NBS TECHNICAL NOTE 617

Thermophysical Properties of Parahydrogen from the Freezing Liquid Line to 5000 R for Pressures to 10,000 Psia

NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards[1] was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau consists of the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Center for Computer Sciences and Technology, and the Office for Information Programs.

THE INSTITUTE FOR BASIC STANDARDS provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of a Center for Radiation Research, an Office of Measurement Services and the following divisions:

Applied Mathematics—Electricity—Heat—Mechanics—Optical Physics—Linac Radiation[2]—Nuclear Radiation[2]—Applied Radiation[2]—Quantum Electronics[3]—Electromagnetics[3]—Time and Frequency[3]—Laboratory Astrophysics[3]—Cryogenics[3].

THE INSTITUTE FOR MATERIALS RESEARCH conducts materials research leading to improved methods of measurement, standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; and develops, produces, and distributes standard reference materials. The Institute consists of the Office of Standard Reference Materials and the following divisions:

Analytical Chemistry—Polymers—Metallurgy—Inorganic Materials—Reactor Radiation—Physical Chemistry.

THE INSTITUTE FOR APPLIED TECHNOLOGY provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations leading to the development of technological standards (including mandatory safety standards), codes and methods of test; and provides technical advice and services to Government agencies upon request. The Institute also monitors NBS engineering standards activities and provides liaison between NBS and national and international engineering standards bodies. The Institute consists of the following technical divisions and offices:

Engineering Standards Services—Weights and Measures—Flammable Fabrics—Invention and Innovation—Vehicle Systems Research—Product Evaluation Technology—Building Research—Electronic Technology—Technical Analysis—Measurement Engineering.

THE CENTER FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides technical services designed to aid Government agencies in improving cost effectiveness in the conduct of their programs through the selection, acquisition, and effective utilization of automatic data processing equipment; and serves as the principal focus within the executive branch for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Center consists of the following offices and divisions:

Information Processing Standards—Computer Information—Computer Services—Systems Development—Information Processing Technology.

THE OFFICE FOR INFORMATION PROGRAMS promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System; provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world, and directs the public information activities of the Bureau. The Office consists of the following organizational units:

Office of Standard Reference Data—Office of Technical Information and Publications—Library—Office of Public Information—Office of International Relations.

THERMOPHYSICAL PROPERTIES OF PARAHYDROGEN FROM THE FREEZING LIQUID LINE TO 5000 R FOR PRESSURES TO 10,000 PSIA*

Robert D. McCarty and Lloyd A. Weber

Tables of thermophysical properties of parahydrogen are presented for temperatures from the melting line to 5000 R for pressures from 1 to 10,000 psia. The tables include entropy, enthalpy, internal energy, density, volume, speed of sound, specific heat, thermal conductivity, viscosity, thermal diffusivity, Prandtl number and the dielectric constant for 65 isobars. Also included in the isobaric tables are quantities of special utility in heat transfer and thermodynamic calculations: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_V$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V)_T$, $1/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vapor and liquid are given which include all of the above properties, plus the surface tension. Tables for the P-T of the freezing liquid, index of refraction and the derived Joule-Thomson inversion curve are also presented.

Key Words: Density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; hydrogen; index of refraction; Joule-Thomson coefficient; latent heat; melting point; Prandtl number; specific heat; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

1. Introduction

The purpose of this document is to assemble, under a single cover, data on many of the properties of hydrogen commonly used for engineering calculations, over as wide a temperature and pressure range as possible, and present these data in a form convenient to the engineer. All of the data presented here have been critically selected and represent the "best values" for that particular property at this time.

2. Thermodynamic and Related Properties

2.1 PVT Surface

The PVT surface of Roder, et al. (1965), which is based on the experimental data of Goodwin, et al. (1963), was used to calculate all of the thermodynamic and related properties for temperatures below 90 K. The computer program used by Roder, et al. (1965) was modified to allow extrapolation to pressures of 10,000 psi, see Region B, figure 1. For densities greater than 5 lb/ft^3, the representation of the PVT surface by Roder, et al. (1965) was replaced with an empirical equation of state like that previously used for oxygen (Weber, L. A., 1970). This equation is cubic in both temperature and density and fits the experimental data with an average standard deviation of 0.01% in density. An equation of state of the modified Strobridge (1962) type was used to calculate all of the thermodynamic and related properties for temperatures above 100 K. To insure a smooth transition between the two surfaces a weighted average of the low and high temperature surfaces was used between 90 and 100 K. This average was calculated by equation (1).

$$P(\rho,T) = P_{\text{low range}}(\rho,T)\,[(100 - T)/10] + P_{\text{high range}}(\rho,T)\,[1 + (T-100)/10] \qquad (1)$$

The equation of state developed for temperatures above 100 K has not been previously published and will be described here. The equation of state is:

$$\begin{aligned} P_{atm} = {} & \rho R T + (N_1 T + N_2 + N_3/T + N_4/T^2 + N_5/T^4)\rho^2 \\ & + (N_6 T^2 + N_7 T + N_8)\rho^3 + N_9 \rho^4 T \\ & + \rho^3 (N_{10}/T^2 + N_{11}/T^3 + N_{12}/T^4) e^{\gamma\rho^2} \\ & + \rho^5 (N_{13}/T^2 + N_{14}/T^3 + N_{15}/T^4) e^{\gamma\rho^2} \\ & + N_{16}\rho^6 \end{aligned} \qquad (2)$$

where P is in atmospheres, T is in Kelvin, and ρ is in moles per liter. The parameters for equation (2) are given in table 1.

