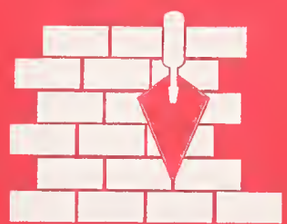
NIST Special Publication 305—Supplement 26

Publications of the National Institute of Standards and Technology 1994–1996 Catalog



NIST
U.S. Department of Commerce
Technology Administration
National Institute of Standards and Technology

The National Institute of Standards and Technology was established in 1988 by Congress to "assist industry in the development of technology . . . needed to improve product quality, to modernize manufacturing processes, to ensure product reliability . . . and to facilitate rapid commercialization . . . of products based on new scientific discoveries."

NIST, originally founded as the National Bureau of Standards in 1901, works to strengthen U.S. industry's competitiveness; advance science and engineering; and improve public health, safety, and the environment. One of the agency's basic functions is to develop, maintain, and retain custody of the national standards of measurement, and provide the means and methods for comparing standards used in science, engineering, manufacturing, commerce, industry, and education with the standards adopted or recognized by the Federal Government.

As an agency of the U.S. Commerce Department's Technology Administration, NIST conducts basic and applied research in the physical sciences and engineering, and develops measurement techniques, test methods, standards, and related services. The Institute does generic and precompetitive work on new and advanced technologies. NIST's research facilities are located at Gaithersburg, MD 20899, and at Boulder, CO 80303. Major technical operating units and their principal activities are listed below. For more information contact the Publications and Program Inquiries Desk, 301-975-3058.

CONTENTS

CATALOG STRUCTURE AND USE

Full bibliographic citations including keywords and abstracts for National Institute of Standards and Technology (NIST) papers published and entered into the National Technical Information Service (NTIS) collection are cited in the "NIST Publications Announcements" section of this catalog. (Also included are papers published prior to 1994 but not reported in previous supplements of this annual catalog.) Entries are arranged by NTIS subject classifications which consist of 37 broad subject categories (see back cover) and over 350 subcategories. Within a subcategory, entries are listed alphanumerically by NTIS order number.

Four indexes are included to allow the user to identify papers by personal author, keywords, title, and NTIS order/report number. Each entry lists the appropriate title, the NTIS order number, and the abstract number.

Papers may also be identified by searching the NTIS database either online via commercially available *systems such as DIALOG, or in the issues of NTIS's Government Reports Announcements and Index* and its *Government Reports Annual Index*.

AVAILABILITY AND ORDERING INFORMATION

The highest quality and least expensive copies of NIST publications published as Government documents are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Publications cited with stock numbers (SN) should be ordered by these numbers. GPO will accept payment by check, money order, VISA, MasterCard, or deposit account. For availability and price, write to the GPO or telephone (202) 783-3238. Should a NIST publication be out of print at the GPO, its continued availability is assured at NTIS which sells publications in microfiche or paper copy reproduced from microfiche.

If an entry has a price code, such as PC A04/MF A01, the publication may be ordered from NTIS in paper copy (PC) or microfiche (MF) or both if both codes are given. Order from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. A copy of the latest price code schedule is available from NTIS. NTIS will accept payment by check, money order, VISA, American Express, MasterCard, or deposit account. NTIS is the sole source of Federal Information Processing Standards (FIPS), Interagency Reports (IRs), and Grant/Contract Reports (GCRs). For more information call (703) 487-4650.

Papers noted "Not Available NTIS" may be obtained directly from the author or from the external publisher cited. Such papers are not for sale by either the GPO or NTIS.

Two other sources for NIST publications are depository libraries (libraries designated to receive Government publications) and Department of Commerce District Offices. The depository libraries listed in Appendix A receive selected NIST publications (see inside back cover for a description of the various NIST publication series). While not every Government publication is sent to all depository libraries, certain depositories designated as Regional Depositories receive and retain one copy of all Government publications made available. Contact the depository library in your area to obtain information on what is available and where.

Department of Commerce District Offices listed in Appendix B provide ready access at the local level to publications, statistical data and summaries, and surveys. Each District Office serves as an official sales agency of the Superintendent of Documents, U.S. Government Printing Office. A wide range of Government publications can be purchased from these offices. In addition, the reference library of each District Office contains review copies of many Government publications.

Abstract

This report is a formal, functional analysis of fire detection systems' requirements. The performance parameters of fire detection systems are given as conditional probabilities. These parameters are identified by the objective analysis of the functions of a fire detection system. It is demonstrated that using the false alarm rate to specify the malfunctioning of a threshold detection system is inadequate. The principal function of fire detection systems is identified as the notification of anti-fire agents of the probability of an unwanted fire. The evaluation of the information provided by a detector system is central to its worth.

Putting the Information Infrastructure to Work: Report of the Information Infrastructure Task Force Committee on Applications and Technology.
Special pub.
May 94, 114p, NIST/SP-857, ISBN-0-16-043188-3.
Also available from Supt. of Docs. as SN003-003-03267-1.

Keywords: *Information systems, *National interests, Commerce, Manufacturing, Industries, Health care, Education, Environmental monitoring, Libraries, Government agencies, Public participation, Citizen participation, *NII(National Information Infrastructure), Information superhighways.

The goal of this document is to express how improvements in the technical foundation upon which modern communications rests can benefit all Americans. The authors call this platform the National Information Infrastructure (NII), meaning the facilities and services that enable efficient creation and diffusion of useful information. They wish to focus the public debate on the uses of the NII and the benefits to be derived by applications of advanced computing and communications technologies.

This document identifies a set of interfaces, services, and formats which are to be provided to users of an information infrastructure, and the methods for accessing these services. This document provides a context and guidance for standards selection, but does not identify standards for use within an information infrastructure. The document may, however, refer to standards in order to illustrate aspects of the services which are important in making selections among the candidate specifications. This discussion will provide a basic set of terminology and concepts to support discussion and resolution of policy issues. Finally, technical guidance is provided to agencies which intend to use information infrastructure for exchange of government information and services within government, and to deliver government information and services to citizens and organizations outside of government.

ADMINISTRATION & MANAGEMENT

Management Information Systems

Manager's Guide for Monitoring Data Integrity in Financial Systems.
Special pub.
R. Sies. Feb 96, 72p, NIST/SP-500-233.
Also available from Supt. of Docs. as SN003-003-03387-1. See also PB95-216602.

Keywords: *Financial management, *Monitoring, *Accounting, *Automation, Data integrity, Computer security, Data processing security, Electronic data exchange, Management information systems, Software tools, Federal information systems.

This guide will enable the manager to identify and justify inclusin of software tools and techniques into new or existing financial systems. The result would be a Monitoring Module consisting of a set of software routines and an easy-to-use report generator. The users of financial and accounting systems and the users of systems that feed data into financial and accounting systems could use the Monitoring Module in a proactive way to ensure the accuracy, completeness, and timeliness of input to the financial systems. The Monitoring Module if included in new or existing systems would help ensure consistency of data across the organization, and provide management with more ability to test and report the level of success with which their management goals are being met. In an environment where most financial transactions are automated, there may be no 'paper trail.' Furthermore, implementation of highly automated financial systems may expose organizations to increased risks of waste, fraud, or abuse if system controls fail to be effective. It is imperative, therefore, that automated monitoring capabilities as sophisticated as the automated financial operations themselves be available to managers. This guide is a step in that direction.

Management Practice

Development and Validation of Multicriteria Ratings: A Case Study.
Final rept.
S. I. Gass, and S. R. Torrence. 1991, 10p.
Pub. in Socio-Economic Planning Sciences 25, n2 p133-142 1991.

Keywords: *Ratings, Conferences, Complexity, Costs, Services, Decision making, Criteria, Calibrating, Models, Reprints, *Multicriteria, AHP(Analytic Hierarchy Process), US NIST.

Using the hierarchical structure and methodology of the Analytic Hierarchy Process (AHP), a procedure was developed for the rating of conferences in terms of their complexity that enabled the Public Information Division of the National Institute of Standards and Technology to assess the cost of its staff's services. A meeting's complexity is measured by a multicriteria process that involves both the time and expertise of the Division's staff. The validity of the model, that is the calibration of the weights of the decision criteria, was established by showing that the weighting procedure of the AHP replicated the previous year's decisions.

Standards Activities of Organizations in the United States.
Special pub. (Final).
R. B. Toth. Sep 96, 788p.
Contract NIST-43NANB514538
Also available from Supt. of Docs. as SN003-003-03427-4. See also PB91-177774.

Keywords: *Standardization, *Organizations, *United States, *Directories, Sources, Standards, Trade associations, National government, Specifications, Military organizations, Technical societies, Recommendations, Test methods, Coding.

The directory is a guide to mandatory and voluntary standards activities in the United States at the Federal level and by nongovernment (trade associations, technical and other professional societies). It excludes proprietary (company) standards and those of local levels of government. Superseding the 1991 edition (NBS SP 806), 'Standards Activities of Organizations in the United States', it includes standards distributors, libraries, and information centers. It also lists organizations that no longer develop standards or have become defunct since the previous directory was issued. Over 700 current descriptive commentaries are formatted, with subject headings to facilitate access to specific information. The main sections cover developers of formal and informal nongovernment studies; Federal agencies which develop standards; sources of standards documents and information; a subject index and related listings covering acronyms and initials, defunct bodies, and those organizations with name changes. Organizations have been included if they develop standards or contribute to the standardization process, whether voluntary of mandatory, or are sources of standards documents or information. An introductory section provides general information on Federal (including military) standards activities, a list of 20 major nongovernment standards developers, and an overview of U.S. (National) standardization activities.

Self Monitoring Accounting Systems.
Special pub.
R. F. Sies. Mar 95, 18p, NIST/SP-500/226.
Also available from Supt. of Docs. as SN003-003-03324-3.

Keywords: *Financial management, *Auditing, *National government, Computer systems programs, Chief Financial Officers(CFO) Act of 1990.

The Federal Government is in need of financial systems that provide more complete, consistent, reliable, and timely information. This report recommends a service for use by management in performing self audits of financial systems. Tools used in the past by Electronic Data Processing Auditors to audit accounting systems are examined, and the similarities between these tools and the service. The use of this service is then described, as it would be used, within the accounting system. How the service can provide more internal control and financial information usually obtained from analysis performed by financial consultants is explained.

Research Program Administration & Technology Transfer

Department of Energy, Washington, DC.
Economic, Energy, and Environmental Impacts of the Energy-Related Inventions Program.
M. A. Brown, C. R. Wilson, C. A. Franchuk, S. M. Cohn, and D. Jones. 31 Jul 94, 100p, ORNL/CON-381.
Contract AC05-84OR21400

Keywords: *Economic impact, *Inventions, Inventions/Environmental impacts, Commercialization, US DOE, Grants, Patents, Program evaluation, ERIP (Energy Related Inventions Program), US NIST.

The report provides information on the economic, energy, and environmental impacts of inventions supported by the Energy-Related Inventions Program (ERIP)--a program jointly operated by the US Department of Energy and the National Institute of Standards and Technology (NIST). It describes the results of the latest in a series of ERIP evaluation projects that have been completed since 1980. The period of interest is 1980 through 1992. The evaluation is based on data collected in 1993 through mail and telephone surveys of 253 program participants, and historical data collected during previous evaluations for an additional 189 participants.

00,009
PB94-157831 PC A12/MF A03
Bio En-Gene-Er Associates, Inc., Wilmington, DE.
Opportunities for Innovation: Biotechnology.
R. M. Busche. Sep 93, 275p, NIST/GCR-93/633.
Grant NANB2D1219
Sponsored by National Inst. of Standards and Technology (CSTL), Gaithersburg, MD. Biotechnology Div.

Keywords: *Biotechnology, *Technology innovations, *Commercial development, *US NIST, Health care, Farm crops, Chemical industry, Electronics industry, Mining, Pollution control, Plastics industry, Drug industry, Small businesses, Research and development, Government/industry relations, Food processing, Animal husbandry, Genetic engineering, Renewable resources, Ethanol fuels, Biodegradability, Biomass, Synthetic fuels, Bioconversion, Agribusiness.

The basic purpose of this project is to help small businesses get on the fast track in biotechnology research and development leading to the spin off of viable commercial businesses, probably with the help of larger companies having the resources for commercialization that are lacking in a small enterprise. Such resources could include financing, and positions in marketing, manufacturing, regulatory affairs, and raw material supply, to name a few. In general, biotechnology can be expected to have a major impact on fundamental human needs engendered in the market segments of: health care, agriculture, forestry, food ingredients, industrial chemicals, plastics, energy, mining, pollution control, and bioelectronics.

Contract NIST-50SBNB2C7187
Library of Congress catalog card no. 93-86600. Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD.

Keywords: *Manufacturing, *Small businesses, *Public policies, Technology transfer, Performance evaluation, Technology assessment, Advisory services, Regulations, Government/industry relations, US NIST, National government, State government, Operating costs, Quality, Improvement, Competition, Industrial sector, Technical assistance, *Modernization, MTC(Manufacturing Technology Centers), Manufacturing extension centers.

State and local governments have created industrial assistance services, the federal government has multiple programs aimed at helping small businesses, and there is strong interest in the Clinton administration in creating a national network of industrial assistance centers (Clinton and Gore, 1993). Expanding the National Institute of Standards and Technology (NIST) Manufacturing Technology Centers (MTCs) program is one mechanism for creating such a national assistance network. Given this context--rapid changes in manu-

facturing, growth in the numbers of smaller manufacturers, and their apparent lag in modernization effort--NIST asked the Manufacturing Studies Board to form a committee to examine the barriers to manufacturing improvement in smaller firms and to identify the appropriate role of the MTCs in addressing those barriers. In addition to discussing barriers facing smaller manufacturers, both company representatives and assistance providers discussed opportunities to help firms overcome these barriers and to improve significantly their production costs, quality, and market responsiveness. The recommendations of the committee reflect the changed circumstances that have resulted from the emergence in early 1993 of substantial additional federal funding for industrial assistance activities, as well as President Clinton's proposals for the creation of a national network of manufacturing extension centers.

PB94-185360 Not available NTIS
National Inst. of Standards and Technology (EEEL), Gaithersburg, MD. Electronics and Electrical Engineering Lab. Office.
Transfer of Technology from Defense to Civilian Sectors.
Final rept.
R. Hebner. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Power Engineering Review, p9-11 May 94.

Keywords: *Technology transfer, *Defense industry, *Government/industry relations, Reprints, Civilian population, Economic development, Technology utilization, Science, Electricity.

Changes occurring today within government with respect to its science and technology policies reflect the close linkage that has existed between technology and defense. In the past, the best minds of the times were set to solve technology problems at the government's behest to provide for national defense. Today, the Cold War has ended. The situation provides the U.S. with a window of opportunity to redefine its technology investment strategy. New forms of government-industry interaction are being explored to help technology make a difference in the civilian economy like it has in national defense.

Preliminary Functional Specifications of a Prototype Electronic Research Notebook for NIST.
S. J. Chang, E. Fong, J. Foti, and B. Rosen. Apr 94, 65p, NISTIR-5395.

Keywords: *Research and development, *Information management, *Data storage, *Multimedia, Information retrieval, Computer security, Digital techniques, Requirements, Technology assessment, ERNs(Electronic Research Notebooks), US NIST.

This report is a preliminary study on the feasibility and possible use of electronic research notebooks (ERNs) at the National Institute of Standards and Technology (NIST). The goal of this project is to determine the requirements for ERN and to assess current technologies for the design of a prototype ERN for NIST scientists. The project involves the determination and specifications of functional requirements of the ERN. NIST scientists were interviewed to survey current notekeeping practices and identify specific needs for the ERN. The survey identified a set of basic and enhanced ERN features. Current technologies and products were also assessed in order to see how these requirements may be met. A potential system configuration is proposed where functional specifications for a basic ERN are defined.

Differences in Competitive Strategies between the United States and Japan.
Final rept.
H. Hellwig. 1992, 2p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Engineering Management 39, n1 p77-78 1992.

Keywords: *Technology innovation, *Competition, *United States, *Japan, Technology transfer, Research and development, Commercialization, Businesses, Product development, Human resources, Production, Reprints.

The subject is introduced with a taxonomy (called product genesis) of the process of bringing an idea from the laboratory to the marketplace. A discussion of the competitive threshold follows: in a competitive fashion, the traditional strategic approach in both countries is discussed in the areas of human resources, production processes, and business objectives. These strategies are mapped against the various stages of product genesis. The hypothesis is developed that the competitive threshold for Japanese firms is much further downstream than the onset of competitive worries in U.S. companies; i.e., U.S. companies already protect their applied research activities whereas their Japanese counterparts still cooperate at this stage and become protective only before design or prototyping of products and processes takes place.

Automated Manufacturing Research Facility 1994 Annual Report.
D. C. Stieren, and C. F. Albus. Nov 94, 78p, NISTIR-5613.
Sponsored by Office of Naval Research, Arlington, VA. Manufacturing Science and Technology Div.

Keywords: *Computer aided manufacturing, *Research facilities, US NIST, Navy, Reporting requirements, Robotics, Annual reports.

The Automated Manufacturing Research Facility (AMRF) was created at the National Institute of Standards and Technology (NIST) in 1982 in order to provide a national testbed for research and development in computer integrated manufacturing. Since its founding, the AMRF has achieved several significant accomplishments. Among these include the development of over 25 commercial products, roughly 20 patents, and more than 25 national and international standards. Most of the AMRF efforts have been jointly funded by NIST, the Navy ManTech Program, other agencies, and industry. AMRF technical projects are conducted primarily within the Manufacturing Engineering Laboratory (MEL) of NIST.

Unpredictable Certainty. Information Infrastructure through 2000.
c1996, 298p, ISBN-0-309-05432-X.
Grant NSF-IRI-9421465
Library of Congress catalog card no. 96-67383. Sponsored by National Science Foundation, Arlington, VA., Advanced Research Projects Agency, Arlington, VA. and National Inst. of Standards and Technology, Gaithersburg, MD.

Keywords: *Computer networks, *Telecommunication, *Government policies, *Meetings, Technology assessment, Technology transfer, Trends, Information technology, Economic models, Financing, Television, Investment, Electronics industry, Communication networks, United States, Telephones, Wireless communications, Public sector, Private sector, *NII(National Information Infrastructure), Internet.

The authors have available an impressive array of information technology. They can transmit literature, movies, music, and talk. Government, businesses, and individuals are eager to go on-line to buy, sell, teach, learn, and more. The Unpredictable Certainty explores the national information infrastructure (NII) as the collection of all public and private information services. How will more and better services reach the home, small businesses, and remote locations. The Unpredictable Certainty examine swho will finance the NII, exploring how technology companies decide to invest in deployment and the vain search of 'killer apps' (applications that drive markets). It discusses who will pay for ongoing services and how they will pay, looking at past cost/price models relevant to the future. The Unpredictable Certainty discusses the underlying technologies, appliances, and services needed before the NII becomes a reality; reviews key features of important technologies, and analyzes current levels of deployment in telephone, cable and broadcast television, and wireless systems, and the difficulties in interconnection. The volume explores the challenge of open interfaces that stimulate new applications but also facilitate competition, the trend toward the separation of infrastructure from specific services, the tension between mature services and new contenders, the growth of the Internet, and more.

Working Conference on Global Growth of Technology: Is America Prepared. Held in Gaithersburg, Maryland on December 7, 1995.
Special pub.
G. Mulholland, J. Fassett, and C. Ehrlich. Jun 96, 108p, NIST/SP-897.
Errata sheet inserted. Also available from Supt. of Docs. as SN003-003-03413-4. Prepared in cooperation with President's Council on Competitiveness, Washington, DC.

Keywords: *Technology innovation, *United States, Economic growth, Government policies, Government/industry relations, Meetings, International trade, Investments, Productivity, Living standards, *Global economy.

The purpose of this conference 'Global Growth of Technology: Is America Prepared' - was to articulate the issues behind the question and to address these issues from the broadest range of perspectives. The impetus for the conference was provided by the National Institute of Standards and support of the Council on Competitiveness (CoC) for organizing this meeting. NIST and the CoC are appropriate partners to host this conference: NIST's programs are defined by its core mission of promoting U.S. economic growth by working with industry to develop technology, measurements, and standards; the CoC focuses on the key issues related to competitiveness such as trade, productivity, investment, and the U.S. standard of living.

Recent Approaches to Extreme Value Estimation with Application to Wind Speeds. Part 1. The Pickands Method.
Final rept.
J. A. Lechner, S. D. Leigh, and E. Simiu. 1992, 11p.
Pub. in Jnl. of Wind Engineering and Industrial Aerodynamics 41-44, p509-519 1992.

Keywords: *Wind velocity, *Wind pressure, *Estimating, *Extreme-value problems, Statistical analysis, Wind effects, Functions(Mathematics), Dynamic loads, Wind measurement, Reprints, *Extreme value estimation.

The last 15 years have seen the development of a new body of theory and of a new generation of statistical estimation procedures applicable to extreme data. Essentially these approaches emphasize the primacy of the information concerning the largest of the extremes (the tails), as opposed to information inherent in the bulk of the extreme data (the body of the distribution). We consider the application of a terminal CME (conditional mean exceedance) slope estimator, inspired by Bryson (1974), to yearly extreme wind data samples obtained from more than 100 stations in the conterminous United States. Next we apply our own implementation of the Pickands method, serially fitting exponential and Generalized Pareto (or Generalized Extreme Value) Distribution models to the conditional exceedance CDF's of the wind data, starting with each ordered sample value in turn, and plotting the fitted tail index versus the order number.

Sponsored by Department of the Air Force, Wright-Patterson AFB, OH.
Pub. in Proceedings of International Symposium on Fire Safety Science (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p925-936.

Keywords: *Fire extinguishing agents, *Fire suppression, *Aircraft fires, Effectiveness, Fire protection, Fire fighting, Ignition, Combustion, Aviation safety, Fire safety, Reprints, Halon 1301.

Alternatives to halon 1301 are sought which are effective fire suppressing agents and which do not create unacceptable safety, environmental, or systems compatibility problems. Investigations of eleven chemical compounds using a deflagration/detonation tube have revealed a great potential for the technique to study the fire suppression process. The facility is used to evaluate new suppressants, establishing their dynamic characteristics as well as elucidating complex suppression mechanisms occurring in fires under highly dynamic conditions typical of fast turbulent flames, explosions and detonations. The deflagration/detonation tube arrangement has been successfully employed to clearly discriminate among the dynamic characteristics of the eleven alternative agents, revealing new unexpected effects. The results have been used to help select among the alternatives for full-scale testing in simulated aircraft dry bay fires.

Sponsored by Department of the Air Force, Wright-Patterson AFB, OH.
Pub. in Proceedings of the International Symposium on Fire Safety Science (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p1255-1265.

Keywords: *Hydraulic fluids, *JP-8 jet fuel, *Fire extinguishing agents, *Aircraft fires, Fire suppression, Fire fighting, Aviation safety, Aviation fuels, Fire safety, Concentration(Composition), Fire protection, Fuel sprays, Flames, Combustion, Reprints, Halon 1301.

A coaxial turbulent spray burner was used to determine the suppression characteristics of twelve different fire fighting agents in elevated temperature hydraulic fluid and jet fuel (JP-8) spray flames. The effectiveness of the gaseous agents, being considered as alternatives to halon 1301, was compared based upon the mass required for suppression and the equivalent storage volume, normalized by the amount of halon 1301 required to suppress the flame. The elevated temperature results were compared to measurements previously obtained with the incoming air and JP-8 at ambient temperature. No statistically significant difference in relative agent performance was found between the heated hydraulic flame and the previous JP-8 experiments.

Flow of Alternative Agents in Piping.
Final rept.
T. G. Cleary, W. L. Grosshandler, and J. C. Yang. 1994, 11p.
Sponsored by Department of the Air Force, Wright-Patterson AFB, OH.
Pub. in Proceedings of Halon Options Technical Working Conference, Albuquerque, NM., May 3-5, 1994, p105-115.

Keywords: *Fire extinguishing agents, *Fire suppression, *Fluid flow, *Nacelles, *Aircraft fires, Engine inlets, Flow measurement, Aircraft safety, Fire fighting, Piping systems, Two phase flow, Fire protection, Pressure gradients, Reprints, HFC-227ea, Halon 1301.

As part of the USAF, Army, Navy and FAA sponsored halon replacement project, the pipe flow characteristics of selected alternative agents for engine nacelle fire protection are being studied. Due to the remote location of the agent storage bottle, piping is required to transport the agent to various locations in an engine nacelle. The pipe flow from an agent bottle is characterized as a transient, two-phase flow. Since the selected alternative agents have thermophysical properties different from halon 1301, the flow characteristics will be different, which may require system design changes. An experimental apparatus to study the flow characteristics of the alternative agents was designed and is described. Preliminary results on the flow characteristics of HFC-227ea and halon 1301 are presented.

Apr 94, 857p, NIST/SP-861.
Also available from Supt. of Docs. as SN003-003-03268-9. Sponsored by Department of the Air Force, Wright-Patterson AFB, OH., Naval Air Systems Command, Washington, DC., Aviation and Troop Command (Army), St. Louis, MO., and Federal Aviation Administration Technical Center, Atlantic City, NJ.

Keywords: *Aircraft fires, *Halon alternatives, *Fire suppression, Fluorocarbons, Thermodynamic properties, Fluid dynamics, Combustion chemistry, Reaction kinetics, Fire research, *Halon 1301, HCFCs(Hydrochlorofluorocarbons), FCs(Fluorocarbons), HFCs(Hydrofluorocarbons), Discharge rate, National Institute of Standards and Technology.

Civilian and military aircraft suppliers and operators are searching for alternatives to the discontinued chemical Halon 1301 (CF3Br) for protecting aircraft against in-flight fires. This study identifies the best two or three candidates from among a list of twelve fluorocarbons (FCs), hydrofluorocarbons (HFCs), and hydrochlorofluorocarbons(HCFCs) for full-scale testing in the engine nacelle and dry bay simulators at Wright-Patterson Air Force Base. An assessment of the potential for a powder, sodium bicarbonate (NaHCO3), and other realistic gaseous candidates was also requested. The primary recommendations for the dry bay application were FC-218 and HFC-125; partial testing of CF3I was also recommended. Details of all aspects of the research program and the rationale for making these recommendations are provided in this special publication.

Fracture Testing of Large-Scale Thin-Sheet Aluminum Alloy.
R. deWit, R. J. Fields, S. R. Low, D. E. Harne, and T. Foecke. May 95, 32p, NISTIR-5661.
Sponsored by Federal Aviation Administration, Washington, DC.

Keywords: *Aluminum alloys, *Fracture tests, *Aircraft, Toughness, Fracture properties, Crack propagation, Plastic properties, Models, Fuselages, Monocoque construction, Aircraft panels, R-curve, MSD(Multiple Site Damage), US FAA.

A series of fracture tests on large-scale, pre-cracked, aluminum alloy panel was carried out to examine and to characterize the process by which cracks propagate and link up in this material. Extended grips and test fixtures were specially designed to enable the panel specimens to be loaded in tension in a 1780-kN-capacity universal testing machine. Using existing information, a test matrix was set up to explore regions of failure controlled by fracture mechanics, with additional tests near the boundary between plastic collapse and fracture. In addition, a variety of multiple site damage (MSD) configurations were included to distinguish between various proposed linkage mechanisms. All tests but one used anti-buckling guides. The data were analyzed by two different procedures, (1) the plastic zone model based on the residual strength diagram, and (2) the R-curve. The first three tests were used to determine the basic material properties, and these results were then used in the analysis of the subsequent tests with MSD cracks.

Computer-Aided Molecular Design of Fire Resistant Aircraft Materials.
Final rept.
M. R. Nyden, and J. E. Brown. 1993, 93p.
Also available as N94-10779 (Order as N94-10766).
Pub. in International Conference for the Promotion of Advanced Fire Resistant Aircraft Interior Materials, Atlantic City, NJ., February 9-11, 1993, p147-158.

Keywords: *Computer-aided design, *Aircraft construction materials, *Flammability testing, *Fire resistant materials, Aircraft fires, Honeycomb structures, Ignition, Burning rate, Commercial aircraft, Nonflammable materials, Molecular structure, Heat treatment, Heat transmission, Flame calorimeters, Reprints.

Molecular dynamic simulations and Cone Calorimeter measurements were used to assess the effects of electron beam irradiation and heat treatments on the flammability of the honeycomb composites used in the sidewalls, ceilings and stowage bins of commercial aircraft. The irradiation of this material did not result in any measureable changes. A dramatic reduction in the peak rate of heat release, however, was observed in samples that had been heated overnight at 250 deg C.

The document presents a theory based on power balance for aperture excitation of electrically large, lossy cavities. The theory yields expressions for shielding effectiveness, cavity Q, and cavity time constant. In shielding effectiveness calculations, the incident field can be either a single plane wave or a uniformly random field to model reverberation chamber or random field illumination. The Q theory includes wall loss, absorption by lossy objects within the cavity, aperture leakage, and power received by antennas within the cavity. Extensive measurements of shielding effectiveness, cavity Q, and cavity time constant were made on a rectangular cavity, and good agreement with theory was obtained for frequencies from 1 to 18 GHz.

Measurements of Shielding Effectiveness and Cavity Characteristics of Airplanes.
D. A. Hill, M. L. Crawford, R. T. Johnk, A. R. Ondrejka, and D. G. Camell. Jul 94, 63p, NISTIR-5023.

Keywords: *Avionics, *Electromagnetic shielding, *Electromagnetic interference, *Electromagnetic measurement, Electromagnetic fields, Time domain, Electromagnetic wave propagation, Leakage, Frequencies, Electronic warfare.

We present measured data for shielding effectiveness, cavity Q, and cavity time constant of three small (twin-engine) airplanes for frequencies from 400 MHz to 18 GHz. Both cw and time-domain measurement methods were used, and the time-domain method yields higher values of cavity Q. Both methods yield Q values below a theoretical upper bound determined by window leakage losses. The measured shielding effectiveness is quite variable, but averages about 15 dB. The measured time constants are also variable and average about 15 ns. This short time constant is a result of the low Q of the aircraft cavities.

Corrosion Resistance of Materials for Renovation of the United States Botanic Garden Conservatory.
E. Escalante, and R. E. Ricker. Jan 94, 29p, NISTIR-5360.
Sponsored by Architect of the Capitol, Washington, DC.

Keywords: *Greenhouses, *Renovating, *Corrosion resistance, Washington DC, Botany, District of Columbia, Trusses, Steel structures, Moisture, *United States Botanic Garden.

The purpose of the report is to evaluate the corrosivity of the greenhouse environments and their effect on materials considered for restoration of the Botanic Garden Conservatory. On the basis of this evaluation, recommendations are made on materials which will provide the best performance in these environments. To accomplish this goal of materials selection, the range of conditions anticipated in the greenhouses, in combination with the various herbicides, pesticides, and fertilizers normally used are considered. Special corrosion control considerations, where necessary, are pointed out. The information presented here is intended to serve as a general guideline to the architects and engineers responsible for designing the details of the botanic garden conservatory. Within the time limits of the review, the authors can only address the major problems that the designers will encounter and some of the more important details that will lead to a successful design.

Individual Carotenoid Content of SRM 1548 Total Diet and Influence of Storage Temperature, Lyophilization, and Irradiation on Dietary Carotenoids.
Final rept.
N. E. Craft, S. A. Wise, and J. H. Soares. 1993, 6p.
Pub. in Jnl. of Agricultural and Food Chemistry 41, n2 p208-213 1993.

Keywords: *Animal feed, *Food analysis, *Carotenoids, *Food storage, Liquid chromatography, Temperature, Lyophilization, Reprints, *Standard reference materials.

A modified version of the AOAC procedure for the extraction of carotenoids from mixed feeds was coupled with an isocratic reversed-phase liquid chromatography (LC) method to measure individual carotenoids in SRM 1548 total diet and in a high-carotenoid mixed diet (HCMD). The major carotenoids identified in SRM 1548 were lycopene, beta-carotene, lutein, alpha-carotene, and zeaxanthin in descending order of concentration. The concentration of all carotenoids in SRM 1548 decreased as storage temperature increased. Significant differences in carotenoid concentrations occurred between -80 and 4 C storage temperatures. Lyophilization of the HCMD significantly decreased beta-carotene and lycopene concentrations and produced an apparent increase in xanthophyll concentrations. Exposure to gamma-irradiation significantly decreased alpha-carotene and beta-carotene concentrations and led to an apparent increase in beta-cryptoxanthin. SRM-1548 was found to be unsuitable for use as a reference material for carotenoid measurements, while HCMD has greater potential as a reference material.

NIST issues food related, chemical composition Standard Reference Materials (SRMs) for validating food analyses. SRMs certified for inorganic constituents are: Non-Fat Milk Powder (SRM 1549), Oyster Tissue (SRM 1566a), Bovine Liver (SRM 1577a), Wheat Flour (SRM 1567a), Rice Flour (SRM 1568a), and Total Diet (SRM 1548). The certificate of analysis for the total diet SRM also provides a certified concentration for cholesterol. Oyster tissue, a renewal SRM, is certified for 25 elements including 6 (Al, Cl, I, P, S, and V) that had not been certified in the previously issued SRM 1566. The elemental certified concentrations are based on concordant results of two or more independent analytical methods. The chemical compositions of the six food matrix SRMs are tabulated. Three food matrix SRMs certified for organic constituents are: Cholesterol and Fat-Soluble Vitamins in Coconut Oil (SRM 1563), Cholesterol in Whole Egg Powder (SRM 1845) and Organics in Cod Liver Oil (SRM 1588). Serum and urine matrix SRMs are also available that may be useful for metabolic and bioavailability studies.

Estimation of the Absorbed Dose in Radiation-Processed Food. 2. Test of the EPR Response Function by an Exponential Fitting Analysis.
Final rept.
M. F. Desrosiers. 1991, 3p.
Pub. in Applied Radiation and Isotopes-International Jnl. of Radiation Applications and Instrumentation 42, n7 p617-619 1991. See also Part 3, PB94-199684.

Keywords: *Food processing, *Dosimetry, *Ionizing radiation, Meat, Electron paramagnetic resonance, Dose-response relationships, Reprints.

The use of electron paramagnetic resonance (EPR) spectrometry to accurately estimate the absorbed dose to radiation-processed bones (and thus meats) is examined. Additive re-irradiation of the bone produced a dose response which was used to determine the initial dose by back-extrapolation. It was found that an exponential fit (versus linear or polynomial) to the data provided improved accuracy of the estimated dose. These data as well as the protocol for the additive dose method are presented.

Pub. in Applied Radiation and Isotopes 44, n1/2 p439-442 1993. See also Part 2, PB94-199650.

Keywords: *Food processing, *Ionizing radiation, *Dosimetry, Durapatite, Electron paramagnetic resonance, Meat, Chickens, Bones, Dose-response relationships, Reprints.

Electron paramagnetic resonance (EPR) spectrometry is evaluated as a method to retrospectively assess the absorbed dose to radiation-processed chicken (containing bone). Decay of the hydroxyapatite paramagnetic center EPR signal intensity was monitored at three different dose levels (0.5, 3.0, 7.0 kGy) up to 20 days, and the dose was assessed for each level at 1, 8, and 20 days after irradiation. It was determined that the time of evaluation (up to 20 days post-irradiation) did not adversely affect the estimate for 0.5 and 3.0 kGy bone, and only moderately affected the 7.0 kGy estimates.

Estimation of the Absorbed Dose in Radiation-Processed Food. 4. EPR Measurements on Eggshell.
Final rept.
M. F. Desrosiers, F. G. Le, P. M. Harewood, E. S. Josephson, and M. Montesalvo. 1993, 5p.
Pub. in Agricultural Food Chemistry 41, p1471-1475 1993. See also Part 3, PB94-199684.

Keywords: *Food processing, *Ionizing radiation, *Dosimetry, Egg shell, Electron paramagnetic resonance, Salmonella, Dose-response relationships, Eggs, Reprints.

Fresh whole eggs were treated with ionizing radiation for Salmonellae control testing. The eggshell was then removed and examined by electron paramagnetic resonance (EPR) spectroscopy to determine if EPR could be used to (1) distinguish irradiated from unirradiated eggs and (2) assess the absorbed dose. No EPR signals were detected in unirradiated eggs, while strong signals were measurable for more than 200 days after irradiation. Although a number of EPR signals were measured, the most intense resonance (g = 2.0019) was used for dosimetry throughout the study. This signal was observed to increase linearly with dose (up to approximately 6 kGy), which decayed approximately 20% within the first 5 days after irradiation and remained relatively constant thereafter. The standard added-dose method was used to assess, retrospectively, the dose to eggs processed at 0.2, 0.7, and 1.4 kGy. Relatively good results were obtained when measurement was made on the day the shell was reirradiated; with this procedure estimates were better for shell processed at the lower doses.

Pub. in Applied Radiation and Isotopes-International Jnl. of Radiation Applications and Instrumentation 42, n7 p613-616 1991. Sponsored by Monash Univ., Clayton (Australia). Dept. of Physics.

Keywords: *Food processing, *Bones, *Dosimetry, *Cesium 137, Electron paramagnetic resonance, Chickens, Meat, Regression analysis, Reprints.

Free radicals produced in chicken bone tissue by (137)Cs gamma rays were measured using electron paramagnetic resonance (EPR) spectroscopy. The yield of radicals was proportional to the absorbed dose. Additive re-irradiation of previously irradiated bones is the basis of a method to estimate the absorbed dose in radiation-processed foods. The ability of the method to accurately provide estimates for a range of doses (0.5 - 7.4 kGy) is tested here. It was determined that a linear fit to the data yielded good dose estimates for bone irradiated < 2 kGy, but failed at the higher doses using a linear approximation to the dose response. These data and their implications are discussed.

Keywords: *Separation processes, *Biotechnology, *Pharmacology, Materials recovery, Supercritical fluids, Solubility, Bioprocessing, Extraction, Food processing, Drugs, Reprints, *Supercritical fluid extraction, *Bioproducts.

In this review, the application of supercritical fluid extraction to biological products is discussed. The review begins with a general discussion of the supercritical fluid state, covering pure fluid and mixture properties, solubility, transport phenomena, and phase diagram modeling. The major experimental measurement are discussed, especially the determination of solute solubility in supercritical fluids. Some recent applications in the areas of pharmaceuticals and foods are described in detail. Finally, an overview of current work and future prospects is presented.

Pub. in Transactions of the American Nuclear Society 71, p8-11 1994.

Keywords: *Radiation dosage, *Food irradiation, *Dosimetry, Gamma rays, X rays, Absorption, Dose-response relationships, Reprints.

Measurements of absorbed dose, dose rate, and dose distribution in food products are vital to the success of treatment of food by ionizing radiation (x- and gamma radiation and electron beams). Dosimetry is used not only for regulatory purposes and quality control, but as documentation of research leading to each food treatment process and for setting proper doses and acceptable dose limits. For regulatory purposes as well as for economic viability of food irradiation, such documentation is thoroughly dependent on dosimetry. It must include process characterization, dosimeter calibration data, dose mapping results, routine dosimetry data and associated process parameters and control for each run, readout equipment maintenance and standard operating procedures, statistical data, product loading and dosimeter locations, dose uniformity, and evaluations of probability that the process specifications have (or have not) been met.

Inter-Laboratory Trials of the EPR Method for the Detection of Irradiated Meats Containing Bone.
Final rept.
M. F. Desrosiers, F. G. Le, and W. L. McLaughlin. 1994, 7p.
Pub. in International Jnl. of Food Science and Technology, v29 p153-159 1994.

Keywords: *Food, *Labelling compliance, *Meats, Reprints, Test evaluation, Irradiaton, Bone, *Foreign technology, *Electron paramagnetic resonance.

Three international trials on the use of electron paramagnetic resonance (EPR) to detect irradiated meats containing bone were sponsored as part of a coordinated research programmed by the International Atomic Energy Agency. In these trials, 11 laboratories used EPR to examine a total of 154 bone samples from three different meats. In one of the trials food irradiation processing conditions were simulated. The results were 100% successful for identifying both irradiated and unirradiated bones. A protocol for the EPR method is provided.

Commentary on 'Optimization of Experimental Parameters for the EPR Detection of the Cellulosic Radical in Irradiated Foodstuffs'.
Final rept.
M. Desrosiers, D. Bensen, and D. Yaczko. 1995, 6p.
Pub. in International Jnl. of Food Science and Technology, v30 p675-680 1995.

Keywords: *Food processing, Reprints, Standards, Protocols, *Foreign technology, *EPR, Spectrometer parameters.

After many interlaboratory trials, several EPR methods for the detection of irradiated foods are being prepared as standard protocols. The works of Goodman et al. (1994) and Raffi et al. (1992) present conflicting general recommendations for optimum parameter sets in the EPR protocols. Here we demonstrate that shortcomings of recommending general parameter sets for the varying types of food samples and the different spectrometer configurations employed to examine them.

Goddard High Resolution Spectrograph: Instrument, Goals, and Science Results.
Final rept.
J. L. Linsky. 1994, 19p.
Pub. in Publications of the Astronomical Society of the Pacific, v106 p890-908 Aug 94.

Keywords: *Spaceborne astronomy, *Ultraviolet astronomy, Spectrographs, Spectral resolution, Stellar physics, Stellar activity, Stellar spectra, Sky surveys(Astronomy), Hubble Space Telescope, Reprints, *Goddard High Resolution Spectrograph.

The Goddard High Resolution Spectrograph (GHRS), currently in Earth orbit on the Hubble Space Telescope (HST), operates in the wavelength range 1150-3200 A with spectral resolutions of approximately 2 x 10 to the 3rd power, 2 x 10 to the 4th power, and 1 x 10 to the 5th power. The instrument and its development from inception, its current status, the approach to operations, representative results in the major areas of the scientific goals, and prospects for the future are described.

Four Years of Monitoring alpha Orionis with the VLA: Where Have All the Flares Gone.
Final rept.
S. A. Drake, J. A. Bookbinder, D. R. Florkowski, R. E. Stencel, J. L. Linsky, and T. Simon. 1992, 3p.
Pub. in Proceedings of Cambridge Workshop on Cool Stars, Stellar Systems, and the Sun (7th), Tucson, AZ., October 1991, p455-457 1992.

Keywords: *Supergiant stars, *Red giant stars, Stellar chromospheres, Stellar winds, Radio astronomy, Reprints, *Alpha Orionis star, Very large array(VLA).

We observed this prototypical M supergiant using the VLA at centimeter wavelengths about once a month over a 4-year period from July 1986 to September 1990, resulting in a cumulative exposure time of about 120 hours. There is no evidence for radio flaring at any of the observing wavelengths. Low-level variability (about = or < 25%) does appear to be present at the shorter wavelengths (2 and 3.6 cm) and may be also occurring at 6 cm, and is usually in the form of temporary decreases of the radio flux densities from their usual levels. The timescale for these radio dips is not well-determined by the present data set, but significant variability on a timescale of = or < 1 month is observed on occasion. There is no correlation between the variations observed at the different wavelengths.

Contract NASA-NAG5-82
Pub. in Astrophysical Jnl. 403, p412-425, 20 Jan 93. Sponsored by National Aeronautics and Space Administration, Washington, DC.

Keywords: *Solar activity, *Stellar evolution, Stellar coronae, Stellar winds, Ultraviolet spectra, X-ray spectra, Atmospheric models, Late stars, IUE, Reprints, *Beta Hydri star.

The secular decay of solar-type activity with age is studied through a detailed comparison of the present Sun (G2 V) with the very old (9-10 Gyr) solar-type star beta Hydri (G2 IV), taken as a proxy of the future Sun. Analyses of successive atmospheric layers are made, and this Paper III in the series treats the outermost parts. The far-UV emission lines from the transition zone are among the faintest so far seen in any solar-type star. The significance of the deduced fluxes for the weak and marginally detected lines is tested through two independent reductions of IUE data. The coronal soft X-ray spectrum was measured through different filters on EXOSAT and compared to simulated X-ray observations of the Sun seen as a star. The flux from beta Hydri is weaker than that from the solar corona and has a different spectrum.

Rotational Modulation and Flares on RS Canum Venaticorum and BY Draconis Stars. XVI. IUE Spectroscopy and VLA Observations of C1182(=V 1005 Orionis) in October 1983.
Final rept.
M. Mathioudakis, J. G. Doyle, M. Rodono, S. Avgoloupis, J. L. Linsky, D. Gary, L. N. Mavridis, P. Varvoglis, D. M. Gibson, and P. B. Byrne. 1991, 11p.
Pub. in Astron. Astrophys. 244, p155-165 1991.

Keywords: *Stellar flares, Ultraviolet spectra, Microwave spectra, Radiative transfer, IUE, Reprints, Very large array (VLA).

A large flare was detected simultaneously with IUE and VLA on GI 182 on 5 October 1983, this event showing the largest C IV flare enhancement yet observed by IUE. A smaller flare was also detected on 4 October, although only with the IUE satellite. We use line ratio and emission measure techniques to derive various physical parameters of the flares, i.e., the electron pressures and the dimensions of the emitting plasma. The radio data suggest that the flare was an optically-thick gyro-resonance or gyro-synchrotron event. There is no evidence that the event was circularly polarized.

High Sensitivity Survey of Radio Continuum Emission in Herbig Ae/Be Stars.
Final rept.
S. L. Skinner, A. Brown, J. Linsky, and R. T. Stewart. 1992, 3p.
Contract NASA-W-17772
Pub. in Proceedings of Cambridge Workshop on Cool Stars, Stellar Systems, and the Sun (7th), Tucson, AZ., October 1991, p331-333 1992. Sponsored by NASA Center for AeroSpace Information, Baltimore-Washington International Airport, MD.

Keywords: *Pre-main sequence stars, Radio sources(Astronomy), Radio emission, High sensitivity, Surveys, Reprints, Very large array(VLA).

We present results of a high sensitivity VLA/Australia Telescope survey of radio continuum emission from the 57 Herbig Ae/Be stars (and candidates) cataloged by Finkenzeller and Mundt (1984). Twelve stars were detected at the primary observing wavelength of 3.6 cm, with an additional five stars possibly detected. Upper limits for undetected stars are typically 0.1 mJy (3 sigma). Follow-up observations in the wavelength range 2 - 20 cm give spectral index estimates for 9 stars. Preliminary analysis suggests that the radio emission is of thermal origin in most cases, although nonthermal emission is a possibility for TY CrA and MWC 137.

Astrophysics

Keywords: *X-ray sources, *Quasars, Radio sources(Astronomy), Emission spectra, Red shift, Reprints.

A flux-limited catalog of radio sources in the northern sky has been used to select about 600 weak x-ray sources from a database of about 10(sup 5) 2-4 sigma fluctuations derived from Einstein Observatory Imaging proportional counter x-ray images. Optical spectroscopy of only six of these sources resulted in the discovery of a quasar with an emission-line redshift of 3.87, the highest redshift x-ray source yet discovered. Subsequent VLA observations reveal the source to have a flat-spectrum radio core plus an unresolved radio lobe 2.5 seconds away with a spectral index of alpha=-1.45. The lobe is connected to the core by a weak jet. The integrated flux density of the source at 20 cm is 0.66 Jy. The V magnitude of the quasar in 19.5, and the tentative x-ray source has a very soft spectrum. The authors discuss the properties of the object in the context of known high-redshift radio sources and existing x-ray selected quasar samples, and comment on the potential of our discovery technique for exploring the properties of very distant active galaxies.

IUE Observations of Solar-Type Stars in the Pleiades and the Hyades.
Final rept.
J. P. Caillault, O. Vilhu, and J. L. Linsky. 20 Dec 91, 8p.
Contracts NASA-NAG5-82, NASA-INT-89-00202
Pub. in Astrophysical Jnl. 383, p594-601, 20 Dec 91. Sponsored by NASA Center for AeroSpace Information, Baltimore-Washington International Airport, MD. and National Science Foundation, Arlington, VA.

Keywords: *Pleiades cluster, *F stars, *G stars, Stellar chromospheres, Stellar spectra, Satellite observation, Ultraviolet spectra, Late stars, Magnesium ions, Carbon ions, IUE, Reprints, *Hyades cluster.

The authors have made the first extensive set of IUE observations of solar-type stars (spectral types F5-G5) in the Pleiades. Spectra were obtained in 1988 January and August for both the transition region (C IV 1550 A; low-resolution) and chromospheric (Mg II 2800 A; high-resolution) emission wavelength regions, respectively. The Pleiades solar-type stars lie at the extreme limit of what IUE can observe in very long exposures. The authors were able to detect Mg II fluxes for two out of three Pleiades stars and interesting C IV upper limits for two of these stars. Long-wavelength, high-resolution spectra were also obtained for previously unobserved solar-type stars in Hyades. With the inclusion of spectra of additional Hyades stars obtained from the IUE archives, they have calculated surface fluxes and fractional luminosities for both clusters' solar-type stars. These values provide a better estimate for the Mg II saturation line for single (as opposed to contact-binary) stars.

Keywords: *Stellar chromospheres, Stellar winds, Stellar spectra, Ultraviolet spectra, Emission spectra, Late stars, K stars, Copper ions, Silicon ions, Iron ions, Nickel ions, Cobalt ions, Reprints, Alpha Tavri star.

The K5 III star alpha Tau was observed with the Goddard High Resolution Spectrograph on 1990 November 27 as part of the Science Assessment Program for the Hubble Space Telescope. The observations include spectra in both the Large and Small Science Apertures in modes G270M at 2345 A and echelle B at 2325 A. The spectra show intersystem and permitted chromospheric emissions lines of C II (right bracket), Si II (right bracket), Fe II, Fe I, Ni II, and Co II. Resolved profiles of the C II (right bracket) lines indicate a complex chromospheric turbulent velocity distribution with mean value of approx. 24 km/s (right bracket), while their observed wavelengths indicate a 4 km/s downflow of the CII (right bracket) plasma. Twenty-five new emission lines have been found in the 2320-2370 A region, 17 of which have been identified with the aid of Skylab data obtained above the solar limb, including four lines from Co II (UV 8) and an Fe I (UV 12) line.

Keywords: *Binary stars, *Stellar coronal, *Stellar temperature, X-ray spectra, ROSAT mission, Reprints, Sky surveys(Astronomy).

The authors present the results from an analysis of X-ray spectra of 44 RS CVn systems obtained during the ROSAT All-Sky Survey with the Position Sensitive Proportional Counter (PSPC). Thermal plasma models with two temperature components are found to reproduce the observations better than single or continuous temperature models. The authors typically find that a bimodal distribution of temperatures centered near 2 x 10(sup 6) and 1.6 x 10(sup 7) K fit the data best. They show that the PSPC temperatures agree well with those from similar low-resolution measurements, although differences exist, primarily due to differing detector bandpasses. After comparing coronal characteristics--temperature or emission measure--with stellar parameters including rotation period and dynamo number, the authors find no compelling relationship. Including a gravity term, as suggested by previous investigators, leads to a deceptive relationship, because gravity is a strong function of rotation period for these systems. Similarly, the height integrates emission measures of the components in the two-temperature models, including a gravity term, are found to be well correlated with temperature.

Pub. in Stellar Atmospheres: Beyond Classical Models, p431-439 1991.

Keywords: *Stellar envelopes, *Stellar atmospheres, *Radiative transfer, Ionization cross sections, Transition probabilities, Computer applications, Photoionization, Reprints, Opacity project, Atomic data.

The Opacity Project was organized to compute new opacities for stellar envelopes, but has produced as a secondary product a vast amount of atomic radiative data for almost all elements of astrophysical interest. The photoionization cross sections in many cases show extensive resonance structure, which introduces complications when they are used in stellar modeling. Possible ways of dealing with this problem are discussed. Finally, a method of presenting atomic data in standardized subroutines in order to eliminate the need for large, special purpose data sets is proposed.

Sponsored by NASA Center for AeroSpace Information, Baltimore-Washington International Airport, MD.
Pub. in Proceedings of IAU Joint Commission Meeting on Solar and Stellar Coronae, Buenos Aires, Argentina, July 31, 1991, p577-589 1992.

Keywords: *Stellar coronae, *Ultraviolet spectra, Hubble Space Telescope, Stellar spectra, Giant stars, Late stars, Binary stars, Emission spectra, Electron density, Stellar chromospheres, Reprints, *Capella star, *Gamma Draconis star.

I report on the first GHRS (Goddard High Resolution Spectrograph) spectra of two very different late-type giant stars - Capella and gamma Dra. Capella is a 104 day period binary system consisting of two stars (G9 III and G0 III) each of which shows bright emission lines formed in solar-like transition region and coronae. By contrast, gamma Dra is a hybrid-chromosphere star with very weak emission lines from high-temperature plasma. Low-dispersion spectra of these stars covering the 1160 to 1717 A spectral range show unresolved emission lines from neutral species through N V. The very different surface fluxes detected in the spectra of these stars suggest different types of heating mechanisms.

Pub. in The Astrophysical Jnl. 402, p694-709, 10 Jan 93.

Keywords: *Interstellar matter, Far ultraviolet radiation, Hubble Space Telescope, Ultraviolet spectra, Binary stars, Line of sight, Giant stars, Late stars, Hydrogen, Deuterium, Magnesium ions, Iron ions, Ratios, Reprints, Capella star.

We analyze HST Goddard High-Resolution Spectrograph observations of the 1216, 2600, and 2800 A spectral regions for the spectroscopic binary system Capella, obtained at orbital phase 0.26 with 3.27-3.57 km/s resolution and high signal-to-noise ratio. We infer the column densities of H I, D I, Mg II, and Fe II for the local interstellar medium along the 12.5 pc line of sight, together with estimates of the temperature and turbulent velocity. If we assume that the intrinsic Ly(alpha) lines of the component stars in the Capella system can be approximated as scaled solar lines (with self-reversals), which is consistent with the observed Ly(alpha) profile of the high radial velocity star delta Lep, then the average interstellar neutral hydrogen number density = 0.047/cc.

Pub. in Proceedings of Cambridge Workshop on Cool Stars, Stellar Systems, and the Sun (7th), Tucson, AZ., October 1991, v26 p325-327 1992.

Keywords: *Magnetic stars, *Radio stars, Radio sources(Astronomy), Stellar magnetospheres, Stellar winds, Peculiar stars, B stars, A stars, Reprints.

We have detected a total of 16 magnetic Bp-Ap stars at 6 cm, out of 61 observed, including both He-strong and He-weak/Si-strong stars with log L(6) = 14.7 to 17.9, but none of the classical (SrCrEu-type) Ap stars at a detection limit of log L(6) < 14.9. We believe that the radio-emitting CP (chemically peculiar) stars form a distinct class of radio stars that differs from both the hot star wind sources and the active late-type stars. For the detected CP stars, we find that L(6) is proportional to M(sup 0.5) B(rms), produced by optically thick nonthermal gyrosynchrotron emission. In our model, the electrons are accelerated in current sheets located 10-20 radii from the star.

Radio Emission from Chemically Peculiar Stars.
Final rept.
J. L. Linsky, S. A. Drake, and T. S. Bastian. 1992, 16p.
Sponsored by NASA Center for AeroSpace Information, Baltimore-Washington International Airport, MD.
Pub. in The Astrophysical Jnl. 393, n1 p341-356, 1 Jul 92.

Keywords: *Magnetic stars, *Radio stars, Radio sources(Astronomy), Stellar magnetospheres, Radio emission, Electron trajectories, Stellar winds, Peculiar stars, B stars, A stars, Very large array(VLA), Reprints.

We have extended the initial survey of radio emission from magnetic Bp-Ap stars by Drake et al, in five subsequent very large array (VLA) observing runs. A total of 16 sources have been detected at 6 cm out of 61 observed, giving a detection rate of 26%. Of these stars, three are also detected at 2 cm, four at 3.6 cm, and five at 20 cm. In addition to the three He-strong and two He-weak/Si-strong stars previously reported as radio sources, we have detected 11 new stars as radio sources with spectral types B5-A0 that are He-weak and Si-strong. We have not yet detected any of the classical (SrCrEu-type) Ap stars despite many attempts. We find a wide range of high 6 cm radio luminosities for the detected stars, with log L(6) = 14.7-17.9. We show that all of the observed properties of radio emission from these stars may be understood in terms of optically thick gyrosynchrotron emission from a nonthermal distribution of electrons. We propose a model in which the electrons are produced in current sheets forming 10-20 radii from the star. In this model the electrons travel along magnetic fields to smaller radii and higher magnetic latitudes where they mirror and radiate microwave radiation.

Rapid Decline in the Optical Emission from SN 1957D in M83.
Final rept.
K. S. Long, P. F. Winkler, and W. P. Blair. 1992, 5p.
Pub. in Astrophysical Jnl. 395, p632-636, 20 Aug 92.

Keywords: *Supernova remnants, Emission spectra, Oxygen ions, Sulfur ions, H alpha line, Nucleosynthesis, Reprints, *Supernova 1957D.

As part of a search for the supernova remnants in M83, we have obtained new interference filter images of the site of SN 1957D and new spectra of the young supernova remnant (SNR) itself. Images were obtained in the light of H(alpha) (O III), (S II), and several continuum bands using the prime focus CCD camera on the CTIO 4 m telescope. An inspection of the images shows that the flux from the SNR, as observed through the (O III) filter, has decreased by at least a factor of 5 compared with observations made at Las Campanas 4 years earlier. There is no indication of a change in the emission from the SNR in any other filter. Spectroscopic observations conducted at the position of the SN yield an (O III) flux in 1991 April, down by a factor of 3 from measurements with the same instrument 2 years earlier.

Infrared Spectra of van der Waals Complexes of Importance in Planetary Atmospheres.
Final rept.
G. T. Fraser, A. S. Pine, and W. J. Lafferty. 1990, 5p.
Pub. in Proceedings of International Conference on Laboratory Research for Planetary Atmospheres (1st), p64-68 May 90.

Keywords: *Planetary atmospheres, *Infrared spectra, *Complexes, Van der Waals forces, Near infrared radiation, Vibrational spectra, Venus atmosphere, Mars atmosphere, Predissociation, Argon complexes, Trimers, Dimers, Reprints, *Carbon dioxide complexes.

It has been suggested that (CO2)2 and Ar-CO2 are important constituents of the planetary atmospheres of Venus and Mars. Here, we present recent results on the laboratory spectroscopy of CO2-containing van der Waals complexes which may be of use in the modeling of the spectra of planetary atmospheres. Sub-Doppler infrared spectra have been obtained for (CO2)2, (CO2)3, and rare-gas-CO2 complexes in the vicinity of the CO2 Fermi diad (nu(1) + nu(3), 2nu(2) + nu(3)) at 2.7 micrometers using a color-center-laser optothermal spectrometer. From the spectroscopic constants, the geometries of the complexes have been determined and van der Waals vibrational frequencies have been estimated. The equilibrium configurations are C(2h), C(3h), and C(2v), for (CO2)2, (CO2)3, and the rare-gas-CO2 complexes, respectively. The linewidths of the rovibrational transitions are = or < 22 MHz, indicating that predissociation is as much as four orders of magnitude faster than radiative processes for vibrational relaxation in these complexes.

IRAS Spectroscopic Observations of Young Planetary Nebulae.
Final rept.
C. Y. Zhang, and S. Kwok. 1990, 16p.
Pub. in Astronomy and Astrophysics 237, p479-494 1990.

Keywords: *Planetary nebulae, *Interstellar matter, *Cosmic dust, Intermediate infrared radiation, Infrared astronomy, Infrared Astronomy Satellite, Stellar evolution, Silicates, Oxygen, Carbon, Reprints.

The 18 micrometer silicate dust feature is detected in 11 young planetary nebulae selected from radio properties. The presence of the 18 micrometer silicate feature suggests that oxygen-rich planetary nebulae are more common than previously believed. The silicate dust probably originates from the remnants of the circumstellar envelopes of the nebulae's asymptotic-giant-branch progenitors and remains visible in young planetary nebulae. Most interestingly, there are six young planetary nebulae that show both oxygen- and carbon-rich dust features. It is possible that a planetary nebula that descends from an oxygen-rich progenitor star will be classified as carbon rich as the silicate feature diminishes and the ultraviolet-excited polycyclic aromatic hydrocarbon bands become more prominent as the nebula ages. We suggest that a true chemical origin of planetary nebulae can only be reliably determined from young planetary nebulae.

Keywords: *Solar activity, *Stellar evolution, *Stellar coronae, Stellar winds, Ultraviolet spectra, X-ray spectra, Atmospheric models, Late stars, EXOSAT satellite, IUE, Reprints.

The secular decay of solar-type activity with age is studied through a detailed comparison of the present Sun (G2 V) with the very old (9-10 Gyr) solar-type star beta Hyi (G2 IV), taken as a proxy of the future Sun. Analyses of successive atmospheric layers are made, and this Paper III in the series treats the outermost parts. The far-UV emission lines from the transition zone are among the faintest so far seen in any solar-type star. The significance of the deduced fluxes for the weak and marginally detected lines is tested through two independent reductions of IUE data. The coronal soft X-ray spectrum was measured through different filters on EXOSAT and compared to simulated X-ray observations of the Sun seen as a star. The flux from beta Hyi is weaker than that from the solar corona and has a different spectrum. Implications are discussed.

Pub. in Astrophysical Jnl. 402, p710-720, 10 Jan 93.

Keywords: *Lyman alpha radiation, Lyman spectra, Emission spectra, Ultraviolet spectra, Binary stars, IUE, Reprints, *Capella star.

We describe the hydrogen Ly(alpha) emission of the spectroscopic binary Capella (G8 III + G0 III) recorded at 0.1 A resolution by the International Ultraviolet Explorer (IUE). The overt changes in the composite line shape with orbital phase are controlled by the active G0 III star and permit a dissection of the stellar components despite the obliteration of the central portion of the profile by atomic hydrogen and deuterium absorption along the 12.5 pc sightline. The Ly(alpha) line shape of the active G0 III star is surprisingly asymmetric and possibly is variable. Both characteristics suggest a stellar wind of moderate excitation, a key component of the coronal evolution scenario of Simon and Drake for the Hertzsprung-gap giants.

The observations of the quasar 3C 273 taken with the Goddard High Resolution Spectrograph in February 1991 are presented here. We have included both the reduced raw data, and smoothed and deconvolved spectra. Also, a list of observed absorption lines is presented. The data comprise 11 spectra, including 1 low resolution observation and 10 medium resolution observations. The wavelength region covered ranged from about 1,150 to 2,820 A, but was not all inclusive. The procedures used to obtain and reduce the data, including corrections for fixed pattern noise, compensation for the effects of spherical aberration in the HST primary mirror, and objective detection of weak absorption lines, are described. We have also included a short discussion on the detection of galactic Ni II and Virgo cluster metal lines.

Pub. in Astrophysical Jnl. 387, p248-257, 1 Mar 92.

Keywords: *Spectral lines, Radiative transfer, Reprints, Sobolev approximation, Expanding atmospheres.

The formation of a spectral line in a uniformly expanding infinite medium is investigated in the Sobolev approximation with particular attention to the various mechanisms for frequency redistribution. Numerical and analytic solutions of the transfer equation are presented for a number of redistribution functions and their approximations, including type I and type II partial redistribution, coherent scattering and complete redistribution, and the Fokker-Planck and uncorrelated ap-

proximation to the R(II) function. The solutions for the mean intensity are shown to depend very much on the type of redistribution mechanism, while for the frequency-weighted mean intensity J(bar), which enters the rate equations, this dependence is weak. This implies that the use of Sobolev escape probabilities based on complete redistribution can be an adequate approximation for many calculations for which only the radiative excitation rates are needed. However, it is shown that the criteria for applicability of Sobolev theory may be difficult to meet when transfer occurs primarily in the Voigt wings, especially for complete redistribution.

Pub. in Monthly Notices of the Royal Astronomical Society 254, p277-290 1992.

Keywords: *Hydrogen, Lyman lines, Cosmic dust, Element abundance, Universe, Radiative recombination, Radiative transfer, Radio astronomy, Helium, Reprints.

We explore systematically the effect on the recombination spectrum of hydrogen arising from: (i) finite optical thickness in the Lyman Lines; (ii) the overlapping of Lyman lines near the series limit; (iii) the absorption of Lyman lines by dust or photoionization, and (iv) the long-wave radiation emitted by dust. Full account is taken of electron and heavy particle collisions in redistributing energy and angular momentum. We find that each of these deviations from the classical Case B leads to observable effects, and that dust influences the recombination spectrum in characteristic ways that may make possible new observational constraints on dust properties in nebulosities. On the basis of these calculations, we believe the uncertainty in the determination of the helium-to-hydrogen abundance ratio in the Universe may be larger than currently claimed.

Keywords: *Interstellar matter, *Deuterium, *Hydrogen, *Isotope ratio, Hubble space telescope, Lyman alpha radiation, Line of sight, Galactic evolution, Cosmology, Reprints, Procyon star.

We report on our ongoing program to measure the deuterium/hydrogen (D/H) ratio and interstellar gas properties along many lines of sight through the local interstellar medium using the Hubble Space Telescope (HST) Goddard High-Resolution Spectrograph. For the line of sight towards Capella (12.5 pc) we had previously found D/H = 1.65(+ 0.07, -0.18) X 10(exp -5), T = 7,000 K, and turbulent velocity 1.66 km/s. These quantities were determined by modeling the interstellar hydrogen and deuterium Lyman alpha lines and the resonance lines of Fe II and Mg II against the background stellar emission-line profiles. We now report on our preliminary analysis of these spectral lines for the line of sight toward Procyon (3.5 pc). We find that D/H = 1.40 + or - 0.05 X l0(exp -5). Further analysis of this and other lines of sight are planned to determine whether the D/H ratio varies within the local interstellar medium. We infer the primordial value of D/H from Galactic evolution models and comment on the derived baryon density of the Universe.

Pub. in Advances in Space Research 11, n11 p(11)5-(11)14 1991.

Keywords: *Ultraviolet astronomy, Extreme ultraviolet radiation, Far ultraviolet radiation, Ultraviolet spectrometers, Ultraviolet spectra, Spaceborne astronomy, Stellar coronae, Flare stars, G stars, Reprints.

In anticipation of more sensitive EUV and FUV spectroscopic instruments, we simulate spectra, including interstellar absorption, of solar-like, RS CVn, and flare stars as folded through the instrument parameters of the Extreme Ultraviolet Explorer (EUVE), Lyman/Far Ultraviolet Spectroscopic Explorer (FUSE) Phase A, and a desirable next-generation spectrometer. We find that even the relatively insensitive EUVE spectrometer will be able to detect sufficient spectral lines from many active binary and dMe stars to determine their coronal emission measure distributions. The Lyman/FUSE or next-generation spectrometers are needed to study solar-type stars or flaring stars with high time resolution. The high throughput and effective area of a next-generation spectrometer is needed for Doppler imaging studies, stellar wind and downflow measurements, and high time and spectral resolution of stellar flares.

New High-Redshift Damped Lyman-alpha Absorption Systems and the Redshift Evolution of Damped Absorbers.
Final rept.
R. L. White, A. L. Kinney, and R. H. Becker. 1993, 14p.
Pub. in Astrophysical Jnl. 407, n2 p456-469, 20 Apr 93.

Keywords: *Lyman alpha radiation, Galactic evolution, Absorption spectra, Red shift, Cosmology, Galaxies, Reprints.

We have discovered two high-redshift (Z(abs) = 3.388 and 2.908) damped Ly(alpha) absorption systems and a third possible damped system (Z(abs) =3.080) while obtaining spectra of optical counterparts from a sample of flat spectrum radio sources. These three systems all have higher redshifts than any previously known damped Ly(alpha) absorption systems in the spectra of radio-loud quasars, and they are among the highest redshift damped Ly(alpha) systems known. This is the first good statistical evidence for evolution in the number (or size) of damped Ly(alpha) absorbers at high redshift. We argue that the most likely explanation for the rapid disappearance of damped Ly(alpha) absorbers between z = 3.5 and z = 3 is that we are observing the epoch of galaxy formation.

CCD Mosaic Images of the Supernova Remnant 3C 400.2.
Final rept.
P. F. Winkler, T. M. Olinger, and S. A. Westerbeke. 1993, 11p.
Sponsored by National Science Foundation, Washington, DC. and National Aeronautics and Space Administration, Washington, DC.
Pub. in Astrophysical Jnl. 405, p608-613, 10 Mar 93.

Keywords: *Supernova remnants, Charge coupled devices, H alpha radiation, Nitrogen ions, Oxygen ions, Sulfur ions, Planetary nebulae, Reprints.

We have constructed CCD mosaic images of the old Galactic supernova remnant 3C 400.2 in lines of H(alpha) + (N II), (S II), and (O III), plus a continuum band. These are the first CCD images covering the full extent of this remnant, and they reveal significantly more nebulosity than the deepest photographic plates. Comparison with radio and X-ray images indicates dramatically different morphology in the three regimes. The optical images both in H(alpha) + (N II) and in (S II) show an almost complete, irregular shell of emission, with a diameter of about 16', little over half that of the radio shell, while the X-ray structure is a centrally peaked ellipsoid. We also report a previously uncataloged planetary nebula southwest of 3C 400.2.

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Astronomical Jnl. 108, n6 p2203-2206 Dec 94.

Keywords: *Peculiar stars, *Radio emission, *Stellar magnetic fields, Radio sources(Astronomy), Stellar magnetosphere, Steller luminosity, Stellar temperature, Very large array(VLA), Reprints.

The authors observed 23 members of the Am and HgMn subclasses of chemically peculiar (CP) stars with the VLA to search for nonthermal radio emission at levels comparable to those found for the Si and He peculiar subclasses of the CP stars be Linsky et al. (ApJ, 393, 341 (1992)). The authors detected none of the Am and HgMn stars as radio emitters with upper limits typically < 0.20 mJy. Applying a correlation between radio luminosity, surface magnetic field, and effective temperature derived from previous radio studies of the Si and He peculiar CP stars, the authors find that the predicted radio luminosities of alpha-And (an HgMn star) and Sirius (a hot Am star) are more than an order of magnitude larger than the observed upper limits, indicating that these stars lack magnetospheres, and, by inference, surface magnetic fields.

X-ray Emission from Chemically Peculiar Stars.
Final rept.
S. A. Drake, J. L. Linsky, J. H. M. M. Schmitt, and C. Rosso. 1994, 5p.
Contract NASA-W-17772
Sponsored by NASA Scientific and Technical Information Facility, Baltimore, MD.
Pub. in Astrophysical Jnl. 420, p387-391, 1 Jan 94.

Keywords: *X ray emission, *Peculiar stars, *Stellar magnetic fields, Binary stars, Companion stars, Steller magnetospheres, X ray sources, Radio sources(Astronomy), Steller luminosity, X ray astronomy, Rosat mission, Reprints.

The authors have searched the ROSAT All-Sky Survey (RASS) database at the positions of approximately 100 magnetic Bp-Ap stars of the helium-strong, helium-weak, silicon, and strontium-chromium subclasses. The authors detect X-ray sources at the positions of 10 of these stars; in four cases the X-ray emission presumably arises from an early-type companion with a radiatively driven wind, while the authors believe that the magnetic chemically peculiar (CP) star is the most likely X-ray source (as opposed to a binary companion) in at least three and at most five of the six remaining cases. The authors discuss the X-ray and radio emission properties of their sample of CP stars, and argue that both types of emission may be magnetospheric in origin; however, there is clearly not a simple one-to-one correspondence between them, since many of the magnetic stars that are detected radio sources were not detected as X-ray sources in the present survey.

Pub. in Astronomy and Astrophysics 284, p91-104 1994.

Keywords: *Binary stars, *Steller flares, *Radio sources(Astronomy), *X ray sources, Radio emission, Stellar coronae, Stellar chromospheres, Stellar radiation, Radio spectra, Ultraviolet spectra, Variable stars, Rosat mission, Very large array(VLA), IVE, Radio astronomy, Reprints.

As part of a coordinated program of multi-wavelength observations of RS CVn close binary systems, the authors observed 15 systems with the VLA and 10 systems with IUE, simultaneously or nearly simultaneously with the ROSAT All Sky Survey observations of these stars. Of the 22 systems observed with ROSAT, three were observed both by IUE and the VLA. The prinicipal aim of this program was to check the validity of the existing empirical correlations between the radio and soft X-ray emissions of their coronae, and between the chromospheric/transition region and coronal emissions.

Keywords: *Flare stars, *Ultraviolet spectra, *Chromospheres, Reprints, Emission spectra.

We analyze high-resolution HST spectra of the dM0e flare star AU Mic, including the profiles of the C IV 1548.2 A, 1550.8 A and Si IV 1393.8 A, 1402.8 A lines obtained with the G160M grating of the Goddard High-Resolution Spectrograph. The quiescent profiles of the C IV and Si IV lines are broad, and not simple Gaussian in shape. Flux in the C IV and Si IV lines, for example, can be measured reliably out to about + or - 200 km s-1 from line center. Each of the C IV and Si IV profiles can be fitted accurately by two Gaussians (one narrow and the other broad) centered on nearly the same wavelength, with the narrower component accounting for roughly 60% of the total integrated flux. The narrow components have similar line widths to those observed in solar active and quiet region. The broad Gaussian components of the AU Mic line profiles are reminiscent of the broad C IV profiles observed in solar transition region explosive events, which are thought to be associated with emerging magnetic flux regions where field reconnnection occurs.

Pub. in Astrophysical Jnl. 421, p800-808, 1 Feb 94.

Keywords: *Stellar coronae, *Stellar spectra, *Spectral resolution, Noise reduction, Emission spectra, Stellar flares, Stellar chromospheres, Ultraviolet spectra, Late stars, Reprints, HST(Hubble Space Telescope), High Resolution Spectrography.

The authors report on an observation of AU Mic taken with the Goddard High Resolution Spectrograph, aboard the Hubble Space Telescope. The data consist of a rapid sequence of spectra covering the wavelength range 1345-1375 Angstroms with a spectral resolution of 10,000. The observations were originally intended to search for spectral variations during flares. No flares were detected during the 3.5 hr of monitoring. A method of reducing the noise while combining the individual spectra in the time series is described which resulted in the elimination of half of the noise while rejecting only a small fraction of the stellar signal. The resultant spectrum was of sufficient quality to allow the detection of emission lines with an integrated flux of 10(exp -15) ergs/sq cm/s or greater. Lines of C I, O I, O V, Cl I, and Fe XXI were detected, This is the first indisputable detection of the 1354 Angstroms Fe XXI line, formed at T about 10(exp 7)K, on a star other than the Sun. The line was well resolved and displayed no significant bulk motions or profile asymmetry.

We report the results of a volume-limited ROSAT Wide Field Camera (WFC) survey of all nondegenerate stars within 10 pc. Of the 220 known star systems within 10 pc, we find that 41 are positive detections in at least one of the two WFC filter bandpasses (S1 and S2), while we consider another 14 to be marginal detections. We compute X-ray luminosities for the WFC detections using Einstein Imaging Proportional Counter (IPC) data, and these IPC luminosities are discussed along with the WFC luminosities throughout the paper for purposes of comparison. Extreme ultraviolet (EUV) luminosity functions are computed for single stars of different spectral types using both S1 and S2 luminosities, and these luminosity functions are compared with X-ray luminosity functions derived by previous authors using IPC data.

Final rept.
K. G. Carpenter, R. D. Robinson, G. M. Wahlgren, J. L. Linsky, and A. Brown. 1994, 16p.
Pub. in Astrophysical Jnl., v428 p329-344, 10 Jun 94.

Keywords: *Far ultraviolet radiation, *Cool stars, *Ultraviolet spectra, *Stellar spectra, M stars, Supergiant stars, Red giant stars, Late stars, Stellar chromospheres, Stellar atmospheres, Stellar temperature, Line spectra, Ultraviolet astronomy, Reprints, *Alpha Orionis star.

We present far-UV (1200-1930 A) observations of the prototypical red supergiant star alpha Ori, obtained with the Goddard High Resolution Spectrograph (GHRS) on the Hubble Space Telescope. The observations, obtained in both low- (G140L) and medium- (G160/200M) resolution modes, umamibiguously confirm that the UV 'continuum' tentatively seen with IUE is in fact a true continuum and is not due to a blend of numerous faint emission features or scattering inside the IUE spectrograph. This continuum appears to originate in the chromosphere of the star, at temperatures ranging from 3000-5000 K, and we argue that it is not related to previously reported putative companions or to bright spots on the stellar disks.

Stars, Atmospheres, Radiative Transfer.
Final rept.
D. G. Hummer. 1992, 2p.
Pub. in Astronomy and Astrophysics Encyclopedia, p703-704 Mar 92.

Keywords: *Stellar atmospheres, *Radiative transfer, *Transition probabilities, Stellar spectra, Stellar winds, Stellar temperature, Stellar mass, Gases, Radiation, Stars, Flow rate, Stellar models, Reprints.

Radiative transfer in stellar atmospheres refers to the quantitative treatment of the flow of radiant energy through the outer layers of stars and the interaction of radiation with the gas in these regions. In addition to radiant energy, in certain types of stars a small amount of energy is transported through the atmosphere by the large-scale motion of the gas itself; both forms, of course, arise ultimately from thermonuclear processes deep inside the stars. The division between these two modes is not fixed, as radiation can transfer momentum to the gas, causing outflows known as stellar winds, and flow energy can be transformed into radiation by shocks. Radiation undergoes repeated interactions with the gas, which collectively determine the rate at which it can escape from the atmosphere. Because the rate at which energy is produced deepin the star is essentially fixed. These interactions establish the equilibrium distribution of temperature and density in the atmosphere. In addition to this constructive role, radiative transfer also plays a diagnostic role, for the spectrum of the escaping radiation carries with it all that we can possibly learn about the internal physical conditions of the atmosphere and the underlying layers.

Keywords: *X ray sources, *Stellar radiation, *Sky surveys(Astronomy), Binary stars, Stellar coronae, Radio sources(Astronomy), Very large array(VLA), X ray astronomy, Radio astronomy, Reprints.

Source confusion makes it difficult to identify active stars, such as the RS CVn binaries, with X-ray sources detected in low angular resolution surveys. Short (15 minute) VLA radio continuum observations of candidates having appropriate spectral types and X-ray to visual flux ratios obtained from an X-ray selected sample, combined with other information, has enabled us either to confirm or rule out proposed late-star counterparts for 27 out of 32 X-ray sources selected from the Einstein Slew Survey.

Keywords: *Magnetic fields, *Orion nebula, *Spectral lines, Interstellar gas, Cosmic gases, Molecular clouds, Interstellar clouds, Cosmic dust, Zeeman effect, Polarization, Emission spectra, Reprints.

The authors review the observational aspects of magnetic fields in dense, star-forming regions. First the authors discuss ways to observe the field. Next, they discuss selected observational results, focusing on detailed discussions of a small number of points rather than a generalized discussion that covers the waterfront. Next the authors discuss the derivation of the complete magnetic vector, including both the systematic and fluctuating component, from a large sample of Zeeman and linear polarization measurements for the L204 dark cloud. Third, they discuss the virial theorem as it applies to dark clouds in general and one dark cloud. Finally the authors critically discuss the numerous claims for alignment of cloud structural features with the plane-of-the-sky component of the magnetic field and find that many of these have not been definitively established.

Pub. in Physics of Solar and Stellar Coronae, p257-266 Sep 93.

Keywords: *Peculiar stars, *A stars, *Stellar temperature, Stellar spectra, Emission spectra, Radio emission, X ray emission, Stellar luminosity, Stellar coronae, Steller magnetospheres, Reprints.

The authors will show that the magnetic chemically peculiar (CP) stars hotter than about spectral type A2 display many of the phenomena seen in the most active late-type stars. In particular, many CP stars are luminous nonthermal radio sources and ROSAT confirms that many are also luminous coronal x-ray sources like the RS CVn systems. A wind-fed magnetosphere model has been proposed to explain both the nonthermal radio and the x-ray emission. In this model, the stellar wind plays the role of a mechanical energy source analogous to the role played by convection in the active late-type stars.

Between 1990 August and 1991 January the ROSAT/IUE All Sky Survey (RIASS) coordinated pointings by the International Ultraviolet Explorer with the continuous X-ray/EUV mapping by the Roentgensatellit. The campaign provided an unprecedented multiwavelength view of a wide variety of cosmic sources. We report findings for F-K stars, a large proprtion of the RIASS targets. Forty-eight of our 91 'Coronathon' candidates were observed by the IUE during the campaign. For stars missed by the IUE, we supplemented the ROSAT survey fluxes with archival UV spectra and/or follow-on observations. In addition to the coordinated work, we examined the UV emission histories of the Coronathon stars.

Pub. in Astrophysical Jnl., v451 p335-351 Sep 95.

Keywords: *Deuterium, *Ultraviolet star, *Line of sight, *Interstellar matter, Stellar spectra, Line spectra, D lines, H lines, Hydrogen, Stellar composition, Abundance, Isotope ratio, Lyman alpha radiation, Emission spectra, Absorption spectra, Reprints, Pryocyon star, Capella star.

We present Goddard High-Resolution Spectrograph observations of the interstellar H I and D I Ly(alpha) lines and the Mg II and Fe II resonance lines formed along the lines of sight toward the nearby stars Procyon (3.5 pc, l=214 degrees, b=13 degrees) and Capella (12.5 pc, l=163 degrees, b=5 degrees). New observations of Capella were obtained at orbital phase 0.80, when the radial velocities of the intrinsic Ly(alpha) emission lines of each star were nearly reversed from those of the previous observations at phase 0.26 (analyzed by Linsky et al.). For the analysis of the Procyon line of sight we assumed that (D/H)(sub LISM) = 1.6 x 10 to the -5th power, the same value as for the Capella line of sight, and we modified the broadened solar profile to achieve agreement between the simulated and observed line profiles.

Experimental Determination of the Rate Constant for the Reaction of C2H3 with H2 and Implications for the Partitioning of Hydrocarbons in Atmospheres of the Outer Planets.
Final rept.
A. Fahr, P. S. Monks, L. J. Stief, and A. H. Laufer. 1995, 8p.
Pub. in ICARUS, v116 p415-422 1995.

Keywords: *Gas giant planets, *Planetary atmospheres, *Hydrocarbons, Atmospheric chemistry, Chemical reaction kinetics, Partition, Absorption spectroscopy, Gas chromatography, Hydrogen ions, Vinyl radicals, Jupiter atmosphere, Photolysis, Laser pumping, Reprints, Rate constants.

The reaction between C2H3 and H2 has been suggested to be potentially important in accounting for observational data on the abundance of low-molecular weight hydrocarbons in the atmospheres of the giant planets. In the work, the room temperature rate constant for the reaction of the vinyl radical with molecular hydrogen has been determined by employing laser photolysis coupled to a kinetic-absorption spectroscopic technique and separately via a gas chromatographic product analysis technique.

Keywords: *Marine atmospheres, *Calibration, Environment, Reprints, Intercomparison, Measurement, Standards, Radium-226, Radon-222.

As part of an international 222Rn measurement intercomparison conducted at Bermuda in October 1991, NIST provided standardized sample additions of known, but undisclosed ('blind') 222Rn concentrations that could be related to U.S. national standards. The standardized sample additions were obtained with a calibrated 226Ra source and a specially-designed manifold used to obtain well-known dilution factors from simultaneous flow-rate measurements. The additions were introduced over sampling periods of several hours (typically 4 h) into a common streamline on a sampling tower used by the participating laboratories for their measurements. The standarized 222Rn activity concentrations for the intercomparision ranged from approximately 2.5 Bq.m-3 to 35 Bq.m-3 (of which the lower end of this range approached concentration levels for ambient Bermudian air) and had overall uncertainties, approximating a 3 standard deviation uncertainty interval, of about 6% to 13%. This paper describes the calibration and methodology for the standardized sample addition.

Comparison of Meteor Activity with Occurrence of Sporadic E Reflections.
V. C. Pineo. 14 Jul 50, 2p.
Pub. in Science, v112 n2898 p50-51, 14 Jul 50.

Keywords: *Meteors, *Ionization trails, *Meteor burst communications, Ionosphere, Reprints, Electromagnetic wave reflections, E region, Sporadic e layer.

In a previous paper, the writer presented evidence to show that the character of the echo obtained from a trail of ionization produced by a meteor is different in character from the echoes frequently obtained on ionosphere recorders and described as sporadic E reflections. Since the presentation of that paper a statistical study has been carried out on the frequency of reflections obtained with the meteor equipment in operation by the Central Radio Propagation Laboratory of the National Bureau of Standards, and the frequency of occurrence of sporadic E reflections observed over the same hiterval with the automatic multifrequency ionosphere recorder operated by the laboratory. By sporadic E, also sometimes called abnormal E, is meant what Lovell referred to as long duration abnormalities in the E region as distinguished from what Appleton and Naismith referred to as ionization bursts. In the scaling of sporadic E data from the vertical incidence ionosphere records, extreme eare was taken to see that only reflections of the sporadic E type were scaled. (MM).

Free Radical Chemistry of the Atmospheric Aqueous Phase.
Final rept.
R. E. Huie. 1995, 46p.
See also PB90-218207.
Pub. in Free Radical Chemistry of the Atmospheric Aqueous Phase, Chapter 10, p374-419 1995.

Keywords: *Atomspheric chemistry, *Free radicals, Electron transfer, Ionizing radiation, Aerosols, Fog, Clouds(Meteorology), Chemical reactions, Reprints, *Aqueous phase, Gas phase.

The chemical environment of the atmospheric aqueous phase: clouds, fogs, aerosols, and raindrops, has a rich chemistry strongly dependent upon the surrounding gas phase. For many atmospheric species, this environment is quite different than the gas phase; in water, they may hydrate, protonate, deprotonate, or dissociate. Most important, the aqueous phase opens up the possibility of an entirely new class of chemical reaction: electron transfer. In this review, the author will discuss the aqueous-phase chemistry of a number of free radicals of possible importance to the aqueous phase of the atmosphere.

Computational Model for the Rise and Dispersion of Wind-Blown, Buoyancy-Driven Plumes. Part 2. Linearly Stratified Atmosphere.
Final rept.
X. Zhang, and A. F. Ghoniem. Dec 93, 49p, NIST-GCR-93-637.
Contract 60NANB0D1036
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Wind direction, *Dispersions, *Plumes, *Buoyancy, Mathematical models, Atmospheric composition, Stratification, Dynamics, Atmospheric density, Vorticity, Height, Lagrangian functions, Baroclinic vorticity.

A multi-dimensional computational model of wind-blown, buoyancy-driven flows is applied to study the effect of atmospheric stratification on the rise and dispersion of plumes. The model utilizes Lagrangian transport elements, distributed in the plane of the plume cross section normal to the wind direction, to capture the evolution of the vorticity and density field, and another set of elements to model the dynamics in the atmosphere surrounding the plume. Solutions are obtained for a case in which atmospheric density changes linearly with height. Computational results show that, similar to the case of a neutrally stratified atmosphere, the plume acquires a kidney-shaped cross section which persists for a long distance downstream the source and may bifurcate into separate and distinct lumps.

Extreme Wind Estimates by the Conditional Mean Exceedance Procedure.
J. L. Gross, N. A. Heckert, J. A. Lechner, and E. Simiu. Apr 95, 20p, NISTIR-5531.

Keywords: *Wind velocity, *Estimating, Functions(Mathematics), Mathematical models.

We describe work aimed at improving procedures for the estimation of non-tornadic extreme wind speeds, regardless of their direction, in regions not subjected to hurricanes. Using the Generalized Pareto Distribution (GPD) approach and the Conditional Mean Exceedance (CME) estimation method, we analyze 115 17-year to 52-year sets of largest annual speeds and sets drawn from 48 15-year to 26-year records of maximum daily wind speeds. Based on this analysis we attempt an assessment of the widely held belief that the Gumbel distribution with site-dependent location and scale parameters is a universal model of extreme wind speeds. Some of our results suggest that the reverse Weibull distribution is a more appropriate model. This would result in more reasonable estimates of wind-induced failure probabilities and wind load factors than the corresponding estimates based on the Gumbel distribution. However, our assessment is so far only tentative owing to uncertainties inherent in our results. Future work based on lower thresholds (larger data samples) and alternative estimation methods is planned.

Low-Temperature Performance of Radiosonde Electric Hygrometer Elements.
Research paper.
A. Wexler. Jul 49, 8p, RP2003.
Pub. in Jnl. of Research of the National Bureau of Standards, v43 p49-56, Jul 49.

Keywords: *Radiosondes, *Hygrometers, Reprints, Low temperature, Electric power, Calibration, Range(Extremes), Humidity, Atmospheric sounding.

The performance of radiosonde electric hygrometer elements was investigated in the temperature range

from 0 to 400 C. It was found that an element indicated relative humidity with an average deviation of + 2.4-percent relative humidity from the average calibration for all of the elements tested. The maximum deviation in indication of any element did not exceed 10.5-percent relative humidity. The lag in response was found to increase markedly with decrease in temperature, to depend upon the magnitude and direction of relative humidity change, and the relative humidity from which the change was made.

Radiometric Model of the Transmission Cell-Reciprocal Nephelometer.
Final rept.
G. W. Mulholland, and N. P. Bryner. 1994, 15p.
Pub. in Atmospheric Environment 28, n5 p873-887 1994.

Keywords: *Nephelometers, *Aerosols, *Light scattering, *Radiometric correction, *Atmospheric scattering, Aerosol generators, Microspheres, Polystyrene, Absorptivity, Optical measuring instruments, Atmospheric optics, Reprints.

A radiometric model has been developed to assess the effects of angular truncation, finite size of the detector, and angle response characteristics of the cosine sensor on the measurement of the total scattering coefficient by a transmission cell-reciprocal nephelometer. These effects are computed for monodisperse polystyrene spheres over the size range 0.02-8 micrometers based on Mie theory and for smoke agglomerates ranging from 10 to 10(exp 7) primary units based on the Fisher-Burford approximation. The accuracy of the model calculations is determined by comparison with exact solutions for the case of a detector with an infinitesimal area and for a finite area detector with a diffuse scattering function. The predicted results are compared with measured results for six different sizes of monodisperse polystyrene sphere aerosols with particle diameters in the range 0.1-2.35 micrometers. The measurements were carried out as a function of the distance between the laser beam and detector for 1.3 and 2.7 cm diameter cosine sensors. A table of design parameters for making accurate total scattering measurements is obtained for both spheres and agglomerates. An accuracy of + or - 5% was obtained for spherical particles with diameters less than or equal to 1.1 micrometers with our TCRN, and we estimate that similar performance would be obtained for smoke agglomerates with up to 3 x 10(exp 3) primary spheres per agglomerate.

Report on USDA Ultraviolet Spectroradiometers.
E. A. Early, and A. Thompson. Jul 96, 36p, NISTIR-5871.

Keywords: *Spectroradiometers, *Ultraviolet spectroradiometers, Radiometers, Linearity, Responsivity, Slit-scatter, Stray-light, Wavelength.

Two ultraviolet spectroradiometers manufactured by Research Support Instruments, Inc., and the Atmospheric Science Research Center for the U.S. Department of Agriculture monitoring network were characterized. From measurements of the linearity of the instruments, the dead time of the photon counting system was approximately 12 ns. From spectral scans of the emission lines of a Hg lamp, the wavelength precision of the instrument of 0.02 nm, while the accuracy is 0.04 nm. Spectral scans of the 325 nm line of a HeCd laser showed that the bandwidth of the instruments is 0.3 nm and that the monochromators have a stray light rejection of 10 to the minus 8 power. The spectral irradiance responsivity, determined with FEL-type irradiance standards lamps, changes both with movement of the instruments and with time.

Extreme Wind Distribution Tails: A 'Peaks Over Threshold' Approach.
Building science series.
E. Simiu, and N. A. Heckert. Mar 95, 80p.
Also available from Supt. of Docs. Prepared in cooperation with Johns Hopkins Univ., Baltimore, MD. Dept. of Civil Engineering. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *Wind velocity, *Extreme value problems, Wind effects, Wind pressure, Wind loads, Dynamic Loads, Winds, Structural engineering, Statistical analysis, Weibull distribution, Graphs(Charts), *Peaks over threshold methods, Load factors, Extreme winds, Probabilistic models.

The authors seek to ascertain whether the reverse Weibull distribution is an appropriate extreme wind speed model by performing statistical analyses based on the 'peaks over threshold' approach. The data are taken principally from records of the largest daily wind speeds obtained over periods of 15 to 26 years at 44 U.S. weather stations in areas not subjected to mature hurricane winds. From these records the authors create samples with reduced mutual correlation among the data. In our opinion, the analyses provide persuasive evidence that extreme wind speeds' are described predominantly by reverse Weibull distributions, which unlike the Gumbel distribution have finite upper tail and lead to reasonable estimates of wind load factors. Instructions are provided for accessing the data and attendant programs.

Intended for public comment and discussion, this document is the second volume of papers in which the Information Infrastructure Task Force has attempted to articulate in clear terms, with sufficient detail, how improvements in the National Information Infrastructure (NII) can help meet other social goals. These are not plans to be enacted, but the material with which the citizens and their government may have a structured conversation, a purposeful interaction, and deliberation on the issues raised in the evolution of more capable means of information processing and human communications. Eight papers are presented in this volume: (1) NII: An Investment in People with Disabilities; (2) Supply and Demand of Electric Power and the NII; (3) Improving Transportation: The NII and Intelligent Transportation Systems; (4) Promoting Telecommuting: An Application of the NII; (5) The Effect of NII on Local, State, and Federal Emergency Management; (6) Public Empowerment with Environmental Information; (7) Arts, Humanities, and Culture on the NII; and (8) Public Safety and the NII: Supporting Law Enforcement and Criminal Justice. Six of the papers include references. (BBM).

Investing in Education to Meet a National Need for a Technical-Professional Workforce in a Post-Industrial Economy.
Final rept.
D. A. Swyt. 1990, 10p.
Pub. in Keynote Paper NATO Advanced Research Conference, Eindhoven, Netherlands, October 9-12, 1990.

Keywords: *Education, *Fixed investment, *Labor force, Technology, Productivity, Economy, United States, Reprints.

Workforce data show that the U.S. is shifting from blue-collar production to technical-professional service as the basis of its post-industrial economy. The lesson of increased effectiveness with increased capital per person has not been lost on U.S. service industries which have for the last decade lead the U.S. economy in capital spending. In contrast, what may be the most important service industry -- basic public education -- has undergone a steep fifteen-year-long decline in its growth in capital investment per student. This suggests that means to focus on capital spending in basic education, such as instituting capital-equipment budgets, are in order.

Established in the Spring of 1984, the Montgomery Education Connection (MEC) is a non-profit public-private partnership formed specifically to link Montegomery County Public Schools and the county's employers. The mission is simply to share private sector resources to improve the education of our children and future employees. The objectives of the organization are to identify the school system needs, to identify community resources to meet those needs, and to identify business needs to which the school system can respond. The Resource Educational Awareness partnership (REAP) is the NIST in-house program that works with the MEC. The goal is to share NIST resources through presenters who visit the schools, through science kits and materials to loan, and through lab visits and special activities.

Pub. in Case-Based Reasoning Papers from the 1993 Workshop, Washington, DC., July 11-12, 1993, p41-47.

Keywords: *Litigation, *Information retrieval, Lawsuits, Comparisons, Knowledge representation, Information systems, Integrated systems, Reprints, *Case-based reasoning, Case indexing, Case representation, Case retrieval, Multi-layer systems.

This paper presents a multi-layered case representation for addressing the problem of comparing and indexing cases in a case-based reasoning system using both the facts and the underlying themes associated with those cases. In many domains, experts discuss problems in terms of multiple layers of abstract principles, classifying problems by conflicts, strategies, or themes important to the domain. Representing the case as a single flat frame does not support reasoning about the underlying themes in the case because it does not represent interconnections among the facts and themes of the case. Instead, a case-based reasoner should use a multi-layered representation including both these facts and interconnections.This representation has implications for much of the case-based reasoning process including case comparison, selection and retrieval mechanisms. The paper will describe the CHASER case-based reasoning system which uses a multi-layered case representation approach to reason about tort law cases.

Consensus Process in Standards Development.
Final rept.
B. L. Collins. 1995, 17p.
Sponsored by National Center for Education Statistics, Washington, DC.
Pub. in Proceedings of Joint Conference on Standard Setting for Large-Scale Assessments, Washington, DC., October 5-7, 1994, v2 p203-219 Oct 95.

Keywords: *Education, *Standards, *Agreements, Procedures, Requirements, Process control, Product development, Systems engineering, Ouality assurance, ISO, Reprints, US NIST, American National Standards Institute.

The American National Standards Institute (ANSI), all major standards developers in the United States, the National Institute of Standards and Technology (NIST), and the International Organization for Standardization (ISO) have each defined procedures for developing consensus. Although these procedures are generally applied to the development of product and process standards to ensure quality, safety, health, and/or environmental integrity, they may provide a useful model for evaluating the effectiveness of procedures and standards developed in the field of education. The general consensus process is described with particular focus on relevance for developing standards for education.

Proposed International Interactive Courseware Standard.
Final rept.
W. F. Thode, L. A. Welsch, J. Keck, and S. Lewis. 1991, 10p.
Pub. in International Training Equipment Conference (ITEC) (2nd), Maastricht, Netherlands, April 15-17, 1991, 10p.

Keywords: *Video recording, *Training aids, *Standards, *Computer assisted instruction, Teaching

methods, Computer programs, Computer graphics, Military training, Interoperability, Interactive systems, Man computer interface, Reprints.

Millions of dollars are invested in the development of interactive courseware training to be delivered by microcomputer-based training systems, often with interactive video included. Significant development and delivery costs can be avoided if new interactive courseware materials can be made to operate on multiple delivery platforms. A standard that uses a virtual device interface is a flexible approach to interactive courseware portability. The US Department of Defense is adopting this standard as a requirement for future purchases of interactive courseware by the uniformed services. The interface is also under study by the US National Institute for Standards and Technology as a potential component of a general multimedia courseware architecture.

Influence of Tempering Method on Residual Stress in Dental Porcelain.
Final rept.
K. Asaoka, N. Kuwayama, and J. Tesk. 1992, 5p.

Keywords: *Dental materials, *Residual stress, *Porcelain, Thermophysical properties, Cooling curves, Computer simulation, Metal strips, Reprints.

The porcelain component of a porcelain-fused-to-metal restoration is strengthened by residual (tempering) stresses which are induced by cooling procedures followed in dental laboratories. The thermophysical properties of materials and cooling rate are the main factors which determine the residual stress. In this paper, the temperatures in the midplane of body-porcelain disks were measured from a heat-soak temperature (1000 C) to room temperature during two different cooling procedures: slow cooling in air and forced-air cooling. Experimental results approximated exponential cooling wherein the cooling rates could be represented by a linear equation of temperature. Residual stresses, as affected by the tempering method and thickness of a porcelain disk, were calculated by computer simulation for regions away from the edges. The cooling rate dependencies of the glass transition temperature and the temperature distribution during cooling were also included. The cooling rates used in this simulation were derived from the tempering data.

Adsorption of Low-Molecular-Weight Sodium Polyacrylate on Hydroxyapatite.
Final rept.
D. N. Misra. Oct 93, 5p.
Pub. in Jnl. of Dental Research 71, n10 p1418-1422 Oct 93. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Molecular weight, *Polyacrylates, *Hydroxyapatites, *Adsorption, *Dental cements, Minerals, Electrostatics, Osmolar concentration, Phosphates, Teeth, Isotherms, Reprints.

Adsorption of low-molecular-weight sodium polyacrylate from aqueous solution onto synthetic hydroxyapatite was studied at room temperature so that the mechanism of adhesion of polyacrylate cements to tooth mineral could be elucidated. The adsorption isotherm of sodium polyacrylate was Langmuirian in shape and was thus qualitatively different from that of polyacrylic acid (Misra, 1991), which exhibited an adsorption maximum. The self-association of the molecules that probably causes the maximum to occur with polyacrylic acid was effectively absent for the relatively well-ionized, electrostatically repelling polyacrylate ions of the salt. With the adsorption of acrylate ions, the concentration of phosphate ions increased monotonically, while the concentration of calcium ions showed a minimum. The adsorption of sodium polycrylate was irreversible, as it was for polyacrylic acid.

Interaction of Some Coupling Agents and Organic Compounds with Hydroxyapatite: Hydrogen Bonding, Adsorption and Adhesion.
Final rept.
D. N. Misra. 1994, 13p.
Pub. in Jnl. of Adhesion Science and Technology, v8 n2 p87-99 1994. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Hydroxyapatites, *Adsorption, *Hydrogen bonding, *Organic compounds, *Adhesion, *Dental materials, Solutions, Cross-linking reagents, Bone cements, Dental cements, Osmolar concentration, Reprints.

Adhesion to hydroxyapatite (which is the structural prototype of bone or tooth mineral) is a first step towards the efficacious application of restorative composites and bone cements to teeth and bones. The key medium to effect chemical adhesion between the mineralized substrate and a composite resin is a coupling agent. On the basis of many adsorption studies, primarily by the author, which are reviewed in this paper, it is proposed that a potential coupling agent suitable for dental adhesion can develop strong and durable bonds with a substrate through its hydrogen-bonding functional groups. The coupling agents must also be polyfunctional or possess some hydrophobic moieties to be hydrolytically stable. The criterion defining the capability for adhesion of a compound to hydroxyapatite is determined through a study of its adsorption characteristics from a particular solvent. The stability of this bond in aqueous environments may be determined by desorbing the adsorbed compound with water. The surface orientation of a coupling agent and whether it is reversibly or irreversibly adsorbed from a solvent primarily depend on the balance between the type, location, and number of hydrophilic and hydrophobic moieties in the agent molecule. In the case of water-soluble ionic compounds as coupling agents, the uptake of the compounds will also be influenced by the concentrations of calcium, phosphate, and hydrogen ions in the solution.

The study examined the effect of three additives, amine, peroxide and stabilizer, in two concentrations in a metal primer on the adhesion between a cast metal alloy and a resin composite using a 23 factorial statistical design. The additives, benzoylperoxide (BPO) used at 1% or 2% w/w and N,N-dimethyl-p-toluidine (DMPT) at 0.5% or 1.8% w/w, are polymerization initiators. The third additive, butylated hydroxytoluene (BHT) at 0.01% or 0.03% w/w, is used as a stabilizer. BPO and BHT were dissolved in an acetone solution containing 20% of the adhesive resin pyromellitic glyceroldimethacrylate (PMGDM). DMPT was in a separate acetone solution. Bonding resin and composite were applied over the primer and stored overnight in water. Bond strengths were determined by shearing the composite from the metal at a cross head speed of 0.5 mm/min.

Pub. in Kirk-Othmer Encyclopedia of Chemical Technology, (Fourth Edition), v7 p946-1022 1993.

Keywords: *Dental materials, *Equipment and supplies, Dentistry, Composites, Porcelain, Metals, Glasses, Ceramics, Alloys, Polymers, Dental cements, Temporary dental restoration, Permanent dental restoration, Cost analysis, Reprints.

Dental therapy includes the replacement of hard and soft oral tissues lost through disease using inert materials that may be metallic, ceramic, or organic, or composites employing combinations of these three classes. The operative restorations and prostheses are made of amalgam, precious and nonprecious alloys, special cements, synthetic polymers, porcelain, and glass-ceramics. All must withstand the rigors of the oral environment. The accessory materials needed in the fabrication procedures include synthetic polymers, synthetic and natural gums and waxes, hydrocolloids, gypsums, and refractories. The total value of dental supplies and equipment manufactured in the United States in 1992 is estimated at about $1.2 billion. These materials are used by about 170,000 practicing dentists (1992) and >8,500 commercial dental laboratories employing about 40-50,000 technicians. The dental materials market is limited because the public does not buy directly except for toothpastes, mouthwashes, tooth brushes, denture aids, etc.

Effect of Transformation of Alloy on Transient and Residual Stresses in a Porcelain-Metal Strip.
Final rept.
K. Asaoka, and J. A. Tesk. 1992, 6p.
Pub. in Residual Stresses - III, Science and Technology, v1 p626-631 1992.

Keywords: *Dental materials, *Phase transformations, *Alloys, *Stress analysis, *Computer simulation, *Composite materials, Thermal expansion, Residual stress, Porcelain, Metal strips, Ceramics, Transient loads, High strength, Reprints.

High strength dental alloys are usually strengthened by phase transformations which affect their coefficients of thermal expansion. These transformations can affect the stresses developed in porcelain-fused-to-metal (PFM) restorations. In order to aid the understanding of these effects, we conducted computer simulations of stresses developed in a PFM strip. Pd alloys were chosen as Pd-based alloys form the basis for some major alternatives to high cost gold alloys, yet can maintain many of the desirable characteristics. The Pd-Cu alloy system which has a super lattice at 40.3 atomic % Cu displays a typical first-order transformation feature. The transient stresses in the porcelains and alloy thermal contraction and curvature of a PFM beam were computed for cooling from a heat soak temperature to room temperature. The residual stress distribution in the composite was also computed. Effects of the transformation of the alloy on transient and residual stresses were revealed from the results of the simulations.

F. C. Eichmiller. 1993, 3p.
Pub. in Jnl. of Indiana Dental Association 72, n5 p22-24 1993. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Dental materials, *Adhesive bonding, *Dentistry, *Polymers, Dentin, Monomers, Acids, Surfaces, Reprints, Restorative materials.

The newer generation of dentin adhesives has changed the practice of restorative dentistry. Two features common to most of the bonding restorative materials are the ability to alter, through the use of acidic etching agents, the surface of the dentin and the ability to completely wet and re-infiltrate the altered dentin surface with a hydrophilic polymerizable monomer. The acidic etchants remove or break up the smear layer, partially demineralize and/or alter the mineral in the first few microns of the dentin surface, and expose the collagen fibril network. The hydrophilic adhesive monomers that contain both acidic and methacrylate groups on the same molecule are bifunctional in nature. These monomers are able to infiltrate the demineralized dentin due to their hydrophilic nature and polymerize to encapsulate the exposed collagen fibers. Available products can be divided into two broad categories: systems that contain a low concentration of adhesive monomer diluted in a volatile solvent and systems that use adhesive resins of moderate to high viscosity. Knowledge of the features and properties of dentin adhesives provides the needed rationale for the protocol of application and the proper choice of materials in restorative dentistry.

Selective Inhibition of Crystal Growth on Octacalcium Phosphate and Nonstoichiometric Hydroxyapatite by Pyrophosphate at Physiological Concentration.
Final rept.
N. Eidelman, W. E. Brown, and J. L. Meyer. 1991, 10p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Crystal Growth 113, p643-652 1991.

Keywords: *Calcium phosphates, *Pyrophosphates, *Crystal growth, *Inhibitors, Apatites, Hydroxy compounds, Dental materials, Reprints, Hydroxyapatite, Biominerals.

Octacalcium phosphate, Ca8H2(PO4)6(dot)5H2O (OCP), appears to be a precursor in biomineral formation. The formation of OCP as the precursor is supported by the observation that stoichiometric hydroxyapatite, Ca5(PO4)3OH (OHAp), cannot form directly because of the presence of its growth inhibitors in serum. Therefore, the effects of the physiological concentration of pyrophosphate (P2O7(4-)), one of the most important calcium phosphate growth inhibitors in blood, on calcium phosphate growth rates on OCP and nonstoichiometric OHAp (apatite) seeds were measured. The amounts of seed crystals used to initiate the growth were adjusted by trial and error so that the control growth rates (in the absence of P2O7(4-)) were the same on both OCP and apatite seeds at a given supersaturation. The crystal growth on both kinds of seed crystals from supersaturated solutions in the presence of I microM P2O7(4-) added once ('one-time' addition) at constant pH (7.4) and 25 C was determined by KOH titration and decreases in Ca and PO4 concentrations in the solutions. Crystal growth on OCP seed crystals in the presence of a constant concentration of I microM P2O7(4-) was measured. The results of this study show that: (1) P2O7(4-) ions inhibited the growth on the apatite seeds more than on the OCP seeds; (2) apparently OCP precipitated on both types of seeds, followed by its hydrolysis to a more apatite-like phase; (3) slower crystal growth was observed on OCP seeds in the presence of a constant physiological concentration of P2O7(4-) (I microM) than in the 'one-time' addition of P2O7(4-).

Periapical Tissue Reactions to a Calcium Phosphate Cement in the Teeth of Monkeys.
Final rept.
Y. C. Hong, J. T. Wang, C. Y. Hong, W. E. Brown, and L. C. Chow. 1991, 14p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Biomedical Materials Research 25, p485-498 1991.

Keywords: *Dental materials, *Calcium phosphates, *Biocompatible materials, *Biological effects, *Root canal filling materials, Laboratory animals, Monkeys, Tissues(Biology), Dental pulp cavity, Comparison, Performance evaluation, Reprints, Grossman sealer, Sargenti N2.

A calcium phosphate cement, Grossman sealer, and Sargenti N2 were compared under conditions where root canals of monkey incisors were deliberately overfilled and the apical tissue responses were evaluated histologically. The periapical tissues exposed to Sargenti N2 revealed severe irritation at all times through the 6-month experimental period. The reactions to Grossman sealer were milder but persisted throughout the observation period. The calcium-phosphate-cement treated animals showed mild tissue irritation after 1 month, but thereafter the adverse tissue reactions were minimal. The compatibility of calcium phosphate cement with the periapical tissue suggests that the cement may have other applications in dentistry and medicine.

Effect of Three Sterilization Techniques on Finger Pluggers.
Final rept.
W. D. Luper, F. C. Eichmiller, W. Doblecki, D. Campbell, and S. H. Li. 1991, 4p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Endodontics 17, n8 p361-364 Aug 91.

Keywords: *Sterilization, Dental materials, Fatigue(Materials), Fracture(Materials), Autoclaving, Heat, Steam, Reprints, *Finger pluggers.

The effects of different sterilization methods on fatigue life of finger pluggers was investigated. Four sizes (A, B, C, D) of finger pluggers were subjected to 1, 8, or 15 cycles of steam autoclave, dry heat, or bead sterilization. Controls were not sterilized. Finger pluggers were subjected to cyclic bending until fracture. Only the autoclave 8-cycles subgroup of the A finger pluggers had a significantly lower number of cycles to failure compared to controls. The following subgroups had significantly greater cycles before failure when compared to their controls: autoclave 15-, bead 1-, and bead 15-cycles subgroups of B finger pluggers; autoclave 1-, 8-, and 15-, dry heat 1-, and bead 15-cycles subgroups of C finger pluggers; and the bead 15-cycles subgroup of D finger pluggers. The others were not different. Since all but one sterilized group had cyclic lifetimes that were not significantly shorter than nonsterilized controls, clinicians can generally use any of the 3 sterilization methods without a detrimental effect on fatigue life of finger pluggers.

Keywords: *Dental materials, *Dentistry, *Technology innovation, Adhesion, Dental cements, Dentin, Dental enamel, Licenses, Protective coatings, Calcium phosphates, Composite resins, Reprints, *Paffenbarger Research Center, National Institute of Standards and Technology.

Science Research (CEMSR) and Paffenbarger Research Center (PRC) at the National Institute of Standards and Technology (NIST) has been in the forefront of transferring new and improved dental technologies to the profession since 1928. The list of PRC/NIST innovations is long and impressive. During the past five years, dentistry has seen the commercialization of a PRC adhesion system for bonding composites to dentin and enamel simultaneously and glass-ceramic inserts that improve the properties of composite restorations. Licenses are currently being negotiated with dental manufacturers for a variety of other products based on American Dental Association Health Foundation (ADAHF) patents. Current research includes the further development of calcium phosphate cements for various dental and medical applications; resins that exhibit minimal dimensional change on hardening; protective coatings for dentin, as well as enamel; and synthetic dentin.

Keywords: *Crystal structure, *Calcium phosphates, *Pyrophosphates, *Potassium phosphates, Dental materials, Layers, X-ray diffraction, Reprints.

The crystal structure of Ca2KH3(P2O7)2 3H20 has been determined by single crystal X-ray diffraction. Crystals are monoclinic, space group P2(sub 1)/n with a = 10.518(3), b = 19.253(9), c = 7.340(3)A, Beta = 90.07(2) deg, and Z = 4. The structure was refined to R = 0.048 and R(sub w) = 0.044 for 1,839 reflections with I > than or = 3 sigma(I). The structure consists of a compact assembly of Ca, K, HP2O7, and H2P2O7 ions and three water molecules arranged in layers perpendicular to the b-axis. The two independent Ca ions and the HP2O7 ion comprise one layer; K and H2P2O7 ions and the three water molecules form an interstitial layer. Coordinations of the two independent Ca ions are quite similar, but the environments of HP2O7 and H2P2O7 ions are quite different, probably due to their locations in different layers. The general structural features are quite similar to those of Ca(NH4)HP2O7.

Crystal Structure of Calcium Adipate Monohydrate.
Final rept.
M. Mathew, S. Takagi, and H. L. Ammon. 1993, 5p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Crystallographic and Spectroscopic Research 23, n8 p617-621 1993.

Keywords: *Crystal structure, Dental materials, X-ray diffraction, Polymers, Chemical bonds, Layers, Monocrystals, Hydrates, Least squares method, Reprints, *Calcium adipate monohydrate, *Calcium dicarboxylate.

The crystal structure of calcium adipate monohydrate, Ca(C6H8O4) (H2O), has been determined by single crystal X-ray diffraction study. The structure was refined by full-matrix least-squares techniques to R = 0.040, R(sub w) = 0.058 for 1,283 reflections with I > or = 3 sigma(I). Ca is coordinated to seven oxygen atoms and the coordination polyhedron is best described as pentagonal bipyramid. The coordinations of the two carboxylate groups in adipate ion are quite different. One carboxylate group binds three different Ca ions forming a four-membered chelate ring with one Ca ion and unidentate bridge bonds to two other Ca ions. The other carboxylate group links to two Ca ions through unidentate bonds. The structure is highly polymeric, but with a layer-type structure parallel to (001) with the hydrocarbon chains sandwiched between the polar regions consisting of Ca, carboxylate and water molecules.

Evaluation of Fracture Toughness and Residual Stress in Dental Porcelain by Indentation-Microfracture Method.
Final rept.
K. Asaoka, J. A. Tesk, and J. R. Kelly. 1994, 6p.
Pub. in International Conference on Residual Stresses (4th), Baltimore, MD., June 8-10, 1994, p854-859.

Keywords: *Dental materials, *Porcelain, *Residual stress, *Fracture strength, Surfaces, Toughness, Study estimates, Crack propagation, Reprints, *Indentation-microfracture method.

The indentation-microfracture (IM) method was applied to estimate both the fracture toughness, K(sub Ic), and residual stress in the surface of 2.0 x 10.0 mm disks of two dental porcelains (A and B) that were either slowly cooled or tempered by two different treatments. The shape parameter, m, for Weibull plots of the K(sub Ic)'s that were measured by IM method, was calculated to be within the range of 7.1 to 9.1 for the slowly cooled specimens. Tempering had no significant effect on the Weibull shape parameters. The surface residual stresses for porcelain A were estimated to be 26-28 and 64-88 MPa in compression for specimens cooled in ambient air and with forced air, respectively, as calculated from the median/radial crack length after indentation. The estimated residual stresses were in good agreement with the results of computer simulations by Asaoka et al. It was concluded that the IM method can be applied for measurement of the fracture toughness and residual stress in the near surface region (100-400 micrometers deep) for dental metal-ceramic porcelains that have a micro structure that is unaffected by cooling rate.

Image Information Transfer Properties of X-Ray Intensifying Screens in the Energy Range from 17 to 320 keV.
Final rept.
A. Ginzburg, and C. E. Dick. 1993, 9p.
Pub. in Medical Physics 20, n4 p1013-1021 Jul/Aug 93.

Keywords: *Biomedical radiography, *Fluorescent screens, *X-ray fluorescence, KeV range 10-100, KeV range 100-1000, X-ray absorption, Image intensifiers, Quantum efficiency, Calcium tungstates, Rare earths, Phosphors, Reprints.

The image information transfer properties of a number of x-ray fluorescent screens have been measured for x-ray energies from 17 to 320 keV. The detective quantum efficiency of the screens at each x-ray energy has been determined by separate measurements of the x-ray absorption efficiency and the statistical factor associated with the emission of optical photons upon absorption of an incident x ray. Data have been recorded for both rare-earth phosphor screens and calcium tungstate screens. The value of the statistical factor for optical photon emission tends toward a constant value as the incident energy increases. Comparisons of the image information transfer properties are presented for several screens, which have been measured over a ten year interval. The utility of the screens for high-energy radiography is discussed.

Pub. in Dental Materials 8, p278-282 Jul 92.

Keywords: *Dentin, *Dental materials, *Surfactants, *Chemical bonds, Polymerization, Monomers, Feasibility studies, Reprints, *Pyromellitic dianhydride, *Methacrylate/hydroxyethyl, Chemical reaction mechanisms.

Effective dentin bonding systems based on para-PMDM diadduct of pyromellitic dianhydride and 2-hydroxyethyl methacrylate (HEMA) have been developed. Para-PMDM, a solid of limited solubility, is usually applied from an acetone solution to dentin that has been preconditioned with acid and N-phenylglycine. The feasibility of using a liquid, surface-active bonding resin to substitute for or to supplement para-PMDM was explored. The results suggest that solutions based on Mono(2-methacryloyloxy)ethyl phthalate (MMEP) and/or para-PMDM in acetone or in other monomers, especially those containing HEMA, can effectively promote bonding to dentin. A new mechanism for the observed self-polymerization of MMEP or para-PMDM with N-phenylglycine is proposed.

Effects of Calcium Phosphate Solutions on Dentin Permeability.
Final rept.
M. S. Tung, H. J. Bowen, G. Derkson, and D. H. Pashley. 1993, 5p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Endodontics 19, n8 p383-387 Aug 93.

Keywords: *Calcium phosphates, *Dentin permeability, *Dental materials, Precipitation(Chemistry), pH, X-ray diffraction, Scanning electron microscopy, Solutions, Kinetics, Reprints, *Dental tubules.

Calcium phosphate solutions at various concentrations and pH levels were used to obstruct the dental tubules. The effects were evaluated by measurements of permeability through dentin discs and by scanning electron microscopy. Precipitation kinetics were followed by pH changes in the solutions and products were determined by X-ray powder diffraction. The solutions were applied in two ways: (a) calcium and phosphate solutions were mixed before application and (b) one solution (calcium or phosphate) was applied first followed by the other solution.

Modified Surface-Active Monomers for Adhesive Bonding to Dentin.
Final rept.
S. Venz, and B. Dickens. 1993, 5p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Dental Research 72, n3 p582-586 Mar 93.

Keywords: *Adhesive bonding, *Dentin, *Monomers, *Adhesives, Performance evaluation, Reliability, Curing, Synthesis(Chemistry), Surface properties, Reprints, *PMGDM, PMDM, Pyromellitic dianhydride, Glycerol dimethacrylate.

PMGDM, a PMDM-type adhesive monomer, was synthesized from pyromellitic dianhydride and glycerol dimethacrylate. Only the para isomer of PMDM, a solid, is used in dental adhesives. The adhesive monomer PMGDM is a liquid and consists of a mixture of para- and meta isomers. This study shows that PMGDM has several advantages over PMDM. The adhesive bonds were tested in both shear and tensile modes. PMDM was used as the control. The reliability of the bonds, as judged from the Weibull modulus and Weibull characteristic strength, was improved by (1) use of more concentrated solutions of PMGDM adhesive, (2) use of an adhesive thickness of about 25 micrometers and (3) modification of PMGDM with a diluent monomer which is expected to enhance the degree of cure and/or the dentin-wetting properties of the adhesive resin.

Evaluation of Fracture Toughness and Residual Stress in Dental Porcelain by Indentation-Microfracture Method.
Final rept.
K. Asaoka, J. A. Tesk, and J. R. Kelly. 1994, 6p.
Pub. in Proceedings of International Conference on Residual Stresses (4th), Baltimore, MD., June 8-10, 1994, p854-859.

Keywords: *Dental materials, *Residual stress, *Porcelain, *Fracture strength, *Surfaces, Study estimates, Microstructure, Computerized simulation, Crack propagation, Reprints, *Indentation-microfracture method.

The indentation-microfracture (IM) method was applied to estimate both the fracture toughness, K(sub Ic) and residual stress in the surface of 2.0 x 10.0 mm disks of two dental porcelains (A and B) that were either slowly cooled or tempered by two different treatments. The shape parameter, m, for Weibull plots of the K(sub Ic)'s that were measured by IM method, was calculated to be within the range of 7.1 to 9.1 for the slowly cooled specimens. Tempering had no significant effect on the Weibull shape parameters. The surface residual stresses for porcelain A were estimated to be 26-28 and 64-88 MPa in compression for specimens cooled in ambient air and with forced air, respectively, as calculated from the median/radial crack length after indentation. The estimated residual stress were in good agreement with the results of computer simulations by Asaoka et al. It was concluded that the IM method can be applied for measurement of the fracture toughness and residual stress in the near surface region (100-400 micrometers deep) for dental metal-ceramic porcelains that have a micro structure that is unaffected by cooling rate.

Wear of Human Enamel against a Commercial Castable Ceramic Restorative Material.
Final rept.
D. S. Palmer, M. T. Barco, G. B. Pelleu, and J. E. McKinney. 1991, 4p.
Pub. in Jnl. of Prosthetic Dentistry 65, n2 p192-195 Feb 91.

Keywords: *Dental enamel, *Wear tests, *Ceramics, *Dental restoration, *Dental materials, Comparison, Casting, Porcelain, Reprints.

This study determined the effect of castable ceramic, with and without shading porcelain applied, on enamel wear. The wear produced by conventional dental porcelain was used as a control. Cusp tips from extracted human third molars were precision-machined into cones of enamel approximately 1 mm long. Three groups of nine cones each were abraded against rotating disks of (1) castable ceramic with shading porcelain, (2) castable ceramic without shading porcelain, and (3) conventional dental porcelain. Enamel wear was calculated from microscopic measurements of the enamel cones before and after abrading. Significant differences were found between castable ceramic with and without shading porcelain and between conventional dental porcelain and castable ceramic with shading porcelain ($p < 0.001$ ANOVA and 0.05 Scheffe's test). These findings suggest that castable ceramic with shading porcelain should not be used in regions that will function against opposing natural teeth.

Ring-Opening Dental Resin Systems Based on Cyclic Acetals.
Final rept.
B. Reed, J. Stansbury, and J. Antonucci. 1994, 7p.
Pub. in Polymers of Biological and Biomedical Significance, Chapter 15, p184-190 1994.

Keywords: *Dental materials, *Polymerization, *Monomers, *Cyclic compounds, *Acetals, Free radicals, Mechanical properties, Resin matrix composites, Molecular structure, Reprints.

For monomers of comparable size, ring-opening polymerization results in less shrinkage than that which accompanies 1,2-vinyl addition polymerization. Two monomer types were synthesized, nonvinyl (NVCA) and vinyl (VCA) cyclic acetals. The goals of this study were to assess the potential for reduced shrinkage through free radical ring-opening polymerization of NVCA and VCA type monomers, and to test the mechanical strength of dental resin composites formulated with these novel monomers. Homo- and copolymerizations were conducted with several NVCAs and VCAs to evaluate their potential as comonomers in dental polymeric composites. Composite specimens were formulated with PBMD, a VCA derived from terephthaldehyde, and EBPADM, an ethoxylated bisphenol A dimethacrylate, and tested for their mechanical strength.

Pub. in Jnl. of Molecular Liquids 56, p237-243 1993.

Keywords: *Dental materials, *Calcium phosphates, *Solubility, *Ethanol, Mixtures, Dielectric properties, Born approximation, Reprints, *Dicalcium phosphate dihydrate.

Solubility values of dicalcium phosphate dihydrate were determined in 0, 7.86, 16.04, 24.53, and 33.38% by weight ethanol-water mixtures at 37 C. The decreased solubility of DCPD, expressed as solubility product (K(sub sp)), from pK(sub sp) = 6.69 at 0% ethanol to 8.91 at 33.38% ethanol, was mainly due to the decrease in the dielectric constant. The data were fitted to the simple Born equation as follows: pK(sub sp) - 6.69 = 575.2(1/epsilon - 0.0135).

J. W. Stansbury, and J. M. Antonucci. 1992, 4p.
Sponsored by National Inst. of Dental Research, Bethesda, MD.
Pub. in Dental Materials 8, p270-273 Jul 92.

Keywords: *Dental materials, *Monomers, *Polymerization, Mechanical properties, Free radicals, Synthesis(Chemistry), Cyclic compounds, Curing, Chemical bonds, Methacrylates, Reprints, *Methylene lactones, Methylene butyrolactone.

alpha-Methylene-gamma-butyrolactone (MBL), which can be described as the cyclic analog of methyl methacrylate, exhibits greater reactivity in free radical polymerizations than conventional methacrylate monomers. Unfilled resin formulations composed of Bis-GMA/MBL or Bis-GMA/TEGDMA/MBL were light-cured. The effect of the more reactive methylene lactone monomer on mechanical properties and the degree of conversion of the polymers was examined. The infrared absorption bands for the carbon-carbon double bonds of MBL and the methacrylate monomers are well resolved and allow the conversion of each component to be calculated individually. The synthesis and polymerization of several substituted methylene lactones was also studied.

Pub. in Dental Materials 10, p26-32 1994.

Keywords: *Calcium phosphate, *Dental cements, *Biocompatibility, In vitro analysis, Dental materials, Hardness, Physical properties, Blood plasma, Synthetic materials, Biochemistry, Performance evaluation, Reprints, Hydroxyapatite.

The purpose of the study was to gain a better understanding of the integration of calcium phosphate cement (CPC) implants in biological tissue. An invitro continuous flow system was employed to examine the protracted behavior of disc-shaped specimens of this bioactive material under sustained physiological-like solution conditions. The results suggest that under in vivo conditions, CPC implants would not dissolve in phyisological fluids. Carbonate hydroxyapatite (OHAp) coatings may form on the implants, which may enhance bonding of implants to bone by mechanically strengthening the interface between them.

Keywords: *Dental materials, *Ions, *Crystal structure, X ray diffraction, Hydration, Chemical analysis, Infrared spectroscopy, Reprints, *Octacalcium phosphate succinate, Octacalcium phosphate, Octacalcium phosphate carboxylates.

Octacalcium phosphate succinate, Ca8(HPO4)1.07(succ)0.93(PO4)4-6H2O (OCP-SUCC), has an approx 50% larger hydrated layer volume than that of its parent compound, octacalcium phosphate, Ca8(HPO4)2(PO4)4-5H2O (OCP). The incorporation of structurally excess ions in OCP-SUCC was established by chemical analysis, X-ray powder diffraction, and infrared spectroscopy. Both excess succinate and counter ammonium ions were found to incorporate in the hydrated layer of the OCP-SUCC structure; this incorporation caused a slight expansion in the alpha-axis of up to 3%. Removal of these excess ions resulted in contraction of the alpha-axis to near that of OCP-SUCC. OCP-SUCC and particularly other OCP-carboxylates (OCPCs) that have larger hydrated layer volumes have a potential to incorporate various molecules and ions; these OCPCs could serve as vehicles to facilitate slow release of these additives into aqueous solutions.

Pub. in Jnl. of Chemical Crystallography 24, n7 p437-440 1994.

Keywords: *Dental materials, *Crystal structure, Calcium compounds, X ray diffraction, Hydrates, Chemical bonds, Monocrystals, Polymers, Reprints, *Calcium succinate monohydrate, Calcium adipate monohydrate.

The crystal structure of calcium succinate monohydrate, Ca(C4H4O4)-H2O, has been determined by single crystal X-ray diffraction. The crystals are monoclinic. The structure was refined by full-matrix least-squares techniques to R = 0.027, R(sub w) = 0.040, for 829 reflections with I > or = 3 sigma(I). Ca is coordinated to seven oxygen atoms, and the coordination polyhedron is best described as a pentagonal bipyramid. One carboxylate group in the succinate ion is bonded to three different Ca ions, forming a four-membered chelate ring with one Ca ion and unidentate bridge bonds to two other Ca ions. The other carboxylate group is bonded to two Ca ions through unidentate bonds. The structure is highly polymeric. The general structural features are nearly identical to those of calcium adipate monohydrate.

Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Materials Research Society Symposia Proceedings, v350 p41-46 1994.

Keywords: *Intermetallic compounds, *Dental materials, *Ambient temperature, *Synthesis(Chemistry), Interfaces, Thin films, Binary systems(Materials), Melting points, Diffusion, Indium alloys, Silver alloys, Tin alloys, Reprints.

Room-temperature intermetallic compound formation occurs when one of the component metals has a very

low melting point or when two metals in close contact interdiffuse very rapidly. Compound formation at room temperature at the interface of superposed thin films has been observed in several instances, often in systems relating to electronic materials. The overall amount of compound produced in such configurations, however, is limited, due to the intrinsic limitations involved in the thin layer geometry. Bulk quantities of intermetallic can be produced at ambient temperature in solids by increasing the interface area between the components that interdiffuse rapidly. This condition can be achieved by having small size powder particles of one component coated with a layer of the second component. The very large interface area leads to rapid formation of bulk quantities of compounds even at ambient temperature. By appropriate control of the initial constituents and the coating parameters, it is possible to custom-prepare various intermetallic compounds present in binary systems such as silver-tin, gold-tin and silver-indium in which fast interdiffusion takes place.

Keywords: *Ethanol, *Dental materials, *Solubility, Physicochemical properties, Aqueous solutions, Calcium phosphates, Reprints, *Apatite/hydroxy.

Hydroxyapatite (HA), Ca5(PO4)3OH, is the prototype of the inorganic constituent found in tooth and bone. Its physico-chemical properties have wide biological and industrial importance. Hence, its solubility in aqueous solutions has been extensively studied. Although ethanol has been known to increase the association constants of ionic compounds and decrease their solubilities, the effect of ethanol on the solubility of HA has not been studied. Recently, ethanol has been reported to affect the precipitation of HA and other calcium phosphates. This effect of ethanol may be due to the increase in precipitation rate or the effect on the solubility of HA or both. Therefore, the purpose of this study is to investigate the effect of ethanol on the solubility of HA.

The purpose of this study was to improve the handling and physical properties of a self-setting, water-based calcium phosphate cement by combining it with polymerizable resins and to study the setting reactions involved. Dual-cured composite cements were prepared from a calcium phosphate cement powder and dental monomers that contain carboxylated hydrophilic resins or resin/water mixtures. The hydrophilic acidic resins allows mixing with water and/or allow rapid diffusion of water into the resinous cement so that the dissolution and reprecipitation processes required for the conversion of the calcium phosphate components to hydroxyapatite can occur. The characteristics of the resulting composite cements suggest that the materials may be useful in pulp capping and/or cavity lining.

Keywords: *Dental cements, *Calcium phosphates, *Polymers, *Hydroxyapatites, X ray diffraction, Chemical reactions, Reprints, Apatite/hydroxy, Poly(maleic acid-ether/methyl vinyl), Tetracalcium phosphate, Dicalcium phosphate anhydrous.

Recently it was shown that the reaction of aqueous solutions of poly(alkenoic acids) with mixtures of tetracalcium phosphate (TTCP) and dicalcium phosphate anhydrous (DCPA) formed strong polymeric calcium phosphate cements. Surprisingly, x-ray diffraction (XRD) analysis of these cements, even after prolonged storage in water, failed to reveal the presence of hydroxyapatite (OHAp). In this study poly(methyl vinyl ether-maleic acid), (PMVE-Ma) was reacted with only TTCP to form polymeric calcium phosphate cements. TTCP samples ground for different lengths of time were used as the base powder. Grinding enhanced the reactivity of TTCP with PMVE-Ma and yielded cements with higher diametral tensile strengths than similar cements formulated with unground TTCP. XRD analysis of the ground TTCP/PMVE-Ma cements also showed the presence of significant amounts of OHAp.

Reduction of Marginal Gaps in Composite Restorations by Use of Glass-Ceramic Inserts.
Final rept.
L. A. George, N. D. Richards, and F. C. Eichmiller. 1995, 4p.
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Operative Dentistry 20, p151-154 1995.

Keywords: *Dental materials, *Inserts, *Composite materials, *Shrinkage, Glass, Ceramics, Polymerization, Monomers, Gaps, Teeth, Reprints.

The objective of this study was to evaluate the effects of glass-ceramic inserts on reducing the marginal gaps caused by polymerization shrinkage in composite restorations. A light microscope was used to measure the largest gap at margins around restorations made in glass cylinders and tooth cavities with and without adhesion promoters. Where the cylinder was not silanated, the average gap was less in samples containing an insert than in those without. Two preparations were made in the dentin of 20 human molars. In each molar one cavity was restored with a dentin bonding agent and composite and the other with a dentin bonding agent and an inserted seated in the composite. The average maximum gap width of restorations containing inserts was statistically less than for those with only composite (paired t-test, $P < 0.0001$). When considering the volume of composite displaced by the insert, these results indicate that the use of a glass-ceramic insert decreased the marginal gaps resulting from polymerization shrinkage.

Failure of All-Ceramic Fixed Partial Dentures 'In vitro' and 'In vivo': Analysis and Modeling.
Final rept.
J. R. Kelly, J. A. Tesk, and J. A. Sorensen. 1995, 6p.
Pub. in Jnl. of Dental Research, v74 n6 p1253-1258 1995.

Keywords: *Dental materials, *Failure analysis, In vitro analysis, Reprints, Prosthodontics.

Hertzian cone cracks visible at the loading site of 20 all-ceramic fixed partial dentures (FPDs), tested in vitro, led to the hypotheses that failure was due to the propagation of localized contact damage crack systems (Hertizian stress state) and that such damage was an unlikely clinical failure mode. Fractographic analysis of the 20 laboratory-failed and nine clinically-failed all-ceramic FPDs allowed for definitive testing of these hypotheses and a comparison between in vitro and in vivo failure behavior. In all cases, failure occurred in the FPD connectors (none from contact damage), with approximately 70 to 78% orginating from the interface between the core and veener ceramics. The coincidence between failure origins provides strong evidence that the in vitro test modeled aspects of structural behavior having clinical importance. The fractographic observations, coupled with the in vitro failure load data, furnished very specfic boundary conditions which were applied to constrain mathematical models of FPD connector failure. Finite element analysis (FEA) of the laboratory PPDs found that maximum principal tensile stresses would occur at locations consistent with the fractographic observations only if (1) there were appropriate elastic moduli differences between the ceramics; and (2) a small amount of abutment rotation was allowed. Weibull failure probability (Pf) calculations, incorporating FEA stress profiles, very closely replicate the veneer interface was much lower than that for the free veneer surface (i.e, the interface is of lower quality with regard to defects).

Pub. in Proceedings of American Ceramic Society, Bioceramics: Materials and Applications, Indianapolis, IN., April 24-28, 1994, v48 p157-172.

Keywords: *Dental materials, *Biocompatible materials, *Reconstruction, Ceramics, Porcelain, Glasses, Dental cements, Temporary dental restoration, Permanent dental restoration, Teeth, Reprints.

Properties of ceramics that make them appropriate for use in dental applications include compressive strength, durability, radiopacity, and inertness towards the oral environment. The principle dental use of ceramics is in the aesthetic restoration of missing teeth or tooth structure. Aesthetic dental ceramics are primarily manufactured from two classes of materials, beneficiated feldspathic minerals, and glass-ceramics. Processing restorations with feldspathic materials generally involves stacking powder-water slurries upon a metal framework and subsequent sintering. Glass-ceramics used in restorative parts involves the casting or forming of complex shapes that are then cerammed.

The setting time of a calcium phosphate cement consisting of tetracalcium phosphate (TTCP) and dicalcium phosphate anhydrous (DCPA) was reduced from 30 to 5 min by use of a cement liquid that contained a phosphate concentration of 0.25 mol/l or higher. The diametral tensile strength and conversion of the cement ingredients to hydroxyapatite (OHAp) during the first 3 h were also significantly increased by the phosphate. However, the phosphate produced no significant effects on the properties of the 24-h cement samples. Results from additional experiments in a slurry system verified that the high phosphate concentration in the solution accelerated the formation of OHAp in the TTCP-DCPA system, and this reaction could explain the fast-setting properties of the cements.

Reinforcement of Cancellous Bone Screws with Calcium Phosphate Cement.
Final rept.
L. E. Mermelstein, L. C. Chow, C. Friedman, and J. J. Crisco. 1996, 6p.
Pub. in Jnl. of Orthopaedic Trauma, v10 n1 p15-20 1996.

Keywords: *Cancellous bone, *Biomaterials, Reprints, *Calcium phosphate cement, *Screw fixation.

The ability of calcium phosphate cement (CPC) to reinforce cancellous screws placed in previously stripped holes was studied in vitro. The distal end of canine femurs were harvested. A total of fifteen screws were placed in six femurs. The pullout strength (failure force), failure displacement, stiffness and energy absorbed were determined for the screws in the intact cancellous bone. Next, these stripped screw holes were packed with CPC. The pullout test was repeated, and the results were compared using a paired, Student's t test. We found that the CPC was able to reinforce the previously stripped holes and significantly increase the pullout strength (1159 plus or minus 278 N vs. 678 plus or minus 297 N) and the stiffness (1,900 plus or minus 569 N/mm vs. 1,519 plus or minus 609 N/mm) of the constructs, as well as the energy absorbed by the constructs until failure (467 plus or minus 180 N/mm vs. 278 plus or minus 140 N mm). There was no difference in the failure displacement (0.94 plus or minus 0.23 vs. 0.85 plus or minus 0.51 mm). This study documents the ability of CPC to acutely reinforce cancellous bone screws in a region with no or poor quality cancellous bone.

Polymeric Calcium Phosphate Cements Derived from Poly(methyl vinyl ether-maleic acid).
Final rept.
Y. Matsuya, J. M. Antonucci, S. Matsuya, S. Takagi, and L. C. Chow. 1996, 6p.
Pub. in Dental Materials, v12 p2-7 Jan 96.

Keywords: *Dental materials, *Acid bonded reaction cements, *Polybasic organic acids, *Calcium phosphates, Cements, Reprints.

The purpose of this study was to assess the feasibility of forming polymeric calcium phosphate cements from a mixed powder of dicalcium phosphate/tetracalcium phosphate or only tetracalcium phosphate and poly(methyl vinyl ether-maleic acid) (PMVE-Ma), and to study their setting reaction. The setting reaction process of the polymeric cements was evaluated by mechanical strength tests, infrared spectroscopy and x-ray diffraction analysis and compared with that of a water-setting calcium phosphate cement. The machanical strength data were analyzed using ANOVA and Scheffe's multiple comparisons test.

Overview of Bioelectrical Impedance Analyzers.
Final rept.
N. M. Oldham. 1996, 8p.
See also PB96-122635.
Pub. in American Jnl. of Clinical Nutrition, v64 n3 p405S-412S Sep 96.

Keywords: *Bioinstrumentation, *Electrical impedance, *Body composition, Humans, Algorithms, Liquids, Bodywater, Physical fitness, Electrical measuring instruments, Reprints, *Bioelectrical impedance analyzers, Body fat.

Six commercial bioelectrical impedance analyzers were evaluated to determine their accuracy as impedance meters, their sensitivity to contact impedance, and other operating parameters such as maximum current amplitude and test waveform. Over a range of impedances that simulate human body impedance, analyzer errors varied from less than 1% to nearly 20%. Larger errors were observed when the contact impedance was at the limits of the operating range of the analyzer. Body models, sources of error, and several simple tests that the user can perform are also discussed.

Pub. in Conference of Analysis of Neural Network Applications, ANNA-91, Fairfax, VA., May 29-31, 1991, p160-175.

Keywords: *Character recognition, *Neural nets, Image processing, Feature extraction, Pattern recognition, Fonts, Accuracy, Reprints, Back propagation, Gabor functions.

A neural network architecture for size and local shape invariant digit recognition has been developed. The network is based on known biological data on the structure of vertebrate vision but is implemented using more conventional numerical methods for image feature extraction and pattern classification. The input receptor field structure of the network uses Gabor function feature selection. The classification section of the network uses back propagation. Using these features as neurode input, an implementation of back propagation on a serial machine achieved 100% accuracy when trained and tested on a single font size and style while classifying at a rate of 2ms per character.

Texture-Independent Vision-Based Closed-Loop Fuzzy Controllers for Navigation Tasks.
S. R. Kundur, and D. Raviv. Apr 95, 40p, NISTIR-5637.
Grant NSF-IRI-9115939
Prepared in cooperation with Florida Atlantic Univ., Boca Raton. Sponsored by National Science Foundation, Arlington, VA. Div. of Information, Robotics and Intelligent Systems.

Keywords: *Fuzzy logic, *Computer vision, *Controllers, *Autonomous navigation, Computerized simulation, Cameras, Image processing, Visual perception, Real time operations.

The paper deals with vision-based closed-loop control schemes for collision avoidance as well as maintenance of clearance in a-priori unknown textured environments. These control schemes are base on fuzzy logic and employ a visual motion cue, they call the Visual Threat Cue (VTC) that provides some measure for a relative change in range as well as clearance between 3D surface and a fixated observer in motion. It is a collective measure obtained directly from the raw data of gray level images, is independent of the 3D surface texture and needsno optical flow information, 3D reconstruction, segmentation, feature tracking or preprocessing. This motion cue is scale-independent, rotation independent and is measure in (time-1) units. Design of a closed-loop conventional controller for vision based navigation tasks pose a problem as the system is complex and ill-defined. On the other hand fuzzy control which is closer in spirit to human thinking and can implement linguistically expressed heuristic contrl policies directly without any knowledge about the dynamics of the complex process. The fuzzy controllers were tested in real time using a 486-based Personal Computer and a camera capable of undergoing 6-DOF motion. Results are highly encouraging.

Physicochemical Properties of Calcific Deposits Isolated from Porcine Bioprosthetic Heart Valves Removed from Patients Following 2-13 Years Function.
Final rept.
B. B. Tomazic, W. E. Brown, and F. J. Schoen. 1994, 13p.
Pub. in Jnl. of Biomedical Materials Research 28, p35-47 1994. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Calcium phosphates, *Heart valve prosthesis, *Prosthesis failure, *Chemical properties, *Physical properties, Humans, Mineralization, Fourier

transform infrared spectroscopy, Scanning electron microscopy, X-ray diffraction, Chemical analysis, Swine, Reprints.

The purpose of the study was to characterize the physicochemical properties of calcific deposits that cause the failure of tissue-derived heart valve bioprosthese. This was done in an effort to understand the mechanism of pathologic biomineralization in the cardiovascular system and potentially prevent deterioration of bioprosthese. Calcific deposits taken from 10 failed bioprosthetic valves that had been implanted in patients for 2-13 years were characterized by chemical analysis, x-ray diffraction, FTIR spectroscopy, scanning electron microscopy, polarized light microscopy, and solubility measurements. The combined results identified the biomineral as an apatitic calcium phosphate salt with substantial incorporation of sodium, magnesium and carbonate. The average Ca/PO4 ratio for this young pathologic biomineral was approximately 1.3, considerably lower than approximately 1.7 found in mature atherosclerotic plaque biomineral and mature skeletal biomineral, both of which approximate hydroxyapatite in composition. Deproteinated calcific deposits from bioprosthese had thermodynamic solubilities comparable to those of both atherosclerotic plaque, typical pathologic biomineral and hydrolyzed octacalcium phosphate, a proposed precursor phase to biomineral apatite. This suggests an approach toward prevention of bioprosthetic tissue calcification through control of the formation of the kinetically favored OCP precursor and/or its transformation into bioapatite.

