CIRCULAR OF THE NATIONAL BUREAU OF STANDARDS C101 [(ed. 2)]

Physical Properties of Materials: I. Strengths and Related
Properties of Metals and Wood

ANNOUNCEMENT

Circular 101 (2d edition) of April 23, 1924, entitled Physical Properties of Materials: I. Strength and Related Properties of Metals and Wood, has been out of print for some months.

The properties of materials are of the utmost value to technicians. They are working factors in design, construction, and use—they are the real objects purchased, sold, and used.

Since it does not seem probable that a revision can be made in the near future, and in view of the continuing persistent demand, it was decided to reprint the second edition of the Circular with no change and to issue this Supplement, containing certain corrections and giving some additional or substitute data.

The sources of the data are cited for each item. The sources include journals, specifications, Bureau work, and manufacturers' records.

LYMAN J. BRIGGS, *Director*.

February 12, 1937.

Reference book not to be
taken from the Library.

Aluminum: ³ Pure— Al, 99.3.....	2.70	5.6-6.3	8.8-10.6	8,000- 9,000	12,500- 15,000	10-40	20-30	650 (1,218° F)	(168)
Normalized, me- chanically worked and annealed at 400° C (752° F), Cast, sand.....		6.0	7.7-9.1	8,500	11,000- 13,000	15-25	4-23-28	4-6	(168)

Copper (Inyite)— Cu, 7.0-8.5; other elements not over 1.7; Al, balance, ⁹	Not over 2.89		14.8- 19.7		21,000- 28,000				(168)
Cu, 9.25-10.75; other elements not over 2.0; Al, balance, ⁹ 10	Not over 2.95		14.8- 19.7		21,000- 28,000				(168)
Cu, 11.5-13.5; other elements not over 1.7; Al, balance.	Not over 2.97		13.4		19,000				(168)

See footnotes at end of table.

TABLE 2.—Tensile requirements of sheet aluminum

(Navy Department Specifications 47A2, Nov. 1, 1926)

Condition	Thickness in.	Tensile strength		Elongation in 2 inches Percent
		kg/mm ²	lb/in. ²	
Soft.....	0.258 to 0.051.....	8.4	12,000	30
	.051 to .032.....	8.4	12,000	25
	.032 to .020.....	8.4	12,000	20
	.020 to .013.....	8.4	12,000	15
Medium hard.....	.162 to .051.....	11.2	16,000	7
	.051 to .032.....	11.2	16,000	5
	.032 to .020.....	11.2	16,000	4
	.020 to .013.....	11.2	16,000	3
Hard.....	.102 to .051.....	15.5	22,000	4
	.051 to .032.....	16.9	24,000	3
	.032 to .020.....	18.3	26,000	2
	.020 to .013.....	21.1	30,000	1

NOTE.—Bend test specimens cut from either soft or medium hard sheet, either parallel with or transversely to the direction of final rolling, shall withstand cold bending flat on themselves without cracking. The bend test is not required for the hard temper. From sheets of soft or hard temper, the specimens may be cut in any direction of the sheet; from sheets of medium hard temper, the specimens shall be cut with the major axis parallel to the direction of final rolling.

ADDITIONS AND CORRECTIONS TO CIRCULAR 101

(The citations below refer to the page numbers in Circular 101, 2d edition)