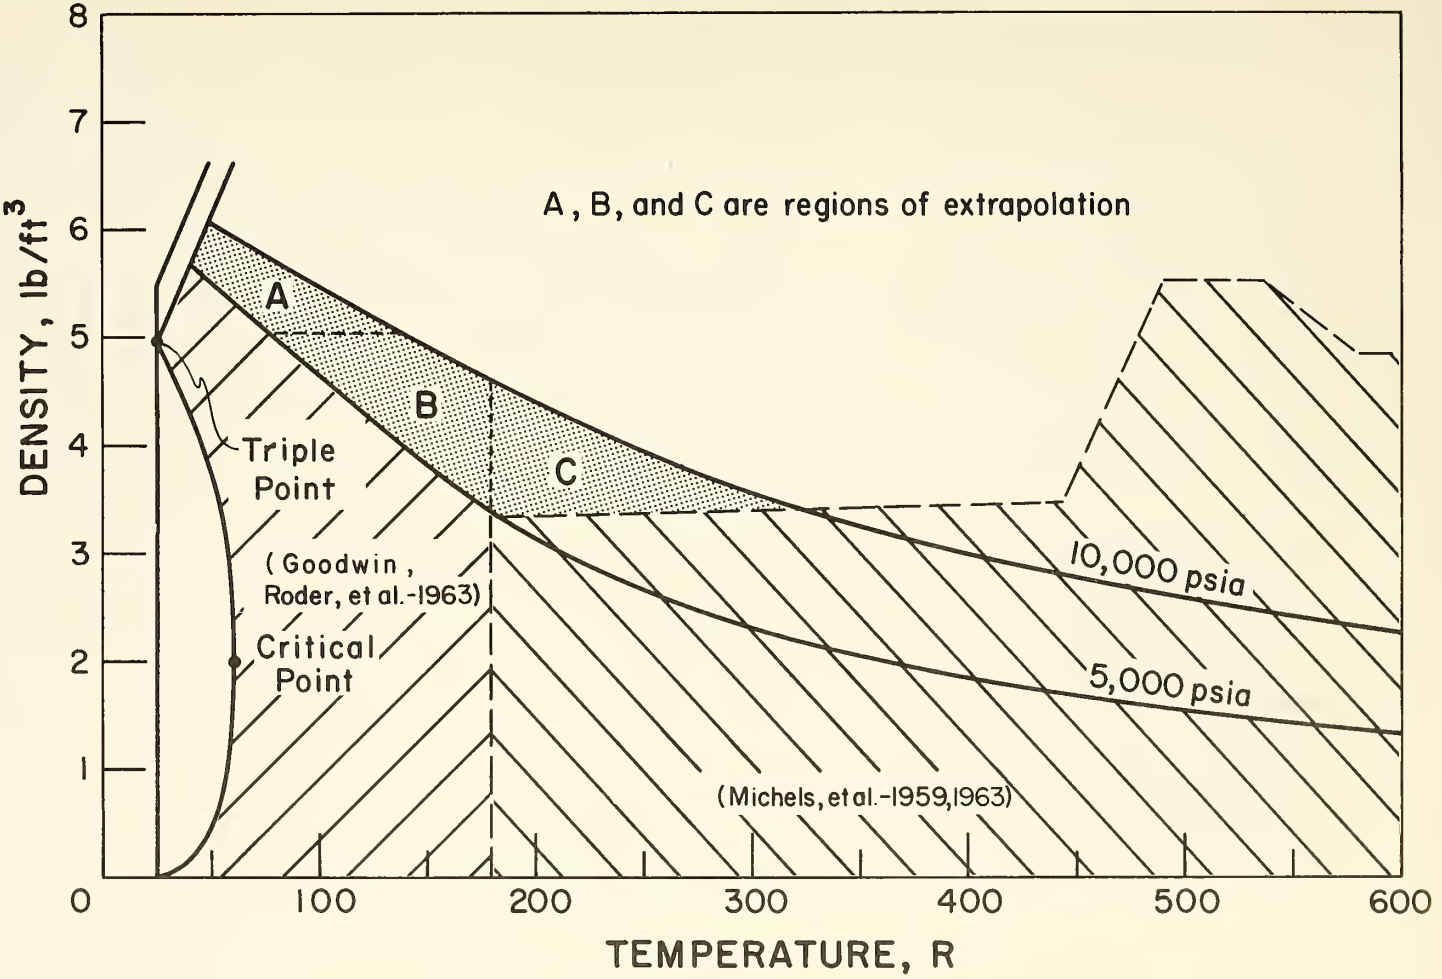

Figure 1. A density-temperature diagram showing regions of experimental data and regions of extrapolation below 600 R.

Table 1. Least squares estimates of parameters N_i in equation (2)

$N_1 = 1.4961551208 \times 10^{-3}$	$N_{10} = -3.1263011903 \times 10^{+1}$
$N_2 = -1.5006828624 \times 10^{-2}$	$N_{11} = 5.3359371204 \times 10^{+2}$
$N_3 = -2.8434013385 \times 10^{+1}$	$N_{12} = 8.8611547530 \times 10^{+4}$
$N_4 = 1.5564502978 \times 10^{+3}$	$N_{13} = 2.0727677845 \times 10^{-1}$
$N_5 = -2.1545800614 \times 10^{6}$	$N_{14} = -2.2517870830 \times 10^{+1}$
$N_6 = -3.5038610714 \times 10^{-8}$	$N_{15} = 6.8278056458 \times 10^{+2}$
$N_7 = 3.8441135632 \times 10^{-5}$	$N_{16} = 4.9195075735 \times 10^{-8}$
$N_8 = 1.4760364722 \times 10^{-3}$	$\gamma = -0.0018$
$N_9 = 9.7378323406 \times 10^{-8}$	$R = 0.0820535$