F. C. Eichmiller, and E. E. Parry. 1994, 4p.
Pub. in Operative Dentistry 19, p7-10 1994. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Dental prosthesis design, Dental cements, Partial denture, Alignment, Pins, Reprints.

The design and fabrication of multi-unit fixed prostheses where abutment teeth are misaligned have been difficult technical challenges for dentists and dental technicians. There have been a number of methods developed to attain a common path of insertion, including modified preparation designs, telescopic copings placed on abutments to correct alignment, adhesively retained bridge frameworks, and mechanical precision attachments between sections of a segmented prosthesis. This paper describes a method of fabricating a precision attachment on a segmented prosthesis that can be rigidly fixed after cementation. The technique involves the use of a cast tapered pin to permanently attach the prosthesis segments together. All parts can be fabricated by conventional lost-wax techniques with a minimum of instrumentation. The technique has the added advantage of being reversible should the prosthesis ever need to be separated for repair or recementation.

Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Biomedical Materials Research 27, p217-225 1993.

Keywords: *Heart valve prosthesis, *Purification, *Mineralization, Extraction, X-ray diffraction, Crystallization, Calcification, Performance evaluation, Comparison, Reprints, *Hypochlorite treatment, *Deproteination, *Hydrazine treatment.

The quantitative deproteination of calcific deposits from surgically explanted heart valve bioprostheses was carried out by both hypochlorite and hydrazine extraction to establish which is better procedure for preparing purified mineral suitable for detailed chemical and structural characterization. Hypochlorite treatment resulted in a material with a higher Ca/PO4 ratio than that of the untreated deposits. The hydrazine treatment did not produce such an effect. A systematic comparison of x-ray diffraction patterns of calcific deposits showed an increase in crystallinity of hypochlorite-treated versus native material, while the crystallinity of hydrazine-treated materials did not change. The deproteination is preferable to hypochlorite extraction in isolating pathologic mineral deposits from bioprosthetic materials for further study.

This investigation was performed to provide a comprehensive physicochemical characterization of clacific deposits (CDs) that form on human heart valves under various pathological conditions. The authors examined and characterized CDs associated with aortic stenosis on congenitally bicuspid valves (n = 10), degenerative aortic stenosis on valves with previously normal anatomy (n = 10), an Rheumatic aortic (n = 10) and mitral (n = 10) stenosis. Native and deproteinated CDs underwent chemical analysis and structural characterization, whereas deproteinated CDs were measured for thermodynamic solubility. The CDs in valvular heart disease were microcrystalline apatitic products containing substantial amounts of sodium, magnesium, carbonate, fluoride, and organic fraction.

Pub. in Jnl. of Biomedical Materials Research 25, p1231-1248 1991.

Keywords: *Dental materials, *Composite materials, *Water, *Absorption, Moisture content, Sorption, Hydrogen bonds, Reprints, *Near infrared spectroscopy.

A near infrared (NIR) method using the 5200/cm absorption of water has been employed to examine water absorbed in photopolymerized dental resins and composites in the form of 0.01 cm- to 0.15 cm-thick specimens. Water sorption was determined gravimetrically and correlated to the absorbance in the NIR spectrum. The NIR absorptivity, epsilon, of water absorbed in a polymeric medium was found to be inversely related to the degree of hydrophilicity and hydrogen bonding capability of the polymer. The presence of water clusters in a polyethylene oxide methacrylate polymer was inferred from convex-up curvature in the plot of epsilon vs. water content.

Optical Density Measurements of Laser Eye Protection Materials.
Final rept.
T. R. Scott, R. J. Rockwell, and P. Batra. 1993, 10p.
Pub. in Proceedings of the International Laser Safety Conference, Cincinnati, OH., December 1-4, 1992, p8-7-8-16 1993.

Keywords: *Laser hazards, *Eye safety, *Optical density, Laser beams, Laser safety, Protective equipment, Optical filters, Optical properties, Vision, Configurations, Wavelengths, Reprints, *Protective eyewear, Eye protectors.

Various types of protective eyewear are available for use in shielding the user's eyes from the harmful effects of intense laser radiation. Proper protective eyewear is chosen by selecting materials whose inherent transmission characteristics are appropriate for the expected laser operating conditions (e.g. wavelength, power level, etc). For convenience, the transmittance values of protective eyewear are typically expressed in terms of optical density (i.e. the logarithm to the base 20 of the reciprocal of the transmittance) for specific laser wavelengths. These density values are usually stamped or printed on the eyewear assemblies. The paper describes the measurement methods and results of the optical density measurements performed on designated protective eyewear samples at several specific laser wavelengths. The measurement configurations and associated measurement error sources will also be reviewed.

Keywords: *Bays(Structural units), *Fire tests, *Computerized simulation, Warehouses, Smoke, Industrial buildings, Plumes, Hangars.

Large spaces, such as those found in warehouses, historical buildings, atriums, and aircraft hangars, represent some of the most difficult fire protection challenges since they are frequently of historical significance, contain large quantities of fuel, have unique geometries, and/or present special life safety problems. Accurate detector activation predictions are important in these large spaces, as timely detection of a fire is more difficult due to the distance heat and products of combustion must travel to reach sprinklers and detectors. The Building and Fire Research Laboratory (BFRL) was given the opportunity to make measurements during fire calibration tests of the heat detection system in an aircraft hangar with a nominal 30.4 m (100 ft) ceiling height near Dallas, TX. Three closed-door tests were conducted.

The paper presents the reconstruction of the Happyland Social Club fire using the HAZARD I fire hazard assessment method along with an examination of four potential mitigation strategies: automatic sprinklers, a door at the base of the stairway to the second floor, a second means of egress from the second floor, or a noncombustible interior finish. The paper concludes that the traditional second means of egress might have not eliminated the observed fatalities, and that the noncombustible interior finish or sprinkler options would, with the former being the more cost effective approach.

Keywords: *Office buildings, *Fires, Smoke, District of Columbia, Flames, Flashover, *Building fires, Pulaski building.

An analysis of an office building fire was made using fire modeling techniques. The data to conduct the analysis was obtained through on-site inspection and interviews. The analysis describes a rapid fire developing in easily ignited boxing materials that flashed over in about six minutes from flame initiation, causing failure of the ceiling system, venting of fire products in the plenum system above the ceiling, and rapid filling of the entire flow area with smoke. The report suggests a likely source of ignition and provides analysis of the impact that several fire protection systems would have had were they present at the time of the fire.

Evaluating Small Board and Care Homes: Sprinklered vs. Nonsprinklered Fire Protection.
S. Deal. Nov 93, 63p, NISTIR-5302.
Sponsored by Fire Administration, Emmitsburg, MD.

Keywords: *Fire safety, *Nursing homes, Evacuating(Transportation), Computerized simulation, Sprinklers, Egress, Fire hazards.

This report studied the effectiveness of sprinklered and nonsprinklered fire protection options in small Board and Care homes. The tools used to compare the effectiveness of these fire protection options were mathematical fire models, experimental data and documented fire incidents. The mathematical models estimated fire protection effectiveness through a margin of safety analysis. The margin of safety is defined in this report as the excess time an evacuee has to reach a point of safety before that evacuee's exit path becomes untenable. The margin of safety calculations considered fire growth, detection/alarm activation, evacuee egress movement and smoke tenability analysis. Two egress movement plans were simulated; one plan reflected necessary movement in a one-exit home, the second plan reflected movement in a two-exit home. Two fast-growing, large flashover fires (with high and low CO production rates) and a small, smoldering fire were modeled. Two sets of full-scale spinklered and post-flashover fire experiments, as well as 61 documented fire incidents were included in the study of fire protection system effectiveness.

System: IBM PC or compatible; MS DOS 3.0+ operating system. Language: FORTRAN and Assembly. Hardware requirements: 386 processor or later with 3 megabytes of RAM. Supersedes PB92-500420.
The software is available on three 3 1/2 inch diskettes, 1.44M high density.

Keywords: *Software, *Fire hazards, *Buildings, Fire damage, Fire losses, Injuries, Casualties, Fire safety, Fires, Evacuation, Building materials, Furniture, Diskettes, *Hazard assessment, HAZARD I computer program, Fire models.

A method for quantifying the hazards to occupants of buildings from fires, and the relative contribution of specific products (e.g., furniture, wire insulation) to those hazards is presented. The method, called HAZARD I, combines expert judgement and calculations to estimate the consequences of a specified fire. These procedures involve four steps: (1) defining the content, (2) defining the scenario, (3) calculating the hazard, and (4) evaluating the consequences. Steps 1, 2, and 4 are largely judgemental and depend on the expertise of the user. Step 3, which involves use of the extensive computer software, requires considerable expertise in fire safety practice. The heart of HAZARD I is a sequence of computer software procedures which calculate the development of hazardous conditions over time, calculate the time needed by building occupants to escape under those conditions, and estimate the resulting loss of life based on assumed occupant behavior and tenability criteria.

Pub. in Proceedings of Pacific Rim Conference on Building Officials, Honolulu, HI., April 9-13, 1989, p1-12.

Keywords: *Fire hazards, *Building codes, *Risk assessment, Fire safety, Safety engineering, Fire prevention, Fire damage, Fire losses, Buildings, Computerized simulation, Reprints, HAZARD I computer program, Hazard assessment.

The National Institute of Standards and Technology has developed a quantitative method for evaluation of fire hazard, HAZARD I, built around a computer software package designed for use on a personal computer. This system permits the user to simulate the consequences, in terms of loss of life, injury, or ultimately property damage of a specified fire in a prescribed building. The paper outlines HAZARD I and recent improvements to it, and reports the results of trial uses of this new tool. The steps envisioned for the effective transfer of this new technology within the fire safety community are examined and the implications of it for fire and building code officials are drawn.

In commemoration of the ASHRAE Centennial, the paper is a brief history of ASHRAE's activities in fire and smoke control. The first ASHRAE fire related symposium marked the start of a period of ASHRAE fire related activity that is ongoing. This was followed by formation of a Technical Committee 5.6 on Fire and Smoke Control. In those early years, the committee also found time to develop a chapter for the ASHRAE handbook and to play a vital role in member education. In later years, the committee became well focused and highly efficient at most every aspect of technical committee effort.

Keywords: *Fires, *Combustion products, *Buildings, Carbon monoxide, Soot, Toxicity, Gases, Tests.

The overall scope of this research is to investigate the phenomena that control the generation and oxidation of compartment fire exhaust gases, specifically carbon monoxide (CO), total unburned hydrocarbons (THC) and soot, which are transported down an adjacent corridor. The first year of the investigation concentrated on the formation of exhaust gases, mainly CO, within the compartment. In the second year, a hallway was attached to the compartment in such a manner that the gases from the compartment entered at the ceiling of the corridor. The oxidation of the exhaust gases down the hallway was studied for a corridor having no soffits at either end. During the past year, three additional hallway soffit combinations were added to see the results of varying the fluid mechanics of the exhaust gases within the hallway.

Fire Codes for Global Practice.
Final rept.
R. W. Bukowski. 1995, 3p.
Pub. in Progressive Architecture, p117-119 Jun 95.

Keywords: *Fire safety, *Building codes, *Design standards, Fire codes, Safety design, Safety engineering, Fire research, Fire hazards, Buildings, Design analysis, Design criteria, Risk management, Compliance, Global, Reprints.

Architecture in a world economy, with multinational clients and a global range of building materials and systems, demands fire codes based on performance. The International Council for Building Research is now working on methods to verify compliance under performance-based fire codes. Performance codes will have several advantages: code objectives clearly stated and understood by all parties, and analytical methods, data, and assumptions formallized in a single code of practice.

Fire models and other predictive methods are becoming common means of supporting the design and arrangement of building fire safety features to code officials where strict compliance with prescriptive requirements is not possible. This paper provides code officials faced with such analyses guidance on the key elements which should be addressed to ensure credibility. Guidelines are presented covering the selection of appropriate models and methods, design fires, evacuation calculations, sensitivity and uncertainty, and documentation. Some comments on establishing an independent review process for alternative design analyses and on certification of appropriate methods are included.

Pub. in Fire Science and Technology, v14 n1-2 p61-73 1994.

Keywords: *Fire tests, *Pressure dependence, *Ordinary differential equations, Compartment analysis, Heat transfer, Exothermic reactions, Combustion, Pressure gradients, Mathematical models, Numerical analysis, Phase plane analysis, Thermodynamics, Reprints, Fire models, Zone fires, Singular perturbation analysis.

The nonadiabatic nature of low-speed combustion and fire, in which strongly exothermic reactions produce large temperture variations but only mild pressure variations, can cause difficulty when integrating zone models of enclosure fires. Examples of simple zone fire models are examined to illustrate the analytical nature of the problems encountered. These difficulties arise in the solution of the equations for the pressure in general enclosures because the pressure equilibrates much more rapidly than other dynamical variables. Singular perturbation methods and phase plane analyses, together with numerical integration of the nondimensionalized equations, are employed to study the stiff nature of the equations. We conclude that many of the difficulties associated with numerical integration of zone fire models may be circumvented by appropriate analysis of the zone fire model equations.

A postearthquake fire and lifeline workshop sponsored by the Building and Fire Research Laboratory, National Institute of Standards and Technology, was held January 30-31, 1995, in Long Beach, California. The objective of the workshop was to identify technology development and research needs that will be used in developing recommendations to reduce the number and severity of postearthquake fires. The workshop participants included leaders in the fire service, fire protection engineering, codes and standards, insurance, transportation systems, and water, gas, power distribution, and telecommunication utilities systems with experience in dealing with consequences of earthquakes. The workshop participants developed a list of priority project areas where further research, technology development, or information collection and dissemination would serve as a vital step in the future reduction of the losses from postearthquake fires.

This report summarizes a large number of investigations designed to characterize the formation of carbon monoxide (CO) in enclosure fires--the most important factor in fire deaths. It includes a review analysis of the studies which form the basis for the global equivalence ratio (GER) concept. Based on the findings, two completely new mechanisms for the formation of CO, in addition to the quenching of a fire plume by a rich

upper layer, which is described by the GER concept, are identified.

Keywords: *Fire research, *Information retrieval, *Data bases, Information systems, Fire protection, Fire safety, Safety engineering, Information dissemination, Fire prevention, Reprints.

As information technology expands, information has become more readily available but the sources of this information have become more diverse. Within the field of fire research and engineering, it has become more challenging to find critical information because traditional sources of information have been augmented by a variety of electronic sources. Looking for specific information used to be performed by brute force, i.e., checking the library card catalog. With the explosion in computer communication, information retrieval has become an art form. The fire scientists or engineer must develop a familiarity with a wide range of old and new methods for acquiring information as well as staying abreast of latest developments. Success in the new world order of information science will go to the well informed user. An overview of print and electronic resources that are described in this paper can provide a starting point for responding to any information request.

Heights of Wall-Fire Flames.
Final rept.
H. E. Mitler. 1995, 5p.
Pub. in Proceedings of the International Conference on Fire Research and Engineering, Orlando, FL., September 10-15, 1995.

Keywords: *Fire research, *Walls, *Flames, Height, Fires, Pyrolysis, Reprints, Line fire, Wall fires.

A correlation between the visible height of a flame and the power output of the flame is useful for a number of reasons. Thus, observation of a fire can permit one to estimate the rate of heat release and therefore the fuel flow rate. Again, an expression for the flame height is needed in order to calculate the upward flame spread rate on walls. It is therefore important that such an expression be reliable. The heights of flames from line burners adjacent to walls have been correlated by a number of workers.

Elements of a Framework for Fire Safety Engineering.
Final rept.
J. E. Snell. 1993, 10p.
Pub. in International Fire Conference (6th), Interflam '93, Oxford, England, March 30-April 1, 1993, p447-456.

Keywords: *Fire safety, *Safety engineering, *Design criteria, Fire prevention, Fire codes, Fire research, Risk analysis, Decision making, Standards, Reprints.

The paper lays out a framework for fire safety engineering based on scientific tools for fire safety design and decision-making. These tools include computer-based models for fire safety hazard and risk prediction, measurement methods to provide data for such methods, databases and expert systems to provide access to them, and the ultimate integration of these tools with other elements of computer-aided design, construction and conformity assessment. The paper suggests needs, roles and actions required to bring fire safety engineering to the level of sophistication enjoyed in most other areas of engineering practice. The need for international cooperation and public-private collaboration is stressed.

The Brudsen-Holmes method of power spectrum estimation for the Duffing-Holmes oscillator is applied to the case of weak quasiperiodic excitation and then extended to weak colored noise excitation with any specified spectral density. A novel model of near-Gaussian noise is introduced to achieve this extension. The results obtained by this approach coincide with and extend those obtained by Stone and Holmes' application of the Fokker-Planck equation. In particular, our results confirm Stone's conjecture that the expression for the mean time between successive maxima in the case of colored noise similar to that for white noise.

Keywords: *Noise, *Chaos, Building technology, Dynamical systems, Reprints, Melnidov transforms, Multistable systems, Phase space flux, Stochastic equations.

Additive noise is shown to induce chaotic motion with sensitive dependence on initial conditions in multistable dynamical systems. This establishes a fundamental connection between two fields hitherto viewed as distinct: deterministic chaos and stochastic differential equations modeling the dynamics of multistable systems. Our results for additive noise are then generalized to multiplicative noise. Using a newly introduced model of shot noise, these results for multiplicative noise are applied to the Duffing oscillator with shot noise-like dissipation.

Keywords: *Chaos, *Noise, Dynamical systems, Reprints, *Foreign technology, Nonlinear systems, Shot noise, Stochastic systems.

Stochastic differential equations and classical technique related to the Fokker-Planck equation are standard bases for the analysis of nonlinear systems perturbed by noise. An alternative, complementary approach applicable to systems featuring heteroclinic or homoclinic orbits uses phases space flux as a measure of noise-induced chaotic dynamics. We continue our development of this method, extending our previous treatment additive noise to the more general case of multiplicative noise. This extension is used with a new model of shot noise to treat the Duffing oscillator with shot noise-like dissipation.

Keywords: *Chaos, *Buckled columns, Structural engineering, Reprints, Fluid elasticity, Galloping oscillators.

Motivated by recent numerical investigations according to which certain types of deep-water compliant offshore structures may experience undesirable chaotic motions, two types of experimental structural systems capable of exhibiting chaotic or apparently chaotic behavior were studied. The first type of system is a harmonically forced buckled column with a concentrated mass at midspan and with pretensioned continuous springs. For this system a model with pretensioned continuous springs. For this system a model with acceptable predictive capabilities can be constructed if the continuous springs are represented by a sufficient number of lumped masses with discrete stiffnesses. The second type of system consists either of a galloping square bar or of a pair of parallel, elastically coupled galloping square bars. Our results suggest that the behavior of this type of system, including apparently chaotic behavior, can be described at least to a first approximation by conventional fluidelastic models. However, the predictive capabilities of such models are poor, i.e., in the present state of the art the existence of certain types of hydroelastic behavior may be altogether missed at the design stage. The incorporation of stochastic excitations in the models to account for small flow irregularities may result in improved prediction capabilities.

In the 1980's, computer models and other predictive methods were increasingly applied to a broad range of practical problems in fire safety. Incertainties in the models' predictions were no greater than those associated with the traditional, but much more expensive full-scale experimental studies. Seperate, multi-year research projects in Japan and the United States resulted in the publication of prototype fire hazard analysis systems which demonstrated the ability to account for the complex interaction of the fire, building, active protection systems, occupant actions, and detailed outcomes including damage estimates and fatality counts.

Keywords: *Fire detection systems, *Video recording, Smoke detectors, Position(Location), Computerized simulation.

In the report we present the results of work directed toward the development of a working prototype of a system that can automatically detect, locate, and size an accidential fire. The fire detection system uses a video camera to gather temperature data from an array of temperature-sensitive, color-changing sensors distributed around a compartment, and a personal computer based inverse problem solution algorithm to determine the fire's location and heat release rate using the gathered temperature data. Such a system offers great promise for use in industrial facilities such as warehouses and factor floors which combine significant fire risks with minimal human monitoring for extended periods.

The investigation focuses on the transport of carbon monoxide (CO) away from a burning compartment and the conditions necessary for the existence of fatally high concentrations of CO at remote locations. During the past year, the research has concentrated on the transport of CO away from a reduced-scale burning compartment located on the side of the end of a hallway. High levels of CO were transported to remote locations by limiting the air entrainment into the plume of compartment fire gases entering the hallway. The non-uniform transport of combustion gases down the hallway explains the locations of fatalities in previously reported fires.

Keywords: *Buildings, *Research management, Cost benefit analysis, Case studies, Economic analysis, Construction management, Energy conservation, Life cycle costs.

This report is the outgrowth of a series of microstudies prepared by NIST's Building and Fire Research Laboratory (BFRL). This report has four major purposes. First, it examines five standardized methods for evaluating existing and past research projects. Second, it establishes a framework for identifying, classifying, quantifying, and analyzing the benefits and costs of a research project, of a research program, or of a new technology. Third, it presents a generic format and a set of guidelines for summarizing the economic impacts of alternative research investments. Fourth, it illustrates--by way of two case studies--how the framework and standardized methods would be applied in practice.

Keywords: *Evacuation, *Fire safety, *Human behavior, Fire hazards, Smoke, Escape(Abandonment), Exits, Egress, Decision making, Office buildings, Surveys, Computerized simulation, *EXIT89 computer model, Emergency escape, World Trade Center, New York City(New York).

The features of an enhanced model for egress from fires in non-residential occupancies is presented along with a users manual describing the use of the model. The enhancements to the model include analysis of locations of safety, smoke blockages, disabled occupants, and delays in egress. Comparisons with some available field measurements is presented. Further analysis of human behavior during a fire in the World Trade Center is presented. While previous human behavior studies have shown that people will move through smoke, this incident demonstrated that people will not only move through smoke, but also through worsening conditions. Implications for evacuation and training are discussed.

Benefits and Costs of Research: A Case Study of the Fire Safety Evaluation System.
Final rept.
R. E. Chapman, and S. F. Weber. Jul 96, 93p, NISTIR-5863.
See also PB96-202221.

Keywords: *Fire safety, *Research management, Benefit cost analysis, Case studies, Investments, Buildings, Life cycle costs, Hospitals, Nursing homes.

This report focuses on a critical analysis of the economic impacts from past BFRL research efforts leading to the development and introduction of the performance-based Fire Safety Evaluation System (FSES) for hospital and nursing home occupancies. The FSES was developed as an alternative to prescriptive compliance to the Life Safety Code for hospitals and nursing homes participating in the Medicare and Medicaid programs. The case study estimates the cost saving from using FSES-based modifications to promote fire safety in existing hospitals and nursing homes over the period from 1975 through 1995.

Keywords: *Office buildings, *Fire safety, Federal buildings, Combustion, Flammability, Surveys, Furniture, Books, Papers.

The method, used in the latest study performed in 1975, for surveying offices to determine fuel load estimates is presented. The frequency distribution for the estimates of the fuel load found in the study are presented. Two methods for determining movable fuel load are utilized in this study. Movable fuel load is considered to be the furniture, equipment, and other items brought in for the service of the occupants after construction of the building. Direct weighing techniques are utilized in both methods. In one method, the office contents are taken from their operational location and weighed. The second method, weighs the office contents when packaged for either relocation or remodeling purposes. Surveys were conducted in buildings at the University of Maryland College Park and at the General Services Administration (GSA) Headquarters Building in Washington, D.C.

Summary of Federal Construction and Building R and D in 1994.
S. McGaraghan. Sep 96, 38p, NISTIR-5849.
Prepared in cooperation with Department of Energy, Washington, DC.

Keywords: *Federal building, *Construction, *Research and development, Tables(Data), Contracts, Databases, US DOA, US DOC, US DOD, US DOE, US EPA, US DOT, US HHS, NSF(National Science Foundation).

In 1994, the federal government supported approximately $70 billion of research and development (R&D) in many different areas through a wide variety of government agencies and contractors. Because the work is spread among so many different entities, it can be difficult to develop a clear picture of the work being done in any one area. In response to this, a new database has been developed which tracks funding from the appropriation down to the project award level, allowing for comprehensive searches. The study, found that approximately $566 million was spent on R&D for construction and building in 1994. Two agencies, the Department of Defense and the Department of Energy, together account for nearly 75% of the total. In all, 12 agencies were found to have supported R&D in this area.

Two full size furnished bedrooms were burned, June 5 and June 6, at the University of Maryland Fire and Rescue Institute Facilities. These burns were performed for two cooperating agencies; The Alcohol, Tobacco and Firearms Agency of the Treasury Department, who used them as part of their Certified Fire Investigator training, and the Building and Fire Research Laboratory of NIST, who used them for forensic research. It was intended that these two burns be identical, to see if close analysis of the results would find differences. There were differences, possibly due to small differences in the inflow of ventilation air. In both cases, ignition was caused by burning newspaper on an upholstered chair. This report describes the test arrangement and instrumented results.

Grant NIST-60NANB5D0136
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Fire protection, *Foam, FORTAN, Numerical analysis, Mathematical models, Thermal radiation.

The overall objective of the current research program is to identify the parameters associated with the performance of fire-fighting foams used to protect structures from heat and fire damage. Specifically, the current research focuses on the destruction of a fire-fighting foam subjected to heat radiation. A numerical model which predicts the foam's properties during the destruction process is sought. The model is developed using experimental measurements and observations as a guide. Experimental results and the numerical model are used to identify the role of the various parameters which govern the foam's behavior.

Grant NIST-60NANB4D1625
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Office buildings, *Fires, Furniture, Fuels, Surveys, Flammability, Federal buildings.

The development of survey methods for determining the occupant load in office buildings (business occupancies) is described. Considerations involved in formulating the survey methods are presented. The type of data to be collected and data collection techniques are discussed. The two survey methods utilized to collect the population counts within contemporary office building are a building walk-through and a telephone survey. Occupant load data obtained from the survey methods applied in 23 office buildings located in the Washington, DC area are presented. Data are presented on the magnitude and distribution of the loads. The building data is sorted according to the following groups: open plan office designs versus well-compartmented office designs, and government (federal and county) versus privater sector tenants. Statistical summaries of the data are presented.

Keywords: *Office buildings, *Air quality, *Ventilation, Space HVAC systems, Indoor air pollution, Air flow, Ducts, Comfort.

The manual describes procedures for assessing ventilation system performance and other aspects of build-

ing ventilation in mechanically ventilated commercial buildings. These procedures are intended to provide basic information on building ventilation for comparing ventilation performance to standards, guidelines and building design values and for investigating indoor air quality problems. The procedures in the manual are based on established measurement techniques and available instrumentation and provide practical means for obtaining reliable information on ventilation performance.

Fire Hazard and Risk: Evaluating Alternative Technologies.
Final rept.
J. E. Snell. 1990, 20p.
Pub. in Proceedings of Symposium Sprinklers in Residential and Commercial Buildings, Charleston, SC., August 19-20, 1990, 20p.

Keywords: *Fire hazards, *Risk assessment, *Buildings, Fire protection, Sprinklers, Fire safety, Fire detectors, Fire resistance, Design, Reprints.

Fire safety decisions typically involve difficult choices between safety, cost and functionality. Obviously, buildings could be made completely fire safe by making sure they, and their contents simply do not burn, or by providing technologies that would clearly overpower any possible fire threat. Unfortunately, few would like, could afford or would be comfortable in such surroundings. Typically, the cost and functionality aspects of designs and products are well understood and effectively communicated. However, until recently means have not been available to quantify the fire hazard or risk people face, or to measure the effectiveness of fire protection technologies in specific real world situations. The paper reviews the status and potential of new tools for evaluating fire hazard and risk, cites examples of recent applications, and offers observations relevant to the current debate on the best means to provide fire safety in residential and commercial buildings.

Air Change Effectiveness Measurements in Two Modern Office Buildings.
Final rept.
A. K. Persily, W. S. Dols, and S. J. Nabinger. 1994, 16p.
Pub. in Indoor Air 4, p40-55 1994. Sponsored by Department of Energy, Washington, DC. Office of Buildings Energy R and D.

Keywords: *Office buildings, *Indoor air quality, *Tracer techniques, *Ventilation, Flow measurement, Air circulation, Air flow, Indoor air pollution, Pollution monitoring, HVAC systems, Test methods, Reprints, *Air change effectiveness.

Local age of air and air change effectiveness were determined in two office buildings using tracer gas techniques to study the applicability of the associated measurement procedures in the mechanically ventilated office buildings. Measurement issues examined include the establishment of a uniform tracer gas concentration at the start of the test and the relationship of ventilation system configuration and system operation to the test procedure. Air change effectiveness was determined at locations in the occupied space based on the local age of air at that location and the age of air in the corresponding ventilation system return duct. These tests provide data on air change effectiveness to supplement the limited database on mechanically ventilated office buildings in the U.S. In addition, the experience obtained with the measurement procedures will assist in the development of a standardized approach to measuring air change effectiveness in the field.

Pub. in Lighting Design and Application, p21-23 Oct 90.

Keywords: *Lighting systems, *Luminaires, *Energy conservation, *Energy efficiency, *Daylighting, Illuminating, Light sources, Computer graphics, Visibility, Lighting equipment, Highway lighting, Reprints.

The technical highlights from the recent IESNA Conference in Baltimore, MD are summarized in some detail. At the session 48 papers on lighting research, technology, design and application were presented. Topics discussed included light sources and conservation issues for displays; efficiency standards for lamps; daylight measurement and modeling; lamp performance including fluorescent, incandescent, metal halide, high pressure sodium, and special sources; tunnel and roadway lighting; measurement and controls; modeling and lighting geometry; calculations; visibility and visual performance; computer graphics; and VDT's. Issues relating to energy conservation, such as efficiency standards, daylighting, and new lamp technology generated considerable attention, as did papers on lighting and conservation as well as computer graphics as a design tool.

Using Emulator/Testers for Commissioning EMCS Software, Operator Training, Algorithm Development, and Tuning Local Control Loops.
Final rept.
G. E. Kelly, C. Park, and J. P. Barnett. 1991, 10p.
Sponsored by Department of Energy, Washington, DC.
Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transactions, pt1 p669-678 1991.

Keywords: *Buildings, *Energy management, *Control systems, Simulation, Simulators, Real time, Computer graphics, Man computer interface, Heating, Air conditioning, Algorithms, Reprints, EMCS(Energy Management and Control System), US NIST, HVACSIM+ computer program.

A Building Emulator/EMCS Tester emulates a building and its mechanical system in real time. The Emulator/Tester is connected to the Energy Management and Control System (EMCS) in place of the regular sensors and actuators. The EMCS then controls the simulated building as it would a real building, while the Emulator/Tester evaluates the EMCS performance. An Emulator/Tester has been developed by the National Institute of Standards and Technology (NIST). Two studies were performed. The first involved a model of a building operated in the heating mode, while the second consisted of the building air handling system supplying conditioned air to a single building zone during summer operation. Both studies showed good agreement between the simulation and emulation results. An exercise using the Emulator/Tester to facilitate the tuning of local control loops was performed. Two different tuning methods were explored. Information is also presented on how the Emulator/Tester can be used for training, commissioning EMCS software, and developing new control algorithms.

Improved Automated Current Control for Standard Lamps.
J. H. Walker, and A. Thompson. 1994, 7p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n3 p255-261 May/Jun 94.

Keywords: *Lamps, *Standards, *Radiance, Irradiance, Radiometry.

As radiometric lamp standards improve, the need to set lamp current to specific values becomes more important. Commercially available power supplies typically provide 12 bit internal digital-to-analog logic which permits current control with a relative expanded uncertainty of about 1 part in 4096, corresponding to an expanded uncertainty of the current of about 2 mA at 8 A (in this paper, expanded uncertainties are given as 2 standard deviations). For the FEL-type standard spectral irradiance lamp, this corresponds to a spectral irradiance difference of 0.12% at 655 nm. The authors have developed a technique using 16 bit digital-to-analog conversion which permits current control with a relative expanded uncertainty of about 1 part in 65536, corresponding to an expanded uncertainty of the current of about 0.1 mA at 8 A.

Field Measurements of Ventilation and Ventilation Effectiveness in an Office/Library Building.
Final rept.
A. K. Persily, and W. S. Dols. 1990, 21p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of the AIVC Conference on Ventilation System Performance (11th), Belgirate, Italy, September 18-21, 1990, p294-313.

Keywords: *Ventilation, *Office buildings, *Indoor air pollution, *Air flow, *Libraries, *Thermal comfort, Field tests, District of Columbia, Tracer techniques, Spatial distribution, Performance evaluation, Environmental engineering, Reprints.

Mechanical ventilation system performance involves the provision of adequate amounts of outdoor air, uniform distribution of ventilation air within the occupied space, and the maintenance of thermal comfort. Standardized measurement techniques exist to evaluate thermal comfort and air exchange rates in mechanically ventilated buildings; field techniques to evaluate air distribution or ventilation effectiveness are still being developed. The paper presents field measurements of air exchange rates and ventilation effectiveness in an office/library building in Washington D.C. The tracer gas decay technique was used to measure whole building air exchange rates. Ventilation effectiveness was investigated at several locations within the building through the measurement of local tracer gas decay rate and mean local age of air. The ventila-

tion effectiveness measurements serve as an investigation of the applicability of the measurement procedures employed, providing insight into the measurement issue of establishing initial conditions, the spatial variation in tests results within a building, and the repeatability between tests.

Water Efficient Plumbing Fixtures through Standards and Test Methods.
Final rept.
L. S. Galowin, and J. A. Swaffield. 1990, 5p.
Pub. in Proceedings of CONSERV 90 - National Conference and Exposition Offering Water Supply Solutions for the 1990s, Phoenix, AZ., August 12-16, 1990, p179-183.

Keywords: *Standards, *Test methods, *Waste consumption, *Sewage, *Building codes, *Piping systems, Drainage, Waste disposal, Buildings, Water flow, Conservation, Reprints, *Low flow plumbing fixtures.

Concern exists for low volume fixture flows from water conserving plumbing fixtures and devices discharged into the drainage system to perform the functions for waste removal, transport and clearing the drains. Reduced flow rates and volumetric limits on water consumption for plumbing fixtures and appliances for the water saving plumbing products are proposed in national legislation introduced in the U.S. Congress. Research, experiments and test measurements in both laboratories and actual field installments are reviewed. Conditions included measured solid waste transport from water closet discharges into drainlines and loading conditions for a variety of laboratory type simulants applicable for test methods in standards. Data shows that sweeping of wastes through the drainage piping with low flows can be accomplished. The application of selected research results in the preparation of test method procedures for plumbing standards is discussed, e.g., drainline waste transport test of low flush water closets. Computer modeling calculations and data show the 'carry out' of the waste solids from the building to the sewer, or septic system, may occur in a series of successive carries and not necessarily from a single discharge of a fixture.

Indoor Air Quality Impacts of Residential HVAC Systems, Phase 1 Report: Computer Simulation Plan.
S. J. Emmerich, and A. K. Persily. Feb 94, 123p, NISTIR-5346.
Sponsored by Consumer Product Safety Commission, Washington, DC. Directorate of Engineering Science.

Keywords: *Indoor air pollution, *Residential buildings, *Computerized simulation, Design criteria, HVAC systems, Air flow, Combustion products, Air quality, Air pollution control, Ventilation, Contaminants.

NIST has completed the first phase of a project to study the impact of HVAC systems on residential indoor air quality and to assess the potential for using residential forced-air systems to control indoor pollutant levels. This project will use computer simulations to assess the ability of modifications to central forced-air heating and cooling systems to control the concentrations of selected pollutants in single-family residential buildings. The first phase consisted of three major efforts: conducting a literature review, developing a plan for computer analysis, and holding an expert workshop to discuss the plan. The second phase of the project will involve performing the computer simulations and analyzing the results. This report details the results of the Phase I efforts. The objective of the literature review was to obtain information for planning computer simulations that will be performed in Phase II of the project.

Assessing Ventilation Effectiveness in Mechanically Ventilated Office Buildings.
Final rept.
A. K. Persily. 1993, 12p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of International Symposium on Room Air Convection and Ventilation Effectiveness, Tokyo, Japan, July 22-24, 1992, p201-212 1993.

Keywords: *Office buildings, *Ventilation systems, *Air circulation, *Indoor air quality, Air infiltration, Air flow, Air intakes, Intake systems, Vents, Space HVAC systems, Test and evaluation, Reprints.

Mechanical ventilation systems are designed and operated to bring outdoor air into buildings, distribute ventilation air within the occupied space, remove internally generated contaminants, and maintain thermal comfort. The paper presents a general discussion of ventilation effectiveness in mechanically ventilated office buildings as the ability of the ventilation system to provide ventilation air in a manner consistent with the design goals of the system. The design and performance of air distribution systems are discussed on a range of scales, from the air handler to the individual workspace, as are the means for assessing ventilation effectiveness on each of these scales. Various approaches to the assessment of mixing within ventilated spaces, the most common conception of ventilation effectiveness, are presented and discussed in relation to their use in mechanically ventilated office buildings.

Modeling Radon Transport in Multistory Residential Buildings.
Final rept.
A. K. Persily. 1993, 17p.
Pub. in Modeling of Indoor Air Quality and Exposure, ASTM STP 1205, p226-242 1993.

Keywords: *Residential buildings, *Radon, *Radionuclide migration, *Flow models, Air flow, Air circulation, Spatial distribution, Air infiltration, Leakage, Radioecological concentration, Indoor air pollution, Air pollution monitoring, Computerized simulation, Reprints.

Radon concentrations have been studied extensively in single-family residential buildings, but relatively little work has been done in large buildings, including multistory residential buildings. The paper presents the results of a computer simulation of airflow and radon transport in a twelve-story residential building. Interzone airflow rates and radon concentrations were predicted using the multizone airflow and contaminant dispersal program CONTAM88. Limited simulations were conducted to study the influence of two different radon source terms, indoor-outdoor temperature difference and exterior wall leakage values on radon transport and radon concentration distributions.

Life-Cycle Costing Workshop for Energy Conservation in Buildings: Student Manual.
Final rept.
S. K. Fuller, and S. R. Petersen. Oct 94, 236p, NISTIR-5165.
Supersedes PB93-198984. See also PB93-208460. Sponsored by Federal Energy Management Program, Washington, DC.

Keywords: *Federal buildings, *Energy conservation, *Life cycle costs, *Training, Space HVAC systems, Facilities management, Operation and maintenance, Operating costs, Cost analysis, Energy efficiency, Computer applications, Education, *BLCC computer program, BLCC(Building Life-Cycle Cost).

The Student Manual for the Life-cycle Costing Workshop for Energy Conservation in Buildings is a workbook for a two-day course on life-cycle cost (LCC) analysis. The purpose of the workshop is to provide professionals concerned with energy conservation in federal buildings with the knowledge and skills they need to perform economic analyses quickly and correctly. The Student Manual presents the criteria and methods that govern LCC analysis for energy conservation in federal buildings; treats basic economic concepts; gives step-by-step instructions for performing LCC analyses; and introduces computer software and hands-on exercises for performing LCC analyses both manually and on PCs.

Performance of Compact Fluorescent Lamps at Different Ambient Temperatures.
Final rept.
B. L. Collins, S. J. Treado, and M. J. Ouellette. 1994, 14p.
Pub. in Jnl. of the Illuminating Engineering Society 23, n2 p72-85 1994.

Keywords: *Fluorescent lamps, *Temperature effects, *Performance evaluation, *Luminous intensity, Light sources, Power factor, Energy efficiency, Energy conservation, Reprints.

Compact fluorescent lamps are used to replace incandescent lamps to aid in energy conservation in commercial and domestic lighting applications. In conjunction with the Institute for Research in Construction (IRC) at the National Research Council, Canada (NRCC), the Lighting Group at the National Institute of Standards and Technology (NIST) conducted an experimental evaluation of twelve sets of different types of compact fluorescent lamps at six different ambient temperature conditions. An additional set of incandescent lamps was also evaluated for comparison. A total of three lamps were tested for each of the thirteen lamp types, both compact fluorescent and incandescent.

Using Emulators to Evaluate the Performance of Building Energy Management Systems.
Final rept.
G. E. Kelly, W. B. May, J. Y. Kao, and C. Park. 1994, 12p.
Sponsored by Department of Energy, Washington, DC. Building Systems and Materials Div.
Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transactions 100, pt1 p1482-1493 1994.

Keywords: *Space HVAC systems, *Computerized simulation, *Performance tests, Control systems, Heating systems, Ventilation, Air conditioning, Energy consumption, Comfort, Performance evaluation, Reprints, *Building Energy Management Systems, Emulators.

The performance of a building energy management system (BEMS) is directly related to the amount of energy consumed in a building and the comfort of the building's occupants. The paper describes using emulators to evaluate a BEMS. Major topics include setting up a BEMS and an emulator, evaluating system/command and DDC software, and methodologies for testing BEMS application algorithms. Considerations are presented for evaluating the programming capabilities of a BEMS, DDC control loop performance, and rating different aspects of BEMS performance. A brief discussion of BEMS software is also included.

Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transactions 100, pt1 p1455-1464 1994.

Keywords: *Energy management systems, *Control systems, *Performance tests, *Computerized simulation, *Space HVAC systems, Ventilation, Air conditioning, Heating systems, Comfort, Real time, Performance evaluation, Energy consumption, Predictions, Test methods, Reprints.

An emulator consists of a real-time simulation of a building and its HVAC system and a hardware interface that allows the simulation to be connected to a real control system. As part of a research project, an experiment involving four different emulators with two different (EMCS) was performed to study the reproducibility of the emulation method. The paper presents the results of this experiment in the form of a comparison of the predictions of energy consumption, thermal comfort, and control activity obtained from tests of the EMCS using emulators based on different design and different simulation programs.

Algorithm to Describe the Spread of a Wall Fire under a Ceiling.
H. E. Mitler. Nov 94, 62p, NISTIR-5547.

Keywords: *Algorithms, *Ceilings(Architecture), *Buildings, *Flame propagation, Thermal radiation, Convection(Heat transfer), Plumes, Ignition, Mathematical models, Combustion, Flames, Burning rate, *Wall fires, SPREAD computer program.

After some discussion of wall fires, the effects that a ceiling has on a wall fire are analyzed and discussed qualitatively. There are two kinds of effects: first, when the upper sill of the ventilating opening lies below the ceiling (as is usual), a layer of hot gas is trapped, which heats the walls by convection and radiation; the heated ceiling also radiates to the walls. A calculation which uses the wall-fire computer model SPREAD is carried out to demonstrate how these effects can be calculated now. Second, when the flame impinges on the ceiling, it bifurcates and spreads horizontally, rather than vertically. A simple algorithm is presented which calculates the spread rate of these horizontal flame extensions, as well as the modified pyrolysis rate, due to the modified radiation feedbacks.

See also PB90-164484. Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Office buildings, *Indoor air quality, *Ventilation systems, *Test and evaluation, Space HVAC systems, Indoor air pollution, Air quality standards, Specifications, Cooling and ventilating equipment, Building materials, Air flow, Air infiltration, Comfort.

Commissioning does not always include the verification of an 'acceptable' indoor environment for the building occupants, including factors related to indoor air quality (IAQ). In light of growing concern about indoor air quality, IAQ commissioning could become an important part of building commissioning programs. The program described in this report consisted of three tasks: (1) evaluate the mechanical ventilation system design from an IAQ perspective; (2) develop a set of environmental performance parameters and associated reference values that will be used to evaluate IAQ in the building; and, (3) measure these environmental parameters in the building and compare them with the reference values developed in Task 2.

BLCC: The NIST 'Building Life-Cycle Cost' Program, Version 4.21. User's Guide and Reference Manual.
S. R. Petersen. Jan 95, 103p, NISTIR-5185-2.
Sponsored by Federal Energy Management Program, Washington, DC.

Keywords: *Buildings, *Energy efficiency, *Life cycle costs, User manuals, Investments, Computer applications, Energy conservation, Operating costs, Economic analysis, Benefit cost analysis.

The NIST Building Life-Cycle Cost (BLCC) computer program provides economic analysis of proposed capital investments that are expected to reduce long-term operating costs of buildings or building systems/components. It is especially useful for evaluating the costs and benefits of energy conservation projects in buildings. Two or more alternative designs can be evaluated to determine which has the lowest life-cycle cost and therefore is most economical in the long run. Economic measures, including net savings, savings-to-investment ratio, adjusted internal rate of return, and years to payback can be calculated for any design alternative relative to the designated base case. BLCC can be used for evaluating federal (including Department of Defense), state, and local government projects as well as projects in the private sector. It complies with ASTM standards related to building economics as well as FEMP and OMB Circular A-94 guidelines for economic analysis of federal building projects. BLCC has new capabilities for using demand charges and block rate calculations for computing annual electricity costs. While BLCC is primarily intended for the economic evaluation of building systems, it can be applied to a wide range of project investments which are intended primarily to reduce future operating-related costs.

Measurements of Outdoor Air Distribution in an Office Building.
W. S. Dols, and A. K. Persily. Jun 94, 58p, NISTIR-5320.
Sponsored by Bonneville Power Administration, Portland, OR.

Keywords: *Office buildings, *Air circulation, *Ventilation, *Indoor air quality, Air infiltration, Air flow rates, Flow measurement, Air sampling, Tracer techniques, Environmental surveys, Outdoor air.

The National Institute of Standards and Technology (NIST) has performed a study of methods to measure the local outdoor air delivery rates in an office building. This is a follow-up study of one which was performed in the same building to measure outdoor airflow rates to the building as a whole. This study focuses on the delivery of outdoor air to smaller sections of the building. Airflow rates were measured to various zones of the building which range in size from that served by an entire air handler to individual workstations served by a single supply air diffuser. Comparisons were made between the use of different procedures used to measure airflow rates to the same zones in terms of relative accuracies and levels of effort involved in performing the measurements. The use of tracer gas techniques to measure local ages of air was also demonstrated. The local ages of air were then used to determine air change effectiveness of the ventilation system at the measurement locations. Air change effectiveness provides a measure of the uniformity of outdoor air delivery and mixing in a space.

Least-Cost Energy Decisions for Buildings. Part 3. Choosing Economic Evaluation Methods. Video Training Workbook.
H. E. Marshall. May 95, 56p, NISTIR-5604.
See also PB94-165982. Sponsored by Federal Energy Management Program, Washington, DC.

Keywords: *Buildings, *Energy efficiency, *Cost benefit analysis, Environmental engineering, Value engineering, Facilities management, Operation and maintenance, Energy conservation, Life cycle costs, Operating costs, Return on investment, Cost analysis, Economic analysis, Alternatives, Workbooks, Savings-to-investment ratio.

The workbook and its companion video are the third in a series of training video-workbook modules designed to assist you in using economic analysis to improve the long-run economy of your buildings. This module describes the types of investment decisions that you will have to deal with when you evaluate energy conservation projects--decisions to accept or reject a project, what design to choose, and what priority to assign candidate projects. Then it tells you how to match the different types of investment decisions with the appropriate economic methods. The workbook supports the video with expanded descriptions of technical material shown in the video; figures and tables presented in the video; formulas for computing economic measures used in the video; exercises to give you practice; and a glossary of technical terms used by the video instructors.

Pub. in Proceedings of Building Simulation Conference, Nice, France, August 20-22, 1991, p1-6.

Keywords: *Space HVAC systems, *Computerized simulation, *Performance tests, Control systems, Heating systems, Ventilation, Air conditioning, Energy consumption, Comfort, Performance evaluation, Reprints, *Building Energy Management Systems, Emulators.

Three complementary approaches may be used in the performance of building control systems-simulation, emulation and field testing. In emulation a real-time simulation of the building and HVAC plant is connected to a real building energy management system (BEMS) via a hardware interface. Emulation has the advantage of allowing controlled, repeatable experiments whilst testing real devices that may contain proprietary algorithms. Building emulators have been developed by the authors in the context of IEA Annex 17, which is concerned with the use of simulation to evaluate the performances of BEMS. The paper discusses different approaches to the design of building emulators and describes the different architectures, hardware and software used by the authors. The problem of evaluating the overall performance of BEMS is discussed and results are presented that illustrate the use of emulators to investigate the influence of the tuning of local loop controls on building performance.

Pub. in Indoor Air Quality Engineering Indoor Environments, p33-43 1994.

Keywords: *Office buildings, *Indoor air quality, *Environmental surveys, Ventilation systems, Building materials, Air flow, Air circulation, Air infiltration, Air intakes, Baseline measurements, Monitoring, Air sampling, Flow measurement, Design analysis, Reprints.

An indoor air quality commissioning program has been developed and is being implemented in a new office building in Rockville, Maryland. New buildings can have an increased potential for indoor air quality (IAQ) problems due to new building materials and deficiencies in mechanical ventilation system operation during construction and initial occupancy. This IAQ commissioning effort is being implemented to reduce the potential for such problems in this building. This commissioning program consists of three tasks: (1) evaluate the mechanical ventilation system design, (2) develop a set of environmental parameters and associated reference values that will be used to evaluate IAQ in the building, and (3) measure various environmental parameters for comparison with the reference values developed in task 2.

Keywords: *Computer-aided design, *Design criteria, Architecture, Design analysis, Building codes, Requirements, Standards compliance, Reprints, *Building design, Standards processing.

An approach to providing computer-aided support for using design standards in design system is presented. The standards processing system we developed is composed of five major components that interact with each other using the Internet: standards processing servers which evaluate a given design to check whether it satisfies the requirements of a specific design standard; the standards processor broker which is used by the designer to identify applicable design standards; the data server which acts as a front-end between the database of the design system and the standards processing activities, multiple standards can be dealt with by the design system and the design system is insulated from changes in standards.

Mathematical Analysis of Practices to Control Moisture in the Roof Cavities of Manufactured Houses.
D. M. Burch, G. A. Tsongas, and G. N. Walton. Sep 96, 63p, NISTIR-5880.
Prepared in cooperation with Portland State Univ., OR. Dept. of Mechanical Engineering.

Keywords: *Moisture, *Roofs, *Prefabricated buildings, Mathematical models, Vents, Cavities, Venting, Mobile homes.

This report presents a mathematical model to simulate the performance of a double-wide manufactured house constructed in compliance with HUD Standards. An interior vapor retarder was installed in the ceiling construction and ventilation openings were installed in the roof cavity consistent with HUD's 1/300 Rule. The effect of passive and mechanical ventilation, as well as a wide range of other factors on the roof sheathing moisture content was investigated as a function of time. The weekly average moisture content of the lower surface of the plywood sheathing was analyzed in several cold climates, while the relative humidity at the lower surface of the ceiling insulation was analyzed in a hot and humid climate.

New buildings can have an increase potential for indoor air quality problems due to new building materials and deficiencies in mechanical ventilation system performance during construction and initial occupany. In order to decrease the potential for such problems, an indoor air quality commissioning program was developed and implemented in a new office building for the U.S. Nuclear Regulatory Commission (NRC). The indoor air quality commissioning effort consisted of three tasks: (1) evaluation of the mechanical ventilation system design, (2) development of a set of environmental parameters and associated reference values to be used in evaluating the building indoor air quality, and (3) measurement of these environmental parameters in this building and comparison of them with the reference values developed in task 2. The evaluation of the mechanical ventilation system design was based on the recommendations of the 1987 BOCA mechanical code and ASHRAE Standard 62-1989. The design evaluation showed that the system ventilation rates were consistent with the recommendations of both documents. The environmental parameters identified in task 2 address ventilation system performance, indoor pollutant levels, and thermal comfort. The reference values for these parameters were based on available standards and guidelines as well as on the results of previous indoor air quality research. In task 3, these environmental parameters were measured in three phases of building construction: after completion of interior buildout, after the installation of the systems furniture, and roughly one month after occupancy. The measured values were within the project reference values with only a few exceptions, and these exceptions were usually attributed to a correctable circumstance.

Post-Occupancy Evaluation of the Forrestal Building.
Final rept.
P. A. Sanders, and B. L. Collins. 1996, 15p.
Pub. in Jnl. of the Illuminating Engineering Society, p89-103, Summer 1996.

Keywords: *Office buildings, *Work environments, *Surveys, Workplace layout, Comfort, Human reactions, Reprints.

Post-occupancy evaluation techniques provide a means for evaluating occupant responses to changes in an environment and linking this response to physical measures of that environment. Post-occupancy evaluations use a battery of tests to assess environmental conditions in the facility, including questionnaire surveys of the occupants, physical measures, personal observations, and individual interviews. The post-occupancy evaluation technique is designed to provide information about the occupants' reaction to their work spaces and document the physical conditions to which they are responding, usually on a pre- and post-retrofit basis.

Fault Diagnosis of an Air-Handling Unit Using Artificial Neural Networks.
Final rept.
W. Y. Lee, and C. Park. 1996, 10p.
Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transactions: Symposia, v102 pt1 p540-549 Jun 96.

Keywords: *Neural nets, *Fault detection, *Space HVAC systems, Air conditioning, Heating systems, Ventilation systems, Control systems, Error analysis, Error detection codes, Reprints, Air handling systems.

The objective of the study is to describe the application of artificial neural networks to the problem of fault diagnosis in an air-handling unit. Initially, residuals of system variables that can be used to quantify the dominant symptoms of fault modes of operation are selected. Idealized steady-state patterns of the residuals are then defined for each fault mode of operation. The study-state relationship between the dominant symptoms and the faults is learned by an artificial neural network using the backpropagation algorithm. The trained neural network is applied to experimental data for various faults and successfully identifies each fault.

Building Life Cycle Cost Computer Program (BLCC) Version 4.4-97 (for Microcomputers).
Model-Simulation.
Sep 96, 2 diskettes.
MS DOS operating system. Documentation is in Word Perfect 5.1. Supersedes PB95-502779, PB95-503397 and PB96-5002794.
The software is on two 3 1/2 inch DOS diskettes, 1.44M high density. File format: ASCII text.

Keywords: *Software, *Buildings, *Life cycle costs, *Energy conservation, *Benefit-cost analysis, Operating costs, Economic analysis, Return on investment, Savings, Prices, Project management, National government, State government, Local government, Standards, Diskettes, Documentation.

The software provides economic analysis of proposed capital investments that are expected to reduce long-term operating costs of buildings or building systems/components. It is especially useful for evaluating the costs and benefits of energy conservation projects in buildings. Two or more alternative designs can be evaluated to determine which has the lowest life-cycle cost and therefore is most economical in the long run. Economic measures, including net savings, savings-to-investment ratio, adjusted internal rate of return, and years to payback can be calculated for any design alternative relative to the designated base case. BLCC can be used for evaluating federal (including Department of Defense), state, and local government projects as well as projects in the private sector. It complies with ASTM standards related to building economics as well as FEMP and OMB Circular A-94 guidelines for economic analysis of federal building projects. It has new capabilities for using demand charges and block rate calculations for computing annual electricity costs. While it is primarily intended for the economic evaluation of building systems, it can be applied to a wide range of project investments which are intended primarily to reduce future operating-related costs.

Some Factors Affecting Design of a Furniture Calorimeter Hood and Exhaust.
L. Y. Cooper. Dec 93, 26p, NISTIR-5298.

Keywords: *Calorimeters, *Fire tests, *Furniture, Exhaust systems, Plumes, Hoods, Flames, Flow rate, Mathematical models, Design criteria.

This work considers factors affecting the design of an effective and versatile furniture calorimeter hood and exhaust system. The purpose of the furniture calorimeter, design functions, and inherent limitations of a particular design are discussed. The interactions between the hood structure and the fire and its plume are analyzed in the context of avoiding: flame impingement on the hood; enhanced combustion of a test article, over and above that of a free-burn; loss of combustion product plume gases due to 'spill-over' below the hood; unacceptable dilution of plume gases in the measurement section of the exhaust duct. The concept of the ideally designed hood is introduced, where, throughout the course of the burn of a test article the hood is always immediately above the flame tip and the exhaust rate always exactly matches the hood-ceiling-elevation plume-flow rate. Methods to partially or completely achieve the ideal design are presented. These include the combined features of adjustable hood evaluation and adjustable hood exhaust rate. The ideas and results of analyses developed are applied in examples relevant to the existing furniture calorimeter hood and exhaust system of the NIST Fire Research Laboratory Building 205. Recommendations for improvements to this facility are presented.

Feasibility and Design Considerations of Emergency Evacuation by Elevators.
J. H. Klote, D. M. Alvord, B. M. Levin, and N. E. Groner. Sep 92, 127p, NISTIR-4870.
See also PB92-164771 and PB92-238641. Prepared in cooperation with George Mason Univ., Fairfax, VA. Sponsored by Public Buildings Service, Washington, DC. Office of Real Property Management and Safety.

Keywords: *Elevators(Lifts), *Evacuating(Transportation), Design criteria, Handicapped workers, Feasibility, Human factors engineering, Fire safety, Emergencies, Computerized simulation, Smoke, Egress.

Throughout most of the world, warning signs next to elevators indicate they should not be used in fire situations, and today's elevators have not been designed for fire evacuation and should not be used for fire evacuation. However, the idea of using elevators to speed up fire evacuation and to evacuate persons with disabilities has gained considerable attention. The potential of elevator evacuation is so significant that the U.S. General Services Administration (GSA) has sponsored a research project at NIST to develop techniques for occupant use of elevators during building evacuations. This paper is the final report of that project, and it addresses fundamental system considerations, engineering design considerations, design analysis, and human behavior. This paper shows that use of elevators in addition to stairs during a fire emergency allows occupants and firefighters an additional system of vertical transportation.

Performance Parameters of Fire Detection Systems.
R. L. Smith. Jun 94, 20p, NISTIR-5439.

Keywords: *Fire detectors, *Buildings, Fire prevention, Parameters, Fire extinguishers, Warning systems, Probability theory, Smoke detectors, Mathematical models, Fires.

This report is a formal, functional analysis of fire detection systems' requirements. The performance parameters of fire detection systems are given as conditional probabilities. These parameters are identified by the objective analysis of the functions of a fire detection system. It is demonstrated that using the false alarm rate to specify the malfunctioning of a threshold detection system is inadequate. The principal function of fire detection systems is identified as the notification of anti-fire agents of the probability of an unwanted fire. The evaluation of the information provided by a detector system is central to its worth.

Toxicity, Fire Hazard and Upholstered Furniture.
Final rept.
V. Babrauskas. 1992, 9p.
Pub. in Proceedings of European Conference on Furniture Flammability (3rd), Brussels, London, November 24-25, 1992, p125-133.

Keywords: *Fire hazards, *Toxicity, *Furniture, Fires, Combustion products, Burning rate, Fire safety, Safety engineering, Reprints, *Upholstery.

Fire fatalities associated with upholstered furniture fires commonly involve the toxic effects of fire gases. Extensive results, however, both from experiments and from modeling, are presented in this paper that demonstrate that occupant life safety can only be ensured by assuring that furniture fires do not reach a high heat release rate. Differences among commercial products associated with toxicity effects are not significant. A very remote possibility exists that someone could produce furniture having combustion products' toxicity significantly greater than exists in the present marketplace. A combustion toxicity test does exist which would allow the accurate screening out of such products. Any usable combustion toxicity test method requires the use of test animals; no non-animal-based test is possible which can successfully identify products of unusual or extreme toxicity.

Studies Assess Performance of Residential Detectors.
Final rept.
R. W. Bukowski. 1993, 7p.
Pub. in National Fire Protection Association Jnl. 87, n1 p48-54 Jan/Feb 93.

Keywords: *Residential buildings, *Fire detectors, *Fire safety, Performance, Fire protection, Smoke detectors, Warning systems, Literature surveys, Reprints, *Building fires, *Heat detectors.

Current thinking on the performance of residential heat detectors compared to smoke detectors has recently been challenged. The paper was prepared to assemble a comprehensive picture from the literature of what is known about the relative performance of these two detector types in residential fires. The paper reviews 10 independent studies, conducted over two decades, in four countries, involving 206 tests in houses and apartments, typically burning actual items (furniture, mattresses, boxes of trash, clothing, etc.) and using real heat and smoke detectors representative of devices being sold at the time. In each case, the study is summarized and the conclusions relative to heat and smoke detector performance are quoted. All of the studies reach essentially identical conclusions, that: (1) either the ionization or photoelectric smoke detectors when located outside bedrooms and on each level of a house provides adequate warning to allow occupants to evacuate through their normal egress routes for most residential fire scenarios; and (2) heat detectors, even when located in the room of fire origin (effectively requiring locating a heat detector in every room) do not provide adequate warning in most fire scenarios.

Smoke Control Systems for Elevator Fire Evacuation.
Final rept.
J. H. Klote, and G. T. Tamura. 1991, 12p.
Pub. in Proceedings of American Society of Mechanical Engineers Symposium on Elevators and Fire, Baltimore, MD., February 19-20, 1991, p83-94.

Keywords: *Elevators(Lifts), *Evacuation, *Smoke, *Fire safety, Buildings, Handicapped persons, Emergencies, Pressurizing, Ventilation, Fire tests, Stairways, Reprints, *Smoke control, *Elevator fires, Piston effect.

Some people cannot use stairwells because of physical disabilities, and for these people fire evacuation is a serious problem. A potential solution of this problem is the use of elevators for fire evacuation. A joint project of the U.S. National Institute of Standards and Technology (NIST) and the National Research Council of Canada (NRCC) was formed to evaluate the feasibility of using elevators for the evacuation of the handicapped during a fire. This project consisted of conceptual studies, full scale fire experiments, and theoretical analysis. This paper summarizes the findings of the joint project that are relevant to the design of smoke control systems for elevators. A method of dealing with elevator piston effect is discussed. All other things being equal, piston effect is considerably greater for single car hoistways than for multiple car hoistways. Different approaches to deal with the pressure fluctuations due to opening and closing of building doors are presented. A method of design analysis is presented with an example analysis. Results indicate that there are many types of elevator smoke control systems which can be designed to provide acceptable levels of pressurization even under severe conditions of doors opening and closing.

Measurement of Room Conditions and Response of Sprinklers and Smoke Detectors during a Simulated Two-Bed Hospital Patient Room Fire.
K. A. Notarianni. Jul 93, 142p, NISTIR-5240.
See also PB88-164223. Sponsored by National Institutes of Health, Bethesda, MD. Div. of Engineering Services.

Keywords: *Sprinklers, *Smoke detectors, *Fire protection, *Beds, Fire safety, Heat flux, Temperature, Safety equipment, Furniture, Time dependence, *Hospital fires.

A series of experiments are reported in which a wood crib was burned within a simulated two bed hospital patient room in order to measure the activation times of various types of quick and standard response sprinklers and ionization and photoelectric smoke detectors at several locations in the room simulating multiple options for protection of the space. Gas and surface temperatures, heat flux, carbon dioxide, carbon monoxide, and oxygen concentrations were continuously measured in order to access the tenability of the room. Of the parameters measured, temperature was the best indicator of the tenability of the space. Temperature at time of activation of the quickl response sprinklers was at or below 77 deg C (171 deg F) at the five foot level and at or below 48 deg C (118 deg F) at the three foot level between the patient beds, in all tests with the exception of the shielded fire scenario where temperatures at the five and three foot levels reached 111 deg C (232 deg F), and 78 deg C (172 deg F) respectively. An initial detector activation was received between 232-377 seconds prior to activation of the first sprinkler, and 552-722 seconds prior to activation of the QR-EC sidewall sprinkler.

Sprinkler Fire Suppression Algorithm.
Final rept.
D. Madrzykowski, and R. L. Vettori. 1992, 14p.
Pub. in Jnl. of Fire Prot. Engr. 4, n4 p151-164 1992.

Keywords: *Sprinklers, *Fire suppression, *Algorithms, *Furniture, *Buildings, Fire protection, Fire hazards, Models, Activation, Burning rate, Time dependence, Reprints, *Building fires.

A study was conducted to develop a sprinkler fire suppression algorithm for use with sprinkler activation time models. Large-scale experiments were performed to determine the heat release rate (HRR) of selected office fuel packages with and without sprinklers operating. Eight different fuel packages were evaluated. The results from these experiments were used to develop a time dependent HRR reduction factor. The sprinkler fire suppression algorithm consists of multiplying the HRR reduction factor by the HRR at the time of sprinkler activation, yielding an expected upper bound to the HRR at a given time after sprinkler activation for office furnishing fires that are not heavily shielded. This sprinkler fire suppression algorithm can be thought of as a 'zeroth order' fire suppression model for 'light hazard' occupancies with a sprinkler spray density of 0.07 mm/s (0.1 gpm/sq ft) or greater.

Assessment of Technologies for Advanced Fire Detection.
Final rept.
W. Grosshandler. 1992, 10p.
Pub. in Proceedings of a Conference on Heat and Mass Transfer in Fire and Combustion Systems, Anaheim, CA., November 8-13, 1992, p1-10.

Keywords: *Fire alarm systems, *Fire detectors, *Technology assessment, *Buildings, Fire safety, Microelectronics, Fire protection, False alarms, Flame propagation, Infrared detectors, Ignition, Reprints.

The majority of fires are sensed either by the heat or the smoke they produce at a set location in space, with an alarm signal being issued when a threshold temperature or particulate level is exceeded. Many of these sensors are inexpensive and perfectly suitable for certain applications, but issues such as false alarms and increased performance can necessitate alternative sensing techniques. Advances in sensor technology, in microelectronics, and in our understanding of ignition and flame spread provide an opportunity to greatly enhance the performance of fire detection systems in traditional applications. Technological advances have also led to new situations with unique protection requirements at a time when environmental considerations have eliminated our most effective suppressants (halons), making the early detection of a fire even more critical. This article describes some of these developments, suggests possible applications, and indicates limitations to the technologies which need to be overcome before exploitation is feasible.

Acoustic Emission of Structural Materials Exposed to Open Flames.
Final rept.
W. Grosshandler, and M. Jackson. 1994, 20p.
See also PB93-138980.
Pub. in Fire Safety Jnl. 22, p209-228 1994.

Keywords: *Fire tests, *Acoustic emission, *Construction materials, *Fire detectors, Heat flux, Signal processing, Fires, Plywood, Wallboard, Flames, Fire safety, Transducers, Reprints.

The use of acoustic emission (AE) as an early indicator of structural materials exposed to a flame has been investigated and found to be possible. Piezoelectric

transducers have been mounted directly on 0.5 m long, simply supported beams of aluminum, gypsum board, wood and plastic, and have been used to record ultrasonic events resulting from a small flame placed under the beam. The number of AE events in a minute and the cumulative energy released during the heating cycle provide a good measure of the overheated state of some of these materials even before a temperature increase is indicated. The measured signals varied in energy and number with the type of material, the thickness of the specimen and heat flux. Wood was particularly susceptible to acoustic emission, producing more than 1000 events/min in a solid fir board and 30/min in 13 mm thick plywood when the flame exceeded 1 kW. Some critical issues which remain to be investigated before this technique can be adapted to practical fire detection are mentioned.

Pub. in Fire Safety Jnl. 23, p79-102 1994.

Keywords: *Fire hazards, *Ignition, *Upholstery, Fires, Combustion, Furniture, Calorimeters, Residential buildings, Fabrics, Chairs, Reprints, *Home fires.

A set of upholstered chairs constructed from five different fabric/foam combinations was subjected to a variety of ignition sources suggested by fire statistics. The sources included a cigarette, a small match-like flame, an incandescent lamp, a space heater, and a large flame source (TB 133 ignition source). The tests were performed in a furniture calorimeter where heat release rate and species production rates were obtained. For any chair type, the time to the peak heat release rate depended on the ignition sequence, but the magnitude of the peak did not, within the scatter of the data for any given chair. HAZARD 1, the fire hazard assessment method developed at the National Institute of Standards and Technology (NIST), was used to quantify the hazard posed by the different ignition scenarios.

Pub. in Proceedings of International Symposium on Fire Safety Science (4th), Ottawa Ontario, Canada, June 13-17, 1994, p773-784.

Keywords: *Fire detectors, *Acoustic emissions, Warning systems, Signal processing, Fire alarm systems, Acoustic detectors, Fire safety, Transducers, Acoustic signals, Reprints.

Acoustic emission (AE) has been shown to be a viable concept for the early indication of an open flame impinging on various structural materials. To assess its effectiveness in a more realistic environment, experiments have been performed in a 2.4 m cubical room constructed of gypsum board and wood. AE transducers were mounted on top of a ceiling joist and on a wall stud. The threats examined were a natural gas fire producing a thermal load up to 125 kW, and a charring condition achieved by attaching a 550 W electrical heater to a wall stud. A signal discernable above the background was recorded from at least one AE sensor in six of nine situations. The conclusion is that AE emission appears to be sufficiently sensitive to detect two particular threats, and that an overheated condition in a wall or ceiling can be detected if it is not more than 3 m from the transducer.

Review of Measurements and Candidate Signatures for Early Fire Detection.
W. L. Grosshandler. Jan 95, 44p, NISTIR-5555.

Keywords: *Fire detectors, *Infrared signatures, *Fire protection, Combustion, Smoke, Fires, Acoustic measurement, Transport properties, Flames, Carbon monoxide, Test methods.

The physical and chemical transformations associated with a burgeoning fire are discussed and the results of past experimental measurements of these transformations are summarized. Standard test methods for the current generation of fire detectors and recent developments in detection technologies for which existing standards may not be suitable are described. The literature has been reviewed to determine the extent to which fires have been characterized in their early phase. One finds dramatic variations in the measured magnitude and rate of growth of CO concentration in a variety of standard fires. The variation is also large between repeat runs of the same tests. When scaled by estimated mass consumed of fuel, the different standard fires group a bit more systematically. Additional measurements of species, temperature and velocity just above the flame are suggested to get a more complete footprint of each fire type. Similar measurements of non-fire nuisance sources are required in order to discriminate between a fire and non-threatening situation with a high degree of certainty. The concept of a universal fire emulator/detector evaluator (FE/DE) is introduced. The objective is to have a facility that will eliminate the unavoidable run-to-run variations associated with full-scale tests, and to allow more well controlled environments. Computational fluid dynamics could then be used to insert the fire source into the space being protected to guide detector placement and to predict system performance, as well as to compare alternative systems and new concepts on a level, realistic playing field.

Behavior of Mock-Ups in the California Technical Bulletin 133 Test Protocol: Fabric and Barrier Effects.
T. J. Ohlemiller, and J. R. Shields. May 95, 80p, NISTIR-5653.

Keywords: *Furniture, *Flammability testing, *Heat transmission, Upholstery, Fabrics, Buring rate, Heat flux, Ignition, Heat transmission, Flame propagation, Heat transfer, Calorimeters, Fire tests, *California Technical Bulletin 133.

Twenty-seven material combinations (seven fabrics, four barriers and two polyurethane foams) were tested in four cushion mock-up form in accord with California Technical Bulletin 133 using a furniture calorimeter. Both mock-up and Cone sample behavior were recorded on video to facilitate behavioral comparisons of the samples; distinct differences were noted for thermoplastics fabrics. The mock-up behavior always comprised at least a heat release peak during the 80 second gas burner exposure; it often included a later and larger peak as well. A statistical fit of the available data to these more complex types of correlations appears to work best for charring fabrics; it helps improve the correlation for all types of fabrics but at least two material combinations were outliers.

Some Factors Affecting the Design of a Calorimeter Hood and Exhaust.
Final rept.
L. Y. Cooper. 1994, 14p.
See also PB94-139193.
Pub. in Jnl. of Fire Protection Engineering, v6 n3 p99-112 1994.

Keywords: *Plumes, *Calorimeters, *Fire tests, *Furniture, Exhaust systems, Hoods, Flames, Walls, Flow rate, Design criteria, Mathematical models, Combustion, Reprints.

This paper considers factors affecting the design of an effective and versatile calorimeter hood and exhaust system. The purpose of the calorimeter, design functions, and inherent limitations of a particular design are discussed. The interactions between the hood structure and the fire and its plume are analyzed in the context of avoiding: flame impingement on the hood; enhanced combustion of a test article, over and above that of a free-burn; loss of combustion product plume gases due to 'spill-over' below the hood; and unacceptable dilution of plume gases in the measurement section of the exhaust duct. Methods to partially or completely achieve the ideal design are presented. These include the combined features of adjustable hood elevation and adjustable hood exhaust rate.

Study of Technology for Detecting Pre-Ignition Conditions of Cooking-Related Fires Associated with Electric and Gas Ranges and Cooktops, Phase 1 Report.
E. L. Johnsson. Oct 95, 117p, NISTIR-5729.
Contract CPSC-IAG-95-1145
Sponsored by Consumer Product Safety Commission, Bethesda, MD.

Keywords: *Fires, *Cooking devices, *Ignition, Residential buildings, Kitchens, Reviews, Technlogy innovation.

A significant portion of residential fires stem from kitchen cooking fires. Existing fire data indicate that cooking fires primarily are unattended and most often involve oil or grease. The purpose of this investigation was to ascertain the existence of one or more common features or characteristics of the pre-ignition environment that could be used as input to a sensor in a pre-fire detection device. The ultimate goal of this continuing study is to evaluate the feasibility of incorporating such a device into the range that would react to a pre-fire condition and reduce the occurrence of unwanted kitchen fires.

Evaluation of Sprinkler Activation Prediction Methods.
Final rept.
D. Madrzykowski. 1995, 8p.
Pub. in International Conference on Fire Science and Engineering (1st), ASIAFLAM '95, Kowloon, Hong Kong, March 15-16, 1995, p211-218.

Keywords: *Sprinklers, *Activation, *Time lapse, Fire suppression, Flame propagation, Fire detectors, Gas burners, Fire tests, Computer models, Reprints, Compartment fires, Heat release rate, Thermal detectors.

The objective of this study was to evaluate the ability of sprinkler activation models to predict activation time. Large scale compartment fire tests were used to obtain activation times for four different types of sprinklers. The tests were conducted in an 18.9 m by 2.35 m high compartment using floor based, gas burner fires with constant heat release rates of 115, 155, 215, 290, and

520 kW. Non-dimensional sprinkler radial positions, r/H, of 0.67 and 1.3 were evaluated. In addition to sprinkler activation times, ceiling jet temperature, velocity, and radiation measurements were made. The study included: (1) a review of public domain, personal-computer based, single-compartment thermal-detector activation models; (2) an analysis of predicted vs. experimental sprinkler activation times; and (3) a method to determine the applicability of current sprinkler activation models.

Keywords: *Residential buildings, *Fire tests, Furniture, Flammability, Rooms, Smoke detectors, Sprinklers, Temperature measurement, Velocity measurement, Flame propagation, Heat flux, Santa Ana(California), Fuel loads, Mass loss.

A series of fire experiments were conducted in vacant single family dwelling on South Bristol Street in Santa Ana, California. Fire experiments were conducted in bedrooms and living rooms. Fuel consisted of either home furnishings or a propane burner. Fire phenomena measured included: temperatures within various rooms, wall jet velocity, fuel mass dring burning, heat flux smoke detector activation time, sprinkler activation time, oxygen concentration, and time to full room involvement.

Quantifying the Ignition Propensity of Cigarettes.
Final rept.
T. J. Ohlemiller, K. M. Villa, E. Braun, J. R. Lawson, R. G. Gann, K. R. Eberhardt, and R. H. Harris. 1995, 15p.
Pub. in Fire and Materials, v19 p155-169 1995.

Keywords: *Ignition, *Flammability testing, *Fire hazards, Upholstery, Fabrics, Furniture, Combustion, Tobacco products, Fire tests, Test products, Statistical analysis, Reprints, *Cigarettes.

Research funded under the Fire Safe Cigarette Act of 1990 (United States Public Law 101-352) has led to the development of two test methods for measuring the ignition propensity of cigarettes. The Mock-Up Ignition Test Method uses substrates physically similar to upholstered furniture and mattresses: a layer of fabric over padding. The measure of cigarette performance is ignition or non-ignition of the substrate. The Cigarette Extinction Test Method replaces the fabric/padding assembly with multiple layers of common filter paper. The measure of performance is full-length burning or self-extinguishment of the cigarette. Routine measurement of the relative ignition propensity of cigarettes is feasible using either of the two methods. Using the two methods, some current commercial cigarettes are shown to have reduced ignition propensities relative to the current best-selling cigarettes.

State of the Art Report on Seismic Design Requirements for Nonstructural Building Components.
L. T. Phan, and A. W. Taylor. Jun 96, 78p, NISTIR-5857.

Keywords: *Earthquake engineering, *Building codes, *Lighting equipment, *Ceilings, *Sprinkler systems, Seismic design, United States, New Zealand, Japan, Seismic effect, Earthquake damage, Damage assessment, Dynamic response, Loads(Forces), Displacement, Requirements, Nonstructural components.

Seismic design requirements for nonstructural building components of five major building codes, including the 1994 Uniform Building Code, the 1994 Standard Building Code, the 1994 NEHRP Recommended Provisions for Seismic Regulations for New Buildings, the New Zealand Building Code, and the Japanese Building Code, were reviewed in this study. Comparisons of codes reveal wide variation in seismic force and displacement requirements, both in terms of levels of stringency and levels of details. The study also found a lack of focused investigations, dedicated to mitigating seismic damage to nonstructural building components, even though widespread damage to nonstructural building components continues to be observed in recent earthquakes. Based on the findings of this review, areas of needed research were identified.

Sponsored by Department of Energy, Washington, DC. Office of Codes and Standards.
Pub. in American Society of Heating, Refrigerating and Air-Conditioning Engineers Transaction Annual Meeting, San Antonio, TX., June 23-26, 1996, v102 pt2 p1-11.

Keywords: *Refrigerators, *Freezers, *Energy consumption, *Performance evaluation, Temperature measurement, Room temperature, Humidity, Doors, Performance tests, Reprints.

Two refrigerator-freezers, one with a top-freezer and one with side-by-side doors, were tested in the laboratory to determine the sensitivity of their energy consumption to various operational factors. Room temperature, room humidity, door openings, and the setting of the anti-sweat heater switch were the factors examined. The results indicated that the room temperature and door openings had a significantly greater effect on energy consumption than the other two factors. More detailed tests were then performed under different room temperature and door opening combinations. The relationship of door openings and the equivalent test room temperature were established. Finally, the effect on energy of different temperature settings were studied. Test results are presented and discussed.

Global Equivalence Ratio Concept and the Prediction of Carbon Monoxide Formation in Enclosure Fires.
W. M. Pitts. Jun 94, 172p, NIST/MONO-179.
Also available from Supt. of Docs. as SN003-003-03271-9. See also PB89-200091 and PB90-209602.

Keywords: *Carbon monoxide, *Fire hazards, *Buildings, Mortality, Combustion products, Global, Standards, Natural gas, Rooms, Exhaust gases, Enclosures, Safety engineering, Reaction kinetics, Pyrolysis, Ventilation, Polymers, Plywood, Mathematical models, Flow distribution, Reduced scale enclosure, Oxygenated polymers.

This report summarizes investigations of the formation of carbon monoxide (CO) in enclosure fires--the most

important factor in fire deaths. It contains the first complete review and analysis of the literature available on the global equivalence ratio (GER) concept. The results of a number of recent investigations (including work during the past fiscal year) which were either supported by the BFRL Grants Program or carried out in-house are then discussed. Based on the findings, two completely new mechanisms for the formation of CO, in addition to the quenching of a fire plume by a rich upper layer covered by the GER concept, are identified. The first involves reaction of rich flame gases with air which is entrained directly into the high-temperature upper layer of an enclosure fire. The second results from the pyrolysis of oxygenated polymers (such as wood) which are located in a rich, high-temperature upper layer. The findings of these studies form the basis of an analysis which yields the conditions for which use of the GER concept is appropriate for predicting CO formation in enclosure fires.

Predicting the Fire Performance of Buildings: Establishing Appropriate Calculation Methods for Regulatory Applications.
Final rept.
R. W. Bukowski. 1995, 10p.
Pub. in Proceedings of the International Conference on Fire Science and Engineering (1st), ASIAFLAM '95, Kowloon, Hong Kong, March 15-16, 1995, p9-18.

Keywords: *Fire safety, *Design standards, *Safety factors, Fire codes, Building codes, Regulations, Risk analysis, Fire protection, Performance standards, Fire hazards, Models, Reprints.

This paper explores questions from the perspective of the fire scientist, the practicing engineer, and the regulatory official. The fir scientist needs to be explicit about the impact of assumptions on the applicability of the results. The engineer needs to utilize methods and assumptions which are justified by the application and to assess the sensitivity and uncertainty implications. The regulatory officials are insisting on appropriate and properly documented methods. There is a need for models and calculations incorporated into codes of practice, handbooks, or the codes themselves to be reviewed, verified, documented, and approved for use in specific manners and by qualified persons. There are international efforts to define levels of risk acceptable to society in specific occupancies.

Status of Construction and Construction Technologies.
Final rept.
R. N. Wright. 1993, 9p.
Pub. in Proceedings Symposium on Advanced Building Technologies, Troy, NY., April 10, 1992, p10-18 1993.

Keywords: *Construction industry, *Competition, *North America, Automation, Productivity, Buildings, Design, Construction materials, Maintainability, Market research, Reprints, *Building technology, Intelligent buildings, Constructability.

Trends in building technology for North America will be dominated by advances in building process technologies: advanced computation and automation. These will facilitate effective responses to demands for increasing the international competitiveness of North American commerce and industry, supporting new industries, commerce and life styles, improving safety and health, and conserving energy and the environment. Advanced information technologies will affect organization of the building process to allow better attention to design to issues such as constructability, maintainability, and productivity of constructed facilities. Automation will advance in design, construction and operation (intelligent buildings) of constructed facilities.

Program of the Subcommittee on Construction and Building.
R. N. Wright, A. H. Rosenfeld, and A. J. Fowell. Jun 94, 50p, NISTIR-5443.
Prepared in cooperation with Department of Energy, Washington, DC. Assistant Secretary for Energy Efficiency and Renewable Energy.

Keywords: *Construction, *Competitiveness, *Technology innovation, Health, Automation, Construction materials, Buildings, Energy efficiency, Productivity, Research, Safety, *Building technology.

The National Science and Technology Council (NSTC), a cabinet-level group charged with setting Federal technology policy, has established the Committee on Civilian Industrial Technology (CCIT), to enhance the international competitiveness of U.S. industry. The Subcommittee on Construction and Building (C&B) of CCIT deals with Federal technology policies and programs related to the industries that conduct R&D, and produce, operate and maintain constructed facilities including buildings and infrastructure. The report provides some background on the construction industry, describes the role, the goals, and milestones of the program, and lists the Federal agencies participating in the Subcommittee. The goals of better buildings and improved health and safety of construction workers have been strongly endorsed in a white paper developed and published by the Civil Engineering Research Foundation. The white paper is included as an appendix.

Standards in Building Economics: Why We Need Them and How to Write Them.
Final rept.
H. E. Marshall. 1992, 7p.
Pub. in Proceedings of 1992 American Association of Cost Engineers Transactions, Orlando, FL., June 28-July 1, 1992, pL.5.1-L.5.7.

Keywords: *Buildings, *Economic analysis, *Standards, Construction management, Budgeting, Life cycle costs, Profits, Benefit cost analysis, Reprints.

Standard methods, guides, and classifications are available for use in the economic evaluation of buildings and building components. Standards help owners, consultants, designers, and managers to reduce project costs and enhance profits by providing a consistent basis for comparing the economic worth of building alternatives. This applies to government and private projects undertaken domestically and abroad. The paper explains how sometimes conflicting vested interests can work as a team in the standards process to create consensus standards. It surveys and explains the application of specific ASTM standard methods, such as life-cycle costing and the savings-to-investment ratio methods. It explains the role that business, government agencies, and professional societies such as the American Association of Cost Engineers (AACE) play in the promulgation of standards. The paper concludes that organizations need to participate in or at least be abreast of the latest developments in standard methods to reduce expenditures, keep competitive, and maximize profits.

Supersedes PB94-193646. Prepared in cooperation with Department of Energy, Washington, DC. Assistant Secretary for Energy Efficiency and Renewable Energy.

Keywords: *Construction, *Competitiveness, *Technology innovation, Health, Buildings, Construction materials, Safety, Automation, Research and development, Productivity, Energy efficiency.

The President has established the National Science and Technology Council (NSTC), a cabinet-level group charged with setting Federal science and technology policy, to coordinate and prioritize R&D and deployment strategies across a broad cross-section of public and private interests. It has established nine research and development committees, including the Committee on Civilian Industrial Technology (CCIT) to collaborate with the private sector in developing a comprehensive national technology policy. The purpose of CCIT is to enhance the international competitiveness of U.S. industry through Federal technology policies and programs. The Subcommittee on Construction and Building coordinates and defines priorities for Federal research, development and deployment related to the industries that produce, operate and maintain constructed facilities, including buildings and infrastructure. The Subcommittee on Construction and Building has studied research priorities including those expressed by the construction industry and defined two priority thrusts; better constructed facilities and health and safety of the construction workforce.

Economic Methods and Risk Analysis Techniques for Evaluating Building Investments: A Survey.
Final rept.
H. E. Marshall. 1991, 55p.
See also PB90-241589.
Pub. in CIB Report, Published by the International Council for Building Research, Studies and Documentation, n136 55p 1991.

Keywords: *Buildings, *Construction management, *Life cycle costs, *Cost benefit analysis, Cost engineering, Investments, Budgeting, Interest rate of return, Return on investment, Cost estimation, Economic analysis, Project administration, Risk management, Decision making, Reprints.

Traditional economic methods--life cycle costing, benefit-to-cost ratio, net benefits analysis, adjusted internal rate of return, and discounted payback--are described for evaluating building decisions about accepting or rejecting a given building, and the economically efficient combination of projects competing for a limited budget. Appropriate applications for each economic method are described. Technically correct formulas for the methods are presented. Techniques are described that to some extent account for uncertainty in input variables and in some cases risk exposure and risk attitude. The techniques are conservative benefit and cost estimating, sensitivity analysis, the risk-adjusted discount rate, mean-variance criterion, coefficient of variation, decision analysis, simulation, mathematical/analytical technique, and portfolio analysis. Advantages and disadvantages of each are described. Guidance is provided for selecting the appropriate technique for any given investment problem.

Keywords: *Buildings, *Life cycle costs, *Cost benefit analysis, Building materials, Construction, Fabrication, Architecture, Space HVAC systems, Energy management systems, Ranking, Project administration, Operating costs, Cost engineering, Investments, Return on investment, Economic analysis, Alternatives, Decision making, MADA(Multiattribute Decision Analysis).

Multiattribute decision analysis (MADA) methods consider non-financial attributes (qualitative and quantitative) in addition to common financial worth measures when evaluating project alternatives. The report reviews 14 classes of methods for performing MADA. It summarizes their usefulness for screening, ranking, and choosing among projects; their data input requirements; and how each method scores project alternatives. Two methods--the analytical hierarchy process (AHP) and non-traditional capital investment criteria (NCIC)--are described in detail. Assumptions, procedures, strengths, and limitations are described for each.

Fire Induced Thermal Fields in Window Glass I: Theory.
Rept. for 31 Aug 91-31 Aug 92.
A. A. Joshi, and P. J. Pagni. Nov 93, 35p, NIST-GCR-93-634.
Grant 60NANB1D1168
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Glass, *Windows, *Fires, *Thermal analysis, Heat transfer, Buildings, Heat flux, Mathematical models, Construction materials, Temperature distribution.

Window glass breaking plays an important role in compartment fire dynamics as the window acts as a wall before breaking and as a vent after breaking. Previous work suggested a model for the time to breakage of a window glass exposed to a particular fire. In this paper, the glass thermal fields obtained using that model are examined in detail. The temperature field dependence on heat transfer coefficients, radiative decay length and flame radiation is explored. The results show that the glass surface temperature increases with a decrease in the decay length and increases with an increase in flame radiation heat flux. Early in the fire, the glass temperature may be higher than the hot layer temperature due to direct impingement of flame radiation. Later the glass temperature lags the hot layer temperature. The variation of the time to breakage as a function of the shading width and decay length is also presented and the results indicate that the breaking time decreases with an increase in the shading width and decreases with a decrease in decay length. Heat flux maps for typical conditions indicate that most of the heat influx is stored in the glass, increasing its temperature.

Performance Approach to the Development of Criteria for Low-Sloped Roof Membranes.
W. J. Rossiter, G. J. C. Frohnsdorff, L. W. Masters, and J. W. Martin. Jul 91, 35p, NISTIR-4638.

Keywords: *Roofs, *Membranes, *Waterproofing, *Industrial buildings, *Commercial buildings, Composite materials, Polymers, Bitumens, Thermoplastic resins, Insulation boards, Barrier coatings, Vapor deposition, Requirements, Diagrams, Test methods, Performance evaluation, United States, Low-sloped roof system, Structural deck.

Waterproofing of roofs of commercial and industrial buildings in the United States is primarily accomplished using low-sloped membrane roofing systems. Estimates indicate that approximately 300 million square meters (3 billion square feet) of membrane roofing is installed annually. The three main types of membranes are built-up bituminous, single-ply elastomeric and thermoplastic, and polymer-modified bitumens. In addition to the membrane, the other main components are insulation boards and the structural deck, with elements such as vapor retarders and membrane surfacings used in some systems.

Microstructural Features of Some Low Water/Solids, Silica Fume Mortars Cured at Different Temperatures.
P. E. Stutzman, and J. R. Clifton. Apr 92, 20p, NISTIR-4790.

Keywords: *Mortars(Materials), *Microstructure, Silicon dioxide, Portland cements, Plasticizers, Concretes, *HPC(High Performance Concrete).

The microstructure of mortars with water/solids ratios (w/s) of 0.36 and 0.29, cured under water at 7, 23, and 40 C, were studied by scanning electron microscopy and X-ray powder diffractometry. The mortars contained silica fume and a superplasticizer. The degree of hydration and extent of pozzolanic reaction was estimated after quantifying the residual unhydrated cement by image analysis and the mass percent calcium hydroxide by X-ray powder diffraction. Their microstructures were fairly homogeneous in both the bulk paste and at the past-aggregate transition zone. In all mortars, the outer 250 micrometers was hydrated to about 85 percent and highly microcracked. The degree of hydration decreased rapidly beyond the outer zone to about 69 percent and less microcracking was observed. A temperature effect on the reactivity of silica fume was found.

Analysis of Failed Dry Pipe Fire Suppression System Couplings from the Filene Center at Wolf Trap Farm Park for the Performing Arts.
M. R. Stoudt, J. L. Fink, and R. E. Ricker. Mar 94, 16p, NISTIR-5389.
Sponsored by Wolf Trap Farm Park for the Performing Arts, Vienna, VA.

Keywords: *Pipe joints, *Sprinkler systems, *Brittle fracturing, Pipe bends, Cast iron, Metallurgical analysis, Freezing, Wolf Trap Farm Park(Virginia).

A detailed metallurgical analysis was performed on a number of gray cast iron couplings taken from a dry pipe fire suppression system at the Filene Center to verify the source of failure. The results of the analysis indicated that all of the specimens failed in a brittle manner due to the stresses induced by the expansion of freezing water. The available background information indicated that the ambient air temperature on the night of the failures was low enough to induce freezing in a relatively short time period.

Improvement in Predicting Smoke Movement in Compartmented Structures.
Final rept.
W. W. Jones, and G. P. Forney. 1993, 29p.
Pub. in Fire Safety Jnl. 21, p269-297 1993.

Keywords: *Fires, *Flow models, *Buildings, Fire safety, Radiative transfer, Ventilation, Smoke, Transport properties, Buoyancy, Reprints, *Smoke propagation, *Compartment fires, CFAST Model.

This paper describes improvements which have been made in the CFAST model of fire growth and smoke transport for compartmented structures. In particular, we are interested in the ability to model the movement of toxic gases from the room of origin of a fire to a distant compartment. The newest phenomena in the model are vertical flow and mechanical ventilation. Finally, we have improved the radiation transport scheme which affects energy distribution, and therefore the buoyancy forces. These are very important in actual situations relevant to fire growth and smoke propagation, as is demonstrated.

Quantitative Phase Abundance Analysis of Three Cement Clinker Reference Materials by Scanning Electron Microscopy.
Final rept.
P. E. Stutzman. 1990, 12p.
Pub. in Proceedings of Conference on Advances in Cementitious Materials, Gaithersburg, MD., July 22-26, 1990, p199-210 1991.

Keywords: *Cements, *Scanning electron microscopy, *Image analysis, Test methods, X rays, Backscattering, Microstructure, Grain size, Brightness, Construction materials, Reprints, *Portland cement clinker, *Reference materials.

Three portland cement clinker reference materials are available from the Standard Reference Materials Program at the National Institute of Standards and Technology. They are the first clinker reference materials for phase abundance analyses and were selected as representative of North American clinker production with respect to the range of phase abundance, grain size, and distribution. They are intended for use in the development and testing of methods for quantitative phase abundance analyses of portland cement clinker. Portland cement clinker microstructures were characterized by backscattering electron imaging in the scanning electron microscope. Clinker phases were identified on the basis of their brightness, grain morphology, occurrence within the clinker, and composition. Quantitative phase abundance analyses by point counting, and by image analysis of backscattered electron images and, for periclase, of X-ray maps, generally agreed with the reference material values. With its capability to clearly image polished clinker sections at a wide range of magnifications, the scanning electron microscope with X-ray analysis and with image analysis capabilities is a powerful tool for quantitative cement clinker microscopy.

Proficiency Testing as a Component of Quality Assurance in Construction Materials Laboratories.
Final rept.
J. H. Pielert. 1990, 11p.
Pub. in Proceedings of International Symposium Test Quality and Quality Assurance in Testing Laboratories for Construction Materials and Structures, Saint-Remy-les-Chevreuse, France, October 15-17, 1990, p60-70.
Sponsored by American Society for Testing and Materials, Philadelphia, PA.

Keywords: *Laboratories, *Construction materials, *Quality assurance, *Interlaboratory comparisons, Standards, Test facilities, Quality control, Standardization, Sampling, Concretes, Accuracy, Precision, Reprints, *Proficiency testing, Construction Materials Reference Laboratories.

Proficiency testing is a procedure for using results generated in interlaboratory test comparisons for the purpose of assessing the technical competence of participating testing laboratories. This gives users of laboratory services confidence that a testing laboratory is capable of obtaining reliable results. Interlaboratory testing involves the organization, performance and evaluation of tests on the same or similar materials by two or more different laboratories in accordance with predetermined conditions. Interlaboratory testing may also be used for checking the individual performance of laboratory staff, evaluating the effectiveness of a test method, and determining characteristics of a material or product. Programs in the United States which use proficiency testing to evaluate laboratory performance are discussed along with international programs which have been identified by RILEM Technical Committee 91-Cement Reference Laboratories. The U.S. Construction Materials Reference Laboratories which distributes over 6,000 samples of 13 different construction materials is highlighted, along with ASTM standardization activities related to proficiency and interlaboratory testing.

Calculating Flame Spread on Horizontal and Vertical Surfaces.
G. N. Ahmed, M. A. Dietenberger, and W. W. Jones. Apr 94, 58p, NISTIR-5392.
Prepared in cooperation with Portland Cement Association, Skokie, IL. and Forest Products Lab., Madison, WI.

Keywords: *Algorithms, *Flame propagation, Fires, Buildings, Heat flux, Pyrolysis, Geometry, Ignition, Mathematical models, Soot, *Compartment fires, *Fire models.

The flame spread model described in this paper is a new algorithm which provides the capability to calculate a self-consistent fire based substantially on bench scale fire data. The flame spread model simulates object fire growth and burnout of a slab in a room and produces acceptable predictions of the spread of fire, smoke and production of both toxic and nontoxic gases. The purpose of the flame spread model is to allow a fire to grow realistically, possibly making a hole in the material surface. This is one mechanism for barrier penetration. The algorithm is based on empirical data, gathered from standard test apparatus, including the Cone Calorimeter and the LIFT (lateral ignition flame spread test method). The objective of including the flame spread model is to predict the accelerative growth of a fire from ignition to a peak value and then the gradual termination normally seen in a fire. The intent of the project was to develop an algorithm which could be utilized in a complete model of a fire in a building. The three-dimensional aspects of the flame spread model include: first, panels made of combustible materials with different thicknesses and at various orientations; second, flames of two basic types, pool fire and purely wall fire; third, a radiation heat exchange between objects, flames, and gases. The pool fire has a flame spreading polygon on a horizontal panel and the wall fire is used either for inclined or vertical panels.

Grant NIST-60NANB1D1177
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Combustion physics, *Buildings, Fires, Heat flux, Radiative heat transfer, Accuracy, Flame propagation, Building codes, Mathematical models, Algorithms, *Ceiling jets, *Fire dynamics, Fire codes.

The report summarizes accomplishments of a Factory Mutual Research Corporation (FMRC) project on the Prediction of Fire Dynamics for the NIST grant period August 1991 through August 1992. Work performed under a subcontract by Professor H.W. Emmons on Ceiling-Jet Dynamics and on Development of Strategies for Performance Fire Codes is first described under Task 1. The accomplishment of three tasks performed at FMRC are then presented in summaries of Tasks 2-4. All of this work is aimed at the development of subroutines or algorithms that can be used in NIST/BFRL comprehensive computer models. During the past year, there has been further progress in the development of predictive models for flame radiant heat flux and in the development of a practical laboratory test method for measuring the smoke point of solid noncharring or charring materials. This progress should allow continuing improvements in the accuracy and applicability of fire propagation theories.

Keywords: *Residential buildings, *Mathematical models, *Egress, *Human behavior, *Fires, *Fire safety, Algorithms, Reprints, Human reactions, Decision making, Injury prevention, Escape(Abandonment), HAZARD I Computer program.

The Building and Fire Research Laboratory has been developing mathematical models for predicting the environmental conditions which occur as a fire develops and spreads. These models form a significant part of the computer program entitled HAZARD I. Human egress modeling has been implemented in HAZARD I by means of simulation of actual human movement, invoking psychological theories and heuristic methodologies to create paths which the humans in the residential building under consideration would likely have taken. The research supported by this grant has been rather successful at finding mathematical models, appropriate solution techniques, coding the techniques, and making sample applications. In seven different research papers the results of the research have been documented. Six of these papers have appeared in print, while the seventh is submitted for publication. The full copies of the papers are included as appendices of this report, while summaries are presented

here for the reader's convenience. The research performed has advanced the state of the art in fire egress analysis, which forms an important part of fire hazard analysis and modeling as embodied in HAZARD I. In doing so, some new mathematical ideas, algorithms and theories have also been advanced. It is particularly satisfying to have new mathematics derived in support of such an important national priority as fire safety, and, as the mathematical knowledge is general, it may be of service to others in the future.

Analysis of Moisture Accumulation in a Wood-Frame Wall Subjected to Winter Climate.
Final rept.
D. M. Burch, and W. C. Thomas. 1992, 13p.
Pub. in Proceedings of Conference on Thermal Performance of the Exterior Envelopes of Buildings V, Clearwater Beach, FL., December 7-10, 1992, p467-479. See also PB92-116334. Sponsored by Department of Energy, Washington, DC.

Keywords: *Wood products, *Moisture content, *Walls, *Mathematical models, *Environmental effects, Winter, Performance evaluation, Construction materials, Moisture resistance, Capillary flow, Diffusion, Heat transfer, Water vapor, Finite difference method, Framed structures, Permeability, Humidity, Reprints.

A transient, one-dimensional, finite-difference model is presented that predicts that coupled transfer of heat and moisture in a multilayer wall under nonisothermal conditions. The model can predict moisture transfer in the diffusion through the capillary flow regimes. It has a provision to account for convective moisture transfer by including embedded cavities that may be coupled to indoor and outdoor air. The model is subsequently used to predict the time-varying average moisture content in the sheathing and siding of a wood-frame wall as a function of time of year. The effect of several construction parameters on the winter moisture accumulation is investigated. The parameters include the interior vapor retarder permeance, sheathing permeance, exterior paint permeance, indoor air leakage, and the amount of insulation.

Keywords: *Data base management systems, *Information systems, *Fire tests, *Buildings, Construction materials, Furniture, Data bases, Fire safety, Flammability, Ignition, Burning rate, *Fire Data Management System.

The Fire Data Management System (FDMS) is being developed under international collaboration to provide uniform means for storing fire test data. The purpose of the present work has been to aid the development of the FDMS for practical use by fire safety design professionals. To be of practical use by fire safety design professionals, the FDMS must contain relevant data and these data must be readily accessible. Currently, the data fields in the FDMS are too general and too restricted to be of practical design use. Additional data fields are needed in the FDMS to assist the design professional find flammability test data relevant to the design of different combustible objects in buildings. To help identify the types of additional data fields that are needed, a series of morphological charts have been developed to describe the types, elements and attributes of combustible objects in buildings. These morphological charts represent a first effort to describe a common syntax for identifying appropriate objects and their attributes for flammability analyses. Further refinement of the charts is needed.

Keywords: *Walls, *Pyrolysis, *Flame propagation, Burning rate, Fire safety, Fires, Heat flux, Mathematical models, Temperature measuring instruments.

Flame spread behavior and the pyrolysis region spread characteristics along vertical corner walls were studied in detail with an automated infrared imaging temperature measurement technique (IR technique). The technique was recently developed for the measurement of transient pyrolysis temperature on both charring and non-charring materials. Temporal isotherms on PMMA samples were successfully obtained, from which the progress rate of the pyrolysis front was automatically deduced. It was found that the pyrolysis front shape was always M-shaped, i.e., no spread along the corner, and the maximum spread is in a few centimeters away from the corner. Understanding of the mechanism of the M-shape formation is important in developing a prediction model of the spread rate. Four possible mechanisms were identified and flame displacement effects are found to be the principal mechanism. Transient total heat flux distributions above the M-shape pyrolysis peak for a spreading fire were measured. Using these values, it was shown that the upward spread rate is predictable from a simple, one-dimensional, thermal model.

Keywords: *Walls, *Turbulent flow, *Flame propagation, Heat flux, Burning rate, Data bases, Radiant flux density, Mathematical models.

Progress made on NIST grant number 60NANB8D0849 for the period September 30, 1991 to January 15, 1993 is reported. The overall objective is to understand the upward flame spread phenomenon under simulated surrounding fire conditions by establishing a data base for upward flame spread under external radiation, developing a mathematical model, measuring the relevant basic material properties needed, and checking the validity of the model by comparing its results with data. Emphasis is placed on studying and predicting the behavior of practical wall materials used in building and vehicle interiors, and textiles. In the past year, the authors measured flame spread on several different materials under a range of external radiant fluxes of up to 15 kW/sq m. A model for describing the upward flame spread process was developed and numerical results were compared with data. The model needed input of certain properties, such as the burning rate characteristics and surface radiation properties. A series of supporting studies were undertaken which provided the needed input properties to the model and other useful material property data.

Combined Buoyancy- and Pressure-Driven Flow Through a Shallow, Horizontal, Circular Vent.
L. Y. Cooper. Apr 94, 50p, NISTIR-5384.
See also PB94-103694.

Keywords: *Vents, *Air flow, *Buoyancy, *Flame propagation, Fire protection, Buildings, Boundary value problems, Boundary conditions, Mathematical models, Flow rate, *Compartment fires, *Fire models.

Combined buoyancy- and pressure-driven (i.e., forced) flow through a horizontal vent is considered where the vent-connected spaces near the elevation of the vent are filled with fluids of different density in an unstable configuration, with the density of the top space larger than that of the bottom space. With zero-to-moderate cross-vent pressure difference, delta p, the instability leads to a bi-directional exchange flow between the two spaces. For relatively large delta p, the flow through the vent is unidirectional, from the high- to the low-pressure space. Previously published experimental data and results of an analysis of the relevant boundary value problems are used to develop a flow model which takes all of these effects into account. The result is a uniformly valid algorithm to calculate flow through shallow (small depth-to-span ratio), horizontal, circular vents under high-Grashof number conditions. This is suitable for general use in zone-type compartment fire models (e.g., an ambient temperature environment above the vent and a hot smoky environment below). The algorithm is used in example applications where steady rate-of-burning in a ceiling-vented room is estimated as a function of room temperature, vent area, and oxygen concentration. Results of the analysis are seen to be consistent with previously published data involving ceiling-vented fire scenarios.

VENTCF2: An Algorithm and Associated FORTRAN 77 Subroutine for Calculating Flow through a Horizontal Ceiling/Floor Vent in a Zone-Type Compartment Fire Model.
L. Y. Cooper. Aug 94, 71p, NISTIR-5470.

Keywords: *Fire protection, *Vents, *Algorithms, *Subroutines, *Flame propagation, Air flow, Fire safety, Enthalpy, Mass flow, Mathematical models, Buildings, *Compartment fires, *VENTCF2 computer program, *Fire models.

An algorithm and associated FORTRAN 77 subroutine, called VENTCF2, is presented for calculating the effects on two-layer compartment fire environments of

the quasi-steady flow through a circular, shallow (i.e., small ratio of depth to diameter), horizontal vent connecting two spaces. The two spaces can be either two inside rooms of a multi-room facility or one inside room and the outside ambient environment local to the vent. The description of the flow through the vent is determined by combining considerations of the uni-directional-type of flow driven by a cross-vent pressure difference and, when appropriate, the combined pressure- and buoyancy-driven flows which occur when the density configuration across the vent is unstable, i.e., a relatively cool, dense gas in the upper space overlays a less dense gas in the lower space. In the algorithm, calculation of the rates of flow exchange between the two spaces is based on previously reported model equations. Characteristics of the geometry and the instantaneous environments of the two spaces are assumed to be known and specified as inputs. The outputs calculated by the algorithm/subroutine are the rates and the properties of the vent flow at the elevation of the vent as it enters the top space from the bottom space and/or as it enters the bottom space from the top space. Rates of mass, enthalpy, and products of combustion extracted by the vent flows from upper and lower layers of inside room environments and from outside ambient spaces are determined explicitly.

Suppression Research: Strategies.
Final rept.
D. D. Evans. 1992, 15p.
Pub. in Proceedings of International Conference on Fire Suppression Research (1st), Stockholm, Sweden, May 5-8, 1992, p21-35.

Keywords: *Fire extinguishers, *Fire tests, Burning rate, Fire fighting, Fires, Diffusion, Sprinklers, Mathematical models, Furniture, Reprints, *Extinction time.

Millions of unwanted fires occur each year. More effective fire suppression is a means to minimizing property damage and life loss due to fire. The Damkohler number, which is the ratio of the characteristic time for flow or diffusion of reactants to the time required for reaction, is the basis for a fire extinction criterion that may provide insight for many fire suppression situations. A correlation of wood crib fire extinction data is used to show the predictive capabilities that can be developed from experimental results alone, even without complete and general understanding of the fire suppression phenomena. The use of computer field modeling techniques is discussed as a means to generate insight into the complex physical interactions that occur during fire suppression in an enclosure.

No zoned smoke control system has been tested under real fire conditions. This paper presents a general overview of a project of full scale fire experiments to be conducted at the Plaza Hotel Building in Washington, DC. The objectives of these experiments are to evaluate the current approach concerning minimum pressure difference and to achieve smoke control for zoned smoke control systems with and without stairwell pressurization. Also, the interaction between smoke control and the fire will be studied. Air will be exhausted at six changes per hour from the fire floor to evaluate the effect of this common exhaust rate on the fire energy release rate.

Pub. in American Society of Heating, Refrigeration and Air-Conditioning Engineers Jnl., p34-37 Nov 92.

Keywords: *Buildings, *Fire safety, *Smoke, Manuals, Elevators(Lifts), Stairways, Pressurization, Air flow, Ventilation, Toxicity, Reliability, Reprints, *Smoke control, *Building fires, ASHRAE(American Society of Heating Refrigerating and Air Conditioning Engineers).

The American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) smoke control manual has been extensively revised and expanded. This manual consolidates and systematically presents data and calculational procedures for use by smoke management system designers. Fundamental issues of smoke management include reliability, activation, smoke obscuration, toxicity, and the driving forces of smoke movement. The mechanisms of compartmentation, dilution, air flow, pressurization, and buoyancy are used by themselves or in combination to manage smoke conditions in fire situations. The new manual presents systems for stairwell pressurization, elevator smoke control, zoned smoke control, and atrium smoke management.

Keywords: *Smoke, *Toxicity, *Test methods, Computerized simulation, Fire hazards, Fire safety, Heat flux, Combustion products, Buildings, Reprints, *Building fires.

A comprehensive methodology has been developed for obtaining and using smoke toxicity data for fire hazard analysis. This bench-scale method can simulate diverse fire conditions and identify extremely toxic smoke under both pre- and post-flashover conditions. However, incidence data show that most of the fire deaths in the U.S. occur outside the room of fire origin from smoke and toxic gases that are generated from a fire under post-flashover conditions. Therefore, the most relevant real-scale combustion conditions to simulate in the bench-scale apparatus would be the post-flashover conditions which are achieved by using radiant heat, a high heat flux, and correcting the bench-scale carbon monoxide (CO) results to agree with CO yields observed in real-scale post-flashover fires. The number of test animals (Fischer 344 male rats) is minimized by using the N-Gas Model to estimate the LC50 value from the chemical analysis of the smoke. The prediction is checked with a small number of animal tests and an approximate LC50 value is determined. The bench-scale results have been validated with full-scale room wall burns of a limited number of materials of widely differing characteristics chosen to challenge the system. The toxic potency values are assessed to determine if the smoke from a material or product is unusually or extremely toxic and can then be used in computations of fire hazard.

EXITT: A Simulation Model of Occupant Decisions and Actions in Residential Fires.
Final rept.
B. M. Levin. 1989, 10p.
Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p561-570 1989.

Keywords: *Residential buildings, *Computerized simulation, *Evacuation, *Decision making, Fire hazards, Smoke, Fire safety, Emergencies, Human behavior, Reprints, *Residential building fires, EXITT computer program, Escape time.

EXITT is a discrete event simulation of occupant decisions and actions in a postulated fire. To run the model the physical descriptions of a residence, a specific fire in that residence, and the assumed occupants of the residence are entered into the computer. Based on a large set of decision rules, the occupants make decisions which are a function of the smoke conditions in the building, the characteristics and status of the occupants (including their capabilities), and the available travel routes. The occupants investigate the fire, alert and assist others, and evacuate the building. The simulation ends when all the occupants are either out of the building or are trapped by the smoke.

Hollow Clay Tile Prism Tests for Martin Marietta Energy Systems: Task 2 Testing.
C. W. C. Yancey. 1993, 324p, NISTIR-5328.
Color illustrations reproduced in black and white.

Keywords: *Compressive strength, *Modulus of elasticity, *Clays, *Tiles, *Poisson ratio, Masonry, Construction materials, Mechanical properties, Loads(Forces), Displacement, *Hollow clay tile prisms.

Forty-one Hollow Clay Tile prisms were tested in monotonic, uniaxial compression to failure as the second task in a two-task prism test program for the Department of Energy (DOE). Twenty prisms were nominally 330 mm (13 in) thick and twenty-one were nominally 200 mm (8 in) thick. Twenty-one prisms were tested with the compressive load applied normal to the axis of the hollow cores and the other twenty were subjected to compressive load acting parallel to the axis of the cores. The objectives of the Task 2 test series were to: (1) obtain the compressive strength, (2) determine the modulus of elasticity in compression, (3) determine Poisson's ratio for the prisms, (4) study and understand the behavior of this type of masonry prism, (5) determine whether workmanship during construction of the prisms significantly affects the strength and (6) compare the results of using load control versus displacement control while loading the prisms. Test results are presented in tabular form to report the gross and net area compressive strengths, and Secant Modulus of Elasticity on the gross and net areas. Load-displacement plots are presented to graphically report on the output from vertical and horizontal Linear Variable Differential Transformers attached to the prism faces.

Survey of Recent Cementitious Materials Research in Western Europe.
D. P. Bentz. Aug 94, 35p, NISTIR-5480.

Keywords: *Cements, *Concretes, *Hydration, *Research management, Microstructure, Shrinkage, Cracking(Fracturing), Concrete durability.

The report summarizes recent research on cementitious materials in western Europe, based on a perspective gained during a six month stay at the Centre Scientifique et Technique du Batiment in Grenoble, France. During this time period, the author visited sixteen laboratories in seven different European countries. Numerous publications, all included in the reference list of this report, were obtained during these visits. Research is grouped into topical areas with a

brief description of separate activities at each institution. Emphasis has been placed on those research topics of interest to the Building Materials Division of NIST. A list of researchers working on cementitious materials in western Europe is also provided for those readers wishing to obtain further information on specific topics.

Keywords: *Masonry, *Walls, Shear stress, Cyclic loads, Tests, Seismic design, Earthquake engineering, Buildings.

A review of the current status of research on masonry structures at the Building and Fire Research Laboratory of the National Institute of Standards and Technology (NIST) is presented, and an ongoing project on partially-grouted masonry shear walls is summarized. The report draws from previous work conducted at NIST including a comprehensive literature review, simulated seismic load tests of unreinforced and reinforced masonry walls, and numerical analyses employing empirical formulations and finite element models. The previous NIST research culminates with a preliminary draft outlining a research program on partially-grouted masonry walls and numerical analyses.

Controlling Moisture in the Walls of Manufactured Housing.
Technical note.
D. M. Burch, and A. TenWolde. Dec 92, 42p, NISTIR-4981, HUD-0006080.
See also AD-A139 637. Sponsored by Department of Housing and Urban Development, Washington, DC. Office of Policy Development and Research and Forest Products Lab., Madison, WI.

Keywords: *Walls, *Moisture, *Permeability, *Construction materials, *Housing(Dwellings), Humidity, Boundary conditions, Diffusion, Condensation, Wallboard, Ventilation, *Manufactured housing.

This report contains the results of a detailed computer analysis to investigate the effectiveness of three alternative practices for controlling moisture accumulation in the walls of manufactured housing during the winter. The three practices included: (1) providing a vapor retarder, (2) using permeable sheathing and siding, and (3) providing an outdoor ventilated cavity. The current Manufactured Home Construction and Safety Standards do not require a vapor retarder for practices 2 and 3. The analysis was carried out for a cold winter climate (Madison, WI), an intermediate winter climate (Boston, MA), a mild winter climate (Atlanta, GA), and a Pacific northwest climate (Portland, OR). The practice of providing a vapor retarder was found to be effective in all four climates. The moisture content of the siding was always considerably below fiber saturation. On the other hand, the practice of using permeable sheathing and siding and the practice of providing an outdoor ventilated cavity were not always effective in colder climates.

Measurements of Moisture Diffusivity for Porous Building Materials.
Final rept.
R. F. Richards. 1992, 11p.
Sponsored by Department of Energy, Washington, DC. Pub. in Proceedings of Conference on Thermal Performance of the Exterior Envelopes of Buildings V, Clearwater Beach, FL., December 7-10, 1992, p501-511.

Keywords: *Construction materials, *Porous materials, *Diffusivity, *Moisture, Mass transfer, Flux(Rate), Pressure, Steady state, Moisture content, Reprints.

Moisture diffusivities of several common porous building materials were determined experimentally. Both wood-based and inorganic materials were included in the study. A steady-flux method was used that involved determining the one-dimensional moisture content profile produced in a sample through which a known constant flux of water is flowing. The transient mass fluxes through samples upon exposure to water, steady-state mass fluxes, one-dimensional moisture content profiles, and capillary pressure curves for low suction pressures, as well as the moisture diffusivities for a range of moisture contents, are presented for each material. Results of the study are compared to previously published measurements for similar materials.

Verification of a Model of Fire and Smoke Transport.
Final rept.
R. D. Peacock, W. W. Jones, and R. W. Bukowski. 1993, 41p.
Pub. in Fire Safety Jnl. 21, p89-129 1993.

Keywords: *Fires, *Smoke, Flame propagation, Fire tests, Computer programs, Combustion products, Mathematical models, Algorithms, Reprints, *Fire models, *Smoke transport, *Room fires.

A set of comparisons between a comprehensive room fire model and a range of real-scale fire experiments is presented. For these comparisons, a zone-based model, CFAST ('consolidated fire and smoke transport' model) is used. The model predicts the evolution of a fire in a room and the subsequent transport of the smoke and toxic gases which result from this fire. These comparisons serve two purposes: to determine, within limits, the accuracy of the predictions for those quantities of interest to the users of the models (usually those extensive variables related to hazard), and to highlight the strengths and weaknesses of the underlying algorithms in the models to guide future improvements in this and other models. The predicted variables selected for comparison deal with both of these purposes. Although differences between the model and the experiments were clear, they can be explained by limitations of the model and of the experiments.

Suggestions for a Logically-Consistent Structure for Service Life Prediction Standards.
Final rept.
G. Frohnsdorff, and L. Masters. 1990, 14p.
Pub. in Proceedings of International Conference on Durability of Building Materials and Components (5th), Brighton, UK., November 7-9, 1990, p113-126.

Keywords: *Service life, *Construction materials, *Aging(Materials), *Standards, Degradation, Life(Durability), Buildings, Prediction analysis techniques, Reprints, *Environmental characterization.

Ability to predict the service life of building materials, components, and systems is needed to improve the selection process. Evaluation of durability using existing standards does not give adequate service life information. Because service life prediction is more complex than current durability evaluations, its standardization will require a new body of standards to be put in place. The standards must define a general methodology, and essential components of the methodology. These are environmental characterization, characterization of the item whose service life is to be predicted, identification of the mechanisms and kinetics of the degradation processes, development of mathematical models of degradation, application of the models in service life prediction, and reporting of the results. It is proposed that the needed standards must comprise a hierarchy with the highest level being the general methodology, the second level defining the essential components of the methodology, and the third and lower levels describing the application of the generic standards to specific materials, components, or systems.

Sponsored by National Roofing Contractors Association, Rosemont, IL. and Johns Hopkins Univ., Baltimore, MD.
Pub. in Proceedings of a Symposium on Roofing Research and Standards Development, ASTM STP 1088, San Francisco, CA., June 17, 1990, v2 p37-52.

Keywords: *Thermal analysis, *Membranes, *Roofs, *Test methods, Construction materials, Elongation, Calorimetry, Thermogravimetric analysis, Heat measurement, Reprints, *EPDM ruhber roofing, ASTM D 4637, Dynamic mechanical analysis.

This study was conducted to provide data on the feasibility of using thermal analysis (TA) methods for the characterization of roofing membrane materials. TA methods have never been widely applied to such materials. The TA methods used were thermogravimetry (TG), differential scanning calorimetry (DSC), and dynamic mechanical analysis (DMA). Three black (carbon black filled), two white (titanium dioxide pigmented), and one white on black laminate ethylene propylene diene terpolymer (EPDM) membrane materials were analyzed before and after exposure to the heat, ozone and UV conditions given in ASTM D 4637, and also to outdoor exposure. Load-elongation tests were conducted to compare the results with those of the TA methods. The results indicated that: (1) TA techniques can be used to analyze EPDM membrane materials; (2) both the black and white membrane materials showed only slight property changes under exposure, as determined using the TA methods; and (3) in contrast to the TA results, the load elongation values displayed relatively large changes.

Sponsored by National Roofing Contractors Association, Rosemont. IL. and Johns Hopkins Univ., Baltimore, MD.
Pub. in Proceedings of a Conference on Materials Characterization by Thermomechanical Analysis, ASTM STP 1136, Philadelphia, PA., March 19-20, 1990, p168-175 1991.

Keywords: *Roofs, *Membranes, *Test methods, Thermal analysis, Construction materials, Elongation, Heat measurement, Reprints, *EPDM rubber roofing, *Thermal mechanical analysis, ASTM D 4637.

This study was conducted to provide baseline data on the applicability of thermal mechanical analysis (TMA) for characterizing EPDM roofing membrane materials. TMA has not been used extensively for the analysis of such materials. Three black and three white membrane materials were analyzed before and after exposure to the heat, ozone, and UV conditions described in ASTM D 4637, as well as to outdoor exposure. Load-elongation was conducted as a comparison to the TMA results. The results indicated that: (1) TMA can be applied to the characterization of EPDM membrane materials showing the differences in glass transition temperature between various brand name products; (2) changes in glass transition temperatures induced by the exposure conditions were relatively low and covered the same range for both the black and white membrane materials; and (3) in contrast to the TMA testing, the percent elongation values displayed relatively large changes.

Pub. in Jnl. of Materials Science 27, n8 p2083-2092 1992.

Keywords: *Portland cement, *Microstructure, *Computerized simulation, *Diffusivity, *Chlorides, Hydration, Durability, Construction materials, Transport properties, Image analysis, Porosity, Reprints.

A digital-image-based model of the microstructure of cement paste, coupled with exact transport algorithms, is used to study the diffusivity of portland cement paste. The principal preparation and material variables are water:cement ratio, degree of cement hydration, and capillary porosity. Computational methods are described in some detail, and diffusivity results are presented and found to agree within experimental error with the available experimental measurements. Model cement pastes prepared with different water:cement ratios, and having different degrees of cement hydration, are found to have diffusivities that lie on a single master curve when plotted as a function of capillary porosity. Using percolation ideas, the diffusivity of cement paste is mapped out as a function of capillary porosity for any water:cement ratio cement paste.

Digital Simulation of the Aggregate-Cement Paste Interfacial Zone in Concrete.
Final rept.
E. J. Garboczi, and D. P. Bentz. 1991, 6p.
Sponsored by Northwestern Univ., Evanston, IL. Dept. of Civil Engineering.
Pub. in Jnl. of Materials Research 6, n1 p196-201 1991.

Keywords: *Concretes, *Interfaces, *Aggregates, *Computerized simulation, Hydration, Curing, Portland cement, Image analysis, Porosity, Diffusion, Construction materials, Scanning electron microscopy, Reprints, *Interfacial zone.

Back-scattered scanning electron microscopy, along with quantitative image analysis techniques, have clearly demonstrated the existence of a highly porous interfacial region between the aggregate and the hardened cement paste matrix in ordinary Portland cement concrete. This paper presents the results of a digital-image-based simulation model of this interfacial zone. A dissolution-diffusion-reaction cycle of hydrating cement particles is directly simulated using cement particles packed around a simple non-reactive aggregate particle. The model is two-dimensional, as we are comparing to experimental results obtained on images of polished sections. The qualitative features seen in the experiment, such as large amounts of porosity and calcium hydroxide in the interfacial zone, are faithfully reproduced. The new mechanism of one-sided growth is proposed, along with the usual particle-packing ideas, as an explanation of the origin of the characteristic features of the interfacial zone.

This report describes the fire research projects performed in the Building and Fire Research Laboratory (BFRL) and under its extramural grants program during Fiscal Year 1993. Included are research performed both with funds appropriated to the BFRL Fire Research Program and under contract to outside organizations. The BFRL Fire Research Program has directed its efforts under four program thrusts. The in-house priority projects, extramural grants, and externally-funded efforts thus form an integrated, focussed ensemble. This publication is organized along those lines: (1) Performance-based Fire Standards; (2) Fire Safe Materials and Products; (3) Advanced Fire Sensing and Suppression; (4) Large/Industrial Fires. For the convenience of the reader, an alphabetical listing of all grants is contained in the Part 2.0.

Simulating Smoke Movement through Long Vertical Shafts in Zone-Type Compartment Fire Models.
L. Y. Cooper. Nov 94, 40p, NISTIR-5526.

Keywords: *Smoke, *Air flow, *Buoyancy, *Two phase flow, Turbulence, Vents, Plumes, Diffusion, Elevators(Lifts), Density, Mathematical models, *Zone-type compartment fire models, *Building fires.

A limitation of traditional zone-type compartment fire modeling concepts identify; namely, the inadequacy of two-layer quasi-steady-buoyant-plume analyses to simulate the fire-generated environment in room configurations with large height-to-span ratios, e.g., elevator shafts and long, vertical, ventilation shafts and ducts. A possible means of removing this limitation is developed. This involves a method of analysis and associated model equations that can be implemented and used to advance zone-type models. The model equations simulate time-dependent flows in a long, ventilated, vertical shaft/duct with an arbitrary vertical density distribution, including one or more intervals along the shaft/duct length where the vertical distribution of the average cross-section density may be unstably stratified, i.e., density increasing with increasing elevation. The model equations are partially verified by favorable comparisons between solutions and previously published data from unsteady experiments in long vertical tubes involving initially unstable configurations: salt-water over fresh-water and heavy-gas over light-gas. Additional verification of the proposed equation set with cold-air over hot-air systems and with fire-driven smoke flows, both of which involve gas-to-surface heat transfer, is required before this model can be used with confidence in professional practice.

Percolation and Pore Structure in Mortars and Concrete.
Final rept.
D. Winslow, M. Cohen, D. Bentz, K. Snyder, and E. Garboczi. 1994, 13p.
Sponsored by Center for Advanced Cement-Based Materials, Evanston, IL.
Pub. in Cement and Concrete Research 24, n1 p25-37 1994.

Keywords: *Building materials, *Concretes, *Motars, *Pore structure, *Percolation, Computerized simulation, Microstructure, Interfaces, Durability, Transport properties, Reprints, Mercury intrusion porosimetry, Silica fume.

The cement paste in concrete and mortar has been shown to have a pore size distribution different than that of plain paste hydrated without aggregate. For mortar and concrete, additional porosity occurs in pore sizes larger than the plain paste's threshold diameter as measured by mercury intrusion. Based on the assumption that these larger pores are essentially present only in the interfacial zones surrounding each aggregate, an experimental program was designed in which the volume fraction of sand in a mortar was varied in a systematic fashion and the resultant pore sys-

tem probed using mercury intrusion porosimetry. The intrusion characteristics were observed to change drastically at a critical sand content. Similar results are observed for a series of mortar specimens in which the cement paste contains 10% silica fume. To better interpret the experimental results, a hard core/soft shell computer model has been developed to examine the percolation characteristics of these interfacial zone pores. Using the model, interfacial zone percolation in concretes is also examined. Finally, the implications of interfacial zone percolation for transport properties and durability of mortar and concrete are discussed.

Effects of Humidity and Elevated Temperature on the Density and Thermal Conductivity of a Rigid Polyisocyanurate Foam Co-Blown with CCl3F and CO2.
Final rept.
R. R. Zarr, and T. Nguyen. 1994, 21p.
Pub. in Jnl. of Thermal Insul. and Bldg. Envs. 17, p330-350 Apr 94.

Keywords: *High temperature tests, *Humidity, *Thermal conductivity, *Density(Mass/volume), *Foams, *Thermal insulation, Thermal resistance, Heat measurement, Thermodynamic properties, Laminates, Thermophysical properties, Temperature dependence, Test facilities, Reprints, *Rigid polyisocyanurate foam.

Measurements of density and apparent thermal conductivity are presented for specimens cut from rigid polyisocyanurate foam co-blown with trichlorofluoromethane and carbon dioxide. Eight specimens, nominally 580 by 580 by 27 mm, were prepared from two boards (1.2 by 2.4 m by 50mm) of foam laminated with permeable facers. Four specimens were placed in an ambient condition of 22 C and 40% relative humidity (RH). The other four specimens were each placed in one of the following environments: (1) 60 C and less than 10% RH; (2) 60 C and 40% RH; (3) 60 C and 60% RH; and (4) 60 C and 75% RH. Measurements of apparent thermal conductivity at 24 C were conducted over a period of 372 days at approximately 50-day intervals. Curves of specimen mass, volume, density, and thermal conductivity versus time are presented, and the implications of changes in these properties are discussed.

Effects of Adhesive Thickness, Open Time, and Surface Cleanness on the Peel Strength of Adhesive-Bonded Seams of EPDM Rubber Roofing Membrane.
Final rept.
H. Watanabe, and W. J. Rossiter. 1990, 16p.
Pub. in Roofing Research and Standards Development: ASTM STP 1088, v2 p21-36 1990.

Keywords: *Roofing, *Adhesion, *Peel strength, *Seams(Joints), Adhesive bonding, Surface properties, Construction materials, Roofs, Contamination, Failure modes, Rubber, Membranes, Curing, Strength(Mechanics), Cleanliness, Reprints, *EPDM Rubber Roofing Membrane, Open time.

A laboratory study was undertaken to examine the effects of adhesive thickness, open time, and surface cleanness on T-peel strength of EPDM rubber seam specimens. Seam specimens bonded with butyl-based contact adhesive were tested after a 2-week cure time. The peel strength generally showed a positive dependency on the adhesive thickness except that it tended towards a plateau value for thick adhesive layers. The leveling of peel strength at large thickness might result from the presence of small voids in the adhesive layer. The peel strength was not dependent on the open times used in this study. Increased levels of surface contamination lowered the peel strength and changed the failure mode from cohesive to interfacial.

Pub. in Proceedings of Society of the Plastics Industry Annual Technical/Marketing Conference (34th) Polyurethanes 92, New Orleans, LA., October 21-24, 1992, p422-430.

Keywords: *Humidity, *High temperature tests, *Density(Mass/volume), *Thermal conductivity, *Thermal insulation, Test methods, Heat measurement, Temperature dependence, Thermal resistance, Thermodynamic properties, Thermophysical properties, Test facilities, Reprints, *Rigid polyisocyanurate foam.

Measurements of apparent thermal conductivity are presented for specimens of rigid polyisocyanurate (PIR) foam cut from a commercial insulation product and aged in air 60 C and different humidities. Eight specimens, nominally 600 by 600 mm, were prepared from two boards (1.2 by 2.4 by 0.05 m) of rigid PIR foam blown with trichlorofluoromethane and having permeable organic-inorganic facers. Facers and excess foam were removed by sanding the specimens to a thickness of 27.9 + or - 0.1 mm. Four specimens were placed in ambient conditions of 22 C and 40% relative humidity (RH). Measurements of apparent thermal conductivity were conducted at 24 C and a temperature difference of 22 C using a heat-flow-meter apparatus conforming to ASTM Test Method C 518. Measurements were conducted for a period of 357 days at approximately 50-day intervals. Aging curves of specimen mass, volume, density, and thermal conductivity for rigid PIR foam are presented and implications of changes in these properties are discussed in the paper.

Room Temperature Thermal Conductivity of Fumed-Silica Insulation for a Standard Reference Material.
Final rept.
R. R. Zarr, T. A. Somers, and D. F. Ebberts. 1991, 23p.
Pub. in Improved Thermal Insulation Problems and Perspectives, Chapter 5, p97-119 1991.

Keywords: *Thermal conductivity, *Thermal insulation, *Silicon dioxide, Conductive heat transfer, Thermal resistance, Heat measurement, Thermodynamic properties, Test facilities, Reprints, *Standard reference materials.

Thermal conductivity of fumed-silica insulation board was measured using the National Institute of Standards and Technology 1-meter Guarded Hot Plate. Measurements were conducted for the following range of parameters: bulk density, 304.5 to 325.4 kg/cu m, mean temperature, 283.1 to 311.0 K; and barometric pressure, 97.51 to 103.43 KPa. The effect of moisture content on room-temperature measurements was minimized by prior conditioning of the specimen at 100 C for 24 hours. Seventy-five samples (600 by 600 by 25.4 mm) were transferred to the Office of Standard Reference Materials in Gaithersburg, Maryland, USA. The material is offered as a Standard Reference Material having a low thermal conductivity at room temperature.

Effects of Specimen Edge Conditions on Heat Release Rate.
Final rept.
V. Babrauskas, W. H. Twilley, and W. J. Parker. 1993, 13p.
Pub. in Fire and Materials 17, n2 p51-63 1993.

Keywords: *Calorimeters, *Fire tests, *Edges, *Construction materials, *Heat flux, Burning rate, Heat transmission, Flammability, Plastics, Wood, Heat measurement, Reprints, *Reaction-to-fire tests.

When bench-scale specimens are tested for heat release rate, it is generally of interest that the behavior of the specimen simulate, as much as is possible, that of a real-scale product performing in a real fire. A number of issues have been raised recently by workers trying to understand the optimal conditions of specimen preparation and mounting. In the present study a large number of materials were explored in the Cone Calorimeter to determine the effect of edge conditions and edge frames. It was found that by the use of an insulated edge frame, heat release rate values can be obtained which are slightly closer to expected true values. The testing procedure, however, is significantly more complicated. This makes the insulated edge frame useful for collecting specialized data for fire modeling, but not for conducting routine reactions-to-fire tests. For routine testing use, it is recommended: (1) that no edge frame needs to be used unless the test specimen presents special difficulties, such as due to intumescence; (2) that in those cases where the use of the steel edge frame is found necessary, the results should be reported on the basis of an effective exposure area of 0.0081 sq m. When reported on such a basis, the heat release rate results do not show a systematic bias, compared to results with no edge frame.

Method of Predicting Smoke Movement in Atria with Application to Smoke Management.
J. H. Klote. Oct 94, 96p, NISTIR-5516.
Also available from Supt. of Docs.

Keywords: *Smoke, *Air flow, *Fires, *Buildings, *Atria, Unsteady flow, Fire tests, Temperature distribution, Mathematical models, Architecture, Building codes, Mass flow, Steady flow, *Smoke management, *Fire models, ASMET computer program, ASMET (Atria Smoke Management Engineering Tools).

The paper presents information that can be used for predicting smoke movement for design of atrium smoke management systems. NFPA 92B (1991) and the smoke control design book by Klote and Milke (1992) define smoke as the airborne solid and liquid particulates and gases evolved when a material undergoes pyrolysis or combustion, together with the quantity of air that is entrained or otherwise mixed into the mass. In recent years, approaches to smoke management in atria have been introduced into codes and engineering guides (BOCA; UBC 1993; NFPA 92B 1991; Klote and Milke 1992; Hansel and Morgan 1994). While these basic approaches differ in many respects, they all have the zone fire model concept as a common foundation and consist of a collection of algebraic equations intended for design calculation. For simplicity, discussion of the basic approaches is limited to those of NFPA 92B. However, much of this applies to the other approaches as well. The paper explains the physical concepts behind NFPA 92B including system limitations. The conservative nature of this approach is investigated, and the unique design challenge of atrium smoke detection is discussed. The application of zone computer fire models to atrium design is addressed. This paper also presents a computer program entitled Atria Smoke Management Engineering Tools (ASMET) that consists of a set of equations that may be of help for conventional applications. Appendices C and D describe ASMET including brief user instructions.

Characteristics of Adhesive-Bonded Seams Sampled from EPDM Roof Membranes.
Final rept.
W. Rossiter, J. Seiler, W. Spencer, J. Lechner, and P. Stutzman. 1991, 13p.
Pub. in Proceedings of International Symposium on Roofing Technology (3rd), Montreal, Canada, April 17-19, 1991, p167-179.

Keywords: *Failure analysis, *Seams(Joints), *Adhesive bonding, *Roofing, *Characterization, Rubber, Membranes, Construction materials, Adhesives, Scanning electron microscopy, Sampling, Nondestructive tests, Mechanical properties, Defects, Reprints, *EPDM roof membranes.

This study reports on the characterization of seam samples cut from EPDM roof systems. The availability of data on seam characteristics and failure analysis is beneficial to furthering the understanding of seam performance and to developing performance criteria for seams. Forty-eight samples were cut from EPDM roofs whose seams were rated as having provided satisfactory or unsatisfactory performance. The samples were

subjected to laboratory tests which included identification of the adhesive, measurement of adhesive thickness, and determination of the strength and mode of failure in peel. Comparisons were made between the test results and performance ratings. It was found that the majority of the unsatisfactorily performing seams contained neoprene-based adhesives and were exposed on roofs for 45 months or more when sampled. Of the samples subjected to SEM analysis, the majority showed evidence of release agent on the rubber and adhesive surfaces analyzed. This finding provided evidence that a field method to judge rubber surface cleanness before application of the adhesive is needed.

Rheology of Fresh Cement Paste.
Final rept.
L. J. Struble. 1991, 23p.
Sponsored by National Science Foundation, Washington, DC. and Northwestern Univ., Evanston, IL. Center for Advanced Cement-Based Materials.
Pub. in Ceram. Trans. 16, p7-29 1991.

Keywords: *Cements, *Rheology, *Microstructure, Construction materials, Binders(Materials), Curing, Particulates, Dispersions, Flow theory, Reprints.

Rheology provides considerable information about the microstructure of dense particulate suspensions, and an important reason for studying the flow behavior of fresh cement paste is to infer the extent to which particles are flocculated, how densely they are picked, and how their microstructure is modified by hydration reactions prior to set. These aspects of the fresh paste microstructure influence both the initial flow behavior and the ultimate performance of concrete. The rheology of fresh cement paste and other dense particulate suspensions is reviewed. There has been much progress in formulating relationships between flow behavior and microstructure of disperse suspensions, and recent advances in dense, flocculated suspensions have been assisted in part by new experimental techniques. This recent understanding offers encouragement as well as promising research directions in developing direct relationships between flow behavior and microstructure for flocculated cement particles in fresh paste.

P. E. Stutzman. 1991, 5p.
Pub. in Proceedings of American Society of Civil Engineers Engineering Mechanics Specialty Conference, Columbus, OH., May 20-22, 1991, p1087-1091.

Keywords: *Concrete, *Portland cement, *Characterization, *Scanning electron microscopy, Microstructure, Image analysis, X-ray analysis, Petrography, Nondestructive tests, Microanalysis, Inspection, Reprints.

The scanning electron microscope (SEM) is a powerful tool for the microstructural and chemical characterization of cement and concrete. Imaging techniques such as secondary electron, backscattered electron, and X-ray imaging provide information about surface texture, microstructure, aggregates, and the air void system. X-ray microanalysis is useful for qualitative and quantitative chemical analysis and X-ray mapping of element distribution. Image processing and analysis is used for quantification of microstructural features. The linking of these operations will provide automated, quantitative, and consistent analysis of portland cement and concrete.

Wall Flame Heights with External Radiation.
Final rept.
K. M. Tu, and J. G. Quintiere. 1991, 9p.
Pub. in Fire Technology 27, n3 p195-203 Aug 91.

Keywords: *Walls, *Burning rate, *Fire tests, *Fiberboard, Heat flux, Wallboard, Heat transfer, Construction materials, Fire safety, Wood particle boards, PMMA, Reprints, *Upward flame spread.

This work was an experimental study of upward flame spread of vertically oriented wall material with external radiation. Its inherent potentials of high fire growth rate and spreading to surrounding materials makes this study a very challenged task. An existing flame heat transfer fire testing apparatus was used to study the upward flame spread potential of two kinds of wall materials: (1) the PMMA (Polymethylmethacrylate) and (2) the Douglas Fir Particle Board. PMMA is non-charring whereas Douglas Fir Particle Board is a charring material. Various levels of external radiant heat flux ranging from 1.8 W/sq cm to 3.4 W/sq cm were imposed on to the wall samples for carrying out the series of fire tests. Relevant parameters measured were fuel mass burning rate, wall fire flame height, external radiant heat flux level and flame heat transfer, etc. Observations and data measurements of these experimental results were employed to evaluate flammability characteristics of wall materials as well as validating the application of ignition and flame spread theory on predicting material performance.

Pulse-Echo Ultrasonic Evaluation of the Integrity of Seams of Single-Ply Roof Membranes.
Final rept.
H. Watanabe, and W. J. Rossiter. 1991, 12p.
Pub. in Proceedings of 1991 International Symposium on Roofing Technology, p72-83.

Keywords: *Roofing, *Ultrasonic tests, *Seams(Joints), *Adhesive bonding, Membranes, Defects, Voids, Nondestructive tests, Construction materials, Reprints, *Single-ply roof membranes, *Pulse-echo ultrasonic evaluation.

This paper summarizes results of a study to develop an ultrasonic pulse-echo method for evaluating the integrity of seams of single-ply roofing membranes. A prototype pulse-echo apparatus (the field scanner), which was designed to scan across seams of roofs while maintaining acoustic coupling to the seam surface, was developed. Results of initial laboratory investigations showed that voids in seams could be distinguished from well-bonded sections using the intensity of the echo from the adhesive layer. This echo was relatively weak for well-bonded seams, and relatively strong for voids. Seams of existing EPDM single-ply membranes were examined by roof-top scanning to evaluate the performance of the field scanner in practice. The findings indicated that the field scanner was sensitive to detecting micro-cavities that could be created in the adhesive layer at the time of seam fabrication, thus resulting in false positive readings. It was concluded that, at least in its present form, the field scanner had limited applicability to resolving micro-cavities from voids and delaminations in solvent-adhesive seams.

Keywords: *Fires, *Plumes, *Convective heat transfer, *Ceilings(Architecture), *Walls, Jet flow, Heat flux, Temperature distribution, Algorithms, Velocity distribution, Subroutines, Mathematical models, Reprints, CEILHT subroutine.

This work presents a model to predict the instantaneous rate of convective heat transfer form fire plume gases to the overhead ceiling surface in a room of fire origin. The room is assumed to be a rectangular parallelopiped and, at times of interest, ceiling temperatures are simulated as being uniform. Also presented is an estimate of the convective heat transfer, due to ceiling-jet-driven wall flows, to both the upper and lower portions of the walls. The effect on the heat transfer of the location of the fire within the room is taken into account. Finally presented is a model of the velocity and temperature distributions in the ceiling jet. The model equations were used to develop an algorithm and associated modular computer subroutine to carry out the indicated heat transfer calculations. The subroutine is written in FORTRAN 77 and called CEILHT. The algorithm and subroutine are suitable for use in two-layer zone-type compartment fire model computer codes. The subroutine was tested for a variety of fire environments involving a 10(exp 7) W fire in a 8m x 8m x 4m high enclosure. While the calculated results were plausible, it is important to point out that CEILHT simulations have not been experimentally validated.

Manufactured Housing Walls That Provide Satisfactory Moisture Performance in All Climates.
D. M. Burch, C. A. Saunders, and A. TenWolde. Jan 95, 36p, NISTIR-5558.
See also PB95-105136. Prepared in cooperation with Forest Products Lab., Madison, WI. Sponsored by Department of Housing and Urban Development, Washington, DC. Office of Policy Development and Research.

Keywords: *Construction materials, *Walls, *Moistureproofing, *Prefabricated buildings, Moisture, Diffusion, Plywood, Wallboard, Cold regions, Mathematical models, Humidity, Thermal insulation, Permeability, Hot regions, *Moisture transfer.

We used the MOIST Computer Model to conduct a detailed analysis of the moisture performance of one wall typical of current construction practice in manufactured housing, and two new alternative wall designs with potential for better moisture performance in a wider variety of climates. The analysis showed that the current-practice wall with an interior vapor retarder performed acceptably in a cold climate (Madison, WI), but poorly in a hot and humid climate (Miami, FL). The alternative wall designs both exhibited satisfactory moisture performance in the cold climate and the hot and humid climate, even with moderately severe indoor conditions. The alternative wall designs also performed satisfactorily in a mixed climate (Little Rock, AR). These alternative wall designs should be of interest to the manufactured housing industry, which distributes homes to all climatic regions of the United States.

Pub. in Proceedings of International Symposium on Fire Safety Science (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p185-193.

