar 91.

Keywords: *High temperature superconductors, *Superconducting films, *BSCCO superconductors, Time dependence, Cooling rate, Microstructure, Annealing, Reprints, *Bismuth strontium calcium cuprates, Sputtered coatings, Surface texture.

The effects of anneal time and cooling rate on the formation and texturing of superconducting Bi2Sr2CaCu2O8 (BSCCO) films were investigated. Samples were prepared by sputter depositing amorphous BSCCO films, annealing them at 870 C in flowing 20% O2-80% Ar for 30, 60, or 180 minutes and then cooling them. Two cooling rates were investigated: a fast cool of 80 C/min and a slow cool of 9 C/min. It was observed that effective coupling between superconducting 2,212 grains occurs when films exhibit a minimum amount of (001) texturing. In addition, the nucleation and growth kinetics are significantly different for the isothermal and cooling regimes of thermal processing. Consequently, anneal time and cooling rate play distinct roles in the achievement of the appropriate texture and microstructure in the films: longer anneal times increase the volume fraction of the 2,212 phase while slower cooling rates enhance grain growth and texturing.

The ability to fabricate nanometer-sized structures that are stable in air has the potential to contribute significantly to the advancement of new nanotechnologies and our understanding of nanoscale systems. Laser light can be used to control the motion of atoms on a nanoscopic scale. Chromium atoms were focused by a standing-wave laser field as they deposited onto a silicon substrate. The resulting nanostructure consisted of a series of narrow lines covering 0.4 millimeter by 1 millimeter. Atomic force microscopy measurements showed a line width of 65 + or - 6 nanometers, a spacing of 212.78 nanometers, and a height of 34 + or - 10 nanometers. The observed line widths and shapes are compared with the predictions of a semiclassical atom optical model.

Experimentally determined thermal contact resistance (conductance) data are compared with predictions based on two different theories. One of the theories assumes elastic contact, while the other theory is based on the assumption of plastic contact. Even though the high plastic index calculated for the contacting surface suggested that contacting asperities would deform plastically, the experimental data generally agree better with the predictions obtained using the elastic contact model than with the predictions obtained using the plastic contact model.

J. Moreland. 1993, 2p.
Pub. in Proceedings of the Annual Meeting of the Microscopy Society of America (51st), Cincinnati, OH., August 2-6, 1993, p1034-1035.

Keywords: Scanning tunneling microscopy, High temperature superconductors, Superconducting films, Magnetic flux, Domain walls, Magnetic recording, Reprints, *Magnetic force microscopy, Bloch walls, Garnet films.

Magnetic force microscopy (MFM) can be done by making a simple change in conventional scanning tunneling microscopy (STM) where the usual rigid STM tip is replaced with a flexible magnetic tip. STM images acquired this way show both the topography and the magnetic forces acting on the flexible tip. The z-motion of the STM piezo tube scanner flexes the tip to balance the magnetic force so that the end of the tip remains a fixed tunneling distance from the sample surface. We present a review of some 'tunneling-stabilized' MFM (TSMFM) images showing magnetic bit tracks on a hard disk, Bloch wall domains in garnet films, and flux patterns in high-T(c) superconductor films. The image resolution of TSMFM is routinely 0.1 micrometer using Au coated magnetic tips cut from Ni or Fe films. Recent results show that a TSMFM resolution of less than 40 nm is possible with micromachined cantilevers coated with a very thin Au-Fe bilayer.

New Exact Solution of the One-Dimensional Schrodinger Equation and Its Application to Polarized Neutron Reflectometry.
Final rept.
H. Zhang, and J. W. Lynn. 1993, 4p.
Pub. in Physical Review Letters 70, n1 p77-80, 4 Jan 93.

Keywords: *Schrodinger equation, *Superconductors, Penetration depth, One dimensional, Magnetization, Neutron scattering, Reprints, *Polarized neutron reflectometry.

An analytic expression for the polarized neutron reflectivity R(sup +,-) (theta, lambda) from a superconductor with penetration depth lambda is derived as an exact solution of the 1D Schroedinger equation in the continuum limit. The down-spin solution R(sup -) (theta, lambda) reveals a surprising oscillatory dependence on lambda within a narrow angular range immediately above the total reflection angle, and in fact vanishes when lambda and H satisfy certain conditions. This exact solution is applicable to other scattering problems with a general exponential dependence in the potential.

Pub. in Jnl. of Applied Physics 74, n12 p7431-7437, 15 Dec 93.

Keywords: *Magnetic domains, *Domain walls, Electron microscopy, Metal films, Cobalt, Platinum, Reprints, Micromagnetics, Multilayers.

An analysis of the micromagnetic structure of domains and domain walls in Co/Pt multilayer films is reported. Magneto-optically written domains have been imaged in a scanning transmission electron microscope by using the modified differential phase contrast mode of Lorentz electron microscopy. These have been compared with computer-simulated images based on a two-dimensional model of a circular, perpendicular magnetized domain with a Bloch-like wall structure. Agreement is found for the domain and stray field contrast, but the absence of wall contrast in the experimental images indicates a more complex wall structure

in the multilayer than was assumed by the model. In a further series of calculations the magnetic microstructure of a Co/Pt multilayer was modeled by solving the Landau-Lifshitz-Gilbert equations. These suggest that the wall structure varies throughout the thickness of the multilayer, allowing significant saving of magnetostatic energy through the establishment of flux closure paths close to the walls, and are consistent with experimental observations.

Pub. in Proceedings of NATO Advanced Study Institute on the Science and Technology of Nanostructured Magnetic Materials, Crete, Greece, June 24-July 6, 1990, p117-136 1991.

Keywords: *Rare earth elements, *Superlattices, Magnetic anisotropy, Magnetic films, Magnetic materials, Magnetostriction, Exchange interactions, Neutron diffraction, Metal films, Magnetism, Reviews, Reprints, *Artificial superlattices, Multilayers.

Intense interest has been generated over the past several years in the growth and properties of layered magnetic materials, both from a fundamental point of view and for applications. For the purposes of this review, the term artificial metallic superlattice will be reserved for true three dimensionally coherent layered structures, while the term multilayer will be used for layered structures in which coherence is present in less than three dimensions. The recent refinements in computer-controlled molecular beam epitaxy (MBE) techniques for the growth of single crystal artificial superlattices of two or more distinct compositions have opened up vast possibilities for the production of tailor-made artificial superlattices with controlled film thicknesses down to atomic dimensions and with highly reproducible stacking sequences. This has provided previously unavailable opportunities to examine problems of interaction ranges, tunneling distances, and other coherent phenomena which are dependent on the superlattice periodicity. In particular, the development starting in 1984 of MBE growth procedures for single crystal rare earth metal superlattices has permitted prototypical tests for verifying many of the theoretical concepts of magnetic exchange, anisotropy, and magnetostriction effects in the rare earths which could not previously be examined in as controlled a way using conventional bulk materials.

Resonant-Photoemission Investigation of the Heusler Alloys Ni2MnSb and NiMnSb.
Final rept.
S. W. Robey, L. T. Hudson, and R. L. Kurtz. 1992, 8p.
Pub. in Physical Review B 46, n18 p11 697-11 704, 1 Nov 92.

Keywords: *Electronic structure, *Photoemission, Heusler alloys, Magnetic alloys, Valence bands, Band theory, Binding energy, Reprints, *Nickel manganese antimonides, Density of states.

Photoemission was used to investigate the electronic density of states (DOS) in Ni2MnSb and NiMnSb. Comparisons with calculated band structures reveal reasonable agreement, but there are indications that the calculations overemphasize Ni 3d contributions at some binding energies. Resonant effects at the Mn 3p core threshold were employed to obtain information on the Mn 3d partial densities of states and these indicate that Mn 3d character is spread throughout the valence bands, in agreement with theory. These effects are strongest in the bottom of the valence band around a binding energy of 3.1 eV and produce structure which agrees well with the theoretical Mn 3d DOS, but are weak for other portions of the calculated Mn DOS. These results are discussed in the context of models for the formation of localized moments in these materials.

Using scanning tunneling microscopy (STM) and reflection high energy electron diffraction (RHEED) we have examined the growth morphology, surface structure, and surface degradation of laser ablated YBa2Cu30(7-delta) thin films. Films from 5 nm to l micrometer thick were studied. The films were deposited on MgO and LaAlO3 substrates using two different excimer laser ablation systems. Both island nucleated and spiral growth morphologies were observed depending on the substrate material and deposition rate used. The initial growth mechanism observed for a 5-10 nm thick film is replicated through different growth layers up to thicknesses of 200 nm. Beyond 200 nm, the films show some a-axis grains and other outgrowths. The thinnest films (5-10 nm) show considerable surface roughness on the order of 3-4 nm. For both growth mechanisms the ledge width remains approximately constant (about 30 nm) and the surface roughness increases as the film thickness increases.

Transport data, magnetic hysteresis and flux creep activation energy experimental results are presented for silver-sheathed high-Tc Bi2Sr2Ca2Cu3Ox superconducting tapes. The 110 K superconducting phase was formed by lead doping in a Bi-Sr-Ca-Cu-O system. The transport critical current density was measured at 4.0 K to be 0.7 x 10(5) A/sq. cm (the corresponding critical current is 74 A) at zero field and 1.6 x 10(4) A/sq. cm at 12 T for H(double vertical bars)ab. Excellent grain alignment in the a-b plane was achieved by a short-melting method, which considerably improved the critical current density and irreversibility line.

Composites of dissimilar materials wherein the sizes of the constituents are on the order of a few nanometers (Nanocomposites) are found to possess properties similar to, but different from, the properties of the individual constituents. When at least one of the constituents possesses a permanent magnetic moment, the magnetization statics and dynamics of the nanocomposite can be very different from that of the magnetic species in bulk form. In addition, the sensitivity of these magnetic properties to composition and morphology allows the class of magnetic nanocomposites to serve as a laboratory for the atomic engineering of materials with specific magnetic characteristics.

Magnetocaloric Effect in Nanocomposites.
Final rept.
R. D. Shull, L. J. Swartzendruber, and L. H. Bennett. 1991, 15p.
Pub. in Proceedings of International Cryocoolers Conference (6th), Plymouth, MA., October 25-26, 1990, p231-245 1991.

Keywords: *Superconductors, *Magnetic properties, Microstructure, Magnetic field, Barium, Yttrium, Copper oxides, Currents, Vortices, Reprints, Twins, BaYCuO, Vortex pinning, Critical currents, Magnetocaloric effect.

The magnetic properties of nanocomposites containing extremely small magnetic particulates dispersed in a nonmagnetic matrix can be very different than those of the bulk magnetic material. Here we consider the consequences of such a microstructure on the magnetocaloric effect. Upon the application of an external magnetic field, the magnetic spins in a material tend to align with the field, thereby reducing the magnetic entropy of the spin system. Creation of a nanocomposite with many very small ferromagnetic regions provides an effective enhanced magnetic moment which can result in certain temperature and field ranges in an increased dT over that provided by either paramagnetic or ferromagnetic materials, with potential application to magnetic refrigeration.

Preparation of 2-Dimensional Ultra Thin Polystyrene Film by Water Casting Method.
Final rept.
K. Shuto, Y. Oishi, T. Kajiyama, and C. C. Han. 1993, 10p.
Pub. in Polymer Jnl. 25, n3 p291-300 1993.

Keywords: *Thin films, *Polystyrene, *Neutron reactions, Electron microscopy, Neutron scattering, Polymers, Gyration, X rays, Reprints, TEM(Transmission electron microscopy), Water casting method, Tagged-polymer method, Radius of gyration.

The preparation condition of polystyrene (PS) ultra thin film by a water casting method was investigated on the basis of transmission electron microscopic (TEM) observations. Homogeneous ultra thin films were prepared from a 0.2-2.0 wt% cyclohexanone solution of PS owing to moderate spreadability of the solution on the water surface. The spreading state of the solution on the water surface depending on the dissipation speed of solvent and entanglements among PS chains were in strong relation to formation of the homogeneous ultra thin film. X-Ray interference measurements revealed that the thickness of the ultra thin film was smaller than the dimension of an unperturbed PS chain.

The crystal structure of Ca(1-x)CuO(2), a low temperature phase in the Ca-Cu-O system, has been studied by X-ray diffraction. The structure contains edge shared chains of CuO4 squares, forming linear (CuO2)-chains and is related to the NaCuO2-type. In contrast to the NaCuO2-type, the calcium atoms are not well localized and various superstructures caused by different Ca ordering are observed.

Pub. in Nuclear Instruments and Methods in Physics Research B 56-7, p304-308 May 91.

Keywords: *Anisotropy, *Polarization, *X rays, Atoms, Molecules, X ray analysis, Reprints, X ray emission.

Strongly anisotropic, polarized Cl Kbeta x-ray emission has been observed from gas-phase CF3Cl following selective resonant excitation with a linearly polarized x-ray beam. Distinctively different polarizations and angular distributions result for emission involving molecular orbitals of different symmetries. A classical model of the x-ray absorption/emission process well describes the observed radiation patterns. A small anisotropy also was measured for Ar Kalpha emission following resonant excitation. The observation of only a small anisotropy in this case is attributed to the averaging out of the individual anisotropies from unresolved final states. The authors review the experimental methods and results and discuss theoretical models used to describe polarization and anisotropy effects in x-ray absorption and emission from atoms and molecules.

The surface topography of YBa2CU3O(7-delta) thin films was studied with both atomic force microscopy (AFM) and scanning tunneling microscopy (STM). The AFM images revealed a high density of small distinct nanoparticles, 10-50 nm across and 5-20 nm high, which did not appear in STM images of the same samples. Scanning the STM tip across the surface broke off particles and moved them to the edge of the scanned area, where they were later imaged with the AFM.

Keywords: *Elastic properties, *Crystal lattices, *Crystal defects, Crystal structures, Bonding, Crystallography, Strain rate, Stress analysis, Reprints, *Bond-length mismatch.

We study a triangular network containing two kinds of Hooke springs with different natural lengths. If the two spring constants are the same, we can solve the model exactly and show that Vegard's law is obeyed, irrespective of whether the bonds are arranged randomly or in a correlated way. A more complete description of these networks is obtained through the mean lengths and length fluctuations associated with the two kinds of bonds, and the strain energy. The complete distribution of bond lengths is obtained numerically and shows an interesting and unexpected symmetry for the random case. Finally, we show that numerical results for a similar system, but with different force constants as well as different natural lengths, can be well accounted for by using an effective medium theory which reduces to the exact results when the two spring constants are made equal. We show that these lattices can be described very accurately up to about 50% length mismatches, when pleating occurs and the lattices develop local instabilities.

Keywords: *High temperature superconductors, *YBCO superconductors, Type 2 superconductors, Magnetic measurement, Magnetic induction, Activation energy, Time dependence, Single crystals, Reprints, *Yttrium barium cuprates, Vortex mobility.

A method for determination of the basic parameters of vortex mobility from the magnetic induction vs. time curve obtained from a zero-field cooled superconductor is presented. Three stages of magnetizing are considered. Measurement of the log-creep rate allows determination of the activation moment alpha, while the study of the kinetics during the approach to equilibrium provides the relaxation time r, and the equilibrium inductions B(o). Then the activation energy U can be calculated. These two stages were obtained both for three different samples of YBa2Cu3O7: a single crystal, a sintered powder, and a sample prepared by the quench-melt-growth (QMG) process. The QMG sample was perfect enough to give reliable quantitative results.

Keywords: *Magnetic recording, Remanent magnetism, Coercive force, Experimentation, Verification, Particulates, Reprints, *Preisach model, Angular dependence, Micromagnetics.

A vector moving Preisach model has been developed that describes partially oriented particulate media by pseudo-particles, consisting of a distribution of several basic particles with various orientations of easy axes. The model uses switching modes calculated by a micro-magnetic simulation of physical particles. In order to test this model, the angular dependence of the magnetic properties was measured by a VSM for several samples of commercial recording media that had different degrees of particle orientation. The experimental results are in good agreement with the orientation dependence of the squareness, remanence, and coercivity, as predicted by the model.

Tunneling spectroscopy measurements were performed on squeezable electron tunneling (SET) junctions using Bi-Sr-Ca-Cu-O, Y-Ba-Cu-O, and Nb electrodes in a variety of combinations. A zero-bias conductance peak has been seen repeatedly in the current-voltage (I(V)) and the conductance-voltage (G(V)) characteristics. A model is presented to explain this conductance peak in terms of quasi-particle tunneling, phase diffusion, and a supercurrent. Two additional structures have been seen repeatedly in I(V) and G(B). One of these structures has the characteristics of an energy gap feature. The other structure, which can mimic the gap feature, is explained in terms of the switching to the voltage state of a grain boundary junction that is in series with the SET junction. The dependence of these features upon temperature and the force applied to the junction are examined.

T. Walsh, J. Moreland, R. H. Ono, and T. S. Kalkur. 1991, 4p.
Pub. in Physical Review Letters 66, n4 p516-519 1991.

Keywords: *High temperature superconductors, *Superconducting junctions, *Superconducting films, *BSCCO superconductors, *Energy gap, Temperature range 0000-0013 K, Quasi particles, Electron tunneling, Thin films, Reprints, *Bismuth strontium calcium cuprates.

We have used squeezable electron tunneling junctions, at 4 K, to examine the zero-bias conductance peak that has been found in high temperature superconductor tunnel junction spectra by a number of researchers. In addition, peaks in the differential conductance-voltage characteristic have been found repeatedly between 46 and 64 mV. We interpret the voltages at which these peaks occur to be the gap voltage 2 delta (4 K). The zero-bias conductance peak can be explained in terms of a supercurrent and thermal excitations, both quasi-particles and phase diffusion.

H. Zhang, and J. W. Lynn. 1993, 12p.
Pub. in Physical Review B 48, n21 p15 893-15 904, 1 Dec 93.

Keywords: *Superconducting films, *Superconductors, Polarized beams, Penetration depth, Angle of incidence, Schrodinger equation, Magnetic fields, Thick films, Meissner effect, Ferromagnetic materials, Magnetization, Reprints, *Neutron reflection, *Polarized neutron reflectometry.

We have obtained an analytic expression for the reflectivity R(sup + -)(theta, lambda) of polarized neutrons from a superconductor in the Meissner state, where lambda is the magnetic-field penetration depth and theta is the incident angle of the neutron beam. The result is derived as an exact solution of the 1D Schroedinger equation in the continuum limit, with an interaction potential. The solution for R(sup + -)(theta, lambda) reveals surprising features in its lambda dependence that have not been discovered in previous numerical studies. In particular, R(sup -)(theta, lambda) displays an oscillatory dependence on lambda within a narrow angular range immediately above the total reflection angle, instead of a monotonic dependence as inferred from earlier numerical calculations. The solution also reveals that complete transmission for the down-spin state (R(sup -)(theta, lambda) = 0) may occur when lambda and H (the applied magnetic field) satisfy certain conditions.

Dislocation Emission at Ledges on Cracks.
Final rept.
S. J. Zhou, and R. Thomson. 1991, 15p.
Pub. in Jnl. of Materials Research 6, n3 p639-653 1991.

Keywords: *Dislocations, *Emission, *Crack tips, *Ledges, Brittleness, Fracture(Mechanics), Cracking(Fracturing), Crack initiation, Solid mechanics, Reprints.

In this paper, we propose that, depending on their height, ledges on cracks can be efficient sources of dislocations at loadings well below the critical loading for homogeneous emission. Detailed three dimensional elastic calculations are presented supporting this proposition. There are two configurations for emission; one which blunts the crack, and one we call a jogging configuration. By our calculations, the blunting configuration should be the more efficient source; however, jogging dislocations are more frequently observed, experimentally. We find that the ledge is only a finite source of dislocations, in the sense that the ledge height decreases as the dislocations are emitted. The atomic configuration at the ledge is composed of finite lengths of real dislocations, which is the reason why such dislocations can be emitted easier than homogeneously produced dislocations. The stresses at the ledge tip produce a cloud of bound dislocations near the ledge, pinned at the ledge ends, so that the ledge crack configuration becomes delocalized. Delocalization of the pile-up dislocations in the jogging direction may explain why the jogging dislocations are more frequently seen. Implications for DFZ's and ductile transitions are discussed.

Shielding of Cracks in a Plastically Polarizable Material.
Final rept.
S. J. Zhou, and R. Thomson. 1991, 10p.
Pub. in Jnl. of Materials Research 6, n8 p1763-1772 1991.

Keywords: *Shielding, *Crack tips, *Fracture strength, *Dislocations, Plastic properties, Mechanical properties, Polarization(Waves), Dipoles, Emission, Brittleness, Reprints, *Plastically polarizable materials.

In this paper, we address some fundamental questions regarding the response of a crack to externally generated dislocations. We note that since dislocations formed at external sources in the material must be in the form of loops or dipoles, that the theory must be couched in terms of crack shielding in a plastically polarizable medium. There are strong analogies to dielectric theory. We prove two general theorems: (1) Dipoles formed in the emission geometry relative to a crack tip always antishield the crack, and (2) when dipoles are induced during uniform motion through a uniformly plastically polarizable material, then the shielding is always positive. We illustrate these general theorems with a number of special cases for fixed and polarizable sources. Finally, we simulate the self consistent time dependent response of a crack to a polarizable source as the crack moves past it. The results show the crack is initially antishielded, but that positive shielding always dominates during later stages of configuration evolution. The crack may be arrested by the source, or it may break away from it, depending upon the various parameters--source strength and geometry, dislocation mobility, Griffith condition for the crack, etc. The results indicate that the time dependence of crack shielding in the presence of a nonuniform density of sources will be very important in practical cases of brittle transitions in materials.

Pub. in Jnl. of Applied Physics 73, n12 p8161-8168, 15 Jun 93.

Keywords: *Gallium arsenides, *Silicon additions, Molecular beam epitaxy, Synchrotron radiation, Ion implantation, Thermal diffusion, Standing waves, Position finding, Crystal lattices, X-ray analysis, Doped crystals, Impurities, NSLS, Reprints, *Lattice sites.

The x-ray standing wave (XSW) technique was applied to determine the lattice location of Si impurity atoms in GaAs(100) crystals. The synchrotron radiation of X24A at the national synchrotron light source was used to set up backreflection XSW, an experimental geometry which drastically relaxes the otherwise stringent requirement on the lattice perfection. Specifically, the lattice sites were determined with respect to the (left bracket) 311 (right bracket) reflection planes which differentiate a Ga site from an As site. With the aid of an appropriate choice of the x-ray fluorescence filter, we were able to study GaAs(100) samples with very low levels of Si impurities. On a sample doped with 4 X 10(exp 18)/cc Si during the molecular-beam epitaxy growth, we found that the Si atoms predominantly occupied the Ga sites. On both an ion-implanted sample after annealing and a sample with Si impurities introduced by thermal diffusion, about 30% of the Si atoms occupied the Ga sites, and the rest occupied random sites. The As site occupation was less than 6%. Suggestions are made for further experiments with improved sensitivity.

Field Dependence of the Magnetic Ordering of Cu in R2CuO4 (R = Nd, Sm).
Final rept.
S. Skanthakumar, J. W. Lynn, J. L. Peng, and Z. Y. Li. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p6326-6328, 15 May 93.

Keywords: Neutron diffraction, Electron spin, Spin orientation, Copper, Reprints, *Neodymium cuprates, *Samarium cuprates, *Magnetic ordering, Magnetic field dependence.

We have used neutron diffraction techniques to study the field dependence of the magnetic ordering of Cu spins in R2CuO4 (R=Nd,Sm) in order to distinguish between the proposed collinear and noncollinear spin structures. In the proposed collinear spin structure, there are two separate domains with the spins either along the (110) or along the (1-10) directions, while in the noncollinear model there is a single domain with the alternate-layer spins along the (100) and (010) directions, respectively. If a magnetic field is applied along the (1-10), strong hysteresis effects are anticipated for the collinear spin structure due to domain repopulation, while such effects are not expected for the noncollinear spin structure. Our field dependent data do not show any hysteresis effects associated with the pure Cu ordering, which strongly suggest that the noncollinear spin structure is correct for the magnetic spin configuration of the Cu spins of both compounds. Hysteresis effects in a field are observed in Sm2CuO4 near and below the Sm ordering temperature, and these are most likely caused by the interaction between Sm and Cu sublattices.

Observation of Noncollinear Magnetic Structure for the Cu Spins in Nd2CuO4-Type Systems.
Final rept.
S. Skanthakumar, J. W. Lynn, J. L. Peng, and Z. Y. Li. 1993, 4p.
Pub. in Physical Review B 47, n10 p6173-6176, 1 Mar 93.

Keywords: Spin orientation, Neutron diffraction, Electron spin, Copper, Reprints, *Neodymium cuprates, *Samarium cuprates, Magnetic field dependence, Magnetic ordering.

Field-dependent neutron-diffraction measurements have been taken on Nd2CuO4 and Sm2CuO4 in order to distinguish between the proposed collinear and noncollinear spin structures for the Cu ions. For magnetic fields applied along the (110) direction, both systems exhibit Bragg intensities that are continuous and reversible with H. For Nd2CuO4 we have also taken data for fields applied within an angle alpha of the (100) direction, and we have found that the intensities of the magnetic reflections increase or decrease depending on the sign of alpha. Both of these observations are only consistent with the noncollinear spin model.

Pub. in Jnl. of Vacuum Science and Technology A 11, n4 p1361-1366 Jul/Aug 93.

Keywords: *Superconducting films, *Magnesium oxides, *Surface analysis, High temperature superconductors, Substrates, Thin films, Microstructure, Annealing, Impurities, Calcium, Reprints, *Dysprosium barium cuprates.

This article reports results from a study on the effect bulk impurities in MgO substrates may have when substrates are annealed to improve film microstructure and transport properties. DyBaCuO thin films are prepared by molecular beam reactive coevaporation on

both annealed and unannealed MgO(100). While predeposition annealing has led to improved film quality for some groups, under our conditions just the opposite occurs. We point out the existence of Ca segregation to the MgO surface as a factor that needs investigation because Ca is a common contaminant in commercially supplied MgO. Atomic force microscope images show decoration of annealed substrates with submicron size particles that may be composed of the segregated Ca. These particles seem to underlie the distinct differences seen in the surface microstructure of films on annealed and unannealed substrates.

Pub. in Jnl. of Electronic Materials 23, n2 p195-200 1994.

Keywords: *Indium phosphides, *Vapor phase epitaxy, Atomic force microscopy, Optical microscopy, Surface roughness, Orientation(Direction), Light scattering, Laser radiation, Substrates, Reprints, In situ monitoring, Surface topography.

Surface morphology of InP layers is monitored during organometallic vapor phase epitaxy using an in situ diffuse laser light scattering technique. Changes in the diffuse scatter signal are noted for several substrate orientations near the (001) plane and at various growth temperatures. The diffuse scatter signal is shown to be a semi-quantitative indicator of surface roughness through post-growth examination of the samples with phase contrast optical microscopy and atomic force microscopy. Singular substrates consistently have almost featureless surfaces and very little diffuse scattering during growth. Vicinal substrates display a more complicated morphological evolution which cannot be deduced from the diffuse scattering alone but which does produce characteristic changes in diffuse scattering.

Keywords: *Josephson junctions, Josephson effect, Cooper pairs, Superconductivity, Reprints, *Single electron transistors, Coulomb blockage, Supercurrent, Nanoelectronics, Shapiro steps.

Measurements of two ultrasmall Josephson junctions connected in series show a supercurrent with magnitude much greater than previously reported for similar devices. The dependence of the supercurrent on gate charge shows agreement with predictions made by Averin and Likharev that are based on a conjugate relationship between the junction phase and charge variables. The transport of Cooper pairs through the two junctions makes the devices behave effectively as a single junction whose critical current is modulated by the gate charge.

Keywords: *Magnetic susceptibility, *Superconductors, Superconducting films, Alternating current, Granular materials, Critical field, Critical current, Meissner effect, Demagnetization, Thin films, Sensitivity, Operation, Calibration, Design, Reviews, Reprints, Susceptometers.

This review critically analyzes current practice in the design, calibration, sensitivity determination, and operation of alternating-field susceptometers, and examines applications in magnetic susceptibility measurements of superconductors. Critical parameters of the intrinsic and coupling components of granular superconductors may be deduced from magnetic susceptibility measurements. The onset of intrinsic diamagnetism corresponds to the initial decrease in electrical resistivity upon cooling, but the onset of intergranular coupling coincides with the temperature for zero resistivity. The lower critical field may be determined by the field at which the imaginary part of susceptibility increases from zero. Unusual features in the susceptibility of superconductor films, such as a magnetic moment that is independent of film thickness and the variation of susceptibility with angle, are related to demagnetization.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity 4, n2 p61-64 Jun 94.

Keywords: *High temperature superconductors, *Superconducting films, *YBCO superconductors, *Electric contacts, *Contact resistance, Soldered joints, Critical current, Electrical resistance, Thin films, Indium, Silver, Reprints, *Yttrium barium cuprates, *Pressure contacts.

High current, low resistance, nonmagnetic, and nondestructive pressure contacts to Ag pads on YBa2Cu3O(7-delta) (YBCO) thin film superconductors were developed in this study. The contact resistance reported here includes the resistance of the current lead/Ag pad interface, the Ag pad/YBCO interface, and the bulk resistance of the contact material. This total contact resistance is the relevant parameter which determines power dissipation during critical-current measurements. It was found that regardless of the optimization of the Ag pad/YBCO interface through annealing, a pressure contact can yield a lower total resistance than a soldered contact. The lowest resistance obtained with pressure contacts was 3 (micro)ohms (for a 2 X 4 sq mm contact). These contacts may be useful for many different high temperature superconductor (HTS) studies where high-current contacts with low heating are needed.

B. Han, D. A. Neumayer, T. J. Marks, V. P. Dravid, D. A. Rudman, and H. Zhang. 1993, 3p.
Pub. in Applied Physics Letters 63, n26 p3639-3641, 27 Dec 93.

Keywords: *YBCO superconductors, High temperature superconductors, Metalorganic chemical vapor deposition, Temperature range 0400-1000 K, Superconducting films, Perovskites, Precursor, Thin films, Substrates, Reprints, *Praseodymium gallates, *Yttrium barium cuprates, Lanthanum aluminates, Buffer layers.

Phase-pure thin films of the YBa2Cu3O(7-x) (YBCO) lattice matched and low loss tangent perovskite insulator PrGaO3 have been grown in situ on single-crystal (110) LaAlO3 substrates by metalorganic chemical vapor deposition (MOCVD). Films were grown at temperatures of 750-800 C using beta-diketonate precursors M(dpm)3 (M = Pr,Ga; dpm = dipivaloylmethanate). YBCO films were then grown on the MOCVD-derived PrGaO3 by pulsed laser deposition (PLD). Scanning electron microscopy reveals that the PrGaO3 films have smooth, featureless surfaces. As assessed by x-ray diffraction, the PrGaO3 films grow epitaxially on LaAlO3 with a high degree of (001) and/or (110) plane orientation parallel to the substrate surface, and the subsequent YBCO films grow with a (00l) orientation. Rocking curve and phi-scan analyses reveal that the PrGaO3 and YBCO films grow epitaxially. YBCO films grown by PLD on the MOCVD-derived PrGaO3 exhibit T(c) = 91 K and J(c) = 6 X 10(exp 6) A/sq cm at 77 K in zero field.

Relationship between Bulk-Modulus Temperature Dependence and Thermal Expansivity.
Final rept.
H. Ledbetter. 1994, 5p.
Pub. in Physica Status Solidi (b) 181, p81-85 1994.

Keywords: *Bulk modulus, *Thermal expansion, Zero point energy, Temperature dependence, Debye temperature, Gruneisen constant, Elastic properties, Metals, Reprints.

The relationship between two anharmonic physical properties is considered: the bulk-modulus temperature dependence and the thermal expansivity. For the first, Varshni's relationship is used, which derives from an Einstein-oscillator model of crystals. For the second, a relationship from Slater is used with a similar basis. The ration of the two properties is found to be gamma + 1, where gamma denotes the usual Gruneisen parameter. Varshni's adjustable parameter s is interpreted in terms of the Gruneisen parameter, the Einstein temperature, and the atomic volume. Applied to metals, our relationship works well for those with s-p-electron bonding, but poorly for those where d-electrons contribute to bonding.

Low-Temperature Elastic Constants of Y1Ba2Cu3O7.
Final rept.
H. Ledbetter, M. Lei, A. Hermann, and Z. Sheng. 1994, 7p.
Pub. in Physica C 225, p397-403 1994.

Keywords: *YBCO superconductors, *Elastic properties, High temperature superconductors, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature dependence, Polycrystalline, Ultrasonic tests, Bulk modulus, Shear modulus, Young modulus, Poisson ratio, Reprints, *Yttrium barium cuprates.

Using ultrasonic methods, we studied the 4-295 K elastic constants of a 'good' Y1Ba2Cu3O7 polycrystal. We report the bulk, shear, Young moduli and the Poisson ratio. Except for the Poisson ratio, all elastic constants show smooth temperature behavior. Near T(c) during cooling, the Poisson ratio decreases irregularly. Focusing on the bulk modulus B, we use simple thermodynamics to show that the harmonic-observed decrement at T = O corresponds to expectation, but the temperature effect dB/dT is too large by about a factor of two. We attribute the irregular slope to oxygen-atom reordering. Against many reports, our bulk-modulus value is approximately that found in monocrystals or that predicted by an ionic-crystal model calculation.

Pub. in Physical Review B 49, n6 p4199-4208, 1 Feb 94.

Keywords: *YBCO superconductors, *Superconducting films, High temperature superconductors, Extremely high frequency, Microwave transmission, Temperature dependence, Type 2 superconductors, Penetration depth, Thin films, Substrates, Reprints, Magnetic field dependence, Surface impedance, Vortex dynamics, Lanthanum aluminates, Magnetoreflectance.

Microwave transmission and reflection measurements are performed simultaneously on thin films (approx 1,800 A) of YBa2Cu3O(7-x) having their c axis per-

pendicular to the LaAlO3 substrate. We determine power transmission and reflection fractions, Tau(T,H) and R(T,H), as functions of temperature and static magnetic field (O < H < 5.4 T), the latter being applied perpendicular to the film. A guided-wave model, which we develop for our experimental situation, is the basis of a computational algorithm that extracts quantitative values of the complex penetration depth (lambda bar), or alternatively the complex surface impedance Z(s), from Tau and R data. This inversion algorithm is successful when applied to test data generated from a phenomenological theory describing the electrodynamic response of a type-II superconductor. The procedure is applied to Tau(T,H) and R(T,H) measurements to infer the temperature- and field-dependent complex penetration depth (lambda bar)(T,H) that completely characterizes the superconductive film's electromagnetic response.

Hot-Electron Microcalorimeters for X-ray and Phonon Detection.
Final rept.
M. Nahum, J. M. Martinis, and S. Castles. 1993, 6p.
Pub. in Jnl. of Low Temperature Physics 93, n3/4 p733-738 1993.

Keywords: *X ray detectors, *Superconducting junctions, *Calorimeters, Electron temperature, Electron funneling, Hot electrons, Metal films, Dark matter, Tunnel junctions, Microcalorimetry, Prototypes, Reprints, *Phonon detectors, *Microcalorimeters.

We propose a novel hot-electron microcalorimeter for measurements of x-rays or phonons produced by the interaction of a high energy particle with the underlying substrate. This type of detector uses a normal metal film to absorb the incoming excitation which subsequently heats the electrons above the lattice temperature. The temperature of the electrons is measured from the current - voltage characteristics of a superconductor-insulator-normal metal tunnel junction, where part of the absorber forms the normal electrode. We present simple calculations of the energy sensitivity of the junction and of the ultimate performance of x-ray and phonon detectors. We also present preliminary measurements of prototype devices which were used to test the basic detector physics.

Proposed Antiferromagnetically Coupled Dual-Layer Magnetic Force Microscope Tips.
Final rept.
J. O. Oti, P. Rice, and S. Russek. 1994, 3p.
Pub. in Jnl. of Applied Physics 75, n10 p6881-6883, 15 May 94.

Keywords: Magnetic films, Exchange interactions, Antiferromagnetism, Magnetostatics, Resolution, Reprints, *Magnetic force microscopy, *Microscope tips, Dual layers, Micromagnetics.

A magnetic force microscope tip designed from dual-layer magnetic films of antiferromagnetically coupled magnetic layers is proposed. A theoretical analysis of the possible advantages of such a tip over conventional single-layer tips is given, using an extension to dual layers of a previously described micromagnetic model of single-layer tips. In contrast to single-layer tips, the magnetic domains of dual-layer tips are less sensitive to the fringing fields of the specimen, and the tips' stray fields are greatly reduced, thus minimizing the likelihood of erasure of the sample magnetization. These properties of dual-layer tips should lead to improved resolution of magnetic force microscopy images.

Magnetic and Magnetoresistive Properties of Inhomogeneous Magnetic Dual-Layer Films.
Final rept.
J. O. Oti, S. E. Russek, and S. C. Sanders. 1994, 3p.
Pub. in Jnl. of Applied Physics 75, n10 p6519-6521, 15 May 94.

Keywords: *Magnetoresistance, *Magnetic films, Magnetic anisotropy, Coercive force, Exchange interactions, Cobalt alloys, Nickel alloys, Metal films, Magnetostatics, Chromium, Simulation, Reprints, Dual layers, Micromagnetics, Multilayers.

Magnetic and magnetoresistive properties of sputtered Co alloy dual-layer films are compared with micromagnetic simulations. The simulations elucidate the details of the switching behavior of the dual-layer films as a function of the interlayer exchange and magnetostatic interactions. The simulations have led to a conceptual understanding of the coercive field splitting caused by the interlayer interactions. A calculation of the anisotropic magnetoresistance (AMR) has been included in the simulations. The AMR provides a second independent macroscopic quantity (in addition to the average magnetization) which can be measured and compared with the micromagnetic simulations. The AMR is more sensitive to the micromagnetic structure perpendicular to the applied field and is a better test of the accuracy of the micromagnetic model. The simulations qualitatively describe the measured AMR data on CoNi-Cr-CoNi dual layers.

Keywords: *YBCO superconductors, *Electron tunneling, High temperature superconductors, Superconducting films, Electrical resistivity, Boundary layer, Thin films, Interfaces, Silver, Reprints, *Yttrium barium cuprates, Contact resistivity.

We have measured interface transport in thin-film YBa2Cu3O(7-delta)/Ag interfaces having resistivities ranging from 10(exp -8) to 10(exp -3) ohm sq cm. Analysis of the interface I-V data indicates that tunneling is the predominant transport mechanism even for the in situ interfaces having contact resistivities of 1-7 X 10(exp -8) ohm sq cm. Zero-bias conductance peaks are also observed for the entire range of interface resistivity. The similarity of the zero-bias conductance peaks among these widely varying interfaces suggests that the low-temperature interface transport is governed by the same mechanism in each case. These conductance peaks are analyzed in the framework of the Appelbaum-Anderson model for tunneling assisted by magnetic scattering from isolated magnetic spins in the interface.

Keywords: *High temperature superconductors, *Gamma ray astronomy, *Meetings, High-Tc superconductors, Electron tunneling, Radio galaxies, Radio sources(Astronomy), Gamma ray observatory, Cosmic rays, Quasars, Cuprates, *Ginzburg symposium.

A one day symposium honoring Professor Vitaly L. Ginzburg and his many contributions to the world of physics was held at the National Institute of Standards and Technology. An additional purpose was to explore future directions for research in the context of his extensive involvement in the rapid developments in physics in the last fifty years. This transcription of the proceedings includes invited talks on some of those recent developments in such fields as superconductivity and astrophysics. Prof. Ginzburg's own address 'What problems of physics and astrophysics seem now to be especially important and interesting' was the focus for discussion on the future directions of physics research. Titles of the other papers given at the symposium are as follows: New Phenomena in Proximity Effect Tunneling in High TC Superconductors; Radio Galaxies, Quasars, and Superluminal Radio Sources; Exotic Properties of High TC Materials and the Ginzburg Parameter; Gamma Ray Astrophysics and Early Results of the Compton Observatory; Some Puzzles of the Normal State of High TC Oxides; Galactic Annihilation Radiation.

Keywords: *Josephson junctions, *Thermal noise, High temperature superconductors, YBCO superconductors, Reprints, Yttrium barium cuprates, RSJ model.

We have fabricated YBa2Cu3O(7-delta)-normal metal-YBa2Cu3O(7-delta) step-edge Josephson junctions that fit the resistively shunted junction model with Johnson-Nyquist thermal noise. The I-V curves are well fit over a large temperature range for junctions of varying critical current values. There is good agreement between the fitted thermal noise temperature and the measured ambient temperature. This is strong evidence that these junctions are not dominated by superconducting shorts longer than the superconducting coherence length.

Thin Film Reaction Kinetics of Niobium/Aluminum Multilayers.
Final rept.
K. R. Coffey, K. Barmak, D. A. Rudman, and S. Foner. 1992, 9p.
Pub. in Jnl. of Applied Physics 72, n4 p1341-1349, 15 Aug 92.

Keywords: *Aluminum alloys, *Niobium alloys, *Phase studies, Transmission electron microscopy, X ray diffraction, Reaction kinetics, Metal films, Thin films, Nucleation, Calorimetry, Superconductors, Reprints, *Niobium aluminides, Multilayers.

Phase formation kinetics in Nb/Al multilayered thin films having overall compositions of 25, 33, 50, and 75 at. % Al have been investigated using scanning calorimetry, x-ray diffraction, and cross-sectional transmission electron microscopy. The first phase to form upon annealing the Nb/Al layered structure of all samples is the NbAl3 intermetallic. Calorimetry clearly identifies the NbAl3 formation to be a two-stage process. The first stage is the formation of a planar layer

by nucleation and growth to coalescence while the second stage is the thickening of the planar layer. The next phase observed in samples of 25 and 33 at. % Al is the A15 superconducting phase, Nb3Al. The Nb3Al growth completes a first reaction stage similar to the NbAl3, but the subsequent thickening reaction stage is not observed without simultaneous Nb2Al growth. The high interface velocities derived from the calorimetry for formation of both NbAl3 and the A15 Nb3Al indicate that atomic transport must be by grain boundary diffusion.

Aspects of a Deformable Superconductor Model for the Vortex Mass.
Final rept.
M. W. Coffey. 1994, 9p.
Pub. in Jnl. of Low Temperature Physics 96, n1/2 p81-89 1994.

Keywords: *Superconductivity, Type 2 superconductors, Mathematical models, Temperature dependence, Critical field, Quasi-particles, Elasticity, Mass, Reprints, Vortex dynamics.

A deformable superconductor model for the vortex mass per unit length mu(sub d) in a type-II superconductor is discussed. A new identity for the inertial vortex mass in this model is presented which holds for an arbitrary quasiparticle fraction when the ionic displacement is irrotational. This result is used to show unphysical behavior in the temperature dependence of the ionic-strain-field vortex mass and is key in resolving this difficulty. A possibility for the experimental observation of the strain field mechanism is discussed.

Deformable Superconductor Model for the Fluxon Mass.
Final rept.
M. W. Coffey. 1994, 4p.
Pub. in Physical Review B 49, p9774-9777, 1 Apr 94.

Keywords: *Superconductivity, Type 2 superconductors, Mathematical models, Quasi-particles, Elasticity, Mass, Reprints, *Fluxons, Vortex dynamics.

Outstanding difficulties in a deformable type-II superconductor model for the fluxon inertial mass per unit length mu(sub d) are resolved. An identity for the inertial mass, valid for an arbitrary quasiparticle fraction when the ionic displacement field is irrotational, plays a critical role in the analysis. This approach avoids previously employed approximations, leading to qualitatively different results, including a fluxon mass which properly vanishes at the transition temperature and which has a greatly reduced magnitude. A framework for the solution of the elasticity equation for an isotropic superconductor is presented and the close relation between mu(sub d) and the ionic strain field is shown.

We report a significant increase in the pinning energy of vortices in single-crystal Bi2Sr2CaCu2O8 when irradiated with heavy ions such as Ar(1+). This is in contrast with the results of light ion (H(1+), He(1+)) irradiations which give pinning energies comparable with those of unirradiated crystals. The stronger pinning is attributed to defects larger than point defects, e.g., clusters or amorphized regions. As a result of higher pinning energies, critical currents persist at markedly higher temperatures and fields.

Keywords: *Zinc selenides, Molecular beam epitaxy, Semiconducting films, Dielectric properties, Complex numbers, Refractive index, Energy gap, Thin films, Gallium arsenides, Ellipsometry, Substrates, Reprints.

Spectroscopic ellipsometry was used to determine the real and imaginary parts of the dielectric function of ZnSe thin films grown on (001) GaAs substrates by molecular-beam epitaxy, for energies between 1.5 and 5.0 eV. A sum of harmonic oscillators is used to fit the dielectric function in order to determine the values of the threshold energies at the critical points. The fundamental energy gap was determined to be at 2.68 eV. The E(0) + Delta(0) and E(1) points were found to be equal to 3.126 and 4.75 eV, respectively. Below the fundamental absorption edge, a Sellmeir-type function was used to represent the refractive index. At the critical points, E(0) and E(0) + Delta(0), the fitting was improved by using an explicit function combining the contributions of these two points to the dielectric function.

Pub. in Physical Review B 50, n13 p9409-9418, 1 Oct 94.

Keywords: *Josephson junctions, High temperature superconductors, Alternating current, YBCO superconductors, Grain boundaries, Josephson effect, Parallel orientation, Microwaves, Reprints, Grain boundary junctions, Yttrium barium cuprates.

Half-integral constant voltage steps were observed in many high-T(c) grain-boundary Josephson junctions of YBa2Cu3O(7-delta) when a microwave field was applied. Five distinct observed behaviors of the widths of both integral and half-integral steps as a function of microwave amplitude, Delta I(dc)(I(ac)), are reproduced by simulations of two or three junctions in parallel. This provides quantitative evidence that a single high-T(c) grain-boundary junction is composed of several junctions in parallel. These junctions are formed by the overlap of superconducting filaments on either side of the grain boundary, and the spacing between ones with relatively large critical currents is approximately 20 micrometers.

L. F. Goodrich, A. N. Srivastava, and T. C. Stauffer. 1993, 7p.
Pub. in Cryogenics 33, n12 p1142-1148 1993.

Keywords: *High temperature superconductors, *Electrical measurement, *Critical current, BSCCO superconductors, High-Tc superconductors, Performance evaluation, Design, Reprints, *Standard reference devices.

Obtaining repeatable critical current measurements for a high temperature superconductor (HTS) is a challenging task, as HTSs are highly susceptible to degradation due to mechanical stress, moisture, thermal cycling and aging. This paper discusses the development of a high temperature superconducting standard reference device (SRD) to address these measurement concerns, and gives preliminary data on its characteristics. An SRD is an HTS specimen that has had its critical current //(c) non-destructively evaluated. Because HTSs are sensitive to mechanical alterations, minor changes in sample preparation or mounting procedure could yield large changes in the measured critical current. Preliminary data on SRDs made using Bi-based oxide tapes (2212) with an Ag substrate are presented. Differences between two consecutive measurements of //(c) can typically change by 40%; these deviations have been reduced to about 4%.

Keywords: *YBCO superconductors, *Niobium stannides, High temperature superconductors, Type 2 superconductors, Temperature dependence, Experimental data, Meissner effect, Magnetic flux, Flux pinning, Magnetization, Diamagnetism, Reprints, *Yttrium barium cuprates.

Experimental aspects of flux expulsion in Nb3Sn and YBa2Cu3O7 type-II superconductors are presented. There is a clear distinction in magnetization between field-cooled measured-upon-cooling (FCC) and field-cooled measured-upon-warming (FCW) results. This thermal hysteresis, predicted in the temperature-dependent critical-state model at low fields by Clem and Hao, was observed for measuring fields up to about 0.5 T. The model explains the observation of increases in diamagnetism after field cooling and thermal cycling. The thermal hysteresis, together with weak links, accounts for the occurrence of a negative peak in FCW magnetization. The FCC-FCW bifurcation observed for a 0.1 mT field down to 5 K might imply that flux lines are not completely frozen below the temperature at which the lower critical field is equal to the measuring field, but are expelled from the sample even in the Meissner state.

Magneto-Transport Properties of HgCdTe.
Final rept.
J. R. Lowney, J. S. Kim, and D. G. Seiler. 1994, 7p.
Pub. in EMIS Data Reviews, p264-270 1994.

Keywords: *Mercury cadmium tellurides, Shubnikov-de Haas effect, Hall effect, Magnetoresistivity, Reprints.

Magnetotransport techniques are widely used to characterize the electrical properties of HgCdTe. The Hall-effect method is the most common method of determining the carrier density and mobility of semiconductor materials. Multicarrier characterization techniques are needed for determination of carrier densities and mobilities in a multicarrier system present in layered-structures or in a variety of complex semiconductor materials. Because of the importance of these methods for proper electrical characterization of complex HgCdTe single crystals or layered-structures, we discuss this topic pedagogically with the primary objective of promulgation of this emerging tool to the HgCdTe characterization community. We also discuss magnetoresistance and magnetoresistance-based techniques such as the Shubnikov-de Haas effect and magnetophonon effect, which have been used to characterize HgCdTe materials. These techniques are capable of providing very accurate data if applied with care and proper analysis.

Pub. in Physical Review B 48, n24 p18 316-18 319, 15 Dec 93.

Keywords: Electron tunneling, Thermal noise, Performance, Accuracy, Reprints, *Coulomb blockade, Electron pumps.

We calculate how noise generated by a finite environmental impedance limits the ultimate performance of Coulomb-blockade devices and possible current or charge standards. We have expressed the environmental theory of the Coulomb blockade in terms of the spectral density of the voltage noise arising from the environment, and have calculated the resulting single-junction tunneling, and two-junction cotunneling rates. These rates are used to predict the tunneling rate of electrons through a five-junction pump and may explain the anomalously large rates that are observed experimentally.

Keywords: Metrology, Accuracy, Tests, Reprints, *Electron pumps, Single electron tunneling, Coulomb blockage.

We have measured the electron leakage rate through a 5 junction electron pump. Our observed rate of about 0.3 e/s is several orders of magnitude larger than predicted by thermal activation or cotunneling rates. Our results may be explained by the environmental theory of the Coulomb blockade where noise from the environment causes photon assisted tunneling.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 29, n6 p2359-2364 Nov 93.

Keywords: Exchange interactions, Magnetic anisotropy, Magnetic films, Numerical solution, Magnetostatics, Thin films, Reviews, Reprints, *Micromagnetics, Magnetic force microscopy.

Numerical micromagnetics is a flexible and powerful means of designing and characterizing magnetic devices. This paper presents an overview of numerical methods of solution of micromagnetics problems. The modeling of exchange, anisotropy and magnetostatic interaction fields in magnetic films, and micromagnetic modeling of magnetic force microscopy are discussed.

Using a new form of magnetic force microscope (dc MFM), magnetic force images of a thin-film recording head have been made. Using dc MFM, atomic force microscope images are presented of the surface topography and magnetic forces taken simultaneously, allowing direct correlation of magnetic fields to the pole pieces. Magnetic force images of the head at typical head-to-disk spacings are presented. The tips used for these images had two different magnetic coatings.

High Temperature Superconductor-Normal Metal-Superconductor Josephson Junctions with High Characteristic Voltages.
Final rept.
P. A. Rosenthal, E. N. Grossman, R. H. Ono, and L. R. Vale. 1993, 3p.
Pub. in Applied Physics Letters 63, n14 p1984-1986, 4 Oct 93.

Keywords: *Josephson junctions, High temperature superconductors, Superconducting films, Submillimeter waves, Far infrared radiation, YBCO superconductors, Epitaxy, Reprints, Yttrium barium cuprates.

We have fabricated step edge superconductor-normal metal-superconductor microbridges using YBa2Cu3O(7-x) (YBCO) and noble metals with critical current-normal resistance (I(c)R(N)) products as high as 10 mV and normal resistances up to 38 ohms. Our fabrication process achieves high values of the I(c)R(N) product by exploiting the anisotropy in the properties of epitaxial YBCO films, allowing contact only between normal metal and superconductor through the crystalline axes which support the largest Josephson coupling. This results in a dramatic increase in the normal resistance of a junction without decreasing its critical current. We discuss the role of the superconductor-normal metal boundary resistance on the junction electrical properties. We have coupled submillimeter wave rf currents quasioptically into junctions integrated at the feeds of noble metal planar log periodic antennas and have induced up to 7 Shapiro steps in the current-voltage characteristics with a 760 GHz beam from a far infrared laser.

The surface degradation of c-axis oriented YBa2Cu3O(7-delta) thin films due to air, CO2, N2, O2, and vacuum exposure has been studied with reflection high-energy electron diffraction (RHEED), scanning tunneling microscopy, and contact resistivity measurements. The formation of an amorphous surface reaction layer upon exposure to air and CO2 is monitored with RHEED and correlated with an increase in contact resistivity. The contact resistivity of samples exposed to air increases with time. Surfaces exposed to CO2 show a similar degradation while surfaces exposed to N2 showed a slightly different degradation mechanism. Vacuum exposed surfaces show little increase in contact resistivity, indicating no long-term surface oxygen loss.

Keywords: *Diffusion, *Transport properties, *Porous materials, Permeability, Three dimensional models, Grain boundaries, Nuclear magnetic resonance, Porosity, Microstructure, Fluid flow, Reprints, *X ray microtomography.

We will review recent progress in our understanding of classical transport in porous media. Theoretical concepts will be illustrated with two distinct kinds of calculations. The first involve the grain consolidation model and are based on a particular multisize packing of spherical grains. The computational methods developed here are sufficiently accurate that we propose to combine them with direct measurements of the pore and grain geometry based on X-ray microtomography. Our preliminary results indicate that this approach may well play an important part in future studies of transport in porous media.

Contract ONR-N00014-92-F-0003
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Applied Physics Letters 61, n2 p237-239, 13 Jul 92.

Keywords: *Electrometers, Tunnel junctions, Shot noise, Reprints, *Coulomb blockade electrometers, Single electron tunneling, Quantum noise.

We have measured the noise of a Coulomb blockade electrometer. Below 100 Hz, the noise referred to the input charge has a 1/f power spectrum with a charge noise of 3 X 10(exp -4) e/Hz(sup 1/2) and an energy sensitivity E(N) of 3 X 10(exp 4)(Planck's constant) at 10 Hz. The 1/f noise probably results from the stochastic occupation of charge traps which could in principle be eliminated. The theoretical noise floor is set by shot noise, and indirect measurements show that this contribution to E(N) can be as small as 1.5 (Planck's constant), suggesting that the electrometer will be a quantum limited amplifier if the 1/f noise can be eliminated.

Pub. in Applied Physics Letters 65, n12 p1587-1589, 19 Sep 94.

Keywords: *YBCO superconductors, *Superconducting films, High-Tc superconductors, Transition temperature, Thin films, Annealing, Strains, Reprints, *Yttrium barium cuprates.

In situ coevaporated YBa2Cu3O(7-delta) thin films have a slightly depressed transition temperature T(c), though they have excellent radio-frequency surface resistance characteristics. These films consistently have less orthorhombic strain than laser ablated or post-annealed films. Low temperature (320-420 C) post-annealing of in situ coevaporated films in 100 kPa of O2 raised T(c) to values as high as 91.5 K with some increase in the orthorhombic strain. All measured thin films show less variation of T(c) with orthorhombic strain than does bulk material.

Crossover in the Pinning Mechanism of Anisotropic Fluxon Cores.
Final rept.
L. D. Cooley, A. Gurevich, and D. C. Larbalestier. 1994, 4p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of International Workshop on Critical Currents in Superconductors (7th), Alpbach, Austria, January 24-27, 1994, p573-576.

Keywords: *Flux pinning, *Superconductors, Josephson effect, Crystal defects, Anisotropy, Reprints, Fluxons.

We propose that thin planar defects have a strong magnetic flux-pinning force. Magnetic pinning results from the anisotropic nature of a fluxon when the core is situated in the plane of the defect, and is a consequence of nonlocal Josephson electrodynamics. Since the magnetic pinning force approaches the maximum core-pinning force, a crossover from core pinning to magnetic pinning is predicted when the proximity coupling becomes strong. This model is supported by flux-pinning measurements of an artificial pinning center superconductor.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p3825-3827 Nov 94.

Keywords: *Magnetic devices, *Magnetoresistance, Sizes(Dimensions), Magnetic films, Metal films, Thin films, Magnetization, Cobalt alloys, Iron alloys, Nickel alloys, Copper, Silver, Reprints, Magnetic multilayers.

Giant magnetoresistance (GMR) was measured as a function of device size for patterned NiCoFe/Cu and NiFe/Ag films. For the quasi-granular NiCoFe/Cu films, the normalized maximum change in resistivity (Delta)rho/rho was 8% for most of the samples. For the NiFe/Ag films, antiparallel alignment was achieved through magnetostatic coupling, not exchange fields, with a (Delta)rho/rho of 4.5%. The films were patterned into stripes with Au current leads for size-effect measurements. The height of the stripes varied from 0.5 to 16 micrometers and the track width varied from 1 to 16 micrometers. Discrete switching events and anomalous low-field dips in the response were observed for both materials for small device sizes.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4464-4466 Nov 94.

Keywords: *Ferrite garnets, Yttrium iron garnets, Bismuth additions, Gallium additions, Faraday effect, Frequency response, Response functions, Magneto-optics, Substitutes, Sensitivity, Reprints, *Magnetic field sensors.

We report measurements of the magneto-optic response function and frequency response for three bulk iron garnet crystals grown by a flux technique. The samples were the product of an intensive effort to develop iron garnet compositions with properties specifically optimized for magnetic field sensing. Sensitivity enhancement was achieved through both bismuth substitution (for increasing the saturation Faraday rotation) and gallium substitution (for reducing the saturation magnetization). Frequency response measurements indicate that bismuth substitution actually improves performance (compared to unsubstituted yttrium iron garnet) in contrast with gallium, which causes substantial degradation.

The technique of X-ray photoelectron and Auger electron forward scattering has developed in the past few years into one of the most valuable structural diagnostics for investigating the early stages of epitaxial thin-film growth. A review is given here of this technique with special emphasis on its application to epitaxial films of interest to the thin-film magnetism community. The aim of this review is to provide an easily readable, self-contained account directed primarily at experimentalists, with the hope of making forward scattering accessible to new or occasional users. Some familiarity with XPS and Auger spectroscopy is assumed, as is an elementary knowledge of quantum mechanics.

Keywords: *Magnetic susceptibility, *Superconductors, Temperature dependence, Crystal field, Single crystals, Polycrystals, Magnetic moments, Reprints, *Praseodymium cerium cuprates.

We measured the temperature dependence of the magnetic susceptibility of Pr(2-x)Ce(x)CuO4 monocrystals and polycrystals in the composition range x = 0-0.18. For all compositions, the susceptibility curves reveal strong crystal-field effects and are evaluated in terms of Van Vleck's equation for magnetic susceptibility. At temperatures above 100 K, the behavior could be described by a Curie-Weiss-like equation, the parameters of which allow us to characterize the crystal-field interactions. The concentration dependence of these parameters is much stronger in the monocrystals, with the apparent magnetic moment going through a sharp maximum near x = 0.1, the composition of the onset of superconductivity after a reducing anneal. The concentration dependence of the magnetic moment can be qualitatively interpreted as a contribution of charge-carrying spins in localized states, mainly through initiating Cu(2+)-Pr(3+) interactions. With increasing Ce, these additional spins can not remain localized, thus the magnetic moment decreases, and a reducing anneal results in superconductivity.

Crystal Structure and Magnetic Properties of CuGeO3.
Final rept.
M. Green, M. Kurmoo, J. Stalick, and P. Day. 1994, 2p.
Pub. in Jnl. of the Chemical Society, Chemical Communications, p1995-1996 1994.

Keywords: *Crystal structure, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Room temperature, Magnetic susceptibility, Magnetic properties, Neutron diffraction, Reprints, *Copper germanates, Rietveld method.

The crystal structure of CuGeO3, which has been reported to undergo a spin-Peierls transition at 14 K, is

determined by neutron powder diffraction at 300, 20 and 4.2 K and the structure refined in the space group Pmma at all three temperatures, ie without displacement of the Cu atoms from a uniform one-dimensional chain; anisotropic broadening of (h0l) reflections, observed in all three data sets, is successfully modeled by an orthorhombic micro-strain along a and c, i.e. perpendicular to Cu-Cu chains. Below 10 K the magnetic susceptibility fits very well to the Bulaevskii model, indicating a ratio of 0.69 between the Cu-Cu exchange constants in the dimerised chain and a mean exchange constant of 88 K.

Pub. in Physical Review Letters 73, n20 p2756-2759, 14 Nov 94.

Keywords: *Superconductors, Temperature range 0000-0013 K, Phase transformations, Antiferromagnetic materials, Neutron scattering, Oscillations, Reprints, *Holmium nickel boron carbides, *Magnetic ordering.

The nature of the holmium order in the reentrant superconductor (T(c) = 7.5 K) HoNi2B2C is revealed by neutron scattering. Upon cooling, a transversely polarized oscillatory magnetic state is formed (T(M) approx = 8 K), characterized by a wave vector (0,0,Q(c)) where Q(c) approx = 0.05/A is only weakly dependent on temperature and field. At the reentrant superconducting transition (about 5 K), the amplitude of the oscillatory state abruptly decreases in favor of a commensurate antiferromagnet, whereby superconductivity is restored and coexists with antiferromagnetism at low temperatures.

Analytical Expressions for Barkhausen Jump Size Distributions.
Final rept.
F. Y. Hunt, and R. D. McMichael. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4356-4358 Nov 94.

Keywords: *Barkhausen effect, Langevin equation, Markov chains, Random walk, Bessel functions, Reprints.

In previous calculations of Barkhausen jump size distributions, the Langevin equation was used to describe the pinning field h(c). In this paper, h(c) is modeled by discretized random walks which are used to obtain analytical expressions for the Barkhausen jump size distribution, P(tau). For a bounded random walk which reduces to the Langevin function in the continuum limit, P(tau) is a sum of exponentials which is compared to functions of the form P(tau) = tau(sup -alpha)exp(-tau/tau(0)). The scaling exponent changes from alpha approx = 1.5 for small jumps to alpha approx = 1.0 for jumps larger than the correlation length. For an unbounded random walk with exponentially distributed distances between steps in h(c), P(tau) is shown to be proportional to a modified Bessel function which, for long jumps, is asymptotically a pure power law, tau(exp -3/2). This suggests that the scaling exponent shift and the exponential cutoff are caused by correlations in h(c).

Dependence of Tc on Debye Temperature Theta(sub D) for Various Cuprates.
Final rept.
H. Ledbetter. 1994, 2p.
Pub. in Physica C 235-240, p1325-1326 1994.

Keywords: *High-Tc superconductors, *Critical temperature, *Debye temperature, Temperature dependence, Mercury inorganic compounds, YBCO superconductors, BSCCO superconductors, Electron phonon interactions, Reprints, Thallium barium calcium cuprates, Lanthanum cuprates.

The author extends the T(c)-Theta(D) relationship established by Ledbetter and coworkers for La-O and Y-O, and by Dominec for Bi-O, to include Tl-O and Hg-O compounds. In BCS-McMillan materials, Theta(D) occurs both in the pre-exponential factor in the expression T(c) approx = Theta(D) exp (-1/lambda) and in McMillan's expression for the electron-phonon parameter lambda = C/M < omega squared > , where < omega > approx Theta(D). In BCS materials, T(c) increases with decreasing Theta(D), that is with lattice softening. In all five cuprate superconductors listed above, the opposite occurs: T(c) increases with lattice stiffening. From these results, the author draws two principal conclusions. First, T(c) depends on phonons because it depends on Theta(D), the quintessential phonon parameter. Second, the T(c)-Theta(D) relationship for high-T(c) oxide superconductors differs dramatically from that for conventional BCS materials.

Elastic Constants of a Material with Orthorhombic Symmetry: An Alternative Measurement Approach.
Final rept.
M. Lei, H. Ledbetter, and Y. Xie. 1994, 4p.
Pub. in Jnl. of Applied Physics 76, n5 p2738-2741, 1 Sep 94.

Keywords: *Elastic properties, Fiber reinforced composites, Orthorhombic lattices, Ultrasonic radiation, Measurement, Anisotropy, Reprints.

An alternative approach to measuring the complete anisotropic elastic constants C(ij)(S(ij)) of an orthorhombic-symmetry material is proposed. This approach requires measurements along only principal directions: 100. In this approach, a pulse-echo (megahertz-frequency) method was used to measure C(11), C(22), C(33), C(44), C(55), and C(66). A resonance (kilohertz-frequency) method was used to measure three elastic compliances: S(11), S(22), and S(33). Combining the C(ii) with the S(ii), the complete sets of C(ij) and S(ij) were obtained. This approach avoids the troublesome, error-prone determination of off-diagonal C(ij) (S(ij)) by the usual measurements along nonprincipal directions. The approach was applied to a boron-aluminum composite where the off-diagonal terms remain uncertain. In principle, the approach applies to any orthorhombic-symmetry material.

UCu3Al2 crystallizes in an ordered variant of the hexagonal CaCu5 structure. By neutron powder-diffraction, the U atoms were found to occupy the 1a sites, while the 2c sites are occupied by Cu atoms only and a random occupation of the 3g sites by the remaining Cu and Al is found. The magnetic susceptibility, measured on a single crystal grown by the Czochralski tri-arc technique, is found to be maximal within the hexagonal basal plane with a maximum at about 10 K. For fields applied within the basal plane, the magnetization at 4.2 K exhibits a slight S-shape starting slightly below 15 T. No such anomalies are found for fields applied along the c-axis where the magnetic response is found to be much lower. No additional magnetic peaks, which could be related with long-range antiferromagnetic ordering, were detected in the neutron powder-patterns at low temperatures.

Epitaxial Growth and Characterization of the Ordered Vacancy Compound CuIn3Se5 on GaAs (100) Fabricated by Molecular Beam Epitaxy.
Final rept.
A. J. Nelson, M. Bode, G. Horner, K. Sinha, and J. Moreland. 1994, 5p.
Pub. in Materials Research Society Symposia Proceedings, v340 p599-603 1994.

Keywords: *Epitaxial growth, Molecular beam epitaxy, Transmission electron microscopy, Atomic force microscopy, X ray diffraction, Raman spectra, Gallium arsenides, Single crystals, Stacking faults, Energy gap, Photoluminescence, Substrates, Films, Reprints, *Copper indium selenides.

Epitaxial growth of the ordered vacancy compound (OVC) CuIn3Se5 has been achieved on GaAs (100) by molecular beam expitaxy (MBE) from Cu2Se and In2Se3 sources. Electron probe microanalysis and X-ray diffraction have confirmed the composition for the 1-3-5 OVC phase and that the film is single crystal CuIn3Se5 (100). Transmission electron microscopy (TEM) characterization of the material also showed it to be single crystalline. Structural defects in the layer consisted mainly of stacking faults. Photoluminescence (PL) measurements performed at 7.5 K indicate that the bandgap is 1.28 eV. Raman spectra reveal a strong polarized peak at 152/cm, which is believed to arise from the totally symmetric vibration of the Se atoms in the lattice. Atomic force microscopy reveals faceting in a preferred (100) orientation.

High Resolution Inelastic Neutron Scattering Study of Phonon Self-Energy Effects in YBCO.
Final rept.
D. Reznik, B. Keimer, F. Dogan, and I. A. Aksay. 1994, 2p.
Pub. in Physica C 235-240, p1733-1734 1994.

Keywords: *YBCO superconductors, *Phonons, Temperature range 0013-0065 K, Temperature range 0065-0273 K, High resolution, Neutron scattering, Inelastic scattering, High-Tc superconductors, Self-energy, Single crystals, Reprints, *Yttrium barium cuprates.

We report preliminary results of the high resolution inelastic neutron scattering measurements of the 42.5 meV optical phonon branch in YBCO, whose behavior at momentum transfer q=0 has been extensively studied by Raman scattering. The experiment was done on a large (75g) single crystal of YBa2Cu3O(7-x) (T(c) approx = 90K) with the resolution of 2 meV (full width at half maximum). In cooling from 100K to 50K, we observe a small softening of the phonon energy at q=0.25, 0.25, 0, but no significant linewidth change.

Pub. in Physical Review B 49, n24 p16 899-16 916, 15 Jun 94.

Keywords: *Tantalum sulfides, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Scanning tunneling microscopy, Fourier transformation, Domain structure, Reprints.

Using scanning tunneling microscopy (STM), we studied 1T-TaS2 in all four of its charge-density-wave (CDW) supporting phases over the temperature range 360-143 K. Special attention was given to the search for discommensurate structures and the distinguishing of true CDW discommensurations and domains from apparent discommensurations and domains formed by interference between the CDW and the atomic lattice. In the lowest-temperature commensurate (C) phase, we find that the CDW is in the commensurate configuration as expected. In the nearly commensurate (NC) phase, the CDW is in a true domain structure as evidenced by satellite spots in the Fourier transforms of the STM images. In the triclinic (T) phase, the STM data indicate that the CDW is in a striped domain phase, which is significantly different from the domain model previously proposed. Finally, in the high-temperature incommensurate (I) phase, we find unexpected satellite spots in the STM Fourier transforms, suggesting that a CDW modulation is also present in this phase.

Novel YBa2Cu3O7-x and YBa2Cu3O7-x/Y4Ba3O9 Multilayer Films by Bias-Masked 'On-Axis' Magnetron Sputtering.
Final rept.
J. H. Xu, G. G. Zheng, A. M. Grishin, J. Moreland, B. M. Moon, and K. V. Rao. 1994, 3p.
Pub. in Applied Physics Letters 64, n14 p1874-1876, 4 Apr 94.

Keywords: *YBCO superconductors, *Superconducting films, *Dielectric films, High temperature superconductors, Scanning tunneling microscopy, Strontium titanates, Magnetrons, Sputtering, Substrates, Reprints, *Yttrium barium cuprates, Lanthanum aluminates, Multilayers.

In situ YBa2Cu3O(7-x) (YBCO) films have been fabricated on SrTiO3 (001) and LaAlO3 (001) substrates by on-axis biased-radio-frequency magnetron sputtering in Ar-10% O2 at total pressures as low as 3 Pa (0.03 mbar) and a deposition rate 210 nm/h. Negative oxygen ion-resputtering has been considerably reduced by introducing a biased copper mask between the substrate and target. The surface morphology and physical properties of the films are greatly improved on applying a positive dc substrate bias with respect to grounded deposition chamber. We have obtained superconducting YBCO films with transport critical current as high as 10(exp 6) A/sq cm at 77 K and low normal-state resistivity by this approach. However, films deposited by negative dc bias under identical sputtering conditions are insulating. We identify the insulating films to be c-axis oriented Y4Ba3O9 (YBO) films. Furthermore, YBCO films could be grown on the YBO layers without any degradation of T(sub C) and c-axis orientation. This novel bias sputtering feature gives us a unique opportunity to produce superconductor/insulator, YBCO/YBO, multilayers from a single YBCO target.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Ultraviolet Technology V, San Diego, CA., July 26-27, 1994, v2282 p39-48.

Keywords: *Molecular beam epitaxy, *Epitaxial growth, *Gallium arsenides, Time-of-flight mass spectrometers, Vacuum ultraviolet radiation, Neodymium lasers, YAG lasers, Laser radiation, Photoionization, Reprints.

Epitaxial growth of III-V semiconductor materials is probed in a molecular beam epitaxy reactor by single photon ionization of the gaseous fluxes using vacuum ultraviolet (VUV) laser radiation. The ninth harmonic of the Nd:YAG laser is produced by frequency tripling the output to 355 nm and then to 118 nm in a Xe/Ar mixture. Together with a time-of-flight mass spectrometer, this radiation is used to selectively probe the gaseous fluxes of Ga, As, As2, and As4 during molecular beam epitaxy of III-V materials. The essential aspects of the method and details of calibration procedures to obtain relative fluxes are described. Recent work to correlate the flux determinations with Reflection High Energy Electron Diffraction (RHEED) oscillations during GaAs epitaxial growth will be discussed.

Early History and Future Outlook for the X-ray Crystal Density Method.
Final rept.
R. D. Deslattes. 1994, 7p.
Pub. in Metrologia 31, p173-179 1994.

Keywords: *Crystal structure, X ray diffraction, Historical aspects, Reprints, X ray interferometry, Avogadro constant.

It is useful to recall that the (late nineteenth-century) Baltimore Lectures of Lord Kelvin indicated that the likely sizes of atomic particles spanned almost two decades. Yet in the early years of the present century, Sir William Bragg's ansatz, together with the oil-drop e, gave the first reliable estimate of the scale of crystal interplanar spacings. The converse process of using an XRCD approach to obtain a value for the Avogadro constant was, prior to the advent of x-ray interferometry, limited by the need to connect optical and x-ray wavelengths before using the latter to estimate unit cell dimensions in crystals. Other limitations of these early measurements included the use of water as a density standard and the assignment of molar masses to individual specimens based on geochemical abundance averages. All these difficulties were overcome, in principle, with the application of x-ray/optical interferometry to the determination of lattice periods, the use of solid object density standards, and the determination of densities and isotopic abundances on individual monocrystalline specimens. While the present-day situation is addressed in other contributions to this workshop, the present essay attempts to place some of the early work in context and to look also to the future.

Pub. in Jnl. of Applied Physics 77, n1 p21-27, 1 Jan 95.

Keywords: *Gallium antimonides, *Gallium arsenides, *Antimony, *Molecular beam epitaxy, *Epitaxial growth, Semiconducting films, X ray diffraction, Crystal growth, Reprints, Heteroepitaxial films, Heterostructures.

The requirements for heteroepitaxial growth of Sb on both GaSb and GaAs, and the subsequent growth of GaSb on Sb, using molecular-beam epitaxy are described. These systems serve as examples of the heteroepitaxy of group-V elements with III-V compounds, i.e., between materials using different bonding and possessing different electronic properties. The quality of the films was determined using high-resolution four-circle x-ray diffraction, and comparisons were made between different structures. GaSb was found to grow (III) oriented on Sb (III) with an inverted stacking sequence. A simple epitaxial model is proposed to explain this.

Keywords: *Sputtering, Electric discharges, Direct current, Thin films, Silicon, Reprints, Deposition rates, Sputtered films.

A physical model for anode deposition rates in parallel-plate, dc-diode sputtering is presented and tested. The deposition rate has been measured as a function of the discharge voltage, the anode-cathode gap and the pressure, using silicon or molybdenum cathodes with argon. Deposition rates as high as 23 A/s were obtained using 3 kV, and it is shown that deposition efficiency is similar to that obtained with magnetrons. The deposition rate varies inversely with anode-cathode gap at constant pressure and voltage and almost linearly with power density for discharge voltages above a threshold which depends on the cathode material. These observations are explained by the model, which can be used to estimate the deposition rates for any cathode material and gas for which the ion sputtering yields are known. Potential advantages and complications of dc diode sputtering for thin film deposition are discussed, and optimum conditions for high, uniform deposition rates are described.

Surface Modification of YBa2Cu3O7-delta Thin Films Using the Scanning Tunneling Microscope: Five Methods.
Final rept.
R. E. Thomson, J. Moreland, and A. Roshko. 1994, 13p.
Pub. in Nanotechnology 5, p57-69 1994.

Keywords: *YBCO superconductors, *Superconducting films, High temperature superconductors, Scanning tunneling microscopy, Thin films, Reprints, *Yttrium barium cuprates, *Surface modification, Nanolithography.

We have investigated using the scanning tunneling microscope (STM) as a tool for surface modification of YBa2Cu3O(7-delta) (YBCO) thin films and have identified five distinct methods whereby the STM tip can modify the superconductor surface. (i) By lowering the tunneling resistance we make the tip scratch or 'mill' the sample surface mechanically. (ii) By increasing the bias voltage above about 4 V we can modify the surface by an apparent electron beam damaging process. (iii) By increasing the bias voltage above 10 V and raising the tunneling current, we can cause a more dramatic effect which is probably due to a thermal process. (iv) By operating the STM in a damp carbon dioxide atmosphere we can cause the STM tip to etch the surface electrochemically. (v) Finally, we have some preliminary data suggesting that the high field under an extremely sharp tip displaces the oxygen atoms in the YBCO lattice. Examples of each of these techniques are shown and discussed.

Keywords: *Diamonds, *Thin films, *Meetings, Vapor deposition, Electron emission, Cutting tools, Crystallization, Nucleation, Optics, Brazing, Wear, Composite materials, Models.

Interest in commercializing diamond technology and related materials technologies continues to grow. This can be attested to by the large number of abstracts received for this meeting, the Third International Conference on the Applications of Diamond Films and Related Materials. More than 300 abstracts were received. Cutting tools coated with CVD diamond are of immediate commercial interest. Other applications, such as diamond windows and diamond heat spreaders, are developing but at a slower pace. Interest in cubic boron nitride is receiving more attention because of its resistance to oxidation and because it can be used on tools to machine ferrous materials.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2915-2918 Jun 95.

Keywords: *Josephson junctions, *Electric potential, *Arrays, *Transition temperature, Comparative evaluations, High temperature, Bias, YBCO superconductors, Epitaxy, Heterojunction devices, Electric current, Resistance, Reprints, SNS junctions, Shapiro steps, Voltage-standard arrays.

The authors have explored two high-transition temperature Josephson junction technologies for application in voltage standard arrays: step-edge junctions made with TBa2Cu3O(7-delta) and Au normal-metal bridges, and stacked series arrays of Josephson junctions in selectively doped, epitaxially grown Bi2Sr2CaCu2O8 heterostructures. For both kinds of junctions, Shapiro steps induced by a microwave bias were characterized as a function of power. The authors compare the two technologies with respect to critical current and normal resistance uniformity, maximum achievable critical current, critical-current normal resistance product, and operating temperature.

Keywords: *Metrology, *Electron tunneling, *Capacitance, Capacitors, Electric bridges, Cryogenic equipment, Precision, Ratios, Electron spectroscopy, Superconductivity, Electrometers, Reprints, SET(Single electron tunneling).

A metrological application is reported of the single electron tunneling (SET) phenomena: a precise measurement of the ratio of two cryogenic capacitors. The measurement used a superconducting SET electrometer as the null detector for a capacitance bridge. A 3-ppm level of imprecision has been achieved in the measurement of the capacitance ratio from 100 to 1000 Hz. Further improvements can be made in the attempt to obtain an imprecision of 10(exp -8) at lower frequencies, sufficient for the metrological measurement of capacitance or the fine-structure constant using a SET pump.

Physical Basis for Half-Integral Shapiro Steps in a DC SQUID.
Final rept.
E. A. Early, A. F. Clark, and C. J. Lobb. 1995, 13p.
Pub. in Physica C, v245 p308-320 1995.

Keywords: *SQUID(Detectors), *Direct current, *Josephson junctions, Alternating current, Dynamic characteristics, Equations of motion, Projectory analysis, Energy storage, Potential, Reprints, DC SQUID, AC Josephson effect, Shapiro steps.

The dynamics of a DC SQUID is analogous to the classical dynamics of a particle subject to conservative,

damping, and driving forces in two dimensions. The equations of motion define a trajectory on a potential-energy surface derived from the conservative forces, the components of which correspond to different forms of stored energy in the SQUID. In the presence of a periodic driving force, half-integral Shapiro steps are possible when the trajectory follows a zig-zag path between minima of the potential surface. This description of the dynamics in terms of a potential surface provides an intuitive, physical basis for previous simulation results on half-integral Shapiro step in a DC SQUID.

Keywords: *Josephson junctions, *Molecular beam epitaxy, Phase locked systems, High temperature, Current density, Superconductors, Alternating current, Wafers, Layers, Reprints.

The authors report on the properties of stacked series arrays of trilayer Josephson junctions grown by atomic layer-by-layer molecular beam epitaxy. Trilayer Josephson junctions oriented so that the current travels in the c-axis direction have been described previously. Series arrays are made by placing more than one barrier layer in the Ba2Sr2CaCu2O8-based, (2212), epitaxial structure. Single molecular layers of 2212 doped with Dy to reduce the local carrier concentration are used as barriers, and are placed very close to each other, e.g., separated by only a few molecular layers of the superconducting phase. Phase locking of a.c. Josephson currents has been observed. The critical current density of such junctions has been observed to be very uniform on wafers that are free of second phase defects, and operation up to 60 K has been obtained.

Lattice Dynamics of Semiconducting, Metallic, and Superconducting Ba1-xKxBiO3 Studied by Inelastic Neutron Scattering.
Final rept.
M. A. Green, K. Prassides, D. A. Neumann, and P. Day. 1995, 6p.
Pub. in Chemistry of Materials, v7 p888-893 1995.

Keywords: *Crystal lattices, *Superconductors, *Semiconductors(Materials), *Neutron scattering, Chemical composition, Phase diagrams, Temperature, Energy levels, Phase transformations, Barium oxides, Potassium, Bismuth oxides, BCS theory, Reprints.

Inelastic neutron scattering has been used to study the lattice dynamics in Ba(1-x)KxBiO3 over a wide range of compositions, covering regions of the (composition (x), temperature (T)) phase diagram displaying semiconducting, metallic, and superconducting behavior. Modes are assigned using interatomic potentials calculations, which show good agreement with experiment. The oxygen phonon modes are very sensitive to changes in composition and oxidation state of the Bi ions. Phonon anomalies observed in both the oxygen TO bending (about 33 meV) and stretching (about 62 meV) modes as a function of temperature are discussed within the context of the BCS theory. Novel behavior is shown by the LO oxygen bending mode at about 42 meV that shows a strong dependence on composition, proposed to arise from the occurrence of structural phase transitions in this system.

The authors have investigated YBz2Cu3O7-delta superconductor- normal-superconductor Josephson junctions as mixers of 30THz radiation. The authors have directly observed (2nd order) differencefrequencies from 10 MHz to 12.8 GHz between two CO2 laser lines. Applying a third microwave signal to the junction, the authors have observed CO2 laser difference frequencies up to 27 GHz. The d.c. bias dependence of the difference frequency signal, as well as other evidence, suggests two distinct mixing mechanisms: hot-electron mixing in the junction banks at high d.c. biases, and bolometric Josephson mixing at low d.c. biases. The latter is the first observation of Josephson mixing at CO2 laser frequencies in high-T(sub C) junctions. The Josephson mixing has generated observable mixing products up to 6th order.

Effect of Stoichiometry on the Phases Present in Boron Nitride Thin Films.
Final rept.
L. B. Hackenberger, L. J. Pilione, R. Messier, and G. P. Lamaze. 1994, 7p.
Pub. in Jnl. of Vacuum Science and Technology A 12, n4 p1569-1575 Jul/Aug 94.

Keywords: *Boron nitrides, *Thin films, *Stoichiometry, Nondestructive tests, Neutron absorption, Chemical composition, Solids, Phase, Chemical analysis, Reprints, NDP(Neutron depth profiling).

Boron nitride thin films were deposited by ion-assisted evaporation and characterized by neutron depth profiling (NDP), a nondestructive method for the compositional analysis of solids. The phases present in the films were determined by infrared spectroscopy. Examination of the data presented here and comparison with the work of other authors revealed that stoichiometric or nearly stoichiometric films contained the greatest amount of the cubic phase. This led to the proposition that film stoichiometry is one of the factors that stabilize cubic boron nitride in boron nitride thin films. A shift in the position of the cubic boron nitride infrared absorption was also observed by the present authors which was related to film stoichiometry.

Oxygen Dependance of the Crystal Structure of HgBa2CuO4+ and Its Relation to Superconductivity.
Final rept.
Q. Huang, J. W. Lynn, Q. Xiong, and C. W. Chu. 1995, 9p.
Pub. in Physical Review B, v52 n1 p462-470 Jul 95.

Keywords: *Mercury oxides, *Crystal structure, *Superconductivity, Phase transformations, Mercury compounds, Oxygen, Barium, Copper, Lattice parameters, Doped crystals, Temperature, Reprints.

Powder neutron-diffraction profile refinement techniques have been used to investigate the oxygen dependence of the crystal structure and its effect on the superconducting phase transition in high-quality samples of the superconductor HgBa2CuO(4+delta) (0.04 less than or equal to delta less than or equal to 0.23). The sustem remains tetragonal (space group P4/mmm) over the full range of temperature (10-300 K) and oxygen concentration explored. The a-axis lattice parameter decreases smoothly with increasing delta, while the c-axis lattice parameter exhibits a maximum. The extra oxygen in the material is found to randomly occupy the centered O(3) site (1/2, 1/2, 0) in the Hg layer, and no other additional site for the extra oxygen was found in the structure. There is also no mixing of the cations on the Cu and Hg sites.

Keywords: *SQIDS(Detectors), *Radiation counters, *Phonons, Transitions, Edges, Tungsten, Thin films, Silicon, Substrates, Feedback, Temperature, Superconductors, Reprints.

The authors are developing and testing a new type of superconducting transition edge sensor for phonon mediated particle detection. This sensor consists of a superconducting tungsten thin film deposition on a silicon substrate. The temperature of the film is held constant within the superconducting transitions (T(sub c) = 70 mK) by a feedback process, with the substrate temperature well below the film temperature. Phonon energy deposited in the film is removed by a reduction in feedback Joule heating, which is measured using a series array of DC SQUIDs. The resulting signals show improvements in linearity and signal-to-noise ratio over the authors' previous transition edge sensors.

Simulation of C60 Through the Plastic Transition Temperatures.
Final rept.
S. D. Johnson, R. D. Mountain, and P. H. E. Meijer. 1995, 3p.
Pub. in Jnl. of Physical Chemistry, v103 n3 p1106-1108 Jul 95.

Keywords: *Carbon 60, *Transition temperature, *Plastic properties, Molecular interactions, Solid phase, Phase transformations, Solid phase, Phase transformations, Models, Simulation, Charge distribution, Crystal structure, Reprints, Fullerene, Molecular dynamics.

An interaction model is presented that accounts for the phase transitions in a crystalline C60 at 90 and 250

K. This was obtained by a molecular dynamics simulation of the C60 crystal. These transitions are used as indirect evidence of the appropriateness of the charge distribution. Additional support of the proposed charge distribution comes from the agreement of multiple energies with theoretical considerations.

Phase Locking in Two-Dimensional Arrays of Josephson Junctions: Effect of Critical-Current Nonuniformity.
Final rept.
R. L. Kautz. 1995, 5p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2702-2706 Jun 95.

Keywords: *Josephson junctions, *Microwave oscillators, *Phase locked systems, Arrays, Superconductivity, Numerical analysis, Simulation, Nonuniformity, Electric current, Reprints.

Numerical simulations are used to study mutual phase locking in two-dimensional arrays of Josephson junctions for parameters typical of successful millimeter-wave oscillators. Such arrays are shown to be very tolerant of random critical-current nonuniformities. However, comparison with an equivalent series array reveals that the locking between rows in a two-dimensonal array is principally due to feedback through the external load and not to internal coupling between rows.

Tensile Deformation-Induced Microstructures in Free-Standing Copper Thin Films.
Final rept.
R. R. Keller, J. M. Phelps, and D. T. Read. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v338 p227-232 1994.

Keywords: *Thin films, *Copper, *Microstructure, *Tensile deformation, Dislocations(Materials), Fractures(Materials), Reliability, Electron microscopy, Loads(Forces), Plastic deformation, Reprints, TEM(Transmission electron microscopy).

Existing work in the mechanical behavior of thin films focuses mainly on measurement of macroscopic properties without string correlation to microstructural features. The authors used transmission electron microscopy (TEM) to characterize the microstructures of free-standing copper thin films both before and after monotonic tensile deformation in an ex-situ thin film tensile testing system, as well as during in-situ loading in the TEM. The defect structures contributing to plastic deformation were investigated with an emphasis on comparison to mechanisms known to operate in bulk copper. The thin film exhibited much lower ductility (approximately 1%) than that normally observed in bulk form (greater than 40%). The predominant plastic deformation mechanisms did not include the typical dislocation activity that occurs in bulk copper, but rather greatly inhibited dislocation interactions typical of stages I and II hardening only.

Magnetostriction and Giant Magnetoresistance in Annealed NiFe/Ag Multilayers.
Final rept.
Y. K. Kim, and S. C. Sanders. 1995, 3p.
Pub. in Applied Physics Letters 66, n8 p1009-1011, 20 Feb 95.

Keywords: *Magnetostriction, *Magnetoresistivity, *Annealing, *Thin films, Temperature dependence, Nickel compounds, Iron compounds, Gold, Stress relieving, Sensors, Magnetic tape, Recording heads, Reprints, GMR, Multilayers.

Magnetostriction data are reported for NiFe/Ag multilayer thin films displaying giant magnetoresistance. Magnetostriction and magnetoresistance were measured as functions of annealing temperature for NiFe/Ag samples having different numbers of NiFe/Ag bilayers and Ag spacer thicknesses. They varied systematically with annealing temperature in a manner consistent with residual stress reduction and microstructural changes such as grain-boundary diffusion and grain growth. Zero magnetostriction concurrent with high magnetoresistance ratio (5%) and field sensitivity (7.5%(kA/m)(0.6%/Oe)) was observed for an optimal multilayer configuration and annealing temperature. This combination of zero magnetostriction and high magnetoresistive response makes the NiFe/Ag multilayer system an attractive candidate for high-performance magnetic recording read-head sensors.

Optically Stabilized Tunable Diode-Laser System for Saturation Spectroscopy.
Final rept.
M. Murtz, M. Schaefer, T. George, J. S. Wells, and W. Urban. 1995, 7p.
Pub. in Applied Physics B, v60 p31-37 1995.

Keywords: *Saturation spectroscopy, *Lead salt diode lasers, *Laser applications, Tunable lasers, Diodes, Lasers, Reprints, *Foreign technology, Optical Feedback.

We present an optically stabilized lead-salt diode-laser system which is the nucleus of a very-high resolution instrument for sub-Doppler molecular spectroscopy in the mid-infrared. By application of external optical feedback, we have narrowed the diode-laser linewidth by two orders of magnitude, yielding a spectral width of less than 200 kHz. The diode-laser frequency is stabilized and controlled via the external reflector by variable-frequency offset-locking the diode-laser to a CO laser frequency. This substantial improvement in the spectral properties enabled us to perform a Lamb-dip experiment on a carbonyl sulfide (OCS) absorption line near 1985 cm-1.

Pub. in Applied Physics Letters, v65 n24 p2123-2125 Dec 94.

Keywords: *Tunneling(Electronics), *Superconductors, *Refrigerators, Reprints, Junctions, Electro phonon coupling.

We present measurements on a novel electronic microrefrigerator that can cool conduction electrons significantly below the lattice temperature. A normal-insulator-superconductor tunnel junction is used to extract electrons from the normal metal electrode whose energy is higher than the Fermi energy. Electrons with an average energy equal to the Fermi energy are returned to the metal by a superconducting contact. Consequently, the high-energy thermal excitations are removed from the normal metal, thus cooling the electrons. For lattice temperatures higher than 100 mK the data can be explained by a simple theory incorporating the BCS density of states in the superconducting electrode and the coupling between electrons and phonons. At lower temperatures our measurement suggests that the electron energies in the normal electrode depart strongly from an equilibrium distribution.

Keywords: *Josephson junctions, *Integrated circuits, *Superconductors, *Fabrication, Low temperature, Very large scale integration, Thin films, Vapor deposition, Cyclotron resonance, Silicon dioxide, Experimental design, Statistical quality control, Reprints.

A superconducting integrated circuit fabrication process has been developed to encompass a wide range of applications such as Josephson voltage standards, VLSI scale array oscillators, SQUIDS, and kinetic-inductance-based devices. An optimal Josephson junction low temperature processing for all deposition and etching steps. This low temperature process involves an electron cyclotron resonance-based plasma-enhanced chemical vapor deposition of SiO2 films for interlayer dielectrics. Experimental design and statistical process control techniques have been used to ensure high quality oxide films. Oxide and niobiom etches include endpoint detection and controlled overetch of all films. An overview of the fabrication process is presented.

Keywords: *Surface roughness, *Films, *Silicon, Amorphous materials, Vapor deposition, Topology, Microscopy, Crystal growth, Voids, Substrates, Reprints, Hydrogenated amorphous silicon, Scanning tunneling microscopy.

A scanning tunneling microscope has been used to study the topology of the surface of device-quality, hydrogenated amorphous silicon deposited by rf discharge from silane or hot wire CVD. The substrates were oxide-free single-crystal silicon or GaAs. Films studied were either grown in the authors' laboratory and observed with no air exposure, or grown at other laboratories producing device-quality photovoltaic cells and viewed after air exposures of less than 30 minutes. Thin films (10 nm) representing early growth stages appear significantly smoother than the thicker films. The topology of thick films (greater than 50 nm) has large variations over individual samples. Overall surface roughness measured on sub-micron areas of the authors' films is very inhomogeneous.

Pub. in Applied Physics Letters, v66 n23 p3209-3211 Jun 95.

Keywords: *Josephson junctions, *Arrays, Magnetic fields, Stability, Numerical analysis, Oscillators, Reprints, *Phase locking.

The stability of the periodic solution of the two-cell ladder array has been numerically investigated in order to explore intrinsic phase-locking mechanisms relevant to arrays and stacked junction oscillators. In zero magnetic field the periodic in-phase solution of the system

is neutrally stable. However, this solution is stable over a finite voltage range when an applied control current exceeds a critical value. The dependence upon system parameters of the boundaries of the stable range and the critical control current is investigated. Finally, the influence of the control current on the microwave power in a typical range of stability is calculated.

Keywords: *Josephson junctions, *Critical current, *Temperature dependence, *Magnetic fields, Gold, Modulation, Electrical properties, Transport properties, Superconducting devices, YBCO superconductors, Reprints, Step-edge SNS YBCO/Au junctions.

The authors compare the electrical transport properties of superconductor-normal metal-superconductor SNS step-edge YBCO/Au junctions where the Au is deposited at 100 deg C and 600 deg C. For both types of junctions the authors observe Resistively Shunted Junctions (RSJ) current-voltage characteristics. The critical currents Ic in all cases are similar for a given YBCO thickness to step height ratio, while the normal resistance R(sub n) for the Au deposited at 600 C is consistently 25% lower. The normalized temperature dependence of the I(sub c)R(sub n) product is identical for all junctions with Au deposited at high temperatures and varies among junctions on a single chop for Au deposited at 100 deg C. Low magnetic field modulation of the critical current can show either the expected Fraunhoffer-like pattern or a double-junction modulation for both types of devices. The modulation period is consistently a factor of three lower for the high-temperature deposited Au.

Temperature and Field Dependence of Flux Pinning in NbTi with Aritificial Pinning Centers.
Final rept.
S. L. Wipf, and L. D. Cooley. 1994, 4p.
Pub. in Proceedings of the International Workshop on Critical Currents in Superconductors, Alpback, Austria, January 24-27, 1994, p613-616.

Keywords: *Flux pinning, *Superconducters, Reprints, Niobium titanium, Efficiency, Force, *Foreign technology.

An experimental study of artificial pinning centers in NbTi covered a large range of many parameters: size of pints from 65nm down to 7.7nm (Pins spaced at twice their size in hexagonal array), critical current densities at tempertures between 2K and Tc at fields up to Bc2. The objective of this paper is to understand mainly the field dependence of flux pinning in this material with a view to achieve optimal performance in a practical conductor. We conclude that in these samples the optimal pinning at 5T is between 14 and 28 nm pin size and that the pinning is within a factor of 4 plus or minus 1 of the ultimate possible.

Distribution of Dielectric Relaxation Times and the Moment Problem.
Final rept.
J. Baker-Jarvis, and M. D. Janezic. 1994, 2p.
Pub. in Proceedings of the Conference on Precision Electromagnetic Measurements (CPEM), Boulder, CO., June 27-July 1, 1994, p356-357.

Keywords: *Permittivity, Reprints, Maximum entry method, *Dielectric relaxation, *Moment problem.

A procedure for deconvolving time-dependent distribution functions from permittivity data is developed. The problem is reduced to solving an associated moment problem. This moment problem is then solved using a maximum-entropy procedure. A new algorithm for approximating the associated Lagrange multipliers in the distribution function is also outlined. The method is applied to permittivity modeling both for in-band and out-of-band regions. The numerical results indicate that the technique has potential for deconvolving the distribution function from the permittivity data.

Measured Stopping Powers of Hydrogen and Helium in Polystyrene Near Their Maximum Values.
Final rept.
L. Leblanc, G. G. Ross, and W. E. Wallace. 1995, 6p.
Pub. in Nuclear Instruments and Methods in Physics Research B, v95 p457-462 1995.

Keywords: *Energy losses, *Backscattering, *Stopping power, Reprints, Ion beams, Polymers, Hydrogen, Helium.

Rutherford backscattering at two different angles on multilayer targets is used to measure the stopping powers of hydrogen and helium ions in polystyrene in the energy range near their maximum values. In the energy range from 40 to 300 keV/amu, the hydrogen stopping power reaches a maximum value of 9.8 eV/10 to the 15th power atoms/cm. sq. at 81 keV/amu. As the energy increases from 25 to 90 keV/amu, the helium stopping power increases from 15.7 to 26.0 eV/(10 to the 15th power atoms/cm.sq.). Identical results (in keV/amu energy units) were obtained for 2H and 1H, as well as for 4He and 3He. The hydrogen and helium measured stopping power values are compared to the results calculated from two empirical models (Bragg's rule and the cores-and-bonds model). A function has been fit to the experimental data, including those previosly published, which permits rapid calculation of the stopping powers.

Spectroscopic Study of Quantized Breakdown Voltage States of the Quantum Hall Effect.
C. F. Lavine, M. E. Cage, and R. E. Elmquist. 1994, 8p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n6 p757-764 Nov/Dec 94.

Keywords: *Spectroscopic analysis, *Electric potential, *Electrical faults, *Hall effect, Quantum theory, Semiconductors(Materials), Electron gas, Spectra, Solid-state plasma, Energy losses, Dissipation factor, Histograms, Two dimensional, NIST(National Institute of Standards and Technology).

Quantized breakdown voltage states are observed in a second, wide, high-quality GaAs/AlGaAs sample made from another wafer, demonstrating that quantization of the longitudinal voltage drop along the sample is a general feature of the quantum Hall effect in the breakdown regime. The voltage states are interpreted in a simple energy conservation model as occuring when electrons are excited to higher Landau levels and then return to the original level. A spectroscopic study of these dissipative voltage states reveals how well they are quantized. The statistical variations of the quantized voltages increase linearly with quantum number.

Measurement of the Weak-Localization Complex Conductivity at 1 Ghz in Disordered Ag Wires.
Final rept.
J. B. Pieper, J. C. Price, and J. M. Martinis. 1992, 4p.
Pub. in Physical Review B, v45 n7 p3857-3860 Feb 92.

Keywords: *Magnetoconductance, Reprints, *Electron diffusion constant, *Weak localization.

The authors have measured the complex magnetoconductivity of disordered quasi-dimensional Ag wires at 1 GHz and at 200 Hz. Because 1 GHz is of the same order as the dephasing rate, the authors have been able to observe the frequency dependence

of weak localization. Both the real and imaginary parts of the conductivity at 1 GHz are in good agreement with theory. The data yield an accurate value for the electron diffusion constant, which is not well determined by dc measurements, and support the theory of weak localization at finite frequency.

Effect of Sm2BaCuO5 on the Properties of Sintered (Bulk) YBa2Cu3O6+x.
Final rept.
M. D. Hill, J. E. Blendell, C. K. Chiang, L. Chacon, J. F. Kelly, L. H. Bennett, and J. J. Ritter. 1995, 5p.
Pub. in Physica C, n251 p361-365, 7 Jul 95.

Keywords: *Critical current, *Superconductors, *Sintering, Transport properties, Current density, Superconductivity, Solid solutions, Microstructure, Samarium, Barium oxides, Copper oxides, Yttrium oxides, Reprints, *YBCO superconductors, High temperature superconductors, Weale-links.

The addition of Sm2BaCuO5 to YBa2Cu3O(6+x) has been shown to increase the transport critical current density. Because Sm2BaCuO5 and CuO do not coexist at equilibrium, additions of Sm2BaCuO5 to YBa2Cu3O(6+x) cause a reaction with the Cu rich liquid phase usually present during sintering. This forms crystalline phases that do not completely cover the grain boundaries. Sm was found to be homogeneously distributed in the YBa2Cu3O(6+x), matrix. Additions of 5 mole% Sm2BaCuO5 and sintering temperatures of 950 deg. C are effective in increasing the transport critical current density.

Building a Better Crycooler.
Final rept.
R. Radebaugh. 1992, 4p.
Pub. in Superconductor Industry, p22-25 Fall 92.

Keywords: *Cryogenics, Reprints, Electronics, Pulse tube, Refrigeration, Superconductors, *Cryocoolers, Brayton, Gifford-McMahon, Joule-Thomson, Stirling.

The lack of satisfactory cryocoolers designed specifically for superconducting electronics has hindered the marketability of superconducting devices. This article reviews the current status of the five most common cryocoolers: Joule-Thomson, Brayton, Stirling, Gifford-McMahon, and pulse tubes. Advantages and disadvantages of each type of commercially available cryocoolers are given. Most of these cryocoolers have been developed for the cooling of infrared sensors and can sometimes be adapted for use with superconducting electronics. Current areas of research are discussed and some projections for the future are given.

Mesoscopic Conductance Fluctuations in Large Devices.
Final rept.
C. A. Richter, D. G. Seiler, and J. C. Pellegrino. 1995, 4p.
Pub. in Workbook of the International Conference on the Physics of Semiconductors (22nd), Vancouver, British Columbia, Canada, August 15-19, 1994, v3 p1967-1970 1995.

Keywords: *Conductance, *Fluctuations, Reprints, *Mesoscopic.

An ac magnetic field modulation and lock-in amplifier technique was used to study 'universal' conductance fluctuations in GaAs/AlGaAs devices. The enhanced measurement sensitivity of this technique permits universal conductance fluctuations to be observed and studied in a new large-size-scale regime where devices have been considered macroscopic. It generally has been assumed that a finite temperature, coherent quantum interference effects could not be observed in devices of this large size.

Novel Method for Determining Thin Film Density by Energy-Dispersive X-ray Reflectivity.
Final rept.
W. E. Wallace, and W. L. Wu. 1995, 3p.
Pub. in Applied Physics Letters, v67 n9 p1203-1205 Aug 95.

Keywords: *Thin films, *X ray density measurement, Reflectance, X rays, Wavelengths, Alignment, Silicon dioxide, Single crystals, Reprints, Spin-on-glass, Polysilsesquioxane.

A technique utilizing the reflection of x-rays to determine material density at flat surfaces is described. The effects of sample misalignment limit the accuracy of x-ray reflectivity as typically practiced. These effects may be properly accounted for by measuring the critical angle for reflection at many different x-ray wavelengths simultaneously from which an extrapolation of the position of the critical angle at infinite wavelength may be made. This extrapolation has the effect of correcting for sample misalignment. Use of the technique is demonstrated for single-crystal silicon surfaces and for silica spin-on-glass thin films.

Characterization of Liquid-Phase Epitaxially Grown HgCdTe Films by Magnetoresistance Measurements.
Final rept.
J. S. Kim, D. G. Seiler, L. Colombo, and M. C. Chen. 1995, 6p.
Pub. in Jnl. of Electronic Materials, v24 n9 p1305-1310 1995.

Keywords: *Magnetoresistance, *Films, Epitaxy, Magnetic properties, Reprints, HgCdTe.

In this paper, we demonstrate that measurements of the magnetoresistance can be used as a valuable alternative to conventional characterization tools to study transport properties of advanced semiconducting materials, structures, or devices. We have measured magnetoresistance on two different systems, namely, three liquid-phase epitaxially grown HgCdTe Films and two GaAs-based high-electron-mobility-transistor (HEMT) structures. The results are analyzed by using a two-carrier model as a reference in the context of the reduced-conductivity-tensor scheme. The HEMT data are in quantitative agreement with the two-carrier model, but the HgCdTe data exhibit appreciable deviations from the model. The observed deviations strongly indicate a mobility spread and material complexity in the HgCdTe samples which are probably associated with inhomogeneities and the resulting anomalous electrical behavior.

See also PB95-168993.
Pub. in Applied Physics Letters, v66 n23 p3203-3205 Jun 95.

Keywords: *X-ray detectors, *Superconducting junctions, *Calorimeters, Electron temperature, Hot electrons, Metal films, Reprints, *Phonon detectors, *Microcalorimeters.

Measurements are presented on a novel microcalorimeter for the detectionof x-rays. This detector uses a normal metal film deposited on a thin membrane to absorb x-ray photons. The subsequent temperature rise of theelectrons is measured from the current-voltage characteristics of a normal-insulator-superconductor tunnel junction, where part of the absorber forms the normal electrode. A superconducting-quantum- interference-device is used as a low-noise high-bandwidth readout for the junction. We have measured an energy resolution of 22 eV full width at half-maximum and a time constant of 15micro s for a detector operating at 80 mK and having a 0.5 micrometer thick Au adsorber with an area of 100 x 100 micrometer square.

Distributed Feedback Lasers in Rare-Earth-Doped Phosphate Glass.
Final rept.
D. L. Veasey, K. J. Malone, J. A. Aust, N. A. Sanford, and A. Roshko. 1995, 3p.
Pub. in Proceedings of the European Conference on Integrated Optics, Delft, The Netherlands, April 3-6, 1995, p579-581.

Keywords: *Grating, *Lasers, *Glass, Phosphate glass, Waveguide, Reprints, *Foreign technology.

We have successfully demonstrated waveguide lasers operating at 1056.1, 1058.2, and 1062.6 nm in Nd-doped phosphate glass. The waveguides were fabricated by potassium ion exchange from a nitrate melt. Distributed feedback grating patterns were holographically written at 458 nm in photoresist spun on the sample surfaces. The gratings were developed, coated with chromium at a 60-degree evaporation angle, and were then transferred into the glass by argon ion sputtering. Typical laser threshold was 32 mW of absorbed pump power at 805 nm with a corresponding slope efficiency of 2%.

Anisotropy of Interfaces in an Ordered Alloy: A Multiple-Order-Parameter Model.
R. J. Braun, J. W. Cahn, G. B. McFadden, and A. A. Wheeler. Apr 95, 70p, NISTIR-5641.
Prepared in cooperation with Delaware Univ., Newark. Dept. of Mathematical Sciences. Sponsored by Southampton Univ. (England). Faculty of Mathematical Studies.

Keywords: *Face centered cubic lattices, *Alloys, Anisotropy, Lattice parameters, Crystal symmetry, Phase transformations, Binary systems(Materials).

The authors develop a diffuse-interface theory of ordering of a binary alloy on a face-centered-cubic (FCC) crystal lattice. A continuum, multiple-order-parameter theory is used that incorporates the underlying symmetries of the FCC crystal in both the bulk and gradient-energy terms of the free energy. With the theory the authors are able to compute interphase and antiphase boundaries for general orientations with respect to the fixed crystal axes. The authors are able to compute the structure of these interfaces, which compare very well with previous calculations by Kikuchi and Cahn using the cluster variation method. For the parameters the authors have studied, they find that the anisotropy of the surface free energy is not sufficiently strong to cause edges or corners in equilibrium shapes.

Pub. in Applied Physics Letters, v65 n26 p3395-3397 Dec 94.

Keywords: *Thin films, *X ray diffraction, *Lasers, Reprints, *Pulsed laser deposition, YBCO.

High quality films of YBa2Cu3O7-sigma on LaAlO3 have been grown by pulsed-laser deposition at oxygen pressures of 2.4-54 Pa (25-400 mTorr). X-ray diffraction reveals the coexistence of grains that align with the substrate axes (axial grains). The axial grains are tetragonal while the diagonal grains achieve lattice parameters close to bulk YBa2Cu3O7. The relative proportion of axial grains accounts for the measured variations of normal-state conductance and superconducting critical current density from film to film, based on a simple two-dimensional model of randomly positioned, insulating axial grains.

Accuracy of the Electron Pump.
Final rept.
H. D. Jensen, and J. M. Martinis. 1992, 21p.
See also PB95-168910 and PB95-175873.
Pub. in Physical Review B, v46 n20 p407-427 Nov 92.

Keywords: Metrology, Reprints, Tests, Accuracy, *Electron pumps, Single electron tunneling, Coulomb blockage, Cotunneling.

The authors calculate the accuracy of the single electron pump numerically and analytically. With a biasing of the device that the authors describe as optimal, the accuracy is computed with finite temperature cotunneling rates that systematically include all possible cotunneling processes. A simple graphical representation of the operation of the pump illustrates when cotunneling processes become active. The authors show that the accuracy is limited by cotunneling, thermal activation, and operating the device at too high a frequency; simple approximation formulas are given for these errors. Metrological accuracy is attainable for devices with five or more junctions and with parameters that are experimentally attainable.

Pub. in International Society for Optical Engineering, Los Angeles, CA., January 25-27, 1994, v2160 p208-218 Jul 94.

Keywords: *High temperature superconductors, *Superconductors, Reprints, *Phase locking, *SNS junctions.

The authors have investigated the interaction between high critical temperature (high-Tc) superconductor-normal metal-superconductor step-edge junctions coupled through a non-superconducting feedback loop. The authors have characterized the strength of the interaction as a function of frequency and temperature for both a circuit without a groundplane and an all high-Tc multilayer circuit incorporating a superconducting ground plane. The authors observed relative locking strengths (the ratio of the measured locking current IL to the junctions average critical current Ic) as large as IL/IC=9% and peak locking frequencies as high as 1.06 THz. The maximum temperature at which locking occurred was 35 K. An analysis of the temperature dependence of the locking current accounting for thermal fluctuations in the context of Johnson noise from resistive elements in the circuit agrees well with the authors' experimental observations.

Keywords: *Chromium, *Exchange coupling, *Magnetism, Reprints, Iron, Electron microscopy, Polarization, Microscopy, *Foreign technology.

Realizing the ultimate limits in fabrication requires the controlled placement of material at the single atomic layer limit. This precision is required for both semiconductor and magnetic devices, the two largest industries racing towards the Ultimate Limits in fabrication. In this report the authors summarize results on the effects of thickness fluctuations on the exchange coupling in Fe/Cr/Fe trilayer structures. This work demonstrates the importance of controlling thin film thickness at the single atomic layer level in magnetic systems.

An evening panel discussion on magnetic units, attended by 150 participants, was held at the 1994 Joint MMM-Intermag Conference in Albuquerque, New Mexico, USA. The season was organized by C.D. Graham, Jr., and moderated by R.B. Goldfarb. The panel members were asked to describe the use of magnetic units in the countries, and to make appropriate comments and recommendations. In addition to units, several panelists talked about distinction between magnetic induction B and magnetic field strength H, and the conversion of equations. After the panelists' opening statements, the floor was opened for questions and discussion from the audience. Below are the panelists' summaries of their remarks. By agreement with authors, this article is not subject to copyright.

Pub. in Applied Physics Letters, v66 n3 p373-375 Jan 95.

Keywords: *Magnetometers, Multilayers, Noise, Trilayers, Reprints, *Flux transformers, YBCO.

We have fabricated YB2Cu3O7-x-SrTiO3-YBa2Cu3O7-x (YBCO-STO-YBCO) trilayers, in which each layer is patterned photolithographically, capping the first YBCO film with an in situ STO film. Atomic force microscopy demonstrates that the capping process dramatically improves the quality of the surface of the second layer, allowing the growth of an upper YBCO film with a substantially reduced level of low-frequency flux noise. A magnetometer with a multiturn flux transformer coupled to a dc superconducting quantum interference device achieved a magnetic field noise of 74 fT Hz-1/2 at 1 Hz, improving to 31 fT Hz-1/2 at 1 kHz.

Pub. in Physica B Condensed Matter, v213-214 p72-74 1995.

Keywords: *Superconducting, Transverse, Longitudinal, Reprints, *Phonon dispersion.

The authors have measured two phonon-dispersion curves above 50 meV in a superconducting (Tc=33 K) single crystal of La1.8Sr0.15CuO4. In the normal phase (T=45 K), the authors show that the A1 mode compatible with the Raman A1g(425 cm-1) mode is weakly dispersive, falling from 53.7 meV at the zone center to about 51 meV at the zone boundary along the tetragonal (0.0) direction. For the A1 mode compatible with the infra-red A2u (480 cm to the minus one) mode, they observe a significant dispersion of the photonon energy which drops monotonically from 60 to 56 meV. The global features of these dispersion curves were similar to those previously reported in studies of both pure and 10% Sr doped La2CuO4. However significant differences in the shape of the dispersion of the highest A1 branch is shown, as well as a significant softening with increasing carrier concentration.

Electron-electron Interactions, Coupled-Plasmon-Phonon Modes, and Mobility in n-Type GaAs.
Final rept.
B. A. Sanborn. 1995, 9p.
Pub. in Physical Review B, v51 n20 p14 256-14 264 May 95.

Keywords: *Electron scattering, Mobility, Reprints, *Electron-electron interactions, GaAs, Coupled modes, Boltzmann equation, Dynamic screening.

The paper investigates the mobility of electrons scattering from the coupled system of electrons and longitudinal-optical (LO) phonons in n-type GaAs. The Boltzmann equation is solved exactly for low electric fields by an iterative method, including electron-electron and electron-LO-phonon self-energy is treated in the plasmon-pole approximation. Scattering from ionized impurities screened in static RPA is calculated with phase-shift cross sections and scattering from RPA screened deformation potential and piezoelectric acoustic phonons is included in the elastic approximation. The results show that dynamic screening and plasmon-phonon coupling significantly modify inelastic scattering at low temperatures and densities. The effect on mobility is obscured by ionized impurity scattering in conventionally doped material, but should be important in modulation doped structures. For uncompensated bulk n-type GaAs, the RPA phase-shift model for electron-impurity scattering gives lower drift mobilities than the standard Thomas-Fermi or Born calculations, which are high compared to experiment.

Evidence for Tunneling and Magnetic Scatttering at 'In situ' YBCO/Noble-Metal Interfaces.
Final rept.
S. C. Sanders, S. E. Russek, C. C. Clickner, and J. W. Ekin. 1995, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2404-2407 Jun 95.

Keywords: *Conductance, *Electrical transport, Contacts, Reprints, Tunneling, Interfaces, Noble metals, *YBCO superconductors.

We report low-temperature conductance data for in situ YBa2Cu3O7-sigma (YBCO)/Au, and YBCO/Pt planar c-axis interfaces. Analysis of the conductance data for these interfaces, which have resistivities as low as 1 x 10 to the minus 8th power omega-cm2, indicates that tunneling is the predominant transport mechanism. Zero-bias conductance peaks are present for all of the in situ interfaces. These peaks are analyzed in the framework of the Appelbaum model and are attributed to the presence of isolated magnetic spins at the interface. The presence and similarity of the peaks for each noble-metal overlayer supports the hypothesis that the magnetic spins are inherent to the YBCO surface.

Neutron-Powder-Diffraction Study of the Long-Range Order in the Octahedral Sublattice of LaD2.25.
Final rept.
T. J. Udovic, Q. Huang, J. J. Rush, J. Schefer, and I. S. Anderson. 1995, 11p.
Pub. in Physical Review B, v51 n18 p12 116-12 126 1995.

Keywords: *Crystal structure, *Lanthanum deuteride, Neutron diffraction, Reprints, Rare earths, Long range order.

Neutron-powder-diffraction patterns of the superstoichiometric rare-earth dideuteride LaD2.25 were measured between 15 and 400 K. Profile refinements indicated that, above approximately 345 K, the LaD2.25 structure is cubic (Fm3m) with deuterium fully occupying the tetrahedral (t) interstices of the fcc La lattice and the excess deuterium occupying a portion of the octahedral (o) interstices with full statistical disorder. As the temperature is decreased below approximately 345 K, the LaD2.25 structure undergoes a transformation to tetragonal symmetry concomitant with the onset of deuterium long-range order (I4/mmm) in the o sublattice. Fully developed long-range order is established near 230 K and ideally corresponds to the occare-earth-deuterium systems possessing similar D/Metal stoichiometric ratios. This ordering is accompanied by an outward expansion of the cubic ensemble of eight t-site deuterium atoms surrounding each o-site deuterium (Do) atom. Moreover, the c-directed La-Do bond distances are decreased by a displacement of the La atoms toward the Do atoms.

Keywords: *Superconductors, *Coils, Superconducting devices, Reprints, Fatigue degradation, NbTi, Residual resistivity, Stability strain, Quench energy.

In comparative measurements of small-scale epoxy-impregnated Cu-stabilized and Al/Cu-stabilized Nb-Ti test coils at 4 K and 5 T, the heat energy required to quench the Al/Cu-stabilized coil was 4 to 12 times greater than for the Cu-stabilized coil, depending on the relative operating current. Also, the coils' stabilizer resistivity (p) was measured as a function of mechanical fatigue to test for strain-induced degradation. The p of the Cu-stabilized coil is relatively unaffected by fatigue, while that of the Al/Cu-stabilized coil increases with fatigue. However, in these coils, having a typical stabilizer:superconductor ratio of 4:1, the degradation of the Al/Cu-stablized coil beings to saturate after several hundred fatigue cycles; after 2000 fatigue cycles to 0.2% strain, the p of the Al/Cu-stabilized coil is still 2.6 times lower than the p of the Cu-stabilized coil.

The drive for further miniaturization of electronic and magnetic devices continues to place increasing demands on the authors' abilities to fabricate very small structures and to understand and exploit the physical laws applicable in such devices. Optical lithographic techniques continue to be refined and limitations imposed by diffraction are driving the wavelength of the photons utilized toward the x-ray region. Still shorter wavelength particles, high energy electrons, are used for the highest resolution mask making. A logical extension of the progression would involve using atoms, because of their short de Broglie wavelength, as the pattern generating particle, either to expose a resist, or to deposit structures directly. The authors' are exploring how the techniques of atom optics, a field paralleling electron optics but utilizing neutral atoms instead of electrons, can be used to fabricate structures on the nanometer scale. This article is a brief summary of the authors' research on this topic. A more detailed treatment can be found elsewhere.

Keywords: *YBCO superconductors, *Electric contacts, Thin films, Silver, Magnetic scattering, Reprints, *Anneling.

The resistivity of YBCO/Ag interfaces has been measured for different oxygen annealing temperatures for a series of ex-situ fabricated thin-film contacts having sizes ranging from 16 micrometers x 16 micrometers down to 4 micrometers x 4 micrometers. The interface resistivity began to decrease after annealing at 300 deg C for 10 minutes in one atmosphere oxygen. After annealing at 400 deg C, the contact resistivity decreased by several orders of magnitude to the 10 to the minus 7 power Omega-(cm)squared range. The 500-nm thick Ag layer showed massive surface diffusion and agglomeration for annealing temperatures above -400 deg C; this temperature thus represents a practical limit for oxygen annealing the TBCO/Ag interface system for more than 10 minutes. Rapid cooling of the chip after annealing led to a severe loss of critical current density in the YBCO layer, which could be restored by reannealing and cooling at a slower rate of 50 deg C/min.

Ultrasonic-Resonance Spectroscopy of Bulk and Layered Solids.
Final rept.
C. Fortunko, H. Ledbetter, and P. Heyliger. 1995, 6p.
Pub. in International Symposium on Surface Waves in Solid and Layered Structures and National Conference on Acoustoelectronics, Moscow-St. Petersburg, May 17-23, 1994, p430-435 1995.

Keywords: *Resonat frequency, *Composites, Copper, Elastic constants, Layered solids, Thin films, Superconductors, Reprints, *Foreign technology, *Ultrasonic-resonance spectroscopy.

The authors used ultrasonic-resonance spectroscopy (URS) to determine the complete elastic-stiffness. The

authors show spectra for five materials: polycrystal and monocrystal copper, laminated composite B1/Al, a seven-layer structure aramid-epoxy/Al, a YBa2Cu3O7 superconductive film on a SrTiO3 substrate. Frequencies involved are 100 kHz - 5 MHz. Specimen sizes are approximately 1 cm. The URS approach offers the principal advantage of one measurement for a multicomponent tensor property: for orthotropic symmetry, nine independence components.

Domain Structures in Magnetoresistive Granular Metals.
Final rept.
A. Gavrin, M. H. Kelley, J. Q. Xiao, and C. L. Chien. 1995, 3p.
Pub. in Applied Physics Letters, v66 n13 p1683-1685 Mar 95.

Keywords: *Electron microscopy, *Magnetioresistance, Metal alloys, Cobalt, Reprints, *Granular materials, Polarizaton analysis, Annealing.

The author imagined the magnetic domain structure of several heterogeneous CovAg1-x alloys by using scanning electron microscopy with polarization analysis. These images show that extended domain structures exist in both the as-deposited samples and in samples annealed at moderate temperatures. This suggests that a significant fraction of the cobalt in these materials does not contribute to the giant magnetoresistance. Only those samples annealed at 600 deg C and containing less than 40% cobalt by volume show no domain structure.

Theory of the Magneto-Optic Kerr Effect in the Near Field.
Final rept.
V. A. Kosobukin. 1995, 7p.
Pub. in Proceedings of the International Society for Optical Engineering Near-Field Optics, San Diego, CA., July 9-10, 1995, v2535 p9-15.

Keywords: *Magneto-optical effects, Kerr effect, Near field, Reprints, Light scattering, Surface plasmons.

A theory is developed for the magneto-optic Kerr effect (MOKE) excited via an optical near field. The model under consideration includes a semi-infinite ferromagnet and a small non-magnetic metal particle which is located nearby and possesses a long-living surface plasmon. A multiple-scattering formulation of the problem is given. Considering the Rayleigh scattering of light and the magneto-optical light polarization conversion as elementary events, all the essential optical processes are classified, and those which contribute to the near-field excitation, is treated self-consistently to all orders in light-matter interaction, and the magneto-optical interaction is described in the first order approximation of perturbation theory. The scattered light field is discussed with special emphasis on the change of optical polarization due to MOKE.

Low Magnetostriction in Annealed NiFe/Ag Giant Magnetoresistive Multilayers.
Final rept.
Y. K. Kim, S. C. Sanders, and S. E. Russek. 1995, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics, v31 n6 p3964-3966 Nov 95.

Keywords: *Magnetoresistivity, *Annealing, *Thin films, Temperature dependence, Nickel compounds, Iron compounds, Silver, Sensors, Magnetic tape, Recording heads, Reprints, *Magnetorestriction, Multilayers.

Systematic changes were observed in magnetostriction and magnetoresistance ratio for NiFe/Ag multilayers as a function of annealing temperature. Optimal multilayer configurations (number of bilayers and Ag layer thickness) can be engineered to achieve zero magnetostriction concurrent with high magnetoresistance sensitivity. This feature makes the NiFe/Ag multilayers potentially useful for high-performance magnetic recording read-sensors.

Stagnant Film Model of the Effect of Natural Convection on the Dendrite Operating State.
Final rept.
R. F. Sekerka, S. R. Coriell, and G. B. McFadden. 1995, 7p.
Pub. in Jnl. of Crystal Growth, v154 p370-376 Apr 95.

Keywords: *Dendritic crystals, *Crystal growth, *Films, *Mathematical models, Convection, Heat transfer, Nusselt number, Fluid dynamics, Reprints.

We develop a simple model of the influence of natural convection on the selection of the operating state (dendrite tip velocity, V, and tip radius, rho) for dendritic growth of a pure material. We hypothesize that the important aspects if natural convection can be accounted for by considering the global convection that would occur in the vicinity of a sphere of radius R that characterizes the size of a dendritic array that is growing from a point source. We estimate the thickness, delta, of a stagnant boundary layer surrounding this sphere by matching the value of the Nusselt number obtained from the heat transfer literature. We solve the steady-state problem of a paraboloidal dendrite at temperature T(sub M) growing toward a confocal paraboloid at temperature T(sub infinity) located at a distance delta from the tip.

Magnetoresistance of Thin-Film NiFe Devices Exhibiting Single-Domain Behavior.
Final rept.
R. W. Cross, J. O. Oti, S. E. Russek, T. Silva, and Y. K. Kim. 1995, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics, v31 n6 p3358-3360 Nov 95.

Keywords: *Magnetoresistivity, *Thin films, Nickel compounds, Iron compounds, Magnetization, Hysteresis, Devices, Single domain, Reprints, Barkhausen.

Rectangular NiFe stripes as small as 1 x 5 microm were fabricated and characterized as a function of film thickness. Gold current leads were sputtered and patterned onto the stripes so that magnetoresistance measurements could be performed. A uniform in-plane magnetic field was applied transverse to the stripe length and at various angles from the perpendicular direction. For film thicknesses greater than 10 nm, the magnetoresistance for all of the devices had large jumps and hysteresis due to domain formation. As the thickness of the film decreased below 10 nm, the domain structure disappeared for stripe heights 2 microm or less. Theoretical calculations of the magnetization reversals were obtained using a numerical implementation of the Stoner-Wohlfarth model for the switching of a single-domain ellipsoidal particle.

See also PB93-153369.
Pub. in Cryogenics, v35 VAMAS Supplement, pS19-S23 1995.

Keywords: *Superconductors, *Critical current, Electrical measurement, Comparative evaluations, Reprints, *Foreign technology, Thermal contraction.

The critical current Ic of a superconductor is a quantitative evaluation of its current carrying capacity, and is defined as the current at which a specified electric field criterion Ec, or resistivity criterion Pc is achieved in the specimen. Typical electric field and resistivity criteria are 10 to the minus one microm and 10 to the minus 14th power omega m, respectively. The voltage-current (V-1) characteristic of the superconductor can be modelled by the empirical equation V = V0(III0) sup n where I0 is the observed current at voltage V0. The value of n can be thought of as a 'figure of merit' for the conductor, and reflects the abruptness of the transition from the superconducting to the normal state, with typical values ranging from 10 to 100.

The authors conducted an interlaboratory comparison of critical current (Ic) measurements on Bi2Sr2Ca2Cu3O10 tapes (2223). The study includes measurements from six participating US laboratories, with NIST as the central, organizing laboratory. A number of specimens were prepared with different degrees of instrumentation to isolate sources of variability. Most of the specimens were pre-measured by NIST to reduce uncertainties due to sample variability. Different specimen routing patterns among the laboratories were implemented to isolate sources of variability due to the specimen's measurement history.

Pub. in Cryogenics, v35 VAMAS Supplement, pS29-S32 1995.

Keywords: *Superconductors, Comparative evaluations, Contraction, Electrical measurement, Reprints, *Foreign technology, *Niobium stannoides, *Critical current.

It is typical for Nb3Sn-Cu superconductor specimens to be wound into coils on tubular measurement mandrels for critical current measurements. If the thermal contraction of the mandrel is different from that of the specimen, either tensile or compressive axial strain could develop upon cooling from room temperature to liquid helium temperature, thus affecting the measured critical current Ic1.2. The amount of strain depends on the magnitude of the differential contraction, the relative strength of the specimen and mandrel, and the mechanical coupling between the specimen and its mandrel.

Keywords: *Josephson junctions, *YBCO superconductors, Noise, Mixing circuits, Heterodyning, Reprints, SNS junctions, Terahertz, Mixer.

The authors have measured the noise of YBa2Cu3O7-delta superconductor- normal-superconductor (SNS) junctions whose high normal-state resistances and characteristic frequencies make them suitable for THz frequency mixers. By directly measuring the 1 GHz powerspectral density delivered to a low-noise 50 Ohms radiometer system, thenoise could be measured over a wide range of dc voltage and temperature,without complications due to 1/f noise, and without invoking any specific model. The effective noise temperature of the normal resistanceis approximately equal to the physical temperature at high temperatures,but approaches a limiting value at low temperatures, implying an excess current noise of unknown origin.

Keywords: *Superconductors, *Low temperature tests, *Interlaboratory comparisons, Temperature dependence, Liquid helium, Pressure, Cryostats, Reproducibility, Niobium stannides, Reprints, Critical current, Mandrel.

The critical current (Ic) of a NbTi or Nb3Sn superconductor specimen depends on its temperature. The pressure, and thus the liquid helium temperature, may vary between laboratories due to different altitudes and different cryostats used for the Ic measurement. Thus, it is necessary to study the temperature dependence of the specimen's critical current. This paper presents measurements of Ic as a function of temperature for tests carried out at the Technical University of Vienna (TUW) and the National Institute of Standards and Technology (NIST).

Pub. in Proceedings of the International Workshop on the Measurement and Characterization of Ultra-Shallow Doping Profiles in Semiconductors (3rd), Research Triangle Park, NC., March 20-22, 1995, p9.1-9.8.

Keywords: *Microscopy, *Scanning, *Semiconductor devices, *Silicon, Dopes, Profiles, Experimental data, Models, Reprints, AFM(Atomic force microscope), SCM(Scanning capacitance microscope).

A scattering capacitance microscope (SCM) has been implemented by interfacing a commercial contact-mode atomic force microscope (AFM) with a high-sensitivity capacitance sensor. SCM has promise as a next-generation dopant-profiling technique because the measurement is inherently two dimensional, has a potential spatial resolution limited by tip diameter of at least 20 nm, and requires no current carrying metal-semiconductor contact. Different capacitance images have been made with the SCM of a variety of bulk-doped samples and in the vicinity of pn junctions and homojunctions. Also, a computer code has been written that can numerically solve Poisson's equation for a model SCM geometry by using the method of collocation of Gaussian points.

Effects of Substrate Surface Steps on the Microstructure of Epitaxial Ba2YCu3O7-x Thin Films on (001) LaAlO3.
Final rept.
P. C. McIntyre, M. J. Cima, and A. Roshko. 1995, 10p.
Pub. in Jnl. of Crystal Growth, v149 p64-73 1995.

Keywords: *Epitaxy, *YBCO superconductors, *Thin films, Critical temperature, High temperature, Substrates, Crystal growth, Morphology, Reprints.

The effect of steps in the (001) surface of LaAlO3 substrates on the microstructural evolution of heteroepitaxial Ba2YCu3O7(7-x) (BYC) thin films were characterized by high resolution transmission electron microscopy (TEM) and atomic force microscopy (AFM). Native substrate surface steps acted as nucleation sites for both the c-axis normal and c-axis in-plane (a-axis normal) orientations in BYC films prepared by post-deposition annealing of a precursor film. The density of c-axis in-plane BYC grains varied dramatically across the surface of the substrates. In several samples. The spatial pattern of c-axis in-plane regions present in the BYC films was similar to the twin structure present in the LaAlO3 substrates.

Pub. in Physical Review Letters, v75 n16 p2960-2963 Oct 95.

Keywords: *Tunneling spectroscopy, *Surface states, Band structure, Reprints, Bcc (001) surfaces, Cr, Fe.

The authors have discovered an intense, sharp feature in tunneling spectra of the Fe(001) and Cr(001) surfaces that derives from a bcc surface state near the Fermi level. Band-structure calculations show that this state is a general feature of bcc(001) surfaces, and that it originates from a nearly unperturbed d orbital extending out into the vacuum region. This general feature should permit chemical identification with atomic spatial resolution on bcc(001) surfaces. The surface state is in the minority spin band for Fe and Cr, so it should be useful for future spin-polarized tunneling experiments.

Keywords: *Semiconductors, *Metrology, *Circuit technology, Analytical technology, Characterization, Microelectronics, Process development, Reprints.

Semiconductor characterization is an indispensable enabler of all modern microelectronics and optoelectronic circuit, and is in the critical path for maintaining the steady decline in cost-per-function of silicon integrated circuit technology. It is also driving new developments in compound semiconductor materials and devices (III-V and II-VI). In this overview, we present a perspective on measurement technology relative to business and economic challenges of the semiconductor industry, and illustrate the key role metrology plays in modern process development and manufacturing. We also describe how new characterization techniques evolve for semiconductor applications.

Final rept.
J. H. Burnett, P. M. Amirtharaj, H. M. Cheong, B. Elman, W. Paul, and E. S. Koteles. 1996, 5p.
Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p634-638 1996.

Keywords: *Spectroscopy, Reprints, GaAs, Heterostructure, Pressure, Stress, *Quantum-well, HgCdTe, Photoluminescence, Uniaxial pressure.

We discuss the use of externally applied pressure for determining the origin of the peaks in absorption spectra (and related spectra) of semiconductor heterostructures. This technique depends on the different effective mass dependences of the various types of heterostructure energy levels involved in absorption transitions, such as electron, heavy-hole, light-hole, exciton, and defect levels, and the dissimilar pressure dependences of the various masses. Measurements of the hydrostatic or uniaxial pressure dependences of the spectral peaks thus distinguish peaks associated with these different types of energy levels. The approach is demonstrated for GaAs/AlGaAs quantum wells and HgTe/HgCdTe superlattices using hydrostatic pressure. We also briefly discuss the use of externally applied uniaxial pressure for distinguishing heavy- and light-hole-related peaks, and using the heavy-hole/light-hole splitting for determining quantitatively the amount of built-in uniaxial strain in the heterostructure layers.

Keywords: *Exchange coupling, *Magnetic multilayers, Reprints, *Scanning electron microscopy, Reflection high energy diffraction, Scanning tunneling microscopy.

In the late 1980's, a number of exciting yet puzzling observations resulted from experiments investigating the coupling between two ferromagnetic layers separated by a nonferromagnetic spacer layer. A pioneering experiment by Grunberg et al. showed that Fe layers separated by a thin Cr spacer aligned with antiparallel magnetization, but with Au as the spacer layer, a parallel alignment occured. The long-range magnetic dipole from each layer would tend to explain antiparallel alignment; small pinholes in the spacer layer would produce parallel alignment. Alternatively, the layers might be coupled through the spacer-layer conduction electrons by the Ruderman-Kittel-Kasuya-Yosida (RKKY) effects. This was expected to produce an oscillation in coupling as the spacer thickness increased, that is an oscillation between parallel and antiparallel alignment. Oscillatory coupling was first observed by Parkin et al. Researchers had also found that, at spacer thickness where antiparallel alignment occured, the Fe/Cr/Fe system can exhibit a giant magnetoresistance (GMR) effect, that is, an anomalously large change in resistance when a magnetic field is applied. The potential technological importance of the GMR effect to magnetic sensing and magnetic information storage added further impetus to the already rapidly growing area of research in magnetic multilayers.

Pub. in Proceedings of the International Workshop on Semiconductor Characterization: Present Status and Future Needs, Gaithersburg, MD., January 30-February 2, 1995, p308-312 1996.

Keywords: *Microscopy, *Scanning, *Seniconductor devices, *Silicon, Dopes, Profiles, Experimental data, Models, Reprints, AFM(Atomic force microscope), SCM(Scanning capacitance microscope).

A scanning capacitance microscope (SCM) for the two-dimensional profiling of dopants in silicon has been implemented by interfacing a commercial atomic force microscope (AFM) with a high densitivity capacitance sensor. The AFM is used to control the position of a conducting tip and measure surface topography, while other electonics are used to control and record a simultaneous measurement of the capacitance-voltage (C-V) response between the tip and a semiconductor. The operation of the SCM has been quantified by acquiring differential capacitance images of a variety of lateral pn-junctions and uniformly doped silicon samples. The shape of the C-V response between the AFM tip and oxidized silicon has been measured. Also, a computer code has been written to solve poisson's equation for the SCM geometry in three dimensions by using the method of collocation of Gaussian points. The purpose of the SCM modeling is to extract the dopant profile from the SCM measurement.

Reference Relations for the Evaluation of the Materials Properties of Orthorhombic YBa2Cu3Ox Superconductors.
Final rept.
R. G. Munro, and H. Chen. 1996, 6p.
Pub. in Jnl. of the American Ceramic Society, v79 n3 p603-608 1996.

Keywords: *Ceramics, *Superonductors, Reprints, Critical temperature, Lattice parameters.

Several expressions, suitable as reference relations, pertaining to the composition and temperature dependencies of the properties of orthorhombic YBA2Cu3Ox superconductors have been derived from statistical assessments of collections of data from independent experimental studies. Relations are given for (1) the critical temperature vs oxygen contents, (2) the lattice parameters at room temperature vs oxygen content, (3) the lattice parameters at fixed oxygen content vs temperature, (4) the anisotropic thermal expansion vs temperature, (5) the isotropic polycrystalline thermal expansion vs temperature, and (6) the mass density vs temperature.

Characterization of the Structure of LaD2.50 by Neutron Powder Diffraction.
Final rept.
T. J. Udovic, Q. Huang, and J. J. Rush. 1996, 9p.
Pub. in Jnl. of Solid State Chemistry, Article No. 0096, v122 p151-159 1996.

Keywords: *Neutron diffraction, Reprints, *Lanthanum deuteride, Long range order, Metal hydride, Phase transition.

Neutron powder diffraction (NPD) measurements of the rare-earth deuteride LaD2.50 were undertaken between 10 and 430 K. Rietveld refinements indicated that, above approximately 385 K, the LaD2.50 structure is cubic (Fm3m) with deuterium fully occupying the terrahedral (t) interstices of the fcc La lattice and the excess deuterium occupying a portion of the octahedral (o) interstices with full statistical disorder. As the temperature is decreased below approximately 385 K, the LaD2.50 structure undergoes a tetragonal distortion concomitant with the onset of deuterium long-range order (I41amd) in the o sublattice, similar to previous structural results for the light-rare-earth deuterides RD2+x for 0.3 less than x less than 0.5. Fully developed long-range order is established in the vicinity of 200 to 230 K.

Texture Measurement of Sintered Alumina Using the March-Dollase Function.
Final rept.
J. P. Cline, M. D. Vaudin, J. E. Blendell, K. J. Bowman, N. Medendorp, C. A. Handwerker, and R. Jiggets. 1994, 6p.
Pub. in Advances in X-ray Analysis, v37 p473-478 1994.

Keywords: *Alumina, Texture, Reprints, *March-Dollase, *Pole figures, Rietveld refinement, X ray diffraction.

The Rietveld method entails the calculation of a powder diffraction pattern from crystallographic, microstructural and equipment characteristics. These characteristics are related to the form of the pattern through a series of model functions. The difference between an observed and calculated pattern is then minimized by sequentially refining the physical parameters contained within the model functions to obtain an accurate and precise desceiption of the specimen. A powder diffraction pattern from a specimen exhibiting crystallographic texture, or preferred orientation, will display intensity values which differ systematically from those calculated for a specimen of random orientation. This systematic discrepancy can be addressed by incorporating into the Rietveld refinement a model function for sample texture. A successful model for texture will accurately assess the phase abundance and degree of texture from both oriented and randomized specimens. In this study the authors use the March-Dollase model function to characterize texture development in sintered alumina with respect to processing variables and sintering time.

Dielectric Behavior of a Polycarbonate/Polyester Mixture Upon Transesterification.
Final rept.
B. J. Factor, F. I. Mopsik, and C. C. Han. 1996, 3p.
Pub. in Macromolecules, v29 n6 p2318-2320 1996.

Keywords: *Dielectric spectroscopy, Polycarbonates, Polyesters, Reprints, *Transesterfication.

Dielectric relaxation spectroscopy provides a sensitive measure of the local environment surrounding molecular dipoles. In the examination of polymers, it is customary to record the complex dielectric constant e(star)(v)=e'(v)+ie'(v) as a function of frequency v. The form of the spectra can often be related to aspects of specimen structure. For example, the distribution of local environments that arise due to concentration fluctuations in polymer blends and diblock copolymers has been characterized using this technique. Further information concerning the dipolar magnitude as well as local geometric constraints can also be obtained through accurate measurement of the dielectric dispersion magnitude.

Workshop on Characterizing Diamond Films (4th). Held in Gaithersburg, Maryland on March 4-5, 1996.
A. Feldman, A. P. Malshe, and J. E. Graebner. Apr 96, 33p, NISTIR-5837.
See also report on 3rd Workshop, PB94-187663. Prepared in cooperation with Arkansas Univ., Little Rock.

Keywords: *Diamonds, *Films, *Meetings, Cutting tools, Adhesion, Chemical vapor deposition, Interlaboratory comparisons, Thermal conductivity, Thermal diffusivity, Tungsten carbides, Round robin tests.

The fourth in a series of workshops was held at NIST on March 4th and 5th, 1996 to discuss the characterization of diamond films and the need for standards in diamond technology. The audience targeted for this workshop were the producers and potential users of chemical vapor deposited (CVD) diamond technology in the United States. Two technical topics that have relevance to applications of CVD diamond were discussed; adhesion of CVD diamond to cutting tool materials and standardization of thermal conductivity measurement for heat spreading applications. A new round-robin of thermal conductivity measurements was planned which will utilize specimens having significantly better homogeneity than those used in a previous round robin.

Epitaxial Nucleation and Growth of Chemically Derived Ba2YCu3O7-x Thin Films on (001) SrTiO3.
Final rept.
P. C. McIntyre, M. J. Cima, and A. Roshko. 1995, 11p.
Pub. in Jnl. of Applied Physics, v77 n10 p5263-5272 May 95.

Keywords: *Epitaxy, *Nucleation, *Thin films, *YBCO superconductors, Growth, Organometallic compounds, Kinetics, Phase transformations, X rays, Microstructure, Barium oxides, Copper oxides, Yttrium oxides, Reprints.

The nucleation and growth kinetics of epitaxial Ba2YCu3O(7-x) thin films prepared on (001) SrTiO3 by postdeposition annealing of a chemically derived intermediate layer were investigated in specimens quenched from the growth anneal. The films were produced by spin-on deposition of a metal-organic precursor solution at room temperature and ambient pressure, and subsequent postdeposition annealing to form Ba2Ycu3O(7-x) (BYC). Integrated x-ray intensities of reflections from the majority, c-axis-normal epitaxial BYC in the films were analyzed as a function of time at annealing temperature. The linear transformation kinetics suggest the growth process is controlled by molecular processes at the BY/intermediate interface, and is not rate limited by diffusion.

Notion of a xi-Vector and a Stress Tensor for a General Class of Anisotropic Diffuse Interface Models.
A. A. Wheeler, and G. B. McFadden. Apr 96, 29p, NISTIR-5848.
Prepared in cooperation with Southampton Univ. (England). Faculty of Mathematical Studies.

Keywords: *Surface diffusion, *Anistropy, *Interfaces, *Stress tensors, Binary systems(Materials), Phase transitions, Vector analysis, Surface energy, Three dimensional, Phase field models, Gibbs-Thomson equation, Xi vectors.

The authors consider a general class of multiple-order-parameter models which represent the diffuse interface of a first-order phase transition with anisotropic surface energy and kinetics. They show that in the sharp interface limit, it is possible to construct a xi-vector and they derive the three-dimensional form of the Gibbs-Thomson equation. Moreover they develop the notion of a stress tensor for diffuse interface theories and show that it may be used to derive the equilibrium conditions for edges in interfaces as well as multiple functions. The authors also show that when edges form in the special case of a phase-field model, a weak shock forms in which the spatial derivatives of the phase field are not continuous, and they derive the jump conditions.

High-Tc Multilayer Step-Edge Josephson Junctions and SQUIDs.
Final rept.
N. Missert, T. E. Harvey, R. H. Ono, and C. D. Reintsema. 1993, 3p.
Pub. in Applied Physics Letters, v63 n12 p1690-1692 Sep 93.

Keywords: *Josephson junctions, *Yttrium barium copper oxides, *High temperature superconductors, Fabrication, Thin films, Strontium titanates, Neodymium oxides, Gadolinium oxides, Silver, Reprints, Superconducting Quantum Interference Devices, SQUIDS(Superconducting Quantum Interference Devices), Yttrium barium cuprates, SNS junctions.

The authors have developed a reliable process to fabricate high-quality YBa2Cu3O(7-x) (YBCO) superconductor normal metal-superconductor (SNS) step-edge junctions and SQUIDs over YBCO ground planes. These multilevel circuits employ thin films of SrTiO3 and NdGaO3 as the insulating layer between the active device and the ground plane and use Ag as the normal metal in the Josephson junction. The reproducibility and uniformity of the junctions are better than our single-level devices grown directly on step edges cut into single-crystal substrates. Here the critical current variation among junctions on a single wafer is less than a factor of 2. Junctions grown on thin-film step edges of SrTiO3 have critical currents near 2 MA at 4K, while those grown on NdGaO3 step edges have critical currents near 0.5 mA at 4 K.

The progress report, in addition to describing recent work in the authors' laboratory, highlights the general character and importance of electron collisions with highly-charged ions (HCI) and describes major advances in the field since the previous conference on the subject. Thus, while the authors' principle efforts are currently directed toward investigation of excitation of HCI, there have been very notable advances by others in the areas of ionization and recombination and an attempt is made to put these into context of the field in general. Also, for the first time, significant progress is now being made by others in experimental investigation of elastic scattering electrons from HCI.

Hot-Electron Microcalorimeter for X-ray Detection Using a Superconducting Transition Edge Sensor with Electrothermal Feedback.
Final rept.
K. D. Irwin, G. C. Hilton, J. M. Martinis, and B. Cabrera. 1996, 3p.
Pub. in Nuclear Instruments and Methods in Physics Research A, v370 p177-179 Apr 96.

Keywords: *X-ray detectors, *Superconductivity junctions, *Calorimeters, Electron temperature, Metal films, Hot electrons, Reprints, *Phonon detectors, *Micro calorimeters.

The authors investigate a hot-electron microcalorimeter for X-ray detection. The X-ray absorber consists of a normal metal film in thermal and electrical contact with a superconducting transition-edge sensor. The sensor is formed by a proximity-effect bilayer of aluminum and silver, with a sharp superconducting transition near 100 mK. Energy from X-rays absorbed in the normal film is removed by a reduction of the Joule heating in the proximity bilayer due to electrothermal feedback and measured using a SQUID. The feedback mode of operation allows the measurement of incident energy with no free parameters and should lead to improvement in detector resolution over existing hot-electron microcalorimeters.

Magnetic Flux Pinning in Epitaxial YBa2Cu3O7-delta Thin Films.
Final rept.
A. Roshko, L. F. Goodrich, D. A. Rudman, R. Moerman, and L. R. Vale. 1995, 4p.
Pub. in Jnl. of Electronic Materials, v24 n12 p1919-1922 1995.

Keywords: *Flux pinning, *Thin films, Morphology, Dislocations, Microstructures, Reprints, Scanning tunneling microscopy, Nucleation mechanism.

The influence of microstructure on the critical current density of laser ablated YBa2Cu3O7 thin films has been examined. Scanning tunneling microscopy was used to examine the morphologies of YBa2Cu3O7 films and the morphology data were then correlated with measurements of the critical current density. The films were found to grow by an island nucleation and growth mechanism. The critical current densities of the films are similar to those of films with screw dislocation growth, indicating that screw dislocation growth is not necessary for good pinning. The data suggest that the critical current density in applied magnetic field may be higher in films with higher densities of growth features.

Time-Resolved Measurements of the Polarization State of Four-Wave Mixing Signals from GaAs Multiple Quantum Wells.
Final rept.
A. E. Paul, J. A. Bolger, A. L. Smirl, and J. G. Pellegrino. 1996, 10p.
Pub. in Jnl. of the Optical Society of America B, v13 n5 p1016-1025 May 96.

Keywords: *Gallium arsenides, *Aluminum gallium arsenides, *Quantum wells, *Polarization, Optical properties, Excitons, Reprints, Four wave mixing.

The complete polarization state of the degenerate four-wave mixing signal from a GaAs/Al2Ga1-xAs multiple quantum well is determined by time resolution of all four of its Stokes parameters as a function of the relative angle between the two linear input polarizations. The degree of ellipticity and the orientation of the polarization ellipse are both observed to vary dramatically in time, and the temporal evolution is found to be consistent with previous measurements of the time-integrated Stokes parameters and to provide new constraints for physical models. The results are shown to be qualitatively consistent with a phenomenological model requiring the inclusion of both many-body interactions and biexcitonic effects.

CRYSTMET is a computer-readable database of critically evaluated crystallographic data for metals (including alloys, intermerallics and minerals) accompanied by pertinent chemical, physical and bibliographic information. It currently contains about 60,000 entries and covers the literature exhaustively from 1913. Scientific editing of the abstracted entries, consisting of numerous automated entries, consisting of numerous automated and manual checks, is done to ensure consistency with related, previously published studies, to assign structure types where necessary and to help guarantee the accuracy of the data and related information. Analyses of the entries and their distribution across key journals as a function of time show interesting trends in the complexity of the compounds studied as well as in the elements they contain. Two applications of CRYSTMET are the identification of unknowns and the prediction of properties of materials. CRYSTMET is available either online or via license of a private copy from the Canadian Scientific Numeric Database Service (CAN/SND). The indexed online search and analysis system is easy and economical to use yet fast and powerful. Development of a new system is under way combining the capabilities of ORACLE with the flexibility of a modern interface based on the Netscape browsing tool.

The NIST Crystal and Electron Diffraction Data Center builds a comprehensive database with evaluated chemical, physical, and crystallographic information on all types of well-characterized substances. The data are evaluated and standardized by specially designed computer programs as well as by experts in the field. From its master database, the Data Center produces NIST Crystal Data and an Electron Diffraction Database with over 220,000 and 81,000 entries, respectively. These distribution databases are made available to the scientific community via CD-ROM, scientific community via CD-ROM, scientific instruments and online systems. In addition, the Data Center has developed theory and software that can be used for establishing all types of lattice relationships, for the determination of symmetry, for the identification of unknowns using lattice matching techniques, and for data evaluation.

Backscattered electron Kikuchi patterns (BEKP) suitable for crystallographic phase analysis can be collected in the scanning electron microscope (SEM) with a newly developed charge coupled device (CCD) based detector. Crystallographic phase identification using BEKP in the SEM is unique in that it permits high magnification images and BEKP's to be collected from a bulk specimen. The combination of scanning electron microscope (SEM) imaging, BEKP, and energy dispersive x-ray spectrometry holds the promise of a powerful new tool for materials science.

The Crystallographic Information File (CIF) uses the self-defining STAR file structure. This requires the creation of a dictionary of data names and definitions. A basic dictionary of terms needed to describe the crystal structures of small molecules was approved in 1991 and is currently used for the submission of papers to Acta Crystallographica C. A number of extensions to this dictionary are in preparation. By storing the dictionary itself as a STAR file, the definitions and relationships in the CIF dictionary become computer interpretable. This offers many possibilities for the automatic handling of crystallographic information.

Keywords: *Crystallography, *Journals, Quality control, Publications, Crystal structure, Error analysis.

Quality control of the papers in its journals is a major concern of the International Union of Crystallography. Recent technology development, not least the emergence of a standard data interchange file format, have facilitated the checking of numerical data in a paper, and its error-free transference to the printed page. Consequently, database holdings derived from IUCr journals will be of greater accuracy. Other publishers of crystallographic data may benefit from these innovations.

Keywords: *Crystallography, *Information systems, *Data validation, *Inorganic compounds, Crystal structure, Publications, Bibliometrics.

In the following paper the input procedures for the Inorganic Crystal Structure Database (ICSD) will be outlined. The input flow of the data is explained. Since the data have been excerpted from journal articles a bibliometric analysis of the relevant literature is presented. The types of data and the form in which they are recorded are discussed. Finally, illustrations are given of the importance of data checking and the data checking procedures are described in detail.

Some characteristics of the World Wide Web (WWW) and its Virtual Library (W3VL) are described. Aspects of the setting up, maintenance, future development and objectives of the World Wide Web Virtual Library: Crystallography are detailed. An overview of the successful use of WWW in the organization of two crystallographic conferences and one entirely electronic conference is given. A revolution in scientific publication is under way with the introduction of WWW and CD-ROM technologies and a few of the points important to crystallography are touched upon. An application to distance teaching in crystallography is described. There is no mention of WWW applications to crystallographic databases in this paper as others at the Workshop have adequately described their work.

The ongoing computer revolution is causing changes in all crystallographic data activities and is blurring distinctions between what have traditional been independent efforts. As computer technology removes barriers in data storage, retrieval, and networking, unprecedented opportunities arise to achive the dream of all crystallographers: easy access to all crystallographic data. One topic stressed was the importance of quality throughout all stages of the data flow including collection, publication, and incorportaion into a database. A second major focus was software tools. Many u ers emphasized that use and accepatance of crystallographic databases by the general scientific community is directly related to the availability and quality of the search tools. A third theme was related to access and availability of all the information. Among the questions raised were: how data will be made available to the user community, and 'Who will be the power brokers in the future technologies. Issues such as these demonstrate the need among the representatives of the various data activities for future meetings to foster a continuing dialog. In addition, many attendees emphasized the need for much greater cooperation among the data centers, among the journals and the date centers, and among users and the data centers.

Neutron Scattering Study of Antiferromagnetic Order in the Magnetic Superconductors RNi2B2C.
Final rept.
J. W. Lynn, O. Huang, S. K. Sinha, R. Nagarajan, C. Godart, Z. Hossain, and L. C. Gupta. 1996, 3p.
Pub. in Physica B, v223 and 224 p66-68 1996.

Keywords: *Superconductors, *Neutron scattering, *Magnetic order, Reprints.

Neutron diffraction has been used to investigate the magnetic order and crystallography of RNi2B2C. For R = Dy the magnetic order that develops at 10 K consists of ferromagnetic sheets of spins in the tetragonal a-b plane which are stacked antiferromagnetically along the c-axis. An identical magnetic order is observed for R = Ho at low T, while from approximately 5 K to T(N) approximately equal to 8 K each layer along the c-axis is rotated by 163 degrees to form a spiral state, which strongly couples the magnetic order to the superconductivity. Small a-axis peaks are also observed in a narrow temperature range, but the c-axis-peaks are dominant. In ErNi2B2C(Tc = 11 K) an antiferromagnetic a-axis spin density wave stage develops below T(N) = 6.8 K, which readily coexists with the superconductivity indicating that weak coupling occurs between this type of magnetic state and the superconducting state. There is no evidence of magnetic order for either R = Ce or R = Y.

Results of Capacitance Ratio Measurements for the Single Electron Pump-Capacitor Charging Experiment.
Final rept.
N. M. Zimmerman, A. F. Clark, and E. R. Williams. 1996, 2p.
See also PB96-102157.
Pub. in Conference on Precision Electromagnetic Measurements, Braunschweig, Germany, June 17-20, 1996, p505-506.

Keywords: *Metrology, *Electron tunneling, *Capacitance, Electric bridges, Precision, Ratios, Capacitors, Reprints, *Foreign technology, SET(Single electron tunneling).

The authors report on a metrological application of the single electron tunneling (SET) phenomena: a precise measurement of the ratio of two cryogenic capacitors. The measurement used a superconducting SET electrometer as the null detector for a capacitance bridge. They have achieved a 3-ppm level of imprecision in the measurement of capacitance ratio from 100 to 1000 Hz. They used custom-made cryogenic vacuum-gap capacitors, which have a leakage resistance of no less than 10(19) omega. Further improvements can be made in the attempt to obtain an imprecision of 10(-8) at lower frequencies, sufficient for the metrological measurement of capacitance or the fine-structure constant using an SET pump.

Majority and Minority Electron and Hole Mobilities in Heavily Doped Gallium Aluminum Arsenide.
Final rept.
H. S. Bennett. 1996, 10p.
See also PB91-236968.
Pub. in Jnl. of Applied Physics, v80 n7 p3844-3853 Oct 96.

Keywords: *Gallium arsenides, *Electron mobility, *Hole mobility, Minority carriers, Semiconductor doping, Doped materials, Reprints.

The majority electron and minority hole mobilities were calculated in Gal-yAlyAs for donor densities between 10 to the 16th power and 10 to the 19th power to the minus 3 power. Similarly, the majority hole and minority electron mobilities were calculated for acceptor densities between 10 to the 16th power and 10 to the 20th power to the minus 3 power. The mole fraction of AlAs, y, varies between 0.0 and 0.3 in these calculations. All the important scattering mechanisms have been included. The ionized impurity and carrier-carrier scattering processes were treated with a quantum-mechanical, phase-shift analysis. These calculations are the first to use a phase-shift analysis for minority carriers scattering from majority carriers in ternary compounds such as Gal-yAlyAs. The results are in good agreement with experiment for majority mobilities and predict that at high dopant densities minority mobilities should increase with increasing dopant density for a short range of densities. This effect occurs because of the reduction of plasmon scattering and the removal of carriers from carrier-carrier scattering due to the Pauli exclusion principle.

Pub. in Jnl. of Vacuum Science and Technology, v14 n2 p1210-1213 Mar 96.

Keywords: *Microscopy, *Thin films, *Magnetic force microscopy, *Superconductors, High temperature, Vortices, Reprints.

The authors have imaged vortices in superconducting thin films with a low-temperature magnetic force microscope that utilizes microfabricated piezoresistive cantilevers with built-in tips. The films of YBa2Cu3O7-x and Bi2Sr2Ca1Cu2O8+x, are made by laser ablation and molecular beam epitaxy, respectively. The vortices usually appear as round features in the noncontact image with a diameter of about 1 micrometer or slightly less. In some cases the position of the vortices is correlated to defects observed in the topographic image of the same area. The vortices move sometimes, especially after taking a topographic (contact mode) scan.

Xi-Vector Formulation of Anisotropic Phase-Field Models: 3-D Asymptotics.
Final rept.
A. A. Wheeler, and G. B. McFadden. 1996, 15p.
Pub. in European Jnl. of Applied Mathematics, v7 p367-381 1996.

Keywords: *Solidification, Liquids-solid interfaces, Surface energy, Differential geometry, Asymptotic series, Vector analysis, Reprints, *Foreign technology, *Phase field models, Allen-Cahn equation, Gibbs-Thomson equation.

In the paper the authors present a new formulation of a large class of phase-field models, which describe solidification of a pure material and allow for both surface energy an interface kinetic anisotropy, in terms of the Hoffman-Cahn epsilon-vector. The Hoffman-Cahn epsilon-vector has previously been used in the context of sharp interface models, where it provides an elegant tool for the representation and analysis of interfaces with anisotropic surface energy. The authors show that the usual gradient-energy formulations of anisotropic phase-field models are expressed in a natural way in terms of the epsilon-vector when apprpriately interpreted. They use this new formulation of the phase-field equations to provide a concise derivation of the Gibbs-Thomson-Herring equation in the sharp-interface limit in three dimensions.

Pub. in Proceedings of Pressure Vessels and Piping Conference, Nashville, TN., June 17-21, 1990, p105-115.

Keywords: *Fracture mechanics, *Error analysis, *Finite element method, *Stress analysis, Glass, Computational grids, Plates, Computerized simulation, Mathematical models, Estimates, Reprints.

A simple error-estimate technique using commercially available general purpose finite element codes to solve a class of engineering problems is presented. The technique is based on the assumption that the class of engineering problems to be solved can be simplified to a new class having known analytical solutions. A two-phase procedure is developed where a series of successively-refined mesh designs with acceptable error estimates for the simplified class of problems is used to guide the finite element modeling of the actual engineering problem. To illustrate the procedure, an application in the preliminary design of a circular glass plate with a center hole, a 3-sector configuration, and reinforcing beams at all edges of the sectors, is reported. Error estimates and rates of convergence for parameters of practical interest are derived from numerical results using a finite element code named ANSYS (versions 4.3A and 4.4) as implemented on a Sun3-110 workstation.

Sponsored by GKSS - Forschungszentrum Geesthacht G.m.b.H., Hamburg (Germany, F.R.).
Pub. in International Jnl. of Fracture 48, p219-229 1991.

Keywords: *Crack propagation, *Fracture strength, *Electric potential, *Nondestructive tests, Tensile tests, Fracturing, Asymmetry, Panels, Calibration, Reprints, Johnson formula.

The well-known Johnson formula relates the electrical potential drop across a symmetric center crack in a current-carrying tensile panel to the crack length. To allow individual measurement of the crack growth at both ends of such a crack, the potential measured between contact points located on opposite sides and equidistant from the panel center line has been studied. Because this potential must ideally be identically zero for symmetric crack growth, it is termed the asymmetric potential. Its sign and magnitude are related to the direction and extent of asymmetric crack growth. It was found that contact points directly above the ends of the initial symmetric crack provide a signal which is well-suited to the determination of the asymmetry of the crack extension. This information is complementary to the total crack length information obtained using the Johnson formula. Experimental measurements and theoretical results were used to produce calibration formulae relating the asymmetric potential to the asymmetry of the crack dimensions in center-cracked panels.

A constructive method for approximating attractors was recently developed by Foias and Temam, who applied it to systems in which the nonlinearity is due to a bilinear operator. The purpose of the note is to test the practical applicability of the method to autonomous galloping oscillators, in which the nonlinearity, is due to seventh degree polynomials. The authors give revised versions of two of the expressions given in the original method. They then compare results obtained by algebraic approximation on the one hand and numerical integration on the other. The authors conclude with an assessment of the limitations of the method as applied to the systems.

Exponentially Rapid Coarsening and Buckling in Coherently Self-Stressed Thin Plates.
Final rept.
J. W. Cahn, and R. Kobayashi. 1995, 14p.
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Acta Metall. Mater. 43, n3 p931-944 1995.

Keywords: *Buckling, *Coarseness, *Nonlinear systems, *Thin plates, Diffusion, Elastic properties, Wetting, Stress analysis, Decomposition, Reprints.

The nonlinear equations that couple diffusion and stress are solved by computation for one-dimensional spinodal decomposition and coarsening in a thin plate. The vicinity of two critical values of the stress parameter are explored. At small values of elastic self-stresses, coarsening changes to exponentially fast from the exponentially slow dynamics expected for one-dimensions in the absence of stress. Coarsening is by rapid thickening of a single layer of a different phase from each of the two plate surfaces, leading to bending of the plate. Even though the diffusion equation is the same for bulk and thin plate and changes type at the coherent spinodal transition, in a thin plate the changes near this transition are gradual; the difference in behavior is due to the boundary conditions. Furthermore elasto-chemical equilibria through this transition are completely continuous. If the elastic term is large compared to the wetting term, surface wetting layers of phase of lower energy are found to disappear late in the coarsening.

Noise Modeling and Reliability of Behavior Prediction for Multi-Stable Hydroelastic Systems.
Final rept.
E. Simiu, and M. Frey. 1992, 6p.
Pub. in Proceedings of the International Conference on Offshore Mechanics and Arctic Eng. (OMAE) (11th), Alberta, Canada, June 7-12, 1992, Safety and Reliability, v2 p39-44.

Keywords: *Oscillators, *Hydroelasticity, Modelling, Noise, Hydrodynamics, Prediction, Behavior, Reprints, *Hydroelastic systems.

This paper reviews results of experiments conducted on a simple multi-stable hydroelastic (galloping) oscillator. These results show that a noise may cause a multi-stable hydroelastic system to exhibit chaotic behavior, and that in some instances such behavior cannot be predicted reliably unless noise effects are carefully accounted for. We then present results of a theoretical investigation of a simple, paradigmatic multi-stable system, the Duffing-Holmes oscillator. The results of this investigation show that for the system being considered, noise promotes the occurance of chaotic behavior associated with Smale horseshoes. This theoretical investigation is the first phase of an effort to develop analytical tools for predicting reliably the potential for chaotic behavior of actual hydroelastic systems such as deep-water compliant platforms.

Chaotic Motions of Coupled Galloping Oscillators and Their Modeling as Diffusion Progresses.
Final rept.
E. Simiu, G. R. Cook, and B. Alibe. 1991, 8p.
See also PB93-153245.
Pub. in International Conference on Applications of Statistics and Probability (6th), Mexico City, Mexico, June 17-21, 1991, v2 p993-1000.

Keywords: *Chaos, *Diffusion, *Oscillators, Models, Elastic properties, Stability, Stochastic processes, Differential equations, Structural engineering, Hydroelasticity, Reliability, Nonlinear systems, Reprints, *Galloping oscillators, *Fluidelasticity.

According to numerical investigations recently reported in the literature certain types of compliant offshore structures may experience undesirable hydroelastic responses, including chaotic responses. The question arises whether such responses can be predicted reliably by using current fluidelastic models. We addressed this question in the specific case of a paradigmatic, strongly nonlinear hydroelastic oscillator exhibits strongly chaotic behavior. It is then shown that modeling the hydroelastic system as a nonlinear diffusion process helps to improve substantially the reliability of the predictions.

Exits in Multistable Systems Excited by Coin-Toss Square-Wave Dichotomous Noise: A Chaotic Dynamics Approach.
Final rept.
Y. R. Sivathanu, C. Hagwood, and E. Simiu. 1995, 7p.
Pub. in Physical Review E, v52 n5 p4669-4675 Nov 95.

Keywords: *Stochastic processes, *Structural engineering, *Noise, Chaos, Construction, Functions(Mathematics), Functional analysis, Reprints, Melnikov function.

We consider a wide class of multistable systems perturbed by adissipative term and coin-toss square-wave dichotomous noise. These systems behave like their harmonically or quasiperiodically driven counterparts: depending upon the system parameters, the steady-state motion is confined to one well for all time or experiences exits from the wells. This similarity suggests the application to the stochastic systems of a Melnikov approach originally developed for the deterministic case. The noise induces a Melnikov process that may be used to obtain a simple condition guaranteeing the nonoccurrence of exits from a well.

SSME LOX Duct Flowmeter Design and Test Results.
Final rept.
J. D. Siegwarth. 1994, 8p.
Pub. in Advanced Earth-to-Orbit Propulsion Technology 1994 NASA Conference, Huntsville, AL., May 17-19, 1994, Publication 3282, v1 p105-112.

Keywords: *Flowmeters, Liquid oxygen, Reprints, Water, *Space Shuttle, *Vortex, Vortex shedding.

A vortex shedding flowmeter designed to measure Liquid oxygen flow in the RS007031 duct of the Space Shuttle Main Engine has been built and tested using water and liquid nitrogen (LN2). The best meter performance was obtained with an elbow located a few diameters upstream and the vane axis perpendicular to the plane of the bend rather than with a long straight section upstream of the meter. At either the same flow velocity or the same Reynolds number, the meter performance was better for LN2 than for water. A flowmeter vane of circular cross section has been developed for the 28 mm branch of the RS007032 duct. The performance of these meters approaches that of commercial flowmeters.

Partial Pressure Analysis in Space Testing.
C. R. Tilford. Nov 94, 13p.
In NASA. Goddard Space Flight Center, Eighteenth Space Simulation Conference: Space Mission Success Through Testing p 257-269. Sponsored by Jhu.

Keywords: *Contamination, *Gas pressure, *Instrument errors, *Measuring instruments, *Partial pressure, *Space environment simulation, Calibrating, Vacuum systems, Exposure, Handbooks, Pressure vessels, Quadrupoles, Residual gas, Sensitivity.

For vacuum-system or test-article analysis it is often desirable to know the species and partial pressures of the vacuum gases. Residual gas or Partial Pressure Analyzers (PPA's) are commonly used for this purpose. These are mass spectrometer-type instruments, most commonly employing quadrupole filters. These instruments can be extremely useful, but they should be used with caution. Depending on the instrument design, calibration procedures, and conditions of use, measurements made with these instruments can be accurate to within a few percent, or in error by two or more orders of magnitude. Significant sources of error can include relative gas sensitivities that differ from handbook values by an order of magnitude, changes in sensitivity with pressure by as much as two orders of magnitude, changes in sensitivity with time after exposure to chemically active gases, and the dependence of the sensitivity for one gas on the pressures of other gases. However, for most instruments, these errors can be greatly reduced with proper operating procedures and conditions of use. In this paper, data are presented illustrating performance characteristics for different instruments and gases, operating parameters are recommended to minimize some errors, and calibrations procedures are described that can detect and/or correct other errors.

Ignition and Subsequent Transition to Flame Spread in a Microgravity Environment.
T. Kashiwagi, K. Mcgrattan, and H. Baum. Aug 95, 6p.
In NASA. Lewis Research Center, the 3RD International Microgravity Combustion Workshop p 207-212.

Keywords: *Computerized simulation, *Flame propagation, *Flames, *Flow distribution, *Gravitational effects, *Heat flux, *Ignition, *Microgravity, Extinguishing, Fire prevention, Fires, Three dimensional flow, Time dependence, Two dimensional flow.

The fire safety strategy in a spacecraft is (1) to detect any fire as early as possible, (2) to keep any fire as small as possible, and (3) to extinguish any fire as quickly as possible. This suggests that a material which undergoes a momentary, localized ignition might be tolerable but a material which permits a transition to flame spread would significantly increase the fire hazard. Therefore, it is important to understand how the transition from localized ignition to flame spread occurs and what parameters significantly affect the transition. The fundamental processes involved in ignition and flame spread have been extensively studied, but they have been studied separately. Some of the steady state flame models start from ignition to reach a steady state, but since the objective of such a calculation is to obtain the steady state flame spread rate, the calculation through the transition process is made without high accuracy to save computational time. We have studied the transition from a small localized ignition at the center of a thermally thin paper in a microgravity environment. The configuration for that study was axisymmetric, but more general versions of the numerical scheme have been developed by including the effects of a slow, external flow in both two and three dimensions. By exploiting the non-buoyant nature of the flow, it is possible to achieve resolution of fractions of millimeters for 3D flow domains on the order of 10 centimeters. Because the calculations are time dependent, we can study the evolution of multiple flame fronts originating from a localized ignition source. The interaction of these fronts determines whether or not they will eventually achieve steady state spread. Most flame spread studies in microgravity consider two-dimensional flame spread initiated by ignition at one end of a sample strip with or against a slow external flow. In this configuration there is only one flame front. A more realistic scenario involves separate, oppositely directed fronts in two dimensions, or a continuous, radially directed front in three dimensions. We present here some results of both the two and three dimensional codes.

Pub. in Proceedings of Space Congress 'Yesterday's Vision is Tomorrow's Reality' (13th), Cocoa Beach, FL., April 27-30, 1993, p1-9 - 1-16.

Keywords: *Space industrialization, *Aerospace environments, *Welding, *Lunar exploration, Space shuttle missions, Space manufacturing, Space laboratories, Space stations, Space processing, Plasma arc welding, Laser welding, Gas tungsten arc welding, Electron beam welding, Space exploration, Reprints, Space Exploration Initiative.

This paper establishes the value of having an in-space welding capability and identifies its applications, both near-term for Shuttle-Spacelab missions and Space Station Freedom, and longer-term for the First Lunar Outpost and Manned Mission to Mars. The leading candidate technologies, consisting of Electron Beam, Gas Tungsten Arc, Plasma Arc, and Laser Beam, are examined against the criteria for an in-space welding system. Research and development work to date, striving to achieve an in-space welding capability, is reviewed. Finally, a series of strategic NASA flight experiments is discussed as the remaining development required for achieving a complete in-space welding capability, which can fully serve the Space Exploration Initiative. This paper summarizes the visions and realities associated with in-space welding.

Overview of NASREM: The NASA/NBS Standard Reference Model for Telerobot Control System Architecture.
J. S. Albus, R. Quintero, and R. Lumia. Apr 94, 14p, NISTIR-5412.
See also PB88-123773 and PB89-193940.

Keywords: *Architecture(Computers), *Robot control, *Space station freedom, *Telerobotics, Control systems design, Robots, Systems engineering, Memory(Computers), Computer systems design, *Computerized control systems, NASA/NBS standard reference model.

The NASA/NBS Standard Reference Model for Telerobot Control System Architecture (NASREM) was developed by the National Institute of Standards and Technology (NIST) for the National Aeronautics and Space Administration (NASA) to provide a software control system architecture guideline for use by development contractors charged with building the Flight Telerobot Servicer (FTS) control system as part of the Freedom Space Station project. The original NASREM document describes a conceptual or domain-independent architecture, and suggests the outline of a functional or domain-specific architecture for FTS. This paper presents an overview of the NASREM conceptual architecture and reviews subsequent work at NIST in defining a functional architecture for the servo and primitive levels. This work suggests outlines for software and hardware architecture specifications, and software development environments to complement the NASREM conceptual and functional architectures.

Evolution of the Flight Telerobotic Servicer.
Final rept.
R. Lumia. 1990, 4p.
Pub. in Proceedings of International Symposium on Artificial Intelligence, Robotics and Automation in Space, Kobe, Japan, November 18-20, 1990, p69-72.

Keywords: *Space Station Freedom, *Manipulators, Automation, Robotics, Robot control, Telerobotics, Reprints, *FTS(Flight Telerobotic Servicer), *Flight Telerobotic Servicer, NASREM(NASA/NIST Standard Reference Model).

The Flight Telerobotic Servicer (FTS) is a two armed manipulator which will be used to build and maintain Space Station Freedom. One of the goals of the project is to be able to upgrade the capabilities of the FTS by incorporating new technology. To achieve this goal the FTS is using the NASA/NIST Standard Reference Model for Telerobot Control System Architecture (NASREM) for its functional architecture. While using NASREM helps integrate new technology into the system, the decisions concerning the precise technology needing development must be addressed. In this paper, an approach to the technological evolution of the FTS will be explored. The approach begins with detailed scripts of representative FTS activities. These scripts are analyzed to determine the generic or common actions performed by the FTS. Then, technological alternatives are described in terms of a decision tree format.

Mapping Processes to Processors for Space-Based Robot Systems.
Final rept.
T. E. Wheatley. 1989, 4p.
Pub. in Institute of Electrical and Electronics Engineers International Conference on Systems Engineering, Fairborn, OH., August 24-26, 1989, p65-68.

Keywords: *Robots, *Space stations, *Computers, Resource allocation, Robot control, Telerobotics, Manipulators, Computer architecture, Algorithms, Servocontrol, Reprints.

The NASA/NBS Standard Reference Model for Telerobot Control System Architecture (NASREM) has been adapted by NASA for use in the Flight Telerobotic Servicer, a two armed telerobotic manipulator which will build and maintain the Space Station. NASREM provides the paradigm that allows standard interfaces to be defined so that functionally equivalent software and hardware modules can be interchanged. This paper examines the mapping of these logical modules onto a functional computer architecture. Interfaces must be first defined which are capable of supporting the algorithms in the literature. After interface definition, the specific computer architecture for the implementation can be determined. An example is shown mapping the SERVO level of NASREM onto a set of computers utilizing the knowledge of the dominant response time required to aid in the selection process.

AISI 44OC martensitic stainless steel is the material of choice for the high pressure oxygen turbopump (HPOTP) of the space shuttle main engine (SSME). Tests have been done over a range of sliding speeds from 0.5 to 2.0 m/s, initial hertzian stresses from 0.915 to 3.66 GPa, and bulk temperatures from -184 deg. C (liquid oxygen temperature) to 760 deg. C. which cover the variations thought to exist in the HPOTP. Data are presented in the form of contour wear maps to allow a more direct view of the interdependencies of the major tribological variables that can be obtained with wear data presented vs. a single variable. Wear maps are used as a tool to aid in the determination of regions dominated by a given wear mode.

Transition from Localized Ignition to Flame Spread Over a Thin Cellulosic Material in Microgravity.
Final rept.
K. B. McGrattan, K. Nakabe, H. R. Baum, and T. Kashiwagi. 1993, 4p.
Pub. in Eastern States Section of the Combustion Institute Technical Meeting, Princeton, NJ., October 1993, Book of Abstracts, p409-412.

Keywords: *Cellulose, *Fire prevention, *Ignition, Combustion, Flame spread, Reprints, Microgravity.

Ignition and flame spread processes are complicated by strong coupling between chemical reactions and transport processes, not only in the gas phase but also in the condensed phase. In most previous studies, ignition and flame spread were studied separately with the result that there has been little understanding of the transition from ignition to flame spread. In fire safety applications this transition is crucial to determine whether a fire will be limited to a localized, temporary burn or whether it will grow to become a large fire. In order to understand the transition to flame spread, the transient mechanisms of ignition and subsequent spread must be studied. However, there have been no definitive experimental or modeling studies because of the complexity of the buoyancy-induced flow near the heated sample surface. One must solve the full Navier-Stokes equations over an extended region to represent accurately the highly unstable buoyant plume and entrainment of surrounding gas. To avoid the complicated nature of the plume problem under normal gravity, previous detailed radiative ignition models were assumed to be one-dimensional or were applied at a stagnation point. Unfortunately, these models could not be extended to include the transition to flame spread.

Pub. in International Microgravity Combustion Workshop (2nd), Cleveland, OH., September 15-17, 1992, p167-179.

Keywords: *Cellulose, *Fire prevention, *Fires, *Flame propagation, *Ignition, *Reduced gravity, Gravitation, Mathematical models, Buoyancy, Entrainment, Reprints, *Spacecraft construction materials.

Both ignition and flame spread on solid fuels are processes that not only are of considerable scientific interest but that also have important fire safety applications. Both types of processes, ignition and flame spread, are complicated by strong coupling between chemical reactions and transport processes, not only in the gas phase but also in the condensed phase. In most previous studies, ignition and flame spread were to flame spread studied separately with the result that there has been little understanding of the transition from ignition limited to flame spread. In fire safety applications this transistion is crucial to determine whether a fire will be limited to a localized, temporary burn or will transition into a growth mode with a potential to become a large fire. In order to understand this transition, the transient mechanisms of ignition and subsequent flame spread must be studied. However, there have been no definitive experimental or modeling studies, because of the complexity of the flow motion generated by buoyancy near the heated sample surface. One must solve the full Navier-Stokes equations over an extended region to represent accurately the highly unstable buoyant plume and entrainment of surrounding gas from far away.

Ignition and Transition to Flame Spread Over a Thermally Thin Cellulosic Sheet in a Microgravity Environment.
Final rept.
K. Nakabe, K. B. McGrattan, T. Kashiwagi, G. Kushida, H. R. Baum, and H. Yamashita. 1994, 14p.
See also PB96-155809.
Pub. in Combustion and Flame, v98 n4 p361-374 1994.

Keywords: *Cellulose, *Fire prevention, *Ignition, Combustion, Flame spread, Reprints, Microgravity.

An axisymmetric, time-dependent model is developed describing auto-ignition and subsequent transition to flame spread over a thermally-thin cellulosic sheet heated by external radiation in a quiescent microgravity environment. Due to the unique combination of a microgravity environment and low Reynolds number associated with the slow, thermally induced flow, the resulting velocity is taken as a potential flow. A one-step global gas phase oxidaton reaction and three global degradation reactions for the condensed phase are used in the model. A maximum external radiant flux of 5 W/sq. cm (Gaussian distribution) with 21%, 30%, and 50% oxygen concentrations is used in the calculations. The results indicate that autoignition is observed for 30% oxygen concentrations but the transition to the flame spread does not occur. For 50% oxygen the trransition is achieved. A detailed discussion of the transition from ignition to flame spread is given as an aid to understanding this process. Also, a comparison is made between the axisymmetric configuration and a two-dimensional (line source) configuration.

Updated Calculations for Routine Space-Shielding Radiation Dose Estimates: SHIELDOSE-2.
S. M. Seltzer. Dec 94, 59p, NISTIR-5477.
Contract NASA-T9311R
See also PB80-176860. Sponsored by National Aeronautics and Space Administration, Houston, TX. Lyndon B. Johnson Space Center.

Keywords: *Spacecraft shielding, *Radiation dosage, Extraterrestrial radiation, Electron irradiation, Proton irradiation, Bremsstrahlung, Cosmic rays, Aluminum, Graphite, Silicon, Water, Gallium arsenides, Air, Calcium fluorides, Silicon dioxide, Computer programs, Fortran, Graphs(Charts), *SHIELDOSE-2 computer program.

New, more-extensive, depth-dose distributions for electrons, electron-bremsstrahlung, and protons have been calculated, based on improvements in cross-section information since the development of the original SHIELDOSE code. The new database covers incident electron energies from 5 keV to 50 MeV, with the bremsstrahlung tail calculated for depths out to 50 g/sq cm, and incident proton energies from 10 keV to 10 GeV. Effects of nuclear interactions on proton depth-dose distributions in aluminum shields have been estimated, and options are provided to include these approximations in test calculations. In addition to the absorbed dose in aluminum, the dose in small volumes of graphite, Si, air, bone, CaF2, GaAs, LiF, SiO2, tissue or water can be evaluated. The functionality of new code is much the same as the old code; however, the resultant dose estimates as a function of depth in aluminum spacecraft can be somewhat different. Through the use of a companion code based on approximate transformations, results can be extended beyond the dose as a function of depth in plane slabs and at centers of solid spheres to include the dose at off-center points in a solid sphere and at the inner surface of spherical shells.

Frozen Orbits for Satellites Close to an Earth-Like Planet.
Final rept.
S. Coffey, A. Deprit, and E. Deprit. 1994, 36p.
Pub. in Celestial Mechanics and Dynamical Astronomy 59, p37-72 1994.

Keywords: *Artificial satellites, *Satellite orbits, Hamiltonian functions, Inclination, Eccentricity, Mission planning, Space missions, Surveys, Reprints, *Satellite theory.

The authors say that a planet is Earth-like if the coefficient of the second order zonal harmonic dominates all other coefficients in the gravity field. This paper concerns the zonal problem for satellites around the Earth-like planet, all other perturbations excluded. By numerical continuation the authors have discovered three families of frozen orbits in the full zonal problem under consideration; (1) a family of stable equilibria starting from the equatorial plane and tending to the critical inclination; (2) an unstable family arising from the bifurcation at the critical inclination; (3) a stable family also arising from that bifurcation and terminating with a polar orbit. Except in the neighborhood of the critical inclination, orbits in the stable families have very small eccentricities, and are thus well suited for survey missions.

The Earth Observing System (EOS) is an international multi-satellite program in global remote sensing of the Earth. The simultaneous goals of acquiring accurate data over many years and correctly identifying systematic effects depend crucially on: (1) calibrating all instruments against a set of recognized physical standards, (2) carefully characterizing the instruments' performances at the system level, (3) adhering to good measurement practices and established protocols, (4) intercomparing instrument measurements where possible, and (5) establishing traceability for all instruments to the common scale of physical quantities maintained at the national standards laboratories.

NIST Thermal Infrared Transfer Standard Radiometer for the Earth Observing System (EOS) Program.
Final rept.
J. P. Rice, and B. C. Johnson. 1996, 5p.
Pub. in The Earth Observer, p31-35 1996.

Keywords: *Earth observing system(EOS), *Infrared radiometers, *Calibration standards, Blackbody radiation, Infrared radiation, Thermometers, Temperature control, Heat transfer, Reprints.

A program to establish radiometric traceability between Earth Observing System (EOS) instrument calibration facilities and the National Institute of Standards and Technology (NIST) radiance scale is underway. To ensure the high accuracy required for instruments used in the National Aeronautics and Space Administration's (NASA's) EOS program, the output of the working standards will be compared to the radiance scale maintained at NIST. Plans are in place for NIST to provide similar radiometers for the EOS program: the Visible Transfer Radiometer (VXR), the Short-wave Infrared Transfer Radiometer (SWIXR), and the Thermal-infrared Transfer Radiometer (TXR). This article describes the TXR.

Feasibility of Fire Evacuation by Elevators at FAA Control Towers.
J. H. Klote, B. M. Levin, and N. E. Groner. Aug 94, 112p, NISTIR-5445.
Prepared in cooperation with George Mason Univ., Fairfax, VA. Sponsored by Federal Aviation Administration, Washington, DC. Engineering and Environmental Safety Div.

Keywords: *Airport towers, *Air traffic control, *Fire safety, *Evacuating(Transportation), Elevators(Lifts), US FAA, Feasibility, Emergencies.

Throughout most of the world, warning signs next to elevators indicated they should not be used in fire situations. Because these elevators have not been designed for fire evacuation, they should not be used for fire evacuation. However, the idea of using elevators for fire evacuation has gained considerable attention. The Federal Aviation Administration (FAA) has sponsored a project to study the feasibility of elevator emergency evacuation at air traffic control towers. This paper describes this project including (1) a general discussion of elevator evacuation, (2) presentation of conceptual criteria for such elevator evacuation systems, and (3) application of that criteria to several ATCTs.

Analytical Estimation of Carrier Multipath Bias on GPS Position Measurements.
Technical note.
C. M. Volk, and J. Levine. Apr 94, 67p, NIST/TN-1366.
Also available from Supt. of Docs. as SN003-003-03266-2. Prepared in cooperation with Joint Inst. for Lab. Astrophysics, Boulder, CO.

Keywords: *Global positioning system, *Multipath transmission, *Position finding, Phase measurement, Mathematical models, Error analysis, Degradation, Accuracy, Bias.

Multipath is one of the factors degrading the accuracy of position measurements obtained with the Global Positioning System (GPS). We investigate the effects of multipath on the carrier phase measurements and the resulting bias on relative GPS positions for observation times longer than several hours. We first model the phase error due to multipath from a single plane reflector in terms of satellite reflector geometry. The model is then employed to estimate upper limits of the multipath bias for general receiver environments. We also consider bias due to multipath from the flat ground, from nearby objects and from tilted ground, obtaining formulae for each situation that depend only on reflector characteristics and geometry. We find that the multipath phase error gives rise to vertical biases smaller than 2 mm and horizontal biases smaller than 1 mm if carrier-phase observations are averaged for at least several hours and if some basic precautions are taken regarding the placement of the receiving antenna.

Earthquake Resistant Construction of Gas and Liquid Fuel Pipeline Systems Serving, or Regulated By, the Federal Government.
Earthquake hazard reduction series no. 67.
F. Y. Yokel, and R. G. Mathey. Jul 92, 79p, NISTIR-4795, FEMA-233.
See also PB94-161817. Sponsored by Federal Emergency Management Agency, Washington, DC.

Keywords: *Pipelines, *Storage tanks, *Earthquake resistant structures, Seismic design, Design standards, Building codes, Piping systems, Pipe joints, Welded joints, Dynamic structural analysis, Natural gas distribution systems, Liquefied natural gas, Oil lines, Gas mains, Soil-Structure interactions, Earthquake engineering, Lifeline systems.

The vulnerability of gas and liquid fuel pipeline systems to damage in past earthquakes, as well as available standards and technologies that can protect these facilities against earthquake damage are reviewed. An overview is presented of measures taken by various Federal Agencies to protect pipeline systems under their jurisdiction against earthquake hazards. It is concluded that the overall performance of pipeline systems in past earthquakes was relatively good, however, older pipelines and above-ground storage tanks were damaged in many earthquakes. Standards and regulations for liquid fuel pipelines contain only general references to seismic loads. Standards and regulations for above-ground fuel storage tanks and for liquefied natural gas facilities contain explicit seismic design provisions. It is recommended that a guideline for earthquake resistant design of gas and liquid fuel pipeline systems be prepared for Federal Agencies to ensure a uniform approach to the protection of these systems.

Gas-Coupled, Pulse-Echo Ultrasonic Crack Detection and Thickness Gaging.
Final rept.
C. M. Fortunko, R. E. Schramm, C. M. Teller, W. P. Dube, M. C. Renken, G. M. Light, and J. D. McColskey. 1995, 8p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, Snowmass Village, CO., July 31-August 5, 1994, v14A p951-958 1995.

Keywords: *Nondestructive tests, *Crack detection, Reprints, *Thickness gages, Ultrasonic thickness gages, Gas-coupled, Pulse-echo.

Ultrasonic inspection is a standard method to assess the integrity of large-diameter oil pipelines. However, similar methods applied to natural-gas pipelines present a considerably greater challenge; gas is apoor coupling agent for the probing ultrasonic signals between the transducer and the pipe wall. Natural gas exhibits a very low specific acoustic impedance (300 Rayls for methane at atmospheric pressure) compared to oil (1.5 Mrayls and higher). Consequently, large ultrasonic-signal transmission losses occur at the transducer/gas and pipe-wall/gas interfaces. To circumvent this obstacle, past exploratory developments included the use of a liquid-filled wheel, electromagnetic- acoustic-transducer (EMAT), and liquid-slug technology. While prototypes of high-speed, in-line inspection systems employing such principles do exist, all exhibit serious operational shortcomings that prevent widespread commercial exploitation.

Fire Safety of Passenger Trains: A Review of Current Approaches and of New Concepts.
Technical note (Final).
R. D. Peacock, R. W. Bukowski, W. W. Jones, J. E. Brown, P. A. Reneke, and V. Babrauskas. Jan 94, 239p, NIST/TN-1406.
Also available from Supt. of Docs. as SN003-003-03246-8. Sponsored by Department of Transportation, Washington, DC.

Keywords: *Fire safety, *Trains, *Passengers, Smoke, Fire tests, Evacuating(Transportation), Rapid transit systems.

New alternative technologies have been developed which can be used to increase intercity passenger train operating speeds. These technologies include steel-wheel-on-rail and magnetic levitation (maglev) systems. Fire safety is an area of particular interest for these technologies, as well as for conventional intercity and commuter trains. While the historical fire record has been very good and few serious passenger train fires have occurred, minor incidents could develop into potential life-threatening events. The report presents a detailed comparison of the fire safety approaches used in the United States, France, and Germany. The strengths and weaknesses of current methods for measuring the fire performance of rail transportation systems are evaluated. An optimum systems approach to fire safety which addresses typical passenger train fire scenarios is analyzed and recommendations are presented to address the current state-of-the-art in materials testing.

Ultrasonic Measurement of Residual Stress in Railroad Wheel Rims.
Final rept.
R. E. Schramm, A. V. Clark, and T. J. McGuire. 1992, 5p.
Sponsored by Federal Railroad Administration, Washington, DC.
Pub. in Proceedings of International Wheelset Congress (10th), Sydney, Australia, September 27-October 1, 1992, p151-155.

Keywords: *Nondestructive tests, *Ultrasonic flow detection, *Railroad trucks, *Stress measurement, *Wheels, Acoustic measurement, Accuracy, Signal processing, Ultrasonics, Transducers, Residual stress, Data analysis, Birefringence, Reprints.

This work discusses three possible acoustic measurement techniques to detect and quantify the stress railroad wheel rims. The goal is to develop instrumentation useful for nondestructive testing during field inspection for potentially dangerous conditions. In each case, the application of novel noncontact transducers (EMATs) takes advantage of minimal surface preparation and the elimination of fluid couplants. Each tech-

nique depends on the very precise (one part in 10(exp 4)) timing of signal arrival. Elastic changes caused by stress generate very small, but detectable velocity changes. However, other factors, notably changes in metallurgical texture, will similarly alter the velocity. Initial tests indicate the possibility of determining the size of this texture effect and reducing the uncertainty in measured stress to about 55 MPa or less. This accuracy would allow judgment on the safety of continued operation of a wheel. For one method, a birefringence approach, we have constructed a prototype that is now at a railroad research center. Ultrasonic data collected with this gear correlate well with those from destructive sawcutting for the four wheels we have examined so far. Work on the design and construction of transducers and data analysis continues.

Keywords: *Residual stress, *Ultrasonic tests, *Railroad cars, *Wheels, Nondestructive tests, Transducers, Inspection, Steels, Transportation safety, Detection, Cracks, Defects, Reprints, *Cast steel railroad wheels.

Residual hoop stresses in the rims of railroad wheels may change from compressive to tensile during their lifetime, a potentially hazardous condition that could lead to wheel failure by cracking. The current U.S. regulation calls for the measurement of discoloration in the wheel plate indicating a history of heating that may lead to unsafe stress. Quantitative measurement by ultrasonic methods is an attractive alternative. Stress influences elastic parameters and causes small changes in sound velocity. We did an extensive series of measurements around the circumference of ten cast-steel wheels; two were as-made, while the others received induction heating at three different energy levels to generate stresses similar to those of in-service wheels. Two different ultrasonic instruments gave comparable results. Destructive evaluation of stress in three wheels by sawcutting showed a good correlation between flange-tip opening displacement and the ultrasonic measurements. This suggests a reliable method and a field-usable instrument for quantitative nondestructive inspection. This could contribute to the safety and dependability of freight rail systems, and reduce costs due to failures and the unnecessary replacement of good wheels.

See also PB95-162046 and PB95-180774.
Pub. in Fire and Materials, v19 p71-87 1995.

Keywords: *Railroad passenger service, *Fire protection, *Risk assessment, *Safety engineering, Rail transportation, Passenger transportation, Fire safety, Transportation safety, Railroad cars, Trains, Fire prevention, Fire hazards, Reprints, Heat release rate.

Recent advances in passenger rail transportation, fire test methods, and hazard analysis necissitate re-examination of requirements for fire safety. The strengths and weaknesses of current methods for measuring the fire performance of rail transportation systems are evaluated. A systems approach to fire safety which addresses typical passenger train fire scenarios is analyzed. A rationale is presented for the direction in which most fire science-oriented organizations in the world are clearly headed - the use of fire hazard and fire risk assessment methods supported by measurement methods based on heat release rate.

Safety Assessment of Railroad Wheels Through Roll-by Detection of Tread Cracks.
Final rept.
A. V. Clark, R. E. Schramm, S. R. Schaps, and B. J. Filla. 1995, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers Conference on Nondestructive Evaluation of Aging Railroads, Oakland, CA., June 6-8, 1995, p109-119.

Keywords: *Railroad trucks, *Wheels, *Cracks, *Detection, Defects, Inspection, Rolling stock, Ultrasonic tests, Nondestructive tests, Railroad cars, Reprints, Electromagnetic acoustic transducers.

A prototype system has been developed for roll-by inspection of cracks in the trends of freight car wheels. The system uses noncontacting electromagnetic-acoustic transducers (EMATs) which generate and receive surface waves propagating along the trend surface. If a defect is present it reflects an echo back to the EMAT. The EMAT itself consists of a coil and permanent magnet which are embedded in a 'rocking shoe'. The rocking shoe is suspended by a spring system in a recess machined into the outer surface of a rail plug. When the wheel is centerend over the shoe, it activates a trigger circuit which energizes the EMAT and causes propagation of the surface wave. The detected echoes are analyzed by a microprocessor which characterizes the wheel as being safe or unsafe. The crack detector system has been subjected to field testing using actual locomotive and rolling stock. It has been able to detect both artificial and real defects at roll-by speeds of 25 km/h (15 mph).

See also PB91-222653. Sponsored by Federal Railroad Administration, Washington, DC. Office of Research and Development.

Keywords: *Railroad trains, *Nondestructive tests, *Wheels, Rolling stock, Ultrasonic tests, Residual stress, Piezoelectric gages, Thermal stresses.

The effect of stress on elastic parameters causes a small change in sound wave velocity. This acoustoelastic effect is the basis for a method of nondestructive evaluation (NDE). The authors used two types of ultrasonic transducers, piezoelectric and electromagnetic, to measure both thickness-averaged and near-surface stresses in the rims of twenty unused, cast-steel railroad wheels. The manufacturer mounted these wheels on a unique dynamometer and induced thermal damage by dragging tread breaks to simulate in-service conditions that might generate tensile hoop

stress. After the authors' ultrasonic nondestructive tests, they cut eighteen wheels with a saw along a radius to measure flange tip opening and verify the stress state.

Keywords: *Hybrid electric-powered vehicles, *Electric-powered vehicles, *Meetings, Electric batteries, Standards, Electric propulsion, Energy storage, Energy conversion, Electrochemistry, Engine components, Automotive engineering.

This is a key period in the development of electric and hybrid electric vehicles. The landmark 1990 legislation in California requires that 2 percent of new automobiles be zero emission vehicles in 1998, rising to 10 percent in the year 2005. This can only be met by electric vehicles. The purpose of the workshop was to concentrate on the technologies to improve the design, performance, manufacturability, and economics of the critical components for the next generation of electric and hybrid electric vehicles for the year 2000 and beyond. The workshop began with invited speakers to cover the general topics of impact of the California legislation, Federal agency programs, development of standards, infrastructure needs, advanced battery development, and the imperatives for commercial success of electric and hybrid electric vehicles. Working sessions were five parallel meetings on Energy Conversion Systems, Energy Storage Systems, Electric Propulsion Systems, Controls and Instrumentation, and Ancillary Systems.

Recommendations on Selection of Vehicle-to-Roadside Communications Standards for Commercial Vehicle Operations.
H. Scott, K. Stouffer, and P. Rowe. Jun 94, 80p, NISTIR-5444.

Keywords: *Highway communication, *Standards, *Data transmission, *Commercial vehicles, Radio links, Communication systems, Transponders, Communication equipment, Communications networks, Automatic highways, Intelligent Vehicle Highway Systems.

The National Institute of Standards and Technology (NIST) Robot Systems Division is participating in a Federal Highway Administration (FHWA) program that is to lead to the recommendation of standards in Vehicle-to-Roadside Communications (VRC) equipment used in commercial vehicle operations (CVO). There is substantial motivation to develop these standards, both on the part of the government and the CVO community. A standardized VRC system will allow states to check credentials, weight, and safety parameters while commercial vehicles travel at highway speeds of up to 160 km/h. This will improve the current situation in which substantial time and productivity is lost while commercial vehicles stop and wait for inspections. More sophisticated systems may employ weigh-in-motion equipment, on-vehicle sensors to determine brake temperature and other parameters in real-time, and other subsystems (navigation, etc.) capable of generating relevant data. This communications link will serve an important role in passing data between various onboard intelligent control system computers and the roadside systems.

Keywords: *Highway communication, *Commercial vehicles, *Data transmission, Transponders, Standards, Communications networks, Communication systems, Automatic highways, Communication equipment, Radio links, Intelligent Vehicle Highway Systems.

The National Institute of Standards and Technology (NIST) Robot Systems Division is participating in a Federal Highway Administration (FHWA) program that is to lead to the recommendation of standards in Vehicle-to-Roadside Communications (VRC) equipment. A standardized VRC system will allow states to check credentials, weight, and safety parameters while commercial vehicles travel at highway speeds of up to 160 km/h. This will improve the current situation in which substantial time and productivity is lost while commercial vehicles stop and wait for inspections. More sophisticated systems may employ weight-in-motion equipment, on-vehicle sensors to determine brake temperature and other parameters in real-time, and other subsystems (navigation, etc.) capable of generating relevant data. This communications link will serve an important role in passing data between various onboard intelligent control system computers and the roadside systems. Numerous incompatible VRC designs and protocols exist, or are being developed. The deployment of incompatible systems will not result in transparent borders, where a truck can pass, for example, from one state to another without stopping. A standard is to be developed or chosen that will meet current and projected requirements, such as those of the Intelligent Vehicle Highway System (IVHS). NIST interacted with various users, VRC equipment manufacturers, IVHS planners, and other government agencies to determine the current and projected VRC requirements. Fifteen systems and six protocols were examined in this study.

Risk Analysis for the Fire Safety of Airline Passengers.
R. L. Smith. Jun 94, 40p, NISTIR-5441.
Contract DTFA03-92-Z-00018
Sponsored by Federal Aviation Administration Technical Center, Atlantic City, NJ.

Keywords: *Fire safety, *Airlines, Passengers, Aircraft fires, Software, Risk analysis, Decision theory, Water.

The purpose of this report is to describe the National Institute of Standards and Technology's work to date relating to the general methodology being developed for the project Risk Analysis for the Fire Safety of Airline Passengers and the software being used to facilitate this methodology. The approach selected involved the use of influence diagrams. Therefore, a brief discussion of influence diagrams is given. The status of their application to the water mist system for passenger planes is given and the overall approach to carrying out the project is described. An example is included that shows how the process works, but the case is fictional, not intended to be realistic.

Pub. in Proceedings of International Symposium on Fire Safety Science (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p1007-1016.

Keywords: *Fire safety, *Rail transportation, *Risk assessment, *Transportation safety, Fires, Railroad cars, Test methods, Standards, Burning rate, Smoke, Combustion, Reprints, *Heat release rate.

Recent advances in guided group transportation, fire test methods, and hazard analysis necessitate re-examination of requirements for fire safety. Several studies have indicated nearly random ability of current tests to predict actual fire behavior. A comparison of the approaches used in the United States, Germany, and France is presented. With the strengths and weaknesses of current methods for measuring the fire performance of materials used in rail transit systems reviewed, a direction is suggested in which most fire science-oriented organizations in the world are clearly headed--fire hazard and fire risk assessment methods supported by measurement methods based on heat release rate.

The objective of this project is to provide thermophysical property data for candidate working

General

fluids in a form suitable for optimizing the design of thermoacoustic refrigerators. The data will be provided in a computer program that calculates the properties of the most promising gas mixtures. This package will consist of currently available data from the literature (provided that it is of sufficient quality) and our own measurements (when insufficient literature data exist). The properties provided are viscosity, thermal conductivity, Prandtl number, density, speed-of-sound, specific heat, enthalpy, and entropy for temperatures between -20 and 30 C and pressures up to 20 bars. We will also explore methods of varying the composition of the working fluid to maintain a constant speed of sound over the operating range of the refrigerator. (MM).

Exposure: An Expert System Fire Code.
Final rept.
R. L. Smith. 1991, 15p.
Pub. in Fire Technology 27, n2 p145-159 May 91.

Keywords: *Fire codes, *Artificial intelligence, *Building codes, Fire spread, Computer programs, Exposure, Cost effectiveness, Walls, Fire safety, Reprints, *Building fires, *Expert systems, Combustibles.

The report addresses the issue of developing an expert or knowledge-based system that deals with the problem of preventing the spread of fire between buildings. A knowledge-based program, EXPOSURE, has been developed that facilitates using more appropriate technology, expanding the problem domain, and providing cost-effective solutions. EXPOSURE can solve the problem of the prevention of the spread of fire between buildings for the case when the exposed building has combustible walls. The use of the expert system EXPOSURE and NFPA 80A produce significantly different recommended minimum separation between buildings. In one case the separation required by NFPA 80A was more than five times greater than what EXPOSURE recommended. The program demonstrates that significant cost savings in achieving the desired level of fire safety and in assuring the levels of safety can be obtained by use of expert system fire codes.

Pub. in Proceedings of Interflam '90 Conference, Canterbury, England, September 3-6, 1990, p305-314.

Keywords: *Fire research, *Technology innovation, *Fire safety, Cost effectiveness, Fire losses, Fire codes, International cooperation, Reprints, Fire research strategies.

Recently, in the U.S.A., fire deaths and injuries have plateaued (and may even be increasing) and the costs of fire safety to society have been increasing and in most cases well ahead of inflation. The paper presents a preliminary analysis of this situation from the perspective of the potential contribution of fire research. It points to the need for major technical innovations in five areas to provide the basis for legitimizing fire prevention technology, or what we have termed the technologies for assured fire safety. These technologies may complement and strengthen the traditional fire safety strategies, further reducing the losses to fire and the economic burdens of fire on society.

AutoBid 2.0: The Microcomputer System for Police Patrol Vehicle Selection.
S. F. Weber. Feb 96, 12p, NISTIR-5787.
Sponsored by National Inst. of Justice, Washington, DC.

Keywords: *Police patrol cars, *Fleet management, *Acquisition, *Decision support systems, Selection, Ranking, Ratings, Factor analysis, Cost benefit analysis, Performance evaluation, Procurement, Decision making, Optimization, Police vehicles, User manuals(Computer programs), AutoBid computer program, Police equipment, Multiattribute analysis.

This report is the user manual for a microcomputer system designed to help police fleet administrators select the patrol vehicle that is best suited to their needs. The system is called AutoBid and uses vehicle performance test data for police patrol package models published annually by the Michigan State Police. The system offers two vehicle selection methods: performance-based and value-based. Performance selection is based on both vehicle test scores alone. It ranks vehicles by their overall test performance independent of cost. Value selection is based on both vehicle cost and test scores. It identifies which vehicle is the 'Best Buy' in terms of the lowest cost for equivalent test performance and ranks the vehicles by the bid price adjusted for performance. Either or both of these methods may be used for a given fleet acqusition decision.

Keywords: *Directories, *Law enforcement, *Organizations, United States, Criminal justice.

This is a directory of organizations that are active in one or more areas of the criminal justice system, including law enforcement, courts, corrections and rehabilitation. The directory lists national organizations primarily, but also includes regional organizations and local organizations of special interest as well as international organizations which have a significant number of American members, a U.S. chapter or subcommit-

tee, or are doing work applicable to law enforcement in this country. The types of national law enforcement and criminal justice organizations listed in this directory are limited by the criterion that they be nonprofit. Included in this category are professional and volunteer social action associations, research centers (usually connected with a university), and government agencies. Strictly social or fraternal organizations are not listed.

PB96-167127 *02,595*

Supercritical Fluid Extraction-Immunoassay for the Rapid Screening of Cocaine in Hair.
PB96-167168 *00,637*

New NIST Rapid Pneumatic Tube System.
PB96-167259 *03,738*

Development of the Ion Exchange-Gravimetric Method for Sodium in Serum as a Definitive Method.
PB96-179148 *01,867*

Preliminary Investigation of Oleoresin Capsicum.
PB96-179486 *03,520*

Fluoride Analytical Methods.
PB96-180237 *03,578*

Isolation and Structural Elucidation of the Predominant Geometrical Isomers of alpha-Carotene.
PB96-190061 *00,640*

Role of Certified Reference Materials in Trace Analysis Quality Assurance.
PB97-110019 *00,650*

Interlaboratory Studies on the Analysis of Hair for Drugs of Abuse: Results from the Fourth Exercise.
PB97-111322 *03,510*

Use of Neutron Beams for Chemical Analysis at NIST.
PB97-112437 *00,652*

Measurement of Ascorbic Acid in Human Plasma and Serum: Stability, Intralaboratory Repeatability, and Interlaboratory Reproducibility.
PB97-112445 *03,511*

CONTAM94: A Multizone Airflow and Contaminant Dispersal Model with a Graphic User Interface.
PB97-113203 *02,570*

Liquid Chromatographic Determination of Carotenoids in Human Serum Using an Engineered C30 and a C18 Stationary Phase.
PB97-119333 *03,512*

Radiocarbon Measurements of Atmospheric Volatile Organic Compounds: Quantifying the Biogenic Contribution.
PB97-122352 *02,574*

ANALYTICAL METHODS

Certification of Polycyclic Aromatic Hydrocarbons in a Marine Sediment Standard Reference Material.
PB96-111778 *02,592*

Application of a Novel Slurry Furnace AAS Protocol for Rapid Assessment of Lead Environmental Contamination.
PB96-112354 *02,526*

ANALYTICAL TECHNIQUES

Classical Analysis: A Look at the Past, Present, and Future.
PB94-185063 *00,528*

Dissolution Problems with Botanical Reference Materials.
PB95-126280 *03,487*

Results of the ASTM Nuclear Methods Intercomparison on NIST Apple and Peach Leaves Standard Reference Materials.
PB97-119036 *03,490*

ANALYZERS

Design and Characterization of X-Ray Multilayer Analyzers for the 50 - 1000 eV Region.
PB94-211851 *03,848*

ANATOMIC MODELS

Summary of the Proceedings of the Workshop on Standard Phantoms for In-vivo Radioactivity Measurement.
PB94-212933 *03,622*

ANELASTICITY

Temperature and Frequency Dependence of Anelasticity in a Nickel Oscillator.
PB96-137732 *03,689*

ANEMOMETERS

Thermal Anemometry for Mass Flow Measurement in Oscillating Cryogenic Gas Flows.
PB96-176789 *04,218*

ANGLE MEASUREMENT

Advanced Angle Metrology System.
PB94-211364 *02,637*

ANGLES (GEOMETRY)

Tilt Effects in Optical Angle Measurements.
PB95-169389 *04,294*

ANGULAR DISTRIBUTIONS

Measuring Nondipolar Asymmetries of Photoelectron Angular Distributions.
PB97-122493 *01,193*

ANGULAR MOMENTUM

Collisional Alignment of CO2 Rotational Angular Momentum States in a Supersonic Expansion.
PB96-103171 *01,069*

ANHARMONIC OSCILLATORS

Anharmonic Oscillator Analysis Using Modified Airy Functions.
PB94-185311 *03,798*

ANIMAL FEED

Individual Carotenoid Content of SRM 1548 Total Diet and Influence of Storage Temperature, Lyophilization, and Irradiation on Dietary Carotenoids.
PB94-200524 *00,033*

ANIMAL HUSBANDRY

Preparation and Monitoring of Lead Acetate Containing Drinking Water Solutions for Toxicity Studies.
PB94-193885 *00,538*

ANIMAL PHYSIOLOGY

Histopathology, Blood Chemistry, and Physiological Status of Normal and Moribund Striped Bass ('Morone saxatilis') Involved in Summer Mortality ('Die-Off') in the Sacramento-San Joaquin Delta of California.
PB94-198157 *00,034*

ANIMAL TISSUES

Development of Frozen Whale Blubber and Liver Reference Materials for the Measurement of Organic and Inorganic Contaminants.
PB95-151676 *00,587*

Determination of Inorganic Constituents in Marine Mammal Tissues.
PB95-152047 *00,589*

Development of the National Marine Mammal Tissue Bank.
PB95-161402 *02,586*

Quality Assurance of Contaminant Measurements in Marine Mammal Tissues.
PB95-164034 *02,588*

Alaska Marine Mammal Tissue Archival Project: Specimen Inventory.
PB95-171344 *02,589*

Concentrations of Chlorinated Hydrocarbons, Heavy Metals and Other Elements in Tissues Banked by the Alaska Marine Mammal Tissue Archival Project.
PB95-209870 *02,590*

Certification of Polychlorinated Biphenyl Congeners and Chlorinated Pesticides in a Whale Blubber Standard Reference Material.
PB96-103023 *03,745*

National Status and Trends Program Specimen Bank: Sampling Protocols, Analytical Methods, Results, and Archive Samples.
PB97-119226 *02,598*

ANIONS

Vibrational Spectra of Molecular Ions Isolated in Solid Neon. 11. NO2(+), NO2(-), and NO3(-).
AD-A275 828/2 *00,708*

Temperature Dependence of the Rate Constants for Reactions of the Sulfate Radical, SO4-, with Anions.
PB94-212172 *00,828*

Temperature Dependence of the Rate Constants for Reactions of the Carbonate Radical with Organic and Inorganic Reductants.
PB94-212206 *00,831*

ANISOLE

Thermal Decomposition of Hydroxy- and Methoxy-Substituted Anisoles.
PB94-173036 *00,767*

ANISOTROPHY

Ultrasonic Measurement of Sheet Anisotropy and Formability.
PB95-153235 *03,213*

ANISOTROPIC MATERIALS

Microwave Dielectric Properties of Anisotropic Materials at Cryogenic Temperatures.
PB96-137765 *02,412*

ANISOTROPY

Convection and Morphological Stability During Directional Solidification.
N95-14548/8 *03,310*

Anisotropic Phase Separation Kinetics in a Polymer Blend Solution Following Cessation of Shear Studied by Light Scattering.
PB95-151247 *01,241*

Anisotropy of Polarized X-ray Emission from Atoms and Molecules.
PB95-163002 *04,621*

ANISTROPY

Fluorescence Anisotropy Measurements on a Polymer Melt as a Function of Applied Shear Stress.
PB94-199296 *01,209*

Hemispherical Test Fixture for Measuring the Wavefields Generated in an Anisotropic Solid.
PB96-190087 *03,181*

Notion of a xi-Vector and a Stress Tensor for a General Class of Anisotropic Diffuse Interface Models.
PB96-193776 *04,78E*

ANNEALING

Magnetostriction and Giant Magnetoresistance in Annealed NiFe/Ag Multilayers.
PB96-102603 *04,716*

Low Magnetostriction in Annealed NiFe/Ag Giant Magnetoresistive Multilayers.
PB96-146691 *04,762*

Annealing of Bragg Gratings in Hydrogen-Loaded Optical Fiber.
PB96-155437 *04,361*

Effect of Intermediate Thermal Processing on Microstructural Changes of Oxygen Implanted Silicon-on-Insulator Material.
PB96-160213 *02,982*

Antiferromagnetic Interlayer Correlations in Annealed Ni80Fe20/Ag Multilayers.
PB97-122220 *03,109*

ANNELING

Oxygen Annealing of Ex-situ YBCO/Ag Thin-Film Interfaces.
PB96-141312 *04,758*

ANNULAR FLOW

Single-Phase Heat Transfer and Pressure Drop Characteristics of an Integral-Spine-Fin Within an Annulus.
PB94-194073 *03,805*

Single-Phase Heat Transfer and Pressure Drop Characteristics of an Integral-Spine Fin Within an Annulus.
PB97-122386 *04,179*

ANOMALOUS DISPERSIONS

Theoretical Form Factor, Attenuation and Scattering Tabulation for Z=1-92 from E=1-10 eV to E=0.4-1.0 MeV.
PB96-145594 *01,104*

ANSI/ASHRAE STANDARD 124-1991

Predicting the Energy Performance Ratings of a Family of Type I Combination Appliances.
PB95-105524 *02,504*

ANTENNA ARRAYS

Optically Linked Three-Loop Antenna System for Determining the Radiation Characteristics of an Electrically Small Source.
PB95-161915 *02,005*

ANTENNA MEASUREMENTS

Planar Near-Field Alignment.
PB94-172491 *01,998*

New Extrapolation/Spherical/Cylindrical Measurement Facility at the National Institute of Standards and Technology.
PB95-153755 *02,004*

ANTENNA RADIATION PATTERNS

Correction Factor for Nonplanar Incident Field in Monopole Calibrations.
PB95-108643 *02,002*

ANTENNAS

Standard Probes for Electromagnetic Field Measurements.
PB94-185436 *01,999*

Planar Near-Field Measurements of Low-Sidelobe Antennas.
PB94-219235 *02,001*

Dual Frequency mm-Wave Radiometer Antenna for Airborne Remote Sensing of Atmosphere and Ocean.
PB95-180378 *02,006*

Standard Antennas for Electromagnetic Interference Measurements and Methods to Calibrate Them.
PB96-102561 *02,007*

Dual-Frequency Millimeter-Wave Radiometer Antenna for Airborne Remote Sensing of Atmosphere and Ocean.
PB96-112289 *02,009*

Comparison of k-Correction and Taylor-Series Correction for Probe-Position Errors in Planar Near-Field Scanning.
PB96-147137 *02,012*

Standard Source Method for Reducing Antenna Factor Errors in Shielded Room Measurements.
PB96-183157 *02,013*

Methodology for Electromagnetic Interference Measurements.
PB96-200126 *02,014*

Comparison of Ultralow-Sidelobe-Antenna Far-Field Patterns Using the Planar-Near-Field Method and the Far-Field Method.
PB96-200373 *02,015*

General Order 'N' Analytic Correction of Probe-Position Errors in Planar Near-Field Measurements.
PB96-200688 *01,562*

Novel Hot-Electron Microbolometer.
PB96-201025 *01,977*

ANTHROPOMETRY

Bibliography on Apparel Sizing and Related Issues.
PB94-161924 *02,806*

Body Dimensions for Apparel.
PB94-187739 *02,813*

ANTIFERROMAGNETIC COUPLING

Magnetic Structure Determination for Annealed Ni80Fe20/Ag Multilayers Using Polarized-Neutron Reflectivity.
PB96-176615 *03,739*

ANTIFERROMAGNETIC MATERIALS

Comment on 'Phase Transitions in Antiferromagnetic Superlattices'.
PB95-152971 *04,587*

ANTIFERROMAGNETICS

Antiferromagnetic Interlayer Correlations in Annealed Ni80Fe20/Ag Multilayers.
PB97-122220 *03,109*

ANTIFERROMAGNETISM

Concurrent Enhancement of Kerr Rotation and Antiferromagnetic Coupling in Epitaxial Fe/Cu/Fe Structures.
PB94-198769 *04,466*

GENERAL THEORETICAL CHEMISTRY & PHYSICS

KEYWORD INDEX

METROLOGY: PHYSICAL MEASUREMENTS

PROPERTIES OF MATERIALS: STRUCTURAL/ MECHANICAL

PROPERTIES OF MATERIALS: THERMODYNAMIC/ TRANSPORT

Screw-Thread Standards for Federal Services, 1957. Handbook H28 (1957), Part 2. Revised.
AD-A280 082/9 *03,599* PC A06/MF A02

Screw-Thread Standards for Federal Services, 1957. Part 1.
AD-A279 290/1 *02,855* PC A10/MF A03

Screw-Thread Standards for Federal Services, 1957. Part 3.
AD-A279 121/8 *02,854* PC A04/MF A01

SDNS Security Management.
PB95-161170 *01,592* Not available NTIS

Sealed Water Calorimeter for Measuring Absorbed Dose.
PB94-219227 *03,517*
(Order as PB94-219219, PC A06/MF A02)

Search for Radio Emission from the 'Non-Magnetic' Chemically Peculiar Stars.
PB96-102249 *00,087* Not available NTIS

Search for Small Violations of the Symmetrization Postulate in an Excited State of Helium.
PB96-123518 *04,050* Not available NTIS

Second Census Optical Character Recognition Systems Conference.
PB94-188711 *01,832* PC A12/MF A03

Second Text REtrieval Conference (TREC-2). Held in Gaithersburg, Maryland on August 31-September 2, 1993.
PB94-178407 *01,686* PC A21/MF A04

Secondary Standard for PM and AM Noise at 5, 10, and 100 MHz.
PB96-123187 *01,554* Not available NTIS

Secondary Target X-Ray Excitation for In vivo Measurement of Lead in Bone.
PB95-108767 *03,496* Not available NTIS

Secure Hash Standard. Category: Computer Security.
FIPS PUB 180-1 *01,568* PC E04

Security Considerations for SOL-Based Implementations of STEP.
PB94-139649 *02,766* PC A03/MF A01

Security in Open Systems.
PB95-105383 *01,473* PC A13/MF A03

Security Program Management.
PB96-156112 *01,610* Not available NTIS

Security Requirements for Cryptographic Modules; Category: Computer Security; Subcategory: Cryptography.
FIPS PUB 140-1 *01,567* PC E05

Segmental Concentration Profiles of End-Tethered Polymers with Excluded-Volume and Surface Interactions.
PB97-119002 *00,654* Not available NTIS

Seismic Instrumentation of Existing Buildings.
PB94-159779 *00,420* PC A04/MF A01

Seismic Performance Behavior of Precast Concrete Beam-Column Joints.
PB95-153110 *00,440* Not available NTIS

Seismic Performance of Circular Bridge Columns Designed in Accordance with AASHTO/CALTRANS Standards.
PB96-146352 *01,346* PC A07/MF A02

Seismic Safety of Federal Buildings. Initial Program: How Much Will It Cost.
PB95-182291 *00,447* PC A03/MF A01

Seismic Strengthening of Reinforced Concrete Frame Buildings.
PB95-108841 *00,430* Not available NTIS

Selected Ion Flow Tube-Laser Induced Fluorescence Instrument for Vibrationally State-Specific Ion-Molecule Reactions.
PB94-185444 *00,774* Not available NTIS

Selection of Appropriate Ultrasonic System Components for NDE of Thick Polymer-Composites.
PB94-185279 *03,133* Not available NTIS

Selective Inhibition of Crystal Growth on Octacalcium Phosphate and Nonstoichiometric Hydroxyapatite by Pyrophosphate at Physiological Concentration.
PB94-211257 *00,147* Not available NTIS

Selectivity Trends in Packed Column Supercritical Fluid Chromatography with C18 Stationary Phases.
PB96-138581 *00,622* Not available NTIS

Self-Assembled Phospholipid/Alkanethiol Biomimetic Bilayers on Gold.
PB95-108460 *00,878* Not available NTIS

Self-Avoiding Surfaces, Topology, and Lattice Animals.
PB95-150512 *04,571* Not available NTIS

Self-Avoiding-Walk Contacts and Random-Walk Self-Intersections in Variable Dimensionality.
PB96-102231 *01,276* Not available NTIS

Self-Biasing Cryogenic Particle Detector Utilizing Electrothermal Feedback and a SQUID Readout.
PB96-102538 *04,712* Not available NTIS

Self Broadening in the nu1 Band of NH3.
PB94-216371 *00,857* Not available NTIS

Self-Calibrated Intelligent Optical Sensors and Systems.
PB96-200738 *04,380* Not available NTIS

Self-Calibrating Fiber Optic Sensors: Potential Design Methods.
PB95-169298 *02,172* Not available NTIS

Self Calibrating Fiber Optic Sensors: Potential Design Methods.
PB95-169306 *02,173* Not available NTIS

Self-Consistent 'GW' and Higher-Order Calculations of Electron States in Metals.
PB97-119341 *01,189* Not available NTIS

Self-Heating in the Coulomb-Blockade Electrometer.
PB94-212685 *04,507* Not available NTIS

Self Monitoring Accounting Systems.
PB95-216602 *00,007* PC A03/MF A01

Self-, N2- and Ar-Broadening and Line Mixing in HCN and C2H2.
PB95-108445 *00,876* Not available NTIS

Self-Organizing Neural Network Character Recognition on a Massively Parallel Computer.
PB95-163994 *01,845* Not available NTIS

Self-Organizing Neural Network Character Recognition Using Adaptive Filtering and Feature Extraction.
PB96-119797 *01,855* Not available NTIS

Self-Reciprocal Fourier Functions.
PB96-200852 *01,974* Not available NTIS

SEM Linewidth Metrology of X-ray Lithography Masks.
PB96-201108 *02,447* Not available NTIS

Semiclassical Explanation of the Generalized Ramsauer-Townsend Minima in Electron-Atom Scattering.
PB95-153532 *03,925* Not available NTIS

Semiconductor Measurement Technology: Design and Testing Guides for the CMOS and Lateral Bipolar-on-SOI Test Library.
PB94-178019 *02,301* PC A07/MF A02

Semiconductor Measurement Technology: HOTPAC. Programs for Thermal Analysis Including Version 3.0 of the TXYZ Program, TXYZ30, and the Thermal MultiLayer Program, TML.
PB95-260766 *02,374* PC A05/MF A01

Semiconductor Measurement Technology: Improved Characterization and Evaluation Measurements for HgCdTe Detector Materials, Processes, and Devices Used on the GOES and TIROS Satellites.
PB94-188810 *02,122* PC A09/MF A02

Semiconductor Measurement Technology: Survey of Optical Characterization Methods for Materials, Processing, and Manufacturing in the Semiconductor Industry.
PB96-154596 *02,706* PC A05/MF A01

Semiconductor Measurement Technology: Test Structure Implementation Document: DC Parametric Test Structures and Test Methods for Monolithic Microwave Integrated Circuits (MMICs).
PB96-117692 *02,399* PC A05/MF A01

SEMPA Studies of Exchange Coupling in Magnetic Multilayers.
PB96-164074 *04,780* Not available NTIS

SEMPA Studies of Oscillatory Exchange Coupling.
PB95-163556 *04,625* Not available NTIS