The PVT data used to estimate the coefficients for equation (2) consisted of the following: the 90 and 100 K isotherms of Roder, et al. (1965) extrapolated to 700 atmospheres; all of the PVT sources used by Woolley, et al. (1948) in their compilation; and all of the isotherms reported by Michels, et al. (1959, 1963). In addition to the PVT data described above, the derivatives $(\partial P/\partial T)_\rho$, $(\partial P/\partial \rho)_T$, the internal energy and C_v data from the extrapolated 90 and 100 K isotherms of Roder, et al. were used in the fit. The internal energy and C_v values of Michels, et al. (1959, 1963) were also used in the fit. As a result of including the internal energy and C_v data of Michels, et al. in the fitting procedure, the disagreement between the calculated internal energies and C_v's and those of Michels, et al. was reduced by an order of magnitude. At 300 K, the maximum disagreement is about 2 BTU/lb in U for pressures less than 10,000 psi.

The highest temperature for the experimental PVT data used in the least squares fit is 673 K. At the time the equation was developed it was desirable to extrapolate the pressures at temperatures to 3000 K. An investigation of the contribution of the second and third virial terms in the equation of state for temperatures from 700 to 3000 K and pressures to 700 atmospheres indicated a strong compensating relationship between the two terms, i.e., if the results of the least squares estimation produced a small second virial for these high temperatures a large third virial resulted, and if the second virial turned out to be too large, the third virial was compensatingly small. Thus the calculated densities from the two extreme situations agreed to within 0.5%.

The uncertainties listed in table 2 are based on the goodness of fit in the region where experimental data exist and upon the variation in calculated density between various extrapolations into regions of pressure and temperature where no experimental data exist. (See figures 1 and 2.)

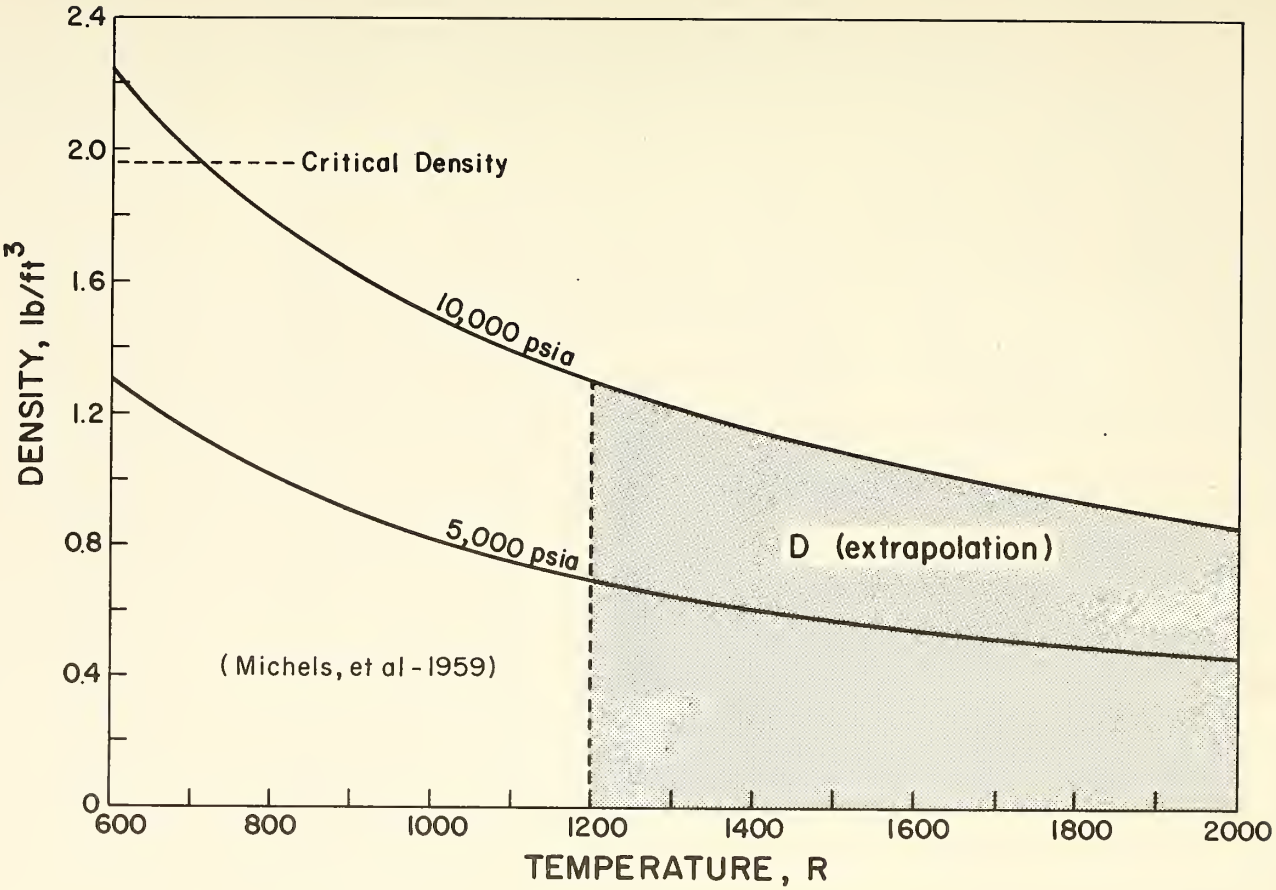

Figure 2. A density-temperature diagram showing regions of extrapolation above 600 R.

Table 2. Uncertainties in the PVT Data

Temperature Range	Pressure Range	Uncertainty in Density
700 - 3000 K	1 - 700 atm	1 % (extrapolation) Region D, figure 2
100 - 700 K	1 - 340 atm	0.5 %
100 - 170 K	340 - 680 atm	1 % (extrapolation) Region C, figure 1
170 - 700 K	340 - 680 atm	0.5 %
13 - 100 K	1 - 340 atm	0.1 % (except critical region)
Critical Region	$T_c \pm 1\%$, $\rho_c \pm 20\%$	6 %
Solid - 100 K	340 - 700 atm	1 % (extrapolation) Regions A and B, figure 1

2.2 Derived Thermodynamic Properties

The enthalpy H, speed of sound W, entropy S, specific heats C_p, C_v, and the internal energy U, were calculated for the lower temperature range directly from the equations taken from Roder, et al. (1965), and should be identical to those of Roder when proper unit conversion is applied. Except in the critical region, ($T_c \pm 1\%$, $\rho_c \pm 20\%$) and the region of extrapolation, the uncertainty in these derived properties calculated from Roder's equations is estimated to be less than 2%. It is difficult to assess the uncertainties of the derived properties in the critical region. For example, the specific heat near the critical point becomes very large but quantitative estimates are not available. In the extrapolated region below 100 K, the uncertainty of the derived properties is estimated to be no greater than 10%. For temperatures between 90 and 100 K, equation (1) was used for each property.

For the high temperature range, $T > 100$ K, the derived thermodynamic properties were calculated by means of the equation of state, equation (2), and the following relationships:

$$S = -R\ell n\left(\frac{\rho RT}{P_o}\right) + \int_{T_o}^{\rho}\left[\frac{R}{\rho} - \frac{1}{\rho^2}\left(\frac{\partial P}{\partial T}\right)_{\rho}\right]d\rho + \int_{o}^{T} C_P^o \frac{dT}{T} \qquad (3)$$

$$H = {}_{T}\int_{o}^{\rho}\left[\frac{P}{\rho^2} - \frac{T}{\rho^2}\left(\frac{\partial P}{\partial T}\right)_{\rho}\right] d\rho + \frac{P}{\rho} - RT + \int_{o}^{T} C_p^o \, dT \qquad (4)$$

$$C_v = C_v^o - {}_{T}\int_{o}^{\rho} \frac{T}{\rho^2}\left(\frac{\partial^2 P}{\partial T^2}\right)_{\rho} d\rho \qquad (5)$$

$$C_P = C_v + T\left(\frac{\partial P}{\partial T}\right)_{\rho}^2 \Big/ \rho^2\left(\frac{\partial P}{\partial \rho}\right)_T \qquad (6)$$

$$W = \left[\left(\frac{C_p}{C_v}\right)\left(\frac{\partial P}{\partial \rho}\right)_T\right]^{\frac{1}{2}} \qquad (7)$$

where P_o is 1 atmosphere and the ideal gas properties, C_p^o and C_v^o are for parahydrogen from Woolley, et al. (1948) who estimates the uncertainty in these properties to be less than 0.3%. The subscript T before the integral signs indicates an isothermal integration.

In all cases the input variable pair was pressure, P, and temperature, T. The uncertainty of the derived properties including the specific heat is estimated to be no more than 2% over the temperature range from 100 to 700 K for pressures less than 350 atmospheres. From 700 to 3000 K the uncertainty of the derived properties is probably no greater than 5%. At the upper limit of the temperature range dissociation is important and has been taken into account. For a detailed description of the dissociation calculations, see Roder, et al. (1972).

At the boundary of the high and low temperature surfaces for pressures below 350 atmospheres the disagreement between the two is no greater than 0.8% in any of the derived properties including specific heat. For pressures above 350 atmospheres the disagreement at the boundary of the high and low temperature surfaces is as much as 3%.

2.3 Related Properties

A number of parameters such as the specific heat input $[\, V(\partial H/\partial V)_P \,]$ are of use to the engineer. Several of the more useful quantities of this kind have been tabulated here for the convenience of the user. These quantities have been derived from the two PVT surfaces described in section 2.1.

Specific heat input

$$\theta = V\left(\frac{\partial H}{\partial V}\right)_P = \rho C_p\left[\left(\frac{\partial P}{\partial \rho}\right)_T \Big/ \left(\frac{\partial P}{\partial T}\right)_V\right] \qquad (8)$$

Energy derivative

$$\Phi = V\left(\frac{\partial P}{\partial U}\right)_v = \frac{V}{C_v}\left(\frac{\partial P}{\partial T}\right)_v \tag{9}$$

Isothermal bulk modulus

$$\alpha = V\left(\frac{\partial P}{\partial V}\right)_T = -\rho\left(\frac{\partial P}{\partial \rho}\right)_T \tag{10}$$

Volume expansivity

$$\beta = \frac{1}{V}\left(\frac{\partial V}{\partial T}\right)_p = \frac{1}{\rho}\left(\frac{\partial P}{\partial T}\right)_\rho \Big/ \left(\frac{\partial P}{\partial \rho}\right)_T \tag{11}$$

2.4 Extrapolations

An immediate need exists in NASA's space shuttle program for hydrogen property data at pressures to 10,000 psia and temperatures to 5000 R. Since no experimental data exist for hydrogen properties over much of this pressure and temperature range, see figures 1 and 2, the existing data were extrapolated to these higher pressures and temperatures to provide interim values until new experimental data become available.

General methods of extrapolation were investigated with varying results. The extrapolations to higher temperatures varied little from method to method; however, the extrapolations to higher densities at the lower temperatures were much more dependent upon the method used. The largest disagreements, as much as 30%, occur in the derived properties such as Cp; however, the various extrapolations of density disagree by as much as 5%. The uncertainty of the tabulated values in appendix E is estimated to be less than the extremes just mentioned because some of the methods of extrapolation were discounted on the basis of behavior which was known to be incorrect. The actual methods used for the calculation of the tabular values varied from region to region and are described in the individual sections. Plots of some of the properties in the high density region of extrapolation are shown here in figures 3 through 8. These plots demonstrate the behavior of the properties in the extrapolated regions and provide a handy reference for the reader.