Keywords: *Transport properties, *Convective flow, *Computational fluid dynamics, Computerized simulation, Mathematical models, Finite difference theory, Combustion, High Reynolds number, Fires, Buoyancy, Navier-Stokes equations, Reprints, *Enclosure fires.

A method of studying the large scale transport of smoke and hot gases induced by fires in enclosures is described. The approach is based on solving the governing equations directly (if approximately) by decomposing the fire-driven flow field into large scale convective and small scale combustion components. In this work, results involving large scale convective transport generated by flow fields associated with typical fire scenarios are presented. The large scale flow is studied using finite difference techniques to solve large eddy simulations of the Navier-Stokes equations at high Reynolds numbers.

Nondestructive Testing of Concrete: History and Challenges.
Final rept.
N. J. Carino. 1994, 56p.
Pub. in Proceedings of V. Mohan Malhotra Symposium on Concrete Technology: Past, Present, and Future, San Francisco, CA., March 21-23, 1994, p623-678.

Keywords: *Concretes, *Nondestructive tests, Ultrasonic tests, Statistical analysis, Test methods, Durability, Mechanical properties, Infrared spectroscopy, Thermography, Reprints.

A brief history of nondestructive testing of hardened concrete over the past 50 years is presented. The contributions of V.M. Malhotra towards the development and promotion of nondestructive testing are emphasized. The underlying principles and inherent limitations of the methods are reviewed, and historical highlights of their development are presented. Test methods are grouped into those which assess in-place strength and those which evaluate non-strength characteristics, such as flaws and deterioration. The paper concludes with a discussion of the challenges for the 21st century in the area of nondestructive testing.

Keywords: *Thermal insulation, *Heat meters, *Calibration, Heat transmission, Errors, Steady state, Precision, Measuring instruments, Reprints.

Calibration measurements of a commercial heat-flow-meter apparatus are presented. The apparatus has been calibrated using the same speciment of high-density fibrous-glass board over a period of four years, from 1989 to 1993. Seventy-three tests have been conducted, generally at ambient conditions of 24 C with a moderate temperature difference of either 15, 22, or 27 C across the specimen. Variations within a set of data for each test have been examined to verify underlying assumptions of randomness, normal frequency distribution of errors, repeatability, and stability of the data. Variations between test data indicate a small drift, on the order of one percent over four years, in the calibration factor of the apparatus. A model has been developed to describe the small drift with time. The analysis of variations between test data has also identified intermittent shifts in the precision of the calibration factor of the apparatus.

R. R. Zarr, and T. Nguyen. 1991, 15p.
Pub. in Proceedings of International Workshop on the Long-Term Thermal Performance of Cellular Plastics (2nd), Ontario, Canada, June 5-7, 1991, 15p.

Keywords: *Thermal conductivity, *Thermal insulation, *Aging(Materials), *Test methods, Heat meters, Thermophysical properties, Heat transmission, Humidity, Foams, Measuring instruments, Expanded plastics, Reprints, *Polyisocyanurate, ASTM C 518.

Measurements of apparent thermal conductivity are presented for specimens of rigid polyisocyanurate (PIR) foam conditioned in one of four environments. Measurements were conducted at 24 C and a temperature difference of 22 C at monthly intervals for six months using a heat-flow-meter apparatus (ASTM Test Method C 518). Four specimens (nominally 610 by 610 mm) were prepared from one commercial board (nominally 1.2 by 2.4 m) of rigid PIR foam blown, with R11 and having permeable organic/inorganic facers. For the six-month period, the increase in apparent thermal conductivity for the four specimens ranged from 11.5 to 14.2%. Aging curves of thermal conductivity for each specimen are described in the paper.

An interstitial space building construction assembly, consisting of a walk-on deck suspended from above by structural steel which also supported a functional floor, reproduce a design planned for use in a new hospital complex at Elmendorf Air Force Base, Alaska. This interstitial space assembly was built in the multi-story steel test structure at the National Institute of Standards and Technology. The construction assembly was tested by the same protocol used to evaluate the Veteran's Administration interstitial space construction assembly, tested in 1984. This protocol followed the National Fire Protection Association's NFPA 251 Fire Tests of Building Construction and Materials Standards, 1990 edition. Fire testing of the interstitial space system was carried out during the summer of 1994. This construction assembly met the requirements for a 2 hour fire endurance rating. The maximum surface temperature on the unexposed functional floor above the interstitial space reached 33 C (91 F) at the end of the two hour period. The maximum structural steel temperature inside of the interstitial space was 123 C (253 F). The structural assembly was evaluated for a total of 2 hours and 30 minutes before the test was terminated.

Also available from Supt. of Docs. as SN003-003-03325-1.

Keywords: *Walls, *Heat transfer, *Moisture content, *Wood, Construction materials, Buildings, Wall temperature, Humidity, Heat flux, Thermal insulation, Wooden structures, Steady state, Thermodynamic properties, MOIST computer program.

This report describes a comprehensive laboratory study to verify the accuracy of MOIST for 12 different wall specimens. The rate of heat transfer through each of the 12 wall specimens was measured. The moisture content of the exterior construction materials was measured for eight of the twelve wall specimens. For the remaining four walls, the relative humidity level was measured at the interior side of the exterior sheathing. The measured heat transfer rates, moisture content levels and relative humidities were compared to the predictions of MOIST. In general, the agreement between MOIST and the experimental measurements was good. The moisture content predicted by MOIST was within one percent of the measured values for seven of the eight walls that contained moisture content sensors. The measured relative humidities for two of the remaining four walls agreed well with the MOIST predictions. The relative humidity measurements from the other two walls could not be compared to MOIST since the walls were constructed with vapor retarder defects that introduced two-dimensional effects. The heat flux predicted by MOIST was within ten percent of the values measured under steady-state conditions.

Burning Rate and Flame Heat Flux For PMMA in the Cone Calorimeter.
Master's thesis.
B. T. Rhodes. Dec 94, 130p, NIST/GCR-95/664.
Grant NIST-60NA2D1266
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD. Fire Science Div.

Keywords: *Calorimeters, *Burning rate, *Flames, *Heat flux, Ignition temperature, Ignition time, Models, Thermoplastic resins, Polymethyl methacrylate, Fire tests, Theses, Black Polycast PMMA, Cone calorimeter.

Ignition and burning rate data are developed for thick (25 mm.) black Polycast PMMA in a Cone Calorimeter heating assembly. The objective is to establish a testing protocol that will lead to the prediction of ignition and burning rate from Cone data. This is done for a thermoplastic like PMMA. For black PMMA, ignition temperatures of 250 to 350 deg C and vaporization temperatures of approximately 325 to 380 deg C were measured over irradiance levels of 15 to 65 kW/sq m. The incident flame heat flux, for irradiation levels of 0

to 75 kW/sq m, is found to be approximately 37 kW/sq m for black PMMA. Its constancy is shown due to the geometry of the Cone flame.

Contract NIST-70NANB1H1173
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD. Fire Safety Engineering Div.

Keywords: *Drops(Liquids), *Evaporative cooling, *Radiant heating, *Solids, Evaporation, Heat transfer, Models, Sprinkler systems, Water sprays, Dissolved gases, Computer programs, Surface temperature, Thermal conductivity, Vaporizing, Contact angle.

A model describing the configuration of a water droplet evaporating on the surface of a radiantly heated semi-infinite solid is developed. A shape factor and the solid-liquid-vapor contact angle described the transient droplet shape, though the initial value of the latter parameter is found to have a negligible effect on the droplet's evaporation. The droplet shape model and a modified radiation heat term are incorporated into a previously-developed computer model to predict the evaporation of a single droplet on a semi-infinite solid subjected to radiant heat input. The code predicts transient temperature profiles that agree well with experiment.

Testing of Selected Self-Leveling Compounds for Floors.
C. F. Ferraris. Jan 95, 36p, NISTIR-5633.
Contract GSA-862-2500
Sponsored by General Services Administration, Washington, DC.

Keywords: *Lightweight concretes, *Construction materials, *Floors, Bonding, Office buildings, Technology utilization, Tests, Concretes, Shrinkage, Adhesives, Properties, Substitutes, Self-leveling compounds.

During the past year, a severe odor has developed in some floors of the Silver Spring Metro Center I building. The odor has been attributed to interactions among a self-leveling compound, carpet adhesive, and the carpet. The owner of the building, General Services Administration (GSA), wants to ascertain if by removing the existing self-leveling compound and replacing it with a compound of a different composition will elminate the odor. The National Institute of Standards and Technology (NIST) was asked to evaluate the properties of selected self-leveling compounds for use at the Silver Spring Metro Center I building. Lightweight concrete was also to be tested for possible use as a substrate for the self-leveling compounds. The report gives the test results obtained on the self-leveling compounds alone or in combination with regular concrete or lightweight concrete. It also gives the results obtained on lightweight concrete alone.

Survey of Concrete Transport Properties and Their Measurement.
N. S. Martys. Feb 95, 52p, NISTIR-5592.

Keywords: *Concretes, *Transport properties, *Service life, *Standards, Permeability, Microstructure, Test methods, Chlorides, Porosity, Tomography, X ray analysis.

In this report we present a survey of the current knowledge of the transport properties of concrete. The basic theory and measurement methods are discussed. Emphasis is placed on transport properties, such as diffusion, permeability, and capillary flow, that may play a large role in degradation processes in high performance concrete. It is concluded that standard test methods used to predict the service life of concrete via measurement of transport properties, especially in high performance concrete, are in general, inadequate or need further development.

Compositional Analysis of Beneficiated Fly Ashes.
P. E. Stutzman, and L. Centeno. May 95, 28p, NISTIR-5598.

Keywords: *Fly ash, *Concretes, *Physical properties, Admixtures, Particle size.

The study is part of a study of the material properties of fly ashes and other mineral admixtures to identify factors that control the performance of mineral admixtures in concrete. The study includes the determination of the kinetics of reactions, development of microstructure, and simulation modelling. The development of microstructure, and simulation modelling. The overall goal is understanding of how the material properties of fly ash affect the properties and durability of concrete. The report examines the composition of a set of fly ashes segregated by particle size, and comments on the effects of compositional and physical attributes on the performance of concrete.

Water-Vapor Measurements of Low-Slope Roofing Materials.
D. M. Burch, and A. O. Desjarlais. 1995, 34p, NISTIR-5681.
Sponsored by Oak Ridge National Lab., TN.

Keywords: *Moisture, *Isotherms, *Roofing, *Permeability, Water vapor, Moisture content, Humidity, Construction materials, Test methods.

New measurement methods recently developed at the National Institute of Standards and Technology were used to measure the sorption isotherm and permeability of several low-slope roofing materials at a mean temperture of 24 deg C (75 F). The materials included: fireboard, perlite board, exterior-grade plywood, polyisocyanurate board insulation with glass-matt facers, and glass-fiber insulation with a facer. For the sorption isotherm measurements, the materials were placed in various ambient relative humidities ranging from a dry to a saturated state. The equilibrium moisture content plotted versus ambient relative humidity at 24 deg C (75 F) gave the sorption isotherm. Separate sorption isotherms were obtained for specimens initially dry (adsorption isotherm) and specimens initially saturated (desorption isotherm). For the permeability measurements, a series of cup measurements was performed, and the permeability was plotted as a function of the mean relative humidity across the specimen.

Also available from Supt. of Docs. as SN003-003-03350-2. See also report for 1994, PB94-207495.

Keywords: *Building, *Fires, *Research management, *Testing laboratories, Building codes, Fire safety, Flammability testing, Standards, Construction materials.

NIST's Building and Fire Research Laboratory (BFRL), one of NIST's eight Laboratories, enhances the competitiveness of U.S. industry and public safety through performances prediction and measurement technologies and technical advances that improve the life cycle quality of constructed facilities. BFRL's efforts are closely coordinated with complementary activities of industry, professional and trade organizations, academe, and other agencies of government. This report summarizes BFRL's research for 1995. The report is arranged by its research programs; structural engineering, materials engineering, mechanical and environmental systems, fire safety and engineering, fire science, and applied economics. Each summary lists the project title, the BFRL point of contact, sponsor, research, and recent results.

CFAST Output Comparison Method and Its Use in Comparing Different CFAST Versions.
D. M. Alvord. Aug 95, 52p, NISTIR-5705.
See also PB93-174902.

Keywords: *Computer models, *Fires, *Flame propagation, *Building, Smoke, Plums, Fire test, Combustion products, Transport properties, Algorithms, Variables, Computerized simulation, Comparison, CFAST computer model.

A multiple step method was developed to compare the output of CFAST simulations, produced either by the same version of CFAST, or by different versions of the model. Scenarios to be compared are run with CFAST before the method is used, producing files containing a history of the model results. The first step of the comparision method produces a text file of important output variables from each of these history files, corresponding to significant fire phenomena occuring during the course of each fire simulation. The next step of the method is used to compare two such text files, and store their differences. Finally, the last step summarizes the difference information found in one or more files from the previous step. The comparison method can be used to find differences between CFAST runs, and track changes in the CFAST model and detect if they perform as anticipated.

Study on the Reuse of Plastic Concrete Using Extended Set-Retarding Admixtures.
C. Lobo, W. F. Guthrie, and R. Kacker. 1995, 15p.
Prepared in cooperation with National Ready Mixed Concrete Association, Silver Spring, MD.
Included in Jnl. of Research of the National Institute of Standards and Technology, v100 n5 p575-589 Sep/Oct 95.

Keywords: *Plastic concrete, *Admixtures, Recycling, Shrinkage, Process variables, Stabilizers(Agents), Environmental issues, Strength, Reprints, NIST(National Institute of Standards and Technology).

The disposal of ready mixed concrete truck wash water and returned plastic concrete is a growing concern of the ready mixed concrete industry. Recently, extended set-retarding admixtures, or stabilizers, which slow or stop the hydration of portland cement have been introduced to the market. In a statistically designed experiment, the properties of blended concrete containing stabilized plastic concrete were evaluated. The variables in the study included (1) concrete age when stabilized, (2) stabilizer dosage, (3) holding period of the treated (stabilized) concrete prior to blending with fresh ingredients, and (4) amount of treated concrete in the blended batch. The setting time, strength, and drying shrinkage of the blended concretes were evaluated.

Hydraulic Radius and Transport in Reconstructed Model Three-Dimensional Porous Media.
Final rept.
D. P. Bentz, and N. S. Martys. 1994, 18p.
Pub. in Transportation in Porous Media, v17 p221-238 1995.

Keywords: *Building technology, *Porous media, *Hydraulic radius, Conductivity, Critical diameter, Permeability, Reconstruction, Reprints, *Foreign technology.

Methods for reconstructing three-dimensional porous media from two-dimensional cross sections are evaluated in terms of the transport properties of the reconstructed systems. Two-dimensional slices are selected at random from model three-dimensional microstructures, based on penetrable spheres, and processed to create a reconstructed representation of the original system. Permeability, conductivity, and a critial pore diameter are computed for the original and reconstructed microstructures to assess the validity of the reconstruction technique. A surface curvature algorithm is utilized to further modify the reconstructed systems by matching the hydraulic radius of the reconstructed three-dimensional system to that of the two-dimensional slice. While having only minor effects on conductivity, this modification significantly improves the agreement between permeabilities and critical diameters of the original and reconstructed systems for porosities in the range of 25-40%. For lower porosities, critical pore diameter is unaffected by the curvature modification so that little improvement between original and reconstructed permeabilities is obtained by matching hydraulic radii.

Computing the Effect of Sprinkler Sprays on Fire Induced Gas Flow.
Final rept.
G. P. Forney, and K. B. McGrattan. 1995, 6p.
Pub. in Proceedings of the International Conference of Fire Research and Engineering, Orlando, FL., September 10-14, 1995, p59-64.

Keywords: *Sprinklers, *Time lapse, *Fire suppression, Fire protection, Gas flow, Fluid flow, Fire tests, Simulation, Walls, Flame propagation, Smoke detectors, Fire fighting, Reprints.

Over the past twenty years there has been much debate concering the interaction of sprinklers and draft curtains in large storage facilities. At issue is whether or not the two fire protection systems are mutually beneficial. Draft curtains inhibit the spread of hot gases near the ceiling. In some cases this may accelerate the activation of sprinklers and in others it could delay the activation of sprinklers needed to suppress the fire. The intent is not necessarily to simulate in detail the two phase interaction of droplets and air from a single sprinkler, nor to predict the suppression of the fire itself, but rather to study the effect of dozens of sprinklers on a fire-driven flow field in enclosures up to 60 meters on a side and 10 meters high. The sprinkler spray serves to cool the upper layer hot gases by mechanical mixing with cooler gases below and absorption of heat by the droplets.

Simplified Design Procedure for Hybrid Precast Concrete Connections.
G. S. Cheok, W. C. Stone, and S. D. Nakaki. Feb 96, 91p, NISTIR-5765.
Sponsored by Concrete Research Council, Detroit, MI.

Keywords: *Earthquake resistant structures, *Precast concrete, *Construction joints, *Beams(Supports), Design criteria, Buildings, Dynamic response.

A design procedure is presented to compute the maximum (plastic) moment, and the story drift capacities of a hybrid precast moment-resisting beam-to-column connection. The hybrid connections consist of mild steel which is used to dissipate energy by yielding and high strength prestressing steel which is used to provide the shear resistance through friction developed at the beam-column interface by the post-tensioning force. The design procedure is based on three 1/3-scale hybrid precast beam-to-column connections tested at the National Institute of Standards and Technology (NIST). The simplified procedure relies on the stess-strain behavior of mild steel up to its ultimate strength and is based on equilibrium equations at the beam-column joint. The appendices include a proposed evaluation criteria for this hybrid connection, sample calculations using the design procedure, and other calculations used to develop the design criteria.

Application of Digital-Image-Based Models to Microstructure, Transport Properties, and Degradation of Cement-Based Materials.
Final rept.
D. P. Bentz, E. J. Garboczi, and N. S. Martys. 1996, 19p.
Pub. in Modelling Microstructure and Its Potential for Studying Transport Properties and Durability, p167-185 1996.

Keywords: *Cements, *Construction materials, Percolation, Transport properties, Microstructure, Durability, Reprints, *Foreign technology.

As multi-phase composites, cement-based materials have physical properties that are strongly influenced by the volume fractions and topologies of the individual phases. Because of their inherent random nature, these materials often defy a simple geometrical description. The use of digital-image-based models allows one to realistically represent this class of materials, as resultant microstructures can be quickly quantified with respect to the volume fraction and interconnectivity or percolation of each phase or any combination of phases. In addition, physical properties such as diffusivity and permeability can be conveniently computed using finite-difference or finite-element techniques. These computer modelling techniques will be demonstrated for microstructural models of these materials at two scales: hydrated cement past at the micrometer level and calcium silicate hydrate gel at the nanometer level. The properties computed for the gel at the nanometer level can be used as input for the micrometer-level model.

Fire Hazard Model Developments and Research Efforts at NIST.
Final rept.
A. J. Fowell. 1993, 7p.
Pub. in Fire Retardant Chemicals Association Meeting Proceedings on Fire Safety, New Orleans, LA., March 21-24, 1993, 7p.

Keywords: *Fire hazards, *Computerized simulation, Fire tests, Fire research, Fire safety, Combustion, Ventilation, Flammability testing, Burning rate, Materials tests, Standards, Reprints, *US NIST, *Fire Models.

Exposure conditions such as location, orientation, ventilation, and proximity to other materials can influence the fire performance of the material, so these parameters must be addressed by the models and/or the flammability characteristics measurements. Before the combination of fire models and bench scale measurement methods become universally accepted as tools for assessing the fire safety suitability of materials for specific aplication, the models must be shown to be valid, some of the shortcomings in the measurement methods need to be addressed and a usable data base needs to be assembled.

Heat Transfer in an Intumescent Material Using a Three-Dimensional Lagrangian Model.
Final rept.
K. M. Butler, H. R. Baum, and T. Kashiwagi. 1996, 6p.
Pub. in International Conference on Fire Research and Engineering, Orlando, FL., September 10-15, 1995, p261-266.

Keywords: *Bubbles, *Intumescence, Mathematical models, Numerical analysis, Thermoplastics, Reprints.

Intumescence is a property of an important class of fire-resistant materials. In the presence of fire, a succession of chemical reactions results in melting, the generation of multiple tiny bubbles causing the material to swell, and solidification into a thick multicellular char layer. An intumescent coating protects the underlying substrate from the fire through two mechanisms: heat is absorbed by the endothermic chemical reactions that produce the bubbles, and the low thermal conductivity of the bubbles provides an insulating layer. The chemical mechanism causes a plateau in the plot of substrate temperature vs. time, and the decreased effective thermal conductivity slows the temperature increase with time for the final char layer.

Calculating Combined Buoyancy- and Pressure-Driven Flow Through a Shallow, Horizontal, Circular Vent; Application to Problem of Steady Burning in a Ceiling-Vented Enclosure.
Final rept.
L. Y. Cooper. 1995, 6p.
See also PB96-164116.
Pub. in International Conference on Fire Research and Engineering Proceedings, Orlando, FL., September 10-15, 1995, p321-326.

Keywords: *Vents, *Air flow, *Buoyancy, *Flame propagation, Fire protection, Buildings, Mathematical models, Flow rate, Reprints.

A model was developed previously for calculating combined buoyancy- and pressure-driven (i.e., forced) flow through a shallow, circular, horizontal vent where the vent-connected spaces are filled with fluids of different density in an unstable configuration (density of the top fluid is larger than that of the bottom). In this paper the model equations are summarized and then applied to the problem of steady burning in a ceiling-vented enclosure where normal atmospheric conditions characterize the upper space environment. Such fire scenarios are seen to involve a zero-to-relatively-moderate cross-vent pressure difference and bi-directional exchange flow between the enclosure and the upper space. A general solution to the problem is obtained. This relates the rate of energy release of the fire to the area of the vent and to the temperature and oxygen concentration of the upper portion of the enclosure environment. The solution is seen to be consistent with previously-published data involving ceiling-vented fire scenarios.

See also PB96-164108 and PB94-210077.
Pub. in American Society of Mechanical Engineers International Mechanical Engineering Congress and Exhibition, Chicago, IL., November 6-11, 1994, Jnl. of Heat Transfer, v117 p659-667 Aug 95.

Keywords: *Vents, *Air flow, *Buoyancy, *Flame propagation, Boundary conditions, Reprints, Fire protection, Buildings, Mathematical models, Flow rate, Boundary value problems.

Combined buoyancy and pressure-driven (i.e., forced) flow through a horizontal vent is considered where the vent-connected spaces are filled with fluids of different density in an unstable configuration (density of the top is larger than that of the bottom). With zero-to-moderate cross-vent pressure difference, delta p, the instability leads to bidirectional exchange flow between the two spaces, e.g., as in the emptying from the bottom of a liquid-filled can with a single vent opening. For relatively large delta p, the flow through the vent is unidirectional, from the high to the low-pressure space, e.g., as is the case when the can has a large enough second vent at the top. Problems of a commonly used unidirectional orifice vent flow model, with Bernoulli's equation and a constant flow coefficient, Cd, are discussed.

Warping of Terrace Pavers at the U.S. Capitol Building.
C. F. Ferraris, P. Stutzman, and J. Clifton. May 96, 26p, NISTIR-5847.

Keywords: Construction materials, Aggregates, Cements, Concretes, Alkali aggregate reactions, Concrete durability, Chemical reactivity, Composition, Silicon dioxide, Environmental effects, Expansion, Shrinkage, Overlays, Substrates, Washington DC, *Pavers,

*United States Capitol, *Warping, Alkali-silica reactions.

The terraces of the U.S. Capitol are covered with cement-based pavers designed to emulate the granite pavers used elsewhere on the Capitol grounds. These pavers are composed of two layers; an upper, decorative white-cement-based mortar with crushed micaceous quartz aggregate supported by a base of conventional concrete. Field inspection and laboratory testing indicates that warping is probably due to the high cement content, environmental exposure conditions, and possibly differences in hydraulic length changes of two layers comprising the pavers. Alkali-silica reactivity (ASR) tests indicate that the base layer aggregate is marginally reactive and the upper layer aggregate is non-reactive.

Keywords: *Thermal insulation, *Standards, *Polystyrene, Building materials, Tests, SRM(Standard Reference Material).

Thermal conductivity measurements at room temperature are presented as the basis for certified values of SRM 1453, expanded polystyrene board. The measurements have been conducted in accordance with a randomized full factorial experimental design with two variables, bulk density and temperature, using NIST's one-meter line-heat-source guarded hot plate apparatus. Uncertainties of the measurements, consistent with current ISO guidelines, have been prepared. The thermal conductivity measurements were conducted over a range of bulk density of 37.4 to 45.8 km/cu m and mean temperature of 281 to 313 K. Statistical analyses of the physical properties of the SRM are presented and include variations between boards, as well as within boards. Measurements of the foam's compressive properties and microstructure are presented.

NIST Construction Automation Program Report No. 2. Proceedings of the NIST Construction Automation Workshop. Held in Gaithersburg, Maryland on March 30-31, 1995.
W. C. Stone. May 96, 159p, NISTIR-5856.

Keywords: *Meetings, *Buildings, *Automation, *Robotics, *Construction, Excavation, Data exchange, Laser metrology, Global positioning system, Telemetry, Virtual reality, Display systems, Wireless communications, Optical detectors, Standards, *Helmet mounted displays.

A two-day workshop on Construction Automation was hosted at NIST from March 30-31, 1995. Research programs actively underway at NIST in this area include the development of sensing systems, hardware, and software algorithms for advanced real-time construction site metrology; wide band telemetry and data acquisition (the ability to track many sensors at once through wireless communications); virtual site simulation and object representation standards (development of robust virtual reality models for construction site objects and machines); person-in-loop systems including head-up displays, virtual simulators, tele-operations workstations, and portable database interrogators which provide information-on-demand to construction site personnel; and semi-autonomous machine operations. These topics, and the need for database and machine interfacing standards, were discussed by workshop participants representing industry, government, and academe. Specific invited presentations included laser distancing, non-line-of-sight and kinematic GPS metrology, automated data exchange standards, real-time kinematic modeling, military helmet-mounted displays, virtual reality displays, construction robotics, automated excavation, virtual site representation, and automated building construction.

Measurement of Rheological Properties of High Performance Concrete: State of the Art Report.
C. F. Ferraris. Jul 96, 41p, NISTIR-5869.

Keywords: *Concretes, *Rheological properties, Test methods, Viscosity, Cements, Slumping, Workability.

The rheology or flow properties of concrete in general and of high performance concrete (HPC) in particular, is important, because many factors such as ease of placement, consolidation, durability, and strength depend on the flow properties. This report gives an overview of the flow properties of a fluid or a suspension, followed by a critical review of the most often used tests for concrete rheology. Particular attention is given to tests that could be used for HPC. Tentative definitions of terms such as workability, consistency, and rheological parameters are provided. An overview of the most promising tests and models for cement paste is given.

Computer Simulations of Binder Removal from 2-D and 3-D Model Particulate Bodies.
Final rept.
J. A. Lewis, M. A. Galler, and D. P. Bentz. 1996, 12p.
Pub. in Jnl. of the American Ceramic Society, v79 n5 p1377-1388 1996.

Keywords: *Binders, *Thermoplastic resins, *Particulates, *Removal, Plasticizers, Microstructure, Liquid phases, Porosity, Transport properties, Isothermal processes, Two dimensional models, Three dimensional models, Computerized simulation, Reprints.

A series of computer simulations were developed to investigate the removal of multicomponent, thermoplastic binders from two- and three-dimensional model particulate bodies. Monosized particles with varying diameters were randomly placed in such systems, and all unoccupied pixels were assigned to the binder phase at ratios of 1:9, 1:2, or 1:1 plasticizer (volatile) to polymeric (nonvolatile) species. Simulations were carried out under isothermal conditions to study the influence of liquid-phase transport processes, i.e., plasticizer diffusion in the binder-filled pore network and capillary-driven redistribution of the binder phase, on plasticizer removal rates. Plasticizer diffusion was modeled by a random-walk algorithm, and nonplanar pore development arising from capillary-driven binder redistribution was modeled by an invasion percolation algorithm. For comparison, simulations were also carried out on systems in which binder redistribution was not permitted.

Pub. in 'Thermal VI' Thermal Performance of the Exterior Envelopes of Buildings VI, Clearwater Beach, FL., December 4-8, 1996, p307-319 1995.

Keywords: *Relative humidity, *Moisture content, *Walls, Water vapor, Wallboards, Panels, Condensation, Diffusion, Heat transfer, Building materials, Winter, Computer models, Computerized simulation, Reprints, *Indoor environments, Moisture transfer, MOIST computer model.

The authors modified the model to calculate the hourly indoor relative humidity during the heating season as a function of outdoor weather conditions, indoor air temperature, building size and airtightness, and indoor moisture generation rate. This enhanced version of MOIST was subsequently used to investigate moisture accumulation in a 5-cm by 15-cm (2-in. by 6-in.) wood-framed wall exposed to a number of different winter climates. Predictions with a constant indoor relative humidity were compared to those with a 'floating' or variable indoor relative humidity. In addition, the variable indoor relative humidity program was used to analyze the effect of building airtightness, the indoor moisture generation rate, and the existence of exfiltration. The need for an interior vapor retarder in walls exposed to cold climates also was examined. Moreover, the effects of exterior insulating sheathing and an exterior vapor retarder were modeled. Results and findings are presented along with pertinent conclusions regarding appropriate building construction techniques in winter heating climates.

Seismic Instrumentation of Existing Buildings.
Final rept.
L. T. Phan. Oct 90, 62p, NISTIR-4419.
Contract GSA/PBS-87-03
Sponsored by Public Buildings Service, Washington, DC. Office of Real Property Development.

Keywords: *Federal buildings, *Earthquake engineering, US GSA, Seismic design, Dynamic structural analysis, Instruments, Computerized simulation, Portland(Oregon), Long Beach(California).

Two existing GSA buildings, one in Long Beach, California, and one in Portland, Oregon, were subjected to low-level vibration tests to determine their dynamic properties and response frequencies. The measured dynamic properties of the buildings were incorporated into the computer models of the buildings and time-history analyses using these models were performed. The purpose of the analyses is to reveal building response under these realistic earthquake excitations, so that logical seismic instrumentation schemes can be developed for these buildings. The results of the analyses suggest that the response of the Portland building is influenced more by torsional and rocking motions, while the response of the Long Beach building is influenced mainly by translational modes. From the observed behavior of the buildings, a seismic instrumentation scheme is developed for each building, and a general guideline for seismic instrumentation in existing building is recommended.

Northridge Earthquake, 1994. Performance of Structures, Lifelines and Fire Protection Systems.
D. Todd, N. Carino, R. M. Chung, W. D. Walton, H. S. Lew, and A. W. Taylor. Mar 94, 176p, NISTIR-5396.

Keywords: *Earthquakes, *Damage assessment, *California, Buildings, Bridges(Structures), Office buildings, Freeways, Apartment buildings, Los Angeles(California), Northridge(California).

A magnitude 6.8 (MS) earthquake centered under the community of Northridge in the San Fernando Valley shook the entire Los Angeles metropolitan area at 4:31 a.m. local time Monday, January 17, 1994. Moderate damage to the built environment was widespread; severe damage included collapsed buildings and highway overpasses. A total of 58 deaths were attributed to the earthquake by the Los Angeles Coroner. About 1,500 people were admitted to hospitals with major injuries; another 16,000 or so were treated and released. Estimates indicated that this will be the United States' most costly natural disaster ever. A multi-agency team, organized under the auspices of the Interagency Committee on Seismic Safety in Construction and headed by the National Institute of Standards and Technology, arrived at the earthquake site within days of the event to document the effects of the earthquake. The team focused on the effects to the built environment, with the goal of capturing perishable data and quickly identifying situations deserving in-depth study. The report includes a summary of the team's observations. While most structural damage occurred in buildings and bridges of construction type and vintage known to be vulnerable to earthquake shaking, there were some unexpected failures. Notable among these were the collapses of relatively modern parking structures and a bridge that appeared to be adequate by today's standards. Recommendations are made for further studies of the Northridge earthquake that can lead to improved mitigation of earthquake effects.

Draft Guidelines for Quality Control Testing of Elastomeric Seismic Isolation Systems.
H. W. Shenton. Feb 94, 33p, NISTIR-5345.
See also PB92-139732.

Keywords: *Vibration isolators, *Buildings, *Earthquake engineering, Seismic design, Quality control, Design criteria, Tests, Lateral forces.

Seismic isolation systems designed according to the 1991 Uniform Building Code, or the 1991 AASHTO Guide Specification for Seismic Isolation Design are required to undergo a series of prototype and quality control tests before being installed in the structure. At the present time standards do not exist for conducting these tests and results are subject to unknown variability. The document represents the initiation of the process to develop standards for quality control testing of seismic isolation systems built in the U.S. The guidelines are devoted specifically to quality control testing of elastomeric systems. The guidelines address material and component tests to be conducted during production, and tests on completed isolation units.

Draft Guideline for Testing and Evaluation of Seismic Isolation Systems.
Final rept.
H. W. Shenton. 1993, 6p.
Pub. in Proceedings of a Seminar on Seismic Isolation, Passive Energy Dissipation, and Active Control, San Francisco, CA., March 11-12, 1993, p349-354.

Keywords: *Vibration isolators, *Earthquake resistant structures, *Building codes, *Test methods, Standards, Structural vibration, Earthquake engineering, Damping, Energy dissipation, Reprints, *Seismic isolation systems.

The Building and Fire Research Laboratory of the National Institute of Standards and Technology is developing a draft guideline for testing and evaluation of seismic base isolation systems. This is a multi-year effort with the goal being the adoption of the guidelines by model code organizations and the Interagency Committee on Seismic Safety in Construction (ICSSC). A five member Oversight Committee has been formed to guide NIST in the development of the guidelines. The committee includes individuals from the research and private sectors with expertise in the design, fabrication and testing of seismic isolation components and hardware, and in the design of structures which incorporate seismic isolation. The draft guideline is intended to be general and comprehensive; it will be applicable to an isolation system regardless of the superstructure; it will be applicable to all viable systems, whether they be elastomeric, sliding or hybrid; and will be applicable to systems which consist of multiple isolator units, or incorporate different components that are distributed throughout the isolation interface. It will cover all pertinent structural evaluation tests of the isolation device. The objective and scope of the effort are described, along with a preliminary multi-year schedule. Progress to date is summarized.

Evaluation and Strengthening Guidelines for Federal Buildings: Identification of Current Federal Agency Programs.
Final rept.
C. D. Poland, W. T. Holmes, J. O. Malley, D. Provencher, and J. Soulages. Mar 94, 153p, NIST/GCR-94/649.
Prepared in cooperation with Interagency Committee on Seismic Safety in Construction. and Degenkolb (H.J.) Associates, San Francisco, CA. Sponsored by Federal Emergency Management Agency, Washington, DC.

Keywords: *Federal buildings, *Earthquake engineering, Seismic design, Standards, Building codes.

The National Institute of Standards and Technology (NIST), by order of the President, is developing seismic evaluation and strengthening guidelines (Guidelines for Federal Buildings) for federally owned and leased buildings. The project is overseen by the Interagency Committee on Seismic Safety in Construction (ICSSC) and funded by the Federal Emergency Management Agency (FEMA). The report develops Task 1, the identification of seismic mitigation programs. The report includes a detailed work plan and schedule for the entire project, a list of ICSSC member contacts, the results of telephone conversations with all ICSSC committee members to identify existing seismic strengthening programs, the results of detailed meetings with seven federal agencies and four private sector organizations selected for in-depth study, and summaries of the performance objectives for all agencies and organizations.

Strengthening Methodology for Lightly Reinforced Concrete Frames-II. Recommended Calculation Techniques for the Design of Infill Walls.
L. T. Phan, D. R. Todd, and H. S. Lew. May 94, 46p, NISTIR-5421.
See also PB94-161354.

Keywords: *Reinforced concrete, *Reinforcement(Structures), *Dynamic structural analysis, *Frames, Concrete structures, Loads(Forces), Shear strength, Earthquake engineering, Displacement, Dynamic response, Infilled walls.

Empirical equations were developed for estimations of ultimate lateral shear strength, story drift ratio at ultimate load, and ductility factor of existing lightly reinforced concrete frames (bare frames), existing monolithic shear walls, and reinforced concrete frames strengthened either by cast-in-place infilled walls or by single or multiple precast concrete panels. These equations were derived based on experimental results of many independently conducted test programs. Estimations of the ultimate shear stress, ultimate story drift ratio (story drift at ultimate load divided by story height), and ductility factor using the empirical equations compared favorably with the experimental results. The estimations confirm many observations made independently in individual test programs. The empirical expressions also provide benchmark values or ranges for these important parameters and thus provide a useful means for quick estimations of seismic capacity of bare, monolithic, and strengthened lightly reinforced concrete frames.

Dynamic Characteristics of Five Tall Buildings during Strong and Low-Amplitude Motions.
Final rept.
M. Celebi, L. T. Phan, and R. D. Marshall. 1993, 15p.
Pub. in Structural Design of Tall Buildings **2**, p1-15 1993.

Keywords: *Structural vibration, *Buildings, *Dynamic response, *Seismic effects, *Soil-structure interactions, Earthquake damage, Earthquake engineering, Dynamic structural analysis, Data acquisition, Accelerometers, Earth movements, Reprints.

The objectives of the paper are to present (1) a comparison of dynamic characteristics of five buildings de-

termined from recorded strong-motion response data and from low-amplitude (ambient vibration) tests, and (2) a description of the low-amplitude ambient testing and PC-based data-acquisition approach that is integrated with the permanent strong-motion instrumentation in the five buildings. All five buildings are within the San Francisco Bay area and the strong-motion dynamic characteristics are extracted from the October 17, 1989 Loma Prieta earthquake response records. Ambient vibration tests on the same five buildings were conducted in September 1990. Analyses of strong-motion response and low-amplitude test data have been performed by many investigators. The present study differs from numerous previous investigations because (1) in the study, accelerometers in the five permanently-instrumented buildings were used during the low-amplitude testing, and (2) rapid screening of the strong-motion response data was achieved with a concerted use of system identification software. The results show for all cases that the fundamental periods and corresponding percentages of critical damping determined from low-amplitude tests are appreciably lower than those determined from strong-motion response records.

Wind Load Provisions of the Manufactured Home Construction and Safety Standards: A Review and Recommendations for Improvement.
R. D. Marshall. May 93, 107p, NISTIR-5189.
See also PB-297 463. Sponsored by Department of Housing and Urban Development, Washington, DC.

Keywords: *Wind loads, *Prefabricated buildings, Hurricanes, Florida, Damage assessment, Building codes, Computerized simulation, *Mobile homes, Hurricane Andrew, Dade County(Florida).

Limited wind speed measurements obtained during landfall of Hurricane Andrew in south Florida and wind speed estimates obtained from a computer-based model and from analyses are summarized and compared with code-specified design speeds for the affected area. Published reports of wind damage to manufactured homes and to conventional wood-framed dwellings are reviewed to identify modes of failure and intensity of damage. In general, manufactured homes which were built subsequent to issuance of the Manufactured Home Construction and Safety Standards (MHCSS) suffered less damage than did units built prior to issuance of the MHCSS.

Seismic Strengthening of Reinforced Concrete Frame Buildings.
Final rept.
L. T. Phan, D. R. Todd, and H. S. Lew. 1993, 10p.
Pub. in Proceedings of the National Earthquake Conference, Memphis, TN., May 2-5, 1993, v2 p235-244.

Keywords: *Reinforced concrete, *Reinforcement(Structures), *Earthquake resistant structures, *Structural response, Earthquake engineering, Structural analysis, Concrete structures, Seismic effects, Dynamic response, Frames, Reprints.

Most reinforced concrete (RC) frame structures in the mid-western and eastern regions of the United States are built mainly for gravity loads without proper seismic design, and thus are vulnerable to severe damage in the event of a major earthquake in these regions. While the need to retrofit these RC frame structures is recognized and different strengthening techniques have been laboratory-tested and applied in practice worldwide, ability to assess the relative merits of different strengthening schemes or to predict the improved performance of a strengthened structure is still lacking. The paper describes the development of experimental-based hysteresis models of unstrengthened and strengthened concrete frames by using the system identification method. The analytical models are validated by comparing the analytical results with results of experiments on strengthened RC frames.

Keywords: *Wind loads, *Prefabricated buildings, *Mobile homes, Hurricanes, Florida, Damage assessment, Building codes, Computerized simulation, Dade County(Florida).

The report describes a continuation of earlier studies carried out by the National Institute of Standards and Technology (NIST) at the request of the Department of Housing and Urban Development (HUD) following the devastation caused by Hurricane Andrew in south Florida on August 24, 1992. In the earlier work, damage to manufactured homes was examined in light of the probable maximum wind speeds in the affected area, and the wind load provisions of selected codes and standards used for structural design in hurricane-prone regions were compared. On the basis of that work, it was recommended that ASCE 7-88 (Minimum Design Loads for Buildings and Other Structures) should be the primary resource document for updating and improving the wind load provisions of the Manufactured Home Construction and Safety Standards (MHCSS).

Losses of property approaches $10 billion, losses of 62 lives, and severe disruption of human activities from the October 17, 1989, Loma Prieta, California, earthquake reminded the United States of the severe threats posed by great earthquakes. Unless enhanced efforts are made to reduce earthquake hazards, a large earthquake close to a major metropolitan area can kill tens of thousands of people, cause tens of billions of dollars of direct property losses, and, through consequent losses, severely disrupt economic activity for the whole nation. 46 of the 50 states are vulnerable to strong earthquakes. In the eastern half of the country, the area that would be affected by an earthquake could be 10 times as large as for a similar earthquake in California.

Experimental results of eight 1/3-scale model precast concrete beam-to-column connections are presented. The test specimens consisted of interior connections designed in accordance with the 1985 Uniform Building Code provisions for Seismic Zones 2 and 4. These tests constitute the second and third phases of a multi-year test program being conducted at the National Institute of Standards and Technology. The objective of the test program is to develop guidelines for an economical precast beam-to-column connection for regions of high seismicity. Variables considered in the research program include location of the post-tensioning steel, the use of post-tensioning bars vs. prestressing strands and fully bonded vs. partially bonded strands. Specimens were subjected to reversed cyclic loading according to a prescribed displacement history. Comparison of results with the monolithic test specimens indicates that the post-tensioned precast concrete specimens had comparable connection strengths, higher ultimate displacement ductilities and total energy dissipation to failure, but lower energy dissipation per cycle.

The experimental test results from three 1/3-scale model precast concrete beam-to-column connections is summarized. These tests are part of a multi-phased test program being conducted at the National Institute of Standards and Technology. The objective of the test program is to develop guidelines for an economical precast beam-to-column connection for regions of high seismicity. The test specimens were interior connections designed using the Uniform Building Code (ICBO, 1985 and 1988) criteria for seismic Zones 2 and 4 as design guidelines. Partially debonded strands were employed in two of the specimens and while the third combined low strength steel with post-tensioning steel. Specimens were subjected to reversed cyclic loading according to a prescribed displacement history. Comparisons are made between the behavior of these precast specimens with previous precast and monolithic specimens which were tested earlier. The comparisons were based on connection strength, connection ductility, and energy absorption characteristics.

Assessment of 'Peaks Over Threshold' Methods for Estimating Extreme Value Distribution Tails.
Final rept.
J. A. Lechner, E. Simiu, and N. A. Heckert. 1993, 10p.
Pub. in Structural Safety 12, p305-314 1993.

Keywords: *Structural analysis, *Wind effects, *Extreme-value problems, Statistical analysis, Methodology, Comparison, Monte Carlo method, Simulation, Reprints, Peaks over threshold methods, CME(Conditional Mean Exceedance) methods.

In the past twenty years a vast new body of extreme value theory was developed, referred to as 'peaks over threshold modeling.' This theory allows the use in the analysis of all data exceeding a sufficiently high threshold, a feature that may result in improved extreme value estimates. The application of the theory depends upon the performance of methods for estimating the distribution parameters corresponding to any given set of extreme data. We present a comparative assessment of the performance of three such methods. The assessment is based on Monte Carlo simulations from populations with four distributions: Gumbel, Weibull, generalized Pareto, and normal. The simulation results showed that the de Haan and the Conditional Mean Exceedance (CME) methods performed consistently better than the Pickands method (NIST implementation). For the distributions, parameter values, and mean recurrence intervals assumed in this work, the CME method outperformed the de Haan method only when the percent estimation errors were about one percent or smaller, a case unlikely to be encountered in wind engineering practice.

Pub. in Proceedings of Joint Meeting UJNR Wind and Seismic Effects (25th), Japan, May 17-20, 1993, p769-786.

Keywords: *Earthquake engineering, *Structural engineering, *Design standards, Seismic design, Structural design, Safety engineering, Dynamic structural analysis, Earthquake resistance, Building codes, Public policy, Reprints, *Seismic safety, Loma Prieta Earthquake.

The Loma Prieta, California earthquake (LPE) of October 17, 1989, has had profound influence on both policies and practices for earthquake hazards reduction in the United States. The paper describes lessons in public policy as well as those in earth, engineering and soil sciences and practices resulting from the earthquake.

The magnitude 6.8 January 17, 1994 Northridge Earthquake was centered under the densely populated San Fernando Valley northeast of Los Angeles, California. At the request of the Department of Housing and Urban Development (HUD), the Building and Fire Research Laboratory (BFRL) of the National Institute of Standards and Technology (NIST) conducted field observations of multi-family residences three stories or more in height in the affected area for the purposes of identifying common damage states in residential construc-

tion. Sixty-nine HUD-affiliated sites, totalling 425 buildings and over 10,000 living units, were visually examined from the exterior and interior. By collecting information primarily on damaged buildings, it was possible to identify typical types and degrees of damage to residential buildings.

Performance of 1/3-Scale Model Precast Concrete Beam-Column Connections Subjected to Cyclic Inelastic Loads. Report No. 4.
G. S. Cheok, and W. C. Stone. Jun 94, 72p, NISTIR-5436.
Errata sheet inserted. See also PB93-227502 and PB94-101813.

Keywords: *Earthquake resistant structures, *Construction joints, *Precast concrete, *Cyclic loads, *Beams(Supports), Model tests, Concrete structures, Earthquake engineering, Structural analysis, Structural failure, Stress analysis, Failure modes, Compressive strength.

Test results of four hybrid post-tensioned concrete beam-to-column connections are presented. The objective of the test program is to develop guidelines for the design of moment resistant precast connections in regions of high seismicity. The hybrid connections consist of mild steel used as energy dissipators and post-tensioning steel used to provide the required shear resistance. Variables examined were different amounts and type of mild steel. The amount of post-tensioning steel was kept constant. The specimens were subjected to reversed cyclic loading in accordance with a prescribed displacement history. The performances of the connections were evaluated based on comparisons of energy dissipation capacity, connection strength, and drift capacity with previous NIST tests. The results show that a hybrid precast connection can be designed so that it matches the performance of a monolithic connection in terms of energy dissipation, strength, and drift capacity.

Effects of Testing Variables on the Measured Compressive Strength of High-Strength (90 MPa) Concrete.
N. J. Carino, and W. F. Guthrie. Oct 94, 147p, NISTIR-5405.
Sponsored by Federal Highway Administration, McLean, VA. Office of Advanced Research.

Keywords: *Compressive strength, *Test methods, Loads(Forces), Stress strain relations, Test facilities, Aggregates, Construction materials, Experimental design, Statistical analysis, Standards, Mechanical properties, *High strength concrete, ASTM C 39, AASHTO T 22.

A review is presented on the factors affecting the measured compressive strength of concrete specimens, with particular emphasis on the testing of high-strength concrete. A full factorial experiment was designed to examine the effects of cylinder size, end preparation, stress rate and type of testing machine on the measured compressive strength. Two concrete mixtures (45 MPa and 90 MPa) were used to determine whether there were interactions between strength level and the other factors. In addition, a 65-MPa mixture was required to allow testing four combinations of specimen size and testing machine. The cylinder sizes were 100 x 200 mm and 150 x 300 mm. The ends of the cylinders were either capped with sulfur mortar or ground flat. The stress rate was either 0.14 MPa/s or 0.34 MPa/s, which are limits currently specified in ASTM C 39 (AASHTO T 22). Besides the main test series, supplementary tests were done to investigate the effects of a defective spherically-seated bearing block. The defective bearing block had a concave depression within the central 100 mm. The maximum value of the depression was more than 0.2 mm, compared with the value of 0.025 mm currently allowed by ASTM C 39 (AASHTO T 22). Comparative tests with 68-MPa concrete showed no difference in mean strength due to the defective bearing block. Analysis of dispersion showed that the 100-mm cylinders had higher within-test variability, but the differences were not statistically significant. Recommendations for modifications to testing standards and future research are provided.

Gust Factors Applied to Hurricane Winds.
Final rept.
W. R. Krayer, and R. D. Marshall. 1992, 7p.
Pub. in Bulletin of the American Meteorological Society 73, n5 p613-617 May 92.

Keywords: *Wind loads, *Hurricanes, *Structural analysis, *Buildings, *Gust loads, Structural engineering, Stress analysis, Dynamic response, Wind pressure, Statistical analysis, Wind velocity, Reprints, *Gust factors.

An important consideration in the design of structures is their response to extreme winds. This is especially true in regions affected by hurricanes. In this research, gust factors derived from hurricane wind-speed records are compared with those derived by Durst and others from open-scale records obtained in well-developed, extratropical storms. Based on records obtained from four hurricanes and 11 different recording stations, it is concluded that an upward adjustment of the Durst gust factors for the estimation of hurricane gust speeds may be in order. Anomalously high gust factors observed for hurricane winds in inland areas suggest the need for additional study. Also, it is concluded that a reexamination of the statistics of gust factors obtained from extratropical storm data would be useful in clearly identifying the appropriate probability distribution function.

Seismic Safety of Federal Buildings. Initial Program: How Much Will It Cost.
D. R. Todd. Apr 94, 40p, NISTIR-5419.
See also PB94-176278, PB94-181856, and PB95-130209. Sponsored by Federal Emergency Management Agency, Washington, DC. Mitigation Directorate.

Keywords: *Federal buildings, *Earthquake engineering, *Reinforcement(Structures), *Cost estimates, Seismic design, Design standards, Design criteria, Structural design, Earthquake resistant structures, Retrofitting, Building codes, Cost analysis, *Seismic safety.

A proposed Executive order titled 'Seismic Safety of Existing Federally Owned or Leased Buildings' sets forth an initial program aimed at laying the foundation of achieving the long-term goal of seismic safety in all Federal buildings. This paper identifies direct costs associated with adoption of the proposed Executive Order and develops an estimate of those costs. It does not consider the value of the benefits associated with adopting the proposed order. The estimated costs represent the aggregate impact on the Federal budget. Note that the estimate of that is presented in this paper does not include the costs of continuing already-existing seismic rehabilitation programs, but considers only costs that would be newly imposed on the Federal budget.

Proceedings: Workshop on Research Needs in Wind Engineering. Held in Gaithersburg, Maryland on September 12-13, 1994.
R. D. Marshall. Feb 95, 78p, NISTIR-5597.

Keywords: *Meetings, *Wind effects, *Wind pressure, *Structural failure, Loads(Forces), Wind(Meteorology), Wind tunnel tests, Storms(Meteorology), Buildings, Damage.

This report presents findings and recommendations developed at a workshop on research needs in wind engineering. Representatives from universities, the private sector, and Federal agencies presented program overviews and participated in working group sessions addressing various aspects of wind engineering research and wind disaster mitigation. Research needs and topics for technology transfer were identified and prioritized. It was concluded that current funding of wind engineering research in the United States falls far short of what is needed to effectively address the problem of spiraling losses due to wind damage. There is, however, considerable wind engineering knowledge now available for implementation by the model building codes and by the building industry in general.

Keywords: *Building codes, *Design standards, *Earthquake resistant structures, Earthquake engineering, Structural engineering, Design criteria, Structural design, Reprints, *Seismic design.

Improvements to the seismic provisions of the legally enforceable building codes implemented by states, counties, and localities derive from improvements to the three major model building codes. The model codes draw from national standards and resource documents for improvements. The NEHRP Recommended Provisions and the SEAOC Blue Book are the two major resource documents for seismic design and construction in this country. Both documents are periodically updated to include new research and investigation results.

The Loma Prieta earthquake occured on October 17, 1989 at 5:04 pm Pacific daylight time along a 45-km long segment of the San Andreas fault in the Santa Cruz Mountains. The earthquake triggered by far the largest number of instruments ever triggered by an earthquake and recordings were obtained at well over 200 locations, including free-field stations, small buildings, high rise structures and dams. The records obtained from the free-field stations are summarized in Appendix A of this report. These include 31 stations at rock sites, nine stations at soft soil sites and 48 stations at other soils sites. The results of subsurface investigations at Treasure Island site and at the San Francisco Airport site were used in the study to calculate the horizontal components of site reponse at these two sites and to assess the procedures used for conducting such response calculations.

Survey of Steel Moment-Resisting Frame Buildings Affected by the 1994 Northridge Earthquake.
N. F. G. Youssef, D. Bonowitz, and J. L. Gross. Apr 95, 176p, NISTIR-5625.
Prepared in cooperation with Nabih Youssef and Associates, Los Angeles, CA.

Keywords: *Buildings, *Steel structures, *Frame structures, *Earthquake damage, Damage assessment, Seismic effects, Structural members, Dynamic response, Dynamic structural analysis, Construction joints, Cracking(Fracturing), Moments, Surveys, *Northridge Earthquake, Los Angeles(California).

The January 1994 Northridge earthquake caused unexpected widespread damage to steel moment-resisting frame (MRF) buildings throughout greater Los Angles. The report presents results of a survey of MRF's inspected for connection damage since the earthquake. The survey is intended to provide an overall view of the greater Los Angeles steel frame population, as well as a single-source building-specific record of observed conditions. A computerized database was developed to track submittals, compile basic survey data, and generate summary tables. Principal conclu-

sions from the survey data support the observation that MRF connection damage is not well correlated to any single structural characteristic. On the contrary, the survey data show that connection performance may be best understood in probabilistic, not deterministic, terms with emphasis on construction and inspection quality.

Enhancements to Program IDARC: Modeling Inelastic Behavior of Welded Connections in Steel Moment-Resisting Frames.
S. K. Kunnath. May 95, 80p, NIST/GCR-95/673.
See also PB93-227502. Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Earthquake engineering, *Reinforced concrete, *Farmed structures, *Computerized simulation, Steels, Damage analysis, Walls, Retrofitting, Computer programs, Hysteresis, IDARC computer program.

An existing computer code, IDARC, is enhanced to permit the modeling of steel moment-resisting frames (SMRFs) with the potential for weld failures at beam-to-column connections. The steel member model is derived from flexibility formulations in order to allow complex degrading hysteresis behavior to be incorporated. A panel zone element is developed to account for inelastic shear deformations in the beam-to-column connection region. Finally, a new conceptual hysteresis model is developed to represent the force-deformation characteristics at a welded connection, before and after weld failure. The results of the study indicate that the enhanced program, referred to as IDASS, is capable of adequately reproducing observed behavior of SMRFs and can be used as an effective tool to investigate the effects of weld failure in steel structures under earthquake loading.

Performance of Federal Buildings in the January 17, 1994 Northridge Earthquake.
D. Todd, and A. Bieniawski. Jan 95, 28p, NISTIR-5574.

Keywords: *Federal buildings, *Earthquake damage, *Seismic effects, Damage assessment, Dynamic structural analysis, Structural response, Structural vibration, US DOC, US DOD, NASA, US DOA, US DOE, US DOI, US GSA, US DOJ, US Postal Service, *Northridge Earthquake, Southern Region(California), Structural damage, Federal Bureau of Prisons, Department of Veterans Affairs.

On January 17, 1994, a magnitude 6.8 earthquake struck Northridge, California, in the northeast suburbs of Los Angeles. This report summarizes information collected by the Interagency Committee on Seismic Safety in Construction (ICSSC) on the performance of federally-owned buildings in the Northridge earthquake. Ten agencies reported that they owned buildings in the affected area. Collectively, over 4000 federally-owned buildings were shaken; approximately 100 were damaged by the quake. Only two sites suffered major damage; most damage was minor.

Strengthening Methodology for Lightly Reinforced Concrete Frames: Recommended Design Guidelines for Strengthening with Infill Walls.
L. T. Phan, G. S. Cheok, and D. R. Todd. May 95, 66p, NISTIR-5682.
See also PB94-187648.

Keywords: *Reinforced concrete, *Reinforcement(Structures), *Structural design, *Frames, Concrete structures, Design analysis, Structural analysis, Earthquake engineering, Displacement, Dynamic response, Design criteria, Structural failure, Shear strength, Loads(Forces), *Infilled walls.

A study of the sensitivity of the behavior of lightly reinforced concrete frames strengthened using the infill wall method to certain variables was conducted. These variables include the infill wall type (cast-in-place and precast), wall thickness, and the amount of anchor area and anchor type. The hysteretic behavior of the frames were predicted using three parameters and equations proposed in previous NIST work. Both quasi-static and transient dynamic analyses were performed using the program IDARC. General design guidelines are proposed based on these analyses and on observations gathered from existing experimental tests.

Literature Review on Seismic Performance of Building Cladding Systems.
Feb 95, 181p, NIST/GCR-95/681.
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Cladding, *Construction, *Buildings, *Earthquake resistance, *Literature surveys, Precast concrete, Reinforced concrete, Steels, Seismic design, Structural members, Structural analysis, Structural response, Seismic effects, Ground motion, Building codes, Earthquake engineering, Seismic isolation, Soil-structure interactions.

Chapter 1 is an introduction that includes definitions, cladding panel configurations, details of architectural precast concrete cladding systems in the U.S.A., New Zealand, Japan, and Canada. Chapter 2 describes the current practice for seismically isolated precast concrete cladding panels and connections, including U.S. codes and their interpretation and foreign codes. Chapter 3 offers information on the structural utilization of precast concrete cladding panels and connections, including a historical overview, levels of contribution in seismic response, architectural implications for structural cladding, conditions for effective structural cladding, and issues of responsibility. Chapter 4 contains abstracts and informational highlights from research on the structural utilization of precast concrete cladding panels and connections, including eleven sets of research projects from the U.S.A., one project from Canada, and one project from Japan. Chapter 5 outlines other cladding materials for heavy panels, including prefabricated panel systems, GFRC panels, new types of reinforcement, a new type of RC sandwich panels, and steel and steel alloy panels.

Effects of Testing Variables on the Strength of High-Strength (90 Mpa) Concrete Cylinders.
Final rept.
N. J. Carino, W. F. Guthrie, E. S. Lagergren, and G. M. Mullings. 1994, 44p.
Pub. in Proceedings of the American Concrete Institute International Conference on High-Performance Concrete, Sinapore, November 15-18, 1994, p589-632.

Keywords: *Compressive strength, *Test methods, Reprints, Meetings, Loads(Forces), Stress strain relations, Test facilities, Aggregates, Construction materials, Statistical analysis, Test equipment, *High strength concrete.

A full factorial experimental design was used to investigate the effects of the following variables on cylinder strength: end preparation (sulfur capping versus grinding), cylinder size (100 versus 150 mm diameter), type of testing machine (1.33-MN capacity versus a 4.45-MN capacity), and nominal stress rate (0.14 versus 0.34 Mpa/s). Two levels of strength were used (45 and 90 Mpa), and three replicates were tested for each run. Specific gravities were measured to check on the consistency of cylinder fabrication. Statistical analyses indicated that all the factors had significant effects on the measured compressive strength. There were significant interactions among the factors, so that the effects were greater than the average values for particular factor settings. For example, the effect of end preparation depended on the strength level. Recommendations for modifications to testing standards are provided.

Response of Buildings to Ambient Vibration and the Loma Prieta Earthquake: A Comparison.
Final rept.
L. T. Phan, R. D. Marshall, and M. Celebi. 1992, 4p.
Pub. in Structures Congress '92, San Antonio, TX., April 13-15, 1992, p583-586.

Keywords: *Structural vibration, *Seismic waves, *Dynamic response, Structural dynamics, Seismic effects, Structural response, Buildings, Ground motion, Earthquakes, San Francisco(CA), Vibration damping, Seismic waves, Spectrum analysis, Soil-structure interactions, Reprints, Loma Prieta Earthquakes, Seismic spectra.

Structural response characteristics of five existing buildings in the San Francisco bay area, obtained from ambient vibration testing conducted after the Loma Prieta earthquake (LPE), are compared with the response characteristics observed during the LPE. The purpose is to provide an assessment of the applicability of ambient vibration testing as a means to obtain dynamic properties for use in earthquake design. The comparisons show that, for all five buildings, the response frequencies measured from ambient vibration testing are higher than those obtained from the LPE, and damping estimates computed from ambient vibration response records are smaller than those from the LPE response records.

Some Notable Hurricanes Revisited.
Final rept.
R. Marshall. 1992, 4p.
Pub. in Structures Congress '92, San Antonio, TX., April 13-15, 1992, p250-253.

Keywords: *Wind velocity, *Hurricanes, *Damage assessment, Tropical storms, Storm damage, Gust loads, Wind loads, Buildings, Dynamic response, Structural analysis, Structural engineering, Reprints.

Recorded hurricane wind speeds, uncorrected for instrument height, averaging time or local wind exposure, can be very misleading. This is particularly true when such records are used to assess the performance of structures exposed to extreme winds. Only when proper corrections are applied can the true distribution of surface wind speeds in a hurricane be ascertained. Recent improvements to adjustment procedures and resulting corrections to wind speed records from some notable hurricanes are described.

ICSSC Guidance on Implementing Executive Order 12941 on Seismic Safety of Existing Federally Owned or Leased Buildings.
D. Todd, and A. Bieniawski. Oct 95, 27p, NISTIR-5734.
Prepared in cooperation with Interagency Committee on Seismic Safety in Construction. Sponsored by Federal Emergency Management Agency, Washington, DC. Mitigation Directorate.

Keywords: *Federal buildings, *Seismic design, *Design standards, *Earthquake resistant structures, Retrofitting, Reinforcement(Structural), Structural stability, Seismic waves, Earthquake engineering, Vulnerability, Building codes, Cost estimates, Government policies, Federal government.

In this guidance document, the Interagency Committee on Seismic Safety in Construction (ICSSC) recommends appropriate approaches for Federal departments and agencies to use in implementing the inventorying and cost estimating requirements of Executive Order 12941. The ICSSC recommends that all Federally-owned buildings be included in an electronic inventory database of specified format. Buildings are to be identified as either exempt or non-exempt from the seismic standards adopted by the order. All exceptionally high risk buildings are to be seismically evaluated, and estimates of the cost of their rehabilitation developed. Additionally, agencies are to perform seismic evaluations on a representative sample of their non-high-risk, non-exempt buildings, and use this information to estimated the vulnerability of that population and the cost of achieving adequate seismic safety.

Recommended Performance-Based Criteria for the Design of Manufactured Home Foundation Systems to Resist Wind and Seismic Loads.
R. D. Marshall, and F. Y. Yokel. Aug 95, 77p, NISTIR-5664.
Contract DU100I93000037
Sponsored by Department of Housing and Urban Development, Washington, DC. Office of Research Evaluation and Monitoring.

Keywords: *Wind effects, *Seismic effects, *Prefabricated buildings, *Building codes, *Design criteria, Earthquake engineering, Wind loads, Hurricanes, Structural vibrations, Dynamic structural analysis, Soil structure interactions, Foundations(Structures), Anchors(Structural), Soils, Performance evaluation, Wind engineering.

This report addresses the issue of tornado wind speeds as a basis for the design of manufactured homes and compares base shears due to earthquake excitation with base shears due to wind loading for various seismic and wind zones. In view of the accepted probabilities of attaining or exceeding design limit states for ordinary buildings, it is concluded that tornadoes should not be a part of the wind load design criteria for manufactured homes. Also, it is concluded that base shears due to wind loading will always govern the design of anchor and tiedown systems in the direction normal to the axis for a manufactured home, regardless of seismic zone. There are several alternative systems on the market or under development that show considerable promise for providing the required resistance to wind and earthquake loads. Finally, a set of performance-based criteria for anchoring manufactured homes against wind and earthquake loads is proposed.

The Building and Fire Research Laboratory (BFRL) of the National Institute of Standards and Technology (NIST) has published comprehensive draft guidelines for testing and evaluating seismic isolation systems. The procedures outlined in the guidelines encompass all the required tests of the isolation systems, from the early stages of development to final production tests. The principal mechanism for soliciting feedback on the draft guidelines was a workshop held on July 25, 1994 in San Francisco. The purpose of the workshop was to provide a forum for review and discussion of the draft guidelines. This report is a summary of the workshop discussions. Topics which received the most attention in the discussions were scale model testing, performance criteria, quality control testing, factors of safety, aging of isolation systems, and the sustained compression test for elastomeric systems. Recommendations were made regarding third party inspection of the test procedure, a test to evaluate the re-centering capability of the isolation system, a direct shear test for elastomeric systems, and fire rating.

Keywords: *Federal buildings, *Seismic design, *Earthquake engineering, Earthquake resistance, Retrofitting, Reinforcement(Structural), Structural stability, Vulnerability, Safety engineering, Inventories, Cost estimates, Reprints.

Work by the Interagency Committee on Seismic Safety in Construction (ICSSC) is expected to lead to the eventual development of a systematic program of seismic upgrading for Federally owned buildings. Steps that have been taken to date include (1) the development of seismic evaluation and rehabilitation standards, (2) the drafting of an Executive Order which adopts the technical standards and calls for a seismic inventory and cost estimate, and (3) the issuance of guidance on how to efficiently and consistently inventory Federally owned buildings and how to estimate the costs of mitigating unacceptable seismic risks.

Pub. in Wind and Seismic Effect: Proceedings of the Joint Meeting (25th), UJNR, Japan, May 1993, p265-272.

Keywords: *Reinforcement(Structures), *Dynamic structural analysis, *Buildings, *Frames, Concrete structures, Reinforced concrete, Load bearing capacity, Shear strength, Earthquakes, Design criteria, Hysteresis, Computerized simulation, Mathematical models, Reprints, Infilled walls.

An analytical method for evaluating the inelastic dynamic structural response of lightly reinforced concrete (RC) frames strengthened by infilled shear walls was developed. This method involved the development of hysteresis failure models for existing and strengthened RC frames and the incorporation of the models into the computer program IDARC for analysis. The hysteresis models were developed in terms of the stiffness degradation parameter, the strength degradation parameter, and the pinching parameter. The results of the analyses showed that (1) hysteresis models developed using one-story, one-bay frames can be incorporated into IDARC for the analysis of frames with more than one-story height, and (2) reasonable predictions of structural behavior, both in terms of ultimate load capacity and in absorbed energy on a per cycle basis, can be determined using the hysteresis models.

Comparison of Responses of a Select Number of Buildings to the 10/17/1989 Loma Prieta (California) Earthquake and Low-Level Amplitude Test Results.
Final rept.
M. Celebi, L. T. Phan, and R. D. Marshall. 1991, 25p.
Pub. in Proceedings, UJNR Joint Meeting (23rd), US-Japan Panel on Wind and Seismic Effects, Tokyo, Japan, May 12-25, 1991, p475-499.

Keywords: *Earthquake damage, *Damage assessment, *Buildings, *Dynamic response, Dynamic structural analysis, Ground motion, Structural vibration, Seismic discrimination, Amplitudes, Seismic effects, Damping, Reprints.

This paper summarizes dynamic characteristics of five buildings within the San Francisco Bay area. The dynamic characteristics are extracted from the October 17, 1989 Loma Prieta earthquake response records and from ambient tests conducted in November 1990. Dynamic characteristics determined for two of the five buildings prior to the Loma Prieta earthquake are also included for comparison. The preliminary results show, in some cases, that low-level test are useful and, in other cases, they show considerable differences with those determined from strong-motion response records.

With a view to applying the 'peaks over threshold' method to the estimation of extreme wind speed data, we perform Monte Carlo simulations for which the parameters of the population distributions were estimated from sets of actual extreme wind speed data. We summarize results concerning (1) the relative efficiency of several estimation procedures used in such methods, (2) the optimal threshold for any given set of data, and (3) estimates based on the 'peaks over threshold' method as compared to estimates based on the epochal approach.

Workgroup Summary Report: Plastic Hinge-Based Techniques for Advanced Analysis.
Final rept.
J. L. Gross. 1993, 3p.
Pub. in Plastic Hinge-Based Methods for Advanced Analysis and Design of Steel Frames, Pittsburgh, PA., April 5, 1992, p175-177 Mar 93.

Keywords: *Construction joints, *Steel structures, *Structural analysis, Framed structures, Structural members, Buckling, Loads(Forces), Moments, Plasticity, Mechanical properties, Dynamic response, Reprints.

The purpose of this workgroup was to demonstrate, clarify, and discuss the current capabilities and limitations of contemporary plastic hinge-based methods for advanced analysis and design of steel frames. The approach taken was to discuss and comment on whether capabilities of current methods are essential to advanced analysis, beneficial (and under what circumstances), or whether there is insufficient information for immediate application of the capability. Some capabilities were assumed to be beyond the present scope and were not addressed.

Estimates of Hurricane Wind Speeds by the 'Peaks Over Threshold' Method.
Technical note.
E. Simiu, N. A. Heckert, and T. Whalen. Feb 96, 49p, NIST/TN-1416.
Grant NSF-CMS-9411642
Also available from Supt. of Docs. as SN003-003-03396. See also PB95-219416. Prepared in cooperation with Johns Hopkins Univ., Baltimore, MD. Dept. of Civil Engineering. Sponsored by National Science Foundation, Arlington, VA. and North Atlantic Treaty Organization, Brussels (Belgium).

Keywords: *Hurricanes, *Wind velocity, *Estimation, Wind effects, Wind loads, Wind pressure, Dynamic loads, Structural reliability, Structural engineering, Design standards, Building codes, Extreme valve problems, Weibull distribution, Graphs(Charts), *Peaks over threshold method, Load factors.

We report results that lend support to the hypothesis that extreme hurricane wind speeds are described predominantly by reverse Weibull distributions, which have limited upper tails. The results are based on the analysis of hurricane wind speed data obtained in an earlier project and used for the development of the ASCE 7-83 and ASCE 7-93 Standard wind speed map. According to our results, wind load factors should be larger in hurricane-prone regions than the load factor specified in current standard provisions. However, the requisite increases are smaller than would be the case in the distributions were assumed to have infinite upper tails, as has been done so far in all principal studies of hurricane winds in the United States.

Modified Optimal Algorithm for Active Structural Control.
F. Sadek, and B. Mohraz. Jan 96, 36p, NISTIR-5782.
Sponsored by Southern Methodist Univ., Dallas, TX. School of Engineering and Applied Science.

Keywords: *Optimal control, *Active control, *Algorithms, Structural dynamics, Seismic isolation, Vibration isolators, Control systems, Buildings, Degrees of freedom, Structureal response, Seismic waves, Dynamic response, Excitation, *Base isolation, Gain matrices, Seismic loads.

This study presents a modification to two linear optimal control algorithms, namely classical and instantaneous, to achieve a greater reduction in structural displacements and control forces. The modification consists of building a library of gain matrices and selecting the gain matrix that would result in the maximum control force without exceeding the control system capacity. The modification was used to compute the response of several single-degree-of-freedom (MDOF) system, and a base isolated structure. The study shows that the external excitation influences the selection of the control system parameters such as controller capacity and gain matrices. These parameters, therefore, should be determined according to the seismic excitation intensity expected at the site.

Method of Estimating the Parameters of Tuned Mass Dampers for Seismic Applications.
F. Sadek, B. Mohraz, A. W. Taylor, and R. M. Chung. Apr 96, 36p, NISTIR-5806.
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD. Structures Div.

Keywords: *Dampers, *Vibration damping, *Structural vibration, Passive systems, Energy dissipation, Buildings, Structural response, Dynamic response, Seismic waves, Seismic effects, Loads(Forces), Tuning, Degrees of freedom, Earthquake engineering, *Passive control, Seismic loads.

The optimum parameters of tuned mass dampers (TMD) that result in considerable reduction in the response of structures to seismic loading are presented. The criterion used to obtain the optimum parameters is to select, for given mass ratio, the frequency (tuning) and damping ratios that would result in equal and larger modal damping in the first two modes of vibration. The parameters are used to compute the response of several single and multi-degree-of-freedom structures with TMDs to different earthquake excitations. The results indicate that the use of the proposed parameters reduces the displacement and acceleration responses significantly. It is shown that as a result of selecting the parameters as proposed in this paper, significant reduction in the response of tall buildings can be achieved.

Probabilistic Estimates of Design Load Factors for Wind-Sensitive Structures Using the 'Peaks Over Threshold' Approach.
Technical note.
T. M. Whalen. Apr 96, 34p, NIST/TN-1418.
Also available from Supt. of Docs. as SN003-003-03407-0. See also PB96-162540.

Keywords: *Hurricanes, *Wind velocity, *Probabilistic estimation, Wind effects, Wind loads, Wind pressure, Dynamic loads, Structural reliability, Structural engineering, Design standards, Building codes, Extreme value problems, Weibull distribution, *Peaks over threshold method, Load factors.

The 'peaks over threshold' method is used to estimate ratios of wind-induced loads with various long mean recurrence intervals to loads with a 50-year mean recurrence interval. The results support the conclusion that the load factor value of 1.3 specified in the ASCE Standards 7-93 and 7-95 is adequate for extratropical storm regions. However, for hurricane-prone regions, the results imply that the standard value of the load factor (even after being augmented by an importance factor specified in the standards) leads to nominal ultimate wind loads with considerably shorter mean recurrence intervals than is the case for extratropical regions. This suggests that the 1.3 load factor value specified in the ASCE Standards 7-93 and 7-95 is inadequate for wind-sensitive structures in hurricane-prone regions.

Governments of industrialized nations play varied but important roles in providing the diverse technology infrastructure that supports a modern, competitive economy. The required technology infrastructure policy model is derived from a microeconomic model of the typical technology-based industry. Existing national strategies have demonstrated the importance of efficiency at the production and market development stages as well as at the R&D stage, but the trend is towards promoting simultaneous efficiency at all these stages. That is, the model and the derived infrastructure functions must cover all stages and interfaces in the technology and related product life cycles.

The International Organization for Standardization/ International Electrotechnical Commission (ISO/IEC) Guide 25, 'General requirements for the competence of calibration and testing laboratories,' has been used by many laboratory accreditation programs worldwide to establish accreditation requirements designed to promote confidence in the calibrations and testing results of laboratories which conform to the guide's requirements. National delegations to the International Laboratory Accreditation Conference (ILAC), an international conference of national organizations interested in laboratory accreditation, were surveyed to collect information on the implementation and supplementation of the requirements of ISO/IEC Guide 25 within the context of their countries' laboratory accreditation programs. This report summarizes the results of that survey. The report also includes a bibliographic list of publications concerned with ISO/IEC Guide 25 implementation compiled from the information submitted by the national delegations.

Keywords: *Commerce, *Telecommunication, *Data management, Electronic mail, Data processing security, Models, Computer networks, Man machine systems, Data base management systems, Distributed computer systems, *Electronic commerce, EDI(Electronic Data Interchange).

This report begins, after citing some important technological advances, by defining electronic commerce and identifying the scope of issues to be addressed within this paper. It then proceeds to examine some ways in which electronic commerce is presently being conducted, most notably with Electronic Data Interchange (EDI). An architectural model for supporting services necessary to conduct electronic commerce is then defined. The chapters that follow provide further detail on the model's components. The final chapter draws some conclusions about the benefits of deploying electronic commerce.

Evaluation and Accreditation of State Calibration Laboratories.
Final rept.
G. L. Harris. 1993, 16p.
Pub. in National Conference of Standards Laboratories Managing Quality to Improve Profitability Workshop and Symposium, Albuquerque, NM., July 25-29 1993, p395-410.

Keywords: *Calibration, *Laboratory accreditation, Measurement control, Metrology training, Interlaboratory testing, Accreditation, Assessments, Reprints.

The primary function of any accreditation process should be the evaluation of laboratory competency. Can the laboratory do what it claims. However, the assessment process should also evaluate the degree of proficiency (skill) that the laboratory demonstrates. Assessment of laboratory facilities is usually straighforward when using documented criteia and checklists. Since accuracy of measurements is an important attribute of any laboratory, how do we evaluate measurement accuracy. We often use the phrase, 'traceable to NIST standards' to convey accuracy relative to national standards, but how do we verify measurement traceability.

The Social Security Administration maintains records of wages earned by every person who has a social security number. Currently, all reports are converted to and maintained on microfilm. When a person's wage record must be verified, the process is cumbersome as the film is difficult to read and employees are listed in no particular order. The EAMATE system automates this manual process through the use of cost effective optical disk technology. The volume contains the appendices to the report on the information retrieval system for EAMATE. It includes user instructions, installation and configuration, system error messages, listing of the code, scout comments from EAMATE testing, and preliminary employer report statistics.

Helping to Reduce Technical Barriers to Trade.
Final rept.
B. L. Collins. 1995, 6p.
Pub. in Bringing Standards Together: An International Framework Conference, Washington, DC., July 18, 1995, p48-53.

Keywords: *Trade, *Barriers, *Standards, Consumer products, Marketing, International trade, Regulations, Conformity, Reprints, *Technical barriers, World trade organization, TBTs(Technical barriers to trade).

Dramatic changes are occurring in the international markets that form the background for U.S. standards and conformity assessment activities. Last year the United States exported about $700 billion worth of goods and services. These goods and services were sold into an increasingly competitive global market containing many barriers to trade. Having a large domestic market, good quality and reasonable prices are not longer guarantees of market access for a product. Technical barriers to trade (TBTs) almost always must be overcome or dealt with constructively to gain access to a market before any product can be traded. Trade experts have indicated that additional exports worth $20 to $40 billion could be produced right now if we could overcome all technical barriers to trade.

Stacking the Cards in Europe: One Company's Story.
Final rept.
H. D. Delaney. 1996, 4p.
Pub in American Society for Testing and Materials Standardization News, v24 n8 p34-37 Aug 96.

Keywords: *Barriers, Europe, Directives, Performance, Standards, Trade, Reprints, *Conformity assessments.

A U.S. manufacturer of connector hoses for gas appliances has encountered a series of difficulties in re-

maining in European markets as a consequence of shifting interpretations of an EU Directive and the applicability of the standards and conformity assessment requirements of individual European nations. Critical issues include the European use of design, rather than performance, standards and lack of access to the European technical committees and working groups. The staff of the U.S. Mission to the European Union, including the NIST standards expert, are assisting American manufacturers and exporters to resolve standards-related trade barriers.

Planning the Infrastructure for Global Electronic Commerce.
Final rept.
R. G. Saltman. 1993, 5p.
Pub. in EDI Forum: Jnl. of Electronic Data Interchange 6, n3 p52, 59-62 1993.

Keywords: *International trade, *Telecommunication, Commerce, Data transmission, Computer networks, Government/industry relations, Standards, Reprints, *Electronic commerce, *Infrastructure.

The components of global electronic commerce and the matrix of concepts underlying its feasibility are elucidated. Some of the issues and choices facing decision-makers on the direction of its development are discussed. Electronic commerce has implications for the way business is conducted, and may in the long run affect the ability of nations to compete effectively in international trade. It is proposed that government-private sector coordination may help provide a sound basis for U.S. representation in forums deciding the future of global electronic commerce. Many of these forums are multi-governmental; they concern technical standards and the administration of international trade. An aim of such representation would be to maximize the probability of outcomes at such forums favorable for U.S. competitiveness.

The fourth meeting of the U.S.-Russia Business Development Committee's Standards Working Group took place on March 27-29, 1995 in New York City, New York hosted by the American Society of Mechanical Engineers International (ASME), and on March 30-31, 1995 in Northbrook, Illinois hosted by Underwriters Laboratories, Inc. (UL). The Russian delegation consisted of representatives of the Committee of the Russian Federation for Standardization, Metrology and Certification (GOSSTANDART). The U.S. delegation included representatives from government agencies and the private sector, including testing and certification bodies, individual companies, and trade associations. The meeting resulted in an exchange of information regarding standards and conformity assessment programs and practices in areas of mutual interest, such as Boilers and Pressure Vessels, occupational and food and drug safety, automotive and telecommunications standards, and electrical and fire safety of consumer and industrial products. Of particular significance was the signing of a Joint Statement on Conformity Assessment between GOSSTANDART and ASME International, a Joint Statement of Information Exchange between GOSSTANDART and FDA, and a working statement between GOSSTANDART and UL.

International Challenges in Defining the Public and Private Interest in Standards.
Final rept.
S. I. Warshaw, and M. H. Saunders. 1995, 8p.
Pub. in SPRU-OECD International Workshop on Standards, Innovation, Competitiveness and Policy, Brighton, England, November 10-12, 1993, p67-74 1995.

Keywords: *Standards, *Regulations, *International agreements, Conformity, Competition, Global, Market analysis, ISO, European Communities, Reprints, Competitiveness, IEC(International Electrotechnical Commission), GATT(General Agreement on Tariffs and Trade).

Increasing global trade and technological integration raise important issues concerning: (1) existing infrastructures and their efficacy for developing internationally accepted standards; (2) the interaction of conformity assessment activities and systems among market-led economies; and (3) the changing prerogatives of governments. As a basis for world trade, manufactures and processors are demanding single globally acceptable technical standards and conformance tests. However, national governments must accommodate domestic health, safety and environmental goals that often differ dramatically between countries and regions.

Experimental Optimization of Peak Shape with Application to Aerosol Generation.
Final rept.
W. S. Liggett, and K. Ehara. 1993, 9p.
Pub. in Proceedings of the Society of Physical and Engineering Science, Rochester, NY., October 1993, p174-182.

Keywords: *Aerosol generators, *Particle size distribution, Hermite polynomials, Laser applications, Optimization, Measurement, Polystyrene, Spheres, Reprints, Chemometrics, Nebulizers.

Consider measuring instruments that respond to a single-component experimental material with a function having a single peak. In the experimental optimization of such instruments, one task is the minimization of peak width. This paper presents an approach to this task based on Hermite function approximation of the peaks observed under various instrument configurations. The approach requires at least two experimental materials with different peak locations and at least two different strengths (concentrations) of each material so that both the horizontal and vertical scale of the instrument response can be adjusted in the comparison of instrument configurations. The approach is applied to the optimization of an aerosol generator that nebulizes polystyrene latex spheres with nearly identical sizes.

In the experiment, the size distribution of the particles in the resulting aerosol is measured with a laser particle counter. The results show that the size distribution in the aerosol changes with time and that various nebulizer adjustments have an important effect on the peak width observed after the nebulizer has run for some period.

Report of Density Intercomparisons Undertaken by the Working Group on Density of the CCM.
Final rept.
R. S. Davis. 1990, 6p.
Pub. in Metrologia 27, n3 p139-144 1990.

Keywords: *Density measurement, Interlaboratory comparisons, International cooperation, Stainless steels, Metrology, Silicon, Reprints, Intercomparison.

The results of international comparisons of density measurements are reported. Participants include national laboratories of Australia, the Federal Republic of Germany, Italy, Japan, the United Kingdom, and the United States, as well as the Bureau International des Poids et Mesures. The comparisons involved hydrostatic density determinations of samples made of single-crystal silicon and samples made of stainless steel. Agreement among laboratories is generally better for samples of silicon than for samples of stainless steel. Overall discrepancies do not, however, appear to be serious with respect to scientific and metrological needs.

This report is a summary outcome statement for the Industrial Applications of Scanned Probe Microscopy (SPM) workshop which was held at National Institute of Standards and Technology (NIST) Gaithersburg on March 24-25, 1994. The meeting, co-sponsored by NIST, SEMATECH, ASTM E42.14, and the American Vacuum Society, was attended by over one hundred SPM users, suppliers, researchers and program managers from industry, government, and academia. The focus of the workshop was on fostering a common understanding of the roles of each of these groups in evolution of applied SPM, to achieve a consensus view on standard practices of SPM-based measurements, and to establish the basic features required of future generations of commercially available SPMs required for quantitative measurement. This report assesses the effectiveness of the workshop format and concludes with specific recommendations for a second, follow-up workshop.

This Proceedings issue describes a Workshop on gas sensing held in Gaithersburg, MD, September, 8-9, 1993. Future gas sensors with improved response characteristics, higher reliability, and lower cost can be expected to have increased application in diverse areas, including environmental monitoring, process control, and personal safety. This Workshop brought together gas sensor manufacturers, present and potential users, and researchers to explore ways to incorporate research discoveries and emerging technologies more efficiently into new, high-performance sensors. The Proceedings includes publications on invited and contributed presentation, reports on discussions of Emerging Technologies and Commercialization and Standards issues, and reports summarizing breakout sessions.

Conformational Alterations of Bovine Insulin Adsorbed on a Silver Electrode.
Final rept.
V. Reipa, A. Gaigalas, and S. Abramowitz. 1993, 16p.
Pub. in Jnl. of Electroanalytical Chemistry, v348 p413-428 1993.

Keywords: *Insulin, *Electrodes, *Silver electrodes, Bovines, Reprints, Disulfide reduction, Protein adsorption, SERS.

Surface enhanced Raman spectra of bovine insulin, adsorbed on the silver electrode from aqueous solutions of micromolar concentrations, are presented for the potential range -0.2 to -1.2 V/AgCl. The data suggest that insulin is bound to silver through ionized tyrosine residues and carboxy terminal groupings. Disulfide linkages are reduced sequentially upon increasing negative potential: A7-B7 at -0.3 to -0.5 V, and A20-B19 at -0.5 to -0.6 V. Rupture of disulfide bonds increased the portion of beta/disordered conformation at the expense of the alpha helix.

Feasibility of Fluorescence Detection of Tetracycline in Media Mixtures Employing a Fiber Optic Probe.
Final rept.
S. A. Glazier, and J. J. Horvath. 1995, 18p.
Pub. in Analytical Letters, v28 n15 p2607-2624 1995.

Keywords: *Fiber optics, *Fluorescence, *Tetracycline, *Fermentation, Media, Reprints.

The work assesses the feasbility of fluorescence detection of tetracycline in very optically dense mixtures of highly fluorescent media ingredients used in tetracycline production by fermentation. The fluorescence measurements are accomplished with a fiber optic probe. Seven difference mixtures were examined in this study. Each one contained a nonfluorescent based on nutrients and salts along with one of the following media ingredients at 5 g/100 mL: cottonseed flour, corn gluten meal, soybean flour, distiller's grains and solubles, corn steep liquor, brewer's yeast, and molasses. The concentration of tetracycline was varied in each mixture and flourescence measurements were made at every concentration step. Excitation light of 390 nm was used to probe the samples, and emission spectra were obtained over the wavelength range from 400 to 600 nm. In most of the samples studied, the fluorescence intensity in the wavelength range corresponding to background media fluorescence (420-480 nm) decreased as the tetracycline concentration increased. The decreases in the short wavelength range might be explained by the absorption by tetracycline of 390 nm excitation light (in competition with absorption by the media) and/or by absorption of background media fluorescence by tetracycline. Frequently, the maximum emission of the mixtures shifted to longer wavelengths. The maximum approached that of tetracycline (approximately 520 nm). Plots of integrated fluorescence intensity, in the emission wavelength regions of 420-480 nm and 500-560 nm, versus tetracycline hydrochloride concentration reflect these shifts. The authors have found that the changes in fluorescence intensity in these two wavelength regions during tetracycline addition depend on the indentity of the media component in the mixture.

Novel Amperometric Immunosensor for Procainamide Employing Light Activated Labels.
Final rept.
S. A. Glazier, and H. H. Weetall. 1994, 1p.
Pub. in Third World Congress on Biosensors, New Orleans, LA., June 1-3, 1994, 1p.

Keywords: *Immunoassays, *Amperometric, Reprints, *Electrochemical immunoassays, *Background currents, Anthraquinone, Procainamide.

Electrochemical immunoassays are often complicated by the presence of electroactive interferences which cause high current backgrounds. The authors are studying a method to correct for background currents in homogeneous immunoassays. The assays are conducted with an immunosensor employing 9,10-anthraquinone derivatives as electroactive labels for the model analyte, procainamide. Anthraquinones have the ability to be photochemically reduced by light to their hydroquinone analogues. In the assay, background correction may possibly be achieved by subtracting the oxidation current of a sample containing the anthraquinone-procainamide conjugate from the current obtained after photoreduction. This scheme relies of preferential reduction of the anthraquinone by proper wavelength selection, and the greater electroactivity of the hydroquinone form at oxidative potentials relative to the parent anthrquinone.

Inhibition of Premixed Methane-Air Flames by Iron Pentacarbonyl.
Final rept.
G. T. Linteris, and G. Gmurczyk. 1995, 5p.
Sponsored by Department of the Air Force, Wright-Patterson AFB, OH.
Pub. in International Colloquium on the Dynamics of Explosions and Reactive Systems, Boulder, CO., July 30-August 4, 1995, 5p.

Keywords: *Chemical inhibition, *Flame chemistry, Reprints, Flame models, Retardants, Flame speed.

Brominated fire suppressants are effective and widely used. Due to their destruction of stratospheric ozone, however, the production of these chemicals was halted in January 1994. Although testing and development of possible substitutes is occurring, a replacement with all of the desirable properties of CF3Br (the most common fire suppressant) has yet to be identified. Consequently, the Fire Science Division at the National Institute of Standards and Technology (NIST) is conducting research to identify new chemical inhibitors, understand the mechanisms of inhibition of known or widely used agents, and evaluate the performance of proposed agents.

Parametric Study of Hydrogen Fluoride Formation in Suppressed Fires.
Final rept.
G. Linteris, and G. Gmurczyk. 1995, 12p.
Pub. in Halon Options Technical Working Conference, Albuquerque, NM., May 9-11, 1995, 12p.

Keywords: *Chemical inhibition, *Fire research, *Flame chemistry, Reprints, Flame models, Retardants, Halon alternatives.

Some of the proposed replacements for CF3Br, the fluorinated hydrocarbons, are required in higher concentrations to extinguish fires and contain more halogen atoms per molecule. Since they decompose in the flame, they produce correspondingly more hydrogen fluoride than CF3Br when suppressing a fire. Recent laboratory experiments with burners using heptane, propane, and methane have indicated that the amount of HF formed in steady state can be estimated within about a factor of two for diffusion flames and within 10% for premixed flames based on equilibrium thermodynamics. In this model for HF formation, the inhibitor molecule is transported to the reaction zone by convection and diffusion and is consumed in the flame sheet to form the most stable products (usually HF, CO2, and COF2). In the present work, the equilibrium model is used to estimate the upper limit of HF formation in suppressed fires. The effects of fuel and agent type, fuel consumption rate, and agent injection rate are included in the model, as are room volume, humidity, and concentration of inhibitor necessary to extinguish the fire.

Molar Heat Capacity at Constant Volume for Air from 67 to 300 K at Pressures to 35 MPa.
Final rept.
J. W. Magee. 1994, 13p.
Pub. in International Jnl. of Thermophysics, v15 n5 p849-861 Sep 94.

Keywords: *Air, *Calorimeters, *Heat capacity, Reprints, High pressure, Isochoric.

Measurements of the molar heat capacity at constant volume Cv for air were conducted with an adiabatic calorimeter. Temperatures ranged from 67 to 300 K, and pressures ranged up to 35 MPa. Measurements were conducted at 17 densities which ranged from gas to highly compressed liquid states. In total, 227 Cv values were obtained. The air sample was prepared gravimetrically from research purity gases resulting in a mole fraction composition of 0.78112 N2 + 0.20966 O2 + 0.00922 Ar. The primary sources of uncertainty are the estimated temperature rise and the estimated quantity of substance in the calorimeter. Overall, the uncertainty of the Cv values is estimated to be less than plus or minus 2% for the gas and plus or minus 5% for the liquid.

Keywords: *Crystallography, *Proteins, *Information systems, Crystal structure, Three dimensional, Software tools, Data base management.

The Protein Data Bank (PDB) is an archive of experimentally determined three-dimensional structures of proteins, nucleic acids, and other biological macromolecules with a 25 year history of service to a global community. PDB is being replaced by 3DB, the Three-Dimensional Database of Biomolecular Structures that will continue to operate from Brookhaven National Laboratory. 3DB will be a highly sophisticated knowledege-based system for archiving and accessing structural information that combines the advantages of object oriented and relational database systems.

Thin-Film Ruthenium Oxide - Iridium Oxide Thermocouples.
Final rept.
K. G. Kreider. 1991, 8p.
Pub. in Proceedings of the Materials Research Society Symposium, Anaheim, CA., April 29-May 3, 1991, v234 p205-212.

Keywords: *Iridium oxide, *Ruthenium oxide, *Thin films, Sputtering, Temperature measurement, Thermocouples, Reprints.

Ruthenium oxide and iridium oxide have outstanding resistance to corrosion. These oxides are also excellent electrical conductors and have been used as biochemical charge injection electrodes. Their unique electrical and electrochemical properties have also led to their consideration as high temperature pH electrodes. Thin films are the most useful form for these applications as they permit the miniaturization of fast response sensors and electrodes. The study was used to characterize the thermoelectric and electrical conductance parameters of ruthenium and iridium oxide sputtered thin films. The electric and thermoelectric properties of the thin films were found to be sensitive to the annealing temperature of the sputtered oxides. The properties of the film are related to the microstructure, stoichiometry and crystal structure as determined by x-ray diffraction. Heat treatments were used to stabilize the thermoelectric response and the thermal coefficient of resistivity.

Ferric Ion Assisted Photooxidation of Halocetates.
Final rept.
P. Maruthamuthu, and R. E. Huie. 1995, 9p.
Pub. in Chemosphere, v30 n11 p2199-2207 1995.

Keywords: *Haloacetates, *Photooxidation, Photodecarboxylation, Hydroxyl radical, Hydrofluorocarbons, Hydrochlorofluorocarbons, Reprints, *Foreign technology.

Aqueous solutions containing ferric ions and chloro- or fluoroacetates were photolyzed by light with wavelengths greater than 300 nm. Significant variation in the extent of reaction was observed, with the totally halogenated acetates degraded very little in the course of the experiments. The relative rates of degradation were found to correlate very well with the relative rates of reaction of the haloacetate with the hydroxyl radical.

36Cl/Cl Accelerator-Mass-Spectrometry Standards: Verification of Their Serial-Dilution-Solution Preparations by Radioactivity Measurements.
R. Colle, and J. W. L. Thomas. 1993, 25p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v98 n6 p653-677 Nov/Dec 93.

Keywords: *Mass spectrometry, *Chlorine 36, *Standards, Proportional counters, Liquid scintillators, Beta decay, Gravimetric analysis, Isotope dilution, Isotope ratio, Radioactivity, Radioisotopes, Metrology, Solutions, *Accelerator mass spectroscopy, Dilution factors.

A consortium of accelerator-mass-spectrometry (AMS) laboratories recently prepared a series of (36)Cl/Cl isotopic ratio AMS standards by an eight-step serial gravimetric dilution scheme. Of the resulting nine solutions, only the latter six could be assayed by AMS to confirm the gravimetric dilution factors. The paper provides the results of relative radioactivity measurements on the first four solutions to verify the first three dilution factors. The fourth solution was the only dilution capable of being directly measured by both AMS and radionuclidic metrology of (36)Cl, and therefore its assay by radioactivity counting was deemed of considerable importance.

Airborne Asbestos Method: Standard Test Method for High Precision Counting of Asbestos Collected on Filters. Version 1.0.
S. Turner, and E. B. Steel. Mar 94, 10p, NISTIR-5350.

Keywords: *Asbestos, *Counting techniques, *Particles, *Chemical analysis, Transmission electron microscopy, Standards, Regulations, Air pollution detection, Water pollution detection, Filters, Procedures.

The analysis of asbestos by transmission electron microscopy (TEM) is important for the determination of the cleanliness of air or water and for research purposes. Counting rules are used to determine the amount of asbestos observed by TEM. This method describes a high precision set of counting rules. For this method, all qualifying particles are counted as one structure; the number of asbestos fibrils within a particle does not affect the number of structures assigned to the particle.

Airborne Asbestos Method: Standard Test Method for Verified Analysis of Asbestos by Transmission Electron Microscopy. Version 2.0.
S. Turner, and E. B. Steel. Mar 94, 26p, NISTIR-5351.
See also PB94-113578.

Keywords: *Asbestos, *Chemical analysis, Air pollution detection, Transmission electron microscopy, Quality assurance, Water pollution detection, Standard, Procedures, *Verified analysis.

The analysis of asbestos by transmission electron microscopy is important for determination of the cleanliness of air or water and for research purposes. Verified analysis provides a method for determining the quality of the analyses. Verified analysis is a procedure in which a grid opening is independently analyzed for asbestos by two or more transmission electron microscope (TEM) operators and in which a comparison and evaluation of the correctness of the analyses are made by a verifying analyst. Detailed information - including absolute or relative location, a sketch, orientation, sized (length, width), morphology, analytical information and structure identification - is recorded for each observed asbestos structure. Comparisons of the analyses are made on a structure-by-structure basis and the percentage of true positives, false positives and false negatives are determined for each TEM operator. Verified analyses can be used as part of a quality assurance program for asbestos analyses and as a training procedure. This report describes a method for conducting a verified analysis. The method is reported in ASTM format. This version contains a revised procedure, examples and flow charts.

Classical Analysis: A Look at the Past, Present, and Future.
Final rept.
C. M. Beck. 1994, 14p.
Pub. in Analytical Chemistry 66, n4 p224A-239A, 15 Feb 94.

Keywords: *Analytical techniques, *Chemical analysis, Measuring instruments, Comparison, Performance evaluation, Laboratories, Testing procedures, Reprints, *Classical analysis.

Despite the fact that instrumental analysis has rightfully assumed an overwhelmingly major role in the analytical laboratory, there remains a limited, although important, need for classical analysis. Instrumental analysis is most useful for elemental determinations at minor and trace levels (about 1% all the way down to 1 atom), and in this range classical analysis performs either poorly or not at all. However, instrumental analysis generally does not give high precision and accuracy at major levels (about 1% up to 100%), and in this range classical analysis does perform well. Moreover, instrumental and classical analysis complement each other and can be used in tandem to the analyst's advantage.

Pub. in Analytical Chemistry 65, n20 p2899-2902, 15 Oct 93.

Keywords: *Rhodium, *Standards, *Chemical analysis, Solutions, Comparison, Certification, Sample preparation, Gravimetric analysis, Spectrum analysis, Solubility, Inorganic salts, Quality assurance, Reprints, *Standard Reference Materials, SRM 3144.

A dual-path approach has been developed for the production of an accurate rhodium solution standard. First, a water-soluble rhodium salt was assayed for rhodium by gravimetry. Second, a different water-soluble rhodium salt was synthesized from a known mass of high-purity rhodium metal. The agreement between both rhodium solution standards, each based on gravimetry, and subject to different random and systematic errors, confirmed the accuracy of their rhodium concentrations. Based on this work an accurate rhodium solution standard (NIST Standard Reference Material (SRM) 3144) was prepared by dissolving in water a weighed

portion of an accurately assayed, homogeneous, water-soluble rhodium salt, which had been dried to constant weight.

Liquid Chromatography: Laser-Enhanced Ionization Spectrometry for the Speciation of Organolead Compounds.
Final rept.
K. S. Epler, T. C. O'Haver, and G. C. Turk. 1994, 4p.
Pub. in Jnl. of Analytical Atomic Spectrometry 9, p79-82 Feb 94.

Keywords: *Liquid chromatography, *Chromatographic analysis, *Organometallic compounds, *Lead compounds, Chemical analysis, Ion spectroscopy, Trace amounts, Reprints, Laser enhanced ionization, Standard reference materials.

Liquid chromatography (LC) and laser-enhanced ionization spectrometry (LEI) have been combined to provide a very sensitive method for the measurement of organolead species. Measurement is possible in environmental and biological matrices, which often contain high levels of easily ionized elements that normally interfere with LEI measurements. However, LC is able to resolve the interferents from the analytes, and LEI is sensitive enough to counterbalance the increase in detection limits that results from the use of LC. The method has been applied to the determination of organolead compounds in National Institute of Standards and Technology Standard Reference Material 1566a, Oyster Tissue. Trace levels of trimethyllead were observed in the Oyster Tissue, but concentrations were variable among the samples tested.

Fourier Transform Atomic Emission Studies Using a Glow Discharge as the Emission Source.
Final rept.
M. R. Winchester, J. C. Travis, and M. L. Salit. 1993, 13p.
Pub. in Spectrochimica Acta 48B, n11 p1325-1337 1993.

Keywords: *Glow discharges, *Emission spectroscopy, Measurement, Precision, Reprints, Fourier transform atomic emission spectroscopy, Photon noise.

The glow discharge (GD) is investigated as a possible atomic emission source for Fourier transform atomic emission spectroscopy (FT-AES). Noise power spectra are presented to demonstrate that GD emission is primarily characterized by photon noise, although a drift noise component exists at extremely low frequencies. The photon noise character is important, as photon noise limited sources are expected to outperform source flicker noise limited sources in terms of measurement precision. The implementation of bandpass restriction and dual channel subtractive noise cancellation as possible means of improving measurement precision are also presented. In both cases, the improvements were found to be minimal, a fact attributed to the probable suitability of the GD for FT-AES.

Keywords: *Pycnometers, *Electronic equipment, *Weight indicators, Laboratory equipment, Calibrating, Standardization, Density(Mass/Volume), Measuring instruments, Glassware, Liquids, Volume, Precision, Mass, Electronic balance, Liquid density.

Pycnometers are used to measure the density of fluids. Usually pycnometer volume is determined by measuring the mass and temperature of contained water and thereafter is used to determine the density of contained fluid by further weighing. The calibration and use of the pycnometer can be achieved on a modern electronic balance without the use of the usual set of mass standards. This paper explores the electronic balance application to pycnometry, presents supporting data with analysis and discusses a pycnometer design.

This publication describes the various factors that can affect the proper functioning of a spectrophotometer and suggests procedures to assess and control these factors. Particular consideration is given to the long- and short-term stability of a spectrophotometer, wavelength accuracy, spectral bandpass, stray radiation, and the accuracy of the transmittance or absorbance scale. A description is given of the Standard Reference Materials (SRMs) that can be used to control these factors. The methods for the preparation, certification, and use of two such materials (SRM 930 and SRM 1930) are also presented. The results obtained in the actual use of the SRMs are examined in some detail. An Appendix contains the reproduction of several publications and Certificates relevant to the subject discussed in this publication.

FAAS(Flame Atomic Absorption Spectrophotometry), Lead nephropathy, NIST(National Institute of Standards and Technology).

The protocols developed and implemented to provide lead acetate containing drinking water solutions for animal toxicity studies are described in detail. The procedure involved preparation of 20 liter batches of high concentration lead acetate solution (20,000 ppm) at National Institute of Standards and Technology (NIST). Conventional flame atomic absorption spectrophotometry (FAAS) was employed to confirm that the lead concentration of the solution was within five percent of the target value. This solution was then dispensed into containers of appropriate volume such that upon dilution at the animal research facility, drinking water solutions containing lead concentrations of 50, 250 and 1000 ppm were produced. Samples of these diluted solutions and samples taken from animal cage water bottles were returned to NIST for follow-up FAAS determination of lead concentration to insure that animal exposure to lead was meeting experimental goals.

Contract DEAIO586ER60446
Pub. in Proceedings of the International Symposium on Resonance Ionization Spectroscopy and Its Applications (4th), Gaithersburg, MD., April 10-15, 1988, p167-170 1989. Sponsored by Department of Energy, Washington, DC.

Keywords: *Resonance ionization mass spectroscopy, Chemical analysis, Laser ablation, Pulsed lasers, Trace elements, Thin films, Reproducibility, Sampling, Reprints, Atom sources.

The efficient application of pulsed-laser resonance ionization mass spectrometry (RIMS) to ultrasensitive analysis requires conservation of samples during the analysis dead time. Laser ablation of solids has been shown to provide vapor plumes of appropriate spatial and temporal properties, but free atom fractions suffer from particle formation due to thermal stress fracturing. The authors report here preliminary studies with semitransparent thin (about 50 A) films, intended to improve the reproducibility and atom yield of laser ablation sampling.

Relative Sensitivity Factors and Useful Yields for a Microfocused Gallium Ion Beam and Time-of-Flight Secondary Ion Mass Spectrometer.
Final rept.
J. Bennett, and D. Simons. 1991, 6p.
Pub. in Jnl. of Vacuum Science and Technology A 9, n3 p1379-1384 1991.

Keywords: *Ion sources, *Gallium ions, Secondary ion mass spectroscopy, Time-of-flight method, Mass spectrometers, Liquid metals, Thin films, Sensitivity, Yield, Magnesium, Calcium, Glass, Reprints.

Relative sensitivity factors for several elements in micrometer size glass particles, bulk glasses and glass thin films have been determined for a Ga(1+) liquid metal ion gun combined with a time-of-flight secondary ion mass spectrometer. The reproducibility of the values within and among glasses of various compositions is better than 20%. Reproducibility is improved by sputter-cleaning the sample prior to data collection. Relative sensitivity factors have also been obtained from bulk glasses using pulsed, low-energy electrons to neutralize charge build-up on the sample. Useful yields for Mg and Ca in a thin glass film were calculated to be a 3.4 x 10(sup -4) and 8.0 x 10(sup -4), respectively.

Concentration Histogram Imaging: A Scatter Diagram Technique for Viewing Two or Three Related Images.
Final rept.
D. S. Bright, and D. E. Newbury. 1991, 7p.
Pub. in Analytical Chemistry 63, n4 p243A-244A, p246A-250A, 15 Feb 91.

Keywords: *Image processing, *Histograms, *Concentration(Composition), *Microanalysis, Reprints, Scatter diagrams, Quantitative analysis, Chemical analysis, X-ray analysis, *Concentration histogram imaging, X-ray maps.

Quantitative compositional mapping involves the production of images, which directly depict the concentrations of the elemental constituents present in a specimen. A problem is encountered when numerical concentration information is to be presented in the form of an image--the authors wish to simultaneously present both spatial position information and numerical concentration data for two or more constituents. The authors have developed the Concentration Histogram Image (CHI) which is a modified scatter diagram, where compositional maps are transformed from real space to concentration space. Unlike the scatter diagram, the CHI is displayed by encoding the frequency information with a thermal color scale. The authors have implemented the CHI on various computers to view the CHI for selected areas of the sample and show the correspondence between features (clumps or bands of points) in the CHI with specific areas in the original maps. The CHI is a useful diagnostical tool for detecting inhomogeneities in materials, checking quantitative corrections of x-ray maps, evaluating sampling and measurements statistics, and selecting features of interest for further analysis.

Germanium Detector Optimization of MDA for Efficiency vs. Low Intrinsic Background.
Final rept.
D. R. Brown, and L. A. Slaback. 1988, 7p.
Pub. in Proceedings of Health Physics Society Midyear Topical Meeting on Instrumentation (22nd), San Antonio, TX., December 4-8, 1988, p46-52.

Keywords: *Detectors, *Germanium, Samples, Spectrum analysis, Standards, Performance evaluation, Reprints, *Minimum detectable activity.

The paper will discuss research performed in selecting a high purity germanium detector of between 20 and 45 percent relative efficiency. The primary goal will be to opumize the minimum detectable activity (MDA) of the detector. Several factors will be evaluated that contribute to MDA; such as, relative background nuclides in the detector structural material, relative detector efficiency, and shield design. Results to be presented include efficiencies for various sample geometries, MDA for several detector/sample configurations, and gamma spectrum analysis of detector background counts.

Applications of the Vortex Tube in Chemical Analysis.
Final rept.
T. J. Bruno. 1992, 13p.
Pub. in Process Control and Quality 3, p195-207 1992. Sponsored by Gas Research Inst., Chicago, IL.

Keywords: *Hilsch tubes, Heat transfer, Laboratory equipment, Chemical analysis, Reprints, *Vortex tubes.

The vortex tube is a unique heating and cooling device that has no moving parts, but operates only with a stream of compressed air. Although first described nearly six decades ago, it has only recently been 'discovered' by scientists and engineers outside of the heat transfer fraternity. The vortex tube can provide air streams at temperatures as low as -40 C, and as high as 190 C. It is especially useful for heating and cooling the small, irregularly shaped instrument components and devices that are so common in chemical analysis. In this paper, the operational essentials of the vortex tube are presented, and several applications in chemical analysis are discussed.

Simple and Efficient Low-Temperature Sample Cell for Infrared Spectrophotometry.
Final rept.
T. J. Bruno. 1992, 2p.
Pub. in Review of Scientific Instruments 63, n10 p4459-4460 Oct 92. Sponsored by Gas Research Inst., Chicago, IL.

Keywords: *Optical equipment, *Infrared spectrophotometers, Hilsch tubes, Solvents, Refrigerants, Design, Reprints, *Low temperature cell, Vortex tubes.

It is often helpful in infrared spectrophotometry to contain a liquid sample in a cell that is maintained at a subambient or nearly cryogenic temperature. Volatile samples and solvents being studied can vaporize and form bubbles in conventional liquid sample cells, especially under the influence of the infrared radiation from the source in a continuous-wave instrument. This will result in the formation of spikes on the spectra. In addition, some analytes are thermally labile and must be protected from warming while the spectrum is recorded. An easily constructed cell cooled with a vortex tube can solve many of these problems, and is in many ways an improvement over commercial devices. In this note, such a cell is described and its application to volatile alternative refrigerants is discussed.

Simple, Inexpensive Apparatus for Sample Concentration.
Final rept.
T. J. Bruno. 1992, 2p.
Pub. in Jnl. of Chemical Education 69, n10 p837-838 Oct 92. Sponsored by Gas Research Inst., Chicago, IL.

Keywords: *Concentrating, *Laboratory equipment, *Design, Reprints, *Sample concentrators, Vortex heating and cooling.

In many synthetic and analytical procedures, it is often necessary to concentrate samples by controlled evaporation of the solvent. Several glass concentrators are available (such as the micro or Kuderna Danish type), consisting of a solution vessel with a collection cold finger directly below, and a reflux tube above. In conventional practice, the solution vessel section is electrically heated in an aluminum block, while the cold finger is kept in ambient air at a lower temperature. An alternative to this technique that provides several important advantages is to use a Ranque-Hilsch vortex tube to both heat the solution vessel and cool the cold finger. In this note, the construction and application of such an apparatus is described.

Establishing Quality Measurements for Inorganic Analysis of Biomaterials.
Final rept.
J. R. DeVoe. 1991, 6p.
Pub. in American Chemical Society Symposium Series - Biol. Trace Elem. Res., v445 p101-106 1991.

Keywords: *Biocompatible materials, *Chemical analysis, *Inorganic compounds, *Trace elements, Diseases, Quality assurance, Interlaboratory comparisons, Reprints.

While there have been a number of excellent studies showing the effects of trace element concentrations in biomaterials in a number of diseases and other health-related processes, the inconsistencies of quantitative analytical data still limit progress. It is suggested that a well integrated system of laboratories that is dedicated to analytical chemistry quality assurance can provide an interlaboratory structure that will improve the quality of the measurements. Quantitative measurement of the elemental-bound compound appears to be greatly needed, and significant effort needs to be expended in this most difficult area. Progress can be greatly enhanced by including the analytical chemist in the biomedical research team.

Importance of Chemometrics in Biomedical Measurements.
Final rept.
L. A. Currie. 1991, 27p.
Pub. in American Chemical Society Symposium Series 445, p74-100 1991.

Keywords: *Biomedical measurements, Trace elements, Multivariate analysis, Quality control, Mathematics, Statistics, Environmental pollutants, Diet, Reprints, *Chemometrics.

Chemometrics as a discipline blends modern mathematical and statistical techniques with chemical knowledge for the design, control, and evaluation of chemical measurements. For complex systems, such as those involving biomedical trace element research the multi-disciplinary efforts toward problem formulation and measurement process design and evaluation can be substantially aided by exploratory chemometric approaches. Following a brief overview of potential chemometrics contributions, primary attention is to be given to exploratory multivariable data analysis techniques, which can capture the essence of a complex data set in a few, visualizable dimensions. Such techniques are appropriate because nuclear-related measurements, quality control samples and data, global dietary intakes, and biological compositions all comprise multiple chemical species, frequently exhibiting correlated behavior. Applications of some of the more powerful techniques, such as principal component factor analysis, are illustrated by multivariable interlaboratory quality control, assessment of pollutant origins, and exploration of daily dietary intake data.

Metrological Measurement Accuracy: Discussion of 'Measurement Error Models' by Leon Jay Gleser.
Final rept.
L. A. Currie. 1991, 9p.
Pub. in Chemom. Intell. Lab. Syst. 10, n1-2 p59-67 1991.

Keywords: *Metrology, Multivariate analysis, Factor analysis, Error analysis, Accuracy, Matrices, Reprints, *Chemometrics.

The paper represents a contribution to the chemist - statistician colloquy on multivariate measurement and model error. Specifically, it is a discussion of 'measurement error models' by Leon Jay Gleser (Dept. of Mathematics and Statistics, Univ. of Pittsburgh). Basic topics addressed include the 'errors in x(-) and y(-)', extended to the multivariable domain, as realized in factor analysis and errors in variables regression. The distinction between structural and functional models for statistical relationships is considered, as well as their asymptotic character. Most importantly, approaches are suggested for complementing the important advances in mathematical statistics (as reviewed by Gleser) with chemical knowledge and insight. These take three forms: chemical limitations imposed on the several statistical assumptions of the measurement error models (especially those involving the diagonal and off-diagonal elements of the variance covariance matrix); chemically feasible approaches to measurement refinement, such as tracer and unique variable techniques for reducing multi-collinearity; and linear and non-linear model refinement, based on scientific knowledge of the system under investigation.

Determination of Boron and Lithium in Diverse Biological Matrices Using Neutron Activation - Mass Spectrometry (NA-MS).
Final rept.
G. V. Iyengar, W. B. Clarke, and R. G. Downing. 1990, 5p.
Pub. in Fresenius Jnl. of Analytical Chemistry 338, n4 p562-566 1990.

Keywords: *Neutron activation analysis, *Mass spectrometry, *Boron, *Lithium, *Chemical analysis, Trace elements, Food, Tissues(Biology), Reprints.

Essential features of the Neutron Activation-Mass Spectrometry (Na-MS) technique are described. Applicability of this technique for the simultaneous determination of boron and lithium is demonstrated for a diverse group of biomaterials. This is a non-destructive type of analytical technique, and dynamic in nature since its coverage extends to a broad range of concentration levels. At the post-irradiation stage, extraneous contamination by natural lithium or boron is nonexistent, since only the radioactive products are the analytes assayed. Coupling the nuclear activation phenomenon which generates (4)He and (3)He (from (10)B and (6)Li, respectively), with the high accuracy potential of mass spectrometry forms the principle of this technique. Under ideal conditions the detection limit is extendable to pg/g concentration ranges and therefore, it is extremely well suited to investigate the natural concentration levels of boron and lithium in biomaterials. The potential of this method for the determination of lithium in biomedical trace element research investigations is of special significance since determination of sub-ppb levels of lithium faces serious analytic difficulties by other analytical techniques due to mainly contamination control and in some cases also to detection limit problems.

High-Sensitivity Determination of Iodine Isotopic Ratios by Thermal and Fast Neutron Activation.
Final rept.
R. M. Lindstrom, G. J. Lutz, and B. R. Norman. 1991, 12p.
Pub. in Jnl. of Trace Microprobe Technology 9, n1 p21-32 1991.

Keywords: *Neutron activation analysis, *Activation analysis, *Iodine 129, *Iodine 127, Radioactive contaminants, High sensitivity, Neutron irradiation, Fission products, Isotope ratio, Thermal neutrons, Fast neutrons, Reprints.

In order to study the transformations of radioiodine in the environment, the analytical method used for the determination of iodine-129 concentrations and of (129)I/(127)I ratios must be capable of measuring concentrations down to the present-day background level, of order 100 million atoms/gram, with acceptable precision and low blank. A neutron activation procedure has been developed to perform reliable concentration

measurements at this level in a few grams of sample. (129)I/(127)I ratios as low as 6 X 10(sup -10) have been measured. The procedure described uses oxygen combustion both before and after irradiation to separate iodine from other elements. Irradiation is performed with optimized fluxes of both thermal and fast neutron. Bromine-82 and other interferences are removed by a gas-solid reaction with Hydrated Manganese Dioxide. High-resolution gamma-ray assay permits small amounts of induced (130)I to be measured simultaneously with (126)I produced from stable iodine by the (n,2n) reaction.

Effects of Target Shape and Neutron Scattering on Element Sensitivities for Neutron-Capture Prompt Gamma-ray Activation Analysis.
Final rept.
E. A. Mackey, G. E. Gordon, R. M. Lindstrom, and D. L. Anderson. 1991, 5p.
Pub. in Analytical Chemistry 63, n3 p288-292 1991.

Keywords: *Activation analysis, Neutron capture gamma rays, Neutron scattering, Sensitivity, Hydrogen, Reprints, Target shape.

A study of the effects of neutron scattering by hydrogen on elemental sensitivities of in-beam neutron capture prompt gamma-ray activation analysis (PGAA) is presented. Elemental sensitivities (counts/s/mg) for H, B, Na, Cl, K, Mn, Br, Ag, Cd, I, Sm, and Gd, increase linearly with H density (g/mL). Nine of the twelve elements studied undergo 1.69 + or - 0.18% enhancement per percent increase in H density. The enhancement of the sensitivity for H itself varies with matrix composition. In a scattering matrix, elemental sensitivity is also a function of target shape. For several series of disk-shaped hydrogenous targets, elemental sensitivities increase with decreasing target thickness until, at some limiting thickness the probability for multiple interactions begins to decrease and this trend is reversed. Consistent with theory, sensitivities measured for spherical hydrogenous targets show no enhancement.

Theoretical Analysis of the Coherence-Induced Spectral Shift Experiments of Kandpal, Vaishya, and Joshi.
J. T. Foley, and M. Wang. 1994, 14p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n3 p267-280 May/Jun 94.

Keywords: *Spectroscopy, *Radiometry, *Spectral shift, Optus, Coherence, Wolf shifts.

The optical system used by Kandpal, Vaishya, and Joshi in their experiments on coherence-induced spectral shifts is analyzed theoretically. An approximate form for the cross-spectral density in the secondary source plane is obtained, and it is shown that, contrary to the assertions of Kandpal, Vaishya, and Joshi, the corresponding complex degree of spectral coherence in this plane is wavelength dependent. After making some assumptions about the behavior of the interference filter used in the system, an approximate form for the spectrum of the light on-axis in the observation plane is obtained. It is shown that the peak wavelengths of this spectrum do not agree with those reported by Kandpal, Vaishya, and Joshi. Possible reasons for this disagreement are discussed.

Electron Probe X-Ray Microanalysis.
Final rept.
D. E. Newbury. 1992, 17p.
Pub. in Encyclopedia of Materials Characterization: Surfaces, Interfaces, Thin Films, Chapter 3.5, p175-191 1992.

Keywords: *Electron probes, *Microanalysis, *X-ray anlaysis, Electron scanning, Electron microscopy, Spatial resolution, Digital systems, Quantitative analysis, Qualitative analysis, Reprints, Elemental analysis, Scanning electron microscopy, Compositional maps.

Electron probe x-ray microanalysis (EPMA) is an elemental analysis technique based upon bombarding a specimen with a focussed beam of energetic electrons (beam energy from 5 - 30 keV) to induce emission of characteristic x-rays (energy range from 0.1 - 15 keV). The energy (wavelength) of the x-rays identifies the elements present in the specimen (qualitative analysis), and the x-ray intensity can be related to the quantity present (quantitative analysis). Elemental coverage extends from beryllium to the actinides. Detection limits are approximately 100 parts per million for elements with atomic numbers greater than 10. Spatial distributions of elemental constituents can be visualized qualitatively by x-ray area scans (dot maps) and quantitatively by digital compositional maps.

Microanalysis to Nanoanalysis: Measuring Composition at High Spatial Resolution.
Final rept.
D. E. Newbury. 1990, 28p.
Pub. in Nanotechnology 1, n2 p103-130 Oct 90.

Keywords: *Spectrochemistry analysis, *Microanalysis, *Measuring instruments, *Spatial resolution, Mass spectrometers, Electron probes, X-ray analysis, Auger electron spectroscopy, Electron scanning, Electron microscopy, High resolution, Reprints, *Nanoanalysis, Laser microbe mass spectrometry, Secondary ion mass spectrometry, Field ion microscopy, Composition.

Spatially-resolved analysis of elemental, isotopic, and molecular constituents is possible with microanalysis and nanoanalysis techniques. At the micrometer scale of spatial resolution, electron probe x-ray microanalysis provides elemental coverage from Be to the actinides with detection limits in the range from 100-1000 parts per million (ppm). Secondary ion mass spectrometry and laser microprobe mass spectrometry detect all elements and isotopes with sensitivity from parts per billion to parts per million, and molecular signals can also be detected. Molecular microanalysis is also performed with photon detection techniques, including infrared, fluorescence, and Raman spectroscopies. Analytical electron microscopy and time-of-flight secondary ion mass spectrometry extend spatial resolution to the 100-nm spatial level.

Design of a Protocol for an Electron Probe Microanalyzer k-Value Round Robin.
Final rept.
D. E. Newbury, and R. B. Marinenko. 1989, 3p.
Pub. in Microbeam Analysis 24, p257-259 1989.

Keywords: *X-ray analysis, *X-ray spectroscopy, Microanalysis, Matrices, Correction, Quantitative analysis, Reprints, *Electron probe microanalysis, *k-value.

The basic measurement in quantitative electron probe microanalysis is the determination of the 'k-value', which is the ratio of the characteristic x-ray intensity measured for an unknown to that measured for a standard. Models for quantitative matrix corrections are tested on suites of k-value measurememts which are not standardized. A k-value round robin is planned which will attempt to establish a new base of measurements with sufficient accuracy and precision to permit adequate testing of the models. A proposal for the measurement protocol for the k-value round robin is described. This protocol is critical if adequate measurements are to be obtained.

Compositional Mapping of the Microstructure of Materials.
Final rept.
D. E. Newbury, R. B. Marinenko, R. L. Myklebust, and D. S. Bright. 1991, 19p.
Pub. in Images of Materials, Chapter 10, p290-308 1991.

Keywords: *Microstructure, *Mass spectrometers, *Image processing, Reprints, Microanalysis, Electron probes, Mapping, Chemical analysis, Digital systems, Compositional mapping, Secondary ion mass spectrometry, Microbeam analysis.

Recent developments in electron probe microanalysis and secondary ion mass spectrometry techniques enable the analyst to prepare compositional maps of the microstructure of materials. The technique of compositional mapping involves performing a complete quantitative analysis at each beam location in the imaged field of view on the specimen. The images directly convey the sense of the spatial distribution and compositional interrelationships of the elemental constituents in the microstructure. The images are supported at every picture element by numerical values of the concentrations, as well as data on the statistical precision of the measurement. The combination of images and conventional numerical concentration data provides a powerful tool for microstructural analysis.

Separation and Identification of Organic Gunshot and Explosive Constituents by Micellar Electrokinetic Capillary Electrophoresis.
Final rept.
D. M. Northrop, D. E. Martire, and W. A. MacCrehan. 1991, 5p.
Pub. in Analytical Chemistry 63, n10 p1038-1042 1991.

Keywords: *Electrophoresis, *Forensic science, *Chemical explosives, Capillaries, Micellar systems, Sodium sulfates, Parameters, Chromatography, Reprints, *MECC(Micellar electrokinetic capillary chromatography), *Micellar electrokinetic capillary chromatography, Gunshot residue, Sodium dodecylsulfate, Capillary zone electrophoresis.

Micellar electrokinetic capillary chromatography (MECC) was used to effect a rapid and efficient separation of some common constituents of gunshot and explosive residues. A separation of 26 constituents of interest was accomplished in under 10 minutes with efficiencies typically between 200,000 and 400,000. The effects of various experimental parameters were studied. Sodium dodecylsulfate (SDS) concentration, pH, addition of a tetraalkylammonium salt, capillary diameter, and injection times were all examined in order to optimize the system. It was found that capillary diameter and injection time played an important role in improving detection limits and efficiencies. This method was applied to extracts from swabbings of a .38 caliber and a .45 caliber shell casing demonstrating the presence of gunshot residues.

S. D. Rasberry, and T. E. Gills. 1991, 6p.
Pub. in Spectrochimica Acta B 46, n12 p1577-1582 1991.

Keywords: *Chemical analysis, *Quality assurance, *Standards, Accuracy, Certification, Concentration(Composition), Procedures, Environmental tests, Industries, Clinical medicine, Nutrition, Construction materials, Reprints, *Standard reference materials.

Analytical measurements are increasingly important to industrial quality assurance (QA) and to critical decision making in such fields as clinical, nutritional, and environmental chemistry. Several factors are important to attaining analyses that are reliably accurate. Some of these include well-designed methods, trained staff, adequate instrumentation, reliable reference materials, laboratory QA procedures, and periodic proficiency testing. The paper will focus on the role of reference materials in accurate chemical analysis. Fundamental attributes of reference materials will be described together with details on how limits of uncertainty are established for certified values. Examples will be drawn from materials recently certified at NIST. Besides industrial examples, such as new alloys and construction materials such as cement and glass, recent clinical, nutritional, and environmental certifications will be cited. Matrices for these types of materials are very wide-ranging and includes human serum (for vitamins in serum, in whole egg powder, and in diet material), lead in reference fuel, organics in cod liver oil, and several others.

Formation of Technical Committee 201 on Surface Chemical Analysis by the International Organization for Standardization.
Final rept.
C. J. Powell, and R. Shimizu. 1993, 4p.
Pub. in Surface and Interface Analysis 20, p322-325 1993.

Keywords: *Chemical analysis, *Surface analysis, Standards, Reprints, International Organization for Standardization, Technical Committee 201.

The International Organization of Standardization (ISO) recently created a new Technical Committee (ISO/TC 201) on Surface Chemical Analysis in response to a proposal from Japan. As of February 1993, ten national standards bodies had indicated willingness to become participating members of ISO/TC 201 (Austria, China, Germany, Italy, Japan, Russia, Sweden, Turkey, the United Kingdom and the United States of America) and fifteen national standards bodies had indicated willingness to become observer members (Australia, Belgium, Egypt, Finland, France, India, Ireland, Korea, Norway, Philippines, Poland, Romania, Singapore, South Africa and Switzerland). The following subcommittees are planned: Terminology; General Procedures; Data Management and Treatment; Depth Profiling; Auger Electron Spectroscopy; Secondary Ion Mass Spectrometry and X-ray Photoelectron Spectroscopy. ISO/TC 201 will develop international standards and will consider standards and documents prepared by other groups as potential international standards. Information is given in this article on the purpose, structure and planned work of ISO/TC 201.

Addition of M and L-Series Lines to NIST Algorithm for Calculation of X-Ray Tube Output Spectral Distributions.
Final rept.
P. A. Pella, L. Feng, and J. A. Small. 1991, 2p.
Pub. in X-ray Spectrometry 20, n3 p109-110 1991.

Keywords: *X-ray fluorescence analysis, *X-ray tubes, Spectral energy distribution, Computation, Tungsten, Gold, Reprints, M lines, L lines, NIST algorithm.

Characteristic M x-ray tube target lines and some minor L-series lines have been added to a previously developed National Institute of Standards and Technology (NIST) algorithm for calculation of the output spectral distributions from x-ray tubes. This algorithm is used in first principle calculations for correction of interelement effects in quantitative x-ray fluorescence analysis. The M lines from x-ray tube targets such as W and Au can be important for excitation of low atomic number elements in some applications. Also, minor L-series lines have been added to give a more complete description of the L-series in the calculated output spectral distribution.

Use of Kinetic Energy Distributions to Determine the Relative Contributions of Gas Phase and Surface Fragmentation in KeV Ion Sputtering of a Quaternary Ammonium Salt.
Final rept.
G. Gillen. 1991, 10p.
Pub. in International Jnl. of Mass Spectrometry and Ion Processes 105, n3 p215-224 1991.

Keywords: *Ammonium compounds, *Mass spectroscopy, *Secondary ion mass spectroscopy, *Quaternary ammonium salts, Organic nitrogen compounds, Kinetic energy, KeV range, Fragmentation, Sputtering, Reprints.

Kinetic energy distributions have been used to evaluate the extent to which gas phase decompositions contribute to the production of fragment ions in organic secondary ion mass spectra. Molecular kinetic energy distributions demonstrate that many fragment ions have a prominent gas phase component which may account for as much as 50% of the observed fragment ion signal obtained in a double focussing mass spectrometer.

Molecular Ion Imaging and Dynamic Secondary Ion Mass Spectrometry of Organic Compounds.
Final rept.
G. Gillen, D. S. Simons, and P. Williams. 1990, 9p.
Pub. in Analytical Chemistry 62, n19 p2122-2130 1990.

Keywords: *Secondary ion mass spectroscopy, *Mass spectroscopy, *Imaging techniques, Quaternary ammonium salts, Aromatic hydrocarbons, Amino acids, Molecular ions, Radiation damage, Fragmentation, Reprints, *Ion imaging.

An ion microscope equipped with a resistive anode encoder imaging system has been used to acquire molecular secondary ion images, with lateral resolutions on the order of 1 micrometer, from several quaternary ammonium salts, an amino acid, and a polynuclear aromatic hydrocarbon, which were deposited onto copper transmission electron microscope grids. All images were generated using the secondary ion signal of the parent molecular species. The primary ion dose dependence of parent and fragment molecular ion signal decays indicate that, for many bulk organic compounds, bombardment-induced fragmentation of parent molecules reaches a saturation at primary ion doses of 1-8 x 10(sup 14) ions/sq cm. Subsequent ion impacts do not significantly contribute to further accumulation of damage in the sample, resulting in desorption of intact parent molecular ions even after prolonged ion bombardment. This saturation process allows molecular images to be obtained at high primary ion doses and allows depth profiles to be obtained from simple molecular/metal test structures.

Combining Data from Independent Chemical Analysis Methods.
Final rept.
S. Schiller, and K. R. Eberhardt. 1991, 7p.
Pub. in Spectrochimica Acta B 46, n12 p1607-1613 1991.

Keywords: *Chemical analysis, Statistical analysis, Data analysis, Inhomogeneity, Certification, Uncertainty, Reprints, Standard reference materials, Systematic errors, Weighted mean.

Often, data from several different chemical analysis methods must be combined to form an overall mean value and uncertainty. However, the data from these different methods frequently do not agree when a statistical comparison is done, so taking a simple average of all of the individual observations is inappropriate. Computation of a weighted mean and corresponding uncertainty that take into consideration the random measurement error within each method as well as the disagreement between methods will be described. Examples of this approach, applied to the certification of NIST's Standard Reference Materials, will be given.

Device for Subambient Temperature Control in Liquid Chromatography.
Final rept.
L. C. Sander, and N. E. Craft. 1990, 3p.
Pub. in Analytical Chemistry 62, n14 p1545-1547 1990.

Keywords: *Liquid column chromatography, *Temperature control, *Cooling systems, *Thermoelectric coolers, Temperature measurement, Heat exchangers, Selectivity, Design, Performance evaluation, Reprints, *Subambient temperature control.

The construction of a device for regulating column temperature in liquid chromatography (LC) is described. The device is based on the thermoelectric cooling principle, and utilizes four thermoelectric heat exchangers placed in contact with an aluminum block. This block is machined to accept commercial LC columns. In the cooling mode, temperatures in the range .25 to 17 C are possible using 'tap water' (17 C) at a flow rate of 1.25 L/min. Although the main purpose of this device is cool LC columns, elevated temperatures are possible (maximum temperature, 99 C) by reversing the polarity of the power supply output. The column cooling device provides an economical, compact and portable means of controlling column temperature. The design allows for maximum flexibility in use and permits the device to be moved between instruments with little effort, as the need arises.

Comparison of the Liquid Chromatographic Behavior of Selected Steroid Isomers Using Different Reversed-Phase Materials and Mobile Phase Compositions.
Final rept.
M. Olsson, L. Sander, and S. Wise. 1991, 11p.
Pub. in Jnl. of Chromatography 537, n1-2 p73-83 1991.

Keywords: *Liquid column chromatography, *Chromatographic analysis, *Isomers, Comparison, Stereochemistry, Temperature dependence, Liquid crystals, Phase change materials, Polymers, Aromatic polycyclic hydrocarbons, Separation, Reprints, *Mobile phase compositions, *Selection rules, *Retention.

Reversed-phase liquid chromatographic selectivity for steroid isomers was found to change as a function of both temperature and mobile-phase composition. The influence of the stationary phase was studied by investigating retention and selectivity on a number of different monomeric and polymeric C18 stationary phase materials, as well as beta-cyclodextrin based phases. Three steroid isomers, i.e., equilin, 17 alpha- and 17 beta-estradiol, were chosen as probe solutes to illustrate the dramatic effect of changes in mobile-phase composition. Selectivity of androstane standards on a polymeric C18 phase was compared to selectivity on liquid crystalline phase in supercritical fluid chromatography (SFC). Although liquid crystalline and polymeric C18 phases have similar shape-selectivity for certain classes of solutes, such as polycyclic aromatic hydrocarbons (PAHs), different trends were observed for androstane isomers.

Automated, High-Precision Coulometric Titrimetry. Part 1. Engineering and Implementation.
Final rept.
K. W. Pratt. 1994, 10p.
See also Part 2, PB95-150207.
Pub. in Analytica Chimica Acta 289, p125-134 1994.

Keywords: *Coulometers, *Chemical analysis, *Primary standards, *Automatic control, Standard deviation, Statistical analysis, Error analysis, Electrochemistry, Benzoic acids, Chromates, Reprints.

Automated constant-current coulometry, based on Faraday's Laws, achieves uncertainties (relative standard deviation) of less than 1 part in 20,000 without chemical standardization. It is applicable to acid-base, redox, and precipitation titrations of high-purity compounds and solutions. Automation of the technique permits unsupervised operation and reduces operator-dependent errors. Initial setup and sample introduction are the sole manual steps. Each assay consists of a main titration at high, constant current, bracketed by the initial and final endpoint routines, each at a lower current. The coulometric assay is analogous to a conventional titration in which two different concentrations of the titrant are used to attain optimum accuracy. The initial endpoint determination corresponds to the blank determination in a classical titration. Each titration includes a statistical analysis of the random and systematic uncertainties associated with the analysis. Individual steps in the procedure are performed by a hierarchical series of subroutines to reduce program complexity. Results are presented for K2Cr2O7, benzoic acid, and solutions of strong acids.

Automated, High Precision Coulometric Titrimetry. Part 2. Strong and Weak Acids and Bases.
Final rept.
K. W. Pratt. 1994, 8p.
See also Part 1, PB95-150199.
Pub. in Analytical Chimica Acta 289, p135-142 1994.

Keywords: *Coulometers, *Chemical analysis, *Benzoic acids, *Sodium carbonates, *Hydrochloric acid, *Automatic control, Standard deviation, Precision, Titration, Reprints.

Automated constant-current coulometric acidimetry, based on Faraday's Laws, is uncertain to less than 1 part in 20,000 (relative standard deviation) and requires no chemical standardization. It is applicable to strong and weak acids and bases, with bases back-titrated after addition of excess strong acid. Initial setup and sample introduction are the sole manual steps. Assays of HCl, benzoic acid, Na2CO3, and tris(hydroxymethyl)aminomethane are presented. In the endpoint determination procedure, a generalized titration equation yields the theoretical charge remaining to the endpoint before each charge addition. The ratio of the experimental to the theoretical charge for the preceding aliquot corrects for experimental deviations.

Pub. in Analytical Chemistry 66, n6 p361 A-367 A, 15 Mar 94.

Keywords: *Chemical analysis, *Modules, *Automatic control, Chemical laboratories, Interfaces, Design, Reprints, *Chemistry workcell, *Laboratory automation, System integration.

An architecture has been developed to facilitate the creation of automated chemical analysis systems. This architecture is based upon the functionality of the traditional analytical chemistry organization, with automated entities specified to anthropomorphically fill the roles of the client for the chemical information, the expert analyst, the laboratory manager and the bench chemist. Standard interfaces between these entities are in the process of being designed. These interfaces, when coupled with standard entity behaviors, will allow for a modular 'plug-and-play' systems integration environment. This paper describes the architecture as it is currently understood and outlines the plan for its further evolution.

Development of Engineered Stationary Phases for the Separation of Carotenoid Isomers.
Final rept.
L. Sander, K. Sharpless, N. Craft, and S. Wise. 1994, 8p.
Pub. in Analytical Chemistry 66, n10 p1667-1674, 15 May 94.

Keywords: *Carotene, *Isomerization, *Separation processes, *Distillation equipment, Ligands, Substrates, Carotenoids, Standards, Phase separation(Materials), Retaining, Aromatic polycyclic hydrocarbons, Nutrients, Reprints.

A variety of bonded phase parameters (endcapping, phase chemistry, ligand length, and substrate parameters) were studied for their effect on column retention and selectivity toward carotenoids. Decisions were made on how each of these variables should be optimized based on the separation of carotenoid and polycyclic aromatic hydrocarbon test probes. A column was designed with the following properties: high absolute retention, enhanced shape recognition of structured solutes, and moderate silanol activity. The effectiveness of this 'carotenoid phase' was demonstrated for the separation of a mixture of structurally similar carotenoid standards, an extract of a food matrix Standard Reference Material, and a beta-carotene dietary supplement under consideration as an agent for cancer intervention/prevention.

Shape Selectivity Assessment of Stationary Phases in Gas Chromatography.
Final rept.
L. C. Sander, M. Schneider, S. A. Wise, and C. Woolley. 1994, 11p.
Pub. in Jnl. of Microcol. Sep. 6, p115-125 1994.

Keywords: *Gas chromatography, *Separation processes, *Distillation equipment, Solutes, Aromatic polycyclic hydrocarbons, Liquid crystals, Phase stability(Materials), Reprints, *Shape selectivity, Methyl polysiloxane.

Column selectivity is examined for a series of smectic liquid crystalline columns and is compared with methyl and C18 polysiloxane columns for the separation of polycyclic aromatic hydrocarbon (PAH) isomers. A set of extended and condensed solute probes is described that provides a sensitive indication of variations in column shape selectivity. Examples of shape selectivity differences are presented for smectic liquid crystalline columns and 5% phenyl polysiloxane columns using various PAH isomer sets. Variations in selectivity have been observed among different smectic liquid crystalline columns, and this problem appears more significant than for methyl polysiloxane columns. The selectivity ratio for tetraphenylmethane and p-terphenyl provides a sensitive indication of column shape selectivity, with a change in elution order occurring between ordered (smectic liquid crystalline) columns and non-ordered (methyl polysiloxane) columns. Shape selectivity differences indicated by this test mixture are apparent for more complex PAH isomer mixtures. Despite stationary phase selectivity variability, smectic liquid crystalline columns offer considerable potential for solving difficult separation problems involving structured solutes.

We report the first monolithic tin oxide (SnO2) gas sensor realized by commercial CMOS foundry fabrication (MO-SIS) and post-fabrication processing techniques. The device is composed of a sensing film that is sputter-deposited on a silicon micromachined hotplate. The fabrication technique requires no masking and utilizes in-situ process control and monitoring of film resistivity during film growth. Gas sensor responses of pure SnO2 films to H2 and O2 with an operating temperature of 350 C are reported. The fabrication methodology allows integration of an array of gas sensors of various films with separate temperature control for each element in the array, and circuits for a low-cost CMOS-based gas sensor system.

A set of four fluorescent standards has been produced and calibrated at the National Institute of Standards and Technology (NIST) for corrected relative spectral emission over the wavelength range from 400 to 740 nm. This new Standard Reference Material (SRM) 1931 has been produced in the form of sintered mixtures of inorganic phosphors and polytetrafluorethylene (PTEE) powder for spectral response calibration of spectrofluorimeters used in biology, medicine and studies of molecular structure. They provide a means for correcting spectrofluorimeter errors due to wavelength dependencies of optics, monochromators, and detectors, thus permitting meaningful intercomparison of results obtained in different laboratories.

Characteristics of Partial Pressure Analyzers.
Final rept.
C. R. Tilford. 1992, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Damage to Space Optics and Properties and Characteristics of Optical Glass, San Diego, CA., July 20, 22-23, 1992, v1761 p119-129.

Keywords: *Gas analysis, *Partial pressure, *Mass spectrometers, Calibration, Sensitivity, Vacuum apparatus, Measuring instruments, Pressure measurement, Reprints, *Partial pressure analyzers, Residual gas analyzers.

Partial pressure or residual gas analyzers are often invaluable for materials and contamination studies. However, some instrument design features and combination of operating parameters can cause performance features quite different from what many users expect. These unexpected performance characteristics can include pressure-dependent sensitivities, the sensitivity for one gas depending on the pressures of other gases, and time-dependent sensitivities after operation with gases such as oxygen or water. These characteristics can greatly complicate instrument calibration and can cause errors as large as two orders of magnitude. This paper discusses measured performance characteristics for different partial pressure analyzers that illustrate a wide range of performances from the different instruments, as well as several features that seem to be common to most instruments.

High-Performance Liquid Chromatography of Phytoplankton Pigments Using a Polymeric Reversed-Phase C18 Column.
Final rept.
L. Van Heukelem, A. J. Lewitus, T. M. Kana, and N. E. Craft. 1992, 6p.
Pub. in Jnl. of Phycology 28, p867-872 1992.

Keywords: *Phytoplankton, *Pigments, *Purification, High pressure liquid chromatography, Molecular structure, Chlorophyll, Carotenoids, Solvents, Reprints, Lutein, Zeaxanthin, Neoxanthin, 19'-hexanoyloxyfucoxanthin, HPLC columns.

A high-performance liquid chromatographic (HPLC) method is described that allows improved resolution of several chemotaxonomically significant phytoplankton pigments. The protocol, which employs two pumps and a modified Mantoura and Llewellyn (1983) solvent system, can be easily adapted for many HPLC systems currently in use. The most unique aspect of the method is the use of a polymeric C18 reversed-phase HPLC column (VYDAC 201TP). In comparison to the monomeric C18 columns typically used in the characterization of phytoplankton pigments, polymeric C18 columns offer superior selectivity for structurally similar compounds. The protocol was evaluated for the ability to resolve most of the phytoplankton pigments of diagnostic importance using algal cultures from nine classes. Pigment pairs that were resolved by the method include (1) lutein and zeaxanthin, (2) neoxanthin and 19'-hexanoyloxyfucoxanthin, and (3) alpha-carotene and beta-carotene, and partial resolution of chlorophyll C1 and chlorophyll C2.

Factorial Design Techniques Applied to Optimization of AMS Graphite Target Preparation.
Final rept.
R. M. Verkouteren, and G. A. Klouda. 1992, 9p.
Pub. in Radiocarbon 34, n3 p335-343 1992.

Keywords: *Mass spectroscopy, *Carbon 14, *Particle accelerator targets, *Factor analysis, Graphite, Error analysis, Methane, Experimental design, Reduction(Chemistry), Monte Carlo method, Carbon dioxide, Reprints, *Accelerator mass spectrometry.

