CLASSIFICATION OF RADIO SUBJECTS—AN EXTENSION OF THE DEWEY DECIMAL SYSTEM¹

ABSTRACT

A systematic scheme of classification of subjects in radio science and engineering is necessary in classifying references to current radio publications and also for classifying all sorts of other radio material, such as reports, reprints, drawings, books, apparatus, etc. In an effort to fill the need for a radio classification this extension of the Dewey decimal system was prepared. Since the publication of Circular No. 138 (superseded by this circular) in 1923,

Since the publication of Circular No. 138 (superseded by this circular) in 1923, the subject classification it presents has been used extensively by many radio research workers and engineers as well as by the radio section of the National Bureau of Standards. The present circular brings the classification up to date and makes a few changes which use has shown to be necessary.

I. INTRODUCTION

Since the publication of Circular No. 138, in 1923, the subject classification it presents has been used extensively by many radio research workers and engineers as well as by the radio section of the Bureau of Standards. The present circular brings the classification up to date and makes a few changes which use has shown to be necessary.

A systematic scheme of classification of subjects in radio science and engineering is necessary in classifying references to current radio publications and also for classifying all sorts of other radio material, such as reports, reprints, drawings, books, apparatus, etc. In an effort to fill the need for a radio classification this extension of the Dewey decimal system was prepared.

Such a system makes it easy to place books on related subjects near together on the shelves, or to file references on the same subject all in the same group and not by the order of their addition to the collection or file. If a classification is to be of the most use, any part of it must be capable of expansion, or it must be possible to disregard any part of the classification without interfering with the usefulness of the remaining parts. These requirements are met.

Thomas

¹ The original circular (C138) was prepared by L. E. Whittemore and R. S. Ould; this circular prepared by J. H. Dellinger and C. B. Jolliffe.

 $\mathbf{2}$

II. THE DEWEY DECIMAL SYSTEM OF CLASSIFICATION

Under the Dewey decimal system,² of which the present classification is an extension, classification is by subject, numbers being used to show the relative positions of the books, cards, or other material. The numbers, therefore, show both what the material is (that is, its subject matter), and where the material is (that is, its location on the shelves or in the files). In the classification list the indentation and the figures prefixed to each item show the rank of each subject in the classification.

Accompanying the extended classification table used in Bureau of Standard files is an alphabetical index.³ The index is used in determining the number to assign to a given item or material, or to learn where to place it in the files. The index is also used by any person desiring to locate the material covering a given subject. The reference number tells immediately where all material on that and on related subjects can be found.

1. OUTLINE OF CLASSIFICATION

The whole subject of radio is given the number 621.384 in the Dewey classification. The relation of this place to the general field of knowledge is shown by the following table:

Class 600	Useful arts.
20	Engineering.
1	Mechanical.
0.300	Electrical.
	Communication.
.004	Radio.

In a strictly radio library or office it is convenient to represent the figure 621.384 by "R" and this abbreviation is used below in the further classification of radio. Thus, R211 indicates 621.384.211.

While some of the details of the Dewey system itself seem to be illogical (for example, electrical engineering a subdivision of mechanical engineering), the system has been widely adopted, and confusion would result from attempts to change it into a more logical form.

The Dewey system has some general features which are found especially advantageous. For example, all general material under a given class is put under the class itself (usually having a final figure 0). The ninth division under any class is usually reserved for miscellaneous items which are as yet of too small importance to classify separately; this should not be confused with the first item (0) under each class which is used for general material pertaining to many or all of the subdivisions under it. The ninth division should be used sparingly; that is, effort should always be made to find a more specific classification. This sometimes requires an extension to be made to the classification at some point.

^a The original circular (C138) was based on the tenth edition, 1919, of Decimal Classification and Relative Index for Libraries, Clipping Notes, etc., by M. Dewey, published by Forrest Press, Lake Placid Club, N. Y. Successive revisions of Dewey's book appeared, and the twelfth edition, 1927, is the basis of the present edition of this circular. Attention is also called to an elaboration of the Dewey system of decimal classification made by the International Institute of Bibliography (published in Classification Decimale Universelle, by Institut International Institute expanded tables are similar in general plan, but differ in detail. For example, in the American Dewey tables radiocommunication is found at 621.384, as ex-plained below, while in the International Institute tables it is found at 621.396. ^a By neglecting detailed numbers this index can be applied to the classification table given in III, 1.

2. DETAILED FORM CLASSIFICATION

The Dewey classification, as well as the extension for radio, is mainly by subject or content, regardless of form. For material covering a general field, special form subdivision of the subject is found practically useful. For classification as to form the following set of numbers may be used in connection with the number corresponding to any subject covered.

- 001 Statistics.
- 002
- Quantities; cost. Contracts; specifications. 003
- Designs: drawings. 004
- 005 Executive: administrative: rules.
- 006 Working; maintenance.
- 007 Laws; regulations.
- 008 Patents.
- 009 Reports of tests; bulletins.
- Theory; methods; programs. 01
- $\tilde{02}$ Textbooks: outlines; manuals.
- 03 Cyclopedias; dictionaries.
- Essays; addresses; lectures; letters; papers. 04
- 05 Periodicals; magazines; reviews; bibliography; publications.
- 06 Societies; associations; transactions; exhibitions.
- 07 Education; training; museums.
- 08 Tables: calculations: charts: maps.
- 09 History; progress; development; biographical.