Sensing Droplet Detachment and Electrode Extension for Control of Gas Metal Arc Welding.
PB96-190160 *03,297* Not available NTIS

Sensitivity Analysis for Mathematical Modeling of Fires in Residential Buildings.
PB96-154968 *00,215* PC A03/MF A01

Sensitivity of Three-Point Circle Fitting.
PB95-136354 *02,901* PC A03/MF A01

Sensor System for Intelligent Processing of Hot-Rolled Steel.
PB96-186069 *03,373* Not available NTIS

Separation and Identification of Organic Gunshot and Explosive Constituents by Micellar Electrokinetic Capillary Electrophoresis.
PB95-107249 *00,566* Not available NTIS

Serial Sectioning of Hardened Cement Paste for Scanning Electron Microscopy.
PB94-172640 *01,305* Not available NTIS

Series Array of DC SQUIDs.
PB95-163861 *02,046* Not available NTIS

SF6 Insulation: Possible Greenhouse Problems and Solutions.
PB95-251625 *02,269* PC A03/MF A01

SF6/N2 Mixtures: Basic and High-Voltage-Insulation Properties.
PB96-123468 *02,230* Not available NTIS

SGML Environment for STEP.
PB95-143103 *02,778* PC A03/MF A01

SGML Parser Validation Procedures.
PB95-174959 *01,717* PC A03/MF A01

Shape of the Temperature-Entropy Saturation Boundary.
PB96-135066 *02,506* Not available NTIS

Shape-Resonance-Enhanced Continuum-Continuum Coupling in Photoionization of CO2.
PB95-164471 *00,983* Not available NTIS

Shape Selectivity Assessment of Stationary Phases in Gas Chromatography.
PB95-150256 *00,579* Not available NTIS

Shape Selectivity in Reversed-Phase Liquid Chromatography for the Separation of Planar and Non-Planar Solutes.
PB95-162608 *00,596* Not available NTIS

Shapiro Steps in Large-Area Metallic-Barrier Josephson Junctions.
PB96-200142 *02,090* Not available NTIS

Sharing Information via the Internet: An Infoserver Case Study.
PB96-131511 *01,493* PC A03/MF A01

Shear Dependence of Critical Fluctuations in Binary Polymer Mixtures by Small Angle Neutron Scattering.
PB94-211612 *01,220* Not available NTIS

Shear Design of High-Strength Concrete Beams: A Review of the State-of-the-Art.
PB96-214713 *01,330* PC A11/MF A03

Shear-Excited Morphological States in a Triblock Copolymer.
PB94-172392 *01,196* Not available NTIS

Shear-Induced Changes in the Order-Disorder Transition Temperature and the Morphology of a Triblock Copolymer.
PB97-118772 *03,130* Not available NTIS

Shear-Induced Martensitic-Like Transformation in a Block Copolymer Melt.
PB96-119508 *01,277* Not available NTIS

Shear-Induced Melting of Two-Dimensional Solids.
PB96-112057 *01,075* Not available NTIS

Shear-Induced Mixing in Polymer Blends.
PB96-148085 *01,287* Not available NTIS

Shear Suppression of Critical Fluctuations in a Diluted Polymer Blend.
PB96-204458 *04,418* Not available NTIS

Shielding of Cracks in a Plastically Polarizable Material.
PB95-164257 *04,631* Not available NTIS

Shock Tube Techniques in Chemical Kinetics.
PB95-163465 *00,968* Not available NTIS

Short-Pulse Detachment of H(-) in the Presence of a Static Electric Field.
PB95-203477 *04,007* Not available NTIS

Short-Range Correlation and Relaxation Effects on the (6p(2))(1)SO Autoionizing State of Atomic Barium.
PB95-202289 *03,973* Not available NTIS

Should NIST Accredit U.S. Calibration Laboratories.
PB95-107280 *02,646* Not available NTIS

Sifting Through Nine Years of NIST Clock Data with TA2.
PB95-181137 *01,547* Not available NTIS

sigma+-sigma- Optical Molasses in a Longitudinal Magnetic Field.
PB95-161840 *03,934* Not available NTIS

Signatures of Large Amplitude Motion in a Weakly Bound Complex: High-Resolution IR Spectroscopy and Quantum Calculations for HeCO2.
PB95-203485 *01,054* Not available NTIS

Significant Contributions of IAPWS to the Power Industry, Science and Technology.
PB96-123252 *01,088* Not available NTIS

Silicon Nitride Boundary Lubrication: Effect of Oxygenates.
PB96-111711 *03,068* Not available NTIS

Silicon Nitride Boundary Lubrication: Lubrication Mechanism of Alcohols.
PB96-111703 *03,067* Not available NTIS

Silicon Photodiodes Optimized for EUV and Soft X-Ray Regions.
PB94-199478 *02,124* Not available NTIS

Silicon Surface Chemistry by IR Spectroscopy in the Mid- to Far-IR Region: H2O and Ethanol on Si(100).
PB96-138565 *01,097* Not available NTIS

NISTIR-5800
Guidelines for Pre-Qualification, Prototype and Quality Control Testing of Seismic Isolation Systems.
PB96-193685 *01,347* PC A08/MF A02

NISTIR-5801
Multizone Modeling of Three Residential Indoor Air Quality Control Options.
PB96-165782 *02,567* PC A08/MF A02

NISTIR-5806
Method of Estimating the Parameters of Tuned Mass Dampers for Seismic Applications.
PB96-167820 *00,473* PC A04/MF A01

NISTIR-5808
Machining Process Planning Activity Model for Systems Integration.
PB96-165428 *02,841* PC A03/MF A01

NISTIR-5809
Numerical Simulation of Rapid Combustion in an Underground Enclosure.
PB96-183132 *01,424* PC A03/MF A01

NISTIR-5810
TMACH Experiment Phase 1. Preliminary Developmental Evaluation.
PB96-195318 *01,618* PC A03/MF A01

NISTIR-5811
Basic Linear Algebra Operations in SLI Arithmetic.
PB96-165931 *03,421* PC A03/MF A01

NISTIR-5815
Electronics and Electrical Engineering Laboratory Technical Progress Bulletin Covering Laboratory Programs, October to December 1995 with 1996 EEEL Events Calendar.
PB96-183116 *01,966* PC A04/MF A01

NISTIR-5816
Electronics and Electrical Engineering Laboratory Technical Publication Announcements Covering Laboratory Programs, July to September 1995 with 1996 EEEL Events Calendar.
PB96-183066 *01,965* PC A03/MF A01

NISTIR-5818
Electronics and Electrical Engineering Laboratory 1995 Technical Accomplishments: Advancing Metrology for Electrotechnology to Support the U.S. Economy.
PB96-164520 *01,959* PC A05/MF A01

NISTIR-5819
X.500 Directory Schema Design Handbook.
PB96-183041 *02,739* PC A03/MF A01

NISTIR-5820
Distributed Communication Methods and Role-Based Access Control for Use in Health Care Applications.
PB96-183165 *01,508* PC A05/MF A01

NISTIR-5821
Aspects of a Product Model Supporting Apparel Virtual Enterprises.
PB96-183231 *02,790* PC A03/MF A01

NISTIR-5822
Proceedings of NIST Workshop: Industry Needs in Welding Research and Standards Development. Held on August 15-16, 1995.
PB96-183124 *02,877* PC A04/MF A01

NISTIR-5823
Survey of Standards for the U.S. Fiber/Textile/Apparel Industry.
PB96-193792 *03,199* PC A06/MF A01

NISTIR-5824
Interoperability Experiments with CORBA and Persistent Object Base Systems.
PB96-183140 *01,772* PC A04/MF A01

NISTIR-5826
Hygrothermal Effects on the Performance of Polymers and Polymeric Composites: A Workshop Report. Held in Gaithersburg, Maryland on September 21-22, 1995.
PB96-183207 *03,180* PC A04/MF A01

NISTIR-5828
CSTL Technical Activities, 1995.
PB96-214630 *00,647* PC A10/MF A03

NISTIR-5832
Electronics and Electrical Engineering Laboratory: 1996 Program Plan. Supporting Technology for U.S. Competitiveness in Electronics.
PB96-175237 *01,962* PC A10/MF A03

NISTIR-5833
Procedure for Product Data Exchange Using STEP Developed in the AutoSTEP Pilot.
PB96-183058 *02,843* PC A04/MF A01

NISTIR-5837
Workshop on Characterizing Diamond Films (4th). Held in Gaithersburg, Maryland on March 4-5, 1996.
PB96-183090 *04,786* PC A04/MF A01

NISTIR-5838
Room-Temperature Thermal Conductivity of Expanded Polystyrene Board for a Standard Reference Material.
PB96-193693 *00,412* PC A04/MF A01

NISTIR-5839
Systems Integration for Manufacturing Applications Program 1995 Annual Report.
PB96-193735 *02,844* PC A05/MF A01

NISTIR-5840
Benefits and Costs of Research: Two Case Studies in Building Technology.
PB96-202221 *00,230* PC A07/MF A02

NISTIR-5842
Methodology for Developing and Implementing Alternative Temperature-Time Curves for Testing the Fire Resistance of Barriers for Nuclear Power Plant Applications.
PB96-193784 *03,742* PC A07/MF A02

NISTIR-5843
Component-Based Handprint Segmentation Using Adaptive Writing Style Model.
PB96-193669 *01,859* PC A03/MF A01

NISTIR-5844
Interoperability Requirements for CAD Data Transfer in the AutoSTEP Project.
PB97-114268 *02,796* PC A03/MF A01

NISTIR-5845
Program of the Manufacturing Engineering Laboratory, 1996. Infrastructural Technology, Measurements, and Standards for the U.S. Manufacturing Industries.
PB96-195276 *02,760* PC A11/MF A03

NISTIR-5846
Computer-Aided Manufacturing Engineering Forum (2nd). Technical Meeting Proceedings. Held in Gaithersburg, Maryland on August 22-23, 1995.
PB96-195334 *02,845* PC A11/MF A03

NISTIR-5847
Warping of Terrace Pavers at the U.S. Capitol Building.
PB96-193651 *00,411* PC A03/MF A01

NISTIR-5848
Notion of a xi-Vector and a Stress Tensor for a General Class of Anisotropic Diffuse Interface Models.
PB96-193776 *04,788* PC A03/MF A01

NISTIR-5849
Summary of Federal Construction and Building R and D in 1994.
PB97-114250 *00,234* PC A04/MF A01

NISTIR-5851
National Semiconductor Metrology Program, Project Portfolio FY 1996.
PB96-195268 *04,789* PC A03/MF A01

PB94-142486
Mass Unit Disseminated to Surrogated Laboratories Using the NIST Portable Mass Calibration Package.
PB94-142486 *03,781* PC A03/MF A01

PB94-142494
Introduction to Traffic Management for Broadband ISDN.
PB94-142494 *01,464* PC A03/MF A01

PB94-142502
Applying Virtual Environments to Manufacturing.
PB94-142502 *02,803* PC A03/MF A01

PB94-142510
Assessment of Uncertainties of Liquid-in-Glass Thermometer Calibrations at the National Institute of Standards and Technology.
PB94-142510 *02,625* PC A03/MF A01

PB94-142528
Context Analysis of the Network Management Domain. Conducted as Part of the Domain Analysis Case Study.
PB94-142528 *01,465* PC A05/MF A01

PB94-142536
Report on Application Integration Architectures (AIA) Workshop. Held in Dallas, Texas on February 8-12, 1993.
PB94-142536 *01,803* PC A07/MF A02

PB94-142791
Feasibility Study: Reference Architecture for Machine Control Systems Integration.
PB94-142791 *02,804* PC A12/MF A03

PB94-142973
In situ Burning of Oil Spills: Mesoscale Experiments.
PB94-142973 *01,355* PC A04/MF A01

PB94-143344
Evaluation of GSA Maintenance Practices of Large Centrifugal Chillers and Review of GSA Refrigerant Management Practices.
PB94-143344 *02,502* PC A04/MF A01

PB94-143401
Next Generation Computer Resources: Reference Model for Project Support Environments (Version 2.0).
PB94-143401 *01,677* PC A06/MF A02

PB94-143427
Computational Model for the Rise and Dispersion of Wind-Blown, Buoyancy-Driven Plumes. Part 2. Linearly Stratified Atmosphere.
PB94-143427 *00,119* PC A03/MF A01

PB94-143542
Ground-Based Smoke Sampling Techniques Training Course and Collaborative Local Smoke Sampling in Saudi Arabia.
PB94-143542 *02,532* PC A05/MF A01

PB94-145620
Reliable Optical Flow Algorithm Using 3-D Hermite Polynomials.
PB94-145620 *01,829* PC A03/MF A01

PB94-145653
Manual for Ventilation Assessment in Mechanically Ventilated Commercial Buildings.
PB94-145653 *00,239* PC A07/MF A02

PB94-145661
System for Calibration of the Marshall Compaction Hammer.
PB94-145661 *01,303* PC A08/MF A02

PB94-145711
Aperture Excitation of Electrically Large, Lossy Cavities.
PB94-145711 *00,029* PC A05/MF A01

PB94-145968
Electronics and Electrical Engineering Laboratory Technical Progress Bulletin Covering Laboratory Programs, January to March 1991, with 1991 EEEL Events Calendar.
PB94-145968 *02,113* PC A03/MF A01

PB94-145976
Use of Computer Models to Predict Temperature and Smoke Movement in High Bay Spaces.
PB94-145976 *00,191* PC A04/MF A01

PB94-145984
Alternating-Field Susceptometry and Magnetic Susceptibility of Supercondoctors. Presented at Office of Naval Research Workshop on Magnetic Susceptibility of Superconductors and Other Spin Systems. Held in Berkeley Springs, West Virginia on 20 May 1991.
PB94-145984 *04,435* PC A01/MF A01

PB94-146636
Modulation of Fossil Fuel Production by Global Temperature Variations, 2.
PB94-146636 *02,533* PC A04/MF A01

PB94-146677
Thermophysical Properties of Fluids for the Gas Industry. Final Report, February 1, 1988-August 31, 1993.
PB94-146677 *02,472* PC A03/MF A01

PB94-150919
Guide to Configuration Management and the Revision Control System for Testbed Users.
PB94-150919 *01,678* PC A03/MF A01

PB94-151776
NIST 60-Millimeter Diameter Cylindrical Cavity Resonator: Performance Evaluation for Permittivity Measurements.
PB94-151776 *02,251* PC A11/MF A03

PB94-151842
NIST Standard Reference Data Products Catalog, 1994.
PB94-151842 *00,727* PC A06/MF A02

PB94-152006
Fire Safety of Passenger Trains: A Review of Current Approaches and of New Concepts.
PB94-152006 *04,848* PC A11/MF A03

PB94-152204
Abstract and Index Collection in the Research Information Center of the National Institute of Standards and Technology.
PB94-152204 *02,744* PC A03/MF A01

PB94-152691
Assessment of Uncertainties of Thermocouple Calibrations at NIST.
PB94-152691 *03,782* PC A03/MF A01

PB94-152709
Submissions to a Planned Encyclopedia of Operations Research on Computational Geometry and the Voronoi/Delaunay Construct.
PB94-152709 *03,425* PC A03/MF A01

PB94-152725
Growth Surface for the Slopes at the Boundary of a Polygon.
PB94-152725 *03,408* PC A03/MF A01

PB94-152733
Photonic Materials: A Report on the Results of a Workshop. Held in Gaithersburg, Maryland on August 26-27, 1992, Volume 1.
PB94-152733 *02,114* PC A05/MF A01

PB94-154325
APDE Demonstration System Architecture. National PDES Testbed Report Series.
PB94-154325 *02,767* PC A03/MF A01

PB94-154341
Electronics and Electrical Engineering Laboratory Technical Progress Bulletin Covering Programs, October to December 1993, with 1994/1995 EEEL Events Calendar.
PB94-154341 *02,115* PC A03/MF A01

PB94-154358
Variant Design for Mechanical Artifacts-A State of the Art Survey.
PB94-154358 *02,768* PC A03/MF A01

PB94-154382
Source of Phenol Emissions Affecting the Indoor Air of an Office Building.
PB94-154382 *03,600* PC A04/MF A01

PB94-154390
Corrosion Resistance of Materials for Renovation of the United States Botanic Garden Conservatory.
PB94-154390 *00,032* PC A03/MF A01

PB94-155579
Development and Characterization of Insulating Layers on Silicon Carbide: Annual Report for February 14, 1988 to February 14, 1989.
PB94-155579 *02,295* PC A03/MF A01

PB94-155587
Sulfur Dioxide Capture in the Combustion of Mixtures of Lime, Refuse-Derived Fuel, and Coal.
PB94-155587 *02,534* PC A04/MF A01

PB94-156866
Concurrent Flow Flame Spread Study.
PB94-156866 *01,356* PC A08/MF A02

PB94-156957
Transient Cooling of a Hot Surface by Droplets Evaporation.
PB94-156957 *03,783* PC A08/MF A02

PB94-156965
Numerical Analysis Support for Compartment Fire Modeling and Incorporation of Heat Conduction into a Zone Fire Model.
PB94-156965 *01,357* PC A04/MF A01

PB94-157831
Opportunities for Innovation: Biotechnology.
PB94-157831 *00,009* PC A12/MF A03

PB94-158268
Boundary Conforming Grid Generation System for Interface Tracking.
PB94-158268 *03,312* PC A03/MF A01

PB94-158573
Study to Determine the Most Important Parameters for Evaluating the Resistance of Soft Body Armor to Penetration by Edged Weapons.
PB94-158573 *03,757* PC A03/MF A01

PB94-159761
Metrology for Electromagnetic Technology: A Bibliography of NIST Publications.
PB94-159761 *02,116* PC A04/MF A01

PB94-159779
Seismic Instrumentation of Existing Buildings.
PB94-159779 *00,420* PC A04/MF A01

PB94-159787
Center for Electronics and Electrical Engineering Technical Progress Bulletin Covering Center Programs, October to December, with 1991 CEEE Events Calendar.
PB94-159787 *02,296* PC A03/MF A01

PB94-159795
Structural EXPRESS Editor.
PB94-159795 *02,769* PC A04/MF A01

PB94-160066
Report on the Workshop on Manufacturing Polymer Composites by Liquid Molding. Held in Gaithersburg, Maryland on September 20-22, 1993.
PB94-160066 *03,131* PC A13/MF A03

PB94-160736
Summary Report of NIST's Industry-Government Consortium Research Program on Flowmeter Installation Effects with Emphasis on the Research Period, January-September 1991: The Reducer.
PB94-160736 *04,196* PC A04/MF A01

PB94-160744
Computation of Dendrites Using a Phase Field Model.
PB94-160744 *04,436* PC A03/MF A01

PB94-160751
Performance Approach to the Development of Criteria for Low-Sloped Roof Membranes.
PB94-160751 *00,329* PC A03/MF A01

PB94-160769
CSTL Technical Activities 1991.
PB94-160769 *00,728* PC A16/MF A03

PB94-160777
Microstructural Features of Some Low Water/Solids, Silica Fume Mortars Cured at Different Temperatures.
PB94-160777 *00,330* PC A03/MF A01

PB94-160785
Comparison of Finite Element and Analytic Calculations of the Resonant Modes and Frequencies of a Thick Shell Sphere.
PB94-160785 *02,626* PC A03/MF A01

PB94-160793
Review of Mathematical Function Library for Microsoft-FORTRAN, John Wiley and Sons, 1989.
PB94-160793 *01,679* PC A03/MF A01

PB94-160801
Cylinder Wipe Air-Drying Intaglio Ink Vehicles for U.S. Currency Inks.
PB94-160801 *03,115* PC A03/MF A01

PB94-160819
Technical Program of the Factory Automation Systems Division 1993.

Raman and Fluorescence Spectra Observed in Laser Microprobe Measurements of Several Compositions in the Ln-Ba-Cu-O System.
PB94-172210 *04,440* Not available NTIS

PB94-172228
Leakage Current Detection in Cryogenic Current Comparator Bridges.
PB94-172228 *02,024* Not available NTIS

PB94-172236
Digitized Simulation of Mercury Intrusion Porosimetry.
PB94-172236 *01,304* Not available NTIS

PB94-172244
Octacalcium Phosphate. 3. Infrared and Raman Vibrational Spectra.
PB94-172244 *00,756* Not available NTIS

PB94-172251
PC-Based Prototype Expert System for Data Management and Analysis of Creep and Fatigue of Selected Materials at Elevated Temperatures.
PB94-172251 *03,202* Not available NTIS

PB94-172269
Complementary Molecular Information on Phthalocyanine Compounds Derived from Laser Microprobe Mass Spectrometry and Micro-Raman Spectroscopy.
PB94-172269 *00,757* Not available NTIS

PB94-172277
Analysis of a Biologically Motivated Neural Network for Character Recognition.
PB94-172277 *00,182* Not available NTIS

PB94-172285
Hot Carrier Excitation of Adlayers: Time-Resolved Measurement of Adsorbate-Lattice Coupling.
PB94-172285 *00,758* Not available NTIS

PB94-172293
Thermal Pulse Study of the Polarization Distributions Produced in Polyvinylidene Fluoride by Corona Poling at Constant Current.
PB94-172293 *01,195* Not available NTIS

PB94-172301
RDI-SIM ECMA Inter-Domain Routing Protocol Simulation Tool.
PB94-172301 *01,683* Not available NTIS

PB94-172319
beta-D-Glucosyl-Hydroxymethyluracil: A Novel Modified Base Present in the DNA of the Parastic Protozoan T. brucei.
PB94-172319 *03,524* Not available NTIS

PB94-172327
Gaseous Electronics Conference Radio-Frequency Reference Cell: A Defined Parallel-Plate Radio-Frequency System for Experimental and Theoretical Studies of Plasma-Processing Discharges.
PB94-172327 *04,404* Not available NTIS

PB94-172335
Bringing Natural Language Information Retrieval Out of the Closet.
PB94-172335 *02,720* Not available NTIS

PB94-172343
Recent Experimental and Modeling Developments in High Temperature Thermochemistry.
PB94-172343 *00,759* Not available NTIS

PB94-172350
Effect of DC Tests on Induced Space Charge.
PB94-172350 *02,212* Not available NTIS

PB94-172368
Wear Mechanism Maps of Ceramics.
PB94-172368 *03,229* Not available NTIS

PB94-172376
Electron Screening Correction to the Self Energy in High-Z Atoms.
PB94-172376 *03,789* Not available NTIS

PB94-172384
Investigation of the Effects of Aging on the Calibration of a Kerr-Cell Measuring System for High Voltage Impulses.
PB94-172384 *02,025* Not available NTIS

PB94-172392
Shear-Excited Morphological States in a Triblock Copolymer.
PB94-172392 *01,196* Not available NTIS

PB94-172400
Fracture Mechanics Analysis of Near-Surface Cracks.
PB94-172400 *03,230* Not available NTIS

PB94-172418
Improvement in Predicting Smoke Movement in Compartmented Structures.
PB94-172418 *00,332* Not available NTIS

PB94-172426
Simultaneous Visual and Calorimetric Measurements of R11, R123, and R123/Alkylbenzene Nucleate Flow Boiling.
PB94-172426 *03,251* Not available NTIS

PB94-172434
Error Propagation Biases in the Calculation of Indentation Fracture Toughness for Ceramics.
PB94-172434 *03,032* Not available NTIS

PB94-172442
Intercomparison of NIST, NPL, PTB, and VSL Thermal Voltage Converters from 100 kHz to 1 MHz.
PB94-172442 *02,026* Not available NTIS

PB94-172459
Intercomparison of Thermal Converters at NIM, NIST, PTB, SIRI and VSL from 10 to 100 MHz.
PB94-172459 *02,027* Not available NTIS

PB94-172467
Thermodynamics of the Hydrolysis of Penicillin G and Ampicillin.
PB94-172467 *03,596* Not available NTIS

PB94-172475
Neutron-Spectroscopy Study of the Hydrogen Vibrations in Hydrogen-Doped YBa2Cu3Ox.
PB94-172475 *04,441* Not available NTIS

PB94-172483
Efficient Method to Compute the Maximum Transient Drain Current Overshoot in Silicon on Insulator Devices.
PB94-172483 *02,300* Not available NTIS

PB94-172491
Planar Near-Field Alignment.
PB94-172491 *01,998* Not available NTIS

PB94-172509
Characterization of the Binding of Gallium, Platinum, and Uranium to Pseudomonas Fluorescens by Small-Angle X-ray Scattering and Transmission Electron Microscopy.
PB94-172509 *03,453* Not available NTIS

PB94-172517
Electrodeposition.
PB94-172517 *00,760* Not available NTIS

PB94-172525
Use of Ion Scattering Spectroscopy to Monitor the Nb Target Nitridation during Reactive Sputtering.
PB94-172525 *00,761* Not available NTIS

PB94-172533
Replicate Measurements for Data Quality and Environmental Modeling.
PB94-172533 *02,515* Not available NTIS

PB94-172541
Nitrogen Effect on Elastic Constants of f.c.c. Fe-18Cr-19Mn Alloys.
PB94-172541 *03,203* Not available NTIS

PB94-172558
Structural and Magnetic Ordering in Iron Oxide/Nickel Oxide Multilayers by X-ray and Neutron Diffraction (Invited).
PB94-172558 *04,442* Not available NTIS

PB94-172566
Time-Perturbation Tuning of MIMD Programs.
PB94-172566 *01,684* Not available NTIS

PB94-172574
Role of Adsorbed Alkalis in Desorption Induced by Electronic Transitions.
PB94-172574 *00,762* Not available NTIS

PB94-172582
Comparative Measurements of High-Voltage Impulses Using a Kerr Cell and a Resistor Divider.
PB94-172582 *02,028* Not available NTIS

PB94-172590
Radiance Temperature (in the Wavelength Range 519-906 nm) of Tungsten at Its Melting Point by a Pulse-Heating Technique.
PB94-172590 *03,397* Not available NTIS

PB94-172608
Adsorption of Low-Molecular-Weight Sodium Polyacrylate on Hydroxyapatite.
PB94-172608 *00,139* Not available NTIS

PB94-172616
Interaction of Some Coupling Agents and Organic Compounds with Hydroxyapatite: Hydrogen Bonding, Adsorption and Adhesion.
PB94-172616 *00,140* Not available NTIS

PB94-172624
Neutron Scattering Study of Shear Induced Turbidity in Polystyrene/Dioctyl Phthalate Solutions at High Shear Rates.
PB94-172624 *01,197* Not available NTIS

PB94-172632
Time Dependent Small Angle Neutron Scattering Behavior in Triblock Copolymers Under Steady Shear.
PB94-172632 *01,198* Not available NTIS

PB94-172640
Serial Sectioning of Hardened Cement Paste for Scanning Electron Microscopy.
PB94-172640 *01,305* Not available NTIS

PB94-172657
Using Synthetic-Perturbation Techniques for Tuning Shared Memory Programs (Extended Abstract).
PB94-172657 *01,685* Not available NTIS

PB94-172665
Enhanced Curie Temperatures and Magnetoelastic Domains in Dy/Lu Super Lattices and Films.
PB94-172665 *04,443* Not available NTIS

PB94-172673
Inelastic Neutron Scattering Studies of Rotational Excitations and the Orientational Potential in C60 and A3C60 Compounds.
PB94-172673 *00,763* Not available NTIS

PB94-172681
AMRF Composite Fabrication Workstation.
PB94-172681 *02,810* Not available NTIS

PB94-172699
Inelastic Interactions of Electrons with Surfaces: Application to Auger-Electron Spectroscopy and X-ray Photoelectron Spectroscopy.
PB94-172699 *00,764* Not available NTIS

PB94-172707
Effects of Elastic Stress on Phase Equilibrium in the Ni-V System.
PB94-172707 *03,313* Not available NTIS

PB94-172715
Microstructure and Tensile Properties of Microalloyed Steel Forgings.
PB94-172715 *03,204* Not available NTIS

PB94-172723
Effect of Two Initiator/Stabilizer Concentrations in a Metal Primer on Bond Strengths of a Composite to a Base Metal Alloy.
PB94-172723 *00,141* Not available NTIS

PB94-172731
Considerations on Data Requirements for Tribological Modeling.
PB94-172731 *02,962* Not available NTIS

PB94-172749
Wear of Selected Materials and Composites Sliding against MoS2 Films.
PB94-172749 *03,231* Not available NTIS

PB94-172756
Temperature Dependence of the Morphology of Thin Diblock Copolymer Films as Revealed by Neutron Reflectivity.
PB94-172756 *01,199* Not available NTIS

PB94-172764
Reaction Sensitivities of Al-Li Alloys and Alloy 2219 in Mechanical-Impact Tests.
PB94-172764 *03,314* Not available NTIS

PB94-172772
Time Scale Algorithm for Post-Processing: AT1 Plus Frequency Variance.
PB94-172772 *01,525* Not available NTIS

PB94-172780
Intelligent Processing of Materials.
PB94-172780 *02,811* Not available NTIS

PB94-172798
Absolute Determination of Electrolytic Conductivity for Primary Standard KC1 Solutions from 0 to 50C.
PB94-172798 *00,765* Not available NTIS

PB94-172806
Current Activities Within the National Biomonitoring Specimen Bank.
PB94-172806 *02,516* Not available NTIS

PB94-172814
Reciprocity Relations in Waveguide Junctions.
PB94-172814 *02,213* Not available NTIS

PB94-172822
Environmental Scanning Electron Microscope Imaging Examples Related to Particle Analysis.
PB94-172822 *00,766* Not available NTIS

PB94-172830
New Critical Review of Experimental Stark Widths and Shifts.
PB94-172830 *03,790* Not available NTIS

PB94-172848
High Temperature Degradation of Structural Composites.
PB94-172848 *03,132* Not available NTIS

PB94-172855
Measurement and Calibration of Large-Area Alpha-Particle Sources at NIST.
PB94-172855 *03,791* Not available NTIS

PB94-172863
Physicochemical Properties of Calcific Deposits Isolated from Porcine Bioprosthetic Heart Valves Removed from Patients Following 2-13 Years Function.
PB94-172863 *00,184* Not available NTIS

PB94-172871
Dental Materials.
PB94-172871 *00,142* Not available NTIS

PB94-172889
Report on the Meeting of the CCU (10th) (of the International Committee of Weights and Measures). Held on July 10-11, 1990.
PB94-172889 *03,792* Not available NTIS

PB94-172897
National Institute of Standards and Technology Resonance Ionization Spectroscopy/Resonance Ionization Mass Spectroscopy Data Service.
PB94-172897 *03,793* Not available NTIS

PB94-172905
Realization of New NIST Radiation Temperature Scales for the 1000 K to 3000 K Region, Using Absolute Radiometric Techniques.
PB94-172905 *03,794* Not available NTIS

PB94-172913
Intelligent Processing of Hot Isostatic Pressing.
PB94-172913 *03,315* Not available NTIS

PB94-172921
Porting Multimedia Applications to the Open System Environment.
PB94-172921 *02,721* Not available NTIS

PB94-172939
Industry and Government-Laboratory Cooperative R and D: An Idea Whose Time Has Come.
PB94-172939 *02,970* Not available NTIS

PB94-172947
Draft Guideline for Testing and Evaluation of Seismic Isolation Systems.
PB94-172947 *00,423* Not available NTIS

PB94-172954
Evaluation and Qualification Standards for an X-Ray Laminography System.
PB94-172954 *02,029* Not available NTIS

PB94-172962
Temperature Increases in Aluminum Alloys during Mechanical-Impact Tests for Oxygen Compatibility.
PB94-172962 *03,316* Not available NTIS

PB94-172970
Surface Forces and Adhesion between Dissimilar Materials Measured in Various Environments.
PB94-172970 *03,033* Not available NTIS

PB94-172988
Greatly Enhanced Soot Scattering in Flickering Ch4/Air Diffusion Flames.
PB94-172988 *01,361* Not available NTIS

PB94-172996
Fine-Structure Constant.
PB94-172996 *03,795* Not available NTIS

PB94-173002
Functions of Technology Infrastructure in a Competitive Economy.
PB94-173002 *00,478* Not available NTIS

PB94-173010
World Model Registration for Effective Off-Line Programming of Robots.
PB94-173010 *02,933* Not available NTIS

PB94-173028
Investing in Education to Meet a National Need for a Technical-Professional Workforce in a Post-Industrial Economy.
PB94-173028 *00,132* Not available NTIS

PB94-173036
Thermal Decomposition of Hydroxy- and Methoxy-Substituted Anisoles.
PB94-173036 *00,767* Not available NTIS

PB94-173044
Dispersions of Magnetic Excitations of the Pr Ions in Pr2CuO4.
PB94-173044 *04,444* Not available NTIS

PB94-173051
Quantitative Phase Abundance Analysis of Three Cement Clinker Reference Materials by Scanning Electron Microscopy.
PB94-173051 *00,333* Not available NTIS

PB94-173069
Homoepitaxial Growth of Iron and a Real Space View of Reflection-High-Energy-Electron Diffraction.

PB94-198652
Discovery of an X-Ray Selected, Radio-Loud Quasar at z=3.9.
PB94-198652 *00,052* Not available NTIS

PB94-198660
Computing S(alpha) Using Symbolic Monte Carlo.
PB94-198660 *03,410* Not available NTIS

PB94-198678
Tunneling-Rotation Spectrum of the Hydrogen Fluoride Dimer.
PB94-198678 *00,793* Not available NTIS

PB94-198686
Integrated Laser Doppler Method for Measuring Planetary Gravity Fields.
PB94-198686 *03,681* Not available NTIS

PB94-198694
Coherent Precipitates in the BCC/Orthorhombic Two Phase Field of the Ti-Al-Nb System.
PB94-198694 *03,317* Not available NTIS

PB94-198702
Crystallographic Characterization of Some Intermetallic Compounds in the Al-Cr System.
PB94-198702 *03,318* Not available NTIS

PB94-198710
Laser Ablation of Thin Films as a Free Atom Source for Pulsed RIMS.
PB94-198710 *00,540* Not available NTIS

PB94-198728
Majority and Minority Mobilities in Heavily Doped Silicon for Device Simulations.
PB94-198728 *02,311* Not available NTIS

PB94-198736
Relative Sensitivity Factors and Useful Yields for a Microfocused Gallium Ion Beam and Time-of-Flight Secondary Ion Mass Spectrometer.
PB94-198736 *00,541* Not available NTIS

PB94-198744
Meissner, Shielding, and Flux Loss Behavior in Single-Crystal YBa2Cu3O6+x.
PB94-198744 *04,464* Not available NTIS

PB94-198751
Magnetic Properties of Pd/Co Multilayers.
PB94-198751 *04,465* Not available NTIS

PB94-198769
Concurrent Enhancement of Kerr Rotation and Antiferromagnetic Coupling in Epitaxial Fe/Cu/Fe Structures.
PB94-198769 *04,466* Not available NTIS

PB94-198777
Digitized Direct Simulation Model of the Microstructural Development of Cement Paste.
PB94-198777 *01,309* Not available NTIS

PB94-198785
Digitized Simulation Model for Microstructural Development.
PB94-198785 *01,310* Not available NTIS

PB94-198793
Modelling the Leaching of Calcium Hydroxide from Cement Paste: Effects on Pore Space Percolation and Diffusivity.
PB94-198793 *01,311* Not available NTIS

PB94-198801
Diffusion Studies in a Digital-Image-Based Cement Paste Microstructural Model.
PB94-198801 *01,312* Not available NTIS

PB94-198819
Milliwatt Mixer for Small Fluid Samples.
PB94-198819 *02,634* Not available NTIS

PB94-198827
Standard Reference Materials (SRM's) for Measuring Genetic Damage.
PB94-198827 *03,516* Not available NTIS

PB94-198835
Scattering Properties of the Leveled-Wave Model of Random Morphologies.
PB94-198835 *03,807* Not available NTIS

PB94-198843
Analysis of SANS from Controlled Pore Glasses.
PB94-198843 *03,035* Not available NTIS

PB94-198850
Structures of Sodium Metal.
PB94-198850 *03,319* Not available NTIS

PB94-198868
Non-Equilibrium Thermodynamic Theory of Viscoplastic Materials.
PB94-198868 *04,467* Not available NTIS

PB94-198876
Modeling Polarization Curves and Impedance Spectra for Simple Electrode Systems.
PB94-198876 *03,188* Not available NTIS

PB94-198884
Diffraction Imaging of Polycrystalline Materials.
PB94-198884 *02,971* Not available NTIS

PB94-198892
Infrared and Microwave Spectroscopy of the Argon - Propyne Dimer.
PB94-198892 *00,794* Not available NTIS

PB94-198900
Dynamic Shear Modulus Measurements with Four Independent Techniques in Nickel-Based Alloys.
PB94-198900 *03,320* Not available NTIS

PB94-198918
Evaluation of Two-Photon Exchange Graphs for Highly-Charged Heliumlike Ions.
PB94-198918 *03,808* Not available NTIS

PB94-198934
Thermodynamic Constraints on Non-Equilibrium Solidification of Ordered Intermetallic Compounds.
PB94-198934 *03,321* Not available NTIS

PB94-198942
Disorder Trapping in Ni2TiAl.
PB94-198942 *03,322* Not available NTIS

PB94-198959
Algorithmic Enhancements to the Method of Centers for Linear Programming Problems.
PB94-198959 *03,426* Not available NTIS

PB94-198967
Software Libraries, Numerical and Statistical.
PB94-198967 *01,689* Not available NTIS

PB94-198975
Portable Vectorized Software for Bessel Function Evaluation.
PB94-198975 *01,690* Not available NTIS

PB94-198983
Virtual Software Repository System.
PB94-198983 *01,691* Not available NTIS

PB94-198991
Liquid and Solid Atomic Ion Plasmas.
PB94-198991 *03,809* Not available NTIS

PB94-199007
Absorption of Ultrasonic Waves in Air at High Frequencies (10-20 MHz).
PB94-199007 *04,182* Not available NTIS

PB94-199015
Absorption of Sound in Gases between 10 and 25 MHz: Argon.
PB94-199015 *04,183* Not available NTIS

PB94-199023
Interaction of Rayleigh Waves with a Rib Attached to a Plate.
PB94-199023 *04,184* Not available NTIS

PB94-199031
Intrinsic Stress in DC Sputtered Niobium.
PB94-199031 *04,468* Not available NTIS

PB94-199049
Adhesion of Composites to Dentin and Enamel.
PB94-199049 *00,144* Not available NTIS

PB94-199056
Development of an Adhesive Bonding System.
PB94-199056 *00,145* Not available NTIS

PB94-199064
Statistical Quality Control Technology In Japan.
PB94-199064 *02,708* Not available NTIS

PB94-199072
Asymptotic Behavior of Modulated Taylor-Couette Flows with a Crystalline Inner Cylinder.
PB94-199072 *04,469* Not available NTIS

PB94-211240
Clinical Perspective on Dentin Adhesives.
PB94-211240 *00,146* Not available NTIS

PB94-211257
Selective Inhibition of Crystal Growth on Octacalcium Phosphate and Nonstoichiometric Hydroxyapatite by Pyrophosphate at Physiological Concentration.
PB94-211257 *00,147* Not available NTIS

PB94-211265
Slab Transmission and Reflection for Point Source and Point Detector.
PB94-211265 *03,838* Not available NTIS

PB94-211273
National Quality Assurance Program for Personnel Radiation Dosimetry: A Case History.
PB94-211273 *03,620* Not available NTIS

PB94-211281
Critical Magnetic-Field Angle for High-Field Current Transport in YBa2Cu3O7 at 76 K.
PB94-211281 *04,490* Not available NTIS

PB94-211299
Superconducting Materials: Specification.
PB94-211299 *04,491* Not available NTIS

PB94-211307
Transport Critical Current of Aligned Polycrystalline Yttrium Barium Copper Oxide (YBa2Cu3O7-delta).
PB94-211307 *04,492* Not available NTIS

PB94-211315
Effect of Axial Strain on the Critical Current of Ag-Sheathed Bi-Based Superconductors in Magnetic Fields Up to 25 T.
PB94-211315 *04,493* Not available NTIS

PB94-211323
In situ Noble Metal YBa2Cu3O7 Thin-Film Contacts.
PB94-211323 *04,494* Not available NTIS

PB94-211331
Total Surface Areas of Group IVA Organometallic Compounds: Predictors of Toxicity to Algae and Bacteria.
PB94-211331 *00,814* Not available NTIS

PB94-211349
Longterm Changes of Silicon Photodiodes and Their Use for Photometric Standardization.
PB94-211349 *04,234* Not available NTIS

PB94-211356
Magnetoelasticity in Rare-Earth Multilayers and Films.
PB94-211356 *04,495* Not available NTIS

PB94-211364
Advanced Angle Metrology System.
PB94-211364 *02,637* Not available NTIS

PB94-211372
Suppression Research: Strategies.
PB94-211372 *00,346* Not available NTIS

PB94-211380
Conditions for Existence of a Reentrant Solid Phase in a Sheared Atomic Fluid.
PB94-211380 *04,198* Not available NTIS

PB94-211398
Reaction Rate Determinations of Vinyl Radical Reactions with Vinyl, Methyl, and Hydrogen Atoms.
PB94-211398 *00,815* Not available NTIS

PB94-211406
Anomalous Odd- to Even-Mass Isotope Ratios in Resonance Ionization with Broad-Band Lasers.
PB94-211406 *03,839* Not available NTIS

PB94-211414
Earth-Based Gravitational Experiments.
PB94-211414 *03,840* Not available NTIS

PB94-211422
Monitoring Polymer Cure by Fluorescence Recovery After Photobleaching.
PB94-211422 *01,218* Not available NTIS

PB94-211430
New Method for Shielding Electron Beams Used for Head and Neck Cancer Treatment.
PB94-211430 *03,621* Not available NTIS

PB94-211448
High-Resolution Infrared Overtone Spectroscopy of ArHF via Nd:YAG/Dye Laser Difference Frequency Generation.
PB94-211448 *00,816* Not available NTIS

PB94-211455
U.S. GOSIP Testing Program.
PB94-211455 *01,807* Not available NTIS

PB94-211463
P-Type Doubling in the Infrared Spectrum of NO-HF.
PB94-211463 *00,817* Not available NTIS

PB94-211471
Analysis of Thermal Wave Propagation in Diamond Films.
PB94-211471 *03,014* Not available NTIS

PB94-211489
Thermal Wave Propagation in Diamond Films.
PB94-211489 *03,015* Not available NTIS

PB94-211497
Magnetic Dipole Line from U LXXI Ground-Term Levels Predicted at 3200 Angstroms.
PB94-211497 *04,407* Not available NTIS

PB94-211505
Photoionization of Small Molecules Using Synchrotron Radiation.
PB94-211505 *03,841* Not available NTIS

PB94-211513
NIST Power Reference Source.
PB94-211513 *00,148* Not available NTIS

PB94-211521
Roles of Copper in Applied Superconductivity.
PB94-211521 *02,255* Not available NTIS

PB94-211539
Benchmarks for the Evaluation of Speech Recognizers.
PB94-211539 *01,566* Not available NTIS

PB94-211547
Neutron Scattering by Multiblock Copolymers of Structure (A-B)N-A.
PB94-211547 *01,219* Not available NTIS

PB94-211554
Atomic Transition Probability Ratios between Some Ar I 4s-4p and 4s-5p Transitions.
PB94-211554 *03,842* Not available NTIS

PB94-211562
Ion Broadening Parameters for Several Argon and Carbon Lines.
PB94-211562 *03,843* Not available NTIS

PB94-211570
Dreams About the Next Generation of Super-Stable Lasers.
PB94-211570 *04,235* Not available NTIS

PB94-211588
24 GHz Josephson Array Voltage Standard.
PB94-211588 *02,033* Not available NTIS

PB94-211596
Estimate of Flame Radiance via a Single Location Measurement in Liquid Pool Flames.
PB94-211596 *02,476* Not available NTIS

PB94-211604
Measurement of Radiative Feedback to the Fuel Surface of a Pool Fire.
PB94-211604 *02,477* Not available NTIS

PB94-211612
Shear Dependence of Critical Fluctuations in Binary Polymer Mixtures by Small Angle Neutron Scattering.
PB94-211612 *01,220* Not available NTIS

PB94-211620
L-threo-beta-Hydroxyhistidine, an Unprecedented Iron(III) Ion-Binding Amino Acid in a Pyoverdine-type Siderophore from Pseudomonas fluorescens 244.
PB94-211620 *00,553* Not available NTIS

PB94-211638
Energy and Migration of Grain Boundaries in Polycrystals.
PB94-211638 *03,332* Not available NTIS

PB94-211646
Fabrication of Platinum-Gold Alloys in Pre-Hispanic South America: Issues of Temperature and Microstructure Control.
PB94-211646 *03,333* Not available NTIS