Many factors influence the preparation and quality of graphite targets for (14)C accelerator mass spectrometry (AMS). We identified four factors (sample size, H2 pressure, catalyst temperature and pretreatment time) as potentially critical, and investigated their effects on two particular characteristics: the integrated rates of CO2 reduction (to graphite) and methane production. We used a 2-level fractional factorial experimental design and determined chemical reduction yield rates through manometry and partial pressure monitoring of residual gases by mass spectrometry. Chemical reduction yield rates ranged from 0.2% to 6.2% per hour. With respect to their influence on percent yield rate, the factors we studied were ordered as: sample size > level of hydrogen > pretreatment of the catalyst. The temperature of the catalyst, and the sample size x hydrogen (2-factor) interaction, were only marginally influential. We estimated uncertainty in the order of influence and magnitudes of the effects by the Monte Carlo method of error propagation. We observed significant methane production in only one experiment, which suggests that methane originates from indigenous carbon in untreated iron catalyst only in the presence of hydrogen and only at thermodynamically favorable temperatures. This exploratory investigation indicates that factorial design techniques are a useful means to investigate multivariate effects on the preparation and quality of AMS graphite targets.

Fresh frozen homogenates of pilot whale blubber and liver tissue were prepared for use as control materials for the determination of organic and inorganic contaminants in marine mammal tissue analyses. The blubber material was analyzed to determine 30 polychlorinated biphenyl congeners and 16 chlorinated pesticides using gas chromatography with electron capture detection and gas chromatography-mass spectrometry. A total of 39 trace elements and methyl-mercury were determined in the liver homogenate using instrumental neutron activation analysis, voltammetry, and cold vapor atomic absorption spectroscopy. The preparation and analysis of these two tissue materials are part of the development of marine mammal tissue reference materials.

Pattern-Recognition Analysis of Low-Resolution X-Ray Fluorescence Spectra.
Final rept.
L. I. Yin, and S. M. Seltzer. 1990, 7p.
Pub. in Nuclear Instruments and Methods in Physics Research A299, p571-577 1990.

Keywords: *X-ray fluorescence analysis, *Pattern recognition, Proportional counters, Correlation coefficients, X-ray spectra, Spectrum analysis, Chemical composition, Reprints, Geological samples.

Using a high-resolution Si(Li) spectrometer to perform X-ray fluorescence (XRF) analysis of various geological, alloy, and paint samples, we have demonstrated that in situations where quantitative information is not the primary concern, a pattern-recognition approach may be used to obtain qualitative results very quickly and efficiently. Specifically, the pattern-recognition technique uses a single parameter, the normalized cor-

relation coefficient, to identify and select samples with similar chemical compositions from their raw XRF spectra. The algorithm can be easily implemented on a personal computer; typically it takes only a few seconds to perform the pairwise comparison of 9 or 10 spectra. We report here the results of our attempt to extend the pattern-recognition technique to the analysis of low-resolution XRF spectra from a proportional counter where the spectral information is considerably poorer than that of the Si(Li) detector. Analyzing the XRF spectra obtained from a set of geological samples both in air and in vacuum, we find that even with a proportional counter the pattern-recognition technique can nevertheless satisfactorily identify samples with similar chemical compositions.

Resolution of DNA in the Presence of Mobility Modifying Polar and Nonpolar Compounds by Discontinuous Electrophoresis on Rehydratable Polyacrylamide Gels.
Final rept.
R. Allen, B. Budowle, and D. Reeder. 1993, 9p.
Pub. in Applied and Theoretical Electrophoresis 3, p173-181 1993.

Keywords: *Deoxyribonucleic acid, *Polyacrylamide gel electrophoresis, *Hydration, Monosaccharides, Alanine, Buffers, Serine, Disaccharides, Alcohols, Glycerol, Reprints.

Ultrathin-layer rehydratable gels were surface loaded and run in the horizontal position to study effects of mobility modification of DNA. Mobility modification of DNA fragments was achieved by the addition of nonpolar monosaccharides and their corresponding sugar alcohols as well as glycerol and ethylene glycol in the leading ion buffer. These compounds show little effect when included in the trailing ion buffer. Disaccharides show no mobility modification. Trailing ions such as serine and members of the Good buffer series reduced also the R(sub F) of double- or single-stranded DNA. While beta-alanine had no effect, serine and members of the Good buffer series, particularly MOPSO, showed a marked ability to decrease the R(sub F), presumably due to changing the unstacking limits. Rapid separation of sequencing gels with high resolution was achieved with discontinuous buffer systems. The potential methodology for high-resolution scanning of gels as DNA zones unstack from moving boundary is suggested.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers: Laser Techniques for State-Selected and State-to-State Chemistry, Los Angeles, CA., January 21-23, 1993, v1858 p367-377. Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Molecular beam epitaxy, *Gallium arsenides, *Indium, *Gallium, *Arsenic, *Mass spectroscopy, Time-of-flight method, Far ultraviolet radiation, Real time operations, Monitoring, Ionization, Laser radiation, Desorption, Silicon, Reprints.

Single photon ionization time-of-flight mass spectroscopy (SPI-TOFMS) is used to monitor chemical fluxes of In, Ga, and As(n), relevant in molecular beam epitaxy of GaAs. With single photon ionization at 118 nm (10.5 eV), the photon energy is large enough to ionize the species, but not sufficient to ionize and fragment. The lack of molecular dissociation of species such as As2 and As4 greatly simplifies the interpretation of mass spectra. SPI-TOFMS provides the ability to measure densities, and hence fluxes, of multiple chemical species above a substrate noninvasively and in real time during conventional molecular beam epitaxy. The relative ionization efficiencies of Ga and the As(n) species at 118 nm are determined. Additionally, this laser probing technique is used to study the isothermal and temperature programmed desorption of arsenic from Si(100). The catalytic cracking of As4 on Si is also examined and discussed. This technique promises to be a valuable in-situ optical diagnostic for III-V and II-VI molecular beam epitaxy.

Liquid Chromatographic Method for the Determination of Carotenoids, Retinoids, and Tocopherols in Human Serum and in Food.
Final rept.
K. S. Epler, R. G. Ziegler, and N. E. Craft. 1993, 12p.
Pub. in Jnl. of Chromatography 619, p37-48 1993.

Keywords: *Liquid chromatography, *Carotenoids, *Retinoids, *Tocopherol, *Chemical analysis, *Food analysis, Ultraviolet spectroscopy, Solvents, Methodology, Reprints.

A liquid chromatographic (LC) has been developed for the quantitative measurement of the six major carotenoids in human serum (lutein, zeaxanthin, beta-cryptoxanthin, lycopene, alpha-carotene, and beta-carotene) as well as retinol, retinyl palmitate, alpha-tocopherol, gamma-tocopherol, and delta-tocopherol. Several polar carotenoids, 2',3'-anhydrolutein, alpha-cryptoxanthin, and geometric isomers of lycopene and beta-carotene are also separated. Retinoids and carotenoids are monitored using a programmable ultraviolet-visible detector, while tocopherols are monitored using a fluorescence detector. The method uses a gradient containing acetonitrile, methanol, and ethyl acetate. Ammonium acetate is introduced with the methanol to minimize carotenoid losses on the LC column aggravated by the use of acetonitrile and ethyl acetate. The method is also applicable to the analysis of foods.

Pub. in Chemical Engineering Science 47, n1 p57-68 1992.

Keywords: *Proteins, *Enzymes, *Mass transfer, Purification, Bovine serum albumin, Salts, Polyethylene glycol, Reprints, *Spray extraction columns, Amyloglucosidase.

Fractional dispersed phase hold-up and dispersed side mass transfer coefficients for bovine serum albumin (BSA) and amyloglucosidase were measured in 22, 34, 50, 56, 70 and 95 mm i.d. spray columns using salt-polyethylene glycol (potassium phosphate-PEG and sodium sulphate-PEG) systems. The effect of distributor design and column height was investigated. The effect of phase compositions of the aqueous phase system was also studied. Empirical and semiempirical correlations have been developed for fractional dispersed phase hold-up and dispersed side mass transfer coefficients.

Pub. in Chemical Engineering Jnl. 46, n3 pB75-B81 1991.

Keywords: *Proteins, *Polyethylene glycol, *Purification, Bovine serum albumin, Mass transfer, Water, Reprints, *Maltodextrin.

Recovery of a model protein, bovine serum albumin (BSA), was demonstrated in a spray column contractor using immiscible aqueous phases, composed of polyethylene glycol (PEG) and maltodextrin (MDX). Dispersed phase (PEG) hold-up and protein transfer coefficients were measured in a 22 mm and a 32 mm i.d. spray columns using several designs of spargers. Protein transfer coefficients were greater in the PEG/maltodextrin system than those encountered in PEG/dextran systems. Empirical correlations have been proposed for mass transfer coefficients and PEG-hold-ups.

Shape Selectivity in Reversed-Phase Liquid Chromatography for the Separation of Planar and Non-Planar Solutes.
Final rept.
L. C. Sander, and S. A. Wise. 1993, 17p.
Pub. in Jnl. of Chromatography A 656, p335-351 1993.

Keywords: *Liquid column chromatography, *Liquid chromatography, *Aromatic polycyclic hydrocarbons, *Solutes, Separation, Mixtures, Isomers, Reviews, Reprints, Shape selectivity, Solute retention.

Solute retention in reversed-phase liquid chromatography is the result of a variety of complex interactions between solute, mobile phase and stationary phase species. An understanding of the parameters that influence retention is useful in the development of separation methods with existing columns. Such knowledge is even more important for the design of new bonded stationary phases with engineered chromatographic properties. This review will examine some of the factors that affect retention and selectivity with alkyl-modified sorbents, particularly for the separation of solutes with well defined, rigid structure (e.g., polycyclic aromatic hydrocarbons). The chromatographic discrimination of compounds on the

basis of molecular structure, namely 'shape selectivity', will be studied in terms of contributions from bonded phase morphology, and in terms of operational conditions. An emphasis is placed on practical choices that are available to control selectivity and optimize separations for isomers and related mixtures.

Pub. in American Chemical Society Symposium Series Biol. Trace Elem. Res. 445, p265-277 1991.

Keywords: *Neutron activation analysis, *Phosphoproteins, *Trace elements, Polyacrylamide gel electrophoresis, Antigen-antibody reactions, Casein, Milk, Eggs, Immunoassay, Gold colloid, Reprints, Phosvitin.

Combinations of biological techniques with neutron activation analysis (NAA) can be employed for protein quantification in biological samples. A protein of interest can be isolated physically with a high resolution separation technique such as polyacrylamide gel electrophoresis (PAGE) or by immunochemical properties, such as with a specific antibody-antigen reaction. NAA is then used for quantification of the isolated protein by determining either an element that is structurally intrinsic, or one that has been introduced as a label. An example of the former method is the determination of phosphoproteins by PAGE/NAA. This method is discussed and results for two phosphoproteins, alpha-casein and phosvitin, are presented for several materials, including an alpha-casein concentration of 26 mg/mL in low-fat milk, and a phosvitin concentration of 4.7 mg/mL in whole egg powder (lyophilized). The second method presented is an immunoassay combining a colloidal gold tag with detection by NAA.

Trace Detection in Conducting Solids Using Laser-Induced Fluorescence in a Cathodic Sputtering Cell.
Final rept.
J. C. Travis, G. C. Turk, R. L. Watters, L. J. Yu, and J. L. Blue. 1991, 11p.
Pub. in Jnl. of Analytical Atomic Spectrometry 6, n4 p261-271 1991.

Keywords: *Laser induced fluorescence, *Atomic spectroscopy, *Chemical analysis, Glow discharges, Trace amounts, Background noise, Background radiation, Sensitivity, Samplers, Brasses, Iron, Reprints, Cathodic sputtering.

A cathodic sputtering atom reservoir designed for atomic absorption spectroscopy of conducting solid samples is examined as a potential sampling device for trace and ultra-trace detection using laser-induced fluorescence (LIF) spectrometry. The analytical results are promising, with sub-(micro)g/g sensitivity for the model analyte (Fe) in brass samples, and with reasonable precision and accuracy (+ or - 15%) for the pulsed laser system used, but with far less sensitivity than might be predicted. Noise studies clearly indicate that laser-induced background fluorescence is the principal limiting noise source. Fundamental material transport studies indicate that diffusional loss of atomic number density to the walls is of much less importance than the background fluorescence in determining the sensitivity of the system. Extrapolations based on cell/experiment design to maximize number density and minimize background emission and fluorescence promise ng/g sensitivities for future implementations.

Enhanced Detection of PCR Products Through Use of TOTO and YOYO Intercalating Dyes with Laser Induced Fluorescence - Capillary Electrophoresis.
Final rept.
K. Srinivasan, S. C. Morris, J. E. Girard, M. C. Kline, and D. J. Reeder. 1993, 5p.
Pub. in Applied and Theoretical Electrophoresis 3, p235-239 1993.

Keywords: *Polymerase chain reaction, *Fluorescence spectroscopy, *Dyes, *Intercalating agents, *Chemical analysis, Reprints, *Capillary electrophoresis, *Thiazole orange, *Oxazole orange.

Recent developments in the chemical synthesis of DNA-binding dyes have enhanced detection of polymerase chain reaction (PCR) products by capillary electrophoresis. These dyes are dimers of thiazole orange (TOTO) or oxazole orange (YOYO) and have a very high binding affinity for DNA. These dyes show enhanced fluorescence signals when they bind to double-stranded DNA and their fluorescence in the unbound state is almost zero, making them extremely useful in detecting minute (fg) quantities of DNA. We report here the utility of these dyes in DNA typing applications using a laser-induced fluorescence detector in conjunction with a capillary electrophoresis system.

R. W. Fox, C. S. Weimer, L. Hollberg, and G. C. Turk. 1993, 9p.
Sponsored by National Aeronautics and Space Administration, Washington, DC. and Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in Spectrochimica Acta Rev. 15, n5 p291-299 1993.

Keywords: *Laser spectroscopy, *Semiconductor lasers, *Spectroscopic analysis, Near infrared radiation, Aluminum gallium arsenides, Laser cavities, Tunable lasers, Nonlinear optics, Visible radiation, Red(Color), Line width, Reprints.

The properties of diode lasers that make them attractive as spectroscopic sources are discussed, along with the use of extended cavities to enhance their tuning range and reduce their linewidths. Semiconductors can now provide efficient, tunable, narrow linewidth laser light over much of the red and near infrared region of the spectrum. The progress in using nonlinear optics to extend the useful wavelength range of diodes lasers is also considered. Our recent analytical work with diode laser spectroscopy provides examples of their application.

J. J. Horvath, and S. A. Glazier. 1993, 2p.
Pub. in American Biotechnology Laboratory 11, n7 2p Jun 93.

Keywords: *Tetracycline, *Chemical analysis, *Cells(Biology), *Fluorescence spectroscopy, Fermentation, Streptomyces aureofaciens, Fiber optics, Soybeans, Reprints.

This work describes a new spectroscopic optical fiber/rod sensor for in situ real time measurement of product concentrations in bioreactors. The variable excitation/emission wavelength capability of this sensor allows for species selective measurement during fermentations. Product concentrations (tetracycline) have been measured in high cell mass fermentation media of Streptomyces aureofaciens with 5% (w/v) soybean meal. By using multiple excitation wavelengths (390 and 413 nm) the linear measurement range was extended to 8160 microgram/ml at cell densities of greater than 50 g/l dry weight. The sensor is robust, able to undergo many cycles of in situ steam sterilization without degradation, and its fluorescence signal is linear with concentration for all species studied in this work.

R. L. Paul, R. M. Lindstrom, and D. H. Vincent. 1994, 7p.
Pub. in Jnl. of Radioanalytical and Nuclear Chemistry 180, n2 p263-269 1994.

Keywords: *Activation analysis, Neutron capture gamma rays, Allende meteorite, Cold neutrons, Progress report, Sensitivity, Reprints, CNRF facility, US NIST.

An instrument for prompt gamma-ray activation analysis is now in operation at the NIST Cold Neutron Research Facility (CNRF). The cold neutron beam is relatively free of contamination by fast neutrons and reactor gamma rays, and the neutron fluence rate is 1.5 (center dot) 10(exp 8)/sq cm (center dot) s (thermal equivalent). As a result of a compact target-detector geometry, the sensitivity is better by a factor of as much as seven than that obtained with an existing thermal instrument, and hydrogen background is a factor of 50 lower. We have applied this instrument to multielement analysis of the Allende meteorite and other materials.

Neutron Scattering by Hydrogen in Cold Neutron Prompt Gamma-Activation Analysis.
Final rept.
R. L. Paul, and E. A. Mackey. 1994, 13p.
Pub. in Jnl. of Radioanalytical and Nuclear Chemistry 181, n2 p321-333 1994.

Keywords: *Activation analysis, *Neutron scattering, *Hydrogen, Neutron capture gamma rays, Cold neutrons, Sensitivity, Reprints.

The effects of neutron scattering by hydrogen within targets for cold neutron prompt gamma-ray activation analysis (CNPGAA) have been characterized. For most targets studied, the probability for neutron absorption, and hence CNPGAA sensitivities (counts (center dot) 1/s (center dot) 1/mg), decrease with increasing H content and with target thickness. Comparisons with results from thermal neutron PGAA indicate that the effects of cold neutron scattering differ from those of thermal neutron scattering. CNPGAA sensitivities for '1/nu' nuclides show similar sensitivity decreases, while Sm sensitivities show smaller decreases.

Chromatographic Cryofocusing and Cryotrapping with the Vortex Tube.
Final rept.
T. J. Bruno. 1994, 4p.
Contract GRI-5088-260-1700
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in Jnl. of Chromatographic Science 32, p112-115 1994.

Keywords: *Chromatographic analysis, *Cryotrapping, *Cryogenic cooling, *Hilsch tubes, Vortices, Solutes, Injections, Desorption, Gas chromatography, Reprints, *Cryofocusing.

Cryofocusing and cryotrapping techniques are the analytical-scale preconcentration or collection of solutes using low temperature, with subsequent solute removal and analysis. Although these methods have been used with many analytical procedures including spectroscopic techniques, the major applications have been in chromatographic methods that involved a wide variety of sample mixtures. We describe a simple, entirely pneumatic approach to chromatographic sample cryofocusing--cryotrapping. The two airstreams from a vortex tube (cold and hot, respectively) are used to both chill the cryofocus region of the injector and then to thermally desorb the collected solutes for injection.

Traceability to the Mole: A New Initiative by CIPM.
Final rept.
J. D. Fassett, and R. L. Watters. 1994, 7p.
Pub. in Reviews on Analytical Chemistry: Euroanalysis VIII, p13-19 1994.

Keywords: *Chemical analysis, Interlaboratory comparisons, Primary standards, Metrology, Reprints, Isotope dilution mass spectroscopy, Traceability.

The CIPM has established a Working Group on Metrology in Chemistry to address the specific problem of traceability of chemical measurements. One of the terms of reference of the Working Group is to draw up an exploratory program of cooperative work among leading national chemical metrology laboratories. This program is designed to test the hypothesis that coordinated analysis of a few key reference materials, using one or two reference methods of wide application, will provide such laboratories with a base from which to extend international comparability to a wider range of methods and reference materials. NIST is coordinating the details of the first interlaboratory exercise. Isotope dilution mass spectrometry (IDMS) has been chosen as the reference method for the initial comparison. The design and status of the interlaboratory exercise is summarized.

Pub. in Analytical Chemistry 66, n21 p3553-3557, 1 Nov 94.

Keywords: *Supercritical fluids, *Phase studies, *Instrumentation, Supercritical fluid chromatography, Light scattering, Binary mixtures, Carbon dioxide, Methanol, Water, Reprints.

Fluid phase behavior has a profound impact on supercritical fluid chromatography performance. The effect of fluid phase behavior on supercritical fluid extraction performance has not been studied. Generally, methods available to generate phase diagrams of fluid mixtures are time-consuming. This paper describes relatively easily constructed instrumentation for the rapid screening of fluid mixtures to determine whether or not they are single phase. Either scattered or transmitted light can be used to probe the phase behavior of the fluids. Examples using CO2/methanol and CO2/water are presented. The phase behavior of multicomponent mixtures of CO2 or Freon (R22, chlorodifluoromethane) with methanol/triethylamine/water was determined.

Standard Reference Material for the Measurement of Particle Mobility by Electrophoretic Light Scattering.
Final rept.
V. A. Hackley, R. S. Premachandran, S. G. Malghan, and S. B. Schiller. 1995, 16p.
Pub. in Colloids and Surfaces A 98, p209-224 1995.

Keywords: *Electrophoresis, *Light scattering, *Calibration standards, Particle motion, Goethite, Phosphates, Statistical quality control, Interlaboratory comparisons, Reprints.

A standard reference material (SRM) was developed for the calibration and evaluation of light scattering equipment used to measure electrophoretic mobility. SRM 1980 is a positive mobility standard containing 500 mg/cubic dm microcrystalline goethite (alpha-FeOOH) and 100 micromol/g phosphate in 0.05 mol/cubic dm sodium perchlorate electrolyte solution at pH 2.5. The suspension is diluted prior to use. A certified mobility value (2.53 + or - 0.12 micrometer cm/v/s) was determined from a statistical analysis of round robin data from five laboratories according to NIST guidelines. This paper documents the development, characterization and evaluation of this material. Also discussed are the various contributions to measurement uncertainty and inconsistency, and appropriate protocols for dealing with these problems.

Overview of Reference Materials Prepared for Standardization of DNA Typing Procedures.
Final rept.
D. J. Reeder, M. C. Kline, and K. L. Richie. 1995, 4p.
Pub. in Fresenius Jnl. of Analytical Chemistry, v352 p246-249 1995.

Keywords: *Calibrating standards, *Quality assurance, *DNA, Standardization, Test methods, Analytical chemistry, Laboratories, Reprints, DNA typing, SRM(Standard Reference Material), NIST(National Institute of Standards and Technology).

Although DNA typing is an accurate, precise, and robust procedure, quality assurance is enhanced by availability of a suitable reference material. The National Institute of Standards and Technology (NIST) recently released a Standard Reference Material (SRM) that meets the calibration and quality assurance needs of laboratories that perform DNA typing. Each step of the analytical process of DNA typing maybe verified by one or more of twenty different components of the SRM. As newer, more sensitive methods for DNA typing have been introduced into the human identification laboratory repertoire, new SRMs will be required for quality assurance.

Applications of the Vortex Tube in Chemical Analysis. Part 2. Applications.
Final rept.
T. J. Bruno. 1993, 9p.
See also PB94-199171.
Pub. in American Laboratory, v25 n14 p16-24 1993.

Keywords: *Hilsch tubes, Reprints, Heat transfer, Laboratory equipment, Chemical analysis, *Vortex tubes.

Many applications of the vortex tube in chromatographic analysis have been devised in recent years mainly because of the usefulness of low-temperature chromatographic techniques. One of the most important is GC column temperature control, especially in subambient ranges. The operation of a GC column at low temperatures began in the mid-1950's, but has received renewed attention for the trace analysis of priority pollutants in air and in the analysis of alternative refrigerant fluids. Subambient temperature GC generally refers to procedures in which the column temperature is between -100 and 0 degrees C, but many separations are greatly enhanced at temperatures no lower than -40 degrees C.

Effects of Target Temperature on Analytical Sensitivities of Cold-Neutron Capture Prompt gamma-ray Activation Analysis.
Final rept.
E. A. Mackey. 1994, 6p.
Pub. in Biological Trace Element Research, p103-108 1994.

Keywords: *Activation analysis, *Neutron scattering, Reprints, Neutron capture gamma rays, Cold neutrons, Sensitivity, *Foreign technology.

Cold-neutron prompt gamma-ray activation analysis sensitivities are often decreased because of an increase in the average neutron energy on scattering within room temperature targets. Experiments were performed to determine whether target cooling would alleviate these effects. Cooling the targets to 77 K increased hydrogen sensitivity by as much as 25%. Target cooling decreases those effects of neutron scattering on CNPGAA sensitivities that are the result of an increased average neutron energy. However, cold-neutron scattering may also change the average path length traveled, and this effect on sensitivity is not alleviated by controlling temperature.

SUM and MEAN: Standard Programs for Activation Analysis.
Final rept.
R. M. Lindstrom. 1994, 7p.
Pub. in Biological Trace Element Research, p597-603 1994.

Keywords: *Activation analysis, *Computer programs, Reprints, Emission spectra, Weighted means, Peak integration, Gamma ray spectrometry.

Two computer programs in use for over a decade in the Nuclear Methods Group at NIST illustrate the utility of standard software: programs widely available and widely used, in which (ideally) well-tested public algorithms produce results that are well understood, and thereby capable of comparison, within the community of users. SUM interactively computes the position, net area, and uncertainty of the area of spectral peaks, and can give better results than automatic peak search programs when peaks are very small, very large, or unusually shaped. MEAN combines unequal measurements of a single quantity, tests for consistency, and obtains the weighted mean and six measures of its uncertainty.

Comparison of Selectivities for PCBs in Gas Chromatography for a Series of Cyanobiphenyl Stationary Phases.
Final rept.
B. R. Hillery, J. E. Girard, M. M. Schantz, M. L. Lee, S. A. Wise, and A. Malik. 1995, 10p.
Pub. in Jnl. of Microcolumn Separations, v7 n3 p221-230 1995.

Keywords: *Chlorinated aromatic hydrocarbons, *Gas chromatography, Columns(Process engineering), Phase, Planar structures, Selectivity, Shapes, Reprints, *Cyanobiphenyl phases, Stationary phases.

Selectivity for polychlorinated biphenyl (PCB) congeners was examined for a series of cyanobiphenyl stationary phases, and the results were compared to a nonpolar 5% phenyl methylpolysiloxane phase and a shape-selective smectic liquid crystalline phase. For all of the columns studied, the degree of ortho substitution of the congener was found to be a significant factor controlling chromatographic retention of PCBs. The retention pattern on six different cyanobiphenyl phases followed the same general pattern as on the liquid crystalline column, though the trends were more exaggerated on the liquid crystalline phase. While the general retention pattern was similar for all of the cyanobiphenyl phases studied, subtle differences were observed, resulting in significant selectivity differences.

We describe a purification system based on a commercial preparative-scale chromatograph with a custom-design condenser, collector, and fraction handling system. In our fraction collector design, all the wetted surfaces were eitner 316 stainless-steel or nickel. The collectors and the integrated gas-handling manifold were designed to be used down to liquid nitrogen temperature and up to 7 MPa of pressure to accommodate low-boiling-point compounds, such as refrigerants. The design, operation, and performance of this apparatus are presented.

Ultrafast Time-Resolved Infrared Probing of Energy Transfer at Surfaces.
Final rept.
R. R. Cavanagh, T. A. Germer, and J. C. Stephenson. 1995, 7p.
Pub. in Vibrational Spectroscopy, v9 p77-83 1995.

Keywords: *Infrared spectrometry, *Energy transfer, *Absorbates, Surfaces, Carbonyl groups, Reprints, *Foreign technology.

Picosecond and femtosecond infrared techniques are used to characterize vibrational energy transfer rates and provide novel insights into the relaxation of non-equilibrium energy distributions. For absorbates on metal surfaces, it is essential to determine the absolute coupling strengths between different degress of freedom, i.e., vibrational modes and low-lying electronic states. In the present work, the spectral shift of the CO stretch has been used to follow the temporal evolution of the adlayer response as a consequence of ultrashort infrared, visible and ultraviolet excitation of the underlying metal. Results from CO/Pt(111) and CO/Cu(100) will be presented, Their differences will be discussed, and comparison will be made to current theoretical models of the damping rates.

Influence of Stationary Phase Chemistry on Shape Recognition in Liquid Chromatography.
Final rept.
L. C. Sander, and S. A. Wise. 1995, 9p.
Pub. in Analytical Chemistry, v67 n18 p3284-3292 1995.

Keywords: *Bonded phase, *Liquid chromatography, Selectivity, Reprints, Polymeric stationary phase, Retention mechanism, Self-assembled monolayer.

Molecular shape recognition is examined for a series of C18 columns prepared using a variety of synthetic approaches. Mono-, di-, and trifunctional silanes are used to prepare stationary phases through monomeric and poly meric surface modification procedures, including an approach employing self-assembled monolayer technology. Shape discrimination properties of the columns were investigated with various nonplanar, planar, and linear polycyclic aromatic hydrocarbon solute probes. Chromatographic retention behavior is examined in the context of recently proposed statistical mechanical 'interphase' retention models.

Pub. in Jnl. of High Resolution Chromatography, v18 p477-482 1995.

Keywords: *Chromatography, Polycyclic aromatic hydrocarbons, Isomers, Reprints, *Shape selectivity, Coupled columns, Coal tar.

The retention behavior of polycyclic aromatic hydrocarbons (PAHs) in packed-column supercritical fluid chromatography (SFC) is studied for monomeric and polymeric C18 columns. Molecular shape discrimination (shape selectivity) is assessed through the use of Standard Reference Materials (SRMs), and changes in selectivity are studied as a function of temperature, pressure, and mobile phase composition. Examples of separations of complex PAH isomer mixtures are presented, and guidelines are provided for modification and optimization of shape selectivity in SFC.

Amperometric Measurement of Moisture in Transformer Oil Using Karl Fischer Reagents.
Final rept.
S. A. Margolis. 1995, 8p.
Pub. in Analytical Chemistry, v67 n23 p4239-4246 Dec 95.

Keywords: *Moisture content, *Electrical measurement, Calibration standards, Coulometers, Mineral oil, Insulating oil, Volumetric analysis, Reprints, Karl Fisher reagents, RMs(Reference Materials).

Moisture was measured in two oil Reference Materials (RMs), transformer oil (RM 8506) and mineral oil (RM 8507), by the volumetric and coulometric Karl Fisher methods. A variety of analysis conditions were used, including the solvent composition of the titration vessel. The maximum amount of moisture was obtained when the chloroform content of the titration vessel was above 65 percent after the solvent had been titrated to dryness. The highest moisture titers were measured by the volumetric method using either the Hydranal or Pyridine-based Karl Fisher reagents or by the coulometric method using Hydranal AG-H reagent. Other coulometric reagents measured lower amounts of moisture even after the addition of organic solvents.

Population Distributions and Intralaboratory Reproducibility for Fat-Soluble Vitamin-Related Compounds in Human Serum.
Final rept.
K. S. Sharpless, and D. L. Duewer. 1995, 7p.
Pub. in Analytical Chemistry, v67 n23 p4416-4422 Dec 95.

Keywords: *Carotenoids, *Vitamins, Histograms, Liquid chromatography, Statistics, Reprints, *Bivariate distributions.

Concentrations of alpha and beta-carotene, lycopene, beta-cryptoxanthim, zeaxanthin, lutein, alpha-, gamma-, and delta-tocopherol, retinol, and retinyl palmitate have been determined in over 1400 human sera from two epidemiological studies. Complete adult population distributions for these analytes, and for a chromatographically defined 'total carotenids' component, are detailed as data-defined histograms. The distributions for retinol and alpha-tocopherol concentrations are much narrower than those for the other analytes. Information provided by analysis of control samples facilitated intercomparison of the two studies and provided univariate and bivariate and bivariate estimates of the intralaboratory measurement reproducibility.

Resonance Ionization Spectroscopy/Resonance Ionization Mass Spectrometry Data Service. V-Data Sheets for Ga, Mn, Sc, and Tl.
Final rept.
E. B. Saloman. 1994, 31p.
Pub. in Spectrochimica Acta, v49B n3 p251-281 1994.

Keywords: *Analytical chemistry, *Atomic data, *Data service, Elemental analysis, Spectroscopy, Reprints, *Foreign technology, Resonance ionization, Mass spectrometry.

A data service has been established at the National Institute of Standards and Technology to provide the necessary information to apply to the techniques of resonance ionization spectrocopy (RIS) and resonance ionization mass spectrometry (RIMS) to routine use in analytical chemistry. This service collects and calculates the relevant atomic data, chooses appropriate resonance ionization schemes, and indicates pertinent operating details of successful RIMS studies. The first group of data sheets was published previously covering the elements As, B, Cd, C, Ge, Au, Fe, Pb, Si and Zn. The second group published covered the elements Al, Ca, Cs, Cr, Co, Cu, Kr, Mg, Hg and Ni. The third group published covered the elements Sb, Bi, P, Na and Sn. The fourth group published covered the elements Be, In, Li, K, Rb, Ag, Ti and V. The fifth group of data sheets is presented here. It covered the elements Ga, Mn, Sc and Tl.

Development of the NIST Transient Pressure and Temperature Calibration Facility.
Final rept.
V. E. Bean, G. J. Rosasco, W. S. Hurst, and W. J. Bowers. 1991, 5p.
Pub. in Proceedings of the Conference of the National Conference of Standards Laboratories, Albuquerque, NM., August 18-22, 1991, p197-201.

Keywords: *Calibration, *Raman spectroscopy, Shock tube, Transducers, Standards, Pressure, Temperature, Reprints, *Foreign technology.

NIST is developing the capability transient-pressure transducers and transient-temperature transducers. The source for both of these calibrations is a chock tube capable of generating reflected shock pressures up to 20 MPa and temperatures in the range of 1200 K with submicrosecond rise times. The shock tube will be calibrated to avoid the assumptions and uncertainties involved in calculating the pressure and temperature from shock tube theory. The primary standard for the calibration of the shock tube is a sample of diatomic gas. Diatomic gas molecules have a fundamental vibrational motion whose frequency is affected by pressure in a simple way. These molecules also have well defined rotational energy levels whose populations provide a reliable measure of temperature. The vibrational frequencies and the populations of the rotational energy levels can be determined by laser spectroscopy. As the time required for the spectroscopic measurements can be reduced to nanoseconds, spectra can be obtained under shock conditions and these spectra can be evaluated in terms of spectra obtained under known static pressure and temperature conditions.

Keywords: *Silver, *Freezing point, *Thermometers, Reprints, *Foreign technology, International Temperature Scale of 1990, ITS-90, HISPRT.

An accurate realization of the International Temperature Scale of 1990 (ITS-90) requires a measurement assurance program for the thermometric fixed-point cells of the defining fixed points. A previous comparison in 1991 of the scales realized at PTB and NIST, through the use of a high-temperature standard platinum resistance thermometer (HTSPRT) calibrated in fixed-point cells in the range between 0 degrees C and 961.78 degrees C at NIST and at PTB, indicated that the differences between the freezing-point temperatures, as realized on the plateaus of the freezing curves, of Sn, Zn and Al fixed-point cells of NIST and PTB were all approximately 1 m degrees C. For silver, however, the maximum temperature difference between the freezing plateaus of the PTB and NIST silver cells appeared to be approximately 18 m degrees C. This extremely large difference was estimated from independent calibrations of the same HTSPRT at PTB and at NIST. In order to determine more accurate values of the temperature differences at the silver point, cell to cell comparisons were carried out recently at NIST.

Pub. in Temperature: Its Measurement and Control in Science and Industry, v6 pt1 p389-394 1992.

Keywords: *Thermometers, Stability, Annealing, Reprints, *High temperature thermometry, International Temperature Scale of 1990.

The stability of high temperature standard platinum resistance thermometers, having nominal resistances of 0.25 to 2.5 ohms, and their use in the realization of the International Temperature Scale of 1990 over the range of 0 degrees C to 961 degrees C were investigated. Special procedures were employed for their use above 500 degrees C. These techniques involved annealing and protection against contamination. A sodium heat-pipe furnace was used to realize the freezing points of aluminum, silver, and gold. The results to be presented yielded information on non-uniqueness, subrange inconsistencies and the effects of heating above 600 degrees C.

G. F. Strouse. 1992, 4p.
Pub. in Temperature: Its Measurement and Control in Science and Industry, v6 pt1 p165-168 1992.

Keywords: *Thermometry, Reprints, *Foreign technology, *Water triple point cells, International Temperature Scale of 1990, Platinum resistance.

Large variations in observations over extended time were recently reported on water triple point (WTP) cells prepared by using liquid nitrogen (LN) cooled rods to freeze the ice mantle. Experiments were conducted to test the results by using the same technique for preparing the WTP cell ice mantle and by using, for comparison, two other techniques -- solid-CO2 and immersion-cooler methods. Because of the strains that are introduced in preparing the ice mantle by the three methods, results that have been obtained at the National Institute of Standards and Technology (NIST) thus far indicate some variations in the observations during the first few days. The LN-cooled-rod technique caused the ice mantle to crack and the observations on WTP cells prepared by this technique indicate more variations than were observed in cells with mantles prepared by other techniques.

NIST Assessment of ITS-90 Non-Uniqueness for 25.5 Ohm SPRTs at Gallium, Indium and Cadmium Fixed Points.
Final rept.
G. F. Strouse. 1992, 4p.
Pub. in Temperature: Its Measurement and Control in Science and Industry, v6 pt1 p175-178 1992.

Keywords: *Thermometry, *Fixed points, Temperature, Reprints, International Temperature Scale of 1990, Platinum resistance.

The use of temperature subranges in the definition of the International Temperature Scale of 1990 (ITS-90) permits standard platinum resistance thermometers (SPRTs) to be measured at defining fixed points of a particular subrange as well as at fixed points not utilized in that subrange. These redundant fixed points allow analysis of the non-uniqueness of the scale. Specifically, with 25.5 ohm SPRTs at gallium, indum, and cadmium fixed points have been made and examined to determine the non-uniqueness at these points. The results of this investigation indicate that the levels of non-uniqueness of the ITS-90 at the three redundant fixed points does not contribute significantly to the total error associated with the calibration of an SPRT.

NIST Measurement Assurance of SPRT Calibrations on the ITS-90: A Quantitative Approach.
Final rept.
G. F. Strouse, and B. W. Mangum. 1993, 17p.
Pub. in Measurement Science Conference, Anaheim, CA., January 21-22, 1993, 17p.

Keywords: *Thermometry, *Fixed points, High temperature, Reprints, HTSPRT, International Temperature Scale of 1990, Platinum resistance.

The National Institute of Standards and Technology (NIST) is responsible for realizing, maintaining and disseminating the International Temperature Scale of 1990 (ITS-90) for the United States of America. One of the methods used for the dissemination of the scale is the calibration of standard platinum resistance thermometers (SPRTs) and high-temperature SPRTs (HTSPRTs), using thermometric fixed points. At NIST, the calibration of these thermometers as defining, interpolating devices for the ITS-90 includes various internal quality control checks in order to minimize the uncertainty associated with a calibration. The internal measurement assurance program incorporated at NIST includes the use of check (HT)SPRTs, control charts, redundant fixed points, and statistical process control. This program, as well as some results showing fixed-point reproducibility and calibration uncertainties, will be discussed.

Pub. in Comite Consultatif de Thermometrie (CCT), 18, Paris, France, September 1993, 23p.

Keywords: *Thermometry, *Fixed points, Temperatures, Reprints, International Temperature Scale of 1990, Platinum resistance.

The International Temperature Scale of 1990 provides greater flexibility than the International Practice Temperature Scale of 1968, Amended Edition 1975, through the use of more fixed points and more temperature subranges. The present investigation examined the ranges of 83.8058 K to 273.16 K and 273.15 K to 933.473 K for 25.5 omega standard platinum resistance thermometers. These two ranges have multiple subranges that partly overlap, creating inconsistencies. The magnitude of the inconsistencies in the interpolation between the appropriate defining fixed points in the temperature overlap regions were investigated. The results show that in all 16 possible combinations of subranges, there were no significant differences between manufacturer/models and that the inconsistencies in most cases are within estimated measurement uncertainties.

Simple and Efficient Methane-Marker Devices for Chromatographic Samples.
Final rept.
T. J. Bruno. 1996, 8p.
Pub. in Jnl. of Chromatography A, v721 p157-164 1996.

Keywords: *Chromatography, Reprints, *Hold-up times, *Methane-marker devices, Retention times.

Calculation of the most useful gas chromatographic retention parameters, such as net and specific retention volumes, relative retentions, and retention indices, requires that raw retention data be corrected for gas hold-up time or volume (sometimes called dead time or volume) of the chromatographic system. When a flame-ionization detector is used, a common technique (where it is physically appropriate) is to introduce methane into the sample as a marker to approximate unretained species to correct for hold-up. This is often done by bubbling methane (or natural gas) through the sample just before injection. In this paper, we describe two easily constructed devices that provide continuous release of methane into liquid samples, sustainable for several weeks or even months. This long-term feature makes the techniques especialy suitable to extensive retention studies done at multiple temperatures as several stationary phases. Moreover, one of the devices described is applicable to commercially available automatic sampler vials. After a detailed description of the construction of the devices is provided, some applications are discussed.

R. Zeisler, D. A. Becker, and T. E. Gills. 1995, 5p.
Pub. in Fresenius Jnl. of Analytical Chemistry, n352 p111-115 1995.

Keywords: *Chemical compositions, *Biological materials, *Trace elements, Comparative evaluations, Reprints, Food, *Foreign technology, Analytical Quality Control Services.

A worldwide laboratory intercomparison was organized by the International Atomic Energy Agency's Analytical Quality Control Services (AQCS) involving the determination of trace elements in plant materials used for human consumption. The National Institute of Standards and Technology (NIST) Standard Reference Materials Program donated 5 kg of spinach designated for the production of the future Standard Reference Material SRM 1570a to this intercomparison: the AQCS provided a similar amount of cabbage. For the study, 150 units of each material were distributed and 114 laboratories reported results on both materials to AQCS. The results for the spinach, encompassing more than forty elements, have been compiled and evaluated; estimates of the elemental concentrations were made based on statistical evaluations, principles of analytical procedures and the laboratory performance indicated by the results on the cabbage material. Satisfactory estimates were obtained for 27 elements. Comparison with IAEA laboratory and NIST reference data did not reveal any significant bias that might have been introduced by the intercomparison approach or its evaluation.

Supercritical Fluid Extraction-Immunoassay for the Rapid Screening of Cocaine in Hair.
Final rept.
J. F. Morrison, S. N. Chesler, and J. L. Reins. 1996, 9p.
Pub. in Jnl. of Microcolumn Separations, v8 n1 p37-45 1996.

Keywords: *Cocaine, *Hair, *Radioimmunoassay, Reprints, Supercritical fluid extraction.

Supercritical fluid extraction-radioimmunoassay (SFE-RIA) was evaluated as a rapid screening tool for the detecion of cocaine residues in human hair. SFE was performed using carbon dioxide modified with triethylamine (TEA) and water, with off-line collection of extracted cocaine in methanol. Extracts were analyzed for the presence of cocaine using a commercially available solid-phase RIA kit. In order to develop a suitable RIA calibration method for reliable measurement of cocaine in SF extracts, calibration data was compared for methanolic standards both with and without the presence of the SF modifier. Methanol had only a minor impact on immunoassay performance, producing an 11% decrease in maximum binding counts. In contrast, the presence of TEA/H2O profoundly degraded assay performance, producing a 60% suppression in assay counts. To preserve RIA sensitivity, SF extracts were evaporated under nitrogen to remove the modifier and reconstituted in menthanol for RIA analysis. Incorporation of the evaporation step permitted the use of modifier-free cocaine calibrators in memthanol. Calibration data was fit to a four-parameter logistic model. SFE-RIA analysis of a series of drug-free hair samples established an RA cut-off value for distinguishing between a negative and presumptive positive cocaine sample at an SF extract concentration of 1.2 ng/mL, or a hair concentration of 0.07 ng/mg. The robustness of the SFE-RIA method was demonstrated by the analysis of a variety of hair samples from both users and non-users. The quantitative SFE-RIA findings correlated well with the values obtained by an acid incubation/GC-MS method.

Resolution of Discrepant Analytical Data in the Certification of Platinum in Two Automobile Catalyst SRMs.
Final rept.
D. A. Becker. 1995, 3p.
Pub. in Fresenius Jnl. of Analytical Chemistry, v352 p224-226 1995.

Keywords: *Automobile catalyst, Analytical interference, Accuracy, Reprints, Quality assurance, *Instrumental neutron activation analysis, *Foreign technology, Standard reference materials, Plantinum determination.

The National Institute of Standards and Technology (NIST) recently developed two recycled automobile catalyst materials as standard reference materials (SRMs), in response to a request from the International Precious Metals Institute. Results of analyses for platinum by two different analytical techniques did not agree well, with the mean differing up to 6%. The palladium results for these same two techniques in the same materials showed much better agreement. Finally, it was determined that on technique (instrumental neutron activation analysis - INAA) had a small, random interference due to a tantalum impurity in/on the acid washed polyethylene bag used to hold the finely powered sample. This Ta was not present in any of the empty bags used to evaluate the bag blank. Once this problem was identified, the unique characteristics of the INAA technique allowed the magnitude of the interference to be accurately determined for each sample, data recalculated, and a final result obtained which agreed well with the second technique.

Pub. in Jnl. of Chromatography A, v704 p157-162 1995.

Keywords: *Alternative refrigerants, *Chromatographic analysis, Reprints, Hydrocarbons, Permeation tubes, Chromatographic samples.

A permeation tube that is sealed internally in a commercially-available automatic sampler vial provides a simple and convenient method of preparing, using, and storing standard retention index samples for long periods of time. The approach is especially suited to the handling of volatile organic compounds that are very important in fuels research, alternative refrigerant research and in many environmental analyses. It also provides the very desirable feature of dispensing sample that is at very low concentration or even at infinite dilution, since no commercial automatic sampler is currently capable of doing this for the analyst. The device is very simple, and can be constructed and prepared with a liquid sample in a few minutes. It requires the use of minimal quantities of sample, and substantially descreases the hazards associated with handling volatile organics in the laboratory.

Isolation and Structural Elucidation of the Predominant Geometrical Isomers of alpha-Carotene.
Final rept.
C. Emenhiser, G. Englert, L. C. Sander, B. Ludwig, and S. J. Schwartz. 1996, 11p.
Pub. in Jnl. of Chromatography A, v719 p333-343 May 96.

Keywords: *Carotene, *Isomers, *Stereochemistry, Isomerization, Chromatographic analysis, Carotenoids, Polymers, Carbon 30, Spectroscopic analysis, Reprints, Liquid chromatography, Geometrical isomers, Shape selectivity.

The recent development and application of a polymeric C30 stationary phase have given unique separations of cis-trans carotenoid isomers in reversed-phase (RP) liquid chromatography (LC) owing to the expectional shape selectivity of this stationary phase. In the present research, several geometrical isomers of alpha-carotene were at least partially resolved from a photo-isomerized mixture when chromatographed on

a 3-micro m polymeric C30 column. Confirmation of the structures of geometrical alpha-carotene isomers will aid further studies on the possible physiological roles of these compounds in biological tissues.

Embossable Grating Couplers for Planar Waveguide Optical Sensors.
Final rept.
B. L. Ramos, S. J. Choquette, and N. F. Fell. 1996, 5p.
Pub. in Analytical Chemistry, v68 n7 p1245-1249 1996.

Keywords: *Grating coupling, *Optical sensors, *Embossable grating, Reprints, Planar waveguide.

Planar optical waveguides are an attractive tool for use in analytical chemistry and spectroscopy. Although similar to fiber optics, planar waveguides have been slow to be commercially accepted due to the difficulty of coupling light into the guide. Generally, prism coupling is the method of choice in the laboratory, as efficiencies approaching 80% can be reached. However, prisms are impractical for routine use for several reasons: expensive positioning equipment is required, coupled power is sensitive to environmental fluctuations, and prism coupling prohibits the fabrication of a truly planar device. The use of thin gratings on the surface of the waveguide allows for a two-dimensional structure to be maintained, while providing enough efficiency to be useful as a sensor. The research efforts focus on developing a technique to make inexpensive, reproducible gratings that are easy to fabricate. By chemically modifying the surface of a commercial grating with a suitable release agent, it is possible to emboss replica gratings onto a variety of waveguide types. The fabrication of embossed gratings will be described, and their performance on glass, ion-diffused, polymer, and semiconductor waveguides will be presented.

Flow Immunoassay Using Solid-Phase Entrapment.
Final rept.
L. Locascio-Brown, L. Martynova, R. G. Christensen, and G. Horvai. 1996, 6p.
Pub. in Analytical Chemistry, v68 n9 p1665-1670 May 96.

Keywords: *Flow injection, *Immunoassay, Sorbents, Separation, Assays, Reprints, *Solid-phase entrapment.

A flow injection immunoassay was performed using a column packed with reversed-phase sorbents to effect separation of the immunoreacted species by entrapping free analyte and allowing antibody-conjugated analyte to pass unretained. Fluorescein-labeled analyte was measured in a competitive assay for the anticonvulsant drug phenytoin. The simplicity of the assay was the greatest advantage of the technique, which allowed for measurement of phenytoin in a 2-min assay time. The reliable detection limit for the assay was 5 nmol L to the minus 1 power of phenytoin in serum. The columns were regenerated with periodic injections of ethanol solutions to remove the entrapped analyte and prepare the column for subsequent analyses.

UV Absorption Cross Sections of Methylchloroform: Temperature-Dependent Gas and Liquid Phase Measurements.
Final rept.
A. K. Nayak, M. J. Kurylo, and A. Fahr. 1995, 5p.
Pub. in Jnl. of Geophysical Research, v100 nD6 p11,185-11,189 Jun 95.

Keywords: *Tungsten silicide, *Formation enthalpy, *Calorimetry, Analytical chemistry, Reprints, *Foreign technology, Methylchloroform.

The absorption cross sections for methylchloroform (CH_3CCl_3) have been measured in the gas phase (from 160 to approximately 240 nm) and in the liquid phase (from approximately 235 to 260 nm) over the temperature range 220-330 K. The liquid phase results were converted into effective gas phase cross sections using a wavelength shift procedure described and verified in earlier work. The results are compared with other available data in the wavelength region 185-240 nm. The multiplicity of measurements in different laboratories lends increased confidence in the quantification of uncertainties in the atmospheric (photolysis and kinetic) lifetime calculations for this important chemical species.

Statistical Aspects of the Certification of Chemical Batch SRMs. Standard Reference Materials.
Special pub.
S. B. Schiller. Jul 96, 52p, NIST-SP-260-125.
Also available from Supt. of Docs. as SN003-003-03416-9. See also PB95-143087.

Keywords: *Chemical analysis, *Calibration standards, *Certification, *Statistical analysis, Analytical methods, Sampling, Chemical composition, Homogeneity, Uncertainty, Confidence level, Accuracy, Precision, Quality control, Quality assurance, *Standard reference materials.

The accurate determination of chemical analytes in batches of material is the principal requirement in chemical Standard Reference Material (SRM) certification. Many measurement made for chemical constituent batch SRMs are destructive, and batches are usually large, so selecting a random but representative sample from the batch is vital to inference about the material. Homogeneity assessment must be done to verify the materials suitability for sale, and to determine what type of statistical interval will make an appropriate summary for the certificate. Finally, results from more than one independent chemical method often must be combined in a statistically meaningful way to arrive at a realistic estimate of the uncertainty of the results achieved. This paper provide guidelines for addressing these statistical issues. The motivations behind those guidelines are also explained to facilitate understanding of them.

Airborne Asbestos Method: Bootstrap Method for Determining the Uncertainty of Asbestos Concentration. Version 1.0.
S. Turner, R. L. Myklebust, B. B. Thorne, S. D. Leigh, and E. B. Steel. Aug 96, 36p, NISTIR-5723.
Sponsored by Environmental Protection Agency, Washington, DC.

Keywords: *Asbestos, *Test methods, *Chemical analysis, *Statistical analysis, *Standards, Electron microscopy, Air pollution detection, Quality assurance, Air filters, Air sampling, *Transmission electron microscopy.

The determination of the uncertainty of the analytical value for the concentration of asbestos in air is of practical use for: (1) comparison of analyses obtained by different operators or laboratories on the same sampling area and (2) providing an indication of how an analytical value compares with values set by government regulations. This test method describes a procedure for determining the component of uncertainty that is due to variation in sampling of a population of values (corresponding to the Type A evaluation of uncertainty described in NIST Technical Note 1297). The test method describes use of a bootstrapping procedure for determination of a 95% confidence interval for the concentration of asbestos deposited onto filters.

Pub. in Jnl. of Electroanalytical Chemistry, v405 p169-176 1996.

Keywords: *Oxidation, *Caffeic acid, Electrooxidation, Ferulic acid, Pulse radiolysis, Reprints, 4-coumaric acid.

Oxidation of caffeic acid (3,4-dihydroxycinnamic acid) 1H3 has been studied by electrochemical methods and by pulse radiolysis in aqueous and organic solvents. The results have been compared with the behavior of 4-coumaric acid 2H2 and ferulic acid 3H2. The first oxidative intermediates have been characterized by their UV spectra and oxidation potentials. In case of 2H2 and 3H2, the initial radicals decay by a second order process indicating a radical-radical coupling mechanism. On the contrary, for caffeic acid the oxidation leads to the formatuion of the corresponding o-quinone through disproportionation of the initial semiquinone radical.

Use of a Naphthylethylcarbamoylated- beta-Cyclodextrin Chiral Stationary Phase for the Separation of Drug Enantiomers and Related Compounds by Sub- and Supercritical Fluid Chromatography.
Final rept.
K. L. Williams, L. C. Sander, and S. A. Wise. 1996, 7p.
Pub. in Chirality, v8 p325-331 Sep 96.

Keywords: *Enantiomeric separation, *Chrial recognition, Derivatized cyclodextrin, Chromatography, Drug analysis, Reprints.

Enantiomeric separation of a variety of drugs and related compounds was achieved on an (S)-naphthylethylcarbamoy lated-beta-cyclodextrin (S-NEC-CD) chiral stationary phase (CSP) using sub- and subcritical fluid chromatography (SFC). Compounds previously resolved on native or derivatized cyclodextrin CSPs in liquid chromatography (LC) using reversed phase or polar organic mobile phase modes could be resolved in SFC using a simple carbon dioxide/methanol eluent. Resolution of cromakalim, which is not possible on the S-NEC-CD column in LC, was readily accomplished in SFC. The importance of modifier, temperature, and pressure was assessed in relation to retention, selectivity, and resolution. The nature of the modifier and the modifier concentration were found to be crucial parameters.

Pub. in Jnl. of Chemical Physics, v105 n11 p4798-4811 Sep 96.

Keywords: *Grafted polymer layer, *Excluded volume, *Surface interaction, Concentration profiles, Reprints, End-tethered polymers.

The segmental concentration profile p of end-tethered flexible polymer chains is calculated for comparison with recent measurements on polymer layers having a low surface grafting density omega. Moments of p are also calculated as these quantities, rather than the full concentration profiles, are usually measured experimentally. Exact calculations of p are summarized for ideal flexible chains with an arbitrary short-range polymer-surface interaction. Though technical difficulties restrict the renormalization group (RG) calculations for swollen chains to limiting values of the polymer-surface interaction, the analysis indicates that the relatively simple, closed-form, Gaussian-chain expression for p provides a good approximation to the RG results if the average size of the Gaussian chain is replaced by its swollen-chain analog. This approximate concentration profile for chains with excluded volume and variable polymer-surface interaction should prove useful when interpretating experimental results for low-grafting-density polymer layers formed in good solvents.

Keywords: *Proteoglycans, *Liposomes, *Calcium phosphates, Precipitation, Cartilage, Calcification, Chondroitin sulfate, Calcium, Reprints, Aggrecan.

The major proteoglycan in cartilage (aggrecan) is a complex macromolecule with numerous chondroitin sulphate, keratan sulphate, and oligosaccharide substituents. It has been proposed that this macromolecule has an important role in regulating mineralization in this tissue, a process which is initiated by the deposition of apatite in matrix vesicles. We have used a liposome-centered endogenous precipitation method as a model for matrix vesicle mineralization to study the effect of the rat chondrosarcoma aggrecan and its chondroitin sulphate and core protein components on apatite formation from solution. Aggrecan (0.5%) in the suspending medium had no effect on intraliposomal precipitation, but severely reduced (approximately 70% reduction at 24 h) its subsequent spread into the medium. The chondroitin sulphate and core protein were similarly inhibitory. The degree to which aggrecan and its constituent parts inhibited pre-

cipitation correlated with their capacity to bind Ca(2+) ions. These findings suggest that functional groups in aggrecan blocked apatite growth by linking via Ca(2+) bridges to growth sites on the crystal surfaces. Similar Ca-mediated interactions may well have a critical regulatory role in cartilage mineralization.

Pub. in Combustion and Flame 87, n1 p100-103 1991.

Keywords: *High temperature superconductors, *High-TC superconductors, *YBCO superconductors, Diffusion flames, Particle size distribution, Reprints, *Flame synthesis, *Yttrium barium cuprates.

High temperature superconducting particles of the 1:2:3 Yttrium-Barium-Copper oxide system have been synthesized in an inverted configuration coannular diffusion flame. The particles were produced from a spray pyrolysis technique, employing aerosolized nitrate salts of Y, Ba and Cu. Particles produced showed a transition temperature of 92 K as determined by magnetic susceptibility measurements. The particles were shown to have a wide particle size distribution, ranging from 10 to 1000 nm. It was also observed that due to the effects of water vapor reactions at high temperatures, only a diffusion flame successfully produced the correct phase.

Pub. in Chem. Mater. 5, n10 p1401-1405 1993.

Keywords: *Chemical preparation, *Chemical analysis, Dentistry, Calcium phosphates, X-ray diffraction, Infrared spectroscopy, Raman spectroscopy, Ions, Molecular structure, Precipitation(Chemistry), Minerals, Calcification, Reprints, *Octacalcium phosphate carboxylates.

The formation of octacalcium phosphate carboxylates, Ca8(HPO4)m(carboxylate)n(PO4)4-yH2O, by conversion of alpha-Ca3(PO4)2 in solutions of 19 ammonium carboxylates (monocarboxylates; saturated, unsaturated, hydroxy, keto, and amino dicarboxylates; and tricarboxylates) was investigated. The various solid phases formed, depending on initial pH's and conversion times, were determined by X-ray diffraction and infrared and Raman spectroscopy. Octacalcium phosphate carboxylates containing structurally incorporated malonate, succinate, adipate, suberate, sebacate, fumarate, malate, and citrate ions were formed and identified. Octacalcium phosphate carboxylates were also formed from pyruvate and alpha-ketoglutarate solutions but with uncertain carboxylate ion structures. All of these identified compounds are structurally similar to octacalcium phosphates, Ca8(HPO4)2(PO4)4-5H2O, but have expanded a-axis unit-cell dimensions that generally increased with increasing number of carbon atoms in the carboxylate ion. Among these compounds, of special importance are those containing carboxylates that are present as intermediates in the Krebs cycle. The possible precipitation of these octacalcium phosphate carboxylates in mitochondria and their possible role as precursors in calcified tissue formation are discussed.

Equilibrium and Calorimetric Investigation of the Hydrolysis of L-Tryptophan to (Indole + Pyruvate + Ammonia).
Final rept.
Y. B. Tewari, and R. N. Goldberg. 1994, 18p.
Pub. in Jnl. of Solution Chemistry 23, n2 p167-184 1994.

Keywords: *Calorimetry, *Hydrolysis, *Tryptophan, *Indoles, *Ammonia, *Pyruvates, *Chemical reactions, *Equilibrium, High pressure liquid chromatography, pH, Temperature, Enthalpy, Catalysis, Reprints.

Apparent equilibrium constants and calorimetric enthalpies of reaction have been measured for the reaction L-tryptophan(aq) + H2O(l) = indole(aq) + pyruvate(aq) + ammonia(aq) which is catalyzed by L-tryptophanase. High-pressure liquid-chromatography and microcalorimetery were used to perform these measurements. The equilibrium measurements were performed as a function of pH, temperature, and ionic strength. The results have been interpreted with a chemical equilibrium model to obtain thermodynamic quantities for the reference reaction: L-tryptophan(aq) + H2O(l) = indole(aq) + pyruvate(-)(aq) + NH4(+)(aq). At T = 25 C and I(sub m) = 0 the results for this reaction are: K(sup o) = (1.05 + or - 0.13) times ten to the minus fourth power, Delta(sub r)G(sup o) = (22.71 + or - 0.33) kJ/mol, Delta(sup r)H(sup o) = (62.0 + or - 2.3) kJ/mol, and Delta(sub r)S(sup o) = (132 + or - 8) J/K/mol. These results have been used together with thermodynamic results from the literature to calculate standard Gibbs energies of formation, standard enthalpies of formation, standard molar entropies, standard molar heat capacities, and standard transformed formation properties for the substances participating in this reaction.

Keywords: *Colloidal dispersion, *Shear thinning, *Rheology, Computerized simulation, Reprints, *Foreign technology, *Small angle neutron scattering.

There is need to understand the structure of hard-sphere dispersions under flow in order to develop models for colloid rheology since changes in structure are related to non-Newtonian behavior. Small-angle neutron scattering (SANS) data for polymer lattices, behaving as nearly hard spheres, at shear rates through the region of the shear thinning are presented. Intensity distributions from these new and detailed low-angle scattering experiments are compared with the intensities calculated directly from computer simulations employing a Rouse model.

Small Angle Neutron Scattering Study of a Clay Suspension Under Shear.
Final rept.
H. J. M. Hanley, G. C. Straty, and F. Tsvetkov. 1994, 3p.
Pub. in Langmuir, v10 p3362-3364 1994.

Keywords: *Clay, Shear, Suspension, Disks, Reprints, *Small angle neutron scattering.

The most useful expression for the orientational probability of cylinders on a suspension subjected to a shear field is that of Hayter and Penfold, reported in 1984. Here an alternative equation is proposed to account for the shear induced orientation of disks. Our equation is then used to interpret SANS (small angle neutron scattering) intensity data from dilute aqueous suspensions of Na-montmorillonite. Parenthetically we note that SANS studies on dilute clay suspensions in equilibrium are well-known but that investigations of clay suspensions under shear are not in the literature.

Accurate Modeling of Size and Strain Broadening in the Rietveld Refinement: The 'Double-Voigt' Approach.
Final rept.
D. Balzar, and H. Ledbetter. 1995, 8p.
Pub. in Advances in X-ray Analysis, v38 p397-404 1995.

Keywords: *Lattice strain, *X ray diffraction, Peak profile, Peak broadening, Reprints, *Rietveld refinement, *Voight function.

In the 'double-Voight' approach, an exact Voigt function describes both size- and strain-broadened profiles. The lattice strain is defined in terms of physically credible mean-square strain averaged over a distance in the diffracting domains. Analysis of Fourier coefficients in a harmonic approximation for strain coefficients leads to the Warren-Averbach method for the separation of size and strain contributions to diffraction line broadening. The model is introduced in the Rietveld refinement program in the following way: Line widths are modeled with only four parameters in the isotropic case. Varied parameters are both surface- and volume-weighted domain sizes and root-mean-square strains averaged over two distances. Refined parameters determine the physically broadened Voigt line profile. Instrumental Voigt line profile parameters are added to obtain the observed (Voigt) line profile. To speed computation, the corresponding pseudo-Voigt function is calculated and used as a fitting function in refinement. The approach allows for both fast computer code and accurate modeling in terms of physically identifiable parameters.

Pub. in Japan Jnl. of Applied Physics, v34 pt1 n4B p2073-2082 Apr 95.

Keywords: *Silicon, *Etching, *Dry processes, Kinetics, Chlorine, Energy, Reprints, *Foreign technology.

A review is presented of the emerging field of neutral-species kinetic-energy-enhanced etching of silicon. As the gate oxide thickness of metal oxide semiconductor field-effect transistors (MOSFET) is decreased to dimensions of 50 Angstroms or less, the potentially damaging effects of high-kinetic-energy ions in plasma processing become important. New methods are required to remove material in a more refined, selective manner. In this review, the motivations of studies of neutral-species enhanced-kinetic-energy etching are described. Currently available sources of neutral reactive species with enhanced kinetic energies of 1-10 eV are discussed, and published experimental and theoretical investigations of enhanced-kinetic-energy neutral etching are reviewed. Problems associated with neutral species etching are also considered, and some possible future developments in the field are summarized.

Determination of Anomalous Superexchange in MnCl2 and Its Graphite Intercalation Compound.
Final rept.
D. G. Wiesler, M. Suzuki, I. S. Suzuki, and N. Rosov. 1995, 4p.
Pub. in Physical Review Letters, v75 n5 p842-945 Jul 95.

Keywords: *Intercalation compound, *Neutron diffractions, Molecular structure, Synthesis, Chemical properties, Reprints, *Graphite, Manganese chloride.

The low-temperature magnetic structure of MnCl2 graphite intercalation compound has been studied by neutron diffraction. Magnetic peaks occur at wave vectors incommensurate with the MnCl2 and graphene sublattices. The in-plane spin configuration is explained by an exchange Hamiltonian that includes three shells of nearest neighbors in the plane. The nearest-neighbor exchange is ferromagnetic but anamalously weak, and the magnetic behavior is dominated instead by the antiferromagnetic third-neighbor interaction. The exchange parameters are used to explain the spin configuration of bulk MnCl2 after adding an interplanar coupling.

Scale-up of packed bed processes, particularly those involving chromatographic separations, is made difficult by a seemingly inevitable increase in dispersion due to packing nonuniformity. To provide a suitable characterization, the authors measured the spatial distribution of dispersion and mixing in packed beds of uniform impervious spherical glass particles by a tracer impulse technique. The key feature in this work is the use of a fiberoptic array at the exit plane to obtain a time-resolved spatially distributed response. All experiments were in the creeping flow regime. The authors used a fluorescent dye with laser excitation through the fiber terminations in the bed. The fluoresced radiation was collected through the same fibers. They analyzed the data by the use of indices of the extent of micromixing based on Danckwerts's original degree of segregation and an additional index of structural uniformity. The computations involve a moment analysis of the individual and average probe responses. A simple model gives expressions for the indices in terms of the Peclet number and is shown to provide a useful limiting case. The computed indices are also shown to be very sensitive to adsorption of dye on the surface of the glass. However, for some of the experiments with the largest spheres using Pyrex glass, the effects of adsorption are indiscernible. This technique successfully separates the contribution of micromixed fluid to overall bed dispersion from the contribution due to the transverse variation of the flow residence time.

Thermophysical Property Data for Supercritical Fluid Extraction Design.
Final rept.
T. J. Bruno. 1991, 32p.
Pub. in Supercritical Fluid Technology: Reviews in Modern Theory and Applications, Chapter 7, p293-324 1991.

Keywords: *Thermophysical properties, *Supercritical state, *Extraction, Reprints, Vapor pressure, Solubility, Stability, Equations of state, Diffusivity, *Supercritical fluid extraction, Chemical stability.

The design of any industrial-scale separation process requires some degree of knowledge about the thermophysical and chemical properties of the materials to be separated. This knowledge can take the form of experimentally measured data, particular for that system, or predictions obtained from a suitable mathematical model such as an equation of state or empirical data correlation. It is generally considered better to use predicted properties, since calculations are far more economical to perform than are experimental studies. Unfortunately, there are relatively few reliable predictive methods currently available that have sufficient accuracy to be used in the design of supercritical fluid extraction (SFE) processes. This is because such processes usually involve high pressures and large, often polar, solutes. In addition, SFE processes often require operation near solvent critical points, where even good models of well-studied systems become marginal. This lack of data is slowly improving as more experimental and applied theoretical studies are completed. In the chapter, the more important thermophysical properties needed for supercritical fluid extraction design are discussed from the experimental point of view. Both the solvent and solute are discussed in terms of equilibrium and transport properties.

Vapor Transport in Materials and Process Chemistry.
Final rept.
J. W. Hastie, and J. P. Hager. 1990, 24p.
Pub. in Proceedings of Elliott Symposium on Chemical Process Metallurgy, Cambridge, MA., June 10-13, 1990, p301-324.

Keywords: *Extractive metallurgy, *Metal vapors, *Materials recovery, Thermochemistry, Halides, Oxides, Sulfides, High temperature, Reprints, *Vapor transport, *Materials chemistry.

As was effectively illustrated by H. H. Kellogg in his 1966 Extractive Metallurgy Lecture to AIME, vaporization chemistry can play a very significant role in extractive metallurgy as well as in other materials processes. The field of high temperature chemistry, with its emphasis on vapor phase material transport, has continued its rapid growth over the almost twenty five year period since Kellogg's milestone lecture. This presentation reviews the results and implications of this growth, and makes recommendations concerning future directions in the research and application of vapor transport to process metallurgy. Particular emphasis is given to advances in measurement and diagnostic techniques and to the development of process models. Representative examples, taken primarily from the authors' respective laboratories, are given for the metallurgically important halide, oxide and sulfide systems.

Pub. in Proceedings of International Symposium on Resonance Ionization Spectroscopy and Its Applications (4th), Gaithersburg, MD., April 10-15, 1988, p129-132 1989.

Keywords: *Free radicals, *Butenes, *Electronic spectra, *Spectrum analysis, Barriers, Potential energy, Energy levels, Molecular spectroscopy, Chemical reactions, Reprints, Resonance enhanced multiphoton ionization spectroscopy.

Resonance enhanced multiphoton ionization (REMPI) studies of 2-butene-1-yl (1-methylallyl) radicals from two geometric isomers of C4H8 precursors yield two distinct REMPI spectra. Analysis of these spectra reveal: (1) that geometric structure is preserved in this chemical reaction due to the existence of a rotational barrier between the cis- and trans-1-methylallyl radicals; (2) a Rydberg-like 3p doublet B(sub 1) intermediate state in each of the isomeric radicals through which REMPI occurs; and (3) an upper limit to the adiabatic ionization potential for the cis-1-methylallyl radical.

Modeling Ceramic Sub-Micron Particle Formation from the Vapor Using Detailed Chemical Kinetics: Comparison with In-situ Laser Diagnostics.
Final rept.
M. R. Zachariah. 1990, 8p.
Pub. in Chemical Engineering Science 45, n8 p2551-2558 1990.

Keywords: *Silicon dioxide, *Particle production, *Particle size distribution, *Ceramics, *Chemical reactors, *Chemical vapor deposition, *Reaction kinetics, Mathematical models, Ionization, Spectrum analysis, Silicon, Hydroxyl radicals, Nucleation, Reprints, *Laser diagnostics, Multiphoton ionization spectroscopy.

In this paper we review the in-situ measurements and modeling of an aerosol flame reactor producing submicron silica aerosols as a generic ceramic. Silica powders are produced in a hydrogen-oxygen counter flow diffusion flame reactor and interrogated with light scattering methods for determination of the time-temperature history of particle growth. In addition laser-induced fluorescence and multi-photon ionization have shown to be applicable as diagnostics in a heavily particle laden flow. These diagnostics have been used to measure the OH radical and silicon atoms. These experimental results have been used in conjunction with detailed chemical kinetics and aerosol dynamic models for particle growth. The results show the effects of multi-component nucleation can alter the chemical purity of the resulting solids.

Pub. in Aerosol Science and Technology 13, n4 p413-425 1990.

Keywords: *Aerosols, *Nucleation, *Retarding, *Agglomeration, *Sintering, Particle size, Monomers, Reprints, *Controlled nucleation.

The formation of agglomerated particles can be a detriment to the production of highly sinterable materials. It has been seen experimentally that agglomerates are almost exclusively constructed from 10-30 nm primary particles. This paper develops criteria for the avoidance of these small primary particles through control of the nucleation rate. The relationship between particle size and number density can be used to obtain regions of stable and unstable particle growth. It is seen that the critical source rate for the prevention of runaway nucleation can be scaled without knowledge of the monomer number density.

Keywords: *Particle production, *Silicon dioxide, *Diffusion flames, Mathematical models, Vapor phases, Nucleation, Density(Number/volume), Temperature gradients, Light scattering, Optical measurement, Silanes, Particle size distribution, Ceramics, Computerized simulation, Reprints.

Recent interest in high temperature materials have focused attention on the processing requirements as well as the fundamentals of submicron particle formation and growth. In this study, silica particle growth in flames was followed by in-situ light scattering dissymmetry methods for the measurement of particle size and number density. In addition, temperature profiles for the flames were obtained by thermocouple thermometry. The majority of the experiments conducted have used silane as the source of silicon, although a limited number of experiments using organo-silicon compounds have been tried. The results have shown that the silicon source concentration and the temperature are the two dominant variables controlling particle growth and morphology. Two particle growth models have been applied, which account for the consumption of the gas precursor, nucleation, and subsequent growth by surface condensation and coalescence. Comparison with experiment have shown good agreement. Finally, numerical simulations of the gas phase chemistry of silicon have shown the presence of multicomponent nucleation under some conditions, evidence for which has been observed by laser extinction measurements.

tering, Chemical reactors, Chemical vapor deposition, Mathematical models, Reprints.

Ceramic particle formation processes have been studied using SiO2 as a model compound. Silica particles have been synthesized in a counterpropagating diffusion flame reactor, in which in-situ measurements of particle size and number density have been made. In addition, the time-temperature history of the particle field has been calculated from a flame simulation. Numerical simulations using moment and sectional methods for particle formation have been applied and compared to the experimental measurements. The simulations for the particle formation assume a kinetically-constrained approach, allowing a simple representation of nucleation, surface growth and coagulation. The results suggest that, if the source rates are known well enough, particle formation of low vapor pressure species can be predicted. Both models do well in predicting the gross features of particle formation (number density and mean particle size), although the moment solution does a poor job of predicting the polydispersity effects during periods of high monomer generation rates.

Pub. in Chemistry of Materials, v8 n8 p1871-1880 1996.

Keywords: *Titanium, *Boron, *Sodium, Nanostructural materials, Fluorescence, Reprints.

The study focuses on the optical characterization of a method for the formation of nanoscale titanium and boron particles. The versatile method can also be used to form a variety of metals as well as ceramic powders such as TiB2. The gas-phase chemical process, given by (mn)Na + (n)MClm -> (M)n + (mn)NaCl, should be generic to many metal chlorides or mixtures of metal chlorides. In the study, either TiCl4 or BCl3 is reacted with Na vapor in a counterflow diffusion flame reactor. After the Cl is stripped from the metal chloride by the Na vapor, nanosize Ti or B particles form and, under certain thermodynamic circumstances, become encased in NaCl, which helps to prevent agglomeration and postflame oxidation. The two-dimensional spatial distribution of Na2 has been optically interrogated using planar laser-induced fluorescence under various conditions to clarify the influence of concentration and transport on particle formation. Reactant concentration and time available for reaction were found to dramatically influence the reactive flow.

Critical Evaluation of Thermal Mass Flow Meters.
Final rept.
S. A. Tison. 1996, 10p.
Pub. in Jnl. of Vacuum Science and Technology A, v14 n4 p2582-2591 Jul/Aug 96.

Keywords: *Flow meters, *Thermal mass flow meters, Gas admission, Correction factors, Reprints.

Many semiconductor processes require that stable and known flows of gas be delivered to the processing

chamber. The thermal mass flow meter (TMFM) is used almost exclusively in the semiconductor industry for the admission of process gases. While TMFM's have been used in the semiconductor industry for over twenty years, much still remains to be understood about their behavior. The abundance of TMFM manufacturers that make instruments which are supposedly interchangeable complicates the use of TMFM's because the instruments generally have different designs and performance. While some attempt has been made via written standards to address the specifications of the instruments, these standards do not address all performance issues and cannot eliminate the systematic errors in the original manufacturers calibration of the TMFM's. Further, the TMFM's used to measure the process gases are generally calibrated with nitrogen and 'corrected' for other gases, but the correction factors are not well understood and are of questionable reliability. It is also important to understand how the TMFM's perform under conditions that differ from the laboratory conditions where they were calibrated and the measurement errors that are introduced as a result of these different operating conditions. This article presents data on the performance of five low-flow TMFM's, from different manufacturers, with full scale ranges of 1.5x10(-6)-3.7x10(-6) mol/s (2-5 sccm). The manufacturers' calibration of the TMFM's with nitrogen as compared to the National Institute of Standards and Technology (NIST) measured values differed by up to 17%. Three of the five tested TMFM's were within the manufacturers' stated tolerance of + or - 1% of full scale. While some of the instruments' initial calibration was poor, all of the TMFM's were stable to within + or - 1% of full scale over the test interval of nine months.

Long-Term Stability of Carrier-Free Polonium Solution Standards.
Final rept.
R. Colle. 1993, 11p.
Pub. in Radioactivity and Radiochemistry 4, n2 p20-35 1993.

Keywords: *Polonium 208, *Solutions, *Stability, *Trace elements, Radiochemistry, Hydrochloric acid, Concentration(Composition), Scintillation counters, Reprints.

The long-term solution stability of trace quantities of polonium in dilute hydrochloric acid has been investigated. Polonium solutions at trace concentrations, under various alkaline, neutral, or weakly acidic conditions are known to be unstable: being readily hydrolyzed, chemically deposited, or volatilized; exhibiting 'radiocollodial' behavior; and undergoing 'plate-out' or adsorption onto glass surfaces. Although stored polonium solutions are generally considered to be stable in the acid range of 0.1 to 1.0 normality (N), scant data exist on any possible long-term effects, particularly for very dilute, aged solutions. In this study, previously standardized carrier-free solutions of (208)Po activity concentration, ranging in age from 1.2 to nearly 9 years, and with acid concentrations from about 0.1 to 2.0 N HCl were re-assayed to determine the remaining soluble fraction of polonium. The results indicate that at acid concentrations of a few tenths of 1 N, the solutions are clearly unstable. In the range of 0.3 to 0.5 N, the results are somewhat equivocal. Only in the range at or above 1 N do the solutions appear to be stable over many years, approaching a decade. All measurements were performed by 4 pi-alpha liquid scintillation counting of gravimetrically-determined aliquots of the standardized, aged solution samples.

Application of Photochemical Reaction in Electrochemical Detection of DNA Intercalation.
Final rept.
P. C. Pandey, and H. H. Weetall. 1994, 6p.
Pub. in Analytical Chemistry 66, n8 p1236-1241, 15 Apr 94.

Keywords: *Electrochemistry, *DNA damage, *Intercalating agents, *Photochemistry, Anthraquinones, Flow injection analysis, Oxidation, Deoxyribonucleic acids, Reduction(Chemistry), Reprints.

A flow injection analysis (FIA) system for the detection of the compounds that intercalate within DNA is reported. A derivative of 9,10-anthraquinone has been used as the reference compound for photoelectrochemical detection. The sodium salts of 9,10-anthraquinone-2,6-disulfonic acid and 9,10-anthraquinone-2 sulfonic acid are photochemically activated and then reduced in the presence of an electron donor (glucose). The electrochemical signal is based on the measurement of the anodic current resulting from the oxidation of the reduced form of 9,10-anthraquinone. The reduced form of the 9,10-anthraquinone is oxidized through a mediated mechanism at the surface of a tetracyanoquinodimethane-(TCNQ)-modified graphite paste electrode covered by a Nucleopore membrane. TCNQ acts as an efficient mediator for the oxidation of reduced 9,10-anthraquinone. Cyclic voltammetry, photocyclic voltammetry, and the photoelectrochemical FIA response of 9,10-anthraquinone are reported. Experimental results show that these anthraquinones can be intercalated within the helix of double-stranded calf thymus DNA.

Photodecomposition Dynamics of Mo(CO)6/Si(111) 7x7: CO Internal State and Translational Energy Distributions.
Final rept.
S. A. Buntin, R. R. Cavanagh, and L. J. Richter. 1993, 4p.
Pub. in Jnl. of Chemical Physics 98, n9 p7651-7654, 1 May 93. Sponsored by Department of Energy, Washington, DC.

Keywords: *Carbon monoxide, Reprints, Rotational states, Metal carbonyls, Photodecomposition, Absorption, Photolysis, Silicon, Hexacarbonylmolybdenum, Photodesorption, Translations.

The rotational state and translational energy distributions of CO photodesorption products resulting from the 266 nm photolysis of Mo(CO)6 absorbed on Si(111) 7X7 with coverages in the multilayer regime are reported. State-resolved measurements show two desorption components with highly disparate energy dispositions. Results for different surface temperatures indicate that the energy content in one component reaches quasi-equilibration with the surface temperature, which is attributed to collisional relaxation of nascent photodecomposition products within the adlayer. The other component exhibits disparate rotational and translational 'temperatures' that are significantly greater than, and independent of, the surface temperature. These nascent photodecomposition products are influenced by both energy quenching effects and dynamical constraints imposed by the existence of the adlayer.

Dynamics of Nonthermal Reactions: Femtosecond Surface Chemistry.
Final rept.
R. R. Cavanagh, D. S. King, J. C. Stephenson, and T. F. Heinz. 1993, 13p.
Pub. in the Jnl. of Physical Chemistry 97, n4 p786-798 1993. Sponsored by Department of Energy, Washington, DC.

Keywords: *Surface reactions, Laser radiation, Light pulses, Energy transfer, Reviews, Reprints, Femtosecond pulses.

Optically driven surface reactions are attracting an increasing level of attention in the physical chemistry community. Not only have there been recent advances in establishing the viability of laser driven surface reactions, but there has also been an increased awareness of the need to understand the underlying reaction mechanisms. The necessity of accounting for energy-transfer processes that occur on the femtosecond time scale is now apparent. In this review the experimental and theoretical basis of our current understanding is surveyed, and prospective areas of advancement are considered.

Over the past ten years the National Institute of Standards and Technology has, through its Office of Radiation Measurement, developed several national Secondary Laboratories systems in the field of ionizing radiation. These Secondary Laboratories systems provide the necessary calibrations and quality assurance testing to support and affirm the caliber of the measurements in special areas of ionizing radiation. The areas that are supported by the program include State Radiation Protection, Personnel Dosimetry, Survey Instrument Calibration, High-level Dosimetry, Radiation Therapy, Bioassay, Survey Instrument Testing, Ionizing Radiation, Environmental Radioactivity, Radioactivity Standards, and Radon.

Rate coefficients for the reaction C2H + C2H2 -> C4H2 + H are measured over the temperature range 170-350 K. The reactions are carried out in a temperature variable flow cell. C2H radicals are produced by pulsed laser photolysis of C2H2, and a tunable infrared color-center laser is used to probe the transient removal of C2H in absorption to derive the rate coefficients. The results show that the rate coefficient is independent of temperature over the range 170-350 K and equal to (1.1 + or - 0.2) x 10(sup -10) exp((28 + or - 20)/T) cc/molecule/s. The reaction studied is of central impor-

tance for models of the photochemistry of the atmospheres of the outer planets, in particular for the satellite Titan, and the implications of the present results for these models are discussed.

Unusual Spin-Trap Chemistry for the Reaction of Hydroxyl Radical with the Carcinogen N-Nitrosodimethylamine.
Final rept.
D. A. Wink, and M. F. Desrosiers. 1991, 6p.
Pub. in Radiation Physics and Chemistry 38, n5 p467-472 1991.

Keywords: *Hydroxyl radicals, *Radiolysis, Radiochemistry, Carcinogens, Reprints, *Chemical reaction mechanisms, *Amine/N-nitrosodimethyl, *Spin trap, Benzene sulfonate/dibromo-nitroso, EPR(Electron Paramagnetic Resonance).

The reaction of the potent carcinogen N-nitrosodimethylamine (NDMA) with hydroxyl radical generated via radiolysis was studied using EPR techniques. Attempts to spin trap NDMA radical intermediates with 3,5-dibromo-4-nitrosobenzene sulfonate (DBNBS) produced only unusual DBNBS radicals. One of these radicals was shown to be generated by both reaction of DBNBS with nitric oxide, and direct oxidation of DBNBS with an organic oxidant (Br2(-)). Another DBNBS radical was identified as a sulfite spin adduct resulting from the degradation of DBNBS by a NDMA reactive intermediate. In the absence of DBNBS, hydroxyl radical reaction with NDMA gave the dimethylnitroxide radical. Unexpectedly, addition of DBNBS to a solution containing dimethylnitroxide produced an EPR spectrum nearly identical to that of NDMA solutions with DBNBS added before radiolysis. A proposed mechanism accounting for these observations is presented.

Pub. in Nuclear Instruments and Methods in Physics Research B 92, p166-171 1994.

Keywords: *Carbon 14 target, Concentration(Composition), Sampling, Environmental materials, Performance evaluation, Poisson equation, Reprints, *Accelerator mass spectrometry.

An accelerator mass spectrometry (AMS) experiment was designed to investigate (14)C target performance for two target types over a range of isotopic concentrations and sample sizes, with a special focus on the ability to measure (14)C in environmental samples having only microgram amounts of carbon. The findings were positive, showing that precision, accuracy, and stability were adequate to determine (14)C to 1% or better in samples containing as little as 25 micrograms carbons. Satisfactory Poisson uncertainty and target stability were demonstrated down to a level of 7 micrograms carbon, but experimental data showed that accurate measurements at that level require detailed knowledge of blank variability and mass dependence of the modern carbon calibration factor.

Keywords: *Isotope dilution, *Chemical analysis, *Biological systems, Reprints, Accuracy, *Foreign technology, Nuclear analytical techniques.

Isotope dilution is a method of chemical analysis based on the mixing (or dilution) of a radioisotope or a separated stable isotope with its natural isotope(s) in the sample. The activity or isotopic ratio of the mixture defines the concentration of the analyte, which is a tremendous advantange for measurement since quantitative separation of the analyte is not required. The technique has a multitude of variations and has been combined with many classical and instrumental procedures used in analytical chemistry. The technique is noted for its accuracy. This review focuses on the application of the technique in the determination of elemental concentrations in biological systems.

Keywords: *Gamma ray spectrometry, *Pulse pileup, Dead times, Reprints, Radioactive decay, *Foreign technology, Random summing.

The accuracy of gamma-ray spectrometric measurements is ultimately limited by the precision of Poisson counting statistics. With careful attention to detail, all other sources of error in the ratio of activities of two sources of a radionuclide in small samples can be made insignificant, even when the statistical limit is well below one percent. An important source of error comes from the dinite time required by the counting electronics to detect and process pulses. Dead-time losses (mostly in the analog-digital converter) are usually compensated very well by the pulse-height analyzer, but pileup losses (mostly in the amplifier) may not be. Errors of 10% or more may result. Several methods are available for detecting and correcting rate-related losses. These methods are sufficiently reliable and well understood that a decaying source can be measured with acceptably small errors even at count rates as high as tens of thousands per second.

Pub. in Jnl. of Radioanalytical and Nuclear Chemistry, Articles, v193 n1 p25-32 1995.

Keywords: *Neutron activation analysis, *Spinach, Elemental analysis, Reprints, Accuracy, *Foreign technology, *Botanical reference material, Standard reference materials.

Analysis for certification have been made by instrumental neutron activation analysis (INAA) for the determination of 21 elements in the Natiaonl Institute of Standards and Technology (NIST) Spinach renewal reference material, SRM 1570a. Elements determined included ones with short halflife products (Al,V, Ca, Mg), intermediate halflife products (Mn, Na, K, La) and long halflife products (Ba, Co, Cr, Cs, Eu, Fe, Rb, Sb, Sc, Se, Sr, Th, and Zn). For the first time a new robotic samplechanger was used in the counting of long halflife indicator isotopes for certification of an SRM. Uncertainties obtained averaged plus or minus 1.80% for the four major and minor constituents (Ca, K, Mg, Na); plus or minus 3.14% for elements with concentrations from 1 to 400 mg/kg (Al, Ba, Cr, Fe, Mn, Rb, Sr, and Zn); and plus or minus 8.31% for the ultra trace elements (less than mg/kg) (Co, Cs, Eu, La, Sb, Sc, Se, Th, and V).

Unique Quality Assurance Aspects of INAA for Reference Material Homogeneity and Certification.
Final rept.
D. A. Becker. 1993, 4p.
Pub. in Fresenius Jnl. of Analytical Chemistry, v345 p298-301 1993.

Keywords: *Neutron activation analysis, *Radiation detection, *Quality assurance, Neutron detection, Radiochemistry, Incident radiation, Excitation, Measurement, Certification, Trace elements, Analytical methods, Reprints, *Standard reference materials, Emitted radiation.

Instrumental neutron activation analysis (INAA) has become one of the primary analytical techniques for certification of elemental content in biological Standard Reference Materials (SRMs) at the National Institute of Standards and Technology (NIST). One important reason why INAA has become so widely used and valuable in the certification of NIST SRMs is that INAA has unique inherent quality assurance (QA) character-

istics which provide the capability for accurate analysis and which often allow the analytical values obtained to be internally evaluated and cross checked. While the NAA technique has the general characteristics of most spectroscopic techniques, the specific characteristics include uniform activation, long and well-documented excited states, highly penetrating emitted radiation, and an excited state decay process which is statistically random in nature.

When a Ne:C2H2 sample is codeposited at approximately 5 K with a beam of neon atoms that has been excited in a microwave discharge, a sharp, prominent absorption assigned to Upsilon(3) of HCCH(+) appears at 3137.6 cm(-1), very close to the previously reported gas-phase band center. Experiments on carbon-13 and deuterium substituted samples support this assignment and permit the identification of all of the infrared-active CH- and CD-stretching fundamentals of the isotopically substituted acetylene cations, as well as the determination of the stretching and stretching-interaction force constants. The absorptions of the carbon-13 substituted acetylene cations have also been identified in the analogous argon-matrix experiments, but exhibit a matrix shift of approximately 30 cm(-1), possibly because of the larger polarizability of argon.

When a NE:NO2 or a Ne:NO:O2 sample is codeposited at approximately 5 K with a beam of neon atoms that have been excited in a microwave discharge, infrared absorptions of NO2+, NO2-, and NO3- appear. Detailed isotopic substitution studies support the assignment of prominent absorptions to v3 of NO2+ and NO2- and of weak to moderately intense absorptions to the v1 + v3 combination band of each of these species. When the contribution of anharmonicity is considered, the positions of the NO2+ absorptions are in satisfactory agreement with the values for the stretching fundamentals obtained in a recent gas-phase study of that species. When the sample is exposed to 240-420 nm mercury-arc radiation, the initially present absorptions of NO3- trapped in sites with a small residual cation interaction diminish in intensity, and the unsplit v3 (e') absorption of isolated NO3- grows. The mechanism responsible for this growth in the absorption of isolated NO3- is considered. Electron capture, Infrared spectrum, Ionization, Neon matrix, NO2+, NO2-, NO3-, Photodetachment.

Tabulation of the Thermodynamic Properties of Normal Hydrogen from Low Temperatures to 300K and from 1 to 100 Atmospheres.
Technical note no. 12.
J. W. Dean. Nov 61, 76p.

Keywords: *Enthalpy, *Entropy, *Hydrogen, *Thermodynamic properties, Temperature, Barometric pressure, Specific volume, Hydrogen gas.

Pressure, volume, temperature, internal energy, enthalpy, and entropy of normal hydrogen gas have been tabulated along isobars in 1 deg K temperature steps. The range covered is from the saturation temperature to 300 deg K and from a pressure of 1 to 100 atmospheres. The source of data is the Research Paper 1932 of the National Bureau of Standards Journal of Research. The method is described by which the data presented in Research Paper 1932 is reduced to properties directly useful for engineering calculations. A method is also described for estimating the effect of ortho-para compositions upon the tabulated properties. Tabular values are presented in the dimensional units of the metric system. The tabulations are also available in the dimensional units of the British system as Technical Note No. 120, Supplement A.

Compilation of the Physical Equilibria and Related Properties of the Hydrogen-Carbon Monoxide System.
Technical note.
D. E. Drayer, and T. M. Flynn. May 61, 96p.

Keywords: *Hydrogen, *Carbon monoxide, *Chemical equilibrium, Physical properties, Solid phases, Vapor phases, Liquid phases, K Factor.

Literature data have been used to calculate K-factors for the hydrogen-carbon monoxide system over the range of 68.2 to 122.2 deg K and 10 to 225 atmospheres. K-factors are presented graphically for eight isotherms over this range. Published data on the solid-vapor region are presented separately as composition versus pressure at constant temperature. A bibliography of approximately 450 references is also presented on related properties for this system and for the pure components.

Arc Spectra of Gallium, Indium, and Thallium.
W. F. Meggers, and R. J. Murphy. 4 Apr 52, 11p.
Pub. in Jnl. of Research of the National Bureau of Standards, v48 n4 p334-344 Apr 52.

Keywords: *Gallium, *Indium, *Infrared spectra, *Thallium, Reprints, Optical properties, Spectra, Visible spectra, Atomic energy levels, *Arc spectra.

This research was inspired by the compilation of Atomic energy levels as derived from the analyses of optical spectra. While compiling the data on gallium spectra, C. E. Moore noted that the first spectrum of gallium (Ga I) was very incompletely investigated. In particular, no Ga I lines had been observed with wavelengths greater than 6414 A in the red, although two infrared lines (11904 and 12096 A) were predicted in 1914 from spectral-series formulas. These predicted infrared lines have now been recorded photographically, and, in addition, 37 new Ga I lines have been discovered. These observations have led to revision and extension of the known atomic-energy levels is derived from the analysis of the Ga I spectrum. jg p.1.

The microwave spectrum of the nitromethane-water complex (CH3NO2-H2O) has been studied with a pulsed-beam Fourier-transform Fabry-Perot-cavity spectrometer. Both a-type and b-type transitions were observed for the A state of the complex with the b-type transition being more intense by a factor of 2. Critical to the rotational assignments were well resolved (14)N nuclear electric quadrupole transitions, and the incorporation of the pulsed nozzle in one of the mirrors which provided a beam coaxial with the cavity axis to attain linewidths of about 2 kHz (full-width at half maximum-FWHM). To provide additional structural information, the spectra of the HDO, D2O, and Cd3NO2 substituents were assigned. The molecular structure derived from the moments of inertia has a center of mass separation of 3.506(7) A. The moments of inertia can not distinguish between two possible forms of the complex, one with the dipole moment vectors aligned and the other with them antialigned. jg p.2.

Pub. in Jnl. of Research of the National Bureau of Standards, v44 p611-641, Jun 50. Available only to DTIJ users. No copies furnished by NTIS.

Keywords: *Microwaves, *Spectra, *Molecular properties, Coupling(Interaction), Frequency, Reprints, Vibration, Molecules, Quantum theory, Intensity, Eigenvalues, Cavities, Ouadrupole moment, Measuring instruments, Tables(Data), Absorption, Rotation, Moment of inertia, Dipole moments, Wavemeters.

This paper presents a group of tables that give the frequencies, assignment of quantum numbers, and intensities of over 700 microwave absorption lines. The best available values of other pertinent molecular data, such as moments of inertia, dipole moments, quadrupole coupling constants, and rotation-vibration constants are also included. The frequencies are listed once for each molecule and again in consecutive ascending order of frequency. References are given for all data included. Frequencies listed to the nearest megacycle were generally measured with a cavity wave meter and may be in error by as much as 10 megacycles, whereas those given to a fraction of megacycle are generally known to an accuracy of about 0.1 megacycle. jg p.1.

Keywords: *Spectrometry, *Image registration, Breast cancer, Setting(Adjusting), Detection, Clinical medicine, Prototypes, Crystals, X rays, Radiography, Diffraction, Quantum efficiency, Spectrometers, Solid state electronics, Pharmacology, Mammography, Retrofitting, Abrasives, Image tubes, Dental equipment.

Phase one of this contract has been devoted to the development and demonstration of the MST prototype crystal spectrometer which was designed to provide accurate measurement of x-ray source voltage and full spectral characterization of the radiation emitted from mammographic x-ray sources. A major advance has been the movement from film to solid state image registration. Our current systems take advantage of recently introduced large area digital radiography sensors which are now being used in place of dental film. Initial clinical trials indicated the need for improved detection quantum efficiency. This has been overcome primarily by increasing the crystal bandpass with an air abrasive treatment of the surface and retrofitting the sensor with a thicker scintillating material. The significance of these advances is that we now have an instrument which: measures kVp to an accuracy in excess of clinical requirements, is easily adaptable to the clinical setting, records the entire spectral profile, including the effects of both inherent and added filtration, and is sensitive enough to obtain these data within the time of a typical mammographic exposure. Not only will this contribute to the quality control of mammography but potentially to refinements in technique.

Measurement of the Thermal Properties of Electrically Conducting Fluids Using Coated Transient Hot Wires.
R. A. Perkins. 1994, 9p, CONF-9404137-6.
Contract AI05-89ER13992
Symposium on Energy Engineering Sciences (12th), Argonne, IL (United States), 27-29 Apr 1994. Sponsored by Department of Energy, Washington, DC.

Keywords: *Argon, *Fluorinated Aliphatic Hydrocarbons, *Probes, *Thermal conductivity, Design, Electrical Insulation, Experimental Data, Performance, Protective Coatings, Refrigerants, Supercritical State, Tantalum Oxides, Tables(data), EDB/360606, EDB/440500.

Measurements of fluid thermal properties using the transient hot-wire technique are described. When bare

hot wires are used in electrically conducting fluids there are additional measurement uncertainties due to the formation of electric double layers on the surfaces of the wires and the cell wall. If the electrical conductivity of the fluid is large enough there is also significant power generation in the fluid. These measurement uncertainties can be eliminated by electrically insulating the hot wires with a thin film. The use of tantalum hot wires with an anodized layer of tantalum pentoxide is demonstrated with measurements on nonpolar argon and polar 1,1,1,2 tetrafluorethane (R134a). Although coated tantalum hot wires have been used previously in a transient mode to measure the thermal conductivity of liquids, this work is the first demonstration of the use of coated wires to measure thermal conductivity in the liquid, vapor, and supercritical gas phases.

Investigating the 3.3 Micron Infrared Fluorescence from Naphthalene Following Ultraviolet Excitation.
R. M. Williams, and S. R. Leone. May 94, 6p.
In NASA Ames Research Center, the Diffuse Interstellar Bands: Contributed Papers p 59-64.

Keywords: *Infrared spectra, *Naphthalene, Absorption spectra, Fluorescence, Molecular excitation, Vapor phases, Excimer lasers, Fourier transformation, Polycyclic aromatic hydrocarbons, Spectrometers, Ultraviolet lasers, Intermediate infrared radiation.

Polycyclic aromatic hydrocarbon (PAH) type molecules are proposed as the carriers of the unidentified infrared (UIR) bands. Detailed studies of the 3.3 micrometer infrared emission features from naphthalene, the simplest PAH, following ultraviolet laser excitation are used in the interpretation of the 3.29 micrometer (3040 cm(sup -1)) UIR band. A time-resolved Fourier transform spectrometer is used to record the infrared emission spectrum of gas-phase naphthalene subsequent to ultraviolet excitation facilitated by an excimer laser operated at either 193 nm or 248 nm. The emission spectra differ significantly from the absorption spectrum in the same spectral region. Following 193 nm excitation the maximum in the emission profile is red-shifted 45 cm(sup -1) relative to the absorption maximum; a 25 cm(sup -1) red-shift is observed after 248 nm excitation. The red-shifting of the emission spectrum is reduced as collisional and radiative relaxation removes energy from the highly vibrationally excited molecules. Coupling between the various vibrational modes is thought to account for the differences between absorption and emission spectra. Strong visible emission is also observed following ultraviolet excitation. Visible emission may play an important role in the rate of radiative relaxation, which according to the interstellar PAH hypothesis occurs only by the slow emission of infrared photons. Studying the visible emission properties of PAH type molecules may be useful in the interpretation of the DIB's observed in absorption.

Keywords: *Meetings, *Electroacoustics, *Laboratory equipment, *Particulates, *Colloids, Ceramics, Electrokinetics, Suspensions, Measuring instruments, Zeta potential, Performance evaluation, Aqueous solutions, Surface chemistry, Coatings, Polarity.

The electroacoustic technique, based on physical affects described by Debye, is relatively new and the laboratory instrumentation has become available only in the last decade. This new instrumentation by Matec Applied Sciences and Pen Kem Inc. is based on the application of either electrical fields or ultrasound as external fields to the particles and measurement of the resulting electrical or ultrasonic response. These instruments, while addressing the primary drawbacks of electrophoresis instruments, allow the determination of signals that are related to the electrokinetic zeta potential for colloidal suspensions in polar and nonpolar media. In recent years, the electroacoustic technique has been extensively utilized for the characterization of a variety of particulates in dense suspensions of polar and nonpolar liquids with great success. As a result of this surge in activity, a number of technical issues have surfaced. In order to discuss these issues and develop a common understanding of the fundamentals of electroacoustics, a workshop was organized at the suggestion of the user community. The volume contains all but two papers presented at the workshop.

Pressure-Volume-Temperature Relations in Liquid and Solid Tritium.
E. R. Grilly. 1993, 12p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v98 n6, p679-690 Nov/Dec 93.

Keywords: *Tritium, *Thermodynamic properties, Temperature range 0013-0065 K, Temperature dependence, Pressure dependence, Solidified gases, Liquefied gases, Deuterium, Hydrogen.

PVT relations in liquid and solid T2 near the melting curve were measured over 20.5 K-22.1 K and 0 MPa-7 MPa (0 bar-70 bar) with a cell that used diaphragms for pressure and volume variation and measurement. Because of ortho-para self conversion, the melting pressure P(m) and the liquid molar volume V(lm) increased with time. Measurements of the volume change on melting and the thermal expansion and compressibility for liquid T2 were consistent with those for H2 and D2. Impurities such as H2, HT, DT, and (3)He were removed by a technique using an adsorption column of cold activated alumina. Corrections for (3)He growth during an experiment were adequate except near the triple point.

The thermodynamic properties of the alkaline earth metals in the condensed state have been critically reassessed, and recommended values for all of the relevant thermodynamic properties are given. These values are compared with those published in recent reviews by the staff at the Institute for High Temperatures (Moscow) and the National Institute of Standards and

Technology (Washington, DC), and the reasons for any differences are discussed in detail. A direct result of this review is a set of recommendations for experimental studies which should enhance the reliability of the thermodynamic results.

Quenching of excited singlet and triplet states of many substances by ground state molecular oxygen produces singlet oxygen, the lowest electronically excited singlet state of molecular oxygen, O2(1 delta sub g). The fractions of singlet and triplet states quenched which produce singlet oxygen and the quantum yields of formation of singlet oxygen in fluid solutions have been critically compiled. Methods for determining yield parameters have been reviewed. Data have been compiled from the literature through 1991. Photosensitizers are included in Table 1. Porphyrins and phthalocyanines are included in Table 2. Other materials which have been investigated for singlet oxygen production, such as dyes and drugs, are collected in Table 3 along with heterogeneous systems such as polymer-bound photosensitizers.

Wavelengths and Energy Level Classifications for the Spectra of Sulfur (S I through S XVI).
V. Kaufman, and W. C. Martin. c1993, 96p.
Included in Jnl. of Physical and Chemical Reference Data, v22 n2 p279-375, Mar/Apr 93. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Research, *Physical chemistry, Atomic energy levels, Ions, Spectra, Wavelengths, Frequencies, Sulfur, Infrared radiation, Ultraviolet radiation, Tables(Data).

Wavelengths and their classifications have been compiled for the spectra of the atom and all positive ions of sulfur (Z = 16). The selections of data are based on the compilations of energy levels by Martin, Zalubas, and Musgrove in 1990, with some updating from the more recent literature. Wavelengths (or wavenumbers) calculated from the differences of the energy levels are given along with the observed values for all classified lines; these calculated wavelengths should in general be more accurate than the observed values wherever the two values differ significantly. No limitation has been imposed on the wavelength range of the classified lines, except for the omission of x-ray transitions in the neutral atom. Two finding lists are also included, one for S I through S III and the other for S IV through S XVI.

Keywords: *Research, *Physical chemistry, Alkene compounds, Thermodynamic properties, Entropy, Gibbs free energy, Specific heat, Vapor pressure, Heat of vaporization, Heat of formation, Ideal gas, Density(Mass/Volume).

The thermodynamic properties of the mono-olefins with carbon numbers greater than C4 were reviewed. Properties included critical properties, vapor pressures, densities, second virial coefficients, enthalpies of vaporization, heat capacities, and enthalpies of combustion. Enthalpies of formation for the liquid, gas, and ideal-gas state at 298.15 K were calculated for 47 compounds based on the experimental values. Gaps in the available data were identified and recommendations for additional experiments are made. Evidence for errors in several of the original experimental results is presented, and revised values are suggested.

Keywords: *Research, *Physical chemistry, Thermodynamic properties, Carbon dioxide, Water, Enthalpy, Equations of state, Volume, Fugacity, Henrys law, Mixtures, Steam, Critical point, FORTRAN, Phases, Boundaries, Computer programs.

A model is presented for the thermodynamic properties of the aqueous mixture of carbon dioxide, up to 30 mol% composition, in a large range of temperatures (400-1000 K) and pressures (0-100 MPa) around the critical point of water. The model for the Helmholtz free energy of the mixture is based on the principle of generalized corresponding states, with the NBS/NRC Steam Tables as the reference state for pure water. Input to the model are data for the critical line of the mixture, apparent molar volume and pVTx data in supercritical water, phase boundaries, excess enthalpies and mixture second virial coefficient data. Comparisons are presented with those data, with Henry's constants and with other formulations available for this system. The Fortran codes for generating these properties are listed in Appendix B.

Thermodynamics of Enzyme-Catalyzed Reactions: Part 1. Oxidoreductases.
R. N. Goldberg, Y. B. Tewari, D. Bell, K. Fazio, and E. Anderson. c1993, 68p.
Prepared in cooperation with Food and Drug Administration, Rockville, MD.
Included in Jnl. of Physical and Chemical Reference Data, v22 n2 p515-582, Mar/Apr 93. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Research, *Physical chemistry, Thermodynamics, Enthalpy, Enzymes, Chemical reactions, Catalysts, Oxidoreductases, Heat of reaction, Chemical equilibrium.

Equilibrium constants and enthalpy changes for reactions catalyzed by oxidoreductases have been compiled. For each reaction the following information is given: the reference for the data; the reaction studied; the name of the enzyme used and its Enzyme Commission number; the method of measurement; the conditions of measurement (temperature, pH, ionic strength, and the buffer(s) and cofactor(s) used); the data and an evaluation of it; and, sometimes, commentary on the data and on any corrections which have been applied to it. The data from 205 references have been examined and evaluated. Chemical Abstract Service Registry Numbers have been assigned to the substances involved in these various reactions. There is a cross reference between the substances and the Enzyme Commission numbers of the enzymes used to catalyze the reactions in which the substances participated.

Included in Jnl. of Physical and Chemical Reference Data, v22 n3 p597-618, May/Jun 93. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Research, *Physical chemistry, Specific heat, Estimating, Liquid phases, Hydrocarbons, Temperature dependence, Least squares method, Organic compounds, Group additivity, Organic liquids.

A second-order group additivity method has been developed for the estimation of the heat capacity of liquid hydrocarbons as a function of temperature in the range from the melting temperature to the normal boiling temperature. The temperature dependence of group contributions and structural corrections has been represented by a polynomial expression. Recommended heat capacities from a large compilation of critically evaluated data that contains over 1300 organic liquids served as a database both for the development and testing of the method.

Keywords: *Research, *Physical chemistry, Enthalpy, Entropy, Water saturation, Density(Mass/Volume), Temperature, Vapor pressure, Correlation, IAPWS(International Association for the Properties of Water and Steam), Saturated liquid density, Saturated vapor density.

In 1987, consistent with the latest experimental data and the internationally recommended values for the critical parameters, the authors published compact and accurate correlation equations for properties on the saturation line of ordinary (light) water substance. (A. Saul and W. Wagner, J. Phys. Chem. Ref. Data 16, 893 (1987)). As an addendum to this 1987 paper the present paper brings all temperature values and adjusted coefficients in all correlation equations given in the 1987 paper into agreement with the International Temperature Scale of 1990 (ITS-90). The new equations form the basis of the 'Revised Supplementary Release on Saturation Properties of Ordinary Water Substance' issued by the International Association for the Properties of Water and Steam (IAPWS). This revised release which contains all equations and coefficients adjusted with regard to the ITS-90 is the main part of this paper.

Estimation of the Thermodynamic Properties of C-H-N-O-S-Halogen Compounds at 298.15 K.
E. S. Domalski, and E. D. Hearing. c1993, 354p.
Included in Jnl. of Physical and Chemical Reference Data, v22 n4 p805-1159, Jul/Aug 93. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Research, *Physical chemistry, Specific heat, Entropy, Enthalpy, Thermodynamic properties, Organic compounds, Hydrocarbons, Halogen organic compounds, Nitrogen organic compounds, Oxygen organic compounds, Sulfur organic compounds, Solid phases, Liquid phases, Vapor phases, Estimating.

An estimation method, which was developed by S. W. Benson and coworkers for calculating the thermodynamic properties of organic compounds in the gas phase, has been extended to the liquid and solid phases for organic compounds at 298.15 K and 101,325 Pa. As with a previous paper dealing with hydrocarbon compounds, comparisons of estimated enthalpies of formation, heat capacities, and entropies with literature values show that extension of the Benson's group additivity approach to the condensed phase is easy to apply and gives satisfactory agreement. This work covers 1512 compounds containing the elements: carbon, hydrogen, oxygen, nitrogen, sulfur, and halogens in the gas, liquid, and solid phases. About 1000 references are provided for the literature values which are cited.

Keywords: *Research, *Physical chemistry, Atomic energy levels, Oxygen, Wavelengths, Frequencies, Ionization potentials, Atomic structure, Atomic spectra.

The authors have assembled a complete list of the most accurately measured wavelengths for all classified lines of singly-ionized oxygen (O II). The data are based mainly on recent extensions of the observations and analysis of this spectrum carried out at the University of Lund, Sweden. They derived new optimal values for the energy levels using a computer code and the observed wavelengths for all classified lines. Relevant astrophysical wavelength measurements, appropriately weighted, were included in the level-optimization calculation.

Keywords: *Research, *Physical chemistry, Thermodynamic properties, Aluminum oxide, Specific heat, Enthalpy, Temperature scales, Calibration standards, SRM720(Standard Reference Material 720), Synthetic sapphire.

Comparison of the National Institute of Standards and Technology's Standard Reference Material 720 certificate values for heat capacity with those obtained from recent experimental determinations indicated the possibilty of a systematic error in the certificate values. Selected experimental determinations of enthalpy increments and heat capacities were fitted in order to obtain a representation of the thermodynamic properties of alpha-Al2O3, a sample of which is the standard reference material (SRM720) for calibration of some types of calorimeters. The fitted equation and calculated values of the heat capacity, the relative enthalpy, and the entropy are given. The new values are more accurate and result from a better representation of the experimental values than did the 1982 SRM720 certificate values.

Included in Jnl. of Physical and Chemical Reference Data, v22 n6 p1459-1468, Nov/Dec 93. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Research, *Physical chemistry, Thermodynamics, Enthalpy, Gibbs free energy, Molybdenum silicides, Tungsten silicides, Titanium silicides, Tantalum silicides, Platinum silicides, Cobalt silicides, Nickel silicides, Evaluated properties.

A critical evaluation is presented of the thermodynamic properties of six disilicides and one monosilicide that are important in the manufacture of very large scale integrated circuits. Values of the standard molar enthalpies of formation HM at T = 298.15 K and p = 0.1 MPa are recommended as follows: WSi2, -(79 + or - 5) kJ/mol, MoSi2, -(137 + or - 4) kJ/mol, TiSi2, -(171 + or - 11) kJ/mol, CoSi2, -(103 + or - 15) kJ/mol, NiSi2, -(88 + or - 12) kJ/mol, TaSi2, -(120 + or - 20) kJ/mol, and PtSi, -(119 + or - 7) kJ/mol. Equations are given for the molar enthalpy increments of some of the silicides along with a few evaluated standard Gibbs free energies of formation. Brief descriptions of methods of synthesis and limited structural information have also been included.

Keywords: *Research, *Physical chemistry, Isotope ratio, Atomic mass, Atomic properties, Radioactive isotopes, Elements, Periodic system, Abundance, IUPAC(International Union of Pure and Applied Chemistry).

The biennial review of atomic weight, Ar(E), determinations and other cognate data has resulted in changes for the standard atomic weight of indium from 114.82 + or - 0.01 to 114.818 + or - 0.003, for tungsten from 183.85 + or - 0.03 to 183.84 + or - 0.01 and for osmium from 190.2 + or - 0.1 to 190.23 + or - 0.03 due to new high precision measurements. Recent investigations on silicon and antimony confirmed the presently accepted Ar values. The footnote 'g' was added for carbon and potassium because it has come to the notice of the Commission that isotope abundance variations have been found in geological specimens in which these elements have an isotopic composition outside the limits for normal material. Because many elements have a different isotopic composition in non-terrestrial materials, recent data on non-terrestrial material are included in this report for the information of the interested scientific community.

Rotational Dynamics of Solid C70: A Neutron-Scattering Study.
Final rept.
C. Christides, T. J. S. Dennis, K. Prassides, J. R. D. Copley, R. L. Cappelletti, and D. A. Neumann. 1994, 7p.
Pub. in Physical Review B 49, n4 p2897-2903, 15 Jan 94.

Keywords: *Fullerenes, Neutron diffraction, Neutron scattering, Inelastic scattering, Temperature dependence, Reprints, Rotational dynamics.

The authors report the results of neutron-diffraction and low-energy neutron-inelastic-scattering experiments on high-purity solid C70 between 10 and 640 K. Thermal hysteresis effects are found to accompany

structural changes both on cooling and on heating. The observed diffuse scattering intensity does not change with temperature. At 10 K broad librational peaks are observed at 1.82(16)meV (full width at half maximum = 1.8(5)meV). The peaks soften and broaden further with increasing temperature. At and above room temperature, they collapse into a single quasielastic line. At 300 K, the diffusive reorientational motion appears to be somewhat anisotropic, becoming less so with increasing temperature. An isotropic rotational diffusion model, in which the motions of adjacent molecules are uncorrelated, describes well the results at 525 K. The temperature dependence of the rotational diffusion constants is consistent with a thermally activated process having an activation energy of 32(7)meV.

Octacalcium Phosphate. 3. Infrared and Raman Vibrational Spectra.
Final rept.
B. O. Fowler, M. Markovic, and W. E. Brown. 1993, 7p.
Pub. in Chem. Mater. 5, n10 p1417-1423 1993. See also PB89-131288. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Raman spectra, *Vibrational spectra, Water, Binding sites, Dentistry, Reprints, *Octacalcium phosphate.

Infrared and Raman band assignments are given for powdered samples of the biologically important compound, octacalcium phosphate, in the 4,000-300-cm(sup -1) range. Specific assignments were made for bands of the two crystallographically independent acidic phosphate groups. The numbers of observed bands were markedly less than those predicted by factor group analysis; additional unresolved bands are probably present. Infrared spectra indicate that two polymorphs of octacalcium phosphate may exist whose structures differ mainly in acidic phosphate and water bonding and in possibly different contents of water. Polymorphic forms of octacalcium phosphate are structurally plausible because of possible differences in bonding of its acidic phosphate groups and water molecules and in number of water molecules. The wavenumber positions of Raman bands, especially acidic phosphate bands, were sensitive to laser excitation power.

R. A. Fletcher, E. S. Etz, and S. Hoeft. 1990, 4p.
Pub. in Proceedings on Annual Conference of the Microbeam Analysis Society (25th), Seattle, WA., August 12-18, 1990, p89-92.

Keywords: *Phthalocyanines, *Molecular structure, *Spectrum analysis, Raman spectroscopy, Mass spectroscopy, Vibrational spectra, Reprints, Laser microprobe mass spectrometry.

The purpose of this work is to show the complementary information about molecular structural characteristics of metal phthalocyanine compounds provided by laser microprobe mass spectrometry (LAMMS) and micro-Raman spectroscopy. The vibrational frequencies found in micro-Raman spectroscopy indicate molecular structure, and mass spectrometry indicates the mass (m/z value) of the molecule, as well as certain structural features. The characteristic fragment peaks that result during the ionization process contain additional information about the molecular species being analyzed.

Recent Experimental and Modeling Developments in High Temperature Thermochemistry.
Final rept.
J. W. Hastie, and D. W. Bonnell. 1989, 15p.
Pub. in Proceedings of Symposium on Thermochemistry and Chemical Processing, Kalpakkam, India, p179-193 1989.

Keywords: *High temperature tests, *Thermochemistry, Vapor phases, Mass spectroscopy, Thermodynamics, Experimental design, Mathematical models, Slags, Glass, Dolomite, Reprints.

The application of thermochemical principles to high temperature processes requires advanced measurement and modeling techniques. Recent work in this area, primarily from the authors' laboratory, is reviewed. Emphasis is on the vapor phase, present in equilibrium with complex liquid and solid process-media such as salts, slags, glasses, minerals, etc. Examples of the thermochemical characterization of several practical systems are given, including silicate glasses, a nuclear waste borosilicate glass, a coal-derived slag and the mineral dolomite. The experimental techniques described include, a modified Knudsen effusion mass spectrometric method and the relatively novel methods of transpiration mass spectrometry and laser vaporization mass spectrometry. The modeling approach considered involves the multicomponent equilibrium calculation of phase compositions and activities using an ideal mixing of complex components, or liquid associate model.

Electrodeposition.
Final rept.
D. S. Lashmore. 1990, 3p.
Pub. in Electrochemistry and Solid State Science in the Electrochemical Society, p12-14 1990.

Keywords: *Electrodeposition, *Metal ions, Metals, Electrochemistry, Amorphous state, Electroforming, Metal matrix composites, Substrates, Alloys, Coatings, Catalysis, Reprints.

Electrodeposition involves reducing metal ions electrochemically from aqueous, inorganic and fused salt electrolytes to form coherent metals and alloys on various substrates. These coatings may be removed from the substrate to constitute free standing parts using a process called electroforming. The reduction of the ions to metal is usually a result of an external electrolytic process; however, autocatalytic processes exist, in which the reducing agent is incorporated into the electrolyte. One of these processes, the autocatalytic nickel phosphorus process, is now in wide commercial use.

Use of Ion Scattering Spectroscopy to Monitor the Nb Target Nitridation during Reactive Sputtering.
Final rept.
D. J. Lichtenwalner, A. C. Anderson, and D. A. Rudman. 1991, 6p.
Pub. in Proceedings of Surface Chemistry and Beam-Solid Interactions Symposium, Boston, MA., November 26-29, 1990, p613-618 1991.

Keywords: *Niobium nitrides, Surface reactions, Surface chemistry, Thin films, Monitoring, Nitrogen, Targets, Reprints, Ion beam reactive sputtering, Ion scattering spectroscopy.

Ion scattering spectroscopy (ISS) has been used to directly monitor the nitrogen coverage of a niobium target during ion-beam reactive sputtering. The measurement shows that the fully reacted target is nearly completely covered with nitrogen, revealing a major difference in the target surface state when reactive sputtering versus the sputtering of a compound target. The functional dependence of the nitrogen coverage on the nitrogen pressure has also been obtained. Taking the fractional target coverage to be a steady-state equilibrium between nitrogen sputter removal and thermal N2 arrival, the measured target coverage has been accurately modeled. The results indicate that the nitridation reaction is controlled by the thermal N2 molecules, which stick to the target with a high probability. This firmly establishes the fact that the molecular N2 flux can control the target reaction. The target coverage model has also been applied to fit the measured deposition rate as a function of the nitrogen pressure, and shows that the deposition rate does not accurately reflect the target coverage.

Role of Adsorbed Alkalis in Desorption Induced by Electronic Transitions.
Final rept.
T. E. Madey, S. A. Joyce, and C. Benndorf. 1989, 10p.
Pub. in Physics and Chemistry of Alkali Metal Adsorption, p185-194 1989. Sponsored by Department of Energy, Washington, DC.

Keywords: *Surface chemistry, *Alkali metals, Adsorption, Desorption, Ions, Reprints, Electron stimulated desorption ion angular distribution.

DIET processes (desorption induced by electronic transitions) involving atoms and molecules on metal surfaces are strongly influenced by coadsorption with alkali metal atoms. Angular distributions and yields of positive ions, negative ions and electronically excited neutrals from adsorbed species are affected by alkali coadsorption, due to a combination of molecular reorientation and electronic effects.

Inelastic Neutron Scattering Studies of Rotational Excitations and the Orientational Potential in C60 and A3C60 Compounds.
Final rept.
D. A. Neumann, J. R. D. Copley, D. Reznik, R. L. Paul, R. M. Lindstrom, W. A. Kamitakahara, and J. J. Rush. 1993, 14p.
Pub. in Jnl. of Physics and Chemistry of Solids 54, n12 p1699-1712 1993.

Keywords: *Fullerenes, Alkali metal compounds, Rotational states, Neutron scattering, Inelastic scattering, Excitation, Reprints, *Buckminsterfullerene, Orientational potentials, Interatomic potentials.

The authors describe neutron scattering studies of rotational excitations of the C(60) molecule in pure C(60) and in A3C(60) (A = alkali metal) compounds. Well-defined peaks due to librations are observed below the orientational ordering transition temperature in C(60) itself, and at all temperatures at which measurements were made (up to 675 K in K3C(60)) in the compounds. The energies of these excitations have been used to extract information about orientational potentials and reorientation mechanisms. For the systems studied so far, the authors find that the size of the ion occupying the tetrahedral site correlates with the librational energy, demonstrating that the repulsive part of the A-C interaction makes a significant contribution to the interatomic potential.

Inelastic Interactions of Electrons with Surfaces: Application to Auger-Electron Spectroscopy and X-ray Photoelectron Spectroscopy.
Final rept.
C. J. Powell. 1994, 15p.
Pub. in Surface Science 299/300, p34-48 1994.

Keywords: *X ray photoelectron spectroscopy, *Auger electron spectroscopy, *Electron scattering, *Surface

analysis, Mean free path, Inelastic scattering, Reprints, Surface composition.

Electron-based probes of surface properties are used frequently in surface science since strong inelastic scattering for electron energies between about 50 and 2000 eV ensures high surface sensitivity. An overview is given of developments in the understanding of inelastic electron scattering in solids with emphasis on important surface properties. Auger-electron spectroscopy (AES) and X-ray photoelectron spectroscopy (XPS) are the two techniques most commonly used for measurements of surface composition. The authors give a brief description of the development of AES and XPS and then proceed to describe the role of inelastic electron scattering in AES and XPS. Attention is given to the measurement of electron attenuation lengths, to the calculation of electron inelastic mean free paths, and to intensity measurements for quantitative AES and XPS.

Environmental Scanning Electron Microscope Imaging Examples Related to Particle Analysis.
Final rept.
S. A. Wight, and C. J. Zeissler. 1993, 5p.
Pub. in Microscopy Research and Technique 25, p393-397 1993.

Keywords: *Scanning electron microscopy, *Particles, *Environmental monitoring, Air pollution sampling, Particulates, Image processing, Filters, Surface energy, Reprints.

The work provides examples of some of the imaging capabilities of environmental scanning electron microscopy applied to easily charged samples relevant to particle analysis. Environmental SEM (also referred to as high pressure or low vacuum SEM) can address uncoated samples that are known to be difficult to image. Most of these specimens are difficult to image by conventional SEM even when coated with a conductive layer. Another area where environmental SEM is particularly applicable is for specimens not compatible with high vaccum, such as volatile specimens. Samples from which images were obtained that otherwise may not have been possible by conventional methods included fly ash particles on an oiled plastic membrane impactor substrate, a one micrometer diameter fiber mounted on the end of a wire, uranium oxide particles embedded in oil-bearing cellulose nitrate, teflon and polycarbonate filter materials with collected air particulate matter, polystyrene latex spheres on cellulosic filter paper, polystyrene latex spheres 'loosely' sitting on a glass slide, and subsurface tracks in an etched nuclear track-etch detector. Surface charging problems experienced in high vacuum SEMs are virtually eliminated in the low vacuum SEM, extending imaging capabilities to samples previously difficult to use or imcompatible with conventional methods.

Thermal Decomposition of Hydroxy- and Methoxy-Substituted Anisoles.
Final rept.
M. M. Suryan, S. A. Kafafi, and S. E. Stein. 1989, 7p.
Pub. in Jnl. of American Chemical Society 111, n4 p1423-1429 1989.

Keywords: *Anisole, *Aryl ethers, *Reaction kinetics, *Pyrolysis, *Binding energy, Chemical bonds, Organic oxygen compounds, Isomers, Reprints, *Hydroxyanisoles, *Methoxyanisoles, Bond homolysis.

Rates of decomposition of anisole and the three isomeric hydroxyanisoles and methoxyanisoles were determined in a very low pressure pyrolysis apparatus. The predominant reaction was O-methyl bond homolysis. Therefore, relative rates provide a quantitative measure of the effects of hydroxy and methoxy substituents on bond strengths in anisoles. The o-hydroxy effect is unusually large (7j kcal/mol bond strength weakening). Rate ratios of ethyoxybenzene (phenetole) and o-hydroxyphenetole were similar to the anisole/o-hydroxyanisole pair, confirming the large o-hydroxy effect. The p-hydroxy group, however, only weakened the anisole O-methyl bond by 2.5 kcal/mol and meta substitution had little effect. Both o- and p-methoxy groups weakened the O-methyl bond by 4 kcal/mol and m-methoxy weakened this bond by 1 kcal/mol. Rates of these reactions, extrapolated to lower temperatures, were similar to rates of condensed phase thermolysis reactions, indicating that homolysis is a key step in the liquid phase reactions.

Can Quantum Mechanical Description of Electron-Sodium Collisions Be Considered Complete. Present Status and Future Prospects for 3s <-> 3p Transitions.
Final rept.
N. Andersen, and K. Bartschat. 1993, 32p.
Pub. in Comments on Atomic and Molecular Physics 29, n3 p157-188 1993. Sponsored by National Science Foundation, Washington, DC.

Keywords: *Electron-atom collisions, *Sodium, Electron scattering, Electron transitions, Quantum mechanics, Polarization(Spin polarization), Reprints, Electron spin polarization.

In the spirit of Bederson's 'Perfect Scattering Experiment,' we generalize the existing description of collision induced atomic S <--> P transitions by spin-polarized electrons on spin-polarized target atoms. Analysis of existing experimental and theoretical data on the 3s <--> 3p transitions in Na determines to what extent the 'perfect scattering experiment' has been achieved to date. Using theoretical data, we demonstrate to what extent additional missing parameters can be extracted from present experiments. Finally, new experimental arrangements are suggested to remove remaining ambiguities.

Low-Energy Electron Scattering from Caesium Atoms: Comparison of a Semirelativistic Breit-Pauli and a Full Relativistic Direc Treatment.
Final rept.
K. Bartschat. 1993, 15p.
Grant NSF-PHY-9014103
Pub. in Jnl. of Phys. B: At. Mol. Opt. Phys. 26, p3595-3609 1993. Sponsored by National Science Foundation, Washington, DC.

Keywords: *Electron-atom collisions, *Cesium, Electron scattering, Differential cross sections, Total cross sections, Relativistic effects, Hamiltonians, R matrix, Comparison, Reprints, Electron spin polarization.

The discrepancies between a previous Breit-Pauli R-matrix calculation by Scott et al and a recent calculation using the Dirac Hamiltonian by Thumm and Norcross are further analyzed and partially resolved. When comparable methods are applied to obtain the best possible target description in both approaches, a reduced Breit-Pauli formulation, with only the one-body spin-orbit operator included to account for relativistic effects explicitly, seems sufficient for an accurate description of most of the low-energy collision processes in this system. There remain, however, some interesting differences between the Breit-Pauli and the Dirac results for spin polarization and asymmetry functions, as well as for very sensitive resonance parameters. To shed more light on the possible origin of these differences, the effect of including additional close-coupling channels on the results is investigated.

Keywords: *Electron-ion collisions, *Indium ions, *Xenon ions, Ionization cross sections, EV range 100-1, 000, Colliding beams, Reprints.

Absolute ionization cross sections for In(1+) and Xe(1+) by electron impact have been measured from below threshold to 200 eV using the crossed-beams technique. The cross sections for In(1+) were possibly enhanced by indirect ionization processes. The excitation of the ion from the 4d(10)5s(2) ground state to the 4d(9)5s(2)5P state followed by autoionization has been postulated. Experimental measurements are compared to configuration-averaged distorted-wave calculations (M. S. Pindzola et al, J. Phys. B 16, L355 (1983)), the semiempirical formula of Lotz (Z. Phys. 216, 241 (1968)), and, in the case of Xe(1+), previous experimental results (C. Achenbach et al, J. Phys. B 17, 1405 (1984)). Also presented are ionization-rate coefficients and fitting parameters for both ions for temperatures in the range 10,000 K = or < T = or < 10 million K.

Contract FA9620-92-J-0072
Pub. in Review of Scientific Instruments 64, n10 p2808-2820 Oct 93. Sponsored by Air Force Office of Scientific Research, Washington, DC.

Keywords: *Ion molecule interactions, *Nitrogen ions, Laser induced fluorescence, Vibrational states, Rotational states, Molecular ions, Charge transfer, Oxygen, Argon, Reprints, Ion flow tubes.

A selected ion flow tube apparatus is coupled with laser induced fluorescence (LIF) detection for the selective monitoring of ion vibrational states and their reactions. Mass selected ions are injected into a flow tube with a venturi inlet using He carrier gas. A 200 Hz dye laser system provides sensitive LIF detection of the injected ions at densities as low as 100,000/cc for N2(1+). The rotational temperatures of the N2(1+) ions are estimated to be about 300 K using the LIF detection, while the vibrational temperatures can be high and may be varied by the injection potentials. Vibrationally state-selected ion-molecule reactions of N2(1+)(nu = 0, 1, and 2) are studied with N2, Ar, and O2 at thermal kinetic energies (E(lab) < 0.1 eV), where translation-to-vibration energy transfer is negligible. Isotopically specific charge-transfer reactions of (15)N2(1+)(nu) with (14)N2 are also studied. The ability to mass select ions and characterize their vibrational states and those of their reaction products allows novel studies of state-to-state ion chemistry.

M. Manning, S. D. Price, and S. R. Leone. 1993, 10p.
Contract AFOSR-F49620-92-J-0071
Pub. in Jnl. of Chemical Physics 99, n11 p8695-8704, 1 Dec 93. Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Ion-atom collisions, *Carbon fluorides, *Rare gases, *Charge transfer, Molecular ions, EV range 10-100, Chemical radicals, Cross sections, Dissociation, Reprints, Dications.

Multiple product channels are observed for the reactions of CF(2+) and CF2(2+) with the rare gases at a laboratory collision energy of 49 + or - 1 eV. A dication beam is produced in an electron impact ion source and mass selected using a quadrupole mass spectrometer. The ion beam is focused into a collision region and a time-of-flight mass spectrometer is used to monitor the reaction products. Reactions of CF(2+) produce CF(1+), C(1+), and F(1+) ions and reactions of CF2(2+) result in CF(2+), CF(1+), C(1+), and F(1+) ion formation accompanied by the corresponding rare gas ions when charge transfer occurs. The relative yields of these products are measured directly. For reactions of both dications, there is a substantial increase in the total reaction cross section as the rare gas collision partner changes from He to Xe. The trends in charge transfer reactivity are successfully modeled using Landau-Zener theory.

Pub. in Jnl. of Crystal Growth 135, p533-538 1994. Sponsored by American Dental Association Health Foundation, Chicago, IL.

Keywords: *Reaction kinetics, *Thermodynamics, *Solubility, pH, Chemical analysis, X-ray diffraction, Infrared spectroscopy, Phase transformations, Reprints, *Octacalcium phosphate succinate, Octacalcium phosphate carboxylates.

Kinetic and thermodynamic studies of octacalcium phosphate succinate (OCP-SUCC), Ca8(HPO4)(2-x)(succ)x(PO4)4'yH2O, where 0.8 < x < 1.0 and 5.5 < y < 6.5, broaden the present knowledge in the chemistry of octacalcium phosphate carboxylates. The kinetics of formation of OCP-SUCC by conversion of alpha-tricalcium phosphate (alpha-TCP), alpha-Ca3(PO4)2, in ammonium succinate solutions was followed at varied initial pH, 37 C. The changes in the liquid phase were monitored by pH measurements. Solid phases were characterized by means of chemical analyses, X-ray diffraction and infrared spectroscopy. The rate of conversion decreased with increasing initial pH. In the solubility experiments the concentrations of calcium, phosphate, succinate, ammonium and pH were determined in solutions equilibrated with OCP-SUCC (6.1 < pH < 7.4).

Keywords: Van der Waals forces, Intermolecular forces, Infrared spectroscopy, High resolution, Matrix isolation, Hydrogen bonds, Argon complexes, Reprints, *Molecular clusters, Hydrogen fluoride complexes.

A long standing goal in the field of cluster research has been to elucidate the transition between the properties of isolated monomer species in the gas phase and the corresponding properties in the condensed phase. One of the most exacting probes of small clusters in this transition region has recently been offered by high resolution spectroscopies, particularly in the microwave and IR region of the spectrum. Such high resolution studies at rotational resolution can provide detailed information on the distribution of the masses in the cluster, as well as clearly distinguish between various low lying isomeric structures of the same molecular composition. High resolution spectroscopy in the IR also provides the opportunity to study dynamical phenomena such as predissociation, isomerization, and IVR channels that can be accessed by quantum state selected vibrational excitation of the clusters.

Keywords: *Electron-atom collisions, *Lithium, *Magnesium, Differential cross sections, Angular distribution, Electron impact, Ionization, Reprints.

Distorted-wave calculations of the triply differential cross sections for electron-impact ionization of Li and Mg are presented for the coplanar, theta (12) = pi geometry in which the final-state electrons share 2 eV of excess energy equally. Our theoretical approach, described in detail elsewhere (C. Pan and A. F. Starace, Phys Rev A 45, 4588 (1992)), employs a partial-wave expansion of initial- and final-state wave functions, treats direct and exchange interactions of initial- and final-state electrons with the target core, and treats the final-state interaction between the two continuum electrons by a screening potential. Li and Mg targets are found to have more complex (e, 2e) angular distributions than either H or He targets, stemming in large part from significant p-wave and higher one-electron phase shifts in the former elements.

Collision-induced neutral loss reactions are observed to be a major product channel for reactions of CF3(2+), SF4(2+), SF3(2+) and SF2(2+) with the rare gases at 49 eV laboratory collision energy. This reactivity, which involves the formation of doubly charged molecular daughter ions, differs markedly from that observed for other molecular dications. The doubly charged product

ion yield is largest for systems in which charge transfer does not compete effectively with the collision-induced process.

Thermodynamic and NMR Study of the Interactions of Cyclodextrins with Cyclohexane Derivatives.
Final rept.
M. V. Rekharsky, F. P. Schwarz, Y. B. Tewari, Y. Yamashoji, R. N. Goldberg, and M. Tanaka. 1994, 6p.
Pub. in Jnl. of Physical Chemistry 98, n15 p4098-4103 1994.

Keywords: *Cyclodextrins, *Cyclohexanols, *Heat of reaction, *Equilibrium, Specific heat, Temperature dependence, Calorimetry, Thermodynamic properties, Nuclear magnetic resonance, Spectrum analysis, Entropy, Reprints.

Equilibrium constants and standard molar enthalpies of reaction have been determined for a series of cyclohexanols and other cyclohexane derivatives with alpha-cyclodextrin (a-cyclodextrin) and beta-cyclodextrin (b-cyclodextrin) by titration calorimetry. For reactions involving cyclohexanol, standard molar heat capacity changes as a function of temperature were also determined. The equilibrium constants for the reactions of the compounds were always larger with b-cyclodextrin than with a-cyclodextrin. The standard molar enthalpies of reaction were similar for both cyclodextrins; however, the standard molar entropies of reaction with b-cyclodextrin were substantially more positive than for the reactions with a-cyclodextrin. The hydrophilic nature of the groups on the cyclohexane ring as well as steric effects were found to influence the thermodynamics of these reactions. NMR spectral analysis indicated that while the proximity of these cyclohexane derivatives to the walls of the two cyclodextrins were comparable, the cyclohexane derivatives penetrate deeper into the larger b-cyclodextrin cavity than into the smaller a-cyclodextrin cavity.

X-Ray Diffraction from Anodic TiO2 Films: In situ and Ex situ Comparison of the Ti(0001) Face.
Final rept.
D. G. Wiesler, M. F. Toney, O. R. Melroy, C. S. McMillan, and W. H. Smyrl. 1994, 9p.
Pub. in Surface Science 302, p341-349 1994.

Keywords: *Titanium dioxide, X-ray diffraction, Synchrotron radiation, Single crystals, Thin films, Crystal structure, Epitaxy, Anodizing, Anatase, Reprints.

X-ray diffraction with synchrotron radiation is used to study the structure and epitaxy of a thin (about 250 A) anodic film grown slowly on the basal plane of single-crystal Ti. Anatase crystallites, roughly 130 A in diameter, are observed, with no indication of other forms of TiO2 or films with lower oxidation state. The oxide is more orientationally disordered than films grown on the (11-20) and (10-10) faces of Ti, but it exhibits weak six- and twelve-fold texturing by the metal sublayer. In situ and ex situ measurements are qualitatively similar, suggesting that the oxide does not change appreciably upon emersion.

Temperature Dependence of the Rate Constants for Reaction of Inorganic Radicals with Organic Reductants.
Final rept.
Z. B. Alfassi, R. E. Huie, P. Neta, and L. C. T. Shoute. 1990, 6p.
Pub. in Jnl. of Physical Chemistry 94, n25 p8800-8805 1990.

Keywords: *Chemical radicals, *Phenols, *Ascorbic acid, *Reaction kinetics, *Temperature dependence, Reprints, Activation energy, Chemical reactions, Molecular ions, Halogens.

Rate constants for the reactions of several inorganic radicals with several organic reductants in aqueous solutions have been measured by pulse radiolysis as a function of temperature, generally between 5 and 75 deg C. The reactions studies were those of the radicals N3, NO2, Br2(-), I2(-), (SCN)2(-) reacting with several phenols and ascorbate. Rate constants were also measured for the reactions of Cl2(-) with phenol and of ClO2 with p-methoxyphenolate. The rate constants measured were in the range of 100,000 to nearly 10 to the 10th power and the calculated Arrhenius activation energies ranged from 7 to 41 kJ/mol. The pre-exponential factors also varied considerably, with log A ranging from 9.2 to 13.9. The temperature dependence of these reactions do not seem to relate to their exothermicities. Variations in rate constants appear to be more strongly dependent on changes in preexponential factors rather than on changes in activation energy.

Pub. in Jnl. of Chemical Physics 97, n9 p6864-6870, 1 Nov 92. Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Silicon, *Arsenic, *Desorption, Reprints, Laser induced fluorescence, Vibrational states, Surface temperature, Temperature dependence, Chemisorption, Dimers.

The desorption dynamics of arsenic from Si(100) and Si(111) are studied by measuring the vibrational population distributions of desorbed As2 using laser-induced fluorescence. In these measurements, a steady state flux of desorbing As2 is produced by continuously dosing a heated Si surface with a beam of As4 from a conventional molecular beam epitaxy oven. Measurements of the fluxes of As2 as a function of surface temperature suggest that the As2 may be kinetically formed in two distinct steps: The As4 first chemisorbs to form atoms on the surface which then recombine to desorb as dimers. However, there may also be direct dissociation of As4 at the hot surface. The vibrational populations of As2 desorbed from Si(100) are Boltzmann and indicate a vibrational temperature that is nearly 350 K lower than the surface temperature. The vibrational populations of As2 desorbed from Si(111) are not Boltzmann, but also have an effective vibrational temperature 400 K colder than the surface temperature. The observed lack of accommodation in the desorption from both surfaces is discussed in terms of the possible mechanisms.

Keywords: *Nitrogen heterocyclic compounds, *Oxidation, *Decomposition reactions, *Reaction kinetics, *Chemical radicals, Radiolysis, Chemical reactions, Electrochemistry, Photolysis, Reprints, *10-Methylacridan, Cation radicals, Deprotonation.

Photolysis of 10-methylacridan (AH) in acetonitrile solutions containing CCl4 led to quantitative oxidation of AH to A(+). Laser flash photolysis of the solution with 248 or 308 nm light yielded the cation radical AH(sup dot,+) which decays by deprotonation to give the neutral radical A(sup dot). There is a good agreement between the values determined for k(sub H) here and, previously, by direct electrochemistry using ultramicroelectrodes. The vast majority of the data points in a plot of logk(sub H) vs the pKa of the bases, covering 18 pKa units and rate constants up to the diffusion limit, fall on the same Bronsted line in spite of the fact that they involve bases of quite different structure: pyridines, aliphatic nitrogen bases and carboxylates. Pulse radiolysis experiments in acidic aqueous solutions showed that AH is oxidized by Cl2(sup dot,-) to give AH(sub dot,+), which decays with a first order rate constant of 900/s. Reduction of A(+) gave A(sup dot) which did not undergo protonation even at 2 M HClO4, but reaction of A(+) with H atoms resulted in partial addition of H to the 9 position to give AH(sup dot,+).

Keywords: *Molecule collisions, Surface reactions, Diatomic molecules, Chemisorption, Fractals, Chaos, Reprints, Surface dynamics, Translations.

For a model diatomic molecule-surface collision, we show that the extent of chaoticity, as evidenced in action-angle and lifetime plots, decreases dramatically with an increase in the translational energy of the molecule. In addition to the existence of a threshold for the dissociative chemisorption, there is also an antithreshold at higher energies. The implications for the existence (or lack thereof) of chaos/fractals in molecule-surface collisions are also discussed, particularly as related to translational-vibrational energy redistribution.

Density Matrix Calculation of Population Transfer between Vibrational Levels of Na2 by Stimulated Raman Scattering with Temporally Shifted Laser Beams.
Final rept.
Y. B. Band, and P. S. Julienne. 1991, 8p.
Pub. in Jnl. of Chemical Physics 94, n8 p5291-5298 1991.

Keywords: *Sodium, Reprints, Vibrational states, Electron transitions, Density matrix, Raman spectra, Bloch equations, Laser radiation.

We compare the results of full density matrix calculations with recently reported experimental results describing the population transfer in Na2 using Raman scattering with the fundamental laser beam temporally shifted relative to the Stokes laser beam. Our calculations confirm the conclusion that almost total transfer of the population into the terminal level of the Raman transition can be achieved when the laser frequencies are tuned to resonance and the fundamental laser beam is temporally delayed relative to the Stokes shifted laser beam but still partially overlapping it. We analyze our results when the frequencies of the lasers are tuned off resonance as a function of the Rabi frequencies and the detuning, and compare with experimental and theoretical results. The alignment of the terminal level as a function of time displacement of the Stokes and pump beams is predicted.

Strong Hydrogen Bond in the Formic Acid-Formate Anion System.
Final rept.
H. Basch, and W. J. Stevens. 1991, 7p.
Pub. in Jnl. of the American Chemical Society 113, n1 p95-101 1991. Sponsored by Bar-Ilan Univ., Ramat Gan (Israel).

Keywords: *Hydrogen bonds, *Formic acid, *Molecular orbitals, Mathematical models, Dimerization, Formates, Bonding strength, Quantum chemistry, Reprints, Formate anion.

Hydrogen bond energies and geometric structures of several symmetric and asymmetric formic acid-formate anion dimer complexes have been determined. Ab initio gradient optimization at the self-consistent field (SCF) level in a double zeta + polarization + diffuse Gaussian function basis set was followed by a series of second order Moller Plesset (MP2) single point cal-

culations for the lowest energy structures. The equilibrium asymmetric dimer with the (anti)formic-(syn)formate conformation has the highest binding energy both on the SCF and MP2 levels at 28.8 and 33.0 kcal/mole, respectively. Experimentally, a gas phase heat of dimerization value of 36.8 kcal/mole has been reported for the biformate anion. The calculated stability of this anti dimer includes a C-H-O interaction which is estimated to contribute approximately 2.4 (SCF) or approximately 1.8 (MP2) kcal/mole to the dimer binding energy. The corresponding proton-transferred (syn)formic-(anti)formate complex is calculated less stable by 5.6 (SCF) or 3.7 (MP2) kcal/mole, even though in the isolated monomer syn formic acid is the lower energy conformer by 5.8 (SCF) or 5.4 (MP2) kcal/mole in the same basis set. The greater stability of the anti dimer can be attributed both to less interfragment exchange repulsion and to more coulomb attraction compared with the syn dimer conformation.

Structure of Glycine-Water H-Bonded Complexes.
Final rept.
H. Basch, and W. J. Stevens. 1990, 6p.
Pub. in Chemical Physics Letters 169, n4 p275-280 1990.

Keywords: *Glycine, *Hydrogen bonds, *Water, *Molecular structure, Reprints, Molecular orbitals, Quantum chemistry, Amino acids, *Glycine-water complex, Moller-Plesset perturbation theory, Self consistent field optimization.

Ab initio calculations have been carried out on several cyclic hydrogen-bonded structures of glycine with water. Single configurations self-consistent-field energy-gradient optimization methods were used to obtain the structures using double-zeta plus polarization basis sets. Second-order Moller-Plesset perturbation theory was used to determine the effect of correlation on the hydrogen-bonded distances. The most stable structure is a double hydrogen-bonded structure with the water accepting a proton from the O-H of the carboxyl groups while donating a proton to the carbonyl group. This structure is bound by 8.6 kcal/mol and should be observable experimentally.

The dynamics of molecular multiphoton ionization and fragmentation of a diatomic molecule (Na2) have been studied in molecular beam experiments. Femtosecond laser pulses from an amplified colliding-pulse modelocked (CPM) ring dye laser are employed to induce and probe the molecular transitions. The final continuum states are analyzed by photoelectron spectroscopy, by ion mass spectrometry, and by measuring the kinetic energy of the formed ionic fragments. Pump-probe spectra employing 70-fs laser pulses have been measured to study the time dependence of molecular multiphoton ionization and fragmentation. The oscillatory structure of the transient spectra showing the dynamics on the femtosecond time scale can best be understood in terms of the motion packets in bound molecular potentials. The transient Na2(1+) ionization and the transient Na(1+) fragmentation spectra show that contributions from direct photoionization of singly excited electronic state and from excitation and autoionization of a bound doubly excited molecular state determine the time evolution of molecular multiphoton ionization.

Neutron Powder Diffraction Study of a Na, Cs-Rho Zeolite.
Final rept.
W. H. Baur, A. Bieniok, R. D. Shannon, and E. Prince. 1989, 14p.
Pub. in Zeitschrift fur Kristallographie 187, p253-266 1989.

Keywords: *Zeolites, *Crystal structure, Reprints, Neutron diffraction, Deuterium compounds, Hydrates, Powder(Particles), Temperature range 0273-0400 K, Sodium cesium aluminum silicates, Rho zeolites, Rietveld method.

The crystal structure of a Na, Cs-Rho zeolite was studied at 373 K (Na(8.4)Cs(3.2)Si(36.4)Al(11.6)O96. 5D2O) by neutron powder diffraction and Rietveld profile analysis. It crystallizes in the noncentrosymmetric space group I(bar 4)3m and has a unit cell constant a = 14.6566(4) A. The final residuals are R(I) = 9.65% and R(wp) = 8.01%. The distortion of the (Al,Si)O2-framework of this zeolite fits into the pattern established for other noncentrosymmetric Rho zeolites. Particularly, the ellipticity of the eight-ring and the pore size are strictly a function of the cell constant of the zeolite. The mean distance (Al,Si)-O is observed to be 1.636 A, in excellent agreement with the mean (Al,Si)-O distance of 1.638 A calculated for the Si and Al content of our sample.

Pub. in Jnl. of Chemical Physics 98, n8 p6031-6043, 15 Apr 93. Sponsored by National Science Foundation, Arlington, VA. and Petroleum Research Fund, Washington, DC.

Keywords: *Argon complexes, Reprints, Van der Waals forces, Infrared spectroscopy, Microwave spectroscopy, Molecular structure, Dipole moments, Hamiltonians, Dimers, *Propyne complexes.

Microwave and infrared measurements are reported for the van der Waals complex ArCH3CCH and its isotopomers. The structure is T shaped with equilibrium center-of-mass separation of 3.73 A and an angle of 82 deg. between the molecule symmetry axis and the van der Waals bond. The infrared and microwave spectra are complex due to the effects of a slightly hindered internal rotor. Analysis of the spectral data shows that the dipole moment is almost parallel to the dimer b axis. A modified vibration/rotation Hamiltonian that includes an internal rotor potential is used to show that the barrier to internal rotation is near 10.8/cm.

Measurement of Diffusion in Supercritical Fluid Systems: A Review.
Final rept.
T. J. Bruno. 1993, 7p.
Pub. in Proceedings of Aerospace Sciences Meeting and Exhibit (31st), Reno, NV., January 11-14, 1993, p1-7.

Keywords: *Supercritical state, *Diffusion coefficient, *Aviation fuels, *Chromatographic analysis, Reprints, Diffusion, Thermophysical properties, Chemical analysis, *Supercritical fluid solutions.

In the paper, the experimental procedures that are applicable to the measurement of diffusion in supercritical fluid solutions will be reviewed. This topic is of great importance to the proper design of advanced aircraft and the turbine fuels these aircraft will use. The main reason for this is that the fuels on these high performance aircraft may sometimes operate under supercritical fluid conditions when they are used as a heat sink, for the cooling of friction-heated surfaces. These conditions may produce unfavorable chemical reactions in the fuel. The decomposition products so produced will therefore be a major cause of heat exchanger fouling, and this must be addressed in the early stages of fuel and component design. Since transport properties are needed for these designs, the authors will consider measurements of one of the most critical: the binary interaction diffusion coefficient. After a brief introduction to the concept of diffusion, the authors will discuss in detail the use of chromatographic methods, and then briefly treat light scattering, nuclear magnetic resonance spectra, and physical methods.

New Rydberg States of Aluminum Monofluoride Observed by Resonance-Enhanced Multiphoton Ionization Spectroscopy.
Final rept.
D. V. Dearden, R. D. Johnson, and J. W. Hudgens. 1991, 6p.
Pub. in Jnl. of Physical Chemistry 95, n11 p4291-4296 1991.

Keywords: *Aluminum fluorides, *Rydberg states, *Electronic spectra, *Vibrational spectra, *Chemical reactions, Metastable state, Aluminum, Spectrum analysis, Ionization potentials, Reprints, *Aluminum monofluoride, Resonance enhanced multiphoton ionization spectroscopy.

AlF has been generated in the gas phase by high temperature reduction of AlF3 by Al, and detected and characterized using resonance-enhanced multiphoton ionization. Five Rydberg series comprised of thirteen new Rydberg states have been identified for the first time. Least-squares fitting of the Rydberg series to the Rydberg equation yields the adiabatic ionization potential of AlF, IP(sub a) = 9.729 + or - 0.001 Ev. Vibrational intervals for all of the new Rydberg states are about 20% greater than those of AlF (X(sup 1)Sigma(sup +)), with most lying between 930-980/cm. The vibrational frequencies are in agreement with an ionic bonding model for AlF.

Keywords: *Fluorine organic compounds, *Ethers, *Refrigerants, *Thermodynamic properties, Reprints, Substitutes, Equations of state, Interfacial tension, Specific heat, Critical temperature, Boiling points, *bis(Difluoromethyl)ether, *E134, Speed of sound.

The authors have measured the thermodynamic properties of bis(difluoromethyl) ether, a candidate alternative refrigerant that is also known as E134. From the data the authors obtained the coefficients of a Carnahan-Starling-DeSantis equation of state and a polynomial representation of the ideal-gas heat capacity. This representation of the thermodynamic properties of E134 is consistent with the computer package REFPROP distributed by the National Institute of Standards and Technology to represent the properties of many candidate refrigerants. The representation is based on measurements of the refractive index of the saturated liquid and vapor, and the speed of sound of the dilute vapor. These measurements provide the boiling point, critical parameters, and the ideal-gas heat capacity of E134. Measurements on less pure samples were used to estimate the density of saturated liquid E134 and compressed liquid E134, and the interfacial tension. The pure samples appeared to be stable during the measurements; under similar conditions impure samples were not. Azeotropy in mixtures of E134 with CHF2CH2F (also known as R143) was discovered.

Vibrational Autoionization in H2: Vibrational Branching Ratios and Photoelectron Angular Distributions Near the v(+)=3 Threshold.
Final rept.
J. L. Dehmer, P. M. Dehmer, J. B. West, A. C. Parr, M. A. Hayes, and M. R. F. Siggel. 1992, 7p.
Pub. in Jnl. of Chemical Physics 97, n11 p7911-7917, 1 Dec 92. Sponsored by Department of Energy, Washington, DC.

Keywords: *Hydrogen, *Photoionization, Reprints, Vibrational states, Branching ratio, Angular distribution, Autoionization, Photoelectrons, Asymmetry.

Vibrational branching ratios and photoelectron angular distributions are reported for photoionization of normal (the equilibrium ortho/para mixture) hydrogen in the region just above the nu(+) = 3 ionization limit. This region contains a number of vibrationally autoionizing Rydberg states, and the goal of the work was to observe experimentally the characteristic behavior associated with the decay of these states that was predicted by Raoult and Jungen (J. Chem. Phys. 74,3388 (1981)) on the basis of an MQDT (multichannel quantum defect theory) calculation on para-H2 (J double prime = 0). We have indeed observed that vibrational autoionization strongly favors the ionization channel representing the minimum change in the vibrational state of the ion core, as predicted. We also observed a sharp reduction in the photoelectron asymmetry of the nu(+) = 3 (and, to a lesser extent, the nu(+) = 2) ionization channel for resonant photoionization. Hence, qualitative agreement with theory is observed; however, a quantitative comparison now requires an extended calculation that includes the additional rotational levels that were populated under the present experimental conditions.

Maximum Entropy as a Tool for the Determination of the C-Axis Profile of Layered Compounds.
Final rept.
P. Depondt, D. A. Neumann, and S. F. Trevino. 1993, 6p.
Pub. in Acta Crystallographica B49, p153-158 1993.

Keywords: *Organometallic compounds, Reprints, Molybdenum compounds, Maximum entropy method, Room temperature, Neutron scattering, Structure factors, Deuterium compounds, Intercalation, Graphite, *Layered compounds.

A simple procedure for the determination of the structure normal to the basal plane of layered compounds based on the now ubiquitous maximum-entropy method is presented. It is illustrated by the analysis of room-temperature (00l) elastic neutron-scattering experiments performed on two graphite intercalation compounds, stage 3 C(44.6)MoCl(5) and stage 1 KC24(ND3)4.3. The former example is quite simple, requiring only a crude heuristic model to determine the structure-factor phases. The latter shows good sensitivity to the orientation of the ND3 threefold axis with respect to the basal plane, thus providing its first direct determination.

Keywords: *Zinc, *Heat of fusion, *Fusion(Melting), *Enthalpy, Reprints, Specific heat, Transition temperature, Calorimetry, Measurement, Standard reference materials, Method of mixtures.

The temperature and enthalpy of fusion of a pure zinc specimen chosen from NIST SRM 2221a have been measured for the first time simultaneously in a high-precision, method-of-mixtures, isothermal, phase-change calorimeter. The measured temperature of fusion (692.745 + or - 0.010) K was obtained with a new partial-fusion technique described herein. This result agrees well with the IPTS-68 temperature for the freezing point of pure zinc. The measured enthalpy of fusion (7026 + or - 40) J/mol differs substantially from previous values in the evaluated literature. Detailed examination of the original zinc literature data and of the several published attempts to derive from them the enthalpy of fusion has reinforced the author's conclusion that the present result for the enthalpy of fusion of zinc is of higher accuracy than any value currently given in evaluated data compilations.

Fragment Energy and Vector Correlations in the Overtone-Pumped Dissociation of HN3X(1)A'.
Final rept.
M. P. Casassa, B. R. Foy, J. C. Stephenson, and D. S. King. 1993, 12p.
Pub. in Jnl. of Chemical Physics 94, n1 p250-261 1991.

Keywords: *Hydrazoic acid, *Dissociation, *Photochemical reactions, Vibration, Energy levels, Molecular structure, Reprints, Vibrational predissociation.

NH stretching overtone and combination states in the HN3 singlet XA' state were excited by IR-visible double resonance pumping and by direct overtone pumping in the range 17670/cm to 20070/cm. NH fragments in the singlet a-delta and triplet X sigma(sup-1) states were detected by laser induced fluorescence with sub-Doppler resolution to determine branching ratios, correlated fragment rotational state and kinetic energy distributions, and fragment vector correlations. The spin-forbidden triplet channel was accessible to all states excited, while the threshold for the singlet channel was determined to lie in the range 18190 to 18755/cm. Vector correlations and lambda-doublet propensities show that nonplanar dissociation processes influence the NH rotations, but become less important for higher NH rotational states.

Time-Resolved Probes of Surface Dynamics.
Final rept.
R. R. Cavanagh, E. J. Heilweil, and J. C. Stephenson. 1993, 7p.
Pub. in Surface Science 283, p226-232 1993.

Keywords: *Carbon monoxide, Reprints, Vibrational spectra, Density matrix, Transient response, Excited states, Line shape, Infrared radiation, Absorption, Surfaces, Platinum, Femtosecond pulses.

The excited vibrational state dynamics of CO absorbed on Pt(111) are explored using subpicosecond infrared pump-probe techniques. The response for a CO(nu = 1) adlayer for coverages of 0.1, 0.3, and 0.5 monolayers is measured as a function of time delay and probe wavelength. The observed transient CO vibrational spectra reveal a shift to lower frequency of the CO internal stretch mode as the degree of excitation of the adlayer is increased. These spectra are discussed in terms of density matrix models which address the coherence time of the adlayer (nu = 1) excitation and the excited state spectral characteristics of strongly-coupled anharmonic oscillators. The two-to-three picosecond recovery time of the transient response is consistent with relaxation through electron-hole pair creation. The relationship of the measured T(1) decay to the observed lineshape is addressed.

Reactivity of Pd and Sn Adsorbates on Plasma and Thermally Oxidized SnO2(110).
Final rept.
R. Cavicchi, and S. Semancik. 1991, 9p.
Pub. in Surface Science 257, p70-78 1991.

Keywords: *Tin oxides, *Surface analysis, Reprints, Surface reactions, Metal films, Semiconductors, Chemisorption, Absorbates, Interfaces, Palladium.

The surface accumulation layer that forms as a result of oxygen vacancies near the surface of an oxide semiconductor can be used as an extremely sensitive probe of phenomena occurring at the surface. By incorporating a UHV-compatible, four-point conductance measurement in our surface analysis apparatus, we have investigated the formation of metal-semiconductor interfaces on SnO2(110) with varying oxygen stoichiometry. For only a 0.1 monolayer equivalent (ML) coverage of Sn deposited onto a high-oxygen-content surface prepared by oxygen plasma treatment, we observe a 500-fold increase in conductance. Our results suggest that at this coverage, Sn reacts with the excess chemisorbed oxygen and also creates point defects by abstracting oxygen from the lattice. In contrast, Pd reacts only with chemisorbed species, as indicated by a smaller conductance change and by differences in the size-effect shifted core levels observed at the

same coverage for thermal and plasma oxidized surfaces. Oxygen plasma treatment of an 8 ML Pd film is shown to be an effective room temperature oxidation procedure and is used as a basis of comparison for studies of the reaction of submonolayer coverages of Pd on plasma and thermally oxidized surfaces.

Pure Element Sputtering Yield Data: Appendix 4.
Final rept.
G. P. Chambers, and J. Fine. 1992, 16p.
Pub. in Practical Surface Analysis, v2 p705-720 1992.

Keywords: *Surface analysis, *Sputtering, Ion bombardment, Argon ions, Xenon ions, EV range 100-1000, KeV range 01-10, KeV range 10-100, Yield, Reprints, Depth profiles.

An evaluated compilation of absolute sputtering yield data has been prepared for those parameters specific to surface analysis and depth profiling. This compilation was done for elemental targets bombarded with ion species of Ar and Xe at energies from O.5 to 20 keV. Data evaluation was based on the target surface cleanliness during measurement and on the total ion dose. Calculated yields were fitted to the evaluated data to obtain evaluated sputtering yields. We have shown this approach to be consistent and reliable.

Pub. in Physical Review B 46, n18 p12 088-12 091, 1 Nov 92.

Keywords: *Superconductors, Rubidium compounds, Potassium compounds, Room temperature, Neutron scattering, Inelastic scattering, Doped materials, Librations, Fullerenes, Reprints, *Fullerides.

We have measured the low-energy inelastic neutron scattering spectra of superconducting K3C60 and insulating Rb6C60. Well-defined peaks are observed at room temperature at 3.59(4) meV (full width at half maximum (FWHM) = 1.11(15) meV) and 5.49(38) meV (FWHM = 3.41(44) meV), respectively. They harden with decreasing temperature and the dependence of their intensities on the scattering vector shows that they are due to small-amplitude librational motion. No anomalous behavior of the librational peak was observed on cooling through the superconducting transition temperature, indicating that electron-librational coupling is weak. The energy barrier for reorientation is estimated to be at least twice as large in K3C60 as in C60. Substantial disorder persists for K3C60 in the superconducting state.

Introduction of a NIST Instrument Sensitivity Standard Reference Material for X-Ray Powder Diffraction.
Final rept.
J. P. Cline, S. B. Schiller, and R. Jenkins. 1992, 12p.
Pub. in Advances in X-Ray Analysis, v35 p341-352 1992.

Keywords: *Sample preparation, *X-ray diffraction, *Diffractometers, *Powder(Particles), Interlaboratory comparisons, Aluminum oxide, Chemical analysis, Performance evaluation, Design criteria, Error analysis, Certification, Sensitivity, Reprints, *Standard reference materials, NIST(National Institute of Standards and Technology), SRM 1976.

Improvements in sample preparation methods have resulted in increased accuracy in x-ray powder diffraction intensity measurements. This improvement has focused scrutiny on the instrument as a potential source of error. NIST Standard Reference Material, SRM 1976 consists of a sintered alpha alumina, corundum, plate certified with respect to 12 relative intensity values from 25 to 145 degrees 2 theta. Its function is to allow for standardization of powder diffraction intensity as a function of 2 theta angle (instrument sensitivity). An increase in the accuracy of interlaboratory comparisons of diffraction intensity and related determinations will result. Utilization of the SRM requires the user to collect intensity data from the test instrument in a manner which conforms to that used in the certification. Graphical interpretation of the ratio of these data to those on the certificate will allow for appropriate judgment as to the condition of the test instrument.

2-Tunneling Path Internal-Axis-Method-Like Treatment of the Microwave Spectrum of Divinyl Ether.
Final rept.
L. H. Coudert. 1988, 22p.
Pub. in Jnl. of Molecular Spectroscopy 132, n1 p13-34 1988.

Keywords: *Ethers, *Spectrum analysis, *Microwave spectra, Molecular structure, Rotational spectra, Isomers, Stereochemistry, Reprints, *Divinyl ether.

The microwave spectrum of the cis-trans conformer of divinyl ether, previously measured by Hirose and coworkers, has been fit using a multidimensional Internal Axis Method-like (IAM-like) treatment which accounts for the 27 MHz tunneling splitting displayed by this molecule. This multidimensional IAM-like treatment begins by first determining the various feasible tunneling path(s) connecting the two frameworks of the molecules. For the tunneling process corresponding to an antigeared rotation of each vinyl unit about axes coinciding with the respective CO bonds, two limiting cases are considered: if the molecule goes through a planar configuration during the tunneling, only one tunneling path arises; if the intermediate configuration is not planar, two equivalent tunneling paths occur. The consequences for the J and K dependence of the splitting area are examined, and using this formalism the microwave data are fitted with an RMS deviation of 0.17 MHz. The parameters to the J and K dependence of the splitting are also determined and their values are interpreted in favor of a two tunneling path system. A comparison with the values obtained theoretically for those parameters is also carried out.

Two-Dimensional POMMIE Carbon-Proton Chemical Shift Correlated (13)C NMR Spectrum Editing.
Final rept.
B. Coxon. 1990, 6p.
Pub. in Canadian Jnl. of Chemistry 68, n7 p1145-1150 1990.

Keywords: *Triacetyloleandomycin, *Nuclear magnetic resonance, *Carbon 13, *Spectrum analysis, Reprints, Molecular structure, Computer programs, Protons, Chemical shift.

Two pulse sequences are described for acquisition of two-dimensional carbon-proton chemical shift correlated, (13)C NMR spectra by the 'phase oscillations to maximize editing technique'. One of these sequences provides two-dimensional, carbon-proton chemical shift correlated spectra in which the (1)H-(1)H coupling constants are present in the (1)H chemical shift dimension, whereas the other sequence includes a bilinear rotation decoupling unit that removes the vicinal (1)H-(1)H couplings in this dimension. Extensions of these techniques to generation of two-dimensional, carbon-proton chemical shift correlated CH, CH2, and CH3, (13)C NMR subspectra from linear combinations of three, two-dimensional data sets are described. Decreased residual signals in the edited 2D subspectra have been achieved by Pascal programs that include six floating point coefficients, and a method for their calibration is discussed. Results are reported for troleandomycin (1).

Extension of Heterodyne Frequency Measurements on OCS to 87 THz (2900 cm(-1)).
Final rept.
A. Dax, M. Murtz, J. S. Wells, W. Urban, M. Schneider, and E. Bachem. 1992, 6p.
Pub. in Jnl. of Molecular Spectroscopy 156, p98-103 1992.

Keywords: *Carbon oxysulfide, *Frequency measurement, Reprints, Transition radiation, Carbon monoxide lasers, Infrared radiation, Calibration, Frequencies, Tables(Data), *Carbonyl sulfide.

Heterodyne frequency measurements have been extended to 87 THz by using the CO overtone laser as a transfer oscillator. Measurements were made on the 11(sup 1)1-01(sup 1)0 band of OCS at 2900/cm. Frequency differences were measured between a tunable diode laser (TDL) which was locked to OCS absorption lines and a stabilized overtone laser which was referenced to stabilized CO2 lasers. These measurements have been combined with earlier Fourier transform (FT) measurements and a comprehensive set of data from frequency and FT measurements on lower lying transitions in OCS. This permits obtaining accurate values of transition frequencies for calibration of spectra in the 3.4-micrometer region.

R. L. Dubs, and P. S. Julienne. 1991, 11p.
Pub. in Jnl. of Chemical Physics 95, n6 p4177-4187 1991.

Keywords: *Photodissociation, *Potassium, Polarization(Waves), Fluorescence, Alignment, Reprints, Multichannel quantum defect theory, Half collision analysis.

Recent experiments by Zafiropulos et al (Phys. Rev. Lett. 61, 1485 (1988)) indicate that K2 photodissociation through the B singlet Pi(u) state results in fluorescence polarization which is strongly dependent on excitation wavelength. To understand these results, we have studied the K2 system quantum mechanically using a half collision analysis derived from the generalized form of multichannel quantum defect theory. An approximation called the Adiabatic (a->c) / Recoil(c->e) approximation is developed for the half collision matrix which reproduces quantitatively the exact half collision results projected for the close-coupled wavefunction. The quantum mechanical expression for the polarization as a function of J(0) and total energy E is found to be extremely simple in this approximation, depending only on J(0) and the single-channel P, Q and R phase shifts for the adiabatic reference states corresponding to the B singlet Pi(u) state at short distance.

Intersystem Crossing in Collisions of Aligned Ca(4s5p (1)P) + He: A Half Collision Analysis Using Multichannel Quantum Defect Theory.
Final rept.
R. L. Dubs, P. S. Julienne, and F. H. Mies. 1990, 9p.
Pub. in Jnl. of Chemical Physics 93, n12 p8784-8792 1990.

Keywords: *Atom-atom collisions, *Atomic collisions, Factorization, Scattering, Alignment, Calcium, Helium, Reprints, Intersystem crossings, Multichannel quantum defect theory, Half collision analysis.

A half collision analysis of alignment effects on intersystem crossing in the collisions of Ca (4s5p singlet P) with He has been performed using generalized Multichannel Quantum Defect Theory (MCQDT). The theory provides a rigorous analytical representation of the numerically exact close-coupled scattering wavefunctions. The half collision analysis results in a factorization of the full quantum collision problem into a number of simpler quantum mechanical problems which reflect different regions of development during the collision. A WKB-assisted, frame transformation approximation to the incoming half collision matrix is tested numerically and is found to be useful in projecting out information on the 'locking results' concept.

Total Surface Areas of Group IVA Organometallic Compounds: Predictors of Toxicity to Algae and Bacteria.
Final rept.
G. Eng, E. J. Tierney, G. J. Olson, F. E. Brinckman, and J. M. Bellama. 1991, 5p.
Pub. in Appl. Organomet. Chem. 5, n1 p33-37 1991.

Keywords: *Toxicity, *Organometallic compounds, *Surface area, *Algae, *Bacteria, Structure-activity relationships, Group 4A compounds, Metals, Solubility, Organotin compounds, Organosilicon compounds, Reprints, Organogermanium compounds, Organolead compounds.

There exists a high correlation between molecular surface area (TSA) of triorganotin and triorganolead compounds and their toxicity towards an algae (E. coli) and a bacterium (S. capricornutum). Parallel attempts to correlate other Group IVA organometals incorporating silicon or germanium were unsuccessful. It was further demonstrated, however, that a high correlation was obtainable between certain series of compounds with the same organic substituent but different metal centers involving all Group IVA elements. In both instances, the inability to obtain a quantitative structure-activity relationship (QSAR) for all systems studied appears to be a function of the solubility of the compounds. While organotin TSA values have been found to correlate well with their toxicities toward various organisms, this study clearly suggests that this type of QSAR can be readily extended to include other organometal systems, provided that there is no solubility problem and the toxicity is a function of the hydrophobicity of the organometal compounds.

Pub. in Jnl. of Chemical Physics 93, n5 p2992-3004 1990.

Keywords: *Hydrogen bonds, *Nitrogen oxides, *Hydrogen fluoride, *Infrared spectra, Spectrum analysis, Rotational states, Vibrational spectra, Reprints, *Van der Waals complex.

The HF stretching band of the NO-HF open-shell complex has been recorded using a molecular-beam optothermal spectrometer. The spectrum exhibits P-type doubling indicative of an unpaired electron spin coupled to the rotational angular momentum of a bent complex with substantially quenched electron orbital angular momentum. From B' = 0.111316(28)/cm, the zero-point center-of-mass separation is estimated to be 3.439(3) A. The HF frequency shift of 84/cm indicates that the complex is hydrogen bonded, and the spectral intensities imply that the HF axis is aligned closely to the center-of-mass axis and the NO is off axis by 30 + or - 15 deg. The Renner-Teller-like orbital quenching parameter is somewhat larger than the spin-orbit constant in the free NO molecule and increases substantially upon vibrational excitation. The transitions in this band exhibit vibrational predissociation broadening of 200 + or - 40 MHz (FWHM), similar to that observed for a number of closed-shell hydrogen-bonded HF complexes.

Radiation Chemistry of Cyanine Dyes: Oxidation and Reduction of Merocyanine 540.
Final rept.
A. Harriman, and P. Neta. 1991, 6p.
Pub. in Jnl. of Physical Chemistry 95, n6 p2415-2420 1991.

Keywords: *Reaction kinetics, *Oxidation reduction reactions, *Antiviral agents, *Radiolysis, *Cyanine dyes, Decomposition reactions, Free radicals, Leukemias, Reprints, *Merocyanine 540.

Merocyanine 540 (MC) shows promise as a treatment for certain types of leukemia. It is shown that MC readily undergoes one-electron reduction under pulse radiolytic conditions. The pi-radical anion, produced by reduction with hydrated electrons and 2-hydroxypropyl radicals, disproportionates rapidly under anaerobic conditions but reduces O2 to superoxide ions in aerated solution. The dye reacts with trichloromethylperoxyl radicals to form several products, one of which is believed to be an adduct formed by addition of CCl3OO(dot) to the bridgehead carbon-atom of the benzoxazole subunit. This species decays via first-order kinetics under pulse radiolytic conditions to form cleavage products. A second primary product is believed to arise from addition of CCl3O2(dot) to the polymethine chain to form an alpha-amino carbon-centered radical capable of reducing O2 to superoxide ions. Preliminary studies indicate that the breakdown products are cytotoxic and could be important intermediates for the known antiviral activity of MC.

Supercritical Solubility of Solids from Near-Critical Dilute-Mixture Theory.
Final rept.
A. H. Harvey. 1990, 4p.
Pub. in Jnl. of Physical Chemistry 94, n22 p8403-8406 1990.

Keywords: *Critical point, *Solubility, *Supercritical fluids, *Phase diagrams, *Solids, Henrys law, Phase transformations, Thermodynamics, Reprints, *Near-critical Dilute Mixture Theory.

A recently derived asymptotic theory for Henry's Law constants near the critical point of a solvent is adapted to the description of the solubility of solids in supercritical fluids. When solubility data for several systems are examined in the manner suggested by the theory, all the experimental isotherms for a given system (with the exception of a few near-critical points where we attribute the deviations to finite-concentration effects) collapse onto a single curve which is linear over a substantial range of solvent densities. This work provides a theoretical justification for some often-noted empirical relationships between solubilities and enhancement factors and the density of the supercritical solvent.

Use of Extended Permutation-Inversion Groups in Constructing Hyperfine Hamiltonians for Symmetrical-Top Internal Rotor Molecules Like H3C-SiH3.
Final rept.
J. T. Hougen, W. L. Meerts, and I. Ozier. 1991, 41p.
Pub. in Jnl. of Molecular Spectroscopy 146, n1 p8-48 1991.

Keywords: *Molecular beams, Selection rules, Hamiltonians, Silicon compounds, Reprints, Permutation groups.

The m-fold extended group G(sub 18, sup m), corresponding to the permutation-inversion group G(sub 18) for molecules like H3C-SiH3, has been obtained. In this group, m is the smallest integer for which m(rho) is also an 'integer,' where rho is the usual ratio of the moment of inertia of the top about A axis to the moment of inertia of the molecule about the A axis. The extended group has 18m elements, divided into (9m+3)/2 or (9m+6)/2 classes, for odd and even values of m, respectively. It is possible to rationalize the pattern of observed and unobserved avoided-crossing signals in recent molecular beam studies of symmetric top internal rotor molecules. With the understanding, it also proved possible to detect for the first time one of the 'missing' avoided-crossing signals in CH3SiH3.

J. W. Hudgens, R. D. Johnson, R. S. Timonen, J. A. Seetula, and D. Gutman. 1991, 6p.
Pub. in Jnl. of Physical Chemistry 95, n11 p4400-4405 1991.

Keywords: *Reaction kinetics, *Free radicals, *Temperature dependence, *Thermodynamic properties, Entropy, Specific heat, Heat of formation, Chemical equilibrium, Thermochemistry, Reprints, *Trichloromethyl radicals.

The rate constant of the CCl3 + Br2 -> CCl3Br + Br reaction was determined as a function of temperature between 300 and 532 K and fit to an Arrhenius expression. The reaction was studied in a tubular flow reactor using laser photolysis to produce the CCl3 reactant and photoionization mass spectrometry to monitor CCl3 in time resolved experiments. Previously published kinetic data were evaluated to calculate k(sub 1), the rate constant for the reverse reaction, and recent spectroscopic data were used to calculate accurate entropies and heat capacities. The rate constants were used in a Third Law thermodynamic calculation to obtain values for the standard enthalpies of formation of CCl3 and CCl3(1+), 17.7 and 205.9 kcal/mol, respectively.

Resonance Enhanced Multiphoton Ionization Detection of GeF and GeCl Radicals.
Final rept.
J. W. Hudgens, R. D. Johnson, and B. Tsai. 1989, 4p.
Pub. in Inst. Phys. Conf. Ser. Reson. Ioniz. Spectrosc. 94, p125-128 1989.

Keywords: *Electron transitions, *Rydberg states, *Germanium, *Electronic spectra, Energy levels, Excited states, Chemical radicals, Laser spectroscopy, Spectrum analysis, Reprints, *Germanium fluoride radicals, *Germanium chloride radicals, Multiphoton ionization.

Resonance enhanced multiphoton ionization (REMPI) spectra of GeF and GeCl radicals were observed between 400-500 nm. Numerous vibrational bands of several electronic states were observed through 2+1, 1+2, and 1+1+1 REMPI excitation mechanisms. The use of REMPI spectroscopy enabled observation of several 'one photon forbidden' transitions.

Keywords: *Electron transitions, *Rydberg states, *Electronic spectra, *Free radicals, Energy levels, Spectrum analysis, Molecular orbitals, Optical spectra, Molecular structure, Reprints, *Trichloromethyl radicals, Multiphoton ionization.

The structures and optical spectroscopy of the CCl3 radical and cation were studied by ab initio molecular orbital calculations and by experiment. The structures of the X singlet A'(sub 1) state of the CCl3 cation and the X doublet A(sub 1) and X doublet A(sub 2)(sup double prime) structures of the CCl3 radical were optimized by ab initio calculations using the 6-31G(star) basis set. The ground state of the CCl3 radical is of X doublet A(sub 1) symmetry with r(sub e) (C-Cl)= 1.7142 A and Cl-C-Cl bond angle = 117.10 deg. Vibrational frequencies for each CCl3 species were computed. In experiments the electronic spectrum of (35)C Cl3 radicals was observed between 336-440 nm using mass resolved resonance enhanced multiphoton ionization (REMPI) spectroscopy. The spectrum arose from two-photon resonances with planar Rydberg states.

Pub. in Chemical Physics Letters 205, n2,3 p163-167, 9 Apr 93.

Keywords: *Reaction kinetics, *Peroxy radicals, Temperature dependence, Chemical reactions, Methanol, Reprints, *Hydroxymethyl peroxy radicals, *Methanol peroxy radical, Sulfate radicals.

The rate constant for the self-reaction of the peroxyl radical derived from methanol, HOCH2OO(dot), has been measured over the temperature range 5-53 C. The radical has a maximum absorptivity of 970 l/mol/cm at 240 nm and an absorptivity of about 510 l/mol/cm at 280 nm. From a modified Arrhenius fit to the data, the rate constant at 25 C was calculated to be K298K = ((7.4 + or - 0.1) X 10 to the 8th power) l/mol/s and the temperature dependence of the reaction to be E/R = 1395 + or - 66 K. As part of this study, the rate constant for the recombination of the sulfate radical, SO4(1-), was found to be ((4.4 + or - 0.4) X 10 to the 8th power) l/mol/s, independent of temperature over the range 12 to 53 C.

Temperature Dependence of the Rate Constants for Reactions of the Sulfate Radical, SO4-, with Anions.
Final rept.
R. E. Huie, and C. L. Clifton. 1990, 7p.
Pub. in Jnl. of Physical Chemistry 94, n23 p8561-8567 1990.

Keywords: *Reaction kinetics, *Sulfates, *Chemical radicals, *Anions, Activation energy, Temperature dependence, Electron transfer, Chemical reactions, Reprints, *Sulfate radicals.

Rate constants have been measured as a function of temperature over the range 10 to 60 C for the reactions of the sulfate radical, SO4(1-) with azide, chloride, cyanate, cyanide, acetate, and carbonate anions. Room temperature rate constants ranged from about 5,000,000 to 5 times 10 to the 11th power/M/s. The variation of the rate constant with substrate depended mainly on the Arrhenius pre-exponential factor and less on the activation energy. For the reaction of SO4(1-) with Cl(1-), the dependence of the rate constant on ionic strength was determined to be in agreement with the theoretical prediction.

Pub. in Radiation Physics and Chemistry 38, n5 p477-481 1991.

Keywords: *Electron transfer, *Oxidation reduction reactions, *Free radicals, *Reaction kinetics, *Chemical equilibrium, Radiolysis, Anions, Electric potential, Electrodes, Reprints, *Carbonate radicals, *Sulfate radicals, Reduction potentials.

Electron transfer reactions of the carbonate radical anion with azide, bromide, and hypochlorite ions have been studied by pulse radiolysis. From the equilibrium Br2(1-)(dot) + CO3(2-) = 2Br(1-) + CO3(-)(dot) and the known redox potential for the Br2(1-)(dot)/2Br(1-) half reaction, the redox potential for the ClO(dot)/ClO(1-) half reaction was derived. The equilibrium reaction SO4(1-)(dot) + Cl(1-) = SO4(2-) + Cl(dot) was studied by laser photolysis using 284 nm excitation of S208(2-) to produce SO4(1-)(dot) by examining the rate of reaction of this radical with Cl(1-) in the presence of varying concentrations of SO4(2-). By modeling the reactions occurring in this system, the rate constant and equilibrium constant for the reaction of Cl(dot) with SO4(2-) were derived.

Reaction of NO with Superoxide.
Final rept.
R. E. Huie, and S. Padmaja. 1993, 5p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Free Rad. Res. Comms. 18, n4 p195-199 1993.

Keywords: *Reaction kinetics, *Nitric oxide, *Superoxide radicals, Free radicals, Catalysts, Formates, Reprints, *Peroxynitrite radicals.

The rate constant for the reaction of NO with the superoxide anion was determined to be ((6.7 + or - 0.9) X 10 to the 9th power)l/mol/s, considerably higher than previously reported. Rate measurements were made from pH 5.6 to 12.5 both by monitoring the loss of the superoxide anion and the formation of the product peroxynitrite radical. The decay rate of the peroxynitrite radical, in the presence of 0.1 mol/l formate, ranges from 1.2/s at pH 5 to about 0.2/s in strong base, the latter value probably reflecting catalysis by formate.

Temperature Dependence of the Rate Constants for Reactions of the Carbonate Radical with Organic and Inorganic Reductants.
Final rept.
R. E. Huie, L. C. T. Shoute, and P. Neta. 1991, 12p.
Pub. in International Jnl. of Chemical Kinetics 23, n6 p541-552 1991.

Keywords: *Reaction kinetics, *Chemical radicals, *Carbonates, *Anions, *Temperature dependence, *Organic ions, Activation energy, Oxidation reduction reactions, Radiolysis, Reprints, *Carbonate radicals.

Rate constants have been measured by pulse radiolysis for the reactions of the carbonate radical with a number of organic and inorganic reactants as a function of temperature, generally over the range 5 to 80 C. The reactants include the substitution-inert cyano complexes of Fe(II), Mo(IV), and W(IV), the simple inorganic anions (SO3)(2-), (ClO2)(1-), (NO2)(1-), I(1-), SCN(1-), several phenolates, ascorbate, tryptophane, cysteine, cystine, methionine, triethylamine, and allyl alcohol. The measured rate constants ranged from less than 100,000 to (3 X 10 to the 9th power)/M/s and the activation energies ranged from -11.4 to 18.8 kJ/mol. The activation energies for the metal complexes and inorganic anions generally decrease with increasing driving force for the reaction, as expected for an outer sphere electron transfer. For highly exothermic reactions, however, the activation energy appears to increase, probably reflecting the temperature dependence of diffusion. For many of the organic reactants, the activation energies were low and independent of driving force, suggesting that the oxidation is via an inner sphere mechanism.

Formalism and Parameters for Quantitative Surface Analysis by Auger Electron Spectroscopy and X-Ray Photoelectron Spectroscopy.
Final rept.
A. Jablonski, and C. J. Powell. 1993, 16p.
Pub. in Surface and Interface Analysis 20, p771-786 1993.

Keywords: *Surface analysis, X-ray photoelectron spectroscopy, Auger electron spectroscopy, Elastic scattering, Electron scattering, Electron transport, Quantitative analysis, Reprints.

It has been realized during the last 5 years that quantitative surface analyses by Auger electron spectroscopy (AES) and x-ray photoelectron spectroscopy (XPS) can be greatly complicated by the effects of elastic electron scattering. These effects had previously been largely ignored. We review here the effects of elastic scattering in the formalism of quantitative surface analysis by AES and XPS and discuss the various definitions of terms (inelastic mean free path, attenuation length and escape depth) that have been used to describe inelastic scattering and the surface sensitivities of various electron spectroscopies. We show how a realistic theoretical model of electron transport that includes elastic electron scattering can be related, for some analytical situations, to the common simple formalism of AES and XPS in which elastic scattering is neglected. We consider specifically measurements of overlayer thickness, determination of surface composition for a homogeneous surface region and estimation of the average depth of analysis and we indicate which parameter describing inelastic scattering can be used in the simple formalism for these applications.

Glass Transition of Organic Liquids Confined to Small Pores.
Final rept.
C. L. Jackson, and G. B. McKenna. 1991, 4p.
Pub. in Jnl. of Non-Crystalline Solids 131, p221-224 1991.

Keywords: *Organic compounds, *Porous materials, *Glass, *Glass transition temperature, Phase transformations, Benzyl alcohols, Calorimetry, Reprints, *Organic liquids, o-Terphenyl.

The glass transition temperatures, Tg, of organic liquids confined to small pores were studied by differential scanning calorimetry (DSC). The Tg was measured as a function of pore size in controlled pore glasses having pore diameters in the range of 40-730 A. The surface of the glass was treated with hexamethyldisilazane to promote wetting by the organic liquids studied (o-terphenyl and benzyl alcohol). Glasses formed in the pores had a lower Tg than in the bulk and the reduction in Tg increased as the pore size decreased. For example, the depression of the glass transition temperature, delta Tg, of benzyl alcohol in 40 A and 85 A pores was 7.2 K and 3.1 K, respectively. The magnitude of delta Tg also depends on the material, e.g. for o-terphenyl in the 85 A pores delta Tg was 8.8K versus 3.1K for benzyl alcohol. In general, it was noted that delta Tg was considerably less than for the depression of the crystalline melting point delta Tm, studied in related work. For example, for benzyl alcohol in the 85 A pores, delta Tm was approximately 25 K and delta Tg was approximately 3 K.

Melting Behavior of Organic Materials Confined in Porous Solids.
Final rept.
C. L. Jackson, and G. B. McKenna. 1990, 10p.
Pub. in Jnl. of Chemical Physics 93, n12 p9002-9011 1990.

Keywords: *Melting points, *Organic compounds, *Porous materials, *Glass, Phase transformations, Heat of fusion, Cyclohexane, Benzene, Naphthalene, Heptanes, Chlorobenzenes, Reprints, *Melting point depression, *Organic liquids, Crystal size.

The solid-liquid phase transition temperatures and heats of fusion (HOF), of non-polar organic solids confined in the pores of controlled pore glasses were measured by differential scanning calorimetry. The pore diameters, d, were in the range of 40-730A and the organics studied were cis-decalin, trans-decalin, cyclohexane, benzene, chlorobenzene, naphthalene and heptane. In accordance with previous reports on studies of inorganic materials, the melting point of the pore solid, T(d), decreased with decreasing pore diameter. In addition, a large reduction in the bulk HOF of the pore solid was measured, which has not been studied in detail by other workers. A linear correlation was found between the melting point depression and the reciprocal diameter, in accordance with the Gibbs-Thomson equation. The calculated values of the solid-liquid interfacial energy, using a modification of the Gibbs-Thomson equation were in good agreement with values reported in the literature based on other methods of measurement.

Keywords: *Electron transitions, *Rydberg states, *Electronic spectra, *Free radicals, Energy levels, Excited states, Rotational spectra, Vibration, Photolysis, Hydrazoic acid, Spectrum analysis, Reprints, *Imidogen radicals, Multiphoton ionization.

Four new electronic states of NH and ND have been observed and analyzed by REMPI (Resonance Enhanced Multiphoton Ionization) Spectroscopy in the region of 258 through 288 nm. The NH (ND) was produced by the photolysis of HN3 (DN3) (hydrazoic acid) in the same wavelength region. The observed two-photon transitions are from the a singlet delta state to 3s and 3p Rydberg states. The new state assignments are : e singlet Pi (3s sigma) at 82857/cm, f singlet Pi (3p sigma) at 86378/cm, g singlet delta (3p pi) at 88141/cm, and h singlet Sigma (3p pi) at 89151/cm. Rotational constants (B and D) and, where possible, vibrational spacings for the twelve observed bands are also determined.

R. D. Johnson, B. P. Tsai, and J. W. Hudgens. 1989, 20p.
Pub. in Jnl. of Chemical Physics 91, n6 p3340-3359, 15 Sep 89.

Keywords: *Electron transitions, *Rydberg states, *Electronic spectra, *Free radicals, Energy levels, Spectrum analysis, Reprints, *Silyl radicals.

The electronic spectra of silyl radicals, SiH3 and SiD3, were observed between 310 and 430 nm (46,000-64,000/cm) by resonance enhanced multiphoton ionization (REMPI) mass spectroscopy. The spectra were generated through a 2 + 1 REMPI mechanism. Two Rydberg series originating from planar, D(sub 3h) point group states were observed. One series, of quantum defect delta = 1.45(2), is comprised of the E doublet A(sub 2)(sup double prime) (4p), J doublet A(sub 2)(sup double prime) (5p), and M doublet A(sub 2)(sup double prime) (6p) Rydberg states which have origins at nu(sub o-o) = 48,438, 56,929, and 60,341/cm in SiH3 and at nu(sub o-o) = 48,391, 56,874, and 60,267/cm in SiD3. In SiD3, the P doublet A(sub 2)(sup double prime) (7p) Rydberg origin was observed at nu(sub o-o) = 62,002/cm. The H, K, and N states observed in the SiD3 spectrum comprise the second Rydberg series, delta = 2.09, and were tentatively assigned as ns doublet A'(sub 1) Rydberg states (n = 5, 6, 7).

Molecular-Beam Optothermal Spectrum of the OH Stretching Band of Methanol.
Final rept.
I. Kleiner, G. T. Fraser, J. T. Hougen, and A. S. Pine. 1991, 18p.
Pub. in Jnl. of Molecular Spectroscopy 147, n1 p155-172 1991.

Keywords: *Methanol, Molecular spectroscopy, Molecular beams, Perturbation, Line width, Reprints, Vibrational relaxation.

The OH stretching fundamental band, nu(1), of CH3OH has been recorded with sub-Doppler resolution using a molecular-beam optothermal spectrometer. The low effective temperature (about 6 K) of the molecular beam greatly reduces the spectral congestion from hot torsional vibrations and high rotational levels seen at room temperature, permitting a reasonably complete assignment, a fit to a global hindered internal rotor Hamiltonian, and identification of several perturbations and their likely perturbers. The observed linewidths are about 15 MHz, yielding an upper limit to any intramolecular vibrational relaxation rate.

Keywords: *Acetaldehyde, Far infrared radiation, Infrared spectra, Band spectra, Rotational states, High resolution, Microwave spectra, Reprints, Fourier transform spectroscopy.

High resolution and low temperature experimental conditions allowed us to carry out the rotational analysis of the nu(15) fundamental band of acetaldehyde, observed around 150/cm. Some 1,000 lines of A and E types have been assigned to the main band and some 90 A-type lines have been identified in the first overtone of the torsion mode. A simultaneous fit, using the non rigid internal axis method, of a very severely selected set of unblended FIR data, together with microwave data published in the literature, allowed us to obtain accurate molecular parameters describing internal and overall rotation in acetaldehyde. In particular, the Fourier coefficients V(3) and V(6) of the barrier for internal rotation as well as the rotationless origins of the nu(15) fundamental band and its first overtone were determined with improved accuracy, compared to the data previously available in the literature. Some difficulties in treating v(t)=1 microwave data lead us to suspect problems in the theoretical model adopted or in the present v(t)=1 microwave data set.

Determination of Osmotic Pressure and Fouling Resistances and Their Effects on Performance of Ultrafiltration Membranes.
Final rept.
M. K. Ko, and J. J. Pellegrino. 1992, 17p.
Pub. in Jnl. of Membrane Science 74, p141-157 1992.

Keywords: *Osmotic pressure, *Ultrafiltration, *Artificial membranes, *Proteins, Adsorption, Bovine serum albumin, Lactoglobins, pH, Sodium chloride, Polarization, Reprints, *Fouling resistance.

A study was made of the effects of material and geometric properties of ultrafiltration (UF) membranes on flux decline due to concentration-polarization (osmotic pressure) and adsorption (fouling) resistances. UF experiments with solutions of beta-lactoglobulin and bovine serum albumin on commercial membranes of poly(vinylpyrrolidone)-coated polycarbonate (PC) and regenerated cellulose (RC) were carried out. A three-stage experimental strategy based on an osmotic pressure-adsorption model was used to separately determine the effective hydraulic membrane resistance, osmotic pressure, and fouling resistance. By a normalization procedure, the performance of membranes with varying material and geometric characteristics could be compared and evaluated in terms of the extent of flux reduction individually due to concentration-polarization and fouling. Under all the conditions studied, the total flux reduction for the PC membrane was mainly controlled by the fouling resistance and for the RC membrane by the osmotic pressure build-up due to concentration-polarization. The effect of bulk protein concentration, transmembrane pressure, crossflow velocity, pH, and NaCl concentration on the individual, relative contributions to flux reduction by osmotic pressure and fouling were found to depend on membrane material properties.

Characterization of the Adsorption-Fouling Layer Using Globular Proteins on Ultrafiltration Membranes.
Final rept.
M. K. Ko, J. J. Pellegrino, R. D. Nassimbene, and P. Marko. 1993, 20p.
Pub. in Jnl. of Membrane Science 76, p101-120 1993.

Keywords: *Adsorption, *Ultrafiltration, *Proteins, *Artificial membranes, Lactoglobins, Bovine serum albumin, Osmotic pressure, Reprints, *Fouling resistance.

The mechanisms of membrane fouling and the effects of properties and structure of the adsorbed-protein layer on membrane fouling were studied using bovine serum albumin (BSA) and beta-lactoglobulin (beta-LG) as test proteins, and poly(vinylpyrrolidone)-coated polycarbonate (PC) and regenerated cellulose (RC) as membranes. Ultrafiltration (UF) experiments were modeled with a 3-parameter resistance model to separately determine resistances due to osmotic pressure and adsorption. An analytical method was also developed to determine protein loadings under UF and static conditions. The dynamic behavior of osmotic pressure or interfacial concentration is discussed on the basis of the material balance around the interface. Derjaguin-Landau and Verwey-Overbeek (DLVO) theory and the concept of a rate-limiting step are applied to phenomena that occur at the interface during protein adsorption. A steric hindrance repulsion due to PVP tails on the PC membrane has a pronounced effect on protein loading. The hydrophilic matrix of RC may act as a water reservoir that maintains continuous hydration of the adsorbed layer, which can be dehydrated during protein adsorption. We believe that hydration results in a lower fouling resistance. Additionally, the size of the pores relative to the protein molecule has a pronounced effect on the properties and structure of the adsorbed layer and its fouling resistance.

Active Site Ionicity and the Mechanism of Carbonic Anhydrase.
Final rept.
M. Krauss, and D. Garmer. 1991, 10p.
Pub. in Jnl. of the American Chemical Society 113, n17 p6426-6435 1991.

Keywords: *Carbonic anhydrase, *Surface properties, Ligands, Protons, Hydrolysis, Bicarbonates, Mathematical models, Bonding strength, Reprints, *Active site ionicity, *Cluster models.

We report ab initio calculations on a cluster model for the active site of the enzyme carbonic anhydrase which also considers the effect of the ionicity of the site on the energetics of ligand binding and reaction behavior. Hydrolysis occurs by a direct attachment of the Zn-bound hydroxyl oxygen on the carbon atom of CO2 with a small activation energy. The final product state in the cluster model has bicarbonate bound by one short and one long metal to oxygen bond. Detailed mechanisms for the initial attachment of OH(1-) on CO2 and proton movement out to the free oxygen atom were studied by locating intermediates and transition states. Two mechanisms for rearrangement of bound bicarbonate to its most stable form are found to have low barriers. The first involves rocking of the bicarbonate from the initial intermediate. The second accomplishes this shift by a cycle exchange of protons with a hydrogen-bound water or Thr-119. Both pathways with a small barrier may be required to explain (18)O exchange experiments.

Keywords: *Rare gases, *Dipole moments, Self-consistent field, Atomic interactions, Perturbation theory, Dimers, Trimers, Neon, Argon, Krypton, Xenon, Reprints.

A hybrid model is used to calculate the dipole moments of rare gas dimers and trimers. The exchange and polarization interactions are obtained with a single-configuration self-consistent-field (SCF) calculation and the dispersion contribution to the dipole obtained by perturbation theory. The SCF dipoles for the trimers are found to compare well with values modeled by an exchange quadrupole induced dipole mechanism. The dispersion dipole for the ArKr dimer is found to be significant compared to the exchange contribution even to the region of the equilibrium separation. Values of the B hyperpolarizability are evaluated for Ne, Ar, Kr, and Xe which allow the perturbation calculation of the dispersion dipole for any pairs of rare gas atoms.

Analysis of Protein Metal Binding Selectivity in a Cluster Model.
Final rept.
M. Krauss, and W. J. Stevens. 1990, 7p.
Pub. in Jnl. of the American Chemical Society 112, n4 p1460-1466 1990.

Keywords: *Calcium ions, *Molecular orbitals, *Subtilisins, Clusters, Water, Formamides, Formates, Proteins, Ligands, Hydrations, Cations, Reprints, *Metal-ligand binding, Binding sites.

Ab initio molecular orbital calculations of the binding energy of metal cations to octahedral clusters of water, formamide, and formate ligands are used to analyze Ca binding sites in proteins. The intrinsic energetics of the first coordination shall provide a basis for evaluating the conformation behavior and the selectivity of cation binding. The enthalpies of binding are modeled by estimating the environmental polarization energy relative to the model cluster of the first shell. Cluster reaction enthalpies are calculated for transferring Mg, Ca, and Na cations from a water cluster to the protein model cluster as a function of cluster size which is found to strongly affect cation binding selectivity between cations of the same and different charges. The selectivity is a function of both steric and electrostatic interactions. As is well known, selectivity between cations of the same charge is dependent on steric factors but there is also an electrostatic component independent of steric influences which is selective between cations of different charge. The data is applied to an analysis of the binding sites in the protein, Subtilisin BPN'.

Cs Cluster Binding to a GaAs Surface.
Final rept.
M. Krauss, and W. J. Stevens. 1990, 10p.
Pub. in Jnl. of Chemical Physics 93, n12 p8915-8924 1990.

Keywords: *Solid clusters, *Gallium arsenides, *Cesium, Van der Waals forces, Polarization characteristics, Charge transfer, Surface reactions, Reprints.

The binding of Cs atoms to cluster models of the (110) surface of GaAs is examined for the polarization, charge transfer, and dispersion interactions. Single-configuration self-consistent-field binding energies to GaAs per Cs atom for two or three Cs atom clusters are calculated to be less than 0.1 eV. Orbital and total charge density plots exhibit a polarized alkali valence charge weakly bound between the alkali atoms and to the Ga atom. A London analysis of the correlation energy between the Cs and GaAs clusters or van der Waals interaction energy finds it is large compared to the difference in binding energies between gas-phase or polyhedral clusters and the quasi-linear clusters that are experimentally observed on the GaAs surface. The large VDW energy is due to the large polarizabilities for quasi-linear chains of Cs atoms those longitudinal component increases approximately with the square of the chain length.

Spectroscopic Constants for the 2.5 and 3.0 micrometer Bands of Acetylene.
Final rept.
W. J. Lafferty, and A. S. Pine. 1990, 8p.
Pub. in Jnl. of Molecular Spectroscopy 141, n2 p223-230 1990.

Keywords: *Acetylene, Near infrared radiation, Laser spectroscopy, Infrared spectroscopy, Band spectra, Rotational states, Vibrational states, Reprints, Fourier transform spectroscopy.

Fourier-transform interferometer and difference-frequency laser spectra of acetylene have been recorded in the 2.5 and 3.0 micrometer regions, yielding improved rotation-vibration constants for the nu2+nu4+nu5, for their associated hot bands originating in the nu4 and nu5 bends, and for the C-H stretch-bend combination bands. An analysis of the Fermi resonance gives more reliable estimates for the deperturbed constants and the anharmonic coupling.

Pub. in Jnl. of Chemical Physics 94, n12 p7810-7818, 15 Jun 91.

Keywords: *Carbon monoxide, Laser induced fluorescence, Rotational states, Molecular ions, Ionic mobility, Electric fields, Velocity, Helium, Doppler effect, Reprints.

Measurements of ion-velocity distributions of CO(1+) in a He buffer gas are presented as a function of an applied electric field. The distributions are obtained by single frequency, laser-induced fluorescence from various initial rotational states with the laser beam propagating parallel and perpendicular to the drift velocity vector. All distributions are well represented by a Maxwellian for the observed E/N range of 0-13 Td. From the width of the Doppler profiles, translational 'temperatures' are calculated, which are compared to simple attractive and repulsive Maxwell models as a function of the field. The measured values disagree with the predictions, which are well established for atomic ion systems. The differences are discussed in terms of rotationally inelastic energy transfer in the collisions, which is predicted by kinetic theory models.

Q. Li, T. J. McIlrath, E. B. Saloman, and T. B. Lucatorto. 1991, 4p.
Pub. in Institute of Physics, Conference Series on Resonance Ionization Spectroscopy, v114 p55-58 1991.

Keywords: *Autoionization, *Calcium, Resonance ionization mass spectroscopy, Time-of-flight spectrometers, Laser isotope separation, Atomic energy levels, Photoionization, Reprints, Two photon processes.

Autoionization levels belonging to configurations of 3p(6) 3dnl are being studied as part of an effort to find efficient ionization pathways applicable to ultrasensitive isotopic analysis and laser isotope separation. The studies are performed in a RIMS (Resonance Ionization Mass Spectroscopy) apparatus with a time-of-flight mass spectrometer and simple thermal filament atomization source. Estimates of two-photon transition rates and excited state photoionization cross sections show that the 4s(2) singlet S(0)-->-->3d5x singlet D(2)-->3d7p singlet P(1) (autoionizing) ionization pathway might be efficient enough to allow effective isoptically selective ionization with cw Ti:sapphire lasers.

Pub. in Jnl. of Chemical Physics 97, n11 p8009-8018, 1 Dec 92.

Keywords: *Argon complexes, Van der Waals forces, Infrared spectroscopy, Intermolecular forces, High resolution, Predissociation, Reprints, *Hydrogen fluoride complexes, Supersonic expansion, Potential energy surfaces.

The perturbed (nu,b,k,n)=(1210),(1113)<-(0000) band of ArHF is observed in a tunable laser/slit supersonic expansion spectrometer. The (1210) level correlates with j=2 rotation of the HF within the complex and therefore provides a test of high-order terms in a Legendre expansion of the intermolecular potential. Transitions to (1113) are observed due to intensity sharing with (1210), induced by a strong homogeneous (J-independent) perturbation that is analyzed quantitatively. The (1113) level has three quanta of Van der Waals stretch and thus probes the radial dependence of the potential close to the dissociation limit. The vibrational and rotational assignment is made possible by predictions based on the new H6(4,3,2) intermolecular potential of Hutson (J. Chem. Phys. 96, 6752 (1992)), which agree nearly quantitatively with experiment.

Modified Leung-Griffiths Model of Vapor-Liquid Equilibrium: Extended Scaling and Binary Mixtures of Dissimilar Fluids.
Final rept.
J. J. Lynch, and J. C. Rainwater. 1992, 15p.
Pub. in Fluid Phase Equilibria 75, p23-37 1992. Sponsored by Department of Energy, Washington, DC.

Keywords: *Liquid-vapor equilibrium, *Carbon dioxide, *Butanes, Binary mixtures, Simplex method, Critical point, Reprints, Leung-Griffiths model, Wegner correction.

Extended scaling or the Wegner correction has been added to a model of vapor-liquid equilibrium (VLE) designed for the extended critical region. The model, that of Leung and Griffiths as modified by Moldover, Rainwater and co-workers, has heretofore incorporated only simple scaling. The revised formalism has been applied to the abundant data on carbon dioxide + n-butane, where versions of the model with and without extended scaling have been optimized by the simplex method. With extended scaling, the average thermodynamic 'distance' between a measured and calculated dew or bubble point decreases by approximately 30 percent.

Thermophysical properties data, including thermodynamic and transport properties, are fundamental to the clear understanding of supercritical fluid processes and technology. Benchmark experimental measurements provide the best check of theoretically-based predictive models for the thermophysical properties of supercritical fluids, including CO2 and CO2-rich mixtures. For this reason, a review of published data will be given herein. Only highly accurate thermophysical property data, capable of testing predictive models, has been considered in this context.

Keywords: *Lithium deuterides, *Lithium hydrides, Vibrational spectra, Rotational spectra, Vapor phases, High resolution, Measurement, Reprints, Fourier transform spectroscopy, Dunham constants.

Fourier transform spectra have been measured for the rotational (Delta v = 0) and vibrational (Delta v = 1) spectrum of lithium hydride and lithium deuteride in the gas phase. Dunham potential constants and

rovibrational constants are given for LiH and LiD. Difficulties were encountered in attempts to fit all four isotopic species to a single modified Dunham potential function. Even data for a single isotopic species could not be fit to a Dunham potential function without significant systematic deviations. These problems are attributed to break down in the Born-Oppenheimer approximation.

Pub. in Jnl. of Quantitative Spectroscopy and Radiative Transfer 50, n2 p167-178 1993.

Keywords: *Ammonia, Band spectra, Laser spectrometers, Pressure dependence, Reprints, Self broadening, Pressure shifts, Dicke narrowing.

Self-broadening coefficients, pressure shifts and integrated intensities have been measured for Q- and R-branch transitions in the nu(1) fundamental band of ammonia using a difference-frequency laser spectrometer. A strong, systematic J and K dependence of the broadening coefficients, reminiscent of the ground-state inversion transitions, is observed and compared with semiclassical line broadening calculations. Dicke narrowing is evident at intermediate pressures for the sharpest lines, primarily the R(J, O) transitions. Incipient line mixing is apparent in the Q branch at pressures above about 0.1 bar.

Kinetics and Mechanism of the Collision-Activated Dissociation of the Acetone Cation.
Final rept.
R. I. Martinez, and B. Ganguli. 1992, 18p.
Pub. in Jnl. of the American Society for Mass Spectrometry 3, n4 p427-444 1992.

Keywords: Branching ratio, Reprints, *Acetone cations, Acetyl cations, Methyl cations, Collisionally induced dissociation, Tandem mass spectrometers.

For center-of-mass collision energies E(cm) = 1-60 eV, the major fragment ions for the collision-activated dissociation (CAD) of the acetone cation are the acetyl cation (m/z 43; absolute branching ratios of 0.96-0.60) and the methyl cation (m/z 15; absolute branching ratios of 0.02-0.26); the absolute total cross-sections were 24-35 A(sup 2). The breakdown curves (viz, plots of the absolute branching ratios versus E(cm)) show complex, complementary energy dependences for production of MeCO(1+) and Me(1+), indicating apparent closure of the Me(1+) channel for E(cm) > 30 eV. Our observations are consistent with a competition between three fast, primary (direct) reactions, each of which opens sequentially at its respective threshold energy.

Carbon Acidities of Aromatic Compounds. 1. Effects of In-Ring Aza and External Electron-Withdrawing Groups.
Final rept.
M. Mautner, and S. A. Kafafi. 1988, 7p.
Pub. in Jnl. of the American Chemical Society 110, n19 p6297-6303 1988.

Keywords: *Acidity, *Carbon, *Diazines, *Benzene, *Structural chemical analysis, Aromatic compounds, Heterocyclic compounds, Chemical reactivity, Anions, Hydrogen ions, Reprints, *Electron withdrawing groups, *Carbon acidity, Topological charge distribution, Gas phase acidity.

We report experimental intrinsic carbon acidities and theoretical AM1 results on benzene derivatives and nitrogen heterocyclics. When benzene and pyridine are compared, in-ring aza substitution increases the acidity, i.e. decreases the acid dissociation energy by 9.7 kcal/mol. Further aza substitution in 1,2- and 1,3-diazine increases the acidity by an additional 8.6 and 5.8 kcal/mol, respectively. However, in 1,4-diazine, where the deprotonated carbon must be adjacent to nitrogen, lone-pair repulsion decreases the acidity below pyridine. The in-ring aza-substitution effects are qualitatively similar in those observed in azoles by Taft et al., but their parameters for one-pair repulsion and electronegative substituents do not reproduce the effects quantitatively. The electron-withdrawing substituents, F, CF3, CN, and NO2 also increase the acidity of benzene by 13.5, 13.6, 17.5, and 46.5 kcal/mol, and CHCH2 increases it by 9.7 kcal/mol. The effects of F and CHCH2 demonstrate that the ring acidity is affected by the sigma rather than pi donating or withdrawing ability of substituents. Ab initio calculations at the MP2=FC/6-31G(star)/ /RHF/6-31G level were performed on pyridine and diazines. The computed ab initio DPEs were consistently higher than the experimental values by about 22 kcal/mol. Semiempirical computations using Dewar's AM1 method for 1,4-diazine suggest that a correction of 11 kcal/mol is needed for adjacent lone-pair repulsion. With this correction, AM1 predicts qualitatively sensible deprotonation sites for diazines and F-, CN-, CF3-, and CHCH2-substituted benzenes and reproduces the deprotonation energies within 6 kcal/mol.

M. Meot-Ner, and L. W. Sieck. 1991, 13p.
Pub. in Jnl. of the American Chemical Society 113, n12 p4448-4460 1991.

Keywords: *Proton transport, *Thermodynamic equilibrium, Thermochemistry, Temperature dependence, Reaction kinetics, Reprints, *Proton affinity, Ionic equilibria.

An interlocking ladder of relative proton affinities (PA) of 43 compounds, over a range of 55 kcal/mol, was obtained from the temperature dependence of proton transfer equilibria. From C3H6 (PA=179.5 kcal/mol) to i-C4H8 (PA-195.9 kcal/mol) the results agree well with tabulated values, but for the upper PA range the present values are increased significantly. For example, the present vs. literature PA values are: NH3, 208.3 + or - 1 vs. 204.0; CH3NH2; 219.6 vs. 214.1; t-C4H9NH2, 229.2 vs. 220.8 kcal/mol (all relative values + or - 1 kcal/mol, related to PA(i-C4H8) = 195.9 kcal/mol). The new value for the latter is also confirmed by the association thermochemistry of t-C4H9(1+) with NH3.

A. McIlroy, and D. J. Nesbitt. 1991, 29p.
Grants NSF-PHY86-04504, NSF-CHE86-05970
Sponsored by National Science Foundation, Washington, DC.
Pub. in Advances in Molecular Vibrations and Collision Dynamics, v1A p109-137 1991.

Keywords: *Molecular vibration, *Complexes, Van der Waals forces, Infrared spectroscopy, Infrared absorption, Molecular dynamics, Line broadening, Excited states, High resolution, Predissociation, Reprints, Intermolecular potentials, Supersonic expansion.

The combination of low temperatures from supersonic jet expansions and high-resolution laser IR absorption methods provides a nearly ideal probe of quantum state resolved unimolecular dynamics in vibrationally excited molecules under collision-free conditions. In this paper we present three classes of examples of such studies from our laboratory. (1) First, we discuss how precise (< 10(sup -4)/cm) rotation-vibration spectroscopy can be used to obtain intermolecular potentials for weakly bound complexes. (2) Next we analyze data on van der Waals systems where the internal vibrational energy in the complex is sufficient to photofragment the weak bond and thereby lead to predissociative line broadening in the spectra. (3) Finally, we consider vibrational dynamics in the limit of chemically bound, stable molecules such as terminal acetylenes, where excess fine structure in a high-resolution spectrum can be used to infer rates of intramolecular energy flow.

New Values for Silicon Reference Materials, Certified for Isotope Abundance Ratios. Letter to the Editor.
P. De Bievre, S. Valkiers, and H. S. Peiser. 1994, 2p.
Prepared in cooperation with National Inst. of Standards and Technology, Gaithersburg, MD.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n2 p201-202 Mar/Apr 94.

Keywords: *Silicon, *Isotope ratios, *Atomic mass, Abundance, Cyclotron frequency, Silicon tetrafluoride, Penning effect, Penning trap, Reference materials, National Institute of Standards and Technology.

New isotope abundance and relative atomic mass (atomic weight) values-with low, hitherto unattained uncertainty-are reported for two previously described silicon reference materials using a well-known method with an improved isotope-ratio mass spectrometer. These new values are directly traceable to the SI, more specifically to the unit for amount of substance, the mole, and independent of the SI unit of mass and of the Avogadro constant. Besides, the residual mass-spectrometric uncertainties, these new values depend in effect only on a recently published direct comparison of the cyclotron frequency in a Penning trap of (28)Si(+1) with that of (12)C(1+).

Changes in the Redox State of Iridium Oxide Clusters and Their Relation to Catalytic Water Oxidation: Radiolytic and Electrochemical Studies.
Final rept.
G. S. Nahor, P. Hapiot, P. Neta, and P. Harriman. 1991, 6p.
Pub. in Jnl. of Physical Chemistry 95, n2 p616-621 1991.

Keywords: *Iridium oxides, *Catalysts, *Water, *Photochemical reactions, *Oxidation, Reaction kinetics, Oxidation reduction reactions, Electrochemistry, Radiolysis, Optical properties, Reprints.

Radiolytically prepared iridium oxide (IrOx.nH2O) clusters have been shown to catalyze the photochemical oxidation of water. These catalysts have been oxidized by radiolytic or electrochemical methods and the changes in their optical absorption and redox state have been studied. The clusters contain 4-5 Ir atoms in a mixture of Ir(III) and Ir(IV) states, formally described as Ir(3.2+). Time-resolved pulse radiolytic studies revealed three processes in the sub-second time-scale. The same species were observed in gamma-radiolysis and in spectroelectrochemical experiments. Further oxidation of the cluster leads to oxidation of water to O2. The kinetics of all the above processes are pH dependent and involve acid-base equilibria in the various oxidation states.

One-Electron Oxidation of Nickel Porphyrins. Effect of Structure and Medium on Formation of Nickel(III) Porphyrin or Nickel(II) Porphyrin pi-Radical Cation.
Final rept.
G. S. Nahor, P. Neta, P. Hambright, and L. R. Robinson. 1991, 4p.
Pub. in Jnl. of Physical Chemistry 95, n11 p4415-4418 1991.

Keywords: *Nickel compounds, *Porphyrins, *Oxidation, Photochemical reactions, Spectrum analysis, Cations, Radicals, Transition element compounds, Reprints, One-electron oxidation, Pi-radical cations.

The oxidation of several nickel(II) porphyrins by various radicals has been studied by pulse radiolysis in different media. Photochemical oxidation was also examined in some cases. The absorption spectrum of the oxidation product was monitored within several microseconds after the pulse. Two types of differential spectra were observed, a broad absorption at 640-700 nm ascribed to the pi-radical cation, or a sharp absorption at 560-580 nm ascribed to nickel(III) porphyrin. Ni(II)TPP (tetraphenylporphyrin) in several organic solvents, protic and aprotic, was oxidized to Ni(III)TPP.

Site of One-Electron Reduction of Ni(II) Porphyrins. Formation of Ni(I) Porphyrin of Ni(II) Porphyrin pi-Radical Anion.
Final rept.
G. S. Nahor, P. Neta, P. Hambright, L. R. Robinson, and A. Harriman. 1990, 5p.
Pub. in Jnl. of Physical Chemistry 94, n17 p6659-6663 1990.

Keywords: *Radiolysis, *Reduction(Chemistry), *Nickel compounds, *Porphyrins, Spectroscopic analysis, Reaction kinetics, Radicals, Anions, Electrochemistry, Reprints, One-electron reduction, Pi-radical anions.

The products (Ni(II)P) have been examined by radiolytic reduction in protic media to determine whether (Ni(I)P) or the pi-radical anion Ni(II)P(1-) is formed. Kinetic spectrophotometric detection was utilized to record absorption spectra of products immediately after one-electron reduction and gamma-radiolysis was used for recording the spectra of the stable reduction products. The initial reduction product was dependent on the nature of substituents on the porphyrin but not on the redox potential; a meso-4-pyridyl group seems to direct the reduction toward the porphyrin ring whereas, in most other cases, reduction occurred on the metal. On longer time-scales (minutes) all porphyrins produced the two-electron reduced products, chlorin or phlorin anion.

Reduction of Dinitrogen to Ammonia in Aqueous Solution Mediated by Colloidal Metals.
Final rept.
G. S. Nahor, L. C. T. Shoute, P. Neta, and A. Harriman. 1990, 6p.
Pub. in Jnl. of the Chemical Society 86, n23 p3927-3933 1990.

Keywords: *Reduction(Chemistry), *Nitrogen, *Colloids, Reprints, Metals, Radicals, Radiolysis, Photolysis, Ammonia, Rubidium, Rhenium, Platinum, PVA(Polyvinyl alcohol), PB(Polybrene), PSS(Polystyrene sulfonate).

Reduction of N2 to NH3 was investigated by radiolysis and photolysis in N2-saturated aqueous solutions containing colloidal dispersions of Ru, Pt, or Rh stabilized either by neutral (poly(vinyl alcohol), PVA) or charged (polybrene, PB, or polystyrene sulfonate, PSS) polymers. The yield depends on the irradiation time, colloid concentration, type of reducing radical, and pH. At longer irradiations the concentration of NH3 increased at a much slower rate until the reaction stopped. The results suggest fast and efficient reduction of any N2 that is pre-absorbed at highly reactive, possibly metal oxide, sites on the surface of the colloid.

Metalloporphyrin Sensitized Photooxidation of Water to Oxygen on the Surface of Colloidal Iridium Oxides - Photochemical and Pulse Radiolytic Studies.
Final rept.
G. S. Nahor, A. N. Thompson, P. Neta, P. Hambright, and A. Harriman. 1989, 7p.
Pub. in Jnl. of Physical Chemistry 93, n16 p6181-6187 1989.

Keywords: *Porphyrins, *Photolysis, *Water, *Oxidation, Colloids, Radicals, Cations, Photochemical reactions, Reaction kinetics, Radiolysis, Transition metals, Iridium, Reprints, Iridium oxide.

Derviatives of TSPP (tetrakis(4-sulfonatophenyl)porphyrin) were prepared and tested as photosensitizers for oxidation of water to oxygen on the surface of colloidal iridium oxide. Triplet quantum yields, energies, and lifetimes were measured by laser flash photolysis. Rate constants for quenching the porphyrin triplet state with 02 and with persulfate ions were also determined. The rate of interaction between the porphyrin radical cations and colliodal Ir02 particles were measured by pulse radiolysis for several of the compounds. Illumination of a porphyrin in the presence of sodium perfulfate and an Ir02 colloid resulted in generation of 02 in a process that was strongly dependent upon pH and upon the nature of the photosensitizer in the same manner as the kinetics determined by pulse radiolysis. The rate of 02 production under any conditions could be explained on the basis of thermodynamic criteria relating to either of the individual quenching or water oxidation steps.

Determination of the Molecular Parameters of NiH in Its (2)Delta Ground State by Laser Magnetic Resonance.
Final rept.
T. Nelis, S. P. Beaton, K. M. Evenson, and J. M. Brown. 1991, 17p.
Pub. in Jnl. of Molecular Spectroscopy 148, n2 p462-478 1991.

Keywords: *Molecular structure, *Nickel hydrides, Laser spectroscopy, Magnetic resonance, Rotational states, Far infrared radiation, Radicals, Transition metals, Ground state, Infrared spectra, Zeeman effect, Reprints, *LMR(Laser magnetic resonance), *Laser magnetic resonance.

The rotational spectrum of the NiH radical in the nu=0 level of its X(2)Delta state has been studied by laser magnetic resonance (LMR) at far-infrared wavelengths. Transitions have been detected for all 5 isotopes of nickel and within both the lower ((sup2)Delta 5/2) and upper ((sup 2)Delta 3/2) spin components. Nuclear hyperfine splittings for both the proton and (61)Ni (I=3/2) are observed. The effective Zeeman Hamiltonian for a molecule in a (2s+1)Delta state is developed and used to fit all the data together with the similar magnetic resonance observations of the (1,0) vibration-rotation band. There are several indications that this exercise is only just possible in the case of NiH in its X(2)Delta state.

Crystal Structure of a New Sodium Zinc Arsenate Phase Solved by 'Simulated Annealing'.
Final rept.
T. M. Nenoff, W. T. A. Harrison, G. D. Stucky, J. M. Nicol, and J. M. Newsam. 1993, 5p.
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Zeolites 13, p506-510 Sep/Oct 93.

Keywords: *Crystal structure, *Powder metals, *Phase studies, Simulation, Annealing, Crystallography, Neutron diffraction, X-ray diffraction, Sodium compounds, Zinc compounds, Reprints, *Sodium zinc arsenate, Simulated annealing, Sodalite analogs, Rietvelt profile refinement.

The framework structure of a new sodium zinc arsenate, produced by dehydration of the Na6(ZnAsO4)6 8 H2O sodalite analog, has been solved by a simulated annealing method. This method utilizes typical tetrahedral-atom bonding schemes with possible space group and unit cell dimensions to randomly generate possible continuous frameworks and their calculated energies. The Rietveld refinement of the Na6(ZnAsO4)6 solution phase was initially performed on room temperature X-ray data and then continued on low-temperature constant wavelength neutron data. The sodium zinc phosphate is a hexagonal polycrystalline material. The tridymite structural analog undergoes a room-temperature transformation to the open-framework sodalite structure.

Pub. in Mode Selective Chemistry, p113-126 1991.

Keywords: *Infrared spectroscopy, *High resolution, *Hydrogen bonds, Energy transfer, Van der Waals forces, Quantum chemistry, Frequencies, Slits, Supersonic jet flow, Reprints, Mode specific, Predissociation, Sub-Doppler.

State resolved vibrational dynamics in weakly bound complexes is investigated via high resolution IR absorption spectroscopy in a slit supersonic jet expansion. The tunable frequency near IR source can readily excite the high frequency intramolecular vibrations of the subunits, as well as the low frequency, intermolecular vibrations via combination band excitations built on the high frequency modes. These upper state energies lie far above the van der Waals binding energy limit, and yet predissociate typically on the nsec time scale or longer (i.e. many millions of vibrational periods). This exceptional metastability in such small systems is highly non-statistical, and proves to be a rich arena of vibrational mode mixing and mode-specific predissociation behavior. The authors select recent examples from their group effort to illustrate these concepts.

Keywords: *Infrared spectroscopy, *Water, *Argon, *High resolution, Quantum chemistry, Energy transfer, Van der Waals forces, Spectrum analysis, Frequencies, Supersonic jet flow, Kinetics, Collisions, Reprints, Local mode, Vibrational predissociation.

Para ArH2O complexes are detected in the near IR via slit jet direct absorption spectroscopy using cw difference frequency generation of high resolution tunable infrared radiation (IR) in the 3780 cm(-1)V3=10 asymmetric OH stretch region. Frequency shifts in the f parity levels (Q branch), and both frequency shifts and predissociation broadened linewidths in the e parity levels (P/R branch) are evidenced in the spectrum, unambiguously characteristic of an avoided crossing in the vicinity of J'=6 with a second, near resonant vibration-internal rotation state in ArH2O. The data establish a clear upper limit on the dissociation bond strength for para ArH2O, and place spectroscopic constraints on the promoting internal rotor state in ArH2O (v1=1). A simple local mode theory of half-collision induced mixing between symmetric and asymmetric stretch excitation in H2O is presented.

Solvent Effects in the Reactions of Peroxyl Radicals with Organic Reductants. Evidence for Proton Transfer Mediated Electron Transfer.
Final rept.
P. Neta, P. Maruthamuthu, S. Steenken, and R. E. Huie. 1989, 6p.
Pub. in Jnl. of Physical Chemistry 93, n22 p7654-7659 1989.

Keywords: *Electron transfer, *Radiolysis, *Radicals, *Solvents, Protons, Reduction(Chemistry), Reaction kinetics, Solvent properties, Reprints, *Peroxyl radicals, Proton transfer.

Absolute rate constants for the reactions of substituted methylperoxyl radicals with ascorbate, urate, trolox (6-hydroxy-2,5,7,8-tetramethylchromane-2-carboxylic acid), and TMPD (N,N,N',N'-tetramethyl-p-phenylenediamine) have been determined by pulse radiolysis in different solvents. In water-alcohol or water-dioxane solutions the rate constants for trihalomethylperoxyl radicals generally increase with increasing water content. The rate constants were found to correlate well with a two-parameter equation which includes the dielectric constant of the solvent and the coordinate covalency parameter, a measure of the proton-transfer basicity of the solvent.

Inelastic Neutron Scattering Studies of Nonlinear Optical Materials: p-Nitroaniline Adsorbed in ALPO-5.
Final rept.
J. Nicol, T. J. Udovic, J. J. Rush, S. D. Cox, and G. D. Stucky. 1990, 6p.
Pub. in Materials Research Society Symposia Proceedings Neutron Scattering Materials Science, v166 p367-372 1990.

Keywords: *Vibrational spectra, *Analines, Reprints, Optical materials, Nonlinear optics, Nitro compounds, Molecular sieves, Hydrogen bonds, Neutron scattering, Inelastic scattering, Adsorption, *Nitroanilines.

Inelastic neutron scattering has been used to characterize the vibrational spectroscopy below 220 meV of para-nitroaniline adsorbed in the molecular sieve ALPO-5. Samples at loadings of both 3 and 13 weight %, which represent the onset of and the maximum in the nonlinear optical properties respectively, were studied. The torsional vibration of the amino (NH2) group has been identified at ca. 50 meV. The splitting and structure of this mode is sensitive to the loading level. This can be related to differences in the nature of the hydrogen bonding in these materials.

Fluctuation Dominated Recombination Kinetics with Traps.
Final rept.
J. C. Rasaiah, J. Zhu, J. B. Hubbard, and R. J. Rubin. 1990, 7p.
Pub. in Jnl. of Chemical Physics 93, n8 p5768-5774, 15 Oct 90.

Keywords: *Recombination reactions, *Fluctuations, Annihilation reactions, Computerized simulation, Kinetics, Diffusion, Trapping, Exponential functions, Reprints, Donsker-Varadhan Model, Lattices.

Theoretical and computer simulation studies of annihilation reactions with traps on two and in three dimensional lattice systems are discussed. Several remarkable features of these reactions, some predicted by theory and others observed in computer simulations, are pointed out. The stretched exponential behavior of the Donsker-Varadhan formula A(t) approximately equal to e raised to the -t(supd/(d + 2)) power, where d is the dimensionality, already found for the reactant decay in A-A annihilation reactions with traps on a square lattice (Rasaiah et al. - J. Phys. Chem., in press), was tested for universality by studying triangular and hexagonal lattices in two dimensions (2d) and a cubic lattice in three dimensions (3d). The same behavior is also observed when the free particle annihilation is turned off.

Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Jnl. of Quantitative Spectroscopy and Radiative Transfer 50, n2 p149-166 1993.

Keywords: *Hydrogen cyanide, *Acetylene, Intermediate infrared radiation, Pressure broadening, Band spectra, Tunable lasers, Nitrogen, Argon, Reprints, Collisional energy transfer, Q branches, Self broadening.

Self-, N2- and Ar-broadening coefficients have been measured for the stretch-bend infrared combination bands nu(sub 1) + nu(sub 2, sup 1) (4004/cm) of HCN and nu(sub 1) + nu(sub 5, sup 1) (4091/cm) of C2H2 using a tunable difference-frequency laser. At atmospheric pressures, the Q branches of these bands exhibit significant rotational narrowing or line mixing. The broadening coefficients have been fit with empirical rotationally inelastic collision rate laws, which are then used to model the line mixing in the overlapped Q-branch profiles. Simple energy gap fitting laws appear to be suitable for the shorter-range intermolecular quadrupole-quadrupole and induction forces, whereas an energy-corrected-sudden scaling law works better for the longer-range dipole-dipole and dipole-quadrupole collision partners. In all cases, the line-coupling coefficients are substantially reduced from the rotationally inelastic rates fit to the broadening coefficients, indicating that 35-70% of the broadening may be due to other collisional mechanisms such as cross-relaxation to the degenerate (Pi) state vibrational level.

Alkanethiols can act as hydrophobic monolayer substrates for the formation of phospholipid-containing bilayers. Phospholipid vesicles were allowed to fuse to alkanethiol monolayers, resulting in stable, solvent-free lipid bilayers on gold electrodes. The capacitance of these belayers has been determined by impedance measurements, and the effect of the pore-forming peptide melittin on the bilayer has been determined by the measurement of faradaic current. These supported self-assembling phospholipid/alkanethiol bilayers demonstrate properties consistent with those of fluid membranes, and provide a useful way to study the electrical characteristics of membranes in the absence of solvent.

Fokker-Planck Description of Multivalent Interactions.
Final rept.
A. L. Plant, M. Gray, and J. B. Hubbard. 1993, 15p.
Pub. in Biophysical Chemistry 48, p75-89 1993.

Keywords: *Binding sites, *Kinetics, *Chemical models, Liposomes, Reprints, *Fokker-Planck descriptions.

A dynamic model is presented which uses a mean first passage time to characterize multivalent binding as the continuum limit of a one-step stochastic process. The use of a stochastic model instead of a model based on rate equations permits consideration of fluctuations in the number of bonds formed. The importance of fluctuations to the problem of multivalent interactions, especially low affinity interactions, is discussed. Assumptions for the theory are based on data in which liposomes were used as a model system for multivalency. The data suggest a linear sequential process of bond rupture, and thus a high degree of cooperativity in the microscopic events associated with multivalent liposomal binding.

Pub. in Jnl. of Chemical Physics 95, n5, p3053-3063, 1 Sep 91.

Keywords: *Photoelectron spectroscopy, *Atomic clusters, Negative ions, Electron affinity, Excited states, Ground state, Reprints, *Bismuth clusters.

The authors have recorded the 351 nm photoelectron spectra of Bi(-)2, Bi(-)3, and Bi(-)4. The spectrum of Bi(-)2 shows transitions to at least seven electronic states of Bi2 neutral, four of which are observed with vibrational resolution. Term energies, bond lengths, and vibrational frequencies are obtained for the anion ground state and for the first three excited states of Bi2. These results are compared to previous spectroscopic measurements and to the ab initio calculations presented in the accompanying paper. The photoelectron spectrum of Bi(-)3 reveals some of the electronic structure of Bi3 and the results are discussed in comparison to recent theoretical work. Adiabatic electron affinities are obtained for Bi2 (1.271(8) eV) and for Bi3 (1.60(3) eV). The electron affinity of Bi4 is estimated from the onset of photodetachment to be 1.05(10) eV.

Vibrational Energy Transfer in S1 p-Difluorobenzene. A Comparison of Low and Room Temperature Collisions.
Final rept.
C. J. Pursell, and C. S. Parmenter. 1993, 7p.
Pub. in Jnl. of Physical Chemistry 97, n8 p1615-1621 1993.

Keywords: *Atom-molecule collisions, Temperature range 0013-0065 K, Room temperature, Vibrational states, Energy transfer, Difluoro compounds, Helium, Argon, Reprints, *Difluorobenzene.

Vibrational energy transfer in S(1) p-difluorobenzene has been studied at low temperature within a supersonic free jet. Quantitative relative cross sections for the state-to-state vibrational energy transfer channels (i.e. flow patterns) from the 8(sup 2) vibrational level (epsilon(vib) = 346/cm) were obtained for low energy collisions (T approx = 20-35 K) with He and Ar. They are qualitatively similar to analogous flow patterns obtained earlier from the 0(sup 0) level from room temperature (300 K) collisions with He and Ar. Both the 300 K and the low temperature flow patterns show that the vibrational energy transfer is selective among the possible channels and that the competition among vibrational channels is distinctive for each collisional partner. The low and room temperature flow patterns differ, however, in quantitative detail. A treatment of the standard SSH-T vibrational energy transfer model describes semiquantitatively the flow patterns at both low and room temperature and for collisions with He and Ar. The success of a single model suggests that vibrational energy transfer in S(1) p-difluorobenzene is governed by the same mechanism over the entire span of collision energies associated with temperatures from about 20 to 300 K.

Measurement of the Self Broadening of the H2Q(0-5) Raman Transitions from 295 to 1000 K.
Final rept.
L. A. Rahn, R. L. Farrow, and G. J. Rosasco. 1991, 14p.
Pub. in Physical Review A 43, n11 p6075-6088 1991.

Keywords: *Raman spectroscopy, *Hydrogen, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Temperature dependence, Pressure dependence, Vibrational states, Line broadening, High resolution, Reprints, Self broadening, Q branches.

High-resolution inverse Raman spectroscopy (IRS) has been used to measure the self-broadening coefficients of the Raman Q-branch transitions in pure (natural) hydrogen. Measurements of six lines (Q(0)-Q(5)) were made at pressures from 2 to 50 atmospheres and from 295 to 1000 K. The dependence of the derived broadening coefficients on temperature and rotational quantum number is analyzed using the energy-corrected-sudden scaling law (A. E. DePristo, J. Chem. Phys. 73, 2145 (1980)). The authors discuss three models for the J-dependence of the pure-vibrational dephasing and find that models with little or no J-dependence in the pure-vibrational dephasing are preferred.

Calculation of Enthalpy and Entropy Differences of Near-Critical Binary Mixtures with the Modified Leung-Griffiths Model.
Final rept.
J. C. Rainwater, and D. G. Friend. 1993, 10p.
Pub. in Jnl. of Chemical Physics 98, n3 p2298-2307, 1 Feb 93.

Keywords: *Liquid vapor equilibrium, *Binary mixtures, *Benzene, *Alkanes, *Entropy, *Enthalpy, Thermodynamic properties, Phase transformations, Fugacity, Free energy, Mathematical models, Reprints, *Clapeyron equation, *Leung-Griffiths Model.

In previous applications of the Leung-Griffiths model as modified by Moldover and Rainwater, many near-critical vapor-liquid equilibrium surfaces have been described successfully in the space of pressure, temperature, density, and composition, but calorimetric properties such as entropy and enthalpy have not been examined. Such calculations are difficult in general because of the need to determine a parameter that is usually unknown in the definition of an independent field variable (the fugacity fraction). However, a generalization for mixtures of the Clapeyron equation is available which allows for the calculation of differences in entropy, enthalpy, and free energies between a pair of (noncoexisting) dew and bubble points at the same temperature and composition. A calculation of entropy differences from a correlation of carbon dioxide + propylene agrees well with results inferred indirectly from experimental data. As a more direct check, calculation of enthalpy differences from a correlation of n-pentane + benzene agrees with an interpolation of enthalpy data provided by calorimetric measurements of Lenoir and Hipkin. The generalized Clapeyron equation appears to be singular at the maxcondentherm point, but it is shown that the singular terms cancel one another and that the leading-order finite term is consistent with a thermodynamic Maxwell relation.

Polarized Transient Hot Wire Thermal Conductivity Measurements.
Final rept.
R. A. Perkins, A. Laesecke, and C. A. Nieto de Castro. 1992, 12p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Fluid Phase Equilibria 80, p275-286 1992.

Keywords: *Thermal conductivity, *Fluorohydrocarbons, Liquids, Refrigerants, Substitutes, Reprints, *1, *1-chloro-1, *R134a, *R142b, 1, 1, 2-Tetrafluoroethane, 1-difluoroethane, Transient hot wire instruments.

Additional experimental uncertainty is introduced in thermal conductivity data obtained with the transient hot-wire technique when bare hot wires are used in polar liquids. The use of a dc polarization voltage applied between the hot wires and the cell wall greatly reduces this uncertainty for polar liquids. Differences between polarized and nonpolarized experiments are described for the alternative refrigerants 1,1,1,2-tetrafluoroethane (R134a) and 1-chloro-1,1-difluoroethane (R142b). Comparisons are made between data from the polarized transient hot-wire technique and other experimental techniques for R142b. The polarization technique enables existing transient hot-wire instruments with bare wires to study the thermal conductivity of moderately polar liquids with confidence.

Mid- and Near-Infrared Spectra of Water and Water Dimer Isolated in Solid Neon.
Final rept.
D. Forney, M. E. Jacox, and W. E. Thompson. 1993, 5p.
Sponsored by Army Research Office, Research Triangle Park, NC.
Pub. in Jnl. of Molecular Spectroscopy 157, p479-493 1993.

Keywords: *Water, *Infrared spectra, Temperature range 0000-0013 K, Intermediate infrared radiation, Near infrared radiation, Deuterium compounds, Matrix isolation, Oxygen 16, Oxygen 18, Dimers, Reprints, Solid neon.

Spectra have been obtained between 700 and 8000/cm for H2(16)O, and between 700 and 5000/cm for deuterium and/or oxygen-18-enriched water, trapped in solid neon at approximately 5 K. Samples with Ne:water mole ratios between 400 and 6400 were studied. As in the heavier rare-gas solids, isolated water molecules can undergo relatively free rotation in solid neon, and nuclear spin equilibration is slow. The observed spectra can be explained by postulating excitation from the two lowest rotational levels of the water molecule. Absorptions of nonrotating water are also present in the spectrum. The matrix shifts for water isolated in a neon matrix are much smaller than those reported for water in matrices of the heavier rare gases. Absorptions contributed by the H- or D-donor moiety of (H2O)2, (HDO)2, and (D2O)2 have also been identified and assigned.

Keywords: *Molecular ions, *Vibrational spectra, *Water, Temperature range 0000-0013 K, Infrared absorption, Infrared spectra, Deuterium compounds, Matrix isolation, Photodetachment, Reprints, Solid neon.

When a Ne:H2O = or > 200 sample is codeposited at approximately 5 K with a beam of neon atoms that have been excited in a microwave discharge, new infrared absorptions appear close to the gas-phase band centers of the three vibrational fundamentals of H2O(1+). Detailed isotopic substitution studies confirm this assignment and provide assignments for all of the vibrational fundamentals of HDO(1+) and D2O(1+). When ions are present in the neon matrix, rotation of a significant fraction of the water molecules is inhibited. Electrons produced by the photodetachment of anions, which must be present to maintain overall charge neutrality of the deposit, accelerate nuclear spin equilibration of water in the matrix. As the concentration of H2O(1+) is decreased by capture of the photodetached electrons, the absorptions assigned to nonrotating water are also reduced in intensity. The nature of the other ionic species which may be present in the sample is considered.

Vibrational Spectra of Molecular Ions Isolated in Solid Neon. XI. NO2(+), NO2(-), and NO3(-).
Final rept.
D. Forney, W. E. Thompson, and M. E. Jacox. 1993, 11p.
Sponsored by Army Research Office, Research Triangle Park, NC.
Pub. in Jnl. of Chemical Physics 99, n10 p7393-7403, 15 Nov 93.

Keywords: *Molecular ions, *Nitrogen dioxide, *Vibrational spectra, Temperature range 0000-0013 K, Infrared absorption, Infrared spectra, Electron capture, Matrix isolation, Reprints, *Solid neon, *Nitrite ions, *Nitrate ions.

When a Ne:NO2 or a Ne:NO:O2 sample is codeposited at approximately 5 K with a beam of neon atoms that have been excited in a microwave discharge, infrared absorptions of NO2(1+), NO2(1-), and NO3(1-) appear. Detailed isotopic substitution studies support the assignment of prominent absorptions to nu(sub 3) of NO2(1+) and NO2(1-) and of weak to moderately intense absorptions to the nu(sub 1) + nu(sub 3) combination band of each of these species. When the contribution of anharmonicity is considered, the positions of the NO2(1+) absorptions are in satisfactory agreement with the values for the stretching fundamentals obtained in a recent gas-phase study of that species. When the sample is exposed to 240-420 nm mercury-arc radiation, the initially present absorptions of NO3(1-) trapped in sites with a small residual cation interaction diminish in intensity, and the unsplit nu(sub 3)(e') absorption of isolated NO3(1-) grows. The mechanism responsible for this growth in the absorption of isolated NO3(1-) is considered.

Thermodynamic Properties of the Methane-Ethane System.
Final rept.
D. G. Friend, and J. F. Ely. 1992, 12p.
Sponsored by Department of Energy, Washington, DC. and Gas Research Inst., Chicago, IL.
Pub. in Fluid Phase Equilibria 79, p77-88 1992.

Keywords: *Thermophysical properties, *Methane, *Ethane, *Binary mixtures, Thermodynamic properties, Liquid phases, Equations of state, Critical point, Specific heat, Phase stability(Materials), Pressure, Volume, Temperature, Acoustic velocity, Reprints, *Extended corresponding states.

Our recently completed wide-ranging correlations for the thermophysical properties of methane and ethane fluids have enabled us to improve the extended corresponding states calculations for the properties of the binary mixtures. The pure fluid equations are based on the analytic Schmidt-Wagner equation of state and give improved results in the general region of the critical point. We use these pure fluid equations (and a reference fluid for which an equivalent equation is known) to calculate properties and compare with experimental PVT data, isochoric heat capacities, and sound speeds of binary mixtures of methane and ethane. We also examine the properties at the vapor-liquid boundary and compare the representation from the classical extended corresponding states calculations with quantities derived from a scaling theory model. The shape of the binary mixture phase boundary is improved with this model, however our new representation of the single phase properties provides only a slight improvement over models based on modified Benedict-Webb-Rubin pure fluid equations of state.

Conductance Response of Pd/SnO2(110) Model Gas Sensors to H2 and O2.
Final rept.
T. B. Fryberger, and S. Semancik. 1990, 5p.
Pub. in Sensors and Actuators B 2, n4 p305-309 1990.

Keywords: *Gas detectors, *Tin oxides, *Palladium, *Hydrogen, *Oxygen, Metal oxide semiconductors, Electrical conductivity, Gas analysis, Surface analysis, Adsorption, Reprints.

Gases can influence the conductance of tin oxide sensors by a variety of mechanisms. In general, it is difficult to distinguish between different sensing mechanisms because so little is known about the sensor surface during operation. We have used surface analytical techniques together with in situ gas conductance response measurements to study gas sensing mechanisms on well-characterized Pd/SnO2(110) model sensor surfaces. In this letter, we report results for H2 and O2 adsorption and coadsorption: hydrogen was chosen because of its importance both as a gas to be monitored and as an adsorption product of hydrocarbons and alcohols, and oxygen because it is nearly always abundant in the sensor ambient (often, air).

Single-Atom Point Source for Electrons: Field-Emission Resonance Tunneling in Scanning Tunneling Microscopy.
Final rept.
J. W. Gadzuk. 1993, 8p.
Pub. in Physical Review B 47, n19 p12 832-12 839, 15 May 93.

Keywords: *Scanning tunneling microscopy, *Resonant tunneling, Field emission, Atomic clusters, Point sources, Electron sources, Atoms, Reprints, Tunneling spectroscopy.

Many years ago spectroscopic evidence based on a single-electron process, namely, field-emission resonance tunneling, was reported showing the electronic structure of single atoms adsorbed on metal surfaces. Huge enhancements in the highly collimated tunneling current through the virtual states of the adparticle made the single-atom spectroscopy feasible when the field-emission spectrometer was operated in the 'probe-hole mode.' A related effect is currently popular in today's scanning tunneling microscopy and also in nanometer-cluster spectroscopy. The phenomenology and theory of the effect is presented, and the current activity is considered in light of what has been uncovered in the field-emission work.

Aggregation Kinetics of Colloidal Particles Destabilized by Enzymes.
Final rept.
A. K. Gaigalas, and H. H. Weetall. 1993, 7p.
Pub. in Analytical Biochemistry 213, p329-335 1993.

Keywords: *Colloids, *Kinetics, *Enzymes, Radiation scattering, Light, Diffusion, Particle density(Concentration), Chemical models, Agglomeration, Proteins, Carbohydrates, Photons, Reprints.

Dynamic light scattering was used to measure enzymatic activity by monitoring the rate of destabilization of colloidal particles coated with proteins or carbohydrates. The photon autocorrelation spectrum was analyzed using a cumulant expansion or direct inversion. In all cases, the measured average diffusion coefficient and the standard deviation of the diffusion coefficient decreased with time. A kinetic model with a bimodal particle distribution function was used to represent the time dependence of the cumulants. The cumulants are very sensitive to the details of the particle distribution.

Picosecond Measurement of Substrate-to-Adsorbate Energy Transfer: The Frustrated Translation of CO/Pt(111).
Final rept.
T. A. Germer, J. C. Stephenson, E. J. Heilweil, and R. R. Cavanagh. 1993, 9p.
Pub. in Jnl. of Chemical Physics 98, n12 p9986-9994, 15 Jun 93.

Keywords: *Carbon monoxide, *Adsorbates, Vibrational states, Temperature dependence, Picosecond pulses, Infrared radiation, Energy transfer, Excitation, Substrates, Platinum, Phonons, Reprints, Translations.

The transient infrared response of CO/Pt(111) following picosecond visible excitation is reported. A spectrally broad decrease in reflectivity correlates with heating of the Pt lattice, and an observed shift in the CO(nu = 0 --> 1) transition is interpreted as heating of the 60/cm in-plane frustrated translational mode. A phenomenological three temperature model that assumes the adsorbate vibrational temperature exclusively couples to either the electronic temperature (with a time constant tau(e)) or to the lattice temperature (with a time constant tau(lat)) describes the temporal response of the adsorbate vibrations. The lattice phonon temperature and measured temperature dependence of the optical constants predict the observed spectrally broad reflectivity change. Density matrix methods model the infrared response of the transiently heated molecule. Limits of tau(e) = 2 plus or minus 1 ps or tau(lat) < 1 ps are established by comparison of predicted spectra and the data.

Biological Macromolecular Crystallization Database: A Tool for Developing Crystallization Strategies.
Final rept.
G. L. Gilliland, and D. Bickham. 1990, 6p.
Pub. in Methods 1, n1 p6-11 1990.

Keywords: *Crystallization, *Data bases, X-ray diffraction, Reprints, *Biological macromolecules.

The Biological Macromolecule Crystallization Database (BMCD) contains the crystallization conditions and crystal data for crystal forms of all classes of biological macromolecules which have had the unit cell dimensions and space group determined by single-crystal x-ray diffraction analysis. The BMCD provides a menu driven interface which allows searching the data for a value or a range of values for any of nineteen different parameters, individually or in any combination. The results of a search may be displayed or printed in a variety of different formats. Besides providing the information necessary to crystallize a particular macromolecule, the BMCD may be utilized to design strategies for the crystallization of molecules which have not previously been crystallized. Strategies for the crystallization of modified (or mutant) biological macromolecules, biological macromolecules which are homologous to previously crystallized macromolecules, and unique biological macromolecules which have not been previously crystallized are discussed.

Keywords: *Surface chemistry, *Silicon dioxide, *Porous media, *Small angle scattering, *Molecular

structure, *Particles, Neutron scattering, Adsorbates, Hydrocarbons, Grafted polymerization, Chemical bonds, Liquid column chromatography, Reprints.

Small angle neutron scattering has been used to characterize the structure of linear hydrocarbon chains chemically grafted to the internal pore surfaces of microporous silica particles. The aim of this work has been to relate the structure of the bonded adsorbate layers in these particles to their performance in, for example, reverse-phase liquid chromatography. By filling the pore space in the modified silica with a solution that matches the scattering density of the silica framework, the scattering from the adsorbate layers is enhanced and provides a sensitive probe of the effective thickness, uniformity and degree of solvent penetration in the layers. Results are presented for both monomeric and polymeric phases of alkyl chains ranging from C8 to C30 bonded to silica particles with a mean pore size of 100 nm.

Formulation of the Refractive Index of Water and Steam.
Final rept.
P. Schiebener, J. Straub, J. M. H. Levelt Sengers, and J. S. Gallagher. 1990, 8p.
Pub. in Properties of Water and Steam, p103-110 1990.

Keywords: *Water vapor, *Water, *Steam, *Refractive index, Equations of state, Temperature dependence, Infrared radiation, Visible radiation, Ultraviolet radiation, Supercooling, Reprints, Density dependence.

A new formulation is presented of the refractive index of water and steam over large ranges of temperature and density, and in the visible, infared and ultraviolet up to the first resonances. The formulation makes use of the fact that the molar refractivity of water and steam, at constant wavelength, varies no more than a few percent, so that temperature and density dependence require very few adjustable parameters. The NBS/NRC equation is used to convert experimental pressures to temperatures. It is demonstrated that the formulation, in conjunction with the best refractive index data, can be used to discriminate between various highly accurate equations of state for water.

Near Critical Fluid Interfaces: A Comparison of Theory and Experiment.
Final rept.
J. W. Schmidt. 1991, 13p.
Pub. in Physica A 172, n1-2 p40-52 1991.

Keywords: *Interfaces, *Liquids, *Reflectivity, *Elliptical configuration, Capillary waves, Temperature dependence, Density(Mass/Volume), Phase transformations, Reprints, Consolute points.

Measurements of the ellipticity and reflectivity of liquid-liquid interfaces in mixtures near their consolute points are compared with theories of the interface. Both sets of measurements yield the same interfacial thickness within experimental error when scaled appropriately by theories that combine both the density-profile and capillary-wave aspects of the interface. The theories correctly predict the temperature dependence of the thickness, but systematically overestimate the thickness itself. When the few comparable data for pure fluids are scaled to the same theories, they show an unexpected temperature dependence of the thickness which is not consistent with the mixture results.

Structure of the Vapor-Liquid Interface Near the Critical Point.
Final rept.
J. W. Schmidt, and M. R. Moldover. 1993, 8p.
Pub. in Jnl. of Chemical Physics 99, n1 p582-589, 1 Jul 93.

Keywords: *Liquid-vapor interfaces, *Ellipsometry, *Critical point, Carbon dioxide, Sulfur hexafluoride, Fluroalkanes, Phase diagrams, Refractivity, Reprints, Trifluoromethane.

We measured the thicknesses of the vapor-liquid interfaces near the critical points of carbon dioxide (CO2), sulfur hexafluoride (SF6), and trifluoromethane (CHF3), using ellipsometry. The data (when scaled by the refractive index difference and the correlation length) are in agreement with other ellipticity data for binary and pseudobinary mixtures at low pressures. Fully constrained theories of the interface correctly predict the temperature dependence and scaling of the thickness but systematically overestimate the thickness itself by 15%-20%. The theory can be brought into agreement with experiment when an intrinsic interfacial stiffness is added to the theory. A novel feature of the present measurements is that the effects from pressure-induced window strain were measured and mitigated by using a cylindrically-symmetric pressure cell with floating seals.

Operational Mode and Gas Species Effects on Rotational Drag in Pneumatic Dead Weight Pressure Gages.
Final rept.
J. W. Schmidt, B. E. Welch, and C. D. Ehrlich. 1993, 9p.
Pub. in Meas. Sci. Technol. 4, p26-34 1993.

Keywords: *Relaxation(Mechanics), *Rotation, *Pressure gages, *Gas dynamics, *Helium, *Hydrogen, *Nitrogen, *Sulfur hexafluoride, Pistons, Mathematical models, Low pressure, Spin, Annuli, Reprints, *Rotational drag, Spin time.

Rotational dissipation in a low-pressure pneumatic dead weight piston gauge has been measured for four gases: He, H2, N2 and SF6. Significant differences in the rotational dissipation were observed between the four gas species. Even larger differences were observed between two operational modes (gauge and absolute). The measured results are interpreted by a model for the rotational dissipation due to the gas in the annular region between the piston and cylinder. Good agreement was found between the measured and modeled results for all four gas species with essentially no adjustable parameters.

Flow of Microemulsions through Microscopic Pores.
Final rept.
D. Ripple, and R. F. Berg. 1992, 5p.
Pub. in Jnl. of Chemical Physics 97, n10 p7761-7765, 15 Nov 92.

Keywords: *Viscosity, *Microemulsions, Drops(Liquids), Volume, Water, Decanes, Porosity, Reprints, Dioctylsulfosuccinate, AOT, Ternary systems.

The flow of the microemulsion dioctylsulfosuccinate (AOT)/decane/water through 0.1 and 1.0 micrometer diameter pores was studied for water droplet volume fractions ranging from 0 to 0.5. The viscosity of these microemulsions, as measured in a capillary viscometer with a bore of approximately 1 mm diameter, exceeds by as much as a factor of 4 theoretical predictions of the viscosity of suspensions of hard or liquid spheres. If droplet clustering causes this viscosity enhancement, then flow of the microemulsions through pores with diameter small compared to the characteristic cluster size should display a large finite-size effect. The apparent viscosity of the microemulsions in pores differed from the viscosity measured in the capillary viscometer by less than 40% for 0.1 micrometer diameter pores and by less than 8% for 1.0 micrometer diameter pores. These differences are of the same scale as estimates of two effects: adsorption of droplets on the pore wall and the enhanced flow of suspensions near a wall. The absence of larger finite-size effects implies that clustering of droplets on length scales of 0.1 micrometer or larger does not contribute substantially to the microemulsion viscosity.

Michaelis-Menten Equation for an Enzyme in an Oscillating Electric Field.
Final rept.
B. Robertson, and R. D. Astumian. 1990, 6p.
Pub. in Biophysical Jnl. 58, p969-974 Oct 90.

Keywords: *Enzymes, *Electric fields, Oscillations, Protein conformation, Catalysis, Thermodynamics, Reprints, *Michaelis-Menten equation.

The electric charges on an enzyme may move concomitantly with a conformational change. Such an enzyme will absorb energy from an oscillating electric field. If, in addition, the enzyme has a larger association constant for substrate than for product, as is often true, it can use this energy to drive the catalyzed reaction away from equilibrium. Approximate analytical expressions are given for the field-driven flux, electrical power absorbed, free-energy produced per unit time, thermodynamic efficiency, and zero-flux concentrations. The field-driven flux is written as a generalized Michaelis-Menten equation.

Pub. in Jnl. of Chemical Physics 98, n12 p9466-9471, 15 Jun 93.

Keywords: *Electron-molecule collisions, *Sulfur fluorides, *Electron attachment, *Gas dissociation, Milli eV Range, EV range 01-10, Fluorine ions, Negative ions, Cross sections, Resonance, Reprints, *Sulfur oxofluorides.

The absolute cross sections for dissociative electron attachment to the molecules S2F10S2OF10, and

S2O2F10 were measured in an electron transmission experiment. The corresponding negative-ion fragments were identified in a separate mass spectrometric measurement. For S2F10, the attachment of thermal electrons (energy less than 0.1 eV) appears to result primarily in the formation of F(-) and SF5(-) with possibly a small fraction of SF4(-) and SF6(-). The ions F(-) and SF5(-) are also produced from two attachment resonances at electron energies of about 4.5 and 9.5 eV. Both S2OF10 and S2O2F10 have unusually large dissociative attachment cross sections at energies near 0.1 eV. Electron attachment to S2OF10 yields primarily SOF5(-), while S2O2F10 yields both SF5(-) and SOF5(-) with possible minor fractions of F(-) and SOF3(-).

Keywords: *Chlorine oxides, *Infrared spectra, Atmospheric composition, High resolution, Infrared spectroscopy, Band spectra, Dioxides, Chlorine 35, Chlorine 37, Reprints, Molecular constants.

Fourier Transform Infrared (FTIR) spectra of the 2nu(sub 1) and nu(sub 1) + nu(sub 3) of ClO2 (OClO) have been recorded in the 2000/cm region, with an instrumental resolution of about 0.004/cm. The spectra have been analyzed using a Hamiltonian which includes spin-rotation terms to provide the first high-resolution analysis of these bands. Around 1900 transitions of (35)ClO2 (plus about 600 of (37)ClO2) have been assigned in 2nu(sub 1), and 1100 transitions of (35)ClO2 (plus about 450 of (37)ClO2) have been identified in nu(sub 1) + nu(sub 3). By making use of all available data, accurate band centers, rotational constants, spin rotational constants, and a number of the chi(sub rs) anharmonicity constants as well as alpha and gamma parameters have been obtained.

Intensities and Dipole Moment Derivatives of the Fundamental Bands of (35)ClO2 and an Intensity Analysis of the nu1 Band.
Final rept.
J. Ortigoso, R. Escribano, J. B. Burkholder, and W. J. Lafferty. 1992, 9p.
Pub. in Jnl. of Molecular Spectroscopy 156, p89-97 1992.

Keywords: *Chlorine oxides, *Infrared spectra, Dipole moments, Band spectra, Luminous intensity, Brightness, Chlorine 35, Dioxides, Reprints, Herman-Wallis factors.

Integrated band intensities of all the fundamental bands of OClO as well as the 2nu(sub 1) overtone and the nu(sub 1) + nu(sub 3) combination band have been measured. Dipole moment derivatives with respect to the normal coordinates have been derived for these bands. For the nu(sub 1) band (35)ClO2 individual relative lines intensities have been obtained for many high K(sub alpha) (sup r)R branch lines, and a systematic deviation from intensities calculated from a zero order model, in which rotation-vibration interactions are not included, has been found. The deviation can be explained with the use of a transformed dipole moment operator. We have compared these results with those obtained using an expression derived by Watson for symmetric tops.

Reaction of Nitric Oxide with Organic Peroxyl Radicals.
Final rept.
S. Padmaja, and R. E. Huie. 1993, 6p.
Pub. in Biochemical and Biophysical Research Communications 195, n2 p539-544 1993.

Keywords: *Peroxyl radicals, *Nitric oxide, *Reaction kinetics, Free .radicals, Aqueous solutions, Biochemistry, Reprints, Alcoholic solutions.

Nitric oxide and organic peroxyl radicals are key reactive radicals implicated in a wide range of biological processes. We have measured rate constants for the reactions of several organic peroxyl radicals with nitric oxide in aqueous solution and found that they are all fast, with k = 1-3 X 10(exp 9) L/mol/s. The reactions lead to the formation of an intermediate, identified as the organic peroxynitrite, which decayed with a rate constant of k = 0.1-0.3/s. Possible products of this decay include the more reactive alkoxyl and nitrogen dioxide free radicals, or the less reactive organic nitrate. In alcoholic solutions, the rate constants of the initial reactions were similar, but the product decay rates were about 200 times faster. Because of the ubiquity of both nitric oxide and organic peroxyl radicals, their interaction could make a significant contribution to many physiological processes.

Ca4Bi6O13: A Compound Containing an Unusually Low Bismuth Coordination Number and Short Bi Bi Contacts.
Final rept.
J. B. Parise, C. C. Torardi, M. H. Whangbo, B. P. Burton, C. J. Rawn, and R. S. Roth. 1990, 5p.
Pub. in Chemistry of Materials 2, n4 p454-458 1990.

Keywords: *Crystal structure, Second harmonic generation, Orthorhombic lattices, Molecular orbitals, Bismuth oxides, Calcium oxides, Reprints, *Calcium bismuthates, *Calcium bismuth oxides.

Single crystals and powder samples of Ca4Bi6O13 have been synthesized and studied by x-ray diffraction. This compound crystallizes in the orthorhombic space group C2mm, with a= 5.9368(7), b= 17.356(4), c= 7.206(4)A. The absence of a center of symmetry was confirmed by the presence of a second harmonic signal some 60 times that observed for quartz. A weak superstructure exists along c due to alternation of oxygen and vacancies along the c-axial direction. The structure consists of ribbons of edge-linked BiO5 square pyramids running parallel with the c-axis. These chains are linked via a 3-coordinate Bi atom to form semicylinders stacked along the a-axial direction.

Pub. in Chemical Physics Letters 221, p467-472 1994.

Keywords: *Argon, Virial coefficients, Predictions, Acoustics, Reprints, *Interatomic potentials.

The recent literature abounds with proposed interatomic potential functions for argon. Of these the Hartree-Fock dispersion (HFD) type functions have been very successful and are considered to be among the best characterizations of the argon interaction to date. It is the purpose of this Letter, however, to show that of the proposed HFD-type potentials, none predict the recent acoustic virial coefficients measured by Moldover et al. In view of this, an alternative interatomic potential has been constructed for argon. The potential is of the Hartree-Fock dispersion individually damped (HFD-ID) type and represents a subtle but significant improvement for the interaction.

Time-Resolved Measurements of Energy Transfer at Surfaces.
Final rept.
R. R. Cavanagh, E. J. Heilweil, and J. C. Stephenson. 1994, 13p.
Pub. in Surface Science 299/300, p643-655 1994.

Keywords: *Surfaces, *Adsorbates, Solid surfaces, Liquid surfaces, Metal surfaces, Energy transfer, Excited states, Picosecond pulses, Semiconductors, Dielectrics, Electronic states, Measurement, Reprints, Femtosecond pulses.

Developments in time-resolved measurements of energy transfer at surfaces are reviewed. Picosecond and femtosecond measurements of vibrational and electronic relaxation at surfaces are highlighted. Experimental results for vibrational relaxation of simple adsorbates on metals, semiconductors, and insulators are reviewed, and relaxation mechanisms such as electron-hole pair formation, multiphonon relaxation and image dipole damping are considered. Energy transfer involving excited electronic states of molecules on liquid and solid dielectric surfaces and the relaxation of surface electronic states on semiconductors and of image states on metal surfaces are discussed.

Keywords: *Fullerenes, *Phase transformations, Orientation(Direction), Metastable state, Supercooling, Impurities, Reprints, Differential scanning calorimetry.

Modulated differential scanning calorimetry of sublimed C(70) shows clear evidence for four first-order transitions, two strong and two weak, which we associate with the two different molecular rotational degrees of freedom in majority (equilibrium) and minority (metastable) phases. The latter correspond to the two different stacking sequences of close-packed layers, and their relative contributions of the thermal data correlate well with high-temperature x-ray powder-diffraction results. The upper of the thermal data correlate well with high-temperature x-ray powder-diffraction results. The upper (long axis tumbling) transition in the majority phase exhibits 50 K supercooling when scanned at 2 K/min. C(60) impurities at the few % level depress the transition temperatures substantially.

Simulations of Glass Forming Liquids: What Has Been Learned.
Final rept.
R. D. Mountain. 1994, 3p.
Pub. in International Jnl. of Modern Physics C 5, n2 p247-249 1994.

Keywords: Computerized simulation, Molecular dynamics, Amorphous state, Thermodynamic properties, Supercooling, Glass, Reprints, *Supercooled liquids.

Molecular dynamics simulations of supercooled fluid mixtures of soft-spheres and of Lennard-Jones particles have revealed the existence of a kinetic transition that occurs above the glass transition temperature. This transition appears to be thermodynamic in origin. It is associated with a change in the local mobility of the particles. The basis of these conclusions is discussed.

Calculations of Electron Inelastic Mean Free Paths. 5. Data for 14 Organic Compounds over the 50-2000 eV Range.
Final rept.
S. Tanuma, C. J. Powell, and D. R. Penn. 1993, 12p.
Pub. in Surface and Interface Analysis 21, p165-176 1993.

Keywords: *Mean free path, *Electron scattering, *Electron collisions, EV range 10-100, EV range 100-

1000, KeV range 1-10, Inelastic scattering, Paraffins, Adenines, Carotene, Albumins, Diphenyl compounds, Guanines, Polyacetylene, Polyethylene, Polymethyl methacrylate, Polystyrene, DNA, Surface analysis, Electron spectroscopy, Reprints, Kapton(Trademark).

We report calculations of electron inelastic mean free paths (IMFPs) of 50-2000 eV electrons for a group of 14 organic compounds: 26-n-paraffin, adenine, beta-carotene, bovine plasma albumin, deoxyribonucleic acid, diphenyl-hexatriene, guanine, kapton, polyacetylene, poly(butene-1-sulfone), polyethylene, polymethylmethacrylate, polystyrene and poly(2-vinylpyridine). The computed IMFPs for these compounds showed greater similarities in magnitude and in the dependences on electron energy than was found in our previous calculations for groups of elements and inorganic compounds (Papers II and III in this series). Comparison of the IMFPs for the organic compounds with values obtained from our predictive IMFP formula TPP-2 showed systematic differences of approx 40%. These differences are due to the extrapolation of TPP-2 from the regime of mainly high-density elements (from which it had been developed and tested) to the low-density materials such as the organic compounds. We analyzed the IMFP data for the groups of elements and organic compounds together and derived a modified empirical expression for one of the parameters in our predictive IMFP equation. The modified equation, denoted TPP-2M, is believed to be satisfactory for estimating IMFPs in elements, inorganic compounds and organic compounds.

Neutron Reflectometry Studies of Surface Oxidation.
Final rept.
D. G. Wiesler, and C. F. Majkrzak. 1994, 6p.
Pub. in Physica B 198, p181-186 1994.

Keywords: *Titanium oxides, *Oxide films, *Oxidation, Anodic coatings, Film thickness, Aqueous electrolytes, Surface chemistry, Corrosion resistance, Reprints, Neutron reflectometry, Film density, Hydrogen loading.

We have employed neutron reflectometry to study the thickness and density of thin oxide films of Ti in contact with electrolyte. Such films play an important role in corrosion resistance and surface chemistry in aqueous environments. We compare the structures of such oxides formed by either ramping the potential or by step polarization. The effect of subsequent cathodic bias on the films is explored, and the time evolution of the hydrogen content in the oxide and metal is investigated.

Microwave Spectra of van der Waals Complexes of Importance in Planetary Atmospheres.
Final rept.
R. D. Suenram, and F. J. Lovas. 1989, 7p.
Pub. in Proceedings of International Conference on Laboratory Research for Planetary Atmospheres (1st), Bowie, MD., October 25-27, 1989, p78-84.

Keywords: *Microwave spectra, *Planetary atmospheres, *Complexes, Van der Waals forces, Hydrogen bonds, Nitrogen complexes, Oxygen complexes, Rotational spectra, Trimers, Reprints, *Water dimers, Carbon dioxide complexes, Carbon monoxide complexes, Hydrogen sulfide complexes, Sulfur dioxide complexes, Water complexes, Ozone complexes.

The Fourier-transform Fabry-Perot pulsed-molecular-beam microwave spectrometer at NIST has been used to study the microwave spectra of a number of molecular dimers and trimers that may be present in planetary atmospheres. The weak van der Waals bonds associated with these species usually give rise to rotational-tunneling splittings in the microwave spectra. We have used the microwave spectrum of the water dimer species to illustrate the complications that can arise in the study of the rotational spectra of these loosely bound species. In addition to the water dimer species, the microwave spectra of the following hydrogen-bonded and van der Waals complexes have been studied: (CO2)2 H20, CO2 (H2O)2, CO2 H2S, N2 H2O, CO H2O, SO2 H2O, and O3 H2O.

Pub. in Jnl. of Chemical Physics 98, n7 p5985-5989, 1 Apr 93.

Keywords: *Deuterium fluorides, *Hydrogen fluoride, *Molecular clusters, *Infrared spectroscopy, Molecular vibration, Absorption spectra, Hydrogen bonds, High resolution, Deuterium compounds, Fine structure, Ground state, Trimers, Reprints, Supersonic expansion.

We present high resolution, infrared laser absorption spectra of (DF)3 in a slit supersonic jet expansion. In contrast to previous structureless near IR spectra of (HF)3, the (DF)3 data reveal clear rotational structure characteristic of a cyclic, 6-membered 'ring,' and therefore provide the first accurate experimental evidence for the equilibrium geometry of any hydrogen fluoride oligomer beyond the well-studied dimer. Furthermore, the spectra display homogeneous rotational fine structure 2-3 orders of magnitude in excess of what could be anticipated from a single vibrational band. Analysis of this fine structure elucidates a novel IVR mechanism which involves single hydrogen bond cleavage, and consequent opening of the (DF)3 ring on the 40 ps time scale.

Pub. in Chemical Physics Letters 182, n1 p39-44, 19 Jul 91.

Keywords: Laser applications, Room temperature, Excited states, Heavy water, Quenching, Oxygen, Reprints, *Bromine atoms, Rate constants.

Quenching rate constants for spin-orbit excited Br* atoms (doublet P(1/2)) with H2O, D2O, HDO, and O2 are measured at 300 K using a two-laser pump-probe technique. The rate constants and error bars for the water species are given. The relative rates for the water species are in qualitative agreement with models for electronic-to-vibrational energy transfer based upon dipole-quadrupole coupling. Quenching of Br* by oxygen is found to be extremely inefficient, which is in disagreement with previously reported results by four orders of magnitude.

Calculations of Electron Inelastic Mean Free Paths (IMFPs). 4. Evaluation of Calculated IMFPs and of the Predictive IMFP Formula TPP-2 for Electron Energies between 50 and 2000 eV.
Final rept.
S. Tanuma, C. J. Powell, and D. R. Penn. 1993, 13p.
Pub. in Surface and Interface Analysis 20, p77-89 1993.

Keywords: *Mean free path, *Electron scattering, *Electron collisions, EV range 10-100, EV range 100-1000, KeV range 1-10, Inelastic scattering, Aluminum oxides, Gallium arsenides, Uncertainty, Reprints.

We have made additional evaluations of the electron inelastic mean free paths (IMFPs) and of the predictive IMFP formula TPP-2 presented in papers II and III of this series. Comparisons have been made with other formulae for the IMFPs and electron attenuation lengths (ALs). We find substantial differences between our IMFP results for 27 elements and 15 inorganic compounds and the AL formulae of Seah and Dench; these differences include different dependences on electron energy and on material parameters. We present IMFP calculations for Al2O3 and GaAs from TPP-2 in which each parameter of the formula is varied in some physically reasonable range about the true value for each compound; these results show the sensitivity of the computed IMFPs to the choices of parameter values. Finally, we give a summary of sources of uncertainty in the IMFP algorithm, in the experimental optical data from which IMFPs are calculated, and of the TPP-2 formula. We conclude that TPP-2 is robust and useful for predicting IMFPs for electron energies and material parameter values in ranges for which the formula was developed and tested.

Silver Metalization of Octadecanethiol Monolayers Self-Assembled on Gold.
Final rept.
M. J. Tarlov. 1992, 10p.
Pub. in Langmuir 8, n1 p80-89 1992.

Keywords: *Thiols, *Monomolecular films, *Silver, *Gold, *Surface chemistry, *Vapor deposition, Atomic energy levels, Temperature dependence, X-ray analysis, Ultraviolet spectroscopy, Reprints, *Octadecanethiol, *Self assembled monolayers, *Silver deposition.

The interaction between evaporated silver and self-assembled monolayers of octadecanethiol (ODT) on gold was studied at temperatures of 300 and 90 K using X-ray photoelectron spectroscopy (XPS), ultraviolet photoelectron spectroscopy (UPS), and ion scattering spectroscopy (ISS). Equivalent Ag coverages ranging from submonolayers to multilayers were examined. Ag deposited at 300 K penetrates the ODT monolayer and resides at the ODT/gold interface. The attenuation behavior of the XPS C 1s and Au 4f signals reveals that Ag nucleates as clusters underneath the ODT monolayer. UPS and ISS data are in accord with XPS results and, furthermore, indicate that the deposited Ag does not significantly alter the ODT monolayer film structure. In contrast to the behavior observed at 300 K, results from Ag deposition at 90 K indicate that Ag forms clusters on the ODT monolayer surface. In this case the Ag 3d core level exhibits a shift to higher binding energy relative to that of metallic silver that is attributable to a final state Coulombic effect characteristic of metal clusters on relatively poorly conducting substrates. There is apparently little chemical interaction between Ag and the hydrocarbon chains at both 90 and 300 K, although at 300 K Ag 3d XPS data suggest that Ag bonds to sulfur head groups. The low-temperature Ag/ODT/Au structure is apparently a metastable phase because warming of the sample to room temperature results in the migration of the Ag to the ODT/Au interface and possibly further clustering.

UV-Photopatterning of Alkylthiolate Monolayers Self-Assembled on Gold and Silver.
Final rept.
M. J. Tarlov, D. R. F. Burgess, and J. G. Gillen.
1993, 2p.
Pub. in Jnl. of the American Chemcial Society 115, n12 p5305-5306, 16 Jun 93.

Keywords: *Thiols, *Monomolecular films, *Gold, *Silver, *Ultraviolet radiation, *Coating processes, Surface properties, X-ray analysis, Mass spectroscopy, Surface chemistry, Reprints, *Alkylthiolates, *Self assembled monolayers, *Photopatterning.

A method of photopatterning alkylthiolate self-assembled monolayers (SAMs) on gold and silver is described. A pattern of alkylsulfonates is first formed on the alkylthiolate SAMs by ultraviolet (UV) irradiation through a mask. The sample is then immersed in a dilute solution of a different alkylthiol and the alkylsulfonates in the exposed areas are displaced resulting in the incorporation of the second alkylthiol. X-ray photoelectron spectroscopy (XPS) and secondary ion mass spectrometry (SIMS) imaging were used to characterize the UV-irradiated and exchanged monolayers. XPS spectra of the S 2p region indicate the formation of sulfonate species upon UV irradiation and their displacement by thiolates following immersion. SIMS images of photopatterned and thiol-exchanged SAMs confirm the existence of two molecularly distinct assemblies with faithful reproduction of the mask pattern and resolution of features as small as 15 micrometers.

Activated Dynamics, Loss of Ergodicity, and Transport in Supercooled Liquids.
Final rept.
D. Thirumalai, and R. D. Mountain. 1993, 11p.
Sponsored by National Science Foundation, Washington, DC.
Pub. in Physical Review E 47, n1 p479-489 Jan 93.

Keywords: Ergodic processes, Molecular dynamics, Self-diffusion, Computerized simulation, Temperature dependence, Shear properties, Supercooling, Viscosity, Mixtures, Glass, Reprints, *Supercooled liquids.

The dynamics of the transition from supercooled liquid to glass is examined in terms of several probes: ergodic measures, self-diffusion coefficients, the Van Hove self-correlation functions, and the shear viscosity. Constant-pressure molecular-dynamics calculations at several temperatures are performed for a Lennard-Jones mixture and binary mixtures of soft spheres. The temperature dependence of the ergodicity diffusion parameters for both systems follow the Vogel-Fulcher law. On the other hand, the self-diffusion coefficients exhibit Arrhenius behavior for the soft-sphere system, but Vogel-Fulcher behavior for the Lennard-Jones system. These observations suggest that loss of effective ergodicity may be the universal feature of glass-forming substances. Various probes of the dynamics of the mixtures studied here suggest that the mechanism for mass transport dramatically changes from a simple diffusive process to one that involves activated transitions.

Methyl Torsional Levels of Solid Acetonitrile (CH3CN): A Neutron Scattering Study.
Final rept.
S. F. Trevino, C. S. Choi, and D. A. Neumann. 1993, 5p.
Pub. in Jnl. of Chemical Physics 98, n1 p78-82, 1 Jan 93.

Keywords: *Acetonitrile, Neutron scattering, Neutron diffraction, Crystal structure, Deuterium compounds, Rotational states, Activation energy, Methyl radicals, Reprints.

Neutron powder diffraction has been used to obtain the thermal parameters for the deuterium atoms and to confirm the crystal structure of acetonitrile-d(3) at 4 K. Inelastic neutron scattering from both isotopic species is used to determine the energies of the first and second rotational levels of the methyl group. These four levels are reasonably reproduced by a threefold potential with V(3) = 125 meV. The activation energy derived from this potential is in agreement with that previously obtained from the temperature dependence of T(1) in proton magnetic resonance measurements.

Pub. in Jnl. of the American Chemical Society 112, n5 p1665-1671 1990.

Keywords: *Tetralin, *Cyclobutene compounds, *Reaction kinetics, *Vapor phases, Temperature dependence, Shock tubes, Chemical reactions, Aromatic hydrocarbons, Styrene, Lasers, Pyrolysis, Reprints, *Benzocyclobutene, *Decyclization, Unimolecular reactions.

Tetralin has been decomposed in single pulse shock tube experiments in the temperature range of 1,000-1,400 K. The initial unimolecular decomposition channels are the formation of benzocyclobutene and o-allytoluene. Benzocyclobutene decomposes to form styrene. The main products from the hydrogen atom induced decomposition of tetralin are dihydronaphthalenes, styrene, indene and napthalene. Rate constant expressions for these reactions were determined. Comparisons are made with published results from the laser powered pyrolysis and shock tube studies, and it is concluded that in both cases the initial unimolecular channels are accessed. The temperatures in the laser experiments are at least as high as in the shock tube studies. The rate expressions for tetralin decomposition are compatible with a biradical mechanism and follow the general patterns for related cyclic compounds.

Mechanism and Rate Constants for the Reactions of Hydrogen Atoms with Isobutene at High Temperatures.
Final rept.
W. Tsang, and J. A. Walker. 1989, 8p.
Pub. in Proceedings of Conference International Symposium on Combustion (22nd), National Institute of Standards and Technology, p1015-1022 1989.

Keywords: *Butenes, *Hydrogen, *Reaction kinetics, *Decomposition reactions, *2-Methylpropene, Shock tubes, Temperature dependence, High temperature, Pyrolysis, Reprints, *Hydrogen atoms, *Isobutene, Hydrogen abstraction.

Hydrogen atoms from the thermal decomposition of 2,3,3 trimethylbutanol-2 have been used to induce the decomposition of isobutene in single pulse shock tube experiments. We have been able to observe products arising from all of the high temperature reaction channels for hydrogen attack on isobutene. The following rate expressions have been determined: k(H + isobutene -> propylene + CH3) = 1.72 x 10(exp 10) Exp(-1808/T) l/mol-s and k(H + isobutene -> 2-methyl-2-allyl + H2) = 1.72 x 10(exp 11) Exp(-4024/T) l/mol-s in the temperature range of 1,000-1,180 K and at 2.5-3 atmospheres of pressure. The rate constants for the abstraction of vinylic hydrogens are not more than 8% of that for abstraction of the allylic hydrogens. Comparisons are made with rate constants of similar processes involving branched aromatics and lower temperature results on isobutene. Interesting correlations are observed and lead to the possibility of estimating rate expressions for reactions involving other olefins.

Experimental Method for Obtaining Critical Densities of Binary Mixtures: Application to Ethane + n-Butane.
Final rept.
L. J. Van Poolen, V. G. Niesen, and J. C. Rainwater. 1991, 25p.
Pub. in Fluid Phase Equilibria 66, p161-185 1991.

Keywords: *Binary mixtures, *Ethane, *Butanes, *Density(Mass/volume), Phase transformations, Vapor phases, Liquid phases, Thermophysical properties, Reprints, *Critical density, *Rectilinear diameter, Van Poolen-Rainwater procedure, Leung-Griffiths theory.

According to the experimental and analytical procedure proposed by Van Poolen and Rainwater, rectilinear diameters based on measured vapor-liquid coexistence densities along a path of constant overall density and composition have been determined and used to obtain critical densities of the binary mixture ethane + n-butane. Seven experimental runs for the mixture were made at compositions ranging from 21.65 to 80.75 mol% ethane. The procedure has been explored as a new way to determine critical densities of mixtures. Results are compared with densities generated from a modified Leung-Griffiths correlation of the extensive vapor-liquid equilibrium data of Kay. The critical densities obtained are in agreement with the correlation within the overall uncertainty of the method, thereby verifying the proposed technique.

A. B. Wedding, J. Borysow, and A. V. Phelps. 1993, 8p.
Contract USAF-FY1455-84-N0641
Sponsored by Phillips Lab., Kirtland AFB, NM.
Pub. in Jnl. of Chemical Physics 98, n8 p6227-6234, 15 Apr 93.

Keywords: *Molecular collisions, *Nitrogen, Molecular energy levels, Molecular excitation, Metastable state, Rotational states, Electric discharges, Optical pumping, Time dependence, Laser applications, Reprints, Rate coefficients.

Quenching and rotational coupling rate coefficients have been measured for the J = 4-10, nu = O levels of the a(double prime) singlet Sigma(g)(1+) metastable state of N2 in collisions with ground state N2. Laser absorption is used to monitor the population of rotational levels of the a(double prime) singlet Sigma(g)(1+) state following depletion of the population of one or more levels by optical pumping to other states. The observed time dependence of the recovery of population of the perturbed level and the collision induced growth and decay of the populations of adjacent levels are interpreted in terms of quenching to other electronic levels and excitation exchange among adjacent rotational levels.

Nonadiabatic Effects in the Photoassociation of H2S.
Final rept.
K. Weide, V. Staemmler, and R. Schinke. 1990, 2p.
Pub. in Jnl. of Chemical Physics 93, n1 p861-862, 1 Jul 90.

Keywords: *Hydrogen sulfide, *Photodissociation, Nonadiabatic conditions, Vibrational states, Excited states, Reprints, *Photoassociation.

The photodissociation of H2S in the 195 nm band has been extensively investigated in the last decade. Although the major part of the experimental data indicates an overall dissociation dynamics similar to H2O, pronounced differences have been noted. The central question is whether H2S dissociates via a single electronic state, like H2O, or if two states are involved. This question concerns also the origin of the very diffuse vibrational structure. Using the CEPA method we calculated the potential energies of the two lowest excited singlet states for a fixed bond angle of 92 deg. In C(2nu) symmetry these states are singlet B(1) and singlet A(2).

Studies of the Higher Order Smectic Phase of the Large Electroclinic Effect Material W317.
Final rept.
P. A. Williams, L. Komitov, A. G. Rappaport, D. M. Walba, G. W. Day, B. N. Thomas, and N. A. Clark. 1993, 11p.
Pub. in Liquid Crystals 14, n4 p1095-1105 1993.

Keywords: *Liquid crystals, Temperature dependence, Electric fields, Reprints, *Electroclinic effect, *W317 liquid crystal, Smectic phases.

We present studies of the large electroclinic effect material W317. We found via X-ray scattering, calorimetry and optical observation that quenching from the smectic A phase results in several higher order phases including an orthogonal (hexatic) smectic with short range in-layer translational order and no interlayer order. We characterize the electroclinic response in the quenched phase, and determine its magnitude and response time as a function of electric field amplitude and temperature.

Pub. in Jnl. of Solid State Chemistry 85, n1 p117-132 1990.

Keywords: *Barium oxides, *Yttrium oxides, *Copper oxides, *Rare earth compounds, *Phase diagrams, *Crystal chemistry, High temperature superconductors, YBCO superconductors, Solid solutions, Ternary systems, Crystal phase transformations, Reprints, Yttrium barium cuprates, Phase equilibrium.

A general trend of phase formation, solid solution formation and phase relationship is found to be correlated with the size of R in the BaO-1/2R2O3-CuO systems, where R=lanthanides and yttrium. There is a progressive change in the phase relationship and appearance of these ternary diagrams in the CuO rich region, from the La through the Nd, Sm, Eu, Gd, Y to the Er system, with samples prepared in air at 950 C. Firstly, the La system has the greatest number of ternary compounds. Secondly, the superconductor materials, Ba2RCu3O(6+x), of the first half of the f-block elements, e.g. R=La, Nd, Sm, Eu and Gd, which are relatively larger in size, exhibit solid solution of Ba(2-z)R(1+z)Cu3O(6+x) with range of formation according to the size of R. These solutions terminate at Gd, after which the superconductor phase presumably assumes a point stoichiometry. Thirdly, a trend regarding the tieline connection between the phases Ba(2-x)R(1+x)Cu3O(6+x), CuO, BaR2CuO5 and binary phase R2CuO4/R2Cu2O5 is observed.

Keywords: *Ammonia, *Photodissociation, Far ultraviolet radiation, Rotational states, Vibrational states, Infrared spectroscopy, Emission spectroscopy, Room temperature, Reprints, *Ammonia radicals, Fourier transform spectroscopy.

The rovibrational state distribution of the nascent NH2(A(tilde) doublet A(1)) fragments generated by 193.3 nm photodissociation of a room temperature sample of NH3 is determined through an analysis of a major portion (6000-13000/cm) of the NH2(A(tilde) doublet A(1) --> X(tilde) doublet B(1)) near infrared emission spectrum obtained by time-resolved Fourier transform infrared emission spectroscopy. The essential features are entirely consistent with a direct carry over, into the fragment, of the out-of-plane bending vibrational motion introduced in the parent molecule by the photoexcitation process.

Keywords: *Nonaqueous electrolytes, Temperature dependence, Phenyl ether, Binary mixtures, Ammonium compounds, Reprints, Phase separation(Materials), Critical exponents, Consolute points.

We report turbidity measurements of a nonaqueous ionic solution of triethyl n-hexylammonium triethyl n-hexylboride in diphenyl ether. A classical susceptibility critical exponent gamma = 1.01 + or - 0.01 is obtained over the reduced temperature range 10(exp -4) = or < t = or < 10(exp -1). The best fits of the sample transmission had a standard deviation of 0.39% over this range. Ising and spherical model critical exponents are firmly excluded. The correlation length amplitude zeta(0) from fitting is 1.0 + or - 0.2 nm which is much larger than values found in neutral fluids and some aqueous binary mixtures.

Keywords: *Carbon monoxide, *Rotational spectra, *Infrared spectra, Far infrared radiation, Carbon 13, Reprints, Fourier transform spectroscopy.

The pure rotational spectrum of (13)CO between 0.66 and 3.3 THz has been measured with a tunable far infrared spectrometer. Revised values for B(o), D(o), and H(o) have been obtained with a 50 kHz 1 sigma standard deviation of the fit. Additional measurements were performed with a Fourier transform spectrometer, and a 1 MHz (3.3 x 10(exp -5)/cm) measurement accuracy is demonstrated with this device. The rotational spectrum from J double prime = O to J double prime = 30 is calculated and gives the frequencies with an accuracy (one sigma) of better than 120 kHz.

Microwave and Submillimeter Spectroscopy of Ar-NH3 States Correlating with Ar+NH3(j=1, k=1).
Final rept.
E. Zwart, H. Linnartz, W. L. Meerts, W. Klemperer, G. T. Fraser, and D. D. Nelson. 1991, 11p.
Pub. in Jnl. of Chemical Physics 95, n2 p793-803 1991.

Keywords: *Argon complexes, *Microwave spectroscopy, Van der Waals forces, Submillimeter waves, Microwave spectra, Hamiltonians, Anisotropy, Reprints, *Ammonia complexes, Intermolecular potentials.

Microwave and submillimeter transitions for Ar-NH3 have been observed and assigned for the two Sigma and two Pi states correlating asymptotically with Ar + NH3 (j=1, k=1). The Sigma states are found to lie below the Pi states and are separated by approximately the inversion splitting of free NH3. For the Pi states the NH3 inversion tunneling is nearly quenched, being only weakly allowed through Coriolis interactions with the nearby Sigma states. The observed microwave and submillimeter spectra also allow the determination of (14)N quadrupole coupling constants and relative submillimeter absorption intensities. All the above results are interpreted using a model internal-rotation inversion Hamiltonian, leading to detailed information about the anisotropy of the intermolecular potential.

Pub. in Jnl. of Crystal Growth 110, n1-2 p119-130 1991.

Keywords: *Pancreatic ribonuclease, *Crystals, pH, Hydrogen bonding, Electrostatics, Van der Waals forces, Binding sites, Solvents, Cattle, Reprints.

The crystal packing interactions of two crystal forms of bovine ribonuclease A are compared. An analysis of the crystal packing interactions, including solvent bridging, indicates that the high-alcohol crystal form of ribonuclease A has a balance of hydrogen bonding, electrostatic and van der Waals interactions. In contrast, the high-salt crystal packing forces are dominated by van der Waals interactions, but at the dimer interface of the molecules in this crystal form the interactions have a large electrostatic component. The electrostatic interactions of the dimer may be due to a rearrangement in the charge-charge interactions at the active site, a direct result of the presence of the inhibitor, deoxythymidine, covalently bound to His 12.

Memory Function Approach to the Shape of Pressure Broadened Molecular Bands.
Final rept.
G. Birnbaum. 1994, 14p.
Pub. in Molecular Physics 81, n3 p519-532 1994.

Keywords: *Molecular absorption, *Absorption spectra, *Pressure broadening, Molecular collisions, Quantum mechanics, Spectral bands, Line spectra, Spectroscopy, Reprints, *Memory function, Far wings, Line interference.

A unified treatment of the shape of pressure-broadened molecular absorption bands from near resonance to the far wings is achieved by an approach using memory functions. Empirical models for these functions are employed that interpolate between known short and long time behavior. This treatment includes the following band shaping mechanisms: line interference, finite duration of collision, molecular torques, and detailed balance. Line interference can produce a very sharp decrease in absorption in the periphery of a band, e.g., as in the nu(sub 3) band of carbon dioxide. Absorption in the far wings, which in this band exhibits a much less rapid decrease with increasing frequency, is attributed to the effect of molecular torques acting during collisions. By using a model memory function, a simple analytical expression is obtained for the far wing absorption. The parameters in this model are related to known molecular quantities. The computed and measured far wing absorption of the nu(sub 3) band of carbon dioxide broadened by argon at 296 K and 613 K are compared.

S. J. Boyes. 1994, 6p.
Pub. in Chemical Physics Letters 221, p467-472 1994.

Keywords: *Argon, Virial coefficients, Interatomic forces, Reprints, *Interatomic potentials.

The recent literature abounds with proposed interatomic potential functions for argon. Of these at Hartree-Fock dispersion (HFD) type functions have been very successful and are considered to be among the best characterizations of the argon interaction to date. It is the purpose of this Letter, however, to show that of the proposed HFD-type potentials, none predict the recent acoustic virial coefficients measured by Moldover et al. In view of this, an alternative interatomic potential has been constructed for argon. The potential is of the Hartree-Fock dispersion individually damped (HFD-ID) type and represents a subtle but significant improvement for the interaction.

Measurements of the translational energy and internal state distributions of OH products produced in the bimolecular reaction (16)O(singlet D) + H2(18)O --> (16)OH + (18)OH are reviewed. These detailed measurements reveal relationships between the states of geminate fragments produced in individual reaction events. Preliminary measurements on the same reaction initiated in O3 (dot) H2O clusters formed in free jet expansions are reported. The dynamics of the cluster reaction are dramatically different than those of the bimolecular reaction. The results indicate that the third body present in the cluster (O2), carries a significant amount of the energy released in the reaction.

We have measured the low-energy neutron inelastic-scattering (NIS) spectra of superconducting Na2RbC(60) in the temperature range 50-350 K. Well-defined librational peaks are observed at 50 K at 2.83(17) meV (FWHM = 1.7(5) meV). They soften and broaden with increasing temperature. Their behavior mimics that found in solid C(60) and differs markedly from K3C(60). The rotational barrier for C(60) reorientations in Na2RbC(60) is somewhat higher than in pristine C(60) and approximately half as large as in K3C(60). An order-disorder transition is anticipated at a temperature higher than that found in C(60).

Pub. in Physical Review B 49, n4 p2897-2903, 15 Jan 94.

Keywords: *Fullerenes, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature range 0400-1000 K, Temperature dependence, Neutron diffraction, Neutron scattering, Inelastic scattering, Low energy, Reprints, Rotational dynamics.

We report the results of neutron-diffraction and low-energy neutron-inelastic-scattering experiments on high-purity solid C(70) between 10 and 640 K. Thermal hysteresis effects are found to accompany structural changes both on cooling and on heating. The observed diffuse scattering intensity does not change with temperature. At 10 K broad librational peaks are observed at 1.82(16) meV (full width at half maximum = 1.8(5) meV). The peaks soften and broaden further with in-

creasing temperature. At and above room temperature, they collapse into a single quasielastic line. At 300 K, the diffusive reorientational motion appears to be somewhat anisotropic, becoming less so with increasing temperature. An isotropic rotational diffusion model, in which the motions of adjacent molecules are uncorrelated, describes well the results at 525 K. The temperature dependence of the rotational diffusion constants is consistent with a thermally activated process having an activation energy of 32(7) meV.

C(60) (buckminsterfullerene) is the most well-known, the most stable, the most readily available, and in many respects the most interesting member of a recently discovered class of pure carbon molecules known as the fullerenes. A method of making macroscopic quantities of fullerene mixtures was described in late 1990, and since that time many scientists have been investigating the properties of C(60), the higher fullerenes, and their various compounds and derivatives. To date most of the neutron scattering research on these materials has been carried out either at the 20 MW research reactor of the National Institute of Standards and Technology (NIST), or at the ISIS spallation source, Rutherford-Appleton Laboratory. In this article we shall describe the research that has interested and occupied us the most, namely diffraction and low energy inelastic scattering studies of solid C(60). Much of the work that we omit is discussed in two recently published reviews.

Keywords: *Fluorohydrocarbons, *Refrigerants, *Dielectric properties, *Cavity resonators, Radio waves, Dipole moments, Binary mixtures, Ethane, Carbon dioxide, Argon, Calibration, Helium, Mathematical models, Reprints, *1,1,1,2,3,3-hexafluoropropane, *R236ea, Phase boundaries, Clausius-Mossotti equation.

We have used a reentrant radio-frequency (rf) cavity as a resonator operating near 375 MHz to measure changes in the dielectric constant of fluids within it. The utility of these measurements was demonstrated by determining the dipole moment of 1,1,1,2,3,3-hexafluoropropane, a candidate replacement refrigerant (denoted R236ea) and by detecting the phase boundaries in the mixture ((1-x)C2H6 + xCO2), for the mole fraction x = 0.492. The densities of the coexisting phases of the mixture were determined using the Clausius-Mossotti relation which has errors on the order of 0.5% in this application. To test the accuracy of the present techniques, the rf resonator was calibrated with helium and then used to redetermine the molar polarizability A(sub e) of argon. The results were in excellent agreement with published values. Our design of the reentrant resonator makes it suitable for use with corrosive fluids at temperatures up to 400 C.

The expanded responsibilities the authors were given nearly six years ago in becoming the National Institute of Standards and Technology have provided us with a significant challenge. In response to this challenge, the authors have expanded their interactions with U.S. industry to meet their needs and help improve their global competitiveness, while continuing to provide the national system of chemical and physical measurements, the fundamental research base for tomorrow's chemical science and technology, and a national reference laboratory to address critical problems related to public health and safety. With these goals in mind, the report contains research from the following divisions: Biotechnology, Chemical Engineering, Chemical Kinetics and Thermodynamics, Inorganic Analytical Research, Organic Analytical Research, Process Measurements, Surface and Microanalysis Science, and Thermophysics.

Pub. in Jnl. of Solid State Chemistry 108, p80-86 1994.

Keywords: *Crystal structure, Barium oxides, Cobalt oxides, Copper oxides, Yttrium oxides, Perovskites, Room temperature, Tetragonal lattices, Lattice parameters, Neutron diffraction, Magnetic moments, Reprints, *Yttrium barium cuprate cobaltates, *Magnetic ordering.

The nuclear and magnetic structures of the oxygen-deficient perovskite YBaCuCoO5 have been determined by neutron powder diffraction at room temperature. The nuclear structure has the symmetry of space group P4/mmm and lattice parameters a = 3.8679(1), c = 7.5674(2) A. Copper and cobalt atoms are completely disordered in this compound and the oxygen vacancies are located on the layer of the yttrium atoms. As a consequence of this configuration, the Co/Cu atoms have fivefold, pyramidal coordination. The magnetic structure is based on a unit cell related to that of the nuclear structure by an axis transformation of matrix (1, -1, 0/1, 1, 0/0, 0, 2). The magnetic origin of the extra reflections observed experimentally was established by polarized neutron diffraction measurements. If we assume that the magnetic structure has tetragonal symmetry, then the magnetic moments have to assume an orientation parallel to the c axis of the unit cell.

Detailed physicochemical characterization of octacalcium phosphate carboxylates (OCPCs) with structurally incorporated succinate, adipate, suberate, sebacate, fumarate, and citrate ions is reported. Compositional formulas of the OCPCs were derived from Ca, P, C, H, and H2O analyses. X-ray diffraction patterns of OCPCs show structural similarity with the parent compound octacalcium phosphate (OCP); the b and c axes of the unit cells were nearly the same as those of OCP but the a axes were progressively expanded concomitant with carbon chain length. Infrared and Raman assignments were made for nearly all bands of these six OCPCs; an OCP-succinate containing the deuterated succinate ion was prepared to facilitate band assignments. Spectra of the OCPCs, as compared to that of OCP, showed the presence of carboxylate groups, changes in water bonding, only slight changes in PO4 environments, and preferential reduction in HPO4(5) content. OCP has two crystallographically nonequivalent HPO4 groups (designated 5 and 6); the preferential replacement of HPO4(5) by the dicarboxylate ion is plausible considering lattice geometry. By utilizing combined data from the different methods, the possible positions of carboxylate ions in the OCPC structures are discussed.

Pub. in Jnl. of Chemical Physics 100, n2 p775-785, 15 Jan 94.

Keywords: *Nitrogen complexes, *Infrared spectroscopy, Vibrational states, Rotational states, Absorption spectra, High resolution, Hydrogen bonds, Infrared lasers, Nitrogen 14, Nitrogen 15, Isomers, Reprints, *Hydrogen fluoride complexes, *Deuterium fluoride complexes, *Isotopomers, Vibrational predissociation, Supersonic expansion, Potential energy surfaces.

High resolution IR laser direct absorption spectra in a slit jet are presented and analyzed for nitrogen ((15)N(14)N-HF, (14)N(15)N-HF, (15)N(15)N-HF, and deuterium ((14)N(14)N-DF) substituted N2HF isotopomers. Both (14)N(15)N-HF and (15)N(14)N-HF isomers are observed, indicating a sufficiently deep minimum in the hydrogen bonding potential energy surface to quench internal rotation of the N2. The vibrationally averaged stretching potentials for each substituted species are recovered from rotational Rydberg-Klein-Rees (RKR) analysis. Features of the one-dimensional (1D) potential surface such as hydrogen bond length, harmonic force constant, and well depth are then tested for isotopic invariance by direct comparison of the different isotopomers. Agreement among the various N substituted species for HF based complexes for either nu(HF)=0 or 1 is excellent, and provides effective 1D potentials for the stretching coordinate between 3.39 and 3.75 A.

Diffusion of Copper into Gold Plating.
Final rept.
S. P. Pucic. 1993, 4p.
Pub. in Proceedings of Institute of Electrical and Electronics Engineers Instrumentation and Measurement Technology Conference, Irvine, CA., May 18-20, 1993, p114-117.

Keywords: *Copper alloys, *Gold alloys, *Diffusion coefficient, *Electroplating, *Electrical resistivity, *Microwaves, *Interfaces, Electromagnetic radiation, Copper oxides, Surface properties, Electrical engineering, Nickel, Skin effects, Ambient temperature, Reprints.

The value of the room temperature copper - gold interdiffusion coefficient derived by extrapolating from high temperature measurements is an underestimate by several orders of magnitude. Once the full thickness of the gold film is penetrated, copper accumulates on the surface, and a layer of high concentration of copper exists immediately below the gold/air interface. Electrical resistivity of an alloy is much higher than the resistivity of either component. This high resistivity layer may be localized within the skin depth of propagating electromagnetic waves; in cases where copper has reached the surface, it is permanently within the skin depth at any frequency. A nickel 'diffusion barrier,' commonly applied between copper and gold, is unsuitable in many microwave and millimeter-wave applications because of ferromagnetism of nickel at room temperature. The compound that forms on the surface of untreated copper at room temperature in a reasonably clean atmosphere is cuprous oxide. Its properties make it a better alternative to gold in microwave and millimeter-wave engineering.

Pub. in Physical Review B 49, n2 p1005-1010, 1 Jan 94.

Keywords: *Fullerenes, Neutron scattering, Inelastic scattering, Temperature dependence, MeV range 1-10, Superconductors, Librations, Potentials, Phonons, Reprints, *Rubidium potassium fullerides, Density of states.

We report the results of inelastic neutron-scattering measurements on Rb(2.6)K(0.4)C(60). Librational modes were observed as broad peaks with maxima between 4.1 and 4.7 meV, as the temperature is lowered from 300 to 12 K. As in K3C(60), no change in the width or position of the librational peak was observed when the sample was cooled through the superconducting transition. Thus any coupling of the librations to electronic states is small. The magnitude of the orientational potential barrier was estimated from the librational peak frequency. A flat background observed in the low-energy inelastic-scattering spectra is ascribed to two-phonon scattering. The density of states of intramolecular modes is similar to that of previously studied M3C(60) compounds; modes at 53 and 66 meV in pure C(60) are not observed in Rb(2.6)K(0.4)C(60).

Keywords: *Nitric oxide, *Desorption, Near infrared radiation, Visible radiation, Vibrational states, Surface chemistry, Substrates, Silicon, Reprints, *Laser induced desorption.

Laser-induced desorption of NO from Si(111) has been investigated using state-specific detection techniques. The observed energy partitioning in the desorbed NO varies significantly with the NO coverage. Characterization of energy partitioning with desorption-laser wavelengths in the range 355-1907 nm indicates that different substrate electronic excitations are responsible for the desorption at low NO coverage vs saturation coverage. The relationship between the substrate electronic excitation and observed vibrational-state-population distributions is explored.

Viscosity of the Saturated Liquid Phase of Six Halogenated Compounds and Three Mixtures.
Final rept.
D. Ripple, and O. Matar. 1993, 5p.
Pub. in Jnl. of Chemical and Engineering Data 38, n4 p560-564 1993.

Keywords: *Kinematic viscosity, *Fluorohydrocarbons, *Binary mixtures, Viscometers, Temperature dependence, Refrigerants, Reprints, *1,1,1,2-Tetrafluoroethane, *Bis(difluoromethyl) ether, *2-Difluoromethoxy-1,1,1-trifluoroethane, *Pentafluoroethane, *1-Chloro-1,2,2,2-tetrafluoroethane, *Difluoromethane, *R134a, *RE134, *RE245, *R125, *R124, *R32.

Data are reported for the viscosity of six saturated liquids and three mixtures of these liquids over a temperature range from 250 to 330 K. The liquids studied are the halogenated compounds, 1,1,1,2-tetrafluoroethane (R134a), bis(difluoromethyl) ether (RE134), 2-(difluoromethoxy)-1,1,1-trifluoroethane (RE245), pentafluoroethane (R125), 1-chloro-1,2,2,2-tetrafluoroethane (R124), and difluoromethane (R32). The mixtures studied are R125 + R134a, R32 + R134a, and R32 + R124, all at approximately 50% mole fraction. A capillary viscometer constructed of stainless steel and sapphire was used to obtain the data. The measurements are accurate to 3-5% of the kinematic viscosity. A free volume model of viscosity was used to correlate the data.

Pub. in Jnl. of Chemical Physics 94, n12 p7625-7633, 15 Jun 91.

Keywords: *Raman spectra, *Deuterium, *Hydrogen, Atom-molecule collisions, Atom-atom collisions, Line broadening, Line shape, Colliding beams, Helium, Argon, Reprints.

Beam crossings within a spherical-mirror, multipass-cell provide the opportunity to measure, simultaneously, the Raman spectrum for both the forward and backward scattering geometries. The analyses necessary to quantitatively account for such forward-backward spectra are summarized. These simultaneous forward-backward spectra enable unique experimental tests of lineshape functions used for the description of the Raman Q-branch spectrum under conditions where Doppler contributions and Dicke narrowing are significant. Results for the D2:D2 and D2:He systems support the well-known Galatry, or soft collision, lineshape function. For the case of D2:Ar, evidence is advanced for the need to employ the more general complex soft collision function. In addition, these studies have provided data on linear-with-density line broadening (previously published) and line shifting coefficients (reported here) for these molecular systems.

Vibronic Coupling and Other Many-Body Effects in the 4sigmag(-1) Photoionization Channel of CO2.
Final rept.
P. Roy, R. J. Bartlett, W. J. Trela, S. H. Southworth, J. E. Hardis, V. Schmidt, J. L. Dehmer, T. A. Ferrett, and A. C. Parr. 1991, 8p.
Pub. in Jnl. of Chemical Physics 94, n2 p949-956 1991.

Keywords: *Carbon dioxide, *Photoionization, EV range 10-100, Photoelectron spectroscopy, Branching ratio, Vibrational states, Angular distribution, Forbidden transitions, Autoionization, Reprints.

Vibrational branching ratios and photoelectron angular distributions were measured for 4(sigma)g photoionization of CO2 in the energy range 20-28 eV. Of particular interest are three vibrational components of the resulting CO2(1+) C(tilde) doublet Sigma(sub g, sup +) state--the allowed (000) and (100) bands and the forbidden (101) band. The wavelength dependence of the beta parameter for the forbidden band deviated significantly from that of the two allowed bands, showing instead a strong resemblance to that of the B(tilde) doublet Sigma(sub u, sup +) state. This behavior suggests that vibronic coupling to the B(tilde) doublet Sigma(sub u, sup +) state is responsible for the appearance of the forbidden (101) band in the C(tilde) doublet Sigma(sub g, sup +) state photoelectron spectrum. We also observe evidence for other many-body effects--shape-resonance-induced continuum-continuum coupling and doubly-excited autoionizing resonances--in the present data.

Temperature Dependence of the Rate Constants for Reaction of Dihalide and Azide Radicals with Inorganic Reductants.
Final rept.
L. C. T. Shoute, Z. B. Alfassi, P. Neta, and R. E. Huie. 1991, 5p.
Pub. in Jnl. of Physical Chemistry 95, n8 p3238-3242 1991.

Keywords: *Radiolysis, *Radicals, *Temperature, *Reaction kinetics, Inorganic azides, Chemical reactions, Inorganic compounds, Reduction(Chemistry), Radiation chemistry, Activation energy, Reprints, Rate constants.

Rate constants for several reactions of inorganic radicals with inorganic reductants in aqueous solutions have been measured by pulse radiolysis as a function of temperature, generally between 5 and 75 deg C. The temperature dependence of the reaction rate constant is correlated to the reaction exothermicity for the metal complexes, which apparently react by outersphere electron transfer. The simple anions, however, have lower activation energies, which do not correlate well with the exothermicities, suggesting that these anions probably react by an inner-sphere mechanism.

L. C. T. Shoute, and P. Neta. 1991, 4p.
Pub. in Jnl. of Physical Chemistry 95, n11 p4411-4414 1991.

Keywords: *Radiolysis, *Iodine, *Iodine organic compounds, *Reaction kinetics, Atoms, Cations, Chemical reactions, Organic solvents, Radicals, Radiation chemistry, Chemical reactivity, Reprints, Pulse radiolysis.

Pulse radiolysis of iodomethane in various organic solvents leads to formation of iodine atoms or iodomethane radical cations, which in turn form complexes with iodomethane or with the solvent. Radiolysis in cyclohexane gives CH3I.I, which exhibits an absorption peak at 390 nm, whereas radiolysis in benzene forms the solvent complex, C6H6.I, which exhibits an intense broad absorption centered at 490 nm. Replacing the methyl group of iodomethane radical cation with ethyl or isopropyl decreases the reactivity, whereas trifluoromethyl increases the reactivity. These oxidation reactions proceed via an intermediate complex between the iodine species and the organic reductant.

Keywords: *Diamonds, *Graphite, *Precursors, Thermodynamics, Nucleation, Stability, Reprints, Nanostructures.

The letter 'Nanometre-Sized Diamonds are More Stable Than Graphite' by Badziag et al. (BVEG) attempts to provide a basis for the increasingly common observation that diamond is a product in carbon-forming reaction systems. In a plot of bonding energy versus H/C ratio they find diamond precursors to be of lower energy than graphite precursors. They suggest that this implies that diamond precursors are more 'stable' than graphite precursors, hence, from a thermodynamic standpoint, homogeneous diamond nucleation is no more difficult than graphite nucleation.

Shock Tube Techniques in Chemical Kinetics.
Final rept.
W. Tsang, and A. Lifshitz. 1990, 41p.
Pub. in Annual Review of Physical Chemistry 41, p559-599 1990.

Keywords: *Shock tubes, *Reaction kinetics, *Reviews, High temperature, Chemical reactions, Ignition, Reprints.

The review is concerned with the use of shock tubes to study the kinetics of high temperature gas phase chemical processes. It will emphasize reports on investigations published during the past ten years. The last Annual Review article on this subject was published in 1969 by Belford and Strehlow. A book 'Shock Waves in Chemistry', published in 1981, covers much of the literature during the intervening years. There are many reasons for interest in high temperature chemical kinetics. Increasing the temperature opens new reaction channels and thus expands the range of phenomena that can be studied. In conjunction with lower temperature results, the nature of the chemical reaction can be more properly defined. Many important industrial processes occur at high temperatures. With the increasing role of computer simulations for the understanding of such complex processes, there is a great need for fundamental quantitative kinetic information which are the necessary inputs for such programs. The shock tube provides a unique means of generating controlled and chemically well defined high temperature environments.

Pub. in Zeitschrift fuer Physikalische Chemie 179, p349-357 1993.

Keywords: *Lutetium hydrides, *Scandium hydrides, *Yttrium hydrides, *Vibrational spectra, Neutron spectroscopy, Neutron scattering, Solid solutions, Deuterides, Reprints.

Incoherent inelastic neutron scattering was used to study the vibrational spectroscopy of hydrogen (and deuterium) in alpha-phase solid solution with Sc, Lu, and Y. Low-resolution spectra of the tetrahedrally-bound H (and D) in the three rare-earth metals exhibit similar behavior: a soft c-axis-polarized vibration about 25-30% lower in energy than the doubly-degenerate vibrations polarized along the basal plane. Previous diffuse elastic neutron scattering studies of these systems indicate the existence of short-range ordering of metal-atom-bridged hydrogen pairs into c-axis directed chains. High-resolution spectra of the broad c-axis vibrations reveal a temperature- and H-concentration-dependent splitting believed to represent local 'optic' and 'acoustic' bands associated with the dynamical coupling of these hydrogen pairs.

Pub. in Proceedings of Conference on Frontiers of Chemistry (2nd), Columbus, OH., November 11-14, 1990, v2 p21-23.

Keywords: *Molecular orbitals, *Chemical bonds, *Solids, *Brittleness, *Environmental effects, Silicon dioxide, Numerical analysis, Crack propagation, Covalent bonds, Self consistent field, Strains, Reprints.

Based on crack growth rate data, it is known that most brittle solids, ranging from completely ionic (MgF2) to mixed ionic/covalent (SiO2, Al2O3), undergo environmentally enhanced bond rupture. In order to further our understanding of the bond rupture mechanism, we have carried out molecular orbital calculations (MO) using the ab initio self-consistent field technique. The work to date has involved investigations of the effects of strain on the atomic charges, bond overlap population and ionic character of the Si-O bond at the crack tip of silica. Silica was chosen as the model material because of the extensive experimental data available on it.

Brownian Diffusion of Hard Spheres at Finite Concentrations.
Final rept.
M. S. Selim, M. A. Al-Naafa, and M. C. Jones. 1993, 14p.
Pub. in American Institute of Chemical Engineers Jnl. 39, n1 p3-16 Jan 93.

Keywords: *Viscosity, *Spheres, *Brownian movement, *Diffusion coefficient, Dispersions, Silica, Concentration(Composition), Colloids, Reprints, Concentration dependence.

The authors investigated the effect of concentration on the Brownian diffusion of uncharged rigid spheres. Monosize silica spheres were prepared according to the method of Stober (1968). The particles were sterically stabilized by chemisorption of stearic alcohol at their surface by the method developed by van Helden (1981). Particle radius was 14.5 nm from electron micrographs of the coated particles. Osmotic pressure measurements of the sterically stabilized particles dispersed in cyclohexane showed that the particles behaved as hard spheres. The measurements agreed well with predictions from the Carnahan-Starling equation over the concentration range 0.0458 < phi < 0.37 where phi is the volume fraction of the particles in the suspension. Viscosity measurements of silica dispersions were made over the concentration range 0 < phi < 0.25. The Brownian diffusion coefficient of the particles dispersed in cyclohexane was measured over the concentration range 0.0055 < phi < 0.248 using Taylor's hydrodynamic stability method.

Pub. in Theoretica Chimica Acta 84, p85-93 1992.

Keywords: *Chemical bonds, *Atomic ions, Potential energy, Wave functions, Reprints, Dication potentials.

The potential energy of interacting atomic ions A(+) + B(+) often shows a shallow local minimum separated by a broad potential barrier from the dissociation products at much lower energy. Early interpretations of dication potential shapes were based on the similarity of the electronic structure between isoelectronic neutral and ionic species and led to a picture of a chemical bond superimposed on a repulsive Coulomb potential. More recently, barriers in dication potentials have commonly been interpreted as avoided curve crossings involving covalent and ionic structures. In this paper, we demonstrate that the former model is the appropriate one except in cases with very small asymptotic ionic/covalent energy splittings. By deriving dication wavefunctions from their neutral isoelectronic counterparts, we obtain upper bound dication potential curves which show all the characteristic features. By further modeling induction effects, we arrive at an almost quantitative fit of accurate ab initio dication potentials.

Pub. in International Jnl. of Thermophysics 14, n4 p893-922 Jul 93.

Keywords: *Supercritical fluids, Diffusion coefficient, Light scattering, Critical point, Carbon dioxide, Benzene, Toluene, Diffusivity, Reprints, Taylor dispersion.

This paper describes some of the experimental and theoretical problems encountered when the Taylor dispersion method is applied to the measurement of diffusion coefficients near gas-liquid critical points. We have used our own measurements of diffusion of benzene and toluene in supercritical carbon dioxide, along with measurements from several other sources, to illustrate some of the experimental challenges. Special attention is given to the peak shape. The intercomparisons are greatly simplified by comparing the experimental data as functions of density, rather than pressure. We find large and unexplained discrepancies between the various experimental sources. We discuss the theoretical predictions for the relationships between the diffusion coefficients and diffusivities obtained from Taylor dispersion and dynamic light scattering in fluids near critical points. We conclude that there is no strong reason to press for Taylor dispersion measurements near the gas-liquid critical point of the carrier gas.

Critical Behavior of Ionic Fluids.
Final rept.
J. M. H. L. Sengers, and J. A. Given. 1993, 15p.
Pub. in Molecular Physics 80, n4 p899-913 1993.

Keywords: *Electrolytes, Thermodynamic properties, Critical point, Reviews, Reprints, Ionic fluids, Phase separation.

The past 25 years have seen detailed experimental confirmation, in many fluids, of concepts from the theory of critical phenomena. It has been demonstrated that fluids belong to the universality class of the 3D Ising model, with critical exponents as given by renormalization group calculations. Nevertheless, there is an important class of fluid systems, those with ionic components, for which it is not clear that the notions of critical behavior developed for uncharged systems apply. We will review the available experimental evidence, and assess the state of theoretical knowledge.

Standard States, Reference States and Finite-Concentration Effects in Near-Critical Mixtures with Applications to Aqueous Solutions.
Final rept.
J. M. H. L. Sengers, A. H. Harvey, R. Crovetto, and J. S. Gallagher. 1992, 23p.
Pub. in Fluid Phase Equilibria 81, p85-107 1992.

Keywords: *Aqueous solutions, *Critical point, Critical experiments, Liquid-gas mixtures, Debye-Huckel theory, Supercritical fluids, Helmholtz free energy, Concentration(Composition), Activity coefficients, Carbon dioxide, Dilution, Reprints.

The excess Gibbs free energy reference states of both solvent and solute, as commonly used for aqueous solutions, behave anomalously near the critical point of water. This leads to a concentration-dependence of the partial and apparent molar properties that is stronger than usually assumed for nonelectrolyte as well as for electrolyte solutions, and affects a large range of pressure-temperature space where water is highly compressible. As a consequence, extrapolation techniques developed for extracting infinite-dilution properties from data at finite concentration will fail. Examples from various experimental sources, including recent volume measurements in supercritical dilute aqueous CO2, will be used to make this point. The anomalous initial concentration dependence of apparent molar properties interferes with the determination of the Debye-Huckel limiting law description, conventionally incorporated in the excess Gibbs free energy, fails when the compressibility of the solvent changes rapidly. A more appropriate frame of reference will be proposed.

Surface Geometry of BaO on W(100): A Surface-Extended X-Ray-Absorption Fine-Structure Study.
Final rept.
A. Shih, C. Hor, W. Elam, J. Kirkland, and D. Mueller. 1991, 9p.
Pub. in Physical Review B 44, n11 p5818-5826, 15 Sep 91.

Keywords: *Barium oxides, *Monomolecular films, Surface analysis, Substrates, Single crystals, Adsorption, Tungsten, Reprints, X-ray absorption fine structure.

A surface-extended x-ray-absorption fine-structure study of ordered monolayers of coadsorbed barium and oxygen on a single-crystal W(100) surface is described. A (square root of 2) X (square root of 2) R45(degrees) structure with a stoichiometric barium-to-oxygen ratio, and a (2(square root of 2)) X (square root of 2) R45(degrees) structure with a nearly 1:2 barium-to-oxygen atomic ratio both form on W(100). The surface-extended x-ray absorption fine-structure results indicate that all of the barium and oxygen atoms are nearly coplanar in the (square root of 2) X (square root of 2) R45(degrees) overlayer. The Ba-to-O distance in this overlayer is 3.20 + or - 0.05 A and beta = 82 deg + or - 5 deg, where beta is the angle between the Ba-O internuclear axis and the surface normal. For the (2(square root of 2)) X (square root of 2) R45(degrees) overlayer, there are two types of oxygen sites. Oxygen atoms, nearly coplanar with the barium atoms are also present in these films.

Observation of a Stable Methoxy Intermediate on Cr(110).
Final rept.
N. D. Shinn. 1992, 9p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Surface Science 278, p157-165 1992.

Keywords: *Surface chemistry, Photoelectron spectroscopy, Ultraviolet spectroscopy, Chemical dissociation, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Stability, Work functions, Photoemission, Methanol, Chromium, Reprints, *Methoxy radicals.

Ultraviolet photoelectron spectroscopy (UPS) and work function changes are used to identify a stable methoxy intermediate, CH3O(ads), on Cr(110) at 90 K following low exposures of methanol, CH3OH(g). Higher methanol exposures at 90 K add subsequent layers of physisorbed methanol which desorb above 120 K. Methoxy dissociation into atomic fragments occurs between 250 and 400 K. The absence of a stable CO(ads) dissociation intermediate indicates that methyl group dehydrogenation is rate limiting on Cr(110). As was previously found on Fe(100) and Mo(100), the stability of CH3O(ads) over CO(ads) on Cr(110) is opposite of that proposed by Sexton based upon relative heats of adsorption. Consideration of the CH3O:metal and CO:metal bonding mechanisms leads to the proposition that substrate electronic properties, rather than steric or substrate morphological factors, are responsible for the anomalous methoxy stability on these surfaces.

Fragment State Correlations in the Dissociation of NO.HF(v=1).
Final rept.
J. H. Shorter, M. P. Casassa, and D. S. King. 1992, 8p.
Pub. in Jnl. of Chemical Physics 97, n3 p1824-1831, 1 Aug 92.

Keywords: *Chemical dissociation, Chemical bonds, Excited states, Vibrational states, Rotational states, Fragments, Dimers, Reprints, *Nitric oxide complexes, *Hydrogen fluoride complexes, *Vibrational predissociation.

The NO(nu,J)-fragment population distributions and recoil energies were measured for the vibrational predissociation of NO (dot) HF following excitation of the H-F stretch. Most of the available energy appears in NO vibration and/or HF rotation. There is little recoil momentum. The data support two possibilities for the NO (dot) HF dimer bond energy: (1) D(0) = 448 + or - 5/cm with coincident pairs of fragments NO(nu = 0) + HF(J = 12) and NO(nu = 1) + HF(J = 8); (2) D(0) = 1769 + or - 10/cm with J(HF) = 9 and 2, respectively.

Shape-Resonance-Enhanced Continuum-Continuum Coupling in Photoionization of CO2.
Final rept.
M. R. F. Siggel, J. B. West, M. A. Hayes, I. Iga, A. C. Parr, and J. L. Dehmer. 1993, 8p.
Pub. in Jnl. of Chemical Physics 99, n3 p1556-1563, 1 Aug 93.

Keywords: *Carbon monoxide, *Photoionization, EV range 10-100, Angular distribution, Branching ratio, Electronic states, Photoelectrons, Asymmetry, Reprints.

We have measured photoionization branching ratios and photoelectron asymmetry parameters for photoionization of CO2 leading to the first four electronic states of CO2(1+) over the photon energy range from 20 to 50 eV. The motivation for this work was the prediction by Lucchese (J. Chem. Phys. 92, 4203 (1990)) that the sigma(sub mu) shape resonance in the (4 sigma(sub g))(sup -1) C(tilde) doublet Sigma(sub g, sup +) ionization channel would influence the photoionization dynamics in the other valence-shell continua through continuum-continuum channel interaction, with the main effect occurring in the (3 sigma(sub mu))(sup -1) B(tilde) doublet Sigma(sub mu, sup +) channel. Indeed, clear evidence for this phenomenon is observed in this channel, the most prominent indication being a broad, shallow minimum in the asymmetry parameter at approx 40 eV. Comparisons of the present results with theory and other measurements reflect good overall agreement and provide some guidance regarding the effectiveness of alternative approximations used in the theoretical calculations.

The vapor pressures of 1-chloro-1,1-difluoroethane (R142b) and 1,1-difluoroethane (R152a) have been measured at temperatures between 224.8 and 284.7 K for R142b and between 219.9 and 273.1 K for R152a by a comparative ebulliometric technique. Our results have been combined with selected published results to provide a smoothing equation for the vapor pressure. For R142b, our equation is valid from 200 to 300 K while for R152a the temperature range goes from 215 K to the critical temperature, near 386 K.

Pub. in Jnl. of Physical Chemistry 97, n24 p6564-6572 1993.

Keywords: *Cytochrome c, *Monomolecular films, *Gold, *Adsorption, Electron transfer, Electrodes, Spectrum analysis, Kinetics, Surface properties, Biochemistry, Reprints, *Alkane thiolates.

Composite monolayer structures comprised of cytochrome c strongly adsorbed to alkanethiolate self-assembled (SA) monolayers on sputter-deposited gold film electrodes, i.e., cyt c/HOOC(CH2)nS/Au(n = 5, 10, 15), were examined using cyclic voltammetry (CV), electrochemical impedance spectroscopy (EIS), and X-ray photoelectron spectroscopy (XPS). Monolayer coverage of cytochrome c in a stable, functional, electroactive state was obtained in neutral phosphate buffer of low ionic strength for the thickest film (n = 15). Somewhat lower electroactive coverages were generally observed with the thinner SA monolayers (n = 5, 10). The surface formal potential of cytochrome c, +215 mV vs NHE, is nearly identical to values previously reported for cytochrome c bound to physiological membranes. The potential usefulness of these composite monolayers for investigating biological electron transfer is highlighted.

Thermodynamic Properties of R134a(1,1,1,2-Tetrafluoroethane).
Final rept.
M. L. Huber, and M. O. McLinden. 1992, 10p.
Pub. in Proceedings of International Refrigeration Conference, Purdue University, July 14-17, 1992, 10p.

Keywords: *Fluorohydrocarbons, *Thermodynamic properties, *Refrigerants, Temperature dependence, Pressure dependence, Specific heat, Density(Mass/volume), Vapor pressure, Acoustic velocity, Vapor phases, Liquid phases, Phase transformation, Equations of state, Volume, Reprints, *R134a, *1,1,1,2-Tetrafluoroethane, Benedict-Webb-Rubin equation.

The thermodynamic surface of R134a is expressed in terms of a 32-term modified Benedict-Webb-Rubin (MBWR) equation of state. Coefficients for this equation and for the ancillary equations representing the saturated liquid and vapor densities and the vapor pressure are presented. Temperatures are given on the new International Temperature Scale of 1990 (ITS 90). The MBWR coefficients were obtained using a multi-property fit that used experimental data for PVT properties, isochoric heat capacity, second-virial coefficients, speed of sound, and coexistence properties, including new measurements not used in previous formulations. The formulation is applicable to both the liquid and vapor phases at pressures up to 70 MPa, and for a temperature range from the triple point to 450 K. The accuracy of the equation of state is estimated to be + and - 0.2 % in density, + and - 1.0 % in constant-volume heat capacities, and + and - 0.6 % in the sound velocity, except in the critical region, based on comparisons with experimental data. In addition, a comprehensive bibliography of experimental data for R134a is presented.

High-Temperature Adiabatic Calorimeter for Constant-Volume Heat Capacity Measurements of Compressed Gases and Liquids.
Final rept.
J. W. Magee. 1991, 5p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Symposium on Energy Engineering Sciences (9th), Argonne, IL., May 13-15, 1991, 5p.

Keywords: *Specific heat, *Calorimeters, Calorimetry, Compressed gases, High pressure, High temperature, Reprints, *Constant volume heat capacity, *Adiabatic calorimeters.

A high-temperature adiabatic calorimeter has been developed to measure constant-volume molar heat capacity. The chief design feature is its nearly identical twin cells which allow accurate measurement of energy differences without large corrections for energy losses due to thermal radiation fluxes. Operating conditions for the calorimeter are temperatures from 300 to 700 K at pressures from 0 to 20 MPa. The calorimeter is designed to measure heat capacities of both gases and liquids, especially fluids of interest to emerging energy technologies.

Contract DE-FG05-883413902
Sponsored by Department of Energy, Washington, DC.
Pub. in International Jnl. of Thermophysics 15, n4 p687-697 Jul 94.

Keywords: *Equations of state, *Critical point, *Scaling laws, Mathematical models, Thermodynamic properties, Thermophysical properties, Ideal gas law, Reprints, Carnahan-Starling-DeSantis equation of state.

In this paper we present a method which modifies a classical equation of state by incorporating the nonclassical critical behavior. As an example we have applied our procedure to the Carnahan-Starling-DeSantis (CSD) equation of state. The resulting equation reproduces the universal scaling behavior near the critical point and reduces to the universal ideal-gas behavior at low densities. We show that the renormalized CSD equation yields an improved and consistent representation of both mechanical and caloric thermodynamic properties. In addition, the suppression of the critical temperature due to the critical fluctuations is clearly demonstrated.

Neighbor Tables for Molecular Dynamics Simulations.
R. D. Mountain. Dec 94, 15p, NISTIR-5545.

Keywords: *Condensed matter physics, *Molecular dynamics, *Computerized simulation, Monte Carlo meth-

od, Thermodynamic properties, Transport properties, Computer programs, Particle interactions, Sorting, Liquids, Solids, *Neighbor tables, Fortran 77 programming language, Cell index method, Method of shadows, Particle simulations.

Two methods for constructing a neighbor table for use in Molecular Dynamics simulations are discussed. A linked-list based method is shown to require time for generation of the table that is roughly proportional to the number of particles, N, in the system when the range of forces is small compared to the volume of the system. An alternative method that requires O (N(sup 2)) operations is also discussed and problems where it may be preferable to the linked-list method are mentioned. Source code listing both methods is included in appendices.

Pub. in Jnl. of Molecular Spectroscopy 164, p395-415 1994.

Keywords: *Rotational spectra, Far infrared radiation, Hyperfine structure, Chemical radicals, Chemical bonds, Ground states, M1-transitions, E2-transitions, Reprints, *Cobalt hydrides, Laser magnetic resonance.

Five rotational transitions of CoH in its ground triplet Phi state have been detected by far-infrared laser magnetic resonance, three in the lowest Omega = 4 component and two in the Omega = 3 component. All of the Zeeman transitions show an octet hyperfine pattern due to the (59)Co nucleus (I = 7/2). The much smaller proton doubling was also resolved for most transitions. The data have been fitted to experimental accuracy by an effective Hamiltonian for a molecule in an isolated triplet Phi state. The electron orbital and spin g factors determined by the data confirm conclusively that the ground state of CoH is a triplet Phi state. The accurate measurement of the rotational constant allows the equilibrium bond length to be determined. The cobalt hyperfine splittings have been fitted to determine magnetic dipole and electric quadrupole parameters.

Fine-Structure Intervals of (14)N(+) By Far-Infrared Laser Magnetic Resonance.
Final rept.
J. M. Brown, and A. L. Cooksy. 1994, 4p.
Pub. in Astrophysical Jnl. 428, pL37-L40, 10 Jun 94.

Keywords: *Nitrogen ions, Far infrared radiation, Laser spectroscopy, Hyperfine structure, Fine structure, Ground states, Nitrogen 14, Reprints, Laser magnetic resonance.

The far-infrared laser magnetic resonance spectra associated with both fine-structure transitions in (14)N(1+) in its ground triplet P state have been recorded. This is the first laboratory observation of the J = 1 <-- 0 transition and its frequency has been determined two orders of magnitude more accurately than previously. The measurement of the J = 2 <-- 1 spectrum revealed a small error in the previous laboratory measurements. The fine-structure splittings (free of hyperfine interactions) determined in this work are (Delta)E(10) = 1461.13190 (61) GHz, (Delta)E(21) = 2459.38006 (37) GHz. Zero-field transition frequencies which include the effects of hyperfine structure have also been calculated. Refined values for the hyperfine constants and the g(J) factors have been obtained.

Partial Scattered Intensities from a Binary Suspension of Polystyrene and Silica.
Final rept.
H. J. M. Hanley, G. C. Straty, and P. Lindner. 1994, 8p.
Sponsored by Department of Energy, Washington, DC.
Pub. in LANGMUIR 10, n1 p72-79 1994.

Keywords: *Neutron scattering, *Suspensions, *Binary systems(Materials), *Silicon dioxide, *Polystyrene, Small angle scattering, Latex, Particles, Mixtures, Water, Structure factors, Reprints, *Colloidal suspensions.

The paper reports SANS (small angle neutron scattering) experiments on aqueous binary suspension mixtures of charged polystyrene latex and silica particles, characterized by the size ratio, gamma= sigma(sub si)/sigma(sub pa) approximately 0.72, with a nominal polystyrene diameter, sigma(sub pa) = 91 nm. The scattered intensities are reported over the wave vector (O) range 0.025 < Q/nm(sup -1) < 0.4. Partial scattered intensities were obtained by contrast matching the constituents with an appropriate D2O/H2O solvent. Results are presented. The partial scattered intensity of polystyrene differs significantly from that of silica at a given value of n, and the partial scattered intensity of a component in a mixture suspension can differ markedly from the equivalent scattered intensity of the component in a pure suspension. The variation of the intensity with Q for silica in a 1/1 mixture suggests long range silica order at low O. There is some evidence that the larger component, polystyrene, may form a polycrystalline fcc phase, in agreement with the density functional theory. The effect of multiple scattering on the data is discussed.

Keywords: *Supercritical fluids, *Solubility, *Ferrocenes, *Measuring instruments, Carbon dioxide, Thermophysical properties, Solutes, Test facilities, Concentration(Composition), Reprints, *High pressure cells.

This paper describes the design, construction, and operation of an ultraviolet-visible light-transmission cell for high-pressure fluids. The cell can be operated at pressures as high as 70 MPa and at temperatures up to 100 C. This instrument was specifically designed to measure the solubility of solutes in supercritical fluids. The cell has an internal saturator and fluid circulator that are easy to remove and clean. The solubility of ferrocene in supercritical carbon dioxide was measured in the high-pressure cell described here. At 40 C, the mole fraction of ferrocene in carbon dioxide increased from 0.00005 to 0.0015 as the solvent density was increased from 5 to 17 mol/L.

Elastic-Electron-Scattering Effects on Angular Distributions in X-ray Photoelectron Spectroscopy.
Final rept.
A. Jablonski, and C. J. Powell. 1994, 10p.
Pub. in Physical Review B 50, n7 p4739-4748, 15 Aug 94.

Keywords: *X ray photoelectron spectroscopy, *Electron scattering, Monte Carlo method, Angular distribution, Surface analysis, Elastic scattering, Photoionization, Photoemission, Simulation, Gold, Reprints.

Electron trajectories in x-ray photoemission from solids are partially randomized by elastic collisions, and thus the angular distribution of photoelectrons leaving the surface is different from that for isolated atoms. This problem is approached in the present work by extensive Monte Carlo simulations of electron trajectories resulting from photoionization of the gold 4s, 4p(3/2), 4d(5/2), and 4f(7/2) subshells by Mg characteristic x rays. Calculations were made for the full range of angles of x-ray incidence and for all possible positions of the electron energy analyzer. In comparisons with intensities predicted from the common formalism in which elastic scattering is neglected, it was found that the elastic-scattering effects can be accounted for with two correction factors. These factors are, to a large extent, independent of experimental geometry for certain ranges of angles.

Grazing Incidence X-ray Photoemission and Its Implementation on Synchrotron Light Source X-ray Beamlines.
Final rept.
T. Jach, M. J. Chester, and S. M. Thurgate. 1994, 3p.
Pub. in Nuclear Instruments and Methods in Physics Research A 347, p507-509 1994.

Keywords: *X ray photoelectron spectroscopy, Synchrotron radiation sources, X ray sources, Grazing incidence, KeV range 1-10, Chemical composition, Oxide films, Surface layers, Photoemission, Germanium, Reprints, Surface composition.

Grazing incidence X-ray photoemission spectroscopy provides a method of obtaining information about surface chemical composition as well as the variation of composition with depth. Photoemission spectra are taken as X-rays are directed onto a surface over a range of incidence angles near the critical angle for total external reflection. The technique is particularly suited to the study of surface layers in the thickness range 10-40 A, using X-rays in the energy range of 1-2 keV. We have implemented the technique in a geometry that minimizes distortion of the spectral lineshape by keeping a fixed relationship between the sample and the electron spectrometer. We present data taken in the laboratory that illustrate its application to the study of oxide films on Ge. The counting time for a spectrum would be shortened considerably by implementing the method on a soft X-ray beamline at a synchrotron light source. We present a method for doing so that retains the advantages of a fixed geometry between the sample and the electron spectrometer.

Correlation of the Ideal Gas Properties of Five Aromatic Hydrocarbons.
Final rept.
A. Laesecke. 1993, 3p.
Pub. in Ind. Eng. Chem. Res. 32, p759-761 1993.

Keywords: *Benzene, *Toluene, *Xylenes, *Ideal gas, *Specific heat, *Enthalpy, *Entropy, *Empirical equations, Thermodynamic properties, Temperature dependence, Mathematical models, Statistical mechanics, Reprints, *Temperature functions.

The ideal gas thermodynamic properties specific heat capacity, specific entropy, and specific enthalpy have been correlated for benzene, toluene, o-xylene, m-xylene, and p-xylene by a uniform, semiempirical function of temperature. The correlation is based on literature values calculated from statistical mechanics for temperatures up to 1500 K for benzene and up to 3000 K for the other molecules. The temperature function chosen is more accurate than that used for previous correlations, and can be used in a wider temperature range.

Composition Dependence of a Field Variable Along the Binary Fluid Mixture Critical Locus.
Final rept.
J. C. Rainwater, and D. G. Friend. 1994, 7p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Physics Letters A 191, p431-437 1994.

Keywords: Binary mixtures, Liquid-vapor equilibrium, Critical point, Concentration(Composition), Temperature, Phase transformations, Phase diagrams, Thermodynamic properties, Fluids, Reprints, *Field variables, Critical line.

There are several classes of field variables used to extend the principle of critical-point universality to binary fluid mixtures. In particular, one can construct a field variable with sufficient flexibility to allow linearity in composition along the critical locus for the large class of binary systems with a critical line which is monotonic in temperature. This choice of hidden field variable has been used extensively in studies of vapor-liquid equilibrium, but a recent study of an alternative class of field variables suggests that linearity in composition along the critical locus cannot, in principle, be imposed exactly. It is demonstrated that several arguments presented by proponents of this proposition do not, in fact, apply to the field variable constructed in our studies.

Equilibrium Pair Distribution Function of a Gas: Aspects Associated with the Presence of Bound States.
Final rept.
J. C. Rainwater, and R. F. Snider. 1993, 11p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Jnl. of Chemical Physics 99, n11 p9111-9121, 1 Dec 93.

Keywords: *Distribution functions, *Potential energy, *Dimers, *Gases, Momentum, Chemical equilibrium, Thermodynamic equilibrium, Moments, Mathematical models, Atoms, Reprints, *Potential functions.

At thermal equilibrium the momentum distribution of atoms in a gas is usually assumed to be Maxwellian, whether classically or quantally. However, if an atom is bound in a diatomic molecule, the atom's momentum distribution is non-Maxwellian. This paper explores the consequent singlet and pair particle distribution functions in a gas having both unbound atoms and bound pairs of atoms. Comment is made on the range of behavior associated with whether the chemical equilibrium constant for diatom formation is small or large. Calculations of distribution functions and their moments for atoms which are members of dimers are presented for some specific model potentials.

Pure Rotational Spectra of CuH and CuD in Their Ground States Measured by Tunable Far-Infrared Spectroscopy.
Final rept.
T. D. Varberg, and K. M. Evenson. 1994, 5p.
Pub. in Jnl. of Molecular Spectroscopy 164, p531-535 1994.

Keywords: *Copper hydrides, *Rotational spectra, *Infrared spectra, Molecular spectroscopy, Far infrared radiation, Ground states, Copper 63, Copper 65, Reprints, *Copper deuterides.

Pure rotational transitions of CuH and CuD within the Chi singlet Sigma(+) (upsilon = 0) state were measured over the ranges J(double prime) = 1 to 10 for CuH and J(double prime) = 2 to 18 for CuD, including both the (63)Cu and (65)Cu isotopes. The rotational parameters B(0), D(0), H(0), and L(0) were separately determined for each of the four isotopomers by least-squares fitting to the observed transitions. For (65)CuH, (63)CuD and (65)CuD, these parameters are about two orders of magnitude more accurate than those determined by previous workers. Accurate calculated frequencies of all four isotopomers which will be useful in astronomical studies of CuH and CuD are given.

Keywords: *Polyamines, *Phosphates, Electrodes, Anions, Cyclic compounds, Reprints, *Selective electrodes, Cyclodecane-dione/decyl-triaza, Ionophore.

A cyclic polyamine, 3-decyl-1,5,8-triazacyclodecane-2,4-dione (N3-cyclic amine), was used as the ionophore for a dibasic phosphate-selective electrode. This electrode exhibited a linear response between 1.0 micromol/L and 0.1 mol/L dibasic phosphate activity with a near-Nernstian slope of approximately -29 mV per activity decade. The electrode selectivity for dibasic phosphate over other commonly occurring anions was evaluated. A mechanism for the selectivity of the electrode toward HPO4(-2) ions is postulated to be a function of the size and charge of the N3- cyclic amine ionophore relative to the size and charge of HPO4(-2) ions. The electrode's superior selectivity and sensitivity make possible the direct measurement of phosphate activity in a wide variety of applications.

Keywords: *Metal carbonyls, *Photodecomposition, Temperature range 0065-0273 K, Photochemical reactions, Surface chemistry, Ultraviolet radiation, Excited states, Silicon, Reprints, *Hexacarbonylmolybdenum, Laser induced desorption.

State-resolved detection techniques have been used to characterize the ultraviolet photodecomposition dynamics of Mo(CO)6 on Si(111) 7 X 7 at 100 K. Details of the excitation/fragmentation mechanism including adsorbate energy transfer were examined by measuring the cross sections and the internal and translational energies of the photoejected CO from submonolayer through multilayer coverage regimes. The CO energy distributions are found to be independent of Mo(CO)6 coverage, and can be characterized by two components with markedly different mean energies. In contrast to the coverage independence of the measured energy disposal, the cross section was found to decrease by a factor of 3 from multilayer coverages to submonolayer coverages.

Keywords: Binary systems(Materials), Temperature gradients, Temperature effects, Rayleigh Taylor instability, Cylindrical configuration, Capillarity, Metals, Reprints, *Crystal-melt interface, Two phase systems.

The temperature of a crystal-melt interface at equilibrium is given by the Gibbs-Thomson equation, which relates the interface temperature to the mean curvature of the interface. As isothermal cylindrical crystal-melt interface is subject to capillary instabilities of the type originally studied by Rayleigh. The dependence of this instability on the materials properties of the system is described for a two-phase, single-component system with isotropic surface energy. The effect of radial temperature gradients on the instability is also given. For metallic systems, the instability can be important at micrometer-sized length scales, but become insignificant at macroscopic (millimeter-sized) length scales. Heating the liquid causes stabilization, and the instability is completely suppressed for large enough temperature gradients in the liquid.

Pub. in Physica A 210, p453-460 1994.

Keywords: *Monte Carlo method, Lennard-Jones potential, Computerized simulation, Triple point, Efficiency, Sampling, Liquids, Algorithms, Reprints.

An easily applied, physically motivated algorithm for determining the efficiency of Monte Carlo simulations is introduced. The theoretical basis for the algorithm is developed. As an illustration, I apply the method to the Lennard-Jones liquid near the triple point. We show that an acceptance ratio of 0.2 is twice as efficient for the purpose of generating a satisfactory sample as is an acceptance ratio of 0.5. There is a strong correlation between the efficiency measure and the diffusion rate of liquid particles during the simulation. We argue that the optimal value of the acceptance ratio is calculable from short Monte Carlo simulations. The method is very general and is applicable to Monte Carlo simulations involving arbitrary potentials.

The sodalite cage containing only an electron as a nonframework 'anion' is well adapted for the study of solvated 'electride' Wigner lattices and quantitative mapping of the intra- and intercage electronic potential surfaces. In this paper we report the direct synthesis of anion free cage structures of the form Na3( )(ABO4)3(center dot)nH2O (A: B = Al.Ga:Si.Ge) as possible precursors for sodalite electride synthesis. A novel, low-temperature sodalite dehydroxylation method is presented for the preparation of Na3( )(AlSiO4)3(center dot)4H2O from Na4(OH)(AlSiO4)3(center dot)1.72H2O. Results from a neutron diffraction study of Na3(ZnAsO4)3(center dot)4H2O give evidence of hydrogen bonding between the framework oxygen atoms and the Beta-cage substructure and aid in explanation of analog unit cell trends. All of the investigated sodalites have an ordered array of their framework tetrahedral cations and crystallize in the cubic space group P(bar 4)3n, Z = 2.

Incoherent inelastic neutron scattering (IINS) measurements of hydrogen bound to Ir6 clusters in the nanoscale pores of zeolite NaY and similar clusters in KL zeolite are reported. On the basis of hydrogen uptake measurements and the observation of peaks in the IINS spectra, we infer that hydrogen is bound to the metal nanoclusters in the zeolite pores. The IINS data for both zeolites are similar and consistent with the presence of IrH2 species.

Keywords: Time-of-flight spectrometers, Polarization characteristics, Vibrational states, Deuterium compounds, Neutron scattering, Inelastic scattering, Films, Reprints, *Poly(p-phenylene vinylene), Density of states, Lattice modes.

Mode polarization and energy spectra for the lattice modes of poly(p-phenylene vinylene) are obtained by inelastic-incoherent-neutron-scattering methods. Experiments were performed on stretch-oriented, highly crystalline films with time-of-flight and filter-analyzer spectrometers. By measuring all-hydrogen and vinylene-deuterated samples, we show that almost all of the observed modes can be attributed to phenylene motions. The low-energy features in the vibrational density of states consist of a longitudinal 2.5-meV mode assigned to a damped translational motion along the chain axis, a 7-meV phenyl ring in-phase librational mode (transverse with respect to the chain axis), and strong bands at 15 and 25 meV showing mixed polarization, the latter also displaying negative frequency shift with increasing temperature. Higher-frequency modes are in excellent agreement with published infrared and Raman studies, as well as with the results of our vibrational analysis based on the semiempirical AM1 method.

Powder Neutron Diffraction Investigation of Structure and Cation Ordering in Ba2+xBi2-xO6-y.
Final rept.
K. P. Reis, A. J. Jacobson, and J. M. Nicol. 1993, 16p.
Pub. in Jnl. of Solid State Chemistry 107, p428-443 1993.

Keywords: *Crystal structure, Time-of-flight method, Ambient temperature, Neutron diffraction, Monoclinic lattices, Cubic lattices, Cations, Reprints, *Barium bismuthates, *Barium bismuth oxides.

The structures and cation ordering of several barium bismuth oxide phases, Ba(2+x)Bi(2-x)O(6-y) (x = 0.22, 0.28, 0.40, 0.67), have been determined at ambient temperature from constant wavelength and time-of-flight neutron powder diffraction data. The end member of the series, Ba2Bi(III)Bi(V)O6, has a monoclinic distortion of the simple cubic perovskite structure with an ordered arrangement of the Bi(3+) and Bi(5+) cations on the B sites. When additional barium atoms are introduced into the structure, substitution of Ba for Bi(III) occurs to give phases with the composition Ba2((Bi(1-x)Ba(x))Bi)O6 when x < 0.6. The monoclinic structure at x = 0 changes first to a rhombohedral structure and then to cubic as x is increased. At x = 0.67, the structure remains cubic but the cation distribution changes to give an unusual arrangement, with Bi(3+) cations on the perovskite A sites and complete Ba(2+)/Bi(5+) ordering on the B sites.

Thermodynamic Study of the Reactions of Cyclodextrins with Primary and Secondary Aliphatic Alcohols, with D- and L-Phenylalanine, and with L-Phenylalanineamide.
Final rept.
M. V. Rekharsky, F. P. Schwarz, Y. B. Tewari, and R. N. Goldberg. 1994, 7p.
Pub. in Jnl. of Physical Chemistry 98, n40 p10282-10288, 6 Oct 94.

Keywords: *Thermodynamic properties, *Cyclodextrins, *Alcohols, *Chemical reactions, Heat of reaction, Equilibrium, Specific heat, Entropy, Calorimetry, Volumetric analysis, Gibbs free energy, Aliphatic compounds, Reprints.

Equilibrium constants and standard molar enthalpies of reaction have been determined by titration calorimetry for the reactions of 1-propanol, 2-propanol, 1-butanol, (R)-(+)-2-butanol, (S)-(-)-2-butanol, (+ or -)-butanol, (R)-(+)-2-pentanol, (S)-(-)-2-pentanol, (R)-(+)-2-hexanol, (S)-(-)-2-hexanol, (R)-(+)-2-heptanol, (S)-(-)-2-heptanol, D-phenylalanine, L-phenylalanine, and L-phenylalanineamide with alpha-cyclodextrin and Beta-cyclodextrin. The standard molar Gibbs energies, standard molar enthalpies, and standard molar entropies for these reactions correlate well with respect to the number of carbon atoms in the chemical formula of the alcohol and form a series of distinct curves for the different types of alcohols. The results are also discussed in relation to hydrophobic, steric, and charge effects and the exchange reaction for a ligand from alpha-cyclodextrin to Beta-cyclodextrin. With the exception of the results for the standard molar enthalpies of reaction of the 2-butanols with alpha-cyclodextrin, the results obtained in this study show that, within the indicated uncertainties, there are no differences in any of the thermodynamic quantities for the reactions of these ligands with either alpha- or Beta-cyclodextrin due to the change in the location of a hydrogen atom on an optically active carbon atom.

Pub. in Physical Review B 50, n21 p15 739-15 743, 1 Dec 94.

Keywords: *Yttrium hydrides, Neutron scattering, Inelastic scattering, Vibrational spectra, Phonons, Dynamics, Reprints, *Yttrium deuterides, Isotope dilution neutron spectroscopy, Density of states.

Isotope-dilution neutron spectroscopy was used to investigate the dynamics of the H and D optic vibrations in YH2 and YD2, respectively. The broad, complex, densities of states of the tetrahedrally coordinated H and D atoms in the isotopically pure materials collapse to single, sharp, triply degenerate features when the H and D atoms are sufficiently diluted with their companion isotopes. This demonstrates that the vibrational dispersion for the pure materials is due to the presence of significant H-H and D-D dynamic-coupling interactions. Moreover, a spectral doublet (with 5-meV splitting) superimposed on the sharp D-defect-mode feature for Y(H(0.9)D(0.1))2 is suggestive of localized acoustic and optic branches of dynamically coupled, near-neighbor D-D pairs isolated in the predominantly hydrided material. The magnitude of the splitting implies a D-D/Y-D force-constant ratio of about 6%. The dynamics of both light (H) and heavy (D) mass defects are in general agreement with simple mass-defect theory.

Pub. in Physical Review B 50, n10 p7144-7146, 1 Sep 94.

Keywords: *Terbium hydrides, Concentration(Composition), Quantity ratio, Neutron scattering, Inelastic scattering, Reprints, *Hydrogen ordering, Density of states.

The octahedrally coordinated hydrogen (H(o)) of the superstoichiometric rare-earth dihydrides beta-TbH(2 + x)(0.03 < x < 0.25) has been probed by incoherent inelastic neutron scattering. The H(o) sublattice arrangements and associated optical vibrations are sensitive to the value of x. For x = 0.03 at low temperature, the majority of the low-concentration o-site hydrogens are isolated in a local cubic environment and exhibit a relatively sharp vibrational density of states at 80.8 meV, in accord with the presence of triply degenerate normal modes. In contrast, for x = 0.25, a broad bimodal band peaking at about 76.7 and 83.1 meV is evident, consistent with the type of long-range order that is known to occur in the H(o) sublattice at this higher concentration. Increasing the temperature above the long-range ordering transition leads to a more disordered H(o) sublattice and a density of states similar to that at low values of x but broadened, most likely by the persistence of some short-range order.

Keywords: *Vibrational spectra, *Hydrogen, *Deuterium, *Lutetium, Solid solutions, Neutron scattering, Inelastic scattering, Temperature dependence, Reprints.

The vibrational spectroscopy of hydrogen isotopes in alpha-phase solid solution with Lu was probed by incoherent-inelastic-neutron-scattering methods. Low-resolution spectra of H and D located at tetrahedral interstices are qualitatively similar to those of other rare-earth/hydrogen alpha phases, indicating a vibrational mode along the c direction that is about 30% softer and significantly broader than the doubly degenerate vibrational modes in the basal plane. High-resolution spectra of these broad c-axis vibrations reveal a temperature- and concentration-dependent line shape believed to consist of local acoustic and optic bands associated with the dynamical coupling of hydrogen atoms paired on either side of a metal atom along the c direction. Previous diffuse-elastic-neutron-scattering studies indicate the existence of short-range ordering of these hydrogen pairs into c-axis-oriented chains possessing interchain correlations. The shape and width of these bands at low temperature near the alpha/Beta-phase boundary compared to those of the analogous Sc and Y alpha-phase systems suggest that the extent of ordering in alpha-LuH(x) is intermediate with respect to that in the (less ordered) alpha-ScH(x) and (more ordered) alpha-YH(x) solid solutions.

Sponsored by Electric Power Research Inst., Palo Alto, CA. and Department of Energy, Washington, DC.
Pub. in Physica Scripta T53, p9-29 1994.

Keywords: *Sulfur hexafluoride, *Corona discharges, *Glow discharges, *Plasma chemistry, Decomposition reactions, Gas mixtures, Electron impact, Oxygen fluorides, Oxidation, Reprints.

A zonal plasma chemical model is proposed to account for the observed oxidation and decomposition of sulfur hexafluoride (SF6) by a negative, point-to-plane glow-type corona discharge in pressurized SF6/O2/H2O gas mixtures. The model yields dependencies of stable neutral oxidation by-products such as SOF2, SO2F2, SOF4, S2F(10), and SO2 on time, discharge current, and O2 and H2O concentrations which are consistent with measured results. Electron-impact-induced dissociation of SF6 in the glow region of the discharge is the decomposition rate-controlling process. The relative roles played by different reactions involving neutral free radicals and ions in different zones of the discharge are examined, and in some cases, reaction rate coefficients have been adjusted within reasonable limits to give best fits to observed production rates of various by-products.

Pub. in Jnl. of Chemical Physics 100, n4 p2487-2491, 15 Feb 94.

Keywords: *Hydroxyl radicals, Far infrared radiation, Laser spectroscopy, Electronic structure, Metastable state, Rotational spectra, Infrared spectra, Positive ions, Reprints, Laser magnetic resonance.

The spectrum associated with the J = 3 <-- 2 transition of OH(1+) in the alpha singlet Delta (nu = 0) state has been observed by far infrared laser magnetic resonance spectroscopy. A new microwave discharge source enabled the detection of this spectrum, which is the first observation of the rotational spectrum of an ion in a metastable state. Assignment and least-squares fitting of the observed transitions have determined the following molecular constants: B(0) = 494.420 388 (22) GHz, the proton hyperfine parameter alpha = 74.84 (32) MHz, g'(L) = 1.000 915 (15), and g(r) = - 0.001 815 (18), with the 1(sigma) uncertainties of the last digits in parentheses. The relationship of these parameters to the geometric and electronic structure of OH(1+) is discussed.

Water Adsorption at Polymer/Silicon Wafer Interfaces.
Final rept.
W. L. Wu. 1994, 5p.
Contract N00014-92-F-0036
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Materials Research Society Symposia Proceedings, v338 p565-569 1994.

Keywords: *Interfaces, *Water, *Adsorption, *Neutron scattering, *Wafers, Monocrystals, Reflectivity, Polymers, Silicon, Polyimides, Epoxy resins, Reprints.

Neutron reflectivity (NR) was applied to measure the concentration of water at the buried interfaces between polymer and silicon single crystal wafers. In the polyimide samples excess water was discovered within 30 A of the silicon/polymer interface, where the water concentration reached 17% (by volume) for the samples without a coupling agent and 12% for the ones with a coupling agent. Beyond the interface, the water concentration was measured at 2-3%, which is typical of bulk polyimide. Excess water was also found at the silicon/epoxy interface; more than 30% water was found within 150 A of the interface in the samples with their interface precoated with a coupling agent. The equilibrium moisture content in bulk epoxy used in this study is about 6%. The above results demonstrate conclusively the unique power of NR in determining water concentration near a buried interface, and provide the first quantitative evidence for a water concentration profile which peaks in the interface region.

Keywords: *Molecular beam epitaxy, *Gallium arsenides, *Crystal growth, *Gallium, *Arsenic, Real time operations, Semiconducting films, Laser radiation, Desorption, Reprints, Time-of-flight mass spectroscopy, Reflection high energy electron diffraction, In situ monitoring, Optical probes.

Single photon laser ionization time-of-flight mass spectroscopy (SPI-TOFMS) is used to monitor the gaseous fluxes of Ga, As2, and As4, which are relevant in molecular beam epitaxy (MBE) of GaAs. This noninvasive and real-time technique measures densities, and hence fluxes, of multiple chemical species impinging on or scattered from a substrate during conventional MBE. With single photon ionization at 118 nm (10.5 eV), the energy is sufficient to ionize the species, but insufficient to ionize and fragment. The lack of molecular fragmentation greatly simplifies the interpretation of mass spectra. Additionally, the probe geometry permits simultaneous film growth monitoring using RHEED. Results will be presented on the probing of scattering and desorption of III-V MBE species during GaAs growth. This technique promises to be a valuable in-situ diagnostic for III-V and II-VI MBE.

Pub. in Applied Physics Letters 63, n6 p815-817, 9 Aug 93.

Keywords: *Arsenic, *Silicon, *Desorption, Molecular beam epitaxy, Far ultraviolet radiation, Gallium arsenides, Photoionization, Laser radiation, Reprints, Time-of-flight mass spectroscopy.

Application of the 118 nm single photon laser ionization technique to a molecular beam epitaxy machine is

used for the first time to demonstrate direct desorption of As atoms from Si(100). Both As2 and As are the desorbing species from 1 ML of arsenic on silicon above 1,000 K. This is in contrast to previously reported models that considered only dimer desorption. With a continuous flux of As4, the scattered and desorbing arsenic species from Si(100) are examined as a function of surface temperature (650-1200 K). Atomic desorption is large, 75% + or - 19%, above 1,000 K, and complete conversion of As4 to As2 and As occurs at 1,200 K. The species selectivity of laser ionization time-of-flight mass spectroscopy has broader implications for GaAs growth.

Pub. in Jnl. of Chemical Physics 96, n4 p2492-2495, 15 Feb 92.

Keywords: *Thiophenes, Temperature range 0065-0273 K, Molecular excitation, Fluorescence spectroscopy, Oligomers, Hexanes, Reprints, *Bithiophenes, Polythiophenes, Two photon processes, Dilute solutions.

The 0-0 excitation energy of a singlet A(g) state of 2,2'-bithiophene has been determined by measuring the two-photon fluorescence excitation spectrum of a dilute solution of this molecule in crystalline n-hexane at 77 K. Because the 0-0 energy is what would have been predicted by extrapolating previously measured alpha, omega-dithienylpolyene 2 singlet A(g) 0-0 energies to zero polyene chain length, it is assigned to the 2 singlet A(g) state. The 0-0 band is centered at 36,173/cm, approximately 6,570/cm above the 0-0 of the 1 singlet A(g) to 1 singlet B(u) transition. This order of bithiophene excited singlet states is opposite to that of the linear polyene with the same number of double bonds but may reverse for chains longer than six repeat units.

Pub. in Jnl. of Chemical Physics 96, n7 p4860-4868, 1 Apr 92.

Keywords: *Polyenes, Molecular spectra, Excited states, Multi-photon processes, Supersonic jet flow, Reprints, *Phenylbutadiene, *Phenylhexatriene, Supersonic expansion, Multiphoton ionization, Singlets.

We report vibrationally resolved S(0) --> S(1) excitation spectra and vibronic level decay times for the phenyl-substituted polyenes 1-phenylbutadiene and 1-phenylhexatriene seeded in supersonic He expansions. This information was obtained using one- and two-color resonance-enhanced multiphoton ionization techniques. The shift in the excitation energy of the lowest excited singlet state upon deuteration of the phenyl ring demonstrates that in 1-phenylbutadiene S(1) is mainly an excitation of the benzene ring while in 1-phenylhexatriene S(1) is mainly the 2 singlet A(g) state of hexatriene. Analysis of the excitation spectrum of 1-phenylhexatriene shows that the spectrum contains contributions from two species, the trans,trans and the trans,cis isomers, whose 2 singlet A(g) state excitation energies differ by about 155/cm.

Keywords: *Glow discharges, *Plasma chemistry, *Germanes, *Silanes, Silicon solar cells, Photovoltaic cells, Amorphous silicon, Gas mixtures, Reprints, Disilanes.

A detailed kinetic study of silane-germane glow discharges is presented. Stable gas decomposition and production rates have been measured using mass spectrometry and a kinetic model for the plasma chemistry is developed. It is found that germane depletes about four times faster than silane, nearly independently of their relative fractions. Germane is found to be much more reactive than silane with silylene, germalyn, and atomic hydrogen, and the silylene-germane reaction leads in large part to film, rather than stable gases. The spatial characteristics of the discharge are studied, using optical emission and fiber deposition profiles. From these it is deduced that the present, low-power discharge operates in a 'hybrid' alpha-gamma regime, and that ion effects are important near the electrodes.

Pub. in Jnl. of Physical Chemistry 97, n21 p5506-5518 1993.

Keywords: *Vibrational spectra, Fluorescence spectroscopy, Molecular spectroscopy, Molecular vibration, Fermi resonance, Supersonic jet flow, Reprints, *Difluorobenzene, Ab initio calculations.

The S(1)(singlet B(2u))-S(0)(singlet A(g)) spectroscopy of p-difluorobenzene-d(4) (C6D4F2,pDFB-d(4)) cooled in a supersonic free jet expansion has been characterized by fluorescence excitation (FE) and dispersed fluorescence. The 0(sub 0, sup 0) band lies at 36,987 + or - 1.0/cm (vacuum). The FE band assignments have provided the values of 11 S(1) fundamentals. The pattern of Franck-Condon allowed vibrational activity and of vibronically induced transitions is similar to that of pDFB-h(4). An exception concerns the a(g) mode nu(4) that is a prominent source of progressions in d(4) on account of harmonic mode scrambling but inactive in h(4). Bands involving an out-of-phase mode (nu(8)) that undergoes large frequency change in many aromatics upon formation of rare gas van der Waals complexes have anomalously large intensity when S(1) overtones are excited but normal Franck-Condon intensity for S(0) overtones. This singular behavior occurs in both h(4) and d(4). Four Fermi resonances have been detected.

A new intermolecular potential for Ar-HCl is obtained by fitting to results from high-resolution microwave, far-infrared, and infrared spectroscopy. The new potential is substantially more accurate than any previous Ar-HCl potential and is the first to include the dependence of the potential on the HCl monomer vibration: it is a function of the diatom mass-reduced vibrational quantum number, as well as the intermolecular distance and angle. The functional form used has 19 adjustable parameters, which are determined from the spectroscopic data. The resulting potential, designated H6(4,3,0), reproduces all of the available spectroscopic data for levels of Ar-HCl and Ar-DCl correlating with HCl nu = 0 and 1 and DCl nu = 0 and 1. The trends in intermolecular potentials for the series Ar-HF, Ar-HCl, and Ar-HBr are discussed.

Pub. in Jnl. of Chemical Physics 96, n9 p6752-6767, 1 May 92.

Keywords: *Argon complexes, Van der Waals forces, Intermolecular forces, Microwave spectroscopy, Infrared spectroscopy, High resolution, Anisotropy, Reprints, *Hydrogen fluoride complexes, *Deuterium fluoride complexes, *Intermolecular potentials, Potential energy surfaces, Vibrational dependence.

A new intermolecular potential for Ar-HF is obtained by fitting to results from high-resolution microwave, far-infrared, and infrared spectroscopy. The new potential, designated H6(4,3,2) is a function of the diatom mass-reduced vibrational quantum number, as well as the intermolecular distance R and angle theta, and has 22 adjustable parameters. It reproduces all of the available spectroscopic data for levels of Ar-HF correlating with HF, nu = 0, 1, and 2, and DF, nu = 0 and 1. The H6(4,3,2) potential is qualitatively similar to previous potentials, with a linear Ar-H-F equilibrium geometry and a secondary minimum at the linear Ar-F-H geometry. Predictions of additional spectroscopic properties that would test the new potential are given, including far-infrared and overtone spectra of Ar-DF and dipole moments of excited states of Ar-HF and Ar-DF.

Generalized Stokes-Einstein Equation for Spherical Particle Suspensions.
Final rept.
A. Kholodenko, and J. Douglas. 1995, 10p.
Pub. in Physical Review E 51, n2 p1081-1090 Feb 95.

Keywords: *Suspensions, Diffusion coefficient, Coupled modes, Sum rules, Polymers, Droplets, Spheres, Reprints, Stokes-Einstein equations.

The cooperative diffusion coefficient D(c) for spherical particle suspensions is calculated using a 'mode-coupling' method which extends previous calculations of D(c) for critical fluids and semidilute polymer solutions. The renormalization of the viscosity in the velocity-velocity correlation function from the solvent to the suspension viscosity leads to a generalized Stokes-Einstein (SE) equation in which the suspension viscosity eta replaces the solvent viscosity eta(0) and the correlation length xi (related to the osmotic compressibility) replaces the sphere radius R at nonvanishing suspension concentrations. Insertion of the leading order hard sphere virial expansions for eta and the osmotic compressibility into our generalized SE equation gives a virial expansion for D(c) which is consistent with theoretical estimates obtained by alternative methods. These leading order virial expansions are also consistent with experiments on model ('hard sphere') suspensions. Results are given for the virial expansion of spherical liquid droplets interacting via a contact attractive interaction. Further experiments are required to test the generalized SE equation at higher suspension concentrations.

Single Photon Ionization Time-of-Flight Mass Spectroscopy (SPI-TOFMS) is used as an in situ optical characterization technique to monitor chemical reactions occurring at semiconductor surfaces during molecular beam epitaxial (MBE) growth by detecting gaseous species. In this approach, 118 nm (10.5 eV) laser photons are generated and passed in front of a semiconductor substrate in the ultra-high vacuum (UHV) chamber. Here, the photons ionize the gaseous scattered and desorbed growth species which are detected by time-of-flight mass spectroscopy. SPI-TOFMS has been used to study As(n)/Si(100) desorption kinetics and, more recently, MBE growth of GaAs. Results are presented on the real-time monitoring of GA(n) and As(n) growth species. Simultaneous monitoring of growth with Reflection High-Energy Electron Diffraction (RHEED) is also discussed. Future work includes SPI-TOFMS studies of Si delta-doping in GaAs and surfactant-enhanced epitaxy of Ge on Si. SPI-TOFMS is an in situ UHV optical probe used to study the growth chemistry of semiconductor surfaces. This non-intrusive, species-specific real-time monitor of growth can be applied to increase the quality of device manufacturing.

Keywords: *Argon complexes, Van der Waals forces, Supersonic jet flow, Near infrared radiation, Infrared spectroscopy, High resolution, Rotational states, Reprints, *Water complexes, Potential energy surfaces.

Near-infrared vibration-rotation spectra of jet-cooled Ar-H2O complexes are detected for the first time via direct absorption of tunable difference frequency infrared radiation in a slit supersonic expansion source. Transitions from both the lowest para and ortho complexes are observed which correlate to 0(sub 00) and 1(sub 01) rotational levels of free H2O, respectively, and permit spectroscopic characterization of the complex in both the ground (nu(3) = 0) and asymmetric stretch excited (nu(3) = 1) levels. Information obtained in the study permits determination of a two-dimensional (2D) angular potential-energy surface of the complex as a function of the H2O orientation.

Keywords: *Stereochemistry, Molecular orbitals, Directional control, Energy transfer, Laser radiation, Polarization, Alignment, Symmetry, Collisions, Reprints.

One of the most exciting recent aspects of laser chemistry is the ability to prepare highly aligned, or directional, reagents using the polarization of lasers. It is now possible to investigate chemical processes with directional control in a variety of new measurements. The results provide a means of visualizing the important symmetries of the chemical process with unprecedented detail. Many mechanistic interpretations of chemical transformations are built upon compelling pictures of orbital directionality, electron overlap and transfer, and symmetry arguments. Chemists can exploit the methods of directional control to verify these pictures and to broaden our understanding of chemical stereospecificity.

Keywords: *Butenes, Supersonic jet flow, Molecular vibration, Vibrational states, Infrared spectra, High resolution, Isomerization, Reprints.

The high resolution, slit jet cooled infrared nu = 1 <- - 0 methyl asymmetric stretch spectra of trans-2-butene and 1-butene are reported. Both of these molecules are singly unsaturated butene chains, have 30 vibrational degrees of freedom, and yield nearly equivalent vibrational state densities at CH stretch levels of excitation. The key difference between these two molecules is the presence of a large amplitude C-C-C skeletal torsional coordinate in 1-butene corresponding to a low barrier, internal isomerization pathway which is completely absent in trans-2-butene. The trans-2-butene asymmetric CH stretch (nu 16) spectrum is fully discrete at 0.002/cm resolution, and the coarse structure readily assigned to zero order rovibrational transitions in an asymmetric top. Fragmentation of these zero order transitions into spectral 'clumps' of fine structure provides direct evidence for coupling of the CH stretch to vibrational bath states.

Pub. in Jnl. of Solid State Chemistry 111, p52-57 1994.

Keywords: *Crystal structure, Synchrotron radiation, Neutron diffraction, X ray diffraction, Complex systems, Reprints, *Lanthanum titanium aluminates, Rietveld method, Powder diffraction.

The applicability of powder diffraction techniques to structure determination has improved substantially in recent times, but it has only been successfully utilized in the solution of relatively simple structures of up to 29 atoms in the asymmetric unit. The structure La3Ti5Al15O37, which has 60 atoms in the asymmetric unit, has been solved using a combination of synchrotron X-ray and neutron powder diffraction. This represents a considerable advance in the size of structure that has been solved using powder diffraction techniques. The structure of La3Ti5Al15O37 consists of small regions of simpler structure types in the La/Ti/Al/O system, interleaved to form a complex 3D network.

Acceleration of Intramolecular Vibrational Redistribution by methyl Internal Rotation. A Chemical Timing Study of p-fluorotoluene and p-fluorotoluene-d3.
Final rept.
D. B. Moss, and C. S. Parmenter. 1993, 9p.
Pub. in Jnl. of Chemical Physics 98, n9 p6897-6905, 1 May 93.

Keywords: *Molecular vibration, Vibrational spectra, Vibrational states, Rotational states, Fluorescence spectroscopy, Chemical bonds, Deuteration, Reprints, *Fluorotoluenes, Methyl groups.

Time-integrated, frequency-resolved fluorescence spectroscopy has been used to determine rates of intramolecular vibrational energy redistribution (IVR) from the vibrational levels 3(sup l) (epsilon (vib) approx = 1,200/cm) and 3(sup l)5(sup l) (epsilon (vib) approx = 2,000/cm) in both p-fluorotoluene and p-fluorotoluene-d(3) for comparison with each other and with comparable levels in p-difluorobenzene. Methyl substitution increases the rate of IVR by roughly two orders of magnitude, while deuteration of the methyl rotor produces at most a small (two- to fourfold) further increase in the rate of IVR. It is argued that the IVR response to methyl substitution is a consequence of the methyl internal rotation without significant influence from the methyl vibrations.

Keywords: *Infrared spectroscopy, Absorption spectroscopy, Laser spectroscopy, Near infrared radiation, Supersonic jet flow, Van der Waals forces, Intermolecular forces, Hydrogen bonds, Argon complexes, High resolution, Predissociation, Reviews, Reprints, Potential energy surfaces, Hydrogen fluoride complexes, Deuterium fluoride complexes.

The organization of this review will be as follows: In Sections 2 and 3, some basic experimental considerations are presented to highlight the specific advantages of direct absorption near IR laser methods, as well as the role of pulsed 'slit' jet expansions in obtaining the requisite path lengths and sensitivities. In Section 4, an overview of van der Waals spectroscopy of rare gas hydrogen halides is presented, illustrating the transition between a nearly 'rigid' to a nearly 'free' internal rotor dynamics. In Section 5, we discuss the role of large amplitude motion and intermolecular orientation on energy flow and bond breaking dynamics, focusing on internal rotor predissociation and V-V transfer between the monomer subunits. In Sections 6 and 7, we look to two ongoing areas of investigation of larger clusters. Section 6 presents experimental and theoretical results on the series of Ar(n)-HF and Ar(n)-DF clusters (n = 1, 2, 3 and 4), addressing the n-dependent vibrational red shifts, multibody effects, and intermolecular vibrational modes supported by these 'micromatrices.' Section 7 describes recent explorations into the spectroscopy and dynamics of (DF)3, which provides direct evidence for a cyclic ring 'structure,' and elucidates the hydrogen bond breaking dynamics that lead to ring opening on the 40 psec time scale.

Grant NSF-PHY90-12244
Sponsored by National Science Foundation, Washington, DC.
Pub. in Jnl. of Chemical Physics 98, n1 p478-486, 1 Jan 93.

Keywords: *Nitrogen complexes, Near infrared radiation, Infrared spectroscopy, Rotational spectra, Van der Waals forces, High resolution, Hydrogen bonds, Reprints, *Hydrogen fluoride complexes, Interatomic potentials, RKR method.

A Rydberg-Klein-Rees (RKR)-based method is described which determines effective 1D intermolecular stretching potentials for polyatomic linear complexes from high precision rotational data alone. This extends the 'rotational RKR' inversion method from pseudodiatomic van der Waals clusters with only two nonhydrogenic atoms to much larger complexes with several heavy atoms. Sample inversion of rotational eigenvalues generated from a model 1D potential reproduces the model potential to approx = or < 0.13/cm accuracy and correctly predicts harmonic frequencies, force constants, and dissociation energies to approx = or < 0.1%. In contrast, the commonly used 'pseudodiatomic' approximation lead to quite significant (10%-20%) errors, even for exact model potentials for which these approximations were developed. The method is further tested on high resolution near IR spectroscopic data of (14)N(14)N-HF, which determines the vibrationally averaged hydrogen bond stretching potential from 3.39 approx = or < R(cm) approx = or < 3.85 A. The RKR data yield a hydrogen bond length of R(N-H) = 2.106 A (2.079 A) and predict a van der Waals stretching frequency of 86.9/cm (90.7/cm) for nu(HF) = 0 (nu(HF) = 1).

Pub. in Jnl. of Chemical Physics 96, n8 p5712-5725, 15 Apr 92.

Keywords: *Hydrogen bonds, Van der Waals forces, Supersonic jet flow, Intermolecular forces, Rotational spectra, Vibrational spectra, High resolution, Predissociation, Reprints, *Hydrogen fluoride complexes, Intermolecular potentials, Potential energy surfaces.

High resolution IR data on weakly bound OCOHF complexes formed in a slit supersonic expansion reveal a progression of extremely low frequency vibrational levels associated with the bending of the OCO-HF hydrogen bond. In a previous paper (J Chem Phys 93, 7716 (1990)), we presented a spectroscopic analysis of the fundamental, combination and hot bands observed, corresponding to transitions between nu(bend)(sup l) = 0(sup 0), 1(sup 1), 2(sup 0), 2(sup 2), and 3(sup 1), where nu(bend)(sup l) denotes quanta of OCOHF skeletal bend excitation with l units of vibrational angular momentum. In this paper, we analyze the rotationally resolved data in terms of the rigid bender formalism of Hougen, Bunker and Johns to determine an explicit angular potential, V(theta), for the OCOHF complex in both the HF ground (nu(HF) = 0) and vibrationally excited (nu(HF) = 1) state.

Rate coefficients for the reaction C2H + O2 are measured from 193 to 350 K by using transient absorption spectroscopy with an infrared color center laser. Ethynyl radicals are produced by pulsed laser photolysis of C2H2 in a temperature variable flow cell and a tunable color center laser probes the transient removal of C2H in absorption. The rate coefficient has a slight negative temperature dependence over the range 193-350 K, and an expression is obtained. The lack of a pressure dependence under our experimental conditions strongly suggests that the HCCOO* complex is short lived with respect to encountering a collision and rapidly dissociates to products without competition from collisional stabilization to HCCOO or collisionally induced dissociation to reactants.

Keywords: *Argon complexes, Van der Waals forces, Supersonic jet flow, High resolution, Excimer lasers, Parametric oscillators, Photodissociation, Photolysis, Reprints, *Water complexes.

High resolution IR overtone pumping with an injection seeded optical parametric oscillator (OPO) is used in conjunction with excimer laser photolysis to investigate the state-resolved dynamics of quantum state-selected van der Waals clusters in a slit supersonic expansion. The narrow band IR light source (160 MHz, 5 mJ) preselects a specific upper state via the internal rotor band of Ar-H2O which correlates to a transition in H2O monomer. At fixed UV photolysis and probe wavelength, scanning the high resolution OPO yields the overtone action spectrum of Ar-H2O complexes.

Keywords: *Photoelectron spectroscopy, *Atomic clusters, Near ultraviolet radiation, Ultraviolet spectra, Electronic structure, Electron affinity, Excited states, Negative ions, Reprints, *Antimony clusters.

We report the 351 nm photoelectron spectra of Sb(1-), Sb2(1-), Sb3(1-), and Sb4(1-). The electron affinity of atomic Sb is measured to be 1.046(5) eV. The Sb2(1-) photoelectron spectrum displays rich vibrational and electronic structure. For the photoelectron spectra of Sb3(1-) and Sb4(1-), the observed electronic structure is explained in terms of recently reported ab initio calculations. We report photoelectron angular distributions for all of the observed spectra, and find that the autodetaching resonance causes unusual angular distributions for Sb2(1-) photodetachment. Finally, electron affinity trends for group V atoms, dimers, and small clusters are discussed in light of the present study.

Keywords: Supersonic jet flow, Near infrared radiation, Temperature range 0000-0013 K, Absorption spectra, Infrared spectroscopy, High resolution, Reprints, *Hydrogen chloride dimers, Vibrational predissociation.

An extensive series of near-infrared absorption spectra are recorded for jet-cooled (6-14 K) hydrogen chloride dimer (HCl)2. Both Delta K(alpha) = 0 and Delta K(alpha) = + or - 1 bands are observed for both the free (nu(1)) and bonded (nu(2)) HCl stretches; all three chlorine isotopomers (H(35)Cl-H(35)Cl,H(35)Cl-H(37)Cl, and H(37)Cl-H(37)Cl) are observed and analyzed for K(alpha)(double prime) = or < 2. The slit jet spectrum extends significantly the previous cooled cell infrared study of this complex and provides a measure of tunneling splittings for K(alpha) = 0 and 1 for each of the HCl ground (nu = 0) and excited (nu = 1) states. Mode specific vibrational predissociation is observed via analysis of the absorption line shapes, with Lorentzian contributions to the line profiles of Delta nu(1) approx = or < 1.6 MHz and Delta nu(2) = 5.1 + or - 1.2 (2 sigma) MHz full width at half-maximum for nu(1) and nu(2) excitation, respectively.

Both D- and H-bonded isomers of the mixed dimers formed between HCl and DCl are investigated via high resolution infrared difference frequency and diode laser spectroscopy in the 2,885 and 2,064/cm regions. From an analysis of the relative integrated absorption intensities, the D-bonded complex (i.e., HCl-DCl) is determined to be more stable by 16 + or - 4/cm than the H-bonded (i.e., DCl-HCl) species. All four chlorine isotopic combinations of the lower energy (HCl-DCl) complex are probed via excitation of both HCl and DCl stretches. Additionally, two chlorine isotopomers of the higher energy (DCl-HCl) complex are investigated through HCl excitation. Compared to the facile tunneling observed in both (HCl)2 or (DCl)2 complexes, these mixed dimers exhibit more rigid behavior characteristic of two distinct isomeric species. However, the relatively small energy difference (16 + or - 4/cm) between the two isomers still allows the wave functions for both species to sample both the HCl-DCl and DCl-HCl local minima on the potential surface.

Keywords: *Chlorine, Chemical reactions, Hydrogen chloride, Ethylene, Emission spectroscopy, Infrared spectroscopy, Vibrational states, Chemiluminescence, Photolysis, Reprints, *Atom radical reactions, *Ethyl radicals.

The atom-radical reaction Cl + C2H5 --> HCl(nu) + C2H4 is studied using laser flash photolysis, time-resolved Fourier transform infrared emission spectroscopy and broad band infrared chemiluminescence. The Cl atoms and ethyl radicals are produced from a number of different precursors using one or two lasers. The initial HCl vibrational distribution is determined. The vibrational distribution is characteristic of an addition-elimination mechanism and can be reproduced using modified statistical theories of energy partitioning within the (C2H5Cl) intermediate. The time evolution of the HCl(nu = 4) emission is used to estimate a rate coefficient for this reaction of (3.0 + or - 1.0) X 10(exp -10) cc/molecule/s.

Keywords: *Indium, *Gallium, Laser induced fluorescence, Radiation damage, Surface reactions, Ultrahigh vacuum, Neodymium lasers, YAG lasers, Pulsed lasers, Laser radiation, Silicon, Adsorbates, Reprints, *Laser induced desorption, Surface damage.

Laser-induced desorption (LID) of In and Ga from Si(100) under ultrahigh vacuum conditions is investigated. The frequency-doubled 532 nm, 2-6 ns output of Nd:YAG laser is focused to 0.14 + or - 0.03 J/sq cm on the Si surface to induce desorption. Desorbed In or Ga atoms are detected by laser-induced fluorescence initiated by a second pulsed laser propagating in front of the surface. LID occurs by thermal desorption with approximate desorption energies and preexponential factors in agreement with the literature values obtained previously by isothermal desorption measurements. Experiments at higher coverages suggest that desorption occurs predominantly from the two-dimensional (2D) adlayer with little desorption occurring from the adsorbate islands directly into the vacuum. The 2D layer is resupplied by either diffusion out of adsorbate islands or by diffusion of incorporated adsorbate out of the bulk. Adsorbate-enhanced laser-induced surface damage is also observed; only 0.2 monolayer of In reduces the number of laser pulses required to observe damage by greater than a factor of 30.

Keywords: *Molecular beam epitaxy, *Gallium arsenides, *Gallium, *Arsenic, Real time operations, Semiconducting films, Gas ionization, Far ultraviolet radiation, Laser radiation, Neodymium lasers, YAG lasers, Reprints, Time-of-flight mass spectroscopy.

Single-photon laser ionization time-of-flight mass spectroscopy (TOF-MS) is used to monitor fluxes of As4, As2, and Ga, species that are important in molecular-beam epitaxy of GaAs. With this technique, fluxes of multiple chemical species above a substrate can be measured noninvasively and in real time during conventional molecular-beam epitaxy. Additionally, the geometry of the single-photon ionization TOF-MS permits simultaneous film-growth monitoring by using techniques such as reflection high-energy electron diffraction (RHEED). Here gas-phase arsenic and gallium beams are ionized by a single 118-nm (10.5-eV) photon and detected with a TOF-MS. The 118-nm photons are produced by frequency tripling 355-nm light from a pulsed Nd:YAG laser in Xe. With single-photon ionization, less than 0.4% of the As4(1+) signal fragments to As2(1+). Neither As4(1+) nor As2(1+) fragments to As(1+) at 118 nm. The relative ionization probability of As4/As2 at 118 nm is approximately 4:1. This technique promises to be a powerful tool for analyzing most III-V and II-VI molecular-beam epitaxy growth species.

Thermodynamics of the Hydrolysis of N-Acetyl-L-phenylalanine Ethyl Ester in Water and in Organic Solvents.
Final rept.
Y. B. Tewari, M. M. Schantz, P. C. Pandey, M. V. Rekharsky, and R. N. Goldberg. 1995, 8p.
Pub. in Jnl. of Physical Chemistry 99, n5 p1594-1601, 2 Feb 95.

Keywords: *Thermodynamics, *Hydrolysis, Water, Organic solvents, Equilibrium, Gibbs free energy, Entropy, Enthalpy, Reprints, *Phenylalanine/N-acetyl-(ethyl-ester).

Equilibrium measurements have been performed on the alpha-chymotrypsin-catalyzed hydrolysis reaction of N-acetyl-L-phenylalanine ethyl ester to (N-acetyl-L-phenylalanine + ethanol) with carbon tetrachloride, dichloromethane, toluene, and aqueous phosphate buffer as solvents for the reactants and products. Apparent equilibrium constants were measured as a function of temperature for this reaction in all four solvents. Calorimetric measurements were also performed for this reaction in aqueous phosphate buffer. The rather limited range of values that was found for the equilibrium constants is significant. The very limited amount of information available from the literature is also suggestive of the rule that equilibrium constants for hydrolysis reactions in different solvents are comparable if the reaction refers to neutral species and the concentration of water is included in the formulation of the equilibrium constant. Also, the standard molar enthalpy of reaction was found to be a linear function (slope = 313 K) of the standard molar entropy of reaction. This is indicative of an enthalpy-entropy compensation effect.

Signatures of Large Amplitude Motion in a Weakly Bound Complex: High-Resolution IR Spectroscopy and Quantum Calculations for HeCO2.
Final rept.
M. J. Weida, J. M. Sperhac, D. J. Nesbitt, and J. M. Hutson. 1994, 13p.
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Jnl. of Chemical Physics 101, n10 p8351-8363, 15 Nov 94.

Keywords: *Helium complexes, Molecular dynamics, Infrared spectroscopy, High resolution, Van der Waals forces, Supersonic jet flow, Reprints, *Carbon dioxide complexes, Potential energy surfaces.

The infrared spectrum of the HeCO2 van der Waals molecule is recorded in the region of the CO2 nu(3) asymmetric stretch via direct absorption of a tunable Pb-salt diode laser. HeCO2 is formed in a slit jet supersonic expansion; the slit valve and the stagnation gas must be precooled to -35 C before substantial formation of the complex is observed. Sixty-six rovibrational transitions are recorded by exciting the nu(3) asymmetric stretch of the CO2 monomer within the complex.

Forty-three of these transitions can be assigned using internally consistent combination differences as a b-type band of a T-shaped asymmetric rotor. There are several indications that large amplitude motion is significant to HeCO2, including the poor quality of the fit to an asymmetric rotor model and the large positive inertial defects of Delta = 8.54 and 10.98 u(Angstrom squared) in the ground and excited states, respectively. However, a hindered rotor analysis based on these inertial defects demonstrates that the CO2 motion within the complex is far from the free rotor limit. No evidence of predissociation broadening is observed, indicating a lifetime for the complex of tau > 6 ns.

Standard Reference Material 1744: Aluminum Freezing-Point Standard.
Special pub.
G. F. Strouse. May 95, 41p, NIST/SP-260-124.
Also available from Supt. of Docs. as SN003-003-03342-1.

Keywords: *Aluminum, *Melting points, *Calibration standards, Temperature, Phase transformations, Scale(Ratio), Standardization, Interlaboratory comparisons, *Standard Reference Material 1744, SRM 1744, International Temperature Scale of 1990, ITS-90, Fixed-point cell.

The freezing point of aluminum (660.323 deg. C) is a defining fixed point of the International Temperature Scale of 1990 (ITS-90). Realization of this freezing point is performed using a fixed-point cell containing high purity (greater than or equal to 99.9999% pure) aluminum. The aluminum constituting Standard Reference Material 1744 (SRM 1744) has been evaluated, and certified as suitable for use in the realization of the freezing-point temperature of aluminum for the ITS-90. Based on results obtained with three fixed-point cells containing random samples of SRM 1744, the plateau temperature of a freezing curve of the SRm 1744 aluminum is expected to differ by not more than 1 m deg C from the ITS-90 assigned temperature. In the document, the methods used for the construction of the aluminum freezing-point cells and for the evaluation of SRM 1744 are described.

Thermochemical and Chemical Kinetic Data for Fluorinated Hydrocarbons.
Technical note.
D. R. F. Burgess, M. R. Zachariah, W. Tsang, and P. R. Westmoreland. Jul 95, 184p, NIST/TN-1412.
Also available from Supt. of Docs. as SN003-003-03343-0. Prepared in cooperation with Massachusetts Univ., Amherst. Dept. of Chemical Engineering.

Keywords: *Halohydrocarbons, *Fluorination, *Thermochemistry, *Reaction kinetics, Molecular orbitals, Molecular theory, Transport properties, Models, Environmental chemical substitutes, Chemical extinguishers.

A comprehensive, detailed chemical kinetic mechanism was developed for fluorinated hydrocarbon destruction and flame suppression. Existing fluorinated hydrocarbon thermochemistry and kinetics were compiled and evaluated. For species where no or incomplete thermochemistry was available, these data were calculated through application of ab initio molecular orbital theory. Group additivity values were determined consistent with experimental and ab initio data. For reactions where no or limited kinetics was available, these data were estimated by analogy to hydrocarbon reactions, by using empirical relationships from other fluorinated hydrocarbon reactions, by ab initio transition state calculations, and by application of RRKM and QRRK methods. This report provides the thermochemical and chemical kinetic data used in this work.

Single Photon Laser Ionization as an In-situ Diagnostic for MBE growth.
Final rept.
A. L. Alstrin, A. K. Kunz, P. G. Strupp, and S. R. Leone. 1994, 6p.
Contract ACS-PRF-27135-AC6
Sponsored by Petroleum Research Fund, Washington, DC.
Pub. in Materials Research Society Symposia Proceedings, v324 p359-364 1994.

Keywords: *Molecular beam epitaxy, *Gallium arsenides, *Flux(Rate), Time-of-flight mass spectrometers, YAG lasers, Photons, Neodymium lasers, Diagnostic techniques, Scattering, Desorption, Laser radiation, Ionization, Reprints.

Single photon laser ionization time-of-flight mass spectroscopy (SPI-TOFMS) is used to monitor the gaseous fluxes of Ga and Asn, during molecular beam epitaxy of GaAs. This noninvasive and real-time probe measures densities, and hence fluxes, of multiple chemical species impinging on or scattered from a substrate during conventional MBE. With single photon ionization at 118 nm (10.5 eV, ninth harmonic of Nd: YAG laser), the photon energy is large enough to ionize the species, but insufficient to both ionize and fragment. Results will be presented on the probing of scattering and desorption of III-V MBE species during GaAs growth. This technique promises to be a valuable in-situ diagnostic for III-V and II-VI MBE.

High-Resolution Infrared Overtone Spectroscopy of N2-HF: Vibrational Red Shifts and Predissociation Rate as a Function of HF Stretching Quanta.
Final rept.
J. T. Farrell, O. Sneh, and D. J. Nesbitt. 1994, 7p.
Sponsored by National Science Foundation, Arlington, VA.
Pub. in Jnl. of Physical Chemistry 98, n24 p6068-6074 1994.

Keywords: *Nitrogen compounds, *Hydrofluoric acid, *Infrared spectroscopy, Van der Waals forces, Infrared absorption, High resolution, Potentials, Difference frequency, Electrostatics, Red shift, Reprints.

The high-resolution infrared spectrum of the nu(sub HF) = 2 inversely maps to 0 stretch in N2-HF has been recorded using direct absorption of tunable infrared light in a slit jet spectrometer. The ban origin is located at 7657.4057 1/cm red-shifted 93.39 1/cm from the nu(sub HF) = 2 inversely maps to 0 origin of the HF monomer. The changes in vibrational red shift with HF stretching quanta provide explicit information on the coupling between the high-frequency (i.e., intramolecular) and low-frequency (i.e., intermolecular) degrees of freedom, which can be understood with a simple electrostatic model. Additional evidence for coupling between the low- and high-frequency modes is provided through an analysis of the rotational constants.

Non-Perturbative Relation between the Mutual Diffusion Coefficient, Suspension Viscosity, and Osmotic Compressibility: Application to Concentrated Protein Solutions.
Final rept.
A. K. Gaigalas, V. Reipa, J. Hubbard, J. Edwards, and J. Douglas. 1995, 8p.
Pub. in Chemical Engineering Science, v50 n7 p1107-1114 1995.

Keywords: *Proteins, *Diffusion coefficient, *Viscosity, *Osmosis, Concentration(Composition), Mixtures, Suspensions, Aqueous solutions, Compressibility, Reprints.

The authors test a proposed relation between mutual diffusion coefficient and viscosity in suspensions which is essentially identical to a dynamic mode-coupling theory of diffusion in binary fluid mixtures near a critical mixing point. In contrast to conventional treatments of suspension hydrodynamics, this relation is non-perturbative in the sense that is not necessary to assume that the volume fraction of suspended particles is a small parameter. The mutual diffusion coefficient was then related to the viscosity and osmotic compressibility of the concentrated suspension relative to the infinite dilution limit. The authors conclude that this non-perturbative relation provides a convenient estimate of protein diffusion coefficients as a function of protein concentration.

Pub. in International Jnl. of Thermophysics 15, n6 p1271-1278 1994.

Keywords: *Aqueous solutions, *Binary mixtures, *Carbon dioxide, *Phase diagrams, Algorithms, Gases, Nitrogen, Chemical composition, Chemical equilibrium, Critical point, Pressure, Reprints, *Critical lines, *Type-III mixtures, Gas-gas equilibrium, ECS(Extended corresponding states).

An algorithm has been developed for calculating the gas-gas critical line of type-III binary fluid mixtures for extended corresponding-states (ECS) models. The algorithm searches for an extremum in pressure on the spinodal curve of an isothermal pressure-composition phase diagram of a binary mixture. The method has been applied to solutions of carbon dioxide and of nitrogen in water, starting at the water critical point. Two variants of ECS have been tested for their ability to represent reliable PVTx data in the nitrogen-water mixture. It is demonstrated that in the latter system both ECS variants produce an artifact in the gas-gas critical line in the range of 0-0.2 mole fraction of nitrogen.

Sponsored by National Science Foundation, Arlington, VA. and Department of Energy, Washington, DC.
Pub. in Physical Review B 51, n10 p6500-6514, 1 Mar 95.

Keywords: *Electron scattering, *Phonon response, *Solids, Reprints, Superconductivity, Total dielectric function.

The interaction between two test charges, the response of a solid to an external field, and the normal modes of the solid can be determined from a total dielectric function that includes both electronic and lattice polarizabilities as well as local-field effects. In this paper we examine the relationship between superconductivity and the stability of a solid and derive sum rules for the electronic part of the dielectric function. It is also shown that there are negative eigenvalues of the total static dielectric function, implying the possibility of an attractive interaction between test charges. An attractive interaction is required for superconductivity.

Pub. in Fluid Phase Equilibria, v105 p193-219 1995.

Keywords: *Congruence, *Chain molecules, Reprints, Corresponding states, Bubble points, Thermodynamic properties, Mixtures, Dew points.

The principle of congruence claims that certain thermodynamic and transport properties of a mixture of n-alkanes are the same as those of the pure n-alkane of the mole-fraction-averaged carbon number. We discuss the origin of the principle, and attempts at theoretical justification and validation with respect to experimental data. We demonstrate that the principle applies even in cases where no fundamental justification exists. Whenever the principle applies, prediction of thermodynamic behavior of a mixture of n-alkanes in inherently simpler and usually more accurate than that based on empirical equations of state, molecular interaction parameters, and mixing and combining rules. Our experimental verification serves to pinpoint those properties that can be safely and accurately predicted on the basis of the principle of congruence. The solubility of hydrogen in mixtures of long-chain n-alkanes is used as a prime example.

Pub. in Jnl. of Chemical Physics 100, n9 p6372-6385, 1 May 94.

Keywords: *Alignment, *Carbon dioxide, *Molecular collisions, *Angular momentum, Anisotropy, Infrared lasers, Polarization(Spin alignment), Supersonics, Expansion, Molecular rotation, Reprints.

The rotational alignment of CO2 seeded in a supersonic expansion is measured using a general, direct absorption method based on fast (75 kHz) polarization modulation and phase sensitive detection with of a narrow band tunable IR laser. The anisotropic distribution of bar M(sub j)bar states is created by a directed velocity slip between the carrier gas and a nonspherical seed gas. Strong alignment signals are observed in a pinhole expansion that depend systematically on the carrier gas, stagnation pressure, and J state. In a slit expansion, however, no alignment is detected for comparable conditions. The observed effects are quite significant and occur at rather modest expansion conditions (e.g., 2.5% CO2 in He at 1000 Torr).

Pub. in Polymer Engineering and Science, v35 n12 p1000-1004 Jun 95.

Keywords: *Interfaces, *Moisture, *Wafers, *Polyimides, Concentration(Composition), Adsorption, Water, Neutron scattering, Reflectivity, Polymers, Silicon, Reprints.

Neutron reflectivity (NR) was applied to measure the concentration of water at the buried interfaces between an amorphous polyimide and silicon single crystal wafers. Excess water was discovered within 30 Angstroms of the metal/polymer interface, where the water concentration reached 17% (by volume) for the samples without a coupling agent and 12% for the one with coupling agent. The above results demonstrate conclusively the unique power of NR in determining water concentration near a buried interface, and provide the first quantitative evidence for a water concentration profile which peaks in the interface region.

Pub. in Jnl. of the Optical Society of America B 11, n4 p721-730 May 94.

Keywords: *Phase shift, *Spectroscopy, *Intensity, Frequency modulation, Spectrum analysis, Optical heterodyning, Line spectra, Shape, Reprints, RF signal, Optical Block equations.

The authors discuss experimental observations of an induced phase shift of the rf signal produced in frequency-modulated saturated-absorption measurements under the conditions of large probe-beam intensities. This phase shift can be understood in terms of the phase difference between the phase modulation of the optical driving field and the steady-state macroscopic polarization of the medium. The authors also present theoretically calculated spectra that are based on the optical Bloch equations and that are in excellent agreement with the experimental results.

R. D. Mountain. 1995, 7p.
Pub. in Jnl. of Chemical Physics, v103 n8 p3084-3090, 22 Aug 95.

Keywords: *Hydrogen bonds, *Water, *Mathematical models, *Molecular structure, Chemical bonds, Pairing interactions, Distribution functions, Lifetime, Density, Temperature, Polarization, Reprints, *Molecular dynamics.

Molecular dynamics simulations are used to examine two models for water. The first model is the fixed-charge model introduced by Stillinger and Rahman and the second model is the polarizable model developed by Dang. The site-site, intermolecular pair distribution functions and the hydrogen bond lifetimes are determined for three fluid states for which neutron-diffraction determined pair function exist. The trends in the pair functions and the bond lifetimes with decreasing density and increasing temperature for both models are similar, with the fixed-charge model pair functions changing more slowly, and the bond lifetimes more rapidly than those for the polarizable model.

Colloidal processing of silicon nitride (Si3N4) powders depends largely on the control of reactions at the solid-solution interface. The role of dissolved ions in the surface chemistry of impurities, contaminants and additives in processing are discussed. The interaction of ions at the solid-solution interface was characterized by particle electrokinetic behavior determined for electroacoustic measurements in moderately concentrated suspensions. Ions were classified according to chemical similarity and surface specificity. Specific adsorption was inferred from the movement of the isoelectric point relative to the endemic native value.

Pub. in Zeitschrift fuer Kristallographie, v210 p199-201 1995.

Keywords: *Crystal structure, Reprints, Monocrystals, X ray diffraction, Hydrates, Chemical bonds, *Foreign technology, *Calcium glutarate monohydrate.

The crystal structure of calcium glutarate monohydrate, Ca(C5H6O4).H2O, has been determined by single crystal X-ray diffraction. The crystals are orthorhombic with a = 6.805(1) Angstrom, b = 18.486(2) Angstrom, c = 5.884(1) Angstrom, space group P2(sub 1)2(sub 1)2(sub 2), Z = 4, V = 740.1(2) Angstrom(3), dm = 1.69, and dc = 1.688 mg/cubic m. The structure was refined by the full-matrix least-squares techniques to R = 0.019, Rw = 0.026, for 1198 reflections with I greater than or equal to 3 sigma (I). The absolute configuration was determined. Ca is coordinated to seven oxygen atoms and the coordination polyhedron is best described as pentagonal bipyramid. One carboxylate group of the glutarate ion is bonded to three different Ca ions, forming a four-membered chelate ring with one Ca ion and unidentate bridge bonds to two other Ca ions. The other axis, with the hydrocarbon chains sandwich between the polar regions consisting of the Ca and carboxylate ions and water molecules.

Shear-Induced Melting of Two-Dimensional Solids.
Final rept.
T. Weider, M. A. Glaser, H. J. M. Hanley, and N. A. Clark. 1993, 7p.
Pub. in Physical Review B, v47 n10 p5622-5628, 1 Mar 93.

Keywords: *Melting, *Solids, Reprints, Two dimensions, Shear, Molecular dynamics, Voroni construction.

We have carried out detailed nonequilibrium molecular-dynamics simulation studies of the shear-induced melting transition of a model two-dimensional solid. We find that the shear melting of the two-dimensional soft-disk solid at temperture T=1 and density p=1.03 occurs in two stages: (1) a transition from elastic to plastic behavior takes place as soon as any finite shear rate is applied; (2) qualitativechanges in structural and dynamic behavior occur near a shear rate of gamma = 0.07. For y equal to or less than 0.07, the system possesses very long-range bond-orientational correlations, and the instantaneous static structure factor exhibits pronounced sixfold anisotropy, with a sixfold pattern that rotates uniformly with time in response to the applied shear. For y equal to or greater than 0.07, the system behaves like an ordinary two-dimensional liquid under shear in that the ranges of translational and bond-orientational correlations are comparable and the instances static structure factor does not exhibit persistent sixfold anisotropy. We discuss our results in terms of the two competingpossibilities of a Kosterlitz-Thouless- Halperin-Nelson-Young two-stage melting scenario or a single first-order melting transition.

Structure of a Triglyceride Microemulsion: A Small Angle Neutron Scattering Study.
Final rept.
S. F. Trevino, R. Joubran, N. Parris, and N. F. Berk. 1994, 6p.
Pub. in Langmuir, v10 n8 p2547-2552 Aug 94.

Keywords: *Microemulsions, *Triglycerides, Reprints, Concentration(Composition), Temperature, Soybean oil, *Neutron scattering.

The microscopic structure of a microemulsion of soybean oil, water-ethanol (80/20 wt %), and polyoxyethylene(40) sorbitol hexaoleats has been studied with small angle neutron scattering. The concentrations of the three components are varied such that the oil-surfactant ratio is constant and stable microemulsions are obtained in regions of the phase diagram corresponding to bicontinuous and L2 phases. Small angle neutron scattering is measured as a function of concentration and temperature in order to describe the structure of the microemulsions. The results are consistent with a biocontinuous phase in the cases of largest aqueous content. In the low aqueous concentration samples, a substantial correlation is found in the spatial distribution of this minority phase.

Pub. in International Jnl. of Thermophysics, v16 n4 p929-955 1995.

Keywords: *Water, *Dielectric properties, Electrical resistivity, Audio frequencies, Acoustic measurement, Capacitors, Electrodes, Polarization, Correction, Reprints.

The static relative permittivity (dielectric constant) of water has been determined from capacitance measurements at frequencies between 0.1 and 10 kHz, in the temperature range from 273.2 to 373.2 K at ambient pressure. The capacitor used for these measurements was formed from sapphire-insulated concentric cylinders. The specific conductance of the water used was maintained within 20% of the lowest value ever observed, which is better than in all previous experiments in this range. The new data shed some light on a discrepancy between sets of literature data in liquid water between the triple and boiling points.

Hydrodynamic Similarity in an Oscillating-Body Viscometer.
Final rept.
R. F. Berg. 1995, 10p.
Pub. in International Jnl. of Thermophysics, v16 n5 p1257-1266 Sep 95.

Keywords: *Viscometers, *Hydrodynamics, Calibration, Reprints, Oscillating bodies.

Hydrodynamic similarity can be used to calibrate simply and accurately an oscillating-body viscometer of arbitrarily complicated geometry. Usually, an explicit hydrodynamic model based on a simple geometry is required to deduce viscosity from the transfer function of an oscillating body such as a vibrating wire or a quartz torsion crystal. However, at low Reynolds numbers the transfer function of any immersed oscillator depends on the fluid's viscosity only through the viscous penetration depth. This hydrodynamic similarity can be exploited if the oscillator is over damped and thus is sensitive to viscosity in a broad frequency range. Even an osillator of poorly known geometry can be characterized over a range of penetration depths by measurements in a fluid of known n and p over the corresponding range of frequencies.

Physical Limit to the Stability of Superheated and Stretched Water.
Final rept.
S. B. Kiselev, J. M. H. Levelt Sengers, and Q. Zheng. 1995, 8p.
Pub. in Proceedings of the International Conference on the Properties of Water and Steam (12th), Orlando, FL., September 9-16, 1994, p378-385.

Keywords: *Steam, *Spinodal, Molecular structure, Stability, Reprints, *Water structure, Equations of state.

Several highly accurate formulations of the thermodynamic properties of water and stream are investigated in the regions of supercooled, superheated and stretched liquid water. It is shown that they give considerably different locations for the spinodal, which diminishes the physical relevance of this curve. It is argued that nucleation theories based on local equilibrium fail long before the spinodal is reached. We calculate the physical limit of metastability for superheated and stretched water based on the theory of relaxation of metastable states of Patashinskii and Shumilo. For this application a crossover formalism is used to enable calculation of the critical radius of the nucleus for both positive and negative pressures. The calculated physical limit of metastability agrees with the extrema of superheat, realized in homogeneous states by Skripov et al., and of negative pressure, realized in homogeneous states by Zheng et al.

Decomposition of SF6 and Production of S2F10 in Power Arcs.
Final rept.
H. D. Morrison, F. Y. Chu, M. Eygenraam, I. Sauers, and R. J. Van Brunt. 1995, 7p.
Pub. in International Symposium on Gaseous Dielectrics (7th), Knoxville, TN., April 24-28, 1994, p475-481 1995.

Keywords: *Sulfur hexafluoride, *Decomposition, *Arc discharges, *Electric arcs, Toxic substances, Dielectrics, Electrical insulation, Kinetics, Gas chromatography, Infrared spectroscopy, Gases, Reprints, SF6, S2F10.

Decomposition of SF6 in electrical discharges produces many toxic solids and gases. S2F10 is the most toxic of the gaseous byproducts and has been found in arcs, sparks and corona. We have conducted a series of tests of a power arc discharge contained completely within a bus duct configuration. Among the many other gaseous byproducts, we have detected S2F10 at or below the part per million (ppm) by volume level, providing that S2F10 can be formed directly by a power arc within SF6-insulated equipment. The relative production rate of S2F10 with respect to that of SOF2 and SF4, however, implies that S2F10 is not a significant contributor to the hazard of exposure to decomposed SF6.

Simulation Studies of Supercooled and Glass Forming Liquids.
Final rept.
R. D. Mountain. 1995, 15p.
Pub. in Proceedings of the Winter Meeting on Statistical Physics (23rd), Cuernava, Mexico, January 9-12, 1994, p1-15 1995.

Keywords: *Computerized simulation, *Supercooling, *Glass, *Liquids, Molecular structure, Ergodic process, Convergence, Models, Time, Length, Relaxation time, Reprints, *Supercooled liquids, Molecular dynamics.

A brief review of the results of a number of molecular dynamics simulations of glass forming model systems is presented. A method for determining the ergodic convergence time is described. The results indicate that relaxation of dynamical correlations occurs over many time scales. The characterization of relevant length scales is not well understood. Some suggestions for further studies are presented.

Modification of Cast Epoxy Resin Surfaces during Exposure to Partial Discharges.
Final rept.
H. Slowikowska, T. Las, J. Slowikowski, and R. J. Van Brunt. 1995, 8p.
Pub. in International Symposium on Gaseous Dielectrics (7th), Knoxville, TN., April 24-28, 1994, p635-642 1995.

Keywords: *Dielectrics, *Electrical insulation, *Gas discharges, *Epoxy resins, Electrical resistivity, Surface roughness, Morphology, Sulfur hexafluoride, Nitrogen, Oxygen, Gas mixtures, Reprints, PD(Partial discharges).

Cast epoxy resin materials are commonly used in insulating spacers of gas-insulated high-voltage power systems. It has been showed, that the discharge-induced decrease in surface resisitivity is responsible for dramatic changes in the stochastic behavior of the electrical discharge. In the present work, the nature of partial-discharge (PD) induced damage to cast epoxy resin surfaces has been investigated in more detail using various techniques to examine surface roughness and morphology, as well as resistivity. The effect of generating PD in gases other than air, such as SF6, N2, and N2/O2 mixtures, was also examined.

Electron Attachment to Excited Molecules(1).
Final rept.
L. G. Christophorou. 1995, 1p.
See also DE94019124.
Pub. in International Symposium on Electron- and Photon-Molecule Collisions and Swarms, Berkley, CA., July 22-25, 1995, pE-1.

Keywords: *Electron attachment, *Molecular excitation, Molecular energy levels, Internal energy, Vibration, Rotation, Photodissociation, Cross sections, Lasers, Irradiation, Reprints, *Slow electrons.

The interactions of slow electrons with molecules-especially the processes of electron attachment-depend rather strongly on the internal energy content of the molecules themselves. As a rule, excited molecules interact with slow electrons with substantially larger cross section than do ground-state molecules. 1-5 Studies of electron attachment to vabrationally/rotationally excited, 'hot', molecules 1,3,5-18 and especially to electronically excited molecules 1,3,4,19-24 are rather recent, in contrast to the extensive studies on electron attachment to ground-state molecules which cover many decades 6,25,26.

J. M. H. Levelt Sengers. 1995, 12p.
Pub. in Proceedings of the International Conference on the Properties of Water and Steam (12th), Orlando, FL., September 9-16, 1994, p1-12 1995.

Keywords: *Aqueous solutions, History, Steam tables, Water, Reprints, IAPWS(International Association for the Properties of Water and Steam), Supercritical states, Thermodynamic properties, Transport properties.

The lines are traced from the early international cooperational necessary for efficient design of, and global trade in turbines, boilers and heat exchangers for power generation, to the past and current forms this cooperation assumes in the International Association for the Properties of Water and Steam (IAPWS). The mutually enriching interaction of IAPSW and the scientific world will be illustrated by several examples, taken from the fields of critical phenomena, molecular simulation, and supercritical fluids. The acceptance of IAPWS formulations of steam and water properties of de facto world standards for many other applications besides power generation is a consequence of IAPW's firm commitment to excellence. IAPWS's branching out to impure water and steam, necessitated by the threat impurities pose to the components of power plants, has led to fruitful interactions with aqueous physical chemistry and geochemistry, and may help reach a new synthesis in the science and engineering of reactive supercritical fluid mixtures.

Static Dielectric Constant of Water and Steam.
Final rept.
D. P. Fernandez, A. R. H. Goodwin, R. C. Williams, S. G. Penoncello, Y. Mulev, and J. M. H. Levelt Sengers. 1995, 8p.
Pub. in Proceedings of the International Conference on the Properties of Water and Steam (12th), Orlando, FL., September 9-16, 1994, p109-116 1995.

Keywords: *Dielectric properties, *Steam, *Water, Experimental data, Data correlation, Data bases, Reprints, Relative permittivity.

All relevant static dielectric constant data for water and steam have been collected and evaluated, and will be made available in print and in computerized form. A new formulation of the static dielectric constant or relative permittivity of water and stream has been developed. It is based on the ITS-90 temperature scale, and uses a new fundamental equation for water and steam, likewise based on this scale. It also includes our recently obtained dielectric constant data in liquid water and in saturated steam. The new formulation ranges from -45 to + 600 degrees C in temperature, and from 0.1 to 1189 MPa in pressure. It is based on the dipole correlation or g-factor of Alder and Harris, and formulates this factor with 10 adjustable coefficients and associated powers of reduced density and inverse reduced temperature.

Characterization of the Vibrational Dynamics in the Octahedral Sublattices of LaD2.25 and LaH2.25.
Final rept.
T. J. Udovic, J. J. Rush, and I. S. Anderson. 1995, 10p.
Pub. in Jnl. of Physics: Condensed Matter, v7 p7005-7014 1995.

Keywords: *Vibrational spectroscopy, *Denterides, Dynamics, Hybride, Reprints, Lanthanum, Neutron scattering, Octahedral site, *Tetrahedral site vibrations.

Incoherent inelastic neutron scattering spectroscopy was used to characterize the optic-vibrational density of states (DOS) of the octahedrally coordinated deuterium (Do) and hydrogen (Ho) atoms in LaD2.25, LaH2.25, and LaH2.03. The DOS exhibits a temperature- and concentration-dependent behavior consistent with that oserved previously for the analogous beta-TbH2+x system. At low temperature, the Ho DOS for LaH2.03 is fairly sharp with minor spectral sidebands, indicating that the Ho atoms are predominantly isolated, with some atoms residing in short-range-order domains. Increasing the Ho (or Do) concentration to LaH2.25 (or LaD2.25) yields a dispersion-broadened bimodal DOS characteristic of the Ho (or Do) I4/mmm long-range order that develops in the octahedral sublattice at low temperatures and these higher Ho (or Do) concentrations. For LaH2.25 at higher temperature (340 K), a broad, somewhat asymmetric DOS is suggestive of an Ho sublattice that is now largely disordered yet still possesses some degree of short-range order.

Kinetic-Energy Distributions of Ions Sampled from Radio-Frequency Discharges in Helium, Nitrogen, and Oxygen.
Final rept.
R. J. Van Brunt, J. K. Olthoff, and S. B. Randovanov. 1995, 4p.
Pub. in Proceedings of the International Conference on Gas Discharges and Their Applications (11th), Tokyo, Japan, September 11-15, 1995, v1 pI-486-I-489.

Keywords: *Gas discharges, *Helium, Nitrogen, Oxygen, Reprints, *Foreign technology, Ion kinetic energies, Radio-frequency plasma.

Mass-resolved ion kinetic energy distributions are measured for radio-frequency (rf) discharges sustained in helium, nitrogen, and oxygen in a parallel-plate plasma reactor. The dominate ions for each of the gases are observed to be the parent ions He+, N2+, and O2+, respectively over a wide range of pressures (1.3 to 67 Pa) with an applied rf voltage of 200 V. Ion kinetic-energy distributions at the grounded electrode were measured for these ions, as well as for less abundant ions, such as He2+, N+, N2H+, N3+, N4+, O+, and 3+.

Measurement of S2OF10, and S2O2F10 Production Rates from Spark and Negative Glow Corona Discharge in SF6/O2 Gas Mixtures.
Final rept.
R. J. Van Brunt, J. K. Olthoff, S. L. Firebaugh, and I. Sauers. 1995, 4p.
Sponsored by Electric Power Research Inst., Palo Alto, CA. and Department of Energy, Washington, DC.
Pub. in Proceedings of the International Conference on Gas Discharges and Their Applications (11th), Tokyo, Japan, September 11-15, 1995, v1 pI-316-I-319.

Keywords: *Corona discharge, *Oxygen, Production rates, Spark discharge, Sulfur hexafluoride, Reprints, *Foreign technology, Disulfur decafluoride.

The rates for production of the compounds S2F10, and S2OF10, and S2O2F10 have been measured both in spark and continuous, constant-current (40 micro A) negative glow corona discharges generated using point-to-plane electrode gaps in 'pure' SF6 and SF6/O2 gas mixtures containing different relative amounts of oxygen, up to 10 percent. The measurements were performed for the total gas pressures in the range of 100 to 200 kPa, and the SF6 discharge byproduct concentrations were mesured using a gas chromatograph-mass spectrometric technique and a cryogenic enrichment chromatographic technique, respectively, for the corona and spark experiments. When O2 is added to the gas, there is a dramatic drop in the S2F10 yield from the corna discharge. The results can be explained within the framework of a plasma-chemical model from considerations of the competition among reactions of SF, radicals produced by dissociation of SF6 in the discharge with SF5 itself as well as with O2 and O, and the relative degree of O2 dissociation in the two types of discharges.

Zimm Plot and Its Analogs as Indicators of Vesicle and Micelle Size Polydispersity.
Final rept.
J. H. van Zanten. 1995, 8p.
Pub. in Jnl. of Chemical Physics, v102 n22 p9121-9128 Jun 95.

Keywords: *Light scattering, *Liposomes, *Vesicles, Size distributions, Reprints.

The utility of using the Zimm plot and its analogs, the Debye and Berry plots, as a sensitive means of determining the degree of polydispersity present in solutions of surfactant aggregates such as vesicles or micelles is conclusively demonstrated. These methods of interpreting the excess scattered light intensity due to the surfactant aggregates lead to the determination of the weight-average molecular weight (Mw) and z-average mean square radius ((r2 sub g) z), or radius of gyration, of the surfactant aggregates. These two parameters are very sensitive to any polydispersity which is present in the aggregate solution, since these two experimentally determined quantities represent different moments of the aggregate size distribution. For a given geometric model, apparent surfactant aggregate structural parameters, such as the radius and wall thickness in the case of surfactant vesicles, can be calculated under the assumption of monodisperse aggregates from (r2 sub g)z and Mw determined from a Zimm or Debye analysis of static light scattering spectra.

Decomposition of Sulfur Hexafluoride by X-rays.
Final rept.
J. K. Olthoff, and R. J. Van Brunt. 1995, 6p.
Pub. in International Symposium on Gaseous Dielectrics (7th), Knoxville, TN., April 24-28, 1994, p417-422.

Keywords: *Sulfur hexafluoride, *Physical radiation effects, *Decomposition reactions, *X-rays, Radiation doses, Chemical reaction kinetics, Electric discharges, Corona discharges, Byproducts, Electrical insulation, Gas pressure, Reprints.

In the paper, the authors present results of by-product formation in gaseous SF6 exposed to high-energy X-rays. The identity and concentration of the decomposition by-products are determined by gas chromotography/mass spectrometry techniques that were developed to investigate the decomposition of SF6 exposed to corona discharges. The production curves of SOF2 and S2F10 are determined for a range of SF6 gas pressures, X-ray energies, and X-ray fluxes. Evidence for the presence of other by-products, such as SOF4, SO2F2, and S2O2F10 is also presented. The decomposition data for the SF6 exposed to X-rays are compared with previously published data for SF6 exposed to corona discharges.

Pub. in Physical Review Letters, v75 n12 p2396-2399 Sep 95.

Keywords: *Vibrations, Reprints, *YBCO, *Plane oxygen vibration, Brillouin, q-dependence, Temperature dependence.

The authors have measured the temperature dependence of the peak position and linewidth of the 42.5 meV phonon branch in a twinned single crystal of BYa2Cu2O- as a function of wave vector q. In the (100)/(010) direction in the Brillouin zone, considerable softening and broadening occur below the superconducting transition temperature Tc at some values of q. The authors observe an order of magnitude smaller softening and no linewidth broadening for q in the (110)/(110) direction. Possible implications of these findings for the symmetry of the superconducting order parameter are discussed.

Dielectric Spectroscopic Determination of Temperature Behavior of Electroclinic Parameters in the Liquid Crystal W317.
Final rept.
P. A. Williams, and N. A. Clark. 1995, 5p.
Pub. in Jnl. of Applied Physics, v78 n1 p413-417 Jul 95.

Keywords: *Liquid crystals, Electric fields, Spectroscopy, Free energy, Reprints, *Electroclinic effect, W317 liquid crystal.

We report measurements of the temperature behavior of the electroclinic coupling coefficient c(T) and the inverse tilt suscepitbility A(T), the principal phenomenological parameters determining the magnitude of the electroclinic effect in the chiral smectic A phase of the liquid crystal W317, a material which exhibits an anomalously large electroclinic effect with unusual thermal behavior. We find that c(T) decreases by approximately 30 percent in response to a 40 degrees C increase in temperature. A(T) exhibits a mean field behavior at high temperature, increasing by a factor of 3 as temperature is increased over the range 40 degrees C less than T less than 65 degrees C. However, below approximately 40 degrees C, A(T) becomes nearly independent of temperature over a approximately 10 degrees C range around temperature. This A(T) behavior has not been previously found in electroclinic materials.

The rotational-torsional spectrum of the trans rotational isomer of ethyl alcohol was investigated in the 65-350 GHz frequency region. A total of 481 ground state transitions over a range of J and Ka values up to 33 and 10, respectively, were measured and assigned. Doublets or triplets arising from the A and E torsional states of the v=0 torsional level of the three-fold-symmetric methyl internal rotation have been resolved in 168 of these transitions. Internal rotation theory predicts a significant number of c-type E-state transitions normally forbidden, but allowed when the rotational symmetry operators mix E-state rotational-torsional levels. Over 40 of these transitions have been observed. The newly measured transitions, along with the results of many previous measurements, have been analyzed using an IAM internal rotation Hamiltonia and a Watson A-reduced Hamiltonias to determine the rotational, centrifugal distortion, and torsional constants. All reliable sources of data for the static dielectric constant or relative permittivity of water and steam, many of them unpublished or inaccessible, have been collected, evaluated, corrected when required, and converted to the ITS-90 temperature scale. The data extend over a temperature range from 238 to 873 K and over a pressure range from 0.1 MPa up to 1189 MPa. The evaluative part of this work includes a review of the different types of measurement techniques, and the corrections for frequency dependence due to the impedance of circuit components, and to electrode polarization. It also includes a detailed assessment of the uncertainty of each particular data source, as compared to other sources in the same range of pressure and temperature. Both the raw and the corrected data have been tabulated, and are also available on diskette. A comprehensive list of references to the literature is included. Keywords: *Anomalous dispersions, *Attenuation, Form factors, Reprints, Photoabsorption tabulation, Scattering cross-sections.

In the present study, the primary interactions of x-rays with isolated atoms from Z = 1 (hydrogen) to Z = 92 (uranium) are described and computed within a self-consistent Dirac-Hartree-Fock framework. This has general application across the range of energy from 1-10 eV to 400-1000 keV, with limitations (described below) as the low- and high-energy extremes are approached. Tabulations are provided for the f1 and f2 components of the form factors, together with the photoelectric attenuation coefficient for the atom, micro, and the value for the K-shell, microk, as functions of energy and wavelength. Also provided are estimated correction factors as described in the text, conversion factors, and a simple estimate for the sum of the scattering contributions (from an isolated atom). The method used herein is primarily theoretical and considers intermediate assumptions which limit the precision and applicability of previous theoretical tabulations. Particular concern involves the application of the dispersion relation to derive Re(f) from photoelectric absorption cross-sections.

Keywords: *Barium ions, Data evaluation, Enthalpy, Entropy, Key compounds, Reprints, CODATA, Gibbs energy, Thermochemical measurements.

Recommended thermochemical property values, delta(f)H(deg), delta(f)G(deg) and S(deg) for the aqueous ion of barium, Ba2+, are given at 298.15 K in SI units. The values are: delta(f)H(deg) = -534.64 plus or minus 1.80 kJ.mol(-1), delta(f)G(deg) = -557.60 plus or minus 1.81 kJ.mol(-1) and S(deg) = 8.80 plus or minus 0.50 J-K(-1) mol(-1). They are consistent with the CODATA Key Values for Thermodynamics. The evaluation involves the analysis of the enthalpy changes, Gibbs energy changes, and the entropy measurements for all key substances in the key network. A consistent set of thermochemical property values is given for BaO(cr), BaH2(cr), BaCl2(cr), BaCl2.2H2O(cr), Ba(NO3)2(cr), and BaCO3(cr, witherite), as well as reconstituted recommended process values with uncertainties for reactions involving these substances. Critical Review of Rate Constants for Reactions of Transients from Metal Ions and Metal Complexes in Aqueous Solution.
G. V. Buxton, Q. G. Mulazzani, and A. B. Ross. c1995, 294p.
Prepared in cooperation with Consiglio Nazionale delle Ricerche, Bologna (Italy). Ist. di Fotochimica e Radiazioni d'Alta Energia. and Notre Dame Univ., IN. Radiation Chemistry Data Center.
Included in Jnl. of Physical and Chemical Reference Data, v24 n3 p1055-1349 May/Jun 95. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC. 20036-9976.

Keywords: *Aqueous solutions, *Chemical kinetics, Critical review, Data compilation, Pulse radiolysis, Rate constants, Transients, Reprints, Flash photolysis, Metal ions.

Kinetic data for transient metal species in aqueous solution have been critically reviewed. The compilation covers over 2000 measurements of rate constants involving 660 metal ions and metal complexes from Groups 4-15; lanthanides and actinides are not included. Most of the data have been obtained by the methods of pulse radiolysis or flash photolysis. Data have been collected from 500 publications through 1993. Keywords: *Water, *Thermal conductivity, Liquids, Reprints, Reference materials, Standard reference data.

New experimental data on the thermal conductivity of liquid water along the saturation line have been obtained recently, using the bare and coated transient hot wire technique, with high accuracy. The quality of the data is such that new standard reference values can be proposed with confidence limits of 0.7% at a 95% confidence level. These data and the correlation herein presented revise a previous correlation endorsed by IUPAC. (Copyright (c) 1995 American Institute of Physics and American Chemical Society.)

Accurate values of the apparent standard partial molal Gibbs free energies of formation (delta G deg) of aqueous species, minerals, and gases at high temperatures and pressures are a requisite for characterizing a variety of industrial and natural processes including corrosion of metals, solvent extraction, crystal growth, metamorphism, and the formation of hydrothermal ore deposits. Revision of the HKF equations of state for aqueous species other than H2O (Helgeson, Kirkham and Flowers, 1981) by Tanger and Helgeson (1988) and Shock et al. (1992) permits calculation of delta G deg for these species at temperatures to 1000 deg C and pressures to 5000 bars.

Commission on Atomic Weights and Isotopic Abundances, Reston, VA.
Atomic Weights of the Elements, 1993.
c1995, 15p.
Included in Jnl. of Physical and Chemical Reference Data, v24 n4 p1561-1576 Jul/Aug 95. Available from American Chemical Society, 1155 Sixteenth St., NW, Washington, DC 20036-9976.

Keywords: *Atomic weights, Critical evaluation, Elements, Reprints, *Isotopic compositions, *IUPAC Commission on Atomic Weights.

The biennial review of atomic weight, Ar(E), determinations and other cognate data has resulted in changes for the standard atomic weight of titanium from 47.88 plus or minues 0.03 to 47.867 plus or minus 0.001, of iron from 55.847 plus or minus 0.003 to 55.845 plus or minus 0.002, of antimony from 121.757 plus or minus 0.003 to 121.760 plus or minus 0.001, and of iridium from 192.22 plus or minus 0.03 to 192.217 plus or minus 0.003. Recent investigations on chlorine and bromine confirmed the presently accepted values of Ar(Cl) and Ar(Br). To emphasize the fact that the atomic weight of lithium commonly available in laboratory reagents can vary significantly, the value of lithium, Ar(Li), was enclosed in brackets and a footnote was added. As a result of several changes, the Table of Standard Atomic Weights Abridged to Five Significant Figures has been updated. Because relative isotope-ratio data for stable hydrogen, carbon, and oxygen are commonly being expressed on non-corresponding scales, the Commission recommends that such isotopic data be expreseed only relative to the references VSMOW and VPDB. Keywords: *Ammonia, *Viscosity, Correlation, Critical assessment, Liquids, Representation, Vapors, Reprints.

A new representation of the viscosity of ammonia is presented. The representative equations are based on a set of experimental data selected as a result of a critical assessment of the available information. The validity of the representation extends from 196 K to the critical temperature for both liquid and vapor phases. In the supercritical region the temperature range extends to 680 K for pressures at or below ambient and to 600 K for pressure up to 50 MPa. The accuracy of the representation varies from 0.5% for the viscosity of the dilute gas phase at moderate temperatures to about 5% for the viscosity at high pressures and temperatures. Tables of the viscosity generated by the correlating equation at selected temperatures and pressures and along the saturation line are presented to provide easy reference as well as for the validation of computer codes. High-Temperature High-Pressure Oscillating Tube Densimeter.
Final rept.
R. F. Chang, and M. R. Moldover. 1996, 6p.
Pub. in Review of Scientific Instruments, v67 n1 p251-256 Jan 96.

Keywords: *Densitometers, *Oscillations, Density, High pressure, High temperature, Tubes, Calibrating, Toluene, Thermophysical properties, Reprints.

We describe an oscillating tube densimeter for use at temperatures up to at least 575 K and at pressures up to 20 MPa. After the densimeter was calibrated under vaccum and filled with water, it was used to measure the density of toluene from 298 to 575 k at 13.8 MPa. The results agree (0.1 percent rms deviation) with those obtained using other techniques. In the present densimeter, an alternating current is passed through the tube containing the sample to force the tube to oscillate in the field of a permanent magnet. This design avoids the use of electromagnets (with their attendant polymer or ceramic insolations) and does not require attachment of appendages to the oscillating tube.

Radiation-Chemical Reaction of 2,3,5-Triphenyl-Tetrazolium Chloride in Liquid and Solid State.
Final rept.
A. Kovac, L. Wojnarovits, W. L. McLaughlin, S. E. Ebrahim Eid, and A. Miller. 1996, 4p.
Pub. in Radiation Physics and Chemistry, v47 n3 p483-486 1996.

Keywords: *Radiolysis, *Reaction kinetics, *Pulses, Dosimetry, Oxidation, Reduction(Chemistry), Dosage, Liquids, Solids, Chemical reactions, Radiation chemistry, Reprints, TTC(Triphenyl-tetrazolium chloride), TTC films.

In pulse radiation of 2,3,5-triphenyl-tetrazolium chloride (TTC) at around 360 nm fast formation of intermediate tetrazolium radical was observed under both oxidizing and reducing conditions. In the latter case biomolecular formation of formazan, absorbing at around 480 nm, was observed. This reaction is accompanied by combination to the diformazan dimer, absorbing over the spectral range 500-550 nm. A polyvinyl-alcohol-based TTC film was produced and tested for dosimetry purposes: it gave a measureable response in the 1-100kGy dose range by evaluating the 50 micrometers thick TTC films at the absorption maximum of 493 nm.

Pinch Effect in Commensurate Vortex-Pin Lattices.
Final rept.
L. D. Cooley, and A. M. Grishin. 1995, 4p.
Pub. in Physical Review Letters, v74 n14 p2788-2791 Apr 95.

Keywords: *Commensurate lattices, *Critical state, Magnetization, Superconductors, Reprints, Flux pinning.

The critical state in a superconductor with periodic pins has properties similar to the pinch effect, known in plasma physics. It forms a terrace structure around the average flux density gradient, causing stratification of the transport current into the terrace edges where the flux density gradient is large. Regions of extremely high current thus interlace with regions of near zero current. The appearance of each new terrace inside the superconductor causes the magnetization jump, a new quantum effect in superconductors, corresponds to the addition of one flux quantum threading the pin lattice unit cell.

Neutron Scattering Study of the Lattice Modes of Solid Cubane.
Final rept.
P. M. Gehring, D. A. Neuman, W. A. Kamitakahara, D. P. VanMeurs, J. J. Rush, and P. E. Eaton. 1995, 6p.
Pub. in Jnl. of Physical Chemistry, v99 p4429-4434 1995.

Keywords: *Molecular structure, *Chemical bonds, *Neutron scattering, Lattices, Reprints, *Cubanes.

The authors use neutron time-of-flight scattering techniques to measure the low-frequency vibrational density of states of solid cubane at 100 and 300 K. Debye-like behavior is observed up to approximately 60 cm(-1) at both temperatures. At 100 K, the density of states exhibits three distinct peaks at 78, 94, and 114 cm(-1) before cropping to zero around 150 cm(-1). The authors identify the 114 cm(-1) peak with the Eg librational mode of cubane based on the marked temperature dependence of its frequency and a comparison to Raman measurements. In similar fashion they identify the 94 cm(-1) peak with the Ag librational mode. At 300 K, the librational modes have softened to the extent that the density of states exhibits a plateau-like feature between 60 and 100 cm(-1).

Virial Coefficients of Five Binary Mixtures of Fluorinated Methanes and Ethanes.
Final rept.
L. A. Weber, and D. R. Defibaugh. 1994, 18p.
Pub. in Internaitonal Jnl. of Thermophysics, v15 n5 p863-880 1994.

Keywords: *Hydroflurorocarbons, Refrigerants, Viral coefficients, Reprints, *Pressure vapor temperature, *Polar gases.

The authors have made new measurements of the gas-phase PVT surface of five binary mixtures of hydrofluorocarbons (HFCs) in a Burnett/isochoric apparatus. The components chosen all have moderate to large reduced dipole moments. The authors present PVT data, derived mixture virial coefficients, cross second virial coefficients, and binary interaction parameters for these systems, and the authors compare the results with a recently published model for calculating second and third viral coefficients of polar gases and their mixtures. That model accounts for the polar nature of the molecules with a term containing the reduced dipole moment and it contains mixing rules for the substance-specific parameters needed to calculate the second and third cross virial coefficients. The model and data are in satisfactory agreement, and the model can be used to greatly extend the useful range of the limited set of data.

