CALCULATIONS OF THE FIELD NEAR THE APEX OF A WEDGE SURFACE

JAMES R. WAIT AND CAROLEN M. JACKSON

U. S. DEPARTMENT OF COMMERCE
NATIONAL BUREAU OF STANDARDS

THE NATIONAL BUREAU OF STANDARDS

Functions and Activities

The functions of the National Bureau of Standards include the development and maintenance of the national standards of measurement and the provision of means and methods for making measurements consistent with these standards; the determination of physical constants and properties of materials; the development of methods and instruments for testing materials, devices, and structures; advisory services to government agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; and the development of standard practices, codes, and specifications, including assistance to industry, business and consumers in the development and acceptance of commercial standards and simplified trade practice recommendations. The work includes basic and applied research, development, engineering, instrumentation, testing, evaluation, calibration services, and various consultation and information services. Research projects are also performed for other government agencies when the work relates to and supplements the basic program of the Bureau or when the Bureau's unique competence is required. The scope of activities is suggested by the listing of divisions and sections on the inside of the back cover.

Publications

The results of the Bureau's research are published either in the Bureau's own series of publications or in the journals of professional and scientific societies. The Bureau itself publishes three periodicals available from the Government Printing Office: The Journal of Research, published in four separate sections, presents complete scientific and technical papers; the Technical News Bulletin presents summary and preliminary reports on work in progress; and Central Radio Propagation Laboratory Ionospheric Predictions provides data for determining the best frequencies to use for radio communications throughout the world. There are also seven series of nonperiodical publications: Monographs, Applied Mathematics Series, Handbooks, Miscellaneous Publications, Technical Notes, Commercial Standards, and Simplified Practice Recommendations.

A complete listing of the Bureau's publications can be found in National Bureau of Standards Circular 460, Publications of the National Bureau of Standards, 1901 to June 1947 (\$1.25), and the Supplement to National Bureau of Standards Circular 460, July 1947 to June 1957 (\$1.50), and Miscellaneous Publication 240, July 1957 to June 1960 (includes Titles of Papers Published in Outside Journals 1950 to 1959) (\$2.25); available from the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402.

CALCULATIONS OF THE FIELD NEAR THE APEX OF A WEDGE SURFACE

James R. Wait and Carolen M. Jackson

Using the exact series solution for diffraction by a perfectly conducting wedge, numerical results are presented for the structure of the field in the apex region. This provides insight to the nature of electromagnetic fields near a surface discontinuity. Furthermore, the results provide some justification for the use of approximate boundary conditions which have been used previously in studying radio propagation over terrain features.

1. Introduction

In the bulk of theoretical radio propagation studies, the earth's surface is assumed to be smooth. Unfortunately, it is known from experience that the roughness plays an important role in determining the characteristics of the field. A general mathematical treatment of general unevenness of the surface does not seem to be possible because of the difficulty of rigorously satisfying the boundary conditions. However, if the surface is gently sloping and/or at long wavelengths, some simplifying approximations may be made. It is the principal purpose of the present paper to investigate the validity of these simplifications.

Considerable success has been achieved by Feinberg [1946] in his introduction of approximate boundary conditions for solving rough surface problems. His idea is to transfer the exact boundary conditions on the actual surface to a plane reference surface which may or may not be the mean surface. An example of such a problem would be the calculation of the field in the neighborhood of a sloping beach at a coast line. While the land and the sea may often be idealized as flat horizontal surfaces, the transition region will tend to distort the electric field lines with a subsequent modification of the transmitted wave. Furthermore, a reflected wave will be produced which may be significant in the operation of radio navigational systems.

In order to establish the validity of the approximate boundary conditions which have been used for sloping surfaces, it is desirable to adopt a very simple model which has an exact solution. The wedge is such a model. It consists of two intersecting plane surfaces which are semi-infinite in extent. A wedge in the limiting case where the open angle is 2π is often called a knife edge. The exact solution for the diffracted field in this case may be expressed conveniently in terms of Fresnel integrals. The knife edge model has been used extensively in the study of diffraction by mountainous obstacles and other pronounced relief features. However, in the case of coastal relief and other low lying features, the knife edge is an inadequate model and instead the general wedge is more meaningful. For example, a beach with a linear slope can be regarded as the superposition of two wedges.

The model is illustrated in figure 1. The wedge of assumed perfect conductivity is defined by the surfaces $\phi = 0$ and $\phi = \psi$ with reference to a cylindrical coordinate system (ρ, ϕ, z) . A plane wave is incident from the direction $\phi = \phi_0$ as indicated in figure 1. The field is to be observed at $P(\rho, \phi, z)$ where ϕ is in the range 0 to ψ . For simplicity, the direction of propagation is taken to be perpendicular to the wedge apex. Also, the incident wave of unit strength is polarized so that the magnetic field has only a z component. The exact expression for the resultant magnetic field, which also has only a z component, is given by [Wait, 1959],

$$H_z = \frac{\pi}{\psi} \sum_{m=0, 1, 2, \dots}^{\infty} \epsilon_m \cos \nu \phi \cos \nu \phi_0 \exp(i\nu\pi/2) J_\nu(k\rho), \quad (1)$$

where $\nu = m\pi/\psi$, $\epsilon_0 = 1$, $\epsilon_m = 2$ for $m \neq 0$. In this formula, $J_\nu(k\rho)$ is the Bessel function of order ν and argument $k\rho$ where $k = 2\pi/\text{wavelength}$.

Series formulas of the kind given by (1) are often considered to be unuseable because of poor convergence. For this reason, they are often replaced by asymptotic forms which are particularly useful when $k\rho$ is a large parameter and ψ is somewhat greater than 180° . When $\psi = 180^\circ$ or when ψ is any submultiple of π , the series formula given above may be transformed into a summation from a finite number of image waves. This matter has been discussed in some detail in a previous publication [Wait, 1959].

In the present situation, the wedge is taken to have an angle near 180° , corresponding to a small change of slope of the surface. Also, we are interested in the behavior of the field at all distances from the apex and, consequently, the parameter $k\rho$ may be either small or large compared with unity. For these reasons, it was considered worthwhile to program the infinite series solution despite its poor convergence and other complexities.

The expression for the H_z field [denoted H_Z] is normalized so that $H_z = \exp(+ik\rho)$ if $\phi = \phi_0 = 0$ while $H_z = \exp(-ik\rho)$ if $\phi_0 = 0$ and $\phi = 180^\circ$. This would follow from the identity

$$\sum_{m=0,1,2,\dots}^{\infty} \epsilon_m \exp(im\pi/2) J_m(k\rho) = \exp(ik\rho) \quad , \quad (2)$$

which involves only integral-order Bessel functions.

For the present problem, the electric field has both a ρ and an ϕ component. From Maxwell's equations

$$E_{\rho} = \frac{1}{i \epsilon_0 \omega \rho} \frac{\partial H_z}{\partial \phi} \quad \text{and} \quad E_{\phi} = -\frac{1}{i \epsilon_0 \omega} \frac{\partial H_z}{\partial \rho}, \quad (3)$$

where $\epsilon_0 = 8.854 \times 10^{-12}$ is the dielectric constant of free space.

Thus,

$$EO = -\frac{i \epsilon_0 \omega E_{\phi}}{k} = \frac{\pi}{\psi} \sum_{m=0,1,2,\dots}^{\infty} \epsilon_m \cos \nu \phi \cos \nu \phi_0 \exp(i \nu \pi / 2) J'_{\nu}(k \rho), \quad (4)$$

where $J'_{\nu}(Z) = \frac{d}{dZ} J_{\nu}(Z)$,

$$EP = \frac{i \epsilon_0 \omega E_{\rho}}{k} = \frac{\pi}{\psi} \sum_{m=1,2,3,\dots}^{\infty} 2 \nu \sin \nu \phi \cos \nu \phi_0 \exp(i \nu \pi / 2) \frac{J_{\nu}(k \rho)}{(k \rho)}. \quad (5)$$

The letter symbols H_z , EO , and EP are used to designate the quantities H_z , $-i E_{\phi} / \eta_0$, and $i E_{\rho} / \eta_0$, respectively, where $\eta_0 = \epsilon_0 \omega / k = 120 \pi$. Also, in the subsequent numerical listings, the dimensionless parameter $k \rho$ is designated by X .

For the numerical work, three cases (designated I, II, III) are considered. They are:

- I $\phi_0 = 0, \phi = 0$,
- II $\phi_0 = 0, \phi = 180^{\circ}$,
- III $\phi_0 = 0, \phi = \psi$.

In all these cases, X (or $k\rho$) ranges from 10^{-3} to 50. In case I and case III, $\psi - 180^\circ$ takes the values $0, \pm 5^\circ, \pm 10^\circ, \pm 20^\circ, \pm 30^\circ$. In case II, $\psi - 180^\circ$ takes only the positive values $0, +5^\circ, +10^\circ, +20^\circ, +30^\circ$, because the plane $\phi = 180^\circ$ is inaccessible if $\psi < 180^\circ$.

The totality of the numerical results are listed in the appendix where both Cartesian and polar representations are given. As an interesting check, the infinite series was used in cases I and II for $\psi = 180^\circ$. As indicated in the tabulated results, the magnitude of the normalized fields is unity to better than four-digit accuracy. The phase is also equal to $\pm k\rho \pm 2q\pi$, where q is an integer, to within the same accuracy. To achieve this accuracy at the large values of $k\rho$ (or X), approximately 200 terms in the series were required.

2. Graphical Presentation, Case I.

To illustrate the behavior of the reflected fields in the vicinity of the wedge, the amplitude of H_z and E_ϕ/η_0 is plotted as a function of $k\rho$ in figures 2a, 2b, 2c, and 2d for values of ψ ranging from 150° to 210° and $\phi = \phi_0 = 0^\circ$. It is evident that a standing wave pattern is formed which has a characteristic period of π radians or $1/2$ wavelength. As is evident from figures 2b and 2d, the $|H_z|$ and the $|E_\phi/\eta_0|$ fields have almost an identical pattern except within $1/2$ radian (or $1/6$ wavelength) from the apex. Within the immediate neighborhood of the apex, the characteristics of the magnetic and electric fields are quite different, as illustrated in figures 2a and 2c. In particular, the $|H_z|$ field is finite at $k\rho = 0$. In fact, as may be ascertained from the series solution, $H_z \cong (\pi/\psi)$ as $k\rho$ tends to zero. On the other hand, the E_ϕ field for $\psi > 180^\circ$ has a singular behavior as $k\rho$ tends to zero. In fact, E_ϕ varies

according to $(k\rho)^{\frac{\pi}{\psi} - 1}$ as $k\rho \rightarrow 0$. If $\psi > 180^\circ$, the field rises quite sharply right at the apex. This is analogous to an electrostatic fringing effect which occurs in potential fields near sharp edges. On the other hand, if $\psi < 180^\circ$, the E_ϕ field vanishes at the edge.

Another interesting feature of the curves in figures 2a, 2b, 2c, and 2d is the non-symmetry of the fields about $\psi = 180^\circ$. For example, in figure 2b, it is seen that the reflected wave for $\psi = 150^\circ$ is somewhat greater than the case for $\psi = 210^\circ$. For small departure of ψ from 180° , this non-symmetry disappears. In fact, the curve for $\psi = 175^\circ$ is almost symmetrical with the curve for $\psi = 185^\circ$.

3. Graphical Presentation, Case II

In figures 3a, 3b, 3c, 3d, 3e, and 3f, the amplitude of the field components H_z , E_ϕ , and E_ρ is plotted for the plane $\phi = 180^\circ$ for $\psi = 180^\circ, 185^\circ, 190^\circ, 200^\circ, \text{ and } 210^\circ$. As before, $\phi_0 = 0^\circ$. Here the observer is above the wedge surface at $\phi = \psi$. As may be seen from figures 3a and 3b, the $|H_z|$ field diminishes with distance from the apex. The decrease is more pronounced for the large values of ψ . Actually, the asymptotic limit of all these curves (for $\psi > 180^\circ$ and $k\rho \rightarrow \infty$) is 0.5. The curves for $|E_\phi/\eta_0|$ in figures 3c and 3d show a very similar behavior; the only major difference is the expected singular behavior near the apex. The singular effect is evident in the curves for $|E_\rho/\eta_0|$ given in figures 3e and 3f.

4. Graphical Presentation, Case III

In figures 4a, 4b, 4c, and 4d, the amplitude of the fields H_z and E_ϕ are plotted for the plane $\phi = \psi$ for ψ from 150° to 210° . Here, as in case I, the field E_ρ is identically zero. These curves

for the case $\psi > 180^\circ$ clearly show the shadowing effect of the wedge. On the other hand, if $\psi < 180^\circ$, the fields are magnified somewhat because of the upward tilt of the surface $\phi = \psi$. For all values of ψ , the H_z field is finite at the apex where the E_ϕ field has the expected singular behavior.

5. . Remarks Concerning Phase

The phase of the field for the three cases is available from the tabulated data in the appendix. It should be noted that phase is given in radians and is always listed in the range 0 to 2π . Generally, the phase is rapidly varying because a rapidly varying factor of the type $\exp(\pm ik\rho)$ is included. In order to understand the behavior of the phase, one should subtract the rapidly varying portion. For example, in case I, a meaningful quantity is the phase increment of H_z defined by

$$(\text{phase } H_z) - k\rho \text{ ,}$$

Thus, if there were no reflection from the apex (e. g. , $\psi = 180^\circ$), the field H_z at $\phi = 0$ would be equal to $\exp(ik\rho)$. Phase results which are normalized as indicated are illustrated in figures 5a, 5b, 5c, and 5d for $\phi_0 = 0$ and $\phi = 0$. As expected, the phase of H_z at the apex is zero, but for larger values of $k\rho$, an oscillatory pattern is evident. The phase curves for E_ϕ are quite similar except that the phase is finite at the apex.

6. Effective Surface Impedance

In approximate theoretical treatments of wave propagation over undulating surfaces, the boundary conditions are often applied to some reference plane just above the actual surface. In this context,

it is of interest to plot the exact value of the wave impedance normal to the surface $\phi = 180^\circ$ when $\psi > 180^\circ$. Thus, in figures 6a and 6b, the normalized impedance $|\frac{E_\rho}{\eta_0 H_z}|$ is plotted as a function of $k\rho$. Clearly, in the limiting case, $\psi = 180^\circ$, the impedance must be zero as indicated. However, as ψ is increased beyond 180° , it is evident that the impedance is finite and is approximately proportional to $180^\circ - \psi$. The simplified boundary condition proposed by Feinberg [1946] and applied by Wait and Jackson [1963] is equivalent to using

$$\frac{E_\rho}{\eta_0 H_z} = \frac{\psi - 180^\circ}{57.3^\circ} .$$

For example, if $\psi = 190^\circ$, the normalized impedance is 0.174, which is in fair agreement with the curves in figure 6a, except very near the apex, if $k\rho < 3$. If $\psi = 185^\circ$, the agreement is somewhat better and the upper limit of $k\rho$ stretches out to about 6.

Although the simple approximate boundary condition is not valid for the large values of $k\rho$, it may be used for certain approximate field calculations. An illustrative example is shown in figures 7a and 7b where the reflected field at $\phi = 0$ is shown as calculated by both exact and approximate methods. The approximate method would assume that the boundary condition given by the equation holds on $\phi = 180^\circ$ for all values of $k\rho$. Using a method discussed in a previous paper [Wait and Jackson, 1963], the reflected field would be given by

$$E_\phi^{(r)} \cong \frac{1}{2} \left(\frac{\psi - 180^\circ}{57.3^\circ} \right) g(x) \quad \text{where } x = k\rho ,$$

and

$$g(x) = x e^{-ix} \left[H_0^{(2)}(x) + i H_1^{(2)}(x) \right] - i e^{-ix} H_0^{(2)}(x) .$$

In this expression, $H_0^{(2)}$ and $H_1^{(2)}$ are the Hankel functions of the second kind of order zero and one, respectively. The corresponding exact expression for $E_\phi^{(r)}$, on the plane $\phi = 0$, is obtained by subtracting the incident field $\eta_0^{-1} \exp(ik\rho)$ from the expression for the total field given by (4). In this way, we may write

$$E_\phi^{(r)} = \frac{1}{2} \left(\frac{\psi - 180^\circ}{57.3^\circ} \right) g^+(x) \quad \text{for } \psi > 180^\circ,$$

and

$$E_\phi^{(r)} = -\frac{1}{2} \left(\frac{180^\circ - \psi}{57.3^\circ} \right) g^-(x) \quad \text{for } \psi < 180^\circ,$$

where $g^+(x)$ and $g^-(x)$ are derived from the exact series expressions.

The comparative results of $g(x)$ and $g^\pm(x)$ are shown in figures 7a, 7b, 7c, and 7d in an Argand-type plot for $\psi = 185^\circ$, 190° , 175° , and 170° , respectively. It is evident that despite the violation of the assumed boundary conditions in the approximate approach, $g(x)$ is reasonably close to the exact results obtained from $g^\pm(x)$. Physically, this may be attributed to the importance of the region of the reference boundary near the apex. Contributions from the reference boundary far from the apex must tend to cancel one another. It is noted that the curves for $\psi = 185^\circ$ and 175° show a very close similarity between the approximate and exact forms. As the departures of ψ from 180° become greater, the dissimilarities between exact and approximate results become quite noticeable.

7. Concluding Remarks

This detailed numerical study gives some justification for the use of approximate conditions for gently sloping surfaces. In addition, the detailed description of the field near the apex of a wedge has now been made available. The stated purpose of the paper has thus been accomplished.

THE NATIONAL BUREAU OF STANDARDS

The scope of activities of the National Bureau of Standards at its major laboratories in Washington, D.C., and Boulder, Colorado, is suggested in the following listing of the divisions and sections engaged in technical work. In general, each section carries out specialized research, development, and engineering in the field indicated by its title. A brief description of the activities, and of the resultant publications, appears on the inside of the front cover.

WASHINGTON, D. C.

Electricity. Resistance and Reactance. Electrochemistry. Electrical Instruments. Magnetic Measurements. Dielectrics. High Voltage. Absolute Electrical Measurements.

Metrology. Photometry and Colorimetry. Refractometry. Photographic Research. Length. Engineering Metrology. Mass and Volume.

Heat. Temperature Physics. Heat Measurements. Cryogenic Physics. Equation of State. Statistical Physics.

Radiation Physics. X-ray. Radioactivity. Radiation Theory. High Energy Radiation. Radiological Equipment. Nucleonic Instrumentation. Neutron Physics.

Analytical and Inorganic Chemistry. Pure Substances. Spectrochemistry. Solution Chemistry. Standard Reference Materials. Applied Analytical Research. Crystal Chemistry.

Mechanics. Sound. Pressure and Vacuum. Fluid Mechanics. Engineering Mechanics. Rheology. Combustion Controls.

Polymers. Macromolecules: Synthesis and Structure. Polymer Chemistry. Polymer Physics. Polymer Characterization. Polymer Evaluation and Testing. Applied Polymer Standards and Research. Dental Research.

Metallurgy. Engineering Metallurgy. Metal Reactions. Metal Physics. Electrolysis and Metal Deposition.

Inorganic Solids. Engineering Ceramics. Glass. Solid State Chemistry. Crystal Growth. Physical Properties. Crystallography.

Building Research. Structural Engineering. Fire Research. Mechanical Systems. Organic Building Materials. Codes and Safety Standards. Heat Transfer. Inorganic Building Materials. Metallic Building Materials.

Applied Mathematics. Numerical Analysis. Computation. Statistical Engineering. Mathematical Physics. Operations Research.

Data Processing Systems. Components and Techniques. Computer Technology. Measurements Automation. Engineering Applications. Systems Analysis.

Atomic Physics. Spectroscopy. Infrared Spectroscopy. Far Ultraviolet Physics. Solid State Physics. Electron Physics. Atomic Physics. Plasma Spectroscopy.

Instrumentation. Engineering Electronics. Electron Devices. Electronic Instrumentation. Mechanical Instruments. Basic Instrumentation.

Physical Chemistry. Thermochemistry. Surface Chemistry. Organic Chemistry. Molecular Spectroscopy. Elementary Processes. Mass Spectrometry. Photochemistry and Radiation Chemistry.

Office of Weights and Measures.

BOULDER, COLO.

CRYOGENIC ENGINEERING LABORATORY

Cryogenic Processes. Cryogenic Properties of Solids. Cryogenic Technical Services. Properties of Cryogenic Fluids.

CENTRAL RADIO PROPAGATION LABORATORY

Ionosphere Research and Propagation. Low Frequency and Very Low Frequency Research. Ionosphere Research. Prediction Services. Sun-Earth Relationships. Field Engineering. Radio Warning Services. Vertical Soundings Research.

Troposphere and Space Telecommunications. Data Reduction Instrumentation. Radio Noise. Tropospheric Measurements. Tropospheric Analysis. Spectrum Utilization Research. Radio-Meteorology. Lower Atmosphere Physics.

Radio Systems. Applied Electromagnetic Theory. High Frequency and Very High Frequency Research. Frequency Utilization. Modulation Research. Antenna Research. Radiodetermination.

Upper Atmosphere and Space Physics. Upper Atmosphere and Plasma Physics. High Latitude Ionosphere Physics. Ionosphere and Exosphere Scatter. Airglow and Aurora. Ionospheric Radio Astronomy.

RADIO STANDARDS LABORATORY

Radio Standards Physics. Frequency and Time Disseminations. Radio and Microwave Materials. Atomic Frequency and Time-Interval Standards. Radio Plasma. Microwave Physics.

Radio Standards Engineering. High Frequency Electrical Standards. High Frequency Calibration Services. High Frequency Impedance Standards. Microwave Calibration Services. Microwave Circuit Standards. Low Frequency Calibration Services.

Joint Institute for Laboratory Astrophysics-NBS Group (Univ. of Colo.).
