UNITS OF WEIGHT AND MEASURE—DEFINITIONS AND TABLES OF EQUIVALENTS

CONTENTS

I. INTRODUCTION

With this edition the Tables of Equivalents of United States Customary and Metric Weights and Measures, formerly published as one of the miscellaneous publications of this Bureau, becomes one of the series of Circulars of the Bureau of Standards. Several additions and changes are made in the contents.

One of these is the introduction of complete definitions of all the fundamental units and of the most common multiples and submultiples. This is followed by a section calling attention to the distinction between the *units* of weight and measure and the *standard* weights and measures. Tables are also introduced giving the interrelation of all the units of one kind—for example, of all the usual length units.

Another change that has been made has been that of recomputing all tables involving the liter to conform to the relation of 1 liter = 1.000027 cubic decimeters, a relation determined at the International Bureau of Weights and Measures since the earlier editions of these tables.[1] The United States gallon and bushel, being defined as volumes equivalent to a certain number of cubic inches, their equivalents in liters or hectoliters have heretofore been computed on the assumed relation that 1 liter was equal to 1 cubic decimeter, which, for practically all purposes, is sufficiently exact. The determination of this relation being now completed, however, it has been decided to give the relations of United States liquid and dry capacity units in terms of metric capacity units, and vice versa, in the more exact terms.

In the construction of the tables in this circular, when the fundamental relation of the units furnished directly a reduction factor for use in determining the multiples of the units, this factor was used in its fundamental form, as, for example, that 1 meter = 39.37 inches. Reduction factors which it was necessary to obtain, however, by multiplication, division, powers or roots, etc., of the fundamental relations were usually carried out to a greater degree of accuracy than that to which it is usually possible to make measurements, for convenience

[1] Trav. et Mém. Bur. Int. des Poids et Mesures, 13.

in computing the multiples to the accuracy desired. For example, to convert 606 hectoliters to bushels:

$$1 \text{ hectoliter} = 100 \text{ liters}$$
$$1 \text{ liter} = 1.000027 \text{ cubic decimeters}$$
$$1 \text{ decimeter} = 3.937 \text{ inches}$$
$$1 \text{ cubic decimeter} = (3.937)^3 \text{ inches}$$
$$1 \text{ bushel} = 2150.42 \text{ cubic inches}$$

Therefore 606 hectoliters $= \dfrac{606 \times 100 \times 1.000027 \times (3.937)^3}{2150.42}$

$$= 1719.718 \text{ bushels.}$$

In the actual construction of the tables, however, instead of working out such an extensive computation each time, the reduction factor, 1 hectoliter $= 2.8378189$ bushels, is used in place of the factor $\dfrac{100 \times 1.000027 \times (3.937)^3}{2150.42}$ given above.

When the tables do not give the equivalent of any desired quantity directly and completely the equivalent can usually be obtained, without the necessity of making a multiplication of these reduction factors, by using quantities from several tables, making a shift of decimal points if necessary, and merely adding the results. For example, to obtain the equivalent of 1345 feet 11⅜ inches in meters,

From the table on page 24, 134 feet $= 40.84328$ meters
Therefore 1340 feet $= 408.4328$ meters
From the same table, 5 feet $= 1.52400$ meters

From the table of equivalents of inches in meters, on page 25, or by using the equivalent for 1 inch in the table on page 15 and moving the decimal point one place to the right and adding the equivalent for 1 inch to the result,

11 inches $= 0.27940$ meter.

From the table on page 20, ⅜ inch $= 9.525$ millimeters $= 0.009525$ meter.

1340 feet	= 408.4328	meters
5 feet	= 1.52400	meters
11 inches	= 0.27940	meter
⅜ inch	= 0.00952	meter

Adding, 1345 feet 11⅜ inches $= 410.2457$ meters.

II. FUNDAMENTAL EQUIVALENTS

The fundamental unit of the metric system is the METER, the unit of length. From this the units of capacity (LITER) and of weight (GRAM) were derived. All other units are the decimal subdivisions or multiples of these. These three units are simply related, e. g., for all practical purposes 1 CUBIC DECIMETER equals

1 LITER and 1 LITER of water weighs 1 KILOGRAM. The metric tables are formed by combining the words "METER," "GRAM," and "LITER" with the six numerical prefixes, as in the following tables:

Prefixes		Meaning			Units
milli-	=	*one-thousandth*	$\frac{1}{1000}$	.001	
centi-	=	*one hundredth*	$\frac{1}{100}$	.01	*"meter" for length.*
deci-	=	*one-tenth*	$\frac{1}{10}$	.1	
Unit	=	*one*		1	*"gram" for weight or mass.*
deka-	=	*ten*	$\frac{10}{1}$	10	
hecto-	=	*one hundred*	$\frac{100}{1}$	100	*"liter" for capacity.*
kilo-	=	*one thousand*	$\frac{1000}{1}$	1000	

All lengths, areas, and cubic measures in the following tables are derived from the international meter, the legal equivalent being **1 meter = 39.37 inches** (law of July 28, 1866). In 1893 the United States Office of Standard Weights and Measures was authorized to derive the yard from the meter, using for the purpose the relation legalized in 1866, **1 yard** $= \frac{3600}{3937}$ **meter**. The customary weights are likewise referred to the kilogram (Executive order approved Apr. 5, 1893). This action fixed the values, inasmuch as the reference standards are as perfect and unalterable as it is possible for human skill to make them at this time.

