BUREAU OF STANDARDS

Washington

BUREAU CIRCULAR NO. 19

August 1, 1909.

The wide application of hydrometers as measuring instruments in the collection of revenues, in commerce, and in the industries makes it very important to define the various scales of indication of these instruments in terms of fundamental units.

The confusion and discordance heretofore resulting from the use of various insufficiently defined hydrometer scales, and the lack of opportunity for verifying standards on a uniform basis, led the bureau to investigate the problems connected with hydrometry and to compile standard density tables for definition of hydrometer scales.

In Bureau Circular No. 16 the conditions are announced under which the testing of hydrometers will be conducted, and specifications are given as to the construction, standardization, and accuracy required for hydrometers in order that they be approved as precision instruments.

The present circular comprises the density tables which have been adopted for definition of hydrometer scales, auxiliary tables which have been prepared for reduction of hydrometer readings, tables for computation of volumetric capacity, and others of similar nature giving physical constants for which the bureau receives frequent inquiries.

S. W. STRATTON,
Director.

Approved:

ORMSBY MCHARG,
Acting Secretary.

 $* D_{\frac{4}{4}}^{15} = \text{Density at } 15^\circ \text{ C. referred to water at } 4^\circ \text{ C. as unity.}$

The basis for the preparation of the above table is the experimental work of Mendelejeff.² His calculated values have been supplemented for the purpose of interpolation by the use of Formulas XIII and XV, derived by him. The series of values thus obtained have been corrected for the difference between the values of the density of water assumed by Mendelejeff and those accepted at the present time. They have further been corrected so that the temperatures apply to the scale of the International Hydrogen Thermometer. For this purpose the temperature scale of the thermometer used by Mendelejeff as a standard has been assumed equivalent to that of Geissler thermometer No. 1856, investigated by Fr. Grutzmacher,³ both thermometers being by the same maker apparently at about the same time, and hence very probably differing from the hydrogen scale by approximately the same amount.

Table 3.—Density of Mixtures (by weight) of Ethyl Alcohol and Water at $\frac{20}{4^{\circ}}$ C.

[This table is derived by interpolation from Table 2, based upon the experimental data of Mendelejeff.]

Table 3.—Density of Mixtures (by weight) of Ethyl Alcohol and Water at $\frac{20}{45}$ ° C.—Cont'd.

Table 4.—Specific Gravity of Mixtures (by volume) of Ethyl Alcohol and Water at
 60° F. ($15^{\circ}56$ C.).

[This table, derived by calculation and interpolation from Table 2, based on the experimental data of Mendelejeff, is the basis for standardizing hydrometers graduated to indicate per cent of alcohol by volume.]

Per Cent Alcohol by Volume at 60° F.	Tenths of Per Cent

Table 7.—Temperature Corrections to Saccharometer Readings (Standard at 20° C.).

[This table is calculated using the data on thermal expansion of sugar solutions by Plato,⁴ assuming the instrument to be of Jena 16^{III} glass. The table should be used with caution and only for approximate results when the temperature differs much from the standard temperature or from the temperature of the surrounding air.]

Temper- ature in Degrees Centi- grade	Observed Per Cent of Sugar

⁶ Wissenschaftliche Abhandlungen der Kaiserlichen Normal-Eichungs-Kommission, vol. 5, p. 131, 1900.

Table 10.—Temperature Corrections to Per Cent of Sulphuric Acid Determined by Hydrometer (Standard at 20° C.).

[Calculated from the same data as the preceding table, assuming Jena 16III glass as the material used. The table should be used with caution, and only for approximate results when the temperature differs much from the standard temperature or from the temperature of the surrounding air.]

Table II.—Degrees Baumé Corresponding to Specific Gravities at 60° F. (15°56 C.) Greater than 1.

Calculated from the formula,

$$\text{Degrees Baumé} = 145 - \frac{145}{D_{60^\circ\text{F.}}}$$

which defines the Baumé scale, in general use in the United States, for liquids heavier than water.

$D_{15.56^\circ\text{C.}}$	0	1	2	3	4	5	6	7	8	9	Diff.
1.00	0.000	0.145	0.289	0.434	0.578	0.721	0.865	1.008	1.151	1.293	143

Table II.—Degrees Baumé Corresponding to Specific Gravities at 60° F. (15.56 C.)
Greater than 1—Continued.

Table 12.—Degrees Baumé Corresponding to Specific Gravities at 60° F. (15°56 C.)
Less than 1.

Calculated from the formula,

$$\text{Degrees Baumé} = \frac{\frac{140}{60^\circ} - 130}{D_{60^\circ} F}.$$

which defines the Baumé scale, in general use in the United States, for liquids lighter than water.

Table 13.—Conversion of Density Basis.

Prepared for use in reducing readings of a hydrometer graduated to indicate density or specific gravity at a specified standard temperature, T, referred to water at a specified temperature, T', as unity, to the basis of another standard temperature, t, and reference temperature, t'.

The factor Δ (given in units of the sixth decimal place), multiplied by the density or specific-gravity reading, gives the correction to be applied to the reading to reduce it to the required basis.

For example, if a maker using standards indicating $D_{15^{\circ}56}^{15^{\circ}56}$ C. wishes to graduate a hydrometer to indicate density at 20° C. referred to water at 4° C. (D_4^{20}), the readings of the standard must be corrected by use of the factor + .001062.

Suppose the standard reads 1.5760

The corresponding correction is $1.6 \times .001062 =$ +0.0017

Corrected reading 1.5777

The table is calculated for Jena 16^{III} glass.

Given Basis of Density Reading	Required Basis of Density							
	$\frac{t}{t'}$							
	$\frac{20}{4}$	$\frac{17.5}{4}$	$\frac{15.56}{4}$	$\frac{15}{4}$	$\frac{15}{15}$	$\frac{15.56}{15.56}$	$\frac{17.5}{17.5}$	$\frac{20}{20}$

Table 15.—Buoyancy Constants (mg/cm³).

[Difference in milligrams between the mass and the apparent weight of 1 cubic centimeter of water weighed with brass weights ($d=8.4$) in air at various temperatures and barometer readings (unreduced). A humidity of 50 per cent saturation is assumed. To find the weight of 1 cubic centimeter of air under the conditions assumed in this table, multiply the buoyancy constant by 1.135 (42/37).]

Pressure	Temperature in Degrees Centigrade			
	15	20	25	30
Observed Pressure in Millimeters				
720	1.017	0.998	0.979	0.960

780	1.102	1.081	1.061	1.041

Table 16.—Apparent Weight (in Grams) of Water in Air.

[This table gives the apparent weight, for temperatures between 15° and 30° C., humidity 50 per cent, unreduced barometer reading 76 cm of certain volumes of water weighed with brass weights. This table is based on the data given in Tables 1 and 15, and may be conveniently employed to determine definite volumes of water for calibrating instruments. The table assumes the air to be at the same temperature as the water.]

Table 17.—Temperature Correction for Glass Volumetric Apparatus.

[This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20° C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20° C. the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.000025 per degree Centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from .000023 to .000028.]

Tables of Corrections for Determining the True Capacities of Glass Vessels from the Weight of Water in Air.

Tables 18 to 30 are intended for the calculation of capacities of glass vessels of common sizes from the weight (in air) of the water contained or delivered. They give for each nominal capacity and observed temperature the amounts to be added to the apparent weight (in air against brass weights) of the water contained in or delivered by a glass vessel to give the capacity in cubic centimeters at 20° C. They are calculated on the following data assumed as approximating ordinary conditions:

Observed barometric pressure.....	76 cm.
Relative humidity	50 per cent.
Coefficient of expansion of glass	0.000025 per deg. C.

EXAMPLE OF USE OF TABLE.

Determination of capacity of glass measuring flask marked "To contain 250 cc at 20° C."

Apparent weight of water at the observed temperature 22°3 C.....	249.198
From Table 18, correction.....	0.813

Actual capacity at 20°.....	250.011
-----------------------------	---------