The sequence of figures constituting the form number is simply placed to the right of the sequence of figures constituting the class number.⁴ Thus a periodical on any subject has the subject number followed by 05.

Examples:

R500.05	Periodicals on applications of radio.
R510.05	Periodicals on applications of radio to navigation.
R526.105	Periodicals on radiobeacon systems.
R526.100. 7	Laws regarding radiobeacons.

Thus the classification of any subject may be expanded to meet the needs of an individual file. The complete number gives in a condensed form an indication of what the material is as well as its location in the files.

III. CLASSIFICATION OF RADIO SUBJECTS

1. DETAILS OF USE

In the classification of radio subjects the main features of the Dewey system as to subject and form classification are retained.

The class (R800) is anomalous. This space in the classification is actually used for nonradio matter. Such material should, however, be given its regular class number according to the Dewey system. If it were arranged in strictly numerical order, some of this material would come before radio and some after radio. Bv choosing arbitrarily to use the space denoted by R800 for this purpose it is possible to arrange the nonradio material in classified order, but to keep it subordinate to a larger volume of radio material. Accordingly, a number of nonradio items are included where R800

⁴ In the original circular (C138), the following statement was made: "If the class number already ends in one or two zeros, as 500 or 510, these zeros are disregarded in making up the combined number." This practice has been abandoned and all zeros should be included except under R000.

comes in the list under Section IV below, but are given their number according to the complete classification.

In filing a specific paper under a given class or subdivision, a convenient file number for it can readily be made by using its subject classification number plus a small letter; the order chosen for the letters used for subsequent papers can be according to author, chronological order of accession, or any other consideration depending on the circumstances.

In a card file of references to periodical literature, it is convenient to arrange the cards under each final class or subdivision either in chronological order or in alphabetical order by the names of authors. Cross references may be made conveniently in such a card file by preparing two or more cards and marking each card, after the file number, "X——." For example, suppose an article on fading (R113.1) includes a method of measuring field intensity by radiofrequency comparison method (R273); two cards should be made out, one marked R113.1, XR273 and the other R273, XR113.1. Each of these should be filed under the first number.

The needs of individual collections of files vary widely, and expansions of the system can be made by any person using the system. The following classification table is given as a classification which in itself meets the needs of small collections or files. Persons interested in a particular subject or subjects will find it advantageous to expand the parts in which they are interested, and to use the classification as given for those parts in which they have only a general interest.

In Section V below there is given a detailed extension of this classification which has been evolved to meet the filing needs of the radio section of the Bureau of Standards. In that table there will be found examples of detailed extensions to meet particular circumstances.

In cases where files of an organization are numbered according to an extended system and are made available to another organization using a less extended system, the detailed portion of the classification numbers can be removed. An example of this is the monthly lists of references to current radio literature published by the Bureau of Standards.⁵ The reference numbers in the bureau's own files are according to the table given in Section V; for example, an article on radiobeacon systems for aircraft (visual type) is filed under R526.12. This may be filed in a less extended file under R520 (aircraft radio), R526 (radio as navigation aid), or R526.1 (beacon systems for aircraft), depending on how brief a system is being used.

2. CLASSIFICATION TABLE

R000	RADIO. (Material of a general nature for which no specific classification can be used and which relates to the field as a whole.)
R100	Radio principles. (Material having to do with underlying theory.)
R110	Radio waves. (Transmission phenomena and theory; atmospherics.)
	Antennas. Vacuum tubes.

^{\$} Proc. Inst. Radio Engrs.

- R140 _____Circuit theory and effects.
- R150 _____Generating (transmitting) apparatus (except vacuum tubes. See R130.)
- R160 _____Receiving apparatus.
- R170 _____Interference.
- R190 _____Other radio principles.

R200 ____Radio measurements and standardization.

(Methods of, and apparatus for, measurement.)

- R210 _____Frequency.
- R220 ____Capacity.
- R230 _____Inductance.
- R240 _____Resistance; current; voltage.
- R250 _____Generating (transmitting) apparatus.
- R260 _____Receiving apparatus.
- R270 _____Intensity (field intensity, signal intensity, noise, etc.)
- R280 _____Properties of materials.
- R290 _____Other radio measurements.
- R300 ____Radio apparatus and equipment.

(Component parts of apparatus, not complete communication systems.)

- R320 _____Antennas.
- R330 _____Vacuum tubes.
- R350 _____Generating (transmitting) apparatus.
- R360 _____Receiving apparatus.
- R380 _____Parts; instruments.
- R390 _____Other radio apparatus and equipment.
- R400 ____Radio communication systems.
 - (Complete communication systems, or parts of a system which are considered in relation to the complete system.)
- R410 _____Modulated-wave systems.
- R420 ____Continuous-wave systems.
- R430 _____Interference elimination.
- R440 _____Remote control (by wire).
- R450 _____Connection of radio systems to wire systems.
- R460 _____Duplex and multiplex systems.
- R470 _____Radio-frequency carrier wire systems.
- R480 _____Radio relay systems.
- R490 ____Other systems.
- R500 ____ Applications of radio.

(Radio as an instrument in other arts, industries, etc.)

- R510 _____Marine applications.
- R520 _____Aeronautic applications.
- R530Commercial and special services. (Commercial communications, press, railroads, mining, etc.)
- R540 _____Private.
- R550 _____Broadcasting.
- R560 _____Military.
- R570 _____Remote control by radio.
- R580 _____Picture transmission; television.
- R590 ____Other applications.
- R600 ____Radio stations.

(Equipment, operation, and management.)

R610 _____Equipment.

R620 _____Operation and management.

R700 ____Radio manufacturing.

R710 _____Factories.

R720 Processes.

R740 _____Sales.

(R800) ____Nonradio subjects.

(Material of interest, but not a part of radio. Give complete numbers according to the Dewey system. See Pt. V.)

R900 ____Miscellaneous radio.

(Material which has no specific place. See also R000.)

This is in substantial agreement with the classification as given in the first edition, with the exception of changes in R240, R250, R260, R340, R580, and R590, mostly made for the sake of consistency between parts of the classification.

IV. EXTENSIONS OF RADIO CLASSIFICATION

For larger collections and files a still more detailed extension might be required. The form classification (Sec. II, 2) is very useful for detailed extensions, and may be used under any item in the classification, as occasion requires.

The following extension of the subject classification has been developed for filing material in the radio section, Bureau of Standards. Form classifications (see Sec. II, 2) are not given in the table except under R000, but, as already stated, may be made anywhere in the classification. Radio reference lists and other material published by the bureau are classified according to this table.

V. EXTENDED CLASSIFICATION TABLE USED IN BUREAU OF STANDARD FILES

R000	RADIO.

VI. INDEX TO RADIO CLASSIFICATION

This index applies specifically to Sec. IV, viz, the Bureau of Standards extended classification. It may be used to find the classification number of a subject, or to find the location of information in files or on shelves.

To use the index, find the subject desired in its alphabetical place. The number after it is its classification number, and thus gives the places where the topic will be found on shelves or in files or subject catalogues.

Labels on shelves or drawer fronts may be used to guide readily to the classification number sought. Under the classification number will be found the resources of the library or files on the subject desired.

A Abbreviations, radio traffic, R531.3.	Ammeters, 621.374.41. Ammeters, hot-wire, R242.11. Ammeters, radio, R242.1.
Absorption of radio waves, R113.6. Adcock antennas, R125.4, R325.4.	Amplification factor, receiving vacuum tubes, measurement, R262.4.
Administrative, radio, R005.	Amplification, harmonic, R146.1.
Aerial gavigation, 629.145. (See also R520.)	Amplifiers, R363. Amplifiers, audio-frequency, R363.2.
Aerials, R320.	Amplifiers, harmonic, R357.
Aeronautics, 629.13. (See also R520.)	Amplifier, harmonic, use in frequency
Aeronautics, applications of radio to, R520.	measurements, R213.1. Amplifiers, power, R255, R355.7.
Agriculture, applications of radio to,	Amplifiers, radio-frequency, R363.1.
R534. Aids for landing aircraft, radio, R526.3.	Amplifiers, vacuum tube, principles, R132.
Aircraft, applications of radio to, R520.	Amplifying action of vacuum tubes,
Aircraft, automatic control of, R527.	R132.
Aircraft, receiving from, R523. Aircraft, receiving on, R521.	Amplifying apparatus, measurement, R263.
Aircraft receivers, R521.1.	Analysis of wave form, 537.7.
Aircraft transmitters, R522.1.	Angle of wave front, R113.63. Anode, vacuum tubes. (See Plate.)
Aircraft, transmitting from, R522. Aircraft, transmitting to, R524.	Antennas, R120, R320.
Air mail service, 383. (See also Aero-	Antennas, Adcock, R125.4, R325.4.
nautics, 629.13.) Airplane construction, 629.18.	Antennas, airplane, R525. Antennas, artificial, R327.
Airport receivers, R523.	Antennas, beam, R125.1, R325.1.
Airport transmitters, R524.	Antennas, coil, R125.3, R325.3.
Alphabets, Morse and continental (in- ternational), R531.4.	Antennas, condenser type, with ground or counterpoise, R121, R321.
Alternating-current machinery, 621	Antennas, counterpoise, R321.
313.3. Alternating-current power supply, re-	Antennas, directional (transmitting in or receiving from, a particular direc-
ceiving sets, R366.2.	tion), R125, R325.
Alternating-current power supply, transmitters, R356.2.	Antennas, multiple tuned, R129.1, R329.1.
Alternating-current tubes, R336.	Antennas, other types of, R129, R329. Antennas, wave, R125.2, R325.2.
Alternators, radio-frequency, R154, R354, R421.	Antenna switches, R320.6.
Altimeters, R526.4.	Apparatus, radio, R300.
Amateur radio, R545.	Apparatus, receiving, R360.

Apparatus, transmitting, R350.