PB94-211653
Wire Bond Testing.
PB94-211653 *02,314* Not available NTIS

PB94-211661
Radiation Chemistry of Cyanine Dyes: Oxidation and Reduction of Merocyanine 540.
PB94-211661 *00,818* Not available NTIS

PB94-211679
Laser-Induced Fluorescence Measurements of Formaldehyde in a Methane/Air Diffusion Flame.
PB94-211679 *01,374* Not available NTIS

PB94-211687
Ensuring Accuracy and Traceability of Weighing Instruments.
PB94-211687 *02,638* Not available NTIS

PB94-211695
Particle Size Standards and Their Certification at NIST.
PB94-211695 *02,639* Not available NTIS

PB94-211703
Supercritical Solubility of Solids from Near-Critical Dilute-Mixture Theory.
PB94-211703 *00,819* Not available NTIS

PB94-211711
YBa2Cu3O7-x to Si Interconnection for Hybrid Superconductor/Semiconductor Integration.
PB94-211711 *02,315* Not available NTIS

PB94-211729
Small-Angle X-Ray and Neutron Scattering Study of Block Copolymer/Homopolymer Mixtures.
PB94-211729 *01,221* Not available NTIS

PB94-211737
High Temperature.
PB94-211737 *03,844* Not available NTIS

PB94-211745
Vapor Transport in Materials and Process Chemistry.
PB94-211745 *00,669* Not available NTIS

PB94-211752
Drill-Hearn-Gerasimov Sum Rule.
PB94-211752 *03,845* Not available NTIS

PB94-211760
Polarizability of the Nucleon.
PB94-211760 *03,846* Not available NTIS

PB94-211778
Effect of Microstructure on the Wear Transition of Zirconia-Toughened Alumina.
PB94-211778 *03,141* Not available NTIS

PB94-211786
Asymptotic Wave Function Splitting Procedure for Propagating Spatially Extended Wave Functions: Application to Intense Field Photodissociation of H2(+).
PB94-211786 *03,847* Not available NTIS

PB94-211794
Investigation of the Drive Circuit Requirements for the Power Insulated Gate Bipolar Transistor (IGBT).
PB94-211794 *02,316* Not available NTIS

PB94-211802
Interstellar Disk-Halo Connection in Galaxies: Review of Observational Aspects.
PB94-211802 *00,058* Not available NTIS

PB94-211810
Vibrational Relaxation Measurements of Carbon Monoxide on Metal Clusters.
PB94-211810 *00,820* Not available NTIS

PB94-211828
Discontinuous Volume Change at the Orientational-Ordering Transition in Solid C60.
PB94-211828 *00,821* Not available NTIS

PB94-211836
Differences in Competitive Strategies between the United States and Japan.
PB94-211836 *00,013* Not available NTIS

PB94-211844
Importance of Measurement in Technology-Based Competition.
PB94-211844 *02,929* Not available NTIS

PB94-211851
Design and Characterization of X-Ray Multilayer Analyzers for the 50 - 1000 eV Region.
PB94-211851 *03,848* Not available NTIS

PB94-211869
Fast-Ion Conduction and Disorder in Cation and Anion Arrays in Y2(ZryTi(1-y))2O7 Pyrochlores Induced by Zr Substitution: A Neutron Rietveld Analysis.
PB94-211869 *04,496* Not available NTIS

PB94-211877
Intelligent Control for Multiple Autonomous Undersea Vehicles.
PB94-211877 *03,747* Not available NTIS

PB94-211885
Real-Time Vision for Autonomous and Teleoperated Control of Unmanned Vehicles.
PB94-211885 *03,701* Not available NTIS

PB94-211893
Real-Time Vision for Unmanned Vehicles.
PB94-211893 *03,702* Not available NTIS

PB94-211901
International Conference on Chemical Kinetics (2nd). Held in Gaithersburg, Maryland on July 24-27, 1989.
PB94-211901 *00,822* Not available NTIS

PB94-211919
Elastic Constants of Isotropic Cylinders Using Resonant Ultrasound.
PB94-211919 *04,497* Not available NTIS

PB94-211927
Determination of the Prior-Austenitic Grain Size of Selected Steels Using a Molten Glass Etch.
PB94-211927 *03,208* Not available NTIS

PB94-211935
Pump-Induced Dispersion of Erbium-Doped Fiber Measured by Fourier-Transform Spectroscopy.
PB94-211935 *04,236* Not available NTIS

PB94-211943
Currents Induced on Multiconductor Transmission Lines by Radiation and Injection.
PB94-211943 *02,215* Not available NTIS

PB94-211950
Electromagnetic Scattering by a Periodic Surface with a Wedge Profile.
PB94-211950 *04,421* Not available NTIS

PB94-211968
Aperture Coupling to a Coaxial Air Line: Theory and Experiment.
PB94-211968 *02,216* Not available NTIS

PB94-211976
Crossover to Strong Shear in a Low-Molecular-Weight Critical Polymer Blend.
PB94-211976 *01,222* Not available NTIS

PB94-211984
Tensile Creep of Whisker Reinforced Silicon Nitride.
PB94-211984 *03,142* Not available NTIS

PB94-211992
Microstructural Evolution in Two-Dimensional Two-Phase Polycrystals.
PB94-211992 *04,498* Not available NTIS

PB94-212008
Periapical Tissue Reactions to a Calcium Phosphate Cement in the Teeth of Monkeys.
PB94-212008 *00,149* Not available NTIS

PB94-212016
Associated Object Model for Distributed Systems.
PB94-212016 *01,694* Not available NTIS

PB94-212024
In situ On-Line Optical Fiber Sensor for Fluorescence Monitoring in Bioreactors.
PB94-212024 *03,587* Not available NTIS

PB94-212784
Relativistic and Quantum Electrodynamic Effects in Highly-Charged Ions.
PB94-212784 *03,854* Not available NTIS

PB94-212792
Product Kinetic Energies, Correlations, and Scattering Anisotropy in the Bimolecular Reactor O((1)D)+H2O yields 2OH.
PB94-212792 *00,838* Not available NTIS

PB94-212800
Apparent Molar Heat Capacities and Apparent Molar Volumes of Aqueous Glucose at Temperatures from 298.15 K to 327.01 K.
PB94-212800 *03,459* Not available NTIS

PB94-212818
Evolution of a Turbulent Boundary Layer Induced by a Three-Dimensional Roughness Element.
PB94-212818 *04,200* Not available NTIS

PB94-212826
Molecular-Beam Optothermal Spectrum of the OH Stretching Band of Methanol.
PB94-212826 *00,839* Not available NTIS

PB94-212834
Fundamental Torsion Band in Acetaldehyde.
PB94-212834 *00,840* Not available NTIS

PB94-212842
Atomic Branching Ratio Data for Carbon-Like Ions.
PB94-212842 *03,855* Not available NTIS

PB94-212859
Full Scale Smoke Control Tests at the Plaza Hotel Building.
PB94-212859 *00,347* Not available NTIS

PB94-212867
Overview of Smoke Control Technology.
PB94-212867 *00,348* Not available NTIS

PB94-212875
Preview of ASHRAE's Revised Smoke Control Manual.
PB94-212875 *00,349* Not available NTIS

PB94-212883
Smoke Control Systems for Elevator Fire Evacuation.
PB94-212883 *00,291* Not available NTIS

PB94-212891
Determination of Osmotic Pressure and Fouling Resistances and Their Effects on Performance of Ultrafiltration Membranes.
PB94-212891 *00,841* Not available NTIS

PB94-212909
Characterization of the Adsorption-Fouling Layer Using Globular Proteins on Ultrafiltration Membranes.
PB94-212909 *00,842* Not available NTIS

PB94-212917
High-Spatial-Resolution Resistivity Mapping Applied to Mercury Cadmium Telluride.
PB94-212917 *02,131* Not available NTIS

PB94-212925
Review of Semiconductor Microelectronic Test Structures with Applications to Infrared Detector Materials and Processes.
PB94-212925 *02,132* Not available NTIS

PB94-212933
Summary of the Proceedings of the Workshop on Standard Phantoms for In-vivo Radioactivity Measurement.
PB94-212933 *03,622* Not available NTIS

PB94-212941
Effects of Variable Excluded Volume on the Dimensions of Off-Lattice Polymer Chains.
PB94-212941 *01.229* Not available NTIS

PB94-212958
Observed and Theoretical Creep Rates for an Alumina Ceramic and a Silicon Nitride Ceramic in Flexure.
PB94-212958 *03,040* Not available NTIS

PB94-212966
Defect of Thermal Ramping and Annealing Conditions on Defect Formation in Oxygen Implanted Silicon-On-Insulator Material.
PB94-212966 *02,318* Not available NTIS

PB94-212974
Active Site Ionicity and the Mechanism of Carbonic Anhydrase.
PB94-212974 *00,843* Not available NTIS

PB94-212982
Dipole Moments in Rare Gas Interactions.
PB94-212982 *00,844* Not available NTIS

PB94-212990
Analysis of Protein Metal Binding Selectivity in a Cluster Model.
PB94-212990 *00,845* Not available NTIS

PB94-213006
Cs Cluster Binding to a GaAs Surface.
PB94-213006 *00,846* Not available NTIS

PB94-213014
Iridium Oxide Thin-Film Stability in High-Temperature Corrosive Solutions.
PB94-213014 *03,234* Not available NTIS

PB94-213022
Radiation-Driven Winds of Hot Luminous Stars X. The Determination of Stellar Masses Radii and Distances from Terminal Velocities and Mass-Loss Rates.
PB94-213022 *00,060* Not available NTIS

PB94-213030
Formal Specification and Verification of Control Software for Cryptographic Equipment.
PB94-213030 *01,585* Not available NTIS

PB94-213048
Materials Science with SR Using X-Ray Imaging: Spatial-Resolution/Source Size.
PB94-213048 *04,510* Not available NTIS

PB94-213055
High Resolution Hard X-Ray Microscope.
PB94-213055 *03,856* Not available NTIS

PB94-213063
Thermal Conductivity of R134a.
PB94-213063 *03,857* Not available NTIS

PB94-213071
Spectroscopic Constants for the 2.5 and 3.0 micrometer Bands of Acetylene.
PB94-213071 *00,847* Not available NTIS

PB94-213089
Analysis of Boron in CVD Diamond Surfaces Using Neutron Depth Profiling.
PB94-213089 *04,511* Not available NTIS

PB94-213097
Normal-Incidence Complex-Index Refractometry.
PB94-213097 *04,241* Not available NTIS

PB94-213105
Precision, Accuracy, Uncertainty and Traceability and Their Application to Submicrometer Dimensional Metrology.
PB94-213105 *02,319* Not available NTIS

PB94-213113
Thermochemistry of the Reactions between Adenosine, Adenosine 5'-monophosphate, Inosine, and Inosine 5'-monophosphate; the Conversion of L-histidine to (Urocanic Acid+Ammonia).
PB94-213113 *03,460* Not available NTIS

PB94-213121
Magnetic and Structural Properties of Electrodeposited Copper-Nickel Microlayered Alloys.
PB94-213121 *04,512* Not available NTIS

PB94-213139
Laser-Induced Fluorescence Measurements of Rotationally Resolved Velocity Distributions for CO(+) Drifted in He.
PB94-213139 *00,848* Not available NTIS

PB94-213147
Custom Integrated Circuit Comparator for High-Performance Sampling Applications.
PB94-213147 *02,320* Not available NTIS

PB94-213154
Elastic Deformation of a Monolithic Perfect Crystal Interferometer: Implications for Gravitational Phase Shift Experiments.
PB94-213154 *03,858* Not available NTIS

PB94-213162
Hierarchical Ada Robot Programming System (HARPS): A Complete and Working Telerobot Control System Based on the NASREM Model.
PB94-213162 *02,934* Not available NTIS

PB94-213170
Recent Approaches to Extreme Value Estimation with Application to Wind Speeds. Part 1. The Pickands Method.
PB94-213170 *00,019* Not available NTIS

PB94-213188
Dynamics vs. Static Young's Moduli: A Case Study.
PB94-213188 *03,210* Not available NTIS

PB94-213196
Elastic Constants of Polycrystalline Y1Ba2Cu3Ox.
PB94-213196 *04,513* Not available NTIS

PB94-213204
Thermal Expansion of an SiC Particle-Reinforced Aluminum Composite.
PB94-213204 *03,144* Not available NTIS

PB94-213212
Cast-Iron Elastic Constants: Effect of Graphite Aspect Ratio.
PB94-213212 *03,211* Not available NTIS

PB94-213220
Correlation between Tc and Elastic Constants of (La-M)2CuO4.
PB94-213220 *04,514* Not available NTIS

PB94-213238
Ultracold Collisions: Associative Ionization in a Laser Trap.
PB94-213238 *03,859* Not available NTIS

PB94-213246
Light Scattering from Glossy Coatings on Paper.
PB94-213246 *04,242* Not available NTIS

PB94-213253
Development of a New Small-Scale Smoke Toxicity Test Method and Its Comparison with Real-Scale Fire Tests.
PB94-213253 *00,350* Not available NTIS

PB94-213261
EXITT: A Simulation Model of Occupant Decisions and Actions in Residential Fires.
PB94-213261 *00,351* Not available NTIS

PB94-213279
High-Energy Behavior of the Double Photoionization of Helium from 2 to 12 keV.
PB94-213279 *03,860* Not available NTIS

PB94-213287
Astrophysical Aspects of Neutral Atom Line Broadening.
PB94-213287 *00,061* Not available NTIS

PB94-213295
RIS Studies of Autoionization in Calcium.
PB94-213295 *00,849* Not available NTIS

PB94-213303
Debugger for Tcl Applications.
PB94-213303 *01,695* Not available NTIS

PB94-213311
Kibitz-Connecting Multiple Interactive Programs Together.
PB94-213311 *01,696* Not available NTIS

PB94-213329
Using Expect to Automate System Administration Tasks.
PB94-213329 *01,697* Not available NTIS

PB94-213337
Molecular Spectroscopy.
PB94-213337 *03,861* Not available NTIS

PB94-213345
Relation between AC Impedance Data and Degradation of Coated Steel. 1. Effects of Surface Roughness and Contamination on the Corrosion Behavior of Epoxy Coated Steel.
PB94-213345 *03,189* Not available NTIS

PB94-213352
Elastic Constants and Debye Temperature of Y1Ba2Cu3Ox: Effect of Oxygen Content.
PB94-213352 *04,515* Not available NTIS

PB94-213360
Polarized X-Ray Emission Spectroscopy.
PB94-213360 *03,862* Not available NTIS

PB94-213378
Atomic, Molecular, and Optical Physics with X-rays.
PB94-213378 *03,863* Not available NTIS

PB94-213386
High-Sensitivity Determination of Iodine Isotopic Ratios by Thermal and Fast Neutron Activation.
PB94-213386 *00,555* Not available NTIS

PB94-213394
Neutron Capture Prompt Gamma-Ray Activation Analysis at the NIST Cold Neutron Research Facility.
PB94-213394 *00,556* Not available NTIS

PB94-213402
Atomic Data Needed for Far Ultraviolet Astronomy with HUT and FUSE.
PB94-213402 *00,062* Not available NTIS

PB94-213410
FUSE: The Far Ultraviolet Spectrograph Explorer.
PB94-213410 *00,063* Not available NTIS

PB94-213428
Ultraviolet Observations of Stellar Coronae: Early Results from HST.
PB94-213428 *00,064* Not available NTIS

PB94-213436
X-rays from Stellar Flares.
PB94-213436 *00,065* Not available NTIS

PB94-213444
Goddard High-Resolution Spectrograph Observations of the Local Interstellar Medium and the Deuterium/Hydrogen Ratio along the Line of Sight Toward Capella.
PB94-213444 *00,066* Not available NTIS

PB94-213451
Class of Radio-Emitting Magnetic B Stars and a Wind-Fed Magnetosphere Model.
PB94-213451 *00,067* Not available NTIS

PB94-213469
Radio Emission from Chemically Peculiar Stars.
PB94-213469 *00,068* Not available NTIS

PB94-213477
First Results from a Coordinated ROSAT, IUE, and VLA Study of RS CVn Systems.
PB94-213477 *00,069* Not available NTIS

PB94-213485
Investigation of Mercury Interstitials in Hg(1-x)CdxTe Alloys Using Resonant Impact-Ionization Spectroscopy.
PB94-213485 *02,133* Not available NTIS

PB94-213493
Liposome-Based Flow-Injection Immunoassay for Determining Theophylline in Serum.
PB94-213493 *03,494* Not available NTIS

PB94-213501
Investigation of the Thermal Stability and Char-Forming Tendency of Cross-linked Poly(methyl methacrylate).
PB94-213501 *03,380* Not available NTIS

PB94-213717
Measurement of Room Conditions and Response of Sprinklers and Smoke Detectors during a Simulated Two-Bed Hospital Patient Room Fire.
PB94-213717 *00,292* PC A07/MF A02

PB94-213758
Technical Program Description Systems Integration for Manufacturing (SIMA).
PB94-213758 *02,819* PC A05/MF A01

PB94-213774
Electronics and Electrical Engineering Laboratory Technical Publication Announcements Covering Laboratory Programs,

PB94-216694
Recommended Changes in ASTM Test Methods D2512-82 and G86-84 for Oxygen-Compatibility Mechanical Impact Tests on Metals.
PB94-216694 *03,338* Not available NTIS

PB94-216702
Digital Techniques in HV Tests - Summary of 1989 Panel Session.
PB94-216702 *02,035* Not available NTIS

PB94-216710
Bibliography of Computer Security Glossaries.
PB94-216710 *01,587* Not available NTIS

PB94-216728
Review of Cure Monitoring Techniques for On-Line Process Control.
PB94-216728 *03,145* Not available NTIS

PB94-216736
Effect of Modulated Taylor-Couette Flows on Crystal-Melt Interfaces: Theory and Initial Experiments.
PB94-216736 *04,521* Not available NTIS

PB94-216744
Boundary Integral Method for the Simulation of Two-Dimensional Particle Coarsening.
PB94-216744 *03,411* Not available NTIS

PB94-216751
High-Resolution IR Laser-Driven Vibrational Dynamics in Supersonic Jets: Weakly Bound Complexes and Intramolecular Energy Flow.
PB94-216751 *00,862* Not available NTIS

PB94-217023
Videoconferencing Procurement and Usage Guide.
PB94-217023 *01,470* PC A04/MF A01

PB94-217031
Determination of the Weight Average Molecular Weight of Two Poly(Ethylene Oxides), SRM 1923 and SRM 1924.
PB94-217031 *01,230* PC A03/MF A01

PB94-217098
Publications of the Intelligent Systems Division (Previously Robot Systems Division) Covering the Period January 1971-April 1994.
PB94-217098 *02,935* PC A05/MF A01

PB94-217106
NIST Form-Based Handprint Recognition System.
PB94-217106 *01,838* PC A04/MF A01

PB94-217163
Human Factors Considerations for the Potential Use of Elevators for Fire Evacuation of FAA Air Traffic Control Towers.
PB94-217163 *01,300* PC A03/MF A01

PB94-217486
Hollow Clay Tile Prism Tests for Martin Marietta Energy Systems: Task 2 Testing.
PB94-217486 *00,352* PC A14/MF A03

PB94-218559
Study of Heat Pump Performance Using Mixtures of R32/R134a and R32/R125/R134a as 'Drop-In' Working Fluids for R22 with and Without a Liquid-Suction Heat Exchanger.
PB94-218559 *02,503* PC A04/MF A01

PB94-218567
NIST Workshop on Nanostructured Material (1st): Report of an Industrial Workshop Conducted by the National Institute of Standards and Technology. Held in Gaithersburg, Maryland on May 14-15, 1992.
PB94-218567 *02,973* PC A04/MF A01

PB94-218575
Adaptive, Predictive 2-D Feature Tracking Algorithm for Finding the Focus of Expansion.
PB94-218575 *01,588* PC A03/MF A01

PB94-218583
Survey of Recent Cementitious Materials Research in Western Europe.
PB94-218583 *00,353* PC A03/MF A01

PB94-218591
RangeCAD and the NIST RCS Uncertainty Analysis.
PB94-218591 *01,870* PC A03/MF A01

PB94-219052
NIST Research Program on the Seismic Resistance of Partially-Grouted Masonry Shear Walls.
PB94-219052 *00,354* PC A06/MF A02

PB94-219060
National Voluntary Laboratory Accreditation Program: Energy Efficient Lighting Products.
PB94-219060 *02,642* PC A04/MF A01

PB94-219086
Framework for Information Technology Integration in Process Plant and Related Industries.
PB94-219086 *02,772* PC A04/MF A01

PB94-219094
ISDN Conformance Testing Guidelines: Guidelines for Implementors of ISDN Customer Premises Equipment to Conform to Both National ISDN-1 and North American ISDN Users' Forum Layer 3 Basic Rate Interface Basic Call Control Abstract Test Suites.
PB94-219094 *01,471* PC A03/MF A01

PB94-219102
Analyzing Electronic Commerce.
PB94-219102 *00,480* PC A03/MF A01

PB94-219110
Industry/Government Open Systems Specification Testing Framework. Version 1.0.
PB94-219110 *01,809* PC A06/MF A02

PB94-219219
Journal of Research of the National Institute of Standards and Technology. March/April 1994. Volume 99, Number 2.
PB94-219219 *02,000* PC A06/MF A02

PB94-219227
Sealed Water Calorimeter for Measuring Absorbed Dose.
PB94-219227 *03,517*
(Order as PB94-219219, PC A06/MF A02)

PB94-219235
Planar Near-Field Measurements of Low-Sidelobe Antennas.
PB94-219235 *02,001*
(Order as PB94-219219, PC A06/MF A02)

PB94-219243
Physics Required for Prediction of Long Term Performance of Polymers and Their Composites.
PB94-219243 *03,146*
(Order as PB94-219219, PC A06/MF A02)

PB94-219250
Measurement and Uncertainty of a Calibration Standard for the Scanning Electron Microscope.
PB94-219250 *00,560*
(Order as PB94-219219, PC A06/MF A02)

PB94-219268
New Values for Silicon Reference Materials, Certified for Isotope Abundance Ratios. Letter to the Editor.
PB94-219268 *00,863*
(Order as PB94-219219, PC A06/MF A02)

PB94-219326
Journal of Research of the National Institute of Standards and Technology. May/June 1994. Volume 99, Number 3.
PB94-219326 *02,643* PC A05/MF A02

PB94-219334
Sources of Uncertainty in a DVM-Based Measurement System for a Quantized Hall Resistance Standard.
PB94-219334 *01,884*
(Order as PB94-219326, PC A05/MF A02)

PB94-219342
dc Method for the Absolute Determination of Conductivities of the Primary Standard KCl Solutions from 0C to 50C.
PB94-219342 *02,644*
(Order as PB94-219326, PC A05/MF A02)

PB94-219359
Three-Axis Coil Probe Dimensions and Uncertainties during Measurement of Magnetic Fields from Appliances.
PB94-219359 *01,885*
(Order as PB94-219326, PC A05/MF A02)

PB94-219367
Improved Automated Current Control for Standard Lamps.
PB94-219367 *00,246*
(Order as PB94-219326, PC A05/MF A02)

PB94-219375
Refractive Indices of Fluids Related to Alternative Refrigerants.
PB94-219375 *03,260*
(Order as PB94-219326, PC A05/MF A02)

PB94-219383
Theoretical Analysis of the Coherence-Induced Spectral Shift Experiments of Kandpal, Vaishya, and Joshi.
PB94-219383 *00,561*
(Order as PB94-219326, PC A05/MF A02)

PB94-219391
Comments on the Paper 'Wolf Shifts and Their Physical Interpretation under Laboratory Conditions'.
PB94-219391 *04,246*
(Order as PB94-219326, PC A05/MF A02)

PB94-219409
Reply to Professor Wolf's Comments on My Paper on Wolf Shifts.
PB94-219409 *04,247*
(Order as PB94-219326, PC A05/MF A02)

PB94-500691
FORTRAN Compiler Validation System, Version 2.1.
PB94-500691 *01,698* CP T99

PB94-501988
HAZARD I Fire Hazard Assessment Method (Version 1.2) (for Microcomputers).
PB94-501988 *00,196* Diskette $250.00

PB94-501996
HAZARD I Fire Hazard Assessment Method, Version 1.2 (Upgrade Package) (for Microcomputers).
PB94-501996 *00,197* CP D99

PB94-502077
M (also known as MUMPS) Validation Test Suite, Version 8.3 (for Microcomputers).
PB94-502077 *01,699* Diskette $250.00

PB94-780129
Polymer Composites Workshop. Held in Winona, Minnesota on April 29-30, 1992 (Video).
PB94-780129 *03,147* AV E99

PB94-937300
Validated Products List (Cobol, Fortran, ADA, Pascal, MUMPS, SQL).
PB94-937300 *01,700* Standing Order

PB94-962000
CALS-Automated Interchange of Technical Information.
PB94-962000 *03,657* Standing Order

PB94-962100
CALS-Digital Representation for Communication of Product Data: IGES Application Subsets.
PB94-962100 *03,658* Standing Order

PB94-962200
CALS-Markup Requirements and Generic Style Specifications for Electronic Printed Output and Exchange of Text.
PB94-962200 *03,659* Standing Order

PB94-962300
CALS-Raster Graphics Representation Binary Format Requirements.
PB94-962300 *03,660* Standing Order

PB94-962400
CALS-Digital Representation for Communication of Illustration Date: CGM Application Profile.
PB94-962400 *03,661* Standing Order

PB94-962500
CALS-Department of Defense Computer Aided Acquisition Logistic Support (CALS).
PB94-962500 *03,662* Standing Order

PB94-962600
CALS-Contractor Integrated Technical Information Service (CITIS), Functional Requirements.
PB94-962600 *03,663* Standing Order

PB95-100368
NIOSH Pocket Guide to Chemical Hazards.
PB95-100368 *03,603* PC$14.00/MF A04

PB95-103461
Questions and Answers on Quality, the ISO 9000 Standard Series, Quality System Registration, and Related Issues. More Questions and Answers on the ISO 9000 Standard Series and Related Issues.
PB95-103461 *00,495* PC A03/MF A01

PB95-103677
Report on the Workshop on Advanced Digital Video in the National Information Infrastructure. Held in Washington, D.C. on May 10-11, 1994.
PB95-103677 *01,472* PC A09/MF A03

PB95-103719
Framework for National Information Infrastructure Services.
PB95-103719 *02,723* PC A07/MF A02

PB95-103826
New Expressions of Uncertainties for Humidity Calibrations at the National Institute of Standards and Technology.
PB95-103826 *02,645* PC A02/MF A01

PB95-104907
In Situ Burning Oil Spill Workshop Proceedings. Held in Orlando, Florida on January 26-28, 1994.
PB95-104907 *02,583* PC A06/MF A02

PB95-104915
Abrasive Wear by Diesel Engine Coal-Fuel and Related Particles.
PB95-104915 *01,450* PC A04/MF A01

PB95-104956
Extreme Value Theory and Applications: Proceedings of the Conference on Extreme Value Theory and Applications, Volume 3. Held in Gaithersburg, Maryland in May 1993.
PB95-104956 *03,432* PC A11/MF A03

PB95-104964
Annual Conference on Fire Research: Book of Abstracts, October 17-20, 1994.
PB95-104964 *01,376* PC A09/MF A02

PB95-105011
Energy Price Indices and Discount Factors for Life-Cycle Cost Analysis 1995. Annual Supplement to NIST Handbook 135 and NBS Special Publication 709. (Revised).
PB95-105011 *02,509* PC A04/MF A01

PB95-105029
Present Worth Factors for Life-Cycle Cost Studies in the Department of Defense (1995).
PB95-105029 *03,664* PC A04/MF A01

PB95-105037
Making Sense of Software Engineering Environment Framework Standards.
PB95-105037 *01,701* PC A03/MF A01

PB95-105045
Software Needs in Special Functions.
PB95-105045 *01,702* PC A03/MF A01

PB95-105052
Formulation of Position on U.S. Standards Role in Enterprise Integration.
PB95-105052 *02,773* PC A03/MF A01

PB95-105136
Controlling Moisture in the Walls of Manufactured Housing.
PB95-105136 *00,355* PC A03/MF A01

PB95-105383
Security in Open Systems.
PB95-105383 *01,473* PC A13/MF A03

PB95-105524
Predicting the Energy Performance Ratings of a Family of Type I Combination Appliances.
PB95-105524 *02,504* PC A03/MF A01

PB95-105540
Flow Conditioner Tests for Three Orifice Flowmeter Sizes.
PB95-105540 *04,201* PC A05/MF A01

PB95-107017
Changes in the Redox State of Iridium Oxide Clusters and Their Relation to Catalytic Water Oxidation: Radiolytic and Electrochemical Studies.
PB95-107017 *00,864* Not available NTIS

PB95-140547
Magnetic Ordering of the Cu Spins in PrBa2Cu3O6+x.
PB95-140547 *04,545* Not available NTIS

PB95-140554
Crystal Structure and Magnetic Ordering of the Rare-Earth and Cu Moments in RBa2Cu2NbO8(R=Nd,Pr).
PB95-140554 *04,546* Not available NTIS

PB95-140562
Quasielastic and Inelastic Neutron-Scattering Studies of ((CD3)3ND)FeCl3.2D2O: A One-Dimensional Ising Ferromagnet.
PB95-140562 *04,547* Not available NTIS

PB95-140570
Phase Equilibria in the Systems CaO-CuO and CaO-Bi2O3.
PB95-140570 *03,048* Not available NTIS

PB95-140588
Critical Factors in Non-Lubricated, Non-Abrasive Wear Testing.
PB95-140588 *03,236* Not available NTIS

PB95-140596
Tribological Data: Needs and Opportunities.
PB95-140596 *03,237* Not available NTIS

PB95-140604
Device for Subambient Temperature Control in Liquid Chromatography.
PB95-140604 *00,573* Not available NTIS

PB95-140810
Thermally Activated Hopping of a Single Abrikosov Vortex.
PB95-140810 *04,548* Not available NTIS

PB95-140828
Surface Energy Reduction in Fibrous Monotectic Structures.
PB95-140828 *03,150* Not available NTIS

PB95-140836
Rare-Earth-Doped Waveguide Devices: The Potential for Compact Blue-Green Lasers.
PB95-140836 *04,257* Not available NTIS

PB95-140844
Linewidth Narrowing in an Imbalanced Y-Branch Waveguide Laser.
PB95-140844 *04,258* Not available NTIS

PB95-140851
Nd:LiTaO3 Waveguide Laser.
PB95-140851 *04,259* Not available NTIS

PB95-140869
Wavelengths and Isotope Shifts for Lines of Astrophysical Interest in the Spectrum of Doubly Ionized Mercury (Hg III).
PB95-140869 *03,887* Not available NTIS

PB95-140877
Spectrum and Energy Levels of Triply Ionized Barium (Ba IV).
PB95-140877 *03,888* Not available NTIS

PB95-140885
FPETOOL: Fire Protection Tools for Hazard Estimation. An Overview of Features.
PB95-140885 *00,367* Not available NTIS

PB95-140893
In situ Measurements of Chloride Ion and Corrosion Potential at the Coating/Metal Interface.
PB95-140893 *03,122* Not available NTIS

PB95-140901
Using Torsional Dilatometry to Measure the Effects of Deformations on Physical Aging.
PB95-140901 *03,384* Not available NTIS

PB95-140919
Comparison of Experimental and Computed Species Concentration and Temperature Profiles in Laminar, Two-Dimensional Methane/Air Diffusion Flames.
PB95-140919 *01,379* Not available NTIS

PB95-140927
Aging Effects on XRF Measurements of Solder Coatings.
PB95-140927 *03,123* Not available NTIS

PB95-140935
One- and Two-Sided Burning of Thermally Thin Materials.
PB95-140935 *03,151* Not available NTIS

PB95-140943
Heat Transfer in Thin, Compact Heat Exchangers with Circular, Rectangular, or Pin-Fin Flow Passages.
PB95-140943 *02,751* Not available NTIS

PB95-140950
Chemical and Microbiological Problems Associated with Research on the Biodesulfurization of Coal.
PB95-140950 *02,484* Not available NTIS

PB95-140968
Bioleaching of Cobalt from Smelter Wastes by 'Thiobacillus ferrooxidans'.
PB95-140968 *02,582* Not available NTIS

PB95-140976
Comparison of the Liquid Chromatographic Behavior of Selected Steroid Isomers Using Different Reversed-Phase Materials and Mobile Phase Compositions.
PB95-140976 *00,574* Not available NTIS

PB95-140984
Metrology Requirements of Future Space Power Systems.
PB95-140984 *04,840* Not available NTIS

PB95-140992
Associative Electron Attachment to S2F10, S2OF10, and S2O2F10.
PB95-140992 *00,907* Not available NTIS

PB95-141008
Ion Kinetic-Energy Distributions in Argon rf Glow Discharges.
PB95-141008 *04,409* Not available NTIS

PB95-141016
Critical Current Behavior of Ag-Coated YBa2Cu3O7-x Thin Films.
PB95-141016 *04,549* Not available NTIS

PB95-141024
Magnetic Field Dependence of the Critical Current Anisotropy in Normal Metal-YBa2Cu3O7-delta Thin Film Bilayers.

PB95-242400
Measuring Long Gage Blocks with the NIST Line Scale Interferometer.
PB95-242400 *02,665* PC A03/MF A01

PB95-242418
Testability of Object-Oriented Systems.
PB95-242418 *01,733* PC A05/MF A01

PB95-251617
Water-Vapor Measurements of Low-Slope Roofing Materials.
PB95-251617 *00,399* PC A03/MF A01

PB95-251625
SF6 Insulation: Possible Greenhouse Problems and Solutions.
PB95-251625 *02,269* PC A03/MF A01

PB95-251633
Submarine Automation: Demonstration No. 5.
PB95-251633 *03,748* PC A03/MF A01

PB95-251641
Study of Potential Applications of Automation and Robotics Technology in Construction, Maintenance and Operation of Highway Systems: A Final Report. Volume 4.
PB95-251641 *01,340* PC A06/MF A02

PB95-251658
Algorithm Testing and Evaluation Program for Coordinate Measuring Systems: Testing Methods.
PB95-251658 *02,666* PC A03/MF A01

PB95-251666
User's Guide for the Algorithm Testing System Version 2.0.
PB95-251666 *02,916* PC A03/MF A01

PB95-251674
Center for High Integrity Software System Assurance: Initial Goals and Activities.
PB95-251674 *01,734* PC A03/MF A01

PB95-251682
Study of Potential Applications of Automation and Robotics Technology in Construction, Maintenance and Operation of Highway Systems: A Final Report. Volume 1.
PB95-251682 *01,341* PC A06/MF A02

PB95-251690
Study of Potential Applications of Automation and Robotics Technology in Construction, Maintenance and Operation of Highway Systems: A Final Report. Volume 3.
PB95-251690 *01,342* PC A15/MF A03

PB95-251708
Information Technologies Make Business Sense for the Custom Therapeutic Footwear Industry.
PB95-251708 *02,829* PC A03/MF A01

PB95-251716
Gage Block Handbook.
PB95-251716 *02,667* PC A08/MF A02

PB95-251724
Method and Evaluation of Character Stroke Preservation on Handprint Recognition.
PB95-251724 *01,850* PC A03/MF A01

PB95-251732
Standard Reference Material 1744: Aluminum Freezing-Point Standard.
PB95-251732 *01,055* PC A03/MF A01

PB95-253563
Product Models and Virtual Prototypes in Mechanical Engineering.
PB95-253563 *02,783* PC A03/MF A01

PB95-253571
Advanced Mass Calibration and Measurement Assurance Program for State Calibration Laboratories.
PB95-253571 *02,492* PC A03/MF A01

PB95-253589
Determination of the Residual Stresses Near the Ends of Skip Welds Using Neutron Diffraction and X-ray Diffraction Procedures.
PB95-253589 *02,868* PC A03/MF A01

PB95-253597
Least-Cost Energy Decisions for Buildings. Part 3. Choosing Economic Evaluation Methods. Video Training Workbook.
PB95-253597 *00,265* PC A04/MF A01

PB95-253605
International Green Building Conference and Exposition (2nd). Held in Big Sky, Montana on August 13-15, 1995.
PB95-253605 *02,525* PC A04/MF A01

PB95-254439
Materials Science and Engineering Laboratory Annual Report, December 1993.
PB95-254439 *02,668* PC A03/MF A01

PB95-255204
Proceedings of the Applied Diamond Conference 1995: Applications of Diamond Films and Related Materials International Conference (3rd). Held in Gaithersburg, Maryland, on August 21-24, 1995.
PB95-255204 *04,701* PC A99/MF E11

PB95-255824
Simple Method of Composition Shifting with a Distillation Column for a Heat Pump Employing a Zeotropic Refrigerant Mixture.
PB95-255824 *02,603* PC A03/MF A01

PB95-255832
Integrated Vision Touch-Probe System for Dimensional Inspection Tasks.
PB95-255832 *02,917* PC A03/MF A01

PB95-255840
NIST SRM 9983 High-Rigidity Ball-Bar Stand. User Manual.
PB95-255840 *02,669* PC A03/MF A01

PB95-255865
Study of Potential Applications of Automation and Robotics Technology in Construction, Maintenance and Operation of Highway Systems: A Final Report. Volume 2.
PB95-255865 *01,343* PC A19/MF A04

PB95-255881
Proceedings of the Meeting of the Intergovernmental U.S.-Russian Business Development Committee's Standard Working Group (4th). Held in New York City, New York on March 27-29, 1995 and in Northbrook, Illinois on March 30-31, 1995.
PB95-255881 *00,496* PC A11/MF A03

PB95-255899
New Mass Transport Elements and Components for the NIST IAQ Model.
PB95-255899 *02,558* PC A05/MF A01

PB95-255923
Reproducibility of the Temperature of the Ice Point in Routine Measurements.
PB95-255923 *04,015* PC A03/MF A01

PB95-256053
Applications of Diamond Films and Related Materials: International Conference (3rd). Held in Gaithersburg, Maryland on August 21-24, 1995. Supplement to NIST Special Publication 885.
PB95-256053 *03,063* PC A04/MF A01

PB95-256335
Sliding Vane Flow Conditioner Tests in a 100 Diameter Long 10 inch Natural Gas Orifice Meter at Pacific Gas and Electric. Topical Report, 1990-1992.
PB95-256335 *02,493* PC A04/MF A01

PB95-260618
Thermochemical and Chemical Kinetic Data for Fluorinated Hydrocarbons.
PB95-260618 *01,056* PC A09/MF A02

PB95-260725
Strengthening Methodology for Lightly Reinforced Concrete Frames: Recommended Design Guidelines for Strengthening with Infill Walls.
PB95-260725 *00,454* PC A04/MF A01

PB95-260758
45 deg/0 deg Retlectance Factors of Pressed Polytetrafluoroethylene (PTFE) Powder.
PB95-260758 *04,328* PC A06/MF A02

PB95-260766
Semiconductor Measurement Technology: HOTPAC. Programs for Thermal Analysis Including Version 3.0 of the TXYZ Program, TXYZ30, and the Thermal MultiLayer Program, TML.
PB95-260766 *02,374* PC A05/MF A01

PB95-260808
NIST Standard Reference Data Products Catalog, 1995-96. Achieve with Standard Reference Data.
PB95-260808 *01,057* PC A03/MF A01

PB95-260816
Long-Term Performance of Engineered Concrete Barriers.
PB95-260816 *03,727* PC A03/MF A01

PB95-261897
Journal of Research of the National Institute of Standards and Technology, May/June 1995. Volume 100, Number 3.
PB95-261897 *02,670* PC A07/MF A02

PB95-261905
Determining the Magnetic Properties of 1 kg Mass Standards.
PB95-261905 *04,016*
(Order as PB95-261897, PC A07/MF A02)

PB95-261913
Intercomparison of Photometric Units Maintained at NIST (USA) and PTB (Germany), 1993.
PB95-261913 *04,329*
(Order as PB95-261897, PC A07/MF A02)

PB95-261921
Determination of the Transmittance Uniformity of Optical Filter Standard Reference Materials.
PB95-261921 *02,182*
(Order as PB95-261897, PC A07/MF A02)

PB95-261939
Low-Frequency Model for Radio-Frequency Absorbers.
PB95-261939 *04,424*
(Order as PB95-261897, PC A07/MF A02)

PB95-261947
Using Quantized Breakdown Voltage Signals to Determine the Maximum Electric Fields in a Quantum Hall Effect Sample.
PB95-261947 *02,375*
(Order as PB95-261897, PC A07/MF A02)

PB95-261954
High Accuracy Measurement of Aperture Area Relative to a Standard Known Aperture.
PB95-261954 *01,919*
(Order as PB95-261897, PC A07/MF A02)

PB95-261962
New IUPAC Guidelines for the Reporting of Stable Hydrogen, Carbon, and Oxygen Isotope-Ratio Data. Letter to the Editor.
PB95-261962 *01,058*
(Order as PB95-261897, PC A07/MF A02)

PB95-267779
NIOSH Comments to DOL on Risk Estimates from the Cadmium Cohort Study by L. Stayner, February 7, 1992.
PB95-267779 *03,604* PC A02/MF A01

PB95-267803
Improving Neural Network Performance for Character and Fingerprint Classification by Altering Network Dynamics.
PB95-267803 *01,851* PC A03/MF A01

PB95-267829
Expression Formatter for MACSYMA.
PB95-267829 *01,735* PC A03/MF A01

PB95-267845
Effect of Training Dynamics on Neural Network Performance.
PB95-267845 *01,852* PC A03/MF A01

PB95-267860
Design Engineering Research at NIST.
PB95-267860 *02,784* PC A03/MF A01

PB95-267886
Unravel: A CASE Tool to Assist Evaluation of High Integrity Software. Volume 1. Requirements and Design.
PB95-267886 *01,736* PC A05/MF A01

PB95-267894
Unravel: A CASE Tool to Assist Evaluation of High Integrity Software. Volume 2. User Manual.
PB95-267894 *01,737* PC A04/MF A01

PB95-267928
Estimation of Measurement Uncertainty of Small Circular Features Measured by CMMs.
PB95-267928 *02,918* PC A03/MF A01

PB95-267936
PCASYS: A Pattern-Level Classification Automation System for Fingerprints.
PB95-267936 *01,853* PC A03/MF A01

PB95-267944
National Voluntary Laboratory Accreditation Program (NVLAP): Commercial Products Testing.
PB95-267944 *02,671* PC A02/MF A01

PB96-102546
Simulation of C60 Through the Plastic Transition Temperatures.
PB96-102546 *04,713* Not available NTIS

PB96-102553
Characterization of a Clipped Gaussian Beam.
PB96-102553 *04,331* Not available NTIS

PB96-102561
Standard Antennas for Electromagnetic Interference Measurements and Methods to Calibrate Them.
PB96-102561 *02,007* Not available NTIS

PB96-102579
Measurements of Thermophysical Properties of Nickel Near Its Melting Temperature by a Microsecond-Resolution Transient Technique.
PB96-102579 *04,210* Not available NTIS

PB96-102587
Phase Locking in Two-Dimensional Arrays of Josephson Junctions: Effect of Critical-Current Nonuniformity.
PB96-102587 *04,714* Not available NTIS

PB96-102595
Tensile Deformation-Induced Microstructures in Free-Standing Copper Thin Films.
PB96-102595 *04,715* Not available NTIS

PB96-102603
Magnetostriction and Giant Magnetoresistance in Annealed NiFe/Ag Multilayers.
PB96-102603 *04,716* Not available NTIS

PB96-102611
Measurement and Interpretation of Tidal Tilts in a Small Array.
PB96-102611 *03,686* Not available NTIS

PB96-102629
100 Ampere, 100 kHZ Transconductance Amplifier.
PB96-102629 *02,068* Not available NTIS

PB96-102637
Bonding Wires to Quantized Hall Resistors.
PB96-102637 *01,921* Not available NTIS

PB96-102645
Intercomparison Study of (237)Np Determination in Artificial Urine Samples.
PB96-102645 *03,633* Not available NTIS

PB96-102652
Measurement Methods and Algorithms for Comparison of Local and Remote Clocks.
PB96-102652 *01,549* Not available NTIS

PB96-102660
Measurement of Very Low Frequency Vibrations.
PB96-102660 *03,687* Not available NTIS

PB96-102678
Ouch Those Programs are Painful.
PB96-102678 *01,739* Not available NTIS

PB96-102686
Conformance Testing for OSI Protocols.
PB96-102686 *01,631* Not available NTIS