3. Transport Properties

3.1 Thermal Conductivity

The thermal conductivity values which appear in the tabulations in this document for temperatures below 100 K have been taken from Roder and Diller (1970). The original paper by Roder and Diller does not give interpolation formulas and the calculations necessary for the tabular values appearing here were performed with a computer program furnished by Roder. Roder and Diller (1970) assign an uncertainty of 3% for their measurements. In the range of their experimental data to 150 atmospheres this is a good estimate. The computer routine furnished by Roder was extrapolated to 700 atmospheres. The uncertainty of the thermal conductivity in the extrapolated region below 100 K is estimated to increase from 3% at 150 atmospheres to 10% at 700 atmospheres.

For temperatures of $T > 100$ K the thermal conductivity was calculated using a modified Enskog theory (Hanley, McCarty and Cohen, 1971). The uncertainty of the thermal conductivity calculations in the upper temperature region is estimated as follows. At 100 K and low densities where the calculations may be compared with the experimental data of Roder and Diller (1970) the agreement is very good, i.e., 1%. Comparing the two methods of extrapolation along the 100 K isotherm shows a 2% difference at 100 K and 700 atmospheres of pressure. For temperatures above 100 K no direct comparisons are possible, however, since similar calculations for other gases differ from experimental data by as much as 10%, the uncertainty is estimated to be on the order of 10%.

3.2 Viscosity

In the lower temperature range of $T < 100$ K the viscosities tabulated here are based on the experimental measurements of Diller (1965). These experimental data extend to a maximum of 350 atmospheres at temperatures below 100 K. Diller (1965) suggests using an interpolation formula of the type:

$$\eta = \eta_0 (T) + \eta_E (\rho, T) \tag{12}$$

where $\eta_0 (T)$ is the dilute gas contribution and $\eta_E (\rho, T)$ is called the excess or dense gas contribution. Woolley, et al. (1948) proposes

$$\eta_0 (T) = 8.5558 \left[T^{3/2} / (T + 19.55) \right] \left[(T + 650.39) / (T + 1175.9) \right] \tag{13}$$

for the dilute gas contribution and Diller proposes

$$\eta_E(\rho, T) = A(\rho)\, e^{[B(\rho)/T]} \tag{14}$$

for the excess viscosity contribution. The extrapolation of the functions $A(\rho)$ and $B(\rho)$ as originally published by Diller proved unsatisfactory. Therefore the functions were modified to the following:

$$A(\rho) = \frac{(306.4636\rho - 3350.628\rho^2 + 3868.092\rho^3)}{(1.0 - 18.47830\rho + 110.915\rho^2 + 25.3524\rho^3)} \times 10^{-6} \tag{15}$$

$$B(\rho) = 10.0 + 7.2[(\rho/.07)^6 - (\rho/.07)^{\frac{3}{2}}] - 17.63/e^{58.75(\rho/.07)^3} \tag{16}$$

where T is in Kelvin, ρ is in g/cm^3 and η is in $g/cm\text{-}s \times 10^{-6}$. Diller (1965) estimates the uncertainty of his data to be 0.5%. At the highest densities in the low temperature region of extrapolation the uncertainty in the calculated viscosities could easily reach 10%.

For temperatures of $T > 100$ K, the viscosity was calculated using a modified Enskog theory (Hanley, McCarty and Cohen, 1971). The Enskog theory for viscosity is very similar to that for thermal conductivity and the interested reader is referred to the original publication. The uncertainty of the viscosity calculations in the higher temperature region is estimated as follows. At 100 K where the calculated values may be compared to the experimental data of Diller (1970) the disagreement is about 4% at 5000 psia. Since the Enskog theory is not as accurate for viscosity as it is for thermal conductivity, the uncertainty for the viscosity in the upper temperature range of extrapolation is estimated to be 15%.

4. Surface Tension

Existing experimental data for the surface tension of hydrogen disagree by about 10%. Corruccini (1965a) showed that they could be made to agree by applying corrections to the data. He then combined the older data with additional recent measurements and published the following equation:

$$\gamma = \gamma_o (1 - T/T_c)^{1.065} \tag{17}$$

where γ_o = 5.328 for parahydrogen and 5.369 for normal hydrogen, and T_c = 32.976 K for parahydrogen and T_c = 33.18 for normal hydrogen. The surface tension, γ, is in dyn/cm. The maximum deviation of the experimental data from values calculated from the above equation is 1.3%, the average deviation is approximately 0.6%. No experimental data exist above the normal boiling point.

At the critical temperature, equation (17) is constrained to a value of zero. However, between the critical point and the normal boiling point, experience with other fluids has shown deviations of as much as 5%, expecially for temperatures above T/T_c = 0.8. The values of surface tension which appear in the tabulations were calculated from equation (17).

5. Dielectric Constant

The dielectric constant of a fluid may be calculated from the Clausius-Mossotti equation

$$\frac{\epsilon-1}{\epsilon+2}\frac{1}{\rho} = p \tag{18}$$

where ϵ is the dielectric constant, ρ is the density, and p is the specific polarization, a property of the substance having dimensions of specific volume. Recent measurements of the dielectric constant of parahydrogen by Stewart (1964) are used here. Stewart fit his data to an equation of the form

$$\frac{1}{p} = A + B\rho + C\rho^2 \tag{19}$$

where A = 0.99575, B = -0.09069 and C = 1.1227. The density, ρ, in equation (19) is in units of g/cm^3. Stewart estimates a maximum error of 0.1% in ϵ-1 using equations (18) and (19).