Tetrahedral-Framework Lithium Zinc Phosphate Phases: Location of Light-Atom Positions in LiZnPO4 H2O by Powder Neutron Diffraction and Structure Determination of LiZnPO4 by ab Initio Methods.
Final rept.
W. T. A. Harrison, T. E. Gier, J. M. Nicol, and G. D. Stucky. 1995, 9p.
Pub. in Jnl. of Solid State Chemistry, v114 p249-257 1995.

Keywords: *Ion exchange resins, *Cations, *Crystal structure, Powder(Particles), Neutron diffraction, Synthesis(Chemistry), Phase transformations, Lithium inorganic compounds, Zinc phosphates, Reprints, Powder neutron diffraction, Zeolite A phases.

The syntheses, crystal structures, and certain properties of two lithium zinc phosphate phases, LiZnPO4.H2O and LiZnPO4, are reported. LiZnPO4.H2O is an isostructure of the Li-A-type zeolite LiAlSiO4.H2o and consists of a fully ordered three-dimensional network of vertex-sharing ZnO4 and PO4 tetrahedral units surrounding 8-, 6-, and 4-ring windows. The extraframework lithium cation and water molecular are located in this cavity system. The structure of LiZnPO4 was solved ab initio using synchrontron X-ray powder data and consists of a new semicondensed tetrahedral-framework structure, incorporating the guest lithium cations in squashed 6-ring channels.

Keywords: *Terbium compounds, *Crystal structure, Powder(Particles), Neutron diffraction, Lattice parameters, Rare earth compounds, Chemical bonds, Reprints, Terbium deuteride, Long-range order, Octahedral site occupation.

A neutron-powder-diffraction pattern of the superstoichiometric rare-earth dideuteride TbD2.25 was measured at 70 K. Profile refinements indicated that the TbD2.25 structure possesses I4/mmm symmetry with deuterium fully occupying the tetrahedral (t) interstices of the nominally fcc Tb lattice and the excess deuterium occupying one-fourth of the octahedral (o) interstices with long-range order. Ideal order corresponds to the occupation of only those o sites within every fourth (042)cubic plane, in agreement with the results of a previous TbD2+x study.

Fabrication Issues for the Prototype National Institute of Standards and Technology SRM 2090A Scanning Electron Microscope Magnification Calibration Standard.
Final rept.
B. L. Newell, M. T. Postek, and J. P. van der Ziel. 1995, 5p.
Pub. in Jnl. of Vacuum Science and Technology, Chapter 2671, vB 13 n6 p2671-2675 Nov/Dec 95.

Keywords: *Electron microscopes, *Scanning, *Calibration standards, Prototypes, Lithography, Electron beams, Fabrication, Design, Reprints.

A new National Institute of Standards and Technology scanning electron microscope magnification calibration standard has been fabricated and distributed in production prototype form. The SRM 2090A samples contain structures ranging in pitch from 3000 to 0.2 microm and are useful at both high- and low-accelerating voltages. The design and fabrication of the samples has incorporated many of the improvements suggested through two previous prototype series. This article discusses optimization of the lithographic techniques in the fabrication process. We used electron beam lithography for fabrication because of the 0.1 microm features required on the samples.

Q Branch Lineshape Functions for CARS Thermometry.
Final rept.
G. J. Rosasco, and W. S. Hurst. 1992, 6p.
Pub. in Temperature, Its Measurements and Control in Science and Industry, v6 pt2 p655-660 Feb 92.

Keywords: *Raman spectroscopy, *Temperature measurement, Line spectra, Spectra analysis, Temperature dependence, Pressure, Collision parameters, Reprints, CARS(Coherent Anti-Stokes Raman Spectroscopy), Collisional narrowing, Dicke narrowing.

Knowledge of the pressure and temperature dependence of the spectra distribution is required to allow determination of the temperature from a coherent anti-Stokes Raman spectroscopy (CARS) spectrum. We review our understanding of the physics of line formation for the Raman vibrational Q-branch of diatomic molecules. While we can demonstrate that the role of velocity, phase, and state changing collisions in line formation is reasonably well understood, there are relatively few first principle calculations which allow prediction of the molecular parameters which determine the spectra distribution. We show how quasi-empirical models, which are consistent with our physical understanding, can provide a reliable basis for prediction.

Pub. in Jnl. of Alloys and Compounds, v231 p144-146 1995.

Keywords: .*Niobium compounds, *Neutron scattering, *Microstructure, Inelastic scattering, Alloys, Spectroscopic analysis, Vibration spectra, Lattice parameters, Hydrides, Reprints, Octahedral site occupation, Metal hydrides.

Nb(100-x)VxHy is a random b.c.c. alloy system with an H sublattice disordered with respect to site energies. Previous incoherent inelastic neutron scattering (IINS) studies ascertained both octahedral (o) and tetrahedral (t) site occupation by H for x = 5, 10 and 50. On the basis of spectroscopic and statistical arguments, the low-temperature H vibrational peaks in the Nb-rich, low-H-concentration Nb95V5H1 alloy were assigned to Nb4V2 o sites and NbV3 t sites. To probe the regime of lower H concentration and the effects of D substitution, further IINS spectra were measured for Nb95 V5Hy (y=0.5 and 0.8) and Nb95V5D2.7.

Neutron Spectroscopic Comparison of beta-Phase Rare Earth Hydrides.
Final rept.
T. J. Udovic, J. J. Rush, and I. S. Anderson. 1995, 6p.
Pub. in Jnl. of Alloys and Compounds, v231 p138-143 1995.

Keywords: *Rare earth elements, *Hydrides, *Neutron scattering, *Microstructure, Inelastic scattering, Spectroscopic analysis, Vibrational spectra, Lattice parameters, Phase transformations, Reprints.

The Beta-phase hydrides Beta-RH2+x of a variety of rare metals (R = Tb, Y, La, Ce and Dy) were investigated by incoherent inelastic neutron scattering spectroscopy. The broad, complex vibrational density of states (DOS) of the tetrahedrally coordinated (t-site) Hydrogen (Ht) typically found for these systems is a manifestation of the dynamic coupling within the Ht sublattice due to significant Ht-Ht interactions. A breakdown of this dynamic coupling via isotopic dilution of the Ht atoms with larger mass deuterium atoms is observed spectroscopically by a collapse of the complex DOS into a single sharp feature.

Effects of Pipe Elbows and Tube Bundles on Selected Types of Flowmeters.
Final rept.
G. E. Mattingly, and T. T. Yeh. 1991, 10p.
Pub. in Flow Measurement and Instrumentation Jnl., v2 p4-13 Jan 91.

Keywords: *Pipe elbows, *Measurement accuracy, *Flowmeters, Swirl, Reprints, *Foreign technology, Tube bundles.

The paper presents experimental results for the decay of pipe elbow-produced swirl in pipeflows and its effects on flowmeter measurement accuracy. Experiments include the decay of swirl produced by single and double elbow configurations for pipe diameter Reynolds number of 10 to the 4th power to 10 to the 5th power using water in a 50 mm diameter facility at NIST in Gaithersburg, MD. Results show that different types of swirl are produced by the different piping configurations. The swirl decay is found to be dependent on the type of swirl and the pipe Reynolds number. A high Reynolds number very long lengths of straight, constant diameter pipe are required to dissipate the single eddy type swirl that is produced by the two elbows out-of-plane configuration. Without flow conditioning, it is concluded that the specifications of upstream pipe lengths in the current flowmetering standards may not be sifficient to achieve the desired flow metering accuracy. Experimental results are also presented for the effects produced by tube bundle-type flow conditioners. These results show shifts in orifice meter discharge coefficients that are both positive and negative depending upon pertinent conditions. A range of orifice geometries, Reynolds numbers and meter locations are studied and explanations are put forth to explain these shifts.

Imposed Oscillations of Kinetic Barriers Can Cause an Enzyme to Drive a Chemical Reaction Away from Equilibrium.
Final rept.
R. D. Astumian, and B. Robertson. 1993, 6p.
Pub. in Jnl. of the American Chemical Society, v115 n24 p11063-11068 Dec 93.

Keywords: *Chemical affinity, *Enzyme kinetics, Reprints, Thermodynamics, *Free energy transduction.

The overall Gibbs free energy change (delta G) of a chemical reaction is often termed the driving force of the reaction. The sign of delta G defines the direction of spontaneous reaction, and the condition delta G = 0 defines the point of chemical equilibrium. This is strictly true for elementary reactions--reactions that pass through only one local maximum (the transition state) along the reaction coordinate connecting reactant and product states. However, under many circumstances it is also true for reactions that involve one or more intermediates, particularly if the steady state intermediate concentrations are very small. Here the authors show that externally imposed oscillations or fluctuations can drive a net chemical reaction away from equilibrium so long as the rate constants of at least one elementary step of the overall reaction depend on the fluctuating parameter. This is true even if the overall delta G is independent of the perturbation and it is also true even if the concentrations of the intermediate states are very, very small (i.e., experimental undetectable).

Quadratic Response of a Chemical Reaction to External Oscillations.
Final rept.
R. D. Astumian, B. Robertson, R. S. Li, and J. Ross. 1992, 7p.
Pub. in Jnl. of Chemical Physics, v96 n9 p6536-6542 May 92.

Keywords: *Chemical reactions, *Oscillations, Reprints, *Quadratic response, External periodic perturbations.

The authors develop a second-order response theory to investigate the effects of external periodic perturbations on a chemical reaction at a stable steady state in an open reactor. The authors apply the theory to the quadratic Schlogl model, a single-variable nonlinear reaction. In the presence of oscillating reactant or product concentrations or oscillating rate coefficients, the average intermediate concentration, the fluxes, and the dissipation are each a Lorentzian function of frequency with midpoint at the inverse relaxation time of the system. Thus even very short relaxation times can be determined by measuring average rates as a function of frequency of the perturbation. The amplitude of the Lorentzian depends on the chemical mechanism of the reaction and is proportional to the square of the amplitude of the applied perturbation. The authors also show that energy from the perturbation can be used to drive the reaction in a direction opposite of that predicted by the Gibb's free energy difference of the reactants and products, even under circumstances where the overall affinity is independent of the perturbation.

Vapor-Liquid Equilibria of Ternary Mixtures in the Critical Region on Paths of Constant Temperature and Overall Composition.
Final rept.
L. J. Van Poolen, and J. C. Rainwater. 1995, 9p.
Pub. in International Jnl. of Thermophysics, v16 n2 p473-481 Mar 95.

Keywords: *Critical region, *Ethane, Reprints, Ternary mixtures, Phase rule, *Vapor liquid equilibrium, Leung Griffiths model, N-butane, N-pentain.

High-pressure vapor-liquid equilibrium (VLE) data for the ternary mixture ethane + n-butane + n-pentane due to Thodos and co-workers have been correlated by a ternary version of the modified Leung-Griffiths model. Data were taken along paths of constant temperature and approximately constant overall composition, and a separate test was made for such constancy. Seventeen different specified overall compositions at four different temperatures were correlated. In general, agreement between the correlation and data is very good, particularly for those curves that satisfy the test for constant overall composition. The ternary model has been constructed from correlations of each of the three constituent binaries without any further adjustable parameters.

Density Dependence of Fluid Properties and Non-Newtonian Flows: The Weisenberg Effect.
Final rept.
J. C. Rainwater, H. J. M. Hanley, and A. Narayan. 1995, 17p.
Pub. in Jnl. of Rheology, v39 n6 p1343-1359 Nov/Dec 95.

Keywords: *Rotating cylinders, Compressibility, Couette flow, Reprints, *Weissenberg effect, *Non-Newtonian fluids, Rivlin-Ericksen tensors, Shear dilatancy.

Two approaches which describe the Weissenberg effect (height profile of a non-Newtonian fluid between rotating vertical concentric cylinders) are discussed. The first is based on an earlier calculation with rheological properties of a simple liquid from nonequilibrium molecular dynamics (NEMD). The calculation is redone here using new results on the density dependence of the normal pressure differences. The NEMD calculations are restricted to Couette flow, but describe specifically, in a consistent manner, the effects of finite compressibility. The pressure, viscosity, and normal pressure differences are all found from NEMD to be sensitive functions of density, which requires that the equations of motion be solved iteratively and self-consistently, and a sample calculation is presented for the soft sphere fluid. The second approach is that of Joseph and Fosdick. Their assumptions and techniques are examined and compared with the NEMD calculations.

Nonlinear Correlation of High-Pressure Vapor-Liquid Equilibrium Data for Ethylene + n-Butane Showing Inconsistencies in Experimental Compositions.
Final rept.
J. C. Rainwater, and J. J. Lynch. 1994, 9p.
Pub. in International Jnl. of Thermophysics, v15 n6 p1231-1239 Nov 94.

Keywords: *Critical region, *Ethylene, High pressure, Reprints, *Mole fraction errors, N-butane, Simplex optimization, Vapor-liquid equilibrium.

The modified Leung-Griffiths model is applied to the previously unpublished data, tabulated here, of Williams for high-pressure vapor-liquid equilibria of ethylene + n-butane. It is not possible to obtain a hihgly accurate correlation with the experimentally stated compositions, but evidence is given that those composition measurements may be suspect, although pressure, temperature, and density data are accurate. A simplex optimization method was used for the parameters of the model, and the compositions were also treated as adjustible parameters. With this method a much more accurate correlation is obtained, but the optimized compositions differ in two of four cases by more than 3% from the stated compositions.

Effect of Finite Beam Width on Elastic Light Scattering from Droplets.
Final rept.
J. T. Hodges, and C. Presser. 1993, 5p.
Pub. in Annual Conference on Liquid Atomization and Spray Systems (6th), Worcester, MA., May 17-19, 1993, Volume of Extended Abstracts, p152-156.

Keywords: *Droplets, *Elastic scattering, *Gaussian beam, Reprints, Lorenz-Mie.

A number of experimental techniques based on elastic light scattering are used to measure the size of micron-sized spherical particles and droplets. Some examples include, phase Doppler anemometry, laser diffraction methods, light intensity deconvolution as well as ensemble scattering measurements from axi-symmetric Gaussian and Gaussian sheet beams. In the interpretation of these measurements, the classical Lorenz-Mie theory (LMT) of elastic light scattering or principles of diffraction and ray optics are invoked to predict the phase, amplitude and intensity of the scattered radiation as a function of particle size, refractive index and scattering angle. The reliability and accuracy of these measurements, thus depend on the degree to which the invoked theory predicts the observed features of the scattered field. In this context, it is therefore important to consider realistic situations for which departures from the LMT are significant enough to warrant the use of more exact theories of light scattering.

CO2/CH4 Transport in Polyperfluorosulfonate Ionomers: Effects of Polar Solvents on Permeation and Solubility.
Final rept.
J. Pellegrino, and Y. S. Kang. 1995, 12p.
Pub. in Jnl. of Membrane Science, v99 p163-174 1995.

Keywords: *Permeation, *Solubility, Membranes, Reprints, Modeling, Alcohols, *Polyperfluorosulfonate ionomer, PFSI.

The authors measured CO2 and CH4 gas permeation through polyperfluorosulfonate ionomer (PFSI) that was solvated with water, methanol, ethanol, or 1-propanol. These measurements were compared with predictions based on a two-phase, effective-media, membrane model that considered a number of possible geometries for the distributed phase (the ionic clusters). The transport parameters (solubility and diffusivity) for each of the phases and the volume fraction of dispersed phase were either measured independently or estimated from prior literature data. The authors were unable to match all the experimental observations with this two-phase model. The authors conclude that different polar solvents an incorporate themselves into the fluorocarbon 'continuous phase' in ways that will alter the effective diffusion coefficient of that phase to gas permeation.

Electrical Characterization of Narrow Gap n-Type Bulk HgCdTe Single Crystals by Variable-Magnetic-Field Hall Measurements and Reduced-Conductivity-Tensor Analyses.
Final rept.
J. S. Kim, D. G. Seiler, R. A. Lancaster, and M. B. Reine. 1996, 2p.
Pub. in Extended Abstracts of the 1995 U.S. Workshop on the Physics and Chemistry of Mercury Cadmium Telluride and Other IR Materials, Baltimore, MD., October 10-12, 1995, p31-32 1996.

Keywords: *Hall effect, *Resistance, *Supercondictivity, Reprints, Electron mobility, Electron transport, Gapless state, HgCdTe, Magnetotransport, MCT, Narrow gap.

We have investigated, for the first time, magnetotransport properties of very narrow gap HgCdTe single crystals in the light of the reduced-conductivity-tensor (RCT) scheme to determine the variations of the carrier density and mobility as a function of temperature in the semiconductor-to-semimetal transition region. In this paper, we report the results of variable-magnetic-field and variable-temperature Hall measurements (0 to 1.5 T and 10 K to 300 K) on three n-type bulk HgCdTe single crystals, labeled MCT-1 (x=0.190), MCT-2 (x=0.175), and MCT-3 (x=0.160). The experimental data are analyzed in the context of the RCT scheme of multicarrier characterization, which we have previously used to electrically characterize liquid-phase-epitaxially (LPE) grown HgCdTe films. The latter work deals with type classification if LPE samples according to the degree of anomalous electrical behavior present, from normal to severely anomalous.

Solubilities of Copper(II) and Chromium(III) beta-Diketonates in Supercritical Carbon Dioxide.
Final rept.
A. F. Lagalante, B. N. Hansen, T. J. Bruno, and R. E. Sievers. 1995, 5p.
Pub. in Inorganic Chemistry, v34 p5781-5785 1995.

Keywords: *Carbon dioxide, *Copper, *Solubility, Parameter, Reprints, Beta-diketonates, Supercritical fluids.

The mole fraction solubilities of ten copper(II) and five chromium(III) beta-diketonates were measured in supercritical carbon dioxide with a spectroscopic technique and found to vary over 4 orders of magnitude. Observed trends indicate that the solubility on supercritical carbon dioxide is strongly dictated by the character of the hydrocarbon or fluorocarbon shell surrounding the central metal atom. A group-contribution approach was used to calculate the solubility parameter of the anion of the uncomplexed beta-diketone that was correlated to the experimentally measured solubility. A regular solutions approach was used for Cr(acac)3 to quantitatively attempt to predict the solubility in supercritical carbon dioxide. Solubility data, solubility parameter trends, and limitations of regular solutions theory applied to supercritical fluids are discussed.

Molar Heat Capacity at Constant Volume for (xCO2 + (1-x)C2H6) from 220 to 340 K at Pressures to 35 MPa.
Final rept.
J. W. Magee. 1995, 5p.
Pub. in Jnl. of Chemical and Engineering Data, v40 n2 p438-442 1995.

Keywords: *Heat capacity, *Calorimeters, *High pressure, Ethane, Carbon dioxide, Reprints, Isochoric, Measurement, Mixtures.

Measurements of the molar heat capacity at constant volume (Cv) for (xCO2+(1-x)C2H6), x= 0.25, 0.49, 0.74, were conducted. Tempertures ranged from about 220 to 340 K, and pressures were as high as 35 MPA. Meaurements were conducted on samples in compressed gas and liquid states. The primary sources of uncertainty are the estimated temperature rise and the estimated quantity of substance in the calorimeter. Overall, the uncertainty of the Cv values is estimated to be less than plus or minus 2.0% for vapor and plus or minus 0.5% for liquid.

Pub. in International Jnl. of Thermophysics, v16 n2 p337-346 Mar 95.

Keywords: *Gelation, *Shear, Reprints, *Foreign technology, *Small angle neutron scattering, *Nonequilibrium molecular dynamics, Colloidal silica, Lennard Jones fluid, Spinodal decomposition.

Computer simulations of a two-dimensional Lennard-Jones fluid undergoing spinodal decomposition are reported for the system subjected to planar Couette flow. Key results are the images of the atomic structure and plots of the corresponding pair correlation functions. A companion small-angle neutron scattering (SANS) study of shear-influenced gelation on colloidal silica suspensions at volume fractions phi = 0.1, 0.12, 0.18, and 0.24 is discussed. It is found that the scattered intensity-wave vector curves from the unsheared gels obey a power law for phi less than 0.24. At higher volume fractions, the power law does not seem to be followed. Shear, however, induces an apparent fractal structure in the gel at phi = 0.24. Results from the computer and the SANS experiments indicate that the spinodal decomposition process and the gelation mechanism have features in common.

Small-Angle Neutron-Scattering Study of Dense Sheared Silica Gels.
Final rept.
C. D. Muzny, G. C. Straty, and H. J. M. Hanley. 1994, 4p.
Pub. in Physical Review E, v50 n2 pR675-R678 Aug 94.

Keywords: *Gels, *Shear, Fractal, Reprints, *Small angle neutron scattering, Colloidal silica.

Small-angle neutron-scattering (SANS) shearing experiments on dense colloidal silica suspensions in a H2O-D2O medium are reported for the wave vector range 0.03 less than Q (nm to the minus 1 power) less than 0.8, at volume fractions phi = 0.1, 0.12, 0.18, 0.24, and 0.3. For the unsheared gels, apparent fractal structures were observed at the lower volume fractions, and a small maximum at a Q corresponding to a contact particle morphology was apparent at all volume fractions. A fractional dimension d - 1.60 plus or minus 0.05 was estimated for phi = 0.10 and 0.12 by fitting the power law behavior of the structure factor. Shear induces an apparent fractal domain into the dense gels and enhances the contact particle structure.

Status of the Round Robin on the Transport Properties of R134a.
Final rept.
M. J. Assael, Y. Nagasaka, C. A. Nieto de Castro, E. Vogel, W. A. Wakeham, R. A. Perkins, and K. Strom. 1995, 16p.
Pub. in International Jnl. of Thermophysics, v16 n1 Jan 95.

Keywords: *Refrigerants, *Thermal conductivity, Saturation properties, Transport properties, Viscosity, Reprints, R134a, Dilute gas.

The paper contains a status report on an international project coordinated by the Subcommittee on Transport Properties of commission 1.2 of the International Union of Pure and Applied Chemistry. The project has been conducted to investigate the large discrepancies between the results reported by various authors for the transport properties of R134a. The project has involved the remeasurement of the transport properties of a sin-

gle sample of R134a in nine laboratories throughout the world in order to test the hypothesis that at least part of the discrepancy could be attributed to the purity of the sample. This paper provides an intercomparison of the new experimental results obtained to data in this project for the viscosity and the thermal conductivity in both gaseous and liquid phases. The agreement between the viscosity data from the laboratories contributing to the project was improved with several techniques, now producing consistent results. This suggests that the purity of the samples of R134a used in previous work was at least partly responsible for the discrepancies observed. For the thermal conductivity in the liquid phase the results of the measurements are also more consistant than before, although not for all experimental techniques. Not all of the previous measurements suffered from significant sample impurities, so the present measurements on a consistent high-purity sample can be used to detect data sets which are outliners, possibly because of impurities. Identification of laboratories and techniques with systematic differences may require the examination of data for several fluids. The implications for future measurements of the transport properties of other refrigerants are significant.

Isochoric (p-p-T) Measurements on Liquid and Gaseous Air from 67 to 400 K at Pressures to 35 MPa.
Final rept.
J. B. Howley, J. W. Magee, and W. M. Haynes. 1994, 12p.
Pub. in International Jnl. of Thermophysics, v15 n5 p881-902 Sep 94.

Keywords: *Isochoric, *High pressure, Air, Density, Reprints, Mixtures, Vapor.

Comprehensive isochronic p-p-T measurements have been carried out on liquid and gaseous air along 16 isochores at densities ranging from 2 to 32 mol-dm to the minus 3rd power. The air mixture has a nominal composition of 0.7812 N2 + 0.2096 O2 + 0.0092 Ar. The p-p-T data cover a temperature range from 67 to 400 K at pressures up to 35 MPa. Comparisions with experimental results from independent sources are presented using a fundamental equation of state based, in part, on the p-p-T data from this study.

If we want to understand the properties of condensed molecular matter in detail, we have to study the interactions between molecules, which are often summarized under the name 'van der Waals interactions.' These intermolecular interactions are of a profoundly subtle, multidimensional, long-range, and coupled nature. This is in contrast to intramolecular interactions, where the concepts of chemical bond and harmonic force-field usually form a reasonably localized zero-order reference point at sufficiently low excitation levels. Infrared spectroscopy provides a powerful general tool to study both inter- and intramolecular interactions, since it can cover the full frequency range of fundamental and few-quantum excitation of the associated degrees of freedom. It is in the 'floppy molecule', intermolecular regime where the inversion of high resolution spectroscopic data to interaction potentials is particularly difficult, and thus the demand for interaction between theory and experiment is particularly intense. As one consequence is this difficulty, initial spectroscopic research efforts have concentrated on pairs of molecules, the obvious prototypes of any interaction study. These binary complexes or dimers have revealed an unprecedented richness of structural properties and dynamical behavior, when viewed through the eyes of high resolution microwave, far- and near-IR spectroscopy, 2-5 and modern theoretical tools. Indeed, the astonishing range of challenges and insights provided by dimer spectroscopy deflected the original thrust of a spectroscopy-based understanding of bulk matter toward an extensive, albeit very fruitful, series of diversions.

Magnetic Dielectric Oxides: Subsolidus Phase Relations in the BaO: Fe2O3: TiO2 System.
Final rept.
T. A. Vanderah, J. M. Loezos, and R. S. Roth. 1996, 13p.
Pub. in Jnl. of Solid State Chemistry, Article No. 0006, v121 p38-50 1996.

Keywords: *Phase diagrams, *Solid solutions, *Barium oxides, Reprints, BaO, Fe2O3, TiO2.

The BaO-Fe2O3-TiO2 ternary phase diagram has been investigated at 1250-1270 degrees C in air. X-ray diffraction studies of approximately 150 polycrystalline specimens at room temperature confirmed the existence of sixteen ternary compounds. Two of these compounds, BaFe4Ti2O11 and Ba12Fe28Ti15O84, were previously reported, four were found to be isostructural with known chemically similar compounds, and ten apparently adopt new structure-types. The crystal structures of five of the new ternary phases are briefly described. The oxidation state of iron found in this study is similar to that reported for a study of the BaO-Fe2O3-SnO2 system in air at 1200 degrees C.

Pub. in Jnl. of Chemical Physics, v102 n18 p7046-7058 May 95.

Keywords: *Hydrogen bonds, *Energy transfer, *Rotation, *Collisions, *Chlorine, Preparation, Photochemical reactions, Chemical dissociation, Interactions, Chemicals, Dynamics, Quantum theory, Elastic properties, Reactivities, Reprints, Open shells.

Time- and frequency-resolved infrared (IR) laser absorption methods are used to probe hot atom energy transfer in open shell interactions of Cl(2P3/2) + HCl(J) in the single collision regime. The Cl(2P3/2) atoms are prepared by 308 nm laser photolysis of Cl2, and suffer collisions at E rel approx. 3500 cm to the minus one power with a room temperature HCl distribution in a fast flow cell. Selective collisional excitation of final HCl(Jf) states is monitored by transient IR absorption on R(J equal to or greater than 4) branch lines in the HCl(v=1 greater than 0) band, while depletion of the initial HCl(Ji) states is monitored by transient bleaching of the room temperature Doppler profiles. Analysis of the J dependent Doppler profiles permits extraction of rotational loss cross sections, as a function of initial and final J states, respectively. Absolute transient concentrations of the HCl(Ji) and HCl(Jf) are measured directly from absorbances via Beer's Law, and used to extract absolute collisional cross sections.

Surface Plasmon Microscopy of Biotin-Streptavidin Binding Reactions on UV-Photopatterned Alkanethiol Self-Assembled Monolayers.
Final rept.
D. Piscevic, W. Knoll, and M. J. Tarlov. 1995, 8p.
Pub. in Supermolecular Science, v2 p99-106 1995.

Keywords: *Surface plasmon resonance, Alkanethiols, Reprints, *Foreign technology, *Self assembled monolayers, Photopatterning, Biotin streptavidin.

The authors report surface plasmon imaging of streptavidin binding to photopatterned biotinylated alkanethiol self-assembled monolayers (SMAs) on gold. Micrometer-scale patterns of a mixed biotin- and hydroxyl-terminated monolayer were formed in an inert, hydroxy-terminated alkanethiol monolayer using a UV-photopatterning procedure. Using surface plasmon microscopy, contrast is readily observed between the mixed biotin- and hydroxy-terminated SAM region after specific binding of streptavidin has occurred and the pure hydroxy-terminated region where nonspecific binding of streptavidin is negligible. Surface plasmon microscopy was also to monitor in situ and in real time the binding of streptavidin to the patterned SAMs. The ability of surface plasmon microscopy to detect and spatially resolve 2-dimensional monolayer binding events may prove useful in diagnostic applications involving the parallel interrogation at surface biomolecular arrays.

Adsorption of Potassium N-phenylglycinate on Hydroxyapatite: Role of Solvents and Ionic Charge.
Final rept.
D. N. Misra. 1996, 9p.
Pub. in Colloids and Surfaces, A: Physiocochemical and Engineering Aspects, v108 p277-285 1996.

Keywords: *Adsorption, *Hydroxyapatite, Ionic charge, Reprints, Solvent role, *Foreign technology, Potassium salts, N-phenylglycinate.

The adsorption of the potassium salt of N-phenylglycine (KNPG) on synthetic hydroxyapatite from aqueous and ethanol solutions was studied at 22 degrees C. The adsorption isotherm of KNPG from aqueous solutions is Langmuirian in shape, and the analysis showed that one glycinate ion was adsorbed per about two (100) faces of the unit cell of hydroxyapatite. For each glycinate ion adsorbed, 3.5 phosphate ions were released to the aqueous solution while the calcium concentration decreased slightly. The adsorption from ethanol (99.8%) was total and irreversible from dilute solutions up to a threshold concentration, and reversible and Langmuirian thereafter from concentrated solutions, while the amounts of phosphate and calcium ions in solution are negligible. At maximum coverage from ethanol solution, the surface is fully occupied by reversibly adsorbed molecules which are perched on a one-to-one basis on the top of irreversibly adsorbed molecules totally covering the substrate. The amount of irreversibly adsorbed solute is thus equal to the reversibly adsorbed solute and about twice the maximum amount adsorbed from aqueous solutions.

Thermodynamics of the Hydrolysis of 3,4,5-Trihydroxybenzoic Acid Propyl Ester (n-Propylgallate) to 3,4,5-Trihydroxybenzoic Acid (Gallic Acid) and Propan-l-ol in Aqueous Media and in Toluene.
Final rept.
Y. B. Tewari, M. M. Schantz, M. V. Rekharsky, and R. N. Goldberg. 1996, 15p.
Pub. in Jnl. of Chemical Thermodynamics, v28 p171-185 May 96.

Keywords: *Calorimetry, *Enthalpy, *Equilibrium constants, Gallic acid, Reprints, High performance liquid chromatography, 2-(N-morpholino) ethanesulfonic acid.

Equilibrium measurements at several temperatures between 293 K and 309 K have been performed on the tannase catalyzed reaction; 3,4,5-trihydroxybenzoic acid propyl ester(sin) + H2O(sin) = 2,4,5-trihydroxybenzoic acid(sin) + propan-1-o1(sin), where sin = aqueous phosphate buffer, aqueous acetate buffer, and toluene. The change in binding of the hydrogen ion delta(r)N(H+) for this biochemical reaction in aqueous solution was calculated both from an equilibrium model for the biochemical reaction and from the dependence of the apparent equilibrium constant on pH. Calorimetric measurements were also performed for this biochemical reaction in aqueous phosphate and 2-(N-morpholino)ethanesulfonic acid (MES) buffers. Standard transformed thermodynamic quantities for the overall biochemical reaction as well as standard thermodynamic quantities for chemical reference reactions that involve specific chemical species have been calculated from the experimental results.

T. J. Udovic, Q. Huang, and J. J. Rush. 1996, 13p.
Pub. in Jnl. of Physics and Chem Solids, v57 n4 p423-435 1996.

Keywords: *Alloys, *Inorganic compounds, *Metals, Neutron scattering, Crystal structure, Reprints, *Foreign technology.

Neutron-powder-diffraction (NPD) measurements of the hexagonal rare-earth trideuteride gamma-YD3 were undertaken between 10 and 400 K. Rietveld refinements indicated that the YD3 structure possesses P3cl(D(sup 4)(sub 3d)) symmetry, in agreement with previous NPD studies of YD3 and HoD3. The unit cell is a (sq. root of 3 x sq. root of 3) R30 degrees expansion of the conventional hcp unit cell in the ab plane. To accomodate the D atoms, the c axis for YD3 is elongated by approx 15%(co/ao = 1.8019(1), ao = 3.6627(1) Angstrom, at 295K) compared with that for Y. The D atoms occupy unusual interstitial positions of a slightly distored, hcp metal lattice, instead of the ideal octahedral (o) and tetrahedral (t) sites. In particular, the hypothetical o-site D atoms are displaced vertically toward the Y-defined basal planes, with correlated placements at either near-plane or in-plane threefold metal (m) sites. The t-site D(Dt) atoms are displaced horizontally, also in a correlated fashion, with respect to the m-site D(Dm) atoms.

T. A. Vanderah, Q. Huang, W. Wong-Ng, R. G. Geyer, J. Baker-Jarvis, R. S. Roth, A. Santoro, B. C. Chakoumakos, and R. B. Goldfarb. 1995, 7p.
Pub. in Jnl. of Solid State Chemistry, v120 p121-127 1995.

Keywords: *Magnetic properties, *Dielectric constant, *Barium iron titanate, Neutron diffraction, Reprints, Single crystal structure determination.

The preparation, crystal structure, dielectric properties, and magnetic behavior of the new compound Ba2Fe2Ti4O13 are reported. Structural studies carried out by single-crystal X-ray diffraction and neutron powder diffraction show that this phase is isostructural with K2Ti6O13 and Ba2ZnTi5O13 (C2/m(No. 12); a = 15.216(1), b = 3.8979(3), c = 9.1350(6) Angstrom, Beta = 98.460(7) degrees; V = 535.90(8) Angstrom; Z = 2). The cations Fe(sup 3+) and Ti(sup 4+) are partially ordered among distorted octahedral sites with Ba(sup 2+) occupying eleven-coordinated polyhedra. Ba2Fe2Ti4O13 exhibits TE0 resonance near 10 GHz with a dielectric constant of approx. 28 and a dielectric loss tangent of 2 x 10 to the minus 3. The compound displays complex paramagnetic behavior with marked field dependence; the magnetization at 80 kA/m is several orders of magnitude smaller than that of most ferrites.

Keywords: *Barium, *Energy transfer, *Noble gases, Reprints, *Molecule-molecule collisions, Transition probabilities.

We present a time-resolved study of excitation transfer processes between the low-lying excited states of barium induced by collisions with noble gases. The transient excited-state populations have been measured by means of fluorescence and absorption spectroscopy. Cross sections for spin-changing collisions from 3P1 to 1D2 and from 1D2 to 3D3 as well as for fine-structure mixing within the 3D multiplet were obtained by fitting the numerical solution of a seven-state system of rate equations including diffusion to the experimental data. We compare our results to experimental findings for other alkaline earth metals and report an improved value of the lifetime of the 6s6p3P1 state of barium.

Pub. in Proceedings of the Annual Meeting of the Microscopy Society of America (51st), p1-2 1993.

Keywords: *Electron microscopes, *Scanning, *Calibration standards, Prototypes, Lithography, Electron beams, Fabrication, Design, Reprints.

The National Institute of Standards and Technology (NIST) is in the process of developing a new scanning electron microscope (SEM) magnification calibration reference standard useful at both high and low accelerating voltages. The standard will be useful for all applications to which the SEM is currently being used, but it has been specifically tailored to meet many of the particular needs of the semiconductor industry. A small number of test samples with the pattern were prepared on silicon substrates using electron beam lithography at the National Nanofabrication Facility at Cornell University. The structures were patterned in titanium/palladium with maximum nominal pitch of approximately 3000 micro m scaling down to structures with minimum nominal pitch of 0.4 micro m. Several of these samples were sent out to a number of university, research, semiconductor and their industrial laboratories in an interlaboratory study. The purpose of the study was to test the SEM instrumentation and to review the suitability of the sample design.

NMR Characterization of Injection-Moulded Alumina Green Compacts. Part 2. T2-Weighted Proton Imaging.
Final rept.
P. S. Wang, S. G. Malghan, S. J. Dapkunas, K. F. Hens, and R. Raman. 1995, 6p.
Pub. in Jnl. of Materials Science, v30 p1069-1074 1995.

Keywords: *Nuclear magnetic resonance, *Ceramic slurries, *Proton imaging, Injection moulding, Alumina, Reprints, *Water distribution.

Injection-moulded alumina green compacts containing polypropylene, max, and stearic acid were studied for binder distribution by proton nuclear magnetic resonance (1H NMR) imaging. The solid imaging technique of nuclear spin-spin relaxation time, T2, weighted imaging at 400 MHz was used. This imaging technique utilizes a multiple pulse sequence of D0-(phi/2)plus or minus x-tau-D10-D7-(phi)x-D7-D10-AQ-D0 for echo detection and phase encoding. Two- and three-dimensional images were constructed from the intensities of these nuclear echo signals. Spatially resolved two-dimensional images obtained by the application of this technique indicated that the green compacts fabricated from the same nominal binder composition did not contain the same amounts of binder. This observation agrees well with our previous conclusion drawn from nuclear spin echo studies by Hahn's pulse sequence. A 64x64x64 three-dimensional imaging revealed that the inhomogeneity of binder distribution and internal inperfection do exist at certain locations of the samples. A binder-rich folder line was also detected in one of these green compacts.

Enthalpy Increment Measurements from 4.5 to 318 K for Bismuth(cr). Thermodynamic Properties from 0 K to the Melting Point.
Final rept.
D. G. Archer. 1995, 10p.
Pub. in Jnl. of Chemical and Engineering Data, v40 p1015-1024 1995.

Keywords: *Bismuth, *Thermodynamic properties, Reprints, Enthalpy, Temperature scales, Measurements.

Enthalpy increments for bismuth(cr) were measured from 4.5 to 318 K with an adiabatic calorimeter. The calorimeter's performance was demonstrated through comparison of measured enthalpy increments for copper and aluminum oxide to literature values. The effect that different temperature scales had on these comparisons for copper at low temperatures was discussed. The new enthalpy increments for bismuth(cr) were combined with previously measured thermodynamic properties for temperatures below 4 K and about 300 K in order to generate the thermodynamic properties of bismuth(cr) from 0 K to the melting point.

Temperature Dependence of the Ultraviolet Absorption Cross Section of CF3I.
Final rept.
A. Fahr, A. K. Nayak, and R. E. Huie. 1995, 10p.
Pub. in Chemical Physics, v199 p275-284 1995.

Keywords: *Ultraviolet spectra, *Temperature dependence, Reprints, Temperatures, Absorption, Cross sections, *CF3I.

The ultraviolet absorption cross section of CF3I has been measured in the gas phase over the wavelength range 160-240 nm for temperatures 240, 295, 355 K

and over the wavelength range 240-350 nm for temperatures ranging from 218 to 333 K. Two intense and sharp absorption bands centered at about 160 and 171 nm and a broad and relatively strong band centered at about 267.5 nm were observed. The absorption band centered at 171 nm shows significant vibrational structure. The cross sections, at absorption peaks, between 160 and 175 nm, increased by increasing temperature. At the near-UV maximum of 267.5 nm, the absorption increased with decreasing temperature, but decreased at the lowest temperature. At wavelengths greater than about 280 nm, the absorption cross section decreased with decreasing temperature. The absorption cross sections were found to all fit a triple Gaussian expression for lambda greater than 250 nm.

Temperature Dependent Ultraviolet Absorption Cross Sections of Propylene, Methylacetylene and Vinylacetylene.
Final rept.
A. Fahr, and A. Nayak. 1996, 8p.
Pub. in Chemical Physics, v203 p351-358 1996.

Keywords: *Temperature dependence, *Ultraviolet, *Absorption cross sections, Reprints, Propylene, Methylacetylene, Vinylacetylene, Planetary atmosphere.

The temperature dependence of the UV absorption cross sections of propylene (CH3CH=CH2) and the methylacetylene (CH3C identical with CH) from 160 to 200 nm and vinylacetylene (CH2 = CHC identical with CH) from 160 to 240 nm have been measured in the gas phase, for temperatures ranging from about 220 to 330 K. The propylene spectrum, exhibits a broad absorption band with a maximum at 172.0 nm with some structure to the short wavelength side of the broad band. At the absorption peaks a small increase (about 5%) in the cross sections has been observed with decreasing temperature from 333 to 233 K. At the long wavelength tail of the absorptionn band the cross sections are found to decrease with decreasing temperature. The absorption spectrum of methylacetylene in the region of 160 to 200 nm consists of a broad continuum with a maximum at 172.4 nm. The cross section values, for methylacetylene, near the absorption peak are found to remain nearly independent of temperture. However, at the long wavelength side of the absorption band the cross sections increase with increasing temperature. The spectrum of vinylacetylene consists of a very strong and structured absorption in the 160 to 170 nm region and strong diffuse bands between around 190 and 230 nm. The cross section values at the absorption peaks, determined at low temperatures, are significantly higher than those at higher temperatures.

Diffuse-Interface Description of Fluid Systems.
D. M. Anderson, and G. B. McFadden. Aug 96, 37p, NISTIR-5887.
Figures in this document may not be legible in microfiche.

Keywords: *Critical point, *Diffuse interface, Hydrodynamics, Surface tension, Internal waves, Models, Fluid-fluid systems.

The authors consider a diffuse-interface model for fluid-fluid systems. In classical models, an iterface between two fluids is treated as infinitely thin, or sharp, and is endowed with properties such as surface tension. Diffuse-interface theories replace this sharp interface with continuous variation of an order parameter such as density in a way consistent with microscopic theories of the interface. Surface tension effects, for example, are incorporated into the model through a modified stress tensor in the classical Navier-Stokes equations. The authors relate the diffuse-interface model to classical, sharp interface models by deriving asymptotically the governing equations and the associated boundary conditions used in the sharp-interface formulation. The authors illustrate the diffuse-interface approach by modeling internal gravity waves, which have been observed experimentally be Berg et al. in xenon near its critical point. The authors obtain static density profiles, compute internal wave frequencies and compare with their experimental data and theoretical (classical) results both above and below the critical temperature. The results reveal a singularity in the diffuse-interface model in the limit of incompressible perturbations.

Keywords: *Crystallography, *X ray diffraction, Data bases, Information systems, Crystal structure, Three dimensional models, Microgravity, Nucleic acids, Pesticides, Proteins, *Biological macromolecules.

The NIST/CARB Biological Macromolecule Crystallization Datbase (BMCD), NIST Standard Reference Database 21, contains crystal data and crystallization conditions for biological macromolecules. The database entries include data abstracted from published crystallographic reports. Each entry consists of information describing the biological macromolecule crystallization conditions for each crystal form. The BMCD serves as the NASA Protein Crystal Growth Archive in that it conains protocols and results of crystallization experiments undertaken in microgravity (space). These database entries report the results, whether successful or not, from NASA-sponsored protein crystal growth experiments in microgravity and from microgravity crystallization studies sponsored by other international organizations. The BMCD was designed as a tool to assist x-ray crystallographers in the development of protocols to crystallize biological macromolecules, those that have previously been crystallized, and those that have not been crystallized.

Keywords: *Crystallography, *Error analysis, *Information systems, Data bases, Performance evaluation, Crystal structure.

A large number of incorrect crystal structures is being published today. These structures are proving to be a particular problem to those of us who are interested in comparing structural moieties found in the databases in order to develop structure-property relationships. Problems can reside in the input data, e.g., wrong unit cell or low quality intensity data, or in the structural model, e.g., wrong space group or atom types. Many of the common mistakes are, however, relatively easy to detect and thus should be preventable; at the very least, suspicious structures can be flagged, it not by the authors then by the references and, ultimately, the crystallographic databases. This article describes some of the more common mistakes and their effects on the resulting structures, lists a series of tests that can be used to detect incorrect structures, and makes a strong plea for the publication of higher quality structures.

Compressed Liquid Densities, Saturated Liquid Densities, and Vapor Pressures of 1,1-Difluoroethane.
Final rept.
D. R. Defibaugh, and G. Morrison. 1996, 6p.
Pub. in Jnl. of Chemical and Engineering Data, v41 n3 p376-381 1996.

Keywords: *Vapor pressures, *Liquid densities, Compression, Saturation, Measurements, Correlations, Comparisons, Reprints, *Difluoroethane.

The compressed liquid densities and vapor pressures of 1,1,-difluoroethane (HFC-152a) have been measured, correlated, and compared with other data. The liquid densities were measured with a combined standard uncertainty of plus or minus 0.05% using a vibrating tube densimeter over a temperature range of 243 K to 371 K and at pressures from near the saturated vapor pressure to 6500 kPa; thus the data extend nearly to the critical point (Tc=386.41 K and Pc=4514.7 kPa). The vapor pressures were measured with a combined standard uncertainty of plus or minus 0.02% using a stainless steel ebulliometer in the temperature range from 280 K to 335 K. Saturated liquid densities were calculated by extrapolating the compressed liquid isotherms to the saturation pressure.

Electrolytes Constrained on Fractal Structures: Debye-Huckel Theory.
Final rept.
S. H. Lee, and J. B. Hubbard. 1993, 5p.
Pub. in Jnl. of Chemical Physics, v98 n2 p1504-1508 Jan 93.

Keywords: *Debye-Huckel theory, *Fractal structures, *Electrolytes, Ionic screening, Thermodynamic properties, Reprints.

The authors calculate, via the Debye-Huckel theory, the effect of ionic screening on the thermodynamic properties of an electrolyte confined topologically to an isotropic random fractal structure embedded in three dimensions. It is found that screening effects are generally important, even for low fractal dimensions. In many instances crossover effects occur, whereby with increasing ionic strength, a low dimension fractal is more stabilized by screening than a fractal of higher dimension.

Isopiestic Investigation of the Osmotic and Activity Coefficients of Aqueous NaBr and the Solubility of NaBr2H2O(cr) at 298.15 K: Thermodynamic Properties of the NaBr + H2O System over Wide Ranges of Temperature and Pressure.
Final rept.
J. A. Rard, and D. G. Archer. 1995, 16p.
Pub. in Jnl. of Chemical and Engineering Data, n40 p170-185 1995.

Keywords: *Sodium bromide, *Thermodynamics, Isopiestic, Activity, Solubility, Reprints, CODATA key values.

Isopiestic vapor-pressure measurements have been performed for aqueous solutions of well-characterized high-purity NaBr from 1.9551 to 9.4778 mol-kg(-1) at 298.15 K; the highest five molalities correspond to supersaturated concentrations. Solubilities have also been determined by the methods. A few equilibrations were made between solutions of NaCl and H2SO4 to refine the osmotic coefficients of H2So4 at high molalities. These isopiestic results for NaBr have been combined with other experimental thermodynamic quantities (vapor pressures, activity coefficients, solubilities, freezing temperatures, and volumetric and calorimetric measurements) to yield revised parameters for an extended form a Pitzer's equation applicable over wide ranges of molality, temperature, and pressure. It was not possible to obtain a complete consistency between the experimental results for either the NaBr + H2O system or the NaCl + H2O system with entropies from the CODATA Key Values for Thermodynamics.

Resonance Enhanced Multiphoton Ionization Spectroscopy of the SnF Radical.
Final rept.
J. Pearson, R. N. Dixon, J. W. Hudgens, and R. D. Johnson. 1996, 5p.
See also PB90-170028.
Pub. in Jnl. of Chemical Physics, v104 n12 p4406-4410 1996.

Keywords: *Chemical radicals, *Tin monofluoride, Visible spectrum, Vibrational spectra, Reprints, *Multiphoton ionization, *Multi-photon processes, Rydberg states.

The resonance enhanced multiphoton ionization spectrum of the free radical SnF has been recorded using excitation wavelengths in the range 540 to 360 nm. The previously documented C2(delta), D, E(2)II, and F(2)sigma states and two hitherto unidentified excited states, the H and I(2)phi states, were all observed as two-photon resonances. Band contour simulations yielded spectroscopic constants for the E, F, and I states.

Fluoride Elimination Upon Reaction of Pentafluoroaniline with e (sub eq')(sup -), H, and OH Radicals in Aqueous Solution.
Final rept.
L. C. T. Shoute, J. P. Mittal, and P. Neta. 1996, 5p.
Pub. in Jnl. of Physical Chemistry, v100 n27 p11355-11359 1996.

Keywords: *Pentafluoroaniline, *Pulse radiolysis, Absorption spectra, Reduction, Oxidation, Reprints.

Reduction of pentafluoroaniline (PFA) leads to rapid fluoride elimination to form the aminotetrafluorophenyl radical. This radical undergoes rapid intramolecular electron transfer from the amino group to the phenyl radical site and protonates at the latter site to form the tetrafluoroaniline radical cation or its deprotonated form (pKa = 2.3). Oxidizing radicals such as SO4-, N3, and Cl2- oxidize PFA to the pentafluoroaniline radical cation. The pKa = 1.9 of the pentafluoroaniline radical cation is 3.6 units lower than that expected from the substituent effects of fluorine atoms. Addition of OH to PFA is followed by rapid HF elimination to yield the aminotetrafluorophenoxyl radical. In acidic solution, however, the reaction of OH leads to formation of the pentafluoroaniline radical cation. Fluoride elimination upon reduction and upon OH addition to PFA was confirmed by determination of fluoride ion yield.

Pub. in Jnl. of Physical Chemistry, v99 n14 p4879-4885 1995.

Keywords: *Ionization energy, *Photoionization, Discharge flow, Mass spectrometry, Formation heat, Bond strength, Appearance energy, Reprints.

With the discharge flow-photoionization mass spectrometer (DF-PIMS) coupled to the U-11 beamline at the National Synchrotron Light Source, the authors have measured the ionization energies of C2F4, CF4, and CF2O and appearance energy of FCO+ from CF2O. The PIMS results corroborate those determined by other techniques. With high-level ab initio calculations that utilize a large basis set and isogyric corrections, they have determined an ionization energy of 9.3 plus or minus 0.1 eV for FCO. At 298 K, the heats of formation of FCO (-152 plus or minus 12 kJ/mol) and FCO+ (745.3 plus or minus 9.6 kJ/mol) (relative to (delta)fH 298 (CF2O)= -607.9 plus or minus 7.1 kJ/mol) were determined and agree to within the uncertainties of other measurements but with much higher precision. The authors have evaluated the bond strengths D 298(F-CFO) and D 298(F-CO) to be 535 plus or minus 12 and 121 plus or minus 12 kJ/mol, respectively.

One-Electron Oxidation of Metalloporphycenes as Studied by Radiolytic Methods.
Final rept.
D. M. Guldi, J. Field, J. Grodkowski, P. Neta, and E. Vogel. 1996, 6p.
Pub. in Jnl. of Physical Chemistry, v100 n32 p13609-13614 1996.

Keywords: *Metalloporphycenes, *Radiolysis, Oxidation, Porphycenes, Pulse radiolysis, Absorption spectra, Reprints.

One-electron and two-electron oxidation of 2,7,12,17-tetrapropylporphycene (H2TPrPc) and its Fe, Co, Ni, Cu, and Sn complexes in Ch2Cl2, CCl4, and 2-PrOH solutions have been studied by radiolytic techniques. Formation and decay of intermediates formed upon one-electron oxidation have been followed by kinetic spectrophotometric pulse radiolysis, and the absorption spectra of stable oxidation products have been recorded following gamma-radiolysis. H2TPrPc is oxidized to the pi-radical cation and then to the dication, which is stable in aprotic solvents but is transformed to a different product in 2-PrOH. Similar oxidation to the pi-radical cation and then to the dication was observed for the CuII, SnIV, CoIII, and FeIII porphycenes. CoII and NiII porphycenes underwent radiolytic oxidation to form stable CoIII and NiIII products. The stability of the latter is in contrast with previous electrochemical observations, the difference is ascribed tc the effect of the axial ligand.

Absorption Cross Sections, Kinetics of Formation, and Self-Reaction of the IO Radical Produced via the Laser Photolysis of N2O/I2/N2 Mixtures.
Final rept.
1995, 7p.
Sponsored by Department of the Air Force, Washington, DC. and Department of the Army, Washington, DC.
Pub. in Jnl. of Physical Chemistry, v99 p11701-11707 1995.

Keywords: *Iodine monoxide, *Laser photolysis, Atmosphere chemistry, Kinetics, Ozone, Spectra, Reprints.

The laser photolytic production of the IO radical from N2O/I2/N2 mixtures was used to measure the radical absorption spectrum from 340 to 450 nm. Two new absorption peaks at 403 and 411 nm were observed along with an underlying continuum starting at about 420 nm and extended to about 350 nm. An absorption cross section (2.8 plus or minus 0.5) x 10(-17) cm(2), in good agreement with previous measurements, was determiend for the (4-0) band head at 427.2 nm. From the rate of formation of IO and the rate of loss of I2, rate constants for the reactions O = I2 -> IO + I and O + OI -> O2 + I of (1.4 plus or minus 0.4) x 10(-10) and (1.2 plus or minus 0.5) x 10 to the minus 10 power cm(3)s(-1), respectively, were derived. Finally, from the rate of decay of IO, a rate constant for the reaction IO + IO -> products of (8.0 plus or minus 1.8) x 10(-11) cm(3)s(-1) was obtained. All of the uncertainties expressed are 2 standard deviations derived from the statistical analysis and do not include estimates for possible systematic errors.

Molecular Dynamics Investigation of the Surface/Bulk Equilibrium in an Ethanol-Water Solution.
Final rept.
M. Tarek, D. J. Tobias, and M. L. Klein. 1996, 5p.
Pub. in Jnl. of the Chemical Society, Faraday Trans., v92 n4 p559-563 1996.

Keywords: *Ethanol water solution, *Molecular dynamics, *Surface tension, Surface excess, Hydrogen bonding, Density profiles, Air liquid interface, Reprints, *Foreign technology.

Molecular dynamics simulations of the vapor/solution interface, initiated from an ethanol-water mixture at a mole fraction of ethanol, Xc = 0.1, have been performed. Rapid redistribution of ethanol molecules to the free surface was observed during simulations of two different sized systems. Inspection of the calculated surface structure reveals that after redistributing the ethanol molecules are preferentially oriented such that the alkyl group points out the solution. A 'depletion layer' of enhanced water density beneath the ethanol surface excess was revealed by the simulation. Analysis of the structure involving molecules close to the surface shows that water molecules are arranged to maximize the hydrogen bonding between the oriented ethanol and the adjacent water molecules. The enhanced water density beneath the interface results from this optimization. The surface tension calculated from the simulation is ca. 50% higher than the results of macroscopic experimental measurements. This overestimation is attributed to shortcomings to both the potential function and the simulation methodology. The number of density profiles of the ethanol surface excess were compared with results from neutron reflectivity measurements. The calculated profiles agree better with the experimental measurements at the calculated surface tension (i.e. Xc = 0.022) than those reported for Xc = 0.1 mixtures.

G. W. Bryant, P. S. Julienne, and Y. B. Band. 1996, 4p.
Pub. in Surface Science, n361/362 p801-804 Oct 96.

Keywords: *Excitons, *Quantum wells, Reprints, *Nanostructures, Semiconductor-semiconductor heterostructures, Semi-empirical models, Model calculations.

A theory for excitons in complex quantum nanostructures with complicated geometries and strong coupling between nanostructures is presented. Effective mass models with screened Coulomb interaction give reasonable ground-state energies for excitons in T-shaped quantum wires, coupled T-quantum wires and quantum dot quantum wells, provided the effects of complex geometry are included. A sizable shift between exciton states in quantum wells and T-shaped wires occurs due to a 40% enhancement in binding energy, confirnment in the wire, and significant interwire coupling.

Pub. in Jnl. of Chemical Physics, v104 n22 p8871-8878 Jun 96.

Keywords: *Neon, *Molecular ions, *Vibrational spectra, Boron chlorides, Interactions, Infrared spectra, Reprints, *Matrix isolation.

When a Ne:BCl3 sample is codeposited at approximately 5 K with a beam of neon atoms that have been excited in a microwave discharge, the infrared spectrum of the resulting solid deposit shows a weak to moderately intense absorption of BCl2 and more prominent absorptions which are assigned to the v3 fundamentals of BCl3 (D3h) and of linear, centrosymmetric BCl2. The boron- and chlorine-isotopic structure of the spectrum is consistent with both of these assignments. Ab initio calculations support the BCl2 assignment. An absorption is also tentatively assigned to V3(e) of BCl3. Ab initio calculations for BCl3 are consistent with that assignment. The processes which occur when the solid deposit is exposed to visible and ultraviolet radiation are considered.

See also PB95-125688.
Pub. in Jnl. of Chemical Physics, v105 n10 p3901-3910 1996.

Keywords: *Molecular ions, *Vibrational spectra, Infrared absorption, Infrared spectra, Electron capture, Matrix isolation, Reprints, *Solid neon.

When a Ne:HBr or a Ne:HI sample is codeposited at approximately 5 K with discharge-excited neon atoms, the infrared spectrum of the resulting solid includes not only the absorptions of the HX molecule and its multimers but also a prominent absorption of HBr+ or HI+. The absorption of each of the two cations lies close to its gas-phase band center. The vibrational fundamentals of DBr+ and DI+ are also identified in experiments on deuterium-enriched samples. Other infrared absorptions are assigned to normal and deuterium-substituted (HBr)2+ and (HI)2+, as well as to BrHBr-, and IHI-. Studies of changes in the absorption spectrum which result from exposure of the deposit to filtered visible and near ultraviolet radiation support these assignments and provide further information on photodissociation and photodetachment processes which occur in these systems.

Self-Consistent 'GW' and Higher-Order Calculations of Electron States in Metals.
Final rept.
E. L. Shirley. 1996, 7p.
Pub. in Physical Review B, v54 n11 p7758-7764 Sep 96.

Keywords: *Electron states, *Metals, Self-consistent, Vertex correction, Bandwidths, Reprints.

Past work, treating simple metals in the GW approximation, has largely neglected effects of self-consistency and higher-order vertex corrections on occupied bandwidths. The work presents self-consistent GW results, plus nearly self-consistent higher-order results, for jellium, illustrating that both effects are large, yet largely canceling (e.g., 0.65-eV effects on the sodium bandwidth, but a combined effect of only 0.13 eV). This supports findings that many-body effects substantially reduce such bandwidths.

Oxidation of Ferrous and Ferrocyanide Ions by Peroxyl Radicals.
Final rept.
G. I. Khaikin, Z. B. Alfassi, R. E. Huie, and P. Neta. 1996, 6p.
Pub. in Jnl. of Physical Chemistry, v100 n17 p7072-7077 1996.

Keywords: *Oxidation, *Iron ions, *Peroxyl radicals, Ferrous ions, Ferrocyanide ions, Reprints.

Alkylperoxyl and arylperoxyl radicals were produced by pulse radiolysis in aqueous solutions, and their reactions with ferrous and ferrocyanide ions were studied by kinetic spectrophotometry. Oxidation of Fe(CN)6(4-) took place with rate constants that varied from less than 1 x 10 to the 5th power to 5 x 10 to the 7th power L mol(-1)s(-1), depending on the electron-withdrawing effects of the substituents on the peroxyl radical and presumably reflecting variations in reduction potential of the peroxyl radical, as expected for outer-sphere electron transfer. Oxidation of Fe(aq)(2+), on the other hand, took place by an inner-sphere mechanism controlled by the rate of dissociative interchange of the water ligand. The rate constants were nearly the same for all the peroxyl radicals examined (k=(0.5 - 1.1) x 10 to the 6th power L mol(-1)s(-1)) and involved the formation of a transient intermediate, RO2(-)Fe(3+), which later decomposed to yield Fe(aq)(3+). The decomposition was accelerated by H(+) and by Fe(2+). The proposed mechanism is a modification of a previously suggested reaction scheme.

Perpendicular C-H Stretching Band nu9/nu13 and the Torsional Potential of Dimethylacetylene.
Final rept.
J. Pliva, A. S. Pine, and S. Civis. 1996, 11p.
Pub. in Jnl. of Molecular Spectroscopy, Article No. 0220, v180 p15-25 1996.

Keywords: *Free rotors, *Infrared spectrums, Internal rotation, Torsional potential, Tunable laser, Reprints, *Dimethylacetylene.

The perpendicular band of the fourfold degenerate C-H stretching vibration of dimethylacetylene (2-butyne) occurring in the region 2955-3065 cm(-1) has been measured with Doppler-limited resolution at a temperature of approximately 195 K on a difference-frequency laser spectrometer, and on a high-resolution Fourier transform instrument at room temperature as well as in a molecular jet at approximately 20 K. From a detailed rotational analysis of this complex band, based on an extension of the mode of the rotational-torsional interactions described by P. R. Bunker and C. di Lauro (Chem. Phys. 190, 159-169, 1995), accurate spectroscopic constants were determined for the upper CH stretching state, along with values for the first three components of the Fourier expansion for the torsional potential in the ground state, and for six components of this potential in the upper state. Over 700 lines assigned to 37 well-resolved subbands plus 25 additional unresolved line-like Q-branches were fitted with an overall standard deviation of 0.0024 cm(-1). the results yield a value of 6.316 plus or minus 0.034 cm(-1) for the barrier to internal rotation in the ground state, and 6.643 plus or minus 0.006 cm(-1) for the C-H stretching state. This value for the ground state barrier is somewhat higher than that recently determined from an analysis of the CH3 rocking band by P. R. Bunker et al.

Measuring Nondipolar Asymmetries of Photoelectron Angular Distributions.
Final rept.
P. S. Shaw, U. Arp, and S. H. Southworth. 1996, 10p.
Pub. in Physical Review A, v54 n2 p1463-1472 Aug 96.

Keywords: *Angular distributions, *X rays, *Photoelectrons, Non-dipolar effects, Synchrotrons, Reprints.

In theories of photoelectron angular distributions at soft x-ray energies from 1keV to 10 keV, first-order corrections to the dipole approximation give rise to two non-dipolar asymmetry parameters in addition to the well-known dipolar asymmetry parameter, beta. The non-dipolar parameters characterize the forward/backward asymmetry with respect to the propagation vector of the photon beam. Experimentally, the measurement of the non-dipolar effect has been hampered because of the complications resulting from the three-parameter angular distribution. In the paper, the authors suggest various experimental approaches to the measurement of the three asymmetry parameters using partially linearly polarized x-rays, corresponding to measurements on synchrotron radiation beamlines. They

decribe methods to extract the asymmetry parameters using such approaches.

Absence of Quantum-Mechanical Effects on the Mobility of Argon Ions in Helium Gas at 4.35 K.
Final rept.
L. A. Viehland, and J. J. Hurly. 1996, 4p.
Pub. in Jnl. of Chemical Physics, v105 n24 p1-4 1996.

Keywords: *Transport cross sections, *Argon, *Helium, Mobilities, Potential, Spectroscopy, Reprints.

Quantum-mechanical transport cross sections are accurately computed from recent spectroscopic potentials for the three lowest energy levels of the molecular ion HeAr+. Statistical and ground state combinations of the cross sections are used to compute the transport coefficients describing the motion of Ar+ ions through He gas at 4.35 K. The calculated mobilities do not show the rapid decrease of the experimental values as the ratio of the electric field strength to the gas number density becomes very small. The experimental observations therefore are not due to the effects of orbiting resonance.

Thermal Pulse Study of the Polarization Distributions Produced in Polyvinylidene Fluoride by Corona Poling at Constant Current.
Final rept.
J. A. Giacometti, and A. S. DeReggi. 1 Sep 93, 9p.
Pub. in Jnl. of Applied Physics 74, n5 p3357-3365, 1 Sep 93.

Keywords: *Vinyl resins, *Polarization, *Profiles, Electric corona, Pulse heating, Reprints, *Polyvinylidene fluoride, *Polarization profiles, Corona poling.

A thermal pulse study of the polarization profiles in samples of 12-micrometer-thick, biaxially oriented polyvinylidene fluoride after corona poling under approximately constant-current conditions, using a modified corona triode in atmospheric air, is reported. An electrical characterization of the corona triode is also reported to show how it may be operated in the constant-current mode. Samples poled without electrode on the corona-exposed surface show polarization distributions sensitive to the corona polarity, with polarization depletion on the corona side of the samples when the corona is positive. Polarization-reversal experiments show switching inhomogeneities with a pronounced dependence on the initial corona polarity. The above observations are consistent with a simple model in which positive charges from the positive corona partially penetrate the sample during poling and cause an inhomogeneous reduction of the poling field.

Shear-Excited Morphological States in a Triblock Copolymer.
Final rept.
C. L. Jackson, M. Muthukumar, K. A. Barnes, A. I. Nakatani, C. C. Han, F. A. Morrison, and J. W. Mays. 1994, 2p.
Pub. in Polymer Preprints 35, p624-625 1994.

Keywords: *Shear rate, *Block copolymers, *Morphology, *Polystyrene, *Polybutadiene, Molecular structure, Small angle scattering, Transmission electron microscopy, Excitation, Neutron scattering, Reprints, Molecular configuration.

The effect of shear on the morphology of a triblock copolymer of polystyrene-d8/polybutadiene/polystyrene-d8 (SBS) (23 wt. % styrene-d8, cylindrical morphology) was studied by small angle neutron scattering (SANS) and transmission electron microscopy (TEM). The copolymer was sheared (0.585/s at 100 C) in a cone-and-plate rheometer and quenched to room temperature. The morphology consisted of two distinct structures, including a primary cylindrical spacing of 22 nm, as expected for the equilibrium state, and a secondary spacing of 12 nm, which is hypothesized to be a shear-excited state for this material. A mechanism for producing such a unique morphology is proposed to be the conversion of a bridging configuration between cylinders to a looping configuration.

A. I. Nakatani, J. F. Douglas, Y. B. Ban, and C. C. Han. 1993, 2p.
Pub. in Jnl. of American Chemical Society Polymer Preprints 34, p554-555 1993.

Keywords: *Polystyrene, *Neutron scattering, *Turbidity, *Solutions, *Mixing, Small angle scattering, Shear rate, Polymers, Binary systems(Materials), Non-Newtonian systems, Reprints, *Phthalic acid/(dioctyl-ester), Polymer blends.

The phenomenon of shear induced 'mixing' and 'demixing' in polymer solutions has attracted theoretical and experimental attention since the 1950's. Helfand and Fredrickson (HF) developed a theory which is appropriate for describing the distorted scattering in polymer solutions at low shear rates, but the HF theory is not applicable to fluids in the non-Newtonian flow regime. The range of shear rates where PS/DOP solutions becomes turbid to the eye is typically > 100/s in our experiments where the HF theory is not applicable. We have conducted small angle neutron scattering (SANS) investigations of these PS/DOP solutions at high shear rates in order to examine the scattering in this 'strong shear' regime.

Time Dependent Small Angle Neutron Scattering Behavior in Triblock Copolymers Under Steady Shear.
Final rept.
A. I. Nakatani, F. A. Morrison, J. W. Mays, M. Muthukumar, and C. C. Han. 1993, 2p.
Pub. in American Chemical Society Polymer Preprints 34, p630-631 1993.

Keywords: *Neutron scattering, *Block copolymers, *Temperature dependence, *Polystyrene, *Polybutadiene, Shear rate, Small angle scattering, Shear flow, Isotropy, Anisotropy, Reprints.

We examine a styrene-butadiene-styrene triblock copolymer (23 wt. % styrene, cylindrical morphology, M(sub w) = 8,000/54,000/8,000) in two ways: (a) the shear rate and temperature dependence of the steady shear small angle neutron scattering (SANS) patterns; (b) the transient SANS behavior during steady shear as a function of temperature and shear rate. At low shear rates, above and below the triplet optical density (ODT), an isotropic scattering pattern is observed. Below the quiescent ODT, at somewhat higher shear rates, the sample orients in the flow direction and the scattering becomes anisotropic. Below ODT, at even higher shear rates, a second pair of diffraction spots are observed at higher q. In the third regime, the intensity of the low q peak passes through two distinct maxima and a minimum. The intensity of the higher q peak appears to pass through a maximum at the same time the low q peak is at a minimum.

Temperature Dependence of the Morphology of Thin Diblock Copolymer Films as Revealed by Neutron Reflectivity.
Final rept.
T. P. Russell, S. H. Anastasiadis, S. K. Satija, and C. F. Majkrzak. 1990, 6p.
Pub. in Proceedings on Neutron Scattering for Materials Science Symposium, Boston, MA., November 27-30, 1989, p145-150 1990. See also PB92-170620.

Keywords: *Temperature dependence, *Morphology, *Block copolymers, *Thin films, *Surface properties, Neutron radiography, Reflectivity, Phase transformations, Annealing, Transition temperature, Interfaces, Reprints.

In the report neutron reflectivity studies on the temperature dependence of the morphology of diblock copolymers in the vicinity of the microphase separation transition temperature (MST) is discussed. At temperatures below the MST the ordered multilayered lamellar morphology is found to penetrate through the entire specimen. At temperatures above the MST the periodic variation in the composition of the components is maintained but a clear dissipation of the order is found with increasing distance from either the air copolymer or copolymer/substrate interfaces. An exponentially damped squared cosine function from both interfaces is found to well describe the reflectivity results. The characteristic decay length is found to decrease with increasing temperature in accordance with mean field arguments. Results from two different copolymers with two different molecular weights and, consequently, two different MSTs are found to be identical on a reduced temperature scale.

Grafted Interpenetrating Polymer Networks.
Final rept.
B. J. Bauer, R. M. Briber, and B. Dickens. 1994, 17p.
Pub. in Interpenetrating Polymer Networks, Chapter 7, p179-195 1994.

Keywords: *Graft polymerization, *Polymethyl methacrylate, Thermal analysis, Neutron scattering, X-ray diffraction, Phase transformation, Reprints, *Interpenetrating polymer networks.

A new class of interpenetrating polymer network (IPN) has been studied in which grafting reactions between the two components are varied. Small-angle neutron scattering of grafted and nongrafted IPNs shows that grafting greatly enhances the miscibility of the components. Five nonfunctionalized poly(methyl methacrylates) (PMMAs) with alkacrylate, methacrylate, acrylate, and alpha-methylstyrene end groups were dissolved in styrene-divinylbenzene and polymerized. Small-angle X-ray scattering was used to characterize the extent of phase separation. The uniformity of the IPNs is strongly dependent on the grafting efficiency. Grafted and nongrafted IPNs were also made from the PMMAs and polyethylene glycol diacrylates. Thermal studies showed one transition in the grafted samples and two distinct transitions in a nongrafted sample.

In-Line Optical Monitoring of Injection Molding.
Final rept.
A. J. Bur, F. W. Wang, C. L. Thomas, and J. L. Rose. Apr 94, 9p.
Pub. in Polymer Engineering and Science 34, n8 p671-679 Apr 94.

Keywords: *Solidification, *Injection molding, *Sensors, *Polymers, Fiber optics, Polyethylene, Polystyrene, Crystallization, Fluorescence, In-situ processing, Monitoring, Plastics processing, Reprints.

An optical sensor, consisting of optical fibers to transmit light to and from the mold cavity, was constructed for the purpose of measuring the onset of polymer solidification during injection molding. The sensor was used to detect characteristic fluorescence radiation from a dye which had been doped into the resin at very low concentration. By measuring changes in fluorescence intensity, it was possible to detect whether the state of the resin was liquid or solid. We observed that, as the resin cooled in the mold, the onset of solidification was indicated by highly characteristic and distinct changes in the fluorescence intensity/time profile. Application of the method involved the use of a calibration relationship between the fluorescence intensity and temperature of the doped polymer in order to determine the distinct features which characterize the onset of solidification. Injection molding of a glass forming polymer (polystyrene) and a crystallizable polymer (polyethylene) was monitored by this technique.

Phase Behavior of a Hydrogen Bonding Molecular Composite.
Final rept.
M. D. Dadmun, and C. C. Han. 1993, 6p.
Pub. in Materials Research Society Symposium Proceedings, v305 p171-176 1993.

Keywords: *Composite materials, *Phase transformations, *Hydrogen bonds, Microscopy, Glass transition temperature, Polypeptides, Liquid crystals, Copolymers, Reprints, *Molecular composites, *Liquid crystalline polymers, Poly(hydroxypropyl-L-glutamine).

The phase behavior of a blend containing poly(hydroxypropyl-L-glutamine), a rod-like polypeptide, and a coil-like random copolymer with 1.5% hydrogen bonding monomer is studied using light scattering, DSC, and optical microscopy. The results show that this system has an LCST. The phase behavior of this binary system is complicated by a glass transition and an ordering transition. Evidence is also observed of a possible change in phase demixing process, from nucleation and growth to spinodal decomposition, for a 50/50 blend with a change in temperature.

Influence of Surface Interaction and Chain Stiffness on Polymer-Induced Entropic Forces and the Dimensions of Confined Polymers.
Final rept.
A. L. Kholodenko, D. W. Bearden, and J. F. Douglas. 1994, 19p.
Pub. in Physical Review E 49, n3 p2206-2224 Mar 94.

Keywords: *Polymers, *Entropy, *Stiffness, *Surfaces, Mathematical models, Critical temperature, Reprints, *Confined semiflexible polymers, *Entropic Casimin forces.

The theories of Dolan and Edwards and Eisenriegler et al. for Gaussian chains confined between parallel plates and to a half-space are generalized to chains having arbitrary stiffness. The generalized theory exploits a recently discovered relation between semiflexible polymers and Euclidean-type Dirac fermions in which 'flexible' and 'stiff' polymers correspond to the nonrelativistic (massive) and relativistic (massless) limits of the Dirac propagator, respectively. We show that half-space and parallel-plate problems are interrelated and this allows for a simplified and unified treatment of confined semiflexible polymers. The properties of confined semiflexible chains exhibit a complicated dependence on the polymer-surface interaction and chain stiffness. Results for polymer dimensions and entropic Casimir-like forces between plates are consistent with those obtained previously for flexible chains and corresponding results are obtained for semiflexible polymers. The new results for the forces between plates, having a semiflexible polymer in the gap, exhibit qualitative agreement with experimental data on confined chains at nonvanishing concentrations.

Fluorescence Monitoring of Polarity Change and Gelation during Epoxy Cure.
Final rept.
K. F. Lin, and F. W. Wang. 1994, 5p.
Pub. in Polymer 35, n4 p687-691 1994.

Keywords: *Curing, *Fluorescence, *Polymerization, *Epoxy resins, Temperature, Gelation, Polarity, Monitoring, Molecular structure, Reprints, Hexatriene/(dimethylaminophenyl)-phenyl, Ether/diglycidyl, Bisphenol A, Diethylene triamine.

The fluorescence spectrum of 1-(4-dimethylaminophenyl)-6-phenyl-1,3,5-hexatriene (DMA-DPH) dissolved in a stoichiometric mixture of diglycidyl ether of bisphenol A and diethylene triamine was measured as a function of cure time at various cure temperatures. The frequency of the fluorescence maximum for DMA-DPH increased during the curing reactions because of the change in the polarity of the epoxy resin. In an isothermal cure, the fluorescence frequency increased linearly with the cure time until the gelation occurred. The total change in fluorescence frequency that occurred from the beginning of the isothermal cure to the gelation time was 1,000/cm and was independent of the cure temperature, implying that the chemical structure of the infinite network at the gelation time was independent of the cure temperature. The rate constant, K(sub T), for the polarity change during an isothermal cure of the epoxy resin, defined as the rate constant for the linear increase in fluorescence frequency, was determined. The activation energy of K(sub T) was estimated to be 60 kJ/mol.

X. Liu, R. M. Briber, and B. J. Bauer. 1994, 5p.
Pub. in Jnl. of Polymer Science B 32, p811-815 1994.

Keywords: *Vinyl ether resins, *Crosslinking, Molecular structure, Electron beams, Solutions, Alcohols, Solvation, Chromatographic analysis, Reprints.

The electron beam induced branching of poly(vinylmethyl ether) (PVME) in bulk and in isopropanol solutions has been studied by gel permeation chromatography. The branching probability of bulk PVME induced by high-energy electrons can be characterized by gel permeation chromatography and a simple probability constant obtained. In isopropanol solutions this branching probability is not constant as a function of dose and is found to decrease with decreasing concentration. These results indicate the importance of solvent effects on the crosslinking of PVME in isopropanol solution by electron beam radiation.

Neutron reflectometry is used to obtain a direct measurement of the monomer distribution of a weakly bound end-grafted polystyrene layer in equilibrium with bulk solution, as a function of the polymer concentration and temperature. We report for the first time two new regions in the density profile of the polymers, an excess polymer near the surface and a wetting layer on top of the brush. The physical properties of the polymer layer are strongly affected by the equilibrium between the bound and free polymer molecules.

Previously it was shown that the bulk reaction alkyl acrylates with paraformaldehyde catalyzed by triethylenediamine yields bis(acrylate) monomers having a 1,6 diene structure which favors free radical cyclopolymerization via 6-membered ring formation. In this study the feasibility of extending this reaction to convert fluoro-acrylates and -diacrylates to difunctional and oligomeric fluorinated monomers was explored. The reaction of 2,2,3,3,4,4,4-heptafluorobutyl acrylate (7FBA) under the usual ambient, bulk conditions yielded only trace amounts of products. Elevated temperature (80C) and the use of dimethyl sulfoxide resulted in an improved yield of two types of bis products, a 1,4-diene as well as the expected 1,6 diene (proton NMR). The analogous reaction with 2,2,3,3,4,4-hexafluoropentane-1,5-diacrylate yields a soluble, highly fluorinated, multifunctional oligomer. This type of aldehyde insertion reaction offers an attractive means of preparing otherwise not readily available highly fluorinated multifunctional monomers.

The dependence of Flory-Huggins interaction parameter chi on temperature, composition, and chain length was investigated for binary blends of amorphous model polyolefins, materials which are structurally analogous to copolymers of ethylene and butene-1. The components were prepared by saturating the double bonds of nearly monodisperse polybutadienes (78%, 88%, and 97% vinyl content) with H2 and D2, the latter to provide contrast for small-angle neutron scattering (SANS) experiments. Values of chi were extracted from SANS data in the single-phase region for two series of blends, H97/D88 and H88/D78, using the random phase approximation and the Flory-Huggins expression for free energy of mixing. These values were found to be insensitive to chain length (one test only) and to the component volume fractions for phi = 0.25, 0.50, and 0.75. Their temperature dependence (27-170 C) obeys the form chi(T) = A/T + B with coefficients that connote upper critical solution behavior.

Polybutadiene tagged with anthracene was synthesized and used as a fluorescent molecular probe to study shear-induced orientation in a matrix polymer melt. With the tagged polybutadiene doped into a polybutadiene matrix at 0.1% concentration, steady-state fluorescence anisotropy measurements were carried out under zero shear and under finite shear conditions using an optically instrumented cone and plate rheometer. Measurements were made over a shear rate range for which the specimen displayed non-Newtonian behavior, .00264 to 5.3/S. Anisotropy was observed to decrease with increasing applied shear stress. The magnitude of the effect is small and is attributed to shear-induced orientation of the probe molecule which is engaged in the entanglement network of the host polymer. Diluting the entanglement network using plasticizer produced a smaller effect. For polybutadiene plasticized with 50% cetane, the authors observed that anisotropy was independent of the applied shear stress, indicating that the probe molecule was not participating in the orientation of the matrix entanglement network. A relationship between anisotropy, chromophore relaxation time, and orientation factors was derived and used to deduce an orientation distribution of fluorescent absorption dipoles and to illustrate the difference between shear and extension stress observations. Extension experiments, carried out using a cross-linked polybutadiene specimen, showed that anisotropy increased as a function of applied extensional stress.

A general model for the phase behavior of polymer-polymer aqueous two-phase systems containing small amounts of added inorganic salts has been developed from statistical thermodynamics. The model is based on the solution theory of Hill and new electrolyte model based on Fluctuation Solution Theory. It includes the effect of polymer molecular weight with scaling expressions from the Renormalization Group theory of polymer solutions. The model has been used to calculate the phase diagram and the partitioning of salt for an aqueous two-phase system containing polyethylene glycol (MW=8000) and dextran (MW=28700) with Na2SO4. The calculations have been compared to experiment with good agreement.

Keywords: *Polymers, *Adhesion, *Surface chemistry, Equations of state, Rubbers, Elasticity, Molecular structure, Chemical bonds, Gels, Crosslinking, Reprints, Polymeric chains, Zippering.

The authors calculate the force on a long linear polymer molecule whose one end is zippered down onto a surface or onto a line and whose other end is at a perpendicular distance R from the surface of line. Random coil statistics are used for the unattached portion of the chain. The method is extended to the case when the bonds within the zippered portion are breaking and reforming. They also consider the case where the attached portion is in the form of loops and trains. Applications are discussed briefly. They include (1) Self-healing systems of gels and rubbers where the crosslinks may be hydrogen bonds, (2) Adhesion, (3) The degree of crystallinity in crystal-amorphous lamellar system, (4) The packing of DNA into the head of a bacteriophage virus, and pulling apart of double stranded DNA, (5) An insight into the theory of rubber elasticity, (6) Understanding the critical force for flow in thixotropic systems.

Effect of Curing History on Ultimate Glass Transition Temperature and Network Structure of Crosslinking Polymers.
Final rept.
S. S. Chang. 1992, 11p.
Pub. in Polymer 33, n22 p4768-4778 1992.

Keywords: *Glass transition temperature, *Curing, *Polymerization, *Crosslinking, Differential thermal analysis, Phase transformations, Reprints, *Glycidyl ethers, *Bisphenol-A, *Crosslinking network.

For a particular crosslinking polymer, it is often considered that the final state of crosslinking may be reached by post-curing at temperatures above its ultimate glass transition temperature, T(sub g,u) regardless of previous curing histories. Although this appears to be true over a certain range of variation in curing history, the T(sub g,u) and the network structure depend strongly on the curing history over a wide range of conditions for the homopolymerization of diglycidyl ether of bisphenol-A (DGEBA) catalyzed by 2-ethyl-4-methyl imidazole. As degrees of cure and crosslink increase, the glass transition temperature, T(sub g), of a sample may increase from the monomeric DGEBA value of -22 C to the highest value near 180 C. Depending on the curing thermal history, some samples may only attain a T(sub g,u) of approximately 100 C, even after post-curing at 200 C for 16 h. Although the influence of thermal history on T(sub g) may rank second after the influence of the degree of cure, it is the most important factor on T(sub g,u) for a fixed resin and catalyst composition. The reversible physical aging process appears to be the least influential on T(sub g). As all crosslinking reactions involve competing reactions with different kinetic parameters, we believe that these phenomena are universally observable to a greater or lesser degree in all crosslinking reactions.

How Far Is Far from Critical Point in Polymer Blends. Lattice Cluster Theory Computations for Structured Monomer, Compressible Systems.
Final rept.
J. Dudowicz, M. Lifschitz, K. Freed, and J. Douglas. 1993, 17p.
Pub. in Jnl. of Chemical Physics 99, n6 p4804-4820, 15 Sep 93.

Keywords: *Polymer blends, Critical point, Compressibility, Renormalization, Monomers, Computation, Reprints, Lattice cluster theory.

Although the lattice cluster theory (LCT) incorporates many features which are essential in describing real polymer blends, such as compressibility, monomer structures, local correlations, chain connectivity, and polymer-polymer interactions, it still remains a mean field theory and is therefore not applicable in the vicinity of the critical point where critical fluctuations become large. The LCT, however, permits formulating the Ginzburg criterion, which roughly specifies the temperature range in which mean field applies. The present treatment abandons the conventional assumptions of incompressibility and of composition and the molecular weight independent effective interaction parameter upon which all prior analyses of the Ginzburg criterion are based. Blend compressibility, monomer structure, and local correlations are found to exert profound influences on the blend phase diagram and other critical properties and, thus, exhibit a significant impact on the estimate of the size of the nonclassical region.

Monitoring Polymer Cure by Fluorescence Recovery After Photobleaching.
Final rept.
B. M. Fanconi. 1991, 8p.
Pub. in Rev. Prog. Quant. Nondestr. Eval. 10A, p1127-1134 1991.

Keywords: *Curing, *Polymers, *Monitors, *Tracer techniques, Fiber optics, Fluorescence, Diffusion coefficient, Dyes, Laser applications, Reprints, *Fluorescence Recovery After Photobleaching technique.

Fluorescence recovery after photobleaching (FRAP) is a technique to measure the translational diffusion coef-

ficient of dye molecules in polymer matrices. The sensitivity of the diffusion coefficient to the degree of cure of the polymer matrix provides a means to monitor cure. The aim of the present work is to examine the potential of optic fibers as a means probing the interior of thick specimens by FRAP. The temporal response of the fluorescence intensity has been calculated for an evanescent wave type fiber optic probe. With this probe, the evanescent wave of the photobleaching laser creates a region near the fiber surface devoid of fluorescent molecules. The diffusion coefficient of the dye molecule is determined from the temporal response of the fluorescence. With fiber optics it should be possible to measure translational diffusion coefficients an order of magnitude smaller than those detected by the conventional microscope-based method.

Keywords: *Block copolymers, *Neutron scattering, *Small angle scattering, *Molecular structure, Styrene resins, Polymerization, Deuterium compounds, Monomers, Reprints.

Multiblock copolymers were prepared by anionic copolymerization of deuterated and classical styrene monomers. The use of bifunctional initiators gives copolymers with an odd number of sequences. Neutron scattering experiments were performed on these samples in order to check the existing theories which are extended in the first part to multiblock copolymers with an odd number of blocks. The agreement between theory and experiment is excellent and, surprisingly, the height of the maximum of the curves:scattered intensity versus scattering angle, does not depend on the number of blocks.

Shear Dependence of Critical Fluctuations in Binary Polymer Mixtures by Small Angle Neutron Scattering.
Final rept.
C. C. Han, and A. I. Nakatani. 1990, 1p.
Pub. in Abstracts of Papers of the American Chemical Society 200, p105 Aug 90.

Keywords: *Binary systems(Materials), *Shear rate, *Small angle scattering, *Polystyrene, *Concentration(Composition), Polybutadiene, Neutron scattering, Thermoplastic resins, Deuterium compounds, Polymer blends, Vinyl ether resins, Labeled substances, Temperature dependence, Phase diagrams, Reprints, Poly(ether/vinylmethyl).

Small angle neutron scattering (SANS) has been used to study the concentration fluctuations of binary polymer mixtures under shear. Two different polymer systems: deuterated polystyrene/poly(vinylmethylether) and deuterated polystyrene/polybutadiene have been studied as a function of temperature and shear rate.

Small-Angle X-Ray and Neutron Scattering Study of Block Copolymer/Homopolymer Mixtures.
Final rept.
H. Hasegawa, H. Tanaka, T. Hashimoto, and C. C. Han. 1990, 1p.
Pub. in Abstracts of Papers of the American Chemical Society 200, p279 Aug 90.

Keywords: *Small angle scattering, *X-ray scattering, *Neutron scattering, *Block copolymers, *Binary systems(Materials), *Polystyrene, Polymer blends, Molecular weight, Thermoplastic resins, Polybutadiene, Deformation, Molecular chains, Reprints, Molecular conformations.

We investigated lateral and vertical one-dimensional components of radius of gyration for a single block copolymer chain (Study I) and those of a single homopolymer chain (Study II) in a microdomain space formed by a mixture of diblock copolymers and homopolymers by means of small-angle neutron and X-ray scattering techniques. The molecular weights of the homopolymers were much smaller than those of the corresponding block copolymer chains. The results imply that both the block copolymer and the homopolymer chains in the microdomain space are compressed in the direction parallel to the interface and stretched in the direction perpendicular to the interface. The block copolymer chains undergo an isochoric affine deformation on addition of the homopolymers.

Crossover to Strong Shear in a Low-Molecular-Weight Critical Polymer Blend.
Final rept.
E. K. Hobbie, D. W. Hair, A. I. Nakatani, and C. C. Han. 1992, 4p.
Pub. in Physical Review Letters 69, n13 p1951-1954, 28 Sep 92.

Keywords: *Small angle scattering, *Neutron scattering, *Polymer blends, *Shear flow, Molecular weight, Critical point, Light scattering, Reprints.

Small-angle neutron scattering has been used to measure the influence of shear flow on a low-molecular-weight polymer blend near the critical point. When combined with light scattering measurements of the equilibrium (gamma=0) critical dynamics, these measurements reveal that the long-range critical fluctuations begin to break apart when the shear rate becomes comparable to the characteristic relaxation rate 1/tau(sub c), where tau(sub c) is the equilibrium lifetime of the critical fluctuations. This effect is directly related to the decrease in the critical temperature caused by the flow, and the data are found to be in very good agreement with the theoretical predictions of Onuki and Kawasaki.

Anomalous Freezing and Melting of Solvent Crystals in Swollen Gels of Natural Rubber.
Final rept.
C. L. Jackson, and G. B. McKenna. 1991, 9p.
Pub. in Rubber Chemistry and Technology 64, n5 p760-768 1991.

Keywords: *Elastomers, *Freezing, *Cryoscopy, Gels, Polymers, Crosslinking, Calorimetry, Solvents, Swelling, Reprints, *Freezing point depression.

The anomalously large solvent freezing point depression (fpd), observed in crosslinked rubbers swollen in solvent has been a subject of study for over thirty years without clear resolution. While a sizeable fpd is accounted for by the lowering of the thermodynamic potential of solvent molecules in a polymer solution described by Flory-Huggins theory, the additional fpd observed for crosslinked rubbers has been attributed to various physical effects such as restriction of solvent crystals to small size by the network mesh or difficulty in nucleation of the solvent crystals. In this paper, we identify two points of misunderstanding in the literature on this problem, and attempt to clarify the analysis of fpd for solvent swollen rubbers. The first point relates to the use of Flory-Huggins theory for solvent freezing, where nucleation is a concern, rather than for solvent melting, for which it was intended. We present new experimental calorimetric data on both the freezing and melting of solvent crystals in crosslinked and uncrosslinked natural rubber swollen in benzene to illustrate this point. The second point relates to a reconsideration of the hypothesis of Kuhn, et al., that the anomalous fpd can be accounted for by small crystallite size.

Polymer Liquid Crystalline Materials.
Final rept.
C. L. Jackson, and M. T. Shaw. 1991, 22p.
Pub. in International Materials Reviews 36, n5 p165-186 1991.

Keywords: *Liquid crystals, *Polymers, Molecular structure, Physical properties, Liquid phases, Molecular chains, Rheology, Melts, Solutions, Reprints.

A review of the chemical structures, physical properties and current and potential applications of liquid crystalline polymers (LCPs) is presented. Comparisons are made between LCPs, low molecular weight liquid crystals (LCs) and conventional polymers for readers unfamiliar with the field. The ordered liquid phases are classified and molecular requirements for the formation of LC phases in both LCP melts (thermotropics) and LCP solutions (lyotropics) are discussed. The theoretical predictions of the formation of ordered phases given by Flory and Onsager are compared to experimental data, and other aspects of the phase behavior of LCPs in solution are considered, including physical gelation and crystal-solvate complexes. A wide variety of polymer structures which exhibit LC behavior are presented. These include main-chain (rigid-rod), semi-flexible, main-chain with flexible spacers, side-chain LCPs and various new combinations which have been recently devised. An emphasis is placed on the relationship between chemical and physical structure of LCPs, rather than on the details of the synthesis.

Effect of Cross-Links on the Miscibility of a Deuterated Polybutadiene and Protonated Polybutadiene Blend.
Final rept.
H. Jinnai, H. Hasegawa, T. Hashimoto, R. Birber, and C. C. Han. 1993, 7p.
Pub. in Macromolecules 26, n1 p182-188 1993.

Keywords: *Polymer blends, *Polybutadiene, *Crosslinking, Elastomers, Deuterium compounds, Hydrogen, Labeled substances, Small angle scattering, Neutron scattering, Binary systems(Materials), Temperature, Phase separation(Materials), Reprints.

The effect of peroxide crosslinking on the phase diagram and the scattering function for a critical mixture of perdeuterated polybutadiene (DPB) and protonated polybutadiene (HPB) has been examined by small-angle neutron scattering as a function of temperature. The scattering curves for the cross-linked blends were essentially temperature independent. A comparison of the scattering for the cross-linked blend with that of the linear blend at the cross-linking temperature (150 C) showed a suppression in the scattering due to the presence of the crosslinks. However, it was experimentally found that the concentration fluctuations present at the temperature of crosslinking dominate the scattering, which made it rather difficult to verify the prediction on the scattering function made by de Gennes.

H. Jinnai, H. Hasegawa, T. Hashimoto, and C. C. Han. 1992, 3p.
Pub. in Macromolecules 25, n22 p6078-6080 1992.

Keywords: *Phase diagrams, *Polymer blends, *Polybutadiene, Microstructure, Elastomers, Hydrogen, Labeled substances, Deuterium compounds, Temperature dependence, Small angle scattering, Neutron scattering, Reprints.

Miscibility of elastomer blends with various microstructures have been extensively studied in recent years. The separation of the isotope labeling effect from the microstructure effect has been successfully carried out by Sakurai et al. by using mean-field approximation. One of the important predictions is the possibility of phase diagram inversion from UCST to LCST or vice versa for these random copolymer blends. In this study, such phenomena have been found for a deuterated polybutadiene and hydrogenated polybutadiene pair by studies from small angle neutron scattering (SANS) experiments.

Topological Influences on Polymer Adsorption and Desorption Dynamics.
Final rept.
H. E. Johnson, J. F. Douglas, and S. Granick. 1993, 4p.
Pub. in Physical Review Letters 70, n21 p3267-3270, 24 May 93.

Keywords: *Polymers, *Adsorption, *Desorption, Comparison, Molecular weight, Surface chemistry, Transport properties, Reprints.

The desorption of polymer chains through an overlayer of strongly adsorbed chains was studied to determine the influence of topological constraints on the polymer desorption process. The desorption time of linear chains fits a power law, M(sup a), where M is molecular weight and a = 2.3 + or - 0.2. A comparison of linear and star-branched chains shows that desorption of star-branched chains was greatly suppressed. These findings are reminiscent of entanglement effects in bulk systems. They suggest a unifying perspective from which to analyze polymer mobility at surfaces.

Effects of Variable Excluded Volume on the Dimensions of Off-Lattice Polymer Chains.
Final rept.
D. E. Kranbuehl, and P. H. Verdier. 1993, 6p.
Pub. in Macromolecules 26, n15 p3986-3991 1993.

Keywords: *Molecular models, *Polymers, *Monte Carlo method, Statistical mechanics, Mathematical models, Volume, Reprints, *Off lattice polymer chains, *Bend stick models, Excluded model.

The expansion of bead-stick models of polymer chains by excluded volume has been obtained by Monte Carlo methods for chains with ratios d of hard-sphere bead diameter to stick length between zero (no excluded volume) and unity (connected beads touching) for chains of from 9 to 99 beads. We report values of mean square end-to-end length (l(sup 2)) and apparent power law exponents 2 nu = d(ln(l sup 2))/d(ln(N-1)) for chains of N beads, for eight values of d from 0.30 to 0.93. For the range of chain lengths reported here, the apparent power-law exponent is not independent of d but rather shows a smooth, gradual transition from the well-known result for d = 0 to the previously reported value for d = 1. The variation of 2 nu with bead size is remarkably similar to its variation with short-range attractive energy in other models. The results reported here are compared with those obtained by other workers on and off lattices, for hard-sphere and Lennard-Jones potentials, and with predictions of two-parameter and scaling theories.

The characterization of two narrow molecular weight distribution poly(ethylene oxide) standard reference materials, SRM 1923 and SRM 1924, is described. The weight-average molecular weight of SRM 1923 by light scattering was determined to be 26.9 x 1000 g/mole with a sample standard deviation of 0.87 x 1000 g/mole, based on 3 degrees of freedom. A combined expanded uncertainty of 2 x 1000 g/mole is estimated for this determination. The weight-average molecular weight of SRM 1924 by light scattering was determined to be 120.9 x 1000 g/mole with a sample standard deviation of 1.0 x 1000 g/mole, based on 3 degrees of freedom. A combined expanded uncertainty of 9.0 x 1000 g/mole is estimated for this determination.

SANS and LS Studies of Polymer Mixtures Under Shear Flow.
Final rept.
A. I. Nakatani. 1993, 4p.
Pub. in Polymer Preprints, Japan 42, n1 p134-137 1993.

Keywords: *Polymers, *Mixtures, *Light scattering, *Shear flow, Neutron scattering, Phase transformations, Shear rate, Kinetics, Rheology. Reprints, SANS(Small angle neutron scattering), LS(Light scattering), Polymer blends.

Small angle neutron scattering (SANS) and light scattering (LS) techniques have been used recently for in situ observations of the behavior of polymer mixtures under the influence of an applied shear field. Many prior studies examine the phase behavior of polymer mixtures under shear by turbidimetric or light scattering methods. The smaller size scales accessible with SANS make a combination of LS and SANS desirable. A couette geometry shear cell for SANS and a cone and plate geometry cell for LS have been constructed at the National Institute of Standards and Technology. Details of the two instruments will be described. Various examples of the results from the two instruments will be presented.

Pub. in Polymer Communications 31, n5 p167-169 1990.

Keywords: *Polyethylene, *Crystallization, *Surfaces, Molecular weight, Scanning electron microscopy, Reprints, *Scanning tunneling microscopy.

Rapid cooling of a thin layer of an entangled solution of ultra-high molecular weight polyethylene on a mica sheet resulted in a structure composed of elongated patches of polymer a few nanometers thick, aligned over distances of several micrometers. Some rows of side-by-side patches were thicker and formed a structure with a moss-like appearance at lower magnification. The scanning tunneling microscope was shown to be useful for the examination, at high magnification, of polymer surfaces. The top surface of a thin, conducting layer of evaporated platinum and carbon on a polymer reveals much the same information as could be obtained by removing the platinum and carbon layer and examining it with a transmission electron microscope. The often troublesome step of removing the platinum/carbon replica is not needed for the scanning tunneling microscope.

Pub. in Macromolecules 24, n16 p4646-4656 1991.

Keywords: *Polymers, *Shear flow, *Dynamic response, Plastic flow, Molecular structure, Brownian movement, Fluid dynamics, Hydrodynamics, Reprints.

The dynamic behavior of a terminally anchored freely-jointed bead rod chain, subjected to uniform solvent shear flow, was investigated via Brownian dynamics simulations. Computed segment density distributions and other statistical expressions of the chain conformation demonstrate a strong effect of shear rate on chain behavior. Values of the effective hydrodynamic thickness computed from the numerical similations were also found to be a strong function of the shear rate. Stationary statistical results obtained for the chain extension show two regimes in the configuration space of the model chain, a Brownian regime at low shear rates and a hydrodynamic regime at high shear rates.

Morphology of Symmetric Diblock Copolymers as Revealed by Neutron Reflectivity.
Final rept.
S. K. Satija, C. F. Majkrzak, S. H. Anastasiadis, and T. P. Russell. 1990, 6p.
Pub. in Materials Research Society Symposia Proceedings 166, p139-144 1990.

Keywords: *Block copolymers, *Morphology, *Thin films, *Polystyrene, *Polymethyl methacrylate, Surface properties, Substrates, Neutron radiography, Reflectivity, Annealing, Interfaces, Laminates, Phase transformations, Reprints.

Recently, it has been shown that symmetric diblock copolymers of polystyrene (PS), and polymethylmethacrylate (PMMA), when prepared as thin films (5000A or less) on silicon substrates, exhibit a strong orientation of the lamellar microdomains parallel to the surface of the substrate. This orientation occurs when the copolymer films are annealed at temperatures above the glass transition temperatures of the PS and PMMA blocks and results from the interactions of the two blocks with the air and substrate interfaces. PMMA, the more polar species, preferentially resides at the silicon (silicon oxide)/copolymer interfaces, whereas PS, the lower surface energy component, preferentially segregates to the air/copolymer interface. These interactions, coupled with the chemical connectivity of the PS and PMMA blocks, result in the observed multilayered structure.

Novel Polydiacetylenes Derived from Liquid Crystalline Monomers.
Final rept.
M. A. Schen. 1988, 10p.
Pub. in Proceedings of International Conference on Electrical, Optical and Acoustic Properties of Polymers (1st), Canterbury, UK., September 5-7, 1988, p12/1-12/10.

Keywords: *Liquid crystals, *Acetylene, Small angle scattering, X-ray scattering, Reaction kinetics, Polymerization, Monomers, Reprints, *Polydiacetylenes.

The liquid crystal phase polymerization of a liquid crystalline diacetylene monomer, 1,6 bis-(4-oxybenzylidene 4'-n-octylaniline) 2,4-hexadiyne is reported and characterized. Within the crystal and liquid crystal phases, first-order disappearance of monomer is seen by differential scanning calorimetry with a thermal activation energy of 155 kJ/mol. The lamellar structure characteristic of the monomer smectic phase is conserved with polymerization as shown by X-ray scattering. The topochemical polymerization of diacetylenes is therefore extended to include polymerization in the liquid crystal phase.

Glass Temperature of Polymer Blends: Comparison of Both the Free Volume and the Entropy Predictions with Data.
Final rept.
H. A. Schneider, and E. A. Di Marzio. 1992, 9p.
Pub. in Polymer 33, n16 p3453-3461 1992.

Keywords: *Blends, *Polymers, *Glass transition temperature, *Volume, *Entropy, Mathematical models,

Phase transformations, Monomers, Experimental data, Reprints, *Polymer blends.

An equation derived from the hypothesis that the glass temperature is determined by entropy considerations, and an equation derived from the hypothesis that the glass temperature is determined from free volume considerations are each compared to 17 polymer blend systems. The curves mimic experiment in about half (the same half) of the cases. The (roughly) equivalent predictions of the two equations suggests that the glass temperature of an infinite molecular weight polymer is proportional to the mass of a monomer unit divided by the number of flexible bonds of a monomer unit. A slightly modified treatment suggests proportionality to monomer volume per flexible bond. It is pointed out each of the two equations are zeroth order treatments and that they can each be improved. The improvement arising from the entropy theory requires no parameters.

R. S. Parnas, and Y. Cohen. 1993, 5p.
Pub. in Proceedings of Symposium on Dynamics in Small Confining Systems, Boston, MA., November 30-December 4, 1990, 5p 1993.

Keywords: *Hydrodynamics, *Polymers, *Chains, Brownian movement, Simulation, Shear flow, Molecular structure, Statistical distributions, Radius of gyration, Reprints, *Hydrodynamic interactions, *Bead-rod model.

Brownian dynamics simulations of a terminally anchored, freely-jointed bead-rod chain were used to reveal the effects of Yamakawa hydrodynamic interactions on the statistical properties of the chain. Properties such as the RMS and effective hydrodynamic thicknesses were computed with and without hydrodynamic interactions. Although hydrodynamic interactions significantly influenced the magnitude of the statistical properties of the terminally anchored bead-rod chain, the general trends seen in such properties were not altered. Additionally, the results obtained with the freely-jointed bead-rod model are in better agreement with experimental results than those obtained with bead-spring models, for surface bound polymer layers.

Pub. in Physical Review Letters 72, n18 p2899-2902, 2 May 94.

Keywords: *Block copolymers, *Solids, *Surface properties, Neutron radiography, Reflectivity, Interfaces, Films, Separation, Reprints.

Symmetric, diblock copolymers confined between two solid surfaces were studied by neutron reflectivity. A multilayered morphology with an integral number of layers oriented parallel to the solid interfaces was found in all cases. The period of the confined multilayers deviated from the bulk period in a cyclic manner as a function of the confined film thickness. A first-order transition occurred between the expanded and contracted states of the copolymer chains. The data suggest that the deviation of the period from the bulk value decreases with increasing separation distance.

Structural Stabilization of Phase Separating PC/Polyester Blends through Interfacial Modification by Transesterification Reaction.
Final rept.
H. Yoon, Y. Feng, Y. Qiu, and C. C. Han. 1994, 8p.
Pub. in Jnl. of Polymer Science: Part B. Polymer Physics 32, p1485-1492 1994.

Keywords: *Molecular structure, *Phase separation(Materials), *Polymer blends, *Interfaces, *Esterification, Copolymers, Polycarbonate resins, Time dependence, Temperature dependence, Small angle scattering, Neutron scattering, Melting, Heat measurement, Reprints, Differential scanning calorimetry.

Competition between phase separation and transesterification in immiscible polymer blends of polycarbonate (PC) and a copolyester (PET) is studied as a function of time and temperature by differential scanning calorimetry (DSC) and small-angle neutron scattering (SANS). We found that (1) Global structure coarsens at T greater than or equal to 200 C due to the dominance of phase separation over transesterification and melts at T greater than or equal to 200 C due to the dominance of transesterification at the domain interface. However, transesterification is slow but still significant even at T greater than or equal to 200 C. (2) An intricate balance of transesterification and phase separation rates controls global and interfacial structures. (3) Interfacial structures become measureable under certain conditions, and the interfacial thickness between PC or PET and the copolymers generated by transesterification increases with time. (4) DSC results are consistent with results obtained by SANS, but the latter is more sensitive than the former and differentiates the structural change at different length scales caused by phase separation and transesterification.

Anisotropic Phase Separation Kinetics in a Polymer Blend Solution Following Cessation of Shear Studied by Light Scattering.
Final rept.
D. A. Waldow, A. I. Nakatani, and C. C. Han. 1992, 4p.
Pub. in Polymer 33, n21 p4635-4638 1992.

Keywords: *Polymer blends, *Phase separation(Materials), *Kinetics, *Anisotropy, *Laboratory equipment, *Shear flow, Light scattering, Solutions, Polystyrene, Polybutadiene, Monitoring, Reprints.

A light scattering instrument capable of monitoring the scattering from samples under the influence of a simple shear field has been constructed. The apparatus consists of transparent cone-and-plate fixtures and a two-dimensional charge coupled device array detector. The detector unit is also capable of measuring the scattering patterns as a function of time. The phase separation kinetics of an 8% solution of a polystyrene/polybutadiene (50:50) blend in dioctyl phthalate following cessation of a steady shear is monitored with this instrument. The sample is two-phase in the quiescent state and the applied shear is sufficient to suppress all scattering observed from the quiescent sample (shear-induced mixing). The evolution of the scattering profiles following cessation of shear is quite different parallel and perpendicular to the original flow direction. In the normal direction, a spinodal growth and coarsening mechanism similar to that observed in temperature quench experiments is observed. In the parallel direction, a different mechanism is followed. We believe this is the first report of this type of anisotropic behavior in the phase separation kinetics of a polymer blend.

SANS Study of the Plastic Deformation Mechanism in Polyethylene.
Final rept.
W. Wu, G. D. Wignall, and L. Mandelkern. 1993, 4p.
Pub. in Polymer 33, n19 p4137-4140 1992.

Keywords: *Polyethylene, *Neutron scattering, *Polymer blends, *Plastic deformation, Small angle scattering, Thermoplastic resins, Deuterium compounds, Protons, Separation, Melting, Reprints, SANS(Small Angle Neutron Scattering).

Small angle neutron scattering was used to investigate the role of partial melting and recrystallization in the solid state deformation of polyethylene. Blends containing 4 vol% deuteropolyethylene in protonated polyethylene were deformed in a pure shear mode. The scattering cross section of the undeformed blends was well in excess of that expected for randomly (statistically) dispersed molecules, due to isotopic segregation effects between the deuterated and the protonated species. A significant reduction in the excess scattering was observed as the blends were deformed beyond the yield point. Upon further deformation the cross section underwent a further modest decrease. Such a reduction is known to occur on melting. The neutron scattering results, hence, support the notion of local melting during the yielding and the subsequent deformation processes.

Keywords: *Molecular structure, *Curing, *Epoxy resins, *Heterogeneity, Small angle scattering, X-ray scattering, Mechanical properties, Fracture properties, Toughness, Modulus of elasticity, Impact strength, Glass transition temperature, Reprints.

The effects of different cure procedures on the structure and properties of epoxy samples made from diglycidyl ether of bisphenol A (DGEBA) and mixtures of two linear aliphatic diamines were studied. The elastic modulus, fracture toughness, impact resistance and glass transition temperature were determined for various cure schemes. The morphologies of the cured resins were characterized with small angle x-ray scattering. The results show that samples with the same average morphology (molecular network structure) have similar elastic moduli and glass transition temperatures. If some heterogeneity is introduced in the molecular network structure without changing the average structure, however, the experiments indicate that the toughness can be increased without significantly sacrificing other properties.

To determine the compatibility between the rigid rod and the flexible chain polyquinolines, both small angle

x-ray and neutron scattering measurements were conducted on a sample containing deuterated flexible components. The scattering intensities from both x-ray and neutron were reduced to the absolute scale in order to remove the scattering contribution from microvoids which tended to overshadow the signal from the molecular origin. Quantitative information regarding the extent of segregation of this rigid rod containing blends can be obtained from the scattering data free of microvoid contribution.

Pub. in Physical Review B 47, n18 p12 268-12 271, 1 May 93.

Keywords: *Polymer blends, *Light scattering, *Critical point, *Dynamics, *Polystyrene, *Polybutadiene, Experimental design, Reprints, Phthalate/dioctyl.

The critical dynamics of a moderately-high-molecular-weight polymer blend of polystyrene and polybutadiene diluted in dioctyl phthalate is studied near the consolute point by dynamic light scattering. Fast and slow modes are observed as in previous experiments on a low-molecular-weight binary-polymer-blend melt. The light-scattering data are consistent with a Fisher renormalization of the correlation-length exponent.

Keywords: *Copolymers, *Methyl methacrylate, *Synthesis(Chemistry), *Thermal stability, PMMA, Reprints, *Maleimide/N-phenyl.

The paper describes the synthesis and characterization of six copolymers of methyl methacrylate (MMA) and N-phenyl maleimide (NPM). Thermal stability of PMMA was markedly improved by incorporation of even a very low mole fraction of NPM in the backbone. An increase in mole fraction of NPM from 0.0979 to 0.4766 only marginally affected thermal stability.

Thermodynamic interactions in mixtures of two homopolymers and a block copolymer were obtained from small-angle neutron scattering (SANS) measurements. Experimental SANS profiles from homogeneous, ternary mixtures of model polyolefins--poly(ethyl butylene)/poly(methyl butylene)/poly(methyl butylene)-b-poly(ethyl butylene)--were compared with theoretical predictions based on the multicomponent random phase approximation (RPA). The polymers were nearly monodisperse and were synthesized by saturating the double bonds in anionically synthesized polydienes with H2 and D2, thus yielding polyolefins with neutron scattering contrast.

Pub. in Jnl. of Applied Polymer Science 49, p91-95 1993.

Keywords: *Copolymerization, Reaction kinetics, Decomposition reactions, Endothermic reactions, Reprints, *Maleimide/N-phenyl, *Silane/methacryloxyprophyl trimethoxy.

Copolymerization of N-phenyl maleimide (NPM) and gamma-methacryloxypropyl trimethoxysilane (MTS) in dioxan solution using benzoyl peroxide as an initiator is described. The rate of copolymerization depended on the mole fraction of NPM in the initial feed and decreased with an increase in NPM content. Copolymers having a mole fraction of NPM varying from 0.29 to 0.55 exhibited similar thermal behavior in terms of initial decomposition temperature of maximum rate of weight loss. However, char yield at 600 C depended on NPM content, showing a tendency to increase with the increase in NPM content.

Keywords: *Thermodynamic properties, *Polymerization, *Thermochemistry, Infrared spectroscopy, Nuclear magnetic resonance, Curing, Heat of reaction, Molecular structure, Epoxy resins, Reprints, *Ether/maleimidophenyl glycidyl.

A novel epoxy-maleimide resin, 4-maleimidophenyl glycidyl ether (MGE), was prepared from 4-aminophenol. Characterization was carried out by estimation of the epoxy equivalent and by IR and (1)H-NMR spectroscopy. The MGE resin was cured by heating above 250 C. A decrease in the curing temperature was observed after the addition of a stoichiometric or non-stoichiometric amount of an aromatic diamine. The values of the curing temperature and the heat of the polymerization reaction (Delta H) were independent of diamine concentration but depended on the structure of the diamine. The char yield of cured resins at 800 C in a nitrogen atmosphere ranged from 25% to 40%, which is much higher than the values reported for epoxy resins.

Keywords: *Vinyl copolymers, *Piezoelectricity, *Pyroelectricity, *Polarization(Charge separation), Nylon fibers, Ferromagnetic materials, Hysteresis, Thermal stresses, Reprints.

Piezoelectric and pyroelectric response from polymers arises from changes in polarization resulting from stress or temperature-induced changes in volume. Factors which determine the polarization that can be induced by poling are outlined for amorphous polymers and for semicrystalline polymers. Definitions of piezoelectric and pyroelectric coefficients and the conventions of nomenclature are presented. Typical coefficients for polymers are compared with those for other organic or inorganic materials which exhibit such properties. A brief description of the properties of specific polymers is presented with frequent reference to more detailed review articles.

Self-organization of structure in polymer blends via spinodal decomposition (SD) was studied over a wide spatial-scale and time-scale (both being covered over 4 orders of magnitude) by using a combined time-resolved small-angle neutron scattering and light scattering method. The system studied was a binary critical fluid of deuterated polybutadiene and proton polyisoprene having a narrow molecular weight distribution in a weak segregation limit. The scattering analyses made it possible to study space-time organization of various elements of the structures: (1) global structure, (2) interfacial structure such as mean curvature of the tangled interface, interfacial area density, and interfacial thickness, (3) 'interphase', i.e., interfacial region with characteristic thermal concentration fluctuations, and (4) the local structure characterized by the thermal concentration fluctuations within each domain. In the late stage SD, the form factor from the 'interphase' was found to be time-independent, having the q-dependence of q(sup -2.5).

Time-Resolved Small-Angle Neutron Scattering Study of Spinodal Decomposition in Deuterated and Protonated Polybutadiene Blends. 1. Effect of Initial Thermal Fluctuations.
Final rept.
H. Jinnai, H. Hasegawa, T. Hashimoto, and C. C. Han. 1993, 327p.
Pub. in Jnl. of Chemical Physics 99, n6 p4845-4854, 15 Sep 93.

Keywords: *Polymer blends, *Spinodal decomposition, *Polybutadiene, *Neutron scattering, Synthetic elastomers, Small angle scattering, Deuterium compounds, Protons, Time resolution, Temperature effects, Binary systems(Materials), Phase diagrams, Reprints.

Time-resolved small-angle neutron scattering (SANS) experiments have been performed on the self-assembling process of a binary mixture of deuterated polybutadiene and protonated polybutadiene at the critical composition. This mixture has an upper critical solution temperature type of phase diagram with the spinodal temperature at 99.2 C. Specimens held in the single-phase state at an initial temperature (T(sub i)) were quenched to a point inside the spinodal phase boundary at a final temperature (T(sub f)) to induce phase separation via spinodal decomposition (SD). In order to examine the effect that thermal concentration fluctuations have on SD, three different initial temperatures, T(sub i) = 102.3 C, 123.9 C, and 171.6 C, were chosen while T(sub f) was fixed at -7.5 C. A critical test of the linearized Cahn-Hilliard-Cook theory led to the conclusion that this theory can describe satisfactorily the early stage SD in the deep-quench region.

Localization of a Homopolymer Dissolved in a Lamellar Structure of a Block Copolymer Studied by Small-Angle Neutron Scattering.
Final rept.
Y. Matsushita, N. Torikai, Y. Mogi, I. Noda, and C. C. Han. 1993, 4p.
Pub. in Macromolecules 26, n24 p6346-6349 1993.

Keywords: *Block copolymers, *Neutron scattering, *Molecular structure, *Polymers, Small angle scattering, Lamellar structure, Deuterium compounds, Molecular chains, Phase separation(Materials), Reprints.

The localization of deuterated styrene homopolymer dissolved in a lamellar structure of a styrene-2-

vinylpyridine diblock copolymer was studied in comparison with that of the end part of the block copolymer by observing diffraction from the styrene and 2-vinylpyridine microdomains of deuterated styrene homopolymer/styrene-2-vinylpyridine diblock copolymer blends by small-angle neutron scattering (SANS). Even when the average scattering lengths of both domains were equal, that is, 'phase contrast matching' was theoretically achieved, diffraction was definitely observed. From the diffraction profiles in SANS and the dependence of domain spacing on the volume fraction of the styrene homopolymer, it was found that the homopolymers are isolated in the middle of the polystyrene domain, although they are concentrated less than the end parts of the block chains.

Molecular Weight Dependence of the Lamellar Domain Spacing of ABC Triblock Copolymers and Their Chain Conformation in Lamellar Domains.
Final rept.
Y. Mogi, K. Mori, H. Kotsuji, C. Han, Y. Matsushita, and I. Noda. 1993, 5p.
Pub. in Macromolecules 26, n19 p5169-5173 1993.

Keywords: *Molecular weight, *Block copolymers, *Molecular chains, *X-ray scattering, Lamellar structure, Small angle scattering, Phase separation(Materials), Reprints, *Molecular conformation, Styrene vinylpyridine.

The molecular weight dependence of the lamellar domain spacing of isopren-styrene-2-vinylpyridine triblock copolymers in bulk was studied over the molecular weight range from 40K to 280K by using a small-angle X-ray scattering (SAXS) method. It was found that the lamellar domain spacings of the triblock copolymers are larger than those of styrene-2-vinylpyridine diblock copolymers with the same molecular volumes. This result can be interpreted by theories of microphase separation at the strong segregation limit, taking into account the fact that the number of boundaries in the repeating structure of triblock copolymers is twice as large as that of diblock copolymers. Moreover, small-angle neutron scattering (SANS) studies imply that the middle block chain of triblock copolymers is contracted along the direction parallel to lamellae in almost the same manner as the block chain of the diblock copolymers.

Keywords: *Neutron scattering, *Polystyrene, *Turbidity, *Solutions, Shear rate, Small angle scattering, Deuterium compounds, Hydrogenation, Temperature dependence, Specific heat, Critical temperature, Reprints, Phthalate/dioctyl.

The influence of shear on the small angle neutron scattering from a semidilute solution of polystyrene (PS) dissolved in dioctyl phthalate (DOP) is examined in the limit of strong shear (gamma greater than or = to 100/s). These experiments are restricted to room temperature, which is close to the theta point of PS/DOP. The fraction of deuterated PS chains is varied, while the total polymer weight fraction is fixed at 3%. This is near the critical composition of hydrogenated PS in DOP. The increased scattering at high shear rates ('shear induced turbidity') is interpreted in terms of a critical temperature shift. Scattering along the flow direction is distorted and the scattering data normal to flow is uninfluenced by shear above a wave vector cutoff q*, which is independent of shear rate. This cutoff is found to correspond to the Debye length, characterizing the average intermolecular potential range.

Keywords: *Synthesis(Chemistry), *Polymerization, *Monomers, *Cyclic compounds, Esters, Crosslinking, Vitreous state, Ethers, Intramolecular forces, Reprints.

The reaction of an acrylate ester with paraformaldehyde in the presence of DABCO has given access to a novel class of ether-fused pseudo-dimethacrylate monomers. The 1,6-diene unit incorporated in the monomers can be polymerized through an inter-intramolecular cyclopolymerization process which yields a soluble, ester-substituted, cyclic ether polymer structure. A series of monomers was prepared to evaluate the effect of the substituents on the synthesis and cyclopolymerization. A method was developed which efficiently provided even monomers with very bulky ester groups. Solution polymerization studies indicated that both monomer concentration and ester structure exert significant influence on the mode of polymerization. Apparently, the more hindered monomers are more effective at cyclopolymerization. The bulk polymerization of these monomers resulted in crosslinked, glassy polymers with little or no residual unsaturation. Multifunctional oligomers based on this same chemistry were also prepared and polymerized in this study.

Two approaches using fluorescent dyes dissolved in epoxy resins were used to determine the viscosity changes during the curing process. First, we used a dye whose fluorescence intensity increases with the increase in the local viscosity, and a second dye whose fluorescence intensity is insensitive to the local viscosity. The ratio of the fluorescence intensities of the two dyes was measured to monitor the cure of epoxy resins. In another approach, we measured the diffusion coefficient of a fluorescent dye dissolved in epoxy resins by fluorescence recovery after photobleaching to monitor the cure of epoxy resins. Finally, self-diffusion in concentrated polystyrene solutions was measured by the method of fluorescence recovery after photobleaching.

Small-Angle Neutron Scattering of Poly(vinyl alcohol) Gels.
Final rept.
W. Wu, H. Kurokawa, S. Roy, and R. S. Stein. 1991, 6p.
Pub. in Macromolecules 24, n15 p4328-4333 1991.

Keywords: *Neutron scattering, *Gels, *Polyvinyl alcohol, *Molecular structure, Small angle scattering, Temperature, Transition temperature, Sols, Reprints.

The structure of aqueous poly(vinyl alcohol) (PVA) gels with and without borate ions, hereafter referred to as alkaline gels and hydrogels, respectively, was investigated using small-angle neutron scattering (SANS). The correlation length Xi, a measure of the wavelength of concentration fluctuation, was estimated from the SANS results. The value of Xi showed a modest decrease with increasing temperature. Even at the highest temperature of observation, 95 C, Xi was still a few times greater than the radius of gyration of individual PVA molecules, indicating the presence of PVA clusters in the sol state. The scattered intensities for both the hydrogels and the alkaline gels over a wide temperature range could be superimposed onto one master curve by employing the reduced variables I(q)/Xi(exp 3) and (Xi)(q), where q is the magnitude of the scattering vector. This indicates that the concentration fluctuation can be described adequately by a single characteristic length over a wide temperature range embracing the sol-gel transition temperature.

Pub. in Macromolecules 23, n5 p1438-1443 1990.

Keywords: *Neutron scattering, *Polyvinyl alcohol, *Molecular chains, *Coextruding, Small angle scatter-

ing, Deformation, Birefringence, Least squares method, Regression analysis, Radius of gyration, Reprints, *Molecular conformation.

Chain asymmetry of solid state co-extruded poly(vinyl alcohol) film was studied using small-angle neutron scattering. The radius of gyration R(sub g) was estimated by a nonlinear least square regression analysis with a theoretical scattered intensity function which is based on a model of deformed Gaussian chains. The R(sub g) values for deformed PVA indicate that the poly(vinyl alcohol) chains are deformed affinely at least up to the extension draw ratio of ca. 5, which is in good accordance with the results of birefringence measurement.

Small Angle Neutron Scattering Study on Poly(N-Isopropyl Acrylamide) Gels Near Their Volume-Phase Transition Temperature.
Final rept.
M. Shibayama, T. Tanaka, and C. C. Han. 1992, 13p.
Pub. in Jnl. of Chemical Physics 97, n9 p6829-2841, 1 Nov 92.

Keywords: *Neutron scattering, *Polymers, *Gels, *Phase transformations, *Temperature dependence, Small angle scattering, Heavy water, Solutions, Lorentz transformations, Gauss equation, Ising model, Reprints, *Poly(amide/N-propylacryl).

The small angle neutron scattering experiments were conducted on N-isopropyl acrylamide (NIPA) gels in D2O and on the corresponding NIPA solutions. The NIPA gels underwent a sharp, but a continuous volume phase transition at 34.6 C from a swollen state to a shrunken state with increasing temperature. In the case of the gels, an excess scattering due to the presence of crosslinks was observed at low q region (q < 0.02/A), where q is the magnitude of the scattering vector. The scattered intensity function for the gel was well described with a combination of Gauss and Lorentz-type functions. The Gaussian part results from solidlike inhomogeneity, having a characteristic size of Xi, which is due to the introduction of crosslinks into the system. The Lorentzian part is originated from the liquid nature of the local concentration fluctuations of the gel characterized with a thermal blob of dimension Xi. The critical exponents for the gels support that the volume-phase transition of gels is classified to the three dimensional Ising model reported by Li and Tanaka.

Pub. in Jnl. of Chemical Physics 97, n9 p6842-6854, 1 Nov 92.

Keywords: *Neutron scattering, *Temperature dependence, *Polymers, *Gels, *Statics, Small angle scattering, Electrolytes, Phase transformations, Scattering coefficients, Phase separation(Materials), Heavy water, Reprints, *Poly(amide/N-propylacryl), *Polyacrylic acid.

The static structure factor for poly(N-isopropylacrylamide-co-acrylic acid) (NIPA/AAc) gels was investigated in terms of small-angle neutron scattering (SANS). The NIPA/AAc gels underwent a discrete volume phase transition at 50.8 C from swollen to shrunken states as temperature increased. The static structure factors for NIPA/AAc gels were well described by a Lorentz-type scattered intensity function at temperatures below 34 C which was near the so-called Theta temperature of NIPA in D2O. At higher temperatures, the static structure factor had a distinct scattering maximum although the gel was still in the highly swollen state. The static structure factors were analyzed quantitatively with the theory of Borue and Erukhimovich for polyelectrolyte solutions in a poor solvent. It is found that the concentration fluctuations lead to a microphase separation between polymer rich and poor domains before the system undergoes the volume-phase transition.

Competition between Hydrodynamic Screening ('Draining') and Excluded Volume Interactions in an Isolated Polymer Chain.
Final rept.
J. F. Douglas, and K. F. Freed. 1994, 12p.
Pub. in Macromolecules 27, n21 p6088-6099 1994.

Keywords: *Polymers, *Molecular structure, *Hydrodynamics, *Solutions, Solvents, Dynamics, Coefficient of friction, Intermolecular forces, Configuration interaction, Reprints, Excluded volume, Preaveraging approximation.

A remaining challenge in the theory of polymer solution dynamics is associated with establishing a relation between the macroscopic hydrodynamic properties of polymer solutions and the molecular structure of the polymer and solvent. This problem is unsolved even for the simplest case of polymer solutions at 'infinite dilution'. Recent studies have focused on technical problems such as the 'preaveraging' approximation, epsilon-expansion truncation errors, and the influence of ternary excluded volume interactions which limit the accuracy of analytic calculations. The present paper examines the role of polymer excluded volume in altering intramolecular hydrodynamic interactions and the possible significance of dynamic chain flexibility on hydrodynamic polymer solution properties. This investigation is aided by analysis of our previous renormalization group (RG) computations and simple exactly solvable models. We also examine experimental trends for the variation of the polymer hydrodynamic interaction with solvent and the variation of the translational friction of small molecules with molecular size.

Pub. in Jnl. of Physics A: Mathematical and General 27, p1099-1109 1994.

Keywords: *Polymers, *Series expansion, *Enumeration, Comparison, Thermodynamics, Molecular structure, Reprints, *Self-avoiding walks.

The 1/d expansion method of polymer chains is examined by comparing these expansions for several thermodynamic and structural quantities with the results of standard series analysis of exact enumeration data. The comparisons cover a wide range of spatial dimensions d, including non-integer ones, and are performed for particular values of interaction energy. Good agreement is generally found for d > 4, whereas discrepancies become conspicuous as d decreases to d = 2. Reasonable values are obtained for the exponents nu and gamma in d = 2 - 4 by applying the coherent-anomaly method of Suzuki to our 1/d expansions through fifth order in 1/d.

Pub. in Jnl. of Membrane Science 84, p161-169 1993.

Keywords: *Polymeric films, *Gas transport, *Membranes, Casting, Ions, Separation, Carbon dioxide, Methane, Permeability, Diffusion, Fluorine organic compounds, Surfactants, Reprints, *Poly(sulfonic acid/tetrafluoro).

We have made solution-cast films of perfluorosulfonic acid ionomer (PFSA) that included ionic surfactants in the casting solution. Gas transport measurements were made, using mixtures of CO2 and CH4, through both solution-cast and commercial PFSA films that contained either Na(+) or HEDA(+) (monoprotonated ethylenediamine) counterions. The HEDA(+) provides facilitated transport of CO2 at low partial pressures. For all the films with the Na(+) counterion the difference in permeability was greater at lower feed total pressures than at the higher pressures (approximately 11 MPa). We interpret this result as a mechanical pressure effect on the free volume around the ionic clusters. Additional observations include a 'hindering' effect of the HEDA(+) counterion on both CO2 and CH4 permeation rates but more so for the CO2. We discuss these results in the context of separate factors that are economically attractive at all the pressures studied. However, the permeability of the membranes was below economic targets by a factor of 100 considering the fact that they were 30 micrometers thick.

Ring-Opening Polymerication of a 2-Methylene Spiro Orthocarbonate Bearing a Pendant Methacrylate Group.
Final rept.
J. W. Stansbury. 1994, 13p.
Sponsored by National Inst. of Dental Research, Bethesda, MD.
Pub. in Polymers of Biological and Biomedical Significance, Chapter 14, p171-183 1994.

Keywords: *Monomers, *Synthesis(Chemistry), *Polymerization, *Methacrylates, Dental materials, Molecular structure, Medical supplies, Composite materials, Adhesives, Coatings, Chemical bonds, Crosslinking, Polycarbonate resins, Methylene radicals, Reprints, Chemical reaction mechanisms.

A methacrylate-substituted spiro orthocarbonate monomer was synthesized and evaluated in polymerizations using radical and/or cationic initiators. The monomer contains an exocyclic double bond on the spiro group for radical addition and ring opening independent of the remote methacrylate functionality. Crosslinked polymers were obtained by all modes of initiation with mixed radical and cationic giving optimum conversions and ring opening. The incorporation of the pendant methacrylate group minimizes concerns of leachable products generated by polymerization mechanisms involving single ring opening with elimination of a cyclic carbonate. The spiro vinyl ether-type double bond appears to activate the monomer toward cationic polymerization. The ring-opening polymerization of spiro orthocarbonate monomers can yield expansion in volume and may improve a variety of dental and medical materials such as composites, adhesives, and coatings.

Keywords: *Polymerization, *Free radicals, *Adhesive bonding, Hydroxyl radicals, Oxidation, Reduction(Chemistry), Cations, Anions, Reprints, *Chemical reaction mechanisms, Peroxyl radicals, Glycine/N-tolyl.

The extensive use of N-p-tolylglycine (NTG) and analogous compounds in adhesive bonding technologies requires a better understanding of their role in initiating free-radical polymerization. The fast oxidation and reduction reactions of NTG proceed via the formation of various free radicals and radical cation and anion intermediates. These intermediates were identified and their reactivity with oxygen, to produce the corresponding peroxyl radicals, was measured. Hydroxyl radicals (OH) were used to initiate oxidation reactions of NTG, while the reduction reactions were initiated with hydrated electrons (e(sub aq)(sup -)).

Neutron Scattering Study of the Orientation of a Liquid Crystalline Polymer by Shear Flow.
Final rept.
M. D. Dadmun, and C. C. Han. 1994, 11p.
Pub. in Macromolecules 27, n26 p7522-7532 1994.

Keywords: *Neutron scattering, *Shear flow, *Polymers, *Orientation, Solutions, Shear rate, Dynamics, Rheology, Anistropy, Reprints, *Liquid crystalline polymers, Poly(glutamate/benzyl).

The orientational response of a liquid crystalline polymer (LCP) solution, specifically poly-(benzyl L-glutamate) (PBLG) in deuterated benzyl alcohol, to the application of a shear field has been determined by in-situ neutron scattering. By analyzing the anisotropic two-dimensional scattering pattern, the orientation of the LCP at different shear rates (dot-gamma) in the flow-vorticity plane was determined. It was found that the LCP response has three regimes. At low shear rates, dot-gamma < dot-gamma 1, the orientation of the LCP molecule increases with dot-gamma; at intermediate flow rates, dot-gamma 1 < dot-gamma < dot-gamma 2, there is not much change in the orientation of the PBLG molecule with dot-gamma; and at high dot-gamma, dot-gamma > dot-gamma 2, there is again an increase in the orientation of the LCP with shear rate. The crossover shear rates, dot-gamma 1, and dot-gamma 2, have been shown to correlate well to the first two relaxation times of a rodlike polymer in concentrated solution. The results are also compared and contrasted to some recent studies of the rheology of LCP in solution.

Pub. in Polymer Preprints 35, n2 p920-921 Aug 94.

Keywords: *Polymerization, Reaction kinetics, Electron beams, Dispersions, Dosimetry, Radiolysis, Uses, Reprints, *Radiochromic films.

The GafChromic radiochromic film is a colorless microcrystalline dispersion of an active monomer in a gel binder. It has been developed for direct radiographic imaging and dosimetry (no chemical, optical, or thermal development). This relatively sensitive sensor may be used as a thin-coating on a transparent or reflecting substrate for broad-range dosimetry (5-10(exp 4) Gy) and for registering permanent, high-resolution, high-contrast blue images. Pulse radiolysis studies show that the primary radiation-initiated image formation (lambda(max) = 675 nm) and propagation of the polymerization are terminated within 2 ms with a first-order rate constant of 900/s. Subsequently, there is a much slower exponential hypsochromic shift of the absorption maximum from 675 nm to 665 nm. The devices are currently finding application in clinical radiography, stereotactic radiosurgery, food irradiation, blood irradiation, insect population control, and industrial radiation processing (including medical sterilization qualification and quality control).

Terminally Anchored Chain Interphases: Their Chromatographic Properties.
Final rept.
J. H. van Zanten. 1994, 11p.
See also PB95-181079.
Pub. in Macromolecules 27, n23 p6797-6807, 7 Nov 94.

Keywords: *Polymers, *Chromatographic analysis, *Interfaces, *Solvents, Dispersions, Molecular structure, Phase studies, Block copolymers, Graft polymerization, Solutes, Thermodynamics, Separation processes, Reprints, *Polymer brushes.

A previously developed Flory-type mean-field analysis of the mixing of a multicomponent, polydisperse solvent with an interphase of terminally anchored chains of finite extensibility is utilized in the determination of the chromatographic properties of the interphase. These interphases could be surface-grafted polymer layers or block copolymers at interfaces. The partitioning and retention of solute molecules in the interphase depend on the chain configurations, the entropy of mixing, and the contact interactions among the species present. The theory allows for the calculation of average or global properties such as the polymer, solvent, and solute volume fractions in the interphase, the interphase thickness, and solute partition coefficients and retention factors. Size exclusion and enhancement, affinity, and gradient chromatography are considered.

Keywords: *Polymers, *Interfaces, *Solvents, *Equilibrium, Qualitative analysis, Thermodynamics, Molecular structure, Numerical analysis, Surface properties, Dispersions, Phase studies, Reprints, *Polymer brushes.

A theoretical description of terminally anchored chain interphases is presented for the case of an interphase in contact with a multicomponent solvent composed of species of varying quality and size. This work is an extension of a model proposed by Lai and Halperin to calculate the global properties of a terminally anchored chain interphase, or polymer brush, in contact with a binary solvent in which each component is of monomeric size. Here it is shown that the solvent size, in addition to the solvent quality and chain surface density, has a profound influence on the equilibrium properties of the terminally anchored chain interphase. The approach outlined here yields a simple calculational procedure for qualitatively examining the various global properties of these interphases which are inherent to each potential application as a function of chain surface density and solvent quality and size.

Keywords: *Density(Mass/volume), Polymers, Neutron scattering, Temperature dependence, Solvents, Reprints, *End grafted polymers, *Neutron reflectivity, *Polymer brush.

Neutron reflectivity measurements are made on a chemically end-grafted polymer brush swollen over a range of temperatures above and below the theta point. Good agreement between the brush profiles and recent self-consistent field calculations and numerical simulations is obtained for temperatures in the vicinity of the theta point and in a good solvent. The expansion of the main body of the brush resembles a swelling gel, while the brush tail expands similarly to a polymer in solution.

The average number of nearest-neighbor (NN) contacts (m) of self-avoiding walks (SAW's) on a hypercubic lattice is calculated using direct enumeration and 1/d expansion methods, where d is the spatial dimension. These calculations are compared with exact analytic determinations for the asymptotic number of random-walk (RW) self-intersections in the limit of long chains n maps to infinity. the number of RW (binary, ternary, etc.) self-intersections is a function of the probability Cd that a RW escapes from the origin to infinity and an accurate tabulation of Cd is given in the dimension range 2 < d < 10.

Nonlinear Dynamics of Stiff Polymers.
Final rept.
R. E. Goldstein, and S. A. Langer. 1995, 4p.
Pub. in Physical Review Letters, v75 n6 p1094-1097 Aug 95.

Keywords: *Polymers, *Curve motion, *Nonlinear dynamics, Models, Formalism, Reprints.

A formalism is presented for the nonlinear dynamics of inextensible stiff polymers within the model of local viscous dissipation. By casting the internal elastic forces in an intrinsic representation enforcing the constraint of local inextensibility through a Lagrange multiplier function and utilizing techniques from the differential geometry of curve motion, the dynamics of configurations of arbitrary complexity is reduced to a scalar partical differential equation amenable to analytical and efficient numerical study. As an example, the formalism is applied to the 'folding' dynamics of stiff polymers with pairwise self-interactions and intrinsic curvature.

Keywords: *Polymers, *Combustion, *Flammability, Combustion products, Reprints, *Condensed phase.

The combustion process of polymers is a complex coupling of energy feedback from a flame to the polymer surface with gasification of the polymer surface with gasification of the polymer to generate combustible degradation products. Although there are extensive studies of the effects of wind velocity, gas phase oxygen concentration, external thermal radiation, and gravity on the combustion of polymers, the effects of polymer characteristics on combustion and flammability are not nearly as well understood as those in the gas phase. At present, detailed governing equations for continuity, momentum, energy, and chemical species concentration in the gas phase can readily be written with appropriate boundary conditions, and their solutions can be derived for various cases. However, even those governing equations cannot be derived for the condensed phase without understanding of the governing chemical and physical processes that control the gasification of polymers. This paper concentrates on describing various observed phenomena in polymers (which have been often ignored or neglected) during their combustion, some or all of which might have significant effects on the burning rate and flammability properties. Because of a lack of understanding of the basic combustion mechanisms of polymers, theoretical models able to predict combustion phenomena and flammability properties are not available.

Pub. in Physical Review E, v52 n3 p3256-3259 Sep 95.

Keywords: *Molecular structure, *Neutron scattering, *Polymer blends, Phase separation, Hydrogen bonding, Reprints, Spinodal decomposition, Fractal dimensions.

Time-resolved small-angle neutron scattering has been used to study the dynamics of phase separation in hydrogen-bonded polymer blends under a variety of shallow-quench conditions. Above a well defined cutoff wave vector qc(star), the structure factor S(q,t) is described by an exponential or a stretched exponential decay. The early-stage growth rate R(q) appears to change sign precipitously at the cutoff, however, which is not consistent with a linear theory. Below the cutoff, S(q,t) exhibits nonlinear growth with a characteristic time scale tm(q), and scales as q(-D)f(t/t sup m) with a scaling exponent D that is often different from the universal value d=3.

Pub. in Macromolecules, p7064-7070 Oct 95.

Keywords: *Virial coefficients, *Polymers, *Thermodynamic properties, Solutions, Polybutadiene, Light scattering, Osmosis, Reprints, *Star ploymers, Dilute solutions, Semidilute solutions, Osmotic modulus.

The osmotic modulus of solutions of polybutadiene stars with f=32, 64, and 128 arms have been measured from the dilute to the semidilute regime in the good solvent cyclohexane by static light scattering. Some complementry results on low molecular weight stars have been obtained using SANS. Values of the dimensionless viral ratio g A3/A2(exp2)M is approximately 0.62 for these many-arm stars accord well with the hard-sphere value (5/8). The concentration dependence of the osmotic modulus near the polymer coil overlap concentration, A2Mc is approximately 1, is characterized by a steep increase. In the semidilute regime the osmotic modulus becomes identical with that of a homogeneous linear polymer solution. A linear polybutadiene sample was also considered for comparison with the star polybutadiene measurements.

Keywords: *Acrylic resins, *Dental materials, *Polymers, Polymerization, Chemical reactions, Viscosity, Molecualr weight, Acrylates, Formaldehyde, Reprints.

An amine-catalyzed reaction between acrylates and formaldehyde has been used to convert monoacrylates to difunctional monomers and di-acrylates to multifunctional oligomers by linking the acrylic double bonds together in 1,6-diene pairs. In this study, a convenient single-step process was used with mixtures of mono- and di-acrylate starting materials to produce a series of resins with potential for effective cyclopolymerization. Incremental changes in the ethyl acrylate (EA) to ethoxylated bisphenol A diacrylate (EBPAD) ratio directly supplied cyclopolymerizable resins with a broad range of viscosities and product distributions. Those resins produced from reaction mixtures rich in EA have low viscosities because of high diluent monomer contents and limited oligomerization of EBPAD due to end-cap formation. Resin viscosity and average molecular weight of the oligometric component of the resin were inversely related to the amount of EA used in the reaction. Through the choice of reactants and their ratio, this simple technique has the potential to provide cyclopolymerzable resins for use in a variety of dental polymer applications.

Light-Scattering Studies on Phase Separation in a Binary Blend with Addition of Diblock Copolymers.
Final rept.
L. Sung, and C. C. Han. 1995, 8p.
Pub. in Jnl. of Polymer Science. Part B: Polymer Physics, v33 p2405-2412 1995.

Keywords: *Polymer blends, *Copolymers, *Phase separation, Critical temperature, Diblock, Kinetics, Light scattering, Reprints, Spinodal decomposition.

Time-resolved light-scattering measurements have been conducted to investigate the influence of a diblock copolymer additive on the phase boundaries and the kinetics of the phase separation of a polymer blend. The blend studied was a polystyrene-d8/polybutadiene (PSD/PB) mixture with a diblock copolymer composed of the same homopolymers. It was observed that the critical temperature of the blend, which has an upper critical solution temperature (UCST), decreased with increasing copolymer content and the kinetics of the phase separation via a spinodal decomposition mechanism slowed down in the presence of the copolymer. The features of the spinodal peak position and intensity as a function of time with and without copolymer additive were analyzed for near and off-critical compositions in various temperature jumps. The intermediate and late-stage growth rates do not follow a universal scaling function with the addition of diblock copolymers.

Shear-Induced Mixing in Polymer Blends.
Final rept.
E. K. Hobbie, A. I. Nakatani, and C. C. Han. 1994, 19p.
Pub. in Modern Physics Letters B, v8 n19 p1143-1161 1994.

Keywords: *Polymers, *Shear flow, Neutron scattering, Critical temperature, Phases, Separation, Molecular weight, Stratified flow, Reprints, Critical polymer blends, SANS(Small angle neutron scattering).

The effect of shear flow on phase separation in critical polymer blends is reviewed. For a low-molecular-weight blend, the response is in good agreement with the theoretical predictions of Onuki and Kawasaki. The break-up of large-scale critical fluctuations by the flow leads to a drop in the temperature Tc at which phase separation begins. For a high-molecular-weight blend, the data suggest that the mode-coupling contribution to the decay rate of composition fluctuations is significant in both the miscible and immiscible phases.

Influence of Shear on the Ordering Temperature of a Triblock Copolymer Melt.
Final rept.
A. I. Nakatani, F. A. Morrison, J. F. Douglas, M. Muthukumar, C. C. Han, J. W. Mays, and C. L. Jackson. 1996, 11p.
Pub. in Jnl. of Chemical Physics, v104 n4 p1589-1599 Jan 96.

Keywords: *Block copolymers, *Melts, *Neutron scattering, Copolymers, Reprints, Temperature, Shear, Polystyrene polybutadiene polystyrene.