Page	Addition or correction
22.....	The materials "copper (duralumin, alloy H)" and "copper (duralumin, alloy D)" were heat treated and not soft as stated. National Bureau of Standards measurements in 1924 gave 22 to 24×10^{-3} (per 1° C) as the linear coefficient of expansion of "copper (duralumin)". The reference number given for this material should be deleted.
23.....	According to a letter from the Aluminum Co. of America, dated July 15, 1926, the most advantageous heat treatment for copper (duralumin) is water quenching at 504 to 516° C (940 to 960° F).
24.....	Delete the results for the aluminum-copper-tin alloys.
25.....	Delete footnotes 14 and 16.
26.....	The tensile strengths quoted for aluminum-silicon (Alpax) can be obtained by a special process according to a letter from the Aluminum Co. of America, dated July 15, 1926.
32.....	At bottom of column 18, delete reference number 170. The number 109 just above should read 169. Delete footnote references in columns 2 and 3.
33.....	Delete reference numbers 109 and 170. Substitute reference 169. Delete footnote references in first column. In footnote 40, "12,1500" should read "121,500". Delete footnotes 47 and 48.
34.....	Footnote 50, delete "modulus of elasticity of cast copper, 7,700 kg/mm ² (11,000,000 lb/in ²)". In column 18, delete reference 168.
41.....	Last column, substitute reference 92 for reference 169.
44.....	Column 18, substitute reference 169 for reference 42.
53.....	Delete the data for "Tin, zinc (Gov. bronze or USN gun bronze or admiralty gun metal)". Delete footnotes 63 and 64.
62.....	The third material should be Cu, 70; Zn, 27; Pb, 2; Sn, 1.
72.....	The specific gravity of glucinum, or beryllium, as it is now called, is 1.86, according to a determination at the National Bureau of Standards, in 1927. Substitute reference 174 for 51, in column 18.
85.....	Footnote "16" should read "10".
86.....	Delete footnote reference 4 in first column.
87.....	Delete footnote 4. In footnote 14, the centigrade equivalent of 1,700° F is 928° C.
89.....	Footnote 21, first line, substitute "pearlite" for "perlite".
123.....	Substitute the following for footnote 43: "General appearance of lead; may be cast, rolled, or extruded; specific gravity and melting point close to those of lead; has metallic ring of bell metal; not as brittle as antimonial lead; pronounced increase in hardness upon aging; aging accelerated by steam heat; excellent structure, free from blowholes, and has low coefficient of friction." Substitute "Frary Metal" for "Ulco Metal" as the designation of the table at the bottom of the page.
125.....	Delete footnote reference on pure cold-rolled nickel. Add on next line below, "Pure 61".
130.....	Specific gravity of tantalum should read 16.6.

ADDITIONS AND CORRECTIONS TO CIRCULAR 101—Con.