6. Index of Refraction

The refractive index of a non-polar fluid depends on the wavelength of the incident radiation and on the density of the fluid. The dependence on temperature at fixed densities is usually small enough to be neglected. In addition, the dependence on wavelength can be treated independently of the dependence on density. The Cauchy dispersion formula:

$$r_\Lambda = (\rho, \Lambda) = r_\infty(\rho) + \theta_1/\Lambda^2 + \theta_2/\Lambda^4 \tag{20}$$

accurately represents the wavelength dependence of r_Λ (specific refraction). Corruccini (1965b) pointed out the equivalence of the Maxwell's relation

$$\epsilon = n_{\infty}^2 \tag{21}$$

to

$$p = r_{\infty} \tag{22}$$

which allows the calculation of r_{∞} from the polarizability as a function of density, and therefore

$$\frac{1}{p} = \frac{1}{r_{\infty}(\rho)} = 0.99575 - 0.09069\rho + 1.1227\rho^2 \tag{23}$$

where ρ is density in g/cm^3. Combining equation (20) and equation (23) Corruccini (1965b) found $\theta_1 = 0.7799569 \times 10^6$ and $\theta_2 = 0.495126 \times 10^{12}$. The specific refraction (r_Λ) is in cm^3/g, density is in g/cm^3, and the wavelength (Λ) is in Å. Values of the index of refraction in Table 3 have been calculated from equations (20), (23) and (24)

$$r_\Lambda = \frac{n^2 - 1}{n^2 + 2} \cdot \frac{1}{\rho} . \tag{24}$$

A comparison between Diller's (1968) experimentally determined indices of refraction and those calculated using the method outlined by Corruccini (1965b) agree to about 0.1% except near the critical point where the densities are uncertain. Figure 9 shows the variation of n with wavelength and density.

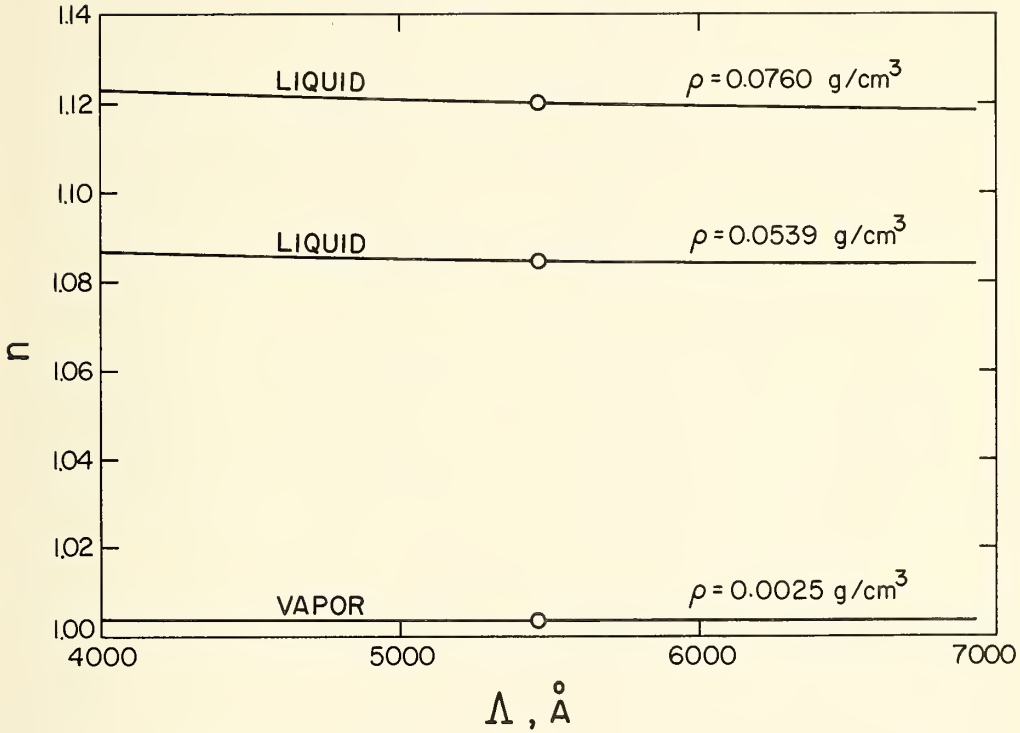

Figure 9. Index of refraction, n, as a function of density and wavelength. The points are experimental values from Diller (1968) at a wavelength of 5462 Å.

Table 3 Index of refraction of saturated liquid parahydrogen at three wavelengths

Temperature, K	Wavelength 4358 Å n	5462 Å n	6939 Å n
15	1.1222	1.1204	1.1191
16	1.1208	1.1189	1.1177
17	1.1192	1.1174	1.1162
18	1.1176	1.1158	1.1146
19	1.1159	1.1141	1.1129
20	1.1141	1.1124	1.1112
21	1.1123	1.1106	1.1095
22	1.1103	1.1086	1.1075
23	1.1082	1.1065	1.1054
24	1.1059	1.1042	1.1032
25	1.1034	1.1018	1.1008
26	1.1007	1.0991	1.0981
27	1.0977	1.0962	1.0952
28	1.0944	1.0929	1.0920
29	1.0906	1.0892	1.0883
30	1.0862	1.0849	1.0840

7. Thermal Diffusivity

The thermal diffusivity of a fluid is defined as

$$\alpha = \lambda/(\rho \cdot C_p) \tag{25}$$

where α is the thermal diffusivity, λ is the thermal conductivity, and C_p is the specific heat at constant pressure. The tabulations of thermal diffusivity in appendices D and E have been calculated using the above equation and the ρ, λ and C_p in the tables. The maximum uncertainty of α is estimated 10% except in the critical region and the regions of extrapolation.

8. Prandtl Number

The Prandtl number, Pr, is frequently used in engineering calculations and is defined as:

$$Pr = C_p \eta/\lambda \tag{26}$$

where C_p is the specific heat at constant pressure, η is the viscosity, and λ is the thermal conductivity. The tabulations of the Prandtl number in appendices D and E have been calculated from equation (26) using values of η, λ and C_p from the adjacent entries in the tables. Since Pr is a function of both η and λ, the uncertainty in Pr could be as much as 15% except in the regions of extrapolation.

9. Joule-Thomson Inversion Curve

The Joule-Thomson coefficient for a fluid is defined as

$$J = \left(\frac{\partial T}{\partial P}\right)_H \tag{27}$$

The locus of points where J = 0 is called the Joule-Thomson inversion curve. The inversion curve state points in Table 4 were calculated using the relationship:

$$T\left(\frac{\partial P}{\partial T}\right)_\rho = \rho\left(\frac{\partial P}{\partial \rho}\right)_T \tag{28}$$

Table 4 Joule-Thomson inversion curve

Temperature		Pressure		Density	
K	R	atm	psia	$mol/cm^3 \times 10^3$	lb_m/ft^3
28	50.4	9.87	145.1	30.06	3.783
29	52.2	15.05	221.2	29.90	3.763

10. The Melting Line

The melting curve for parahydrogen is reported by Goodwin (1962). The values given in Table 5 for T < 25 K were calculated from:

$$P_{atm} = P_t + (T - T_t)[A_1 e^{-\alpha/T} + A_2 T] \quad (29)$$

where P_t (the triple point pressure) is 0.0695 atm, T_c (the triple point temperature) is 13.803 K, $A_1 = 30.3312$, $A_2 = 2.0/3.0$ and $\alpha = 5.693$. No data for pressures higher than 312.23 atmospheres were included in the determination of the above parameters. For temperatures above 22 K, the equation from Mills and Grilly (1955) was used

$$P_{kg/cm^2} = -270.52 + 2.53487 T^{1.764739} \quad (30)$$

where T is in K and P is in kg/cm^2. At T = 22 K the calculated pressures from the equations (29) and (30) disagree by less than 0.1%. At low temperature, i.e., T = 14 K, equation (30) becomes negative. At T = 50 K calculated pressures disagree by about 0.25%.

Table 5 Melting line for parahydrogen

Temperature		Pressure		Density	
K	R	atm	psia	$mol/cm^3 \times 10^3$	lb_m/ft^3
14	25.2	5.89	86.5	38.38	4.830

11. Summary

The objective of the previous sections was: to describe how the calculations were performed in assembling the property tables, and to document the references used in preparing this document. In some cases, where the procedures of particular calculations have previously been documented in great length and detail, these descriptions were not repeated here.

In addition an uncertainty was assigned to every property where it was possible. Uncertainty is defined here to be an estimate of accuracy of a 95% confidence level. These assessments are given in the text of the section or subsection concerned with that property. Finally, the number of digits in the tables of appendices D and E should not be taken as an indication of the accuracy of the number. The tabulations are a direct copy of computer printouts where often more digits for a property are present than its accuracy justifies.

The preparatory work which went into the calculation of these tables has solved some of the existing problems with the PVT surface for hydrogen. In the past all attempts to join a high temperature PVT surface with the PVT surface of Roder, et al. (1965) at 100 K has been thwarted by the problem of discontinuities in the derived thermodynamic properties which were too large to allow a mechanical smoothing such as equation (1). Also the disagreement of the derived thermodynamic properties calculated by an equation of state such as equation (2) with older calculations such as Woolley, et al. (1948) was too large to be attributed to randomness in the data. Both of these problems were solved by including in the least squares fitting procedures the actual values of the derived thermodynamic properties in question.

Certain other problems which exist with the PVT surface of hydrogen were not solved and any future work should be aware of these problems. First, the hydrogen fixed points given here have not been corrected to the IPTS 68 temperature scale. Second, there is an apparent error in the densities near the critical point. This error may be as much as 6%, and it would seem that recent dielectric constant and index of refraction measurements offer a possibility of correcting this error. Third, there exists a disagreement of about 0.3% in density and 15 J/mol in enthalpy between Michels, et al. (1959, 1963) and Roder, et al. (1965). All efforts to explain this difference have not provided clear cut evidence for choosing one source in preference to the other.

Appendix A, List of Symbols and Units

The calculation of the tables and properties presented here was performed in many different systems of units, and converted to engineering units at the very end of the calculations; therefore the reader is cautioned to pay particular attention to the units when consulting individual sections of this document. All conversion factors have been taken from the National Aeronautics and Space Administration Report Number SP-7012 (Mechtly 1964).

R = gas constant, 5.32328 ft^3 - psia/lb_m-R

P = pressure, psia

V = specific volume, ft^3/lb_m

T = absolute temperature, degrees Rankine

ρ = density, lb_m/ft^3

C_p = specific heat at constant pressure, BTU/lb_m-R

C_v = specific heat at constant volume, BTU/lb_m-R

S = entropy, BTU/lb_m-R

H = enthalpy, BTU/lb_m

U = internal energy BTU/lb_m

W = speed of sound, ft/s

$(\partial P/\partial T)_\rho$ = isochore derivative, psia/R

$(\partial P/\partial \rho)_T$ = isotherm derivative, ft^3-psia/lb_m

θ = specific heat input, BTU/lb_m

Φ = energy derivative, psia ft^3/BTU

α = isothermal bulk modulus, psia

β = volume expansivity, 1/R

n = index of refraction, dimensionless

r = specific refraction, ft^3/lb_m

Pr = Prandtl number, dimensionless

p = specific polarizability, ft^3/lb_m

J = Joule-Thomson coefficient, R/psia

λ = thermal conductivity, BTU/ft-hr-R

η = viscosity, lb_m/ft-s

ϵ = dielectric constant, dimensionless

γ = surface tension, lb_f/in

Λ = wavelength, angstrom

$\propto$ = thermal diffusivity, ft^2/hr

Appendix B, Fixed Points

Critical Point

P_c = 187.51 psia (12.759 atm)