PB96-102694
High-Velocity Plasma in the Transition Region of AU Microscopii: Evidence for Magnetic Reconnection and Saturated Heating during Quiescent and Flaring Conditions.
PB96-102694 *00,091* Not available NTIS

PB96-102702
Model for Determining the Density and Mobility of Carriers in Thin Semiconducting Layers with Only Two Contacts.
PB96-102702 *02,378* Not available NTIS

PB96-102710
MONSEL-II: Monte Carlo Simulation of SEM Signals for Linewidth Metrology.
PB96-102710 *02,379* Not available NTIS

PB96-102728
Bacteriorhodopsin Retains Its Light-Induced Proton-Pumping Function After Being Heated to 140C.
PB96-102728 *03,471* Not available NTIS

PB96-102736
Delivering the Same Optical Frequency at Two Places: Accurate Cancellation of Phase Noise Introduced by an Optical Fiber or Other Time-Varying Path.
PB96-102736 *04,332* Not available NTIS

PB96-102744
Analytical Method for Determining Thermal Conductivity from Dynamic Experiments.
PB96-102744 *04,024* Not available NTIS

PB96-102751
Evolution of X-ray Resonance Raman Scattering into X-ray Fluorescence from the Excitation of Xenon Near the L3 Edge.
PB96-102751 *04,025* Not available NTIS

PB96-102769
NBS/NIST Peltier-Effect Microcalorimeter: A Four-Decade Review.
PB96-102769 *01,064* Not available NTIS

PB96-102777
Observing Stellar Coronae with the Goddard High Resolution Spectrograph. I. The dMe Star AU Microscopii.
PB96-102777 *00,092* Not available NTIS

PB96-102785
Comments on 'Conversions between S, Z, Y, h, ABCD, and T Parameters Which Are Valid for Complex Source and Load Impedances'.
PB96-102785 *02,069* Not available NTIS

PB96-102793
Scaling of the Nonlinear Optical Cross Sections of GaAs-AlGaAs Multiple Quantum-Well Hetero n-i-p-i's.
PB96-102793 *02,183* Not available NTIS

PB96-102801
Length Scales for Fragile Glass-Forming Liquids.
PB96-102801 *01,065* Not available NTIS

PB96-102819
Optically Stabilized Tunable Diode-Laser System for Saturation Spectroscopy.
PB96-102819 *04,717* Not available NTIS

PB96-102827
Electronic Microrefrigerator Based on a Normal-Insulator-Superconductor Tunnel Junction.
PB96-102827 *04,718* Not available NTIS

PB96-102835
Probing Potential-Energy Surfaces via High-Resolution IR Laser Spectroscopy.
PB96-102835 *01,066* Not available NTIS

PB96-102843
New Method for Realizing a Luminous Flux Scale Using an Integrating Sphere with an External Source.
PB96-102843 *04,333* Not available NTIS

PB96-102850
Effect of Electrode Material on Measured Ion Energy Distributions in Radio-Frequency Discharges.
PB96-102850 *04,026* Not available NTIS

PB96-102868
Concepts for Fire Protection of Passenger Rail Transportation Vehicles: Past, Present, and Future.
PB96-102868 *04,853* Not available NTIS

PB96-102876
Buffer Layer Modulation-Doped Field-Effect-Transistor Interactions in the Al0.33Ga0.67As/GaAs Superlattice System.
PB96-102876 *02,380* Not available NTIS

PB96-102884
Total-Dielectric-Function Approach to Electron and Phonon Response in Solids.
PB96-102884 *01,067* Not available NTIS

PB96-102892
Principle of Congruence and Its Application to Compressible States.
PB96-102892 *01,068* Not available NTIS

PB96-102900
Phospholipid/Alkanethiol Bilayers for Cell-Surface Receptor Studies by Surface Plasmon Resonance.
PB96-102900 *03,472* Not available NTIS

PB96-102918
Energy Calibration of X-ray Photoelectron Spectrometers: Results of an Interlaboratory Comparison to Evaluate a Proposed Calibration Procedure.
PB96-102918 *04,027* Not available NTIS

PB96-102926
TDDB Characterization of Thin SiO2 Films with Bimodal Failure Populations.
PB96-102926 *02,381* Not available NTIS

PB96-102934
Santa Ana Fire Department Experiment at 1315 South Bristol, July 14, 1994. (Reprint).
PB96-102934 *00,207* Not available NTIS

PB96-102942
Time-Resolved Balmer-Alpha Emission from Fast Hydrogen Atoms in Low Pressure, Radio-Frequency Discharges in Hydrogen.
PB96-102942 *04,028* Not available NTIS

PB96-102959
Ion Kinetic-Energy Distributions and Balmer-alpha (Halpha) Excitation in Ar-H2 Radio-Frequency Discharges.
PB96-102959 *04,029* Not available NTIS

PB96-102967
Pressure Equations in Zone-Fire Modeling.
PB96-102967 *00,208* Not available NTIS

PB96-102975
X-ray Powder Diffraction from Carbon Nanotubes and Nanoparticles.
PB96-102975 *03,064* Not available NTIS

PB96-102983
Damage Processes in Ceramics Resulting from Diamond Tool Indentation and Scratching in Various Environments.
PB96-102983 *03,065* Not available NTIS

PB96-102991
Intracomparison Tests of the FG5 Absolute Gravity Meters.
PB96-102991 *03,688* Not available NTIS

PB96-103007
Boundary Conforming Grid Generation System for Interface Tracking.
PB96-103007 *03,357* Not available NTIS

PB96-103015
Superconducting Integrated Circuit Fabrication with Low Temperature ECR-Based PECVD SiO2 Dielectric Films.
PB96-103015 *04,719* Not available NTIS

PB96-103023
Certification of Polychlorinated Biphenyl Congeners and Chlorinated Pesticides in a Whale Blubber Standard Reference Material.
PB96-103023 *03,745* Not available NTIS

PB96-103031
Using Synthetic Perturbations and Statistical Screening to Assay Shared-Memory Programs.
PB96-103031 *01,740* Not available NTIS

PB96-103049
Time Generation and Distribution.
PB96-103049 *01,550* Not available NTIS

PB96-113329
Gaseous Electronics Conference RF Reference Cell: An Introduction.
PB96-113329 *02,387*
(Order as PB96-113311, PC A09/MF A03)

PB96-113337
Current and Voltage Measurements in the Gaseous Electronics Conference RF Reference Cell.
PB96-113337 *02,388*
(Order as PB96-113311, PC A09/MF A03)

PB96-113345
Optical Emission Spectroscopy on the Gaseous Electronics Conference RF Reference Cell.
PB96-113345 *02,389*
(Order as PB96-113311, PC A09/MF A03)

PB96-113352
Optical Diagnostics in the Gaseous Electronics Conference Reference Cell.
PB96-113352 *02,390*
(Order as PB96-113311, PC A09/MF A03)

PB96-113360
Studies of Ion Kinetic-Energy Distributions in the Gaseous Electronics Conference RF Reference Cell.
PB96-113360 *02,391*
(Order as PB96-113311, PC A09/MF A03)

PB96-113378
Microwave Diagnostic Results from the Gaseous Electronics Conference RF Reference Cell.
PB96-113378 *02,392*
(Order as PB96-113311, PC A09/MF A03)

PB96-113386
Langmuir Probe Measurements in the Gaseous Electronics Conference RF Reference Cell.
PB96-113386 *02,393*
(Order as PB96-113311, PC A09/MF A03)

PB96-113394
Inductively Coupled Plasma Source for the Gaseous Electronics Conference RF Reference Cell.
PB96-113394 *02,394*
(Order as PB96-113311, PC A09/MF A03)

PB96-113402
Reactive Ion Etching in the Gaseous Electronics Conference RF Reference Cell.
PB96-113402 *02,395*
(Order as PB96-113311, PC A09/MF A03)

PB96-113410
Dusty Plasma Studies in the Gaseous Electronics Conference Reference Cell.
PB96-113410 *02,396*
(Order as PB96-113311, PC A09/MF A03)

PB96-113428
One-Dimensional Modeling Studies of the Gaseous Electronics Conference RF Reference Cell.
PB96-113428 *02,397*
(Order as PB96-113311, PC A09/MF A03)

PB96-113436
Two-Dimensional Self-Consistent Radio Frequency Plasma Simulations Relevant to the Gaseous Electronics Conference RF Reference Cell.
PB96-113436 *02,398*
(Order as PB96-113311, PC A09/MF A03)

PB96-113535
Journal of Research of the National Institute of Standards and Technology, November/December 1994. Volume 99, Number 6.
PB96-113535 *04,336* PC A05/MF A01

PB96-113543
Intercomparison between NPL (India) and NIST (USA) Pressure Standards in the Hydraulic Pressure Region Up to 26 MPa.
PB96-113543 *04,211*
(Order as PB96-113535, PC A05/MF A01)

PB96-113550
Intercomparison of the ITS-90 Radiance Temperature Scales of the National Physical Laboratory (U.K.) and the National Institute of Standards and Technology.
PB96-113550 *02,674*
(Order as PB96-113535, PC A05/MF A01)

PB96-113568
Screened-Room Measurements on the NIST Spherical-Dipole Standard Radiator.
PB96-113568 *01,926*
(Order as PB96-113535, PC A05/MF A01)

PB96-113576
Beamcon III, a Linearity Measurement Instrument for Optical Detectors.
PB96-113576 *04,337*
(Order as PB96-113535, PC A05/MF A01)

PB96-113584
Spectroscopic Study of Quantized Breakdown Voltage States of the Quantum Hall Effect.
PB96-113584 *04,730*
(Order as PB96-113535, PC A05/MF A01)

PB96-114764
Turbulent Flame Spread on Vertical Corner Walls.
PB96-114764 *01,403* PC A08/MF A02

PB96-114913

PB96-146865
Light-Scattering Studies on Phase Separation in a Binary Blend with Addition of Diblock Copolymers.
PB96-146865 *01,286* Not available NTIS

PB96-146873
Influence of an Impenetrable Interface on a Polymer Glass-Transition Temperature.
PB96-146873 *03,175* Not available NTIS

PB96-146881
Electrodeposited Cobalt-Tungsten as a Diffusion Barrier between Graphite Fibers and Nickel.
PB96-146881 *03,176* Not available NTIS

PB96-146899
Experimental Determination of the Ionization Energy of IO(X(sup 2)II(sub 3/2)) and Estimations of Delta(sub f)H(sup deg)(sub 0)(IO(sup -)) and PA(IO).
PB96-146899 *00,694* Not available NTIS

PB96-147012
Bioactive Polymeric Dental Materials Based on Amorphous Calcium Phosphate.
PB96-147012 *03,572* Not available NTIS

PB96-147020
Remineralizing Dental Composites Based on Amorphous Calcium Phosphate.
PB96-147020 *03,573* Not available NTIS

PB96-147038
Dielectric Measurements on Printed-Wiring and Circuit Boards, Thin Films, and Substrates: An Overview.
PB96-147038 *02,236* Not available NTIS

PB96-147046
Gravity-Current Transport in Building Fires.
PB96-147046 *01,415* Not available NTIS

PB96-147053
General Types of Information Services.
PB96-147053 *02,735* Not available NTIS

PB96-147061
Rapid Method for the Isolation of Genomic DNA from 'Aspergillus fumigatus'.
PB96-147061 *03,488* Not available NTIS

PB96-147079
Pinch Effect in Commensurate Vortex-Pin Lattices.
PB96-147079 *01,125* Not available NTIS

PB96-147087
Magnetoresistance of Thin-Film NiFe Devices Exhibiting Single-Domain Behavior.
PB96-147087 *04,766* Not available NTIS

PB96-147095
Dynamics of Calcium Phosphate Precipitation.
PB96-147095 *03,574* Not available NTIS

PB96-147103
Absolute Response Calibration of a Transfer Standard Cryogenic Bolometer.
PB96-147103 *04,358* Not available NTIS

PB96-147111
Computing the Effect of Sprinkler Sprays on Fire Induced Gas Flow.
PB96-147111 *00,404* Not available NTIS

PB96-147129
Gas-Coupled, Pulse-Echo Ultrasonic Crack Detection and Thickness Gaging.
PB96-147129 *04,847* Not available NTIS

PB96-147137
Comparison of k-Correction and Taylor-Series Correction for Probe-Position Errors in Planar Near-Field Scanning.
PB96-147137 *02,012* Not available NTIS

PB96-147152
Neutron Scattering Study of the Lattice Modes of Solid Cubane.
PB96-147152 *01,126* Not available NTIS

PB96-147160
II-3: Critical Current Measurement Methods: Quantitative Evaluation.
PB96-147160 *04,767* Not available NTIS

PB96-147178
First VAMAS USA Interlaboratory Comparison of High Temperature Superconductor Critical Current Measurements.
PB96-147178 *04,768* Not available NTIS

PB96-147186
II-5: Thermal Contraction of Materials Used in Nb3Sn Critical Current Measurements.
PB96-147186 *04,769* Not available NTIS

PB96-147194
USA Interlaboratory Comparison of Superconductor Simulator Critical Current Measurements.
PB96-147194 *04,770* Not available NTIS

PB96-147202
Heterodyne Mixing and Direct Detection in High Temperature Josephson Junctions.
PB96-147202 *01,565* Not available NTIS

PB96-147392
Airborne Asbestos Analysis: National Voluntary Laboratory Accreditation Program.
PB96-147392 *02,566* PC A05/MF A01

PB96-147814
Virtual Environments for Health Care. A White Paper for the Advanced Technology Program (ATP), the National Institute of Standards and Technology.
PB96-147814 *03,594* PC A05/MF A01

PB96-147889
Collection of Results for the SPC/E Water Model.
PB96-147889 *01,127* PC A03/MF A01

PB96-147897
Review of Flows Driven By Natural Convection in Adiabatic Shafts.
PB96-147897 *01,416* PC A04/MF A01

PB96-147905
Electronics and Electrical Engineering Laboratory Technical Progress Bulletin Covering Laboratory Programs, July to September 1995 with 1996 EEEL Events Calendar.
PB96-147905 *01,942* PC A04/MF A01

PB96-147913
Technical Impact of the NIST Calibration Service for Electrical Power and Energy.
PB96-147913 *02,462* PC A05/MF A01

PB96-147954
NIST RS274KT Interpreter.
PB96-147954 *02,835* PC A05/MF A01

PB96-147962
Product Realization Process Modeling: A Study of Requirements, Methods and Research Issues.
PB96-147962 *02,836* PC A04/MF A01

PB96-148010
Microwave Noise in High-Tc Josephson Junctions.
PB96-148010 *04,771* Not available NTIS

PB96-148028
Partially Coherent Transmittance of Dielectric Lamellae.
PB96-148028 *04,359* Not available NTIS

PB96-148036
Water Permeability and Chloride Ion Diffusion in Portland Cement Mortars: Relationship to Sand Content and Critical Pore Diameter.
PB96-148036 *03,193* Not available NTIS

PB96-148044
Josephson D/A Converter with Fundamental Accuracy.
PB96-148044 *02,418* Not available NTIS

PB96-148051
Performance and Reliability of NIST 10-V Josephson Arrays.
PB96-148051 *02,419* Not available NTIS

PB96-148069
Accuracy in Time Domain Transmission Line Measurements.
PB96-148069 *04,060* Not available NTIS

PB96-148077
Spatial Correlation Function for Fields in a Reverberation Chamber.
PB96-148077 *04,427* Not available NTIS

PB96-148085
Shear-Induced Mixing in Polymer Blends.
PB96-148085 *01,287* Not available NTIS

PB96-148093
AC-DC Difference Characteristics of High-Voltage Thermal Converters.
PB96-148093 *02,083* Not available NTIS

PB96-148101
Free Radical Chemistry of the Atmospheric Aqueous Phase.
PB96-148101 *00,117* Not available NTIS

PB96-148119
Information Resources for the Fire Community.
PB96-148119 *00,211* Not available NTIS

PB96-148127
High-Temperature Furnace for In situ Small-Angle Neutron Scattering during Ceramic Processing.
PB96-148127 *03,743* Not available NTIS

PB96-148135
Performance of Multilayer Thin-Film Multijunction Thermal Converters.
PB96-148135 *02,084* Not available NTIS

PB96-148143
V-6: Effects of Temperature Variation.
PB96-148143 *04,772* Not available NTIS

PB96-148150
Scanning Capacitance Microscopy Measurements and Modeling: Progress Towards Dopant Profiling of Silicon.
PB96-148150 *04,773* Not available NTIS

PB96-148168
Measurement of Patterned Film Linewidth for Interconnect Characterization.
PB96-148168 *02,420* Not available NTIS

PB96-148176
High-Speed Interconnection Characterization Using Time Domain Network Analysis.
PB96-148176 *04,061* Not available NTIS

PB96-148184
Effects of Substrate Surface Steps on the Microstructure of Epitaxial Ba2YCu3O7-x Thin Films on (001) LaAlO3.
PB96-148184 *04,774* Not available NTIS

PB96-148192
Heights of Wall-Fire Flames.
PB96-148192 *00,212* Not available NTIS

PB96-148200
Examination of the Correlation between Cone Calorimeter Data and Full-Scale Furniture Mock-Up Fires.
PB96-148200 *01,417* Not available NTIS

PB96-151394
Fire Safety Engineering Research in the United States.
PB96-151394 *00,213* Not available NTIS

PB96-151402
Elements of a Framework for Fire Safety Engineering.
PB96-151402 *00,214* Not available NTIS

PB96-154422
Optical Fiber, Fiber Coating, and Connector Ferrule Geometry: Results of Interlaboratory Measurement Comparisons.
PB96-154422 *04,360* PC A05/MF A01

PB96-154463
Workplan to Analyze the Energy Impacts of Envelope Airtightness in Office Buildings.
PB96-154463 *00,273* PC A04/MF A01

PB96-154521
Machine Performance Standard Provides Opportunity to Improve Quality and Productivity.
PB96-154521 *02,837* PC A02/MF A01

PB96-154539
Guidelines for the Development of Mapping Tables.
PB96-154539 *02,786* PC A03/MF A01

PB96-154562
Image Gradient Evolution: A Visual Cue for Danger.
PB96-154562 *02,939* PC A03/MF A01

AutoBid 2.0: The Microcomputer System for Police Patrol Vehicle Selection.
PB96-154570 *04,871* PC A03/MF A01

PB96-154588
C++ in Safety Critical Systems.
PB96-154588 *01,750* PC A04/MF A01

PB96-154596
Semiconductor Measurement Technology: Survey of Optical Characterization Methods for Materials, Processing, and Manufacturing in the Semiconductor Industry.
PB96-154596 *02,706* PC A05/MF A01

PB96-154794
Predicting the Ignition Time and Burning Rate of Thermoplastics in the Cone Calorimeter.
PB96-154794 *01,418* PC A10/MF A03

PB96-154810
Santa Ana Fire Department Experiments at South Bristol Street.
PB96-154810 *00,305* PC A11/MF A03

PB96-154836
Simplified Design Procedure for Hybrid Precast Concrete Connections.
PB96-154836 *00,405* PC A06/MF A01

PB96-154877
NIST SIMA Interactive Management Workshop. Held in Fort Belvoir, Virginia on November 14-16, 1994.
PB96-154877 *02,838* PC A08/MF A02

PB96-154901
Summary and Results of the NIST Workshop on Proposed Guidelines for Testing and Evaluation of Seismic Isolation Systems. Held in San Francisco, California on July 25, 1994.
PB96-154901 *00,463* PC A04/MF A01

PB96-154968
Sensitivity Analysis for Mathematical Modeling of Fires in Residential Buildings.
PB96-154968 *00,215* PC A03/MF A01

PB96-161815
Response to Comments on the NIST Proposed Digital Signature Standard.
PB96-161815 *01,615* Not available NTIS

PB96-161823
Lattice Statics of Interfaces and Interfacial Cracks in Bimaterial Solids.
PB96-161823 *02,985* Not available NTIS

PB96-161831
Effect of CF3H and CF3Br on Laminar Diffusion Flames in Normal and Microgravity.
PB96-161831 *01,420* Not available NTIS

PB96-161849
Effect of CF3H and CF3Br on Laminar Diffusion Flames in Normal and Microgravity.
PB96-161849 *01,421* Not available NTIS

PB96-161856
Vapor-Liquid Equilibria of Temary Mixtures in the Critical Region on Paths of Constant Temperature and Overall Composition.
PB96-161856 *01,139* Not available NTIS

PB96-161864
Gas Absorption during Ion-Irradiation of a Polymer Target.
PB96-161864 *04,099* Not available NTIS

PB96-161872
Upgrade and Modernization Projects at the NBSR.
PB96-161872 *03,737* Not available NTIS

PB96-161880
Electric Field Effects on a Near-Critical Fluid in Microgravity.
PB96-161880 *04,217* Not available NTIS

PB96-161898
Density Dependence of Fluid Properties and Non-Newtonian Flows: The Weisenberg Effect.
PB96-161898 *01,140* Not available NTIS

PB96-161906
Nonlinear Correlation of High-Pressure Vapor-Liquid Equilibrium Data for Ethylene + n-Butane Showing Inconsistencies in Experimental Compositions.
PB96-161906 *01,141* Not available NTIS

PB96-161914
Quantum Collisional Transfer Contributions to the Density Dependence of Gaseous Viscosity.
PB96-161914 *01,142* Not available NTIS

PB96-161922
Correlations between Flaw Tolerance and Reliability in Zirconia.
PB96-161922 *02,986* Not available NTIS

PB96-161930
Cryogenic Flow Calibration in NIST.
PB96-161930 *01,143* Not available NTIS

PB96-161948
Business and Manufacturing Motivations for the Developing of Analytical Technology and Metrology for Semiconductors.
PB96-161948 *04,778* Not available NTIS

PB96-161955
SSME LOX Duct Flowmeter Design and Test Results.
PB96-161955 *04,826* Not available NTIS

PB96-161963
Electrical Measurements for Monitoring and Control of rf Plasma Processing.
PB96-161963 *04,369* Not available NTIS

PB96-161971
Fundamentals of Fracture: A 1993 Prologue, and Other Comments.
PB96-161971 *03,218* Not available NTIS

PB96-161989
Interfacial Crack in a Two-Dimensional Hexagonal Lattice.
PB96-161989 *04,100* Not available NTIS

PB96-161997
Whither Computational Materials Science. Some Thoughts from the Mechanical Properties Front.
PB96-161997 *02,987* Not available NTIS

PB96-162003
Dislocation Core-Core Interaction and Peierls Stress in a Model Hexagonal Lattice.
PB96-162003 *04,101* Not available NTIS

PB96-162441
Energy Price Indices and Discount Factors for Life-Cycle Cost Analysis 1996. Annual Supplement to NIST Handbook 135 and NBS Special Publication 709. (Revised).
PB96-162441 *02,510* PC A05/MF A01

Fracture in Multilayers.
PB96-163613 *02,988* Not available NTIS

PB96-163621
Gage Block Standards, Measurement Capabilities and Laboratory Accreditation.
PB96-163621 *02,757* Not available NTIS

PB96-163639
Autofluorescence Detection of 'Escherichia coli' on Silver Membrane Filters.
PB96-163639 *03,590* Not available NTIS

PB96-163647
Bacterial Enumeration in Storage Water.
PB96-163647 *03,591* Not available NTIS

PB96-163654
Feasibility of Fluorescence Detection of Tetracycline in Media Mixtures Employing a Fiber Optic Probe.
PB96-163654 *00,511* Not available NTIS

PB96-163662
Novel Amperometric Immunosensor for Procainamide Employing Light Activated Labels.
PB96-163662 *00,512* Not available NTIS

PB96-163670
Effect of Finite Beam Width on Elastic Light Scattering from Droplets.
PB96-163670 *01,144* Not available NTIS

PB96-163688
Elastic Scattering from Spheres under Non Plane-Wave Illumination.
PB96-163688 *04,370* Not available NTIS

PB96-163696
Cracks and Dislocations in Face-Centered Cubic Metallic Multilayers.
PB96-163696 *02,989* Not available NTIS

PB96-163704
Model for Microcrack Initiation and Propagation beneath Hertzian Contacts in Polycrystalline Ceramics.
PB96-163704 *03,077* Not available NTIS

PB96-163712
Inhibition of Premixed Methane-Air Flames by Iron Pentacarbonyl.
PB96-163712 *00,513* Not available NTIS

PB96-163720
Parametric Study of Hydrogen Fluoride Formation in Suppressed Fires.
PB96-163720 *00,514* Not available NTIS

PB96-163738
Molar Heat Capacity at Constant Volume for Air from 67 to 300 K at Pressures to 35 MPa.
PB96-163738 *00,515* Not available NTIS

PB96-163746
Charge-Transfer-Induced Multiplet Structure in the N4,5O2,3 Soft-X-ray Emission Spectrum of Lanthanum.
PB96-163746 *04,102* Not available NTIS

PB96-163753
Influence of Shear on the Ordering Temperature of a Triblock Copolymer Melt.
PB96-163753 *01,288* Not available NTIS

PB96-163761
Non-Newtonian Flow between Concentric Cylinders Calculated from Thermophysical Properties Obtained from Simulations.
PB96-163761 *04,103* Not available NTIS

PB96-163779
2D-Scanning Capacitance Microscopy Measurements of Cross-Sectioned VLSI Teststructures.
PB96-163779 *04,104* Not available NTIS

PB96-163787
High-Accuracy Principal-Angle Scanning Spectroscopic Ellipsometry of Semiconductor Interfaces.
PB96-163787 *02,427* Not available NTIS

PB96-163795
Model for Toughness Curves in Two-Phase Ceramics. 2. Microstructural Variables.
PB96-163795 *03,078* Not available NTIS

PB96-163803
CO2/CH4 Transport in Polyperfluorosulfonate Ionomers: Effects of Polar Solvents on Permeation and Solubility.
PB96-163803 *01,145* Not available NTIS

PB96-164017
Natural Convection from an Array of Electronic Packages Mounted on a Horizontal Board in a Narrow Aspect Ratio Enclosure.
PB96-164017 *02,087* Not available NTIS

PB96-164025
Enhanced Voltage-Dividing Potentiometer for High-Precision Feature Placement Metrology.
PB96-164025 *02,428* Not available NTIS

PB96-164033
Retention of Halocarbons on a Hexafluoropropylene Epoxide-Modified Graphitized Carbon Black. 4. Propane-Based Compounds.
PB96-164033 *03,284* Not available NTIS

PB96-164041
Simple and Efficient Methane-Marker Devices for Chromatographic Samples.
PB96-164041 *00,635* Not available NTIS

PB96-165956
Enhancement of R123 Pool Boiling by the Addition of N-Hexane.
PB96-165956 *02,605* PC A04/MF A01

PB96-165964
Using S-Check, Alpha Release 1.0.
PB96-165964 *01,767* PC A05/MF A01

PB96-165972
Preliminary Processing of the Lotung LSST Data.
PB96-165972 *03,690* PC A05/MF A01

PB96-165980
PIECS: A Software Program for Machine Tool Process-Intermittent Error Compensation.
PB96-165980 *02,842* PC A08/MF A02

PB96-165998
Beyond the Technology Roadmaps: An Assessment of Electronic Materials Research and Development.
PB96-165998 *01,961* PC A05/MF A01

PB96-166004
Public Key Infrastructure Invitational Workshop. Held in McLean, Virginia on September 28, 1995.
PB96-166004 *01,616* PC A08/MF A02

PB96-166616
NIST Handbook 44, 1996: Specifications, Tolerances, and Other Technical Requirements for Weighing and Measuring Devices as Adopted by the 80th National Conference on Weights and Measures, 1995.
PB96-166616 *02,926* PC A13/MF A03

PB96-167093
Determination of Total Protein Adsorbed on Solid (Membrane) Surface by a Hydrolysis Technique: Single Protein Adsorption.
PB96-167093 *03,552* Not available NTIS

PB96-167101
Dead Time, Pileup, and Accurate Gamma-Ray Spectrometry.
PB96-167101 *00,697* Not available NTIS

PB96-167119
Loss-Free Counting at IRI and NIST.
PB96-167119 *04,105* Not available NTIS

PB96-167127
Trace Element Concentrations in Cetacean Liver Tissues Archived in the National Marine Mammal Tissue Bank.
PB96-167127 *02,595* Not available NTIS

PB96-167135
Molar Heat Capacity at Constant Volume for (xCO2 + (1-x)C2H6) from 220 to 340 K at Pressures to 35 MPa.
PB96-167135 *01,148* Not available NTIS

PB96-167143
Accurate Electrical Characterization of High-Speed Interconnections.
PB96-167143 *02,240* Not available NTIS

PB96-167150
REFPROP Refrigerant Properties Database: Capabilities, Limitations, and Future Directions.
PB96-167150 *01,149* Not available NTIS

PB96-167168
Supercritical Fluid Extraction-Immunoassay for the Rapid Screening of Cocaine in Hair.
PB96-167168 *00,637* Not available NTIS

PB96-167176
Simulation and SANS Studies of Gelation Under Shear.
PB96-167176 *01,150* Not available NTIS

PB96-167184
Small-Angle Neutron-Scattering Study of Dense Sheared Silica Gels.
PB96-167184 *01,151* Not available NTIS

PB96-167192
Optical Characterization of Materials and Devices for the Semiconductor Industry: Trends and Needs.
PB96-167192 *02,431* Not available NTIS

PB96-167200
Analysis of Transverse Flow in Aligned Fibrous Porous Media.
PB96-167200 *03,177* Not available NTIS

PB96-167218
Status of the Round Robin on the Transport Properties of R134a.
PB96-167218 *01,152* Not available NTIS

PB96-167226
Structural Analysis of Heparin by Raman Spectroscopy.
PB96-167226 *03,480* Not available NTIS

PB96-167234
Viscosity of Defined and Undefined Hydrocarbon Liquids Calculated Using an Extended Corresponding-States Model.
PB96-167234 *02,498* Not available NTIS

PB96-167242
Determination of 21 Elements by INAA for Certification of SRM 1570a, Spinach.
PB96-167242 *00,698* Not available NTIS

PB96-167259
New NIST Rapid Pneumatic Tube System.
PB96-167259 *03,738* Not available NTIS

PB96-167267
Recent Developments in NIST Botanical SRMs.
PB96-167267 *03,489* Not available NTIS

PB96-167275
Relationship of Silver with Selenium and Mercury in the Liver of Two Species of Toothed Whales (Odontocetes).
PB96-167275 *02,596* Not available NTIS

PB96-167283
Resolution of Discrepant Analytical Data in the Certification of Platinum in Two Automobile Catalyst SRMs.
PB96-167283 *00,638* Not available NTIS

PB96-167291
Permeation Tube Approach to Long-Term Use of Automatic Sampler Retention Index Standards.
PB96-167291 *00,639* Not available NTIS

PB96-167309
Retention of Halocarbons on a Hexafluoropropylene Epoxide-Modified Graphitized Carbon Black. 3. Ethene-Based Compounds.
PB96-167309 *03,286* Not available NTIS

PB96-167317
Dynamic Scaling in an Aggregating 2D Lennard-Jones System.
PB96-167317 *04,106* Not available NTIS

PB96-167325
Double-Modulation and Selective Excitation Photoreflectance for Wafer-Level Characterization of Quantum-Well Laser Structures.
PB96-167325 *04,372* Not available NTIS

PB96-167333
Structure and Rheology of Hard-Sphere Systems.
PB96-167333 *00,662* Not available NTIS

PB96-167341
Preparation and Crystal Structure of Sr5TiNb4O17.
PB96-167341 *04,107* Not available NTIS

PB96-167358
Thermophysical Property Standard Reference Data from NIST.
PB96-167358 *01,153* Not available NTIS

PB96-167366
Planar Near-Field Measurements and Microwave Holography for Measuring Aperture Distribution on a 60 GHz Active Array Antenna.
PB96-167366 *03,762* Not available NTIS

PB96-167374
Small Angle Neutron Scattering Study of a Clay Suspension Under Shear.
PB96-167374 *00,663* Not available NTIS

PB96-167382
New Method for the Detection and Measurement of Polyaromatic Carcinogens and Related Compounds by DNA Intercalation.
PB96-167382 *03,481* Not available NTIS

PB96-167390
Isochoric (p-p-T) Measurements on Liquid and Gaseous Air from 67 to 400 K at Pressures to 35 MPa.
PB96-167390 *01,154* Not available NTIS

PB96-167408
Genetically Engineered Pores as Metal Ion Biosensors.
PB96-167408 *03,553* Not available NTIS

PB96-167812
Study to Determine the Existence of an Azeotropic R-22 'Drop-In' Substitute.
PB96-167812 *02,568* PC A04/MF A01

PB96-167820
Method of Estimating the Parameters of Tuned Mass Dampers for Seismic Applications.

PB96-201124 *01,511* Not available NTIS

PB96-201132
New Physics-Based Model for Time-Dependent- Dielectric-Breakdown.
PB96-201132 *02,448* Not available NTIS

PB96-201140
In vitro Inhibition of Membrane-Mediated Calcification by Novel Phosphonates.
PB96-201140 *03,595* Not available NTIS

PB96-201157
Ultrasonic NDE of Sprayed Ceramic Coatings.
PB96-201157 *02,761* Not available NTIS

PB96-201165
Electronically Tunable Fiber Laser for Optical Pumping of (3)He and (4)He.
PB96-201165 *04,381* Not available NTIS

PB96-201173
Spin-Dependent Interface Transmission and Reflection in Magnetic Multilayers (Invited).
PB96-201173 *04,130* Not available NTIS

PB96-201181
NMR Characterization of Injection-Moulded Alumina Green Compacts. Part 2. T2-Weighted Proton Imaging.
PB96-201181 *01,165* Not available NTIS

PB96-201199
Vapor Pressure of Pentafluorodimethyl Ether.
PB96-201199 *00,677* Not available NTIS

PB96-201207
Vibrationally Resolved Photoelectron Angular Distributions and Branching Ratios for the Carbon Dioxide Molecule in the Wavelength Region 685-795 Angstrom.
PB96-201207 *04,131* Not available NTIS

PB96-202122
Developing Quality System Documentation Based on ANSI/NCSL Z540-1-1994: The Optical Technology Division's Effort.
PB96-202122 *01,869* PC A05/MF A01

PB96-202221
Benefits and Costs of Research: Two Case Studies in Building Technology.
PB96-202221 *00,230* PC A07/MF A02

PB96-202239
NIST Construction Automation Program Report No. 2. Proceedings of the NIST Construction Automation Workshop. Held in Gaithersburg, Maryland on March 30-31, 1995.
PB96-202239 *00,413* PC A09/MF A02

PB96-202247
Enhancement of EXIT89 and Analysis of World Trade Center Data.
PB96-202247 *00,231* PC A04/MF A01

PB96-202254
Mixing and Radiation Properties of Buoyant Luminous Flame Environments.
PB96-202254 *01,432* PC A06/MF A01

PB96-202288
Benefits and Costs of Research: A Case Study of the Fire Safety Evaluation System.
PB96-202288 *00,232* PC A06/MF A01

PB96-202296
Development of a Method for Measuring Water-Stripping Resistance of Asphalt/Siliceous Aggregate Mixtures.
PB96-202296 *01,329* PC A09/MF A02

PB96-202304
Sparse Water Sprays in Fire Protection.
PB96-202304 *01,433* PC A13/MF A03

PB96-202320
Application Protocol Information Base World Wide Web Gateway.
PB96-202320 *02,791* PC A03/MF A01

Nanostructure Fabrication via Laser-Focused Atomic Deposition (Invited).
PB96-204094 *04,132* Not available NTIS

PB96-204102
Electric Field Dependent Dielectric Breakdown of Intrinsic SiO2 Films Under Dynamic Stress.
PB96-204102 *02,449* Not available NTIS

PB96-204110
Diffusive Crack Growth at a Bimaterial Interface.
PB96-204110 *03,090* Not available NTIS

PB96-204128
Life Prediction of a Continuous Fiber Reinforced Ceramic Composite Under Creep Conditions.
PB96-204128 *03,091* Not available NTIS

PB96-204136
Hybrid Optical-Electrical Overlay Test Structure.
PB96-204136 *02,450* Not available NTIS

PB96-204144
Properties of a Bose-Einstein Condensate in an Anisotropic Harmonic Potential.
PB96-204144 *04,133* Not available NTIS

PB96-204151
Deuterium Isotope Effect in Vinyl Radical Combination/Dispropor tionationReactions.
PB96-204151 *01,167* Not available NTIS

PB96-204169
Temperature Dependence of the Ultraviolet Absorption Cross Section of CF3I.
PB96-204169 *01,168* Not available NTIS

PB96-204177
Temperature Dependent Ultraviolet Absorption Cross Sections of Propylene, Methylacetylene and Vinylacetylene.
PB96-204177 *01,169* Not available NTIS

PB96-204185
Bulk Modulus and Young's Modulus of Nanocrystalline gamma-Alumina.
PB96-204185 *03,092* Not available NTIS

PB96-204193
Cavity Evolution during Tensil Creep of Si3N4.
PB96-204193 *03,376* Not available NTIS

PB96-204201
Mode-Locked Lasers for High-Accuracy Radiometry.
PB96-204201 *04,134* Not available NTIS

PB96-204417
Greenspan Acoustic Viscometer for Gases.
PB96-204417 *04,220* Not available NTIS

PB96-204425
Adhesion, Contact Electrification, and Acid-Base Properties of Surfaces.
PB96-204425 *03,693* Not available NTIS

PB96-204433
Role of Combustion on Droplet Transport in Pressure-Atomized Spray Flames.
PB96-204433 *01,434* Not available NTIS

PB96-204441
Improving Color Measurements of Displays.
PB96-204441 *02,203* Not available NTIS

PB96-204458
Shear Suppression of Critical Fluctuations in a Diluted Polymer Blend.
PB96-204458 *04,418* Not available NTIS

PB96-204466
Experimental Assessment of Crack-Tip Dislocation Emission Models for an Al67Cr8Ti25 Intermetallic Alloy.
PB96-204466 *03,377* Not available NTIS

PB96-204474
Alvin Van Valkenburg and the Diamond Anvil Cell.
PB96-204474 *04,797* Not available NTIS

PB96-204482
Phase Separation in Thin Film Polymer Blends With and Without Block Copolymer Additives.
PB96-204482 *01,294* Not available NTIS

PB96-204490
Correlations between Electrical and Acoustic Detection of Partial Discharge in Liquids and Implications for Continuous Data Recording.
PB96-204490 *02,248* Not available NTIS

PB96-204508
Determination of Acoustic Center Correction for Type LS2aP Condensor Microphones.
PB96-204508 *04,190* Not available NTIS

PB96-204516
Thermal Wave NDE of Advanced Materials Using Mirage Effect Detection.
PB96-204516 *04,191* Not available NTIS

PB96-204524
Creep and Creep Rupture of Structural Ceramics.
PB96-204524 *03,093* Not available NTIS

PB96-204532
Fracture Mechanism Maps: Their Applicability to Silicon Nitride.
PB96-204532 *03,094* Not available NTIS

PB96-210026
Rapid Evaluation of Mode-Stirred Chambers Using Impulsive Waveforms.
PB96-210026 *01,979* PC A04/MF A01

PB96-210059
Working Conference on Global Growth of Technology: Is America Prepared. Held in Gaithersburg, Maryland on December 7, 1995.
PB96-210059 *00,018* PC A07/MF A02

PB96-210141
Proceedings of the Open Forum on Laboratory Accreditation at the National Institute of Standards and Technology, October 13, 1995.

Troy State University Library

Tuscaloosa

University of Alabama Amelia Gayle Gorgas Library REGIONAL
University of Alabama School of Law Library

Tuskegee

Tuskegee University Hollis Burke Frissell Library

ALASKA

Anchorage

Anchorage Law Library
Anchorage Municipal Libraries Z. J. Loussac Public Library
Department of the Interior Alaska Resources Library
University of Alaska at Anchorage Consortium Library

Fairbanks

University of Alaska Elmer E. Rasmuson Library

Juneau

Alaska State Library
University of Alaska Southeast William A. Egan Library

Ketchikan

University of Alaska Southeast Ketchikan College Library

AMERICAN SAMOA

Pago Pago

American Samoa Community College Learning Resources Center

ARIZONA

Apache Junction

Apache Junction Public Library

Coolidge

Central Arizona College Learning Resources Center

Flagstaff

Northern Arizona University Cline Library

Glendale

Glendale Public LIbrary

Mesa

Mesa Public Library

Phoenix

Arizona Department of Library Archives and Public Records REGIONAL
Grand Canyon University Fleming Library
Maricopa County Library District
Phoenix Public Library

Prescott

Yavapai College Library

Tempe

Arizona State University Hayden Library/Government Documents
Arizona State University Ross-Blakley Law Library

Tucson

Tucson-Pima Public Library
University of Arizona College of Law Library
University of Arizona Main Library

Winslow

Northland Pioneer College Winslow Center Learning Resources Center

Yuma

Yuma County District Library

ARKANSAS

Arkadelphia

Ouachita Baptist University Riley-Hickingbotham Library

Batesville

Lyon College Mabee-Simpson Library

Clarksville

University of the Ozarks Dobson Memorial Library

Conway

University of Central Arkansas Torreyson Library

Fayetteville

University of Arkansas Library
University of Arkansas School of Law Young Law Library

Little Rock

Arkansas State Library REGIONAL
Arkansas Supreme Court Library
Central Arkansas Library System Main Library
University of Arkansas at Little Rock Ottenheimer Library
University of Arkansas at Little Rock Pulaski County Law Library

Magnolia

Southern Arkansas University Magale Library

Monticello

University of Arkansas at Monticello Library

Pine Bluff

University of Arkansas at Pine Bluff Watson Memorial Library

Russellville

Arkansas Technical University Tomlinson Library

Searcy

Harding University Brackett Library

State University

Arkansas State University–Jonesboro Dean B. Ellis Library

Walnut Ridge

Williams Baptist College Felix Goodson Library

CALIFORNIA

Anaheim

Anaheim Public Library

Arcadia

Arcadia Public Library

Arcata

Humboldt State University Library

Bakersfield

California State University Walter W. Stiern Library
Kern County, Beale Memorial Library

Berkeley

University of California Main Library
University of California School of Law Library

Carson

California State University at Dominguez Library
Carson Regional Library Los Angeles County Public Library

Chico

California State University at Chico Meriam Library

Claremont

Claremont Colleges Honnold/Mouth Library

Culver City

Culver City Library Los Angeles County Public Library

Davis

University of California at Davis Shields Library
University of California at Davis Law Library

Downey

Downey City Library

Fresno

California State University at Fresno Henry Madden Library
Fresno County Free Library

Fullerton

California State University at Fullerton University Library

Garden Grove

Orange County Public Library

Hayward

California State University at Hayward Library

Inglewood

Inglewood Public Library

Irvine

University of California at Irvine Main Library

La Jolla

University of California at San Diego Geisel Library

Lakewood

Angelo M. Iacoboni Public Library·Los Angeles County Public Library

Lancaster

Lancaster Public Library

La Verne

University of La Verne College of Law Library

Long Beach

California State University at Long Beach Library
Long Beach Public Library

Los Angeles

California State University at Los Angeles Kennedy Memorial Library
Los Angeles County Law Library
Los Angeles Public Library
Loyola Law School William M. Rains Law Library
Occidental College Mary Norton Clapp Library
Southwestern University School of Law Library
University of California at Los Angeles University Research Library

Out-Of-Print Surcharge
A 25% out-of-print surcharge will be added to titles acquired by NTIS more than three years prior to the current calendar year.

Thank you for your order!

NIST Technical Publications

Periodical

Journal of Research of the National Institute of Standards and Technology—Reports NIST research and development in those disciplines of the physical and engineering sciences in which the Institute is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Institute's technical and scientific programs. Issued six times a year.

Nonperiodicals

Monographs—Major contributions to the technical literature on various subjects related to the Institute's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NIST, NIST annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NIST under the authority of the National Standard Data Act (Public Law 90-396). NOTE: The Journal of Physical and Chemical Reference Data (JPCRD) is published bimonthly for NIST by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements are available from ACS, 1155 Sixteenth St., NW, Washington, DC 20056.

Building Science Series—Disseminates technical information developed at the Institute on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NIST under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NIST administers this program in support of the efforts of private-sector standardizing organizations.

Order the **following** *NIST publications—FIPS and NISTIRs—from the National Technical Information Service, Springfield, VA 22161.*

Federal Information Processing Standards Publications (FIPS PUB)—Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NIST pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NIST Interagency Reports (NISTIR)—A special series of interim or final reports on work performed by NIST for outside sponsors (both government and nongovernment). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service, Springfield, VA 22161, in paper copy or microfiche form.