Page	Addition or correction																																																		
136.....	<p>The following experimental relationships¹ were derived at the National Bureau of Standards for Brinell and Rockwell numbers and for tensile strength of steel:</p> $Bn = \frac{7,300}{130 - 100R_{B\ 1/16}} \text{ for } 100R_{B\ 1/16} > 40 \text{ but } < 100$ $Bn = \frac{3,710}{130 - 100R_{B\ 1/8}} \text{ for } 100R_{B\ 1/8} > 30 \text{ but } < 100$ $Bn = \frac{1,520,000 - 4,500R_C}{(100 - 150R_C)^2} \text{ for } 150R_C > 10 \text{ but } < 40$ $Bn = \frac{25,000 - 10(57 - 150R_C)^2}{100 - 150R_C} \text{ for } 150R_C > 40 \text{ but } < 70$ $Tns. \text{ str. (lb/in.}^2) = \frac{4,750,000 - 12,000R_{B\ 1/16}}{130 - 100R_{B\ 1/16}} \text{ for } 100R_{B\ 1/16} > 82 \text{ but } < 100$ $Tns. \text{ str. (lb/in.}^2) = \frac{10^6(7,000 - 10R_C)}{(100 - 150R_C)^2} \text{ for } 150R_C > 10 \text{ but } < 40$ <p>in which: $_{100}R_{B\ 1/16}$ = Rockwell B number, ball $\frac{1}{16}$ in. diameter, load 100 kg. $_{100}R_{B\ 1/8}$ = Rockwell B number, ball $\frac{1}{8}$ in. diameter, load 100 kg. $_{150}R_C$ = Rockwell C number, brale, load 150 kg.</p>																																																		
139.....	In figure 60, these same steels are identified as nos. 1 to 8, corresponding to the serial order in the table.																																																		
149.....	The tensile strength given for tin, annealed at 50° C (122° F) is 10 times too great. The corrected table should read:																																																		
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2" style="text-align: center;">Metal</th> <th colspan="2" style="text-align: center;">Temperature</th> <th colspan="2" style="text-align: center;">Tensile strength</th> <th style="text-align: center;">Elongation</th> <th style="text-align: center;">Reduction of area</th> </tr> <tr> <th style="text-align: center;">° C</th> <th style="text-align: center;">° F</th> <th style="text-align: center;">kg/mm²</th> <th style="text-align: center;">lb/in.²</th> <th style="text-align: center;">Percent</th> <th style="text-align: center;">Percent</th> </tr> </thead> <tbody> <tr> <td rowspan="7" style="text-align: left;">Tin, annealed at 50° C (122° F)-----</td> <td style="text-align: center;">20</td> <td style="text-align: center;">68</td> <td style="text-align: center;">2.75</td> <td style="text-align: center;">3,910</td> <td style="text-align: center;">40</td> <td style="text-align: center;">74</td> </tr> <tr> <td style="text-align: center;">53</td> <td style="text-align: center;">127</td> <td style="text-align: center;">1.75</td> <td style="text-align: center;">2,490</td> <td style="text-align: center;">45</td> <td style="text-align: center;">72</td> </tr> <tr> <td style="text-align: center;">100</td> <td style="text-align: center;">212</td> <td style="text-align: center;">1.05</td> <td style="text-align: center;">1,490</td> <td style="text-align: center;">45</td> <td style="text-align: center;">82</td> </tr> <tr> <td style="text-align: center;">153</td> <td style="text-align: center;">307</td> <td style="text-align: center;">0.65</td> <td style="text-align: center;">925</td> <td style="text-align: center;">41</td> <td style="text-align: center;">97</td> </tr> <tr> <td style="text-align: center;">180</td> <td style="text-align: center;">356</td> <td style="text-align: center;">.45</td> <td style="text-align: center;">640</td> <td style="text-align: center;">10</td> <td style="text-align: center;">12</td> </tr> <tr> <td style="text-align: center;">207</td> <td style="text-align: center;">405</td> <td style="text-align: center;">.25</td> <td style="text-align: center;">355</td> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> </tr> </tbody> </table>	Metal	Temperature		Tensile strength		Elongation	Reduction of area	° C	° F	kg/mm ²	lb/in. ²	Percent	Percent	Tin, annealed at 50° C (122° F)-----	20	68	2.75	3,910	40	74	53	127	1.75	2,490	45	72	100	212	1.05	1,490	45	82	153	307	0.65	925	41	97	180	356	.45	640	10	12	207	405	.25	355	0	0

¹ National Bureau Standards Research Paper RP185.

Additions and Corrections.

- p. 17 two last lines. For ref. 11 read 63.
p. 19 line 1. For ref. 166 read 168.
pp 32 and 33 drop out footnotes 34, 47 and 48. For ref. 109, 170 read 169.
p. 34 line 7. For ref. 168, 170 read 170.
p. 34, footnote 50. Drop out "modulus of elasticity of cast copper 7,700 kg/mm² (11,000,000 lb./in.²)"
p. 41 lines 1 and 2. For ref. 169 read 92.
p. 44 lines 1-5. For ref. 42 read 169.
p. 72 line 12. For ref. 51 read 174.
p. 85, Note. Insert "of" after "reduction."
p. 86 and 87 Drop out footnote 4.
p. 87 footnote 14. For 938 read 928.
p. 91 footnote 25. Insert(after "Upton".
p. 101, Carbon steel. Insert comma after "maximum."
p. 125 line 4. Drop out footnote 61 after "Pure"
p. 125 line 5, Column 1, Insert "Pure 61"
p. 128 line 9. Drop out "Ni-67;Cu-29;Fe-3;Mn-1;Si, S, C, Co
p. 139, table 20. Insert numbers 1 to 8 opposite the names of steels.
p. 151, table 30, column 4. For "estimated time at load..." read "Time at load..."
p. 153, Fig. 46. For "...0.055; in." read "...0.055 in."
p. 199. Drop out "Aluminum - Ti....41"
p. 200 For "Brazin" read "Brazing."
p. 202 For "Stainless steel, effect of temperatures" read "Stainless steel, effect of temperature."
p. 202 Steel, Cr, effect of temperature. For 156 read 158.
p. 203 Steel, Cr, V, effect of drawing temperature. For 101 read 110.