T_c = 59.357 R (32.976 K)

ρ_c = 1.962 lb_m/ft^3 (0.01559 mol/cm^3)

Normal Boiling Point

P = 14.696 psia (1 atm)

T = 36.482 R (20.268 K)

ρ_{gas} = 0.08351 lb_m/ft^3 (0.0006636 mol/cm^3)

ρ_{liquid} = 4.419 lb_m/ft^3 (0.03511 mol/cm^3)

Triple Point

P = 1.021 psia (0.0695 atm)

T = 24.845 R (13.803 K)

ρ_{gas} = 7.84×10^{-3} lb_m/ft^3 (6.23×10^{-5} mol/cm^3)

ρ_{liquid} = 4.808 lb_m/ft^3 (0.038207 mol/cm^3)

Appendix C, Conversion Factors

Temperature	1.8 R = 1 K
Pressure	14.695949 psia = 1 atm = 1.01325×10^5 N/m^2
Specific Volume	0.00794590 ft^3/lb_m = 1 cm^3/mol
Internal Energy, Enthalpy	0.213405 BTU/lb_m = 1 J/mol

15. SUPPLEMENTARY NOTES

16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.)

Tables of thermophysical properties of para hydrogen are presented for temperatures from the melting line to 5000 R for pressures from 1 to 10,000 psia. The tables include entropy, enthalpy, internal energy, density, volume, speed of sound, specific heat, thermal conductivity, viscosity, thermal diffusivity, Prandtl number and the dielectric constant for 65 isobars. Also included in the isobaric tables are quantitites of special utility in heat transfer and thermodynamic calculations: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_V$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V)_T$, $1/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vapor and liquid are given which include all of the above properties, plus the surface tension. Tables for the P-T of the freezing liquid, index of refraction and the derived Joule-Thomson inversion curve are also presented.

17. KEY WORDS (Alphabetical order, separated by semicolons) Density; dielectric constant; enthalpy; entropy; equation of state; fixed points; heat transfer coefficients; hydrogen; index of refraction; Joule-Thomson; latent heat; melting point; Prandtl number; specific heat; speed of sound; surface tension; thermal conductivity; thermal diffusivity; vapor pressure; viscosity; volume.

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, and chemistry. Comprehensive scientific papers give complete details of the work, including laboratory data, experimental procedures, and theoretical and mathematical analyses. Illustrated with photographs, drawings, and charts. Includes listings of other NBS papers as issued.

Published in two sections, available separately:

• Physics and Chemistry

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, $9.50; $2.25 additional for foreign mailing.

• Mathematical Sciences

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, $5.00; $1.25 additional for foreign mailing.

TECHNICAL NEWS BULLETIN

The best single source of information concerning the Bureau's measurement, research, developmental, cooperative, and publication activities, this monthly publication is designed for the industry-oriented individual whose daily work involves intimate contact with science and technology—*for engineers, chemists, physicists, research managers, product-development managers, and company executives.* Includes listing of all NBS papers as issued. Annual subscription: Domestic, $3.00; $1.00 additional for foreign mailing.

Bibliographic Subscription Services

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau: Cryogenic Data Center Current Awareness Service (weekly), Liquefied Natural Gas (quarterly), Superconducting Devices and Materials (quarterly), and Electromagnetic Metrology Current Awareness Service (monthly). Available only from NBS Boulder Laboratories. Ordering and cost information may be obtained from the Program Information Office, National Bureau of Standards, Boulder, Colorado 80302.

NONPERIODICALS

Applied Mathematics Series. Mathematical tables, manuals, and studies.

Building Science Series. Research results, test methods, and performance criteria of building materials, components, systems, and structures.

Handbooks. Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications. Proceedings of NBS conferences, bibliographies, annual reports, wall charts, pamphlets, etc.

Monographs. Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

National Standard Reference Data Series. NSRDS provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated.

Product Standards. Provide requirements for sizes, types, quality, and methods for testing various industrial products. These standards are developed cooperatively with interested Government and industry groups and provide the basis for common understanding of product characteristics for both buyers and sellers. Their use is voluntary.

Technical Notes. This series consists of communications and reports (covering both other-agency and NBS-sponsored work) of limited or transitory interest.

Federal Information Processing Standards Publications. This series is the official publication within the Federal Government for information on standards adopted and promulgated under the Public Law 89–306, and Bureau of the Budget Circular A–86 entitled, Standardization of Data Elements and Codes in Data Systems.

Consumer Information Series. Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

CATALOGS OF NBS PUBLICATIONS

NBS Special Publication 305, Publications of the NBS. 1966-1967. When ordering, include Catalog No. C13.10:305. Price $2.00; 50 cents additional for foreign mailing.

NBS Special Publication 305, Supplement 1, Publications of the NBS, 1968-1969. When ordering, include Catalog No. C13.10:305/Suppl. 1. Price $4.50; $1.25 additional for foreign mailing.

NBS Special Publication 305, Supplement 2, Publications of the NBS, 1970. When ordering, include Catalog No. C13.10:305/Suppl. 2. Price $3.25; 85 cents additional for foreign mailing.

Order NBS publications (except Bibliographic Subscription Services) from: Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.