The effect of shear on the ordering temperature of a triblock copolymer melt of polystyrene-polybut adient-polystyrene (SBS) is examined by in situ small angle neutron scattering (SANS). Results obtained by SANS arecompared to the rheologically determining order-disorder transition temperature, TRODT == 115 plus or minus C. The SANS measurements from a Couette geometry shear cell are then used to construct a 'dy-

namical phase diagram' based on characteristic changes in the scattering with temperature and shear rate, gamma. A shear rate dependent ordering temperature, T ord(gamma), is identified as the system is sheared isothermally from the disordered state. The scattering behavior is shownto be highly strain dependent. The authors compare their findings on theshear rate dependence of the ordering transition in triblock materials with previous observations on diblock copolymer materials and theoretical expectations for the shear rate dependence of the order-disorder transition temperature. A simple scaling argument leads to a good description of the shear rate dependence of T ord(gamma) in both diblock and triblock copolymer measurements over the range of shearrates examined.

D. L. VanderHart, J. A. Hyatt, R. H. Atalla, and V. C. Tirumalai. 1996, 10p.
Pub. in Macromolecules, v29 p730-739 1996.

Keywords: *Cellulose triacetate, *Oligomers, Crystal structure, Polymorphy, Reprints, *Chain polarity, Raman.

13 C CPMAS NMR and Raman spectra have been taken to oligomers (DP = 2 - 9) and several preparations of cellulose triacetate (CTA). CTA exhibits polymorphism and the NMR spectra of the CTA(I) and CTA(II) allomorphs along with the spectrum of noncrystalline CTA have been isolated. Magnetic inequivalence within the unit cell of CTA(II) is greater than for CTA(I), indicating a lower symmetry in the CTA(II) unit cell. An attempt is made to correlate some of the NMR resonances with proposed X-ray crystal structures for each of these allomorphs. From both the Raman and the NMR spectra of the oligomers, in comparison with the different CTA preparations, it is determined that the pentamer and higher oligomers crystallize into the CTA(I) lattice. On the basis of the Raman spectra, it is argued that CTA(I) and CTA(II) are distinguished by backbone conformational differences. In a single attempt to explore the role of the solvent in determining the crystal habit of the oligomers, the pentamer persisted in the CTA(I) lattice even when crystallization took place in dibenzyl ether, the solvent out of which the CTA polymer forms CTA(II) crystallites. Based on these findings, an approach of obtaining a definitive crystal structure of CTA(I) would be to grow and perform a structural determination on a single crystal of an oligomer of DP greater than 4.

Radiochromic films (GafChromic DM 1260 and MD55), consisting of thin, colorless transparent coatings of a polycrystalline, substituted-diacetylene sensor layer on a clear polyester base, are studied by pulse radiolysis and flash photolysis, in terms of the kinetics of their response to ionizing radiation and ultraviolet light. These films have recently been established for broad applications in radiographic imaging, nuclear medicine, and dosimetry for radiotherapy, blood irradiation, insect population control, food irradiation, and industrial radiation processing. The radiochromic reaction is a solid-state polymerization, whereby the films turn deep blue proportionately to radiation dose, due to progressive 1,4-trans additions as polyconjugations along the ladder-like polymer chains. The pulsed-electron-induced propagation of polymerization has an observed first-order rate constant of the order of 10 to the 3rd power s to the minus 1 power, depending on the irradiation temperature. The UV-induced polymerization is faster by about one order of magnitude. In the case of the electron beam effect, the radiation-induced absorption spectrum exhibits a much slower blue-sift of the primary absorption band on the 10 to the minus 3 power - 10 to the minus 1 power second time scale. This effect is attributed to crystalline strain rearrangements of the stacked polymer strand units.

Thermal Conductivity of Polypyromellitimide Film with Alumina Filler Particles from 4.2 to 300 K.
Final rept.
D. L. Rule, D. R. Smith, and L. L. Sparks. 1996, 8p.
Pub. in Cryogenics, v36 n4 p283-290 1996.

Keywords: *Polymeric films, *Thermal conductivity, *Contact resistance, Alumina, Reprints, *Foreign technology, Polypyromellitimide film, Kapton.

The thermal conductivities of several types of a commercial polyimide (namely polypyromellitimide, PPMI) film were measured over a range of temperatures from 4.2 to 300 K with an unguarded steady state parallel-plate apparatus. Specimens were made by stacking multiple layers of film together. Conductive grease was used between the layers of film to reduce thermal contact resistance. Two specimens were made from two different types of neat film with a thickness of 76 micro m, and three specimens were made from films that contained two different amounts of alumina filler and had thicknesses of 25 or 76 micro m. The conductivity of PPMI film increases with the amount of alumina filler present. The thermal conductivity of specimens made from film of the same type but of different thickness is independent of film thickness, within the limits of experimental uncertainty. The conductivity of a specimen subjected to a simulated curing process by being held at a temperature of 150 degrees C for 90 minutes was indistinguishable from that of a similar, control specimen not subjected to such treatment.

Gas Phase Oxygen Effect on Chain Scission and Monomer Content in Bulk Poly(methyl methacrylate) Degraded by External Thermal Radiation.
Final rept.
J. E. Brown, and T. Kashiwagi. 1996, 10p.
Pub. in Polymer Degradation and Stability, v52 p1-10 1996.

Keywords: *Chain scission, *Polymers, *Thermal degradation, Reprints, Decomposition, Fire research, Gasification, Molecular weight, Chromatography, *Foreign technology, Poly(methyl methacrylate).

The effect of atmospheric oxygen on the thermal decomposition of poly(methyl methacrylate), PMMA, in a slab-like configuration was investigated. Blackbody irradiation of 12 mm thick PMMA slabs on one side was used to simulate the thermal decomposition and gasification of the polymer in a fire environment. Results are reported for chain scission number obtained from molecular weight measurements and for residual monomer content at various levels below the slab surfaces irradiated at 17 and 30k W/sq. m. in atmospheres containint 0, 10, 21 and 41% oxygen in nitrogen. The scission number and polydispersity of surface layers, about 0.1 mm thick, were found to increase linearly with the mole fraction of oxygen in nitrogen. Over this range (0 to 41% O2) the scission number increased from 1.5 to 5.0 and the polydispersity increased from 3.6 yo 11.3 when the PMMA was degraded at the lower flux, while at the higher flux.

Phase Separation in Thin Film Polymer Blends With and Without Block Copolymer Additives.
Final rept.
L. Sung, A. Karim, J. F. Douglas, and C. C. Han. 1996, 2p.
Pub. in Proceedings of the American Chemical Society Division of Polymeric Materials: Science and Engineering, New Orleans, LA., Spring Meeting 1996, v74 p106-107.

Keywords: *Meetings, *Polymer blends, *Thin films, Reprints, *Phase separation kinetics, Symmetric diblock copolymer, Surface pattern formation, Optical microscopy.

Studies of finite size effects on the equilibrium properties and kinetic processes of materials confined to thin films provide important insight into thin film coating applications. Many recent experimental and theoretical investigations have focused on the influence of film thickness on phase stability. Modification of surface interactions near the boundaries of confined materials can lead to essentially new phenomena which should provide the basis for technological applications. Surfactant materials, such as block copolymers, are known to be effective in modifying interfacial properties so that these additives are expected to have a large effect in thin films.

Pub. in Macromolecules, v29 n11 p3918-3924 1996.

Keywords: *Neutron reflectivity, *Polymer interface, Complexation, Ionomer, Diffusion, Reprints.

The interfacial composition and kinetics of interfacial mixing of two polymers that exhibit strong exothermic interactions, poly(N,N'-dimethyle thylenesebacamide) (mPA) and the lithium salt of a lightly sulfonated polystyrene ionomer containing 7.4 mol% sulfonate groups (Li-SPS), were characterized by neutron reflectivity measurements. Blends of Li-SPS and mPA are miscible below ca. 150 degrees C as a result of the formation of an ion-dipole complex between the Li+ sulfonate and amide groups. Neutron reflectivity measurements were carried out on spun-coated bilayer films of the polyamide and a deuterated sample of the ionomer. The films were annealed at 96 degrees C, which is above the melting temperature of the mPA(Tm=75 degrees C) but below the glass transition temperature of the ionomer (Tg=120 degrees C). The interface between the two films exhibited an asymmetric concentration profile due to the large viscosity mismatch between the two polymer, and the interfacial mixing followed neither Fickian nor Case II diffusion. A kinetic model that combined Fickian diffusion with a suppression of mobility due to intermolecular crosslinking adequatelyrepresented the experimental data.

Microstructure Effect on the Phase Behavior of Blends of Deuterated Polybutadiene and Protonated Polyisopene.
Final rept.
R. N. Thudium, and C. C. Han. 1996, 7p.
Pub. in Macromolecules, v29 n6 p2143-2149 1996.

Keywords: *Elastomer blends, *Interaction parameters, *Microstructure effects, Phase behavior, Neutron scattering, Reprints.

Small-angle neutron scattering (SANS) was used to measure the miscibility of blends of protonated polyisoprene (HPI) with 3,4 microstructure in the range of 7-44%, and of deuterated polybutadiene (DPB) with 1,2 microstructure in the range of 9-70%. These data suggest that, for deuterated polybutadiene/protonated polyisoprene blends, overall miscibility is controlled by the 3,4 content of the polyisoprene. This isomeric group is strongly immiscible with the 1,4 -butadiene group and the immiscibility decreases with temperature, while the 3,4 group is weakly miscible with the 1,4 isoprene group and miscibility increases with temperature. Conversely, the 3,4 group is strongly miscible with the 1,2 butadiene group and miscibility decreases with increasing temperature. The differing trends of the interaction parameter with temperature suggest that shifts in the LCST phase diagram can be controlled by judicious changes in microstructure. These theoretical predications were confirmed with experimental small-angle light scattering (SALS) results on all protonated blends. The statistical segment length, b, appears to be independent of temperature, but is dependent on total vinyl level. For the blends used in the study, b has a minimum value at approximately 30-35% total vinyl isomeric groups.

Morphology and Phase Separation Kinetics of a Compatibilized Blend.
Final rept.
C. L. Jackson, L. Sung, and C. C. Han. 1996, 4p.
Pub. in Society of Plastics Engineers Annual Technical Meeting, Indianapolis, IN., May 5-9, 1996, p1599-1602.

Keywords: *Polymer blends, *Block copolymers, *Microscopy, Light scattering, Reprints.

The phase diagram for a low molecular weight blend of deuterated polystyrene (PSD, M(W) = 1000 g/mol) and polybutadiene (PB, M = 5100 g/mol) was determined by light scattering measurements. The critical temperature of the blend was 51 degrees C and the critical composition was approximately 0.75 g/g polysytrene (75% PSD by weight). Upon addition of the PSD-PB diblock copolymer (total M(W) = 10,600 g/mol) linearly to a lower temperature and the rate of phase separation was greatly retarded. The size scale of the phase separated microstructure was also greatly reduced as block copolymer was added, indicating compatibilization of the blend.

Keywords: *Fire safety, *Elevators(Lifts), *Evacuation, *Airport towers, *Human factors, Fire protection, Emergencies, Escape systems, Fires, Human factors engineering, Air traffic control.

The Federal Aviation Administration (FAA) is interested in the possibility of using elevators for evacuation of air traffic control towers during fire emergencies. Assuming that the FAA could design, install, and maintain elevators that could safely be used by tower occupants during fire evacuations, it would be important to study a number of human factor considerations. This report, which is partly based on interviews of occupants in thirteen FAA towers, discusses these issues. Given the fact that there has been a 20-year campaign to discourage elevator use during fire emergencies, most interviewees indicated a willingness to use such elevators as a backup mode of escape with some reluctance. The controls in the elevator would not need any major modification but a special communication system would be needed. Fire emergency plans and training are important to assure proper use of the proposed system and confidence in the safety it provides.

Application of Electromagnetic-Acoustic Transducers for Nondestructive Evaluation of Stresses in Steel Bridge Structures.
Final rept.
M. G. Lozev, A. V. Clark, and P. A. Fuchs. cApr 96, 43p, VTRC-96-R30.
Prepared in cooperation with National Inst. of Standards and Technology, Boulder, CO. and West Virginia Univ., Morgantown. Constructed Facilities Center. Sponsored by Virginia Dept. of Transportation, Richmond.

Keywords: *Bridges(Structures), *Nondestructive tests, Bridge foundations, Steel structures, Transducers, Electromagnetic testing, Virginia, Ultrasonic tests, Dynamic loads.

The report presents the results of a study to (1) assess the applicability of electromagnetic-acoustic transducers for nondestructive evaluation of stresses in bridge structures and (2) evaluate the new ultrasonic instruments as an effective technique for stress surveys in bridge structures. Field tests were performed on two bridges, one a simply supported design and the other an integral backwall bridge. Residual stress measurements were made on a vertical scanline in the web at midspan of a simply-supported bridge. Live load measurements were made by determining the normalized change in arrival times of surface waves propagating between two tranducers mounted on the bottom flange. Good agreement between strain gage and ultrasonic data was obtained, both for the time-history of strain and also for the equivalent stress range.

Keywords: *Marshall method, *Hot mix paving mixtures, *Flexible pavements, Test methods, Bituminous concretes, Road materials, Specifications, Asphalts, Calibration, Compacting.

The Marshall method is used by many state and local highway agencies for the design of hot-mix asphalt pavement. Although the procedure is specified by several industry standards, round-robin programs have confirmed wide variability in Marshall test results. Much of the scatter in the data is attributed to compaction hammer variables, such as: variation in drop weight, drop height, friction, hammer alignment, pedestal support and foundation. With the objective of reducing the variability of Marshall test results, a robust, easy to use and relatively inexpensive test apparatus, described in the report, has been developed for calibration of mechanical Marshall compaction hammers.

Digitized Simulation of Mercury Intrusion Porosimetry.
Final rept.
E. Garboczi, and D. Bentz. 1990, 16p.
Pub. in Proceedings of a Conference on Advances In Cementitious Materials, Gaithersburg, MD., July 22-26, 1990, p365-380.

Keywords: *Cements, *Porous materials, *Microstructure, *Computerized simulation,

Porosimeters, Mercury, Pore structure, Permeability, Porosity, Percolation, Reprints, *Mercury intrusion porosimetry.

Mercury intrusion porosimetry is a widely used method for measuring the pore-size distribution of porous materials. The paper describes an algorithm that has been developed that simulates mercury intrusion into a two-dimensional porous material. The simulation can be implemented on model structures or on micrographs of real porous materials. Using a burning algorithm, the critical pore diameter for mercury connectivity can be directly computed and studied as a function of microstructure. The point at which the intruding mercury becomes continuous is found to occur at the inflection point of the cumulative intrusion curve, in agreement with recent experimental results.

Serial Sectioning of Hardened Cement Paste for Scanning Electron Microscopy.
Final rept.
P. E. Stutzman. 1990, 13p.
Pub. in Proceedings of Conference on Advances in Cementitious Materials, Gaithersburg, MD., July 22-26, 1990, p237-249 1991.

Keywords: *Cements, Scanning electron microscopy, Sequential sampling, Surface preparation, Microstructure, Polishing, Procedures, Indentation hardness tests, Reprints, *Cement pastes, *Serial sectioning.

Serial sectioning is a technique of making and examining thin sections of material to obtain information on three-dimensional structures from a series of two-dimensional images. Procedures were developed to make serial sections of hardened cement paste by the removal of thin layers by polishing. Backscattered electron imaging of the remaining paste block was used to record the paste microstructure after each section was removed. Procedures developed cover the polishing practice, the removal of thin layers by polishing, the estimation of layer thickness, and the location and alignment of specific regions for imaging.

A large database of Portland Cement and Portland Cement Concrete interlaboratory test results has been generated at the Cement and Concrete Reference Laboratory (CCRL) since 1965. The database represents a rich resource inasmuch as the cements tested were produced by many different production facilities, from raw materials obtained from different geological areas, and over a long period of time. Participation varies from 120 to over 200 laboratories, located throughout the United States and in several other countries. Computer and statistical techniques are used to present the data from the first 72 samples in graphical forms to better understand cement and cement testing. Data for each of 10 physical test properties and 11 chemical 'compounds' of Portland cement are represented graphically through use of box plots. For each property and compound, the box plots of data from multiple samples are plotted sequentially as distributed by CCRL and also sorted on median values. In several instances, box plots for one test property are ordered by the median values of another property to analyze possible relationships. Also, the characteristics of each of 72 cements are profiled (graphically) in relation to the population of results of other cements.

Digitized Direct Simulation Model of the Microstructural Development of Cement Paste.
Final rept.
D. P. Bentz, and E. J. Garboczi. 1990, 8p.
Pub. in Mater. Res. Soc. Symp. Proc. Phys. Phenom. Granular Mater., v195 p523-530 1990. Sponsored by Northwestern Univ., Evanston, IL. Center for Advanced Cement-Based Materials.

Keywords: *Cements, *Curing, *Computerized simulation, *Hydration, Diffusivity, Algorithms, Percolation, Transport properties, Microstructure, Models, Reprints.

The complex microstructure of hardened cement paste is produced by hydration reactions between cement particles and the water in which they are suspended. In recent years, algorithms like the diffusion-limited aggregation (DLA) and Eden models have demonstrated that simple growth rules can result in complex aggregated structures. The model described in the paper simulates, via simplified growth rules, the microstructural development of hydrating cement paste. The model has simularities to DLA, but with the additional novel features of dissolution of solid particles, and a free-space nucleation probability. The percolation aspects and transport properties of the model's pore space are computed and discussed.

Digitized Simulation Model for Microstructural Development.
Final rept.
D. P. Bentz, and E. J. Garboczi. 1991, 16p.
Pub. in Ceram. Trans. Adv. Cem. Mater., v16 p211-226 1991.

Keywords: *Cements, *Curing, *Computerized simulation, *Hydration, Diffusivity, Algorithms, Porosity, Transport properties, Microstructure, Models, Reprints.

Characterization of the microstructure of hydrating cement is difficult due to its complexity. Models of the hydration process provide one means of characterization as they attempt to duplicate features of real microstructures. This paper presents a simple model for hydration consisting of random dissolution, diffusion, nucleation, and surface reaction. The model has been developed in a digitized format. Space is represented as an array of pixels, each of which is classified as a given material: reactant, dissolved species, hydrate, or pore. Having the model in digitized format allows for the visualization of the hydration as it occurs and for rapid subsequent quantification of the resultant microstructure. In addition, real images or cement particles can be digitized and used as the starting material for model execution. Algorithms for, and results of, the model are presented.

Modelling the Leaching of Calcium Hydroxide from Cement Paste: Effects on Pore Space Percolation and Diffusivity.
Final rept.
D. P. Bentz, and E. J. Garboczi. 1992, 11p.
Pub. in Materials and Structures 25, p523-533 1992. Sponsored by National Science Foundation, Arlington, VA.

Keywords: *Cements, *Leaching, *Hydration, *Models, Porosity, Percolation, Microstructure, Diffusivity, Calcium hydrides, Durability, Reprints.

As concrete is exposed to the elements, its underlying microstructure can be attacked by a variety of aggressive agents. For example, rainwater and groundwater can degrade the concrete by dissolving soluble constituents such as calcium hydroxide. Using computer simulation, the paper examines the effects of calcium hydroxide dissolution on two material properties: the percolation properties or connectivity of the capillary pore space, and the relative ionic diffusivity. A microstructural model for cement paste is used to produce a hydrated specimen which is subsequently subjected to the leaching process. Pore space percolation characteristics and relative ionic diffusivity are computed throughout the leaching process as a function of total capillary porosity. Material variables examined are water:solids ratio and silica fume content. Percolation theory is used to develop the concept of a critical volume fraction of calcium hydroxide plus capillary pore space. It is shown that this critical combined volume fraction determines the magnitude of the effect of leaching on relative ionic diffusivity.

Maturity Method.
Final rept.
N. J. Carino. 1991, 46p.
Pub. in CRC Handbook on Nondestructive Testing of Concrete, Chapter 5, p101-146 1991.

Keywords: *Concretes, *Curing, *Compressive strength, Temperature effects, Mechanical properties, Activation energy, Arrhenius equation, Standards, Aging(Materials), Concrete durability, Reprints, *Maturity method, ASTM standards.

The chapter reviews the history and technical basis of the maturity method, a technique for estimating the strength gain of concrete based upon the measured temperature history during curing. The combined effects of time and temperature on strength gain are quantified by means of a maturity function. The widely used maturity functions are reviewed critically. It is shown that the traditional maturity function is inadequate compared with the function based upon the Arrhenius equation. The concept of equivalent age, which is the most convenient measure of maturity, is explained. The strength gain of a specific concrete mixture is estimated using the measured maturity and the strength vs. maturity relationship for that mixture. Various proposed strength-maturity relationships are reviewed. It is also explained why the maturity method can only be used reliably to estimate relative strength. Examples are presented to illustrate how this technique can be used in combination with other in-place tests of concrete strength. The ASTM standard dealing with the method is also summarized.

Maturity Functions for Concrete Made with Various Cements and Admixtures.
Final rept.
N. J. Carino, and R. C. Tank. 1991, 15p.
Pub. in Proceedings of International Workshop on Testing during Concrete Construction (RILEM), Mainz, Germany, March 5-7, 1990, p192-206 1991.

Keywords: *Concretes, *Curing, *Compressive strength, Temperature effects, Mechanical properties, Arrhenius equation, Aging(Materials), Cements, Models, Concrete durability, Reprints, *Maturity functions.

A model is proposed for estimating relative strength gain of concrete under isothermal curing conditions. The key feature of the model is the relationship between curing temperature and the rate constant for relative strength development. The strength gain of seven concrete and mortar mixtures under three curing temperatures was studied. It was found that a simple exponential function may be used to describe the observed variations of the rate constant with curing temperature. It is shown that the relative strength development of concrete can be estimated from its temperature history using parameters determined experimentally from tests of isothermally-cured mortar specimens.

Interaction between Naphthalene Sulfonate and Silica Fume in Portland Cement Pastes.
Final rept.
S. Diamond, and L. Struble. 1988, 10p.
Contract AFOSR-155A86-0057
Pub. in Materials Research Society Symposia Proceedings, v114 p117-126 1988. Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Keywords: *Portland cement, *Admixtures, *Curing, Hardening(Materials), Concentration(Composition), Superplasticity, Compressive strength, Reprints, Silica fume, Naphthalene sulfonate, Superplasticizers.

Portland cement pastes were mixed with predissolved naphthalene sulfonate superplasticizer at normal water:cement ratios. Solutions were separated from the fresh pastes at intervals and the residual concentration of the superplasticizer determined by UV spectrophotometry. At low dosage levels essentially all of the superplasticizer was found to be removed from solution within a few minutes; at high dosage levels a substantial concentration was maintained in solution at least to approximately the time of set. In pastes in which silica fume replaced 10% by weight of the cement, it was found that the incorporation of silica fume significantly increased the uptake of superplasticizer. In separate trials it was found that the silica fume by itself absorbed little superplasticizer, even from high pH solution simulating that of cement paste.

The report discusses the expert system HWYCON (Highway Concrete). HWYCON is designed to assist state highway departments in three areas: (1) diagnosing distresses in highway pavements and structures; (2) selecting materials for construction and reconstruction; and (3) obtaining recommendations on materials and procedures for repair and rehabilitation methods. HWYCON is an operational system and will be distributed to state DOT's through SHRP. This document is intended to provide a reference for users of the system who need information that is not covered in the overview and installation document provided with the system.

Quantitative X-Ray Powder Diffraction Methods for Clinker and Cement.
P. E. Stutzman. May 94, 26p, NISTIR-5403.
See also PB92-183664.

Keywords: *Portland cements, *Clinker, X-ray diffraction, Quantitative analysis, Particle size distribution, Chemical composition, Construction materials, *Reference materials, Phase abundance, Sample preparation.

Performance of concrete is influenced by the portland cement phase composition. Phase abundance determination has traditionally been accomplished using two different methods; optical microscopy, and a Bogue calculation based on a chemical analysis. X-ray powder diffraction is a direct, bulk analytical method for phase analysis of fine-grained materials including clinker and cements. Each phase produces a unique diffraction independently of the others with each pattern intensity being proportional to phase concentration. Difficulties in X-ray powder diffraction analysis include correction for sample absorption, selection of reference standards, and determination of individual pattern intensity. These problems are minimized by use of an internal standard, profile fitting, and careful reference standard selection.

Diagnosis of Causes of Concrete Deterioration in the MLP-7A Parking Garage.
P. E. Stutzman, and J. R. Clifton. Jun 94, 26p, NISTIR-5492.

Keywords: *Parking garages, *Concrete durability, *Deterioration, Alkali aggregate reactions, Cracking(Fracturing), Efflorescence, Petrography, Water repellants.

Parking garage MLP-7A at the National Institutes of Health (NIH) is a four-level, cast-in-place concrete structure, approximately seventeen years of age which is exhibiting expansion and cracking of the parapet walls. An accelerated expansion test of aggregate extracted from the structure indicates that the aggregate is reactive and that there is a potential for further expansion. The performance of water repellant treatments were evaluated in field studies on the garage structure. Each repellant treatment reduced water infiltration relative to an untreated test region however, some treatments performed better in regions with visible, fine surface cracks.

NIST Handbook 150-5 presents the technical requirements of the National Voluntary Laboratory Accreditation Program (NVLAP) for the Construction Materials Testing program. It is intended for information and use by staff of accredited laboratories, those laboratories seeking accreditation, other laboratory accreditation systems, users of laboratory services, and others needing information on the requirements for accreditation under the Construction Materials Testing program. This publication supplements NIST Handbook 150 (PB94-178225), NVLAP Procedures and General Requirements, which contains Part 285 of Title 15 of the U.S. Code of Federal Regulations (CFR) plus all general NVLAP procedures, criteria, and policies. Handbook 150-5 contains information that is specific to the Construction Materials Testing program and does not duplicate information contained in the Procedures and General Requirements. It is organized to cross-reference with Handbook 150.

Cellular Automaton Simulations of Cement Hydration and Microstructure Development.
Final rept.
D. P. Bentz, P. V. Coveney, E. J. Garboczi, M. F. Kleyn, and P. E. Stutzman. 1994, 26p.
Sponsored by Northwestern Univ., Evanston, IL.
Pub. in Modelling and Simulation in Materials Science and Engineering 2, p783-808 1994.

Keywords: *Hydration, *Cement, *Microstructure, *Simulation, Models, Slurries, Percolation, Image analysis, Algorithms, Reprints.

Cellular automation algorithms, which operate on a starting digital image of a water-cement suspension, are described. The algorithms simulate the microstructure development process due to hydration reactions that occur between cement and water. This paper describes the evolution of the cement model from a simple model, which treated the cement particles as a single-phase materials, with a greatly simplified hydration chemistry, into a model which has many more chemical species and includes numerous reactions which eventually convert the viscous water-cement suspension into a rigid porous solid. Methods are presented for generating two- and three-dimensional images representing suspension initial conditions; these are derived from both micrographs of real cements and computer-based algorithms. A convenient measure of the point at which the initial paste turns into a solid material is the percolation threshold of the solids. Consideration of these models has already led to the prediction and subsequent experimental observation of a sharply defined onset of shear wave propagation, from ultrasonic measurements through hydrating cement slurries. The amount of hydration needed to reach the percolation threshold can be determined in the present simulations, and our results are compared with time of shear wave onset in actual cement slurries.

Evolution of Porosity and Calcium Hydroxide in Laboratory Concretes Containing Silica Fume.
Final rept.
D. P. Bentz, and P. E. Stutzman. 1994, 7p.
Pub. in Cement and Concrete Research 24, n6 p1044-1050 1994.

Keywords: *Durability, *Concrete, *Calcium hydroxides, Image analysis, Scanning electron microscopy, Interfaces, Microstructure, Hydration, Construction materials, Aggregates, Reprints, *Silica fume.

Laboratory concretes containing only coarse aggregates and 0, 10, or 20% silica fume as a cement replacement were prepared at a constant water-to-solids ratio and sampled at 1, 7, and 28 days. Scanning electron microscopy was utilized to monitor the progress of the hydration reactions both in the bulk paste and in regions near an aggregate surface. Phase volume fractions were determined by quantitative image analysis of the backscattered electron images. In addition, the size of 'individual' two-dimensional cross sections of calcium hydroxide crystals and capillary pores were assessed. Silica fume additions are seen to affect both the amount and size of these microstructural features. Differences are observed between interfacial zone and bulk areas which support previous mercury intrusion measurements of mortar specimens. This analysis lends support to the hypothesis that when silica fume is present, calcium hydroxide crystals form and then dissolve away, contributing to a connected pathway of capillary porosity in the interfacial zone regions.

Field Evaluation of the System for Calibration of the Marshall Compaction Hammer.
H. W. Shenton, and M. M. Cassidy. Feb 95, 80p, NISTIR-5553, FHWA/RD-95/063.
Prepared in cooperation with American Association of State Highway and Transportation Officials, Gaithersburg, MD. Materials Reference Lab. Sponsored by Federal Highway Administration, Washington, DC.

Keywords: *Calibrating, *Compactors, *Hot mix paving mixtures, Bituminous materials, Asphalts, Road materials, Test methods, Highway construction, Mechanical properties, *Marshall compaction hammer.

A system for calibrating the Marshall compaction hammer has recently been developed at the National Institute of Standards and Technology, in collaboration with the American Association of State Highway Transportation Officials (AASHTO), Materials Reference Laboratory (AMRL). The calibration system consists of a spring-mass device with an integral force transducer and a high-speed data acquisition system. The proposed calibration procedure is based on adjusting the number of hammer blows delivered to a specimen, such that a standard compactive effort is supplied during the compaction process, regardless of slight variations in the Marshall hammer. In an earlier laboratory evaluation program, the calibration system and procedure proved to be effective in reducing the variability of Marshall test results. Presented in the report is a summary of a field evaluation program of the calibration system and procedure. In this study, Marshall specimens were prepared in bituminous laboratories using production Marshall hammers: twelve laboratories, or field sites, participated in the study. Sixteen Marshall specimens were prepared at each site.

Prediction of Potential Concrete Strength at Later Ages.
Final rept.
N. J. Carino. 1994, 13p.
Pub. in Significance of Tests and Properties of Concrete and Concrete-Making Materials, ASTM STP 169C, Chapter 15, p140-152 1994.

Keywords: *Concrete, *Reinforced concrete, *Compressive strength, Reprints, Strength(Mechanics), Construction materials, Failure(Mechanics), Curing, Standards.

This chapter deals with methods for estimating the potential, later-age strength of a concrete mixture based upon the compressive strength measured on cylindrical specimens at early ages. The results of the cooperative research program leading to the development of ASTM Test Method for Making, Accelerated Curing, and Testing Concrete Compression Test Specimens (C 684) are reviewed. This review is based on Chapter 13 of ASTM STP 169B, which was written by M.H. Wills, Jr., and was titled 'Accelerated Strength Tests.' The earlier text has been augmented by the addition of information on the high-temperature and pressure accelerated test method that was added to ASTM C 684 in 1989. In addition, the chapter has been expanded by including the basis of ASTM Test Method for Developing Early-Age Compression Test Values and Projecting Later-Age Strengths (C 918).

Recent Development in Nondestructive Testing of Concrete.
Final rept.
N. J. Carino. 1992; 57p.
Pub. in Advances in Concrete Technology, International Symposium on Advances in Concrete Technology, Athens, Greece, May 11-13, 1992, p281-337.

Keywords: *Concrete, *Nondestructive testing, Flaw detection, Impulse response, Reprints, Break-off test, Impact-echo, Torgue test.

Advances in nondestructive testing of concrete are summarized. Test methods are classified into those used to assess in-place strength and those used to locate hidden defects. In the first category, recent developments are presented on the pullout test, the break-off test, the torque test, a review is presented of infrared thermography, ground penetrating radar, and several methods based upon stress wave propagation. The principles of the methods, their advantages and their inherent limitations are discussed. Where appropriate, requirements of relevant ASTM standards are discussed. Future directions for research in the area of nondestructive testing of concrete are presented.

Interfacial Transport in Porous Media: Application to dc Electrical Conductivity of Mortars.
Final rept.
L. M. Schwartz, E. J. Garboczi, and D. P. Bentz. 1995, 11p.
Pub. in Jnl. of Applied Physics, v78 n10 p5898-5908 Nov 95.

Keywords: *Electrical resistivity, *Direct current, *Mortars(Materials), Concretes, Transport properties, Percolation, Durability, Construction materials, Reprints.

A mortar is a composite of inert sand grains surrounded by a porous cement paste matrix. We investigate the electrical conductivity of model mortars that include enhanced electrical conduction in the matrix-sand grain interfacial region. The electrical conductivity is evaluated by a combination of finite element, finite difference, and random walk methods for periodic and disorderd models of motar. Since the effective conductivity within the interfacial zone is often much higher than the bulk matrix conductivity, the qualitative features of transport in these systems is often controlled by the connectivity if the interfacial zone. Special attention is thus given to the geometrical percolation of this zone.

Guide to a Format for Data on Chemical Admixtures in a Materials Property Database.
C. F. Ferraris. Apr 96, 31p, NISTIR-5796.

Keywords: *Admixtures, *Properties, *Data bases, *Format, Concretes, Construction materials, Standards, NIST(National Institute of Standards and Technology).

This guide is the second in a series of related documents that present recommended formats for use in computerization of concrete materials property data. It addresses the problem of distinguishing one chemical admixture from another by providing a logical scheme for systematically organizing and subdividing material characteristics and parameter to create a unique chemical admixture material identifier. The organization and structure presented in this guide provide a framework for cross-referencing chemical admixture properties, data, and other information which is consistent with reporting recommendations contained in the other ACI Committee 126 guides. ACI Committee 126 guides are consistent with the principles laid down in the standard guides that have been prepared by ASTM Committee E-49. This guide is intended for use by those responsible for entering data into a concrete materials property database or preparing tables of concrete properties and information for use by others.

Guide to a Format for Data on Chemical Admixtures in a Materials Property Database. (Reannouncement with new abstract).
C. F. Ferraris. Apr 96, 31p, NISTIR-5796.
Supersedes PB96-165394. Reannouncement with new abstract.

Keywords: *Admixtures, *Properties, *Data bases, *Format, Concretes, Construction materials, Standards, NIST(National Institute of Standards and Technology).

The formats for data on chemical admixtures that are described in the report are intended to aid the creation of a coherent system of concrete materials property databases. The preliminary document is a guide that presents a recommended format for use in computerization of concrete materials property data. It addresses the problem of distinguishing one chemical admixture from another by providing a logical scheme for organizing and subdividing material characteristics and parameters to create a unique chemical admixture material identifier. The organization and structure presented in the guide provide a framework for cross-referencing chemical admixture properties, data, and other information which is consistent with the principles laid down in the standard guides that have been prepared by ASTM Committee E-49 and which are due to be adopted by American Concrete Institute (ACI) Committee 126. The preliminary working document is intended to assist the work of ACI committee 126 by providing a draft for use by committee members and others who may wish to offer suggestions for its development. The preliminary document will be superseded by an official ACI document in the series on concrete materials property database formats that is being prepared by ACI 126.

Development of a Method for Measuring Water-Stripping Resistance of Asphalt/Siliceous Aggregate Mixtures.
T. Nguyen, E. Byrd, D. Bentz, and J. Seiler. Jul 96, 152p, NISTIR-5865.
See also PB96-197249. Sponsored by National Research Council, Washington, DC. Transport Research Board.

Keywords: *Asphalt pavements, *Water effects, *Nondestructive tests, Bonding, Aggregates, Spectroscopic analysis, Interfacial tension, Test methods.

The main objective of this study was to develop a sensitive, spectroscopic technique to nondestructively evaluate the water stripping resistance at the molecular level of an asphalt on a siliceous aggregate. This study consisted of three phases. Phase 1 involved the

development of a nondestructive, spectroscopic technique to measure the amount and thickness of the water layer at the interface between an asphalt and a siliceous aggregate. Phase 2 was to develop a technique to measure the adhesion loss of the asphalt/aggregate mixture exposed to water. And Phase 3 aimed to relate the quantity of the interfacial water layer obtained in Phase 1 with the adhesion loss data generated in Phase 2.

Shear Design of High-Strength Concrete Beams: A Review of the State-of-the-Art.
D. Duthinh, and N. J. Carino. Aug 96, 205p, NISTIR-5870.

Keywords: *Concrete structures, *Beams(Supports), Reinforced concrete, Shear strength, State of the art.

This state-of-the-art review of the shear design of high-strength concrete beams consists of four parts. In the first part, various analysis methods are presented: (1) The plastic solution assumes that both steel reinforcement and concrete, modeled as a modified Mohr-Coulomb material, are at yield. Under shear loading, the concrete web develops an inclined compression field which satisfies both upper and lower bound theorems. A plastic solution of shear friction is also discussed. (2) Both the compression field theory and the modified compression field theory (MCFT) are exact theories in the sense that they satisfy equilibrium, compatibility of displacements and stress-strain relationships. The MCFT accounts for the contribution of the tensile strength of concrete to shear resistance. (3) Other exact solutions are also discussed, that do not assume that the principal stress and principal strain directions are aligned with the shear cracks in the web. (4) The 45 deg truss, the variable angle truss (VAT) and strut-and-tie models (STM) belong to a class of solutions that only satisfy equilibrium.

Draft Guidelines for Pre-Qualification and Prototype Testing of Seismic Isolation Systems.
H. W. Shenton. Mar 94, 104p, NISTIR-5359.

Keywords: *Vibration isolators, *Bridges(Structures), *Prototypes, *Test methods, *Earthquake resistant structures, Building codes, Displacement, Structural vibration, Dynamic structural analysis, Earthquake engineering, Dynamic response, Standards, Stiffness, Vibration damping, Loads(Forces), Test facilities.

At the present time, at least in the United States, seismic isolation systems are custom designed and built on a per project basis. As a result, testing has become an essential element in the design and construction of isolated structures. Prototype and quality control tests are required by the 1991 Uniform Building Code and the American Association of State Highway and Transportation Officials, 1991 Guide Specifications for Seismic Isolation Design. Currently, however, standards do not exist for conducting these tests. The Building and Fire Research Laboratory of the National Institute of Standards and Technology has developed draft guidelines for testing and evaluation of seismic isolation systems. Presented in the report are guidelines for conducting pre-qualification and prototype tests. Pre-qualification tests are currently not required by the codes but are generally conducted during development of a new system and are aimed at evaluating fundamental properties and characteristics of the isolation system. The guidelines include general requirements of the test facility, instrumentation, calibration, data acquisition, data analysis and reporting of result. A total of twenty three tests are included in the guidelines. Performance criteria have been established for all tests, systems that do not meet or exceed these criteria may not function adequately in service. The guidelines are to serve as a resource document for voluntary standard/specification writing organizations, and for practitioners and researchers involved in the design, manufacture and testing of seismic isolation systems.

Draft Guidelines for Quality Control Testing of Sliding Seismic Isolation Systems.
H. W. Shenton. Mar 94, 36p, NISTIR-5371.

Keywords: *Vibration isolators, *Bridges(Structures), *Quality control, *Test methods, *Earthquake resistant structures, Standards, Earthquake engineering, Displacement, Building codes, Vibration damping, Energy dissipation, Structural vibration, Dynamic response, Dynamic structural analysis.

Seismic isolation systems designed according to the 1991 Uniform Building Code, or the 1991 AASHTO Guide Specification for Seismic Isolation Design are required to undergo a series of prototype and quality control tests before being installed in the structure. At the present time, however, standards do not exist for conducting these tests, consequently, results are subject to unknown variability. The document represents the initiation of the process to develop standards for quality control testing of seismic isolation systems built in the U.S. The guidelines are devoted specifically to quality control testing of sliding systems (another report is devoted to quality control testing of elastomeric isolation systems). The guidelines address component part and material tests to be conducted during production, and tests on completed isolation units or components. Production tests are outlined in broad terms for a generic pure sliding device. Two completed isolation unit tests are outlined: sustained compression, and effective stiffness and energy dissipation. Complete details of the test set-up, test procedure, data acquisition, analysis and reporting of results are given in the guidelines. Performance criteria are established for all tests; systems that do not meet these criteria may not perform satisfactorily in service and should be set aside for disposition by the engineer of record.

Keywords: *Concrete pavements, *Portland cements, *Bridge maintenance, Pavement damage, Permeability, Temperature effects, Density, Pavement overlays, Highway maintenance, Compressive strength, Aggregates, Mechanical properties, Admixtures.

The report provides (1) state-of-the-art information on new developments in portland cement concrete materials and applications to users in the highway agencies, especially young engineers just beginning their careers in the field; and (2) new materials and testing methodologies for a variety of important highway and bridge rehabilitation applications. The report includes a condensation of the state-of-the-art synthesis of concrete highway technology prepared as part of this research project. Descriptions of evaluations of test methods for in-place concrete density with the use of nuclear methods and determination of water content of fresh concrete using microwave drying are also incorporated in the report. The report gives summaries of guidelines for avoiding thermal effects in concrete pavement slab placements and packing-based aggregate proportioning for concrete mixtures. The report contains a detailed description of field evaluations of a variety of concrete mixes used for early opening of full depth concrete pavement repairs and bridge deck overlays. Opening times ranged from 2 to 24 hours. Brief descriptions of the methodology and content of the HWYCON expert system, available from SHRP, are also included. Finally, a description of the contents of audiovisual implementation packages for highway personnel dealing with materials testing and pavement and bridge rehabilitation is included. Keywords: *Binders, *Nuclear magnetic resonance, *Magnetic spectroscopy, *Bituminous concretes, *Highways, Asphalt, Molecular diffusion, Chemical properties, Molecular structure, Aggregates, Road materials.

Nuclear magnetic resonance (NMR) spectroscopy was used in solution-state and solid-state experiments on eight asphalt cements. Using a variety of chemical and solution-state NMR spectroscopic techniques, data were obtained about the amounts of aromatic carbon in an average molecule of the asphalt sample, how that carbon is arranged in terms of the size of the average aromatic system and the extent of substitution. The arrangement of the aliphatic portion has also been described in terms of the average number of alicyclic rings, of aliphatic chain length and extent of branching. Concentrations of carboxylic acids and phenols were measured both before and after laboratory oxidative aging. All these data show both surprising similarities and significant differences among the asphalts studied. By using solid-state NMR spectroscopic techniques, the structure of asphaltic cements was probed on a small-distance scale of a few angstroms to 30 micrometers. Differences in molecular mobility were found among the asphalts studied. Changes in molecular mobility after laboratory oxidative aging were found to be small. The implications of these data with regard to the micellar model of asphalt are discussed. The research results' potential impact on understanding asphalt cement properties is explored. Evaluating the Seismic Performance of Lightly-Reinforced Circular Concrete Bridge Columns.
Final rept.
A. W. Taylor, and W. C. Stone. 1993, 10p.
Sponsored by Federal Highway Administration, McLean, VA. Office of Research, Development, and Technology.
Pub. in Proceedings of National Earthquake Conference, Memphis, TN., May 2-5, 1993, p543-552.

Keywords: *Failure modes, *Concrete structures, *Bridges(Structures), *Columns(Supports), *Earthquake damage, *Cyclic loads, Dynamic response, Earthquake engineering, Reinforced concrete, Loads(Forces), Displacement, Hysteresis, Bridge design, Structural analysis, Earthquake engineering, Structural failure, Reprints, *Spirally-reinforced bridge columns, *Hysteretic failure model.

The ability to analytically predict the inelastic dynamic behavior of reinforced concrete bridge structures during earthquakes is dependent on the availability of appropriate hysteretic failure models. To date, several such models have been implemented in research computer codes. However, little information is available concerning the selection of appropriate parameters for the solution of specific types of reinforced concrete structures. As part of an effort to develop an integrated seismic design procedure (ISDP) for reinforced concrete bridge piers, the National Institute of Standards and Technology (NIST) is conducting extensive studies of hysteretic failure models and laboratory data from tests of bridge columns subjected to cyclic lateral loading. A digital database of load-displacement histories has been established for circular, spirally-reinforced bridge columns. A system identification analysis was performed to determine optimal values of three hysteretic failure model parameters for each test specimen. Subsequent regression analyses were conducted to develop equations correlating the hysteretic failure model parameters to the material and geometric properties of the specimens.

Jacket Thickness Requirements for Seismic Retrofitting of Circular Bridge Columns.
Final rept.
A. W. Taylor, and W. C. Stone. 1993, 10p.
Pub. in Proceedings of Symposium on Practical Solutions for Bridge Strengthening and Rehabilitation, Des Moines, IA., April 5-6, 1993, p249-258.

Keywords: *Earthquake resistant structures, *Bridges(Structures), *Reinforcement(Structures), *Thickness, Bridge design, Design criteria, Reinforcing materials, Reinforced concrete, Earthquake engineering, Hysteresis, Failure modes, Earthquake damage, Structural failure, Columns(Supports), Reprints, *Steel jacketing, *Circular bridge columns, *Seismic retrofitting, Cumulative damage model.

Steel jacketing is a common seismic retrofit strategy for circular, spirally-reinforced concrete bridge piers. Although jacketing is recognized as an effective and relatively inexpensive method for improving column ductility, little guidance is available for determining the required thickness of the jacket. In this study jacket thickness requirements were investigated using a time-step inelastic analysis algorithm which incorporates a hysteretic failure rule and a cumulative damage model. A variety of column designs were subjected to a range of real earthquake acceleration histories, and the resulting damage levels, or damage indices were calculated. These same columns were then re-analyzed with steel jackets of varying thicknesses. It was determined that a relatively thin steel jacket--on the order of a few millimeters in thickness--can dramatically improve the seismic performance of a column. Guidelines are presented for calculating required jacket thicknesses, and practical considerations regarding the installation and performance of jackets are discussed.

The National Institute of Standards and Technology, at the request of the Federal Highway Administration, has conducted a study of potential applications of automation and robotics technology in construction, maintenance, and operation of highway systems. The study included a workshop exploring industry perceptions of needs and barriers to adoption, a workshop and a literature search to assess current state of the art practices and trends, and site visits by automation experts to typical highway worksites. Potential technology opportunities were highlighted for short, medium, and long-term efforts in a matrix of intersections between common highway jobs and areas of current technological thrust. From among the opportunities identified, six potential research areas were developed as specific proposals, and subjected to life-cycle cost-benefits analysis. Four were projected to return significant savings by comparison with current practice. Of these, two were identified as also likely to return benefits of significant impact on total highway expenditures and the national economy due to their ability to leverage savings across large numbers of jobs or their effect on a large percentage of highway traffic. This is Volume II of IV.

Degradation of Powder Epoxy Coated Panels Immersed in a Saturated Calcium Hydroxide Solution Containing Sodium Chloride.
Final rept. Aug 92-Jul 94.
J. W. Martin, T. Nguyen, D. Alsheh, E. Byrd, J. Seiler, J. A. Lechner, and E. Embree. Oct 95, 46p, FHWA/RD-94/174.
Contract DTFH61-92-Y-30115
Sponsored by Federal Highway Administration, McLean, VA. Office of Engineering and Highway Operations Research and Development.

Keywords: *Reinforcing steels, *Bars, *Epoxy coatings, *Immersion test(Corrosion), *Corrosion, Marine environments, Chemical attack, Degradation, Protective coatings, Peeling, Exfoliation corrosion, Blistering, Calcium hydroxides, Sodium chloride, Thermography, Anodic blisters, Cathodic disbondment, Wet adhesion, Infrared thermography.

Blasted-steel panels were coated with two commercial powder epoxy coatings. Approximately half (80) of the coated panels were scribed; while the other half remained defect-free. All of the panels were immersed in a saturated calcium hydroxide solution containing 3.5 percent sodium chloride maintained at either 35 or 50 deg. C. None of the unscribed panels degraded after 3074 h of immersion at 35 deg C; whereas, all of the scribed panels degraded within 24 h after immersion, regardless of the immersion solution temperature. Scribed panels degraded in three ways: (1) anodic corrosion, (2) Cathodic disbondment, and (3) wet-adhesion loss.

Alkali-Silica Reaction and High Performance Concrete.
C. F. Ferraris. Aug 95, 20p, NISTIR-5742.
Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Alkali aggregate reactions, *Silicon dioxide, *Concretes, Air, Cement aggregate reactions, Concrete durability, Standards, Tests, Chemical reactions, Performance, Construction materials, ASR(Alkali-silica reaction), HPC(High performance concrete), National Institute of Standards and Technology.

Damage due to alkali-silica reaction (ASR) in concrete is a phenomenon that was first recognized in the U.S. since 1940 and has since been observed in many countries. Despite numerous studies published, the machanism is not yet clearly understood. Nevertheless, the three major factors in concrete have been identified, i.e., the alkalies contained in the pore solution, reactive amorphous or poorly crystallized silica present in certain aggregates, and water. In this study, we attempted to address the question of whether high-performance concrete (HPC) is susceptible to ASR. It was found that air content is the most important variable (other than the three majors factors cited above) that increase expansion of concretes affected by ASR. This study seems to indicate that even HPC is susceptible to ASR if reactive aggregates are used.

Seismic Performance of Circular Bridge Columns Designed in Accordance with AASHTO/CALTRANS Standards.
Building science series (Final).
W. C. Stone, and A. W. Taylor. Feb 93, 132p, NIST/BSS-170.
Also available from Supt. of Docs. as SN003-003-03195-0. Sponsored by Federal Highway Administration, McLean, VA.

Keywords: *Bridges(Structures), *Earthquake resistant structures, *Dynamic structural analysis, Seismic design, Bridge design, Columns(Supports), Earthquake damage, Failure modes, Cyclic loads, Dynamic loads, Lateral pressure, Hysteresis, Reinforcement(Structures), Reinforced concrete, Earthquake engineering, Standards, Circular bridge columns, Spiral reinforcement.

Limitations of present procedures for the design of bridge columns to withstand seismic loads are discussed. Techniques for achieving the earthquake resistant capabilities are described and new design criteria, based on acceptable damage indices as functions of earthquake magnitude, distance, and structural importance, are proposed. Using the proposed procedure and criteria the performance of 72 representative bridge columns designed in accordance with 1992 CALTRANS specifications is analyzed. Analysis parameters included earthquake magnitude, distance from epicenter, subsurface soil characteristics, column aspect ratio, and normalized column axial load. Design charts, based on allowable damage index versus earthquake magnitude, are developed and retrofit strategies are discussed for those designs which do not meet the proposed design criteria.

Keywords: *Vibration isolators, *Test methods, *Earthquake resistant structures, Building codes, Displacement, Structural vibration, Dynamic structural analysis, Earthquake engineering, Dynamic response, Vibration dampling, Sliding, Hybrid systems, Prototypes, Loads(Forces), Bridges(Structures), Standards, Requirements, Quality control, Elastomeric systems, Qualification.

The Building and Fire Research laboratory of the National Institute of Standards and Technology has developed guidelines for testing and evaluation of seismic isolation systems. Included in the report are comprehensive guidelines for conducting pre-qualification, prototype and quality control tests of the isolation system. The guidelines are independent of the type of isolation system and application. Thus, they can be used to test elastomeric, sliding or hybrid isolation systems, for applications that involve buildings, bridges, facilities and other special structures. The guidelines include general requirements of the test facilities and other special structures. The guidelines include general requirements of the test facility, instrumentation, calibration, data acquisition, data analysis and reporting of results. All tests are presented in a standard format that includes test designation, purpose, sequence, procedure, performance criteria, special requirements and exceptions.

Prepared in cooperation with National Inst. of Standards and Technology, Gaithersburg, MD. Sponsored by Federal Highway Administration, Washington, DC. and American Association of State Highway and Transportation Officials, Washington, DC.

Keywords: *Bituminous concretes, *Flexible pavements, *Water resistance, *Nondestructive tests, Aggregates, Mechanical proerties, Infrared spectroscopy, Adhesion, Concrete durability, Pavement bases, Stripping.

The objective of the study was to develop a nondestructive spectroscopic method for measuring water stripping resistance of asphalt/siliceous aggregates exposed to water. Phase 1 of the study developed a technique based on Fourier transform infrared spectroscopy/multiple reflection mode to quantify water layer at the asphalt-siliceous aggregate interface. In Phase 2, a technique to measure adhesion loss of the asphalt-aggregate system exposed to water environment was developed. Phase 3 correlated the quantity of interfacial water layer with the adhesion loss data. In addition, results on the use of spectroscopic technique to evaluate the effectiveness of asphalt antistripping agents are presented. Based on interfacial water inforamtion, mechanisms of stripping asphalt from siliceous aggregates and of transport of water from the environment to asphalt-aggregate interface are presented.

Economics of New-Technology Materials: A Case Study of FRP Bridge Decking.
Final rept.
M. A. Ehlen, and H. E. Marshall. Jul 96, 76p, NISTIR-5864.

Keywords: *Bridge decks, *Cost analysis, *Composite materials, Life cycle costs, Highway bridges, Economic analysis, Technology innovation, Construction materials, Advanced materials, FRP(Fiber reinforced polymers).

The purpose of this report is to provide a general method for evaluating the life-cycle cost effectiveness of new-technology materials in relation to conventional materials. The methods provides users with a tool that helps them choose that material among competing alternative materials that performs the required function at minimum life-cycle cost. To illustrate an application of the economic method, the authors prepare a case study of highway bridge decks. The authors evaluate the use of FRP (Fiber reinforced polymers) materials as an alternative to conventionally used concrete. The rapidly increasing research on FRPs suggest that it will be a major construction material in the future. The authors choose sbridge decks for two reasons: first, this application of FRPs appears technically promising, and second, there is a large number of bridges in the United States that will need to be replaced in the next 10-15 years, suggesting that there will be considerable interest in a case study of this application.

Ground Improvement Techniques for Liquefaction Remediation Near Existing Lifelines.
R. D. Andrus, and R. M. Chung. Oct 95, 89p, NISTIR-5714.

Keywords: *Liquefaction, *Soil stabilization, *Earthquake resistance, Grouting, Soil dynamics, Mixing, Drainage, Conduits, Pipelines, Buildings, Storage tanks, Bridges(Structures), Dams, Soil structure interactions, Deformation, Earth movements, Ground motion, Displacement, Ground subsidence, Seismic effects, Soil mechanics, Earthquake engineering, Cost estimates, *Lifeline systems.

This report reviews five low vibration ground improvement techniques suitable for remedial work near existing structures. The five techniques are: compaction grouting, permeation grouting, jet grouting, in situ soil mixing, and drain pile. The factors which can influence the effectiveness of each technique are identified. Cost estimates are given for each technique, except the drain pile technique which is not yet available in the United States. Nineteen case studies of liquefaction remediation and remedial work near existing lifelines are reviewed. Advantages and constraints of the five techniques are compared. A combination of techniques may provide the most cost-effective ground improvement solution for preventing damage to existing life-

lines resulting from liquefaction-induced horizontal ground displacement, subsidence, and uplift.

This report presents detailed system identification (SI) analyses of the full suite of seismic events at the Lotung site. Estimates of resonant frequencies and damping, and the dependence of these quantities on earthquake intensity is presented. The Lotung site is introduced in Chapter 2 through geological, seismological, and geotechnical descriptions. The SI precedures are discussed in detail in Chapter 3. Chapter 4 presents results of the system identification of the Lotung site data, with a discussion and conclusions given in Chapter 5. Appendix A describes the signal processing used on the raw data, with the integration procedure given in Appendix B. The pore water pressure time histories are shown in Appendix C. A literature review of damping values measured by other researchers is compiled in Appendix D. Finally, comparisons of actual interval outputs and modeled outputs for all events and intervals is given in Appendix E.

Analysis of Droplet Arrival Statistics in a Pressure-Atomized Spray Flame.
Final rept.
J. T. Hodges, C. Presser, A. K. Gupta, and C. T. Avedisian. 1994, 9p.
Pub. in International Symposium on Combustion (25th), Irvine, CA., July 31-August 5, 1994, p353-361.

Keywords: *Combustion, *Fuel sprays, *Drops, Flow visualization, Image analysis, Flames, Kerosene, Reprints.

The statistical behavior of droplets in a kerosene pressure-atomized spray was investigated under swirling and burning conditions. This case was studied in order to better understand individual droplet transport processes downstream of the fuel spray flame. A two-component phase-Doppler particle sizing system was employed to provide information on the droplet size and velocity distributions as well as interarrival-time statistics. Time-resolved information is presented on the instantaneous values of diameter, and the respective axial and radial velocity components. The results provide some evidence of nonsteady interarrival-time statistics (associated with droplet clustering) immediately downstream of the fuel nozzle and at radial coordinates near the center of the spray. The unsteady statistical behavior was most prominent within the shear layer formed near the inner spray boundary. Decomposition of the results into size classes indicated that clustering (attributed to entrainment by recirculating gases) occurred only for the smallest droplets, 0-20 micrometers in diameter. For larger droplets, analysis on the random nature of the spray process revealed that droplet transport generally follows steady Poisson statistics. Furthermore, the information provided here shows that size-class decomposition is important in the analysis of spray behavior.

K. C. Smyth. 16 Jul 93, 24p.

Keywords: *Combustion, Diagnostic equipment, Laser applications, Symposia, Quantitative analysis, Phase studies, Multiphase flow, Flow fields, Laser diagnostics, In situ analysis, Spectroscopy.

The 1993 Gordon Research Conference on the Physics and Chemistry of Laser Diagnostics in Combustion was held at Plymouth State College (South) in Plymouth, New Hampshire, July 12-16, 1993. This conference is primarily concerned with the fundamental physics and chemistry underlying the wide variety of laser-based optical spectroscopic diagnostic techniques which are used for studying combustion processes. The focus is on in-situ and nonperturbing optical methods for one-, two-, and three-dimensional measurements of species concentrations, temperature, and velocity. The development of such quantitative methods using linear and nonlinear optical interactions encompasses a broad scope of interdisciplinary research including basic and applied physics and chemistry.

Combustion of a Polymer (PMMA) Sphere in Microgravity.
J. C. Yang, and A. Hamins. Aug 95, 6p.
In NASA. Lewis Research Center, the 3RD International Microgravity Combustion Workshop p 115-120.

Keywords: *Aerospace vehicles, *Combustion, *Liquid fuels, *Reduced gravity, *Polymers, *Polymethyl methacrylate, *Propulsion, Aerospace safety, Burning rate, Chemical reactions, Flammability, Gravitational effects, *Microgravity.

Polymer combustion is a highly complicated process where chemical reactions may occur not only in the gas phase, but also in the condensed phase as well as at the solid-gas interphase. The chemistry depends strongly on the coupling between the condensed phase and gas phase phenomena. For some polymers, additional complications arise due to the formation of char layers. For others, the behavior of the condensed phase involves swelling, bubbling, melting, sputtering, and multi-stage combustion. Some of these features bear resemblance to the phenomena observed in coal particle combustion. In addition to its relevance to spacecraft fire safety, the combustion of polymeric materials is related to many applications including solid and hybrid rocket propulsion, and of recent interest, waste incineration . The burning rate is one of the most important parameters used to characterize the combustion of polymers. It has been used to rank the polymer flammability under the same experimental conditions and to evaluate various modes of inhibiting polymer flammability. The main objective of this work is to measure the burning rates of a polymeric material in low gravity. Because of inherent logistical difficulties involved in microgravity experiments, it is impossible to examine a wide spectrum of polymeric materials. It is desirable to investigate a polymer whose combustion is less complicated, and yet will lead to a better understanding of the burning characteristics of other more complicated materials. Therefore, a typical non-charring polymer is selected for use in this experimental study. PMMA (polymethylmethacrylate) has been chosen because its thermo-physical properties are well characterized. Although the combustion of PMMA has been extensively studied in 1G experiments, only a limited amount of work has been conducted in low gravity. A spherical sample geometry is chosen in this study because it is the simplest configuration in terms of the microgravity hardware design requirements. Furthermore, a burning PMMA sphere in microgravity represents a one-dimensional flame with overall combustion characteristics expected to be analogous to the combustion of a liquid fuel droplet, a field with many well-developed theories and models. However, differences can also be expected such as the flame-front standoff ratios and the condensed phase processes occurring during combustion.

In situ Burning of Oil Spills: Mesoscale Experiments.
W. D. Walton. Nov 93, 63p, NISTIR-5266.
See also PB94-101839. Sponsored by Minerals Management Service, Herndon, VA. Technology Assessment and Research Branch.

Keywords: *Oil spills, *In-situ combustion, *Fire tests, Crude oil, Burning rate, Plumes, Smoke, Particulates, Water pollution control, Mitigation, Oil-water interfaces, Mesoscale tests.

In 1991 a series of 14 mesoscale fire experiments were performed to measure the burning characteristics of crude oil on salt water. These oil burns in a pan ranged in size from 6 m square to 15 m square. Results of the measurements for burning rate, oil temperature, water temperature, smoke particle size distribution, smoke plume trajectory, and smoke particulate yield are provided. The burning rate as indicated by the regression rate of the oil surface was found to be 0.055 (+ or -) 0.005 mm/s and smoke particulate yields were found to be approximately 0.13 of the oil burned on a mass basis.

Grant NIST-NANB7D737
See also N93-24946. Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Flame propagation, *Gas flow, Combustion, Temperature distribution, Reaction kinetics, Pyrolysis, Mathematical models, Boundary layer, Computer programs, Diffusion flames, Computational fluid dynamics.

An experimental study has been performed of the spread of flames over the surface of thick PMMA and thin filter paper sheets in a forced gaseous flow of varied oxygen concentration moving in the direction of flame spread. It is found that the rate of spread of the PMMA pyrolysis front is time independent, linearly dependent on the gas flow velocity and approximately square power dependent on the oxygen concentration of the gas. The experimental data with thin filter paper sheets shows that the flame spread rate is independent of the flow velocity for forced flow conditions and linearly dependent on the oxygen concentration of the flow. In both experiments, it was found that the flame spread rate data can be correlated in terms of parameters deduced from heat transfer considerations only. This indicates that heat transfer from the flame to the condensed fuel is the primary mechanism controlling the spread of flame. Finite rate chemical kinetic effects have apparently a small influence on the flame spread process itself. Analytical and numerical methods were also employed to study theoretically the flame spread process over thermally thick fuel and in the influence on the flow field behavior in the presence of a flame.

Keywords: *Mathematical models, *Conduction, *Heat transmission, *Fires, Numerical analysis, Prototypes, Temperatures, Fortran, Floors, Walls, Ceilings, Differential equations, Zone fire model.

The research goal for the first year of the grant was to determine the best available numerical technology for use in zone fire modeling. The goal for the second year was to incorporate heat conduction into a zone fire model in a numerically robust and efficient manner. Three prototype zone fire models named MCCFM, CONRAD1 and CONRAD2 were constructed to test the numerical technology used to realize these goals. These zone fire models and their implementations as Fortran codes are presented. The code MCCFM, developed during the first year of the grant, demonstrates the advantages of using mass as a solution variable instead of density. CONRAD1 and CONRAD2 examine two strategies for coupling the heat conduction equation (a one dimensional partial differential equation) with the zone fire modeling ordinary differential equations. CONRAD2 reduces the heat conduction problem to a set of implicitly defined functional equations, a strategy never before used in zone fire modeling.

Experimental and Numerical Studies on Two-Dimensional Gravity Currents in a Horizontal Channel.
W. R. Chan, E. E. Zukoski, and T. Kubota. Jul 93, 264p, NIST/GCR-93/630.
Grant NIST-NANB9D0958
Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Fire tests, *Computational fluid dynamics, Smoke, Channel flow, Currents.

The objective of this investigation is to examine the behavior of two-dimensional gravity currents, especially as applied to the spreading of smoke, generated from a room fire, along a long corridor. Both experimental and numerical techniques were used to provide a model that can adequately explain and predict the behavior of a gravity current under certain boundary conditions. A series of experiments was carried out to study the effects of Reynolds number on gravity currents in a horizontal water channel. Measurements of the time varying front position, velocity profile of the following current, and the depth of a gravity current were made using either dyed liquids or hydrogen bubble technique. Quantitative results were shown to agree with previously published results.

Keywords: *Fires, *Flame propagation, Diffusion flames, Plumes, Optical properties, Raleigh scattering, Soot, Turbulent flow.

Two aspects of unwanted fires were considered: (1) the optical properties of soot in the fuel-lean region of buoyant turbulent diffusion flames, and (2) the structure and mixing properties of buoyant turbulent plumes. The scattering, absorption and extinction properties of soot were measured for conditions where soot structure was known from earlier transmission electron microscopy measurements. The plume study involved laser-induced iodine fluorescence measurements of mean and fluctuating mixture fractions. The results indicated that past measurements of plume properties represent transitional plumes and that self-preserving turbulent plumes are somewhat narrower, with higher levels of mean and fluctuating mixture fractions near the axis.

Greatly Enhanced Soot Scattering in Flickering Ch4/Air Diffusion Flames.
Final rept.
K. C. Smyth, J. E. Harrington, E. L. Johnsson, and W. M. Pitts. 1993, 11p.
Pub. in Combustion and Flame 95, p229-239 1993.

Keywords: *Soot, *Laser induced fluorescence, *Diffusion flames, *Optical images, Combustion, Hydroxyl radicals, Scattering, Strain rate, Particles, Methane, Sampling, Reprints.

Planar images of laser-induced fluorescence from OH radicals and elastic scattering from soot particles are presented in time-varying, laminar CH4/air diffusion flames burning in a co-flowing, axisymmetric configuration at atmospheric pressure. Acoustic forcing is used to phase lock the periodic flame flicker to the pulsed laser system operating at 10.13 Hz. For conditions where the tip of the flame is clipped, the intensity of the light scattered by the soot particles increases dramatically (by more than a factor of 7 for the maximum signals at a point) compared to a steady-state, laminar flame with the same mean fuel flow velocity. Comparison of the scattering signals integrated along the flame radius is carried out in the steady-state and time-varying flames as a function of height above the burner. Time-varying flames exhibit a larger range of combustion conditions than observed in corresponding steady-state flames, including different residence times, temperature histories, local stoichiometries, and strain and scalar dissipation rates. Thus, their investigation promises to yield new insights into a wide variety of chemistry-flowfield interactions which are prominent in turbulent combustion.

Preprints of papers presented at the American Chemical Society National Meeting (207th), San Diego, CA., March 13-17, 1994, p141-146.

Keywords: *Combustion kinetics, *Thermochemistry, *Fluorohydrocarbons, *Fire suppression, *Flames, Combustion chemistry, Fuels, Transport properties, Combustion efficiency, Inhibitors, Reprints, *Chemical reaction mechanisms, Ab initio molecular orbital theory.

A comprehensive, detailed chemical kinetic mechanism was developed for fluorinated hydrocarbon destruction and flame suppression. Existing fluorinated hydrocarbon thermochemistry and kinetics were compiled and evaluated. For species where no or incomplete thermochemistry was available, these data were calculated through application of ab initio molecular orbital theory. Group additivity values were determined consistent with experimental and ab initio data. For reactions where no or limited kinetics was available, these data were estimated by analogy to hydrocarbon reactions, by using empirical relationships from other fluorinated hydrocarbon reactions, by ab initio transition state calculations, and by application of RRKM and QRRK methods. The chemistry was modeled considering different transport conditions (plug flow, premixed flame, opposed flow diffusion flame) and using different fuels (methane, ethylene), equivalence ratios, agents (fluoromethanes, fluoroethanes) and agent concentrations. An overview of this work is presented.

Models of detailed flame chemistry and soot formation are based upon experimental results obtained in steady, laminar flames. For successful application of these descriptions to turbulent combustion, it is instructive to test predictions against measurements in time-varying flowfields. This paper reports the use of optical methods to examine soot production and oxidation processes in a co-flowing, axisymmetric CH4/air diffusion flame in which the fuel flow rate is acoustically forced to create a time-varying flowfield. For a particular forcing condition in which tip clipping occurs (0.75 V loudspeaker excitation), elastic scattering of vertically polarized light from the soot particles increases by nearly an order of magnitude with respect to that observed for a steady flame with the same mean fuel flow rate. The visible flame luminosity and laser-induced fluorescence attributed to polycyclic aromatic hydrocarbons (PAH) are also enhanced. Peak soot volume fractions, as measured by time-resolved laser extinction/tomography at 632.8 and 454.5 nm and calibrated laser-induced incandescence (LII), show a factor of 4-5 enhancement in this flickering flame. The LII method is found to track the soot volume fraction closely and to give better signal-to-noise than the extinction measurements in both the steady and time-varying flowfields. A Mie analysis suggests that most of the enhanced soot production results from the formation of larger particles in the time-varying flowfield.

Keywords: *Flame propagation, *Turbulence, *Fire tests, Velocity distribution, Buoyancy, Soot, Burning rate, Test facilities, Heat flux, Combustion products, Mathematical models, Heat transfer, *Concurrent flow.

A research program is being conducted to study the mechanisms controlling the spread of flames in an oxidizing gas flow moving in the direction of flame propagation. During this reporting period research has been conducted to study the effect of the oxidizer flow characteristics on the concurrent flame spread over thick PMMA sheets. The parameters varied in the experiments are the oxidizer flow velocity, turbulence intensity and oxygen concentration, and the geometrical orientation (floor and ceiling). Their effect on the flame spread process is studied by measuring the rate of flame spread, flame length, surface heat flux, products of combustion and soot. The results of the experiments show that the combined effect of flow velocity, turbulence intensity, and oxygen concentration has a complex influence on the flame spread process. At low flow velocity, the flame spread rate increases monotonically with turbulence intensity. At high flow velocity, however, the flame spread rate increases with flow turbulence at low turbulence intensities, but it decreases at high turbulence intensity values. The effect is more pronounced at high oxygen concentration. These trends appear to be due to a strong influence of the turbulence intensity on the flame temperature and length, and on that heat flux from the flame to the solid fuel. Turbulence enhances mixing, which increases the flame temperature and then the heat flux.

Grant NIST-60NANB0D1042
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Flame propagation, *Flow velocity, Combustion physics, Fires, Mixing layers(Fluids), Compartments, Ignition, Theses, Mathematical models, Froude number, Convective flow, Flow visualization, *Backdraft phenomena, *Compartment fires.

The purpose of this project was to develop a fundamental physical understanding of backdraft phenomena. The research was divided into three phases: exploratory simulations, gravity current modeling, and quantitative backdraft experiments. The primary goal of the first phase was to safely simulate a backdraft in the laboratory. A half-residential-scale compartment was built to conduct exploratory experiments. The initial experiments concluded with a scenario describing the fundamental physics of backdrafts. The importance of the gravity current which enters the compartment after opening was identified. In the second phase, the gravity current speed and the extent of its mixed region was investigated in a series of scaled salt water experiments. The scaled compartment (0.3m x 0.15m x 0.15m) was fitted with a variety of end openings; full, slot, door, and window. Video and photo data indicate that the mixing layer which rides on the gravity current in the full opening case, expands to occupy nearly the entire current in the partial opening cases. The Froude number and nondimensional head height are independent of beta and are in good agreement with numerical simulations and special limits from the literature. In the final phase, 28 backdraft experiments were conducted in a 1.2m by 1.2m by 2.4m compartment. (Copyright (c) 1993 Charles Martin Fleischmann.)

Ignition and burning rate data have been developed for thick (25 mm.) black Polycast PMMA in a Cone Calorimeter heating assembly. The objective was to establish a testing protocol that would lead to the prediction of ignition and burning rate from Cone data. This has been done for a thermoplastic like PMMA. For black PMMA we measured ignition temperatures of 250 to 350 C and vaporization temperatures of approximately 325 to 380 C over irradiance levels of 15 to 60 kW/sq m. The incident flame heat flux, for irradiation levels of 0 to 75 kW/sq m, was found to be approximately 37 kW/sq m for black PMMA. Its constancy has been shown due to the geometry of the Cone flame. Also, this flame can be shown to be nearly transparent for Cone irradiance (greater than 90 percent). The heat of gasification of the black PMMA used was found to be approximately 2.8 kJ/g; higher than other values reported for PMMA. This is believed to be due to differences in molecular structure or pigmentation effects and the types of PMMA tested. A burning rate model was demonstrated to yield good accuracy (greater than 80 percent) in comparison to measured transient values.

The focus of this study was the behavior of thick charring solids in fire situations. Clearly one of the most important parameters governing the fire phenomenon is the rate of release of combustible volatiles into the gas phase, in which they actually burn. Over the years, fire researchers have learned how to model the processes in the gas phase, so that the rate of heat feedback to the solid surface can be reasonably well predicted. Likewise, there exists the ability to model the heat transfer processes at the solid surface and within the solid itself. This study was concerned with the possibility that the inability to come to complete closure on the charring polymer fire problem might derive from difficulties in applying laboratory scale kinetics to actual fire conditions. Specifically, we were concerned about how well small scale laboratory experiments used to derive the kinetics of pyrolysis could be used to predict the behavior of charring solids in fire situations.

Keywords: *Flammability, *Test methods, *Bench tests, *Fire hazards, Burning rate, Combustion, Toxicity, Smoke, Ignition, Test facilities, Reprints.

During the last decade, significant improvements have become available in flammability testing. Rationally-based new methods, derived from fundamental engineering principles, are replacing the previously used empirical tests. The major emphasis in this development work has been to provide a basic set of bench-scale methods which can be used to predict full-scale product performance. Reference methods for conducting full-scale tests will continue to be needed to handle products or situations where the bench-scale methods are not applicable. The bulk of the testing needs, however, can now be fulfilled by use of bench-scale tests which are not only simple to run, but are known to accurately predict the full-scale performance.

Effective exchange of fire test data, even within a single laboratory, has been difficult due to the multiple incompatible data formats and hardware. This issue has been addressed by a careful study of user needs, leading to the development of a series of standard formats whereby fire test data could easily be exchanged among laboratories and design professionals. Both scalar and vector data are included. These formats have been made practical by the development of a computer program, the Fire Data Management System (FDMS), and pertinent hardware standards. The system includes the most commonly used of modern day fire test methods, but also has provisions for future extension to other tests of interest.

Keywords: *Conductive heat transfer, *Sprinklers, *Boundary element method, Heat transfer coefficients, Cooling, Drops(Liquids), Evaporation, Fire fighting, Heat flux, Reprints.

A long term study of the phenomena controlling the extinguishment of solid fuel fires is based on the modeling of the interactions of sprinkler generated droplets impinging hot solid surfaces. The thermal interactions during the evaporation of a liquid droplet deposited on a low conductivity semi-infinite solid are complex because the evaporative process is coupled to intense local cooling of the solid. Sharp temperature gradients in the proximity of the droplet edge cause instabilities in finite difference solutions using reasonable time steps due to the explicit coupling of the liquid-solid region. A boundary element method is proposed in order to overcome these difficulties. The methodology and its application to this specific problem are described in detail. Formal solutions are obtained in the form of surface integrals over the solid and the droplet surfaces. These surface integrals are discretized into summations, which lead to matrix equations for the discretized surface temperatures and heat fluxes. Results for some preliminary tests are discussed to provide an insight on the various aspects of this solution procedure

Pub. in Combustion Science and Technology 90, p1-34 1993.

Keywords: *Diffusion flames, *Concentration(Composition), *Temperature distribution, Methane, Laminar flow, Scalars, Radicals, Dissipation, Combustion, Reprints.

Experimental concentration measurements of the major stable species and five radical species (OH, H atom, O atom, CH, and CH3) obtained on a rectangular Wolfhard-Parker slot burner are compared with a detailed computation of the chemical structure of an axisymmetric laminar, CH4/air diffusion flame burning at atmospheric pressure. In order to examine these CH4/air flames with different geometries and different sizes, the species profiles are plotted as functions of the local mixture fraction, and the scalar dissipation rate has been matched in a region around the stoichiometric surface. The overall agreement in the absolute concentrations, the shape of the profiles, and their location in terms of the local mixture fraction is good to excellent for the stable species (except for O2) and for the most abundant radicals OH, H atom, and O atom. For example, the calculated OH maximum concentration is in much better agreement with the experimental results than are full equilibrium and partial equilibrium estimates. Less satisfactory agreement is found for the CH and CH3 radicals. In addition, significant discrepancies are observed in the temperature field and in the degree of O2 penetration into rich flame regions.

Studies investigating the oxidation of soot and carbon monoxide (CO) have been conducted in a series of laminar diffusion flames. Both overventilated and underventilated conditions have been examined. For the overventilated studies, the production and destruction of CO has been found to be influenced by the amount of soot present in the flame. Measurements of the hydroxyl radical OH(-) have demonstrated that soot can compete for OH(-) when undergoing oxidation and, thus, impede the oxidation of CO to CO2. Absolute concentration measurements for OH(-) have shown that superequilibrium values of OH(-) are achieved in the upper region of these diffusion flames. The results clearly demonstrate that soot particles are far from passive species in flames and can directly affect the chemical pathways involved in the oxidation process through radiative effects on temperature and soot particle reactivity effects on radical concentrations. The chemical makeup and structure of the smoke produced at high equivalence ratio is qualitatively different from smoke produced under overventilated conditions; the smoke is mainly organic rather than graphitic and it has an agglutinated structure rather than an agglomerate structure with distinct primary spheres usually observed in overventilated burning.

Airborne Smoke Sampling Package for Field Measurements of Fires.
Final rept.
J. R. Lawson, G. W. Mulholland, and H. Koseki. 1994, 18p.
Pub. in Fire Technology 30, n1 p155-172 1994.

Keywords: *Airborne equipment, *Measuring instruments, *Combustion products, *Plumes, Crude oil, Petroleum products, Polycyclic aromatic hydrocarbons, Particulates, Sampling, Field tests, Reprints, *Smoke yield, Pool fires.

A unique airborne smoke sample package (ASSP) for determining the smoke yield of large fires has been developed. The ASSP, which weighs less than 4 kg, is light enough to be flown suspended below a tethered helium-filled balloon or attached to a small radio-controlled aircraft. Measurements are made by flying the sampling equipment into a fire's smoke plume. Additional smoke plume measurements that can be made with the ASSP include particle size distribution using a cascade impactor, smoke agglomerate structure using transmission electron microscope (TEM) grids, and polycyclic aromatic hydrocarbons (PAHs) analysis using various sorbent tubes. The application of the ASSP in measuring laboratory and large outdoors petroleum pool fires is discussed.

Oxidation of Soot and Carbon Monoxide in Hydrocarbon Diffusion Flames.
Final rept.
R. Puri, R. J. Santoro, and K. C. Smyth. 1994, 20p.
Pub. in Combustion and Flame 97, p125-144 1994.

Keywords: *Diffusion flames, *Oxidation, *Soot, *Carbon monoxide, Hydrocarbons, Combustion products, Laser induced fluorescence, Hydroxyl radicals, Methane, Collision rates, Concentration(Composition), Reprints.

Ouantitative OH(-) concentrations and primary soot particle sizes have been determined in the soot oxidation regions of axisymmetric diffusion flames burning methane, methane/butane, and methane/1-butene in air at atmospheric pressure. The total carbon flow rate was held constant in these flames while the maximum amount of soot varied by a factor of seven along the centerline. Laser-induced fluorescence measurements of OH(-) were placed on an absolute basis by calibration against earlier absorption results. The primary size measurements of the soot particles were made using thermophoretic sampling and transmission electron microscopy. OH(-) concentrations are greatly reduced in the presence of soot particles. Whereas large superequilibrium ratios are observed in the high-temperature reaction zones in the absence of soot, the OH(-) concentrations approach equilibrium values when the soot loading is high. The diminished OH(-) concentrations are found to arise from reactions with the soot particles and only to a minor degree from lower temperatures due to soot radiation losses. Analysis of the soot oxidation rates computed from the primary particle size profiles as a function of time along the flame centerlines shows that OH(-) is the dominant oxidizer of soot, with O2 making only a small contribution. Higher collision efficiencies of OH(-) reactions with soot particles are found for the flames containing larger soot concentrations at lower temperatures. A comparison of the soot and CO oxidation rates shows that although CO is inherently more reactive than soot, the soot successfully competes with CO for OH(-) and hence suppresses CO oxidation for large soot concentrations.

A data base of chemical kinetic information for use in the modeling of the combustion of organic fuels has been developed at the National Institute of Standards and Technology. The authors have now extended the data base to cover light alkanes with up to four carbon atoms and are now carrying out work involving C3 and C4 unsaturates. They have also carried out extensive compilations of chemical kinetic data pertinent to combustion. They begin with a brief description of the rationale for the effort and their approach to the problem. This will be followed by a summary of their most recent work. They will conclude with a discussion of their approach to solving a number of the special problems that have been encountered.

Keywords: *Sprays, *Atomization, *Fire suppression, *Aircraft fires, Flame propagation, Turbulent flow, Liquid fuels, Aircraft fuels, Combustion kinetics, Combustion properties, Thermodynamic properties, Halon alternatives, Nozzles, Fire research, Reprints.

A research program to characterize candidate compounds for replacing halon 1301 for in-flight aircraft fire protection is described in the paper. The thermodynamical, fluid mechanical, and flame extinction properties are examined, and a number of fuels and flame arrangements are investigated in an attempt to develop a general test protocol which will reliably predict the relative fire suppression efficiency of new agents being considered for a variety of applications. A coaxial turbulent spray burner was built to evaluate the relative effectiveness of agents for suppressing high intensity fuel fires such as one might encounter in a jet engine nacelle. A key element of the facility is the agent delivery system, which is designed to inject the desired amount of material into the air upstream of the fuel nozzle. The influence of air velocity, fuel flow, and injection period on the amount of a N(sub 2) required to extinguish the turbulent spray flame is discussed, and the effectiveness of twelve gaseous agents is compared.

Reactivity of Product Gases Generated in Idealized Enclosure Fire Environments.
Final rept.
W. M. Pitts. 1992, 10p.
Pub. in Proceedings of International Symposium on Combustion (24th), Sydney, Australia, July 5-10, 1992, p1737-1746.

Keywords: *Combustion products, *Reactivity, High temperature gases, Combustion chemistry, Carbon monoxide, Chemical reactions, Flue gases, Reaction products, Reprints, *Combustion gases, *Enclosure fires.

Previous experiments have demonstrated that the mole fractions of major product gases trapped in a hood located above a fire can be correlated in terms of the global equivalence ratio. Full-kinetic calculations are employed to characterize the reactivity and reaction behavior for the product gases observed in a hood experiment burning natural gas as fuel. A range of temperatures (700-1300 K) typical of enclosure fires is considered. Mixing is assumed to be infinitely fast (perfectly-stirred reactor) or infinitely slow (plug-flow reactor). Both isothermal and adiabatic cases are treated. Calculations are reported for a range of residence times (0-20 s) and global equivalence ratios (0.5-2.83). The dominant variable for reaction behavior is found to be temperature. Effects due to mixing and heat transfer assumptions are less important. The results indicate that the hood product gases are reactive for temperatures greater than 800 K. For rich mixtures, reaction generates primarily carbon monoxide as opposed to carbon dioxide. At higher temperatures the formation of hydrogen is favored over water while water is favored in the 800-1000 K range. In the lower temperature range HO2 is the dominant free radical. Uncertainties in rates for reactions involving this species introduce considerable uncertainty into the calculated behaviors. At high temperatures (1100-1300 K) the important free radicals are H atom and OH. The findings suggest that the results of the hood experiments cannot be used directly for the modeling of species production in enclosure fires.

Laser-Induced Fluorescence Measurements of OH. Concentrations in the Oxidation Region of Laminar, Hydrocarbon Diffusion Flames.
Final rept.
R. Puri, M. Moser, R. J. Santoro, and K. C. Smyth. 1992, 8p.
Pub. in Proceedings of International Symposium on Combustion (24th), Sydney, Australia, July 1992, p1015-1022.

Keywords: *Diffusion flames, *Concentration(Composition), *Laser induced fluorescence, *Soot, *Oxidation, Combustion, Laminar flow, Hydroxyl radicals, Ethene, Methane, Flow rate, Combustion products, Reprints.

Ouantitative OH(-) concentrations have been measured in four coannular diffusion flames, burning methane at a single fuel flow rate and ethene at fuel flow rates which produce non-smoking, incipient smoking conditions. Laser-induced fluorescence has been used to make point profile, line image, and two-dimensional image measurements. These data have been placed on an absolute basis by reference to earlier absorption results. Particular emphasis has been placed on the investigation of the soot oxidation region in these laminar flames, since current soot models must utilize either assumed or estimated OH(-) concentrations. As the soot concentration increases, both the OH(-) concentration and the flame temperature are found to decrease. Estimates of the superequilibrium levels of OH(-) increase as the measured concentrations decrease, which makes accurate a priori prediction of OH(-) concentrations problematic in diffusion flames containing significant soot concentrations.

Incinerability of Perchloroethylene and Chlorobenzene.
Final rept.
W. Tsang, and D. Burgess. 1992, 17p.
Pub. in Combustion Science and Technology 82, n1-6 p31-47 1992.

Keywords: *Chlorobenzenes, *Tetrachloroethylene, *Incinerators, *Computerized simulation, Combustion kinetics, Hydroxyl radicals, Methane, Data bases, Reprints, *Perchloroethylene.

The paper reports on the results of computer simulations of the destruction of trace quantities of perchloroethylene and chlorobenzene in organic combustion systems. These results are derived from a data base dealing with methane combustion kinetics, recent measurements on hydrogen atom attack on the chlorinated compounds, and estimates based on literature values of the rate constants for a variety of destruction processes. The roles of OH-radicals and H-atoms as the key agents for destruction are demonstrated. At higher temperatures, unimolecular decompositions begin to become important. The juxtaposition of the various processes makes difficult the construction of a simple algorithm that will readily define the relative ease of destruction of any two compounds. Additional complications arise from the dependence on fuel composition and at higher hazardous waste concentrations. The advantages of using computer simulations in conjunction with laboratory and field results and in deriving a better understanding of incinerator behavior are discussed.

Pub. in Atomization and Sprays 4, p207-222 1994.

Keywords: *Methyl alcohol, *Combustion, Droplets, Sprays, Flames, Binary mixtures, Reprints, *Dodecanol, *Dodecanoic acid, Lauric acid.

The structure of a swirl-stabilized spray flame, fueled by a 75/25 mixture (by volume) of methanol and dodecanol has been examined. Spatially resolved information on droplet size and velocity distributions was obtained under burning conditions using a phase Doppler interferometry system. The effect of system gain (i.e., voltage setting of the photomultiplier tube detectors and laser power) on interpretation of the results was also assessed. The relatively large volatility difference between methanol and dodecanol provided an opportunity to examine the occurrence of microexplosions within spray flames. Evidence of microexploded droplets was revealed by a sudden decrease in droplet size and velocity, and an increase in number density at different spatial positions within the flame. On this basis, results were obtained that indicated the occurrence of microexplosions in the 75/25 mixture flame, but at a reduced extent as compared to prior results reported for methanol flames containing a larger fraction of dodecanol.

Keywords: *Diffusion flames, *Combustion products, *Fire extinguishing agents. Fire suppression, Inhibitors, Combustion, Transport properties, Fluorinated hydrocarbons, Acids, Concentration(Composition), Production rate, Hydrogen fluoride, Hydrogen chloride, Reprints, *Acid gas production.

The proposed replacements to halon 1301, mainly fluorinated and chlorinated hydrocarbons, are expected to be required in significantly higher concentrations than CF3Br to extinguish fires. At these higher concentrations the by-products of the inhibited flames may include correspondingly higher portions of corrosive gases, including HF and HCl. To examine the chemical and transport-releated mechanisms important in producing these acid gases, a series of inhibited flame tests have been performed with several types of laboratory-scale burners, varying agent type and concentration, and fuel type. Production rates were measured for co-flow laminar and turbulent diffusion flames. Systematic selection of the agent concentrations, burner type, and air flow rates allowed an assessment of the relative importance of agent transport and chemical kinetics on the acid gas production rates. These experimental results were then compared to a model which estimates the maximum HF and HCl production rates based on stoichiometric reaction to the most stable products. The results demonstrate the relative significance of F, Cl, and H in the inhibitor and fuel, as well as the effect of different burner configurations.

Keywords: *Burning rate, *Diffusion flames, *Fire extinguishing agents, *Fluorinated hydrocarbons, Fire suppression, Fire protection, Combustion, Oxidation, Flame propagation, Inhibitors, Concentration(Composition), Reprints.

This paper presents the first measurements of the burning rate of premixed flames inhibited by three fluorinated hydrocarbons that have oxidation chemistry which is similar to agents which may be used as replacements for CF3Br. The burning rate of premixed methane-air flames stabilized on a Mache-Hebra nozzle burner was determined using the total area method from schlieren images of the flame. The inhibitors were tested over a range of concentrations and fuel-air equivalence ratios. The measured burning rate reductions are compared with those predicted by numerical solution of the species and energy conservation equations employing a detailed chemical kinetic mechanism recently developed at the National Institute of Standards and Technology (NIST). This paper presents initial efforts at testing and validation of the mechanism using burning rate data. The mode of inhibition of these chemicals is inferred through interpretation of the numerical results.

Keywords: *Burning rate, *Fire extinguishing agents, *Diffusion flames, Fire suppression, Flame propagation, Combustion, Methane, Fire protection, Inhibitors, Mass transfer, Heat transfer, Concentration(Composition), Reprints, *Fluoromethanes.

The agents which are currently being considered as a replacements for fire suppressant agent CF3Br are mostly fluorinated hydrocarbons and perfluorinated alkanes. This abstract describes measurements of the reduction in burning rate of premixed methane-air flames by the single carbon inhibitors CF4, CF3H, and CF2H2. Early studies of the inhibitory effects of halogenated hydrocarbons on flames were conducted in premixed systems. The premixed laminar burning rate is a fundamental parameter describing the overall reaction rate, heat release, and heat and mass transport in a flame. In addition, the reduction in the premixed flame burning rate is useful for understanding the mechanism of chemical inhibition of fires since diffusion flames often have a stabilization region which is premixed, and good correlation has been found between the reduction in burning rate and the concentration of inhibitors found to extinguish diffusion flames. The present burning rate measurements allow an early assessment of the performance of the National Institute of Standards and Technology fluorinated species chemical kinetic mechanism in premixed flames and are considered to be an initial step in the validation and refinement of the mechanism.

Quantitative Measurements of Enhanced Soot Production in a Flickering Methane/Air Diffusion Flame.
Final rept.
C. R. Shaddix, J. E. Harrington, and K. C. Smyth. 1994, 10p.
Pub. in Combustion and Flame 99, p723-732 1994.

Keywords: *Diffusion flames, *Soot, Flow fields, Oxidation, Methane, Flicker, Air, Reprints, Laser induced incandescence, Time varying systems.

Integrated models of soot production and oxidation are based upon experimental results obtained in steady, laminar flames. For successful application of these descriptions to turbulent combustion, it is instructive to test predictions of soot concentrations against experimental measurements obtained in time-varying flowfields. This paper reports quantitative measurements of the local soot volume fraction in a co-flowing, flickering CH4/air diffusion flame burning at atmospheric pressure. Acoustic forcing of the fuel flow rate is used to phase lock the periodic flame flicker close to the natural flicker frequency. Our measurements show that soot production is four times greater for a forcing condition in which flame tip clipping occurs, compared with a steady flame burning with the same mean fuel flow velocity. The soot field in the flickering flame has been characterized using tomographic reconstruction of extinction data obtained at 632.8 nm, laser-induced incandescence (LII) images calibrated against steady CH4/air extinction results, and vertically polarized scattering data.

Carbon monoxide production during room fires has been investigated using natural-gas fires within a reduced-scale enclosure (RSE), an 0.98 m x 0.98 m x 1.46 m(w x h x d) room with a single door opening centered in the front wall. This series of 125 fires with heat release rates (HRR) from 7 to 650 kW and global equivalence ratio phi sub g from 0.2 to 4.2, respectively, has demonstrated that the upper layer is nonuniform in temperature and gas species, and that upper-layer oxygen is depleted for underventilated fires with high-temperature upper layers. For fires having HRR exceeding 400 kW (phi sub g > 2), carbon monoxide concentrations of up to 3.5 percent have been observed in the front portion of the upper layer. Carbon monoxide concentrations in the rear were consistently lower being on the order of 2.0 percent for phi sub g > 2.

Sponsored by Wright Lab., Wright-Patterson AFB, OH. and Naval Air Systems Command, Washington, DC.

Keywords: *Fire extinguishing agents, *Aviation safety, Aircraft fires, Fire fighting, Fire tests, Performance evaluation, Chemical properties, Detonation, Military air facilities, Halon 1301.

Live-fire, full-scale testing has been conducted at Wright-Patterson Air Force Base to identify an agent to replace CF3Br (halon 1301) for suppressing fires in military aircraft dry bays. The three chemicals being considered (C2HF5, HFC-125; C3F8, FC-218; and CF3I, halon 13001) had been evaluated in a previous laboratory study, in which unique properties of each chemical were identified in small-scale experiments. The FC-218 provided the most consistent performance in this new series of experiments which examined lean, stoichiometric and rich initial conditions. Large pressure build ups were not observed during suppression of the propane/air mixtures under the current set of conditions. None of the agents could be ruled out for dry bay applications based upon the results of this study.

Keywords: *Turbulence, *Diffusion flames, Models, Mixing, Plumes, Soot, Optical properties, Velocity, Combustion products, Fuels.

An investigation of the mixing and radiation properties of buoyant turbulent diffusion flames is described. The study was divided into two phases: (1) the structure and mixing properties of turbulent plumes, which must be understood in order to resolve effects of turbulence/radiation interactions and to benchmark models of buoyant turbulent flows; and (2) the fractal and structure properties of soot aggregates, which must be understood in order to develop nonintrusive methods for measuring soot properties of soot in flame environments. Measurements of the turbulent mixing prop-

erties of buoyant turbulent plumes involved laser induced fluorescence (LIF), laser velocimetry (LV) and combined LIF/LV to find mixture fraction and velocity statistics in buoyant turbulent plumes.

M. Choi, A. Hamins, H. Rushmeier, and T. Kashiwagi. 1994, 10p.
Pub. in Proceedings of the International Symposium on Combustion (25th), Irvine, CA., July 31-August 5, 1994, p1471-1480.

Keywords: *Optical properties, *Soot, *Fires, *Heptane, Carbon dioxide, Concentration(Composition), Heat transfer, Temperature, Surfaces, Heat flux, Reprints, Soot volume fraction, Pool fires.

Detailed measurements of the temperature, soot volume fraction and CO2 concentrations have been performed for a 10 cm diameter heptane fire. In addition, the concentrations of H2O and CO were inferred from generalized state relationships. The heat feedback to the surface was calculated by using a reverse Monte Carlo method in conjunction with RADCAL. The use of average and instantaneous values of the temperature and species concentrations results in a 21% difference in the heat flux to the surface. Simultaneous optical measurements using two probes were used to investigate the importance of temperal correlations on the heat transfer calculations. Measurements made throughout the fire indicate that non-simultaneous data sets can be used to accurately predict the heat transfer to the surface.

Pub. in Fire Safety Jnl., v23 p245-270 1994.

Keywords: *Two phase flow, *Flame propagation, *Thermodynamics, Combustion products, Fires, Compartment analysis, Time dependence, Stoichiometry, Methane, Algorithms, Mathematical models, Reprints, *Fire models, GGERM(Generalized Global Equivalence Ratio Model).

A model is developed for predicting the generation rates of oxygen, fuel, and other products of combustion in rooms containing fires and time-dependent fire environments. The model is called the Generalized Global Equivalence Ratio Model (GGERM). It extends the steady state global equivalence ratio model established previously from data of several steady state experimental studies. After describing the GGERM, a concise algorithm is outlined for implementing it in two-layer zone-type compartment fire models. With the algorithm in place, such models could be used to simulate the distribution of combustion products in single or multi-room fire environments under conditions of arbitrary ventilation.

Keywords: *Radiative heat transfer, *Compartment analysis, *Algorithms, Fires, Smoke, Gases, Walls, Heat transmission, Conduction, Convection, Numerical analysis, Computerized simulation, Mathematical models, Reprints, *Fire models, Zone models.

This paper presents algorithms for efficiency computing the radiative heat exchange between four wall surfaces, several fire, and two interior gases. A two-wall and a ten-wall radiation model is also discussed. The structure of this radiation model is exploited to show that only a few configuration factors need to be calculated directly (two rather than 16 for the four-wall model and eight rather than 100 for the ten-wall model) and matrices needed to solve for the net radiative flux striking each surface are shown, after the appropriate transformation is taken, to be diagonally dominant. Iterative methods may then be used to solve the linear equations more efficiently than direct methods such as Gussian elimination.

Keywords: *Algorithms, *Compartment analysis, Mathematical models, Computerized simulation, Fires, Conduction, Pressure dependence, Differential equations, Numerical analysis, Reprints, *Fire models.

In order to design robust and stable zone fire modeling algorithms, the numerical properties of the fire modeling differential equations must be understood. This paper examines some of these properties. Many sets of differential equations for zone fire modeling can be derived using the conservation of mass and energy. A comparison between various possible formulations is made in terms of numerical properties. One property that many formulations possess is the presence of multiple time scales. Pressures equilibrate much faster than other quantities, such as density and temperature. Numerically, this property is known as stiffness. Stiffness, in the context of fire modeling, and numerical methods for handling it are discussed.

Effect of Suppressants on Metal Fires.
T. J. Ohlemiller, and J. R. Shields. Aug 95, 28p, NISTIR-5710.

Keywords: *Fire suppressants, *Titanium, *Magnesium, *Combustion kinetics, Fire extinguishing agents, Halons, Environmental chemical substitutes, Alternatives, Burning rate, Heat transmission, Reaction kinetics, Vapors, Air flow, Fire tests.

The present study is limited to examining the effect of the vapors of various halogen-containing suppressants on the burning of pure magnesium and titanium rods in a slow flow of oxygen-containing gas. The test configuration was instrumented to allow quantitation of the effect of the vapors on the rate of burning. The agents examined in the presence of burning magnesium included halon 1301 (the reference case), HFC-125, HFC-227ea, FC-218 and CF3I. For titanium, time limitations narrowed the study to halon 1301, HFC-227ea(sup 2) and HFC-125.

Turbulent Flame Spread on Vertical Corner Walls.
Doctoral thesis.
C. Qian. Apr 95, 163p, NIST/GCR-95/669.
Grant NIST-60NANB3D1443
Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: *Walls, *Burning rate, Flame propagation, Turbulent flow, Heat flux, Pyrolysis, Thermodynamics, Combustion kinetics, Heat trasnfer, Infared imagery, Fire tests, Fire research, Theses, *Turbulent flames, *Flame spreading.

In this study, attention is given to the corner fire spread mechanism and the flame spread behavior. Infrared (IR) radiometry and image analysis techniques have been developed in this study to measure flame spread rate on large areas with high resolution and frequency. In addition to the flame spread measurement, the fire-induced flow was studied by flow visualization, and the total incident heat flux to the wall surface from the flame was measured by Gardon-type heat flux meters. Based on these experimental studies, a thermal model for corner fire spread has been successfully developed.

Flame Heights and Heat Release Rates of 1991 Kuwait Oil Field Fires.
Final rept.
D. D. Evans, D. Madrzykowski, and G. A. Haynes. 1994, 11p.
Pub. in Fire Safety Science Proceedings of the International Symposium (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p1279-1289.

Keywords: *Oil wells, *Flame propagation, *Radiative heat transfer, *Fires, Kuwait, Burning rate, Heat flux, Heat of combustion, Diffusion flames, Heat release rate, Dissipation, Smoke, Turbulent diffusion, Jet flow, Reprints, Flame height.

A series of measurements were made in the Al Mawqa/Al Ahmadi oil field region of Kuwait to explore the feasibility of assessing the heat release rate of individual well fires through flame height and thermal radiation measurements. The heat release rate of the crude oil well fires was correlated with the flame height. The 12 Kuwait oil field fires measured ranged in calculated heat relaese rate from 90 MW to 2 GW which correspond to flow rates of 0.003 cu m/s (1500 bbls/day) to 0.059cu m/s (30000 bbls/day) which is only 20 percent greater than published National Oceanic and Atmospheric Administration (NOAA) estimates based on information from the Kuwait Oil Company.

Experimental Study of the Stabilization Region of Lifted Turbulent-Jet Diffusion Flames.
Final rept.
C. D. Richards, and W. M. Pitts. 1991, 4p.
See also PB92-117191.
Pub. in Combustion Institute/Eastern States Section Fall Technical Meeting (24th), Ithaca, NY., October 14-16, 1991, p1-4.

Keywords: *Diffusion flames, *Turbulent flow, *Lift, *Jet flow, Fuel combustion, Flame stability, Rayleigh scattering, Image analysis, Concentrations(Composition), Spatial resolution, Light scattering, Reprints, Fuel jets, Temporal resolution.

The stabilization mechanism of a lifted turbulent-jet diffusion flame remains an active area of research despite numerous studies. The early work of Vanquickenbourne and Van Tiggelen provided experimental documentation of lift-off heights for a variety of

fuels. Although this time-averaged view provides a means of predicting lift-off height, more physical insight is required to develop a model of stabilization which includes current knowledge on the structure of turbulent jets and mixing. The present study is in many ways an update of the Vanquickenborne and Van Tiggelen experiments. The anchoring position of a lifted flame is obtained through image analysis of video images and concentration profiles are independently acquired in the corresponding isothermal fuel jets with Rayleigh light scattering (RLS). These diagnostics provide both temporal and spatial resolution.

Field Modeling: Simulating the Effect of Sloped Beamed Ceilings on Detector and Sprinkler Response.
Final rept.
W. D. Davis, G. P. Forney, and R. W. Bukowski. 1994, 42p.
Pub. in National Fire Protection Research Foundation, Batterymarch Park, Quincy, MA., 42p.

Keywords: *Fire detectors, *Sprinkler systems, *Ceilings, *Mathematical models, Smoke detectors, Fire suppression systems, Fire detection systems, Beams, Ventilation, Fire safety, Reprints.

The report describes the results of the second year of the project. During the second year, numerical simulations of smoke movement in response to sloped, beam ceilings were studied. Slopes of 10, 25 and 50 degrees were studied with beams running along or across the slope. It was found that channeling of smoke flow was more prevalent as ceiling slope increased for parallel beam cases. For beams perpendicular to the slope, increasing the ceiling slope decreased the effectiveness of the beams in preventing smoke flow up the ceiling. Based on the predicted smoke movement, recommendations on sensor selection and placement are made for the slope beamed ceilings.

Research has shown that burning can be an effective means to remove oil from the surface of the water after a spill. The paper describes instrument packages developed to determine the amount of various combustion products emitted from large (15 m x 15 m) crude oil pool fires. The increase in burning rate and smoke production with increasing fire size is discussed. Progress is reported on new calculation methods for smoke dispersion and downwind deposition of particulate. Results of example calculations are presented.

Pub. in OCS Study MMS 91-0057 (ALSO) Biennial Report of the Technology Assessment and Research Program (7th), Reston, VA., p27-32 1991.

Keywords: *Blowouts, *Oil wells, *Natural gas wells, *Fire suppression, Fires, Flame propagation, Radiative heat transfer, Jet flow, Burning rate, Diffusion flames, Fire fighting, Fire extinguishing agents, Reprints.

The report summarizes progress during the past two years on understanding the radiation production from both vertical and horizontal jet-flames. These two cases represent two forms of blowout fire events on offshore platforms. The laminar flamelet representation of a turbulent flame is used successfully to predict radiation from vertical methane jet-flames in the range of 1 to 7 MW. Peak temperature in the vertical methane jet-flame with water addition were over predicted by about 20% using the model. The trajectory of horizontal jet-flames, which turn under the influence of buoyancy are predicted using a parabolic finite difference scheme developed in this research program. References are given to other technical reports and publications for details of the work summarized in this paper.

Keywords: *Diffusion flames, *Soot, Combustion products, Laminar flow, Reprints, *Hydroxyl radicals.

Combustion in a simple view is the process of oxidation to form stable products, usually CO2 and H2O, accompanied by the release of energy. Although we often view this as a simple case of oxygen reacting with a fuel to exothermically form product species, it is well known that radicals such as OH, H and O have a significant role in the reaction chemistry. It is the specifics of these reactions which determine the rates at which they proceed and the routes by which minor products such as NO, soot and CO result. The radical species participate in numerous reactions, and there exists a competition among several chemical steps for each reactive species. Important to determining the dominant set of reactions are the local conditions involving temperature, pressure and species concentrations. As these conditions vary, the dominant reactive pathways will also change. It is this dynamic situation which challenges researchers as they attempt to understand the variety of processes which characterize combustion. In the present study, measurements of hydroxyl radicals obtained in laminar diffusion flames containing soot particles are described.

Chemical Stability of Upper-Layer Fire Gases.
Final rept.
W. M. Pitts. 1991, 4p.
Pub. in Fall Technical Meeting of the Eastern Section (24th): Combustion Institute, Cornell University, Ithaca, NY., October 14-16, 1991, 4p.

Keywords: *Carvon monoxide, *Fire gases, Kinetics, Reaction models, Toxic products, Reprints.

The chemical stability of upper-layer fire gases generated during burning in an enclosure is investigated by the use of a full-kinetic model. Initial concentrations of flame gases are those observed in experiments where fire gases are trapped in a hood. Calculations are preformed as a fucntion of layer temperature (700-1300), global equivalence ratio (0.5-2.8), mixing model (perfectly stirred and plug-flow reactors), and heat loss conditions (adiabatic or isothermal). The calculations indicate the flame gases become reactive for temperatures above 800 K.

Pub. in Annual Conference on Flame Retardancy of Polymeric Materials, Applications, Industry Developments, Markets, Stamford, CT., May 14-16, 1991, p1-6.

Keywords: *Polyurethane foam, *Hydrogen cyanide, *Combustion chemistry, *Thermodynamic properties, Combustion products, Copper compounds, Flammability, Ignition, Burning rate, Toxicity, Inhalation, Fire hazards, Fire tests, Reprints.

Hydrogen cyanide (HCN) is one of the gases which is produced during the thermal decomposition of flexible polyurethane foams and which (in combination with carbon monoxide and other fire gases) contributes to the toxicity of the smoke. Flexible polyurethane foams treated with copper or various copper compounds produced significantly less HCN when thermally decomposed that the identical but untreated control foams. The decreased atmospheric concentrations of HCN resulted in the reduction of the acute inhalation toxicity (as measured by lethality in Fischer 344 rats) produced from exposure to this smoke. This reduction of HCN and toxicity occurred regardless of whether the copper or copper compound was added to the foam during its formulation (prior to the foaming process) or as a post-treatment (after formulation).

Solid Propellant Gas Generators: Proceedings of the 1995 Workshop. Held in Gaithersburg, Maryland on June 28-29, 1995.
J. C. Yang, and W. L. Grosshandler. Nov 95, 226p, NISTIR-5766.

Keywords: *Solid propellant combustion, *Gas generators, *Fire extinguishing agents, *Meetings, Fire suppression, Fire fighting, Halons, Aircraft fires, Aircraft safety, Solid propellants, Nacelles, Test methods, Certification, Effectiveness, Performance evaluation, Halon 1301, Fire protection systems.

The intent of the workshop was to bring together gas generator manufacturers, researchers, and potential users to discuss various critical issues related to the evaluation and performance of the gas generators as a fire fighting tool and the search for new propellants. The specific objectives of the workshop, which reflected the need for such an apparatus, were: Identification of certification procedure(s) for gas generators in fire suppression applications; determination of critical parameters for evaluating the fire suppression efficiency of various gas generators; development of a standard methodology to facilitate testing of gas generators; identification of possible applications other than protection of engine nacelles and dry bays; and identification of a new generation of propellants.

Application of Thermodynamic and Detailed Chemical Kinetic Modeling to Understanding Combustion Product Generation in Enclosure Fires.
Final rept.
W. M. Pitts. 1994, 33p.
Pub. in Fire Safety Jnl., v23 n3 p271-303 1994.

Keywords: *Combustion products, *Thermodynamics, *Rooms, *Fire tests, Combustion chemistry, Gases, Enclosures, Carbon monoxide, Chemical reaction kinetics, Chemical equilibrium, Models, Reprints.

Experiments in idealized two-layer fire environments have demonstrated that concentrations of carbon monoxide and other gaseous combustion products can be correlated in terms of the global equivalence ratio. In this paper, the results of detailed chemical kinetic modeling and equilibrium calculations are used to gain insight into the chemical stability of the gases observed within the upper layers of such fires. It is demonstrated that the production of upper-layers gases is kinetically controlled and that for rich conditions concentrations of the upper-layer gas components are far from those expected for thermo-dynamic equilibrium at the layer temperatures. Criteria are provided for determining whether or not the correlations can be employed to predict the generation of combustion products in enclosure fires.

Inhibition of Premixed Methane-Air Flames by Halon Alternatives.
Final rept.
G. T. Linteris, and L. Truett. 1995, 6p.
Pub. in Proceedings of the International Conference of Fire Research and Engineering, Orlando, FL., September 10-15, 1995, p153-158.

Keywords: *Fire extinguishing agents, *Alternatives, *Combustion kinetics, Inhibitors, Fire suppression, Fire fighting, Burning rate, Fluorinated hydrocarbons, Methane, Chemical reaction kinetics, Flame propagation, Energy transfer, Heat transfer, Mass transfer, Environmental chemical substitutes, Halons, Reprints.

This article describes the first measurements of the reduction in burning rate of premixed methane-air flames inhibited by the two-carbon fluorinated species C2F6, C2HF5, C2H2F4 and the three-carbon species C3F8 and C3HF7 all of which are being considered as replacements to CF3Br. The burning rate of premixed methane-air flames stabilized on a Mache-Hebra nozzle burner is determined using the total area method from a schlieren image of the flame. The inhibitors are tested over a range of concentration and fuel-air equivalence ratio. The measured burning rate reduction caused by addition of the inhibitor is compared (for the two-carbon species) with that predicted by numerical solution of the mass, species, and energy conservation equations employing a detailed chemical kinetic mechanism recently developed at the National Institute of Standards and Technology (NIST).

Pub. in Proceedings of the International Conference on Fire Research and Engineering, Orlando, FL., September 10-15, 1995, p27-32 1995.

Keywords: *Fires, *Numerical simulation, Smoke, Gas flow, Convective flow, Dispersion, Heat transfer coefficients, Buildings, Buoyancy, Navier-Stokes equations, Reprints, *Gravity currents.

Gravity currents (GC) are also of interest in the movement of gases in buildings. A GC produced by a fire can transport smoke, toxic material and hot gases, and when the building has long corridors, the current often is one of the most important mechanisms for large-scale mass and energy transport. It is now possible to compute the structure of GCs in detail and to compare features of GCs with available experimental and analytical results. In the next section, the authors describe GCs by solving the Navier-Stokes equations in two dimensions. The authors make comparisons between results from salt-water, fresh-water experiments carried out by Zukoski and coworkers, and the results obtained from the authors' computational simulations.

Pub. in Proceedings of the International Conference of Fire Research and Engineering, Orlando, FL., September 10-15, 1995, p217-222 1995.

Keywords: *Calorimeters, *Furniture, *Fires, Heat transfer, Barriers, Rates(Per time), Fire research, Fire tests, Reprints, *Cone calorimeters, California Technical Bulletin 133, Heat release rate.

As part of an on-going study of the factors which affect heat release rate performance of furniture in the California Technical Bulletin 133, the authors have focused most recently on the role played by interliners or barriers. A barrier in this context is a layer of very low flammability material placed between the fabric and the polyurethane foam to minimize the participation of the latter in a fire. In CB 133 that fire is initiated on the seating area of an upholstered furniture item by an 18 kW gas burner that sprays flames on the seat, seatback and inner arm surfaces. The response of the chair is required to be at most an 80 kW peak in heat release rate. The test applies to furniture in public occupancies; it has been adopted in four states and is under consideration in several others.

Keywords: *Thermoplastic resins, *Ignition time, *Burning rate, *Flammability testing, Polyethylene, Polypropylene, Nylon 66, Fire tests, Ignition temperature, Flame propagation, Heat flux, Heat measurement, Calorimetry, Theses, Cone calorimeter, Mass loss.

Ignition and burning rate data are developed for Nylon 6/6, Polyethylene, and Polypropylene in a Cone Calorimeter heating assembly. The objective is to examine a testing protocol that leads to the prediction of ignition and burning rate for thermoplastics from Cone data. The flame heat flux is not measured, but is inferred from Cone data. The flame heat flux is not measured, but is inferred from Cone data. The constancy of the flame heat flux for thermoplastics in the Cone calorimeter is due to the geometry of the flame. The burning rate model is shown to yield good accuracy in comparison to measured transient values. Ignition and burning rate data are developed for Redwood and Red Oak in a Cone Calorimeter heating assembly. Measements of the flame plus external heat flux are presented. The data is intended to be used for future work to develop a testing protocol and burning rate model for charring materials.

Pub. in International Microgravity Combustion Conference (3rd), Cleveland, OH., April 11-13, 1995, 6p.

Keywords: *Chemical inhibition, *Flame chemistry, Reprints, Flame models, Flame retardants, Diffusion flame.

Chemical inhibition of diffusion flames through addition of halogenated inhibitors is a problem of significant practical and scientific interested. Extension studies on diffusion flames in microgravity have shown that these flames have significantly different characteristics than those under normal gravity (1,2). However, the mechanisms through which inhibitors reach the reactions zone to suppress combustion in diffusion flames and the effectiveness of these compounds under reduced gravity have yet to be investigated. This study reports preliminary results of investigations on the behavior of laminar jet diffusion flames upon the addition of bromotrifluoromethane (CF3Br) and trifluoromethane (CF3H) to the surroundings under normal and microgravity conditions. The results show that the flame structure in microgravity is significantly different from that under normal gravity conditions, and more importantly, that conditions for flame stability are less stringent under microgravity.

Keywords: *Chemical inhibition, *Flame chemistry, Reprints, Flame models, Flame retardants, Diffusion flame.

Due to the ban on production of bromotrifluoromethane (CF2Br) because of its high ozone destruction potential, there has been recent interest in finding a replacement for it for fire extinguishing applications. While a variety of potential replacement are being considered, halogenated hydrocarbons may be a viable alternative for some applications. Consequently, an improved understanding of their action in flames will aid in their effective use. In addition, CF3Br is used as a fire suppressant on the space shuttle, and its action in microgravity has not been tested in diffusion flames. The present study investigates the effects of CF3Br and trifluoromethane (CF3H), the simplest compound representative of the fluorocarbons, in laminar diffusion flames. The primary experiments are laminar gas-jet diffusion flames burning in a quiescent environment containing the inhibitor in normal and microgravity. Experiments were conducted with CF2Br mole fractions in the oxidizer gas of 0.5% to 3%, CF3H mole fractions of 4% to 12%, oxygen mole fractions from 18% to 30%, and ambient pressures of 101 kPa and 25 kPa. Additional opposed-jet counterflow diffusion flame experiments were used to investigate flame structures observed in the microgravity flames.

A study of fire detection methods for use by NASA in protecting their high bay structures is presented. A high bay structure is defined in this study as a structure having a ceiling height in excess of 18 m (60 ft). The analysis conducted in this study dealt with prediction of the expected performance of heat, smoke, and radiation detection systems for simulated fires of the type expected in NASA high bay facilities. The expected performance of smoke, heat, and radiation detectors in simulated fires is calculated using computer modeling. The results of this analysis will aid the development of fire detection strategies for high bay spaces.

Keywords: *Underground space, *Combustion, *Thermodynamic properties, Ignition, Mass transport, Energy transport, Convective flow, Thermal absorption, Accelerating agents, Energy dissipation, Momentum, Equations of motion, Mach number, Equations of state, High temperature, Conservation equations, Conservation laws, Mathematical models, Computational fluid dynamics, *Fire models, Zone models, Field models.

The scenario of interest is a 2-second firing of a rocket in an underground enclosure intended to mimic the effect of burning a high temperature accelerant (HTA). Because of the unusual nature of the problem, at least in the context of typical fire scenarios, two types of numerical models have been applied to the problem. The first, a zone model, divides each room in the enclosure into one or two control volumes, and the transport of mass and energy from the burn room is estimated from the basic conservation laws. The second model, a field model designed for relatively low Mach number flows, solves the conservation equations of mass, momentum and energy discretized over hundreds of thousands of cells.

Minimum Mass Flux Requirements to Suppress Burning Surfaces with Water Sprays.
J. C. Yang, C. I. Boyer, and W. L. Grosshandler. Apr 96, 52p, NISTIR-5795.
Sponsored by Fire Administration, Emmitsburg, MD.

Keywords: *Solid fuels, *Burning rate, *Fire estinguishing agents, Wood, Methylmethacrylates, Polystyrene, Flames, Flow rates, Heat flux, Flow velocity, Water flow, Drop size, Spraying, Mist, Nozzles, Atomization, Low pressure, Mass flow, Fire fighting, Fire suppression, Piezoelectric gages, Requirements, Micronozzles.

Experimental measurements of extinghishment times of burning solid fuels using water were conducted using a prototype micronozzle array and a piezoelectric droplet generator. Solid fuels considered included solid white pine, polymethyl methacrylate, and polystyrene foam. External heat flux was applied to the sample surface during burning. The effects of drop size, sample orientation with respect the the nozzle, and nozzle distance from the sample surface on extinguishment time were examined. The extinguishment time was found to decrease with increasing water flow rate. For a given water flow rate, significant reduction in extinguishment time decreased when the nozzle was positioned further from the sample surface. At high flow rates, the extinghishment was independent of the nozzle-to-sample distance.

Large Eddy Simulations of Smoke Movement in Three Dimensions.
Final rept.
H. R. Baum, K. B. McGrattan, and R. G. Rehm. 1996, 10p.
Pub. in INTERFLAM: Proceedings of the International Interflam Conference (7th), Cambridge, England, March 26-28, 1996, p189-198.

Keywords: *Smoke, *Convection, *Transport, *Computerized simulation, Fire, Gases, Mathematical models, Computation, Navier-stokes equations, Fluid flow, Reprints.

This paper describes a methdology for simulating the transport of smoke and hot gases in enclosures. The approach is based on the use of efficient CFD techniques and high performance computers to solve a form of the Navier Stokes equations specialized to the smoke movement problem. The fire is prescribed in a manner consistent with a mixture fraction based approach to combustion, but the combustion phenomena themselves are not simulated. The mixing and transport of smoke and hot gases is calculated directly from an approximate for of the Navier Stokes equations. The next two sections give a brief description of the mathematical and computational aspects of the model, while the final section illustrates its capability with sample results and a comparison with experiment.

Large Fire Experiments for Fire Model Evaluations.
Final rept.
D. D. Evans. 1996, 6p.
Pub. in Proceedings of the International Interflam Conference (7th), Cambridge, England, March 26-28, 1996, p329-334.

Keywords: *Fire research, *Hydrocarbons, *Fuels, Oil-spills, Smoke, Yield, Models, Fire safety, Building codes, Reprints.

Recent movement towards performance based evaluation of building safety has placed a premium on demonstrating the accuracy of engineering methods and increased the demand for fire performance data from large scale experiments. Data from large scale experiments are generally the basis for development and evaluation of fire models. Verification of engineering methods for prediction of fire related performance of structures, contents, and fire protection systems has become a priority need to support the development of performance based codes and standards. Generally a great impediment to model verification is the lack of means to quantify the degree of agreement between experiments and predictions or repeated experiments. The results have shown that modeling of building fire flows at a resolution of several centimeters is feasible. The advent of high resolution calculations for use in fire safety analysis has increased the demand for high resolution measurements of fire.

Office Work Station Heat Release Rate Study: Full Scale versus Bench Scale.
Final rept.
D. Madrzykowski. 1996, 9p.
Pub. in INTERFLAM '96, Proceedings of the International Interflam Conference (7th), March 26-28, 1996, Cambridge, England, p47-55 1996.

Keywords: *Fire research, *Calorimeters, *Office equipment, Furniture, Fire tests, Heat flux, Reprints, Cone calorimeter, Radiation heat flux.

The National Institute of Standards and Technology (NIST) has conducted a study with office work stations to examine their heat release rates and to determine if the peak heat release rate for a work station can be predicted accurately from cone calorimeter results. Fifteen full scale fire experiments were conducted. Three types of work station panel construction and three work station configurations were examined. Preliminary results for the most common panel construction, fabric over fiberglass batting with a 6 mm thick hardboard core, are presented here. A method utilizing the peak heat release rate from the cone calorimeter experiments has been used successfully to predict peak heat release rates for the most common construction work station.

Pub. in INTERFLAM '96: Proceedings of the International Interflam Conference, Cambridge, England, March 26-28, 1996, p487-496.

Keywords: *Hangars, *Sprinkler systems, *Fire suppression, *Smoke detectors, Fire protection, Fire detectors, Activation, Ventilation, Air flow, Ceilings, Thermodynamic properties, Burning rate, Combustion kinetics, Heat flux, Flame propagation, Fire detection systems, Bays(Structural units), Reprints.

The study was conducted to investigate the response of various fire detectors and automatic sprinklers in high bay aircraft hangars. Laboratory and full-scale experiments as well as computer modeling were conducted to better understand the movement of heat and products of combustion in high bay spaces. Temperature distribution across the ceiling was measured along with the response of various types of fire protection devices as a function of fire size, fuel type, and ventilation conditions. Key findings are presented relating to detector spacing, threshold fire sizes, sprinkler type and temperature ratings, burn rates, heat release rates, and the effect of draft curtains.

Keywords: *Soot, *Combustion products, Diffusion flames, Acetylene, Agglomerates, Light scattering, Standards.

The smoke agglomerates produced by a co-annular diffusion flame with acetylene fuel were characterized by sampling/microscopy and by light scattering measurements. Particles were sampled at various heights above the flame using both thermophoretic sampling and impaction. Transmission electron microscopy was used for the smaller agglomerates obtained by thermophoretic sampling and optical microscopy was used for analysis of particles as large as .4 mm in diameter collected by impaction. The number of primary spheres was estimated from the projected area of the agglomerate and the primary sphere size. The fractal analysis extended over four orders of magnitude in the radius of gyration - the widest range studied for smokes.

The principal objective of the research is to clarify the mechanisms of chemical inhibition of methane-air diffusion flames by CF3Br and CF3H. An experimental, numerical, and analytical study is conducted. An asymptotic analysis is performed to characterize the structure and critical conditions of extinction of uninhibited methane-air diffusion flames. This analyses is extended to methane-air diffusion flames inhibited with CF3Br. Critical conditions of extinction of the flame are measured over a wide range with agents added to the air stream and to the fuel stream. Numerical calculations with detailed chemistry are performed to calculate the structure and critical conditions of flame extinction. The numerical results are compared with the measurements.

Role of Combustion on Droplet Transport in Pressure-Atomized Spray Flames.
Final rept.
A. K. Gupta, C. Presser, J. T. Hodges, and C. T. Avedisian. 1996, 11p.
Pub. in Jnl. of Propulsion and Power, v12 n3 p543-553 Jun 96.

Keywords: *Spray combustion, *Flames, Reprints, Droplets, Kerosene, Velocity.

The transport of droplets in a pressure-atomized kerosene spray flame was examined using a two-component phase Doppler system to measure the droplet size and velocity distributions at several locations within the spray. The effect of combustion on droplet transport was examined by comparing the results to a nonburning spray under similar flow conditions. Directions of motion of droplets are calculated from the measured droplet velocity components to provide information on trajectories and dispersion of droplets. Results show that combustion reduces the strength of gas recirculation as evience by significantly fewer droplets being transported upstream toward the nozzle along the centerline for the burning spray as compared to the nonburning spray. Combustion enhances droplet vaporization and results in reduced number density and larger droplet mean diameters and velocities when compared to the nonburning spray. At the spray centerline there is a wide range of droplet trajectories that are associated with recirculated droplets and those originating from the nozzle There is some correlation between droplet velocity and diameter. Some larger size droplets are also found to be entrained into the recirculation pattern. At the spray boundary, few droplets deviate from the mean direation. Also, droplet velocity is well correlated with increasing diameter but appears to approach an asymptotic value in which droplet velocity becomes insensitive to diameter.

Flammability Characterization with the Lift Apparatus and the Cone Calorimeter.
Final rept.
T. G. Cleary. 1992, 17p.
Pub. in Proceedings of the Fire Retardant Chemicals Association Spring Conference, Orlando, FL., March 29-April 1, 1992, 17p.

Keywords: *Flammability, *Calorimeters, Heat measurement, Characterization, Ignitability, Flame spread, Reprints, *Life apparatus, *Cone calorimeters.

Two small-scale test apparatuses, the LIFT apparatus and the Cone Calorimeter provide ignitability, flame spread, and heat release rate data for combustible solid materials. Data gathered with these apparatuses can be reduced to a limited number of key flammability or fire properties for a particular material. These key properties, in conjunction with the appropriate modelling equations, characterize the time to ignition, flame spread rate, and heat release rate over the range of applicable heating conditions and surface temperatures likely in full-scale fires. These key properties may be used as input parameters in a fire model that predicts flame spread and heat release rates for certain full-scale fire scenarios.

Pub. in a Letter Report on Flame Spread Testing of a Composite Material, p1-16 Feb 93.

Keywords: *Composites, *Flame spread, Ignition, Reprints, LIFT apparatus, ASTM E 1321.

Ignition delay time, lateral flame spread and upward flame spread data were gathered on a composite material (glass fiber/organic resin type). These tests were performed at the request of the Naval Surface Warfare Center. The Navy desires some assessment of the flame spread characteristics of the selected composite; the data gathered here are part of that flame spread characterization. The ignition delay time and lateral spread results were obtained with the LIFT apparatus in accordance with ASTM E 1321. The upward flame spread tests were performed using an experimental electrical radiant panel apparatus.

Keywords: *Fire tests, *Sprinkler systems, Spraying, Mathematical models, Nozzles, Computerized simulation, Water, Combustion, Buildings, Reprints, *Foreign technology.

A general description of the interaction of sprinklers and compartment-fire-generated smoke layers is presented. Various possible aspects of the interaction phenomena (upper-layer smoke entrainment into the sprinkler spray, momentum and mass exchange between droplets and entrained gas, gas cooling by evaporation, buoyancy effects, and others) are discussed in the context of a two-layer-type description of the fire environment. The inputs and outputs for a mathematical submodel which simulates the phenomena are discussed. The submodel is suitable for general use in any two-layer, zone-type compartment fire model. Results from exercising the submodel are presented. These example calculations simulate the interaction between the spray of a real sprinkler device and a range of two-layer fire environments. The calculations reveal an important generic interaction phenomenon, namely, an abrupt and large change in the growth rate of the upper layer that would accompany an increase in upper-layer thickness beyond a critical thickness (for a given upper-layer temperature) or an increase in upper-layer temperature beyond a critical temperature (for a given upper-layer thickness). Exceeding these critical values would lead to a very large rate of growh of upper layer thickness, a growth that could lead to rapid and complete smoke filling of even the largest compartments of fire origin.

Pub. in American Society of Mechanical Engineers Winter Annual Meeting, Anaheim, CA., November 1992, 10p.

Keywords: *Heat flux, *Flames, *Vertical surfaces, Walls, Corners, Dimensional analysis, Reprints.

Dimensional analysis is used to examine heat transfer from flames to vertical surfaces. Configurations include a line fire against a wall, a square burner flame against a wall and in a corner, and window flames impinging on a wall. Dimensionless parameters that affect flame heat flux include x/l(f), y/D, l(f)/D, and kD where x is vertical distance, y is horizontal distance, l(f) if flame length, D is burner dimension, and k is the flame absorption coefficient. Only the effect of these variables is shown; no general correlation is developed, and more data are needed.

Gravity currents (GC) are important physical phenomena which transport smoke and hot gases in corridors of buildings. In the paper, they are studied using large eddy simulations (LES). The transient Navier-Stokes (N-S) equations are numerically integrated with very high resolution, in two dimensions and with high resolution in three dimensions. The LES computations require no adjustable parameters, and are found to agree well with available experimental results in the absence of heat transfer.

Fiber-reinforced polymer composites offer the U.S. military the potential for significant reductions in weight and signatures. Current seaborne applications of composite materials in the U.S. Navy include sonar bow domes and windows, and coastal minehunter MHC-51 hulls. The U.S. navy is also evaluating composite materials of both primary and secondary load-bearing structures such as foundations, deckhouses, and hulls; machinery components such as composite piping, valves, centrifugal pumps, and heat exchangers; and auxiliary or support items such as gratings, stanchions, ventilation ducts, and screens. This new interest in composite materials is due to increased need for a corrosion-free, lightweight, and affordable low-cost alternative to metallic components. The U.S. Army is evaluating composite combat vehicles and the U.S. Air Force has taken the lead in transitioning composite technology to military advantage as evidenced by superior performance of the Stealth Fighter.

NO Production and Destruction in a Methane/Air Diffusion Flame.
Final rept.
K. C. Smyth. 1995, 35p.
Pub. in Combustion Science and Technology, v115 p151-176 1996.

Keywords: *Diffusion flames, *Methane, *Nitrogen oxides, *Combustion chemistry, Combustion products, Laminar flow, Thermodynamic properties, Laser induced fluorescence, Boltz mann equation, Reprints, Collisional quenching.

Concentration profiles have been measured for naturally occurring NO in a laminar CH4/air diffusion flame burning on a rectilinear Wolfhard-Parker slot burner at atmospheric pressure. The observed fluorescence signals have been corrected for (1) the Boltzmann population in the R(sub 1) rotational level of the ground vibronic state and (2) collisional quenching rates as a function of the local temperature and collider concentrations. A reaction path analysis and determination of NO fluxes strongly indicate that prompt NO production outweights the thermal route, but uncertainties in determining the relative contributions to instantaneous NO production are large.

Determination of Hydrogen in Titanium Alloy Jet Engine Compressor Blades by Cold Neutron Capture Prompt Gamma-ray Activation Analysis.
Final rept.
R. L. Paul, and R. M. Lindstrom. 1994, 6p.
Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v13 p1619-1624 1994.

Keywords: *Jet engines, *Titanium alloys, *Hydrogen embrittlement, *Concentration(Composition), *Compressor blades, *Nondestructive tests, Test methods, Structural failure, Hydrogen, Gamma ray scattering, Compressors, Defect analysis, Reprints, *Cold neutron capture prompt gamma-ray activation analysis.

Titanium, an important structural metal, readily absorbs hydrogen. Since the presence of trace amounts of hydrogen causes embrittlement in metals, a reliable nondestructive method of measuring hydrogen in titanium is much needed. We have found cold neutron capture prompt gamma-ray activation analysis (CNPGAA) to be ideal for the measurement of trace amounts of hydrogen. The technique is nondestructive, gives bulk analyses, the results are independent of the chemical form of the element being measured, and the hydrogen peak is interference free. The detection limit for hydrogen in titanium and its alloys is near 100 mg/kg. We have used CNPGAA to measure hydrogen in two titanium alloy jet engine compressor blades from an engine in which a blade had failed during service. While H concentrations in one blade were nearly uniform (approximately 200 mg/kg Ti) at all points measured, H concentrations in the second blade ranged from 140 to 750 mg/kg Ti, with greater H concentrations toward the edges of the blade than in the interior. Analysis of three cross sections, cut from different regions of another blade, showed a similar concentration gradient.

Thin Film Thermocouples for Measurement of Wall Temperatures in Internal Combustion Engines.
Final rept.
D. Burgess, M. Yust, and K. Kreider. 1990, 6p.
Pub. in Proceedings of American Institute of Aeronautics and Astronautics/American Society of Mechanical Engineers Thermophysics and Heat Transfer Conference, Seattle, WA., June 18-20, 1990, p43-48.

Keywords: *Thermocouples, *Thermal conductions, *Internal combustion engines, Ceramics, Heat flux,

Thin films, Lasers, Temperature measuring instruments, Zirconium oxides, Aluminum oxide, Thermal diffusion, Reprints, Zirconia, Alumina.

The transient temperature response of thin film thermocouples (TFTC) was measured using a pulsed laser heating technique. Pt/Pt-10% Rh, Pt/Au, and In2O3/In2O3-SnO2 (ITO) TFTC's with thicknesses ranging from 0.4 to 28 microns were fabricated by sputter deposition on alumina, plasma-sprayed zirconia, and Min-K 2000 substrates. The zirconia TFTC's are used in plugs for determination of the wall heat flux in internal combustion engines. The thermocouple output of the TFTC's was measured as a function of time following irradiation-heating of the thermocouple junction by a 12 ns laser pulse. The magnitude of the temperature jump (thermocouple output) and the temporal response of the TFTCs were found to be consistent with those predicted from a solution to the heat conduction equation. This model assumes that the heat flow is one-dimensional and that the film is thick compared to the thermal diffusion length during the laser heating pulse. For example, it was found that TFTCs with nominal 4 micron thick junctions has temperature decay times of about 5 microseconds, 60 microseconds, and 20 ms for alumina, zirconia, and Min-K 2000 substrates, respectively. These results are related to similar work using thin film resistance sensors and to measurements of the frequency response of TFTCs using an intensity modulated laser heating method. The fabrication of the TFTCs and the utility of heat flux sensors in internal combustion engines are discussed.

Keywords: *Diesel engines, *Abrasion, *Coal, *Wear tests, Piston rings, Fuel slurries, Fuel substitution, Pulverized fuels, Scanning electron microscopy, Engine cylinders, Wear resistance.

The purpose of the work summarized in this report was to obtain a basic understanding of the factors which are responsible for wear of the piston ring and cylinder wall surfaces in diesel engines utilizing coal-fuel. The approach included analytical studies using scanning electron microscopy and energy dispersive x-ray analyses to characterize coal-fuel and various combustion particles, and two different wear tests. The wear tests were a modified pin-on-disk test and a block-on-ring test capable of either unidirectional or reciprocating-rotational sliding. The wear tests in general were conducted with mixtures of the particles and lubricating oil. The particles studied included coal-fuel, particles resulting from the combustion of coal fuel, mineral matter extracted during the processing of coal, and several other common abrasive particle types among which quartz was the most extensively examined. The variables studied included those associated with the particles, such as particle type, size, and hardness; variables related to contact conditions and the surrounding environment; and variables related to the type and properties of the test specimen materials.

Pub. in Lubrication Engineering 48, n3 p189-195 1992.

Keywords: *Lubricating oils, *Deposits, *Engine tests, Lubricants, Calorimeters, Lubrication, Contamination, Test methods, Oxidation, Reprints, *Two-peak method, Pressurized differential scanning calorimetry.

A new laboratory bench test, using the technique of pressurized differential scanning calorimetry (PDSC), has been developed to evaluate deposit forming tendency for liquid lubricants. This method, called 'PDSC two-peak method', attempts to simulate deposit formation mechanism in an engine by heating thin films of oil on steel discs in an oxidative atmosphere. In this paper, the development and optimization of the two-peak test procedure are described. The test was evaluated by characterizing the deposit forming tendencies of five liquid lubricants. The deposit performance ranking for the five oils obtained from this new test method was consistent with engine test ranking.

Deposit Forming Tendencies of Diesel Engine Oils-Correlation between the Two-Peak Method and Engine Tests.
Final rept.
Y. Zhang, J. M. Perez, P. Pei, and S. M. Hsu. 1992, 6p.
Sponsored by Department of Energy, Washington, DC. Energy Conversion and Utilization Technologies Program.
Pub. in Lubrication Engineering 48, n3 p221-226 1992.

Keywords: *Diesel engines, *Lubricating oils, *Deposits, *Engine tests, Lubricants, Colorimeters, Sampling, Contamination, Test methods, Lubrication, Reprints, *Two-peak method, Pressurized differential scanning calorimetry.

The ability to determine the deposit forming tendencies of lubricants utilizing a newly developed laboratory bench method was established using three individual sets of lubricants. The 'Two-Peak Method' was developed at NIST using a pressurized differential scanning calorimeter and a unique sample pan. The method is described and repeatability between operators is demonstrated. The oils used in the study were evaluated in engine oil performance tests, or field tests, by the cooperating laboratories. For each set of oils highly correlatable results between the two-peak method and the engine performance tests were obtained. Several reference oils were included in each set of samples to show agreement between the three sets of samples. The method can be used to predict top land deposits that result increased oil consumption in different types of diesel engines.

Vortex Shedding Flowmeters for SSME Ducts.
Final rept.
J. D. Siegwarth, and M. A. Lewis. 1992, 9p.
Pub. in Proceedings of Advanced Earth-to-Orbit Propulsion Technology Conference, Huntsville, AL., May 19-21, 1992, NASA Conference Publication 3174, v1 p217-225 1992.

Keywords: *Space shuttle main engine, *Liquid oxygen, *Ducted rocket engines, Vortex shedding, Flow meters, Gas flow, Flow measurement, Ducted flow, Reprints, *Vortex shedding flowmeters.

Previous work has shown that vortex shedding flowmeters can measure flow in the Space Shuttle Main Engines (SSME) liquid oxygen ducts under the extreme conditions found there and without any upstream flow conditioning. Though measurement of liquid flow in the 28 mm (1.1 in.) duct is more difficult, recent tests have shown vortex shedders can make this measurement also. An encapsulated sensor design is presented and vortex shedding flowmeters for selected fuel ducts are discussed. A hydrogen gas test facility is needed to complete development of gas meters because of the high velocities found in the fuel ducts.

Integrated Services Digital Network (ISDN); Category: Telecommunications Standard; Subcategory: Integrated Services Digital Network.
5 Oct 93, 35p.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Communication networks, *Digital communications, Communications management, Data transmission, Protocols, Data links, Packet switching, Interoperability, Signal transmission, Telecommunication, *Integrated services digital network, Telecommunications standards, Primary rate interface, Basic rate interface.

The publication defines the generic protocols necessary to establish transparent Integrated Services Digital Network (ISDN) connections among government networks and between government and conformant common carrier networks. This FIPS provides a minimal set of bearer services, and is based on national standards, international standards, and implementation agreements developed by the North American ISDN Users' Forum (NIUF). Future versions of this FIPS will provide protocols for additional services, teleservices and applications. This standard supports a range of integrated services including voice, data, image, and video services.

Administration Standard for the Telecommunications Infrastructure of Federal Buildings. Category: Telecommunications Standard; Subcategory: Telecommunications Administration.
11 Aug 94, 9p.
Prepared in cooperation with National Communications System, Arlington, VA.
Three ring vinyl binder also available; North American Continent price $7.00; all others write for quote.

Keywords: *Telecommunication, *Public buildings, *Federal information processing standards, Passageways, Communication cables, Electrical grounding, Communication equipment, Wire, Administration, National government, Specifications.

This standard, by adoption of ANSI/TIA/EIA-606-1993, Administration Standard for the Telecommunications Infrastructure of Commercial Buildings, specifies the administrative requirements of the telecommunications infrastructure within a new, existing, or renovated office building or campus. Telecommunications infrastructure can be thought of as the collection of those components (telecommunications equipment spaces, cable pathways, grounding, wiring, and termination hardware) that provide the basic support for the distribution of all information within a building or campus. Administration of telecommunications includes documentation (record-keeping, drawings, labeling, etc.) of telecommunications outlet boxes, connectors, cables, termination hardware, patching and cross-connect facilities, conduits, other cable pathways, telecommunications closets, and other spaces.

Technology Trends in Telecommunications: An Overview.
Oct 93, 36p, NISTIR-5282.

Keywords: *Telecommunication, *Trends, *Technological innovations, Economic surveys, Computer networks, User requirements, Data transmission, Wireless communication, Signal processing, Global aspects, Competition, Economic impact, Computer information security, Local area networks, Fiber optics, Information systems, *Diversification.

The article describes the technology trends for telecommunications and their impact on the services provided to the user. The impact of divestiture, together with the advancement of some enabling technologies, is leading to a rapid diversification of the telecommunication industry. The diversification is the subject of the study that summarizes trends in a historic perspective.

Good Security Practices for Electronic Commerce, Including Electronic Data Interchange.
Special pub. (Final).
R. G. Saltman. Dec 93, 68p, NIST/SP-800/9.
Also available from Supt. of Docs. as SN003-003-03243-3. See also PB90-147489 and PB90-148784. Sponsored by Farmers Home Administration, Washington, DC.

Keywords: *Electronic mail, *Data processing security, Computer security, Computer communications, Commerce, Risk assessment, Documents, Data management, Access control, Cryptography, Authentication, Computer privacy, EC(Electronic Commerce), EDI(Electronic Data Interchange).

Electronic commerce (EC) is the use of documents in electronic form, rather than paper, for carrying out functions of business or government that require interchange of information, obligations, or monetary value between organizations. Electronic data interchange (EDI) is the computer-to-computer transmission of strictly formatted messages that can represent documents; EDI is an essential component of EC. With EC, human participation in routine transaction processing is limited or non-existent. Transactions are processed and decisions are made more rapidly, leaving much less time to detect and correct errors. This report presents security procedures and techniques (which encompass internal controls and checks) that constitute good practice in the design, development, testing and operation of EC systems. Principles of risk management and definition of parameters for quantitative risk assessments are provided. The content of the trading partner agreement is discussed, and the components of EC, including the network(s) connecting the partners, are described. Some security techniques considered include audit trails, contingency planning, use of acknowledgments, electronic document management, activities of supporting networks, user access controls to systems and networks, and cryptographic techniques for authentication and confidentiality.

Introduction to Traffic Management for Broadband ISDN.
Y. Chang, D. Su, and S. Wakid. Dec 93, 25p, NISTIR-5214.
See also PB93-149433.

Keywords: *Communications networks, *Traffic management, Communications management, Computer networks, Traffic control, Telecommunication, Standards, Protocols, Congestion, *Broadband Integrated Services Digital Network, *Integrated Services Digital Network, Asynchronous transfer mode.

This paper presents an overview of issues related to the traffic management for the Broadband Integrated Services Digital Networks (B-ISDN). B-ISDN is an emerging high bandwidth telecommunications infrastructure with transmission speeds in the range of mega-bit to giga-bits per second. This paper first analyzes traffic profiles in a B-ISDN environment and their impact on traffic management. It then presents an overview of traffic management for existing communications protocols, and discusses, in depth, how it can be applied to the B-ISDN environment. Finally, the paper gives a brief review of the current work on B-ISDN traffic management by the National Accredited Standards Committee T1 and the International Telegraph and Telephone Consultative Committee (CCITT).

Context Analysis of the Network Management Domain. Conducted as Part of the Domain Analysis Case Study.
C. Dabrowski, and S. B. Katz. Dec 93, 84p, NISTIR-5309.

Keywords: *Communication networks, *Network control, Software engineering, Protocols, Fault detection, *Software reuse, *Domain analysis, Context analysis, FODA(Feature Oriented Domain Analysis), Network management.

A key to increasing software producibility in the development of large, reliable software applications is the systematic reuse of existing software products. Domain analysis is a pivotal technique for developing reusable products that can be used to engineer software systems. The Domain Analysis Case Study was created to investigate domain analysis methods. This report is a product of the Domain Analysis Case Study. This report describes the application of the first phase of a domain analysis effort to the domain of network management systems--software systems that manage communications networks. The first phase of the domain analysis process is called the context analysis phase.