All capacities are based on the equivalent 1 liter equals 1.000027 cubic decimeters. The decimeter is equal to 3.937 inches in accordance with the legal equivalent of the meter given above. The gallon referred to in the tables is the United States gallon of 231 cubic inches. The bushel is the United States bushel of 2,150.42 cubic inches. These units must not be confused with the British units of the same name which differ from those used in the United States. The British gallon is approximately 20 per cent larger and the British bushel 3 per cent larger than the corresponding units used in this country.

The customary weights derived from the international kilogram are based on the value 1 avoirdupois pound = 453.5924277 grams. This value is carried out further than that given in the law, but is in accord with the latter as far as it is there given. The value of the troy pound is based upon the relation just mentioned and also the equivalent $\frac{5760}{7000}$ avoirdupois pounds equals 1 troy pound.

IV. STANDARDS FOR MEASUREMENT

Units of measurement should be distinguished from standards for measurement, particularly in the case of length and capacity. Units of length are fixed distances, independent of any other consideration, while length standards are affected by the expansion and contraction with changes of temperature of the material of which the standard may be composed. It is therefore necessary to fix upon some temperature at which the distance between the defining lines or end surfaces of the standards shall be equal to the unit. The same is true of standards of capacity, which at some definite temperature contain a given number of units of volume.

The temperature at which metric length standards are customarily made correct is 0° C, although 20° C is also used for steel tapes and some other standards intended for use at room or average outdoor temperatures.

The temperature at which standards of length of the customary system are made correct is 62° F.

For measurements of high precision it is also necessary to specify the manner of support of the standards, whether at certain points only or throughout their entire length, and in the case of tapes it is also necessary to give the tension applied to the tape when in use.

In the United States the capacity standards, both metric and customary, are made to hold the specified volumes at 4° C. Standards of capacity are usually made of brass so the capacity at any other temperature may be computed by the use of the coefficient of cubical expansion, usually assumed to be 0.000 054 per degree centigrade. In the purchase and sale of liquids a more important consideration than the temperature of the measures is the temperature of the liquid when measured, for the reason that the large coefficient of expansion of many liquids makes the actual mass of a given volume delivered vary considerably with temperature. For this reason, the custom of buying and selling liquids by weight instead of by measure is recommended. It is further recommended that, when liquids are sold by volume, 68° F or 20° C be adopted as the standard temperature of the liquid.

While the temperature of a weight does not affect its mass, it is nevertheless important that when two weights are compared in air they both be at the same temperature as the air. If there is a difference between the temperature of the air and the weights, convection currents will be set up and the readings of the balance will be thereby affected. Also, since weights are buoyed up by the surrounding air by amounts dependent upon their volumes, it is desirable that the weights of any set be of the same material. If two weights of the same density balance in air of a certain density they will balance in vacuo or in air of a different density.

Brass is the material most widely used for standard weights, although platinum is quite commonly used for weights of 1 gram or less. In the absence

of any knowledge as to the actual density of weights, those made of brass are assumed to have a density of 8.4 at 0° C, while those of platinum are assumed to have a density of 21.5 at 0° C.

V. SPELLING AND ABBREVIATION OF UNITS

The spelling of the names of units adopted by the National Bureau of Standards is that given in the list below.   The spelling of the metric units is in accordance with that given in the law of July 28, 1866, legalizing the metric system in the United States.

Following the names of each unit in the list below is given the abbreviation which the Bureau has adopted.   Attention is particularly called to the following principles:

1. The period is omitted after the abbreviations of the metric units, while it is used after those of the customary system.

2. The exponents, "^{2}" and "^{3}," are used to signify area and volume, respectively, in the case of the metric units instead of the longer prefixes "sq." or "cu." In conformity with this principle the abbreviation for cubic centimeter is "cm^3," instead of "c. c." or "c. cm."   The term "cubic centimeter" as used in chemical work is, in fact, a misnomer, since the unit actually used is the "milliliter," which has a slightly larger volume.   (See p. 4.)

3. The use of the same abbreviation for both singular and plural is recommended.   This practice is already established in expressing metric units and is in accordance with the spirit and chief purpose of abbreviations.

4. It is also suggested that, unless all the text is printed in capital letters, only small letters be used for abbreviations except in the case of A. for acre, where the use of the capital letter is general.

The list of the most common units of weight and measure and their abbreviations follows:
